sleep learning the learning of material presented while one is asleep. The possibility of true sleep learning is still a controversial issue. Simple learning, such as CLASSICAL CONDITIONING, may occur during sleep; more complex learning, such as the acquisition of a foreign language, has not been reliably demonstrated.

sleeplessness n. see SOMNOLENC.

sleep-onset insomnia see INITIAL INSOMN.

sleep paralysis brief inability to move or speak just before falling asleep or upon awakening, often accompanied by terrifying hallucinations. It may occur in any individual but is seen especially in individuals with NARCOLEPSY and may be due to a temporary dysfunction of the RETICULAR ACTIVATING SYSTEM.

sleep pattern a habitual, individual pattern of sleep, such as two 4-hour periods, daytime napping, various forms of insomnia (e.g., initial or intermittent insomnia), or excessive sleep. See also SLEEP–WAKE CYCLE.

sleep psychology a synonym of BEHAVIORAL SLEEP MED-

Sleep Questionnaire and Assessment of Wakefulness (SQAW) an extensive questionnaire to assess sleep behaviors and sleep disorders. [developed in 1979 by U.S. physician Laughton E. Miles at the Stanford University Sleep Disorders Clinic and Research Center]

sleep recovery sleeping more than usual after a period of sleep deprivation, as though in compensation.

sleep-related hypventilation see BREATHING–RELATED SLEEP DISORDER.

sleep rhythm see SLEEP–WAKE CYCLE.

sleep spindles regular sinusoidal electroencephalographic oscillations that rise and fall in amplitude in the shape of symmetrical hairpins or spindles during Stage 2 NREM sleep (see SLEEP STAGES). Spindles have a frequency of about 15 Hz and are believed to indicate a state of light sleep. They are often seen with K COMPLEXES.

sleep stages the stages of nocturnal sleep as distinguished by physiological measures, mainly scalp electroencephalography. Typically, a regular pattern of occipital ALPHA WAVES characteristic of a relaxed state becomes intermittent in STAGE 1 SLEEP, which is marked by drowsiness with upward-rolling eye movements. This progresses to STAGE 2 SLEEP (light sleep), characterized by SLEEP SPINDLES and K COMPLEXES. In STAGE 3 SLEEP and STAGE 4 SLEEP (deep sleep), DELTA WAVES predominate (see SLOW-WAVE SLEEP). These four stages comprise NREM SLEEP and are interspersed with periods of REM SLEEP, when most dreaming occurs. After a period of deep sleep, an individual may return to either light sleep or REM sleep, and the cycle can recur multiple times over a normal night.

sleep talking verbalization during sleep, either in the form of mumbling or coherent speech. It usually occurs during NREM SLEEP, and the sleeper is sometimes responsive to questions or commands. It is generally not considered pathological and occurs at one time or another in most people. Also called somniloquy.

sleep terror disorder a SLEEP DISORDER characterized by repeated episodes of abrupt awakening from NREM SLEEP accompanied by signs of disorientation, extreme panic, and intense anxiety. More intense than NIGHTMARES and occurring during the first few hours of sleep, these episodes typically last between 1 and 10 minutes and involve screaming and symptoms of autonomic arousal, such as profuse perspiration, dilated pupils, rapid breathing, and a rapidly beating heart. The individual is difficult to wake or comfort and does not have detailed recall of the dream upon waking; complete loss of memory for the episode is common. The disorder occurs most often in children and generally resolves itself during adolescence. In adults, it is often associated with psychopathology and a more chronic course. Also called night terror. See also PARASOMNIA.

sleep–wake cycle the natural, brain-controlled bodily rhythm that results in alternate periods of sleep and wakefulness. The sleep–wake cycle may be disrupted by a number of factors, such as flight across time zones, shift work, drug use, or stress (see CIRCADIAN RHYTHM SLEEP DISORDER; DISORDERS OF THE SLEEP–WAKE CYCLE SCHEDULE). Also called sleep rhythm; sleep–wakefulness cycle. See also MONOPHASIC SLEEP; POLYPHASIC SLEEP.

sleep–wake disorder see SLEEP DISORDER.
sleep–wake schedule disorder see CIRCADIAN RHYTHM SLEEP DISORDER.

sleepwalking disorder a SLEEP DISORDER characterized by persistent incidents of complex motor activity during slow-wave NREM SLEEP. These episodes typically occur during the first hours of sleep and involve getting out of bed and walking, although the individual may also perform more complicated tasks, such as eating, talking, or operating machinery. While in this state, the individual stumbles blankly, is essentially unresponsive, and can be awakened only with great difficulty; he or she does not remember the episode upon waking. Also called noctambulation; somnambulism. See also PARASOMNIA.

SLI abbreviation for SPECIFIC LANGUAGE IMPAIRMENT.

slice-of-life commercial see NONOVERT APPEAL.

slip n. an error, such as a SLIP OF THE TONGUE, that is committed unintentionally, even while knowing that it is an error. It implies a momentary loss of deliberate control. See PARAPRAXIS.

slip of the pen see FREUDIAN SLIP; PARAPRAXIS.

slip of the tongue a minor error in speech, such as a SPOONERISM, that is episodic and not related to a speech disorder or a stage of second-language acquisition. Psychoanalysts have long been interested in the significance of such slips, referring to them as FREUDIAN SLIPS and believing them to reveal unconscious associations, motivations, or wishes. Also called lapsus linguae; speech error. See also PARAPRAXIS; VERBAL LEAKAGE.

slippage n. see COGNITIVE SLIPPAGE.

slipped disk a condition in which the gelatinous interior of an intervertebral disk is pushed through a weakened portion of its fibrous coating, pressing on adjacent nerve roots and associated structures. This causes pain in the back, leg, or arm, depending on the position of the disk and the nerve involved, and sometimes nerve damage (resulting in numbness, weakness, etc.). The SCIATIC NERVE is most commonly affected. The medical name for this condition is prolapsed intervertebral disk.

slit viewing see ANORTHOSCOPIC PERCEPTION.

slope n. the steepness or slant of a line on a graph, measured as the change of value on the Y-AXIS associated with a change of one unit of value on the X-AXIS. In a REGRESSION EQUATION, slope is represented by the variable b, with +b indicating an upward slope to the line and −b indicating a downward slope. See also ACCELERATION.

Slosson Intelligence Test (SIT) a brief individual test of verbal intelligence designed for use with individuals ages 4 and older. It consists of 187 oral questions assessing six cognitive domains: vocabulary, general information, similarities and differences, comprehension, quantitative ability, and auditory memory. Originally developed in 1963, the SIT was revised in 1991 (SIT–R) and in 2002 (SIT–R3). [Richard Lawrence Slosson Jr. (1910–1970), U.S. psychologist]

slowdown n. a tactic in which employees seeking workplace change put pressure on management by intentionally slowing production to levels that are costly to the company but not in violation of contractual agreements.

slow euthanasia in the debate over ASSISTED DEATH, a controversial term that refers to the practice of PALLIATIVE SEDATION, whereby a terminally ill person is heavily sedated with opiates in the final hours or days of life. Critics claim this practice is an act of ACTIVE EUTHANASIA as the sedation is likely to hasten death. In response, proponents of the practice have used the PRINCIPLE OF DOUBLE EFFECT to argue that there is no intent to hasten death but only to provide comfort and relieve suffering.

slow learner a child of lower-than-average intelligence. Such children are so designated despite the fact that a somewhat lower-than-average IQ does not necessarily imply slow learning. Slow learners are estimated at 15% to 17% of the average school population. They do not show marked variations from physical, social, and emotional norms and are usually placed in regular classes. The term slow learner is often imprecisely applied to children with mild intellectual disability as well as to children of normal capacity whose intellectual progress is slow.

slow muscle fiber a type of muscle fiber found in SKELETAL MUSCLE that contracts slowly and is resistant to fatigue. Compare FAST MUSCLE FIBER.

slow-release preparation a drug preparation that is formulated in such a way that the active ingredient is released over an extended period. For example, drugs may be administered in the form of transdermal patches applied to the skin, through which they slowly release their contents; or as extended-release capsules, which contain quantities of the active drug surrounded by separate coatings that dissolve at different rates in the stomach and intestines. Injectable slow-release forms (depot preparations) are often oil based; these are taken up into fat stores in the body and released over extended periods of days to weeks. Also called extended-release preparation: sustained-release preparation.

slow wave see DELTA WAVE.

slow-wave sleep deep sleep that is characterized by increasing percentages of particular types of DELTA WAVES on the electroencephalogram, corresponding to Stages 3 and 4 of NREM SLEEP. See also SLEEP STAGES.

Sly syndrome see BETA-GLUCURONIDASE DEFICIENCY.

SM abbreviation for SECONDARY MEMORY.

SMA 1. abbreviation for SPINAL MUSCULAR ATROPHY. 2. abbreviation for SUPPLEMENTARY MOTOR AREA.

smallest space analysis (SSA) a statistical technique for creating a visual representation of data, in which more closely correlated variables are grouped together. Smallest space refers to the fewest number of geometric dimensions (e.g., one dimension may be denoted by a line, two by a square, three by a cube) by which a body of data may be adequately represented. Similar in purpose to FACTOR ANALYSIS and PRINCIPAL COMPONENTS ANALYSIS, smallest space analysis may be applied to the assessment of objects, persons, attitudes, test constructs, and other similar variables.

small for gestational age (SGA) a newborn infant who weighs below the 10th percentile for its sex and gestational age. These babies are often born with a LOW BIRTH WEIGHT.

Smalltalk n. one of the first object-oriented computer languages, designed at Xerox in the 1970s. The name was chosen because the language was designed to be a communication medium for children. Window systems and mouse-driven control eventually emerged from this early research project.
SMART

SMART acronym for Sensory Modality Assessment and Rehabilitation Technique. See VEGETATIVE STATE.

smart house a home that contains numerous devices that can be programmed to perform tasks automatically or be integrated into a single system controlled by a user through one unit. For example, a door can be programmed to unlock automatically whenever a smoke detector sounds in the home, or a light can be turned on and off with a remote control rather than a light switch. Smart house technology can also incorporate elaborate systems and sensors that monitor household equipment, such as appliances and heating and cooling systems, as well as the activities of occupants, often providing alerts to individuals or external agencies as necessary. Such homes are especially important to older adults and individuals with disabilities because they enable increased independence and enhance quality of life.

smell 1. n. an ODOR. 2. n. the sense that enables an organism to detect the odors of volatile substances. Molecules of odorant chemicals carried by air currents are absorbed into nasal mucus and stimulate the OLFACTORY RECEPTORS, where they are converted to neural messages. See OLFACTORY TRANSDUCTION. 3. vb. to detect odor by means of the olfactory system.

smell brain see RHINENCEPHALON.

smell compensation the perception of a combination of ODORANTS as less intense than the component odorants.

Smell Identification Test (SIT) a 40-item test of odor-identification ability for individuals ages 5 years and older. It is used to assess olfactory sensitivity and diagnose or evaluate olfactory impairment, which has been recognized as an important clinical indicator of neurological and psychiatric disorders (e.g., Alzheimer’s disease, Parkinson’s disease). Test participants scratch and sniff a scent-impregnated patch and then identify the odor from a list of four possible choices, repeating the procedure for all 40 test stimuli. A brief version of the test (B-SIT) using 12 odorant stimuli determines gross dysfunction of olfactory sensitivity. Also called University of Pennsylvania Smell Identification Test (UPSIT). [developed by U.S. psychologist Richard L. Doty (1944– )]

smell prism see HENNING’S ODOR PRISM.

Smith–Lemli–Opitz syndrome an autosomal recessive disorder marked by the inability to produce cholesterol and by MICROCEPHALY. Other features may include a broad, short nose; syndactyly (fused digits) or polydactyly (extra digits); and intellectual disability. Nearly all affected males have urethral or other genital anomalies, whereas females have no obvious abnormalities of the external genitalia, a factor that led early investigators to believe erroneously that the syndrome affected only males. This disorder is caused by mutations of the DHC7 gene. Also called RSH syndrome (from the names of the three affected families originally reported); Smith syndrome (reported in 1964 by David W. Smith (1926–1981), U.S. pediatrician; Luc Lemli (1935– ), Belgian pediatrician; and John M. Opitz (1935– ), U.S. geneticist).

smoking n. the act of drawing the smoke of burning TOBACCO or other substances (e.g., marijuana, CRACK cocaine) into the mouth or lungs, leading to rapid onset of the drug’s effect.

smoking cessation treatment interventions to help people quit smoking that typically involve behavioral techniques (e.g., reinforcement), social support, environmental change, and healthy activity substitution (e.g., exercise), sometimes in conjunction with nicotine replacement therapy or other drugs. Group treatment is often offered in community settings.

smoothed curve a graphical representation of the relationship between two variables that has been adjusted to eliminate erratic or sudden changes in SLOPE, so that its fundamental shape and direction will be evident. Also called smooth curve.

smoothing n. a collection of techniques used to reduce the irregularities (RANDOM VARIATION) in a data set or in a plot (curve) of that data, particularly in TIME-SERIES ANALYSIS, so as to more clearly see the underlying trends. See SMOOTHED CURVE.

smooth movement see RAMP MOVEMENT.

smooth muscle any muscle that is not striated and is under the control of the AUTONOMIC NERVOUS SYSTEM (i.e., it is not under voluntary control). Smooth muscles are able to remain in a contracted state for long periods of time or maintain a pattern of rhythmic contractions indefinitely without fatigue. Smooth muscle is found, for example, in the digestive organs, blood vessels, and the muscles of the eyes. Also called involuntary muscle. Compare CARDIAC MUSCLE; SKELETAL MUSCLE.

smooth-pursuit eye movement a slow, continuous eye movement that is responsive to feedback provided by brain regions involved in processing visual information, thus enabling continuous fixation on a moving object. Compare SACCADE.

SMR abbreviation for SENSORIMOTOR RHYTHM.

S/N abbreviation for SIGNAL-TO-NOISE RATIO.

snake phobia a persistent and irrational fear of snakes, classified as a SPECIFIC PHOBIA, animal type. Also called opidiophobia. See also ANIMAL PHOBIA.

sneak mating a practice in which male animals that do not form or defend territories or nest sites or do not vocalize or give displays to attract mates intercept females and mate with them before the females reach the larger, more dominant territorial or displaying males. Sneak mating has a low success rate, but it is frequently the only reproductive strategy available to smaller, subordinate males.

Snellen chart a device for testing VISUAL ACUITY, consisting of printed letters ranging in size from very small to very large. The observer reads the letters at a given distance. Also called Snellen test. [Herman Snellen (1834–1908), Dutch ophthalmologist]

SNF abbreviation for SKILLED NURSING FACILITY.

snow n. slang for COCAINE or sometimes HEROIN or AMPHETAMINE.

snowball sampling a technique to identify and recruit candidates for a study in which existing participants recommend additional potential participants, who themselves are observed and asked to nominate others, and so on until a sufficient number of participants is obtained. Researchers generally use snowball sampling if the population of interest is hard to locate, rare (e.g., people who have an infrequent condition or disease), or otherwise limited.

snow blindness a visual distortion caused by exposure to extreme intensities of white light. It is marked by PHOTO-
PHOBIA, an illusion that all objects are red (see CHROMATOPIA); or temporary loss of vision.

SNP abbreviation for SINGLE-NUCLEOTIDE POLYMORPHISM.

SNRI serotonin and norepinephrine reuptake inhibitor; any of a class of antidepressants that exert their therapeutically desired effects by interfering with the reabsorption of both serotonin and norepinephrine by the neurons that released them. They include VENLAFAXINE and duloxetine.

SOA abbreviation for STIMULUS ONSET ASYNCHRONY.

SOAP test a test of the ability of individuals with APHASIA to understand sentences of varying syntactic complexity: Subject-relative, Object-relative, Active, and Passive. It enables investigators to distinguish between the different types of aphasia.

Soar n. A COGNITIVE ARCHITECTURE, or a complete computational representation, intended to reflect a comprehensive view of human or machine processing, including input/output devices, the use of appropriate knowledge and search-based processing, and components that learn. Soar is based on the PRODUCTION SYSTEM model of human problem solving. See also ADAPTIVE PRODUCTION SYSTEM. [acronym for State, Operator, and Result; created in 1990 by U.S. cognitive and computer scientist Allen Newell (1927–1992)].

S–O association see S–S LEARNING MODEL.

sobriety n. A state in which one abstains from drinking or taking drugs for a period of time: that is, ABSTINENCE.

SOCE abbreviation for sexual orientation change efforts. See CONVERSION THERAPY.

sociability n. The tendency and accompanying skills to seek out companionship, engage in interpersonal relations, and participate in social activities. —sociable adj.

sociability rating an evaluation of an individual’s degree of sociability based on the amount of time devoted to social activities.

social adj. 1. relating to human society. 2. relating to the interactions between individuals, particularly as members of a group or a community. In this sense, the term is not restricted to people but rather applies to all animals.

social acceptance 1. The formal or informal admission of an individual into a group. 2. The absence of social disapproval.

social action 1. Individual or group activities directed to achieving benefits for the community or a segment of the population. See also ACTIVISM; COMMUNITY ACTION GROUP; SOCIAL MOVEMENT. 2. Any human activity seen in terms of its social context. Thus defined, such activity is the characteristic subject matter of the discipline of sociology.

social action program a planned and organized effort to change some aspect of society, such as enacting animal rights legislation or initiating improvements in psychiatric hospitals. See also SOCIAL MOVEMENT.

social adaptation see ADAPTATION.

social-adjective function of an attitude the role an attitude can play in facilitating social interaction and enhancing cohesion among members of a social group. For example, a teenager may adopt positive attitudes toward certain styles of dress and types of music as a means of gaining acceptance by a peer group. See also EGO-DEFENSIVE FUNCTION OF AN ATTITUDE; FUNCTIONAL APPROACH TO ATTITUDES; KNOWLEDGE FUNCTION OF AN ATTITUDE; UTILITARIAN FUNCTION OF AN ATTITUDE; VALUE-EXPRESSIVE FUNCTION OF AN ATTITUDE.

social adjustment accommodation to the demands, restrictions, and mores of society, including the ability to live and work with others harmoniously and to engage in satisfying interactions and relationships.

social affective neuroscience see AFFECTIVE NEUROSCIENCE.

social age (SA) A numerical scale unit expressing how mature a person is in terms of his or her interpersonal skills and ability to fulfill the norms and expectations associated with particular SOCIAL ROLES, as compared to others of the same CHRONOLOGICAL AGE. SA is similar to MENTAL AGE and is derived from ratings gathered from the individual or, in the case of young children, from parents or caregivers using instruments such as the VINELAND ADAPTIVE BEHAVIOR SCALES.

social agency a private or governmental organization that supervises or provides personal services, especially in the fields of health, welfare, and rehabilitation. The general objective of a social agency is to improve the quality of life of its clients.

social anchoring basing one’s attitudes, values, actions, and so forth on the positions taken by others, often to an extreme degree. Anchoring implies an inability to make an independent judgment, whereas social comparison involves assessing one’s position relative to that held by others. See SOCIAL COMPARISON THEORY.

social anxiety fear of social situations in which embarrassment may occur (e.g., making conversation, meeting strangers, dating) or there is a risk of being negatively evaluated by others (e.g., seen as stupid, weak, or anxious). Social anxiety involves apprehensiveness about one’s social status, role, and behavior. When the anxiety causes an individual significant distress or impairment in functioning, a diagnosis of SOCIAL PHOBIA may be warranted.

social anxiety disorder see SOCIAL PHOBIA.

social approval positive appraisal and acceptance of someone or something (a behavior, trait, attribute, or the like) by a social group. Its manifestations may include compliments, praise, statements of approbation, and so on. Compare SOCIAL DISAPPROVAL.

social ascendancy see UPWARD MOBILITY.

social assimilation 1. The process by which two or more cultures or cultural groups are gradually merged, although one is likely to remain dominant. 2. The process by which individuals are absorbed into the culture or mores of the dominant group.

social atom see SOCIUS.

social attachment see ATTACHMENT.

social attitude 1. A person’s general outlook on social issues and approach to his or her social responsibilities. 2. A person’s general disposition or manner toward other people (e.g., friendly or hostile). 3. An opinion or evaluation shared by a social group.

social behavior 1. Any action performed by interdependent conspecifics (members of the same species). 2. In humans, an action that is influenced, directly or indirectly, by the actual, imagined, expected, or implied presence of others. 3. Any one of a set of behaviors exhibited by gre-
socioeconomic status; often, the members of a particular social class share values and have similar cultural interests and social patterns. A popularly used classification divides individuals into an upper class, a middle class (sometimes subdivided into upper middle and lower middle classes), a working class, the working poor, and an underclass.

social climate the general character of the social milieu in which individuals and groups live; that is, the totality of the prevailing customs, mores, and attitudes that influence their behavior and adjustment.

social climbing an attempt to improve one's social standing by associating with people of a higher social class. It often involves efforts to impress such people, cater to their needs, or both.

social clock in a given culture, the set of norms governing the ages at which particular life events—such as beginning school, leaving home, getting married, having children, and retiring—are expected to occur.

social code the social rules and standards (e.g., laws) adhered to by a specific community or by society in general.

social cognition 1. cognition in which people perceive, think about, interpret, categorize, and judge their own social behaviors and those of others. The study of social cognition involves aspects of both cognitive psychology and social psychology. Major areas of interest include attribution theory, person perception, social influence, and the cognitive processes involved in moral judgments. 2. in animal behavior, the knowledge that an individual has about other members of its social group and the ability to reason about the actions of others based on this knowledge. In vervet monkeys, for example, alter an individual in matriline (matrilineal line of descent) A attacks an individual in matriline B, other members of B are more likely to attack members in A.

social breakdown syndrome a symptom pattern observed primarily in institutionalized individuals with chronic mental illness but also in populations such as long-term prisoners and older people in nursing homes. Symptoms include withdrawal, apathy, submissiveness, and progressive social and functional incompetence. Previously considered symptomatic of mental illness, this decline is now attributed to internalized negative stereotypes, such as identification with the sick role and the impact of labeling (see labeling theory); the absence of social support; and institutional factors such as a lack of stimulation, overcrowding, unchanging routine, and disinterest on the part of staff. Also called chronicity; institutionalism: institutional neurosis; social disability syndrome.

social casework see casework.

social category a group of people defined by social class or other common attributes of a social nature, such as homelessness, gender, race, unemployment, or retirement.

social change any process in which the general structure or character of a society is altered. Social change can be as varied as that occurring during the Industrial Revolution of the 19th century or that occurring with the introduction of freer sexual expression in the 20th century. Social change may be the result of impersonal economic and technological forces or determined action by individuals or groups. See also culture change; social evolution; social movement.

social class a major group or division of society having a common level of power and prestige on the basis of a common socioeconomic status. Often, the members of a particular social class share values and have similar cultural interests and social patterns. A popularly used classification divides individuals into an upper class, a middle class (sometimes subdivided into upper middle and lower middle classes), a working class, the working poor, and an underclass.

social competence effectiveness or skill in interper-
Social relations and social situations, increasingly considered an important component of mental health. Social competence involves the ability to evaluate social situations and determine what is expected or required; to recognize the feelings and intentions of others; and to select social behaviors that are most appropriate for that given context. It is important to note, however, that what is required and appropriate for effective social functioning is likely to vary across settings.

**Social competence program** a type of intervention that seeks to foster positive relationships and enhance identity and self-concept. Often implemented in preschool and elementary school classrooms, social competence programs generally include video sequences and vignettes, interactive exercises, self-assessments, and other activities intended to improve participants’ awareness of their feelings as well as their abilities in communication, self-control, conflict resolution, and problem solving.

**Social conflict** interpersonal disagreement or discord. See CONFLICT.

**Social constructionism** the epistemological position, associated mainly with POSTMODERNISM, that any supposed knowledge of reality (e.g., that claimed by science or that provided by concepts such as good and bad) is in fact a construct of language, culture, and society that has no objective or universal validity. That is, knowledge is contingent on humanity’s collective social self rather than on any inherent qualities that items or ideas possess. Social constructionists thus seek to uncover the ways in which individuals and groups participate in the construction of their perceived reality by looking at how various phenomena are created, understood, and accepted by the social institutions and contexts in which they exist. See also SITUATED KNOWLEDGE.

**Social constructivism** the school of thought that recognizes knowledge as embedded in social context and sees human thoughts, feelings, language, and behavior as the result of interchanges with the external world. Social constructivism argues that there is no separation between subjectivity and objectivity and that the dichotomy between the person and the situation is false: The person is intimately and intricately bound within social, cultural, and historical forces and cannot be understood fully without consideration of these social forces. According to social constructivism, not only knowledge but also reality itself is created in an interactive process and thus people are solely what their society shapes them to be.

**Social contagion** the spread of behaviors, attitudes, and affect through crowds and other types of social aggregates from one member to another. Early analyses of social contagion suggested that it resulted from the heightened suggestibility of members and likened the process to the spread of contagious diseases. Subsequent studies suggest that social contagion is sustained by relatively mundane interpersonal processes, such as Imitation, Confirmity, Universality, and Mimicry. Also called group contagion. See also BEHAVIORAL CONTAGION; EMOTIONAL CONTAGION; MASS CONTAGION.

**Social context** the specific circumstance or general environment that serves as a social framework for individual or interpersonal behavior. This context frequently influences, at least to some degree, the actions and feelings that occur within it.

**Social contract** in political theory, the idea that society is based on an unwritten agreement whereby individuals willingly surrender some of their natural freedoms to obtain the greater security and other benefits that follow from government and the rule of law. The classic formulations of social contract theory are those of Thomas HOBBES, John LOCKE, and Swiss-born French philosopher Jean-Jacques Rousseau (1712–1778), each of whom developed it in a very different way: For Hobbes, the social contract justified autocracy as the only bulwark against anarchy; for Locke, it permitted the removal of unjust or arbitrary rulers; for Rousseau, it required the voluntary subjection of the individual to the “general will” of society.

**Social contract orientation** see POSTCONVENTIONAL LEVEL.

**Social control** the power of the institutions, organizations, and laws of society to influence or regulate the behavior of individuals and groups. For example, a person may internalize the values and beliefs of his or her religion and act accordingly; similarly, a person may avoid stealing for fear of being caught by the police and punished (e.g., with fines or incarceration). The human tendency to conform increases the power of social institutions to shape behavior.

**Social convention** any of various established rules, methods, procedures, and practices that have been accepted as guides for social conduct over a relatively long period. Often unwritten, arbitrary, and self-perpetuating, social conventions usually pertain to relatively mundane aspects of society, such as etiquette, social ceremonies, and decorum. See also SOCIAL NORM.

**Social coping** any interpersonally based stress-management strategy. A person using this type of coping style seeks support from family members, friends, or formal service providers to help him or her through a difficult event or situation.

**Social creativity** the tendency, described in SOCIAL IDENTITY THEORY, to draw comparisons between the INGROUP and other groups in domains in which the ingroup is more successful, and to avoid making any comparisons in areas in which other groups surpass the ingroup.

**Social Darwinism** the now discredited theory that social relations develop according to the principles of NATURAL SELECTION advanced by Charles DARWIN. As articulated by Herbert SPENCER and others, the theory proposed that societies evolve through survival of the fittest, the fittest being defined as those with wealth, power, and “natural” superiority in the struggle for existence. With its legitimizing of social, economic, and racial inequality, social Darwinism became a major ideological vehicle for justifying laissez-faire economics, imperialism, and Eugenics in the late 19th and early 20th centuries.

**Social death** 1. a pattern of group behavior that ignores the presence or existence of a person within the group. Social death occurs in situations in which verbal and nonverbal communication would be expected to include all participants but in which one or more individuals are excluded. See SHUNNING; OSTRACISM. 2. the social effect of individuals’ reactions to a living person as if he or she is dead, as sometimes seen among people in the presence of a comatose patient or someone with severe dementia.

**Social decision scheme** a strategy or rule used in a group to select a single alternative from among various alternatives proposed and discussed during the group’s deliberations. These schemes are sometimes explicitly ac-
social deficit

A condition in which individual behaviors are determined by societal events and forces or processes of change at work in any social group. See also ecological study, human ecology, and group dynamics.

social development

The gradual acquisition of certain skills (e.g., language, interpersonal skills), attitudes, relationships, and behavior that enable the individual to interact with others and to function as a member of society.

social differentiation

The process by which a status hierarchy develops within any society or social group. For example, in a care facility for older people, social differentiation might be based on age, level of mobility, or physical impairment.

social dilemma

A situation that creates a conflict between the individual's interests and the collective's interests, such that the individual obtains better outcomes following strategies that over time will lead to suboptimal outcomes for the collective. Such situations have reward structures that favor individuals who act selfishly rather than in ways that benefit the larger social collective; however, if a substantial number of individuals seek maximum personal gain, their results will be lower than if they sought collective outcomes. Social dilemmas are simulated in mixed-motive games, such as the Prisoner's Dilemma. See also Social Trap.

social disability syndrome

See Social Breakdown Syndrome.

social disapproval

Condemnation and rejection of someone or something (a behavior, trait, attribute, or the like) by a social group. Its manifestations may include insults, criticism, disparagement, shunning, and so on. Compare Social Approval.

social discrimination

The differential treatment of individuals based on their cultural background, social class, educational attainment, or other sociocultural distinction.

social distance

The degree to which, psychologically speaking, a person or group wants to remain separate from members of different social groups. This reflects the extent to which individuals or groups accept others of a different ethnicity, race, nationality, or other social background.

social distance scale

A measure of intergroup attitudes that asks respondents to indicate their willingness to accept members of other ethnic, national, or social groups in situations that range from relatively distant (“would allow to live in my country”) to relatively close (“would admit to close kinship by marriage”). When unqualified, the term often refers to the Bogardus Social Distance Scale, one of the most popular of such measures.

social dominance orientation (SDO)

A dispositional tendency to accept and even prefer circumstances that sustain social inequalities, combined with a general preference for hierarchical social structures. [First introduced in 1994 by U.S. social psychologists Felicia Pratto, James Sidanius (1945– ), and colleagues]

social dominance theory (SDT)

A general model of the development and maintenance of social dominance and oppression that assumes societies minimize group conflict by creating consensus on ideologies that promote the superiority of one group over others. Ideologies that promote or maintain group inequality are the tools that legitimize discrimination. To work smoothly, these ideologies must be widely accepted within a society, appearing as self-apparent truths called hierarchy-legitimizing myths. [First formulated by U.S. social psychologists Felicia Pratto, James Sidanius (1945– ), and colleagues]

social drinker

An imprecise categorization generally agreed to signify an individual who tends to drink alcohol in moderation. It is usually a misnomer, as such people do not typically drink only in social situations.

social dynamics

An approach to sociology that focuses on the empirical study of specific societies and social systems in the process of historical change. Compare Social statics. [Conceptualized by Auguste Comte] 2. The forces or processes of change at work in any social group. See Group Dynamics.

social ecology

The study of human or nonhuman organisms in relation to their social environment. See also Ecological Study; Human Ecology; Urban Ecology.

social emotion

Any emotion that depends on one's appraisal or consideration of another person's thoughts, feelings, or actions. For example, pride arises when one feels favorably evaluated by others and perceives concurrent gains in one's status and rank relative to those others, whereas shame arises from one's feeling poorly evaluated...
by others and perceiving losses in status and rank. Other commonly studied social emotions include admiration, embarrassment, envy, guilt, and jealousy. Recent neuroimaging studies reveal the involvement of the medial prefrontal cortex in the processing of social emotions, with adolescents activating more lateral (anterior) regions and adults more posterior (temporal) regions of the medial prefrontal cortex.

**social-emotional leader** an individual who guides others in their pursuits by performing supportive, interpersonally accommodative behaviors. Also called **relationship leader**.

**Social–Emotional scale** see **BAYLEY SCALES OF INFANT AND TODDLER DEVELOPMENT**.

**social engineer** 1. a person engaged in planning social policy and in organizing community action programs to remedy problems such as crime, drug abuse, and urban decay. 2. a pejorative term for a person who attempts to enforce social change by imposing certain abstract or theoretical ideas on society.

**social entrepreneurship** see **ENTREPRENEURSHIP**.

**social equality** equivalent treatment of and opportunity for members of different groups within society regardless of individual distinctions of race, ethnicity, gender, age, social class, sexual orientation, or other characteristics or circumstances. Given its breadth, social equality remains a global ideal yet to be obtained. Hierarchies continue to exist worldwide in which different groups of people are distinguished—whether intentionally or unintentionally—and consequently experience differential treatment that produces divergent daily realities. Consider marriage as an example. Many societies do not permit same-sex marriage, which means that gay men and lesbians in those societies do not have the same legal, economic, and civil rights as their heterosexual counterparts. See also **DIVERSITY**.

**social evolution** the process of gradual change in a society over time, especially as contrasted with the sudden and dramatic changes caused by political upheavals, natural disasters, and the like. See also **CULTURAL DRIFT**; **SOCIAL CHANGE**.

**social exchange theory** a theory envisioning social interactions as an exchange in which the participants seek to maximize their benefits (the rewards they receive minus the costs they incur) within the limits of what is regarded as fair or just. Intrinsic to this hypothesis is the **RECIPIROCITY NORM**: People are expected to reciprocate for the benefits they have received. Social exchange theory is similar to **EQUITY THEORY**, which also maintains that people seek fairness in social relationships and that fairness exists when each party in the relationship has the same ratio of inputs (resources brought to the relationship) to outputs (benefits) as the other party. [proposed by Austrian sociologists George C. Homans (1910–1989) and Peter Blau (1918–2002) and extensively studied by John W. Thibaut and Harold H. Kelley]

**social facilitation** the improvement in an individual’s performance of a task that often occurs when others are present. This effect tends to occur with tasks that are uncomplicated or have been previously mastered through practice. There is some disagreement as to whether the improvement is due to a heightened state of arousal, a greater self awareness, or a reduced attention to unimportant and distracting peripheral stimuli. By contrast, **SOCIAL INTERFERENCE** is likely to be seen when the task is complicated, particularly if it is not well learned. See also **AUDIENCE EFFECT**.

**social factors** factors (e.g., attitudes) that affect thought or behavior in social contexts or that affect **SELF-CONCEPT** vis-à-vis other individuals or groups.

**social feedback** a direct report of the effect of one’s behavior or speech on other people. An example of social feedback is laughter at one’s jokes.

**social fission** the splitting of a social group into smaller groups, usually because of unresolved internal conflict between factions.

**social force** any global, systemic, and relatively powerful process that influences individuals in interpersonal settings, such as **GROUP PRESSURE** and **NORMATIVE INFLUENCE**. See also **SOCIAL INFLUENCE**; **SOCIAL PRESSURE**.

**social gerontology** the study of the social process of aging and the interaction of older adults with their environments, including issues such as the contributions of older adults to the community, services provided in the community for older adults, and the utilization of group residences and communities for older adults.

**social group** see **GROUP**.

**social growth** development of an individual’s knowledge and ability in dealing with other individuals and groups. Social growth is not limited to conformity; much social growth can lie outside the range of cultural expectations.

**social habit** a common form of social behavior that is deeply ingrained and often appears to have an automatic quality (e.g., saying “thank you”).

**social heritage** culturally learned customs, codes, and rules of behavior that are constant across generations. Examples include giving gifts on particular occasions, greeting others when one enters a room, and shaking hands. See **CULTURAL HERITAGE**.

**social identity** 1. the personal qualities that one claims and displays to others so consistently that they are considered to be part of one’s essential, stable self. This public persona may be an accurate indicator of the private, personal self, but it may also be a deliberately contrived image (see **SOCIAL IMAGE**). 2. in social psychology, the part of **SELF-CONCEPT** that is derived from memberships in social groups or categories, ranging from family to nationality or race. Social identity is distinguished from the **PUBLIC SELF** and the **PRIVATE SELF**. Also called **collective self**.

**social identity theory** a conceptual perspective on group processes and intergroup relations that assumes that groups influence their members’ self-concepts and self-esteem, particularly when individuals categorize themselves as group members and identify strongly with the group. According to this theory, people tend to favor their **INGROUP** over an **OUTGROUP** because the former is part of their self-identity. With its emphasis on the importance of group membership for the self, social identity theory contrasts with individualistic analyses of behavior that discount the importance of group identifications. [proposed in 1979 by Polish-born British social psychologist Henri Tajfel (1919–1982) and British social psychologist John C. Turner (1947–2011)]

**social image** an individual’s public persona—that is, the identity or face presented to others in public contexts. See **SOCIAL IDENTITY**; **FACEWORK**.

995 social image
social immobility

**social immobility** a feature of a society with fixed social norms or a rigid class system such that movement from one social class to another is virtually impossible and occurs only in very rare and prescribed instances. The traditional Hindu caste system is an example of such a fixed class society. Compare social mobility.

**social impact assessment** the evaluation of the social effect of a proposed construction project while it is in the planning stage. It is based on studies of potential effects on land values, traffic flow, displacement of jobs and homes, ecological balance, air pollution, and related factors, as well as predicted benefits to the environment and to people who would make use of the new facility.

**social impact theory** a theory of social influence postulating that the amount of influence exerted by a source on a target depends on (a) the strength of the source compared to that of the target (e.g., the social status of the source versus that of the target); (b) the immediacy of the source to the target (e.g., the physical or psychological distance between them); and (c) the number of sources and targets (e.g., several sources influencing a single target). The impact of the source on the target increases as the source’s strength, immediacy, and number increase relative to the target. See also dynamic social impact theory. [originally proposed by U.S. social psychologist Bibb Latané (1937– )]

**social imperception disorder** a condition characterized by a lack of awareness of common social interaction processes and interpersonal behaviors and by difficulty in recognizing and understanding other people’s feelings and emotions.

**social incentive** an inducement to behave in particular approved ways, involving the offer of such interpersonal rewards as acceptance, approval, inclusion, or status.

**social indicator** any feature of a society or a subgroup within it that can be measured over time and is presumed to reveal some underlying aspect of social reality and quality of life. For example, the retail price index is used as a measure of inflation, which in turn is taken as a key indicator of economic performance. Other commonly used indicators are derived from unemployment figures, per capita income, poverty levels, labor conditions, housing costs, mental health, general health and mortality data, nutrition information, pollution levels, crime rates, education levels, opportunities for leisure and recreation, and the status of older adults. Researchers and policymakers frequently use social indicators to assess the extent to which a society is “progressing” as well as to make predictions about its future.

**social influence** 1. any change in an individual’s thoughts, feelings, or behaviors caused by other people, who may be actually present or whose presence is imagined, expected, or only implied. 2. interpersonal processes that can cause individuals to change their thoughts, feelings, or behaviors. See informational influence; interpersonal influence; normative influence. See also social force; social pressure.

**social information processing** a type of human information processing in which social information is encoded, compared with other pertinent information, and retrieved to influence one’s interactions with others. [proposed by U.S. psychologist Kenneth A. Dodge (1954– )]

**social inhibition** the restraint placed on an individual’s expression of her or his feelings, attitudes, motives, and so forth by the belief that others could learn of this behavior and disapprove of it. See also audience effect.

**social-inquiry model** a teaching model that emphasizes the role of social interaction. The social-inquiry model utilizes methods of resolving social issues through a process of logical reasoning coupled with academic inquiry.

**social insects** insects that live together in groups, exhibiting reproductive division of labor, cooperation in care of the young, and multiple generations working together. In colonies of some bees, ants, wasps, and termites, reproduction is limited to one or a few queens, and large numbers of workers (sterile females) build nests, forage for food, tend the larvae, and defend the nest. Social insects are haplodiploid (see haplodiploidy), with males developing from unfertilized eggs. This means that workers share 75% of their genes (whereas queen and worker share only 50%), so they have greater inclusive fitness by tending their siblings than they would by breeding on their own. See also eusociality.

**social instinct** 1. the desire for social contact and a feeling of belonging, as manifested by the tendency to congregate, affiliate, and engage in group behaviors. 2. in the individual psychology of Alfred Adler, an innate drive for cooperation that leads individuals to incorporate social interest and the common good into their efforts to achieve self-realization. See also gregariousness; herd instinct.

**social integration** 1. the process by which separate groups are combined into a unified society, especially when this is pursued as a deliberate policy. It implies a coming together based on individual acceptance of the members of other groups. 2. the process by which an individual is assimilated into a group.

**social intelligence** the ability to understand people and effectively relate to them. It is often contrasted with abstract intelligence and concrete intelligence.

**social intelligence quotient** see social quotient.

**social interaction** any process that involves reciprocal stimulation or response between two or more individuals. These can range from the first encounters between parent and offspring to complex interactions with multiple individuals in adult life. Social interaction includes the development of cooperation and competition, the influence of status and social roles, and the dynamics of group behavior, leadership, and conformity. Persistent social interaction between specific individuals leads to the formation of social relationships. It is only through close observation of social interaction that social organization and social structure can be inferred.

**social interest** in the individual psychology of Alfred Adler, communal feeling based on a recognition that people live in a social context: are an integral part of their family, community, humanity, and the cosmos itself; and have a natural aptitude for acquiring the skills and understanding necessary to solve social problems and to take socially affirmative action. Adler believed, however, that social interest is only partially inherent in adaptive development and needs to be actively cultivated in any individual.

**social interference** 1. any actions that conflict with, obstruct, hamper, or undermine the activities and experiences of others. 2. the reduction of productivity that occurs when individuals work in the presence of others. Compare social facilitation. See also social loafing.
social intervention social action programs designed to increase some type of social good or service.

social introversion a behavioral trait manifested by shy, inhibited, and withdrawn attitudes.

social isolation voluntary or involuntary absence of contact with others. In experimental research on nonhuman animals, this typically indicates separation from other members of the animal’s species. Social isolation often produces abnormal behavioral and physiological changes in both humans and nonhuman animals. See also ISOLATE: LONELINESS.

social isolation syndrome in research, a syndrome produced by raising nonhuman animals in total isolation from other members of their species. It consists of severely abnormal behavior, such as rocking, huddling, self-clasping, and retreating into a corner, as well as impaired sexual behavior.

sociality n. the tendency to live as part of a group with clear organization of social interactions and the ability to cooperate with and adapt to the demands of the group. Benefits of sociality for nonhuman animals include better predator detection and avoidance, increased foraging success through the sharing of information, and protection of young. Costs include increased risk of parasites, increased competition between group members, and increased visibility to predators.

sociality corollary a concept proposing that an individual’s ability to communicate or otherwise interact with another individual is based on an understanding of the other’s PERSONAL CONSTRUCT. [proposed by George A. KELLY]

socialization n. 1. the process by which individuals acquire social skills, beliefs, values, and behaviors necessary to function effectively in society or in a particular group. 2. the process by which employees adjust to an ORGANIZATIONAL culture and learn the knowledge, skills, attitudes, and values expected of them by superiors, peers, subordinates, customers, and others. —socialize v.

socialized delinquency violations of the law by individuals younger than 18 years that result from their adherence to the attitudes and values of a SUBCULTURE—such as a gang—that glorifies criminal or antisocial conduct. Also called subcultural delinquency.

socialized drive any PRIMARY DRIVE that has been modified through SOCIAL LEARNING so that drive satisfaction is achieved through socially acceptable behaviors. An example is sexual gratification achieved through mutually consensual adult sex.

social judgment theory a theory of ATTITUDE CHANGE postulating that the magnitude of PERSUASION produced by a particular message depends on how much the position advocated in the message differs from a person’s attitude. Persuasion is likely to be greater when a message advocates a position that a person finds neither clearly acceptable nor clearly objectionable. See also LATITUDE OF ACCEPTANCE; LATITUDE OF NONCOMMITMENT; LATITUDE OF REJECTION. [attributed to U.S. psychologists Carolyn Wood Sherif (1922–1982), Muzafer SHERIF, and Carl I. Hovland]

social justice norm the socially determined standard that people should be helped by others only if they deserve to be helped. Compare RECIPROCITY NORM; SOCIAL RESPONSIBILITY NORM.

social learning learning that is facilitated through social interactions with other individuals. Several forms of social learning have been identified, including LOCAL ENHANCEMENT, EMULATION, IMITATION, and MIMICRY.

social learning theory the general view that learning is largely or wholly due to modeling, imitation, and other social interactions. More specifically, behavior is assumed to be developed and regulated by external stimulus events, such as the influence of other individuals, and by external reinforcement, such as praise, blame, and reward. For example, if a student receives extra credit for arriving early to class and another student in the classroom observes this, the latter student may model the behavior by arriving a few minutes early each day as well. Indeed, modeling is one of the most pervasive and powerful means of transmitting patterns of behavior: Once observers extract the rules and structure underlying the modeled activities, they can generate new patterns of behavior that conform to those properties but go beyond what they have seen or heard, expanding their knowledge and skills rapidly without having to go through the process of learning by response consequences. Although many researchers have proposed their own specific social learning theories, the term is most commonly associated with the work of Albert BANDURA and Julian ROTTER. Bandura subsequently incorporated cognition into his ideas on social learning, a modification that became known as SOCIAL-COGNITIVE THEORY. Despite the distinction, however, many people use the two terms interchangeably.

social limitation a restriction attributed to social policy or barriers (structural or attitudinal) that limit individuals, particularly those with disabilities, from performing specific tasks or that deny them access to the services and opportunities associated with full participation in society.

social loafing the reduction of individual effort that occurs when people work in groups compared to when they work alone. See also RINGELMANN EFFECT; SOCIAL INTERFERENCE. [first described in 1979 by U.S. social psychologist Bibb Latané (1937– ). U.S.-born Australian social psychologist Kipling D. Williams (1953– ), and U.S. social psychologist Stephen G. Harkins]

socially sensitive research research on topics likely to evoke controversy in the community or strong emotional responses from participants. Such topics would include those that have ethical implications affecting subgroups or cultures within society (e.g., ethnic minorities) or that involve potential costs and consequent problems for the participants, investigators, or sponsors. For example, a study that examines the relative merits of day care for infants versus full-time care by the mother can have broad social implications and thus be considered socially sensitive.

social maladjustment 1. an inability to develop relationships that satisfy affiliative needs. 2. a lack of social finesse or tact. 3. a breakdown in the process of maintaining constructive social relationships.

social marketing the use of marketing techniques (e.g., public service announcements) to prompt socially desirable behaviors, such as eating health foods, driving safely, undergoing regular medical examinations, and the like.

social matching effect the tendency for individuals in brainstorming groups to match the lowest level of productivity displayed by others in the group, resulting in most cases in loss of productivity.
**Social maturity**

**Social maturity** a level of behavior in accordance with the social standards that are the norm for individuals of a particular age.

**Social maturity scale** an instrument that assesses the degree to which an individual performs age-appropriate behaviors. These behaviors are primarily concerned with functioning in the family and community and are sometimes considered in conjunction with measures of intellectual impairment to establish the presence of intellectual disability.

**Social meaning model** a conceptualization of nonverbal behaviors that describes the process by which senders, receivers, and third-party observers interpret the meaning of nonverbal messages. The model suggests that some nonverbal messages, such as a smile, have strong consensual meaning across contexts but that other nonverbal cues, such as eye gaze and physical closeness, may affect their perceived meanings by providing important information about participants’ attitudes, characteristics, and emotions. [Posited in 1991 by U.S. communications professor and educational psychologist Judee K. Burgoon (1948– ) and D. A. Newton]

**Social memory** 1. memory for socially relevant information. Examples include the ability to recognize other individuals with whom one has had previous contact, as well as the capacity to retain and recall specific details about people (e.g., names, birthdays, life stories) and various interactions with them (e.g., conversations). Social memory also is seen in nonhuman animals—for example, rodents are able to identify other members of their species and to distinguish kin from strangers. Studies suggest that the formation of social memories is linked to the pituitary hormones oxytocin and vasopressin, and neuroimaging has revealed that acute stress impairs the retrieval of socially relevant information, theoretically because of stress-induced increases in cortisol levels. Additional neural areas postulated to be involved in this type of memory include the amygdala, entorhinal cortex, and other structures of the medial temporal lobe as well as the hypothalamus. 2. see Collective Memory.

**Social mobility** the extent to which a society permits or encourages change in social class, social status, or social roles. Societies differ in the degree to which they permit or facilitate movement or change in their social hierarchy (see Fixed Class Society; Open Class Society). Compare Social Immobility. See Downward Mobility; Horizontal Mobility; Upward Mobility; Vertical Mobility.

**Social monogamy** see Monogamy.

**Social mores** customs and codes of behavior established by a social group that are not necessarily supported by legal sanctions but that may be as binding as laws. See also Social Convention; Social Norm.

**Social motive** any motive acquired as a result of interaction with others. It may be universal (e.g., Need for Affiliation) or culture specific (e.g., Need for Achievement). See also Psychological Need.

**Social movement** a collaborative and sustained collective undertaking or campaign, usually initiated by a specific event, that generally seeks to implement or prevent social change. Social movements emerge and operate mainly outside accepted political institutions; they can be narrow in scope, targeting particular social concerns (e.g., teenage pregnancy), or they can address fundamental issues in society, such as the Women’s Liberation Movement or the Civil Rights Movement of the 1950s and 1960s. Reformist movements seek the improvement of existing social institutions and practices; revolutionary movements seek large-scale revisions of the social order; reactionary movements oppose change, and communitarian movements strive to create harmonious living conditions in modern society. See also Community Action Program; Social Action Program.

**Social need** see Love Need.

**Social network** the relatively organized set of relationships that an individual or group has with others, including types and methods of communication, patterns of liking and disliking, and the strength of interpersonal connections. Such structures may be analyzed quantitatively using Social Network Analysis. See also Online Social Network.

**Social network analysis** a set of empirical procedures for studying the relational structure of groups and networks graphically and mathematically. For example, as applied to a work group, social network analysis methods would identify the ties or relationships linking each member to every other member and then use that information to calculate such indexes as network density, transitivity of relationships, and closeness of members. See also social movement.

**Social-neuro network therapy** a form of psychotherapy in which various people who maintain significant relationships with a client (e.g., relatives, friends, coworkers) are assembled in group sessions with the client present. See also Network Therapy.

**Social neuroscience** a discipline that aims to integrate the social and biological approaches to human behavior that have often been seen as mutually exclusive. Social neuroscientists use a range of methodologies to elucidate the brain structures that regulate social behavior as well as the reciprocal interactions of the brain’s biological mechanisms (especially the nervous, immune, and endocrine systems) with the social and cultural contexts in which human beings operate. See also Cultural Neuroscience.

**Social norm** any of the socially determined consensual standards that indicate (a) what behaviors are considered typical in a given context (Descriptive Norms) and (b) what behaviors are considered proper in the context (Junctive Norms). Whether implicitly or explicitly, these norms not only prescribe the socially appropriate way to respond in the situation (the “normal” course of action) but also proscribe actions that should be avoided if at all possible. Unlike statistical norms, social norms include an evaluative quality such that those who do not comply and cannot provide an acceptable explanation for their violation are evaluated negatively. Social norms apply across groups and social settings, whereas group norms are specific to a particular group. See also Social Convention.

**Social order** 1. the structures, institutions, and organizing principles that maintain a society in its customary or characteristic form. See Social Organization, 2. a stable or peaceful condition of society.

**Social organism** a social group or society regarded as an organic entity having dynamic, living qualities, such as intention and self-preservation.

**Social organization** the complete set of Social Relationships among members of a society or other group.
which determines the structure of the group and the place of individuals within it. These relationships can be based on several variables: kinship, age, sex, area of residence, and—in human beings—religion, matrimony, or common interests. The social organization is usually implemented by rules of behavior produced by social interactions involving dominace, territoriality, the mating system, and cooperation.

social ossification ingrained social behavior that is difficult to change. For example, social ossification may be seen when a person moves to a new environment with different social rules and standards.

social penetration theory a model stating that relationships grow closer with increasingly intimate self-disclosures. [proposed in 1973 by U.S. psychologists Irwin Altman (1930- ) and Dalmas A. Taylor (1933–1998)]

social perception the processes by which a person uses the behavior of others to form opinions or make inferences about those individuals, particularly regarding their motives, attitudes, or values. Also called interpersonal perception.

social phobia an anxiety disorder that is characterized by extreme and persistent social anxiety or performance anxiety and that causes significant distress or prevents participation in social activities. The feared situation is most often avoided altogether or else it is endured with marked discomfort or dread. Also called social anxiety disorder.

social physique anxiety apprehension and fear related to concerns about how others will perceive one’s physical appearance.

social planning the development of strategies and plans in areas such as education, public health, and social services provision, with the goal of enhancing the quality of life for all members of the community.

social play 1. play that involves interacting with others for fun or sport. Examples include rough-and-tumble play and sometimes sociodramatic play. It is one of three basic types of play traditionally identified, the others being object play and locomotor play. Often considered primarily a human activity, social play also occurs among many nonhuman animals, including fish, reptiles, amphibians, insects, nonhuman mammals, and others. For example, some fish physically tease each other, and wasps engage in mock lighting. 2. patterns of play identified by the 1932 classification system of U.S. child-development researcher Mildred Parten and used to characterize the level of social development and participation of preschool children. The lowest level of this system is solitary play, in which a child is near others but focused on his or her own activity; it progresses to parallel play, in which a child is next to others and using similar objects but still engaged in his or her own activity. The latter is succeeded by associative play, in which a child interacts with others but there is no common purpose or organization to the shared activity, and the series culminates in the highest level, cooperative play, in which a child interacts with others in coordinated, directed activities.

social power see power.

social (pragmatic) communication disorder in DSM-5, a developmental disorder characterized by a child’s difficulties in the social use of language, including impaired ability to use appropriate language in varying situations, to follow conversational rules such as turn taking, and to understand implied or ambiguous meanings, as in metaphors and humor. Such deficits limit the child’s ability to communicate, have friends, and succeed in school.

social presence the degree to which individuals feel that they are in the presence of another person, often used in the analysis of the psychological experience of interacting with others in online groups.

social pressure the exertion of influence on a person or group by another person or group. Like group pressure, social pressure includes rational argument and persuasion (informational influence), calls for conformity (normative influence), and direct forms of influence, such as demands, threats, or personal attacks on the one hand and promises of rewards or social approval on the other (interpersonal influence). See also social force; social influence.

social promotion the practice of advancing students who have not sufficiently mastered the academic skills and knowledge requirements of the prior grade to the next grade level (e.g., from the fourth to the fifth grade). The practice is thought to enhance the students’ social well-being by enabling them to stay with their peers and to avoid the negative social consequences of repeating a grade with younger children. Also called automatic promotion.

social psychology as defined by Gordon W. Allport, the study of how an individual’s thoughts, feelings, and actions are affected by the actual, imagined, or symbolically represented presence of other people. Psychological social psychology differs from sociological social psychology in that the former tends to put greater emphasis on internal psychological processes, whereas the latter focuses on factors that affect social life, such as status, role, and class.

social psychology of the experiment the study of the ways in which the participant-related and experimenter-related artifacts in an experiment arise and operate.

social punishment a negative interpersonal stimulus, such as shunning, emotional withdrawal, or some other sign of disapproval, that decreases the frequency of the behavior that immediately precedes it. Compare social reinforcement. See also social sanction.

social quotient the ratio between social age and chronological age. A social quotient is a parallel concept to an IQ, wherein a score of 100 indicates average performance for age and scores less than 100 indicate below average functioning. The social quotient was used as an index of social maturity in the Vineland Social Maturity Scale (see Vineland Adaptive Behavior Scales). It is now increasingly called the social intelligence quotient.

Social Readjustment Rating Scale see life events rating scale.

social reality the consensus of attitudes, opinions, and beliefs held by members of a group or society.

social recovery restoration of an adaptive, highly functional mental state through social therapy and improvement in social skills. [first described by Harry Stack Sullivan]

social referencing evaluating one’s own modes of thinking, expression, or behavior by comparing them with those of other people so as to understand how to react in a
social reform program

particular situation and to adapt one’s actions and reactions in ways that are perceived to be appropriate. This ability has been demonstrated to emerge at a very early age: Young infants use caregivers’ emotional expressions to guide their behavior in novel, ambiguous situations. See SOCIAL COMPARISON THEORY.

social reform program an intervention program developed and implemented to counter deleterious aspects of a social system, the primary objective being to reduce the effects of malfunctions in the system. Also called counter-measure-intervention program.

social rehabilitation 1. the achievement of a higher level of social functioning by individuals with mental disorders or disabilities through group activities and participation in clubs and other community organizations. 2. the achievement of a higher level of independent functioning and social participation by individuals with physical impairments or disabilities through assistance with their ACTIVITIES OF DAILY LIVING as well as with employment, transportation, and appropriate housing. 3. services and assistance provided to help criminal offenders establish new, noncriminal ways of life and become productive members of the community.

social reinforcement a positive interpersonal stimulus, such as praise, a smile, touch, or another sign of approval, that increases the frequency of the behavior that immediately precedes it. Also called social reward. Compare SOCIAL PUNISHMENT.

social relationship the sum of the SOCIAL INTERACTIONS between individuals over a period of time. Momentary social interactions can be described in terms of parental care, dominant–subordinate or aggressive–fearful interactions, and so on, but a social relationship is the emergent quality from repeated interactions. A dyad (interacting pair) may have a generally positive or generally negative social relationship that is reciprocal or complementary. Dyads with long-term social relationships will adjust behavior with each other according to feedback received.

social relations model a general framework used in studies of interpersonal perception in which a person’s behavior with a particular partner is considered to reflect aspects of the larger group to which the two individuals belong, as well as aspects of the individual emitting the behavior, aspects of the partner, and qualities unique to the two individuals’ relationship with one another. The model makes use of a round-robin rating design in which participants rate one another and their degree of perceptual accuracy in different areas is evaluated. Of particular interest are individual accuracy, or how well a person’s judgments of an individual correspond to how that individual tends to behave across interaction partners; and dyadic accuracy, or how well someone can uniquely judge how a specific individual will behave with him or her. [developed in 1981 by U.S. social psychologist David A. Kenny]

social representation a system, model, or code for unambiguously naming and organizing values, ideas, and conduct, which enables communication and social exchange (i.e., at the levels of language and behavior) among members of a particular group or community. [term coined and theory elaborated by Romanian-bom French psychologist Serge Moscovici (1925–)]

social repression the act or process of controlling, subduing, or suppressing individuals, groups, or larger social aggregations through interpersonal means. Techniques of social repression include information control, the elimination of grassroots reform movements, manipulation of local leaders, and so on.

social resistance 1. group opposition to the political, economic, or social actions and policies of a government or society. 2. subgroup opposition to the values and strictures of a dominant culture.

social responsibility norm the socially determined standard that one should assist those in need when possible. Compare RECIPROCITY NORM; SOCIAL JUSTICE NORM.

social reward see SOCIAL REINFORCEMENT.

social role the set of attitudes and characteristic behaviors expected of an individual who occupies a specific position or performs a particular function in a social context, such as being a spouse or acting as a caregiver for an aging parent.

social role theory a model contending that behavioral differences between men and women can be attributed to cultural standards and expectations about gender rather than to biological factors.

social role valorization a principle, developed in succession to the NORMALIZATION PRINCIPLE, that stresses the importance of creating or supporting socially valued roles for people with disabilities. According to this principle, fulfillment of valued social roles increases the likelihood that a person will be socially accepted by others and will more readily achieve a satisfactory quality of life. [formulated in 1983 by German-bom Canadian sociologist and special educator Wolf Wolensberger (1934–2011)]

social sanction a punishment or other coercive measure imposed on a group member for violation of group rules. See also SOCIAL PUNISHMENT.

social schema a cognitive structure of organized information, or representations, about social norms and collective patterns of behavior within society. Whereas a SELF-SCHEMA involves a person’s conception of herself or himself as an individual and in terms of a particular personal role (or roles) in life, social schemata often underlie behavior of the person acting within group contexts—particularly larger group or societal contexts.

social science 1. any of a number of disciplines concerned with the common elements and collective dimensions of human experience, studied from a scientific and research perspective. These disciplines traditionally have included anthropology, economics, geography, history, linguistics, political science, psychiatry, psychology, and sociology, as well as associated areas of mathematics and biology. Additional fields include related psychological studies in business administration, journalism, law, medicine, public health, and social work. The focus of analysis ranges from the individual to institutions and entire social systems. The general goal is to understand social interactions and to propose solutions to social problems. 2. these disciplines collectively.

Social Security a comprehensive social program providing basic retirement income and insurance, as well as disability, survivor, and MEDICARE benefits. Established in 1935, the program is operated by the U.S. Social Security Administration.

social self 1. those aspects of one’s identity or SELF-CONCEPT that are important to or influenced by interpersonal
feelings, and behavior. See also problem solving, and the ability to regulate one’s cognitions, in Western cultures include assertiveness, coping, communication and friendship-making skills, interpersonal problem solving, and the ability to regulate one’s cognitions, feelings, and behavior. See also SOCIAL COMPETENCE.

**social services** 1. services provided by government and nongovernment agencies and organizations to improve the social welfare of those in need, including people with low income, illness, or disability; older adults; and children. Services might include health care, insurance, subsidized housing, food subsidies, and the like. 2. government services to improve standards of living for all citizens, including services such as roads and public transportation, clean water, electricity, telecommunications, and public health institutions.

**social setting detoxification** see DETOXIFICATION.

**social skills** a set of learned abilities that enable an individual to interact competently and appropriately in a given social context. The most commonly identified social skills in Western cultures include assertiveness, coping, communication and friendship-making skills, interpersonal problem solving, and the ability to regulate one’s cognitions, feelings, and behavior. See also SOCIAL COMPETENCE.

**social skills training (SST)** a form of individual or group therapy for those who need to overcome social inhibition or ineffectiveness. It uses many techniques for teaching effective social interaction in specific situations (e.g., job interviews, dating), including ASSERTIVENESS TRAINING and behavioral and cognitive REHEARSAL.

**social smile** a smile in response to social stimuli. It is first seen in infants at about 4 to 6 weeks of age but is not frequent and unambiguous until about 3 months. An infant’s failure to reach this developmental milestone by 6 months is considered an early indication of autism. Compare ENDOCRINE SMILE.

**social smoker** a person who smokes cigarettes occasionally, often when in the company of other people or when drinking alcoholic beverages, and who is not addicted to cigarettes.

**social speech** speech used with the intent to communicate. Also called socialized speech. See also EGOCENTRIC SPEECH.

**social statistics** 1. an approach to sociology that focuses on the distinctive nature of human societies and social systems considered in the abstract, rather than on the empirical study of any particular society. Compare SOCIAL DYNAMICS, [conceptualized by Auguste Comte] 2. an approach to sociology that examines human societies and sociopolitical systems as they exist at a particular time or moment in history (I.e., relative to their current level of development).

**social statistics** the application of statistical methods to the understanding of social issues and problems. See also DEMOGRAPHY. [formulated by Belgian social statistician Adolphe Quetelet (1796–1874)]

**social status** the relative prestige, authority, and privilege of an individual or group. Social status can be determined by any number of factors—including occupation, level of education, ethnicity, religion, age, rank, achievements, wealth, reputation, authority, and ancestry—with different groups and societies stressing some qualities more than others when allocating status to members.

**social stimulus** any agent, event, or situation with social significance, particularly an individual or group, that elicits a response relevant to interpersonal relationships.

**social stratification** the existence or emergence of separate classes or strata in a society. See CASTE; SOCIAL CLASS; SOCIOECONOMIC STATUS.

**social structure** the complex of relationships and systems that organize and regulate interpersonal phenomena in a group or society. The social structure of a group includes its norms and roles and the status, attraction, and communication relations that link one member to another (see GROUP STRUCTURE). The social structure of a society includes the complex of relations among its constituent individuals, groups, institutions, customs, mores, and so on.

**social studies** a course of study that covers many aspects of the social environment, including disciplines such as geography, history, judicial systems, governments past and present, anthropology, national customs, and sociology.

**social subordination** the relegation of an individual or group to a position of low status or prestige in society. [concept articulated by German philosopher and sociologist Georg Simmel (1858–1918)]

**social support** the provision of assistance or comfort to others, typically to help them cope with biological, psychological, and social stresses. Support may arise from any interpersonal relationship in an individual’s social network, involving caregivers, family members, friends, neighbors, religious institutions, colleagues, or SUPPORT GROUPS. It may take the form of practical help (e.g., doing chores, offering advice), tangible support that involves giving money or other direct material assistance, and emotional support that allows the individual to feel valued, accepted, and understood. See also COPERING; INVISIBLE SUPPORT.

**social technology** 1. use of the principles and methods of SOCIAL SCIENCE to develop practical strategies for confronting and resolving conflicts and problems of society. 2. the techniques so developed.

**social therapy** therapeutic and rehabilitative approaches that use social structures and experiences to improve the interpersonal functioning of individuals, such as MILETH THERAPY and the THERAPEUTIC COMMUNITY.

**social transmission** the transfer of customs, language, or other aspects of the CULTURAL HERITAGE of a group from one generation to the next. See HERITAGE; SOCIAL HERITAGE.

**social trap** a SOCIAL DILEMMA in which individuals, groups, organizations, or whole societies initiate a course of action or establish a set of relationships that lead to negative or even lethal outcomes in the long term, but that once initiated are difficult to withdraw from or alter. In many cases, immediate positive reinforcements lead to behaviors that in the long run are bad for the individual (e.g., addiction) or for society (e.g., the TRAGEDY OF THE COMMONS). Immediate negative reinforcements can prevent behaviors that in the long run would be good for the individual (e.g., studying) or for society (e.g., using mass transportation). See also MIXED-MOTIVE GAME.

**social tunneling** a psychological state, usually associated with a demanding task or stressful environment, characterized by a tendency to ignore social cues that may be relevant to a task, such as spoken commands or alert signals from other people. Compare COGNITIVE TUNNELING.
social withdrawal

social withdrawal retreat from interpersonal relationships, usually accompanied by an attitude of indifference, detachment, and aloofness. Social withdrawal is often associated with disorders such as schizophrenia, autism, and depression.

social work a profession devoted to helping individuals, families, and other groups deal with personal and practical problems within the larger community context of which they are a part. Social workers address a variety of problems, including those related to mental or physical disorder, poverty, living arrangements, child care, occupational stress, and unemployment, especially through involvement in the provision of social services.

social zone the DISTANCE ZONE adopted between people engaged in relationships of a relatively formal nature, such as attorney and client. The social zone is defined as the area of 1.25 m to 3.5 m (4 ft–11½ ft) from a person. See PROXEMICS. Compare INTIMATE ZONE; PERSONAL DISTANCE ZONE; PUBLIC DISTANCE ZONE.

sociedad Interamericana de Psicologia (SIP) see INTERAMERICAN SOCIETY OF PSYCHOLOGY.

societal-reaction theory see LABELING THEORY.

society n. 1. an enduring social group living in a particular place whose members are mutually interdependent and share political and other institutions, laws and mores, and a common culture. 2. any well-established group of individuals (humans or other animals) that typically obtains new members at least in part through sexual reproduction and has relatively self-sufficient systems of action. 3. an organization formed for a particular purpose or to further a common interest or activity. 4. the companionship of other people, popularly and loosely, an elite social level, typically comprising those of high SOCIODEMOGRAPHIC STATUS who possess money, power, and prestige and are considered in some way fashionable. —societal adj.

Society for Neuroscience a nonprofit organization of basic scientists and physicians who study the brain and nervous system. Formed in 1969, the group publishes The Journal of Neuroscience.

Society for Psychical Research a British scholarly society founded in 1882 to promote the scientific investigation of parapsychological and paranormal phenomena. It publishes the Journal of the Society for Psychical Research.

Society for Psychotherapy Research an international, interdisciplinary organization dedicated to the scientific study of psychotherapy in all of its various forms. It publishes the journal Psychotherapy Research.

Society for Research in Child Development (SRCD) a multidisciplinary, nonprofit, professional association founded in 1933 to promote research in the field of human development, to foster the exchange of information among scientists and other professionals of various disciplines, and to improve the application of research findings. It publishes Child Development, among other journals.

Society of Experimental Psychologists an organization whose objective is to advance psychology by arranging conferences on experimental psychology. Founded in 1904 by Edward Bradford Titchener as the Society of Experimentalists, it was reorganized under its current name in 1927.

Society of Experimental Social Psychology a scientific organization dedicated to the advancement of social psychology. It publishes the Journal of Experimental Social Psychology.

Society of Indian Psychologists (SIP) an organization that promotes the well-being and education of American Indians and Alaska Natives, as well as the psychologists, graduate students, and other mental health professionals who serve them. Formed in 1975 from the merger of the American Indian Interest Group and the Network of Indian Psychologists, SIP sponsors research to improve the understanding and treatment of health problems in Indian and Native communities, provides crisis intervention to communities, and seeks government policy changes that enhance health care for these populations. The society also informally mentors students, offers scholarships, and advocates for more federal funding for the Indians Into Psychology Doctoral Education and other psychology training programs.

sociobiology n. the systematic study of the biological basis for social behavior. Sociobiologists believe that populations tend to maintain an optimal level of density (neither overpopulation nor underpopulation) by controls such as aggression, stress, fertility, emigration, predation, and disease. Such controls are held to operate through the Darwinian principle of NATURAL SELECTION. See also EVOLUTIONARY PSYCHOLOGY. [pioneered by U.S. biologist Edward O. Wilson (1929–) —sociobiological adj.

sociocentric bias see GROUP-SERVING BIAS.

sociocentric network see GROUP NETWORK.

sociocentrism n. 1. the tendency to put the needs, concerns, and perspective of the social unit or group before one’s individual, egocentric concerns. See also ALLOCENTRIC. 2. the practice of perceiving and interpreting situations from the point of view of the social group rather than from one’s personal perspective. 3. the tendency to judge one’s own group as superior to other groups across a variety of domains. Whereas ETHOCENTRISM refers to the selective favoring of one’s ethnic, religious, racial, or national groups, sociocentrism usually means the favoring of smaller groups characterized by face-to-face interaction among members. Compare EGOCENTRISM. —sociocentric adj.

sociocognitive bias a subtle bias in judgment to which evaluators may be susceptible. Unlike values, sociocognitive biases are inaccurate judgments that result from shortcomings in cognitive processing; they appear to be universals that intrude regardless of values or ethics.

sociocultural anthropology see ANTHROPOLOGY.

sociocultural deprivation see PSYCHOSOCIAL DEPRIVATION.

sociocultural factors environmental conditions that play a part in healthy and adaptive behavior and well-being or in maladaptive behavior and the etiology of mental disorder and social pathology. Examples of sociocultural factors of a positive nature are a strong sense of family and community support and mentorship, good education and health care, availability of recreational facilities, and exposure to the arts. Examples of a negative nature are slum conditions, poverty, extreme or restrictive occupational pressures, lack of good medical care, and inadequate educational opportunities.

sociocultural perspective 1. any viewpoint or approach to health, mental health, history, politics, economics, or any other area of human experience that emphaz-
sociodrama n. a technique for enhancing human relations and social skills that uses dramatization and role play. See also PSYCHODRAMA.

sociodramatic play a form of play in which a child takes on a social role (e.g., mother, father, police officer, doctor), elaborates a theme in cooperation with at least one other role player, and interacts with at least one other child both actively and verbally.

socioeconomic status (SES) the position of an individual or group on the socioeconomic scale, which is determined by a combination of social and economic factors such as income, amount and kind of education, type and prestige of occupation, place of residence, and—in some societies or parts of society—ethnic origin or religious background. See SOCIAL CLASS.

socioemotional role see RELATIONSHIP ROLE.

socioemotional selectivity theory a lifespan theory of motivation positing that as people age, they reorganize their goals to give priority to those that are emotionally meaningful (e.g., satisfying relationships) rather than to those that are future oriented (e.g., seeking new challenges). The theory predicts that people who are older or who are in other situations that place constraints on time attach greater importance to increasing emotional close ness with significant others than do people who are younger or perceive time as relatively open ended. [first proposed in 1993 by U.S. psychologist Laura L. Carstensen]

sociofugal adj. describing environmental conditions that discourage or prevent social interaction, such as rows of seats facing the same way (e.g., church pews) or ambient noise that interferes with communication. A physical environment with these characteristics is termed a sociofugal space. Compare SOCIOPETAL.

sociogenetics n. the study of the origin and development of societies. —sociogenetic adj.

sociogenic adj. resulting from social factors. For example, a sociogenic hypothesis of schizophrenia posits that stressful social conditions, such as living in impoverished circumstances, are major contributors to and causal agents of the disorder. See also DRIFT HYPOTHESIS.

sociogram n. a graphic representation of the relations among members of a social unit or group. In most cases, each member of the group is depicted by a symbol, such as a lettered circle or square, and the types of relations among members (e.g., communication links, friendship pairings) are depicted by lines and arrows. SOCIOMETRY, as originally developed by Jacob L. Moreno, uses objective data collected by observers or self-reports provided by members of the group to generate sociograms.

sociometric status n. a DIALECT spoken by a particular social group.

sociolinguistics n. the study of the relationship between language and society and of the social circumstances of language usage, especially as related to characteristics such as gender, social class, and ethnicity. Using techniques and findings from linguistics and the social sciences, sociolinguistics is concerned with the individual’s language use in the context of his or her social community or culture. One aspect of this field is the study of linguistic codes, that is, the culturally determined rules and conventions that govern language usage. Social factors are also important in analyzing how languages change over time.

sociological factors social conditions that affect human behavior. Examples of such factors are socioecon omic and educational level, environmental circumstances (e.g., crowding), and the customs and mores of an individual’s social group.

sociological measure a formal measure of aspects of society that may affect the development or maintenance of behaviors or mental health problems. Sociological measures may assess the interrelationships between people or the structural components of a society, for example, and include both quantitative and qualitative methods. See also SOCIOMETRY.

sociological social psychology see SOCIAL PSYCHOLOGY.

sociology n. the scientific study of the origin, development, organization, forms, and functioning of human society, including the analysis of the relationships between individuals and groups, institutions, and society itself. —sociological adj. —sociologist n.

sociometer theory a theory holding that SELF-ESTEEM is important to individuals mainly because it serves as a measure of social appeal (i.e., a sociometer). Specifically, high self-esteem signifies that the self has traits—such as competence, likability, moral virtue, and physical attractiveness—that enhance one’s relational value and promote acceptance by other people. [introduced in 1995 by U.S. social psychologist Mark R. Leary (1954—) and colleagues]

sociometric analysis any investigation of the structural properties of a group (with a particular focus on patterns of liking and disliking) that makes use of procedures from SOCIOMETRY.

sociometric differentiation the gradual development of stronger and more positive interpersonal ties between some members of a group, accompanied by decreases in the quality of relations between other members of the group. See also ATTRACTION RELATIONS; SOCIOMETRY.

sociometric distance the degree of closeness or acceptance between individuals or groups as measured on a SOCIAL DISTANCE SCALE. See also PROXEMICS; SOCIAL DISTANCE.

sociometric status 1. in SOCIOMETRY, the relative interpersonal position of a member within a group as determined by other group members. 2. in measures of peer acceptance among children and adolescents, any of several profiles assigned to an individual based on peer ratings of (a) his or her social preference (i.e., number of the individual’s nominations as most liked minus the number of nominations as least liked) and (b) his or her social impact (i.e., number of the individual’s nominations as most liked plus
sociometric structure

number of nominations as least liked). In research reported in 1982, likability was related to peer perception of a child’s cooperativeness, supportiveness, and physical attractiveness, whereas dislike was related to peer perception of a child’s disruptiveness and aggression. Among status types, a *popular child* received both high social preference and high social impact scores. A *rejected child* received both low social preference and low social impact scores. An *average child* scored at the mean for social preference and social impact. A *neglected child* (typically called an *isolated*) received a low social impact score but was neither actively liked nor actively disliked by peers. A *controversial child* received high social impact scores and mean overall social preference scores but was above the mean for both positive and negative preference ratings. Later studies have proposed subtypes for some of these status profiles—for example, subdividing peer-rejected status into *aggressive-rejected child* and *withdrawn-rejected child.* [Proposed in 1982 by U.S. psychologists John D. Coie (1937– ), Kenneth A. Dodge (1954– ), and Heide Coppotelli].

**sociometric structure** see ATTRACTION RELATIONS.

**sociometric test** a self-report measure of intermember relations in a group, as used in *sociometry* to analyze and develop a graphic representation of the group’s structure (see *sociogram*).

**sociometry** n. a field of research in which various techniques are used to analyze the patterns of intermember relations within groups and to summarize these findings in mathematical and graphic form. In most cases, relationships between members are summarized in a *sociogram,* in which each member is represented by a numbered or lettered symbol and relationships are identified by lines between them with arrows indicating the direction of relationships. The method also yields various indices of group structure and *group cohesion,* including choice status (the number of times a person is chosen by the other group members), rejection status (the number of times a person is rejected by others), the relative number of mutual pairs in a group, and so on. See also *social network analysis: sociometric status.* [developed by Jacob L. Moreno] —sociometric adj.

**socionomics** n. the study of nonsocial influences on social groups; that is, the ways in which the physical environment modifies society. This includes the effects of different terrains and climatic conditions on economic and social organization.

**sociopath** n. a former name for an individual with an ANTISOCIAL PERSONALITY DISORDER.

**sociopathic behavior** see DYSocial BEHAVIOR.

**sociopathic personality** see ANTISOCIAL PERSONALITY DISORDER.

**sociopathy** n. a former name for ANTISOCIAL PERSONALITY DISORDER.

**sociopetal** adj. describing environmental conditions that promote social interaction, such as circular seating arrangements and a comfortable ambient room temperature. A physical environment with these characteristics is termed a *sociopetal space.* Compare *sociofugal.*

**sociosexual assessment** an assessment of an individual to identify or measure his or her awareness of cultural standards regarding social relationships and sexual activity, knowledge of facts about sexuality and the nature and consequences of sexual interaction, and engagement (type and nature) in sexual activities. It may also include an assessment of the risks of actual sexual activity.

**sociosexual orientation** a dimension of personality that describes people’s comfort with and preference for sexual activity in the absence of love or commitment. People who are said to have an unrestricted sociosexual orientation (usually but not exclusively men) report more sexual activity outside of committed intimate relationships (e.g., one-night stands, short-term relationships, extramarital affairs). In evolutionary theorizing, sociosexual orientation is considered a determinant of preferences about the enactment of short-term versus long-term mating strategies.

**sociotechnical systems approach** an approach to the design and evaluation of work systems that developed in Britain after World War II. It is based on the theory that tasks and roles, technology, and the social system constitute a single interrelated system, such that changes in one part require adjustments in the other parts. The introduction of new technologies, for example, may automate some job tasks and lead to decreased job satisfaction and group resistance to the changes. The goal of this approach is to optimize organizational or technological design by considering the ways in which people interact with technology in a variety of environments.

**sociotherapy** n. any supportive therapeutic approach that emphasizes socioenvironmental and interpersonal factors in an individual’s adjustment to his or her surroundings. Sociotherapy may be used with several therapeutic approaches, such as family counseling, vocational retraining, and therapy aimed at assisting an individual’s readjustment to community life following hospitalization for severe mental illness.

**sociotropy** n. the tendency to place an inordinate value on relationships over personal independence, thought to leave one vulnerable to *anxiety depression* in response to the loss of relationships or to conflict.

**socius** n. the individual considered to be the basic unit of society. Also called *social atom.*

**Socratic dialogue** a process of structured inquiry and discussion between two or more people to explore the concepts and values that underlie their everyday activities and judgments. In some psychotherapies, it is a technique in which the therapist poses strategic questions designed to clarify the client’s core beliefs and feelings and, in the case of *cognitive therapy,* to enable the client to discover the distortions in his or her habitual interpretation of a given situation. In psychotherapy, it is also known as the *Socratic-therapeutic method.*

**Socratic effect** the finding that mere expression of beliefs tends to produce greater logical consistency among belief structures. [originally documented by William J. McGuire]

**sodium channel** see ION CHANNEL.

**sodium oxybate** see GHB.

**sodium pump** a membrane protein that uses energy to actively transport sodium ions out of a cell against their concentration gradient. The main sodium pump responsible for maintaining the *resting potential* of animal cells, and hence the excitability of neurons and muscle cells, is called an *Na+/K+ ATPase.* In each cycle, this pump moves three sodium ions out of the cell, across the plasma membrane, in exchange for two potassium ions entering the cell, using energy derived from ATP.
sodium regulation maintenance of the concentration of sodium ions in blood plasma within normal limits. Sodium ions are the principal CATIONS of plasma and extracellular fluid and play a crucial role in fluid and electrolyte balance. Falling levels of plasma sodium trigger release of ALDOSTERONE from the adrenal cortex. This hormone stimulates reabsorption of sodium ions by the kidney tubules, thereby restoring plasma sodium levels. Severe sodium deficiency can be fatal, whereas excessive plasma sodium levels can result in hypertension.

sodomy n. 1. ANAL INTERCOURSE between human beings or sexual intercourse of any kind between a human being and a nonhuman animal (see BESTIALITY). This word is derived from the name of the corrupt town of Sodom described in Genesis 18–19. 2. In legal contexts, any sexual assault that does not involve penile–vaginal penetration.

soft data subjective data that lack the rigor of HARD DATA. Soft data usually result from informal collection methods, such as those lacking RANDOM ASSIGNMENT to conditions, those lacking formal RANDOM SAMPLING, or those based only on anecdote. Soft data may be descriptive or qualitative and are used to help interpret hard data.

soft determinism the position that all events, including human actions and choices, have causes, but that free will and responsibility are compatible with such DETERMINISM. Compare HARD DETERMINISM.

soft key see HARD DRUG.

soft key in ergonomics, a control key that activates multiple functions depending upon the state of the system. Soft keys are usually mapped to a specific area on the display.

soft neurological sign see SOFT SIGN.

soft palate the portion of the roof of the mouth that extends rearward from the HARD PALATE and terminates at a fleshy appendage, the uvula. Consisting of fibromuscular tissue covered by mucous membrane, it separates the oral cavity from the nasopharynx and, when raised, closes off the nasopharynx to produce normal speech sounds. Also called velum palatinum.

soft psychology a usually pejorative name for those areas of psychology that do not always make rigorous use of scientific methods in developing, evaluating, and applying the principles and techniques of academic psychology. For example, experimental researchers may refer to clinical psychology as soft psychology. Compare HARD PSYCHOLOGY.

soft sell see HARD SELL.

soft sign a clinical, behavioral, or neurological sign that may reflect the presence of neurological impairment. Soft signs are subtle, nonspecific, and ambiguous (because they are also seen in individuals without neurological impairment). Examples include slight abnormalities of speech, gait, posture, or behavior; sleep disturbances; slow physical maturation; sensory or perceptual deficits; and short attention span. Also called equivocal sign: soft neurological sign.

soft spot see FONTANEL.

software n. any information-processing program utilized by computers or other electronic equipment. For example, the graphing application that aids a researcher in visualizing and analyzing neuronal structures is software, as is the complex file of data and instructions that comprises a computer’s operating system and enables it to function. Compare HARDWARE. See also ASSISTIVE SOFTWARE.

solution-focused brief therapy BRIEF PSYCHOTHERAPY that focuses on problems in the HERE AND NOW, with specific goals that the client views as important to achieve in a limited time.

Sohval–Soffer syndrome a rare congenital disease characterized by intellectual disability and testicular deficiency, as well as skeletal anomalies and diabetes mellitus. The penis and testes are small, and facial and pubic hair is sparse. [reported in 1953 by Arthur R. Sohval (1904–1985) and Louis J. Soffer (1904–1995), U.S. physicians]

SOI abbreviation for STRUCTURE OF INTELLECT MODEL.

solicitation behavior in animal behavior, the actions shown by one individual seeking to mate with another, typically the behavior of females as they seek to interest a mate in copulation. In some primates, such as capuchin and patas monkeys, males rarely initiate sexual interactions without extensive female solicitation behavior. In many other species, attempts by males to copulate are unsuccessful in the absence of female solicitation behavior.

solipsism n. the philosophical position that one can be sure of the existence of nothing outside the self, as other people and things may be mere figments of one’s own consciousness. Although psychologically unfeasible, such a position is notoriously difficult to refute, either logically or empirically. The question posed by solipsism has been put in various ways, but all arise from the fact that one’s experience of one’s own consciousness and identity is direct and unique, so that one is cut off from the same kind of experience of other minds and the things of the world. See CARTESIAN SELF; ECOCENTRIC PREJUDICE. —solipsist n. —solipsistic adj.

solitary nucleus a collection of neural cell bodies in the medulla oblongata of the brainstem that relays information from the intermediate nerve (see greater superficial petrosal nerve), glossopharyngeal nerve, and vagus nerve. Gustatory (taste) neurons project to the anterior division of the nucleus, with touch and temperature afferents immediately lateral and visceral afferents medial and caudal. Gustatory neurons from the solitary nucleus to control reflexes of acceptance or rejection, to anticipate digestive processes, and to activate higher levels of the fast system (see thalamic taste area). Also called nucleus of the solitary tract (NST).

solitary play see SOCIAL PLAY.

Solomon four-group design an experimental design that assesses the effect of having been pretested on the magnitude of the treatment effect. Participants are randomly divided into four groups and each group experiences a different combination of experimental manipulations: the first group (A) receives the pretest, the treatment, and the posttest; the second group (B) receives only the treatment and posttest; the third group (C) receives the pretest, no treatment, and a posttest; and the fourth group (D) receives only a posttest. The major advantages of the Solomon four-group design over a traditional two-group PRETEST–POSTTEST DESIGN are that it reduces the influence of CONFounds and that it can pinpoint whether changes in the dependent variable are due to some INTERACTION EFFECT between the pretest and the treatment. A major disadvantage, however, is that its analysis and statistics are complex. [Richard L. Solomon]
solute

solute n. the liquid in which a substance (the solute) is dissolved in forming a solution.

soma n. 1. the physical body (Greek, “body”), as distinguished from the mind or spirit (see soul). See MIND–BODY PROBLEM. 2. in neuroscience, the cell body of a neuron. 3. a plant regarded as sacred (and personified as the plant god Soma) by ancient Aryan peoples, which some experts have hypothesized to be FLY AGARIC (Amanita muscaria).

Soma n. a trade name for CARISOPRODOL.

somatesthesia n. see SOMESTHESIA.

somatic adj. 1. describing, relating to, or arising in the body rather than from the mind. 2. describing, relating to, or arising in cells of the body other than the sex cells or their precursors (i.e., germ-line cells). Somatic MUTATIONS cannot be transmitted to the offspring of the affected individual.

somatic anxiety the level of reaction of the SYMPATHETIC NERVOUS SYSTEM that one experiences in any given situation.

somatic area see SOMATOSENSORY AREA.

somatic cell see BODY CELL.

somatic concern worries about one’s bodily health, including concern over physical symptoms (e.g., chest pain, nausea, diarrhea, headaches, shortness of breath) and distressing beliefs about bodily illness or dysfunction. See HYPOCHONDRIASIS.

somatic delusion a false belief related to one or more bodily organs, such as believing that they are functioning improperly or are diseased, injured, or otherwise altered. Although standard tests do not confirm the belief, the individual nonetheless continues to maintain this conviction. Also called somatopsychic delusion.

somatic depression a MAJOR DEPRESSIVE EPISODE in which physical symptoms, such as fatigue or appetite changes, are prominent.

somatic disorder an organic physical disorder, as distinguished from a FUNCTIONAL DISORDER or a PSYCHOSOMATIC DISORDER.

somatic function any function of sensation and muscular contraction that involves the SOMATIC NERVOUS SYSTEM.

somatic hallucination the false perception of a physical occurrence within the body, such as feeling electric currents.

somatic nervous system the part of the nervous system comprising the sensory and motor neurons that innervate the sense organs and the skeletal muscles, as opposed to the AUTONOMIC NERVOUS SYSTEM.

somatic obsession preoccupation with one’s body or any part of it. This concern may be associated with compulsive checking of the body part (e.g., in a mirror or by touch), comparing oneself to others, and seeking reassurance about one’s body. Somatic obsession is the central feature of BODY DysMORPHIC DISORDER but may also be a feature of OBSESSIVE–COMPULSIVE DISORDER if other obsessive-compulsive symptoms are present.

somatic receptor any of the sensory organs located in the skin, including the deeper kinesthetic sense organs (see KINESTHESIS). Types of somatic receptors include free nerve endings, MERKEL’S TACTILE DISKS, MEISSNER’S CORPUSCLES, Krause END BULBS, Golgi Tendon ORGANS, and BASKET ENDINGS.

somatic sense see SOMATOSENSE.

somatic sensory area see SOMATOSENSORY AREA.

somatic sensory system see SOMATOSENSORY SYSTEM.

somatic symptom and related disorders in DSM–5, a new diagnostic category that includes disorders predominately characterized by the presence of bodily symptoms associated with severe distress and impairment. The group includes SOMATIC SYMPTOM DISORDER, ILLNESS ANXIETY DISORDER, CONVERSION DISORDER, psychological factors affecting other medical conditions (e.g., denial of medical symptoms, poor adherence to treatment), and FACTITIOUS DISORDER. The category replaces DSM–IV–TR’s SOMATOFORM DISORDERS as a classification scheme and eliminates HYPOCHONDRIASIS, PAIN DISORDER, and SOMATIZATION DISORDER, although some of their symptom characteristics do inform the conceptualization of disorders in the new collection.

somatic symptom disorder in DSM–5, a disorder characterized by one or more significant bodily symptoms (e.g., pain) that cause distress or impair daily function and by excessive, maladaptive thoughts (preoccupation) or excessive worry about the symptoms, with or without the presence of a medical condition to account for the symptoms. One of two replacement diagnoses for HYPOCHONDRIASIS, somatic symptom disorder is determined based only on this set of criteria and does not also apply to high health anxiety that occurs in the absence of significant somatic symptoms, as in ILLNESS ANXIETY DISORDER. Somatic symptom disorder also replaces such DSM–IV–TR diagnoses as SOMATIZATION DISORDER, requiring only one or two symptoms for diagnosis rather than the much higher symptom count (4 pain, 2 gastrointestinal, 1 sexual, 1 psychoneurological) of the older criteria.

somatic therapy the treatment of mental disorders by physical methods that directly influence the body, such as the administration of drugs (PHARMACOTHERAPY) or the application of a controlled, low-dose electric current (ELECTROCONVULSIVE THERAPY). Also called somatotherapy.

somatic weakness the hypothesized vulnerability, due to congenital susceptibility, of an organ or organ system to the effects of psychological stress. The organ is thus predisposed to becoming the focus of a PSYCHOSOMATIC DISORDER.

somatist n. a person who considers mental disorders to be manifestations of physical (bodily) disease.

somatization n. the expression of psychological disturbance in physical (bodily) symptoms. The first use of the word has controversially been attributed to Viennese psychoanalyst Wilhelm Stekel (1868–1940) to describe what is now called CONVERSION. Some investigators use the word in reference not only to the physical symptoms that occur in almost every type of anxiety disorder but also to the expression of symptoms in such PSYCHOSOMATIC DISORDERS as psychogenic asthma and peptic ulcers.

somatization disorder in DSM–IV–TR, a SOMATOFORM DISORDER involving a history of multiple physical symptoms (at least eight, one of which must be a PSEUDONEUROLOGICAL symptom) of several years’ duration, for which medical attention has been sought but which are appar-
ently not due to any physical disorder or to the effects of a substance such as a medication. The complaints are often described in vague yet colorful or exaggerated terms by the patient, who often appears anxious or depressed. Among the common complaints are feelings of sickness, difficulty in swallowing or walking, blurred vision, abdominal pain, nausea, diarrhea, painful or irregular menstruation, sexual ineptitude, painful intercourse, pain in the back or joints, shortness of breath, palpitations, and chest pain. Somatization disorder has been eliminated from DSM–5 and superseded by SOMATIC SYMPTOM DISORDER.

**somatoform disorder** in DSM–IV–TR, any of a group of disorders marked by physical symptoms suggesting a specific medical condition for which there is no demonstrable biological evidence and for which there is positive evidence or a strong probability that they are linked to psychological factors. The symptoms must cause marked distress or significantly impair normal social or occupational functioning. The group includes SOMATIZATION DISORDER, UNDIFFERENTIATED SOMATOFORM DISORDER, CONVERSION DISORDER, PAIN DISORDER, HYPOCHONDRIASIS, and BODY DYSMORPHIC DISORDER (BDD). Of these, only conversion disorder and BDD have been retained as formal diagnoses in DSM–5, either classified with other similar diagnostic entities within a new somatic category, SOMATIC SYMPTOM AND RELATED DISORDERS, or in the case of BDD, renamed from nominal somatic classification and grouped under a different rubric altogether (see OBSESSIVE-COMPULSIVE DISORDER). The other somatoform disorders have been eliminated, although some of their symptomatic features have been retained as specifiers or criteria for new somatic diagnoses (e.g., SOMATIC SYMPTOM DISORDER).

**somatoform pain disorder** see PAIN DISORDER.

**somatogenesis** n. 1. the process by which germ-cell material develops into body cells. 2. the development of behavioral or personality traits or disorders as a result of anatomical, physiological, or biochemical changes in the body. Also called organogenesis. —somatogenic or somatogenetic adj.

**somatognosia** n. awareness of one’s own body or body parts. Denial of one’s body parts is called ASOMATICognosia and is commonly seen in individuals with NEGLECT.

**somatography** n. a variety of body visualization techniques used in ENGINEERING ANTHROPOMETRY and EQUIPMENT DESIGN. —somatographic adj.

**somatomedin** n. any of a class of polypeptides, produced by the liver in response to stimulation by GROWTH HORMONE, that stimulate protein synthesis and promote growth.

**somatometry** n. measurement of the human body, particularly in order to correlate physique and psychological characteristics. —somatometric adj.

**somatophrenia** n. a tendency to imagine or exaggerate bodily ills. See also HYPOCHONDRIASIS.

**somatoplasm** n. the tissue cells of the body collectively, as distinguished from the germ cells. Compare GERM PLASM.

**somatopsychic delusion** see SOMATIC DELUSION.

**somatopsychology** n. the study of the psychological impact of physiological disease or disability: The term is little used, and the subject matter of somatopsychology is now largely included under the rubric of HEALTH PSYCHOLOGY.

**somatopsychosis** n. 1. a psychosis marked by delusions that involve the person’s body or body parts. 2. a psychosis that is due to a bodily (physical) disease. [defined by U.S. psychiatrist Elmer Ernest Southard (1876–1920)]

**somatosense** n. any of the senses related to touch and position, including KINESTHESIAS, the VISCERAL SENSE, the articular senses (see ARTICULAR SENSATION), and the CUTANEOUS SENSES. Also called somatic sense: somesthesis sense.

**somatosensory area** either of two main areas of the CEREBRAL CORTEX that can be mapped with EVOKED POTENTIALS to reveal points that respond to stimulation of the various SOMATOSENSES. The somatosensory areas vary somewhat among different species; in humans, the PRIMARY SOMATOSENSORY AREA is located in the POSTCENTRAL GYRUS of the anterior parietal lobe, and the SECONDARY SOMATOSENSORY AREA is on the lateral surface of the parietal lobe just dorsal to the LATERAL SULCUS. Also called somatic sensory area: somatic area: somatosensory cortex.

**somatosensory disorder** any disorder of sensory information received from the skin and deep tissue of the body that is associated with impaired or abnormal somatic sensation. Such disorders may affect PROPRIOCEPTION and the perception of pain, touch, or temperature. Examples of somatosensory impairments include hypesthesia (decreased sensitivity of a sense), hyperesthesia (increased sensitivity of a sense), and hypoalgesia (diminished sensitivity to pain).

**somatosensory evoked potential (SEP)** an electrical response in the brain to stimuli such as pain, touch, heat, vibration, or position change.

**somatosensory system** the parts of the nervous system that serve perception of touch, vibration, pain, temperature, and position (see SOMATOSENSE). Nerve fibers from receptors for these senses enter the dorsal roots of the spinal cord and ascend mainly through tracts in the DORSAL COLUMNS to the VENTROPOSTERIOR NUCLEI of the thalamus, from which they are relayed (directly or indirectly) to the SOMATOSENSORY AREAS of the parietal cortex. Also called somatic sensory system.

**somatostatin** n. a hormone secreted by the hypothalamus that inhibits the release of GROWTH HORMONE (somatotropin) by the anterior pituitary gland. It is also secreted by cells in the ISLETS OF LANGERHANS in the pancreas, where it inhibits the secretion of insulin and glucagon. Analogues of somatostatin are used therapeutically in the control of ACROMEGALY. Also called somatostatin-release inhibiting factor (SRIF).

**somatotherapy** n. 1. treatment of physical disorders. 2. see SOMATIC THERAPY.

**somatotonia** n. the personality type that, according to SHELDON’S CONSTITUTIONAL THEORY OF PERSONALITY, is associated with a mesomorphic physique (see MISOMORPH). Somatotonia is characterized by a tendency toward energetic activity, physical courage, and love of power. —somatotonic adj.

**somatopathognosia** n. a form of agnosia in which the individual is unable to localize and orient different parts of the body. Unlike AUTOPATHOAGNOSIA, which refers only to one’s own body parts, somatopathognosia includes the ina-
somatotopic organization

bility to orient and recognize the body parts of others or representations of the body.
somatotopic organization the topographic distribution of areas of the MOTOR CORTEX relating to specific activities of skeletal muscles, as mapped by electrically stimulating a point in the cortex and observing associated movement of a skeletal muscle in the face, the trunk, or a limb. See also MOTOR HOMUNCULUS.
somatotropin n. see GROWTH HORMONE.
somatotropin-release inhibiting factor (SRIF) see SOMATOSTATIN.
somatotype n. the body build or physique of a person, particularly as it relates to his or her temperament or behavioral characteristics (see CONSTITUTIONAL TYPE). Numerous categories of somatypes have been proposed by various investigators since ancient times. The classification of individuals in this way is called somatotypology.
somber–bright dimension in psychological aesthetics, the degree to which a work of art is characterized by dark versus bright colors. Experimental evidence shows that intense brightness, high saturation, and hues that correspond to long wavelengths of light tend to excite a viewer.
somesthesia (somaesthesia) n. sensitivity to cutaneous, kinesthetic, and visceral stimulation. Also called somesthetic. —somesthetic adj.
somesthetic disorder any dysfunction involving the SOMATOSENSES, such as difficulty in maintaining postural or positional awareness or a lack of sensitivity to pain, touch, or temperature. Somesthetic disorders are usually related to PARTIAL LOBE damage.
somesthetic sense see SOMATOSENSE.
somesthetic stimulation stimulation of kinesthetic, cutaneous, or visceral receptors.
somnambulism n. see SLEEPWALKING DISORDER.
somniloquy n. see SLEEP TALKING.
somnolence n. excessive sleepiness or drowsiness, which is sometimes pathological. The condition may be due, for example, to medication, a sleep disorder, or a medical condition (e.g., HYPOPHYROIDISM). —somnolent adj.
somnolentia n. 1. unnatural drowsiness. 2. see CONFUSIONAL AROUSAL.
somnology n. the study of sleep and sleep disorders. —somnologist n.
somnophilia n. an obsolete term for sexual interest and arousal derived from intruding on a sleeping person. It may involve fondling the person or masturbating while watching the person sleep.
sonant 1. n. a vowel or VOiced consonant that is capable of forming a syllable or the nucleus of a syllable. 2. n. a NASAL or LIQUID consonant that functions as a vowel in a particular syllable. Also called sonorant. Compare SEMIVOWEL. 3. adj. related to, having, or producing speech sounds.
Sonata n. a trade name for ZALEPLON.
sone n. see LOUDNESS.
song n. in animal behavior, a complex, relatively long sequence of vocalizations that is often stereotyped in its overall structure or sequence of calls. It is used to defend territories against members of the same sex and species as well as to attract mates. Song is thought to occur primarily in birds, but the term also has been used to describe long acoustic sequences produced by crickets and certain primates (e.g., gibbons). In the northern temperate zone, song is usually seasonal and under the control of gonadal steroids, but in the tropics, there is little evidence of hormonal control.
sonic boom a high-pressure acoustic shock wave, often caused by an aircraft or projectile traveling at supersonic speeds.
Sonic Pathfinder a trademark for a mobility assistance device, worn on the head, that emits ultrasound and provides feedback through earphones for individuals with visual impairment. Feedback consists of the notes of a musical scale, which make a familiar tonal progression as the user approaches an object. The signal received is restricted to the nearest object to the user or, in certain cases, to the object directly ahead of the user.
sonography n. see ULTRASOUND.
sonorant n. see SONANT.
soothability n. the ability of infants and children to calm down and recover from distress.
sophistry n. a style of argumentation designed not to arrive at truth but to persuade others that one’s position is correct. This is generally accomplished by careful strategic use of language and the skillful use of fallacious arguments (see FALLACY). For example, one common type of sophistry is to represent the other’s point of view as more extreme and less plausible than it really is and then attack the extreme version of the position and show that it is wrong. A particular instance of sophistry is called a sophism. The term comes from the Sophists, a group of itinerant teachers in Greece in the 5th century BCE who taught and practiced rhetoric.
sophrosyne n. an ideal of character that was recommended by Greek philosopher PLATO. The word has no direct English equivalent, but it is often translated as “temperance” or “moderation” and carries the sense of being well balanced, prudent, self-disciplined, and sound in judgment.
sopite syndrome a form of MOTION SICKNESS that may develop after prolonged exposure to relatively gentle motion or rocking, as experienced in a moving bus or a rocking boat. Symptoms include dizziness, nausea, chronic fatigue, lack of initiative, drowsiness, lethargy, apathy, and irritability. These can persist for prolonged periods even after exposure ceases. [from Latin sopire, “to put to sleep”]
soporific n. an agent capable of producing sleep, particularly a deep sleep. Also called soporous.
SOPS abbreviation for SCALE OF PRODROMAL SYMPTOMS.
SORC n. an acronym for the four variables employed in behavioral analysis: stimuli (see SITUATIONAL DETERMINANT), ORGANISIM VARIABLES, responses, and consequences (reinforcement contingencies). A functional analysis of behavior may seek to determine how the presentation of certain stimuli leads to specific responses (perhaps influenced by individual, or organismic, variables), which are followed by consequences that may then reinforce the elicited responses.
sorcery drug any of a group of plant alkaloids that includes belladonna, the opium alkaloids, mandrake, aco-
nite, and hemlock. The substances have been chewed, smoked, or brewed into potions since ancient times for purposes of healing or intoxication. Medicinal herbs were usually grown and administered by shamans or native healers; some, such as the opiates and anticholinergics, are used in modern medical pharmacology.

Sorge n. care (German). The term has gained currency in psychology and philosophy chiefly through its use by German philosopher Martin Heidegger (1889–1976) to denote the uniquely human activity of caring or worrying about things.

S–O–R psychology stimulus–organism–response psychology: an extension of the S–R PSYCHOLOGY OF BEHAVIORISTS incorporating the notion of Robert S. WOODWARD that factors within the organism help determine what stimuli the organism is sensitive to and which responses may occur. The O factors could be biological or psychological. S–O–R psychology has been extended beyond CLASSICAL CONDITIONING and INSTRUMENTAL CONDITIONING to encompass areas such as marketing and consumer behavior. For example, an individual’s emotional state when shopping may influence how many products he or she purchases and the particular types or brands.

sorting test a format for assessing the ability to conceptualize, often used in adult neuropsychological assessments or in determining a child’s level of cognitive development. The participant is asked to arrange an assortment of objects by category. A common example is the WISCONSIN CARD SORTING TEST.

sort-recall task a task used in memory research in which participants, usually children, have the opportunity to sort items into groups before having to recall the items at a later time.

Sotos syndrome an autosomal dominant inherited disorder characterized by MACROCEPHALY, distinctive facial features (including wide-set eyes), and learning disabilities or delayed development. Affected infants and children tend to grow quickly and are significantly taller than their siblings and peers, although adult height is usually in the normal range. Also called cerebral gigantism; Nevo syndrome. [reported in 1964 by Juan Fernandez Sotos (1927–1009), U.S. pediatrician]

soul n. the nonphysical aspect of a human being, considered responsible for the functions of mind and individual personality and often thought to live on after the death of the physical body. The English word corresponds to the Greek psyche, often also translated as “mind,” and the Latin anima, usually translated as “spirit.” The concept of the soul was present in early Greek thinking and has been an important feature of many philosophical systems and most religions. Some traditional areas of debate have included whether the soul is material or immaterial, whether nonhuman animals, plants, or seemingly inert natural objects have souls (see PANPSYCHISM), and whether the soul is individual, allowing the personality to persist after death, or whether it is a reflection of a universal “cosmic” soul. Because the existence of the soul has resisted empirical verification, science has generally ignored the concept, and those who adhere to MATERIALISM, POSITIVISM, or REDUCTIONISM reject it absolutely. Despite this, the term survives in the general language to mean the deepest center of a person’s identity and the seat of his or her most important moral, emotional, and aesthetic experiences.

soul image in the ANALYTIC PSYCHOLOGY of Carl JUNG, the deeply unconscious portion of the psyche that is composed of the ANIMUS (or male archetype) and ANIMA (or female archetype).

soul kiss see FRENCH KISS.

sound n. variations in pressure that occur over time in an elastic medium, such as air or water. Sound does not necessarily elicit an auditory sensation—infrasound and ultrasound are respectively below and above the audible range of humans—but in psychology sound usually denotes a stimulus capable of being heard by an organism. See AUDIBILITY RANGE.

sound-attenuating chamber an enclosure designed to reduce the transmission of sounds produced outside the chamber. Also called AUDIOMETRIC CHAMBER. See also ANECHOIC CHAMBER.

sound cage a device for measuring sound localization. See AUDITORY LOCALIZATION.

sound change in linguistics, a change over the course of time in the phonological patterns of a language. Modern languages have developed from their ancestor languages and become differentiated from other languages in the same family through a series of such changes occurring naturally over many centuries. See GENETIC LINGUISTICS; PROTO LANGUAGE.

sounding out see PHONICS.

sound intensity the rate of flow of sound energy through a given area, measured in watts per square meter. In practice, sound intensity is seldom directly measured; it is indirectly determined using pressure measurements and often is expressed in DECIBELS. Sound intensity is proportional to the square of sound pressure.

sound-level meter a device used to measure sound pressure. The sound pressure is transduced by a microphone, processed, and typically expressed in decibels sound-pressure level (dBSPL; see DECIBEL). Some sound-level meters have frequency-weighting scales to approximate the characteristics of human hearing. The DBC scale gives approximately equal weight across most of the AUDIBILITY RANGE. The DBA scale is thought to better approximate the loudness or noisiness of environmental sounds.

sound localization see AUDITORY LOCALIZATION.

sound pressure the force per unit area exerted by a sound wave. The pressure is expressed as changes in the ambient or static pressure (e.g., atmospheric pressure), usually as root-mean-square (rms) pressure changes. The unit of measurement of sound pressure is the pascal (Pa). Also called ACOUSTIC PRESSURE. See also DECIBEL.

sound-pressure level (SPL) see DECIBEL.

sound shadow an area in which sound is blocked by a nontransmitting object, such as the head.

sound spectrography the procedure of analyzing a sound source (typically human speech) in terms of its variations in frequency and intensity over time. The visual record so produced is a sound spectrogram (often shortened to spectrogram), a quasi-three-dimensional representation of sound. The SOUND SPECTRUM, measured over a relatively brief interval, is plotted by the sound spectrograph as a function of time on the x-axis while frequency is plotted on the y-axis and intensity is depicted by shading or color. A spectrogram provides an imperfect representation of the perceptually relevant aspects of sound.
sound spectrum

**sound spectrum** the representation of sound in terms of its frequency composition. Any physically realizable sound and, more generally, any waveform can be represented as a function of time or of frequency. These representations are uniquely related by the Fourier transform or Fourier series (see [Fourier analysis](#)). The spectrum is the frequency-domain representation and consists of the amplitude spectrum (or power spectrum) and the phase spectrum. Both are necessary to describe the sound completely. For example, a sound played backward has the same amplitude spectrum but an altered phase spectrum, and usually the sounds are perceptually very different. Periodic sounds have a line spectrum with a nonzero amplitude only at discrete frequencies. Other sounds have a continuous spectrum; the spectrum is then described in terms of spectral density, which involves units of amplitude or power per hertz. Sound spectra are useful partly because the mammalian auditory system performs an imperfect Fourier analysis. Also called [acoustic spectrum](#); [hertz](#). Sound spectra are useful partly because the mammalian auditory system performs an imperfect Fourier analysis. Also called **acoustic spectrum**: [tonal spectrum](#). See [tonotopic organization](#).

**sound symbolism** see [phonetic symbolism](#).

**sour** adj. denoting the [taste](#) elicited by acids. Increasing sourness generally occurs with declining pH. Acids are involved in many physiological processes and also characterize unripe or spoiled foods; thus, their detection is essential for an organism’s ion homeostasis and food selection.

—sourness 1.

**source amnesia** impaired memory for how, when, or where information was learned despite good memory for the information itself. Source amnesia is often linked to frontal lobe pathology.

**source attractiveness** among [source factors](#), a characteristic denoting the extent to which the source of a persuasive message is seen as physically attractive.

**source confusion** misattribution of the origins of a memory. This may distort eyewitness accounts of the events surrounding a crime. For example, an eyewitness hearing from a police officer that the perpetrator carried a gun may later believe that he or she saw the gun at the crime scene. See also [unconscious transfer](#).

**source credibility** among [source factors](#), a characteristic denoting the extent to which the source of a persuasive message is seen as likely to provide accurate information, which is determined by [source expertise](#) and [source trustworthiness](#).

**source expertise** among [source factors](#), a characteristic denoting the extent to which the source of a persuasive message is seen as knowledgeable about the topic of the message. See also [source credibility](#).

**source factors** characteristics of the source of a persuasive message that are likely to influence the effectiveness of the message. SOURCE ATTRACTIVENESS, SOURCE CREDIBILITY, SOURCE EXPERTISE, SOURCE MAJORITY OR MINORITY STATUS, and SOURCE TRUSTWORTHINESS are all source factors.

**source language** 1. the language (usually a person’s native tongue) used as a starting point when attempting to learn or use another language. 2. the language from which a translation has been or is being made. Compare [TARGET LANGUAGE](#).

**source majority or minority status** among [source factors](#), a characteristic indicating (a) that the source of a message holds a position that is shared by a numerical majority or minority of the population or (b) that the source of a message is a member of a social group that is a numerical majority or minority.

**source memory** memory for the origin of a memory or of knowledge; that is, memory for where or how one came to know what one now remembers. This construct has been expanded to encompass any aspects of context associated with an event, including spatial-temporal, perceptual, or affective attributes. Although the [prefrontal cortex](#) is known to be involved in source memory, its exact contribution remains uncertain. Compare [fact memory](#).

**source monitoring** the process of determining the origins of one’s memories, knowledge, or beliefs, such as whether an event was personally experienced, witnessed on television, or overheard. See also [reality monitoring](#).

**source trait** in [cattell’s personality trait theory](#), any of 16 personality traits, determined by factor analysis, that underlie and determine [surface traits](#). Examples are social boldness, dominance, and openness to change. See also [ability trait](#); [dynamic trait](#); [temperament trait](#).

**source trustworthiness** among [source factors](#), a characteristic denoting the extent to which the source of a persuasive message is seen as honest. See also [source credibility](#).

**Southern blot** a method of detecting a particular DNA sequence in a mixture of DNA molecules. It involves separating the DNAs with [gel electrophoresis](#), blotting the separated DNAs onto nitrocellulose, then using a labeled DNA or RNA probe to hybridize with and highlight the DNA sequence of interest. Compare [Northern blot](#); [Western blot](#). [developed in the 1970s by Edwin Southern (1938– ), British biochemist]

**SOV** abbreviation for [Allport–Vernon–Lindzey study](#) of values.

**space adaptation syndrome** a type of [motion sickness](#) probably caused by an astronaut’s inability to distinguish up from down while in orbit. This confusion results in dizziness and nausea.

**space-based attention** a mode of visual attention operating primarily on a representation of visual space; that is, attention is directed toward spatial locations rather than objects. Compare [object-based attention](#).

**spaced practice** see [distributed practice](#).

**spaced repetition** see [repetition](#) effect.

**space factor** a hypothesized ability, proposed by Louis L. Thurstone in 1938, that accounts for some individual differences in the capacity to perceive and reason about spatial relations. This factor may be related to individual differences in mathematical abilities.

**space motion sickness** a form of [motion sickness](#) experienced during space travel.

**space orientation** see [spatial orientation](#).

**space perception** an awareness, derived from sensory input, of the spatial properties of objects in the environment, including their shape, dimension, and distance.

**space psychology** the application of psychological procedures to the problems of humans functioning in outer space.

**spacing effect** a cognitive phenomenon in which dis-
spatial frequency

Distributing to-be-learned information across time in short, interrupted study sessions leads to better long-term retention than continuous, massed sessions. In other words, distributed practice is more beneficial than massed practice. For example, a student preparing for a Spanish vocabulary exam on Thursday would remember more by studying the Spanish–English word pairs during brief sessions (e.g., 1 hour each) on consecutive prior days (e.g., Monday, Tuesday, and Wednesday) than by cramming study into a single session in one day. The spacing effect has been demonstrated with a wide range of learning paradigms, materials, and participants, but the precise mechanisms underlying it remain unclear. Various explanations have been offered, such as the consolidation theory, which proposes that people notice repetitions of items and create a second representation of each item when they encounter it again; the deficient processing theory, which suggests that people pay more attention to spaced repetitions of an item because the item is thus not as active in memory; the encoding variability theory, which suggests that the contextual information stored with an item varies over time, so that a greater variety of information is stored with spaced presentations, resulting in multiple (or stronger) retrieval routes; and the study-phase retrieval theory, which states that people notice repetitions of items and retrieve the earlier presentation of an item when they encounter it again. Also called distributed-practice effect. See also Lag Effect; Primacy Effect; Recency Effect. [first described in 1885 by Hermann Ebbinghaus]

spandrel n. see Exaptation.

span of apprehension see Apprehension Span.

spasm n. a sudden, involuntary muscle contraction. It may be continuous or sustained (tonic) or it may alternate between contraction and relaxation (clonic). A spasm may be restricted to a particular body part; for example, a vasospasm involves a blood vessel, and a bronchial spasm involves the bronchi. —spasmodic adj.

spasmodic dysphonia a rare voice disorder with symptoms including momentary periods of uncontrolled vocal spasms, stuttering, tightness in the throat, and recurrent hoarseness. The cause is unknown, but the condition may be attributed to a neurological or physiological disturbance or to psychological factors. Spasmodic dysphonia (formerly known as spasmodic dysphonia) particularly affects public speakers.

spasmodic fixation a condition in which an individual is unable to change gaze until the target of fixation is removed. Also called spasm of fixation.

spastic adj. 1. relating to spasm. 2. relating to increased muscle tension (see Spasticity).

spastic colitis see Irritable Bowel Syndrome.

spastic dysarthria see Dysarthria.

spastic dysphonia see Spasmodic Dysphonia.

spastic hemiparesis partial paralysis on one side of the body complicated by spasticity of the limbs on the affected side, which may be quite painful.

spasticity n. a state of increased tension of resting muscles resulting in resistance to passive stretching. It is caused by damage to upper motor neurons and is marked by muscular stiffness or inflexibility and exaggerated tendon reflexes.

spastic paralysis a condition resulting from damage to upper motor neurons and marked by tonic muscle spasms and increased tendon reflexes. Compare Flaccid Paralysis.

spastic paraplegia a form of paraplegia characterized by spasticity of the leg muscles. Also called tetanoid paraplegia.

spatial ability the skill required to orient or perceive one's body in space or to detect or reason about relationships within or between objects in space. For example, spatial ability is required in map reading and assembling jigsaw puzzles.

spatial attention the manner in which an individual distributes attention over a visual scene. Spatial attention is usually directed at the part of the scene on which a person fixates (see Visual Fixation). Also called distributed attention.

spatial autocorrelation a measurement of a variable's association with itself throughout space. Although statistical approaches often assume that measured outcomes are independent of each other, this may not be true for observations made at different locations. For example, measurements made at nearby locations may be closer in value than measurements made at locations farther apart. Spatial autocorrelation thus provides an index of the similarity of objects within an area, the level of interdependence between the variables, and the nature and strength of that interdependence. See also autocorrelation.

spatial cognition the collection, organization, use, and revision of information about one's environment. Spatial cognition enables people to manage a multitude of everyday tasks, such as getting to the breakfast table, taking the subway to work, or using a joystick to move a character in a virtual game. It is a complex phenomenon that often extends beyond immediate perception. Indeed, psychologists have found that people build extensive cognitive maps that they use to think spatially; these maps have a hierarchical structure, such that individuals "see" the major points and then fill in the details. See also spatial memory.

spatial coherence see coherence.

spatial contrast sensitivity see Contrast Sensitivity.

spatial data any observations or measurements with a direct or indirect reference to a specific location or geographical area.

spatial density density that can be changed by altering the amount of space while keeping the number of individuals constant. There is some evidence that the effect of spatial density on crowding is less than that of social density.

spatial discrimination the ability to detect differences in the location of stimuli within multidimensional space.

spatial disorder a disorder of space perception, usually associated with a lesion of the parietal lobe of the brain. It involves impaired memory for locations, constructional apraxia, route-finding difficulties, and poor judgment of the localization of stimuli. Individuals may underestimate the distance of far objects, overestimate the distance of near objects, or be unable to align objects according to instructions.

spatial frequency the number of repeating elements in a pattern per unit distance. In a simple pattern of alternating black and white vertical bars (an example of a square-
wave grating), the spatial frequency is the number of pairs of black and white bars per degree of visual angle, usually expressed as cycles per degree (cpd). See also CONTRAST SENSITIVITY.

**spatial intelligence** the ability to mentally manipulate objects in space and to imagine them in different locations and positions. It is one of the distinct intelligences in Gardner’s MULTIPLE INTELLIGENCES THEORY and also a primary mental ability (S) in Thurstone’s theory of PRIMARY ABILITIES.

**spatial learning** the acquisition of knowledge about the locations of environmental objects and their relative relationships to one another. For example, many nonhuman animals are able to orient within their home range, as demonstrated by their ability when foraging to venture forth and return home in a nonrandom and efficient manner, and they can remember visual or other cues associated with landmarks in order to locate important resources. Spatial learning has been studied for decades in numerous species through the use of MORRIS WATER MAZES, RADIAL MAZES, T MAZES, and other labyrinthine tasks. Although the hippocampus is essential to spatial learning, the cortex of the PARIETAL LOBE, the PRECUNIUS, and other brain structures are selectively involved in the process as well.

**spatial memory** the capacity to remember the position and location of objects or places, which may include orientation, direction, and distance. Spatial memory is essential for ROUTE LEARNING and navigation.

**spatial neglect** see UNI LATERAL NEGLICT.

**spatial orientation** the ability to perceive and adjust one’s location in space in relation to objects in the external environment. See SPATIAL ABILITY.

**spatial relationships** the three-dimensional relationships of objects in space, such as their distance apart and their position relative to each other. Also called spatial relations. See also DEPTH PERCEPTION; SPATIAL ABILITY; SPATIAL INTELLIGENCE.

**spatial summation** a neural mechanism in which an impulse is propagated by two or more POSTSYNAPTIC POTENTIALS occurring simultaneously at different synapses on the same neuron, when the discharge of a single synapse would not be sufficient to activate the neuron. Compare TEMPORAL SUMMATION.

**spatial-temporal reasoning** the ability to conceptualize the three-dimensional relationships of objects in space and to mentally manipulate them as a succession of transformations over a period of time. Spatial-temporal reasoning is a cognitive ability that plays an important role in fields such as architecture, engineering, and mathematics, among others, and in basic tasks such as everyday movement of the body through space.

**spatial threshold** see TWO-POINT THRESHOLD.

**spatial updating** the ability of a moving person to mentally update the locations of objects initially seen, heard, or touched from a different observation point. This cognitive process is crucial for maintaining perceptual stability despite gross and frequent displacements of space following saccadic eye movements (see SACCADE) and other activities. It is an extraordinarily complex phenomenon involving several neural structures, including the HIPPOCAMPU S, the PARieto-OCCIPItal SULCUs, the PRECUNIUs, and posterior areas of the PARIETAL CORTEX. See also SPATIAL COGNITION.

**spatial vision** the ability of the eye and brain to encode and represent spatial patterns of light. The mechanisms of spatial vision are critical for all behavior that involves the processing of visual information.

**spaying** n. the surgical removal of the ovaries of a female mammal as a sterilization procedure.

**SPC** abbreviation for STATISTICAL PROCESS CONTROL.

**speaking in tongues** see GLOSSOLALIA.

**Spearman-Brown prophecy formula** the mathematical formulation of a basic tenet of CLASSICAL TEST THEORY concerning the length (number of items) of a test and its influence on reliability, whereby increasing the number of items with similar content results in increased reliability for the test, and decreasing the number of items leads to decreased reliability. The formula allows a researcher to estimate the gains or losses in reliability that would occur with changes in test size. Also called Spearman-Brown prediction formula. [Charles SPEAR MAN; W. Brown, 20th-century British psychologist]

**Spearman correlation coefficient** (symbol: $r_s$) a nonparametric measure of statistical dependence between two variables that were measured on an ORDINAL scale that is, the individual observations (cases) can be ranked into two ordered series. The Spearman correlation coefficient assesses how well the relationship between the variables can be described using a MONOTONIC function. It ranges in value from +1 to −1. Also called Spearman’s rank correlation coefficient; Spearman’s rho. [Charles SPEARMAN]

**Spearman’s G** in the TWO-FACTOR THEORY of intelligence, GENERAL ABILITY, represented by the factor $g$. [proposed in 1904 by Charles SPEARMAN]

**Spearman’s S** in the TWO-FACTOR THEORY of intelligence, a SPECIFIC ABILITY, represented by the factor $s$. [proposed in 1904 by Charles SPEARMAN]

**special-ability test** a focused examination given to determine whether a student possesses any extraordinary or unusual skills, talents, or abilities.

**special aptitude** see SPECIFIC ABILITY.

**special care unit (SCU)** a unit in a health care institution designed to provide specialized care for people with severe problems, such as dementia, head injuries, or spinal cord injuries.

**special child** see CHILD WITH SPECIAL NEEDS.

**special education** specially designed programs, services, and instruction provided to children with learning, behavioral, or physical disabilities (e.g., visual impairment, hearing loss, neurological disorders) to assist them in becoming independent, productive, and valued members of their communities.

**special factor** see SPECIFIC FACTOR.

**special needs** the requirements of individuals with physical, mental, or emotional disabilities or with financial, community-related, or resource disadvantages. Special needs may warrant SPECIAL EDUCATION, training, or therapy.

**special needs child** see CHILD WITH SPECIAL NEEDS.

**special psychiatric rapid intervention team (SPRINT)** a multidisciplinary U.S. Navy team, consisting of psychologists, psychiatrists, social workers, and chap-
lains, that provides short-term mental health and emotional support immediately after a crisis. The team may also provide educational and consultative services to local supporting agencies.

**special school** a facility that provides focused and individualized education for children with disabilities or other disadvantages who are not prepared to cope with the intellectual and social demands in regular school settings.

**speciation** n. the formation of new species. The process involves one population splitting into two or more populations that are reproductively isolated from each other. Over time, the accrued genetic differences between these populations become so great as to prevent successful interbreeding.

**species** n. in biological taxonomy, the basic unit of classification, consisting of a group of organisms that can interbreed to produce fertile offspring. It is the main subdivision of a genus.

**speciesism** n. discriminatory, prejudicial, or exploitative practices against nonhuman animals, often on the basis of an assumption of human superiority. See also animal rights.

**species recognition** the ability to determine whether another individual is from the same or a different species. Species recognition is important in mate selection to avoid breeding with another species. Cues used for species recognition include species-specific coloration, vocalizations, odors, and behavior.

**species-specific behavior** behavior that is common to nearly all members of a particular species and expressed in essentially the same way. Human language is a prominent example.

**species-specific defense reaction (SSDR)** the characteristic responses of members of a species to aversive stimuli in the absence of previous experience with the stimuli. This bias determines the rate of learning an organism may demonstrate for escape behavior in response to aversive stimuli.

**species specificity of language** the theory that language is an innate characteristic unique to the species Homo sapiens. See language-origin theory; task specificity of language.

**specific ability** an ability used only for a particular intellectual task or a single test in a battery of tests. It does not correlate with other abilities, as opposed to general ability, which correlates at least moderately with other abilities. Also called special aptitude. See also specific factor.

**specific aptitude** see aptitude.

**specific-attitudes theory** the viewpoint that certain psychosomatic disorders are associated with particular attitudes. An example is an association between the feeling of being mistreated and the occurrence of hives. See also specific-reaction theory.

**specific developmental disorders** disorders in which some distinctive and circumscribed ability or area of functioning fails to develop properly from an early age but the difficulties are not attributable to intellectual disability, autism, or any other condition.

**specific-energy doctrine** the concept that the quality of a sensory experience is determined by the type of sensory receptor and its nerve channels; thus, the sense of pain originates with stimulation of pain receptors, hearing with receptors in the inner ear, and so on. Originally it was supposed that the different sensory channels had different forms of neural energy, but it was later realized that the specificity lies in the connections from sensory receptors to sensory areas in the cerebral cortex. Also called law of specific nerve energies. [elaborated in 1838 by Johannes Müller]

**specific exploration** see INSPECTIVE EXPLORATION.

**specific factor (s factor)** 1. (symbol: s) a specialized ability that is postulated to come into play in particular kinds of cognitive tasks. Specific factors, such as mathematical ability, are contrasted with the general factor (g), which underlies every cognitive performance. Also called special factor. [proposed in 1904 by Charles Spearman]

2. In factor analysis, a latent variable that is significant only to a single manifest variable. In contrast, a common factor pertains to multiple manifest variables.

**specific hunger** hunger for foods that satisfy a biological need for a specific nutrient found in those foods. For instance, a protein-deprived animal will seek protein-rich foods even when more palatable but protein-deficient foods are available.

**specificity** n. 1. the quality of being unique, of a particular kind, or limited to a single phenomenon. For example, a stimulus that elicits a particular response is said to have specificity. 2. the probability that a test yields a negative diagnosis given that the individual does not have the condition for which he or she is being tested. Compare sensitivity.

**specificity of behavior** 1. the fact that certain behavior is elicited only by particular stimuli and therefore does not generalize beyond specific situations. 2. a fixed pattern of expected behavior in a situation.

**specificity theory** a theory holding that the mechanism of pain is—like vision and hearing—a specific modality with its own central and peripheral apparatus. According to this theory, pain is produced by nerve impulses that are generated by an injury and are transmitted directly to a pain center in the brain. Compare gate-control theory; pattern theory.

**specific language disability** see LANGUAGE DISABILITY.

**specific language impairment** (SLI) a condition characterized by impaired acquisition and use of oral linguistic abilities in the absence of any neurological damage, sensory deficits, intellectual disability, alterations in physiological mechanisms of speech, severe personality disorders, or environmental factors to account for the disturbance. In other words, children with SLI have difficulty understanding and using words in sentences, particularly complex sentences, for no identifiable reason. Such individuals acquire spoken language skills significantly later than is typical and have varying degrees of difficulty with phonology (word sounds), semantics (word meaning), syntax (word arrangement), and pragmatics (word function). For example, they tend to have limited vocabularies; to omit tense markers, such as the past tense —ed or the third person present —s; to make case errors on pronouns (e.g., him go there instead of he goes there); and to omit the verb to be when functioning as auxiliary or copula (e.g., He running rather than he is running or John big rather than John is big). Additionally, children with SLI often have difficulties on tasks...
specific learning disability

assessing short-term auditory memory, such as nonword repetition and sentence repetition, and frequently have literacy problems as well, exhibiting impairments in areas such as reading accuracy, reading comprehension, and spelling. The causes of SLI are unknown, but gene linkage mapping, twin studies, and family studies suggest strong heritability of the disorder, and several brain imaging studies have found a reduction or reversal of the normal leftward asymmetry in language-related brain centers (notably the planum temporale and Broca’s area) of individuals with SLI. Affecting around 7% of children, SLI is equivalent to the DSM–IV–TR diagnostic categories of expressive language disorder and mixed receptive-expressive language disorder. Throughout the years, the condition has been known by a variety of other names as well, including developmental dysphasia, developmental language disorder, language delay, and language learning disability (LLD).

specific learning disability (SLD) a substantial deficit in scholastic or academic skills that does not pervade all areas of learning but rather is limited to a particular aspect, such as reading or arithmetic difficulty. In U.S. federal legislation, this term is used interchangeably with learning disability.

specific learning disorder see learning disorder. See also disorder of written expression; mathematics disorder; reading disorder.

specific nerve energies see specific-energy doctrine.

specific phobia an anxiety disorder, formerly called simple phobia, characterized by a marked and persistent fear of a specific object, activity, or situation (e.g., dogs, blood, flying, heights). The fear is traditionally defined as excessive or unreasonable and is invariably triggered by the presence or anticipation of the feared object or situation, which is either avoided or endured with marked anxiety or distress. In DSM–IV–TR, specific phobias are classified into five subtypes: (a) animal type, which includes fears of animals or insects (e.g., cats, dogs, birds, mice, ants, snakes); (b) natural environment type, which includes fears of entities in the natural surroundings (e.g., heights, storms, water, lightning); (c) blood-injection-injury type, which includes fears of seeing blood or an injury and of receiving an injection or other invasive medical procedure; (d) situational type, which includes fear of public transportation, elevators, bridges, driving, flying, enclosed places (see claustrophobia), and so forth; and (e) other type, which includes fears that cannot be classified under any of the other subtypes (e.g., fears of choking, vomiting, or contracting an illness; children’s fears of clowns or loud noises). DSM–5 retains these subtypes, but it omits the traditional characterization that each fear type must be excessive or unreasonable to meet diagnostic criteria, stipulating instead that the fear must arise out of proportion to the actual danger posed by the feared object or situation to its context. A fear of loud noises, for example, would be considered understandable if experienced in the context of a war zone and thus would not qualify as a specific phobia.

specific-reaction theory a concept that an innate tendency of the autonomic nervous system to react in a particular way to a stressful situation accounts for psychosomatic symptoms. See also specific-attitudes theory.

specific-status characteristic in expectation-states theory, any of various behavioral and personal characteristics relevant to the setting that people intentionally and unintentionally take into account when making judgments of their own and others’ competence, ability, and social value. Compare diffuse-status characteristic.

specific thalamic projection system the direct sensory pathways via the thalamus for visual, auditory, and somesthetic impulses; that is, neurons that project to the thalamus from specific receptors and then from the thalamus to each of the specific sensory cortices.

specific transfer transfer of skills and knowledge acquired in one task to a similar task in which they are directly relevant. Compare general transfer.

specific variance in factor analysis, the systematic variability that is specific to a particular variable and not shared with other variables. Specific variance contrasts with comminality, the variability that a single variable shares with one or more of the other variables in the analysis, and random error, the unsystematic variability specific to a particular variable.

specious present the lived present, experienced as a distinct “moment” characterized by certain sense impressions and mental events. This sense of inhabiting a particular moment known as the present is psychologically strong but actually specious, because (a) time is continuous and ongoing and (b) the present instant is so infinitely short that it cannot be experienced. See also conscious moment; psychological moment; timeless moment. [introduced in 1882 by E. R. Clay (pseudonym for Irish-born U.S. philosopher E. Robert Kelly) and further developed by William James]

SPECT acronym for single photon emission computed tomography.

spectator effect the effect on performance when a task is carried out in the presence of others. When an individual is confident of being able to perform the task (i.e., has high task confidence), spectators improve performance; when task confidence is low, they worsen it.

spectator role a behavior pattern in which one’s natural sexual responses are blocked by performance anxiety. It involves observing oneself closely and worrying about how well or poorly one is performing sexually, rather than participating fully in the sexual activity; this prevents sexual arousal from occurring. [first described by U.S. sex researchers William H. Masters (1915–2001) and Virginia E. Johnson (1925–2013)]

spectator therapy the beneficial effect on group-therapy members of observing the therapy of fellow members with similar or related problems.

spectral absorption the ability of chemicals to absorb light of specific wavelengths. This is determined by passing lights of nearly pure wavelengths through solutions of the chemicals and measuring the amount of light absorbed. In visual spectral absorption, the principle is applied by measuring the degree to which different wavelengths of light alter retinal photopigment molecules.

spectral color any one of the colors of the visible spectrum, produced when white light is refracted by a prism. The visible spectrum can be divided into some 130 distinguishable spectral colors by human observers. Also called spectral hue. Compare extraspacial hue.

spectral density see sound spectrum.
spectral envelope see ENVELOPE.

spectrally opponent cell a type of neuron in the visual system that is excited by light in certain regions of the visible spectrum and inhibited by light in other regions.

spectral scale a scale that depicts the colors of the spectrum for light of different wavelengths or frequencies by just noticeable differences (see DIFFERENCE THRESHOLD).

spectral sensitivity the relative degree to which light of different wavelengths is absorbed by the photopigments of the retina. Each type of photoreceptor (i.e., rod or cone) has its own characteristic spectral sensitivity.

spectrogram n. see SOUND SPECTROGRAPHY.

spectroscopy n. the study of the spectrum of electromagnetic radiation, especially the visible spectrum, as it interacts with matter. The interpretation of the spectra so produced is used in chemical analysis, in examining molecular structure, and for many other purposes. Spectroscopy is performed using spectrosopes, spectrometers, or spectrophotometers.

spectrum n. (pl. spectra) 1. a distribution of electromagnetic energy displayed by decreasing wavelength. In the case of the visible spectrum, it is the series of visible colors (with wavelengths in the range 400–700 nm) produced when white light is refracted through a prism. 2. a wide range of associated elements, qualities, actions, or occurrences. —spectral adj.

spectrum level the power per hertz of a sound, usually expressed in DECIBELS sound-pressure level (dB SPL). For a waveform with a continuous spectrum, the power spectral density is the power contained in the sound’s bandwidth at a specific frequency f as the change in f approaches zero.

spectrum of consciousness 1. in TRANSPERSONAL PSYCHOLOGY, the full range of human psychological and spiritual experiences concomitant with states of mind. 2. in neurology and neuroscience, the full range of awareness or arousal. See CONSCIOUSNESS.

speculation n. 1. conjectural thinking that is not necessarily supported by scientifically determined evidence. 2. a loosely supported theory or explanation. —speculative adj.

speculative psychology a view of a psychological subject or issue that is based on conjecture or unsupported theory rather than experimental or research evidence. See ARMCHAIR PSYCHOLOGY; RATIONAL PSYCHOLOGY.

speech n. the product of oral–motor movement resulting in articulation of language; the utterance of sounds and words.

speech act an instance of the use of speech considered as an action, especially with regard to the speaker’s intentions and the effect on a listener. A single utterance usually involves several simultaneous speech acts (see ILLICITATIONARY ACT). The study of speech acts is part of the general field of PRAGMATICS.

speech-activated control the use of voice commands to initiate functions of or input information to a device. An example is dialing a phone by speaking the number. Also called voice-activated control.

speech amplification system a system consisting of a microphone attached to a headset and a small amplifier designed to increase the volume of the voice of an individual who is unable to speak loudly because of a voice disorder or respiratory problem.

speech and language disorder any disorder that affects oral or written communication. A speech disorder is one that affects the production of speech, potentially including such problems as poor audibility or intelligibility; unpleasant tonal quality; unusual, distorted, or abnormally effortful sound production; lack of conventional rhythm and stress; and inappropriateness in terms of age or physical or mental development. A language disorder is one that affects the expression or reception (comprehension) of ideas and feelings, potentially including such problems as reduced vocabulary, omissions of articles and modifiers, understanding of nouns but not verbs, difficulties following oral instructions, and syntactical errors. Although speech disorders and language disorders are two distinct entities, they often occur together and thus generally are referred to together.

speech and language pathology 1. inadequate or maladaptive communication behavior and disorders of speech, language, and hearing. 2. the clinical field focused on the study, evaluation, and treatment of speech, voice, and language disorders.

speech and language therapy see SPEECH THERAPY.

speech anxiety see PUBLIC-SPEAKING ANXIETY.

speech aphasia a less common name for expressive APHASIA.

speech apraxia see APRAXIA.

speech area any of the areas of the cerebral cortex that are associated with language perception and production, either oral or written. The speech production (output) areas tend to be located in the left hemisphere in BROCA’S AREA. Speech perception and comprehension tend to be more bilateral, involving WERNICKE’S AREA in the temporal lobe. Activation maps for speech show widely regional distribution with some overlap in the classical language regions of the cortex.

speech audiology the measurement of hearing in terms of the reception of spoken words presented at controlled levels of intensity.

speech community a group of people who speak a particular language or variety of a language (e.g., a dialect).

speech derailment see DERAILEMENT.

speech development see LANGUAGE DEVELOPMENT.

speech discrimination test a phonetically balanced word list used to measure an individual’s ability to understand speech.

speech error see SLIP OF THE TONGUE.

speech functions the various purposes for which spoken language is used, primarily the communication of ideas or information, the maintenance of social relationships, and the expression of feelings or emotions.

speech impairment any problem that affects the production of speech. The term is occasionally used as a synonym for speech disorder (see SPEECH AND LANGUAGE DISORDER).

speech impediment popularly, any speech impairment or disorder. The term is no longer used in formal research or therapeutic practice.

speech intelligibility the degree to which speech
sounds (whether conversational or communication-system output) can be correctly identified and understood by listeners in a particular environment. Background or other system noise is one of the most important factors influencing speech intelligibility. See also ARTICULATION INDEX.

speech, language, and hearing center a professionally staffed clinic or facility offering diagnostic and treatment services to people with communication impairments. The staff typically consists of experts in audiology, speech and language pathology, and speech and hearing sciences. Also called community speech and hearing center.

speech lateralization hemispheric asymmetry in the control of speech production. For most individuals, speech production is located in the left cerebral hemisphere. See also LANGUAGE LOCALIZATION; SPEECH AREA; WADA TEST.

speech origin see LANGUAGE-ORIGIN THEORY.

speech perception the process in which a listener decodes, combines, and converts an incoming stream of otherwise meaningless sound created by the SPEECH PRODUCTION process into a meaningful sequence and phonological representation.

speech processor a device that converts microphone or other input into patterns of electrical stimulation. For example, the processor in a COCHLEAR IMPLANT converts sounds into electrical impulses to stimulate the auditory nerve, thus enabling comprehension of sound and speech.

speech production the psychophysical and neurophysiological processes by which a person uses his or her neural, articulatory, and respiratory capacities to generate spoken language.

speechreading n. see LIPREADING.

speech-reception threshold (SRT) the sound intensity in DECIBELS sound-pressure level (dB SPL) at which speech is just intelligible.

speech recognition system a computer software program capable of recognizing and responding to human speech. Such programs enable users to control computers and create and manipulate documents by dictation, which are unable to provide commands and data input with devices such as a keyboard, touch pad, or mouse.

speech rehabilitation training to restore a lost or impaired speech function. Also called speech reeducation.

speech sound disorder in DSM–5, the term for PHONOLOGICAL DISORDER.

Speech Sounds Perception Test a test in the HALSTEAD–REITAN NEUROPSYCHOLOGICAL BATTERY used to measure a person’s ability to match a spoken nonsense word containing a double e (such as teg) with its written counterpart.

speech synthesizer a computer or other system capable of producing artificial speech. Synthesizers may produce speech in response to input (e.g., from a keyboard or touch pad), or they may convert written text into speech. See also AUDIOTACTILE DEVICE.

speech therapy the application of remedies, treatment, and counseling for the improvement of speech and language. Also called speech and language therapy.

speech-tolerance level the DECIBELS sound-pressure level (dB SPL) at which continuous speech is judged to be uncomfortably loud.

speech-to-noise ratio see SIGNAL-TO-NOISE RATIO.

speed n. slang for an amphetamine, especially METHAMPHETAMINE.

speed-accuracy tradeoff the tendency, when performing a task, for either speed or accuracy to be sacrificed in order to prioritize the other. In experiments, a researcher may vary the speed-accuracy criterion through instructions, payoffs, and deadlines, such that participants can respond quickly with many errors, slowly with few errors, or anywhere in between. In the area of motor control, FITT’S LAW is a specific example of a speed-accuracy tradeoff.

speedball n. a colloquial name for a mixture of heroin and a powerful stimulant (e.g., cocaine or an amphetamine).

speed dating an approach to dating developed in the 1990s in which potential daters engage in a series of brief one-on-one encounters with other potential daters, after which each person indicates in a confidential manner whether he or she is interested in future dates with each of the people met. Only when both answer in the affirmative is contact information exchanged. Typical speed-dating events allow participants to interact with approximately 6 to 10 potential dates for 3 to 8 minutes each. The primary rationale underlying speed dating is that certain important determinants of attraction can be evaluated only in face-to-face interactions and that very brief interactions (sometimes called THIN SLICES OF BEHAVIOR) are sufficient for conveying information about these determinants to potential daters.

speed test a type of test used to calculate the number of problems or tasks the participant can solve or perform in a predesignated block of time. The participant is often, but not always, made aware of the time limit. Compare POWER TEST.

spell n. 1. a hypnotic influence or any influence of one person over another considered similarly powerful and hard to explain. 2. a magical incantation or a curse. 3. a lay term for an episode of a physical or mental disorder.

spelling dyslexia a type of VISUAL WORD-FORM DYSLEXIA manifested by letter-by-letter reading. For example, an affected individual reading the word dog would say, “D-O-G spells dog.” Such individuals may have normal spelling and writing ability but cannot read back what they have written down. In most cases, they have lesions located near the junctions of the occipital, temporal, and parietal lobes (the left ANGULAR GYRUS) of the brain. Modern imaging studies also implicate these regions in word recognition.

sperm n. see SPERMATOZOA.

sperm analysis the evaluation of male fertility according to sperm count per milliliter of ejaculate and sperm morphology (i.e., form and structure) and motility. Also called seminal analysis.

spermarche n. a male’s first ejaculation of semen. Also called semenarche.

spermatic duct see VAS DEFERENS.

spermatocyte n. a cell that emerges during an intermediate stage of SPERMATOGENESIS in the male testis.

spermogenesis n. the production of spermatozoa in the seminiferous tubules of the TESTIS. Male germ cells
spermatorrhoea n. the involuntary discharge of semen in the absence of orgasm.

spermatogenesis adj. the onset of puberty and seasonal in some other animal species.

spermatogonia; sing. spermatogonium n. primary spermatocytes, which undergo meiosis to eventually result in mature spermatocytes (four per spermatocyte). In the first meiotic division, each primary spermatocyte gives rise to two haploid secondary spermatocytes, each of which then undergoes a further division to form two spermatids. The latter, attached to SERTOLI CELLS, mature into spermatocytes. The process is controlled by pituitary gonadotropins, which promote the release of testosterone from the interstitial cells of the testis, which in turn stimulates sperm production. Spermatogenesis is continuous in human males after the onset of puberty and seasonal in some other animal species. —spermatogenetic adj.

spermatoozoan n. (pl. spermatzoa) a single male gamete that develops from a secondary spermatocyte following its development from spermatogonia of the seminiferous tubules. A spermatoozoan fuses with a female gamete (see OVUM) in the process of fertilization. Also called sperm. See also spermatogenesis.

sperm competition competition between the sperm of different males to fertilize the eggs of females that mate with multiple males. Among nonhuman animals, males have several strategies for dealing with sperm competition, including MATING GUARDING, leaving an ejaculatory plug in the female genitalia to prevent other males from mating, or removing sperm from previous males prior to mating. Females have tactics to counter these strategies (see CRYPTIC FEMALE CHOICE). In the muriqui monkey of Brazil, for example, males produce sperm plugs that block the vagina, but both females and other males can remove these plugs.

spherical aberration the failure of light rays to converge at the same focal point because of the curvature of a lens. See also astigmatism.

spherical lens a lens in which either or both of the surfaces are portions of a sphere.

sphericity n. an assumption, encountered in a WITHIN-SUBJECTS ANALYSIS OF VARIANCE of data obtained from the same individuals on multiple occasions, requiring the variations among each individual’s set of scores to be equal or the correlations among all time points to be constant. Results from analyses of variance that violate sphericity require adjustments to compensate for an increased propensity of the researcher to draw invalid conclusions by making a type II error.

sphincter n. a ring-shaped muscle that partly or wholly closes a body orifice, such as the anal sphincters or the iris of the eye.

sphincter control the ability to control the muscles that open and close the openings of the body, particularly the anal and urinary sphincters. Acquiring this ability is an important stage in physical development. See defecation reflex; toilet training.

sphincter morality psychoanalytic theory, personality characteristics and behaviors, such as obstinacy, extreme orderliness, and parsimony, that are associated with an anal-retentive personality. See anal personality.

sphingomyelin n. a phospholipid that occurs abundantly in animal cell membranes. It makes up about one tenth of the lipids of the brain.

spaghmomanometer n. see blood pressure.

spice n. a CANNABIS-like drug that consists of dried leaves sprayed with synthetic chemicals and that is sold as incense. Also called K2.

spicy adj. 1. denoting the taste of highly flavored foods. Spiciness is conveyed mainly through activity of the trigeminal nerve (see trigeminal chemoreception) rather than the gustatory system. 2. denoting one of the primary odor qualities in Henning’s odor prism. —spiciness n.

spider phobia a persistent and irrational fear of spiders. Situations in which spiders may be encountered are often avoided or else endured with intense anxiety or distress. In DSM–IV–TR and DSM–5, spider phobia is classified as a specific phobia, animal type. Also called arachnophobia, arachnophobia. See also animal phobia.

spike n. 1. in behavioral neuroscience, a train of electrical signals recorded from an individual neuron in the brain. Spikes are the action potentials or signals generated by neurons to communicate with one another. 2. in a TIME-SERIES ANALYSIS, a point in time at which there is a sharp increase followed by a rapid decrease in measurements on the dependent variable.

spike-and-wave discharges a pattern of brain waves on an electroencephalogram (see electroencephalography) that is characteristic of absence seizures. It consists of a sharp spike followed by a low-amplitude delta wave and occurs at a frequency of three per second.

spike potential see action potential.

spike-wave activity the pattern produced by an action potential of a neuron when amplified and projected onto the screen of an oscilloscope or a computer monitor. The waveform appears as a sharp, high peak, followed by a short dip below the baseline (the afterpotential), then a return to the predischarge level. The amplitude of the wave spike indicates the intensity of the discharge.

spina bifida any developmental anomaly in which the vertebral canal fails to close normally around the spinal cord; it is a neural tube defect. Individuals with spina bifida have difficulty with sensation, ambulation, and bowel and bladder control; experience weakness or paralysis of the muscles of the legs or feet; and are susceptible to infection. Meningomyelocele is the most common form of spina bifida.

spinal animal a nonhuman animal whose spinal cord has been surgically severed and therefore separated from communication with its brain, so that peripheral processes of the body are controlled only by the spinal cord and nerves.

spinal canal the passage that runs through the spinal column and contains the spinal cord.

spinal column the backbone, consisting of a series of bones (vertebrae) connected by disks of cartilage (intervertebral disks) and held together by muscles and tendons. It extends from the cranium to the coccyx, encloses the spinal cord, and forms the main axis of the body. Also called spine: vertebral column.

spinal cord the part of the central nervous system that extends from the lower end of the medulla oblongata, at
spinal cord disease

the base of the brain, through a canal in the center of the spine as far as the lumbar region. In transverse section, the cord consists of an H-shaped core of gray matter (see PERI-AQUEDUCTAL GRAY; ANTERIOR HORN; DORSAL HORN) surrounded by white matter consisting of tracts of long ascending and descending nerve fibers on either side of the cord that are linked by the WHITE COMMISSURE. The spinal cord is enveloped by the MENINGES and is the origin of the 31 pairs of SPINAL NERVES. See also SPINAL ROOT.

spinal cord disease any pathological condition caused by infection, injury, or a congenital defect of the spinal cord. Examples include Brown-Séquard’s syndrome, Horner’s syndrome, spinal meningitis, amyotrophic lateral sclerosis, multiple sclerosis, and syringomyelia.

spinal cord injury any damage to the spinal cord caused by sudden or progressive external forces. Spinal cord injuries include contusion (bruising), hemorrhage, laceration, transection, and compression. See also INCOMPLETE SPINAL CORD INJURY; RADICULOPATHY; SLIPPED DISK.

spinal ganglion a collection of cell bodies of sensory neurons found in the DORSAL ROOT of each SPINAL NERVE.

spinal gate in GATE-CONTROL THEORY, a neural pathway in the spinal cord that regulates pain perception by opening and closing, thereby allowing or not allowing pain signals to excite DORSAL HORN transmission neurons. According to the theory, the gate can be influenced by physical, emotional, and behavioral factors. See also GATING MECHANISM.

spinal muscular atrophy (SMA) a hereditary (autosomal) MOTOR NEURON DISEASE characterized by wasting (atrophy) of skeletal muscles associated with degeneration of nerve cells in the ANTERIOR HORN of the spinal cord. There are three common types, based on age of onset and symptom severity. Type I (also called Werdnig–Hoffmann disease) is evident at birth or within the first few months of life and is the most severe, resulting in death usually prior to age 2. Type II has an onset of symptoms between 6 months and 2 years and results in delayed motor development, progressive loss of strength, and variable loss of ambulation. Type III (also called Kugelberg–Welander disease) is identified between ages 1 and 15 and is the least severe, associated with slower progression and lower incidence. There is also a Type IV (also called Aran–Duchenne disease), with an onset typically after age 30 and symptoms ranging from mild to severe. Also called progressive muscular atrophy: progressive spinal muscular atrophy.

spinal nerve any of the 31 pairs of nerves that originate in the gray matter of the SPINAL CORD and emerge through openings between the vertebrae of the spine to extend into the body’s dermatomes (skin areas) and skeletal muscles. The spinal nerves comprise 8 cervical nerves, 12 thoracic nerves, 5 lumbar nerves, 5 sacral nerves, and 1 coccygeal nerve. Each attaches to the spinal cord via two short branches, a DORSAL ROOT and a VENTRAL ROOT. See also SPINAL ROOT.

spinal reflex an automatic response controlled solely by neural circuits in the spinal cord, often relating to posture or locomotion. They are sometimes classed as SEGMENTAL REFLEXES, if the circuit involves only one segment of the spinal cord, or as INTERSEGMENTAL REFLEXES, if the impulses must travel through more than one spinal segment. Reflexes that require brain activity are SUPRASEGMENTAL REFLEXES.

spinal root the junction of a SPINAL NERVE and the SPINAL CORD. Near the cord, each spinal nerve divides into a DORSAL ROOT carrying sensory fibers and a VENTRAL ROOT carrying motor fibers, as stated by the BELI–MAGENDIE LAW.

spinal shock a temporary loss of reflex functions below the site of an injury to the spinal cord.

spinal stenosis see STENOSIS.

spinal tap see LUMBAR PUNCTURE.

spindle cell a type of small neuron whose CELL BODY is spindle shaped, being wider in the middle and tapering at the two ends. It should not be confused with a MUSCLE SPINDLE.

spindle waves electroencephalogram patterns associated with light sleep. See SLEEP SPINDLES.

spine n. see SPINAL COLUMN.

spinocerebellar tract a major bundle of nerve fibers that carries impulses from the muscles and other PROPRIOCEPTORS through the spinal cord to the CEREBELLMUM. see PALEOCEREBELLUM.

spinomesencephalic tract see ANTEROLATERAL SYSTEM.

spinoreticular tract see ANTEROLATERAL SYSTEM.

spinothalamic tract either of two ascending pathways for somatosensory impulses that travel through the spinal cord to the thalamus. They are part of the ANTEROLATERAL SYSTEM. The anterior spinothalamic tract serves touch and pressure sensations; the lateral spinothalamic tract carries principally pain and temperature information.

spiral ganglion the mass of cell bodies on the inner wall of the COCHLEA, near the organ of Corti, whose axons form the AUDITORY NERVE.

spiral test a type of intelligence assessment in which the focused themes being evaluated are distributed throughout the test, instead of being grouped together, and become increasingly difficult as the test progresses. Each subsequent spiral of difficulty covers a different domain of intelligence.

spirit n. 1. the nonphysical part of a person: the mental, moral, and emotional characteristics that make up the core of someone’s identity. 2. a vital force seen as animating the bodies of living creatures, sometimes identified with the SOUL and seen as surviving death. 3. an immaterial being, such as a ghost or a deity. 4. in idealist philosophies, a universal mind or idea seen as a fundamental reality and a moving force of events in the world. See ABSOLUTE IDEALISM. 5. the mood, temper, or disposition that temporarily or permanently characterizes a person. 6. courage or morale.

spiritism n. see SPIRITUALISM.

spirit photography the attempt, popular in the late 19th century, to render visible the spirits of deceased individuals by photography. In particular, it was claimed that spirits often left faint imprints on photographs of their loved ones. The first alleged spirit photograph was produced in 1862 by the U.S. engraver William H. Mumler, who was subsequently tried (inconclusively) for fraud. Most of the supposed spirit images produced at this time seem to have been created using a simple process of double exposure or specially prepared plates.

spiritual factor any moral, religious, or mystical belief
spiritual healing see FAITH HEALING.

spiritualism n. 1. in metaphysics, the position that the fundamental reality of the universe is nonmaterial. 2. the belief that the spirits of the dead survive in another world or dimension and that it is possible for the living to receive communications from them through MEDIUMS. With MAGIC and the OCCULT arts, spiritualism may be considered the philosophical and religious counterpart to PARAPSYCHOLOGY. Also called spiritism. 3. the belief that all human and nonhuman animals, plants, and natural objects possess souls and are part of a larger, universal spirit. See PANPSYCHISM. —spiritualist adj., n. —spiritualistic adj.

spirituality n. 1. a concern for or sensitivity to things of the SPIRIT OR SOUL, especially as opposed to materialistic concerns. 2. more specifically, a concern for God and a sensitivity to religious experience, which may include the practice of a particular RELIGION but may also exist without such practice. 3. the fact or state of being incorporeal.

spiritual self see EMPIRICAL SELF.

spirograph n. an instrument for measuring and recording breathing rate and volume.

spirometer n. an instrument used for measuring the air capacity in the lungs. In speech therapy, it may be used to record breathing functions associated with speech production.

SPL abbreviation for sound-pressure level. See DECIBEL.

splanchnic adj. denoting the abdominal organs or VISCERA. In combination with a qualifying prefix, this word is used in the names of various body types to indicate the abdomen (e.g., MACROSPLANCHNIC TYPE, MICROPSPLANCHNIC TYPE).

splanchnic nerve any of certain nerves that serve the abdominal VISCERA. They originate in the ganglia of the SYMPATHETIC CHAIN.

spleen n. 1. an organ that produces lymphocytes, filters and stores blood, and destroys old red blood cells. Although it is not necessary to maintain life, the absence of a spleen may predispose an individual to certain infections. 2. bad temper or ill will. 3. an old term for melancholy or depression.

splenium n. (pl. splenia) a blunt enlargement at the posterior end of the CORPUS CALLOSUM.

spline function a smoothed mathematical representation of a disjointed or disregarded relationship between an INDEPENDENT VARIABLE (x) and a DEPENDENT VARIABLE (y), in which values of y vary sharply for different intervals of x. Each range of x thus has a different SLOPE, and spline functions are formed by joining piecewise polynomials at fixed points called knots. Spline functions (or splines for short) are useful for fitting data that have random components, and they are widely used for interpolation and approximation of data sampled at a discrete set of points (e.g., for TIME-SERIES interpolation).

split-ballot technique a procedure in which a sample is randomly divided into halves and each half receives a slightly different version of a questionnaire or survey designed to measure the same construct. The technique can be used to determine whether different versions of the survey have different outcomes (e.g., whether positioning of items on the questionnaire makes a difference in the outcomes). Also called split-half method.

split brain a brain in which the two cerebral hemispheres have been separated by partial or complete destruction of the corpus callosum (see COMMISSUROTOMY), thereby blocking direct communication between them. Split-brain surgery is used to treat otherwise intractable epilepsy, because it prevents cortical seizure activity from spreading between the hemispheres. Given the extensive communication between the two hemispheres in the intact brain, disruption of this activity in split-brain conditions is of considerable scientific interest. Also called divided brain.

split-brain technique see COMMISSUROTOMY.

split-half reliability a measure of the internal consistency of surveys, psychological tests, questionnaires, and other instruments or techniques that assess participant responses on particular constructs. Split-half reliability is determined by dividing the total set of items (e.g., questions) relating to a construct of interest into halves (e.g., odd-numbered and even-numbered questions) and comparing the results obtained from the two subsets of items thus created. The closer the correlation between results from the two versions, the greater the INTERNAL CONSISTENCY of the survey or instrument. The RELIABILITY of the total survey can be determined by applying the SPEARMAN–BROWN PROPHETIC FORMULA.

split-litter design in animal research, the assignment of litter mates to different groups in an experiment (e.g., the experimental group and the control group) to minimize genetic differences in the study. Also called split-litter technique.

split personality a lay term for an individual with DISASSOCIATIVE IDENTIY DISORDER. It is sometimes confused with SCHIZOPHRENIA, which literally means “splitting of the mind” but does not involve the formation of a second personality.

split-plot design a variation of a full FACTORIAL DESIGN in which one of the INDEPENDENT VARIABLES is held constant while all other combinations of conditions are examined, often using different sample sizes or different randomization schemes. For example, consider a researcher examining the influence on crop yield of four different types of corn seed, three different types of fertilizer, and two different types of planting technique. He or she could have half of the participating farmers plant all of the seed types using one technique and the other half plant all of the seed types using the second technique. Split-plot designs are particularly common in agricultural and industrial contexts, in which certain conditions may be difficult to manipulate or change for experimental purposes. Data from such designs may be examined with a split-plot analysis of variance.

split recovery a statute in which the plaintiff in a civil lawsuit is obligated to share his or her PUNITIVE DAMAGES with the state, which puts the money toward some cause intended to benefit society as a whole (e.g., a government medical assistance fund). The concept of split recovery is intended to address the common criticism that punitive damages tend to be excessive and provide a windfall for plaintiffs, which is contrary to their primary purpose of punishing defendants to deter future misconduct. Many argue that if punitive awards are intended to protect the public by discouraging socially impermissible conduct,
split run

then these awards should be split between the plaintiff and society at large. Currently, eight states have split recovery, although how much money each receives and how it is distributed varies widely. For example, in Alaska 50% of the plaintiff’s punitive award is given to the state and placed in its general treasury fund, whereas in Illinois the specific arrangements are determined on a case-by-case basis entirely at the discretion of the trial judge. Also called alternative distribution: restricted recovery, split award. See also CURATIVE DAMAGES.

split run a method of testing the effectiveness of advertising and other promotions by showing an advertisement to one part of a product’s potential customer base and showing no advertisement (or a different advertisement) to the other part. Sales figures can be assessed from data supplied by stores in which the consumer provides identifying information (e.g., an identification card or membership card). See also COUPON-RETURN Technique.

split-span test a test in which brief auditory messages in the form of two different lists of digits or words are presented rapidly and simultaneously, one list to each ear. Participants are required to report as many digits or words as possible in any order. Typically, participants report first the stimuli presented to one ear, then those presented to the other.

splitting n. 1. in Kleinian analysis and Fairbairnian Theory, a primitive defense mechanism used to protect oneself from conflict, in which objects provoking anxiety and ambivalence are dichotomized into extreme representations (PART-OBJECTS) with either positive or negative qualities, resulting in polarized viewpoints that fluctuate in extremes of seeing the self or others as either all good or all bad. This mechanism is used not only by infants and young children, who are not yet capable of integrating these polarized viewpoints, but also by adults with dysfunctional patterns of dealing with ambivalence; it is often associated with Borderline Personality Disorder. Also called splitting of the object. 2. in Cotherapy, divisiveness that a client provokes between therapists to polarize them on treatment decisions and to undermine the therapeutic process. Also called splitting situation.

split treatment see COLLABORATIVE CARE.

SPMSQ abbreviation for SHORT PORTABLE MENTAL STATUS QUESTIONNAIRE.

spongiform encephalopathy see PRION DISEASE.

spongioblast n. a type of ectodermal cell (see ECTODERM) that can develop into cells of the GLIA.

spontaneity test a type of sociometric test in which an individual in a therapy group is encouraged to improvise freely in reenactments of typical life situations with other members of the group who have been judged to be emotionally related, positively or negatively, to that individual. The goal is to gain insight into interpersonal relationships that are not revealed by the standard sociometric test, which deals only with attraction and rejection among members in a group. [devised by Jacob L. Moreno]

spontaneity training a personality-training program in which a client learns to act naturally and spontaneously in real-life situations by practicing such behavior in graduated sessions. Also called spontaneity therapy. [introduced by Jacob L. Moreno]

spontaneous abortion see ABORTION.

spontaneous alternation the instinctive, successive alternation among the options available in a situation involving discrete choices or exploration. For example, in a learning and memory experiment, a rat in a T MAZE tends to choose the left arm on one trial, the right arm on the next, then the left arm again, and so on.

spontaneous discharge the firing of nerve impulses without direct influence from an external stimulus.

spontaneous memorialization voluntary public response to unexpected and violent death. Examples include the placement of messages, flowers, and other objects at sites associated with terrorist attacks or personal tragedies (e.g., when a shopkeeper has been murdered or a child struck by a hit-and-run driver). The hallmark of spontaneous memorialization is an immediate emotional response on the part of individuals and small groups of people, as distinguished from institutionalized patterns of response.

spontaneous movement movement that results from impulse, occurring without premeditation or planning. Spontaneous movement decreases in some disorders, such as Parkinson’s disease.

spontaneous neural activity the apparently automatic firing of neurons, particularly in the absence of observable stimuli. See SPONTANEOUS DISCHARGE.

spontaneous recovery the reappearance of a conditioned response, following either operant or classical conditioning. After it has been experimentally extinguished (see extinction), spontaneous regression a phenomenon in which a person suddenly relives an event that occurred at an earlier age (e.g., from childhood) and may exhibit appropriate behavior for that age.

spontaneous remission a reduction or disappearance of symptoms without any therapeutic intervention, which may be temporary or permanent. It most commonly refers to medical, rather than psychological, conditions. See also WAITING-LIST PHENOMENON.

spontaneous speech speech that is not in response to a specific question or direction.

spontaneous trait inference a judgment about an individual’s personality traits that is made automatically (i.e., without awareness or intention), usually on the basis of observed behavior. More specifically, spontaneous trait association is the phenomenon by which people who hear an individual describe negative or positive behaviors in others attribute the qualities implied by those behaviors to the speaker.

spoonerism n. a slip of the tongue in which two sound elements (usually initial consonants) are unintentionally transposed, resulting in an utterance with a different and often amusing sense. For example, a person might say sons of toll instead of tons of soil. [W. A. Spooner (1844–1910), British academic noted for slips of this kind]

sport n. 1. a physical contest between individuals or teams that is conducted under codified rules, is controlled by nonparticipants, and can have only one winner. 2. in genetics, an organism that has undergone mutation and is distinctly different from its parents.

sport and exercise psychology a discipline focused
on the development and application of psychological theory for the understanding and modification or enhancement of human behavior in the sport and physical exercise environment. This discipline evolved from an exclusive focus on sport performance and historically has been called sport psychology. However, health and well-being through regular participation in vigorous physical activity programs have become of increasing interest to researchers and practitioners to such an extent that the field is progressively becoming two separate disciplines as exercise psychology merges with health psychology.

Sport Imagery Questionnaire (SIQ) 1. An instrument used to measure the degree to which an athlete uses each of five different functions of imagery: (a) motivational general–arousal (images related to physiological and emotional arousal); (b) motivational general–mastery (images of being a master of self-control); (c) motivational specific (images of winning, achieving a goal, etc.); (d) cognitive general (images of strategies to be used in a game); and (e) cognitive specific (images of proper execution or improvement of a skill). The SIQ consists of 30 statements to which participants respond using a 7-point likert scale, ranging from rarely to often. [developed in 1998 by Craig R. Hall, Diane E. Mack, cognitive psychologist Allan U. Paivio (1925–), and health psychologist Heather A. Hausenblas (1970–)]. 2. An instrument used to measure the imaging abilities of athletes. A participant is asked to imagine four different situations in his or her sport (practicing alone, practicing in front of others, watching a teammate, competing) and then to rate five different characteristics of the resulting imagery on a 5-point likert scale, ranging from no image present to extremely clear and realistic image. [originally developed in 1982 by sport psychologist RainerMartens (1942–)].

Sports Imagery Questionnaire (SIQ) 1. A model of visual attention that likens the focus of attention to a spotlight. Information outside of the spotlight is presumed not to receive processing that requires attention. Compare zoom-lens model of attention.

Spranger’s typology a system of classification that sorts humans by six basic cultural values: theoretical, economic, aesthetic, social, political, and religious. [proposed by Eduard Spranger (1882–1963), German philosopher and psychologist]

spread n. see dispersion.

spreading activation 1. In neuroscience, a hypothetical process in which the activation of one neuron is presumed to spread to connected neurons, making it more likely that they will fire. 2. In cognitive psychology, an analogous model for the association of ideas, memories, and the like, based on the notion that activation of one item stored in memory travels through associated links to activate another item. As each item is activated, further activation may spread through the network, making it more likely that associated items will be recalled. Spreading activation is a feature of some network-memory models of semantic memory.

spreading depression a propagating wave of silence in neuronal activity accompanied by a relatively large negative electric potential. Spreading depression occurs in regions of gray matter, including the cerebral cortex and hippocampus. It may occur spontaneously or be evoked by intense local electrical, chemical, or mechanical stimuli. Cortical spreading depression is related to migraine headaches.

spread of effect see stimulus generalization.

spree murder the act of killing people at two or more locations within a short period of time. See also mass murder.

SPRINT acronym for special psychiatric rapid intervention team.

spurious correlation a situation in which variables are associated through their common relationship with one or more other variables but do not have a causal relationship with one another. For example, assume that data show that the total amount of damage in a fire increases as the number of firefighters at the scene increases. One cannot infer from this that calling fewer firefighters would decrease damage: There is a third variable—the initial size of the fire—that influences both the amount of damage and the number of firefighters present. See third-variable problem.

SQ3R acronym for SLEEP QUESTIONNAIRE AND ASSESSMENT OF WAKEFULNESS.

SQ3R n. one of a variety of study methods developed on the basis of research in cognitive psychology. The formula
Squaring the correlation coefficient represents a method for enhanced learning of reading material. It consists of five steps: survey, question, read, recite, and review.

**Squaring the correlation coefficient** see **COEFFICIENT OF DETERMINATION**.

**Squared multiple correlation coefficient** see **COEFFICIENT OF MULTIPLE DETERMINATION**.

**Square matrix** a data array that has the same number of rows as columns. The number of rows and columns determines the order of the matrix (e.g., 3 rows by 3 columns is an order of 3), and any two square matrices of the same order can be added and multiplied. Square matrices are used in **REGRESSION ANALYSIS**, **FACTOR ANALYSIS**, and other multivariate analytical techniques.

**Square-root transformation** a procedure for converting a set of data in which each value, \( x_i \), is replaced by its **square root**, another number that when multiplied by itself yields \( x_i \). Square-root transformations often result in **HOMOGENEITY OF VARIANCE** for the different levels of the independent variable (\( x \)) under consideration. As with transformations generally, the goal is to obtain data that more closely meet the assumptions of a statistical procedure that is to be applied.

**Squeeze technique** a technique for overcoming premature ejaculation. The penis is stimulated until the man is well aroused, then the partner briefly squeezes the head of the penis where it joins the shaft. When the squeeze is released, a pause in stimulation is taken for 30 seconds to 1 minute. The squeeze and pause lowers arousal, and stimulation is then resumed. After several stimulate–squeezepause–stimulate cycles, the man is stimulated to ejaculation. This procedure conditions the man to maintain an erection longer before ejaculation. [devised by U.S. sex researchers William H. Masters (1915–2001) and Virginia E. Johnson (1925–2013)]

**SQUID** acronym for **SUPERCONDUCTING QUANTUM INTERFERENCE DEVICE**.

**Squint** n. see **CROSS-EYE; STRABISMUS**.

**S–R** abbreviation for stimulus–response.

**SRA** abbreviation for Satanic ritual abuse. See **SATANISM**.

**SRCD** abbreviation for **SOCIETY FOR RESEARCH IN CHILD DEVELOPMENT**.

**SRI** abbreviation for serotonin reuptake inhibitor. See **SSRI**.

**SRIF** abbreviation for somatotropin-release inhibiting factor. See **SOMATOSTATIN**.

**S–R learning model** the hypothesis that learning leads to the formation of stimulus–response connections. In **CLASSICAL CONDITIONING**, this connection is between the conditioned stimulus and the unconditioned response (e.g., between the tone and salivation in Ivan Pその後ov’s procedure); in **INSTRUMENTAL CONDITIONING**, the connection is between the discriminative stimulus and the response (e.g., between a tone and bar pressing).

**S–R–O learning model** stimulus–response–outcome learning model: in **INSTRUMENTAL CONDITIONING**, the hypothesis that associations are acquired between a discriminative stimulus, the instrumental response, and the outcome of reinforcement or punishment.

**S–(R–O) model** stimulus–(response–outcome) model: in **INSTRUMENTAL CONDITIONING**, the hypothesis that a stimulus activates an association between the response to and the outcome of reinforcement or punishment.

**S–R psychology** an approach to psychology in which behavior is conceptualized in terms of stimulus and response. The fundamental goal of adherents is therefore describing functional relationships between stimulus and response—that is, manipulating a stimulus and observing the response. S–R psychology developed from Edward L. THORNDIKE’s connectionism and John B. WATSON’s behaviorism, and S–R theories thus tend to be behavioral rather than cognitive. Examples include Clark L. HULL’s reinforcement theory (see **HULL’S MATHEMATICO-DIDACTIVE THEORY OF LEARNING**) and Edwin R. GUTHRIE’s **CONTINGENCY LEARNING THEORY**. S–R theories are sometimes contrasted with cognitive theories of learning (see **S–S LEARNING MODEL**), such as **PURPOSIVE BEHAVIORISM** or Gestalt psychology. See also **S–O–R PSYCHOLOGY**.

**SRT 1.** abbreviation for **SIMPLE REACTION TIME**. 2. abbreviation for **SPEECH-RECEPTION THRESHOLD**.

**SRY** abbreviation for sex reversal on Y. See **SEX DIFFERENTIATION**.

**SS** symbol for **SUM OF SQUARES**.

**SSA** abbreviation for **SMALLEST SPACE ANALYSIS**.

**SSDR** abbreviation for **SPECIES-SPECIFIC DEFENSE REACTION**.

**SSE 1.** abbreviation for subacute spongiform encephalopathy. See **CREUTZFELDT–JAKOB DISEASE**. 2. symbol for sum of squared errors. See **ERROR SUM OF SQUARES**.

**S-shaped curve** see **OJIVE**.

**SS interval** abbreviation for **SHOCK–SHOCK INTERVAL**.

**S–S learning model** stimulus–stimulus learning model: any learning theory that is cognitive in nature and emphasizes the formation of associations between stimuli, in contrast to theories based on stimulus–response connections (see **S–R PSYCHOLOGY**). Examples include **PURPURIST BEHAVIORISM** and Gestalt learning theory. In **CLASSICAL CONDITIONING**, the S–S learning model postulates associations between conditioned and unconditioned stimuli; in **INSTRUMENTAL CONDITIONING**, the association is between the discriminative stimulus and the reinforcing stimulus or outcome (i.e., the **S–O association**).

**SS** symbol for **REGRCLUSION SUM OF SQUARES**.

**SSRI** selective serotonin reuptake inhibitor: any of a class of antidepressants that are thought to act by blocking the reuptake of serotonin into serotonin-containing neurons in the central nervous system (see also **SEROTONIN AGONIST**). The SSRIs have demonstrated efficacy in the treatment of not only depression but also panic disorder and obsessive-compulsive disorder as well as eating disorders and premenstrual dysphoric disorder. However, the relationship of the reuptake mechanism to the therapeutic qualities of these agents has not been clearly elucidated. SSRIs also block the activity of certain subtypes of serotonin autoreceptors, and this may also be associated with their therapeutic effects. SSRIs have fewer adverse effects than the **TRICYCLIC ANTIDEPRESSANTS** and the **MONOAMINE OXIDASE INHIBITORS**, but common side effects include nausea, headache, anxiety, and tremor, and some patients may experience sexual dysfunction. SSRIs include **FLUOXETINE**, **PAROXETINE**, **SERTRALINE**, **CITALOPRAM**, and **FLUOXAMINE**. Also called **SRI** (serotonin reuptake inhibitor).

**SSS** abbreviation for **SENSATION-SEEKING SCALE**.
SST 1, abbreviation for SELF-STATEMENT TRAINING. 2, abbreviation for SINGLE-SESSION THERAPY. 3, abbreviation for SOCIAL SKILLS TRAINING. 4, abbreviation for STIMULUS SAMPLING THEORY.

s-structure abbreviation for SURFACE STRUCTURE.

SSW abbreviation for STAGGERED SPONDAIC WORD TEST.

stability n. 1, the absence of variation or motion, as applied, for example, to genetics (invariance in characteristics), personality (few emotional or mood changes), or body position (absence of body sway). 2, in developmental psychology, the degree to which a person maintains the same rank order with respect to a particular characteristic (e.g., intelligence test performance) over time in comparison with peers. 3, the property of a system, either open or closed, that regulates its internal environment and tends to maintain a constant condition. 4, see STATISTICAL STABILITY.

stability coefficient an index of RELIABILITY determined via a test–retest method, in which the same test is administered to the same respondents at two different points in time. For example, the stability coefficient of a psychological test may be estimated by determining the degree of similarity between participants’ scores across time. The more the two scores for each participant are alike, the higher the correlation between the two administrations and the greater the stability coefficient of the test. Also called coefficient of stability.

stabilized image an image on the retina that does not move when the eye is moved. A stabilized image will fade rapidly since neurons in the visual system are sensitive to change rather than to sustained stimulation. Even during VISUAL FIXATION images are normally not truly stabilized, because very small eye movements (MICROSCACADES) continually refresh the stimulation of the retina by moving the eyes relative to a target.

stabilizing selection the tendency of NATURAL SELECTION to function so as to maintain the existing mean of a population characteristic (e.g., mean height, mean neck length) over successive generations.

Stablon n. a trade name for TIANEPETINE.

Stadol n. a trade name for BUTORPHANOL.

staffing theory in ECOLOGICAL PSYCHOLOGY, a conceptual model examining the psychological and interpersonal consequences of interacting in situations that are overstuffed or understaffed. It was formerly known as MANNING THEORY.

staff turnover see TURNOVER.

stage n. a relatively discrete period of time in which functioning is qualitatively different from functioning during other periods.

Stage 1 sleep the initial stage of NREM SLEEP, which is characterized by low-amplitude BRAIN WAVES (4–6 Hz) of irregular frequency, a slow heart rate, and reduced muscle tension. See SLEEP STAGES.

Stage 2 sleep a stage of NREM SLEEP that is defined by regular bursts of waves of about 15 Hz (called SLEEP SPINDLES) that progressively increase and then decrease in amplitude. See SLEEP STAGES.

Stage 3 sleep a stage of NREM SLEEP that is defined by the SLEEP SPINDLES seen in Stage 2 sleep interspersed with larger amplitude DELTA WAVES (slow waves of 1–4 Hz). See SLEEP STAGES.

Stage 4 sleep a stage of NREM SLEEP that is defined by the presence of high-amplitude DELTA WAVES (slow waves of 1–4 Hz). See SLEEP STAGES.

stage fright an anxiety reaction associated with speaking or performing in public. The individual becomes tense and apprehensive and may stutter, forget lines, or try to escape the situation. The apprehension may develop into panic symptoms or even a PANIC ATTACK. See also PERFORMANCE ANXIETY.

stage sampling see MULTISTAGE SAMPLING.

stages of change the five steps involved in changing health behavior according to the TRANSTHEORETICAL MODEL: (a) precontemplation (not thinking about changing behavior), (b) contemplation (considering changing behavior), (c) preparation (occasionally changing behavior), (d) action (practicing the healthful behavior on a regular basis, resulting in major benefits), and (e) maintenance (continuing the behavior after 6 months of regular practice). (developed by U.S. clinical psychologist James O. Prochaska [1942–]).

stages of grief a hypothetical model, originally described in 1969 by Elisabeth KüBLER-ROSS, depicting psychological states, moods, or coping strategies that occur during the Dying PROCESS or during periods of bereavement, great loss, or trauma. These begin with the DENIAL STAGE, followed by the ANGER STAGE, BARGAINING STAGE, DEPRESSION STAGE, and ACCEPTANCE STAGE. The model is non-linear in that the stages do not necessarily occur in the given sequence or for a set period of time; moreover, they can recur and overlap before some degree of psychological and emotional resolution occurs. Also called GRIEF CYCLE MODEL.

stage theory any hypothetical construct used to describe phases or steps in a process that occurs over time, such as a theory that development involves discontinuous phases marked by changes in functioning. Examples include Sigmund Freud’s stages of PSYCHOSEXUAL DEVELOPMENT and Jean Piaget’s stages of cognitive development (see PIAGETIAN THEORY). See also STAGES OF CHANGE: STAGES OF GRIEF.

stage theory of strategy development see ADAPTIVE STRATEGY CHOICE MODEL.

staggered entry design in SURVIVAL ANALYSIS, a research design that allows for the entry or exit of participants at any time throughout the course of the study. In a typical survival analysis design, all samples have a common origin—they start at the same time—and there is a single, terminal event (typically, death). By contrast, in a staggered entry design each participant begins the study at a particular time zero and has an ending point corresponding to the length of time that he or she was part of the study (i.e., until he or she experienced the event of interest or otherwise ceased participation). For example, consider a study of a new treatment method implemented at a specific hospital: There will be patients who survived over the entire study period, others who survived but entered the hospital after the study had already begun, and still others who moved away and lost contact with the researcher before the study was concluded.

Staggered Spondaic Word Test (SSW) a test of auditory-processing abilities using equally stressed, two-syllable words in which the first syllable of one word is presented to
one ear and the second syllable of another word is presented to the other ear simultaneously. [originally published in 1962 by U.S. audiologist Jack Katz]

**stagnation** n. see GENERATIVITY VERSUS STAGNATION.

**STAI** abbreviation for STATE–Trait Anxiety Inventory.

**stain** n. a chemical dye that is applied to tissue sections to render them more easily visible during microscopic examination. The choice of stain is determined by the type of tissue and the study objective.

**staircase illusion** a three-dimensional IMPOSSIBLE FIGURE in which a set of stairs appears to continue rising or descending endlessly. It is frequently confused with the SCHRODER STAIRCASE. Also called Penrose staircase. devised by British geneticist and mathematician Lionel Penrose (1898–1972) and British physicist Roger Penrose (1931– )

**staircase method** a variation of the METHOD OF LIMITS in which stimuli are presented in ascending and descending order. When the observer’s response changes, the direction of the stimulus sequence is reversed. This method is efficient because it does not present stimuli that are well above or below threshold.

**staircase phenomenon** 1. any of various phenomena that display graduated or stepwise changes in the response of physical or physiological systems to a series of stimuli. 2. in cardiac muscle, the increase in the force of cardiac contractions as heart rate is increased. 3. in skeletal muscle, the graduated sequence of increasing stronger muscle contractions that occur when a sequence of identical stimuli is applied to a rested muscle. Also called treppe.

**stakeholder** n. in evaluation research, any of a program’s sponsors, funders, decision makers, personnel, or service recipients who either have an investment in the functioning of the program or are potentially affected by information resulting from the evaluation of its processes and outcomes. Conflict can occur between groups of stakeholders with different interests, especially in the specification or weighting of the EVALUATION OBJECTIVES.

**Stalevo** n. a U.S. trade name for a drug combination of levodopa, carbidopa, and entacapone (a catechol-O-methyltransferase inhibitor); it is used in the treatment of Parkinson’s disease, the symptoms of which are due to lack of striatal dopamine. As occurs with the Parkinson’s drug Sinemet, carbidopa in this combination enables levodopa to be administered in lower doses to achieve an effective concentration in the brain, where it is converted into dopamine. Stalevo’s additional ingredient, entacapone, increases and prolongs levodopa plasma levels, allowing increased dopaminergic stimulation.

**stalking** n. 1. a pattern of following or observing a person in an obsessive, intrusive, or harassing manner. The pursued individual is typically a partner from a failed intimate relationship but may be a mental health care provider, a public figure (see EROTIC DELUSION), or other person of interest to the stalker. Stalking may involve direct threats, the intent to cause distress or bodily harm, and interpersonal violence. In the United States, laws against stalking vary from state to state. See also DOMESTIC VIOLENCE; INTIMATE PARTNER VIOLENCE. 2. in animal behavior, see PREDATION.—v. stalk, stalked, stalking.

**stammer** vb., n. see STUTTERING. —v. stammered, stammering, stammerer.

**stance reflex** 1. the automatic activity of skeletal muscle in maintaining the stability of the standing posture. 2. any automatic response that maintains a special standing posture, such as the stance reflexes of a sow in estrus that maintain the animal with its back arched and its body rigid.

**standard application blank (SAB)** in PERSONNEL SELECTION, a standardized form used to obtain basic BIOGRAPHICAL DATA on a candidate for employment, such as age, sex, education, qualifications, employment history, leisure interests, and the like. Compare WEIGHTED APPLICATION BLANK.

**standard Cox regression model** see COX REGRESSION ANALYSIS.

**standard deviation** (symbol: SD) a measure of the variability of a set of scores or values within a group, indicating how narrowly or broadly they deviate from the MEAN. A small standard deviation indicates data points that cluster around the mean, whereas a large standard deviation indicates data points that are dispersed across many different values. The standard deviation is expressed in the same units as the original values in the sample or population studied, so that the standard deviation of a series of measurements of weight would be in pounds, for example.

The standard deviation is equal to the square root of the VARIANCE. If a population of n values has a mean μ, then the standard deviation is $$\sqrt{\frac{\Sigma(X - \mu)^2}{n}}.$$ For a subset of the population, with a mean value $\bar{X}$, the sample standard deviation is $$\sqrt{\frac{\Sigma(X - \bar{X})^2}{(n - 1)}};$$ that is, the divisor is $(n - 1)$ rather than $n$. See also ROOT MEAN SQUARE.

**standard error** (symbol: SE) a quantification of the inherent inaccuracy of a calculated POPULATION value that is attributable to random fluctuations within the SAMPLE data upon which it is based. It is expressed as the STANDARD DEVIATION of the SAMPLING DISTRIBUTION. For example, the SAMPLE MEAN is the usual estimator of a POPULATION MEAN, yet different samples drawn from that same population will yield different values for the mean. Thus, to determine how much sample variability exists, the STANDARD ERROR OF THE MEAN may be obtained by taking the standard deviation of all of the means over all of the samples taken. Standard error is expressed in units given in the same scale of measurement that was used for the sample data (e.g., for a set of means that are given in weight, the standard error unit is also a weight).

**standard error of estimate** (symbol: SEE) for a relationship between two variables ($x$ and $y$) given by a REGRESSION EQUATION, an index of how closely the predicted value of $y$ for a specific value of $x$ matches its actual value. If $y'$ is an estimated value from a regression line and $y$ is the actual value, then the standard error of estimate is $$\sqrt{\frac{\Sigma(y - y')^2}{n}}.$$ where $n$ is the number of points. The smaller the standard error of estimate, the more confident one can be in the accuracy of the estimated (predicted) $y$ value.

**standard error of measurement** (symbol: SEM) an index of the RELIABILITY of an assessment instrument, representing the variation of an individual’s scores across
multiple administrations of the same test. The larger the standard error of measurement, the greater the score variation across administrations. In essence, the standard error of measurement provides an indication of how confident one may be that an individual’s obtained score on any given measurement opportunity represents his or her true score.

**standard error of the mean** (symbol: SEM; \( \sigma_n \)) a statistic that indicates how much the average value (MEAN) for a particular SAMPLE is likely to differ from the average value for the larger POPULATION from which it is drawn. It is equal to \( \sigma / \sqrt{n} \), where \( \sigma \) is the standard deviation of the original distribution and \( n \) is the sample size.

**standard gamma distribution** see gamma distribution.

**standardization** n. 1. the process of establishing NORMS for a test. 2. the use of uniform procedures in test administration to ensure that all participants take the same test under the same conditions and are scored by the same criteria, which in turn ensures that results can be compared to each other. 3. the transformation of data into a distribution of STANDARDIZED SCORES, often one having a mean of 0 and a STANDARD DEVIATION of 1, which produces derived measures of relative standing and allows for comparison of raw scores from different distributions. The Z-SCORE transformation is an example of a standardization.

**standardization group** a sample used to establish reliable norms for the population that it represents. This is done by analyzing the results of the test administered to the sample and ascertaining the average performance level and the relative frequency of each deviation from the mean. The NORMAL DISTRIBUTION thus created is then used for comparison with any specific future test score. For example, the standardization group for a new test of computer literacy in older adults might comprise a large set of test takers above age 60 whose characteristics (e.g., sex, ethnicity, race) reproduce those of the larger population for whom the test is intended. The arrangement of scores obtained by such a standardization group subsequently provides a point of comparison for the scores of other older adults who take the test. Also called norm group: standardization sample.

**standardized coefficient** any index derived from an analysis of two or more variables that have been transformed via STANDARDIZATION, which ensures their value RANGES and VARIANCES are equivalent and thus appropriate for comparison. The term is most commonly used to denote the standardized regression coefficient or beta coefficient.

**standardized distribution** a NORMAL DISTRIBUTION whose values have undergone transformation so as to have a mean of 0 and a STANDARD DEVIATION of 1. Also called standard normal distribution: unit normal distribution.

**standardized interview** see structured interview.

**standardized score** a value derived from a raw score by subtracting the mean value of all scores in the set and dividing by the STANDARD DEVIATION of the set. The advantage of standardized scores is that they are not reflective of the units of the measuring device from which they were obtained and thus can be compared to one another regardless of the device’s scale values. Several types of standardized score exist, including stanines, \( T \) scores, and \( Z \) scores. Also called normal score: standard score. See also STANDARDIZATION.

**standardized test** 1. an assessment instrument whose VALIDITY and RELIABILITY have been established by thorough empirical investigation and analysis. It has clearly defined norms, such that a person’s score is an indication of how well he or she did in comparison to a large group of individuals representative of the population for which the test is intended. 2. an assessment instrument administered in a predetermined manner, such that the questions, conditions of administration, scoring, and interpretation of responses are consistent from one occasion to another.

**standard language** the generally accepted version of a language that is associated with formal and official contexts and with high-status users. Typically, it will be the version used in mainstream media and taught to schoolchildren and second-language learners. Most languages have a number of nonstandard varieties that differ from the standard language in pronunciation, vocabulary, and grammar.

**standard normal distribution** see standardized distribution.

**standard normal variable** any random variable whose probable value follows a NORMAL DISTRIBUTION with a mean of 0 and a STANDARD DEVIATION of 1. Also called unit normal variable.

**standard observer** in color vision research, a hypothetical typical human visual system that is described in terms of mathematical functions and equations relating its quantitative visual responses to measurable physical characteristics of light stimuli. The descriptions are therefore PSYCHOPHYSICAL and used to achieve a shared technical description of the perceptual effects of light stimuli on human observers. The equations that define the standard observer are based on averages of laboratory measurements of the visual responses of human participants to particular light stimuli under particular viewing conditions. See also IDEAL OBSERVER.

**standards of practice** a set of guidelines that delineate the expected techniques and procedures, and the order in which to use them, for interventions with individuals experiencing a range of psychological, medical, or educational conditions. Standards of practice have been developed by the American Psychological Association and other professional associations to ensure that practitioners use the most well researched and validated treatment plans available in their fields.

**standard stimulus** an item used as the basis of comparison in the quantitative investigation of physical stimuli and the sensations and perceptions they produce. For example, in the METHOD OF ADJUSTMENT, a participant may be presented with a sound of a particular intensity (the standard stimulus) and then asked to change the intensity of another sound to match.

**standard treatment control** in a CLINICAL TRIAL, a type of CONTROL CONDITION in which participants receive the treatment typically administered to a group of participants with a given medical problem. Another group of participants receives the experimental treatment. After the trial, the outcomes of the two groups are compared to see if the experimental treatment is better than, as good as, or worse than the standard treatment.

**standpoint theory** a theory in POSTMODERNISM that
proposes that the way an individual views the world is influenced by his or her perspective, which in turn is influenced by the individual’s social group memberships, experiences, location, situated knowledge, and other characteristics. When a person actively focuses on, recognizes, and acknowledges these influences, he or she has obtained a standpoint (i.e., a perspective is passive, but a standpoint is an active choice). [originated in 1807 by German philosopher Georg Wilhelm Friedrich Hegel (1770–1831) in his studies of slavery]

**Stanford Achievement Test** an assessment tool utilizing multiple-choice and open-ended questions designed to measure progress in reading, mathematics, language, spelling, listening, science, and social science. There is also an emphasis on higher level thinking and writing skills. Currently in its 10th edition (2003), the test reflects contemporary education practice with each new edition. [originally developed by Lewis M. Terman]

**Stanford–Binet Intelligence Scale** (SB) a standardized assessment of intelligence and cognitive abilities for individuals ages 2 to 89 years. It currently includes five verbal subtests and five nonverbal subtests that yield Verbal, Nonverbal, and Full Scale IQs (with a mean of 100 and a standard deviation of 15) as well as Fluid Reasoning, Knowledge, Quantitative Reasoning, Visual-Spatial Processing, and Working Memory index scores. The Stanford–Binet test was so named because it was brought to the United States in 1916 by Lewis M. Terman, a professor at Stanford University, as a revision and extension of the original Binet-Simon Scale (the first modern intelligence test) developed in 1905 by Alfred Binet and French physician Théodore Simon (1857–1961) to assess the intellectual ability of French children. The present Stanford–Binet Intelligence Scale (SB5), developed by U.S. psychologist Gale H. Roid (1943– ) and published in 2003, is the fourth revision of the test; the first and second revisions were made by Terman and U.S. psychologist Maud Merrill (1888–1978) and published in 1917 and 1937, respectively; and the third revision, by U.S. psychologists Robert L. Thorndike (1910–1990), Elizabeth P. Hagen (1915–2008), and Jerome M. Sattler (1931– ), was published in 1986.

**Stanford Hypnotic Susceptibility Scale** a standardized 12-item scale used to measure hypnotic susceptibility by means of the participant’s responses to various suggested actions, such as to fall forward, close the eyes, or lower an outstretched arm. [developed at Stanford University by Ernest R. Hilgard]

**Stanford prison study** a controversial 1971 study of the psychological effects of coercive situations, conducted by a research team under the direction of U.S. psychologist Philip G. Zimbardo (1933– ). The male participants were randomly assigned to the roles of either prisoner or guard in a simulated prison at Stanford University. A variety of methods and situations were used to depersonalize participants, diminish their sense of identity, and increase a sense of power on the one hand (guards) and powerlessness on the other (prisoners). The experiment was terminated after only 6 days of the originally scheduled 14, when several participants showed physical manifestations of stress and psychological trauma. The study was criticized on both ethical and methodological grounds but is often cited as an example of the power of the situation, because it illustrated the manner in which social contexts can influence and transform human behavior, often in very negative ways. See also LUCIFER EFFECT.

**Stanford v. Kentucky** a case resulting in a 1989 U.S. Supreme Court ruling that it is permissible to sentence people as young as 16 years of age to death.

**stanine** n. a method of scaling scores on a point scale that ranges from a low of 1 to a high of 9, with a mean of 5 and a standard deviation of 2. A stanine is a standard ninth, referring to the interval used in dividing the results into nine approximately equal parts. A stanine score of 1, 2, or 3 is below average; 4, 5, or 6 is average; and 7, 8, or 9 is above average. A stanine is a type of STANDARDED SCORE and is mainly used with school achievement tests.

**stanolone** n. a semisynthetic analog of DUMPSTERS-TERONE used in the treatment of some breast cancers because of its tumor-suppressing capabilities.

**stapedius muscle** a middle ear muscle that controls the movement of the stapes, one of the ear ossicles. Its activation (the stapedius reflex) is part of the ACOSTIC REFLEX.

**stapes** (pl. stapedes) see OSSICLES.

**star** n. in sociometry, an individual who is frequently chosen when group members select the other members whom they like the most, prefer to work or associate with, admire, and so on. Such individuals are the most popular, best-liked group members. Among children, this status is that of the popular child. See SOCIOMETRIC STATUS.

**star compass** see SUN COMPASS.

**startle response** an unlearned, rapid, reflexlike response to sudden, unexpected, and intense stimuli (e.g., loud noises, flashing lights). This response includes behaviors that serve a protective function, such as closing the eyes, frowning by drawing the eyebrows together, compressing the lips, lowering the head, hunching the shoulders, and bending the trunk and knee. The reaction can be neutralized by context, inhibition, and habituation. Also called startle reaction.

**starvation** n. 1. chronic and severe undernourishment. Common physical effects of starvation include general weakness or asthenia, hunger pangs, sluggishness, and susceptibility to disease. Psychological effects include slowed thought processes, difficulty concentrating, apathy, irritability, reduced sexual desire, and loss of concern for appearance. Psychotic reactions seldom occur except when starvation is accompanied by infection or extreme stress. 2. severe deficiency of any vital resource, as in the oxygen starvation that may occur from exposure to low atmospheric pressure (see AIR-PRESSURE EFFECTS).

**stat** n. a condition of stability, equilibrium, or inactivity, as opposed to a state of flux or change. —static adj.

**STAT** abbreviation for STERNBERG TRIARCHIC ABILITIES TEST.

**state** n. the condition or status of an entity or system at a particular time that is characterized by relative stability of its basic components or elements. Although the components or elements are essentially qualitatively stable, it is possible for them also to be dynamic, as in a hyperactive state or a state of flux.

**state anxiety** anxiety in response to a specific situation that is perceived as threatening or dangerous. State anxiety varies in intensity and fluctuates over time. Compare TRAIT

1026
state-dependent behavior actions that are affected by one’s emotional state, such as saying something hurtful to another while angry.

state-dependent learning learning that occurs in a particular biological or psychological state and is better recalled when the individual is subsequently in the same state. Recall may be diminished when the individual is in a different state. For example, a rat trained to run a maze while under the influence of a psychoactive drug (e.g., pentobarbital) may not run it as successfully without the drug. Also called dissociated learning. See also CONTEXT-SPECIFIC LEARNING.

state-dependent memory a condition in which memory for a past event is improved when the person is in the same biological or psychological state as when the memory was initially formed. For example, alcohol may improve one’s recall of experiences when one was previously under the influence of alcohol (although this level of recall is lower than recall under conditions in which both encoding and retrieval occur in sober states). A distinctive state may arise from a drug, a mood, or a particular place. See CONTEXT-SPECIFIC LEARNING; MOOD-DEPENDENT MEMORY; STATE-DEPENDENT LEARNING.

statement validity analysis a collection of techniques used to assess the truth of statements given during investigations, such as the truth of allegations made by children during interviews concerning sexual abuse. The focus is on the words themselves, independent of case facts. Such analysis is based on the assumption that the flow and quality of truthful statements is different from fabricated ones and it involves examining the use of nouns, pronouns, and verbs; the inclusion of extraneous information; the use of such phrases as “I think,” which indicate lack of connection; and the balance between descriptions of activities before, during, and after the event in question. These provide various criteria that ostensibly enable interviewers to distinguish plausible from implausible accounts. Such methods are still being refined and their accuracy studied and debated. See also CRITERION-BASED CONTENT ANALYSIS.

state orientation a style of responding to dilemmas or conflicts that is characterized by prolonged analysis and assessment of alternatives rather than by swift, decisive action. The hesitation of state orientation thus leads to the perseveration of current mental and behavioral states. Compare ACTION ORIENTATION.

state self-focus see SELF-FOCUS.

state space 1. a graphical representation used to characterize game playing and other search-based problem solving. A state space has four components: (a) a set of nodes or states, (b) a set of arcs linking subsets of the nodes, (c) a nonempty set of nodes indicated as the start nodes of the space, and (d) a nonempty set of goal nodes of the space. The goal nodes are identified by either a property of the state itself (e.g., a checkmate) or a property of the path leading to the goal state (e.g., the shortest path). An architecture such as a PRODUCTION SYSTEM or CLASSIFIER SYSTEM can generate a state-space search. Computational state-space analysis and computer simulations of problem solving often are used as well in the study of how people pursue goal-directed behavior. See also GRAPE; SEARCH TREE. 2. multidimensional space, particularly as related to the depiction of the results of classification methods used to group objects with similar characteristics and patterns of behavior.

state-specific science the concept of science as dependent on a particular state of consciousness, so that a change in consciousness might yield a different kind or content of science. [proposed by U.S. psychologist Charles T. Tart (1937– )]

states versus transformations in PIAGETIAN THEORY, the extent to which a child’s attention is focused on states (e.g., the appearance of an object) rather than on transformations (i.e., what is done to the object), and vice versa, at different stages of cognitive development. At the PREOPERATIONAL STAGE, children center their attention on specific states and ignore the transformations between states, whereas the reverse is true for children at the CONCRETE OPERATIONAL STAGE.

state theories of hypnosis theories positing that hypnosis evokes a distinctive, altered state of consciousness in the hypnotized person. Compare NONSTATE THEORIES OF HYPOnosis.

State–Trait Anxiety Inventory (STAI) a self-report that includes separate measures of STATE ANXIETY and TRAIT ANXIETY. The state anxiety items are designed to measure the intensity of anxiety experienced by participants in specific situations; the trait anxiety items are designed to assess the frequency with which respondents experience anxiety in the face of perceived threats in the environment. [devised in 1970 by Charles D. SPIELBERGER and colleagues]

State v. Mack a case resulting in an influential 1980 Minnesota Supreme Court ruling that testimony based on memories uncovered during hypnosis, or after an eyewitness has undergone a hypnotic induction, is not admissible in court because hypnosis is an unreliable method of retrieving memories. This has been referred to as the per se exclusion rule. However, this rule banning hypnotically retrieved evidence does not apply to defendants. See ROCK V. ARKANSAS.

static ataxia loss of the ability to maintain a fixed position, resulting in excessive swaying and tottering when standing still with the eyes closed or an inability to balance the body on one leg or to extend the arm steadily.

static marriage see CLOSED MARRIAGE.

static response a POSTURAL REFLEX that orients the body against a force, such as gravity. Also called static reflex.

static sense see SENSE OF EQUILIBRIUM.

stationarity n. in TIME-SERIES ANALYSIS, the property of being unchanging or “flat,” such that the data are without trends or periodic fluctuations and the MEAN, VARIANCE, and AUTOCORRELATION structure remain constant over time. Most statistical forecasting methods are based on the assumption that the time series of interest can be mathematically transformed into approximate stationarity (i.e., can be “stationarized”).

statistic n. 1. a number that represents a measurement of some characteristic, construct, variable, or other item of interest. 2. any function of the observations in a SAMPLE that may be used to estimate the unknown but corresponding value in the POPULATION. Examples include measures of CENTRAL TENDENCY (e.g., the MEAN, MEDIAN, MODE), measures of dispersion (e.g., STANDARD DEVIATION, VAR-
statistical analysis

ANCE), and distributional attributes (e.g., skewness, kurtosis). Statistics often are assigned Roman letters (e.g., M, s), whereas the equivalent values in the population (called parameters) are assigned Greek letters (e.g., μ, σ). —statistical adj.

statistical analysis any of a wide range of techniques used to describe, explore, understand, explain, predict, and test hypotheses about data. It involves the examination of data collected from samples within populations as well as the use of probabilistic models to make inferences and draw conclusions.

statistical conclusion validity the degree to which the conclusions drawn from statistical analyses of data are accurate and appropriate. In other words, statistical conclusion validity addresses whether inferences about relationships (i.e., whether the independent variable and dependent variable covary and, if so, how strongly) are reasonable, given the observed data. It is related to but distinct from internal validity, which is concerned with the causality of the relationship.

statistical control the use of statistical procedures to remove the influence of a particular factor that could not be eliminated or controlled by the experimental design in order to better analyze the relationship between two variables. For example, the relationship between age (x) and income earned (y) could be influenced by a third variable, years of education (z). Thus, if a researcher did not first remove the effects of education, he or she might derive erroneous conclusions about the influence of age on income from his or her analysis. One type of statistical control is partial correlation. A second type is analysis of covariance.

statistical decision theory a branch of statistical science concerned with the use of data to arrive at decisions. It focuses upon identifying the values, uncertainties, and other issues relevant to a given decision. Specific equations are used to calculate the degree of loss associated with each course of action and determine the most advantageous choice.

statistical dependence the situation in which the probability of one event occurring given the occurrence of another event is greater than the probability of occurrence of that first event in isolation. In other words, knowing information about one variable provides information about another. Compare statistical independence. See also dependent events.

statistical determinism the position that the laws of probability can be used to predict the likely number of events of a given kind that will occur in a given population under certain defined conditions (e.g., the number of coin tosses per 1,000 that will be heads; the number of male Americans age 70 who will die in a 12-month period).

statistical error see error.

statistical hypothesis a research question posed in a statistically testable form. For example, if a researcher is interested in whether one treatment leads to a more positive outcome than another treatment, he or she could reframe the question in terms of mean differences, such that the null hypothesis is 0 (no difference between treatments) and the alternative hypothesis is not 0 (the difference between treatments is greater or lesser than zero). See also hypothesis testing.

statistical independence the condition in which the occurrence of one event makes it neither more nor less probable that another event will occur. In other words, knowing information about one variable provides no information about the other variable. Compare statistical dependence. See also independent events.

statistical learning theory a theoretical approach in which mathematical models are used to describe processes of learning. The term often is applied specifically to stimulus sampling theory but can be applied more generally to other theories as well.

statistical model a formal description of the relationships between two or more variables in the form of a mathematical equation. It is statistical in that the variables are related in a stochastic rather than a deterministic manner, with each set of possible observations on a variable linked to a set of probability distributions. Many statistical tests involve comparing a particular model with the observed data.

statistical prediction the process of using correlations between variables to hypothesize about future events and outcomes. For example, a university administrator may use a regression equation to predict a student’s college grade-point average with reasonable accuracy from measures of performance in high school, such as scores on tests and final grades in classes.

statistical process control (SPC) in organizational contexts, a method of monitoring, evaluating, and continuously improving the performance of products, systems, or employees through the statistical analysis of performance data.

statistical psychology the application of statistical methods and models to organize, summarize, and interpret data so as to derive descriptions and explanations of cognitive, behavioral, social, and other psychological phenomena.

statistical significance the degree to which a research outcome cannot reasonably be attributed to the operation of chance or random factors. It is determined during significance testing and given by a critical p value, which is the probability of obtaining the observed data if the null hypothesis (i.e., of no significant relationship between variables) were true. Significance generally is a function of sample size—the larger the sample, the less likely it is that one’s findings will have occurred by chance. See also clinical significance; practical significance; significance level.

statistical stability consistency of results across samples, study designs, and analyses. A meta-analysis may be used to examine the stability of means, correlations, and other parameter estimates obtained from different studies of the same population. See also stability coefficient.

statistical test any mathematical technique or procedure used to evaluate the correctness of an empirical hypothesis by determining the likelihood of the sample results occurring by chance. Statistical testing will reveal the probability of committing a type I error if the null hypothesis is rejected. See hypothesis testing; statistical significance.

statistics n. the branch of mathematics in which data are used descriptively or inferentially to find or support answers for scientific and other quantifiable questions. It encompasses various techniques and procedures for recording, organizing, analyzing, and reporting quantitative
information. See also DESCRIPTIVE STATISTICS; INFERENTIAL STATISTICS; SUMMARY STATISTICS. —statistical adj. —statistician n.

statocyst n. (pl. statocysts) see OTOLITH.

statokinetic dissociation see RICHTER’S PHENOMENON.

status n. 1. the reputation or position of an individual or group relative to others, such as an individual’s standing in a social group. See SOCIAL STATUS. 2. a persistent condition, as in STATUS EPILEPTICUS.

status differentiation the gradual rise to positions of greater authority by some individuals within a group, accompanied by decreases in the authority exercised by other members.

status epilepticus a continuous series of seizures. It is a life-threatening condition that requires immediate medical treatment, usually by intravenous medication.

status generalization the tendency for individuals who are known to have achieved or been ascribed authority, respect, and prestige in one context to enjoy relatively higher status in other unrelated contexts. Well-known athletes or wealthy individuals, for example, may rise rapidly to positions of authority in groups even when these diffuse-status characteristics (athleticism, wealth) are not relevant in the current group context. See also EXPECTATION-STATES THEORY.

status incongruence 1. a mismatch between related status dimensions, such as between a person’s socioeconomic level and educational background. 2. a perceived mismatch between a person’s characteristics and his or her role in a particular context. For example, a very young supervisor creates status incongruence in the supervisor-worker dyad by reversing the traditional assumption that managers are older and more experienced than employees. 3. unjust inconsistency in the allocation of status in a group, organization, or society, resulting from biased appraisals of the accomplishments of members of stigmatized groups.

status offense a nondelinquent, noncriminal act considered to be illegal because the perpetrator belongs to a certain group or class of people, most often children. For example, status offenses of minors include truancy, curfew violations, and underage drinking, whereas owning a gun would be a status offense for a felon.

status planning see LANGUAGE PLANNING.

status-quo bias see BEHAVIORAL ECONOMICS.

status relations patterns of relative prestige and respect that determine deference and authority within a group or organization—that is, the “chain of command,” DOMINANCE HIERARCHY, or PECKING ORDER. Also called AUTHORITY RELATIONS.

status symbol any indicator of a person’s prestige or high status in a group or society, such as expensive or rare possessions, an extravagant lifestyle, or membership in prestigious clubs. The term applies particularly to those indicators that individuals deliberately choose to communicate, often to give a falsely high impression of their status level to others.

statutory rape the criminal offense of having sexual intercourse with an individual who is not qualified to give lawful consent because she or he is under the statutory age of consent. In the United States, the age of consent ranges from 14 to 18 years old, depending on each state’s law.

STD abbreviation for SEXUALLY TRANSMITTED DISEASE.

steady state a condition of stability or equilibrium. For example, in behavioral studies, it is a state in which behavior is practically the same over repeated observations in a particular context. In pharmacology, it refers to a consistent, effective plasma (or other fluid) concentration of a medication in the body as a result of regular, often daily, doses to replace the amount of the drug that is excreted.

stealing thunder a courtroom strategy in which admissions of facts to the jury are made by one attorney before these same facts are brought up by the opposing attorney. It is intended to reduce the impact this information may have on the jury.

stealth juror a juror who conceals his or her biases from the judge or attorneys during voir dire, usually in the hope of influencing the outcome of the trial or gaining money or publicity (e.g., via interviews or book deals) from the case.

steatopygia n. the presence of large quantities of fat in the buttocks. In some cultures, steatopygia is considered an element of female beauty.

Steele–Richardson–Olszewski syndrome see PROGRESSIVE SUPERANNUAL PALSY. [John C. Steele and John Clifford Richardson, 20th-century Canadian neurologists; Jerzy Olszewski (1913–1964), Polish-born Canadian neuropathologist]

Steinert’s disease see MYOTONIC MUSCULAR DYSTROPHY. [Hans Gustav Wilhelm Steinert (1875–1911), German physician]

Steinzer effect in discussion groups, the tendency for individuals to speak immediately after those sitting opposite them speak. The effect is strongest in leaderless groups. See also HEAD-OF-THE-TABLE EFFECT. [Bernard Steinzer (1920–2010), U.S. clinical psychologist]

Stelazine n. a trade name for TRIFLUOPERAZINE.

stellate cell any of a number of types of small nerve cells that have many branches, resembling a star; hence stellate. See also CORTICAL LAYERS.

stem-and-leaf plot a graphical method of presenting data that have been measured on an INTERVAL SCALE. A basic stem-and-leaf plot comprises two columns separated by a vertical line; the right column lists the last digit of each data point (the “leaves”) and the left column lists all of the other digits from each data point (the “stems”). Each stem is listed only once and no numbers are skipped, even if that means some stems have no leaves. The leaves are listed in increasing order of magnitude in a row to the right of each stem. For example, consider the following hypothetical values for participants measured on a particular variable:

| 55 | 57 89 |
| 6 | |
| 7 | 45 799 |
| 8 | 3367 |

The stem-and-leaf plot for these values is
stem cell

9 | 259
10 | 7

Also called stemplot.

stem cell a cell that is itself undifferentiated but can divide to produce one or more types of specialized tissue cells (e.g., blood cells, nerve cells). Because of this ability, stem cells act as a kind of continual repair system for the living organism by replenishing specialized cells. Stem cells found in embryos (embryonic stem cells) are produced in humans during the BLASTOCYST stage of development and are capable of forming any type of tissue cell; stem cells that occur in adults (adult stem cells) are more limited in the range of cell types they can produce. Because of this difference, many researchers believe that human embryonic stem cells hold greater potential for the development of therapeutic treatments than do adult stem cells. Nonetheless, the use of adult stem cells to treat some diseases has become common since the 1960s (e.g., the use of bone marrow stem cells in the treatment of leukemia and lymphoma), and research continues on the potential use of both types of stem cells as renewable sources of replacement cells and tissues to treat a range of conditions, such as cardiovascular disease, Alzheimer’s disease, Parkinson’s disease, spinal cord injury, diabetes, and arthritis. There are ethical concerns about human embryonic stem cell research, mainly because harvesting such cells involves destroying the embryo and thus, for some, raises questions about the rights of the unborn.

stem-completion task see WORD-STEM COMPLETION.

steno- combining form narrow or contracted.

stenosis n. the abnormal narrowing of a body conduit or passage. Carotid stenosis is narrowing of a CAROTID ARTERY, such as by atherosclerosis, which limits blood flow to the brain; aortic stenosis is narrowing of the aortic valve leading from the left ventricle, thereby restricting blood flow from the heart to the general circulation; pyloric stenosis restricts the flow of stomach contents into the small intestine; and spinal stenosis is a narrowing of the opening in the spinal column, thereby restricting the spinal cord and resulting in numbness and pain in the lower back and legs. —stenotic adj.

stenosis of aqueduct of Sylvius a hereditary or familial disorder, transmitted as an X-linked recessive gene, marked by massive head enlargement at birth and hydrocephalus due to narrowing of the CEREBRAL AQUEDUCT (aqueduct of Sylvius). In some cases, the disorder develops insidiously after adulthood rather than as a congenital condition.

stepdown selection see BACKWARD ELIMINATION.

stepdown test a memory test used in studies of shock-avoidance learning in rats and mice. When the animal first steps down from an elevated platform in the test chamber, it receives a brief foot shock. On subsequent test trials, the animal is usually much slower to step down, indicating its memory for the shock experience: a lack of hesitation in stepping down on postshock trials is considered a sign of cognitive impairment. Also called stepdown avoidance.

stepfamily n. a family unit formed by the union of parents one or both of whom bring a child or children from a previous union (or unions) into the new household. Also called blended family; reconstituted family.

stepping reflex a reflex movement elicited during the first few weeks of human life by holding an infant upright with his or her feet touching a flat surface and moving the infant gently forward.

stepwise selection see FORWARD SELECTION.

stepwise regression a group of regression analysis techniques that enter predictor (independent) variables into (or delete them from) the regression equation one variable (or block of variables) at a time according to some predefined criterion. It is contrasted with SIMULTANEOUS REGRESSION, which enters all variables at the same time. Also called stepwise multiple regression.

stereoacuity n. see STEREOSCOPIC ACUITY.

stereoblindness n. the inability to see depth using the cue of BINOCULAR DISPARITY, causing impaired depth perception. Stereoblindness is thought to affect 5% to 10% of the general population. It is associated with STRABISMUS during early childhood but may also be caused by occipito-temporal brain injury.

stereochemical smell theory the concept that certain odors are perceived because they are produced by ODORANTS whose stereochemical properties have certain shapes. Seven classes of odorants are postulated: camphoraceous, ethereal, floral, minty, musty, pungent, and putrid. The odorant molecules are thought to fit receptors in a lock-and-key manner that causes the neural membrane to become depolarized or hyperpolarized, which in turn is the cue that produces an odor experience. Since many odorants that share a similar molecular structure produce different odor experiences, it has been hypothesized that the lock-and-key principle may be modified by the orientation of the molecules at the receptor surfaces. Also called lock-and-key theory; steric theory of odor.

stereocilia pl. n. see HAIR CELL.

stereognosis n. the ability to identify the shape of an object by touch.

stereogram n. a picture perceived to have depth because it is produced by the binocular summation of two separate images of the same scene, each image slightly offset from the other in the horizontal plane. Although a STEREOSCOPIC is commonly used to view the images, some observers can fuse the two images by simply crossing or uncrossing their eyes.

stereoisomers n. see ISOMERS.

stereopsis n. DEPTH PERCEPTION provided by means of the BINOCULAR DISPARITY of the images in the two eyes. Also called STEREOSCOPIC DEPTH PERCEPTION; STEREOSCOPIC VISION. See also ANAGLYPH.

stereoscope n. a device that presents two slightly disparate pictures of the same scene, one to each eye. The separate retinal images fuse to produce a binocular, three-dimensional image (see STEREORAM).

stereoscopic acuity visual acuity for the perception of depth. Also called stereoacuity.

stereoscopic depth perception see STEREOPSIS.

stereoscopic motion picture a motion picture in which the dimension of depth is provided by recording the scene through two cameras, each with the perspective of one eye. When each sequence of images is presented to the correct eye at the same time, three-dimensional stereoscopic depth is perceived (see DEPTH PERCEPTION; STEREOPSIS).
stereoscopic vision see STEREOPTIC.

stereotaxis n. active movement of an organism in response to touch or direct contact with a solid object or surface. See TAXIS. —stereotaxic adj.

stereotaxy n. determination of the exact location of a specific area within the body (e.g., the exact location of a nerve center in the brain) by means of three-dimensional measurements. Stereotaxy is used for positioning MICROELECTRODES, CANNULAS, or other devices in the brain for experimental, diagnostic, or therapeutic purposes and for locating an area of the brain prior to surgery. It involves the coordinated use of a STEREOTACTIC ATLAS, a map of the brain featuring a coordinate system and consisting of images and schematic representations of nerve fibers and other structures and serial sections of the brain, and a STEREO TACTIC INSTRUMENT, a device that prohibits damage to neighboring tissues by holding the individual’s head absolutely still in the appropriate position. Also called STEREOTACTIC LOCALIZATION; STEREOTACTIC TECHNIQUE. —stereotactic or stereotaxic adj.

stereotropism n. an orienting response of an organism to touch or to contact with a solid object or surface. —stereotropic adj.

stereotype n. a set of cognitive generalizations (e.g., beliefs, expectations) about the qualities and characteristics of the members of a group or social category. Stereotypes, like SCHEMAS, simplify and expedite perceptions and judgments, but they are often exaggerated, negative rather than positive, and resistant to revision even when perceivers encounter individuals with qualities that are not congruent with the stereotype (see NEGATIVE STEREOTYPE; POSITIVE STEREOTYPE; PREJUDICE). See also EXEMPLAR THEORY; GENDER STEREOTYPE; KERNEL-OF-TRUTH HYPOTHESIS; SEX-ROLE STEREOTYPE. —stereotypic adj.

stereotype accuracy the ability to accurately determine in what way and to what extent a person’s traits correspond to a STEREOTYPE associated with his or her age group, ethnic group, professional group, or other relevant group. Compare DIFFERENTIAL ACCURACY.

stereotyped behavior inflexible behavior that follows a particular pattern and does not alter with changing conditions.

stereotyped movement a repeated movement or gesture, such as a tic, rocking, or head banging.

stereotype threat an individual’s expectation that NEGATIVE STEREOTYPES about his or her membership group will adversely influence others’ judgments of his or her performance and that a poor performance will reflect badly on the member group. This expectation may undermine the individual’s actual ability to perform well. In an academic setting, for example, it has been shown that African American students’ performance in tests of intellectual ability can suffer because of anxiety induced by thinking that they are expected to perform poorly and will be judged according to negative stereotypes about Black intelligence. See also PREJUDICE. [Identified in 1995 by U.S. psychologists Claude M. Steele (1946– ) and Joshua Aronson (1961– ).] stereotypic movement disorder in DSM–IV–TR and DSM–5, a disorder characterized by repetitive, nonfunctional, and often self-injurious behaviors, such as head banging, biting or hitting parts of the body, rocking, or hand waving. It may be associated with intellectual disability and can arise at any age, though typically its onset begins in early childhood. Stereotypic movement disorder is distinguished from other disorders marked by repetitive or persistent movements, such as tic disorders, trichotillomania, and obsessive-compulsive disorder; by stereotyped movements that may occur without self-injury in a neurodevelopmental disorder such as autistic spectrum disorder, or by involuntary movements resulting from the effects of a medication or other substance (as in TARDIVE DYSKINESIA) or from another medical condition such as Huntington’s disease.

stereotypy n. persistent repetition of the same words, movements, or other behavior, particularly as a symptom of disorder (e.g., autism, obsessive-compulsive disorder, schizophrenia). Stereotypy is also seen in nonhuman animals under conditions of social isolation, early social deprivation, or neglect. See STEROTYPIC MOVEMENT DISORDER.

steric theory of odor see STEROCHEMICAL SMELL THEORY.

sterility n. 1. the condition of being incapable of producing offspring, because of either INFERTILITY or surgical or medical intervention (see STERILIZATION). 2. the condition of being incapable of supporting microbial life because of treatment with chemicals, radiation, or heat. —sterile adj.

sterilization n. the process of rendering an organism incapable of sexual reproduction. This may be accomplished surgically (see VASECTOMY; CASTRATION; HYSTERECTOMY; OVARIECTOMY; SALPINGECTOMY; TUBAL LIGATION), or it may result from injury or from exposure to radiation, heat, or chemicals.

Sternberg Triarchic Abilities Test (STAT) a group intelligence test, designed for research purposes, that uses multiple-choice verbal, quantitative, and figural items, as well as essays, to measure analytical, creative, and practical abilities. Revised versions of the test also include other tasks, such as writing stories, telling stories, designing things, and watching movies with practical problems for the examinees to solve. The test yields separate scores for the analytical, creative, and practical components. [Developed in the 1980s by Robert J. Sternberg (1949– ), U.S. psychologist]

steroid n. any organic molecule that is based on four interconnected hydrocarbon rings. The male and female SEX HORMONES are steroids, as are the CORTICOSTEROIDS and other natural substances, such as vitamin D and CHOLESTEROL.

steroid hormone any of a class of hormones whose molecular structure is based on the steroid nucleus of four interconnected rings of carbon atoms. Examples include the SEX HORMONES and CORTICOSTEROIDS.

steroid use the use of ANABOLIC-ANDROGENIC STEROIDS to improve performance, fitness, or appearance. See also PERFORMANCE ENHANCING DRUG.

stethograph n. see PNEUMOGRAPH.

Stevens-Johnson syndrome a condition marked by eruptions of fluid-filled blisters on the skin, mucous membranes, eyes, and genitals. It has a fatality rate of 1% to 5% and may be associated with an adverse reaction to ANTICONVULSANT and antibiotic agents. It is a variant of toxic epidermal necrosis. [Albert M. Stevens (1884–1945) and Frank C. Johnson (1894–1934), U.S. pediatricians]

Stevens law a psychophysical relationship stating that
Stewart–Morel syndrome

the psychological magnitude of a sensation is proportional to a power of the stimulus producing it. This can be expressed as $\Psi = k^s$, where $\Psi$ is the sensation, $k$ is a constant of proportionality, $s$ is the stimulus magnitude, and $n$ is a function of the particular stimulus. Also called Stevens power law. See also FECHNER’S LAW; WEBER’S LAW. [Stanley Smith Stevens]

Stewart–Morel syndrome a disorder characterized by hypertrophy of the frontal bone of the skull, obesity, headache, disturbances affecting the nervous system, and a tendency toward intellectual disability. Also called Morel's syndrome. [Douglas Hunt Stewart (1860–1943), U.S. surgeon; Ferdinand Morel (1888–1957), Swiss psychiatrist]

sthenic type a constitutional type characterized by strength and vigor; it is roughly equivalent to the ATHLETIC TYPE IN KREITSCHEMER TYPOLOGY.

sthenometer n. an instrument for measuring muscle strength.

STI abbreviation for sexually transmitted infection. See SEXUALLY TRANSMITTED DISEASE.

stick shaker in ergonomics, a device within a joystick or other stick control that uses vibration to provide feedback to the operator in certain situations (e.g., the stall of an aircraft engine, wind, turbulence).

stiffness n. 1. inflexibility of the muscles and joints due to injury, DYSTONIA, or over- or underuse. 2. a characteristic, due to the springlike properties of muscles, that determines how the force exerted by a muscle varies as a function of its length for a fixed level of activation.

stigma n. the negative social attitude attached to a characteristic of an individual that may be regarded as a mental, physical, or social deficiency. A stigma implies social disapproval and can lead unfairly to discrimination against and exclusion of the individual.

Stigma Impact Scale (SIS) a self-report questionnaire that measures the effect on patients and their families of negative social attitudes toward the patients' health or mental health condition. Respondents answer questions about the impact of stigma on their quality of life, family relations, social contacts, and self-esteem, rating each item on a scale ranging from 0 (no impact) to 10 (highest impact). The SIS has been used to measure this impact on families with members who have Parkinson's disease, Alzheimer's disease, mental health disorders such as bipolar disorder, and intellectual and developmental disability.

stigmatophilia n. sexual interest in and arousal by a partner who is tattooed or has scars, or by having oneself tattooed, particularly in the genital area.

Stiles–Crawford effect a difference in the perceived brightness or perceived color of a stimulus depending on whether light rays enter the pupil near the edge or through the center. [Walter Stiles (1901–1985), British physicist; Brian H. Crawford (1906–1991), British physiologist]

Stilling Color Vision Test a test consisting of PSEUDOCYCROMATIC CHARTS containing dots of various hues, saturations, and intensities developed for the detection of abnormal color perception. Some of the dots form numbers that are visible to the normal eye but not to the color-blind or color-weak eye. Now obsolete, it is the predecessor to the commonly used ISHIHARA TEST FOR COLOR BLINDNESS. [developed in 1877 by German ophthalmologist Jakob Stilling (1842–1915)]

stim test short for stimulation test, a technique often used prior to a formal POLYGRAPH test to convince examinees that the examiners are infallible in detecting deception. In one variation of the stim test, an examinee is told to select cards from a deck and then to lie about the identity of each card chosen. The examiner ostensibly uses questions about each card selection and the examinee's own physiological indicators to determine each card's actual identity. In reality, the examiner relies on a marked deck to correctly identify the cards chosen by the examinee.

stimulant n. any of various agents that excite functional activity in an organism or in a part of an organism. Stimulants are usually classified according to the body system or function excited (e.g., cardiac stimulants, respiratory stimulants). In psychology, the term usually refers to the CNS STIMULANTS (or psychostimulants).

stimulant intoxication see AMPHETAMINE INTOXICATION; COCAINE INTOXICATION.

stimulant use disorder in DSM–5, a diagnostic category reflecting disordered use of amphetamine-type substances, cocaine, and other stimulants. It combines DSM–IV–TR’s separate abuse and dependence diagnoses for these substances, thereby removing AMPHETAMINE ABUSE, AMPHETAMINE DEPENDENCE, COCAINE ABUSE, and COCAINE DEPENDENCE as distinct entities. Mild, moderate, and severe cases of stimulant use disorder are determined according to the number of symptoms that individuals using these substances may present (e.g., craving; drug-seeking behavior; social and other dysfunction caused by stimulant use; stimulant tolerance; etc.): the number ranges from a minimum of two symptoms for mild cases to more than six for severe.

stimulant withdrawal see AMPHETAMINE WITHDRAWAL; COCAINE WITHDRAWAL.

stimulate vb. 1. to animate, excite, or rouse to activity or heightened action. 2. to apply a stimulus to a sensory receptor or to an excitable cell (e.g., neuron or muscle cell).

stimulating occupation a physical activity or task, such as dancing, that has an arousing and stimulating effect. Compare SEDATIVE OCCUPATION.

stimulation n. the act or process of increasing the level of activity of an organism, particularly that of evoking heightened activity in (eliciting a response from) a sensory receptor, neuron, or other bodily tissue. See also ELECTRICAL STIMULATION.

stimulation effects the physiological changes produced when a stimulus alters the MEMBRANE POTENTIAL of a neuron or muscle cell, resulting in a nerve impulse or muscle contraction. Changes in electric potentials are frequently measured, as are resultant changes in localized blood flow and temperature.

stimulator n. a device used to apply electric current to excite or stimulate a sensory receptor. An early type of stimulator was an induction coil wired to a vibrator that would convert direct-current electricity into pulsations. Modern stimulators incorporate a device for controlling the rate of change in the electric current, since a steady current flow has little stimulus effect.

stimulus n. (pl. stimuli) 1. any agent, event, or situation—internal or external—that elicits a response from an
organism. See CONDItioned STIMulus; UNCONDITIONed STIMulus. 2. any change in physical energy that activates a sensory receptor. See DISTal STIMulus; PROXimal STIMulus.

stimulus-bound adj. 1. relating to a perception that is largely dependent on the qualities of the stimulation and thus involves little or no interpretation. 2. describing behavior that occurs in response to the presence of a specific stimulus (e.g., hungering for and eating a specific food after seeing it). 3. characterizing an individual whose behavior tends to be inflexible and determined primarily by the nature of the stimulus. 4. describing a person, usually a child, who has a poor attention span, is distracted by irrelevant stimuli, and therefore performs below his or her intellectual capacity.

stimulus coding the form in which a stimulus is remembered, such as a COGNITIVE MAP.

stimulus continuum a series of stimuli related to each other along a specific dimension (e.g., a series of tones in the diatonic scale, an unbroken series of shades of blue).

stimulus control the extent to which behavior is influenced by different stimulus conditions. It can refer to different responses occurring in the presence of different stimuli or to differences in the rate, temporal organization, or topography (see RESPONSE TOPOGRAPHY) of a single response in the presence of different stimuli.

stimulus differentiation 1. a process whereby an organism learns to discriminate between two or more stimuli by responding differently to them, such as by responding in the presence of one stimulus but not the other. See also DISCRIMINATION LEARNING. 2. in Gestalt psychology, the process of distinguishing different parts or patterns in a visual field.

stimulus discrimination the ability to distinguish among different stimuli (e.g., to distinguish a circle from an ellipse) and to respond differently to them.

stimulus element any of the individual features of a complex stimulus, such as its shape or color.

stimulus-element approach see CONFIGURAL-CUE APPROACH.

stimulus equivalence the condition in which two or more related stimuli elicit the same response. Stimuli meet the mathematical definition of equivalence if they can be shown to exhibit reflexivity, symmetry, and transitivity. For example, in the context of an ARBITRARY MATCHING TO SAMPLE procedure, if a stimulus is chosen when it also appears as the sample, reflexivity has been shown. If Stimulus A is chosen when B is the sample, and B is chosen when A is the sample, symmetry has been shown. If B is chosen when A is the sample, and C is chosen when B is the sample, and C is chosen when A is the sample, transitivity has been shown.

stimulus evaluation checks (SECs) assessments made on several dimensions when an individual evaluates the impact of an event and hence its emotional intensity and quality. Examples of SECs include checks for novelty, goal relevance, and congruity-incongruity of actions or events with social expectations. See also APPRAISAL DIMENSION. [proposed by Swiss psychologist Klaus Scherer (1943– ) in his theory of appraisal]

stimulus filtering the specialization of the nervous system so that only critical stimuli reach the brain and irrelevant stimuli do not. Female bullfrogs have two auditory organs that respond only to the two dominant frequencies in male courtship calls. Moths have ears with only two neurons: The neurons respond only to sounds in the frequency range of bat ultrasound, and successive filters in the moth’s central nervous system ensure that only bat-produced sounds reach the brain.

stimulus function 1. the role of a stimulus in evoking a response. For example, the taste and texture of ice cream in the mouth function to elicit licking and swallowing. 2. the mathematical relationship between the magnitude of a stimulus and the size of the response.

stimulus generalization the spread of effects of conditioning (either operant or classical) to stimuli that differ in certain aspects from the stimulus present during original conditioning. If responding is indistinguishable from that seen in the presence of the original stimulus, GENERALIZATION is said to be complete (or no attention is commanded by the stimulus difference). If responding is different enough to be detected, DISCRIMINATION is evident as well as generalization. See also STIMULUS CONTROL.

stimulus gradient the variations in a stimulus along a given dimension (e.g., a change in loudness).

stimulus-independent and task-unrelated thoughts (SITUTs) see MIND WANDERING.

stimulus-intensity dynamism in HULL’S MATHEMATO-DEDUCTIVE THEORY OF LEARNING, the concept that the greater the STIMULUS STRENGTH, the greater the organism’s response strength.

stimulus object see OBJECT.

stimulus onset asynchrony (SOA) the time between the onset of one stimulus and the onset of the following stimulus. The term is used mainly in experiments with MASKING.

stimulus overload the condition in which the environment presents too many stimuli to be comfortably processed by an individual, resulting in stress and behavior designed to restore equilibrium. See also COMMUNICATION OVERLOAD; INFORMATION OVERLOAD; SENSORY OVERLOAD.

stimulus proposition the content of a situation brought up as a mental image. Stimulus propositions are part of the BIOnFORMATIONAL THEORY of how and why imagery works to enhance performance. See also RESPONSE PROPOSITION.

stimulus–response (S–R) see S–R PSYCHOLOGY.

stimulus–response chain see RESPONSE CHAIN.

stimulus–response compatibility the extent to which the relationship between stimulus and response facilitates response. Speed and accuracy are affected by this relationship; for instance, a left keypress in response to a stimulus on the left will be quicker and more accurate than a right keypress for a stimulus on the left. This is an example of an element-level compatibility effect, which results from the mapping of individual stimuli to responses within a set. A verbal response to a verbal stimulus is quicker and more accurate than a spatial response to a verbal stimulus. This is an example of a set-level compatibility effect.

stimulus–response theory see S–R PSYCHOLOGY.

stimulus salience the importance, intensity, and detectability of a stimulus. Higher salience is usually associated with quicker learning.
stimulus sampling

**stimulus sampling** a procedure for increasing the generalizability of research results by using multiple stimuli within a category as representative of an experimental condition, as opposed to selecting a single stimulus whose unique characteristics may distort results. For example, a study investigating the effects of gender on monetary generosity would demonstrate stimulus sampling if it employed many males and females to elicit donations from participants instead of using a single male and a single female.

**stimulus sampling theory (SST)** a MATHEMATICAL LEARNING THEORY stating that stimuli are composed of hypothetical elements and that on any given learning trial one learns only a sample of those elements. [developed by William K. SSTES]

**stimulus set** in reaction-time experiments, the expectancy or readiness associated with concentration on the stimulus. See MENTAL SET.

**stimulus situation** all the components of an occurrence or experience that, taken as a whole, comprise a stimulus to which an organism responds. The term is used to highlight the complexity of behavior-arousing events that are unitary patterns comprising many elements (e.g., a concert, an athletic competition). This approach differs from that of traditional behavior analysis, who tend to break down stimuli into smaller, separate elements.

**stimulus–stimulus learning model** see S–S LEARNING MODEL.

**stimulus strength** the actual intensity of a stimulus or its ability to elicit a desired response.

**stimulus substitution** a way of characterizing the outcome of CLASSICAL CONDITIONING when the conditioned stimulus is said to have taken on the functions of the unconditioned stimulus. For example, in Ivan PAVLOV’s early experiments, the sound of a tone paired with food eventually came to elicit salivation, just as the food did; that is, the tone substituted for the food. This characterization is no longer widely accepted.

**stimulus value** 1. the strength of a given stimulus, measured in standard units (e.g., a shock of 40 volts). 2. a theoretical characteristic of a stimulus said to index its effectiveness as a REINFORCER.

**stirrup n.** see OSSICLES.

St. John’s wort a perennial flowering plant, Hypericum perforatum, that has an extensive history of folk use, particularly as a sedative, a treatment for nerve pain and malaria, and a balm for wounds, burns, and insect bites. It is currently a highly popular product used in the treatment of mild to moderate depression, anxiety, and insomnia. There is some research supporting its effectiveness for these purposes, but studies have not demonstrated the superiority of St. John’s wort over placebo in the management of major depression. There is also some research suggesting that the herb possesses anti-inflammatory and antioxidant properties. The active agents are presumed to be HYPERICIN and related compounds. Hypericin is known to exert some effects common to other ANTIDEPRESSANTS, such as inhibition of the reuptake of norepinephrine, dopamine, and serotonin. It may also exert some effects by modulating the neurotransmitters gamma-aminobutyric acid (GABA) and glutamate. The agent should be used with caution, as it may interact adversely with or limit the effectiveness of a number of other drugs, particularly those used to treat HIV/AIDS and cancer and to prevent transplant rejection. It may also lead to SEROTONIN SYNDROME if taken with other serotonergic antidepressants. Taken on its own, its side effects are rare but may include dry mouth, dizziness, diarrhea, nausea, increased sensitivity to sunlight, and fatigue.

**STM** abbreviation for SHORT-TERM MEMORY.

**stochastic adj.** 1. random or undetermined: arising from chance. 2. describing a system or process that follows a probability pattern, such that events may be analyzed according to their statistical probability but not accurately predicted. See PROBABILISM.

**stochastic independence** the condition in which two systems or processes are statistically unrelated, so that one is in no way contingent upon the other.

**stochastic model** 1. a model in which one or more of the inputs allow for random variation, thus generating a range of potential outcome values. Stochastic models are used to estimate the probabilities of various outcomes occurring under varying conditions. They are widely used in the social and behavioral sciences and also in the financial world. Compare DETERMINISTIC MODEL. 2. in artificial intelligence, a model based on co-relational analysis, usually BAYESIAN, used for simulating situations as well as fault diagnosis. Although mathematically well founded, unless simplifying assumptions are made, such models are computationally intractable for complex situations. See GRAPH.

**stochastic process** a random process: a sequence of events with a random probability pattern such that the occurrence of any event in the sequence is independent of past events. For example, the number of people in a doctor’s office who have colds during a 1-month period could be said to follow a stochastic process. In contrast to deterministic processes, stochastic processes involve some indeterminacy, and their development over time may only be described by probability distributions. A MARKOV CHAIN is a stochastic process.

**stochastic variable** see RANDOM VARIABLE.

**Stockholm syndrome** a mental and emotional response in which a captive (e.g., a hostage) displays seeming loyalty to—even affection for—the captor. The captive may come to see law enforcement or rescuers as the enemy because they endanger the captor. The name derives from the case of a woman who was held hostage in 1973 during a bank robbery in Stockholm, Sweden, and became so emotionally attached to one of the robbers that she broke her engagement to another man and remained faithful to her former captor during his prison term. [term coined by Swedish psychiatrist and criminologist Nils Bejerot (1921–1988)]

**stocking anesthesia** a SENSORY CONVERSION SYMPTOM in which there is a loss of sensitivity in the foot and in part of the calf (i.e., areas that would be covered by a stocking) that cannot be explained by a general medical condition or organic dysfunction. Also called foot anesthesia: shoe anesthesia. See also GLOVE ANESTHESIA.

**stomach loading** the experimental process of expanding a balloon into a nonhuman animal’s stomach or filling the stomach with water or an inert substance.

**-stomy (-ostomy) suffix** surgical opening (e.g., tracheostomy; see TRACHEOTOMY).

**stop n.** see PLOSIVE.
stop-signal task a procedure used in choice-reaction tasks in which a signal instructing the participant to withhold the response is presented on some trials at varying intervals after presentation of the stimulus. This is done to determine at what point in processing a response can no longer be inhibited.

storage n. the state of an item that is retained in memory, after encoding and before retrieval. See also retention.

storage-and-transfer model of memory see multitostore model of memory.

storage capacity the amount of information that can be retained in memory. Sensory memory and short-term memory are believed to have limited capacities; long-term memory may have an unlimited capacity.

storm-and-stress period a period of emotional turmoil. The phrase was used by G. Stanley Hall to characterize adolescence, which he believed to correspond to the turbulent transition from savagery to civilization. It is a translation of the German Sturm und Drang, which was the title of a 1776 drama by Friedrich Maximilian von Klinger and was subsequently applied to a German literary movement. Also called Sturm und Drang period.

story model a theory of juror decision making that proposes that jurors organize trial information into narratives or stories to aid comprehension and retention of evidence. See also narrative method.

story-recall test a neuropsychological assessment of memory that requires an individual to recall details of a story that is told or read to him or her.

storytelling n. 1. the recounting by a client of the events, concerns, and problems that led him or her to seek treatment. Therapists can learn much about the motives and origins of conflicts by attending carefully (see active listening) to the stories that clients bring to the session. 2. the use of symbolic talk and allegorical stories by the therapist to aid the client’s understanding of issues. Also called therapeutic storytelling.

stotting n. a stiff-legged jumping display, shown by many species of ungulates, in which all four legs are off the ground at the same time. Stotting appears to communicate to predators that the individual has detected them and has enough vigor to make capture difficult. Studies show that predators are more likely to give up a hunt when an animal stots.

STP see DOM.

strabismic amblyopia see developmental amblyopia.

strabismometer n. an instrument for measuring extent of strabismus.

strabismus n. any chronic abnormal alignment of the eyes, making normal binocular fixation and thus binocular vision impossible. Because strabismic eyes look in different directions, they give the brain conflicting messages, which may result in double vision. Alternatively, the brain may simply ignore, or suppress, one eye’s view altogether. The most common form of strabismus occurs horizontally: One or both eyes deviate inward (convergent strabismus; see cross-eye) or outward (divergent strabismus). However, the deviation may be upward (hypertropia), downward (hypotropia), or in rare cases, twisted clockwise or counterclockwise (cyclotropia). Also called heterotropia: squint.

straitjacket n. an article of clothing that was formerly used to restrain patients in psychiatric hospitals from injuring themselves or others and, in some cases, for punishment. It consisted of a canvas shirt with overlong sleeves that bound the patient’s arms to the chest and were wrapped around and then fastened behind the back. Currently, if as a means of physical restraint for patients is needed, a system of wrist and ankle holds that limit the patient’s range of motion is used. Also called camisole.

strange-hand sign a tactile perceptual disorder characterized by an inability to recognize one’s own hand, usually the left. Individuals may be able to write with the left hand but do not believe the writing is their own or, when clasping the two hands, may be unable to acknowledge the left hand as their own without visual clues. The disorder is caused by a defect of the corpus callosum of the brain. It is similar to, and is often considered a synonym for, alien hand syndrome.

stranger anxiety the distress and apprehension experienced by young children when they are around individuals who are unfamiliar to them. Stranger anxiety is a normal part of cognitive development: Babies differentiate caregivers from other people and display a strong preference for familiar faces. Stranger anxiety usually begins around 8 or 9 months of age and typically lasts into the 3rd year. Also called fear of strangers. See also separation anxiety; xenophobia.

stranger distress see distress.

Strange Situation an experimental technique used to assess quality of attachment in infants and young children (up to the age of 2). The procedure subjects the child to increasing amounts of stress induced by a strange setting, the entry of an unfamiliar person, and two brief separations from the parent. The reaction of the child to each of these situations is used to evaluate the security or insecurity of his or her attachment to the parent. See insecure attachment; secure attachment. [devised in 1978 by Mary D. Salter Ainsworth]

strangulated affect in psychoanalytic theory, an inhibition or retention of the normal discharge of emotion, leading to a substitute discharge in the form of physical symptoms. This theory was advanced in Sigmund Freud’s early formulations to explain the dynamics of conversion hysteria; it was later supplanted by the concept of repression.

stra ta pl. n. see stratum.

strategic family therapy a group of approaches to family therapy in which the focus is on identifying and applying novel interventions to produce behavioral change rather than on helping the family gain insight into the sources of their problems. Also called strategic intervention therapy.
strategic human resource management

strategic human resource management (SHRM) planned and systematic efforts to help organizations improve their competitive performance and achieve their goals by effectively integrating missions and values with employee development and welfare.

strategic intervention therapy see STRATEGIC FAMILY THERAPY.

strategic therapy any intervention that is based on the belief that an individual’s problems are caused by ineffective solutions and on a PROBLEM-SOLVING APPROACH that focuses on pursuing a therapeutic strategy to promote change in the individual’s behavior rather than to understand his or her underlying intrapsychic factors.

strategy n. a program of action designed to achieve a goal or accomplish a task. The term is used in a variety of contexts. For example, in artificial intelligence, it denotes a specific approach used for designing searches of a problem or game space. Strategies in this sense are used to determine which state in the search is to be considered next and are often called heuristics. In biology, however, the term refers to an approach for ensuring REPRODUCTIVE SUCCESS, as in a K-STRATEGY or an R-STRATEGY.

strategy choice model see ADAPTIVE STRATEGY CHOICE MODEL.

stratification n. arrangement into a layered configuration, as in SOCIAL STRATIFICATION. —stratify vb.

stratified sampling the process of selecting a sample from a population comprised of various subgroups (strata) in such a way that each subgroup is represented. For example, in a study of college students, a researcher might wish to examine people from different majors (e.g., social sciences, physical sciences, humanities). The selection procedure within each of these strata may be random or systematic. In stratified random sampling, a chance process (e.g., a RANDOM NUMBER GENERATOR) is used to select individuals, whereas in stratified systematic sampling an objective, orderly procedure is applied to choose individuals (e.g., listing all of the students within each major alphabetically and choosing every 10th case).

stratum n. (pl. strata) a layer (typically one of a number of parallel layers) in a structure, such as a level or class within society (see SOCIAL STRATIFICATION) or any of the subpopulations in survey SAMPLING.

streaming n. 1. in audition, the perception of a sequence of sounds as a unitary phenomenon. Under certain conditions, several streams may be perceived nearly simultaneously, as in musical counterpoint. See FISSION. 2. in education, the separation of students into different categories (streams) of academic ability based on, for example, test results or prior achievements, with each stream having a unique curriculum designed for the needs and capabilities of those within it.

streaming media audio and video that are seen and heard by the user as they are being delivered by the provider. Typically, the term refers to multimedia computer presentations, but television and radio are also considered to be streaming media.

stream of consciousness the notion that the contents of subjective consciousness are a continuous, dynamic flow of ideas, images, feelings, sensations, intuitions, and so forth, rather than a series of discrete, static components. Apart from its context in philosophy of mind and studies of perception, the idea of consciousness as a stream also found highly influential expression in the MODERNISM of early 20th-century writers, such as James Joyce, Marcel Proust, and Virginia Woolf. Also called stream of thought. [introduced in 1890 by William JAMES]

stream olfactometer an Olfactometer that has a constant flow or stream of air into which an odorant can be introduced. See also BLAST OLFACTOMETER.

street hustler see MALE HOMOSEXUAL PROSTITUTION.

street intelligence the skills people apply in their everyday lives. The term evolved from research conducted in the 1990s by psychologists Terezinha Nunes, David Carraher, and others, who found that street children in Brazil did very poorly in paper-and-pencil tests of the skills that they showed themselves well able to use in street contexts. The street intelligence of these children can be viewed as situated intelligence (see SITUATED COGNITION) that failed to transfer to a specific testing environment.

strength of association in statistics, the degree of relationship between two or more variables, as measured by such indices as a CORRELATION COEFFICIENT, COEFFICIENT OF DETERMINATION, ETA SQUARED, or OMEGA SQUARED.

streplosymbolia n. 1. a perceptual disorder characterized by the mirrorlike reversal of objects. 2. a reading difficulty characterized by a tendency to transpose or reverse letters while reading or writing (e.g., tap for put or p for q). [defined in 1937 by U.S. psychiatrist Samuel Torrey Orton (1879–1948)]

stress n. 1. the physiological or psychological response to internal or external stressors. Stress involves changes affecting nearly every system of the body, influencing how people feel and behave. For example, it may be manifested by palpitations, sweating, dry mouth, shortness of breath, fidgeting, accelerated speech, augmentation of negative emotions (if already being experienced), and longer duration of stress fatigue. Severe stress is manifested by the GENERAL ADAPTATION SYNDROME. By causing these mind–body changes, stress contributes directly to psychological and physiological disorder and disease and affects mental and physical health, reducing quality of life. See also CHRONIC STRESS. [first described in the context of psychology around 1940 by Hungarian-born Canadian endocrinologist Hans Selye (1907–1982)] 2. in linguistics, emphasis placed on a word or syllable in speech, generally by pronouncing it more loudly and deliberately than its neighboring units and slightly prolonging its duration. See also ACCENT.

stress casualty a member of the armed forces who is unable to perform his or her duties because of exposure to operational stresses or risk factors. Such stress may result in somatic and behavioral symptoms. The primary cause is an imminent external threat to life, leading to inability to cope with the threat and a consequent overwhelming feeling of helplessness.

stress-decompensation model a concept of the development of abnormal behavior as a result of high levels of stress that lead to the gradual but progressive deterioration of normal behavior to a level that is highly disorganized and dysfunctional.

stress hormone a chemical that is part of the body’s response to threats and other stressors. The primary stress hormone is CORTISOL. Others include EPINEPHRINE, NORADRENERGIC, and CORTICOTROPIN. Together they put the body
into a state of alertness (see FIGHT-OR-FLIGHT RESPONSE), accompanied by increased heart rate and respiration, dilated pupils, sweating, diminished sensitivity to pain, and redirection of blood from the gastrointestinal tract to muscles. Long-term exposure to stress hormones, as in ongoing child abuse or living in a war zone, is one of the causes of posttraumatic stress disorder and has been implicated in the etiology of depression and cancer.

**stress immunity** 1. a highly developed capacity to tolerate emotional strain. 2. failure to react to stressful situations or events.

**stress immunization** the concept that mild stress experienced early in life makes an individual better able to handle stress later in life.

**stress incontinence** 1. a type of URINARY INCONTINENCE that occurs during physical exertion or physical experiences, such as laughing or coughing, that apply increased pressure to the abdomen and bladder. 2. any form of INCONTINENCE whose origin is a high level of stress.

**stress-induced analgesia** a reduced sensitivity to pain that an organism may experience when exposed to extreme physical trauma. For example, soldiers in combat may ignore injuries and instead respond to other threats to their lives, and injured animals fleeing predators may ignore their injuries in order to avoid capture. The precise mechanism is uncertain but may be related to the production of large quantities of ENDOPHINS.

**stress-inoculation training** (SIT) a four-phase training program for stress management often used in COGNITIVE BEHAVIOR THERAPY. Phase 1 entails the identification of one’s reactions to stress and their effects on functioning and psychological well-being: Phase 2 involves learning relaxation and self-regulation techniques; Phase 3 consists of learning coping self-statements (see SELF-STATEMENT TRAINING); and Phase 4 involves assisted progression through a series of increasingly stressful situations using imagery, video, role playing, and real-life situations until the individual is eventually able to cope with the original stress-inducing situation or event. SIT is based on the theory that exposure to moderately stressful events serves to build an individual’s coping resources and that successful adaptation to these events may promote resilience to future stress. [developed by U.S. psychologist Donald Meichenbaum (1940– )]

**stress interview** an interview in which the person being questioned is deliberately subjected to confrontational, emotionally unsettling, or otherwise stressful conditions, such as a combination of aggressive questioning and environmental influences (e.g., harsh lighting). Such techniques are mainly associated with police or military interrogations; in PERSONNEL SELECTION, they have sometimes been used to assess an individual’s ability to manage pressure and handle stress but are generally considered of questionable validity.

**stress management** the use of specific techniques, strategies, or programs—such as relaxation training, anticipation of stress reactions, and breathing techniques—for dealing with stress-inducing situations and the state of being stressed. See also PREVENTIVE STRESS MANAGEMENT.

**stressor** n. any event, force, or condition that results in physical or emotional stress. Stressors may be internal or external forces that require adjustment or COPING STRATEGIES on the part of the affected individual.

**stressor aftereffects** the residual effects that follow exposure to environmental stressors. Immediately after exposure to acute or chronic stressors (e.g., noise, crowding, traffic congestion, social conflict), individuals may manifest negative effects, such as reduced motivation to persist with a task or a decrease in altruistic behavior.

**stress reaction** a pronounced or excessive by-product of conditions of pressure or strain. Examples are extreme feelings of tension or panic, disorganized speech patterns, and accidents caused by the effects of alcohol, drugs, or emotional stress.

**stress test** 1. an examination or evaluation designed to ascertain an individual’s capacity to perform a relatively complex task under purposefully stressful conditions. 2. a medical evaluation designed to assess the effects of stress, typically induced by physical exercise, on cardiac function. The most common of such procedures is a test in which the patient walks or runs on a treadmill while cardiac, respiratory, or other physiological processes are monitored. 3. in MULTIDIMENSIONAL SCALING, a measure that indicates the RELIABILITY or GOODNESS OF FIT of the solution. Stress tests also are used to determine the number of dimensions to be included in the scaling solution.

**stress tolerance** the capacity to withstand pressures and strains and the consequent ability to function effectively and with minimal anxiety under conditions of stress. See also STRESS IMMUNITY.

**stress training** activities designed to help individuals understand the causes of stress and learn strategies for managing it. Training conducted in both simulated and real-life situations is seen as necessary to prepare individuals in high-risk occupations (e.g., soldiers) to operate in stressful conditions and to recognize and manage the effects of stress they are likely to experience on the job. See also COMBAT AND OPERATIONAL STRESS CONTROL.

**stress–vulnerability model** the theory that a genetic or biological predisposition to certain mental disorders (e.g., schizophrenia, mood disorders) exists and that psychological and social factors can increase the likelihood of symptomatic episodes. See also DIATHESIS–STRESS MODEL.

**stretch marks** see STRIA ATROPHICA.

**stretch receptor** a RECEPTOR cell that responds primarily to stretching of muscles. Stretch receptors include the MUSCLE SPINDLES of skeletal muscle.

**stretch reflex** the contraction of a muscle in response to stretching of that muscle. Stretch reflexes support the body against the pull of gravity. Also called MYOTATIC REFLEX. See also EXTENSOR THRUST.

**stria atrophica** purplish scarlike lesions, later becoming white, on the breast, thighs, abdomen, and buttocks. They are associated with pregnancy, rapid growth during puberty and adolescence, Cushing’s syndrome, and topical or prolonged treatment with corticosteroids. Known colloquially as stretch marks.

**striate cortex** the first region of the cerebral cortex that receives visual input from the thalamus, particularly from the LATERAL GENICULATE NUCLEUS. The striate cortex is located in the occipital lobe and contains a dense band of myelinated fibers in layer IVB that appears as a white stripe (stripe of Gennari). Neurons in the striate cortex project to visual areas in the PRESTRIATE CORTEX and to subcortical visual nuclei. Also called BRODMANN’S AREA 17: PRIMARY VISUAL CORTEX. See also V1.
striated muscle see SKELETAL MUSCLE.

stria terminalis the smaller of the two efferent pathways from the AMYGDALA in the brain (see also VENTRAL AMYGDALOID PATHWAY). Its fibers carry impulses from the CORTICOMEDIAL GROUP of amygdaloid nuclei to the septal, hypothalamic, and thalamic areas.

striatum n. see BASAL GANGLIA.

stria vascularis see SCALA MEDIA.

strict scrutiny a test used to ascertain whether a law violates a fundamental right granted under the U.S. Constitution. The government must show that although such a law treats some people favorably and others unfairly, it is nevertheless the least inequitable way of handling an important issue. The test is often invoked in the context of discrimination based on race, gender, or nationality.

stridor dentium see BRUXISM.

stridulation n. see VOCAL COMMUNICATION.

string n. in linguistics, a linear sequence of words or word elements that can be subjected to formal analysis.

striving for superiority in the individual psychology of Alfred Adler, the idea that human beings are motivated by an innate, sovereign drive for realizing their full potential. This drive is defined as the urge for completion and perfection rather than for superiority in the sense of social status or domination over others.

stroboscope n. a device that allows very rapid presentation or illumination of a sequence of images. When sequential still images are presented by a stroboscope, the perception of movement is created, as in a motion picture.

stroboscopic illusion 1. the apparent motion of a series of separate stimuli occurring in close consecutive order, as in motion pictures. 2. the apparent motionlessness or reverse motion of a moving object, such as a rotating fan, produced by illuminating it with a series of intermittent light flashes. Also called stroboscopic effect. See also WINDMILL ILLUSION.

stroke n. disruption of blood flow to the brain, which deprives the tissue of oxygen and nutrients, causing tissue damage and loss of normal function and, potentially, tissue death. A stroke may result from a hemorrhage of a blood vessel in the brain (see HEMORRHAGIC STROKE) or an embolism or thrombus blocking an artery in the brain (see EMBOLIC STROKE; THROMBOTIC STROKE). This term is often used interchangeably with CEREBROVASCULAR ACCIDENT. See also CEREBRAL INFARCTION; CEREBROVASCULAR DISEASE; LACUNAR STROKE; TRANSIENT ISCHEMIC ATTACK.

strong law of effect see LAW OF EFFECT.

strong law of large numbers see LAW OF LARGE NUMBERS.

strong methods 1. problem-solving techniques that are specific to a particular domain or application, such as medical diagnosis. 2. in artificial intelligence, programs that incorporate knowledge specific to a particular application or domain, such as knowledge of the rules of chess in building a chess-playing program. Compare WEAK METHODS.

Stroop Color–Word Interference Test a three-part test in which (a) color names are read as fast as possible; (b) the colors of bars or other shapes are rapidly named; and, most importantly, (c) color hues are named quickly when used to print the names of other colors (such as the word green printed in the color red). The degree to which the participants are subject to interference by the printed words is a measure of their cognitive flexibility, selective attention, and response inhibition (or disinhibition). In clinical neuropsychology, this test is commonly used to assess dysfunction of the frontal lobes of the brain. Also called Stroop test. See also RESPONSE CONFLICT. [J. Ridley Stroop (1897–1973), U.S. psychologist]

Stroop effect the finding that the time it takes a participant to name the color of ink in which a word is printed is longer for words that denote incongruent color names than for neutral words or for words that denote a congruent color. For example, if the word blue is written in red ink (incongruent), participants take longer to say “red” than if the word glue is written in red ink (neutral) or if the word red is written in red ink (congruent). See STROOP COLOR–WORD INTERFERENCE TEST. [J. Ridley Stroop]

structural analysis 1. in psychology, any theory of the organization of mind or personality that attempts to differentiate between component parts and to define the relationship of part to part and whole. Such an analysis can be contrasted with one based on function, dynamics, or behavior. See PERSONALITY STRUCTURE; STRUCTURAL MODEL. 2. in linguistics, an analysis of a word, phrase, sentence, or longer unit in terms of its formal CONSTITUENTS. See PHRASE-STRUCTURE GRAMMAR. 3. any analysis based on the ideas or methods of STRUCTURALISM.

structural approach see STRUCTURAL MODEL.

structural coefficient in STRUCTURAL EQUATION MODELING, a measure of the amount of change expected in an outcome or DEPENDENT VARIABLE given a one-unit change in the causal or INDEPENDENT VARIABLE and no change in any other variable.

structural commitment in U.S. sociologist Michael P. Johnson’s tripartite model of marital commitment, a form of commitment in which a person feels tied to a relationship because of external factors. For example, it is often engendered by the anticipated financial cost or lost social or family connections that would result from ending a relationship. It often leads people to remain in dissatisfying relationships. Also called CONSTRAINT COMMITMENT. Compare MORAL COMMITMENT; PERSONAL COMMITMENT.

structural constraint theory see NEONATIVISM.

structural disorder a disorder related to a defect in or damage to the structure of an organ or tissue, such as the nervous system.

structural equation modeling (SEM) any of a broad range of multivariate analysis methods, including
structural family therapy a type of family therapy that assesses the subsystems, boundaries, hierarchies, and coalitions within a family (its structure) and focuses on direct interactions between the family members (enactment) as the primary method of inducing positive change. Structural family therapy stresses that when appropriately induced to do so, families with problems will discover their own alternatives to their ineffective patterns of relating to one another. For example, a structural family therapist working with a family whose daughter is anorexic would examine such family issues as the framework of authority, the rules that govern the assumption of roles, the various functions that members perform, and the coalitions created by the bonding of certain family members, and then would encourage all members to use this information to develop more productive patterns of interaction that in turn can mitigate the stresses within the family context surrounding the daughter’s condition. Also called structural therapy. [developed in the 1970s by Argentinian-born U.S. family therapist Salvador Minuchin (1921–)].

structural group a therapeutic group made up of individuals selected for those characteristics that would make them most likely to be successful in achieving the goals sought in the therapy. People of different types, temperaments, personalities, and educational levels are combined in a group, based on the concept that their interaction will maximize each other’s benefits in the therapeutic process. Also called structured group. [devised by Jacob L. Moreno]

structural hypothesis see structural model.

structural integration see role theory.

structuralism n. 1. a movement considered to be the first school of psychology as a science, independent of philosophy. Usually attributed to Wilhelm Wundt, but probably more strongly and directly influenced by Edward Bradford Titchener, structuralism defined psychology as the study of mental experience and sought to investigate the structure of such experience through a systematic program of experiments based on trained introspection. Also called structural psychology. 2. a movement in various disciplines that study human behavior and culture that enjoyed particular currency in the 1960s and 1970s. The movement took its impetus from the radically new approach to linguistic analysis pioneered by Swiss linguist Ferdinand de Saussure (1857–1913). Against the prevailing historical and comparative approaches, Saussure maintained that a language is a closed system that must be approached through the detail of its internal structure; linguistic signs (written or spoken words) acquire meaning not through their relationships to external referents but through their structural relationships to other signs in the same system (see arbitrary symbol). The meaning of any particular use of language is therefore grounded in the total abstract system of that language, which is largely defined by a pattern of functional contrasts between elements (see binary feature; minimal pair). The structuralist model of language was extended to cover essentially all social and cultural phenomena, including human thought and action, in the work of French anthropologist Claude Levi-Strauss (1908–2009). For structuralists in anthropology and the other social sciences, there is a connection between the events of the lived world and a deeper structure of abstract relationships and ideas that provides meaning to the events. Structuralist explanations play down individual autonomy and agency, positivistic science, and linear-time causation in favor of explanations in terms of structural and systemic influences operating in the present to produce rule-governed behavior, the true nature of which can be revealed as the underlying structures are revealed. In the 1960s, structuralist ideas exerted a major influence on literary studies; they also provided a basic intellectual framework for the new field of semiotics, which studies the ways in which verbal and nonverbal signs acquire meaning within particular codes of signification. During subsequent decades, structuralism increasingly gave way to poststructuralism.

structuralist 1. n. a therapist who believes that changing the organization’s structure of a group or system, such as a family, will change and improve its patterns of interaction. 2. n. an adherent of structuralism. 3. adj. of or relating to structuralism.

structural matrix see structured interactional group psychotherapy.

structural model 1. in classical psychoanalytic theory, the view that the personality comprises three divisions or functions: (a) the id, which represents instinctual drives; (b) the ego, which controls id drives and mediates between them and external reality; and (c) the superego, which comprises moral precepts and ideals. Sigmund Freud proposed this model in 1923 to replace his earlier topographic model, in which the mind was divided into three regions: the unconscious, preconscious, and conscious. Also called structural approach: structural hypothesis: structural theory. See also dynamic model; ego-dynamic model. 2. in statistics, any theoretical representation of the relationships among a dependent variable and multiple independent variables, whether continuous or discrete. Techniques to derive such models include latent class analysis, path analysis, and structural equation modeling.

structural psychology see structuralism.

structural therapy 1. see structural family therapy. 2. a system of treatment for children with autism, which provides a structured environment emphasizing physical and verbal stimulation in a gamelike setting. The purpose is to increase the amount and variety of stimuli received by the children, thereby helping them relate to their environment in a more realistic manner.

structural zero an entry in a table that is certain to be zero because it corresponds to an impossible outcome, as opposed to an entry that has an empirical value of zero. For example, in studying friendships, one might ask each of 15 people to indicate who among the others is a friend. This would yield a $15 \times 15$ contingency table or matrix, with 1 representing “is a friend” and 0 representing “is not a friend.” Although there would be empirical zeros in some
structure

cells to represent not-a-friend responses, all entries along the diagonal of the matrix are structural zeros since they represent one person’s response with regard to himself or herself rather than to another person.

structure n. 1. a relatively stable arrangement of elements or components organized to form an integrated whole. Structure is often contrasted with FUNCTION to emphasize how something is organized or patterned rather than what it does. See also bidirectionality of structure and function. 2. a complex entity consisting of organized components. 3. according to Jean Piaget, any of the entities that together comprise the enduring knowledge base by which children interpret their world. A structure is equivalent to a scheme. —structural adj.

structure coefficient 1. in regression analysis, a correlation coefficient indicating the extent of relationship between scores on a particular manifest variable and scores on a latent or predicted variable derived from the entire set of variables. It is used to quantify the importance of an observed variable. 2. in discriminant analysis, a value representing the association between a particular variable being considered as a differentiator of group membership and the discriminant function scores derived from the full set of predictor variables.

structured autobiography see autobiography.

structured group see structural group.

structured interactional group psychotherapy a form of group therapy in which the therapist provides a structural matrix for the group’s interactions. This is usually achieved by selecting a different member of the group to be the focus of the interaction—the target patient—in each session. [developed by U.S. psychiatrists Harold I. Kaplan (1928–1998) and Benjamin J. Sadock (1933–)].

structured interview a method for gathering information, used particularly in surveys and personnel selection, in which questions, their wordings, and their order of administration are determined in advance. The choice of answers tends to be fixed and determined in advance as well. With structured interviews, answers can be aggregated and comparisons can be made across different samples or interview periods; interviewees can be assessed consistently (e.g., using a common rating scale); and order effects are minimized. Also called standardized interview. Compare unstructured interview. See also pattemned interview.

structured learning a complex system of psychotherapy based on the idea of psychological skills training, that is, teaching individuals the skills associated with leading healthy and satisfying lives and then helping them gain the ability to consistently and reliably apply these skills outside of the therapeutic setting. This approach involves four essential components: modeling, role play, performance feedback, and transfer of training. The individual is provided with examples of specific behavior to be imitated, is allowed to practice that behavior, is given feedback regarding the performance of the behavior, and completes homework assignments that encourage the use of the behavior in real-world situations. [developed in the mid-1970s by U.S. psychologists Arnold P. Goldstein (1933–2002), Robert P. Sprafkin (1940–), and N. Jane Gershaw (1945–)].

structured learning group a type of interpersonal learning group that helps participants gain self-insight, develop improved interpersonal skills, and solve interpersonal problems through a series of relatively specific exercises, activities, and assignments.

structured observation a systematic method of collecting behavioral data within a controlled environment, often used in research with infants and young children, in which observers measure overt actions and interpersonal processes. In structured observation, researchers (a) select which behaviors are of interest and which are not, (b) clearly define the characteristics of each behavior so that observers all agree on the classification, and (c) note the occurrence and frequency of these targeted behaviors in the situation under analysis. Interaction process analysis and symlog are examples. Structured observation differs from naturalistic observation, which involves observing individuals in their own environments outside of the laboratory.

structured play organized play that is governed by rules and controlled or directed by an adult. A teacher-initiated classroom play activity is an example. Compare free play.

structured Q sort see Q sort.

structured stimulus a well-defined, well-organized stimulus, the perception of which is influenced more by the characteristics of the stimulus than by those of the perceiver. Compare unstructured stimulus.

structure of an attitude the set of properties related to the content of mental representations associated with an attitude, the number of these representations, and the strength and the pattern of associations among these representations. See also tripartite model of attitudes.

structure of intellect model (SOI) a model of intelligence that postulates five operations (cognition, memory, divergent production, convergent production, evaluation), six products (units, classes, relations, systems, transformations, implications), and five contents (symbolic, semantic, behavioral, auditory, visual), for a total of 150 separate factors of intelligence (120 in an earlier version of the theory). The evidence for the theory is weak and in large part was refuted by the work of U.S. psychologist John L. Horn (1928–2006). See also Guilford dimensions of intelligence; [initially proposed in the 1950s by Joy Paul Guilford].

structures of the whole see operation.

structure word see function word.

structuring n. 1. the explanation by a counselor or therapist, usually during the first session of a course of treatment, of the specific procedures and conditions of the therapeutic process. This explanation includes the intended results of treatment, time restrictions, fees, and the function and responsibilities of both client and counselor or therapist. See also contract. 2. in education, the use of behavioral instructions to a student to decrease disruptions in the classroom.

struggle for existence see competition for resources.

strychnine n. an alkaloid derived from NUX VOMICA. It is a stimulant of the central nervous system (see CNS stimulant)—through its ability to antagonize the inhibitory neurotransmitter glycine—and a powerful convulsant, with death usually resulting from paralysis of muscles of respiration. Strychnine has long been used as a rodenti-
cide, and this use continues to the present; there are, however, no clinical applications for it. No marked tolerance develops for it, and increased susceptibility to poisoning is likely from repeated exposure.

**student counseling** see EDUCATIONAL COUNSELING.

**Studentization** *n.* a procedure to eliminate a NUISANCE PARAMETER in particular calculations. It transforms a statistic whose distribution of probable values relies upon the unknown parameter into one whose distribution relies on quantities that can be derived from the sample data. Such transformed statistics are described as “Studentized.” [Student, pseudonym of William S. Gosset (1876–1937), British statistician]

**Studentized range statistic** (symbol: *q*) a statistic used in Tukey’s HONESTLY SIGNIFICANT DIFFERENCE TEST and other MULTIPLE COMPARISON TESTS to establish CRITICAL VALUES for rejecting the NULL HYPOTHESIS. It is the RANGE of a sample expressed in units of the standard distribution for that sample. [Student, pseudonym of William S. Gosset]

**Studentized residual** in REGRESSION ANALYSIS, a standardized statistic describing the variation between obtained and predicted values. It is calculated by obtaining the difference between the empirical value of an observation and the value of that observation predicted by a model, and then dividing that difference (called a residual) by an estimated STANDARD DEVIATION. Studentized residuals are used to identify REGRESSION EQUATIONS that are a poor fit for the observed data. [Student, pseudonym of William S. Gosset]

**student’s disease** the condition of individuals who believe they have the symptoms of a disease or mental disorder that they have been studying or that they have read or heard about.

**students’ evaluation of teaching (SET)** a practice in which students fill out questionnaires or forms regarding the capabilities and performance of their instructor, commonly toward the end of a learning sequence, and instructors then use the information to modify their format or teaching style. SET often includes informal, individualized evaluations, as well as more formal, standardized forms. Also called **student–teacher evaluation**.

**Students of the International Positive Psychology Association (SIPPA)** see INTERNATIONAL POSITIVE PSYCHOLOGY ASSOCIATION.

**Student’s *t* distribution** see *T* DISTRIBUTION. [Student, pseudonym of William S. Gosset]

**Student’s *t* test** see *T* TEST. [Student, pseudonym of William S. Gosset]

**student–teacher evaluation** see STUDENTS’ EVALUATION OF TEACHING.

**study** 1. *n.* a research investigation conducted for the purpose of understanding, explaining, describing, or predicting some phenomenon of interest. It may be conducted in the laboratory or natural environment, and it may yield quantitative or qualitative data. 2. *n.* any attempt to acquire and remember information. 3. *vb.* to engage in study.

**Study of Values** see ALLPORT–VERNON–LINDZEY STUDY OF VALUES.

**study-phase retrieval theory** see SPACING EFFECT.

**study skill** any method used to facilitate the process of learning material, such as outlining, taking notes, underlining, or silent recitation.

**stupor** *n.* 1. a state of lethargy and impaired consciousness, in which an individual is disoriented, unresponsive, and immobile. 2. inability to speak (see MUTISM).

**Sturge–Weber syndrome** a congenital disorder marked by malformation of meningeal blood vessels (hernior leptomeningeal angiomia), a facial PORT-WINE STAIN, glaucoma, and focal-motor seizures. Skin pigmentation may occur on one or both sides of the face or extend into the scalp area. Other features include muscle weakness, paralysis, developmental delay, and intellectual disability. Also called **encephalofacial angiomatosis**; **Kalischer syndrome**; **Parkes–Weber syndrome**; **Sturge–Weber–Dimitri syndrome**. [William A. Sturge (1850–1919) and Frederick Parkes Weber (1863–1962), British physicians; Vicente Dimitri (1885–1955), Austrian physician; S. Kalischer, German physician]

**Sturm und Drang period** see STORM-AND-STRESS PERIOD.

**stuttering** *n.* a disturbance in the normal fluency and time sequencing of speech. It is characterized by frequent repetition or prolongation of sounds, syllables, or words, with hesitations and pauses that disrupt speech. The disorder interferes with one’s ability to communicate with others, especially during stressful situations (e.g., public speaking), and it can be exacerbated by one’s awareness of anxiety over the dysfluency. The struggle to speak may also be accompanied by behaviors such as a rapid eye blinking, trembling lips, or fist clenching. By contrast, speaking in unison with another person, reading orally, or singing may temporarily reduce stuttering. The disorder affects about 1% of all children, with onset occurring between 2 and 7 years of age. Mild cases usually recover spontaneously by the age of 16, but more severe cases may persist into adulthood. In formal diagnostic nomenclature, stuttering is the term used in DSM–IV–TR; it is identified as **childhood-onset fluency disorder** in DSM–5. Also called **stammering**. See also **PRIMARY STUTTERING**; **SECONDARY STUTTERING**. Compare **cluttering**. —stutter *vb.*

**stuttering gait** a gait characterized by hesitancy in taking steps: a walking pattern observed in certain patients with conversion disorder or schizophrenia. In some cases, it is neurological in origin, as with Parkinson’s disease.

**STX** abbreviation for **SAXITOXIN**.

**stylistic ratings** a system of evaluating works of art in terms of their technical attributes, as opposed to the reactions or preferences of those who view the art. Stylistic ratings may be based on factors such as shapes, lines, composition, surface textures, and reproduction of objects or people portrayed.

**stylus maze** a maze that is “run” by moving a stylus through the various pathways. The task may be performed visually or tactually.

**subacute spongiform encephalopathy** (SSE) see **CREUTZFELDT–JAKOB DISEASE**.

**subarachnoid hemorrhage** bleeding into the subarachnoid space surrounding the brain. It may be the result of trauma or a ruptured **ANEURYSM**. Initial symptoms are caused by increasing **INTRACRANIAL PRESSURE** and can include headache and loss of consciousness as escaping blood distends the spaces beneath the arachnoid (see CIS-
subarachnoid space

TERNA), causing compression or spasm of the blood vessels of the thalamus and upper brainstem.

subarachnoid space a space beneath the delicate ARACHNOID MATER, the middle of the three MENINGES that surround the brain and spinal cord. It is occupied by cerebrospinal fluid, which drains into the SUPERIOR SAGITTAL SINUS through ARACHNOID GRANULATIONS.

subcallosal gyrus a portion of the LIMBIC SYSTEM behind the CINGULATE CORTEX. Its functions are reciprocal to those of the cingulate cortex: It inhibits motor neuron activity, whereas the cingulate cortex enhances motor neuron functions.

subception n. 1. short for SUBLIMINAL PERCEPTION. 2. ac- cording to Carl ROGERS, a strategy for keeping unconscious a subliminal, emotion-provoking stimulus that threatens or is incongruent with one’s self-concept.

subcommissural organ a group of secretory EPENDYMAL CELLS on the dorsal wall of the third ventricle of the brain, near the CEREBRAL AQUEDUCT. One of the CIRCUMVENTRICULAR ORGANS, its exact function is unknown.

subconscious n. a lay term that is widely used to denote the UNCONSCIOUS or PRECONSCIOUS mind as described by Sigmund FREUD or the general idea of SUBLIMINAL CONSCIOUSNESS. It is also popularly associated with AUTOSUGGESTION and HYPNOSIS. Because of its imprecision, the term is now generally avoided by psychologists. See also COCONSCIOUSNESS.

subcortical adj. relating to structures or processes in the brain that are located or take place beneath the CEREBRAL CORTEX. See also SUBCORTICAL CENTER.

subcortical aphasia aphasia resulting from damage to subcortical (deeper) areas of the brain (e.g., the basal ganglia) rather than to cortical areas.

subcortical arteriosclerotic encephalopathy seeBinswanger’s Disease.

subcortical center any region of the brain at a level below the CEREBRAL CORTEX that has a particular function or functions. Subcortical centers include the THALAMUS, HYPOTHALAMUS, and BASAL GANGLIA. Within each subcortical structure may be several special centers, such as nuclei of the hypothalamus that regulate sleep, water balance, protein metabolism, and sexual activity.

subcortical dementia dementia caused by damage to or dysfunction of the subcortical (deeper) structures of the brain that may be due, for example, to Parkinson’s disease. It is marked by cognitive slowing, memory impairment (specifically, poor encoding and retrieval but intact storage), visuospatial abnormalities, and mood and affect disturbances. Compare CORTICAL DEMENTIA.

subcortical learning 1. learning that occurs in areas of the brain below the cortex. For example, some simple habits or associations may be learned subcortically (e.g., in the cerebellum). 2. learning that occurs during cortical spreading depression; that is, during a temporary suppression of cortical activity induced by an injection of potassium chloride into the cortex.

subcultural delinquency see SOCIALIZED DELINQUENCY.

subculture n. a group that maintains a characteristic set of customs, behaviors, interests, or beliefs that serves to distinguish it from the larger culture in which the members live. See also COUNTERCULTURE. —subcultural adj.

subculture of violence see CULTURE OF HONOR.

subcutaneous injection injection of a drug beneath the skin, often in the upper arm or thigh where there is an adequate layer of subcutaneous tissue. Although the subcutaneous route is used mainly to inject fluids, medications may also be administered subcutaneously in the form of slowly absorbed pellets. Also called hypodermic injection. See also ADMINISTRATION; SKIN POPPING.

subcutaneous sensibility the sensitivity of nerve receptors (e.g., PACINIAN CORPUSCLES) beneath the skin.

subdelirious state the precursor of full delirium, marked by restlessness, headache, irritability, hypersensitivity to sound and visual stimuli, and emotional instability. Also called subdelirium.

subdural adj. lying beneath the DURA MATER, the outermost of the coverings (meninges) of the brain and spinal cord.

subdural hematoma an accumulation of blood due to bleeding between the DURA MATER membrane and the brain surface. Because the hematoma enlarges and cannot escape through the skull, it causes pressure that distorts brain structures. The bleeding may occur over a period of days or weeks, producing symptoms of confusion, memory loss, or other neurological deficits that may be mistaken as signs of dementia in an older person.

subdural hemorrhage bleeding beneath the DURA MATER, the outermost of the meningeal membranes that surround the brain. It typically occurs as a result of head injury, and the specific symptoms may vary according to the brain area affected by the bleeding.

subfertility n. see FECUNDITY.

subfornical organ a structure in the brain that is respon- sive to ANGIOTENSIN II and contributes to thirst and drinking behavior. One of the CIRCUMVENTRICULAR ORGANS, it is located below the FORNIX.

subgoal n. a goal that serves as an intermediary step to attaining an ultimate goal (i.e., the GOAL OBJECT). For example, completing an outline of an essay may be a subgoal of completing the essay itself—the ultimate goal.

subgranular zone see DENTATE GYRUS.

subiculum n. (pl. subicula) a region of the forebrain ad- jacent to the HIPPOCAMPUS that has reciprocal connections with the hippocampus and the DENTATE GYRUS. It forms part of the HIPPOCAMPAL FORMATION. Also called hippocampal gyrus.

subitize vb. to perceive how many objects are presented, without counting. See APPREHENSION SPAN. [from Latin subi- ta, “at once”]

subject n. 1. generally, the individual human or nonhu- man animal that takes part in an experiment or research study and whose responses or performance are reported or evaluated; less frequently, the “subject” may also be an in- stitution, group, or other entity. Many now recommend that the term PARTICIPANT be used for humans, considering the word subject to be depersonalizing and to imply passiv- ity and submissiveness on the part of the experimentee. 2. in linguistics, the principal noun phrase in a clause or sen- tence about which something is stated (compare PRIDE- CATE). The subject is usually (but not always) the AGENT of
subjectivism

the main action and in English can usually be identified as the noun phrase whose number and person govern the form of the main verb. 3. an area or branch of knowledge or a course of study.

subject bias the influence that research participants’ knowledge about aspects of the research has on their responses to experimental conditions and manipulations. For example, a participant who knows he or she is in the treatment group as opposed to the control group might behave differently than he or she would otherwise. See DEMAND CHARACTERISTICS.

subject history 1. background information about a participant in a study, such as sociological, occupational, and educational data. 2. events that a research participant experiences outside of the controlled environment of the study and that may threaten its INTERNAL VALIDITY. See HISTORY EFFECT.

subjection n. the state of being under the control of another individual or of a government or other organization, especially where this is felt to be oppressive. See also SOCIAL SUBORDINATION.

subjective adj. 1. taking place or existing only within the mind. 2. particular to a specific person and thus intrinsically inaccessible to the experience or observation of others. 3. based on or influenced by personal feelings, interpretations, or prejudices. Compare OBJECTIVE.

subjective attribute a perceptual quality that is uniquely dependent on the individual who experiences it (e.g., a particular taste or color).

subjective colors see FECHNER’S COLORS.

subjective competitive situation an individual’s perception, evaluation, and acceptance of a situation as meeting the criteria of an OBJECTIVE COMPETITIVE SITUATION.

subjective contour an edge or border perceived in an image as a result of the inference of the observer. A common form of a KANIZSA FIGURE contains a triangle with sides that consist of subjective contours. Also called illusory contour.

subjective-equality point see POINT OF SUBJECTIVE EQUALITY.

subjective expected utility (SEU) a hypothetical value that people are presumed to compute (nearly always nonconsciously) in making a rational choice between alternatives, especially in economic matters. When choosing from a fixed set of alternatives, each associated with (a) a given utility value and (b) a SUBJECTIVE PROBABILITY estimate of the desired outcome, people act so as to maximize the value of the product (a) × (b).

subjective expected value in analyses of decision making, the extent to which an outcome is (a) desired or valued and (b) thought to be probable by the decision maker. The choice of one alternative over others is to a considerable extent a function of the personal (or subjective) value placed by an individual on a specific act or outcome as well as the perceived probability (expectation) that the given alternative will lead to that outcome. Many analyses assume that the alternative selected is the one for which the product of the expectation and the subjective value is the highest.

subjective idealism in philosophy, the metaphysical position that what is normally considered the EXTERNAL WORLD is in fact constructed partly or wholly by individual perceiving minds. See IDEALISM; SOLIPSISM.

subjective norm a perception that an individual has regarding whether people important to that individual believe that he or she should or should not perform a particular behavior. See also THEORY OF PLANNED BEHAVIOR: THEORY OF REASONED ACTION.

subjective organization the creation of one’s own idiosyncratic set of associations or groupings among items to be learned in order to facilitate memory. [proposed by Endel Tulving]

subjective prior see PRIOR DISTRIBUTION.

subjective probability an estimate, derived from subjective experience, of the likelihood of a given event or outcome. The subjective probability estimate is used in calculating the SUBJECTIVE EXPECTED UTILITY. Also called personal probability.

subjective psychology a psychological approach that focuses on introspective or phenomenological data. Compare OBJECTIVE PSYCHOLOGY.

subjective responsibility in the moral reasoning typical of children over the age of 10, the idea that an individual’s motives should be taken into account when judging an act. Compare OBJECTIVE RESPONSIBILITY. [proposed by Jean Piaget]

subjective scoring see OBJECTIVE SCORING.

subjective test an assessment tool that is scored according to personal judgment or to standards that are less systematic than those used in OBJECTIVE TESTS. Some essay examinations are examples of a subjective test. Although there are no necessarily right or wrong answers, responses are scored based on appraisals of their appropriateness or quality.

subjective tone any tonelike sound that is perceived by an individual but not present in the acoustic input. This covers a broad range of percepts, including COMBINATION TONES, TINITUS, and AUDITORY HALLUCINATIONS.

subjective visual field the VISUAL FIELD as experienced by a particular observer.

subjective well-being (SWB) one’s appraisal of one’s own level of happiness and LIFE SATISFACTION. In self-report measures of subjective well-being, two components are examined: one’s affective well-being, which refers to the presence of pleasant affect (e.g., feelings of happiness) versus the absence of unpleasant affect (e.g., depressed mood), and one’s cognitive well-being, which refers to one’s evaluation of life overall (i.e., global life satisfaction) and of specific life experiences (e.g., job satisfaction). These components differ in their stability and variability over time and in their relations with other variables. For instance, the association between income and affective well-being is weaker than that between income and cognitive well-being, as demonstrated by reports that unemployed persons had significantly less life satisfaction than employed persons but did not differ in their daily affective well-being.

subjectivism n. 1. in general, any position holding that judgments of fact or value reflect individual states of mind rather than states of affairs that can be said to be true or false independent of individual interpretation. 2. in ethics, the proposition that the ideals, such as “the good,” to which ethical propositions refer are reflections of personal
subjectivity

judgment rather than independent realities. Subjectivism holds that ethical prescriptions reduce to mere statements of personal or cultural preference. Compare OBJECTIVISM.
—subjectivist n., adj.

subjectivity n. 1. in general, the tendency to interpret data or make judgments in the light of personal feelings, beliefs, or experiences. 2. in empirical research, the failure to attain proper standards of OBJECTIVITY.

subject matching see MATCHING.

subject-matter expert on a CROSS-FUNCTIONAL TEAM, a member who contributes highly specialized knowledge of or expertise in a specific job, task, or skill.

subject maturation see MATURATION.

subject of consciousness 1. the observing ego, or “I.” See also NOMINATIVE SELF; SELF AS OBSERVER. 2. the subject matter, or contents, of conscious experience. Compare OBJECT OF CONSCIOUSNESS.

subject role a coherent set of behaviors assumed by a research participant in response to his or her perceptions of what is required or expected in the situation.

subject sophistication a familiarity with general research procedures that may influence a person’s behavior as a participant in a study. It is an issue of particular concern in DECEPTION RESEARCH, as participants may significantly modify their behavior (e.g., specifically searching for any evidence of deceit in the experimental procedure) as they become increasingly knowledgeable about the nature of deception in experiments. Sources of sophistication include participating in research previously, talking to participants from other studies, and reading about studies in the mass media.

subjects’ rights see PARTICIPANTS’ RIGHTS.

subjects-to-variables ratio the number of research participants compared to the number of research variables (e.g., 5 to 1) in a study. The subjects-to-variables ratio provides a guideline for determining what size sample to use to ensure the greatest POWER when conducting a statistical analysis, such as MULTIPLE REGRESSION OR FACTOR ANALYSIS.

subject variable an experience or characteristic of a research participant that is not of primary interest but nonetheless may influence study results and thus must be accounted for during experimentation or data analysis. Examples include age, marital status, religious affiliation, and intelligence. A variable of this type is neither manipulated by the experimenter, as an INDEPENDENT VARIABLE might be, nor is it usually changed in the course of the experiment, as a DEPENDENT VARIABLE might be. Also called background variable.

subjunctive n. in linguistics, the MOOD of a verb used to indicate that a situation is hypothetical or not yet realized, as in If I were in your position or I insist that she go now. Compare IMPERATIVE; INDICATIVE; INTERROGATIVE.

sublimation n. in classical psychoanalytic theory, a DEFENSE MECHANISM in which unacceptable sexual or aggressive drives are unconsciously channeled into socially acceptable modes of expression and redirected into new, learned behaviors, which indirectly provide some satisfaction for the original drives. For example, an exhibitionistic impulse may gain a new outlet in choreography; a voyeuristic urge may lead to scientific research; and a dangerously aggressive drive may be expressed with impunity on the football field. As well as allowing for substitute satisfactions, such outlets are posited to protect individuals from the anxiety induced by the original drive. —sublime vb.

sublimaze n. a trade name for FENTANYL.

subliminal adj. denoting or relating to stimuli that are below the DIFFERENCE THRESHOLD or ABSOLUTE THRESHOLD. —subliminally adv.

subliminal consciousness 1. a level of consciousness at which a stimulus may affect behavior even though the person is not explicitly aware of it. See SUBLIMINAL PERCEPTION. 2. in the psychological theory of British writer Frederic William Henry Myers (1843–1901), a marginal region of consciousness that he posited as an explanation for TELEPATHY and other alleged parapsychological phenomena. Myers believed that the subliminal consciousness had a transpersonal dimension, and this aspect of his theory is sometimes held to have influenced Carl Jung’s notion of the COLLECTIVE UNCONSCIOUS. See also SUPERCONSCIOUS.

subliminal learning information, habits, or attitudes acquired from exposure to stimuli presented below the threshold for conscious awareness (i.e., subliminally).

subliminal perception the registration of stimuli below the level of awareness, particularly stimuli that are too weak (or too rapid) for an individual to consciously perceive them. There has been much debate about whether responses to subliminal stimuli actually occur and whether it is possible for subliminal commands or advertising messages to influence behavior. Experimental evidence indicates that subliminal commands may not directly affect behavior but may prime later responses (see SUBLIMINAL PRIMING). Compare SUPRALIMINAL PERCEPTION.

subliminal persuasion the presentation of information in a manner that may change people’s attitudes without their conscious awareness of the content of the information to which they have been exposed. Subliminal persuasion usually involves extremely brief presentations of visual stimuli (e.g., words, pictures).

subliminal priming stimulation below the threshold of awareness that changes the probability of the later occurrence of related cognitive tasks. See PRIMING; REPETITION PRIMING.

subliminal process see UNCONSCIOUS PROCESS.

subliminal propaganda a form of propaganda in which images or words are displayed too quickly for the conscious mind to perceive. They may, however, influence a person nonconsciously.

subliminal stimulation stimulation that is below the threshold intensity required to elicit a response (see SUBLIMINAL PERCEPTION). Also called subliminal stimulus.

submission n. compliance with or elicit a response (see SUBLIMINAL PERCEPTION). Also called subliminal stimulus.

submission n. compliance with or elicit a response (see SUBLIMINAL PERCEPTION). Also called subliminal stimulus.

submissive adi. n. a tendency to comply with the wishes or obey the orders of others. —submissive adj.

submissive signal in animal behavior, a signal given by a subordinate to a dominant animal indicating that it will not continue to compete with the other for resources. By using submissive signals, low-ranking individuals avoid being attacked, and overall levels of physical aggression are reduced. See APPEASEMENT BEHAVIOR; THREAT DISPLAY.

subnormal adj. denoting something that is below (often significantly below) the normal or expected level. The use
of this term with reference to intelligence is now largely obsolete, and the term BELOW AVERAGE is generally used.

**subnormal period of neuron** a period of time, measured in milliseconds, when neuron excitability is below normal. It follows an absolute REFRACTORY PERIOD or a period of supernormal excitability.

**suboccipital puncture** an alternative procedure to LUMBAR PUNCTURE for obtaining access to the SUBARACHNOID SPACE for diagnostic or therapeutic purposes. It involves the insertion of a needle into the CISTERNA MAGNA through an area near the base of the skull to collect cerebrospinal fluid. Also called **eistern puncture**.

**subordinate** n. 1. one who is subject to the control or authority of another, as in the subordinate–supervisor relationship in the workplace. 2. in nonhuman animal social groups, an individual who in competition for resources is less likely to obtain the resources than another animal. In a stable social group, individuals readily learn which are dominant and which are subordinate so that resource distribution occurs with minimal fighting or direct aggression. See also ANIMAL DOMINANCE.

**subordinate category** a subdivision of a BASIC-LEVEL CATEGORY formed at a more specific level of categorization. For example, Siamese cat is a subordinate category of the basic-level category cat, and rocking chair is a subordinate category of chair. A subordinate category is usually characterized by (a) a high level of resemblance among its members and (b) a relatively low level of difference between its members and those of neighboring categories (e.g., Siamese cats tend to look quite similar to each other but do not look very different from Orientals). The name of the subordinate category often incorporates the name of the basic-level category, as in the examples given above.

**subordinate clause** see CLAUSE; EMBEDDED SENTENCE.

**subordination** n. 1. the placing of something into a lower ranking category or group. More specifically, it is the state of being subservient to and considered less important than others. 2. in linguistics, see COORDINATION.

**Suboxone** n. a trade name for BUPRENORPHINE in combination with NALOXONE.

**subpopulation** n. a subgroup of a larger POPULATION of individuals or cases. For example, if the population of interest in a research study is all U.S. college undergraduates, one could divide the students into subpopulations by state (e.g., individuals attending college in California, New York, Ohio).

**subsample** n. a subset of a SAMPLE of individuals or cases selected for study. For example, if one chooses a random group of college students for research purposes, one could divide the students into subsamples by major (e.g., individuals from the group who are majoring in psychology, mathematics, history).

**subscale** n. a SCALE that taps some specific constituent or otherwise differentiated category of information as part of a larger, overall scheme. For example, a test of intelligence might consist of several subscales (or subtests) assessing verbal and performance aspects or dimensions of intelligence, which in combination yield a verbal intelligence score, a performance intelligence score, and an overall intelligence score.

**subspecies** n. see BREED.

**substance** n. 1. a drug of abuse (e.g., alcohol, cannabis, cocaine, an inhalant), a medication (e.g., a sedative or anxiolytic), or a toxin that is capable of producing harmful effects when ingested or otherwise taken into the body. See SUBSTANCE-RELATED DISORDER. 2. in philosophy, that which has an independent, self-sufficient existence and remains unalteredly itself even though its attributes or properties may change. Philosophers have differed over what qualifies as a substance and whether reality consists of a single substance (see MONISM or more (see DUALISM; PLURALISM).

**substance abuse** a pattern of compulsive substance use marked by recurrent significant social, occupational, legal, or interpersonal adverse consequences, such as repeated absences from work or school, arrests, and marital difficulties. DSM–IV–TR identifies nine drug classes associated with abuse: alcohol, amphetamines, cannabis, cocaine, hallucinogens, inhalants, opioids, phenylcyclines, and sedatives, hypnotics, or anxiolytics. This diagnosis is preempted by the diagnosis of SUBSTANCE DEPENDENCE. If the criteria for abuse and dependence are both met, only the latter diagnosis is given. In DSM–5, however, both have been subsumed into SUBSTANCE USE DISORDER and are no longer considered distinct diagnoses.

**Substance Abuse and Mental Health Services Administration (SAMHSA)** an agency of the U.S. Department of Health and Human Services, established in 1992, that is charged with improving the quality and availability of prevention, treatment, and rehabilitative services in order to reduce illness, death, disability, and cost to society resulting from substance abuse and mental illness. SAMHSA has three program divisions: the Center for Mental Health Services, the Center for Substance Abuse Prevention, and the Center for Substance Abuse Treatment. See also ALCOHOL, DRUG ABUSE AND MENTAL HEALTH ADMINISTRATION.

**substance abuse treatment** inpatient and outpatient programs designed to help individuals diagnosed with substance dependence (i.e., dependence on alcohol or any other drug) to achieve abstinence. These include but are not limited to short- and long-term residential programs (colloquially known as “rehab”), clinic- and hospital-based outpatient programs, METHADONE MAINTENANCE THERAPY, and TWELVE-STEP PROGRAMS. Also called drug abuse treatment. See also ALCOHOL REHABILITATION.

**substance dependence** in DSM–IV–TR, a cluster of cognitive, behavioral, and physiological symptoms indicating continued use of a substance despite significant substance-related problems. There is a pattern of repeated substance ingestion resulting in tolerance, withdrawal symptoms if use is suspended, and an uncontrollable drive to continue use. DSM–IV–TR identifies 10 drug classes associated with dependence: alcohol, amphetamines, cannabis, cocaine, hallucinogens, inhalants, nicotine, opioids, phenylcyclines, and sedatives, hypnotics, or anxiolytics. Often used synonymously with the term ADDICTION, substance dependence has been subsumed with SUBSTANCE ABUSE under the category SUBSTANCE USE DISORDER in DSM–5 and is no longer considered a distinct diagnosis. Also called chemical dependence.

**substance-induced anxiety disorder** clinically significant anxiety (e.g., generalized anxiety, panic attacks, phobic symptoms) caused by the direct physiological effects of exposure to a drug, toxin, or other substance. The anxiety symptoms may be associated with substance intoxication (e.g., alcohol, amphetamines, caffeine), substance withdrawal (e.g., alcohol, cocaine, sedatives), medication
use (e.g., anesthetics, anticholinergics, thyroid mediation), or exposure to heavy metals and toxins (e.g., gasoline, paint, carbon dioxide).

**substance-induced mood disorder** in DSM–IV–TR, significant and persistent emotional disturbance believed to be caused directly by the physiological effects of a substance, which may be a drug of abuse, a medicinal drug, or a heavy metal or toxin (e.g., gasoline, paint, an organophosphate insecticide). When caused by a drug of abuse, the mood disturbance must be more severe than that normally experienced as part of **SUBSTANCE INTOXICATION** or **SUBSTANCE WITHDRAWAL**. Medications that can cause mood disturbance include antihypertensives, steroids, psychotropic drugs, and many others. In DSM–5, the disturbance is called **substance/medication-induced depressive disorder**.

**substance-induced persisting amnestic disorder** a disturbance in memory due to the persisting effects of a substance (see AMNISTIC DISORDER). The ability to learn new information or to recall previously learned information is impaired severely enough to interfere markedly with social or occupational functioning and to represent a significant decline from a previous level of functioning. See ALCOHOL-INDUCED PERSISTING AMNISTIC DISORDER; SEDATIVE-, HYPNOTIC-, OR ANXIOLYTIC-INDUCED PERSISTING AMNISTIC DISORDER.

**substance-induced persisting dementia** multiple cognitive deficits due to the persisting effects of substance abuse. The most notable feature is impaired memory, but there may also be aphasia (impaired expression or understanding of language), apraxia (inability to perform skilled or complex movements), agnosia (impaired ability to interpret sensations correctly), and EXECUTIVE DYSFUNCTION. See also ALCOHOL-INDUCED PERSISTING DEMENTIA.

**substance-induced psychotic disorder** in DSM–IV–TR, prominent hallucinations or delusions due to the direct physiological effects of a substance and not arising as part of a withdrawal syndrome. The equivalent term in DSM–5 is substance/medication-induced psychotic disorder. Also called hallucinosis. See ALCOHOL-INDUCED PSYCHOTIC DISORDER; AMPHETAMINE-INDUCED PSYCHOTIC DISORDER; CANNABIS-INDUCED PSYCHOTIC DISORDER; HALLUCINOGEN-INDUCED PSYCHOTIC DISORDER.

**substance intoxication** a reversible syndrome due to the recent ingestion of a specific substance, including clinically significant behavioral or psychological changes as well as one or more signs of physiological involvement. Although symptoms vary by substance, there are some common manifestations: for example, perceptual disturbances; mood changes; impairments of judgment, attention, and memory; alterations of heartbeat and vision; and speech and coordination difficulties. DSM–IV–TR and DSM–5 identify 10 drug classes associated with intoxication: alcohol, amphetamines, caffeine, cannabis, cocaine, hallucinogens, inhalants, opioids, phencyclidines, and sedatives, hypnotics, or anxiolytics.

**substance intoxication delirium** in DSM–IV–TR and DSM–5, a reversible substance-specific syndrome that develops over a short period of time (usually hours to days) following heavy consumption of the substance. It includes disturbance of consciousness (e.g., reduced ability to focus, sustain, or shift attention), accompanied by changes in cognition (e.g., memory deficit, disorientation, language disturbance) in excess of those usually associated with intoxication with that substance. See ALCOHOL INTOXICATION DELIRIUM; AMPHETAMINE INTOXICATION DELIRIUM; COCAINE INTOXICATION DELIRIUM; PHENCYCLIDINE INTOXICATION DELIRIUM.

**substance P** a neuropeptide that functions as a neurotransmitter in both peripheral and central nervous systems. It belongs to the NEUROKININ family of transmitters. High concentrations of neurons containing substance P are localized in the DORSAL HORN of the spinal cord, where they play a role in the modulation of pain. In peripheral tissues, substance P acts as a vasodilator. It also has a role in sexual behavior and has been implicated in the regulation of mood.

**substance-related disorder** any of various disorders caused by the effects of a drug or a toxin. The term in DSM–5 encompasses SUBSTANCE USE DISORDERS and substance-induced disorders (e.g., intoxication, withdrawal) caused by alcohol; opioids: stimulants (e.g., amphetamine, cocaine); sedatives, hypnotics, or anxiolytics; and other substances. The term also broadly includes mental disorders (e.g., delirium, depression, psychosis) that may be induced by intoxication or withdrawal from various substances, including some medications.

**substance use disorder** a catchall diagnosis encompassing varying degrees of excessive use of a substance. In DSM–5, the diagnosis combines and replaces DSM–IV–TR’s SUBSTANCE ABUSE and SUBSTANCE DEPENDENCE as distinct classifications, with subordinate categories of specific “use disorders” following the same pattern of consolidation: ALCOHOL USE DISORDER, for example, combines and replaces ALCOHOL ABUSE and ALCOHOL DEPENDENCE. Other use disorders whose diagnostic criteria in DSM–5 subsume the former abuse–dependence distinction include those involving caffeine; cannabis; hallucinogens (e.g., phencyclidine use disorder); inhalants; opioids; sedative, hypnotics, or anxiolytics; stimulants (e.g., amphetamine, cocaine); and tobacco.

**substance withdrawal** a syndrome that develops after cessation of prolonged, heavy consumption of a substance. Symptoms vary by substance but generally include physiological, behavioral, and cognitive manifestations, such as nausea and vomiting, insomnia, mood alterations, and anxiety. DSM–IV–TR identifies six drug classes associated with withdrawal: alcohol, amphetamines, cocaine, nicotine, opioids, and sedatives, hypnotics, or anxiolytics. DSM–5 lists tobacco in place of nicotine and further identifies caffeine and cannabis as being associated with a withdrawal syndrome.

**substantia gelatinosa** a gelatinous-appearing mass of extensively interconnected small neurons at the tip of the spinal cord. Some cells in the substantia gelatinosa contain ENDOPHINS and are involved in regulation of pain. Neurons of the substantia gelatinosa extend into the MEDulla OBLONGATA, where they form the spinal TRIGEMINAL NUCLEUS.

**substantia nigra** a region of gray matter in the midbrain, named for its dark pigmentation, that sends DOPAMINERGIC neurons to the BASAL GANGLIA. Depletion of dopaminergic neurons in this region is implicated in Parkinson’s disease.

**substantive rationality** the rationality of a decision, as opposed to the rationality of the processes used to arrive at the decision. Compare PROCEDURAL RATIONALITY.
successive induction

substantive significance see practical significance.

substantive universal see language universal.

substitutive formation see symptom formation.

substitutes for leadership theory a contingency theory of leadership proposing that leadership is not important to effective group performance in some work situations. For instance, a highly structured task (see task structure) may substitute for a directive leader and a highly cohesive work group may substitute for a considerate, supportive leader. See situational leadership theory. [developed in 1978 by Steven Kerr and U.S. organizational behaviorist John Michael Jermier (1950–)]

substitution n. the replacement of one thing with another. In psychoanalytic theory, it denotes the replacement of unacceptable emotions or unattainable goals with alternative feelings or achievable aims. Substitution may be viewed as a positive adaptation or solution (e.g., adoption when one cannot have a child of one’s own) or as a negative, maladaptive response (e.g., emotional eating after a frustrating day at the office). See also defense mechanism.

substitution hypothesis see alteration hypothesis.

substitution pharmacotherapy the prescription of legal drugs to help substance abusers stop taking illegal drugs, particularly opioids, as in the prescribed substitution of methadone for heroin. Also called substitution therapy. See cross-dependence.

substitution test any examination in which the test taker exchanges one set of symbols for another. For example, a person might be required to substitute numbers with letters according to a specific code or to substitute a word in a sentence with a grammatically equivalent alternative. Substitution tests often are used in neuropsychology to evaluate cognitive function and identify individuals with brain damage, dementia, and other conditions.

substrate n. 1. a basis or foundation, such as the physical medium on which an animal or plant lives or grows. 2. a chemical compound that is acted on by an enzyme. The substrate binds specifically to the enzyme’s active site, thereby lowering the energy required for the reaction, which can therefore proceed much faster. When the process is over, the substrate has been changed into different molecules (reaction products), although the enzyme is unchanged. The released enzyme then repeats the process with another substrate of the same composition.

subtest n. a separate division of a test or instrument, usually with an identifiable content (e.g., the multiplication subtest of a mathematics test).

subthalamic nucleus a component of the subthalamus that receives fibers from the globus pallidus as a part of the descending pathway from the basal ganglia. It forms part of the extrapyramidal tract.

subthalamus n. a part of the diencephalon of the brain, wedged between the thalamus and the hypothalamus. It contains the subthalamic nucleus and functions in the regulation of movements controlled by skeletal muscles, together with the basal ganglia and the substantia nigra. —subthalamic adj.

subtherapeutic dose a dose of a drug that does not achieve a particular therapeutic effect. Although this is generally not desired, drugs intended for one purpose may be administered in subtherapeutic doses to achieve a different effect. For example, the tricyclic antidepressants are rarely used in current practice in doses sufficient to alleviate depression; however, they are often used in low (subtherapeutic) doses to promote sleep or alleviate pain.

subthreshold potential a type of graded potential resulting from a stimulus that is not of sufficient intensity to elicit an action potential and does not travel far beyond the immediate region of stimulation. See also decremental conduction; local potential.

subtotal hysterectomy see hysterectomy.

subtraction method see donders’s method.

subtractive bilingualism see additive bilingualism.

subtractive mixture a form of color mixture in which pigments are combined, causing some wavelengths to be absorbed or subtracted from the mixture. Compare additive color mixture. See also color subtraction.

subtractive principle a rule of color mixture stating that the perceived color of a target that absorbs some wavelengths of light will be complementary to the absorbed wavelengths.

subtype n. in diagnostic classification, a subordinate category of a disorder. In DSM–IV–TR and DSM–5, for example, specific phobias are divided into several subtypes, such as specific phobia, animal type (e.g., fear of snakes); specific phobia, situational type (e.g., fear of flying); and others.

Subutex n. a trade name for buprenorphine.

subventricular zone an area of the lateral ventricles. It is the largest zone in which neurogenesis occurs in the adult brain and one of the two main such areas, the other being the subgranular zone of the dentate gyrus.

subvocal speech covert speech associated with faint movements of the lips, tongue, and larynx that resemble speech movements but are inaudible. People often use subvocal speech, for example, when commenting to themselves on their own and others’ actions, perceptions, and feelings.

successful aging avoidance of disease and disability, maintenance of cognitive capacity, continued active engagement in life, and adaptation to the aging process through such strategies as selective optimization with compensation.

successful intelligence in the triarchic theory of intelligence, the ability to succeed in life according to one’s own definition of success, via adaptation to, shaping of, and selection of environments. Successful intelligence involves capitalizing on strengths and compensating for or correcting weaknesses through the use of analytical, creative, and practical skills, which in combination enable one to perform a wide variety of tasks.

successful-approximations method see method of successive approximations.

successive contrast see color contrast; contrast.

successive discrimination in conditioning, a discrimination between stimuli that are presented in succession.

successive induction the succession of movements of limbs or other body parts in a pattern of antagonistic reflex actions. In walking, for example, successive induction requires alternate flexion and extension of muscles in the lower limbs.
successive-intervals method

successive-intervals method see METHOD OF SUCCESSIVE INTERVALS.

successive reproduction see REPEATED REPRODUCTION.

succinimide n. any of a group of chemically related drugs that are effective in the treatment of absence seizures. Discovered in a search for an antidote for drug-induced convulsions, they produce a sedative effect and may cause behavioral changes. Ethosuximide is an example of a succinimide and is sold in the United States under the trade name Zarontin.

succinylcholine n. a drug that relaxes skeletal muscles, used intravenously in anesthesia and before electroconvulsive treatment. It is a neuromuscular blocking agent that does not relieve pain or produce sedation. U.S. trade name: Anectine.

sufficiency n. 1. an inclination to readily and uncritically adopt the ideas, beliefs, attitudes, or actions of others. 2. an occasional synonym for HYPNOTIC SUSCEPTIBILITY. See PRIMARY SUFFICIENCY; SECONDARY SUFFICIENCY; TERTIARY SUFFICIENCY.

suggestion n. 1. an idea or potential course of action presented to another for consideration. 2. the process of inducing acceptance of an idea or course of action, especially through indirect or subtle means. See also AUTOSUGGESTION; PRESTIGE SUGGESTION.

suggestion therapy a type of psychotherapy in which distressing symptoms are alleviated by direct suggestion and reassurance. The technique is sometimes used in HYPNOTHERAPY. A suggestion may be accompanied by an explanation of the meaning and the purpose of the symptoms, but no attempt is made to modify the client’s basic personality.

suicidal crisis a situation in which suicide is threatened or attempted.

suicidal gesture an ATTEMPTED SUICIDE or similar self-destructive behavior, especially when the risk of death is low. See also PARASUICIDE.

suicidal ideation thoughts about or a preoccupation with killing oneself, often as a symptom of a MAJOR DEPRESSIVE EPISODE. Most instances of suicidal ideation do not progress to ATTEMPTED SUICIDE.

suicidality n. the risk of suicide, usually indicated by suicidal ideation or intent, especially as evident in the presence of a well-elaborated suicidal plan.

suicide n. the act of killing oneself. Frequently, suicide occurs in the context of a MAJOR DEPRESSIVE EPISODE, but it may also occur as a result of a substance use or other disorder. It sometimes occurs in the absence of any psychiatric disorder, especially in untenable situations, such as extreme or prolonged bereavement or declining health. See also ATTEMPTED SUICIDE; PASSIVE SUICIDE. —suicidal adj.

suicide attempt see ATTEMPTED SUICIDE.

suicide by cop the act, by one who is suicidal, of purposely eliciting deadly police gunfire on oneself. Also called copicide; officer-assisted suicide; police-assisted suicide.

suicide-prevention center a CRISIS-INTERVENTION facility dealing primarily with individuals who have suicidal thoughts or who have threatened or attempted suicide. Suicide-prevention centers are usually staffed by social workers or paraprofessionals who are trained to respond to such emergencies in person or over a telephone hotline. Suicide-prevention centers also provide community education and outreach, and staff may offer bereavement support to the relatives and loved ones of an individual who has died by suicide.

suicidology n. a multiprofessional discipline devoted to the study of suicidal phenomena and their prevention. Major groups involved are (a) scientists (epidemiologists, sociologists, statisticians, demographers, and social psychologists), (b) clinicians (clinical psychologists, psychiatrists, social workers, trained volunteers, and members of the clergy), and (c) educators (public health educators and
school and college personnel). The term *suicidology* was coined by Edwin S. SNEIDMAN, a founder of the discipline.

**sui juris** having the ability to make legal decisions and possessing full civil rights (Latin, literally: "of his own right"). A person who is sui juris must have reached the age of maturity (typically 18 years old), be fully mentally competent, and not be under the guidance or protection of another (as in a CONSERVATORSHIP).

**sukra prameha** a CULTURE-BOUND SYNDROME found in Sri Lanka, with symptoms similar to those of SHEN-K'UEI.

**sulcus** n. (pl. sulci) a groove, especially one on the surface of the cerebral cortex. The term is often used synonymously with FISSURE. —sulcal adj.

**sulcus centralis** see CENTRAL SULCUS.

**sulcus principalis** in the brain of monkeys, a groove that marks the boundary between the dorsolateral FRONTAL CORTEX and the ventrolateral frontal cortex. Adjacent cortical tissue has been implicated in perception and in working memory.

**Sullivan's interpersonal theory** see INTERPERSONAL THEORY. [Harry Stack SULLIVAN]

**sumatriptan** n. see TRIPATAN.

**Summary statistics** a set of numbers used to communicate succinctly the most important descriptive information about a collection of raw data. For example, the VARIANCE, CENTRAL TENDENCY, SKEWNESS, and KURTOSIS may be used to summarize a sample data set.

**Summated rating scale** a type of assessment instrument comprising a series of statements measuring the same construct or variable to which respondents indicate their degree of agreement or disagreement. The number of response options for each item varies, often from 5 to 7 points (e.g., from strongly agree to strongly disagree). The response values for individual items may be summed to obtain a total or average score that reflects a person's general attitude toward the construct of interest. A Likert scale is the most commonly used summated rating scale. Also called summated rating method: summed scale.

**Summating potential** a slowly changing electric potential that is recorded in the cochlea and is evoked by sound.

**Summation n.** 1. the process in which a neural impulse is propagated by the cumulative effects of two or more stimuli that alone would not be sufficient to activate the neuron. See SPATIAL SUMMATION; TEMPORAL SUMMATION. 2. the increased intensity experienced in a sensation when two stimuli are presented to a receptor in rapid succession or to adjacent areas. 3. (symbol: Σ) a mathematical operation involving the addition of numbers, quantities, or the like. For example, in a set of related values \((x_1, x_2, x_3, \ldots, x_n)\), a summation of all values of the set is indicated by \(\sum x_i\), \(\bar{x}\), or \(\Sigma\).

Often, the limits on the summation sign are omitted when what is intended is otherwise obvious.

**Summation effect** a feature of BINOCULAR CELLS in the visual cortex in which the activity of the cell is greater when stimulation occurs through both eyes than when stimulation occurs through one eye. A similar phenomenon occurs in the auditory system; when both ears are stimulated, there is a binaural summation effect of enhanced loudness.

**Summation time** the longest interval between two successive stimuli such that they are perceived as a single, continuous stimulus.

**Summative evaluation** 1. the appraisal of a student's achievement at the conclusion of an educational program. Also called terminal assessment. 2. in evaluation research, an attempt to assess the overall effectiveness of a program in meeting its objectives and goals after it is in operation. This is in contrast to FORMATIVE EVALUATION, which is used to help in the development of the program. Also called ex post facto evaluation. See also OUTCOME EVALUATION.

**Summer depression** an atypical variant of SEASONAL AFFECTIVE DISORDER in which MAJOR DEPRESSIVE EPISODES tend to occur in the summer months.

**Sum of cross-products** a statistical value obtained for two sets of variables \(x_i\) and \(y_i\) defined by the summation \(\sum (x_i - \bar{x})(y_i - \bar{y})\).

where \(\bar{x}\) is the mean value of \(x_i\) and \(\bar{y}\) the mean value of \(y_i\). It is used in the MULTIVARIATE ANALYSIS OF VARIANCE.

**Sum of products** the value obtained by multiplying each pair of numbers in a set and then adding the individual totals. For example, for the set of number pairs \((1, 3), (2, 4)\):

\[
\sum (1 \times 3) + (2 \times 5) + (4 \times 6) + (6 \times 4) = 12 + 15 + 36 + 24 = 99
\]

**Sum of squared errors** (symbol: SSE) see ERROR SUM OF SQUARES.

**Sum of squares** (symbol: SS) the number obtained by determining the deviation of each point in a data set from some value (such as a mean or predicted value), multiplying each deviation by itself, and adding the resulting products. Thus, for a set of variables \(x_i\):

\[
\sum (x_i - \bar{x})^2
\]

where \(\bar{x}\) is the mean value of \(x_i\). For example, if an analysis yields a mean score of 5 but a person's actual score is 7, the squared deviation for that individual is \((7 - 5)^2 = 4\). This would be added to the squared deviations of all other individuals in the sample. Various types of sums of squares are calculated in ANALYSIS OF VARIANCE, REGRESSION ANALYSIS, and other statistical procedures. See ERROR SUM OF SQUARES.

**Sum strategy** a simple addition strategy used by young children that involves counting together the two addends of a problem. For example, for the problem \(3 + 2 = ?\), a child would say, “1, 2, 3... 4, 5.”

**Sunburst maze** a specific RADIAL MAZE variation consisting of 20 arms projecting from a hub in a pattern resembling sunbeams spreading across the sky, used by Edward C. TOLMAN in the 1940s to study COGNITIVE MAPS. In his experiments, rats were trained to follow a particular route in a sunburst maze from the start to a designated goal. The original route was then blocked and the animals had to choose an alternative path, only one of which
sun compass

pointed toward the goal box. The fact that many rats chose the arm that led to the location of the goal box was taken as evidence that they understood the spatial relation between the start and the goal and could take the shortest path to get there.

sun compass the use of the sun as a directional stimulus in orientation and navigation. Because the sun appears to move across the sky during the day and has different trajectories in different seasons, a sun compass must be coupled with some form of TIME ESTIMATION. To head south at 9 a.m., one needs to keep the sun on the left, but at 3 p.m., one needs to keep the sun on the right. Studies of several species, ranging from bees to fish and birds, have demonstrated a time-compensated sun compass. For nocturnal species, there is evidence of a star compass.

sundown syndrome the tendency, particularly among older adults with dementia or individuals in institutional care, to experience reduced levels of psychological functioning late in the day. Also called sundowning.

sunk-costs effect see BEHAVIORAL ECONOMICS.

su-o yang see KORO.

superconducting quantum interference device (SQUID) a device used in MAGNETOEENCEPHALOGRAPHY for detecting magnetic waves in the brain. These highly sensitive devices must be used in rooms that are screened from all outside magnetic sources. They are useful in the study of in vivo human brain processes.

superconscious n. 1. in certain Eastern traditions, with variation (see BUDDHISM; HINDUISM; TAOISM), a state in which the individual attains supreme knowledge, freedom from pain, and perfect spiritual insight. Practices such as MEDITATION and YOGA (among others) may be directed toward the achievement of this state. 2. in the tradition of HUMANISTIC PSYCHOLOGY, a higher state of awareness that is associated with creative inspiration, spiritual insight, and the attainment of PEAK EXPERIENCES. See BEING Cognition. 3. in the writings of Italian psychiatrist Roberto Asagioi (1888–1974), a synonym for transpersonal awareness. See TRANSPERSONAL PSYCHOLOGY. 4. in the ANALYTIC PSYCHOLOGY of Carl JUNG, another name for the COLLECTIVE UNCONSCIOUS.

superego n. in psychoanalytic theory, the moral component of the personality that represents parental and societal standards and determines personal standards of right and wrong, or conscience, as well as aims and aspirations (see EGO-IDEAL). In the classic Freudian tripartite structure of the psyche, the EGO, which controls personal impulses and directs actions, operates by the rules and principles of the superego, which stem from parental demands and prohibitions. The formation of the superego occurs on an unconscious level, beginning in the first 5 years of life and continuing throughout childhood and adolescence and into adulthood, largely through identification with the parents and later with admired models of behavior. See also PRIMITIVE SUPEREGO.

superego anxiety in psychoanalytic theory, anxiety caused by unconscious superego activity that produces feelings of guilt and demands for atonement. Compare EGO ANXIETY; ID ANXIETY.

superego resistance in psychoanalytic theory, a type of RESISTANCE to psychoanalysis that is created by the superego. It generates a sense of guilt and gives rise to the need for punishment in the form of persistent symptoms. Compare ID RESISTANCE; REPRESSION RESISTANCE.

superego sadism in classical psychoanalytic theory, the aggressive, rigid, and punitive aspect of the superego, or conscience. Its energy is derived from the destructive forces of the ID, and its intensity and strength are dependent on the violent and sadistic fantasies of the child’s primordial strivings. See SADISM.

superficial adj. 1. in anatomy, located close to or at the surface of the body or of an organ. 2. having no deep significance or real substance.

superior adj. in anatomy, higher, above, or toward the head. Compare INFERIOR.

superior canal dehiscence a rare hearing and balance disorder due to a thinning layer of bone in the inner ear that causes hypersensitivity to sound and motion. Symptoms include sudden dizziness; loss of balance; rapid, uncontrollable eye movements; falling down after a loud noise; AUTOPHONY; and hearing loss.

superior colliculus either of a pair of rounded prominences (colliculi) in the brain, one of which lies near each CEREBRAL PIVUNCE, rostrally to the INFERIOR COLICULUS and immediately beneath the PINEAL GLAND. The superior colliculus receives fibers from the OPTIC TRACT and projects fibers to several stations, including the LATERAL GENICULATE NUCLEUS and the RETICULAR FORMATION. The superior colliculus gives rise to the TECTOSPINAL TRACT and is involved in orienting movements of the head and eye toward external stimuli. See also BLINDSPOT.

superior function in the ANALYTIC PSYCHOLOGY of Carl JUNG, the function among the four basic functions—seeing, thinking, intuiting, and feeling—that rules the conscious ego and dominates the other three, which become INFERIOR FUNCTIONS in the unconscious. The superior function determines the FUNCTIONAL TYPE of the individual.

superior intelligence an arbitrary category of general intelligence attained by only 15% of the population. It includes individuals with an IQ of 120 or more on both the WECHSLER ADULT INTELLIGENCE SCALE and the STANFORD-BINET INTELLIGENCE SCALE.

superiority complex in the INDIVIDUAL PSYCHOLOGY of Alfred Adler, an exaggerated opinion of one’s abilities and accomplishments that derives from an overcompensation for feelings of inferiority. See COMPENSATION. Compare INFERIORITY COMPLEX.

superior longitudinal fasciculus a bundle of nerve fibers that connects ridges (gyri) in the cerebral cortex as distant as the FRONTAL LOBE and the OCCIPITAL LOBE. Most are short fibers that connect closer gyri. Near the middle of the fasciculus, some fibers coming from both directions turn abruptly upward into the motor and somatosensory areas of the cortex.

superior oblique the extrinsic EYE MUSCLE that rotates the eye upward when the eye is pointing toward the nose and that contributes to upward motion (together with the SUPERIOR RECTUS) when it contracts with the eye pointing straight ahead.

superior olivary complex (superior olivary nucleus; superior olive) in the OLIVARY NUCLEI, a collection of brain nuclei located in the PONS that is one of the major structures in the AUDITORY PATHWAY. The cells receive excitatory input from the contralateral COCHLEAR NU-
clei in the brainstem and inhibitory input from the ipsilateral cochlear nuclei. The contralateral input comes through the **trapezoid body**, a concentration of transverse nerve fibers in thepons.

**superior rectus** the extrinsic **eye muscle** that rotates the eye upward when the eye is pointing away from the nose and that contributes to upward motion (together with the **superior oblique**) when it contracts with the eye pointing straight ahead.

**superior sagittal sinus** a part of the system of veins that drain blood from the cerebral tissues. It runs across the top of the cerebral cortex, draining venous blood from an area above the eye to the transverse sinus, which empties into the internal jugular vein.

**superior temporal gyrus** a ridge (gyrus) that extends along the upper surface of the **temporal lobe** of the brain, bounded above by the **lateral sulcus** and laterally by the superior temporal sulcus. It has a role in speech perception and production.

**superman n.** the usual English translation of the German word **Urmenschen**, introduced by Friedrich NIETZSCHE. For Nietzsche, the superman represents an ideal type of human life, one who brings into reality the most creative and powerful attributes of humanity, who seizes life courageously in response to the Wille zur Macht (see Will to Power), and who avoids the "slave mentality" that Nietzsche took to be characteristic of the culture of his time. As Nietzsche considered few capable of such affirmative, authentic living, the ideal is essentially aristocratic and nondemocratic. Although the concept has no racial elements, the Nazis later used it to affirm the supposed superiority of the Aryan race and to justify aggression and oppressive racial policies.

**supernatural adj.** of or relating to phenomena that appear to depart from or transcend the laws of the physical universe, especially when these phenomena are taken to be the work of gods, demons, or spirits. Compare **preternatural.**

**supernormal adj.** 1. exceeding or beyond the normal. 2. in psychometrics, denoting a category of individuals or their attributes that are far above the normal range.

**supernormal stimulus** a stimulus that by virtue of being larger or more intense than normally encountered natural stimuli has a greater behavioral effect than the natural stimuli. For example, a gull presented with its own egg and a much larger, artificial egg will attempt to incubate the larger egg. See **peak shift; sensory bias.**

**superordinate category** a high-level category that subsumes a number of **basic-level categories**. For example, **animal** is a superordinate category including the basic-level categories **cat, fish, elephant**, and so on. A superordinate category is usually characterized by (a) low levels of resemblance between members and (b) fundamental differences between its members and those of other categories (e.g., an elephant is not much like a fish, but both are very different from a tree).

**superordinate goal** 1. a goal that takes precedence over one or more other, more conditional goals. 2. a goal that can be attained only if the members of two or more groups work together by pooling their skills, efforts, and resources. In the ROBBERS CAVE EXPERIMENT studying intergroup conflict reduction, superordinate goals were introduced by creating emergencies and problems that could be resolved only through the joint efforts of both groups.

**superposition** n. see **linear system.**

**supersaturated design** a type of factorial design in which dozens of independent variables that influence a single dependent variable of interest are assessed simultaneously to identify those vital few that are most influential. In a supersaturated design, the number of variables being investigated exceeds the number of runs or trials conducted; algorithms and other criteria exist to determine the appropriate number of runs to conduct. Such designs commonly are used for screening purposes, wherein the goal is to identify a small number of dominant active factors with minimal cost.

**supersensitivity** n. heightened responsiveness to a particular neurotransmitter. For example, prolonged blockade of dopamine receptors by some antipsychotic drugs leads to an increase in the number of dopamine receptors; discontinuation of the drug may then result in a marked increase of psychotic symptoms, a condition called **supersensitivity psychosis.**

**superstition** n. 1. an irrational belief in the significance or magical efficacy of certain objects or events (e.g., omens, lucky charms) or a custom or act based on such belief. 2. any unscientific belief accepted without question. —**superstitious** adj.

**superstitious behavior** the behavior that results from accidental reinforcement of an action so that the organism continues to repeat it. For example, a rat that turned in a circle before accidentally hitting a bar and obtaining food might continue turning in a circle before each bar press.

**superstitious control** the illusion that one can influence outcomes through various practices designed to protect oneself, alter the environment, or affect a situation. Such practices include following specific behavior patterns (see **superstitious ritual**). Some people maintain that superstitious control serves a positive psychological function in averting the development of learned helplessness. See **faith healing; magical thinking.**

**superstitious ritual** a specific pattern of behavior that is believed to control one's performance and its outcome when there is no rational reason for this belief. Failure to follow the ritual is believed to have negative effects on performance and outcome. In sport, for example, such rituals might include putting items of a uniform on in a specific order or having team members enter a competition venue in a specific order. Also called **superstitious routine.**

**supertaster** n. a person with uncommonly low gustatory thresholds and strong responses to moderate concentrations of taste stimuli. Supertasters have unusually high numbers of **taste buds.**

**supervalent thought** an extreme preoccupation with a single train of thought. See **obsession; rumination.**

**supervenience** n. in philosophy, the condition in which a higher level property of something is inseparable from the lower level constituents of that thing, such that change in this property only occurs when the lower level constituents change. The term is usually used in a materialist sense to refer to the idea that conscious experience (i.e., a higher level property of the brain) supervenes on—that is, it is entirely dependent on—neural processes (lower level properties of the brain). —**supervene** vb. —**supervenient** adj.
supervised analysis

supervised analysis see CONTROL ANALYSIS.

supervision n. oversight: critical evaluation and guidance provided by a qualified and experienced person (the supervisor) to another individual (the trainee) during the learning of a task or process. In psychotherapy and counseling, supervision by a senior therapist or counselor is required while the trainee learns therapeutic techniques. In rural and other remote settings where the task of providing face-to-face supervisory services to trainees is complicated by geographic constraints, TELESUPERVISION has been used to provide feedback to a trainee via technology such as e-mail, telephone, or videoconferencing. A prescribed number of hours of supervision is required by state licensing boards as part of the requirements for obtaining a license in a mental health field.

supervisory analysis see CONTROL ANALYSIS.

Supervisory Attentional System (SAS) in the CONTROL OF ACTION MODEL, a theoretical higher level cognitive mechanism active in nonroutine or novel situations: It is held to be responsible for troubleshooting and decision making when habitual responses or automatic processes are ineffective or otherwise unsatisfactory. The SAS is thought to be involved in carrying out a variety of other EXECUTIVE FUNCTIONS as well, and it is seen as a network for the coordination and control of cognitive activity and intentional behavior. Compare CONTENTION SCHEDULING SYSTEM. Described in 1980 by U.S. cognitive scientist Donald A. Norman (1935–) and British neuropsychologist Timothy Shallice (1940–).

supervisory control in ergonomics, the role allocated to the human operator in highly automated systems. The operator is responsible for system monitoring, interpretation, decision making, and manual correction or intervention. Reducing the operator’s role to one of supervisory control may result in either optimal or degraded performance, depending chiefly on system design. See also CLUMSY AUTOMATION; FUNCTION ALLOCATION.

superwoman syndrome a set of characteristics found in a woman who performs or attempts to perform all the duties typically associated with several different full-time roles, such as wage earner, mother, homemaker, and wife.

supination n. 1. the act of turning the forearm so that the palm faces upward, or the condition resulting from this action. 2. the act of turning the foot so that the sole faces inward and the medial (inner) margin is raised (as in walking on the outside of one’s feet), or the condition resulting from such an action. 3. the state or condition of being supine (see POSTURE). Compare PRONATION. —supinate vb.

supine adj. see POSTURE.

supplementary motor area (SMA) an area of the motor cortex with somatotopic organization involved in planning and learning new movements that have coordinate control of action model. In contrast to the planning and learning new movements that have coordinate control of action model, neuromotor input to the supplementary motor area is triggered by geographic constraints, TELESUPERVISION has been used to provide feedback to a trainee via technology such as e-mail, telephone, or videoconferencing. A prescribed number of hours of supervision is required by state licensing boards as part of the requirements for obtaining a license in a mental health field.

sup_phy_supp_vb

suppository n. a bullet-shaped medicinal preparation for rectal administration. It dissolves in the rectum to release...
its active component, which is adsorbed through the rectal mucosa. It is primarily used to treat constipation and hemorrhoids. Vaginal suppositories are available for treating gynecological conditions.

**suppressed anger syndrome** see HWA-BYUNG.

**suppression n.** 1. a conscious effort to put disturbing thoughts and experiences out of mind, or to control and inhibit the expression of unacceptable impulses and feelings. It is distinct from the unconscious defense mechanism of repression in psychoanalytic theory. 2. see CONDITIONED SUPPRESSION; RESPONSE SUPPRESSION. —suppress vb.

**suppressive therapy** a form of psychotherapy directed toward the reinforcement of the client’s defense mechanisms and the suppression (rather than expression) of distressing experiences and feelings. Compare EXPRESSIVE THERAPY.

**suppressor effect** a reduction in the correlation between two variables due to the influence of a third variable. Compare REINFORCER EFFECT.

**suppressor variable** a condition or characteristic that is associated with an INDEPENDENT VARIABLE, such that the correlation between the independent variable and the DEPENDENT VARIABLE is less than what it would be otherwise.

**suprachiasmatic nucleus (SCN)** a small region of the HYPOTHALAMUS in the brain, above the OPTIC CHIASM, that is the location of the CIRCADIAN OSCILLATOR, which controls circadian rhythms. It receives direct input from the retina. See also BIOLOGICAL CLOCK.

**supraliminal adj.** describing stimulation that is above the DIFFERENCE THRESHOLD or ABSOLUTE THRESHOLD.

**supraliminal perception** 1. perception of stimuli that are above the absolute threshold (i.e., that are not subliminal). 2. the processing of above-threshold information that is ignored by the perceiver. Examples include the hum of conversation in a crowded room or visual information displayed very briefly during experiments on perception. Compare SUBLIMAL BIN PERCEPTION.

**supramarginal gyrus** a ridge on the inferior parietal lobe that is near WERNICKE’S AREA and is reportedly involved in the articulation and phonological processing of words. Lesions on this gyrus have been associated with some forms of aphasia.

**supranuclear palsy** see PROGRESSIVE SUPRANUCLEAR PALSY.

**supraoptic nucleus** a particular collection of neurons in the HYPOTHALAMUS that lies above the OPTIC CHIASM. Neurons in this nucleus project to the posterior lobe of the PITUITARY GLAND and secrete the hormones OXYTOCIN and VASOPRESSIN.

**suprarenal gland** see ADRENAL GLAND.

**suprasegmental adj.** in linguistics, denoting the phonological features of speech that extend over a series of SEGMENTS rather than forming individual PHONEMES. In English, the principal suprasegmental features are TONE (pitch), STRESS, and JUNCTURE. Also called prosodic. See also PARALANGUAGE; PROSODY.

**suprasegmental reflex** see SPINAL REFLEX.

**surd n.** an UNVOICED consonant.

**surface color** a color perceived as localized on a surface, as opposed to a color that permeates an object (BULKY COLOR) or a FILM COLOR that is not localized to a surface or an object.

**surface dyslexia** a form of acquired DYSLEXIA in which a person is overly reliant on spelling-to-sound correspondence and therefore has difficulty reading irregularly spelled words. Surface dyslexia manifested as a form of DEVELOPMENTAL DYSLEXIA has also been described. See also DEEP DYSLEXIA. [First described in 1973 by British neuropsychologists John C. Marshall (1939–2007) and Freda Newcombe (1925–2001)].

**surface structure (s-structure)** in the TRANSFORMATIONAL GENERATIVE GRAMMAR developed by Noam CHOMSKY, the structure of a grammatical sentence as it actually occurs in speech or writing, as opposed to its underlying DEEP STRUCTURE or abstract logical form. In Chomsky’s theory, the surface structure of a sentence is generated from the deep structure by a series of transformational rules involving the addition, deletion, or reordering of sentence elements. Psycholinguists have investigated whether and to what extent this may serve as a model for the cognitive processes involved in forming and interpreting sentences.

**surface therapy** psychotherapy directed toward relieving the client’s symptoms and emotional stress through such measures as reassurance, suggestion, and direct attempts to modify attitudes and behavior patterns, rather than through exploration and analysis of unconscious motivation and underlying dynamics. Compare DEPTH THERAPY.

**surface trait** in CATTELL’S PERSONALITY TRAIT THEORY, a characteristic manifested as a group of interrelated observable behaviors. For example, arriving early for appointments and leaving the office only after one’s work is complete are visible manifestations of the characteristic of conscientiousness. Surface traits appear consistently and are thought to cluster and to reflect SOURCE TRAITS, which are regarded as the underlying building blocks of personality.

**surgency n.** a personality trait marked by cheerfulness, responsiveness, spontaneity, and sociability but at a level below that of extraversion or mania. [Defined by Raymond B. CATTELL] —surgent adj.

**surplus energy theory** the hypothesis that children and young animals engage in LOCOMOTOR PLAY because they have excess energy that needs to be expended. See also PLAY.

**surprise n.** an emotion typically resulting from the violation of an expectation or the detection of novelty in the environment. It is considered by some theorists to be one of the emotions that have a universal pattern of facial expression. The physiological response includes raising or arching the eyebrows, opening the eyes wide, opening the mouth wide in an oval shape, and gasping.

**surprisingness n.** in psychological aesthetics, a measure of the degree to which one’s expectations are confirmed or defied by a work of art.

**surrogate n.** 1. a person or object that substitutes for the role of an individual who has a significant position in a family or group. See FATHER SURROGATE; MOTHER SURROGATE. 2. more generally, any person or entity that substitutes for another.

**surrogate decision making** a provision in law or a
surrogate father

regulation permitting the appointment of a surrogate for a person—frequently one with intellectual disability, dementia, or mental disorder—who is not competent to make specific decisions regarding consent to medical, surgical, or other health care procedures. The surrogate makes these determinations on behalf of the person.

surrogate father see FATHER SURROGATE.

surrogate mother see MOTHER SURROGATE.

surrogate variable see PROXY VARIABLE.

sumsurvergence n. the deviation or turning upward of one eye in relation to the other. See STRABISMUS.

survey 1. n. a study in which a group of participants is selected from a population and data about or opinions from those participants are collected, measured, and analyzed. Information typically is gathered by interview or self-report questionnaire, and the results thus obtained may then be extrapolated to the whole population. 2. vih to carry out a survey.

survey error the degree to which the results of a survey are inaccurate, due to such factors as SAMPLING BIAS, content or measurement flaws, or the RESPONSE BIASES of participants. See MEASUREMENT ERROR; SAMPLING ERROR.

survey knowledge an overall mental representation of a spatial environment, as if one had a bird’s-eye view of the environment, as contrasted with specific route knowledge (see ROUTE LEARNING).

survival analysis a family of statistical methods used to model a variety of time-related outcomes. The simplest application of survival analysis involves estimating the amount of time until the occurrence of an event (e.g., death, illness, graduation, marriage) for a group of individuals, but the technique also may be applied to compare durations for two or more groups and to build multivariate models that explain variation in duration. Also called event history analysis.

survival instinct see SELF-PRESERVATION INSTINCT.

survival of the fittest the tendency of individuals that are better adapted to a particular environment to be more successful at surviving and producing offspring. This concept is inherent in the theory of evolution by NATURAL SELECTION, as proposed in the 1850s by British naturalists Charles DARWIN and Alfred Russel Wallace (1823–1913). See also COMPETITION FOR RESOURCES; DARWINIAN FITNESS; SOCIAL DARWINISM. [coined by Herbert SPENCER in Principles of Biology (1864) and adopted by Darwin as a synonym for natural selection in the fifth edition of his Origin of Species (1869)]

survival rate in SURVIVAL ANALYSIS, a value used to indicate the frequency of a particular event’s occurrence at a specific point in time. For example, in a health study, the survival rate (i.e., occurrence of death) may be lower within the 1st year of the diagnosis of a moderately serious disease but become progressively higher over time as the disease becomes more serious.

survival ratio in SURVIVAL ANALYSIS, a value used to indicate the elapsed time prior to an event of interest (e.g., disease onset, death) in relation to the total amount of time studied. Larger survival ratios indicate a longer time until the event’s occurrence.

survival value the degree to which a behavioral, physiological, or physical trait will contribute to REPRODUCTIVE SUCCESS. A trait that can be shown to increase the probability of reproductive success in a given environment has high survival value.

survivor guilt remorse or guilt for having survived a catastrophic event when others did not or for not suffering the ills that others had to endure. It is a common reaction stemming in part from a feeling of having failed to do enough to prevent the event or to save those who did not survive. Survivor guilt is also experienced by family members who are found not to carry deleterious genetic mutations that have led to disease and, often, death in other family members, or by family or friends who feel that they did not do enough to succor their loved ones prior to death.

survivorship n. 1. the process of living through and surviving severe disease (e.g., cancer), traumatic life events (e.g., child abuse), or environmental disaster (e.g., earthquake). 2. the state of living into very old age.

susceptibility n. vulnerability: readily affected by or at increased risk of acquiring a particular condition, such as an infection, injury, or disorder.

susceptibility rhythms cyclical variations in sensitivity to infections or allergic responses.

SUSOPS acronym for SUSTAINED OPERATIONS.

suspended rootogram see HANGING ROOTOGRAM.

sensory ligament see ZONULES.

suspicious jealousy a type of JEALOUSY in which a person fears the loss of a valued relationship to a rival even though the person’s partner has not misbehaved and there is no factual basis for this worry. Although suspicious jealousy is unfounded, it may give rise to emotions and behaviors (e.g., anger, conflict, snooping, stalking) that create the selfsame loss of a relationship that the jealous person seeks to avert. Compare REACTIVE JEALOUSY.

suspicousness n. mistrust of the motives or sincerity of others. Although a degree of suspiciousness in certain situations can be natural and likely serves the purposes of self-preservation or survival, extreme, pervasive suspiciousness is a common characteristic of individuals with PARANOID PERSONALITY DISORDER.

sustained attention attentional focus on a task for an extended length of time. Compare ABSORPTION.

sustained operations (SUSOPS) an extended work schedule under demanding conditions. A sustained workload can combine with fatigue and reduced or fragmented sleep to degrade performance, productivity, safety, and the effectiveness of an operation.

sustained-release preparation see SLOW-RELEASE PREPARATION.

susto n. a CULTURE-BOUND SYNDROME occurring among Latinos in the United States and populations in Mexico, Central America, and South America. After experiencing a frightening event, individuals fear that their soul has left their body. Symptoms include weight loss, fatigue, muscle pains, headache, diarrhea, unhappiness, troubled sleep, lack of motivation, and low self-esteem. Also called chibih; espanto; pasmo; perdida del alma; tripa ida.

swallowing n. the process by which ingested material (food, liquid, etc.) is transferred from the mouth cavity to the stomach, which involves a complex series of reflex muscle contractions and relaxations. The muscles of the cheeks, tongue, and roof of the mouth first contract to
form a chute, after which the tongue presses upward and backward against the hard palate. As the substance to be swallowed passes toward the back of the mouth, the soft palate is raised to close the opening to the nasopharynx. At the same time, the epiglottis is lowered over the opening to the trachea (windpipe) to prevent food or fluid entering the respiratory system, and the larynx moves upward to form a seal against the lower side of the epiglottis. As the substance swallowed enters the esophagus, it is moved along by alternate contractions of two layers of muscles (composed of, respectively, longitudinal and circular muscle fibers) so that the food or fluid is advanced toward the stomach, regardless of body position. Also called deglutition.

**swarm intelligence** see ANIMAL INTELLIGENCE.

**SWB** abbreviation for SUBJECTIVE WELL-BEING.

**sweating** *n.* the discharge of a secretion (*sweat*, which comprises water, salts, and various chemicals) from the sweat glands in the skin. Sweating is important in the control of body temperature. Also called perspiration.

**sweet** *adj.* denoting the pleasurable taste associated with sugars, an immediate source of energy. Sugars are detected by specialized proteins contained in a subset of taste receptors cells mainly toward the front of the tongue (see fungiform papillae). —**sweetness** *n.*

**swinging** *n.* slang for uninhibited sexual expression, as in partner swapping and other forms of group sex, one-night stands, and experimentation with unusual sexual activities (e.g., bondage and discipline).

**switchback design** a type of WITHIN-SUBJECTS DESIGN in which participants are assigned to multiple experimental conditions in a specific pattern that controls for personal and time-related variations that may influence individuals’ responses. For example, suppose a researcher is investigating the effect of three types of instruction (A, B, and C) on the performance of six participants, each of whom has a different learning curve. A switchback arrangement for such a study might be:

```
  A  C  B  A  C  B
  C  B  A  B  A  C
  A  C  B  A  C  B
  C  B  A  B  A  C
```

Each row represents a distinct time period and each column represents a specific participant, with only two instruction types switching back and forth for any given participant.

**switch cost** in studies of task switching, the loss of efficiency associated with redirecting attention from one task to another.

**switch device** the input mechanism that allows a person to activate an ENVIRONMENTAL CONTROL DEVICE. See also CONTROL DEVICE; FEEDBACK DEVICE; TARGET DEVICE.

**switching** *n.* 1. in psychotherapy, changing the course of the discussion during a session. This may be done by the client, either purposefully or nonconsciously, when the discussion is too close to sensitive issues. Switching may also be done by the therapist to change the discussion to more relevant therapeutic issues. 2. in DISASSOCIATIVE IDENTITY DISORDER, the often rapid movement between one personality and another.

**switch process** the process by which a person with a BIPOLAR DISORDER experiences the transition from a MAJOR DEPRESSIVE EPISODE to a MANIC EPISODE or vice versa. These processes usually include brief periods of relatively unimpaired functioning.

**SWLS** abbreviation for SATISFACTION WITH LIFE SCALE.

**Sydenham’s chorea** see CHOREA. [Thomas Sydenham (1624–1689), English physician]

**syllabary** *n.* a writing system that represents each SYLLABLE (rather than each PHONEME) with a separate symbol. For instance, Japanese and Cherokee writing systems use syllabaries either in whole or in part. Compare ALPHABET.

**syllable** *n.* in linguistics, a unit of articulation consisting of a stand-alone vowel or a vowel combined with one or more consonants. The syllable length of a speaker’s sentences is often used as a standard of comparison in psycholinguistic research and in psychometric tests of language development and mental ability. —**syllabic** *adj.*

**sylogism** *n.* a form of DEDUCTIVE REASONING in which a categorial proposition (i.e., one taking the form all X are Y, no X are Y, some X are Y, or some X are not Y) is combined with a second proposition having one of its terms in common with the first to yield a third proposition (the conclusion). For example: All men are mortal; some men are tall; therefore some mortals are tall. Of the numerous possible combinations of terms, only 24 are formally valid. An example of an invalid syllogism would be Some women are tall; all mothers are women; therefore some mothers are tall. Although the conclusion is doubtless empirically correct, it cannot be deduced from these premises. —**syllogistic** *adj.*

**Sylvian aqueduct** see CEREBRAL AQUEDUCT.

**Sylvian fissure** see LATERAL SULCUS.

**sym-** *prefix* see SYN-.

**symbiosis** *n.* 1. any relationship in which two species live together in close association, especially one in which both species benefit (see MUTUALISM). For example, in tropical Amazonia, a species of ant lives on a particular tree species that it uses for food and shelter, at the same time removing lichen and other parasites that might harm the tree. Also called biological symbiosis. 2. the stage in infantile development when the infant’s dependence is total and he or she is neither biologically nor psychologically separated from the mother. See also SEPARATION–INDIVIDUATION. 3. a mutually reinforcing relationship in which one individual is overdependent on another to satisfy needs. Such a relationship hampers the development or independence of both individuals and usually results in dysfunction when the dominant individual is unwilling to provide for the dependent individual. Also called symbiotic relationship. —**symbiotic** *adj.*

**symbiotic infantile psychosis** see SYMBIOTIC PSYCHOSIS.

**symbiotic marriage** a marriage or partnership of CORRESPONDENCY, whereby the individuals are entirely reliant upon each other for the gratification of certain psychological needs. Compare SYNERGIC MARRIAGE.

**symbiotic psychosis** an obsolete name for a condition, occurring in children between the ages of 2 and 5, that is characterized by complete emotional dependence on the mother, inability to tolerate separation from her, reactions
symbiotic relationship

of anger and panic if any separation is threatened, and developmental lag. Some of these features are characteristic of SEPARATION ANXIETY DISORDER. Also called symbiotic infantile psychosis; symbiotic infantile psychotic syndrome. [first described by Hungarian-born U.S. child psychoanalyst Margaret Schönberger Mahler (1897–1985)]

symbiotic relationship see SYMBOIOSIS.

symbol n. 1. any object, figure, or image (e.g., flag, logo, pictogram, religious symbol such as a cross) that represents something else. A written or spoken word can be regarded as a particular kind of symbol (see ARBITRARY SYMBOL; SIGNIFIER). In literature and art, symbols are generally suggestive rather than explicit in their meaning: For example, a rose may suggest ideas of beauty, love, femininity, and transience without being limited to any of these meanings in particular. Carl JUNG maintained that the symbols of religion, mythology, and art throw special light on the COLLECTIVE UNCONSCIOUS. See also SIGN. 2. in classical psychoanalytic theory, a disguised representation of a repressed idea, impulse, or wish. See also SYMBOLIZATION. 3. in safety engineering, a pictorial device used in risk communications to warn workers or consumers of the hazards associated with tools or systems. See SIGNAL WORD PANEL.

—symbolic adj.

symbol–digit test a task in which a person is given a list of symbols, each with a corresponding digit, and then a long list of symbols without the digits, each of which the person has to fill in. The test measures the number of symbol–digit pairs completed in a fixed time or the time taken to complete a fixed number of pairs. See also CODE TEST.

symbol grounding the process of establishing and maintaining the correspondence between symbolic representations of objects and the actual physical objects in the real-world environment. For example, if a child is instructed to retrieve the green box from the shelf, he or she cannot do so properly unless able to associate the internal representation of the item conveyed by the concepts of “green” and “box” with the appropriate sensory experience actually associated with the physical object itself. Also called perceptual anchoring.

Symbolic n. the realm of symbols or SIGNIFERS: one of three aspects of the psychoanalytic field defined by French psychoanalyst Jacques Lacan (1901–1981). The achievement of symbolization marks the beginning of ego differentiation and is associated with the infant’s entrance into the world of language, culture, law, and morality. The other two realms are the IMAGINARY and the REAL. See also MIRROR PHASE; NAME-OF-THE-FATHER.

symbolic action see SYMPOMATIC ACT.

symbolic attitude the evaluation of an ATTITUDE OBJECT based on the extent to which it is seen as consistent or inconsistent with a person’s moral values. See also VALUE-EXPRESSIVE FUNCTION OF AN ATTITUDE.

symbolic displacement the process of transferring a response, usually emotional, from its original stimulus to one that represents it.

symbolic function in PIAGETIAN THEORY, the cognitive ability to mentally represent objects that are not in sight. For example, a child playing with a toy can mentally picture and experience the toy even after it has been taken away and he or she can no longer see it. Symbolic function emerges early in the PREOPERATIONAL STAGE and is expressed through DEFERRED Imitation, language, SYMBOLIC PLAY, and mental IMAGERY. Also called semiotic function.

symbolic interactionism a sociological theory that assumes that self-concept is created through interpretation of symbolic gestures, words, actions, and appearances exhibited by others during social interaction. In contrast to Freudian and other approaches that postulate extensive inner dispositions and regard social interaction as resulting from them, symbolic interactionists believe that inner structures result from social interactions. U.S. social thinkers George Herbert Mead and Charles Horton Cooley (1864–1929) are recognized exponents of this view. See GENERALIZED OTHER; LOOKING-CLASS SELF; REFLECTED APPRAISALS.

symbolic learning theory a theory that attempts to explain how IMAGERY works in PERFORMANCE ENHANCEMENT. It suggests that imagery develops and enhances a coding system that creates a mental blueprint of what has to be done to complete an action.

symbolic logic the systematic use of symbols in logical analysis. In modern symbolic logic, the symbols used are those of mathematics, particularly those of SET THEORY. The language of mathematics is well suited to the investigation of the precise conditions of validity in arguments because it is an ARTIFICIAL LANGUAGE, lacking the connotations and subjective meanings present in a NATURAL LANGUAGE, and because relations between mathematical entities are simple and precisely defined. See LOGIC.

symbolic matching to sample see ARBITRARY MATCHING TO SAMPLE.

symbolic mode see SYMBOLIC REPRESENTATION.

symbolic modeling see PARTICIPANT MODELING.

symbolic play a form of play in which the child uses objects as representations of other things. For example, a child may put a leash on a stuffed animal, take it for a walk, and attempt to feed it. Symbolic play may or may not be social. See also IMAGINARY COMPANION.

symbolic process 1. in cognitive psychology, any cognitive activity in which ideas, images, or other MENTAL REPRESENTATIONS serve as mediators of thought. The term is often used to distinguish the HIGHER MENTAL PROCESSES from either (a) lower cognitive functions, such as perception, or (b) neurophysiological activities that underlie processing at the symbolic level. See also SYMBOLIC THINKING; THINKING. 2. in classical psychoanalytic theory, see SYMBOLIZATION.

symbolic representation the process of mentally representing objects and experiences through the use of symbols (including linguistic symbols). In Jerome Seymour Bruner’s theory of cognitive development, it is one of three modes of representing knowledge (compare ENACTIVE REPRESENTATION; ICONIC REPRESENTATION). A child in this mode (called the symbolic mode or stage) is able to depict and convey ideas through the use of words, sounds, and play; the child can, for example, imagine that he or she is a fire engine and make siren noises while pushing a block that represents a speeding engine.

symbolic reward something that has no intrinsic value but is nevertheless prized because it represents something of value. For example, being listed in a city’s social register may be regarded as a symbolic reward for attainment of high social standing.
**symbolic stage** 1. see preoperational stage. 2. see symbolic representation.

**symbolic thinking** the ability to think about objects and events that are not within the immediate environment. It involves the use of signs, symbols, concepts, and abstract relations, as evidenced by language, numeracy, and artistic or ritual expression. Archaeological finds suggest that symbolic thinking may have evolved in humans much earlier than previously thought, possibly toward the end of the Lower Paleolithic period (i.e., more than 70,000 years ago). See also symbolic process.

**symbolism** n. 1. the use of symbols, which is a necessary component of thinking, language use, and numeracy and therefore a fundamental feature in human culture generally (see semiotics: symbolic thinking). In particular, symbolism is central to the literary and visual arts. A specific, early modernist movement, referred to as Symbolism, developed in France in the mid- to late 19th century as a reaction to realism and naturalism. The writing, primarily poetry and drama, was highly evocative and made extensive use of indirect symbolic language to represent character, situation, and action. Leading exponents were the French poets Charles Baudelaire (1821–1867), Arthur Rimbaud (1854–1891), and Stéphane Mallarmé (1842–1898) and the Belgian dramatist Maurice Maeterlinck (1862–1949). 2. see symbolization.

**symbolization** n. 1. in classical psychoanalytic theory, the substitution of a symbol for a repressed impulse, affect, or idea in order to avoid censorship by the superego (e.g., dreaming of a steeple or other phalloic symbol instead of a penis). Also called symbolism. 2. in social-cognitive theory, the ability to think about one's social behavior in terms of words and images. —symbolize vb.

**symbol-substitution test** see code test.

**SYMLOG** n. systematic multiple level observation of groups: a theory and observational system for studying group behavior. The model assumes that group activities and group members can be classified along three dimensions (dominance–submissiveness, friendliness–unfriendliness, and acceptance–nonacceptance of authority) and that groups whose behavioral profiles are characterized by dominance, friendliness, and acceptance of authority usually work together more effectively. See also structured observation. [developed by U.S. social psychologist Robert Freed Bales (1916–2004)]

**Symmetrel** n. a trade name for amantadine.

**symmetrical distribution** a distribution in which the frequency of values above the mean are a mirror image of those below the mean. Compare asymmetrical distribution.

**symmetry** n. 1. the mirrorlike correspondence of parts on opposite sides of a center, providing balance and harmony in the proportions of objects. This is considered an aesthetically pleasing quality. Distinct patterns of symmetry are widely produced. For example, almost all ornamental bands fall into one of seven types of band symmetry, and essentially all patterned wallpaper can be grouped into 17 types of plane symmetry. 2. one of the gestalt principles of organization. It states that people tend to perceive objects as coherent wholes organized around a center point; this is particularly evident when the objects involve unconnected regions bounded by borders. Also called law (or principle) of symmetry. 3. in mathematics and statistics, equality relative to some axis. More specifically, it is a condition in which values are arranged identically above and below the middle of a data set (see normal distribution) or above and below the diagonal of a matrix. Many standard statistical techniques are appropriate only for symmetrical data, such that nonsymmetrical data often are transformed into a roughly symmetrical form prior to analysis. Compare asymmetry. 4. see stimulus equivalence. 5. symmetrical adj.

**symmetry compulsion** a compulsion to arrange objects in a certain way (e.g., in a room) or in a particular order (e.g., on a desk). Symmetry compulsion is associated with obsessions about neatness or perfection. It can be a symptom of obsessive-compulsive disorder or, sometimes, of obsessive-compulsive personality disorder.

**symmetry test** a method of determining whether a graphical representation of a data set demonstrates symmetry about its x-axis, y-axis, or origin, so that knowing the arrangement of values for one portion of the graph (e.g., values above the mean) enables one to determine the values for the opposite, mirror-image portion of the graph (i.e., values below the mean). If the data do possess such symmetry, they can be analyzed using statistical techniques that assume a normal distribution.

**sympathectomy** n. a surgical procedure in which portions of the sympathetic nervous system are excised, severed, or otherwise disrupted. In chemical sympathectomy, this is accomplished by the administration of specific drugs.

**sympathetic-adrenal-medullary axis** (SAM) a neuroendocrine stress-response system. A stressor is perceived via the sympathetic nervous system, triggering in humans the production and release of hormones such as epinephrine and norepinephrine by the adrenal gland (in particular, the medulla). The SAM interacts chemically with the hypothalamic–pituitary–adrenal axis. Also called sympathetic-adrenal-medullary system; sympathetic adrenomedullary system.

**sympathetic chain** either of two beadlike chains of ganglia of the sympathetic nervous system, one chain lying on each side of the spinal column.

**sympathetic division** see sympathetic nervous system.

**sympathetic ganglion** any of the ganglia that form part of either sympathetic chain.

**sympathetic induction** the process in which one person's expressed emotion elicits a similar emotion in another person. See empathy; sympathy.

**sympathetic nervous system** one of the two divisions of the autonomic nervous system (ANS), the other being the parasympathetic nervous system. Anatomically it consists of preganglionic autonomic neurons whose fibers run from the thoracic and lumbar regions of the spinal cord to the chains of sympathetic ganglia. From these arise the fibers of postganglionic autonomic neurons, which innervate organs ranging from the eyes to the reproductive organs. It is defined functionally in terms of its ability to act as an integrated whole in affecting a large number of smooth muscle systems simultaneously, usually in the service of enhancing the fight-or-flight response. Typical sympathetic changes include dilation of the pupils to facilitate vision, constriction of the peripheral arteries to supply more blood to the muscles and the brain, secretion
Symptom Checklist-90–Revised

Sympathomimetic drug

of epinephrine to raise the blood-sugar level and increase metabolism, and reduction of stomach and intestinal activities so that energy can be directed elsewhere. Thus, the sympathetic nervous system tends to antagonize the effects of the parasympathetic nervous system. Also called sympathetic division.

Sympathomimetic drug any pharmacological agent that stimulates activity in the sympathetic nervous system because it potentiates the activity of norepinephrine or epinephrine or has effects similar to these neurotransmitters (hence it is also known as an adrenergic drug). Sympathomimetic drugs include the amphetamines and ephedrine.

Sympathy n. 1. feelings of concern or compassion resulting from an awareness of the suffering or sorrow of another. 2. more generally, a capacity to share in and respond to the concerns or feelings of others. See also empathy. 3. an affinity between individuals on the basis of similar feelings, inclinations, or temperament. —sympathetic adj. —sympathize vb.

Sympatric adj. describing species that occupy the same habitat or overlapping habitats. Species that do not occupy the same habitat are described as allopatric.

Symphorophilia n. sexual interest and arousal derived from stage-managing the occurrence of a disaster and then watching it. The person may masturbate during the disaster or do so afterward while looking at pictures of the event or thinking about it. —symphorophile n.

Symptom n. 1. any deviation from normal functioning that is considered indicative of physical or mental pathology. See disease; disorder; syndrome. 2. in general, any event that is indicative of another event; for example, a series of strikes is a symptom of economic unrest. —symptomatic adj.

Symptomatic act an action that appears to be intended for one purpose (or to have no particular purpose) but that betrays a hidden intention or meaning. In classical psychoanalytic theory, such acts are thought to represent repressed impulses, affects, or ideas. Also called symbolic action. See also compromise formation; freudian slip; parapraxis; symptom formation.

Symptomatic epilepsy see epilepsy.

Symptomatic treatment treatment directed toward the relief of distressing symptoms, as opposed to treatment focused on underlying causes and conditions. Symptomatic treatment of chronic migraines, for example, would involve the use of analgesics to relieve pain without attempting to discover why the migraines are occurring.

Symptomatology n. 1. the combined signs, markers, or indications of a disease or disorder. 2. the scientific study of the markers and indications of a disease or disorder.

Symptom bearer see identified patient.

Symptom checklist any self-report inventory used to assess the severity of symptoms of a given disorder, as used in the beck depression inventory, or across a range of disorders, as in the symptom checklist–90–revised. Symptom checklists are often used in both clinical and research settings to measure treatment progress and outcomes.

Symptom Checklist-90–Revised (SCL-90-R) a 90-item self-report inventory that measures the psychological symptoms and distress of community, medical, and psychiatric respondents along nine primary symptom dimensions and three global indices. The SCL-90-R adds four dimensions to the five assessed in the hopkins symptom checklist, of which it is a direct outgrowth: hostility, phobic anxiety, paranoid ideation, and psychoticism.

Symptom cluster a group of related symptoms that usually occur together, as in a syndrome.

Symptom complex see syndrome.

Symptom-context method a system of gathering data as symptoms arise in vivo in the psychotherapy session as an aid to psychotherapy research, case formulation, and treatment. It is similar to the core conflictual relationship theme method. [developed by Lester luborsky]

Symptom formation 1. in psychoanalytic theory, the development of a somatic or behavioral manifestation of an unconscious impulse or conflict that provokes anxiety. Also called substitute formation. 2. the process by which the indications of physical or psychological pathology develop.

Symptom removal in psychotherapy, elimination of symptoms through direct treatment without addressing underlying issues and unconscious motivation. See also surface therapy.

Symptoms of Dementia Screener (SDS) an informal checklist of 11 yes-or-no questions for lay persons to use to determine whether a family member or friend might be developing dementia. Answering yes to five or more questions (e.g., whether the individual often repeats himself or herself, forgets appointments) indicates that the family member or friend should see a health care professional for further evaluation.

Symptom specificity a hypothesis stating that people with psychosomatic disorders display abnormal responses to stress in particular physiological systems. According to this hypothesis, a person’s complaints will center around a particular organ (e.g., the heart) and set of related symptoms (e.g., cardiovascular symptoms) rather than involving a variety of complaints about different organs or systems.

Symptom substitution in the classical psychoanalytic theory of Sigmund freud, the development of a symptom to replace one that has cleared up as a result of treatment. It is said to occur if the unconscious impulses and conflicts responsible for the original symptom are not dealt with effectively. Symptom substitution is often used as an argument against therapies aimed at symptom removal alone, as in behavior therapy and some forms of hypnotherapy; however, this argument has not been validated.

Syn- (sym-) prefix 1. with or together (e.g., synchroniza- tion). 2. union or fusion (e.g., syncretism).

Synanon n. a residential drug treatment program that utilized confrontation and peer pressure to encourage its members to deal with their addiction. Founded in california in 1958 by Charles dederich (1914–1997), himself a recovering alcoholic, Synanon was the first major drug treatment program in the united states, and its tough love approach to overcoming addiction was widely publicized as innovative and effective. It evolved into an experimental commune that dederich proclaimed as a religion in the mid-1970s. Thereafter, amid accusations of authoritarian practices within the community and Dederich’s no-contest plea to charges of attempted murder, Synanon declined in prominence and was eventually disbanded in 1991.
synapse n. the specialized junction through which neural signals are transmitted from one neuron (the presynaptic neuron) to another (the postsynaptic neuron). In most synapses, the knoblike ending (terminal button) of the axon of a presynaptic neuron faces the dendrite or cell body of the postsynaptic neuron across a narrow gap, the synaptic cleft. The arrival of a neural signal triggers the release of neurotransmitter from synaptic vesicles in the terminal button into the synaptic cleft. Here the molecules of neurotransmitter activate receptors in the postsynaptic membrane and cause the opening of ion channels in the postsynaptic cell. This may lead to excitation or inhibition of the postsynaptic cell, depending on which ion channels are affected. Also called synaptic junction. See also axonal synaptic; electrical synaptic. —synaptic adj.

synapse rearrangement a refinement of synaptic connections, involving the loss of some synapses and the establishment of others, that is often seen in development or that follows loss of or damage to some neurons.

synaptic bouton see axon.

synaptic cleft the gap within a synapse between the knoblike ending of the axon of one neuron and the dendrite or cell body of a neighboring neuron. The synaptic cleft is typically 20 nm to 30 nm wide. Also called synaptic gap.

synaptic depression the reduced ability of a synapse to transmit a neural signal. It is a form of neural plasticity.

synaptic junction see synapse.

synaptic knob see axon.

synaptic pruning a neurodevelopmental process, occurring both before birth and up to the second decade of life, in which the weakest synapses between neurons are eliminated. In schizophrenia research, it is hypothesized that premature or excessive pruning may account for some forms of the disorder.

synaptic transmission see neurotransmission.

synaptic transmitter see neurotransmitter.

synaptic vesicle any of numerous small spherical sacs in the cytoplasm of the knoblike ending of the axon of a presynaptic neuron that contain molecules of neurotransmitter. The transmitter is released into the synaptic cleft when a nerve impulse arrives at the terminal button.

synaptogenesis n. the formation of synapses between neurons as axons and dendrites grow. See also experience-dependent; experience-expectant process.

syncheiria (synchiria) n. a disorder of sensation in which a person experiences pain or touch sensations on both sides of the body when only one side is actually stimulated. It is considered a type of dyschiria.

synchronicity n. in the analytic psychology of Carl Jung, the simultaneous occurrence of events that appear to have a meaningful connection when there is no explicable causal relationship between these events, as in extraordinary coincidences or purported examples of telepathy. Jung suggested that some simultaneous occurrences possess significance through their very coincidence in time.

synchronic linguistics see diachronic linguistics.

synchronism n. the simultaneous occurrence or existence of phenomena. —synchronic adj. —synchronous adj.

synchronization n. in electroencephalography, a pattern of brain-wave activity that appears to be coordinated. See delta wave.

synchronized sleep see NREM sleep.

synchronous brood see asynchronous brood.

synchronous correlation in longitudinal designs, the degree of relationship between variables at a specific moment in time.

synchrony n. 1. the simultaneous occurrence of things or events. 2. the rhythmic coordination of speech and movement that occurs nonconsciously both in and between individuals during communication: In self-synchrony, the individual’s bodily movements (e.g., hand gestures, head movements) tend to be synchronized with his or her own speech; in interactional synchrony, the movements of the listener correspond with the speech and movements of the speaker. The latter term also denotes an interaction between a parent and infant that is characterized by attunement even to small shifts in the responses or signals between them. Parent–infant synchrony in the first months of life has been shown to predict secure attachment in the infant and to promote the child’s later emotional and social development. [originally studied in the 1970s by U.S. psychologist William S. Condon and U.S. psychiatrist Louis W. Sander (1918–2012)] 3. in dance therapy, the act of moving together in harmony, which tends to bring people into greater emotional closeness. —sycopel adj.

syncope n. fainting; a transient loss of consciousness resulting from sudden reduction in the blood supply to the brain. The most common type is vasovagal syncope, in which the drop in blood supply is caused by heightened vagus nerve activity in response to certain triggers, such as standing up too quickly or experiencing unpleasant stimuli (e.g., the sight of blood, severe emotional distress). —syncopal adj.

syncretic thought the first, or prelogical, stage of thinking in a child’s life, characterized by egocentric and frequently animistic thought processes. For example, a simple block may be called a car, or a broomstick may be ridden as a horse. At this stage, connections are likely to be purely accidental: If the sun shines brightly on the child’s birthday, for example, the child may think that the birthday is the reason for the sun to shine. See animism. [proposed by Jean Piaget]

syncretism n. the integration of elements from two or more systems, theories, or concepts into a new system, theory, or concept. The term is mainly applied to systems in which cultures, beliefs, or doctrines that may appear incompatible are nevertheless combined. —syncretic adj.

syndrome n. a set of symptoms and signs that are usually due to a single cause (or set of related causes) and together indicate a particular physical or mental disease or disorder. Also called symptom complex.

synecdoche n. see metonymy.

synectics model an educational approach that emphasizes creative problem solving and the development of teaching methods that enhance student creativity, such as encouraging metaphorical thinking.
synergic marriage

synergic marriage a marriage or partnership that is enhanced by the contributions the partners can make in satisfying each other’s psychological needs in a positive manner. Compare SYMBIOTIC MARRIAGE.

synergism n. the joint action of different elements such that their combined effect is greater than the sum of their individual effects, as, for example, in DRUG SYNERGISM. —synergistic adj.

synergistic muscles muscles that work together to produce a specific action, such as flexion or extension of a limb. See also AGONIST; ANTAGONIST.

synergy n. the coordination of forces or efforts to achieve a goal, as when a group of muscles work together in order to move a limb. Also called coordinate structure. —synergic adj.

synesthesia (synaesthesia) n. a condition in which stimulation of one sense generates a simultaneous sensation in another. These concomitant sensations are automatic (i.e., unintentional, uncontrollable, nonconscious, and efficient), vivid, and consistent over time. Originally, synesthesias also were believed to be asymmetric, but bidirectional associations in which either sensation can induce the other have recently been observed. There are more than 50 different types of synesthesia. Most common are grapheme-color synesthesia, in which a person sees colors when viewing letters, numbers, or words (i.e., graphemes) on a printed page, and time-space synesthesia, in which a person experiences months, days, hours, and other units of time as occupying specific spatial locations around him or her (e.g., January is 10° to the left of midline). Rarer types include mirror-touch synesthesia, in which a person watching another individual being touched feels a tactile sensation on his or her own body, and lexical-gustatory synesthesia (or word-gustatory synesthesia or word-taste synesthesia), in which individuals experience flavors when they hear certain words. Estimates vary; but nearly 5% of people may have some form of this neurological blending of the senses. Various explanations have been offered for the phenomenon, the most popular being the cross-activation theory, proposing that synesthesia stems from increased connectivity between neighboring sensory cortical areas as a result of incomplete developmental pruning of synapses, and the disinhibited feedback theory, proposing that synesthesia arises when the feedback that develops postnatally from higher cortical areas onto lower sensory cortical areas is too weak to inhibit effects from connections between these sensory areas. See also CHROMATIC AUDITION; CHROMESYSTEMIA; PHONISM.

synkinesis (synkinesia) n. see MOTOR OVERFLOW.

synonym n. a word that has exactly or almost exactly the same meaning as another word in the same language, so that the two are ordinarily interchangeable. Compare ANTONYM. —synonymous adj.

synopsia n. a form of SYNESTHESIA in which specific colors are associated with specific tones. Also called synopsy.

syntactics n. the structural and grammatical aspects of language, as distinguished from SEMANTICS.

syntax n. the set of rules that describes how words and phrases in a language are arranged into grammatical sentences, or the branch of linguistics that studies such rules. With MORPHOLOGY, syntax is one of the two traditional subdivisions of grammar. —syntactic or syntactical adj.

syntactic mode the highest stage in experiencing the world, characterized by CONSENSUAL VALIDATION, the development of logical, reality-oriented thinking, and the expression of ideas in a commonly accepted language. [defined by Harry Stack SULLIVAN]

synthesis n. 1. the bringing together of disparate parts or elements—be they physical or conceptual—into a whole. For example, BIOSYNTHESIS is the process by which chemical or biochemical compounds are formed from their constituents, and MENTAL SYNTHESIS involves combining ideas and images into meaningful objects of thought. 2. in philosophy, the final stage of a dialectical process: a third proposition that resolves the opposition between THESIS and ANTHESIS. The synthesis then serves as the thesis in the next phase of the ongoing dialectic. This use of the term is particularly associated with the thought of German philosopher Georg Wilhelm Friedrich Hegel (1770–1831). See also DIALECTICAL MATERIALISM. —synthetic adj.

synthetic approach the combining (synthesizing) of various processes, systems, skills, or other components into a more complex whole as a means of learning or better understanding the whole. For example, a synthetic approach to learning to read is one in which the child first learns to recognize written letters and understand their associated sounds before learning to combine letters into syllables and words. Compare ANALYTIC APPROACH.

synthetic cannabinoid see TETRAHYDROCANNABINOL.

synthetic language see FUSIONAL LANGUAGE.

synthetic opioid see (OPIOID).

synthetic speech speech produced by a machine, usually a computer. Speech synthesis algorithms differ in complexity and in other ways, and therefore the speech they produce varies in quality (intelligibility and naturalness). Compare COMPRESSED SPEECH; DIGITIZED SPEECH.

synthetic validity in industrial and organizational settings, a technique for inferring the validity of a selection test or other predictor of job performance from a job analysis. It involves systematically analyzing a job into its elements, estimating the validity of the test or predictor in predicting performance on each of these elements, and then combining the validities for each element to form an estimate of the validity of the test or predictor for the job as a whole. Synthetic validity can be useful in estimating the validity of selection procedures in small organizations where the larger samples required in CONCURRENT VALIDITY and PREDICTIVE VALIDITY are not available. See also JOB-COMPONENT VALIDITY.

syntonia n. a high degree of emotional responsiveness to the environment. —syntonic adj.

syphilis n. a contagious disease caused by infection with the spirochete bacterium Treponema pallidum. Syphilis is usually a SEXUALLY TRANSMITTED DISEASE, but it can be transmitted through a break or cut in the skin or mucous membrane; it can also be transmitted by an infected pregnant woman to an unborn child. Untreated, syphilis progressively destroys body tissues, particularly those of the heart and nervous system. See also CEREBRAL SYphilIS; GENERAL PARESIS.

syringe exchange program see NEEDLE EXCHANGE PROGRAM.

syringomyelia n. a disorder marked by the presence of a fluid-filled cavity in the spinal cord that expands and elon-
gates over time, causing progressive damage to the spinal cord and resulting in weakness in the arms and legs and loss of temperature and pain sensation. Syringomyelia may occur as a complication of trauma, meningitis, hemorrhage, a tumor, or congenital defects.

**syrinx** n. (pl. syringes) see ANIMAL VOCALIZATION; VOCAL COMMUNICATION.

**system** n. 1. any collective entity consisting of a set of interrelated or interacting elements that have been organized together to perform a function. 2. an orderly method of classification or procedure (e.g., the Library of Congress Classification system). 3. a structured set of facts, concepts, and hypotheses that provide a framework of thought or belief, as in a philosophical system. See CONCEPTUAL SYSTEM. 4. a living organism or one of its major bodily structures (e.g., the respiratory system). —**systematic** adj.

**System 1** in the DUAL PROCESS THEORY of reasoning and decision making, a mode of thought comprising rapid, implicit, and automatic cognitive operations. System 1 is contrasted with the slow, explicit, and controlled processes of **System 2.** In other words, System 1 is intuitive and affective (i.e., what “feels right”), whereas System 2 is logically analytical and deliberate (i.e., what “makes sense”). Additionally, System 1 relies on ASSOCIATIVE MEMORY and thus has a high capacity and entails little effort; System 2 relies on WORKING MEMORY and thus has a limited capacity and entails greater effort. Errors of judgment arise from concurrent failures in both systems: The automatic operations of System 1 generate a faulty intuition, which the controlled operations of System 2 fail to detect and correct. For example, when deciding whether it is more dangerous to travel by car or airplane, a person may quickly recall horrific images of airline disasters and erroneously conclude that flying is more dangerous. This might then be compounded by a failure to think analytically about the total number of automobile versus airline accidents. A variety of other labels have been proposed over the years for this distinction, including impulsive versus reflective, intuition versus reasoning, experiential versus rational, heuristic versus systematic, and Type 1 versus Type 2.

**systematic approach** see TOPOGRAPHIC MODEL.

**systematic behavioral universal** see PSYCHOLOGICAL UNIVERSAL.

**systematic desensitization** a form of BEHAVIOR THERAPY in which COUNTERCONDITIONING is used to reduce anxiety associated with a particular stimulus. It involves the following stages: (a) The client is trained in deep-muscle relaxation; (b) various anxiety-provoking situations related to a particular problem, such as fear of death or a specific phobia, are listed in order from weakest to strongest; and (c) each of these situations is presented in imagination or in reality, beginning with the weakest, while the client practices muscle relaxation. Since the muscle relaxation is incompatible with the anxiety, the client gradually responds less to the anxiety-provoking situations. See also COVERT DESSENSITIZATION; IN VIVO DESSENSITIZATION; RECIPROCAL INHIBITION. [introduced by Joseph Wolpe]

**systematic error** error in which the data values obtained from a sample deviate by a fixed amount from the true values within the population. For example, a scale that repeatedly provides readings 0.5 g lower than the true weight would be demonstrating systematic error. Systematic errors tend to be consistently positive or negative and may occur as a result of SAMPLING BIAS or MEASUREMENT ERROR. Compare RANDOM ERROR.

**systematic multiple level observation of groups** see SYMLOG.

**systematic observation** an objective, well-ordered method for close examination of some phenomenon or aspect of behavior so as to obtain reliable data unbiased by observer interpretation. Systematic observation typically involves specification of the exact actions, attributes, or other variables that are to be recorded and precisely how they are to be recorded. The intent is to ensure that, under the same or similar circumstances, all observers will obtain the same results.

**systematic processing** see HEURISTIC-SYSTEMATIC MODEL.

**systematic random sampling** see SYSTEMATIC SAMPLING.

**systematic rational restructuring** a system of psychotherapy in which the client is encouraged to imagine anxiety-provoking situations while talking about them in a realistic manner that reduces his or her anxieties.

**systematic replication** the process of conducting a study again but with certain consistent differences, often in an attempt to extend the original research to different settings or participants. For example, a systematic replication could refine the design (e.g., by using more participants) or the methodology (e.g., by using more standardized procedures or objective measures). Compare DIRECT REPLICATION.

**systematics** n. see BIOLOGICAL TAXONOMY.

**systematic sampling** a type of sampling process in which all the members of a population are listed and then some objective, orderly procedure is applied to randomly choose specific cases. For example, the population might be listed alphabetically and every seventh case selected. Also called quasirandom sampling: **systematic random sampling**.

**systematic variance** see UNSYSTEMATIC VARIANCE.

**systematized delusion** a false, irrational belief that is highly developed and organized, with multiple elaborations that are coherent, consistent, and logically related. Compare FRAGMENTARY DELUSION.

**system flow diagram** in ergonomics, a flow chart used to illustrate the movement of materials or people within a WORK SYSTEM or to illustrate the direction of movement of information.

**systemic adj.** concerning or having impact on an entire system. For example, a systemic disorder affects an entire organ system or the body as a whole.

**systemic lupus erythematosus (SLE)** see LUPUS ERYTHEMATOSUS.

**systemic mucopolysaccharidosis** see MAROTEAUX-LAMY SYNDROME.

**systemic thinking** a combination of analytical and synthetic thinking that takes account of the impact of a system (or organization) and all its components together. Analytical thinking is concerned with breaking down a concept into its component parts, whereas synthetic thinking is the process of combining components to make a complete whole.

**system model of evaluation** a method of assessing
systems analysis

ORGANIZATIONAL EFFECTIVENESS in terms of a working model of an organization as a multifunctional social unit capable of maintaining itself. It is concerned with assessing the allocation of resources by the organization to reach an optimum level of operation, rather than with assessing the effectiveness of the organization in achieving public goals.

systems analysis the process—and the specialty area itself—of studying any system (e.g., the circulatory system, an organization, a family) so as to comprehend or clarify its internal workings and its purposes, often with a view to improving interrelations among constituent elements or to achieving a desired end more effectively. —systems analyst n.

systems engineering a discipline that adopts an integrated, multidisciplinary approach to the design and analysis of WORK SYSTEMS in order to account for the complex interdependencies of system components, people, and processes. Its goal is to enhance efficiency and safety. See ERGONOMICS: MACROERGONOMICS: SOCIOTECHNICAL SYSTEMS APPROACH. See also ENGINEERING PSYCHOLOGY; HUMAN FACTORS ENGINEERING.

systems of support a framework for identifying the nature and profile of services and supports required by a person with intellectual disability. This is based on considerations of intellectual functioning and adaptive skills, psychological and emotional factors, physical health and etiological factors, and environmental or situational factors.

systems theory see GENERAL SYSTEMS THEORY.

systolic blood pressure the pressure of the blood against the arterial walls produced by the contraction of the heart muscles as the blood is forced into the aorta and the pulmonary artery. See BLOOD PRESSURE. Compare DIASTOLIC BLOOD PRESSURE.
communicate with the participants. In... TABULAR ADJ. EXPLANATORY NOTES.

during a seance, ostensibly reflecting the efforts of spirits to... table-tipping... ERA, but the phenomenon itself was often faked. Also called TABLE-TILTING N. IN SPIRITUALISM, MOVEMENTS OF A TABLE DURING A SEANCE, OSTEOSISTELY REFLECTING THE EFFORTS OF SPIRITS TO COMMUNICATE WITH THE PARTICIPANTS. IN PARAPSYCHOLOGY, THE SAME MOVEMENTS MIGHT BE ATTRIBUTED TO PSYCHOKINESIS. TABLE-TIPPING SEANCES WERE VERY POPULAR IN THE VICTORIAN ERA, BUT THE PHENOMENON ITSELF WAS OFTEN FAKE. ALSO CALLED TABLE-TINGING: TABLE-TURNING.

tabes dorsalis see LOCOMOTOR ATAXIA.

table n. A PRESENTATION OF DATA IN AN ORDERED ARRANGEMENT OF OVERLAPPED VERTICAL COLUMNS AND HORIZONTAL ROWS. AS WITH A GRAPH, THE PURPOSE OF A TABLE IS TO COMMUNICATE INFORMATION (EITHER IN WORDS OR NUMERICAL VALUES) IN A CONCISE, SPACE-EFFICIENT MANNER THAT CAN BE ASSESSED AT A GLANCE AND INTERPRETED EASILY. THE COLUMNS HAVE HEADINGS; THE LEFTMOST COLUMN, WHICH USUALLY LISTS THE INDEPENDENT VARIABLE, IS REFERRED TO AS THE STUB COLUMN. THE INTERSECTION OF A COLUMN AND A ROW IS CALLED A CELL. TABLES ARE OFTEN ACCOMPANIED BY EXPLANATORY NOTES. —TABULAR ADJ.

table-tutting n. In parapsychology, the same movements might be attributed to psychokinesis. Table-tutting seances were very popular in the Victorian era, but the phenomenon itself was often faked. Also called table-tipping: table-turning.

taboo n. 1. A RELIGIOUS, MORAL, OR SOCIAL CONVENTION PROHIBITING A PARTICULAR BEHAVIOR, OBJECT, OR PERSON. THE WORD DERIVES FROM TALU, THE POLYNESIAN TERM FOR “SACRED,” WHICH WAS USED SPECIFICALLY IN REFERENCE TO OBJECTS, RITES, AND INDIVIDUALS SACRED TO SACRED USE OR SERVICE AND, THEREFORE, SEEN AS FORBIDDEN, UNCLEAN, OR UNTOUCHABLE IN SECULAR CONTEXTS. 2. ADJ. PROHIBITED OR STRONGLY DISAPPROVED.

tabula rasa the idea that at birth the mind is like a “blank tablet” (from Latin) and that all knowledge is subsequently derived from sensory experience. The notion of innate ideas is thus dismissed as a fiction. The phrase is mainly associated with John Locke, although he never in fact used it: Locke’s actual phrase was “white paper.” See empiricism.

tachisme n. See ACTION PAINTING.

tachistoscopy n. A DEVICE THAT DISPLAYS (USUALLY BY PROJECTING) VISUAL MATERIAL ON A SCREEN FOR A SPECIFIC AMOUNT OF TIME, USUALLY AT VERY BRIEF INTERVALS. WORDS, NUMBERS, PICTURES, AND SYMBOLS CAN BE RAPIDLY PRESENTED IN THE RIGHT OR LEFT VISUAL FIELD. THE DEVICE IS USED IN EXPERIMENTS CONCERNED WITH VISUAL PERCEPTION, RECOGNITION SPEED, AND MEMORY. IT IS ALSO WIDELY USED IN MARKET RESEARCH CONCERNED WITH ADVERTISING, LOGOS, BRANDING, AND SO FOR. ALSO CALLED T-SCOPE.

tachycombining form fast or accelerated.
tachyathetosis n. See Ekrom’s syndrome.
tachycardia n. See arrhythmia.
tachypnea n. Speech that is characterized by persistent volubility and rapidity. See logorrhea. See also Pressured speech.
tachypnoea n. A rapidly decreasing response to repeated administration of a drug. For example, the blood pressure of a patient might continue to rise despite repeated injections of a drug that normally would lower the blood pressure. —TACHYPNEIC ADJ.
tachypnoeic adj.
tachypnoea n. An altered perception of time, in which time seems to speed up or slow down. See Psychological time. —TACHYPNEIC ADJ.
tacit knowledge knowledge that is informally acquired rather than explicitly taught and allows a person to succeed in certain environments and pursuits. It is stored without awareness and therefore is not easily articulated. Many everyday skills are of this kind, such as the ability to recognize faces or to speak one’s native language. Also called implicit knowledge: unconscious knowledge. [Proposed by Hungarian-born British scientist and philosopher Michael Polanyi (1891–1976)]
tacrine n. An acetylcholinesterase inhibitor used for the treatment of mild to moderate dementia associated with Alzheimer’s disease (see cognitive enhancer). A common adverse reaction to tacrine is liver dysfunction, which limits its use. U.S. trade name: Cognex.
tactcombining form touch.
tactic adj. See Taxis.
tactile agnosia loss or impairment of the ability to recognize and understand the nature of objects through touch. Several distinct subtypes have been identified, including amorphagnosia, impaired recognition of the size and shape of objects: aphylognosis, impaired recognition of such object qualities as weight and texture; and finger agnosia, impaired recognition of one’s own or another person’s fingers.
tactile aid see TACTILE SENSORY AID.
tactile amnesia see astereognosis.
tactile circle an area of the skin where two tactile stimuli presented simultaneously are perceived as one. See also sensory circle.
tactile communication the use of touch as a means of communication. In dogs and wolves, the placing of one individual’s head and neck on the back of another is a signal of dominance. In many nonhuman primates, allogrooming is important in maintaining social relationships and may release hormones that help provide physiological calming or a reward effect.
tactile encoding see VISUAL ENCODING.

tactile extinction see DOUBLE-SIMULTANEOUS TACTILE SENSATION.

Tactile Finger Recognition see FINGER LOCALIZATION TEST.

Tactile Form Perception a test in which participants use one hand to feel a geometric figure made of sandpaper, which is hidden from view, and then identify it from among a set of 12 drawings. There are 20 geometric figures in total: 10 are presented to one hand and 10 to the other. The test assesses nonverbal tactile information-processing ability and is scored for the number of correct identifications. [developed in 1983 by Arthur L. BENTON and colleagues]

tactile form recognition any test of the ability to recognize an object by touch alone. Such tests usually involve blindfolding the participants and asking them to name objects placed in their hands.

Tactile hallucination a false perception involving the sense of touch. These sensations occur in the absence of any external stimulus and may include itching, feeling electric shocks, and feeling insects biting or crawling under the skin. Also called haptic hallucination; tactual hallucination.

tactile illusion an illusion involving the touch sense. Tactile illusions may occur when patterns are pressed on the skin rather than when patterns are experienced through voluntary movement to gain information about the object or surface. Compare HAPTIC ILLUSION.

tactile perception the ability to perceive objects or judge sensations through the sense of touch. The term often refers to judgments of spatial stimulation of the skin, patterns imposed on the skin, or sensory events involving stimulation of the skin (e.g., the thermal properties of a liquid). Some researchers restrict this term to PASSIVE TOUCH. Compare HAPTIC PERCEPTION.

tactile perceptual disorder a condition, due to brain damage, that is characterized by difficulty in discriminating sensations that involve touch receptors. Individuals may be unable to determine the shape, size, texture, or other physical aspects of an object merely by touching it.

tactile receptor any of the CUTANEOUS RECEPTORS or other receptors involved in the SOMATOSENSES.

tactile sense see TOUCH SENSE.

tactile sensory aid a device that makes use of touch to help individuals cope with a hearing or visual impairment. An example of a tactile sensory aid is a vibrator that cues a person with hearing loss that the doorbell is ringing. Other aids provide assistance with reading, and a number of electronic travel aids facilitate orientation and mobility for people with visual impairment. Although tactile sensory aids are also called tactile aids, the latter term is sometimes used more explicitly to refer only to devices that convert auditory information into patterns of skin stimulation—either vibratory (for a vibrotactile aid) or electrical (for an electrotactile aid)—for use in communicating with and teaching speech production to people with profound hearing loss. See also TACTUAL DISPLAY.

Tactile stimulation activation of a sensory receptor by a touch stimulus. Also called tactual stimulation.

tactual display a device for transmitting information that is to be read or otherwise processed through the use of touch. Tactual displays may provide BRAILLE output from a computer or information in letter shapes. They may use simple vibrators, raised pins, or electrocutaneous stimulation of the skin. Tactual displays are useful for people with visual impairment, and some are used for assisting people with hearing loss. See also TACTILE SENSORY AID.

tactual hallucination see TACTILE HALLUCINATION.

tactual localization see POINT LOCALIZATION.

Tactual Performance Test (TPT) a subtest of the HALSTEAD–REITAN NEUROPSYCHOLOGICAL BATTERY that requires a blindfolded individual to place wooden shapes (e.g., stars) into a formboard placed at a 45° angle to the vertical. Performances for the dominant, nondominant, and both hands simultaneously are obtained, and then the blindfold is removed and the individual is asked to draw the shapes and their relative positions on the formboard. The test measures motor skills, tactile perception, nonverbal memory, and other cognitive functions.

tactual shape discrimination the ability to determine the shapes of objects by touch alone, as in the case of a person differentiating between a cylinder and another object when unable to see either one of them.

tactual size discrimination the ability to judge the comparative size of two invisible objects through the sense of touch. It is used as a test for the possible presence of a cortical lesion that would interfere with this ability.

Tactual stimulation see TACTILE STIMULATION.

Tadoma method a technique of communicating with people having both hearing and visual impairment. People with these disabilities learn to place their fingers on the cheek and neck and their thumb on the mouth of the person speaking and translate the vibrations and muscle movements into words. [originated in the 1930s by U.S. teacher Sophia Alcorn (1883–1967); the name is derived from Tad and Oma, two of her students]

TAE abbreviation for tilt AFTEREFFECT.

TAF abbreviation for THOUGHT–ACTION FUSION.

Taft–Hartley Act see LABOR MANAGEMENT RELATIONS ACT.

TAG acronym for TALENTED AND GIFTED.

tagging n. the process of attaching a RADIOACTIVE ISOTOPE to a molecule to label it and create a RADIOACTIVE TRACER. The tagging enables observation of the route and distribution of a substance through the body and also its measurement.

Tag question in linguistics, a short INTERROGATIVE clause attached to the end of a statement to invite the agreement of a listener, as in The bird flew away, didn’t it? or We’ve not been here before, have we? In English, the form of the tag question is determined by the structure of the main statement and a combination of linguistic rules involving pronounominalization, negation, interrogation, and truncation, as seen in the examples given above. The ability of young children to form appropriate tag questions is considered a prime illustration of their early mastery of linguistic rules.

taijin kyofusho a phobia, similar to SOCIAL PHOBIA and unique to Japan, that is characterized by an intense fear that one’s body parts, bodily functions, or facial expres-
sions are embarrassing or offensive to others (e.g., in appearance, odor, or movement).

tail flick test a procedure used to measure pain sensitivity in nonhuman animals (usually rodents). An intense beam of light is focused on a specific spot on the animal’s tail. After a period, the animal abruptly moves its tail to avoid the beam of light. The time that elapses before this tail flick is used as an index of pain sensitivity; analgesic drugs (e.g., morphine) increase the reaction time.

TAIS abbreviation for TEST OF ATTENTIONAL AND INTERPERSONAL STYLE.

Takayasu’s disease a circulatory disorder involving arteries that carry blood from the aortic arch above the heart toward the brain. Occlusion of the innominate, left subclavian, and left carotid arteries results in loss of a pulse in the arms and neck, cramplike pain in the arms, and fainting spells due to CEREBRAL ISCHEMIA. The disease seems to affect mainly young females. [Michishige Takayasu (1872–1938), Japanese physician]

talbot n. a unit of light energy equal to one LUMEN second—that is, the energy carried by one lumen in one second.

Talbot–Plateau law the principle that if a light flickers so rapidly that it is perceived as continuous, its brightness will be determined by the ratio of the duration of the on period to the off period. Thus, the perceived brightness of the stimulus that appears continuous is actually an average of the brightness of the on and off periods. [William Henry Fox Talbot (1800–1877), British physicist; Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]

talent n. an innate skill or ability, or an aptitude to excel in one or more specific or subject areas. Talent cannot be accounted for by normal development patterns and is often not maximized, as its nurturance requires time, energy, sacrifice, dedication, and resources from parents, mentors, and the talented person. Ideal circumstances for the development of a talent include enjoyment of the talent for its own sake and a clear perception of how it can be exploited to fulfill the individual’s long-term aspirations. —talented adj.

talented and gifted (TAG) describing children who display a level of intelligence significantly above average, special abilities, or both, as measured by appropriate standard assessment procedures. Talented and Gifted Education refers to any program that promotes education advocacy, research, and the sharing of ideas between educators and parents of such children.

talion n. retaliation, especially retaliation in kind, as in the biblical injunction “an eye for an eye, a tooth for a tooth.” The talion principle or law plays an important part in psychoanalytic theory; because it includes the general idea of retribution for defying the SUPEREGO and the specific fear (talion dread) that all transgressions, accidental or intentional, will be punished in kind. For example, a person wishing consciously or unconsciously for the death of another person might suffer extreme anxiety caused by the fear that he himself or she herself is dying.

talipes n. see CLUBFOOT.

talking book a recorded book distributed in a variety of formats (e.g., CD/DVD, memory card, Internet download) for use by individuals with visual impairment or certain learning disabilities (e.g., dyslexia). Requiring the use of specially designed playback equipment, talking books differ from commercial audiobooks in their use of the Digital Accessible Information System (DAISY), a technical standard with advanced navigation that allows listeners line-by-line access to complex material, such as a textbook, encyclopedia, or periodical. Talking books provide synchronized multimedia files that include audio and text, and they also support braille output.

talking cure a synonym for insight-oriented psychotherapy; sometimes used dismissively. The term is apt in that the essence of certain psychotherapeutic approaches is for the client to “talk out” his or her problems with the therapist. First used in the context of psychoanalysis, the term was coined by the landmark patient ANNA O.

talk therapy see PSYCHOTHERAPY.

taming of the instinct see NEUTRALIZATION.

tamoxifen n. see ANTIESTROGEN.

tandem reinforcement a SCHEDULE OF REINFORCEMENT for a single response in which two or more schedule requirements must be completed in sequence before reinforcement occurs and no stimulus change accompanies completion of each requirement. For example, in a tandem, fixed-interval 1-minute, fixed-ratio 10 schedule, the first response after 1 minute would initiate the fixed-ratio 10 schedule, and the 10th response would result in reinforcement. Also called tandem schedule of reinforcement. Compare CHAINED SCHEDULE.

tandem therapy in marriage therapy, a practice in which the therapist meets individually with each partner.

tangentiality n. a thought disturbance that is marked by oblique speech in which the person constantly digresses to irrelevant topics and fails to arrive at the main point. In extreme form, it is a manifestation of LOOSENING OF ASSOCIATIONS, a symptom frequently seen in schizophrenia or delirium. Compare CIRCUMSTANTIALLY.

tangential speech verbal communication that repeatedly diverges from the original subject. Resulting from disorganized thought processes or a diminished ability to focus attention, these digressions may continue until the original subject is no longer the focus of the conversation.

tangent screen a vertical screen for plotting the location of a VISUAL RECEPTIVE FIELD for a neuron by moving a spot or bar of light across the screen and noting the regions of maximum response.

tangible support see SOCIAL SUPPORT.

tangible user interface (TUI) in computing, several experimental types of user interface that enable on-screen data to be manipulated by direct physical means. Rather than appearing in graphical form, devices such as windows, icons, and handles are embodied as graspable, physical objects that can be used to access and manipulate data. The general goal of TUI development is to find solutions that bridge the gap between the digital world and the physical environment. Areas currently under investigation include (a) the transformation of architectural surfaces such as walls, doors, and tables into active interfaces with the digital world; (b) the creation of direct links between tangible objects, such as books, pictures, or models, and related digital information; and (c) the use of ambient media, such as light and sound, to convey background information to an operator. Compare GRAPHICAL USER INTERFACE; PERCEPTUAL USER INTERFACE.
Tantric sex

Tantric sex an approach to sex based on the Chinese philosophical and religious system of Taoism. The approach highly values sex, with the belief that long life and even immortality can be obtained through sexual activity. Sexual techniques are aimed at mutual and equal sexual pleasure for each partner. Prolonged love-making sessions, with much general body stroking, and techniques to prolong intercourse are stressed in the tantric approach.

Tantrum n. see Temper TANTRUM.

Taoism (Daoism) n. a classical Chinese philosophy formulated by Laozi (Lao Tzu) in the 5th century BCE. The Tao, meaning “way” or “path,” is seen as the origin of all creation, unknowable in its essence but observable in its manifestations, and as the basis of a spiritual approach to living.

—Taoist adj., n.

Tapering n. in pharmacology, a gradual reduction in the dose of a drug in order to avoid undesirable effects that may occur with rapid cessation. Such effects may be extreme (e.g., convulsions) or relatively mild (e.g., head pain, gastrointestinal discomfort). Drugs that produce physiological dependence (e.g., opiates, benzodiazepines) must be tapered to prevent a withdrawal syndrome and possible seizures (see Sedative, Hypnotic, or Anxiolytic Withdrawal). Also called gradual withdrawal.

Tapetum n. a light-reflecting layer behind the retina of some animals, such as the domestic cat. The tapetum enhances visual sensitivity in nocturnal animals by reflecting back any photons that have passed through the retina, so that these have a second chance to interact with the photopigments in the photoreceptors.

Taphophilia n. a morbid attraction to cemeteries.

Tapping test see Dotting Test; Finger Tapping Test.

Taractan n. a trade name for Chlorprothixene.

Tarasoff decision the 1976 California Supreme Court decision in Tarasoff v. Regents of the University of California, which placed limits on a client’s right to confidentiality by ruling that mental health practitioners who know or reasonably believe that a client poses a threat to another person are obligated to protect the potential victim from danger. Depending on the circumstances, that protection may involve such actions as warning the potential victim, notifying the police of the potential threat posed by the client, or both. The decision was based on a case in which an individual confided to his therapist that he intended to kill a friend and later did so. See also Duty to Protect; Duty to Warn.

Tardive adj. denoting delayed or late-arriving symptoms or disease characteristics, as in Tardive Dyskinesia.

Tardive dyskinesia a movement disorder associated with the use of Antipsychotics, particularly conventional antipsychotics that act primarily as Dopamine-Receptor Antagonists. It is more common with prolonged use (months or years), and older patients, females, and patients with mood disorders are thought to be more susceptible. Symptoms include tremor, so-called choreoathetoid movements (see Chorea-Athetosis), and spasticity of muscle groups, particularly orofacial muscles and muscles in the extremities. Onset is insidious and may be masked by continued use of the antipsychotic, only appearing when the drug is discontinued or the dose lowered. Its incidence is estimated at up to 40% of long-term users of conventional antipsychotics; the incidence is lower with atypical antipsychotics. No effective treatment is known.

Tardive dysmenia a behavioral disorder associated with long-term use of antipsychotic drugs and characterized by changes in affect, social behavior, and level of activity. Symptoms may include an inappropriately loud voice and loquaciousness, euphoria, intrusive behavior (including invasion of others’ privacy), and thought disorder. In addition, the individual may exhibit episodes of social withdrawal interspersed with episodes of hyperactivity, as well as excessive emotional reactivity and explosive hostility. The condition is considered the behavioral equivalent of Tardive Dyskinesia. Also called Iatrogenic Schizophrenia: Tardive Psychosis.

Target n. 1. an area or object that is the focus of a process, inquiry, or activity. 2. the goal object in a task. For example, the target in a visual search might be to find a letter S in a randomly arranged array of letters. In some Concept-Discovery Tasks, the target is the rule that classifies objects as belonging or not belonging to a category. When a search has more than one item as its goal, these are known as the target set. 3. a tissue, organ, or type of cell that is selectively affected by a particular hormone, neurochemical, drug, or microorganism. 4. a neuron that attracts the growth of the Dendrites or Axons of other neurons toward it. 5. in parapsychology experiments, the object or event that the participant attempts to identify in tests of clairvoyance, the message that he or she attempts to receive or respond to in tests of telepathy, or the object that he or she attempts to influence in tests of psychokinesis.

Target behavior the specific behavior or behavioral pattern selected for modification in Behavior Therapy.

Target device the appliance, furnishing, or equipment that responds to commands from a Control Device. See also Environmental Control Device, Feedback Device, Switch Device.

Target language 1. the second or additional language that a nonnative speaker is attempting to use or learn. See also Interlanguage. 2. the language into which a translation has been or is being made. Compare Source Language.

Target patient in Structured Interactional Group Psychotherapy, the group member who becomes the focus of attention and discussion.

Target population the population that a study is intended to research and to which generalizations from samples are to be made. Also called Reference Population.

Target response the response (or response class) chosen to be studied or for which consequences are to be arranged.

Target stimulus a specific stimulus to which participants in a test or experimental procedure must attend or respond. For example, in tests of hearing, the target stimulus may be a specific tone that must be identified; in studies of masking, it is the stimulus obscured or altered by the masker.

Tartini’s tone a Combination Tone more specifically, a difference tone. [First noted by Giuseppe Tartini (1692–1770), Italian Baroque composer]

TAS abbreviation for TELlegen Absorption Scale.

Task n. any goal-oriented activity undertaken by an individual or a group. When such an activity is the subject of observation in an experimental setting (e.g., in problem-solving and decision-making studies), the researcher may
set particular objectives and control and manipulate those objectives, stimuli, or possible responses, thus changing task parameters to observe behavioral adjustments. See also SEARCH.

task analysis 1. the breakdown of a complex task into component tasks to identify the different skills needed to correctly complete the task. In education, for example, it entails the breakdown of a subject or field of study to identify the specific skills the student must possess in order to master it; in industrial and organizational settings, a job is broken down into the skills, knowledge, and specific operations required. See also JOB ANALYSIS. 2. in ergonomics, a method of evaluating a product or system in which researchers interview actual or target users in order to find out (a) what tasks are performed; (b) which of these are most frequently performed and which are most important; (c) how and in what sequence the tasks are performed; (d) what standards of performance apply; and (e) how different categories of user vary in their answers to the above. Although some scripted questions are asked, the interviews are otherwise unstructured, the better to reflect users’ actual experience. Compare COGNITIVE WALK-THROUGH METHOD; CONVERSATION ANALYSIS; HIERARCHIC.

task cohesion the degree to which members of a team or group are attracted to a task and work together through the integration of their skills to complete the task successfully.

task complexity the degree to which there is a need to integrate complicated interactions among different mental and physical aspects of a task.

task conflict see INTRAGROUP CONFLICT.

task demands the effect of a task’s characteristics, including its divisibility and difficulty, on the procedures that an individual or group can use to complete the task.

task identity a motivating characteristic of tasks specified in the JOB-CHARACTERISTICS MODEL of J. Richard Hackman and U.S. organizational behaviorist Greg R. Oldham (1947– ). A job is high in task identity if it entails responsibility for a complete and identifiable piece of work (see NATURAL WORK MODULE), as in writing a proposal or planning and developing a new software program from start to finish. Compare TASK SIGNIFICANCE.

task-motivated adj. denoting a LEADERSHIP STYLE in which the leader concentrates on structuring the tasks the group must complete, providing task-related feedback, and setting goals. It is assessed using the LEAST PREFERRED CO-WORKER SCALE. Also called TASK-ORIENTED. Compare RELATIONSHIP-MOTIVATED.

task orientation a motivational focus on mastering a task. Task orientation is a component of the ACHIEVEMENT GOAL THEORY.

task-oriented group a group primarily devoted to solving a problem, providing a service, creating a product, or engaging in other goal-directed behavior. See ACTION GROUP; WORK GROUP. See also INSTRUMENTAL ORIENTATION.

task role a set of functional GROUP ROLES, either allocated by the leader or adopted by members through self-organization, whose performance promotes the completion of tasks and the achievement of the group’s goals. Compare RELATIONSHIP ROLE.

task significance a motivating characteristic of tasks specified in the JOB-CHARACTERISTICS MODEL developed by J. Richard Hackman and U.S. organizational behaviorist Greg R. Oldham (1947– ). Jobs high in task significance are those that are perceived to be important to the organization or to have great influence on the lives of others. Compare TASK IDENTITY.

task specificity of language the theory, mainly associated with Noam Chomsky, that language use differs from other cognitive tasks in qualitative ways and makes use of components that are specific to this purpose. The theory accords with Chomsky’s ideas of AUTONOMOUS SYNTAX and intuitive GRAMMATICALITY but is incompatible with the approaches taken in FUNCTIONAL GRAMMAR, COGNITIVE GRAMMAR, or behaviorist accounts of language (see VERBAL BEHAVIOR). See also MODULARITY; SPECIES SPECIFICITY OF LANGUAGE.

task-specific tremor see ACTION TREMOR.

task structure the extent to which there is a clear relationship of means to ends in the performance of a task. In a highly structured task, the procedures required to perform the task successfully are known, whereas in an unstructured task, there is uncertainty about how to proceed.

task switching a procedure in which the participant switches between two or more tasks, typically according to a regular schedule in experimental situations. The usual finding is that responses are slower when the task switches than when the same task is merely repeated.

task-unrelated images and thoughts (TUTs) see MIND WANDERING.

task-unrelated thoughts (TUTs) see MIND WANDERING.

tastant n. a substance that stimulates the sense of taste, such as a calorie-free sweetener.

taste n. the sense devoted to the detection of molecules dissolved in liquids (also called gustation), or the sensory experience resulting from perception of GUSTATORY QUALITIES. Dissolved molecules are delivered to the taste receptors—TASTE CELLS—on the tongue, soft palate, larynx, and pharynx. Of the proposed five PRIMARY TASTES, three are dedicated to detecting nutrients: SWEET (sugars), SALTY (sodium), and UMAMI (proteins); and two are for protection: SOUR (from unripe or spoiled foods) and BITTER (from toxins). Taste combines with smell, texture, and appearance to generate a sense of flavor.

taste adaptation a decrease in sensitivity to a stimulus that has been presented continuously to the GUSTATORY SYSTEM. The phenomenon can be complete, and the perception lost, after minutes of stimulation. Adaptation is used to determine whether two stimuli share the same receptor population by inducing adaptation to the first stimulus and then evaluating the degree to which the perception of the second stimulus is diminished.

taste aversion avoidance of a particular taste. See CONDITIONED TASTE AVERSION.

taste-aversion learning see CONDITIONED TASTE AVERSION.

taste blindness reduced sensitivity to the bitter taste of phenylthiocarbamidc (PTC) or propylthiouracil (PROP). Originally thought to be a simple Mendelian recessive trait, taste blindness is now known to extend to other bitter tastes, as well as to salty and sweet tastes, and is associated with having fewer TASTE BUDS.
taste bud

**taste bud** a goblet-shaped structure, 30 × 50 μm, about 6,000 of which occur in the human mouth. Each bud is a collection of about 50 **taste cells** arranged like sections of an orange. At its apex is a **taste pore** through which each taste cell sends a **microvillus** studded with receptor proteins to sample the environment.

taste cell a receptor cell for **gustatory stimuli**. Each has a hairlike extension (see **microvillus**) that protrudes from the opening in the **taste bud**. Humans have about 300,000 taste cells, though the number can vary across individuals, and there are about 50 cells per taste bud. Taste cells can be divided into four anatomical types: **type I cells** comprise 60% of the total, **type II cells** 20%, **type III cells** 15%, and **type IV cells** 5%. All but **type IV cells** may be involved in **taste transduction**. See also **gustatory neuron types**.

taste cortex the area of the cerebral cortex responsible for the perception of taste. The **primary taste cortex** (or primary gustatory cortex) is the first cortical relay for taste. Located along the sharp bend that includes the frontal operculum laterally and the anterior **insula** medially, it receives taste, touch, visceral, and other sensory inputs from the thalamus and permits an integrated evaluation of a chemical. Its output goes to regions that control oral and visceral reflexes in response to foods. The **secondary taste cortex** (or secondary gustatory cortex) is the area of cerebral cortex located in the orbitofrontal cortex, that is the second cortical relay for taste. It identifies **gustatory stimuli** as either pleasant and rewarding or unpleasant and undesirable. This information from the secondary taste cortex interacts with analyses from visual, touch, and olfactory cells to permit an integrated appreciation of flavor.

taste pore a 6 μm opening at the top of each taste bud through which the **microvillus** of its 50 taste cells project to sample the chemical environment.

taste stimulus see **gustatory stimulus**.

taste system see **gustatory system**.

taste transduction the sequence of events involved in converting the detection of chemical molecules into taste signals. **Gustatory stimuli** interact with the **microvillus** of a taste cell, which results in changes in activity in the ion channels within taste receptors. The subsequent **depolarization** within these receptors triggers the release of neurotransmitters that stimulate sensory neurons in the peripheral nervous system (see **greater superficial petrosal nerve**). The mechanisms of transduction vary with the type of gustatory stimulus, although each taste cell is capable of transducing different stimuli. Also called gustatory transduction.

**TAT** abbreviation for ** THEMATIC APPREHENSION TEST**.

tau effect 1. the effect of the timing of stimuli on their perceived spatial location. For example, if three equidistant lights are flashed in succession, but the time interval between the first two is shorter than that between the second and third, then the first two lights are perceived to be closer together than the second and third. 2. the invariant that the time to contact between an object and an observer moving at a constant speed toward each other is inversely proportional to the rate of expansion of the observer’s retinal image of the object, regardless of the size of the object or the speed at which it travels. Research suggests that the tau effect is used in a variety of situations involving the control of movements, for example, by a ballplayer when preparing to catch a ball and by a diving gull in retracting its wings before hitting the surface of the water to catch a fish.

taurine n. a sulfur-containing amino acid. Found in the tissue of many animals, that plays a role in numerous biological processes such as bile-salt formation, osmoregulation, and fat digestion and that may act as a neuromodulator of neurotransmitters such as glycine, γ-aminobutyric acid (GABA), acetylcholine, and glutamate. Although taurine can be endogenously synthesized in the body (in the pancreas), it must also be obtained from diet (e.g., through foods in which it occurs naturally, such as meat, fish, and eggs). Its deficiency has been associated with various conditions ranging from cardiovascular disease and hypertension to epilepsy, depression, and anxiety. Research into the potential benefits or adverse effects of taurine as a dietary supplement for the treatment of these and other conditions is ongoing but inconclusive.

**tau test** see KENDALL’S TAU.

tautology n. 1. in logic, a statement that is always and necessarily true by virtue of the meaning of its component terms and that therefore has no propositional content, as *Either he is alive or he is not alive*. See also circular reasoning. 2. in general use, needless repetition of an idea in a different word, phrase, or sentence, as in necessary essential or individual person. —tautological adj.

**Tavistock Clinic** a major British provider of clinical mental health services, set up in Tavistock Square, London, in 1919. It became a part of the National Health Service in 1947, when the separate **Tavistock Institute of Human Relations** was founded to relate the psychological and social sciences to the needs of society. In 1994, the Tavistock Clinic and the **Portman Clinic** became a trust of the National Health Service and its leading organization for providing postgraduate training in mental health.

taxis n. (pl. *taxes*) active movement of motile organisms in response to a stimulus. Taxis can be a negative response, marked by movement away from the stimulus, or positive, in which case the organism moves toward the stimulus. Taxis differs from tropism, which refers to a simple orientation to or from a natural force (e.g., light or gravity) without changing place, as in plants. Kinds of luxes include phototaxis, in which movement is toward or away from a light source; geotaxis, marked by a movement toward the earth; and chemotaxis, in which the movement is in response to chemicals in the environment. Tropotaxis indicates a direct path toward a source, such as a food smell; klinotaxis is a movement interrupted by pauses to evaluate the sources of stimuli. Also called **tactic behavior**. Compare **kinesis**. —taxic or **tactic** adj.

taxonomic assumption in language development, the tendency of children to suppose that a novel word that refers to one thing also refers to similar things (rather than thematically related things). For example, a child will infer that if the word *dog* refers to a collie it can also refer to a poodle, but not to a thematically related thing, such as a dog bone. Compare **mutual exclusivity assumption**; **whole object assumption**.

taxonomic classification see **conceptual classification**.

taxonomy n. the science of classification (e.g., biological taxonomy) or any scheme of classification itself. —taxonomic adj. —taxonomist n.
taxonomy of educational objectives see BLOOM’S TAXONOMY.

Taylorism n. see SCIENTIFIC MANAGEMENT.

Taylor Manifest Anxiety Scale a 65-item self-report scale, derived from the MINNESOTA MULTIPHASIC PERSONALITY INVENTORY, that was first developed in 1951 and modified and shortened to 50 items in 1953. The scale, consisting of statements (e.g., “I cannot keep my mind on one thing”) to which participants respond true or false, formerly had frequent use in research as a general measure of anxiety symptoms. It correlates with other anxiety measures and with physiological indicators of anxiety. Also called Manifest Anxiety Scale. See CHILDREN’S MANIFEST ANXIETY SCALE. [devised by U.S. psychologist Janet Taylor Spence (1923– )]

Tay–Sachs disease (TSD) an autosomal recessive disorder primarily affecting Ashkenazi Jews of central and eastern European origin. The disease is due to a deficiency of the enzyme hexosaminidase A, resulting in the accumulation of G_{46} gangliosides in all tissues (see GANGLIOSIDOSIS). This process gradually destroys the brain and nerve cells by altering the shape of neurons. Development is normal until the 6th month of infancy, after which there is a deterioration of motor, visual, and cognitive abilities. Death usually occurs between 3 and 5 years of age. Also called G_{46} gangliosidosis. [Warren Tay (1843–1927), British physician; Bernard Sachs (1858–1944), U.S. neurologist]

TBI abbreviation for TRAUMATIC BRAIN INJURY.

TBR items abbreviation for TO-BE-REMEMBERED ITEMS.

TCA abbreviation for TRICYCLIC ANTIDEPRESSANT.

TCD abbreviation for TRANSCRANIAL DOPPLER ULTRASOUNDOGRAPHY.

T cell see LYMPHOCYTE.

TCI abbreviation for TEMPERAMENT AND CHARACTER INVENTORY.

T data test data: information about an individual gathered from formal scientific measurement and objective testing. See also I DATA; O DATA; Q DATA.

TDD abbreviation for TELECOMMUNICATION DEVICE.

t distribution a theoretical PROBABILITY DISTRIBUTION that plays a central role in testing hypotheses about population means, among other parameters. It is the sampling distribution of the statistic (M – µ)/s, where µ is the mean of the population from which the sample is drawn. M is the estimate of the mean of the population as obtained from sample data. and s is the standard deviation of the data set. Also called Student’s t distribution.

teacher-effectiveness evaluation an assessment of specific criteria for instructors, including classroom management, curriculum, parental communication, and the effectiveness of the instructor as shown by student progress. See also STUDENTS’ EVALUATION OF TEACHING.

teaching games classroom instruction in the form of games designed to engage students’ active interest as they work on specific skills (e.g., vocabulary, mathematics). Teaching games can provide a unique opportunity to give students incentives, such as specific rewards or the pleasure of winning.

teaching machine an instrument that (a) automatically presents programmed material to the learner, (b) provides an opportunity to check understanding at each step through problems or questions, and (c) provides feedback as to whether the response is right or wrong. One equivalent of the teaching machine is PROGRAMMED INSTRUCTION, which B. F. SKINNER advocated. The modern-day equivalent of teaching machines is the personal computer, which is widely accepted as a supplement for teaching complex tasks, concepts, or skills, in addition to specific content areas. See BRANCHING.

teaching model see DEVELOPMENTAL TEACHING MODEL.

teaching style the personal attributes that define a teacher’s classroom methods and behavior. Qualities associated with teacher effectiveness include mastery of subject matter, pedagogical thinking, organizational ability, enthusiasm, warmth, calmness, and rapport with students.

team n. an organized task-focused group. Members of such groups combine their individual inputs in a deliberate way in the pursuit of a common goal and are typically cohesive and united.

team building a structured intervention designed to increase the extent to which a group functions as an organized, coherent whole. Such interventions often involve assessing the current level of GROUP DEVELOPMENT, clarifying and prioritizing goals, and increasing group coherence.

team mental model see SHARED MENTAL MODEL.

technical adj. 1. relating to specialized skills, abilities, or techniques. 2. relating to skills or abilities that are mechanical, industrial, or technological. 3. denoting scientific specialization or character.

technical eclecticism in INTEGRATIVE PSYCHOTHERAPY, the use of techniques from various theoretical frameworks to deal with the complex issues of a client. Technical eclecticism uses a systematic and carefully thought out approach that balances theoretical perspectives and treatment processes. [developed by South African-born U.S. psychologist Arnold Allan Lazarus (1932–2013)]

technical term a word or phrase used in a specialized field to refer to objects or concepts that are particular to that field and for which there are no adequate terms in ordinary language. See also JARGON.

technological gatekeeper an organizational or GROUP ROLE that involves channeling information about technological innovations into the organization from the outside. People occupying this role communicate with professionals inside and outside the organization, serving as the conduit for acquiring, translating, and disseminating new technical information.

technostress n. a form of OCCUPATIONAL STRESS that is associated with information and communication technologies such as the Internet, mobile devices, and social media. Technostress is seen in many organizations at all levels, with affected employees becoming anxious or overwhelmed by working in computer-mediated environments in which there is a constant flow of new information. This relatively new phenomenon has significant detrimental effects on individuals’ health, productivity, and work satisfaction and has been proposed as an important predictor of overall job strain. Academic literature, the popular press, and anecdotal evidence suggest that technostress is directly related to ROLE AMBIGUITY, ROLE CONFLICT, supervisor lack of support, and work overload, whereas age and SELF-EFFICACY appear to play more indirect, buffering roles.
tectal nucleus any of certain nuclei located in the SUPERIOR COLICULUS and INFERIOR COLICULUS in the dorsal part of the midbrain. They perform relay functions for the visual and auditory systems and integrate reflex functions. Some neurons in these nuclei are bimodal, responding to both visual and auditory stimuli.

tectorial membrane part of the ORGAN OF CORTI in the cochlea. It consists of a semigelatinous membrane in which the stereocilia of the outer HAIR CELLS are embedded.

tectospinal tract a tract of nerve fibers that starts at the SUPERIOR COLICULUS, crosses the midline at the midbrain, and descends through the midbrain, pons, and medulla oblongata to terminate in the cervical (neck) region of the spinal cord. It functions in turning the head in response to visual, auditory, and somatosensory stimuli. See also VENTROMEDIAL PATHWAY.

tectum n. (pl. tecta) the roof of the MIDBRAIN, dorsal to the CEREBRAL AQUEDUCT. The tectum contains the SUPERIOR COLICULUS, which act as relay and reflex centers for the visual system, and the INFERIOR COLICULUS, which are sensory centers for the auditory system. —tectal adj.

teenage pregnancy see ADOLESCENT PREGNANCY.

teeth grinding see BRUXISM.

teething n. the process in which the teeth erupt through the gums, typically occurring between 4 and 9 months of age. During this process, the infant may exhibit several accompanying symptoms, such as an increase in irritability, sleep disturbance, temporary rejection of bottle or breastfeeding, gum inflammation, and excessive drooling.

tegmentum n. (pl. tegmenta) the central core of the MIDBRAIN and PONS. It contains sensory and motor tracts passing through the midbrain and also several nuclei, including the OCULOMOTOR NUCLEUS, RED NUCLEUS, and SUBTHALAMIC NUCLEUS. —tegmental adj.

Tegretol n. a trade name for CARBAMAZEPINE.

tele- (tel-) combining form 1. distant or over a distance (e.g., TELEPATHY). 2. television or telephone (e.g., TELECONFERENCE).

telecommunication device (TDD) a device used by individuals with hearing loss or speech impairments to communicate via telephone lines. It typically consists of a keyboard, a letter display, and a cradle for the telephone receiver and may also include a printer. An individual types a message and sends it, and another individual with a telecommunication device receives the message, views it on the display, and then types and sends a response. Also called text telephone (TTY).

telecommuting n. working from home using a computer, telephone, or other technology to communicate with people at the central workplace or at other locations. It is the most common alternative work schedule used in public organizations, often offered as a means to recruit and retain employees, boost productivity, and trim facility costs. Also called teleworking. —telecommute vb. —telecommuter n.

teleconferencing n. the use of telecommunications links (e.g., video systems or webcams) to enable real-time group meetings of individuals who are physically distant from one another. Also called video conferencing. —teleconference n., vb.

teleagnosis n. in parapsychology, alleged knowledge of distant events without direct communication, as by Clairvoyance or TELEPATHY. See extrasensory perception.

telegraphic speech 1. condensed or abbreviated speech in which only the most central words, carrying the highest level of information, are spoken. Nouns and verbs are typically featured, whereas adjectives, adverbs, articles, and connective parts of speech are omitted. 2. the speech of children roughly between the ages of 18 and 30 months. This is usually in the form of two-word expressions up to the age of about 24 months (see TWO-WORD STAGE) and thereafter is characterized by short but multi-word expressions (e.g., dog eat bone). Also called telegraphic stage.

telehealth n. the use of telecommunications and information technology to provide access to health assessment, diagnosis, intervention, and information across a distance, rather than face to face. Also called telemedicine.

telekinesis n. a form of PSYCHOKINESIS in which solid matter is purportedly moved or manipulated solely by the power of the mind.

telemedicine n. see TELEHEALTH.

telemetry n. the process of measuring and transmitting quantitative information to a remote location, where it can be recorded and interpreted. For example, a small radio transmitter may be implanted inside a nonhuman animal to measure general activity level as well as a variety of physiological variables, including body temperature, heart rate, and blood pressure. The transmitter sends signals to a receiver located outside the animal. —telemetric adj.

telencephalon n. see CEREBRUM.

telelogic regression see PROGRESSIVE TELEGLOGIC REGRESSION.

teleology n. 1. the position that certain phenomena are best understood and explained in terms of their purposes rather than their causes. In psychology, its proponents hold that mental processes are purposive, that is, directed toward a goal. The view that behavior is to be explained in terms of ends and purposes is frequently contrasted with explanations in terms of causes, such as INSTINCTS and CONDITIONED RESPONSES. See also HORMIC PSYCHOLOGY; PURPOSEFUL PSYCHOLOGY. 2. the concept that the universe or human history or both have purpose and direction and are moving toward a particular goal. This position is usually, but not exclusively, a religious one. —teleologic or teleological adj.

teleonomy n. 1. the property of being goal-directed in terms of structures, functions, and behaviors, which is a fundamental characteristic of living organisms. 2. the apparently directional or “purposeful” character of evolutionary adaptation. The term is used in this context in order to avoid the metaphysical implications of TELEOLOGY. 3. the scientific study of living organisms in terms of evolutionary adaptation. —teleonomic adj.

teleoperator n. a remote-controlled device or system that augments the operator’s physical capabilities while remaining immediately responsive to his or her control (unlike fully automated robotics). Some teleoperators are designed to imitate the body movements of the operator. Teleoperators are used in space, underwater, on high buildings or other inaccessible structures, and in dangerous tasks, such as landmine clearance.
teleopsia n. a visual illusion in which an object appears to be more distant than it is in reality. In some cases, this is caused by lesions in the parietal temporal area of the brain. See also metamorphopsia.

telepathic dream a dream in which one appears to gain insight or information about a person or event despite not having access to the relevant information in waking life. [described by Sigmund Freud]

telepathy n. the alleged direct communication of information from one mind to another, in the absence of any known means of transmission. It is a form of extrasensory perception. See also mind reading, thought transference. —telepathic adj.

telephone counseling 1. a method of treating and managing the problems of clients by telephone. The skills for telephone counseling include (a) careful selection of problems that lend themselves to telephone counseling, (b) listening for cues to issues and ramifications of the problems, (c) good verbal skills that guide the client appropriately, and (d) the ability to respond quickly to avoid gaps and awkward silences. 2. free hotline telephone services that provide listening and referral services rather than formal counseling. Hotline volunteers are trained to provide emotional support in serious situations, especially those involving suicidal callers, but not to give formal advice. See also distance therapy.

telephone scatologia a paraphilia in which an individual obtains sexual pleasure by making obscene telephone calls. See scatophilia.

telephone theory see frequency theory.

teleplasm n. see ectoplasm. —teleplasmic adj.

telepresence n. the sense of being at a remote site when provided with sensory information (e.g., sights, sounds, textures) from that distant place using modern communications technology. See also remote perception.

telepsychotherapy n. see distance therapy.

telergy n. in parapsychology, the alleged ability of a sensitive to confer paranormal abilities to or influence another person’s thoughts via telepathy.

telesthesia (telasthesia) n. see cryptesthesia. —teleesthetic adj.

tele supervision n. see supervision.

Telfaire instructions cautionary instructions read to jurors in cases in which eyewitness identification may be the most critical evidence against the defendant. The instructions address issues that are suspected to lead to eyewitness misidentification and were originally proposed by the judge hearing the appeal in the case United States v. Telfaire (1972), in which the defendant had been convicted solely on the evidence of an identifying witness who was of a different race.

telic adj. purposeful or goal directed in nature, as in telic behavior. See also teleology.

telic continuum a typically J-shaped curve that describes purposeful behavior.

Tellegen Absorption Scale (TAS) a measure of a person’s ability to become deeply involved in a task or an aspect of the environment. Consisting of 34 statements (e.g., “I like to watch cloud shapes change in the sky”) to which participants respond true or false, it is considered to be a reliable indication of the ease with which an individual can be hypnotized. [devised in 1974 by Dutch-born U.S. psychologist Auke Tellegen (1930– )]

telodendron n. see end brush.

telomere n. a structure found at the ends of chromosomes that protects fragments from rejoining after a chromosome has divided. Telomeres become progressively shorter with each cell division, and after a certain number of cell divisions, they become so short that they trigger the cell to stop dividing or to undergo programmed cell death. Telomeres are said to act as a genetic clock that ticks down the number of times the cell can divide safely.

See also Hayflick limit.

temper n. 1. a display of irritation or anger, or a tendency to be quick to anger. See also temper tantrum. 2. a personality characteristic, disposition, or mood.

temperament n. the basic foundation of personality, usually assumed to be biologically determined and present early in life, including such characteristics as energy level, emotional responsiveness, demeanor, mood, response tempo, behavioral inhibition, and willingness to explore. In animal behavior, temperament is defined as an individual’s constitutional pattern of reactions, with a similar range of characteristics. Studies of animals ranging from fish to nonhuman primates have documented differences in temperament, particularly along the shy–bold continuum. Within each population, there are individuals that show high levels of exploratory behavior toward novel features and others that appear to display neophobia.

Temperament and Character Inventory (TCI) a 240-item, true–false self-report inventory derived from Cloninger’s psychobiological model of personality that measures four dimensions of temperament (harm avoidance, novelty seeking, reward dependence, and persistence) and three dimensions of character (self-directedness, cooperativeness, and self-transcendence). The seven main dimensions comprise 25 subscales or facets of personality. Originally developed in 1987 with 100 items and called the Tridimensional Personality Questionnaire (TPQ), the TCI has been updated and revised twice since that time. The most recent version, the Temperament and Character Inventory—Revised (TCI-R), was published in 1999. It has been utilized in research on the genetic heritability of personality, on personality variability in psychopathology, and on the effect of personality on psychotherapy outcome. [developed by U.S. psychiatrist and geneticist C. Robert Cloninger (1944– )]

temperament theory the theory that behavioral tendencies are biologically based and present from birth, forming the disposition of the individual.

temperament trait 1. a biologically based, inherited personality characteristic. 2. a personality trait that involves emotional qualities and affective styles of behavior. It is one of three classes of source traits in Cattell’s pers-
temperance n. any form of auspicious self-restraint, manifested as self-regulation in monitoring and managing one’s emotions, motivation, and behavior and as self-control in the attainment of adaptive goals.

temperature illusion a misinterpretation of a temperature stimulus. PARADOXICAL COLD is an example: A very hot shower may cause goose bumps and a feeling of cold. Also called thermal illusion.

temperature sense a part of the SOMatosensory system concerned with the perception of hotness and coldness, with receptors at various depths in the skin and other body surfaces (e.g., the tongue) that may be exposed to the environment. Also called thermesthesia: thermoesthesia.

temperature spot an area of the skin that contains temperature-sensitive receptors.

temper tantrum a violent outburst of anger commonly occurring between the ages of 2 and 4 and involving such behavior as screaming, kicking, biting, hitting, and head banging. The episodes are usually out of proportion to immediate provocation and sometimes regarded as an expression of accumulated tensions and frustrations. Also called tantrum. See also OPpositional DifFerent DISORDER.

template-matching theory the hypothesis that pattern recognition proceeds by comparing an incoming sensory stimulation pattern to mental images or representations of patterns (templates) until a match is found. This theory is largely considered too simplistic, because the same stimulus can be viewed from multiple perspectives, thereby altering the input pattern, and because a particular stimulus can have many different variations (e.g., a letter of the alphabet can be printed in numerous styles, sizes, orientations); it is impossible to store a template for each specific perspective or variation.

temporal adj. 1. of or pertaining to time or its role in some process, as in temporal conditioning or temporal summation. 2. relating or proximal to the temple, as in temporal lobe. —temporally adv.

temporal appraisal theory a model stating that people’s evaluations of their past selves tend to be more negative than their evaluations of their current selves.

temporal aspects of consciousness those properties of consciousness relating to time and duration, including the SPECIOUS PRESENT, the length of time necessary for sensory stimulation to come to awareness, and the subjective perception of time intervals. See PROTENsity.

temporal bone the bone, located toward the side and base of the skull, that contains the MIDDLE EAR and the INNER EAR.

temporal coding a type of neural plotting of the precise timing of the points of maximum intensity (spikes) between ACTION POTENTIALS. It can provide valuable additional detail to information obtained through simple RATE CODING.

temporal coherence see COHERENCE.

temporal conditioning a procedure in CLASSICAL CONDITIONING in which the unconditioned stimulus is presented at regular intervals but in the absence of an accompanying conditioned stimulus. Compare TRACe CONDITIONING.

temporal consistency the correlation between measurements obtained from the same test or instrument when administered to the same sample on two different occasions. Temporal consistency is an index of the RETRIEVAL RELIABILITY of an instrument. It assumes that there is no substantial change in the construct being measured between the two occasions. The longer the time gap, the greater the likelihood of a lower correlation. Also called temporal stability.

temporal construal theory a model stating that people rely on largely abstract representations (high-level construals) of future situations when making decisions for the distant future but on more concrete representations (low-level construals) when making decisions for the near future.

temporal discounting see BEHAVIORAL ECONOMICS.

temporal discrimination in conditioning, a differential response made according to the duration of a stimulus or circumstance.

temporal frequency the number of occurrences of a repeating event per unit of time. For example, if 80 repeating events occur within 20 seconds, the frequency (f) is 80/20 = 4.

temporal-frequency discrimination the ability to distinguish different temporal patterns in visual, auditory, or other types of stimuli (e.g., different pulse rates by touch). See also PATTERN DISCRIMINATION.

temporal gradient a pattern of retrograde amnesia characterized by greater loss of memory for events from the recent past (i.e., close to the onset of the amnesia) than for events from the remote past. See also RIbOT’S LAW.

temporal hallucinations see TEMPORAL LOBE ILLUSIONS.

temporal lobe one of the four main subdivisions of each CEREBRAL HEMISPHERE in the brain, lying immediately below the LATerAL SulCus on the outer surface of each hemisphere. It contains the auditory projection and auditory association areas and also areas for higher order visual processing. The medial temporal lobe contains regions important for memory formation.

temporal lobe amnesia a memory disorder, secondary to injury of the temporal lobe (particularly medial structures, such as the hippocampus), that prevents the formation of new memories.

temporal lobectomy the surgical excision of a temporal lobe or a portion of the lobe. It may be performed in the treatment of temporal lobe epilepsy, the location and size of the lesion determining which tissues and related functions may be affected.

temporal lobe epilepsy a type of epilepsy characterized by recurrent COMPLEX PARTIAL SEIZURES of temporal lobe origin.

temporal lobe illusions distorted perceptions that may be associated with complex partial seizures arising from abnormal discharge of neurons in the temporal lobe. They often include distortions of the sizes or shapes of objects, recurrent dreamlike thoughts, or sensations of déjà vu. Hallucinations, such as the sound of threatening
voices, may also be experienced. Also called temporal hallucinations: temporal lobe hallucinations.

temporal lobe syndrome a group of personality and behavioral disturbances associated with temporal lobe epilepsy in some individuals. These may include a pronounced sense of rightness, preoccupation with details, compulsive writing or drawing, religiosity, and changes in sexual attitudes.

temporal modulation transfer function (TMTF) a formula describing the ability to follow changes in the magnitude of a stimulus over time. In psychoacoustics, a TMTF is usually obtained by measuring the amount of sinusoidal amplitude modulation that is necessary to detect the modulation (a modulation threshold) as a function of the frequency of that modulation. TMTFs are similarly measured in other modalities. The utility of the TMTF is grounded in linear systems theory, specifically the principle that the transfer function of a linear system provides a complete description of the system.

temporal perceptual disorder a condition, observed in some individuals with lesions in the left hemisphere of the brain, that is characterized by difficulty in perceiving visual and auditory stimuli over time. For example, individuals may be unable to identify a sequence of vowels repeated at measured time intervals.

temporal precedence in establishing cause–effect relationships between two variables, the principle that the cause must be shown to have occurred before the effect. Two other requirements are those of covariation and nonspecificity (i.e., there are no plausible alternative explanations for the observed relationship).

temporal stability see TEMPORAL CONSISTENCY.

temporal summation a neural mechanism in which an impulse is propagated by two successive postsynaptic potentials (PSPs), neither of which alone is of sufficient intensity to cause a response. The partial depolarization caused by the first PSP continues for a few milliseconds and is able, with the additive effect of the second PSP, to produce an above-threshold depolarization sufficient to elicit an action potential. Compare SPATIAL SUMMATION.

temporal validity a type of external validity that refers to the generalizability of a study’s results across time. Also called temporal external validity.

temporary commitment emergency involuntary hospitalization of a patient with a mental disorder for a limited period of observation or treatment.

temporary lesion a nonpermanent disruption of the normal functioning of a specific brain area in an organism, typically produced by an injection of drugs into that brain area or by electromagnetic stimulation of the area.

temporary threshold shift (TTS) a brief alteration or disruption of the normal level of hearing. For example, after relatively prolonged exposure to very loud noise, one’s absolute threshold may shift so that minimal sound intensities that could normally be detected are temporarily inaudible. A similar shift can occur in vision.

temporomandibular joint syndrome see TMJ SYNDROME.

temptation n. a desire, or a stimulus that facilitates a desire, to behave in a certain way, especially in a way contrary to one’s own or society’s standards of behavior.

tend-and-befriend response a proposed physiological and behavioral stress regulatory system that is an alternative to the classic FIGHT-OR-FLIGHT RESPONSE and that is stronger in females than in males. Tending involves nurturant activities designed to protect the self and offspring, to promote a sense of safety, and to reduce distress, and befriending is expressed in the creation and maintenance of social networks that aid in this process. Neuroendocrinal evidence from research on both human and nonhuman animals suggests an underlying physiological mechanism mediated by oxytocin and moderated by female sex hormones and opioid peptide mechanisms. [proposed in 2000 by U.S. social psychologist Shelley E. Taylor (1946– ) and colleagues]

tendentious apperception the tendency to perceive what one wishes to perceive in an event or situation. See also PERCEPTUAL SET.

tender-mindedness n. a personality trait characterized by intellectualism, idealism, optimism, dogmatism, religiousness, and monism. Compare TOUGH-MINDEDNESS. [first described by William James]—tender-minded adj.

tender years doctrine the assumption in child custody cases that mothers should be awarded custody of their children during the formative years of development. See also PRIMARY CARETAKER STANDARD.

tendinitis n. see REpetitive strain injury.

tendon n. a strong band of tissue that connects a muscle to a bone.

tendon reflex the automatic contraction of a muscle elicited by stretching a tendon. Such reflexes are mediated by tendon stretch detectors, called golgi Tendon Organs. An example of a tendon reflex is the Patellar reflex, elicited by tapping or stretching the patellar tendon just below the kneecap. Also called deep reflex.

tendon sensation the kinesthetic sensation produced by stimulating the receptors in a tendon, such as by stretching it.

Tenex n. a trade name for guanfacine.

Tennessee Self-Concept Scale (TSCS) a self-report assessment consisting of descriptive statements to which participants respond using a 5-point scale, ranging from always false to always true. It is available in two forms—Adult, containing 82 items for use with individuals 13 years and older, and Child, containing 76 items for use with individuals 7 to 14 years old—and yields measurements on six substantive dimensions of self-concept (Physical, Moral, Personal, Family, Social, Academic/Work) within three domains (Identity, Satisfaction, Behavior). The TSCS was originally published in 1964; the most recent version is the TSCS-2, published in 1996. [originally developed by U.S. psychologist William H. Fitts (1918– )] TENS transcutaneous electrical nerve stimulation: a procedure in which mild electrical pulses are delivered through small electrodes attached to the skin. TENS is most commonly used to relieve or reduce chronic pain. The pulses stimulate nerves that supply the region in which the pain is felt and thus inhibit transmission of pain signals.

tense 1. adj. in a state of nervous activity. 2. n. in linguistics, one of a set of forms taken by a verb to mark the relation between the time of the reported action (or state or condition) and the time of the utterance. In addition to the simple present (I run) and simple past (I ran), English has a tense
tension

future tense formed using the auxiliary verbs shall and will; additional aspects of the verb, expressing completed or continuous action, can be formed using the auxiliary verbs be, have, and do (I did run, I am running, etc.).

tension n. 1. a feeling of physical and psychological strain accompanied by discomfort, uneasiness, and pressure to seek relief through talk or action. 2. the force resulting from contraction or extension of a muscle or tendon.

tension headache a persistent headache produced by acute or prolonged emotional or physical strain and usually accompanied by insomnia, irritability, and painful contraction of the neck muscles.

tension law a concept that any deviation from an organism’s optimal level of external conditions (e.g., temperature, atmospheric pressure) produces a state of tension. Compare HOMEOSTASIS.

tension reduction alleviation of feelings of tension. A variety of techniques may be used for this purpose, including RELAXATION THERAPY, tranquilizing drugs, muscle relaxants, hypnotic suggestion, periods of MEDITATION, verbal CATHARSIS, or MOVEMENT THERAPY.

tensor tympani a middle ear muscle that controls the movement of the TYPANIC MEMBRANE (eardrum). Its activation (the tympanic reflex) is part of the ACOSTIC REFLEX.

tenth cranial nerve see VAGUS NERVE.

tenting n. lengthening and expansion of the inner two thirds of the vagina and elevation of the uterus during the excitement and plateau phases of the female SEXUAL RESPONSE CYCLE. Tenting may facilitate conception by allowing pooling of the semen near the cervix.

tentorial herniation see TRANS TENTORIAL HERNIATION.

tentorium cerebelli a fold of DURA MATER that separates the upper (dorsal) surface of the cerebellum from the lower (basal) surfaces of the occipital and temporal lobes of the cerebrum. The tentorium cerebelli is attached at the midline to the falx cerebri, a vertical fold of dura mater that lines the inner (medial) surface of each cerebral hemisphere.

ten–twenty system a standardized system of imaginary lines on the head that allows for placement of electrodes during ELECTROENCEPHALOGRAPHY.

tentuate n. a trade name for DIETHYLPROPION.

tenure n. see JOB TENURE.

teratogen n. an agent that induces developmental abnormalities in a fetus. The process that results in these abnormalities is called teratogenesis: a teratogen is a fetus or offspring with these abnormalities.

teratological defect a structural or functional abnormality in offspring caused by hereditary factors or an environmental influence, such as maternal exposure to drugs or X-rays during pregnancy. Examples of such defects include Down syndrome, associated with abnormal genetic factors, and THALIDOMIDE syndrome, marked by deformed arms and legs and caused by thalidomide taken during the mother’s pregnancy.

teratology n. the study of developmental abnormalities and their causes. —teratological adj.

term n. the point in a pregnancy at which childbirth is normally expected to occur. In humans, this is defined as 37 to 42 weeks after the woman’s last menstruation. See also GESTATION PERIOD; PRETERM VIABILITY.

Terman–McNemar Test of Mental Ability an early group intelligence test designed for students in Grades 7 through 12 and consisting of 162 four- or five-option multiple-choice items within seven types of verbal subtest: synonyms, classification, logical selection, information, analogies, opposites, and best answer. It was a modification and replacement of the 1920 Terman Group Test of Mental Ability, which was also a group-administered test but consisted of two-option multiple-choice items within 10 subtests: classification, logical selection, information, analogies, best answer, word meaning, sentence meaning, mixed sentences, arithmetic, and number series. [developed in 1942 by Lewis M. Terman and Quinn McNemar (1900–1986), U.S. psychologists]

Terman’s giftedness study a longitudinal study of 1,528 gifted children in California. The participants—3 to 19 years old—had IQs above 135. The study suggested that individuals who are gifted as children tend to exhibit greater success throughout their lifetimes, as measured by conventional societal standards, than those who are not. It also suggested that 2% of the population is gifted and that gifted children have better health and happier lives than their counterparts. [initiated in 1921 by Lewis M. Terman]

terminal 1. adj. referring to the end. 2. n. the end of a structure, such as an AXON terminal.

terminal assessment see SUMMATIVE EVALUATION.

terminal behavior 1. relatively unvaried behavior that is predominant in the period shortly before reinforcement occurs during operant or instrumental conditioning. Compare ADJUNCTIVE BEHAVIOR. 2. a response that either is not part of an organism’s current behavioral repertoire or is not occurring at a desired rate, strength, or magnitude. Increasing terminal behavior is the aim of specific behavioral interventions.

terminal button (terminal bouton) see AXON.

terminal care services for people with terminal illness, now usually provided by HOSPICES, which may be either freestanding units or associated with hospitals, nursing homes, or extended care facilities. The emphasis is on PALLIATIVE CARE, pain control, supportive psychological services, and involvement in family and social activities, with the goal of enabling patients to live out their lives in comfort, peace, and dignity.

terminal decline a rapid deterioration in cognitive abilities immediately before death. The cognitive abilities that appear to be most prone to terminal decline are those least affected by normal aging (see HOLD FUNCTIONS). Also called terminal drop.

terminal event in a series of related events, an event that can occur only once and after which no other event of interest can occur. In many clinical and observational studies, the terminal event is death, whereas nonterminal or recurrent events include hospitalizations, relapses, recurrence of behaviors and symptoms, and the like.

terminal insomnia a chronic problem in which an individual habitually awakens very early, feels unrefreshed, and cannot go back to sleep. It is a common symptom of a MAJOR DEPRESSIVE EPISODE. Also called early-morning awakening insomnia. Compare INITIAL INSOMNIA; MIDDLE INSOMNIA.
terminal link see CONCURRENT-CHAINS PROCEDURE.

terminal threshold the stimulus intensity above which no further changes in sensation occur.

termination n. in therapy, the conclusion of treatment. Termination may be suggested by the client or therapist or may be by mutual agreement. It can be immediate or prolonged; in the latter case, a date for the final session is established and sessions are sometimes scheduled less frequently over the intervening period. In premature termination, treatment is ended before either the therapist or client considers the therapy complete. This may result, for example, from difficulties in the therapeutic relationship, misunderstanding of the required length of treatment, a change in the client’s financial circumstances, or departure of the client or therapist to another location.

TerraNova CAT see CALIFORNIA ACHIEVEMENT TESTS.

territorial aggression the act of defending a defined space (a territory) by fighting or threatening intruders of the same species. See also TERRITORIALITY.

territorial dominance 1. in animal behavior, the ability of resident animals to protect a defined space (their territory) as well as to drive out intruders that may be larger and stronger. Residents typically have a competitive advantage over intruders that they would not have in a neutral environment. See TERRITORIALITY. 2. the tendency of people to dominate interpersonal interactions to a greater extent when in their own homes or offices.

territoriality n. 1. the defense by a nonhuman animal of a specific geographic area (its primary territory) against intrusion from other members of the same species. Territoriality differs from HOME RANGE in being an area that is actively defended and from PERSONAL SPACE in being a geographic area. Territoriality is observed in a wide range of animals and is found most often where there are specific defensible resources, such as a concentration of food or shelter. It is maintained through singing in birds and through SCENT MARKING in many mammals (e.g., antelope, dogs), as well as by active patrolling of territory boundaries. 2. in humans, behavior associated with the need or ability to control and regulate access to a space, which reflects feelings of identity derived from use of and attachment to a familiar place. See also PUBLIC TERRITORY.

territorial marking the use of SCENT MARKING to indicate territory boundaries.

terror n. intense and overwhelming fear.

terrorism n. systematic intimidation or coercion to attain political or religious objectives using unlawful and unpredictable force or violence against property, persons, or governments. See also BIOTERRORISM. —terrorist adj., n.

terror management theory a theory proposing that control of DEATH ANXIETY is the primary function of society and the main motivation in human behavior. Accordingly, awareness of the inevitability of death (mortality salience) motivates people to maintain faith in the absolute validity of the cultural worldviews (i.e., beliefs and values) that give their lives meaning and to believe that they are living up to those standards, thus attaining a sense of personal value or self-esteem that buffers them against the frightening recognition of their own mortality. See also ONTOLOGICAL CONFRONTATION, [based on the work of U.S. cultural anthropologist Ernest Becker (1925–1974) and developed by U.S. psychologists Jeff Greenberg (1954– )], Sheldon Solomon (1953– ) and Tom Pyszczynski (1954– ).

tertiary care highly specialized care given to patients who are in danger of disability or death. Tertiary care often requires sophisticated technologies provided by highly specialized practitioners and facilities, such as neurologists, neurosurgeons, thoracic surgeons, and intensive care units. Compare PRIMARY CARE; SECONDARY CARE.

tertiary circular reaction in PIAGETIAN THEORY, an infant’s action that creatively alters former schemes to fit the requirements of new situations. Tertiary circular reactions emerge toward the end of the SENSORIMOTOR STAGE, at about the beginning of the 2nd year; they differ from earlier behaviors in that the child can, for the first time, develop new schemes to achieve a desired goal. Also called discovery of new means through active experimentation. See also PRIMARY CIRCULAR REACTION; SECONDARY CIRCULAR REACTION.

tertiary prevention intervention for individuals or groups with already established psychological or physical conditions, disorders, or diseases. Tertiary interventions include attempts to minimize negative effects, prevent further disease or disorder related to complications, prevent relapse, and restore the highest physical or psychological functioning possible. Compare PRIMARY PREVENTION; SECONDARY PREVENTION.

tertiary suggestibility the easy, uncritical acceptance by an individual of another person’s recommendation because of social pressure or the prestige of the person making the recommendation. Compare PRIMARY SUGGESTIBILITY; SECONDARY SUGGESTIBILITY. [proposed by Hans Eysenck]

test 1. n. any procedure or method used to examine or determine the presence of some factor or phenomenon. 2. n. a standardized set of questions or other items designed to assess knowledge, skills, interests, or other characteristics of an examinee. See PSYCHOLOGICAL TEST. 3. n. a set of operations, usually statistical in nature, designed to determine the validity of a hypothesis. 4. vb. to administer a test.

testability n. the degree to which a hypothesis or theory is capable of being evaluated empirically.

test age see AGE EQUIVALENT.

testamentary capacity the mental competence to make a will. It involves being able to understand and remember the nature and extent of one’s property and knowing who or what will receive that property.

test analysis a detailed statistical assessment of a test’s PSYCHOMETRIC properties, including an evaluation of the quality of the test items and of the test as a whole. It usually includes information such as the MEAN and STANDARD DEVIATION for the test scores in the population used to develop the test, as well as data on the test’s RELIABILITY; it may also include data on such factors as item difficulty value, ITEM DISCRIMINABILITY, and the effect of item DISTRACTORS.

test anxiety tension and apprehensiveness associated with taking a test, frequently resulting in a decrease in test performance. See PERFORMANCE ANXIETY.

test battery a group, series, or set of several tests designed to be administered as a unit in order to obtain a comprehensive assessment of a particular factor or phe-
test bias

nomenon. For example, a researcher may administer a battery of health surveys to a group of individuals diagnosed with a particular disease to assess multiple facets of the disease. Depending on the purpose of testing, individual tests may measure the same or different areas (or both) and may be scored separately or combined into a single score.

test bias the tendency of scores on a test to systematically over- or underestimate the true performance of individuals to whom that test is administered, particularly because they are members of specific groups (e.g., ethnic minorities, one or the other gender). See also CULTURAL TEST BIAS.

test cutoff 1. the prearranged ending point or limit for an assessment. The limit may be in terms of time, number of incorrect answers given, or number of questions administered. 2. a predetermined score performance standard for a given test. Those who perform at or above this score will be considered, for example, for admittance to certain programs or colleges; those who perform below this score will not.

test for contrasts any procedure used to determine which of the specific groups examined in an ANALYSIS OF VARIANCE are significantly different from each other, whether this takes the form of a POST HOC COMPARISON carried out after the data have been observed or an A PRIORI COMPARISON formulated before observation. For example, suppose one wished to analyze the outcomes from three different modes of training: (a) video-based instruction, (b) live lecture by an instructor, and (c) text reading only. After conducting an analysis of variance and obtaining results indicating there is a significant difference between the three modes, one could use a test for contrasts to evaluate various combinations of modes to identify where exactly the differences lie. Examples of specific tests for contrasts include the SCHIFFF TEST, TUKEY’S HONESTLY SIGNIFICANT DIFFERENCE TEST, and the FISHER LEAST SIGNIFICANT DIFFERENCE TEST.

test for equality of variance any procedure used to test for HOMOGENEITY OF VARIANCE. The assumption that the VARIANCES in the populations sampled are substantially equal is basic to many statistical procedures. If this assumption is violated, it may be necessary to transform the data or use NONPARAMETRIC TESTS. Also called test of homogeneity.

test for independence a procedure used to test the hypothesis of association or relationship between two variables. The observed frequencies of a variable are compared with the frequencies that would be expected if the NULL HYPOTHESIS of no association (i.e., statistical independence) were true. The CHI-SQUARE TEST is often used for this purpose.

test for normality any procedure used to test whether a data set follows a NORMAL DISTRIBUTION. Many statistical procedures are based on the assumption that the RANDOM VARIABLE of interest is normally distributed. When this assumption is violated, interpretation and inference from the statistical tests may not be warranted. Often, normality is most conveniently assessed using graphical methods, such as a STEM-AND-LEAF PLOT, to visualize the differences between an empirical distribution and the standard normal distribution. Alternatively, there are statistical tests of normality, such as the KOLMOGOROV–SMIRNOV GOODNESS-OF-FIT TEST and the SHAPIRO–WILK TEST.

testicle n. a TESTIS and its surrounding structures, including the system of ducts within the scrotum. —testicular adj.

testicular atrophy reduction in size or loss of function of a testis as a result of obstruction of its blood supply, injury, infection, or surgical repair of an inguinal hernia. Pressure testicular atrophy may result from failure of a testis to descend normally from the abdominal cavity during sexual development.

testicular feminization syndrome see ANDROGEN-INSensitivity SYNDROME.
testimony n. evidence given in court by an individual who is under oath. See EXPERT TESTIMONY; EYEWITNESS TESTIMONY; OPINION TESTIMONY; ULTIMATE OPINION TESTIMONY.

testing effect the finding that taking a test on previously studied material leads to better retention than does restudying that material for an equivalent amount of time. Although testing is often conceptualized as an assessment tool, this finding suggests that testing (or retrieval practice) can also be considered a learning tool. Indeed, exams or tests seem to activate retrieval processes that facilitate the learning of study material and cause knowledge to be stored more effectively in long-term memory.

testing the limits 1. in psychological testing, allowing a participant to proceed beyond time limits (or waiving other standardized requirements) to see if he or she can complete an item or do better under alternate conditions. 2. attempts by an individual to see how far he or she can test rules before the rules are enforced. An example would be seeing how much talking one can get away with in a class before being reprimanded by the teacher. 3. a method used to study adult age differences in cognition in which research participants are required to perform a task to the best of their ability and are then tested after extensive practice on the task. See also RESERVE CAPACITY. [developed by Paul B. BALTES and his associates]

test interpretation the clinical, educational, vocational, or other practical inferences given to a particular test result. Such conclusions are typically drawn by an expert in testing or by suitable computer software.

testis n. (pl. testes) the principal male reproductive organ, a pair of which is normally located in the scrotum. The testes produce sperm in the SEMINIFEROUS TUBULES (see SPERMATOGENESIS) and male sex hormones (ANDROGENS) in INTERSTITIAL CELLS. See TESTICLE. See also CRYPTOCHIDISM; HYPERMOBILE TESTES.

testis-determining factor see SEX DIFFERENTIATION.

test marketing research undertaken to assess consumer reactions to new or altered products. Companies often try to carry out this research discreetly so that competitors are unaware of any potential changes. On the basis of the results, products may be introduced into the general market, introduced after changes, or withdrawn.

test norm the typical standard of performance on a test, as established by testing a large group of people (the STANDARDIZATION GROUP) and analyzing their scores. In NORM-REFERENCED TESTING, subsequent test takers’ scores are compared with the test norm to estimate the position of the tested individuals in a predefined population with respect to the trait being measured.

Test of Attentional and Interpersonal Style (TAINS) a self-report inventory used to determine an individ-
ual’s dominant attentional style (see ATTENTIONAL FOCUS) and profile his or her style of interacting with others. Widely used in sports to predict and enhance athletic performance and in business to select and train individuals for particular jobs, the TAI consists of 144 items (e.g., “All I need is a little information and I can come up with a large number of ideas”) grouped into 17 subscales. [developed in 1976 by U.S. psychologist Robert M. Nideffer (1942– )]

**Test of Nonverbal Intelligence (TONI)** a language-free test of intelligence, abstract reasoning, and problem solving for individuals ages 6 through 89 years. The test items present problems of progressively increasing difficulty, with each item consisting of a stimulus figure and a set of choices below the stimulus that have up to eight abstract characteristics (i.e., shape, position, direction, rotation, contiguity, shading, size, and movement). Due to its language-free and motor-reduced format, the test can be used with individuals who have linguistic, hearing, or motor impairments or who are not proficient in English.

First published in 1982, the test is now in its fourth edition (TONI-4), published in 2010. [developed by Linda Brown, Rita J. Sherbenou, and Susan K. Johnsen]

**test of significance** any statistical test or procedure, such as a T TEST, Z TEST, F TEST, or CHI-SQUARE TEST, used in SIGNIFICANCE TESTING.

**test of simple effects** in an ANALYSIS OF VARIANCE, a test used to determine the effect of one INDEPENDENT VARIABLE on the DEPENDENT VARIABLE at a single level of a second independent variable: that is, the test is used to examine the effects of one of the independent variables with the other independent variable held constant. For example, consider a researcher who finds a statistically significant interaction between two independent variables, A and B, that each have two levels, A1 and A2, and B1 and B2. In this case, a test of simple effects involves two statistical tests: one of the difference between A1 and A2 at B1 and a second of the difference between A1 and A2 at B2. The comparisons can also be undertaken by examining the difference between B1 and B2 at A1 and the difference between B1 and B2 at A2.

**Test of Variables of Attention (TOVA)** a computerized CONTINUOUS PERFORMANCE TEST of sustained attention and impulsivity, typically used as a screening tool for attention-deficit/hyperactivity disorder. The test involves brief stimulus presentations at a fast rate and has both visual and auditory versions for individuals ages 6 and older, as well as a screening preschool version. The task for the visual version is to press a button in response to monochromatic targets (e.g., a small square at the top of a large square), ignoring nontargets (e.g., a small square at the bottom of a large square). In the first half of the test, targets are infrequent (they appear on 22.5% of the trials, eliciting errors of omission), whereas in the second half, targets are more frequent (they appear on 77.5% of the trials with an increased rate of presentation, eliciting errors of commission). Thus, the first half of the test is sensitive to problems with sustained attention, whereas the second half taps problems with inhibitory control. Test performance yields a number of other variables reflecting various behavioral features (e.g., consistency of response time). Developed in the 1960s by U.S. psychiatrist Lawrence M. Greenberg, the test was initially used with a mechanical device; the computerized version was introduced in 1991, and the most recent version (TOVA-8) has been available since 2011.

**test-operate-test-exit (TOTE)** see FEEDBACK LOOP.

**testosterone** n. a male sex hormone and the most potent of the ANDROGENS produced by the testes. It stimulates the development of male reproductive organs, including the prostate gland, and secondary SEX CHARACTERISTICS, such as beard, bone, and muscle growth. Women normally secrete small amounts of testosterone from the adrenal cortex and ovaries.

**test profile** an overall description or summary of an individual’s relative standing or characteristics obtained by collating the findings from a series of tests or subtests. For example, a personality profile may show the data gathered on personality and other tests of interest and be used to evaluate the individual in areas related to his or her personal, educational, and professional lives, including temperament, decision-making methods and communication style, and general attitude toward work and life.

**test–retest correlation** the degree of association between measurements of the same variable obtained when the same test is administered on separate occasions. It is a simple estimator of the RELIABILITY of a test or instrument and is indexed by the test–retest coefficient.

**test–retest reliability** see TEST RELIABILITY.

**test selection** the process of choosing the most useful test or set of assessment instruments to provide accurate diagnostic or other psychological information. Test selection is made on the basis of psychological history (often in conjunction with medical history), interviews, other pretest knowledge of the individual or group to be tested, or some combination of these.

**test sensitization** the design of a classification test so that it achieves optimum accuracy in identifying those participants who fall into particular categories. For example, a test may be sensitized by including certain items that are designed specifically to identify the highest performing students or employees.

**test sophistication** familiarity with a particular test or type of test, which might affect the score attained. See TESTWISE.

**test statistic** 1. the numerical result of a STATISTICAL TEST, which is used to determine STATISTICAL SIGNIFICANCE and evaluate the viability of a hypothesis. 2. any of the statistics relating to a test or its components, such as indices of item difficulty, item RELIABILITY, ITEM DISCRIMINABILITY, and so on. See TEST ANALYSIS.

**test–study–test method** an approach to the teaching of spelling (and other similar content-acquisition subjects) that involves a pretest to determine the words a child knows, study of the words the child did not know, and then a retest.

**test theory** the body of theory underlying the interpretation and use of test scores. Of central concern is the definition and measurement of RELIABILITY. Theoretical frameworks include CLASSICAL TEST THEORY, GENERALIZABILITY THEORY, and ITEM RESPONSE THEORY.

**test-tube baby** a colloquial term for a baby born after IN VITRO FERTILIZATION.

**testwise** adj. describing a test taker who has developed skills and strategies that are not related to the construct being measured on the test but that facilitate an increased test score. Experience with similar tests, coaching, or the ability to respond advantageously to items that contain ex-
traneous clues and suggestions may yield a score that is higher than the true ability of the test taker.

**testwise alpha level** in **hypothesis testing**, the **significance level** (i.e., the level of risk of a **type I error**) selected for each individual test within a larger experiment. This is in contrast to **experiment-wise alpha level**, which sets the total risk of Type I error for the experiment. As more significance tests are conducted, the experiment-wise alpha level goes up, unless there is an adjustment to lower the testwise alpha level.

**testwise error rate** in a test involving **multiple comparisons**, the probability of making a **Type I error** on any specific test or comparison. **Factorial designs** allow for the possibility of performing many such individual contrasts, and the related **family-wise error rate** reflects the possibility of Type I error across the entire set of comparisons. Also called **comparison-wise error rate**; **per-comparison error rate**. See also **experiment-wise error rate**.

**tetanizing shock** an electric shock that produces sustained muscular contractions.

**tetanoid paraplegia** see **spastic paraplegia**.

**tetany** **tetanoid paraplegia** see **spastic paraplegia**.

**tetanus** n. see **calcium-deficiency disorders**.

**tetartanopia** n. an extremely rare form of partial color blindness marked by difficulty in discriminating between yellow and blue. Luminosity perception is normal, but the yellow and blue perception processes have confused or possibly merged connections. Its existence is considered controversial. See **dichromatism**.

**tetra-** (**tetra-**) combining form four.

**tetraabenzine** n. a drug used in the treatment of Huntington’s disease and other hyperkinetic movement disorders. It acts by depleting brain stores of the monoamine neurotransmitters dopamine, norepinephrine, and serotonin and produces such side effects as **Parkinsonism**, sedation, and depression. U.S. trade name: **Kenazine**. Canadian trade name: **Nitoman**.

**tetrachoric correlation coefficient** (symbol: \( r_{c} \)) an index reflecting the degree of relationship between two continuous variables that have both been dichotomized. For example, a researcher may need to correlate pass–fail on a test and graduate–nongraduate from school, wherein pass–fail is the dichotomization of continuous scores on a test and graduate–nongraduate is a dichotomization of grade-point average.

**tetrachromatism** n. 1. the color vision of organisms that have four different types of cone cells that respond to different wavelengths. Such organisms (e.g., zebrafish, many birds) are called **tetrachromats**. 2. the theory that normal color vision in humans is based upon perception of the four colors red, green, blue, and yellow.

**tetrachromat** any of the various nuclei of the thalamus. THCs that trigger waves of electrical activity in the cerebral cortex. Several thalamic nuclei have been found to initiate cortical discharges, including the intralaminar, midline, reticular, and ventralis anterior nuclei. Pacemaker neurons...
in the reticular nucleus excite cortical cells to fire synchronously in the pattern of SLOW-WAVE SLEEP.

thalamic sensory gating adjustment by the THALAMUS of the brain’s responses to stimuli. The thalamus functions as a conduit, but it also serves as a gatekeeper for most of the sensory input flowing into the brain. This gate is managed by alterations in various neurotransmitter systems, thereby restricting or expanding the flow of afferent stimuli back to the rest of the brain. For example, if the brain is getting more than it needs of a stimulus, the thalamus makes adjustments to reduce the stimulation.

thalamic taste area the area of the THALAMUS that relays taste information from the SOLITARY NUCLEUS to the primary Taste cortex. About one third of its neurons respond to taste; others are activated by touch or temperature stimulation of the mouth or even by the anticipation of an approaching taste stimulus.

thalamic theory of Cannon see CANNON–BARD THEORY.

thalamocortical system the THALAMUS and cerebral cortex collectively. These parts of the brain are so closely and reciprocally interconnected—especially in mammals—that they are often treated as a single system. Normal functioning of this system appears to be necessary for conscious experiences and voluntary actions. During waking states, groups of neurons in this system exhibit a pattern of continuous firing. During states of reduced consciousness, such as deep sleep, the entire system goes into an oscillatory mode characterized by neuronal burst–pause firing.

thalamotomy a neurosurgical technique in which a portion of the THALAMUS is destroyed. It is used primarily to relieve tremors in patients with Parkinson’s disease and to relieve pain. Developed in the 1940s for the treatment of severe, intractable mental illness (e.g. schizophrenia, depression), the technique is sometimes used for that purpose today as well.

thalamus n. (pl. thalami) a mass of gray matter forming part of the DIENCEPHALON of the brain, whose two lobes form the walls of the THIRD VENTRICLE. It consists of a collection of sensory, motor, autonomic, and associational nuclei, serving as a relay for nerve impulses traveling between the spinal cord and brainstem and the cerebral cortex. Specific areas of the body surface and cerebral cortex are related to specific parts of the thalamus. Many structural and functional regions of the thalamus have been identified, including the DORSOMEDIAL NUCLEUS, the LATEROVENTRAL NUCLEUS, and the VENTROPOSTERIOR NUCLEUS. See also EPITHALAMUS, SUBTHALAMUS. —thalamic adj.

thalidomide n. a drug reintroduced into the United States in 1998 as an immunosuppressant for treatment of cutaneous manifestations of erythema nodosum leprosum (a severe, acute form of leprosy). A derivative of the sedative GLUTETHYMIDE, it was originally (in the late 1950s and early 1960s) used to treat anxiety and morning sickness in pregnancy until its association with severe, life-threatening birth defects became apparent. Numerous fetal abnormalities—including abnormal limb development (see PHOCOMELIA) and gastrointestinal, cardiac, and neurological deficits—were common and the drug was withdrawn. Prescription requires special training by prescribers and pharmacists, and thalidomide must not be taken by women who are pregnant; both women and men who are taking thalidomide must comply with various conditions and contraceptive measures. Its mechanism of action is unclear. U.S. trade name: Thalomid.

thano- (thanat-) combining form death.

thanatology n. the study of death and death-related behaviors, thoughts, feelings, and phenomena. Death was mostly the province of theology until the 1960s, when existential thinkers and a broad spectrum of care providers, educators, and social and behavioral scientists became interested in death-related issues. —thanatologist n.

thanatomania n. see VOODOO DEATH.

thanatomimetic n. behavior that bears a strong resemblance to death and that may serve as a survival strategy. Examples can be seen in death-fearing spiders and opossums in response to a predator. —thanatomimetic adj.

thanatophobia n. a persistent and irrational fear of death or dying. This fear may focus on the death of oneself or of loved ones and is often associated with HYPOCHONDRIASIS. —thanatophobic adj.

Thanatos n. the personification of death and the brother of Hypnos (sleep) in Greek mythology, whose name was chosen by Sigmund FREUD to designate a theoretical set of strivings oriented toward the reduction of tension and life activity (see DEATH INSTINCT). In Freud’s DUAL INSTINCT THEORY, Thanatos is seen as involved in a dialectic process with EROS (love), the striving toward sexuality, continued development, and heightened experience (see LIFE INSTINCT). See also NIRVANA PRINCIPLE.

that’s-not-all technique a two-step procedure for enhancing COMPLIANCE that consists of (a) presenting an initial large request and then, before the person can respond, (b) immediately making the request more attractive by reducing it to a more modest target request or by offering some additional benefit. Compliance with the target request is greater following the initial request than would have been the case if the target request had been presented on its own. See also DOOR-IN-THE-FACE TECHNIQUE, FOOT-IN-THE-DOOR TECHNIQUE, LOW-BALL TECHNIQUE.

THC abbreviation for TETRAHYDROCANNABINOL.

theater of consciousness a metaphor in which the objects of conscious experience are likened to the actors in an attentional spotlight on a stage, whereas nonconscious psychological functions are likened to the darkened audience and the invisible backstage crew. See also CARTESIAN THEATER.

Theater of Spontaneity an experimental theater established in Vienna in 1921 by Jacob L. MORENO. The process of playing unrehearsed, improvised parts in the theater not only proved to be effective training for actors but also frequently had a beneficial effect on their interpersonal relationships. This technique evolved into PSYCHODRAMA, which Moreno brought to the United States in 1925.

thebaine n. an OPIUM alkaloid that is chemically similar to morphine but has stimulatory effects. It comprises about 0.2% of natural opium. Although thebaine lacks the analgesic effect of morphine, it can be converted to several important opioid agonists and antagonists (e.g., buprenorphine, naxalone).

theism n. belief in God, especially a personal God considered to be the creator and sustainer of the universe, who cares for and intervenes in creation but is distinct from it. Theism is central to orthodox Judeo-Christian be-
Thematic Apperception Test (TAT) a projective test, developed by Henry Alexander Murbay and his associates, in which participants are held to reveal their attitudes, feelings, conflicts, and personality characteristics in the oral or written stories they make up about a series of ambiguous black-and-white pictures. Prior to administering the test, the examiner assures the participant that there are no right or wrong answers and indicates that the narratives should have a beginning, middle, and ending. At the end, the stories are discussed to elucidate themes and patterns. Systematic coding schemes, with demonstrated reliability and validity, have been developed to assess different aspects of personality functioning derived from TAT stories, including motivation for achievement, power, affiliation, and intimacy; gender identity; defense mechanisms; and mental processes influencing interpersonal relations. The TAT is one of the most frequently used and researched tests in psychology, particularly in clinical settings for diagnosing disorders, describing personality, and assessing strengths and weaknesses in personality functioning. See also CHIL- DREN’S APPERCEPTION TEST.

Theological construct an explanatory concept that is not itself directly observable but that can be inferred from observed or measured data. In psychology, many hypothe- sized internal processes are of this kind, being presumed to underlie specific overt behaviors. For example, a personal- ity dimension, such as neuroticism, might be described as a theoretical construct measurable by means of a question- naire.

Theoretical distribution a DISTRIBUTION that is derived from certain principles or assumptions by logical and mathematical reasoning, as opposed to one derived from real-world data obtained by empirical research. Examples include the NORMAL DISTRIBUTION, BINOMIAL DISTRIBUTION, and POISSON DISTRIBUTION. In general, the procedures of INFERENTIAL STATISTICS involve taking one or more empiri- cally observed distributions and referring these to an appro- priate theoretical distribution. When there is corre- spondence between an empirical and a theoretical distribution, the latter may be used to make inferences (predictions) about the probability of future empirical events. Also called reference distribution.

Theoretical integration combining concepts from differ- ent therapeutic approaches to produce meaningful FRAMES that may help explain the dynamics or causes of problems in the functioning of an individual when any single traditional theoretical approach by itself fails to explain the behavior adequately.

Theoretical orientation an organized set of assump- tions or preferences for given theories that provides a coun- selor or clinician with a conceptual framework for understanding a client’s needs and for formulating a ra- tionale for specific interventions.

Theoretical prediction see PREDICTION.

Theoretical probability the mathematical likelihood of a particular event occurring, as determined by dividing the number of positive outcomes by the total number of possible outcomes. For example, when flipping a coin, the theoretical probability that a tail will occur is 1 divided by 2 (the number of possible outcomes), giving a probability of .5 or 50%.

Theoretical sampling a strategy, often adopted in QUALITATIVE RESEARCH, that involves the PURPOSEFUL SAM- PLING of further data while a theoretical framework is still under construction. To gain a deeper understanding of the constructs involved, the researcher samples new research sites, cases, incidents, time periods, or data sources to compare with those that have already been studied. In this way, he or she seeks to build a theory from the emerging data while continuing to select new samples to examine and elaborate on the theory. See GROUNDED THEORY.

Theoretical statistics the study of statistics from a mathematical and theoretical perspective, involving PROB- ability theory, descriptive methods, inferences, and model building. For example, a researcher could use theo- retical statistics to describe a set of achievement data, con- duct HYPOTHESIS TESTING, and create models assessing
possible predictors of achievement. Also called mathematical statistics. Compare applied statistics.

theory. n. 1. a principle or body of interrelated principles that purports to explain or predict a number of interrelated phenomena. See construct; model. 2. in the philosophy of science, a set of logically related explanatory hypotheses that are consistent with a body of empirical facts and that may suggest more empirical relationships. See scientific explanation. 3. in general usage, abstract or speculative thought as opposed to practice. —theoretical adj.

theory-laden adj. 1. describing a term or expression that can be understood only in the context of a particular theory. For example, some specialized vocabulary used in accounts of behavioral phenomena can be understood only in the context of the theory that generated the vocabulary and in the context of other constructs that are part of the theory’s explanatory accounts. 2. describing a proposition or observation that reflects theoretical presuppositions on the part of the person who deploys it. Often these presuppositions, which may be a source of bias, are unconscious or unacknowledged. Some claim that all observations are theory-laden and thus that objectivity is impossible.

theory of aging. any of several hypotheses about the biological, psychological, or social causes of the aging process.

theory of evolution see evolutionary theory.

theory of forms. the doctrine of Plato that all things have a real, permanent existence as ideas or forms independent of one’s senses and of the impoverished examples that one can perceive. Also called theory of ideas. See analogy of the cave; platonic idealism; reminiscence theory of knowledge.

theory of mental self-government. a model of cognitive styles that proposes several dimensions to describe the preferred ways in which individuals think or express their cognitive abilities. The dimensions include (a) governmental—preferences for the legislative, executive, and judicial functions of cognition (i.e., in planning, implementing, and evaluating); (b) problem solving—styles labeled monarchic (a tendency to pursue one goal at a time), hierarchic (multiple goals with different priorities), oligarchic (multiple equally important goals), and anarchic (unstructured, random problem solving); (c) global versus local thinking—preferring to think about large, abstract issues on the one hand or concrete details on the other; (d) internal versus external thinking—related to introversion–extraversion, social skills, and cooperativeness; and (e) conservative or progressive—rule-based leanings versus those that are creative and change oriented. [proposed in 1988 by U.S. psychologist Robert J. Sternberg (1949– )]

theory of mind. the understanding that others have intentions, desires, beliefs, perceptions, and emotions different from one’s own and that such intentions, desires, and so forth affect people’s actions and behaviors. Children show the rudiments of theory of mind as toddlers, have a limited understanding of the relation between belief and action by age 3, and can begin to infer false beliefs in others by around age 4 (see false-belief task). There has been considerable controversy about whether nonhuman animals have this ability. See also belief–desire reasoning; mindblindness.

theory of misapplied constancy. a theory of illusions proposing that the underlying cause is the inappropriate use of cues that normally allow accurate perception of such properties as size and shape. For example, depth might be misestimated if a display has converging lines that do not actually recede in depth: An object inside the lines would be seen as farther away than it actually is, and thus its size would also be misperceived.

theory of personal investment. a motivational theory stating that the degree to which an individual will invest personal resources of time and effort in an activity, in anticipation of benefits, is a function of personal incentives (mastery orientation, competitive orientation, affiliation, status); beliefs about oneself (sense of competence, self-reliance, goal-directedness, identity); and perceived options (behavioral choices seen as available in the specific situation). [proposed in 1986 by U.S. psychologists Martin L. Maehr (1932– ) and Larry A. Bruskamp]

theory of planned behavior. a model that resembles the theory of reasoned action but also incorporates the construct of perceived behavioral control. Perceived behavioral control is added to attitude toward behavior and subjective norms as the antecedents influencing both the intention to perform a behavior and the performance of the behavior itself. [originally proposed by U.S. social psychologist Icek Ajzen (1942– )]

theory of reasoned action. the theory that attitudes toward a behavior and subjective norms (perceived expectations) regarding a behavior determine a person’s intention to perform that behavior. Intentions are in turn assumed to cause the actual behavior. Also called reasoned action model. See also theory of planned behavior. [originally proposed by U.S. social psychologists Martin Fishbein (1936–2009) and Icek Ajzen (1942– )]

theory theory. a model proposing that children naturally construct theories to explain what they experience and that cognitive development occurs as they generate, test, and change theories about the physical and social world through ongoing observation, learning, and adaptation.

Theory X and Y. two contrasting types of managerial philosophy: Theory X managers assume that workers are passive, lazy, and motivated only by money and security, whereas Theory Y managers assume that workers want to grow psychologically and desire autonomy and responsibility. It is hypothesized that these assumptions are self-fulfilling, so that workers who are subjected to Theory X management will act in a lazy and untrustworthy manner, and those who are subjected to Theory Y management and are provided with a workplace that encourages psychological growth will show creativity and initiative. A Theory X manager is authoritarian in leadership style, whereas a Theory Y manager is participative and democratic. [described by Douglas McGregor (1906–1964), U.S. management consultant and social psychologist]

Theory Z. a managerial philosophy that emphasizes participative decision making by employees, the encouragement of team spirit, and the use of measures to develop
therapeutic
greater respect between managers and employees. See also DEMING MANAGEMENT METHOD; TOTAL QUALITY MANAGEMENT. [identified by U.S. management theorist William G. Ouchi (1943– )]

therapeutic 1. adj. pertaining to therapeutics, the branch of medical science concerned with the treatment of diseases and disorders and the discovery and application of remedial agents or methods. 2. adj. having beneficial or curative effects. 3. n. a compound that is used to treat specific diseases or medical conditions.

therapeutic abortion an abortion that is performed for medical reasons, such as to preserve the mother’s health or save her life.

therapeutic alliance a cooperative working relationship between client and therapist, considered by many to be an essential aspect of successful therapy. Derived from the concept of the psychosanalytic working alliance, the therapeutic alliance comprises bonds, goals, and tasks. Bonds are constituted by the core conditions of therapy, the client’s attitude toward the therapist, and the therapist’s style of relating to the client: goals are the mutually negotiated, understood, agreed upon, and regularly reviewed aims of the therapy; and tasks are the activities carried out by both client and therapist. See THERAPIST–PATIENT RELATIONSHIP. [concept developed by U.S. psychologist Edward S. Bordin (1913–1992)]

therapeutic atmosphere an environment of acceptance, empathic understanding, and unconditional positive regard in which clients feel free to verbalize and consider their thoughts, behaviors, and emotions and make constructive changes in their attitudes and reactions.

therapeutic camp a camp that provides part-time care, therapeutic treatment, rehabilitation, or a combination of these for individuals, often children and adolescents, with a variety of conditions. Examples include camps for children with learning disabilities, for children and adolescents with HIV or AIDS, and for individuals with head injuries.

therapeutic communication any comment or verbalized observation by the therapist that increases the client’s awareness or self-understanding.

therapeutic community a setting for individuals requiring therapy for a range of psychosocial problems and disorders that is based on an interpersonal, socially interactive approach to treatment, both among residents and among staff (i.e., community as method or therapy). The term covers a variety of short- and long-term residential programs as well as day treatment and ambulatory programs. The staff is typically multidisciplinary and may consist of human services professionals and clinicians providing mental health, medical, vocational, educational, fiscal, and legal services, among others. Originating as an alternative to conventional psychiatric approaches, therapeutic communities have become a significant form of psychosocial treatment. See MILIEU THERAPY. [developed by British psychiatrist Maxwell Shaw Jones (1907–1990)]

therapeutic crisis a turning point in the treatment process, usually due to sudden insight or a significant revelation on the part of the client or patient. The crisis may have positive or negative implications and may lead to a change for the better or the worse, depending on how it is handled.

therapeutic exercise a regimen of movement exercises prescribed to an individual by a clinician, physical therapist, or other practitioner as part of the individual’s postsurgical convalescence, treatment for a chronic condition, or rehabilitation from disease or injury. Therapeutic exercises are recommended for numerous physical reasons, including to alleviate pain (e.g., postsurgical pain, chronic back pain); to increase cardiopulmonary function following a heart attack or heart surgery; to decrease muscle rigidity caused by movement disorders such as Parkinson’s disease; or to improve mobility impaired by stroke, spinal cord injury, multiple sclerosis, or other neurological conditions. A wide variety of exercises is available, but broadly speaking, most are designed to increase physical endurance, flexibility, or strength (e.g., CIRCUIT RESISTANCE TRAINING). Those used for a given individual are determined according to his or her needs and abilities. Therapeutic exercises also promote psychological health and may be prescribed to reduce stress, induce relaxation, improve mood, increase energy levels, or otherwise enhance psychological function and well-being in individuals, with or without physical challenges, who are susceptible to depression, anxiety, agitation, or other mental health problems.

derapeutic factors factors in GROUP THERAPY that bring about therapeutic change. These include altruism, catharsis, cohesion, family reenactment, feedback, hope, identification, interpersonal learning, reality testing, role flexibility, universality, and vicarious learning. Therapeutic factors are often confused with COMMON FACTORS because both delineate effective change factors across theoretical models and techniques of therapy; however, common factors refer to individual psychotherapy, whereas therapeutic factors refer to group psychotherapy. Formerly called curative factors. [identified by U.S. psychologist Irwin Yalom (1931– )]

therapeutic group a group of individuals who meet under the leadership of a therapist for the express purpose of working together to improve the mental and emotional health of the members.

therapeutic group analysis see GROUP–ANALYTIC PSYCHOTHERAPY.

therapeutic index any of several indices relating the clinical effectiveness of a drug to its safety factor, the most common being the THERAPEUTIC RATIO. Other therapeutic indices include the ratio of the minimum toxic dose to the minimum EFFECTIVE DOSE and the difference between the minimum effective dose and the minimum toxic dose.

therapeutic jurisprudence the study of law as a therapeutic agent. Therapeutic jurisprudence involves the examination of how laws, procedures, and people who play an active role within the legal system (e.g., judges, law enforcement agents) may either help or harm the various other individuals involved (e.g., defendants, victims).

therapeutic matrix in COUPLES THERAPY, the specific combination of therapists and clients that is used in the sessions, such as a different therapist for each partner in COLLABORATIVE THERAPY or one or more therapists seeing the couple together in CONJOINT THERAPY.

therapeutic process see PSYCHOTHERAPEUTIC PROCESS.

therapeutic ratio an index relating the clinical effectiveness of a drug to its safety factor, calculated by dividing the median LETHAL DOSE (LD₅₀) by the median EFFECTIVE DOSE (ED₅₀). A drug is often considered safe only if its thera-
patients are exposed. The focus is primarily on the "cure" of physical or mental disorders or diseases. In the context of mental health, the term is often used synonymously with psychotherapist (see PSYCHOTHERAPY).

therapist–patient relationship the relationship developed in therapy between a psychotherapist and the patient (client) receiving therapy. There has been much theory and research concerning this interaction, particularly how it varies and changes over time and the significant implications that the dynamic has for the way in which treatment is offered and for its outcomes. The relationship has ethical dimensions that are often specified in PRACTICE GUIDELINES. See also THERAPEUTIC ALLIANCE.

Theraplay n. a short-term ATTACHMENT-BASED INTERVENTION in which elements of play therapy (e.g., games, playful interaction) are used to strengthen parent–child bonds and to promote secure attachments, self-regulation, and communication skills in children. The intervention has been used primarily to help families at high risk for dysfunctional parent–child (or caregiver–child) relationships, including families with foster or adopted children who are struggling with attachment problems and families with children who have autism, social anxiety, language disorders, or other conditions affecting a child’s ability to establish or maintain relationships with others. [originated in the late 1960s for Head Start preschoolers by German-born U.S. psychologist Ann M. Jernberg (1928–1993) and colleagues]

therapy n. 1. remediation of physical, mental, or behavioral disorders or disease. 2. see PSYCHOTHERAPY.

therapy group climate see GROUP CLIMATE.

therapy outcome research research that investigates the end results of therapy or other interventions to which patients are exposed. The focus is primarily on the "cure" (or not) of patients, but the research also evaluates their experiences, preferences, and values, as well as the wider influence on society. The aim is to identify shortfalls in practice and to develop strategies to prevent or mitigate problems and improve care. See also TREATMENT OUTCOME RESEARCH; TREATMENT PROCESS RESEARCH.

therapy puppet a puppet used for ROLE PLAY in therapy with children. The use of a therapy puppet is sometimes more effective in revealing a child’s thoughts and feelings than is direct communication by the child with the therapist.

therapy supervision see SUPERVISION.

therblig n. a unit of movement sometimes used to describe and record industrial operations for the purposes of TIME AND MOTION STUDIES. It represents any one of the 18 fundamental, standardized activities involved in such operations: search, find, select, grasp, hold, position, assemble, use, disassemble, inspect, transport loaded, transport unloaded, pre-position for next operation, release load, unavoidable delay, avoidable delay, plan, and rest to overcome fatigue. [coined by U.S. engineer and efficiency expert Frank B. Gilbreth (1868–1924) and Lillian Moller Gilbreth, from a backward spelling of their surname]

there-and-then approach a historical approach to therapy, focusing on the roots of the client’s difficulties in past experience, as opposed to the HERE-AND-NOW approach.

thermal comfort the subjective evaluation of feelings with respect to temperature. Major contributing factors include humidity, air velocity, clothing, and level of physical exertion. Contrary to widespread belief, the range of thermal comfort is remarkably stable cross-culturally.

thermal discrimination the ability to detect differences in temperature among stimuli. Some animals (e.g., snakes) are able to locate prey by differences of a fraction of a degree between the temperature of the environment and that produced by the body heat of potential prey. Humans, however, are much less sensitive to temperature change.

thermalgesia n. an abnormal reaction to heat in which a warm stimulus produces pain.

thermalgia n. a condition characterized by intense, burning pain.

thermal illusion see TEMPERATURE ILLUSION.

thermal sensitivity the ability to detect temperature, which is generally perceived relative to the body’s temperature. See TEMPERATURE SENSE.

thermal stimulation stimulation of the skin with heat or cold.

thermistor n. a device used to measure temperatures according to their effects on the electrical resistance of semiconducting materials. Tiny thermistors can be implanted in neurons of nonhuman animals to measure such data as the energy of metabolic activity during nervous-system functions.

thermo- (therm-): combining form heat.

thermoanesthesia n. 1. loss or absence of the ability to distinguish between heat and cold by touch. 2. insensitivity to heat. Also called thermanesthesia.

thermode n. a device made of copper through which water can be circulated at a controlled temperature. A thermode can be implanted in an organ of a nonhuman animal in order to determine the effects of temperature...
thermoesthesia

changes on surrounding tissues. Much information about thermal receptors has been obtained in this manner.

thermoesthesia (thermesthesia) n. see TEMPERATURE SENSE.

thermography n. a diagnostic technique in which thermally sensitive liquid crystals or infrared photography are used to detect temperature changes over the surface of the body. Thermography functions on the basis that diseased tissues, such as tumors, produce more heat than surrounding tissues and the heat can be measured in terms of infrared radiation.

thermoneceptor n. 1. a receptor or sense organ that is activated by cold or warm stimuli. 2. a part of the central nervous system that monitors and maintains the temperature of the body core and its vital organs. There is evidence for separate thermoregulatory regions in the spinal cord, brainstem, and hypothalamus.

thermoregulation n. the behavioral and physiological processes, collectively, that maintain normal body temperature. These processes include sweating and shivering. See also HOMOSTASIS.

thesis n. (pl. theses) 1. in logic, a proposition to be subjected to logical analysis in the interest of proof or disproof. 2. more generally, any idea or proposition put forward in argumentation. 3. in philosophy, the first stage of a dialectical process: a proposition that is opposed by an ANTITHESIS, thereby generating a new proposition referred to as a SYNTHESIS. The synthesis serves as the thesis for the next phase of the ongoing process. This use of the term is associated particularly with the work of German philosopher Georg Wilhelm Friedrich Hegel (1770–1831). See also DIALECTICAL MATERIALISM. 4. a dissertation based on original research, especially one required for an advanced academic degree.

theta feedback NEUROFEEDBACK involving theta waves, of a frequency between 4 Hz and 7 Hz.

theta wave in electroencephalography, a type of regular BRAIN WAVE with a frequency of 4 Hz to 7 Hz. Theta waves occur during REM SLEEP in nonhuman animals. Stage 2 NREM SLEEP in humans, and the drowsy state prior to sleep onset in newborn infants, adolescents, and adults. Such waves are also recorded in TRANCES, HYPNOSIS, and DAYDREAMS. The hippocampus and frontal lobes are sources of theta activity. Also called theta rhythm.

they-group n. see OUTGROUP.

thiamine (thiamin) n. a vitamin of the B complex present in various foods and also normally present in blood plasma and cerebrospinal fluid. Deficiency of thiamine results in neurological symptoms, as occurs in BERI-BERI, ALCOHOLIC NEUROPATHY, and KORSAKOFF’S SYNDROME. In severe cases, WERNICKE’S ENCEPHALOPATHY may result. Also called vitamin B1.

thiazide diuretic any of a group of synthetic chemicals developed in the 1950s and widely used in the treatment of hypertension. Thiazides cause the excretion of approximately equal amounts of sodium and chloride with an accompanying volume of water, thereby lowering blood pressure. Also called benzothiadiazide.

thick description in QUALITATIVE RESEARCH, the delineation and interpretation of observed behavior within its particular context so that the behavior becomes meaningful to an outsider. The context may be a small unit (a family or work environment) or a larger unit (a community or general culture). The researcher not only accurately describes observed behavior or social actions but also assigns purpose, motivation, and intentionality to these actions by explaining the context within which they took place; thick description conveys the thoughts and feelings of participants as well as the complex web of relationships among them. In contrast, a thin description is a superficial account that does not explore underlying meanings. [introduced in 1973 by U.S. anthropologist Clifford Geertz (1926–2006)]

thick stripes broad bands of CYTOCHROME OXIDASE activity in the region of the prefrontal cortex known as V2. The thick stripes receive input from layer IVb of V1 and analyze signals carried by the MAGNOCYLLULAR SYSTEM.

thienobenzodiazepine n. any member of a class of chemically related compounds that include OLANZAPINE, an ATYPICAL ANTIPSYCHOTIC introduced into the U.S. market in 1996.

thigmesthesia n. sensitivity to pressure. See TOUCH SENSE.

think-aloud protocol a transcript of ongoing mental activity, as reported by a participant engaged in some task. The participant thinks aloud while performing the task, thus creating a record of his or her cognitive processing for later analysis. See PROTOCOL ANALYSIS.

thinking n. cognitive behavior in which ideas, images, MENTAL REPRESENTATIONS, or other hypothetical elements of thought are experienced or manipulated. In this sense, thinking includes imagining, remembering, problem solving, daydreaming, FREE ASSOCIATION, concept formation, and many other processes. Thinking may be said to have two defining characteristics: (a) it is covert—that is, it is not directly observable but must be inferred from actions or self-reports; and (b) it is symbolic—that is, it seems to involve operations on mental symbols or representations, the nature of which remains obscure and controversial (see SYMBOLIC PROCESS).

thinking style see COGNITIVE STYLE.

thinking through a typically multistage, multilayered thought process in which the individual attempts to understand and achieve insight into his or her own reactions, thought processes, or behavior, such as through consideration and analysis of cause and effect.

thinking type in the ANALYTIC PSYCHOLOGY of Carl JUNG, a FUNCTIONAL TYPE exemplified by the individual who evaluates information or ideas rationally and logically. The thinking type is one of Jung’s two RATIONAL TYPES, the other being the FEELING TYPE. See also INTUITIVE TYPE; SENSATION TYPE.

thinning n. in conditioning, a gradual increase in the intermittency of reinforcement.

thin slices of behavior extremely small samples of behavior upon which people are able to base relatively accurate judgments about others. In research, thin slices are brief video or aural clips usually lasting from 1 second to 5 minutes, sampled from longer streams of behavior, from which raters are able to make better than chance accuracy judgments about the person being shown or heard. Such findings are thought to demonstrate humans’ remarkable ability to process social information quickly, automatically, and efficiently, an ability that likely has evolutionary signif-
thin stripes thin bands of increased CYTOCHROME OXIDASE activity in the region of the precrastiate cortex known as V2. The thin stripes receive input from the CYTOCHROME OXIDASE BLOBS of V1 and contain neurons from the PARVOCELLULAR system that are sensitive to color.

thiopental n. an ultrashort-acting BARBITURATE used primarily as an anesthetic that can be administered intravenously to produce almost immediate loss of consciousness. It may also be used as an antidote for an overdose of stimulants or convulsants. At one time, it was occasionally used in psychotherapy to induce a state of relaxation and suggestibility. In nonmedical circles, it gained notoriety as a TRUTH SERUM. U.S. trade name: Pentothal.

thioridazine n. a low-potency antipsychotic of the piperidine PHENOTHIAZINE class that, like others of its class, causes sedation and significant anticholinergic effects. Adverse effects unique to thioridazine include the potential to cause retinal changes possibly leading to blindness (retinitis pigmentosa) at doses exceeding 800 mg per day. It can also cause severe disturbances in heart rhythm: Its ability to prolong the Q-T interval may cause fatal arrhythmias (see ELECTROCARDIOGRAPHIC EFFECT). It should not be taken by patients who have cardiac arrhythmias or who are taking other drugs that may prolong the Q-T interval. U.S. trade name: Navane.

thioxanthene n. any of a group of antipsychotic drugs, generally of intermediate potency, that resemble the PHENOTHIAZINES in pharmacological activity and molecular structure. Like the phenothiazines, they are associated with cardiovascular and anticholinergic side effects, as well as EXTRAPYRAMIDAL SYMPTOMS common to all dopamine-blocking agents. Their use has largely been supplanted by newer antipsychotics. Thioxanthenes include thiothixene (U.S. trade name: Mellaril), flupenthixol, and ZUCLOPENTHIXOL. Only thiotixene is currently available in the United States.

third cranial nerve see OCULOMOTOR NERVE.

third moment see MOMENT.

third-party administrator (TPA) in health insurance, a fiscal intermediary organization that provides administrative services, including claims processing and underwriting, for other parties (e.g., insurance companies, employers) but does not carry any insurance risk.

third-party payer an organization, usually an insurance company, prepayment plan, or government agency, that pays for the health expenses incurred by the insured. The third party (to the agreement) is distinguished from the first party, which is the individual receiving the services, and the second party, which is the individual or institution providing the services.

third-person effect a tendency for a person to expect that others will be more strongly influenced by (i.e., will respond to and take action as a result of) a persuasive communication in the mass media than he or she would be. The third-person effect has been studied extensively and is of particular interest in politics, social policy, and health psychology. It generally is explained in terms of a desire for self-enhancement; People are motivated to reinforce their positive self-images and thus are unrealistically optimistic in comparing themselves to others. Negative attitudes toward the media generally (i.e., believing newspaper, television, and radio communications to be manipulative or otherwise deceitful) may also play a role. Also called third-person perception. [coined in 1983 by U.S. sociologist W. Phillips Davison (1918–2012)]

third-person perspective a public, external, and objective point of view on human behavior and experience. Compare FIRST-PERSON PERSPECTIVE; SECOND-PERSON PERSPECTIVE.

third-person perspective memory see OBSERVER MEMORY.

third quartile see QUARTILE.

third variable see HIDDEN VARIABLE.

third-variable problem the fact that an observed correlation between two variables may be due to the common correlation between each of the variables and a third variable rather than any underlying relationship (in a causal sense) of the two variables with each other. In other words, when two variables, a and b, are found to be positively or negatively correlated, it does not necessarily mean that one causes the other: It may be that changes in an unmeasured or unintended third variable, c, are causing a random and coincidental relationship between the two variables by independently changing a and b. For example, as the sales of air conditioners increase, the number of drownings also increases: The unintended third variable in this case would be the increase in heat. See HIDDEN VARIABLE.

third ventricle a cavity of the brain, filled with CEREBROSPINAL FLUID, that forms a cleft between the two lobes of the THALAMUS beneath the cerebral hemispheres. It communicates with the LATERAL VENTRICLES and caudally with the fourth ventricle through the CEREBRAL AQUEDUCT.

thirst n. the sensation caused by a need for increased fluid intake to maintain an optimum balance of water and electrolytes in body tissues. Water is lost from the body mainly in urine, through sweat, and via the lungs. Dehydration causes a reduced production of saliva and the feeling of a dry mouth. In addition, a specialized area of the hypothalamus in the brain detects and responds to the changes in OSMOTIC PRESSURE that result from increased concentration of electrolytes in extracellular fluid subsequent to water loss (see OSMORECEPTOR). See also HYPOVOLEMIC THIRST; OSMOMETRIC THIRST.

Thomas S. class action a class action lawsuit in North Carolina that recognized a special class of people in state psychiatric hospitals. Many class members had both mental retardation and severe and persistent or recurring mental illness (MR/MI). The court order required specific services and supports for those members. Although the class was dissolved in 1998, the case resulted in the establishment of a division that administers MR/MI services within the state-led agency for mental retardation services.

Thomistic psychology the psychological principles found in the writings of Thomas Aquinas and revived in the early 20th century by a number of Roman Catholic thinkers. Aquinas emphasized ARISTOTELIAN logic, the compatibility of reason with faith, human free will, and the knowledge of God as ultimate happiness. See also SCHOLASTICISM.

thoracic adj. pertaining to the thorax—the portion of the mammalian body cavity bounded by the ribs, shoulders, and diaphragm—or to a structure contained within this...
thought n. 1. the process of THINKING. 2. an idea, image, opinion, or other product of thinking. 3. attention or consideration given to something or someone.

thought–action fusion (TAF) 1. the belief that if one thinks about an unpleasant event or disturbing act, it is more likely to occur. 2. the belief that thinking about an act is morally equivalent to carrying it out. TAF is often considered to be a feature particularly of OBSESSIVE-COMPULSIVE DISORDER. See also MAGICAL THINKING.

thought avoidance the evasion of unwanted mental events, typically those that are unpleasant or dissonant. Thought avoidance may function as a psychological defense mechanism as well as a means of therapeutic change.

thought broadcasting the delusion that one’s thoughts are being disseminated throughout the environment (e.g., by means of television, radio, or other media) for all to hear.

thought deprivation see BLOCKING.

thought derailment disconnected thought processes, as manifested by a tendency to shift from one topic to another that is indirectly related or completely unrelated to the first. Thought derailment is a symptom of schizophrenia: the term is essentially equivalent to COGNITIVE DERAILEMENT.

thought disorder a cognitive disturbance that affects communication, language, or thought content, including POVERTY OF IDEAS, NEODLOGISMS, PARALOGIA, WORD SALAD, and DELUSIONS. A thought disorder is considered by some to be the most important mark of schizophrenia (see also SCHIZOPHRENIC THINKING), but it is also associated with mood disorders, dementia, mania, and neurological diseases (among other conditions). Also called thought disturbance. See CONTENT-THOUGHT DISORDER; FORMAL THINKING DISORDER.

thought echoing see ÉCHO DES PENSEES.

thought experiment a mental exercise in which a hypothesis or idea is put to the test without actually conducting an experiment or research project. The purpose is to explore the logical consequences of the hypothesis or idea. Thought experiments often involve arguments about events of a hypothetical or counterfactual nature, which nevertheless have implications for the actual world. They can be used to challenge the intellectual status quo, correct misinformation, identify flaws in an argument, or generate ideas as part of a problem-solving exercise. Thought experiments are most familiar in philosophy (e.g., CHINESE ROOM ARGUMENT) but are also used in the physical sciences, generally as a step toward designing a physical experiment.

thought insertion a delusion in which the individual believes that thoughts have been irresistibly forced into his or her mind and ascribes these thoughts to outside sources.

thought intrusion see INTRUSIVE THOUGHTS.

thought monitoring the process of tracking and noticing one’s own thoughts.

thought obstruction see BLOCKING.

thought pressure see PRESSURE OF IDEAS.

thought process any of the COGNITIVE PROCESSES involved in such mental activities as reasoning, remembering, imagining, problem solving, and making judgments. See THINKING. See also HIGHER MENTAL PROCESS; MEDIATION PROCESS; SYMBOLIC PROCESS.

thought record a common COGNITIVE RESTRUCTURING tool used to help individuals identify and change negative, unrealistic, and maladaptive thinking. Individuals record events that triggered distress, list any AUTOMATIC THOUGHTS that were elicited by each event, and cite evidence to support or disprove these thoughts. They then use their evaluation of the evidence to form more balanced, realistic, or objective thoughts. Thought records can be used during therapy sessions to recall past events or as SELF-MONITORING homework. [introduced by Aaron T. BECK]

thought reform see COERCIVE PERSUASION.

thought sampling typically, the making of audio recordings or written notes on the stream of one’s thoughts, feelings, and so forth for therapeutic or scientific purposes.

thought stopping the skill of using a physical or cognitive cue to stop negative thoughts and redirect them to a neutral or positive orientation. This skill is taught in some behavior therapies, when the therapist shouts “Stop!” to interrupt a trend toward undesirable thoughts and trains clients to apply this technique to themselves.

thought suppression the attempt to control the content of one’s mental processes and specifically to rid oneself of undesired thoughts or images. Ironically, engaging in thought suppression often only serves to make the unwanted thoughts more intrusive.

thought transference a supposed phenomenon in which the mental activities of one person are transmitted without physical means to the mind of another person. With MIND READING, it is one of the two main forms of TELEPATHY.

thought withdrawal the delusion that one’s thoughts are being removed from one’s mind by other people or forces outside oneself.

threat n. 1. a condition that is appraised as a danger to one’s self or well-being or to a group. 2. an indication of unpleasant consequences that is used as a means of coercion for failure to comply with a given request or demand. 3. any event, information, or feedback that is perceived as conveying negative information about the self. —threaten vb. —threatening adj.

threat appraisal the cognitive and emotional processes involved in assessing the potentiality and level of threat.

threat display any of various ritualized communication signals used by nonhuman animals to indicate that attack or aggression might follow. Examples are fluffed-out fur or
feathers, certain facial expressions or body postures, and low-frequency vocalizations (e.g., growls). Animals faced with a threat display can submit or flee before an attack begins. The use of ritualized threat displays can minimize direct physical aggression to the benefit of both individuals.

**threat to self-esteem model** the idea that help from another may be perceived as a threat to one’s self because it implies that one is incapable or inferior. In these circumstances, the recipient of help may respond negatively to it. [proposed in 1986 by psychologists Arie Nadler and Jeffrey D. Fisher]

**three-burst pattern** see TRIPHASIC PATTERN.

**three-component theory** see TRICHROMATIC THEORY.

**360-degree feedback system** a procedure for evaluating JOB PERFORMANCE and providing feedback to employees. It involves asking supervisors, peers, subordinates, and clients of an employee, as well as the employee, to evaluate the employee’s performance. A comparison of the employee’s self-rating with the ratings of the others is then provided as feedback. Also called 360-degree appraisal system: 360-degree evaluation.

**three-mountains test** a PIAGETIAN APPRAISAL used to assess visual perspective taking in children. A doll is placed at various locations around a three-dimensional display of three mountains, and children must indicate how the doll sees the display. Children younger than 8 years old have difficulty performing this test correctly, although they are able to understand that others have a visual perspective that is different from their own when less complicated tasks are used.

**three-parameter model** in ITEM RESPONSE THEORY, a model that specifies three parameters affecting an individual’s response to a particular test item: (a) the difficulty level of the item; (b) the DISCRIMINATING POWER of the item; and (c) in multiple-choice items, the effect of guessing. The probability of a correct response to the item is held to be a mathematical function of these parameters.

**three-stage model** see INFORMATION-PROCESSING MODEL.

**three-stage sampling** see MULTISTAGE SAMPLING.

**three-stage theory** the view that skill acquisition (e.g., of motor skills) proceeds through three stages that progressively require less attention and become more automatic. According to U.S. psychologists Paul Morris Fitts (1912–1965) and Michael F. Posner (1936—), the stages are cognitive (understanding what needs to be done and how to do it), associative (improvement through practice and feedback), and autonomous (automatic performance). See also MOTOR LEARNING; SKILL LEARNING.

**three-stratum model of intelligence** a psychometric model of intelligence based on a factorial reanalysis of several hundred data sets available in the literature. It is considered by some researchers to be the most thoroughly supported of the various PSYCHOMETRIC THEORIES OF INTELLIGENCE. The three strata correspond to (a) minor group factors at the first (lowest) level; (b) major group factors at the second level (fluid intelligence, crystallized intelligence, general memory and learning, broad visual perception, broad auditory perception, broad retrieval ability, broad cognitive speediness, and processing speed); and (c) the general factor at the third (highest) level. [proposed in the 1990s by U.S. psychologist John B. Carroll (1916–2003)]

**three-term contingency** specification of the stimulus circumstances, the response, and the outcome in a REINFORCEMENT CONTINGENCY. It is formulated as $S \rightarrow R \rightarrow S'$ or denoted ABC (for antecedent, behavior, and consequence).

**three-way analysis of variance** an ANALYSIS OF VARIANCE that isolates the MAIN EFFECTS of three independent variables, $a, b,$ and $c$, on a dependent variable and their INTERACTION EFFECTS—one three-way interaction, $a \times b \times c$, and three two-way interactions, $a \times b$, $a \times c$, and $b \times c$.

**three-way design** an experimental design in which three independent variables are examined simultaneously to observe their separate MAIN EFFECTS and their joint INTERACTION EFFECTS on a dependent variable of interest. Data from such designs often are evaluated with a THREE-WAY ANALYSIS OF VARIANCE.

**three-way interaction** in a THREE-WAY ANALYSIS OF VARIANCE, the joint effect of all three independent variables, $a, b,$ and $c$, on a dependent variable. A statistically significant three-way interaction indicates that one or more of the three possible two-way interactions $(a \times b, a \times c, \text{and } b \times c)$ differ across the levels of a third variable. For example, the $a \times b$ interaction may differ for one level of $c$ compared to another level of $c$. A three-way interaction is a type of HIGHER ORDER INTERACTION.

**threshold** $n.$ 1. in psychophysics, the magnitude of a stimulus that will lead to its detection 50% of the time. 2. the minimum intensity of a stimulus that is necessary to evoke a response. For example, an AUDITORY THRESHOLD is the slightest perceptible sound; an excitatory threshold is the minimum stimulus intensity that triggers an ACTION POTENTIAL in a neuron; and a renal threshold is the concentration of a substance in the blood required before the excess is excreted. Also called LIMEN; RESPONSE THRESHOLD. See also ABSOLUTE THRESHOLD; DIFFERENCE THRESHOLD.

**threshold effect** an effect in a dependent variable that does not occur until a certain level, or threshold, is reached in an independent variable. For example, a drug may have no effect at all until a certain dosage level (the threshold value) is reached. The change in the dependent variable can be an irreversible dichotomous change (e.g., from functional to not functional), or it can be continuous, such that the dependent variable changes each time the independent variable crosses the threshold in either direction.

**threshold model** any model specifying that there is a value within a range of values for an independent variable at which the dependent variable (e.g., the behavior or action of a participant) changes from one state (e.g., unwilling to buy a product) to another (e.g., willing to buy the product).

**threshold of consciousness** the minimum above which stimuli enter awareness, characterized in terms of stimulus intensity, duration, and relevance. The threshold concept has been applied to memory and mood as well as to sensory stimulation.

**threshold shift** a change in threshold as a result of a change in such variables as level of adaptation or context.

**threshold theory** the hypothesis in GROUP DYNAMICS that conflict is beneficial provided it does not exceed the tolerance threshold of the group members for too long. [developed by U.S. communication theorist Ernest G. Bormann (1925–2008)]

**threshold traits analysis** (TTA) in personnel selection, a method of identifying the traits required for acceptable performance in a given position. Subject-matter
thrombosis

experts (usually supervisors or current holders of a position) rate the importance, uniqueness, relevance, level, and practicality of 33 traits for a particular position. [proposed by industrial and organizational psychologist Felix Manuel Lopez (1917—)]

**thrombosis** n. the presence or formation of a blood clot (THROMBUS) in a blood vessel, including vessels in the heart (coronary thrombosis). Thrombosis is likely to develop where blood flow is impeded by disease, injury, or a foreign substance. Formation of a blood clot in a vein is called **venous thrombosis** (see deep vein thrombosis). A thrombosis in the brain (cerebral thrombosis) can cause a thrombotic stroke or cerebrovascular accident. See also auditory thrombosis. —thrombotic adj.

**thrombotic stroke** the most common type of stroke, occurring when blood flow to the brain is blocked by a cerebral thrombosis. A thrombosis typically results from the narrowing and eventual occlusion of a large blood vessel in the brain, especially the carotid or middle cerebral artery, by atherosclerosis.

**thrombus** n. a blood clot that forms in a blood vessel (see thrombosis). A thrombus that becomes detached from its point of origin and is carried in the blood to obstruct another site is called an embolus (see embolism).

**thumb opposition** the ability to coordinate the thumb and forefinger in finger grip movements. Thumb opposition begins to develop around the 3rd or 4th month of infancy, although it is not fully achieved until the second half of the first year, as eye-hand coordination grows more skillful.

**thumb sucking** a common habit among infants and young children, formerly classified as a habit disturbance when persisting beyond 3 or 4 years. It is often explained as a sucking impulse from which the child derives pleasure as well as comfort and relaxation.

**Thurstone attitude scales** a direct attitude measure that involves generating a large set of statements designed to reflect varying levels of positivity or preference toward an attitude object. A group of judges are then asked to rate how positive or negative each statement is, usually on a 9- or 11-point scale. The central tendency and dispersion of the judges’ ratings for each statement are computed, and a set of statements with low dispersions is selected. This set contains two statements reflecting each of the scale points on the rating scale (i.e., two statements having an average rating of 1, two statements having an average rating of 2, and so on) and makes up the final attitude scale. When the scale is administered, respondents are instructed to indicate which statements they endorse, and their attitude score is the median of the scale values for these statements. See also likert scale; semantic differential. [Louis L. Thurstone]

**thymine** (symbol: T) n. a pyrimidine compound in the nucleotides of living organisms. It is one of the four bases in DNA that constitute the genetic code, the others being adenine, cytosine, and guanine. In RNA, uracil replaces thymine.

**thymus** n. an organ, located in the lower neck region, that is part of the immune system. The thymus reaches maximum size at puberty, then shrinks. During infancy, it is the site of formation of lymphocytes.

**thyro- combining form of or relating to the thyroid gland.**

**thyroid gland** an endocrine gland forming a shieldlike structure on the front and sides of the throat, just below the thyroid cartilage. It produces the iodine-containing thyroid hormones (thyroxine and triiodothyronine) in response to thyroid-stimulating hormone from the anterior pituitary gland. C cells (parafollicular cells) in the thyroid produce the hormone calcitonin, which controls levels of calcium and phosphate in the blood.

**thyroid hormone** any of the hormones synthesized and released by the thyroid gland. The primary thyroid hormone, thyroxine (T4), is metabolized to triiodothyronine (T3) within target tissues. Plasma levels of T3 are much higher than those of T4, but T3 has the more potent physiological activity. Both hormones play a central role in regulating basic metabolic processes and the early development of the brain, and their excess secretion has major effects on functioning (see congenital hypothyroidism; myxedema; thyrotoxicosis). Calcitonin, a hormone released by parafollicular cells of the thyroid gland, plays a crucial role in calcium and phosphate metabolism.

**thyroid-stimulating hormone** (TSH) a hormone produced by the anterior pituitary gland that stimulates production and release of thyroxine and triiodothyronine from the thyroid gland. Its secretion is controlled by thyrotropin-releasing hormone from the hypothalamus. Injections of TSH are used in the differential diagnosis of disorders of the thyroid gland. Also called thyrotropic hormone: thyrotropin.

**thyroplasty** n. any surgical procedure performed on the cartilages of the larynx to alter the length or position of the vocal cords in order to improve voice and sound production. Also called laryngeal framework surgery.

**thyrotoxicosis** n. a condition caused by an excess of thyroid hormones, which may be produced by an overactive thyroid gland or administered therapeutically. Endogenous thyrotoxicosis may be familial and can involve an autoimmune reaction in which the patient’s antibodies stimulate rather than destroy the cells producing thyroid hormone. Thyrotoxicosis is characterized by nervousness, tremor, palpitation, weakness, heat sensitivity with sweating, and increased appetite with weight loss. There may be exophthalmos associated with goiter. Thyrotoxicosis is frequently associated with hyperplasia (enlargement) of the thyroid gland, as in Graves’ disease, or the development of thyroid nodules (Plummer’s disease), which occurs in older people. See also hyperthyroidism.

**thyrotropin** n. see thyroid-stimulating hormone.

**thyrotropin-releasing hormone** (TRH) a hormone produced by the hypothalamus that regulates the release of thyroid-stimulating hormone.

**thyroxine** (T4) n. an iodine-containing hormone produced by the thyroid gland. It is the principal thyroid hormone, and it helps regulate metabolism by controlling oxidation rate in cells. See also triiodothyronine.

TIA abbreviation for transient ischemic attack.

**tianeptine** n. a novel antidepressant compound with a modified tricyclic structure thought to act by increasing brain-derived neurotrophic factor via glutamatergic mechanisms, which in turn decreases serotonin neurotransmission. Its efficacy compares favorably to currently used antidepressants. French trade name: Stablon.

**tic** n. a sudden, involuntary vocalization (vocal tic) or contraction of a small group of muscles (motor tic) that is recurrent and nonrhythmic. Tics may be simple (e.g., eye
blinking, shoulder shrugging, grimacing, throat clearing, grunting, yelping) or complex (e.g., hand gestures, touching, jumping, ECHOLALIA, COPROLALIA). They may be psychogenic in origin, or they may occur as an adverse effect of a medication or other substance or result from a head injury, neurological disorder, or general medical condition.

**tic disorder** any one of a group of disorders characterized by the occurrence many times a day of motor tics, vocal tics, or both that is not due to a general medical condition or the effects of a medication. The group includes TOURETTE’S DISORDER, CHRONIC MOTOR OR VOCAL TIC DISORDER, and TRANSIENT TIC DISORDER.

tic douloureux see TRIGEMINAL NEURALGIA.

tickle experience a sensation produced by impulses from adjacent skin receptors that are stimulated lightly in rapid succession. It is assumed that the receptors involved are also responsible for the sensations of itch and pain and that the method of stimulation accounts for the different sensations.

tight culture a homogeneous social group whose members have the same cultural attributes (e.g., language, social customs, religion) and tend toward a rigid adherence to the collective norms of their group. Compare LOOSE CULTURE. [defined by Greek-born U.S. psychologist Harry C. Triandis (1926– )]

tightrope test a test of the ability of rats to maintain their balance while climbing a sloping wire in order to obtain food.

tigroid bodies see NISSL BODIES.

tilt aftereffect (TAE) see AFTEREFFECT.

timbre n. the perceptual attribute relating to the quality of a sound. Two perceptually different sounds with the same pitch and loudness differ in their timbre. Timbre is determined primarily by the SPECTRUM but also is affected by temporal and intensive characteristics. Also called TONE COLOR. —TIMBRAL adj.

time n. a concept by which events are ordered into past, present, and future. Through the observation of recurrent phenomena, such as the rotation of the earth, time is divided into periods and used to measure the duration of events and rates of change. Time appears to be so abstract, and at the same time so fundamental, that no universally satisfactory definition has been formulated. It is a matter of debate whether time is a construct arising from human- tians’ marking of change or some sort of medium through which change occurs. Although classical mechanics regarded time as absolute, the special theory of relativity maintains that time is relative to motion. Philosophers have also differed over whether time is absolute or relative to particular perspectives and conditions.

**time agnosia** an inability to perceive the passage of time, usually due to a disorder involving the temporal area of the brain. Individuals are unable to estimate short time intervals and believe long periods of time to be much shorter than they actually are. Their awareness of the existence of time, however, is retained. Causes may include a stroke, alcoholic coma, or a head injury; soldiers have experienced time agnosia after a combat trauma.

time and motion study an analysis of industrial operations or other complex tasks into their component steps, observing the time required for each. Common in the early years of SCIENTIFIC MANAGEMENT, such studies may serve a number of different purposes, enabling an employer to set performance targets, increase productivity, rationalize pay rates and pricing policy, reduce employee fatigue, and prevent accidents. Also called MOTION AND TIME STUDY. See also THERBLIG. [revised by U.S. engineer and efficiency expert Frank B. Gilbreth (1868–1924) and Lillian Moller GILBRETH]

time and rhythm disorders speech and language problems related to the timing of sounds and syllables, including repetitions, prolongations, and stuttering. The disorders are often functional and may be complicated by stress. They may be treated with a combination of psychotherapy and speech therapy, using such techniques as cancellation (interrupted stuttering), voluntary stuttering, or rewarding or reinforcing fluent speech.

time-compressed speech words and phrases presented to the ear with small elements removed, which has the effect of increasing the rate of presentation. Time-compressed speech is used to measure auditory perceptual abilities. Also called TIME-ALTED SPEECH. See also DISTORTED SPEECH TEST.

**time discounting** giving less weight or importance to future events than to present events, often in connection with the utility values associated with these events.

**time distortion** a type of perceptual transformation, sometimes experienced in altered states of consciousness, in which time appears to pass either with great rapidity or with extreme slowness. Perception of past and future may also be transformed.

timed test any test in which the participant’s speed contributes to the final score.

**time error** in psychophysics, a misjudgment due to the relative position of stimuli in time. For example, the first of two identical tones sounded consecutively tends to be judged as louder than the second.

**time estimation** the ability to monitor elapsed time. In operant conditioning studies using fixed-interval schedules, nonhuman animals can estimate the time between one reward and the occurrence of the next reward. In nature, time estimation is important for finding prey that emerge at a fixed time of day or season and is essential for navigation when sun or star cues are used (see SUN COMPASS).

**time-extended therapy** a form of GROUP THERAPY in which prolonged sessions replace or alternate with sessions of normal length. The experience is usually highly emotional and revealing because the participants become fatigued and have insufficient energy for defensive games. See also MARATHON GROUP.

**time-lag design** a type of QUASI-EXPERIMENTAL RESEARCH in which participants of the same age are compared at different time periods. It is typically used in developmental, educational, and social psychological contexts to study whether there are differences in a given characteristic for samples of equal age but drawn from different cohorts measured at different times. For example, a time-lag study of intelligence might compare a group of people who were 20 years old in 2005 with groups who were 20 years old in 2006, 2007, and 2008. Time-lag designs have the benefit of controlling for time-of-testing effects. However, there are drawbacks of low INTERNAL VALIDITY and difficulty in separating COHORT EFFECTS from AGE EFFECTS.

**time-lagged correlation** the correlation of a measure
at one point in time with the value of that same measure at a different point in time. An example is the correlation of IQ scores of individuals when they are 5 years old with their IQ scores when they are 10 years old. See STABILITY COEFFICIENT.

timeless moment 1. the infinitely small dimension of the present instant as conceptualized by traditional linear time. See PSYCHOLOGICAL MOMENT; SPEIOUS PRESENT. 2. an experience in which one’s normal awareness of time dissolves and one feels a sense of holistic involvement with another person or thing or with the universe as a whole. Such PEAK EXPERIENCES are of particular interest in HUMANISTIC PSYCHOLOGY. See BEING COGNITION.

time-limited day treatment an outpatient all-day therapeutic community approach used with clients diagnosed with personality disorders that capitalizes on the positive attributes of the clients as a group. [developed by Canadian psychologist William E. Piper (1945– )]

time-limited psychotherapy (TLP) therapy that is limited to a predetermined number of sessions over a specified period of time. See also BRIEF PSYCHOTHERAPY.

time–location sampling a method of finding research participants in which members of a hard-to-reach target population (e.g., homeless people, migrant workers) are recruited from specific locations at which they may be found during specific time periods. The sample is selected in stages: (a) the SAMPLING FRAME is determined, comprising all of the locations at which there is sufficient attendance by persons in the population of interest to make sampling worthwhile; (b) a random sample of locations is chosen from this frame; and (c) a sample of participants is chosen, usually randomly, during each sampling event. Also called VENUE SAMPLING.

time-of-measurement effect an effect that is due to the social and historical influences present at the time a measurement is made. These effects are difficult to separate from AGE EFFECTS in longitudinal designs.

time out (TO) 1. a technique, originating from BEHAVIOR THERAPY, in which undesirable behavior is weakened and its occurrence decreased, typically by moving the individual away from the area that is reinforcing the behavior. The technique is used by teachers in schools and by parents to decrease undesirable behavior in a child. Also called TIME OUT FROM REINFORCEMENT. 2. in OPERANT CONDITIONING, a time interval during which a behavior does not occur. A time-out procedure may be used to eliminate the stimulus effects of earlier behaviors or as a marker in a series of events.

time-out theory a theory to explain the positive effect of exercise as a stress-management technique. It proposes that when exercising, the individual is taking a time out from the real world and its stress inducers, thereby allowing the body to shut down the physical and mental manifestations of stress.

time sampling in DIRECT OBSERVATION, a data collection strategy that involves noting and recording the occurrence of a target behavior whenever it is seen during a stated time interval. The process may involve fixed time periods (e.g., every 5 minutes) or random time intervals. For example, a researcher may observe a group of children for 10 seconds every 5 minutes for a specific 30-minute period each day, noting the occurrence or nonoccurrence of particular behaviors (overt actions). Observations taken during these periods are known as TIME SAMPLES. An individual score is assigned on the basis of one or more of the following: (a) the number of time units in which the defined behavior occurs, (b) the total frequency of occurrence of the defined behavior in the total observational time, and (c) the average frequency of the defined behavior per unit of time. See PARTIAL-INTERVAL RECORDING; WHOLE-INTERVAL RECORDING.

time score a score based on the amount of time used to complete a particular task. An example is the number of minutes a 3-year-old child requires to solve a simple puzzle.

time sense the ability to estimate time intervals or the time of day without information from clocks. Numerous external and internal stimuli contribute to a sense of time, including the position of the sun in the sky, regular daily events (e.g., mealtimes, school classes), and internal body rhythms (see BIOLOGICAL CLOCK). However, one’s estimation of the passage of time can be influenced and distorted by many factors (see PSYCHOLOGICAL TIME).

time-sequential design an experimental design to separate AGE EFFECTS from time-of-measurement and COHORT EFFECTS (i.e., to determine if the results obtained are age-related only). In a time-sequential design, a second age group is added to a TIME-LAG DESIGN, and two or more cross-sectional comparisons are made at different times of testing.

time series a set of measures on a single attribute, variable, or construct obtained repeatedly over time.

time-series analysis a branch of statistics that involves the analysis of changes in a single variable recorded repeatedly over time. The data may have an internal structure (e.g., AUTOCORRELATION, trend, seasonal variation) that should be accounted for and that provides input allowing for the prediction of future values of the variable. Compare CROSS-SECTIONAL ANALYSIS.

time-series design an experimental design that involves the observation of units (e.g., people, countries) over a defined time period. Data collected from such designs may be evaluated with TIME-SERIES ANALYSIS.

time sharing the process of rapidly switching attention from one task to another when two or more tasks are performed concurrently. An individual’s time-sharing ability can be used to predict his or her performance in complex tasks.

time–space synesthesia see SYNESTHESIA.

timidity n. 1. the tendency to take great caution in approaching a perceived risk or to avoid the risk altogether. 2. see SHYNESS. —timid adj.

timing-of-events model a paradigm that describes adult psychosocial development as influenced by the expected or unexpected occurrence and timing of particular life events. See OFF-TIME LIFE EVENTS; ON-TIME LIFE EVENTS. [initially described in the 1950s by Bernice Levin NEUGARTEN]

tinnitus n. noises in one or both ears, including ringing, buzzing, or clicking, due to acute ear problems, such as MÉNIÈRE’S DISEASE, disturbances in the receptor mechanism, side effects of drugs (especially tricyclic antidepressants), or epileptic aura. Occasionally, tinnitus is due to psychogenic factors (see SENSORY CONVERSION SYMPTOMS).

tip node see GRAPH.
tip-of-the-tongue phenomenon (TOT phenomenon) the experience of attempting to retrieve from memory a specific name or word but not being able to do so. Usually, the name or word is eventually retrieved, but while on the TOT, it seems to hover tantalizingly on the rim of consciousness. See also FEELING OF KNOWING; RETRIEVAL BLOCK.

tissue n. a structure composed of identical or similar cells with the same or similar function, as in ADIPOSE TISSUE, erectile tissue, or muscle tissue.

tissue damage injury to body tissue causing impairment of function, such as nerve damage in multiple sclerosis or damage caused by radiation. Tissue damage is a common cause of pain. Cuts, pinpricks, or other painful experiences are accompanied by the release of HISTAMINE or other substances known to excite pain receptors.

Titchener circles see EBINGHAUS ILLUSION. [Edward Bradford TITCHENER]

tit-for-tat strategy (TFT strategy) a bargaining method in which a party initially cooperates with another party but thereafter imitates the other party’s behavior: Cooperation is met with cooperation, competition with competition.

titration n. a technique used in determining the optimum dose of a drug needed to produce a desired effect in a particular individual. The dosage may be either gradually increased until a noticeable improvement is observed in the patient or adjusted downward from a level that is obviously excessive because of unwanted adverse effects or toxicity. To avoid unpleasant side effects when starting pharmacotherapy, some drugs must be slowly titrated upward to a therapeutic dose. Likewise, many drugs should be slowly titrated downward upon cessation of therapy both to avoid discontinuation side effects and to monitor for the recurrence of symptoms. See TAPERING.

TLP abbreviation for TIME-LIMITED PSYCHOTHERAPY.

T lymphocyte see Lymphocyte.

TM abbreviation for TRANSCENDENTAL MEDITATION.

TMA 1. abbreviation for TRANSCORTICAL MOTOR APHASIA. 2. abbreviation for TRIMETHOXYPHAMPETAMINE.

T maze a maze shaped like the letter T, consisting of a start box and a stem that leads to a choice between left and right arms, one being incorrect and the other leading to the goal box. More complicated mazes can be formed by joining several T mazes in sequence. A variant of this apparatus is the Y MAZE: both are used in experiments on animal cognition.

TMI abbreviation for TRANSMARGINAL INHIBITION.

TMJ syndrome a disorder of muscles operating the lower jaw at the temporomandibular joint (TMJ) just in front of the ear. The condition—which may be due to tension or stress, arthritis, dislocation or other injury, or a tumor—is often marked by facial pain, limited jaw movement, and clicking of the jaw during movement.

TMS abbreviation for TRANSCRANIAL MAGNETIC STIMULATION.

TMTF abbreviation for TEMPORAL MODULATION TRANSFER FUNCTION.

TO abbreviation for TIME OUT.

tobacco n. the dried leaves of the plant Nicotiana tabacum and other Nicotiana species (native to tropical America), which are smoked, chewed, or sniffed for their stimulant effects. The main active ingredient is NICOTINE. The leaves also contain volatile oils, which give tobacco its characteristic odor and flavor. Tobacco was used by the native tribes of North and South America when the first European explorers arrived and was quickly transplanted to gardens and plantations throughout the world. It has no therapeutic value but is of great commercial and medical importance because of its widespread use and associated detrimental cardiovascular, pulmonary, and carcinogenic effects. Indeed, smoking tobacco cigarettes was first identified by the U.S. Surgeon General in the 1960s as a major preventable cause of death and disability.

tobacco dependence an informal name for NICOTINE DEPENDENCE.

tobacco use disorder see NICOTINE DEPENDENCE.

tobacco withdrawal see NICOTINE WITHDRAWAL.

to-be-remembered items (TBR items) in experiments on memory, the specific items presented to the participant for recall, such as a list of letters, numerals, or words.

Tobit analysis a type of regression analysis used when a dependent variable with values above or below a certain threshold takes on the value of that threshold; that is, the exact value of the variable is unknown or ignored (see CENSORED DATA). For example, in an analysis of aptitude in college students, the dependent variable could be a score on a standardized aptitude test that has an upper limit of 500 (the threshold value). Students who answer all questions on the test correctly receive a score of 500, even though these students may not have equal aptitude. In such a case, the influence of independent variables, such as reading and math scores, on the dependent variable of academic aptitude is more appropriately studied with Tobit regression analysis than with ordinary least squares regression because the threshold values would bias the slope of the obtained regression line. Also called CENSORED REGRESSION; Tobit model. [named by analogy with LOGIT ANALYSIS, after James Tobin (1918–2002), U.S. economist]

toe drop a loss of muscular control of the toes. It is a sign of the onset of CHARCOT–MARIE–TOOTH DISEASE, in which the peripheral nerves of the extremities gradually degenerate and cease transmitting impulses. Toe drop progresses to FOOT DROP.

Tofranil n. a trade name for IMIPRAMINE.

toilet training the process of teaching a child to control the emptying of the bowel and bladder by learned inhibition of natural reflexes and to excrete in the appropriate place and manner. Although defecation and urination involve functions of the autonomic nervous system, toilet training conditions the individual to override the reflex action with voluntary nerve control. See DEFECATION REFLEX; MICTURATION REFLEX. See also ENCOPRESIS; ENURESIS.

token economy in BEHAVIOR THERAPY, a program, sometimes conducted in an institutional setting (e.g., a hospital or classroom), in which desired behavior is reinforced by offering tokens that can be exchanged for special foods, television time, passes, or other rewards. See also BACKUP REINFORCER; BEHAVIOR MODIFICATION; OPERANT CONDITIONING THERAPY.

token identity theory see IDENTITY THEORY.
tokenism

*tokenism* *n.* the making of a perfunctory or symbolic gesture that suggests commitment to a practice or standard, particularly by hiring or promoting a single member of a previously excluded group to demonstrate one's benevolent intentions. For example, an all-White company may hire a token Black employee to give the appearance of organizational parity as opposed to actually eliminating racial inequality in the workplace. Tokenism depends on the prevailing norms, structures, and conceptualizations (e.g., of ideal *ingroup* and *outgroup* members) of the cultural context in which it is embedded.

token reinforcer an object that has no inherent reinforcing value in itself but that can be exchanged for a *reinforcer*. The best known example is money. Also called token reward.

**Token Test** a test of auditory language processing in which participants are asked to manipulate tokens of different shapes, sizes, and colors in response to increasingly complex instructions. The Token Test is used to identify and evaluate receptive language dysfunction associated with *aphasia*. [originally developed in 1962 by Italian neuropsychologists Ennio De Renzi and Luigi A. Vignolo]

tolerance *n.* 1. a condition, resulting from persistent use of a drug, characterized by a markedly diminished effect with regular use of the same dose of the drug or by a need to increase the dose markedly over time to achieve the same desired effect. Tolerance is one of the two prime indicants of *physical dependence* on a drug, the other being a characteristic withdrawal syndrome (see *substance withdrawal*). Development of drug tolerance involves several mechanisms, including pharmacological ones (i.e., metabolic tolerance and *pharmacodynamic tolerance*) and a behavioral one (i.e., a behavioral conditioning process). Also called drug *tolerance*. See *substance dependence*. 2. acceptance of others whose actions, beliefs, physical capabilities, religion, customs, ethnicity, nationality, and so on differ from one's own. 3. a fair and objective attitude toward points of view different from one's own. 4. permissible or allowable deviation from a specified value or standard. —tolerant *adj.*

tolerance interval a range of values within which, with some probability, a specified proportion of a population falls. For instance, a researcher may be 95% confident that 90% of the population of interest in a particular study will fall within the range specified by the tolerance interval. It differs from a *confidence interval*, which bounds a single population parameter (e.g., the mean or variance).

tolerance limit the uppermost or lowermost value of a *tolerance interval*.

tolnacche *n.* a plant, *Datura inoxia*, belonging to the nightshade family and closely related to *jimsonweed*, that contains numerous alkaloids with powerful *anticholinergic* effects. The plant has been used by indigenous peoples of North and Central America in religious ceremonies and adolescent rituals.

toluen *n.* a volatile solvent that, when chronically inhaled, can cause kidney failure and death. See *inhalant*.

Tolvron *n.* a trade name for *mianserin*.

tomato effect the rejection of an effective treatment because it does not fit an established medical model or because it does not make sense in light of currently accepted medical theories. It has been applied to biofeedback training. The tomato effect is so named because in America the tomato—known to be a member of the nightshade family—was originally thought to be poisonous; for this reason, tomatoes were not consumed in America until 1820, even though Europeans had been eating them for generations without harm.

tomboyism *n.* the tendency of girls to adopt behavior traditionally associated with boys. See also *role confusion; sissy behavior*. —tomboy *n.*

tomography *n.* a technique for revealing the detailed structure of a tissue or organ through a particular plane that involves the compilation of a series of images taken from multiple perspectives. Examples include *computed tomography* and *positron emission tomography*. —tomographic *adj.*

tomomania *n.* a compulsive urge to undergo surgery. See also *Münchausen syndrome*. -tomy (-otomy) *suffix* surgical cutting (e.g., *lobotomy*). See also -ectomy.

tonal *adj.* a perceptual characteristic of a sound. The primary tonal attributes are *pitch*, *loudness*, and *timbre*.

tonal *chroma* see *tonality*.

tonal attribute a perceptual characteristic of a sound. The primary tonal attributes are *pitch*, *loudness*, and *timbre*.

tonal *chroma* see *tonality*.

tonal *language* the musical *pitch* of a sound. Also called *tonal*.

tonal *language* see *tone*.

tonal *sensation* an auditory sensation that produces *pitch*. The term is sometimes loosely used to describe any auditory sensation.

tonal *spectrum* see *sound spectrum*.

tonal *volume* the extensity or space-filling quality of a sound.

tone *n.* 1. a *pure tone*. 2. a sound that has *pitch*. 3. in *linguistics*, a phonetic variable along the dimension of *pitch*. In a *tonal language*, such as Mandarin or Thai, tone has a phonemic function (see *phoneme*) in that differences in tone are sufficient to mark a distinction between words that are otherwise pronounced identically. In English, tone is an important *suprasegmental* feature of speech, with different patterns of *intonation* serving to distinguish different types of utterance, such as statements and questions. —tonal *adj.*

tone *color* see *timbre*.

tone *deafness* inability to distinguish differences in pitch. Also called *asonia*.

tongue *kiss* see *french kiss*.

tongue *tie* see *ankyloglossia*.

TONI abbreviation for *test of nonverbal intelligence*. 

tonic *adj.* of or relating to muscle tone, especially a state
of continuous muscle tension or contraction, which may be normal (see TONUS) or abnormal. For example, a tonic phase of facial muscles prevents the lower jaw from falling open, a normal function. Abnormally, in the tonic phase of a TONIC–CLONIC SEIZURE, the muscles controlling respiration may undergo spasm, resulting in a temporary suspension of breathing.

tonic activation a form of arousal mediated by the RETICULAR FORMATION and identified as tonic because of its persistent effect. Compare PHASIC ACTIVATION.

tonic–clonic seizure a seizure characterized by both TONIC and CLONIC motor movements. In the tonic phase, the muscles go into spasm and the individual falls to the ground unconscious; breathing may be suspended. This is followed by the clonic phase, marked by rapidly alternating contraction and relaxation of the muscles, resulting in jaw movements (the tongue may be bitten) and urinary incontinence. Formerly called grand mal seizure.

tonic contraction the sustained contraction of different groups of fibers within a muscle to maintain continual muscular tension (tonus).

tonic epilepsy a type of epilepsy in which only TONIC muscle contractions occur.

tonic immobility see DEATH FEIGNING.

tonic labyrinth reflex a reflex, occurring normally during infancy and pathologically thereafter, that involves contraction of FLEXOR muscles (those that bend limbs) if the head is tilted forward and contraction of EXTENSOR muscles (those that straighten limbs) if the head is tilted backward.

tonic pupil of Adie a unilateral eye defect, caused by damage to the nerves supplying the intrinsic EYE MUSCLES, in which the pupil responds poorly to light and very slowly to convergence. [William John Adie (1886–1935), Australian-born British physician and neurologist]

tonic receptor a receptor cell whose frequency of discharge of nerve impulses declines slowly or not at all as stimulation is maintained. Compare PHASIC RECEPTOR.

tonic reflex 1. any reflex involving a significant delay between muscle contraction and relaxation. 2. any reflex that enables a muscle or group of muscles to maintain a certain level of tension, or tonus. Signals from stretch receptors in muscles and tendons are integrated within the spinal cord, and the signals in the efferent motor neurons are adjusted accordingly. Such reflexes are crucial for maintaining posture and for movement.

tonic spasm see SPASM.

tono- (ton-) combining form 1. sound or tone (e.g., TONOTOPIC ORGANIZATION). 2. tension or pressure (e.g., TONOMETRY).

tonometer n. 1. a device that can produce a tone of a given pitch or can measure the pitch of other tones. 2. see TONOMETRY.

tonometry n. a method of measuring INTRAOCULAR PRESSURE that is used in the diagnosis of glaucoma and ocular hypertension. Tonometry is usually performed with a device (called a tonometer) that blows a puff of air against the eyeball and automatically measures the amount of indentation (resistance of the surface of the eye), which indicates the intraocular pressure.

tonotopic organization the fundamental principle that different frequencies stimulate different places within structures of the mammalian auditory system. This organization begins in the COCHLEA, where different frequencies tend to cause maximal vibration at different places along the BASILAR MEMBRANE and thus stimulate different HAIR CELLS. The hair cells are discretely innervated, so different auditory nerve fibers respond to a relatively limited range of frequencies, with the maximal response at the best frequency of the fiber. This frequency-to-place mapping is preserved in the AUDITORY CORTEX.

tonus n. a continuous, slight stretching tension or contraction in muscles when they are at rest. For example, the jaw muscles exhibit tonus when not used for eating or talking. Tonus serves to keep the muscles ready for action. See also TONIC.

tool design in HUMAN ENGINEERING, an approach to the design of instruments and tools that addresses HUMAN FACTORS concerns, such as the avoidance of muscle fatigue or injury. See also EQUIPMENT DESIGN; WORKSPACE DESIGN.

tools of intellectual adaptation methods of thinking, learning, or remembering or strategies for problem solving that children internalize from their interactions with more competent members of society. [defined by Lev Vygotsky]

tool-using behavior the ability of nonhuman animals to use objects as tools. For example, a finch may use a cactus spine to probe for insects, and an antlion may hurl grains of sand at prey to make them fall into a pit. Chimpanzees frequently use sticks to push into termite mounds, use leaves as sponges for drinking or cleaning themselves, and use stones of different sizes as hammers and anvils to break open nuts. Distinctive patterns of tool use are found in different populations of chimpanzees across Africa, suggesting “cultural traditions” of tool-using behavior. Chimpanzees, orangutans, and capuchin monkeys in captivity also demonstrate the ability to use novel objects as tools to reach otherwise inaccessible food. This behavior requires a capacity to generalize relationships between the presence of an object in the environment and its usefulness in extending the animal’s reach.

topagnosia n. 1. loss of the ability to localize touch. Individuals can feel tactile stimuli but cannot recognize the site of stimulation. See TACTILE AGNOSIA. 2. loss of the ability to recognize familiar surroundings.

topalgia n. pain that is localized in a small area without any lesion or trauma to account for it. Topalgia often is a symptom of SOMATOFORM DISORDER, particularly in cases in which the pain seems to occur in unlikely segments of nerve or circulatory patterns.

Topamax n. a trade name for Topiramate.

topdog n. a set of internal moral standards or rules of conduct that produce anxiety and conflict in the individual when they are not fulfilled or carried out. The topdog is an ego state of superiority over the UNDERDOG. [defined by German-born U.S. psychiatrist Frederick (Fritz) S. Perls (1893–1970)]

top-down design a deductive approach in which the design of a system or product is driven by conceptual guidelines rather than by empirical data (e.g., test results or user feedback). For example, menus or other displays of functions on a computer interface generally follow a hierarchical structure from basic function categories to group-
top-down processing

ings or specific tasks via a series of submenus. Compare BOTTOM-UP DESIGN.

top-down processing INFORMATION PROCESSING in which an overall hypothesis about or general conceptualization of a stimulus is applied to and influences the analysis of incoming stimulus data. For example, in reading, knowledge about letter and word frequencies, syntax, and other regularities in language guides recognition of incoming information. In this type of processing, a person’s higher level knowledge, concepts, or expectations influence the processing of lower level information (see PROOFREADER’S ILLUSION). Typically, perceptual or cognitive mechanisms use top-down processing when information is familiar and not especially complex. Also called conceptually driven processing: top-down analysis. Compare BOTTOM-UP PROCESSING. See also DEEP PROCESSING; SEMANTIC ENCODING.

topographical memory memory for the arrangement and relationships of objects in a spatial environment.

topographical psychology any system of mapping the mind by locating the various mental processes in different regions of the mind. Carl JUNG, for example, divided the mind into the conscious ego, the personal unconscious, and the collective unconscious; Sigmund FREUD divided the mind into the conscious, preconscious, and unconscious (see TOPOGRAPHIC MODEL). Also called mental topography.

topographic model the original division of the psyche into three regions or systems as proposed by Sigmund FREUD in 1900. The divisions are (a) the unconscious (UCs), made up of unconscious impulses clustering around specific drives or instincts, such as hunger, thirst, and sex, as well as any repressed childhood memories associated with them; (b) the conscious (Cs), which enables the individual to adapt to society, distinguish between inner and outer reality, delay gratification, and anticipate the future; and (c) the preconscious (Pcs), which stands between the conscious and unconscious and is made up of logical, realistic ideas intermingled with irrational images and fantasies. Also called descriptive approach; systematic approach: topographic hypothesis. Compare DYNAMIC MODEL: ECONOMIC MODEL. See also STRUCTURAL MODEL.

topographic organization the arrangement of components in a structure, particularly the orderly spatial relationship between the distribution of neural receptors in an area of the body and a related distribution of neurons representing the same functions in cortical sensory regions of the brain. Thus, the motor cortex shows somatotopic organization, the primary visual cortex shows a topographic mapping of the retina (see retinotopic map), and the auditory system shows tonotopic organization.

topography of response see RESPONSE TOPOGRAPHY.

topological psychology a system of psychology in which phenomena are described and classified in terms of the formal relationships of attractions and repulsions (valences) in an individual’s life space. The result is a geometric map of needs, purposes, and goals. [proposed by Kurt LEWIN using concepts from TOPOLOGY]

topography n. the study of geometric forms and their transformations in space. Jean PIAGET used topological concepts to describe the development of spatial thinking in infants and children. Kurt LEWIN used such concepts in describing behavior in the LIFE SPACE.

toremifene n. see ANTIESTROGEN.

torpid adj. a condition of total inactivity or lethargy. Only a very strong stimulus can elicit a response from an individual in such a condition.

Torrance Tests of Creative Thinking (TTCT) two batteries of pencil-and-paper test items—a verbal test and a figural test—used to assess creative potential in children and adults in terms of such characteristics as fluency, flexibility, originality, and elaboration. Typical test “activities,” as they are called, involve listing possible consequences of the action in an intriguing picture, citing ways of improving a toy, and incorporating a curved line in drawing an unusual picture. See ARF TESTS; CREATIVITY MEASUREMENT. [originally devised in 1966 by Ellis Paul Torrance (1915–2003). U.S. psychologist]
torsades de pointes see ELECTROCARDIOGRAPHIC EFFECT.

torsion n. in vision, the movement of the eyeball around an axis running horizontally from the pupil through the back of the eye.

tort n. a wrongful act, not including a breach of contract, that may be subject to recoverable damages in a civil lawsuit.

torticollis n. a continuous or spasmodic contraction of the neck muscles, resulting in rotation of the chin and twisting of the head to one side. This form of DYSTONIA may be neurological and may respond to drug treatment or BIOFEEDBACK training. However, it may also be psychogenic. Torticollis is sometimes classed as a complex (dystonic) TIC.

—torticollar adj.

torture n. the debasement of individuals to severe, painful physical abuse and violence. Torture may also involve mental or psychological abuse. See also PRISONER ABUSE.

total color blindness see ACHROMATISM.

total degrees of freedom the total number of observations in an analysis minus one. For example, in an experiment in which there are 4 conditions, with 20 participants randomly assigned to each condition, there are 80 independent observations: The total degrees of freedom is 79 (80 – 1) observations, as there is one constraint on any value that will be computed to describe the sample, such as the MEAN. Relisted, each individual condition has its own DEGREES OF FREEDOM as well: 20 – 1 = 19.

total effect in the study of causal effects, the total extent to which the dependent (or outcome) variable is changed by the independent (or predictor) variable, including any indirect effect through a MEDIATOR. In a simple example, if the independent variable, x, is presumed to cause the outcome variable, y, the PATH COEFFICIENT of this direct effect, A, is the total effect. If there is an intervening variable, linked by two path coefficients, B and C, this indirect effect is BC, and the total effect is A + BC. See also PATH ANALYSIS.

total hysterectomy see Hysterectomy.

total immersion a program for second-language acquisition in which all instruction is in the new language and there is minimal use of the individual’s native language. In school-based immersion programs, the second language is incorporated into the teaching of other subjects, with the goal of creating a bilingual classroom. Early immersion refers to programs begun when children are in kindergarten or Grade 1 and continued through the rest of elementary school.

total institution 1. a highly organized and restrictive social INSTITUTION that maintains a high degree of control over the activities of those individuals who are members of, or confined to, it. Prisons, mental health facilities, and military bases are (in many cases) examples, because nearly all the activities of prisoners, patients, and personnel are regulated by the staff or officers. 2. a traditional social institution that becomes so rigid that it takes on many of the qualities of a restrictive social institution. Marriage, for example, has been characterized as a total institution because it often creates a high degree of uniformity in the lifestyles and choices of adults.

total lipodystrophy a form of LIPODYSTROPHY, often congenital but occasionally acquired, that is characterized by the absence of adipose tissue in the subcutaneous tissue, perirenal area, epicardium, and mesentry. See also PARTIAL LIPODYSTROPHY.

total-package arbitration a form of dispute resolution in which the parties in conflict submit their preferred terms for a settlement to a neutral party (the arbitrator), who must choose the entire package of demands submitted by one of the parties rather than selectively accepting some demands from one party and some demands from the other. The knowledge that a dispute will be settled in this way often motivates parties in conflict to reach consensus prior to arbitration, since a compromise will yield a better outcome than the binding imposition of the other party’s package.

total quality management (TQM) in industrial and organizational settings, a comprehensive approach to management that involves a commitment to continuous improvements in quality and productivity. It usually entails improved training and communications in the workplace, greater participation of employees in making decisions, redesign of the work process, and the use of statistical techniques to monitor quality (see STATISTICAL PROCESS CONTROL). TQM programs are customer focused: Employees identify internal and external customers, assess their needs, and commit themselves to meeting these needs in total at the first attempt. Also called CONTINUOUS IMPROVEMENT.

total recall 1. the ability to remember an event completely and accurately. 2. in a recall task, the total number of items remembered across conditions or tests.

total sum of squares (symbol: TSS) in ANALYSIS OF VARIANCE and REGRESSION ANALYSIS, the sum of SQUARES due to the effects of treatment plus the sum of squares due to error.

total variance in ANALYSIS OF VARIANCE and REGRESSION ANALYSIS, the variability that is due to the effects of treatment (TRUE VARIANCE) plus the variability that is due to error (ERROR VARIANCE).

totem n. 1. a revered animal, plant, natural force, or inanimate object that is conceived as the ancestor, symbol, protector, or tutelary spirit of a people, CLAN, or community. It is usually made the focus of certain ritual activities and TABOOS, typically against killing or eating it. 2. as interpreted by Sigmund FREUD in Totem and Taboo (1912–1913), any symbol or representation of the primal father.

—totemic adj. —totemism n.

TOTE model see FEEDBACK LOOP.

TOT phenomenon abbreviation for TIP-OF-THE-TONGUE PHENOMENON.

touch n. the sensation produced by contact of an object with the surface of the skin. Sensitivity to touch varies in different parts of the body; for example, the lips and fingers are far more sensitive than the torso or back. See also TOUCH SENSE.

touch blends complex sensations derived from engaging in ACTIVE TOUCH to experience different qualities of an object, including hardness, softness, roughness, smoothness, wetness, dryness, and stickiness.

toucherism n. sexual interest and arousal obtained from touching a stranger on an erotic part of the body, particularly the breasts, buttocks, or genitals. This is often done in doorways or hallways as an apparent accident. See also FROTTEURISM.
touch fiber a nerve fiber that is a receptor for a contact stimulus, such as stroking or light pressure.

touch sense the ability to perceive an object or other stimulus that comes into contact with the surface of the skin (e.g., by pressure, stroking). Also called tactile sense. See HAPTIC PERCEPTION; TACTILE PERCEPTION. See also CUTANEOUS SENSE.

touch spot any of the small areas of the skin that are particularly sensitive to light contact.

touch therapy treatment that involves touching or manipulating parts of an individual’s body to ease physical pain or to promote relaxation and a general sense of well-being. Touch therapy has been shown to have numerous benefits for children (among others), such as improving the physical and psychological development of preterm infants and bringing about a greater tolerance of touch by children with autism, which has resulted in enhanced bonding and communication with their parents. Also called therapeutic touch. See also COMPLEMENTARY AND ALTERNATIVE MEDICINE; MASSAGE.

tough love the fostering of individuals’ well-being by requiring them to act responsibly and to seek professional assistance for problem behaviors. Often, strict oversight and restrictions of personal freedom and privileges must be willingly accepted by the target individual. Tough love is typically a stance taken by the families of adolescents or young adults with a prolonged history of substance abuse.

tough-mindedness n. 1. a personality trait reflecting the extent to which people demonstrate low levels of compassion and high levels of aggression in social interactions. [proposed by Hans Eysenck] 2. a personality trait characterized by empiricism, materialism, skepticism, and fatalism. Compare TENDER-MINDEDNESS. [first described by William James] —tough-minded adj.

Tourette’s disorder a TIC DISORDER characterized by many motor tics and one or more vocal tics, such as grunts, yelps, barks, sniffs, or (rarely) COPROLALLIA. The tics occur many times a day for more than a year, during which time any period free of tics is never longer than 3 months. The age of onset for the disorder is before 18 years; in most cases, it starts during childhood or early adolescence. Also called Gilles de la Tourette’s syndrome. [first described in 1885 by Georges Gilles de la Tourette (1857–1904), French physician]

TOVA abbreviation for TEST OF VARIABLES OF ATTENTION.

Tower of Hanoi a puzzle often used in studies of problem solving and tests of EXECUTIVE FUNCTIONS. In the most basic version, three disks of successively decreasing diameter are stacked on one of three vertical pegs. The solver’s task is to move the stack to another peg one disk at a time, never stacking a larger disk on a smaller one, in the fewest possible moves. The puzzle was invented in 1883 by French mathematician Édouard Lucas (1842–1891). A similar test, the Tower of London, was developed in the 1980s by British neuropsychologist Timothy Shallice (1940– ) to investigate planning ability in individuals with frontal lobe dysfunction; in this case, the solver’s task is to move three colored beads (or rings) from their initial position on vertical pegs to predetermined positions on other pegs, using the fewest number of moves possible.

tox- (toxic-; toxo-; toxico-) combining form poison or poisoning.

toxemia of pregnancy a syndrome of edema, hypertension, and proteinuria that may develop in the last trimester of a pregnancy. It is now more commonly known as PREECLAMPSIA, which may progress to ECLAMPSIA.

toxic delirium delirium due to the action of a poison on the brain, as may result from a drug overdose, an adverse drug interaction, overmedication, or other conditions.

toxic disorder a brain disorder due to acute or chronic intoxication from poisoning by mercury, manganese, lead, bromide, alcohol, barbiturates, or other substances.

toxic epidermal necrosis see STEVENS–JOHNSON SYNDROME.

toxicity n. the capacity of a substance to produce poisonous effects in an organism. The toxicity of a substance—whether a drug, an industrial or household chemical, or other agent—generally is related to the size of the dose per body weight of the individual, expressed in terms of milligrams of chemical per kilogram of body weight. Toxicity also may be expressed in terms of the median LETHAL DOSE (LD₅₀). See also BEHAVIORAL TOXICITY.

toxic-metabolic encephalopathy see METABOLIC ENCEPHALOPATHY.

xicology n. the study of poisons and their mechanisms of action, effects, detection, treatment, and antidotes. See also BEHAVIORAL TOXICOLOGY; DEVELOPMENTAL TOXICOLOGY; NEUROTOXICOLOGY.

toxicomania n. 1. a morbid desire to consume poisons. 2. a severe dependency on drugs.

toxicosis n. (pl. toxicoses) 1. any disease or condition of ill health that is the result of poisoning. 2. see CONDITIONED TASTE AVERTION.

toxic psychosis any psychosis resulting from ingestion of poisons or drugs or caused by toxins produced within the body.

toxin n. a poisonous substance, especially one produced by a living organism.

toxo- combining form see TOX-.

toxoplasmosis n. a disease caused by infection with the protozoan parasite Toxoplasma gondii, which invades and multiplies within the tissues of mammals and birds. For example, the parasites reproduce in the intestinal cells of cats, and the disease may be transmitted to humans through accidental ingestion (via careless handling) of cat feces. Human infection may also result from eating raw or undercooked meat or, very rarely, from blood transfusion or organ transplantation. When acquired by a pregnant woman, the parasite can be transmitted to the fetus (congenital toxoplasmosis), causing hydrocephalus, blindness, intellectual disability, and other neurological disorders.

toy test any of a variety of projective tests for children that make use of dolls, puppets, or other toys. See PROJECTIVE TECHNIQUE.

TPA abbreviation for THIRD-PARTY ADMINISTRATOR.

TPD abbreviation for trance and possession disorder. See DISSOCIATIVE TRANCE DISORDER.

TPQ abbreviation for Tridimensional Personality Questionnaire. See TEMPERAMENT AND CHARACTER INVENTORY.

TPT abbreviation for TACTUAL PERFORMANCE TEST.

TQM abbreviation for TOTAL QUALITY MANAGEMENT.
trace n. 1. see MEMORY TRACE. 2. in multivariate statistics and linear algebra, the sum of the elements on the MAIN DIAGONAL of a SQUARE MATRIX.

trace conditioning a procedure in CLASSICAL CONDITIONING in which a conditioned stimulus and an unconditioned stimulus are separated by a constant interval (called the trace interval), with the conditioned stimulus presented first. Compare TEMPORAL CONDITIONING.

trace-decay theory see DECAY THEORY.

tracer n. see RADIOACTIVE TRACER.

tracheotomy n. surgery to create an opening (tracheotomy) in the trachea (windpipe) through the neck to relieve impaired or obstructed breathing.

trachoma n. an infection of the eye, involving mainly the conjunctiva and cornea, caused by a strain of the bacterium Chlamydia trachomatis. Trachoma begins with pain, tearing, and photophobia; untreated, it progresses to blindness. The causative bacterium is also responsible for a form of NONGONOCOCCAL URETHRITIS. See OPHTHALMIA.

tracking n. 1. the process of smoothly following a moving object with the eyes or using eye movements to continuously follow a path. See VISUAL PURSUIT. 2. a type of task in which the goal is to make movements that follow a constantly moving target. 3. monitoring the progress of a student by means of recording test and homework scores, observing behavior within the classroom, eliciting a self-report, or a combination of these. —track vb.

tract n. 1. a bundle or group of nerve fibers within the central nervous system. The name of a tract typically indicates its site of origin followed by its site of termination; for example, the reticulospinal tract runs from the reticular formation of the brainstem to the spinal cord. Compare NERVE. 2. a series of organs that as a whole accomplishes a specific function (e.g., the digestive tract). 3. a region, passage, or pathway.

tractotomy n. the surgical interruption of a nerve tract in the brainstem or spinal cord. One form of tractotomy is of benefit in bipolar disorder that is resistant to other forms of treatment.

trademark n. any word, phrase, name, symbol, device, or combination thereof used by manufacturers or merchants to identify their products (e.g., Oreo cookies, Lycura stretch fiber, Crayola crayons) and to distinguish them from the products of others. Common trademarks include slogans, logos, and specific packaging designs. Whereas a trademark identifies products, a trade name identifies the company that makes or sells them. However, in the area of pharmacology, the two terms are often used interchangeably to refer to PROPRIETARY DRUGS.

trade union see UNION.

tradition n. a set of social customs or ethnic or family practices handed down from generation to generation. See also HERITAGE. —traditional adj.

traditional authority see AUTHORITY.

traditionalism n. 1. a set of social practices and conditions considered typical of societies that are economically and technologically undeveloped, relatively static in their structures and customs, rural rather than urban, and religious rather than secular and that tend to emphasize family or collective responsibilities rather than individual rights and aspirations. The adequacy of this description and of the dichotomy between traditional and modern societies that it implies is by no means universally accepted. See MODERNIZATION. See also CULTURAL EPOCH THEORY; PRIMITIVE. 2. more generally, adherence to any set of political, religious, or cultural traditions. —traditionalist n. —traditionalistic adj.

traditional marriage 1. a marriage according to the historical norms of a given society; usually for the primary purpose of establishing a family. Although prenuptial customs vary in different cultures, a traditional marriage generally follows a period of courtship, public announcement of wedding plans, and a wedding ceremony. Compare NON-TRADITIONAL MARRIAGE. 2. a marriage of husband and wife, wherein the former is the primary or sole breadwinner and the latter holds primary or sole responsibility for maintaining the home and managing child care.

traditional medicine see FOLK MEDICINE.

tradition-directed adj. describing or relating to individuals whose values, goals, and behavior are largely determined by their traditional cultural heritage, that is, by the social norms transmitted by their parents. Compare INNER-DIRECTED; OTHER-DIRECTED. [introduced by U.S. sociologist David Riesman (1909–2002)]

trafficking n. illegal transportation and trade in people or commodities. Human trafficking involves the transport of men, women, or children from one location to another, usually by coercion (e.g., kidnapping or threats) or by enticement through fraudulent means (e.g., with promises of legitimate work), to be forcibly exploited for the profit of others. Examples of such exploitation include forced servitude, prostitution (sex trafficking), forced extraction of organs for sale to the medical market for transplantation, and surrogacy in which a woman is coerced into bearing a child for another. Human trafficking has become a multi-million dollar international industry. Trafficking also refers to the smuggling of cocaine, heroin, and other illegal drugs from their point of manufacture in one location to their distribution and sale in another (i.e., drug trafficking).

tragedy of the commons a SOCIAL DILEMMA that occurs when a course of action benefiting individual members of a community in the short term is detrimental to the long-term welfare of the community. In the original example of this dilemma, if each herdsman in a village seeks to maximize his individual gain by keeping as many of his cattle as possible on common grazing land, this will eventually make the land unusable by all, because the grass of the pasture is a limited resource. The tragedy is that complete freedom in a society brings ruin to all. Also called commons dilemma. [introduced in 1968 by U.S. ecologist Garrett Hardin (1915–2003)]

Trail Making Test (TMT) a connect-the-dot task that forms part of the HALSTEAD–REITAN NEUROPSYCHOLOGICAL BATTERY. Trails A requires the connection in sequence of 25 dots labeled by numbers. Trails B requires the connection in sequence of 25 dots labeled by alternating numbers and letters (1–A–2–B–3–C). The test, one of the most widely used for cognitive impairment, is purported to measure several functions, particularly cognitive flexibility, alternating attention, sequencing, visual search, and motor speed. The TMT, originally developed in 1938 by U.S. psychologists John E. Partington and Russell G. Leiter, was initially known as the Divided Attention Test and subsequently as Partington’s Pathways Test.

train 1. vb. to teach or condition an individual to perform...
trainability

certain responses, behaviors, tasks, or activities, particularly in a learning experiment. 2. n. a succession of mild electrical impulses, such as is given in brain stimulation.

trainability n. the capacity of an individual to benefit from training and to gain proficiency in a particular skill.

—trainable adj.

trainable mentally retarded in SPECIAL EDUCATION, a rarely used term for a category of people, usually children or young adults, with moderate mental retardation (an IQ of 35 to 49) who do not appear to profit from academic education in special classes but are able to achieve a degree of self-care, social adjustment, and vocational usefulness in such settings as sheltered workshops.

trainer n. 1. in mental health, a professional leader or facilitator of a sensitivity training group (see T-GROUP). 2. a teacher or supervisor of individuals learning to practice psychotherapy.

training n. systematic instruction and practice by which an individual acquires competence in a specific discipline, talent, or vocational or recreational skill or activity.

training analysis PSYCHOANALYSIS of a trainee analyst. Its purpose is not only to provide training in the concepts and techniques of psychoanalysis but also to increase insight into personal sensitivities or other emotional reactions that might interfere with the process of analyzing patients in the form of a COUNTERTRANSFERENCE.

training evaluation a review of PERSONNEL TRAINING programs to determine their effectiveness and efficiency. Training evaluations can focus on trainee attitudes and reactions to the training, trainee knowledge of the information disseminated in the program, or changes in the behavior of the trainee and resulting benefits to the group or organization. See TRAINING VALIDITY.

training group see T-GROUP.

training log a form of SELF-MONITORING in which athletes record sleep patterns, food intake, mood, anxiety levels, and physical activities. Also called sport self-talk log.

training school formerly, a rehabilitation facility for children or adults with intellectual or developmental disabilities at which interdisciplinary teams of therapists and allied health care practitioners offered residential, health, training, vocational, and leisure services. Although such facilities attempted to provide homelike settings, this was seldom achieved in practice. Their use, once common, greatly diminished in the late 20th century. See also PUBLIC RESIDENTIAL FACILITY.

training study a study in which a participant’s task performance is assessed after he or she has been instructed in the use of a strategy. In cognitive developmental research, training studies are used to assess MEDIATIONAL DEFICIENCY and PRODUCTION DEFICIENCY.

training systems design a specialty area in which principles drawn from COGNITIVE ERGONOMICS and general educational theory are applied to the design and evaluation of systems created to facilitate learning and transfer of knowledge and skills.

training validity the success of a training program as judged by the performance of trainees on criteria that form part of the program. For example, the success of a program focusing on truck-driving skills might be evaluated on the basis of how well the trainees perform in driving a simulator used for instruction. This is to be distinguished from

transfer validity, in which the program is evaluated on how well the trainees perform in the workplace after training (i.e., how well the trainee performs in driving real trucks on the job). See TRAINING EVALUATION.

trait n. 1. an enduring personality characteristic that describes or determines an individual’s behavior across a range of situations. 2. in genetics, an attribute resulting from a hereditary predisposition (e.g., hair color, facial features). 3. in ITEM RESPONSE THEORY, an individual’s level of competence on a certain task or aptitude measurement.

trait anxiety proneness to experience anxiety. People with high trait anxiety tend to view the world as more dangerous or threatening than those with low trait anxiety and to respond with STATE ANXIETY to situations that would not elicit this response in people with low trait anxiety [defined in 1972 and 1983 by Charles D. SPIELBERGER].

trait negativity bias the tendency for negative personality traits to play a greater role than positive personality traits in determining overall impressions and to be cited more often in attributions of motive. Also called NEGATIVITY BIAS. See also BAD IS STRONGER THAN GOOD; POSITIVE–NEGATIVE ASYMMETRY.

trait organization the way in which an individual’s personality characteristics are related and comprise a unique, integrated whole.

trait profile a graphic display of test scores in which each score represents an individual personality characteristic (trait). These scores or ratings are often arranged on a common scale to enable them to be interpreted quickly. See TEST PROFILE.

trait rating a technique in which a given behavioral feature or character attribute is observed, rated, and recorded.

trait rumination a tendency to focus attention on negative thoughts and emotions, which is associated with longer and more severe episodes of depression or anxiety.

trait self-focus see self-focus.

trait theory approaches that explain personality in terms of internal characteristics that are presumed to determine behavior. Some examples are ALPORT’S PERSONALITY TRAIT THEORY, CATTELL’S PERSONALITY TRAIT THEORY, and the FIVE-FACTOR PERSONALITY MODEL.

trait theory of leadership any of various approaches to leadership that consider cognitive and noncognitive abilities and personality characteristics as important determinants of success in a leadership role. Among the traits that have been shown to be positively related to successful leadership are general intelligence, extraversion, self-confidence, decisiveness, and ACTION ORIENTATION. See LEADERSHIP THEORIES.

trait–treatment interaction (TTI) the interplay between personal characteristics (e.g., gender, aptitude) and conditions of treatments (e.g., methods of instruction) as it affects a dependent variable (e.g., scores on an academic test). Using ANALYSIS OF VARIANCE or MULTIPLE REGRESSION analysis, it is possible to determine the best type of treatment for people with different traits. See also APITUDE–TREATMENT INTERACTION.

trait validity the degree to which responses to a test’s items provide accurate measurement of a personality characteristic (trait). A test has trait validity if an association can be demonstrated between the test scores and the pre-

**trajectories of dying** the rate of movement and the length of the passage from a life-threatening condition to death. In 1968, U.S. sociologists Barney G. Glaser (1930–) and Anselm L. Strauss (1916–1996) developed a classification of dying trajectories, two of which have received particular attention from clinicians and researchers. The first, the *lingering trajectory*, is often characteristic of long-term, terminally ill patients who seldom receive aggressive, all-out treatment. By contrast, the second is the *quick trajectory* associated with an emergency situation, in which any possible intervention to save a person’s life might be attempted.

**trajectory n.** the sequence of positions through which an object travels over time during a specific movement.

**trance** n. 1. *An ALTERED STATE OF CONSCIOUSNESS* characterized by decreased awareness of and responsiveness to stimuli and an apparent loss of voluntary power. 2. a state brought about by HYPNOTIC INDUCTION or AUTOSUGGESTION and characterized by susceptibility to suggestion. Hypnotized persons may report a **light trance**, in which they might accept suggestions that, for example, they cannot open their eyes or they lack sensation in a limb, or a **medium trance**, in which they may experience POSTHYPNOTIC AMNESIA and POSTHYPNOTIC SUGGESTION. A **deep trance** might be characterized by an inability to open the eyes without affecting the trance, complete somnambulism, positive and negative posthypnotic hallucinations, and hyperesthesia (excessive sensitivity). The reality of such trance states has been the subject of much debate. Also called **hypnotic trance**.

**trance and possession disorder (TPD)** see **DISSOCIATIVE TRANCE DISORDER**.

**trance disorder** see **DISSOCIATIVE TRANCE DISORDER**.

**trance logic** the apparent tendency of hypnotized individuals to engage simultaneously in logically contradictory or paradoxical thoughts and perceptions and to be oblivious to their incongruity. It has been suggested that trance logic represents evidence of PARALLEL PROCESSING in that there appears to be simultaneous registration of information at different levels of awareness. See **DIVIDED CONSCIOUSNESS**; **NEODISSOCIATION THEORY**, [coined by Martin T. Orne].

**tranquilizer n.** a drug that is used to reduce physiological and subjective symptoms of anxiety. In the past, distinctions were made between so-called major tranquilizers (ANTIPSYCHOTICS) and minor tranquilizers (ANXIOLYTICS; e.g., benzodiazepines).

**tranquilizer chair** a heavy wooden chair used in early psychiatry in which patients were strapped at the chest, abdomen, ankles, and knees, with their head inserted in a wooden box. This method of restraint was preferred to the STRAITJACKET because it reduced the flow of blood to the head and did not interfere with bloodletting, one of the standard treatments of the time. [devised by U.S. physician and psychiatrist Benjamin Rush (1745–1813)]

**transaction** n. 1. any interaction between the individual and the social or physical environment, especially during encounters between two or more people. 2. in some psychotherapies, the interplay between the therapist and the patient and ultimately between the patient and other individuals in his or her environment.

**transactional analysis (TA)** a theory of personality and a form of dynamic group or individual psychotherapy focusing on characteristic interactions that reveal internal **EGO STATES** and the games people play in social situations. Specifically, the approach involves (a) a study of three primary ego states (parent, child, adult) to determine which one is dominant in the transaction in question; (b) identification of the tricks and expedients, or games, habitually used in the client’s transactions; and (c) **SCRIPT ANALYSIS** of the unconscious plan of the client’s life to uncover the sources of his or her emotional problems. [developed in the 1950s by Canadian-born U.S. psychiatrist Eric Berne (1910–1970)]

**transactional contingent reward** an interaction between two individuals in which one party offers rewards to the other contingent on specific actions or outcomes.

**transactional evaluation** an attempt to apply the principles of **GENERAL SYSTEMS THEORY** to the area of program innovation. It is designed to minimize the disruption of the reallocation process that occurs when changes are introduced in an organization and thereby to minimize any personal threat and defensiveness felt by participants in the system.

**transactionalism n.** 1. an approach to **ENVIRONMENTAL PSYCHOLOGY** that emphasizes the continuing process of interaction between a person and his or her physical and social environment. This process is characterized as an ongoing series of “transactions” in which the person’s behaviors are modified by environmental factors and vice versa. 2. an approach to perception that emphasizes the interaction of people and their environments. Rather than being mere passive observers, people draw on past experiences to form perceptions of present situations and even of novel stimuli. —**transactionalist adj. n.**

**transactional leadership** a style of leadership in which the emphasis is on ensuring that followers accomplish tasks. Transactional leaders influence others through exchange relationships in which benefits are promised in return for compliance. Compare TRANSFORMATIONAL LEADERSHIP. [introduced by U.S. political scientist James MacGregor Burns (1918–2014)]

**transactional model of development** a framework in which development is viewed as the continuous and bi-directional interchange between an active organism, with a unique biological constitution, and its changing environment. See also **DEVELOPMENTAL SYSTEMS APPROACH**.

**transactional psychotherapy** psychotherapy that emphasizes the daily interactions between the client and others in his or her life. TRANSACTIONAL ANALYSIS is a specific type of therapy that is based on types of transactions that are considered dysfunctional.

**transactive memory system** a system in which information to be remembered is distributed among various members of a group, who can then each be relied on to provide that information when it is needed.

**transcendence n.** in **METAPHYSICS** and in the study of consciousness, a state of existence or perception that is not definable in terms of normal understanding or experience. The term may imply a state that goes beyond conventional conceptions of the natural world. —**transcendent adj.**

**transcendence need** in the psychoanalysis of Erich Fromm, the human need to create so as to rise above passivity and attain a sense of meaning and purpose in an im-
transcendence therapy

permanent and seemingly random or accidental universe. Both creativity and destructiveness are considered by Fromm to be manifestations of the transcendence need.

transcendence therapy a form of therapy that is spiritually oriented and intended to help people achieve inner peace by first understanding their role in the larger picture of life and then using that understanding to overcome disappointments, difficulties, and other hardships. [developed by Dutch-born U.S. psychologist Adrian van Kaam (1920–2007)]

transcendentalism n. any philosophical position holding that ultimate reality lies beyond the level of sensory appearances or empirical investigation, such as the THEORY OF FORMS proposed by PLATO. The philosophical ideas of German thinkers Immanuel KANT, Georg Wilhelm Friedrich Hegel (1770–1831), and Johann Gottlieb Fichte (1762–1814) are later examples of transcendentalism. The philosophical ideas of U.S. essayist and poet Ralph Waldo Emerson (1803–1882) and several of his New England contemporaries, which are based upon a search for reality through intuition, are also typically described as transcendentalist. See also IDEALISM; MYSTICISM. —transcendental adj.

—transcendentalist adj.

transcendental meditation (TM) a technique of concentrative meditation for achieving an altered state of consciousness. Based on the Bhagavad Gita and other ancient Hindu writings, it was introduced in the United States in 1959 by Indian-born guru Maharishi Mahesh Yogi. The modern version of the original discipline consists of six steps that culminate in sitting with one’s eyes closed, while repeating a MANTRA, for two 20-minute periods a day. Repetition of the mantra serves to block distracting thoughts and to induce a state of relaxation in which images and ideas can arise from deeper levels of the mind and from the cosmic source of all thought and being. The result is said to be not only a greater sense of well-being but also more harmonious interpersonal relations and the achievement of a state of ultimate self-awareness and restful alertness. See also MYSTIC UNION.

transcendental state a level of consciousness believed to reach beyond waking, sleeping, and hypnotic states. It is characterized physically by lowered metabolism and reduced adrenergic functions and psychologically by alleviation of tension, anxiety, and frustration and a high level of tranquility.

transcendent counseling a form of counseling based on the notion that behavior is a product of an individual’s lifestyle and that behavior change can only be achieved through lifestyle change. Various techniques and activities are employed, such as interpersonal counseling, the use of relaxation and meditation, and adoption of exercise and nutrition programs. [developed by U.S. psychologist Frederick D. Harper (1943– )]

transcortical adj. referring to the passage of activity from one part of the cerebral cortex to another.

transcortical aphasia a general term for an APHASIA caused by a lesion outside of BROCA’S AREA and WERNICKE’S AREA. As a result, the individual will be able to repeat spoken words but will have difficulty producing independent speech or understanding speech. There are three classic forms: TRANSCORTICAL MOTOR APHASIA, TRANSCORTICAL SENSORY APHASIA, and MIXED TRANSCORTICAL APHASIA (i.e., the motor and sensory forms combined).

transcortical motor aphasia (TMA) a form of APHASIA in which individuals cannot initiate speech but can repeat words. It is caused by a lesion just in front of BROCA’S AREA.

transcortical sensory aphasia (TSA) a form of APHASIA in which individuals cannot understand other people’s speech but can repeat words. It is caused by a lesion just behind BROCA’S AREA.

transcranial Doppler ultrasonography (TCD) a noninvasive test that uses ultrasonic waves to monitor blood velocities in large arteries in the brain. Typically used diagnostically to detect conditions affecting blood flow to and within the brain, TCD is advantageous in that it can be administered at bedside. Also called TRANSCRANIAL Doppler sonography; TRANSCRANIAL Doppler ultrasound.

transcranial magnetic stimulation (TMS) localized electrical stimulation of the brain caused by changes in the magnetic field in coils of wire placed around the head. Depending on the parameters, TMS may elicit a response or disrupt functioning in the region for a brief time. The technique was originally devised and is primarily used as an investigatory tool to assess the effects of electrical stimulation of the motor cortex. It is approved for treatment of depression and is being investigated as a possible therapy for other psychological conditions, such as obsessive-compulsive disorder and Tourette’s disorder, and for some types of movement disorders. Repetitive transcranial magnetic stimulation (rTMS) consists of a series of TMS pulses.

transcription n. the process whereby the genetic information contained in DNA is transferred to a molecule of MESSENGER RNA (mRNA), which subsequently directs protein synthesis. The base sequence of the mRNA is complementary to that of the coding DNA strand and faithfully represents the instructions for assembling the component amino acids of the protein encoded by the gene (see GENETIC CODE).

transcultural psychotherapy any form of PSYCHO-DYNAMIC PSYCHOTHERAPY that emphasizes cultural sensitivity and awareness, including culturally defined concepts of emotion, drives, and behavior. In the psychiatric community, the term is used somewhat more often in a sense similar to MULTICULTURAL THERAPY in clinical psychology.

transcutaneous electrical nerve stimulation see TENS.

transdermal patch an adhesive application that is designed to release a drug at a steady rate via absorption through the skin into the bloodstream. Transdermal patches are used, for example, to administer nicotine in progressively smaller doses to people who are trying to give up smoking.

Transderm-Scop n. a trade name for SCOPOLAMINE.

transducer n. a device or system that converts energy from one form to another. Sensory RECEPTOR cells are an example.

transduction n. the process by which one form of energy is converted into another. The term denotes SENSORY TRANSDUCTION in particular, the transformation of the energy of a stimulus into a change in the electric potential across the membrane of a RECEPTOR cell. See ORATORY TRANSDUCTION; TASTE TRANSDUCTION; VISUAL TRANSDUCTION.
transductive reasoning the tendency of a child in the preoperational stage of cognitive development to see a connection between unrelated instances, using neither deductive nor inductive means to do so. For example, the child might say, I haven’t had my nap, so it isn’t afternoon.

[proposed by Jean Piaget]

transsection n. the severing or cutting of something transversely, such as a nerve tract or fiber or the spinal cord. —transsect vb.

transfer 1. vb. to shift or change from one location to another, one form to another, or one situation or condition to another. 2. n. the shift or change thus produced, as in transfer of training. 3. n. in gestalt psychology, the use of the solution to one problem in solving a second problem that has elements in common with the first.

transfer-appropriate processing a theory stating that memory performance is better when the cognitive processes engaged during retrieval match the cognitive processes that were engaged when the material was encoded. For example, test performance should be relatively good if both study and test conditions emphasize either semantic processing on the one hand or perceptual processing on the other, but test performance will not be as good if study conditions emphasize one (e.g., semantic) and test conditions emphasize another (e.g., perceptual). See encoding specificity.

transferase n. any of a class of enzymes that catalyze the transfer of atoms or groups from one molecule to another. The aminotransferases are an example.

transfer by generalization see general transfer.

transference n. in psychoanalysis, a patient’s displacement or projection onto the analyst of those unconscious feelings and wishes originally directed toward important individuals, such as parents, in the patient’s childhood. It is posited that this process brings repressed material to the surface where it can be reexperienced, studied, and worked through to discover the sources of a patient’s current neurotic difficulties and to alleviate their harmful effects. Although the theoretical aspects of the term are specific to psychoanalysis, transference has a recognized role in various other types of therapeutic encounter, including counseling and short-term dynamic psychotherapy. The term’s broader meaning—an unconscious repetition of earlier behaviors and their projection onto new subjects—is acknowledged as applying to all human interactions. See also analysis of transference, countertransference, negative transference, positive transference.

transference analysis see analysis of transference.

transference cure see flight into health.

transference distortion see parataxic distortion.

transference neurosis in psychoanalysis, neurotic reactions released by the transference process that result from the revival and reliving of the patient’s early conflicts and traumas. These reactions are posited to replace the original neurosis and help the patient become aware that his or her attitudes and behavior are actually repetitions of infantile drives. It is believed that the transference neurosis must be resolved if the patient is to free himself or herself from the harmful effects of past experiences and adopt more appropriate attitudes and responses.

transference remission see flight into health.

transference resistance in psychoanalysis, a form of resistance to the disclosure of unconscious material, in which the patient maintains silence or attempts to act out feelings of love or hate transferred from past relationships to the analyst.

transfer function model 1. a model used in functional magnetic resonance imaging to describe the shape of responses. A neuron receives a number of inputs, each of which comes via a connection that has a strength or weight; these weights correspond to the synaptic efficacy of the neuron. Each neuron also has a single threshold value. Activation of the neuron is determined by the weighted sum of the inputs minus the threshold. The activation signal is passed through a transfer function to produce the output of the neuron. 2. in time-series analysis, a type of model used to forecast a time series that is influenced by present and past values of other time series.

transfer of principles see general transfer.

transfer of training the influence of prior learning on new learning, either to enhance it (see positive transfer) or to hamper it (see negative transfer). Solving a new problem is usually easier if previously learned principles or components can be applied, but in some cases these may confuse or mislead. The general principles of mathematics, for example, transfer to computer programming, but a knowledge of Spanish may have both positive and negative effects in learning Italian. See also general transfer, specific transfer.

transfer RNA see RNA.

transfer validity see training validity.

transformation n. 1. any change in appearance, form, function, or structure. See also metamorphosis. 2. the conversion of data to a different form through a rule-based and usually mathematical process, such as changing Fahrenheit to Celsius. In statistics, a raw score is often transformed into a standardized score for purposes of comparison. See also linear transformation, nonlinear transformation. 3. in psychoanalytic theory, the process by which unconscious wishes or impulses are disguised in order to gain admittance to consciousness. —transform vb. —transformational adj.

transformational generative grammar a type of generative grammar based on the idea that sentences have an underlying deep structure as well as the surface structure observable in speech or writing and that the former gives rise to the latter through the operation of a small number of transformational rules involving the movement, addition, and deletion of constituents. This approach to syntactic structures was pioneered by Noam Chomsky in the late 1950s as a means of supplementing the more limited analysis made possible by phrase-structure grammar. Also called transformational grammar. See also kernel sentence.

transformational leadership a charismatic, inspiring style of leading others that usually involves heightening followers’ motivation, confidence, and satisfaction; uniting them in the pursuit of shared, challenging goals; and changing their beliefs, values, and needs. Compare transactional leadership. [introduced by U.S. political scientist James MacGregor Burns (1918–2014)]

transformational rules see transformational generative grammar.

transformation theory the hypothesis that, over the
course of time, one biological species can change into a different species. See DARWINISM: EVOLUTION.

**transgender** adj. having or relating to a GENDER IDENTITY that differs from the culturally determined gender roles for one’s birth sex (i.e., the biological sex one was born with) or for one’s sex as surgically assigned at birth. Transgender identities include TRANSEXUALISM, some forms of TRANSVESTISM, and INTERSEX. These identities should not be confused with sexual orientation. Also called transgendered. Compare CISGENDER. —transgenderism n.

**transgenerational design** see UNIVERSAL DESIGN.

**transgenerational patterns** patterns of behavior or personality characteristics that appear in successive generations, often referring especially to negative or maladaptive behaviors (e.g., drug abuse, adolescent pregnancy, child abuse).

**transgenic adj.** describing an organism in which a foreign or altered gene has been deliberately introduced into the GENOME.

**transience** n. 1. impermanence. 2. a feeling of impermanence combined with an anticipation of loss. In classical psychoanalytic theory, the idea that everything is transient may interfere with enjoyment and preclude the establishment of deep or lasting relationships. —transient adj.

**transient global amnesia (TGA)** a sudden GLOBAL AMNESIA—a form of transient AMNESTIC DISORDER—that typically resolves within 24 hours and occurs in the absence of any other neurological abnormalities. Individuals with TGA appear confused and disoriented and ask frequent repetitive questions to try and make sense of their experience. They are unable to acquire new memories (anterograde amnesia); they also exhibit amnesia for recently experienced events (retrograde amnesia). As the episode of TGA clears, new learning gradually returns to normal and retrograde amnesia shrinks; individuals are left with a dense memory gap for the period of TGA. Although TGA may be triggered by precipitating events (e.g., physical exertion), the mechanism responsible for its occurrence is poorly understood.

**transient ischemic attack (TIA)** an episode during which an area of the brain is suddenly deprived of oxygen because its blood supply is temporarily interrupted, for example, by thrombosis, embolism, or vascular spasm. Symptoms are the same as those of STROKE but disappear completely, typically within 24 hours.

**transient monocular blindness** see AMAUROSIS FUGAX.

**transient tic disorder** a TIC DISORDER involving the presence of one or more tics occurring many times a day for a period of between 4 weeks and 1 year. The tics may be simple (e.g., eye blinking, facial grimacing, throat clearing, sniffing) or more complex (e.g., hand gestures, stomping, ECHOLALIA, meaningless change in vocal pitch or volume).

**transient tremor** see TREMOR.

**transitional bilingual education** see BILINGUAL EDUCATION.

**transitional employment** a VOCATIONAL REHABILITATION program whereby individuals with disabilities or those who are economically, socially, or otherwise disadvantaged (e.g., those who are homeless or dependent on welfare) are placed in temporary, entry-level positions in a competitive working environment to gain the skills and experience needed to obtain a permanent job in the community workforce. Positions are often provided by participating companies, and each placement typically lasts 6 to 9 months. Program participants may hold several transitional employment positions before obtaining permanent employment. See also SUPPORTED EMPLOYMENT.

**transitional living** a supervised living situation that allows patients with psychiatric or neurological disorders to make the transition from the dependence of a hospital setting to greater independence before returning to fully independent living.

**transitional object** 1. a doll, blanket, or other thing spontaneously chosen and used by a child to ease the anxiety of separation from his or her first external OBJECT, the mother, until the child has established an internal object, or mental representation of her, that provides a sense of security and comfort. [first described by British psychoanalyst Donald Winnicott (1896–1971)] 2. by extension, any person or thing that provides security, emotional well-being, and a symbolic connection with a valued other.

**transitional phenomenon** an internal representation of the relationship between an individual’s inner subjective understanding of the world and the objective reality of the world. See also TRANSITIONAL OBJECT. [first described by British psychoanalyst Donald Winnicott (1896–1971)]

**transition probability** the probability of moving from one state of a system into another state. If a MARKOV CHAIN is in state i, the transition probability, $\pi_j$, is the probability of going into state j at the next time step.

**transitive inference task** a type of task used to assess children’s ability to make transitive inferences, that is, to infer the relationship between two concepts or objects based on earlier acquired information. In one example, a series of sticks is arranged in order of increasing length (e.g., A, B, C, D, E); if children know that $D > C$ and $C > B$, they will make a correct transitive inference if they state that $D > B$, even though they have never seen these two sticks together.

**transitivism** n. the illusory assumption that one’s symptoms or other characteristics are shared by other people. For example, individuals with schizophrenia might believe that others are also experiencing their hallucinations (e.g., hearing voices) or delusions (e.g., of being persecuted).

**transitivity** n. 1. the quality of a relationship among elements such that the relationship transfers across those elements. For example, a transitive relationship would be the following: Given that $a > b$, and $b > c$, it must be the case that $a > c$. Compare INTRANSITIVITY. 2. see STIMULUS EQUIVALENCE. —transitive adj.

**translation** n. 1. the act or process of rendering words, sentences, or texts into a different language or the written or spoken rendering so produced. The degree to which a good translation reproduces the form as well as the content of the original will depend on a range of factors, notably the compatibility of the SOURCE LANGUAGE and the TARGET LANGUAGE, the nature of the original speech or text, and the purpose of the translation. See also INTERPRET. 2. in genetics, the process whereby the genetic information contained in MESSENGER RNA, in the form of a sequence of CODONS, is “translated” into a sequence of amino acids in protein synthesis. See GENETIC CODE.
translational and back-translation a method of ensuring that the translation of an assessment instrument into another language is adequate, used primarily in cross-cultural research. A bilingual person translates items from the source language to the target language, and a different bilingual person then independently translates the items back into the source language. The researcher can compare the original with the back-translated version to see if anything important was changed in the translation.

translocation n. the breakage of a large segment of DNA from one chromosome and its subsequent attachment to a different chromosome. It is a type of chromosomal mutation.

transmarginal inhibition (TMI) in classical conditioning, the point at which the conditioned response (CR) elicited by a conditioned stimulus (CS) can lead to a paradoxical reduction in the CR. Hans Eysenck applied this concept of a conditioning threshold in his theory of personality, in which he proposed that introverts should respond more strongly than extroverts to conditions of high arousal (e.g., punishment) but that, depending on the interaction between personality and stimulus intensity, the presence of a TMI may result in lower levels of arousal in introverts than in extraverts.

transmission n. 1. the act or process of causing something (e.g., a disease) to pass from one place or person to another. See also horizontal transmission. 2. in neuroscience, see neurotransmission. 3. the inheritance of traits through successive generations. 4. the handing down of customs and mores from generation to generation. See social transmission. See also cultural heritage. —transmissible adj. —transmit vb.

transmitter n. 1. an instrument or device that encodes and sends a message or impulse to a receiver or aids in its transmission. 2. a neurotransmitter.

transmuting internalization in self psychology, significant changes and growth that can occur in a patient during treatment as the empathic failures that he or she experienced in early life are recognized and acknowledged by the therapist or analyst. [first described by Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981)]

transneural degeneration see transsynaptic degeneration.

transneuronal degeneration see transsynaptic degeneration.

transorbital lobotomy see lobotomy.

transparency n. 1. openness in relating to other people, with minimal attempts to make a good impression. 2. the state of being “invisible” in certain social situations. An individual may try not to be noticed by avoiding eye contact, remaining still, hiding behind another person, or using other similar tactics.

transpersonal psychology an area of humanistic psychology that focuses on the exploration of the nature, varieties, causes, and effects of “higher” states of consciousness and transcendent experiences. Transpersonal refers to the concern with ends that transcend personal identity and individual, immediate desires. See also being cognition; peak experience.

transplacental transmission see horizontal transmission.

transplantation n. 1. the surgical implantation of a tissue or organ from one part of the body into another or from one person (the donor) into another (the recipient). 2. the removal of a person from a permanent home to a temporary residence or nursing home.

transporter n. a protein complex that spans a cell membrane and conveys ions, neurotransmitters, or other substances between the exterior and interior of the cell. For example, at synapses between neurons, transporters in the presynaptic membrane recognize and bind to neurotransmitter molecules and return them to the presynaptic neuron for reuse (see reuptake). Transporters may utilize passive transport, in which a substance is transported into or out of a cell according to its concentration gradient across the cell membrane; or active transport, which is an energy-dependent process often relying on the hydrolysis of ATP to provide energy to facilitate movement of a substance from one side of the cell membrane to the other.

transposition n. 1. the process of transferring a learned relationship between two or more stimuli to a new set of stimuli. For example, if an organism is trained to select a 10 cm diameter disk over a 7 cm disk, and then in a transfer test chooses a 13 cm disk over a 10 cm disk (even though reinforcement has been obtained only for choosing a 10 cm disk), transposition of the relationship “bigger than” has occurred. 2. generally, an interchange of positions among two or more elements in a system. —transpositional adj.

transposition of affect the transfer of the emotional component associated with a particular idea or object to an unrelated idea or object. Also called displacement of affect.

transsexualism n. a condition consisting of a persistent sense of discomfort and inappropriateness relating to one’s anatomical sex, with a persistent wish to be rid of one’s genitals and to live as a member of the other sex. Those with this condition often seek to change their sex through surgical and hormonal means (see sex reassignment). Transsexualism is characterized as a gender identity disorder in DSM–IV–TR, where its diagnosis is applicable only if the condition is not due to another mental disorder, such as schizophrenia, and it is not associated with an intersex condition or genetic abnormality. In DSM–5, the discomfort or distress that may be associated with one’s sense of gender incongruence, not one’s transsexual identification per se, is given primacy through the inclusion of gender dysphoria in place of gender identity disorder as a diagnostic class. —transsexual adj., n.

transsynaptic degeneration the degradation of a neuron that results from the death of a neighboring neuron with which it formed synapses. Also called transneuronal degeneration: transneuronal degeneration.

transstentorial herniation a type of herniation that occurs when increased intracranial pressure (resulting, e.g., from a tumor or head injury) displaces the medial temporal lobe or the deep hemisphere structures of the brain through the tentorial notch (an opening in the fold of dura mater that separates the cerebellum from the cerebrum). This causes displacement of the midbrain sideways and downward, which in turn may cause death. Also called tentorial herniation: uncinal herniation.

transtheoretical model (TTM) a five-stage theory to explain changes in people’s health behavior. It suggests that change takes time, that different interventions are effective at different stages, and that there are multiple out-
transverse plane

comes (e.g., in belief structure, self-efficacy) occurring across the stages. See STAGES OF CHANGE. [developed in the 1970s by U.S. clinical psychologist James O. Prochaska (1942—) ]

transverse plane see HORIZONTAL PLANE.

transvestic fetishism in DSM–IV–TR, a PARAPHILIA characterized by the wearing of female clothes by a heterosexual male for the purpose of achieving sexual excitement and arousal. The term in DSM–5 is transvestic disorder, signifying that the paraphilia is only pathological if it causes distress or significant functional impairment. Whether disordered or not, it is distinct from TRANSEXISM, the nonsexualized CROSS-DRESSING by men or women of any sexual preference.

transvestism n. the habit, practiced by men or women, of wearing the clothes of the opposite sex but without the sexual arousal that CROSS-DRESSING serves in the predominately male paraphilia, TRANVESTIC PETISHISM. Also called transvestitism. —transvestic adj. —transvestite n.

Tranxene n. a trade name for CLORAZEPATE.

tranylcypromine n. see MONOAMINE OXIDASE INHIBITOR.

trapezoid body a bundle of transverse nerve fibers in the PONS that carries afferent fibers from the COCHLEAR NUCLEI to the SUPERIOR OLIVARY COMPLEX and the nuclei of the LATERAL LEMNISCUS, as well as efferent fibers from the INFERIOR COLICULI and lateral lemniscus to the cochlear nuclei.

t ratio the formula used for the T TEST, in which the numerator is the difference between the means of the two groups of interest and the denominator is a measure of the DISPERSION of the scores used to compute the means. The t value so obtained is compared to a T DISTRIBUTION table to determine if the difference between the means is significant or likely to have been a chance finding.

trauma n. 1. any disturbing experience that results in significant fear, helplessness, DISSOCIATION, confusion, or other disruptive feelings intense enough to have a long-lasting negative effect on a person’s attitudes, behavior, and other aspects of functioning. Traumatic events include those caused by human behavior (e.g., rape, war, industrial accidents) as well as by nature (e.g., earthquakes) and often challenge an individual’s view of the world as a just, safe, and predictable place. 2. any serious physical injury, such as a widespread burn or a blow to the head. —traumatic adj.

traumagenic adj. describing or relating to the dynamics by which a traumatic event (e.g., childhood sexual abuse) may have long-term negative consequences, including the development of a mental disorder.

traumagenic psychosis see SITUATIONAL PSYCHOSIS.

trauma management therapy a treatment program intended to alleviate the anxiety and fear, manage the anger, and enhance the interpersonal functioning of combat veterans with posttraumatic stress disorder (PTSD). It is a sequential multicomponent approach that combines (a) education, in which the client is informed about the symptom chronicity, skill deficits, and extreme social maladjustment associated with PTSD; (b) EXPOSURE THERAPY, in which the client reexperiences—imagination or through virtual reality—his or her specific traumatic event during individually administered weekly sessions; (c) programmed practice, in which the client performs exposure-related homework assigned by the therapist; and (d) socioemotional rehabilitation, in which the client participates in structured, group-administered social and emotional skills training sessions. [developed in 1996 by clinical psychologists B. Christopher Frueh (1963—), Samuel M. Turner (1944—2005), Deborah C. Beidel, and Robert F. Mirabella and health administrator and political scientist Walter J. Jones]

traumatic brain injury (TBI) damage to brain tissue caused by external mechanical forces, as evidenced by objective neurological findings, posttraumatic amnesia, skull fracture, or loss of consciousness.

traumatic disorder any disorder that results from physical or psychological trauma.

traumatic encephalopathy an ENCEPHALOPATHY secondary to a serious brain injury.

traumatic fistula see FISTULA.

traumatic grief a severe form of separation distress that usually occurs following the sudden and unexpected death of a loved one. Numbness and shock are frequently accompanied by a sense of futility and the meaninglessness of life, although the total syndrome includes many other painful and dysfunctional responses.

traumatic gynecologic fistula see FISTULA.

traumatic hemorrhage a type of CEREBRAL HEMORRHAGE that results from serious brain injury.

traveling salesperson problem (TSP) a classic route-picking puzzle used in studies of problem solving in both human and nonhuman animals. The individual is presented with a number of points and must choose the most efficient possible route between them, as would a salesperson needing to stop at several locations. Humans often find the shortest route when there are only a few points, but when there are many stops, they instead use the “nearest neighbor” system (repeatedly selecting the location closest to their current one) to produce solutions.

traveling wave see BASILAR MEMBRANE.

traveling wave theory see HEARING THEORIES.

trazodone n. a chemically unique antidepressant that was introduced as a safer alternative to the tricyclic agents. Initially marketed in an immediate-release formulation, it was of limited use as an antidepressant due to its pronounced sedative effects and its association with prolonged, painful, and unwanted erections (priapism) in a very small number of men who took the drug. Its mechanism of antidepressant action is unclear; it is not a potent inhibitor of either serotonin or norepinephrine reuptake, and it is an antagonist at the 5-HT1a serotonin receptor. Nonetheless, trazodone is commonly used in low doses for bedtime sedation or for controlling agitation and hostility in geriatric patients (U.S. trade name: Desyrel). Additionally, in 2010, the U.S. Food and Drug Administration approved trazodone in an extended-release formulation for treatment of depression (U.S. trade name: Oleptro).

Treacher Collins syndrome an autosomal dominant disorder that affects the development of small bones in the face. The facial anomalies—a small, retracted chin; small, downward-slanting eyes with defects of the iris; cleft palate; and deformed or absent ears—vary from minimal to severe. Hearing loss may also occur. Most individuals with the syndrome have normal intelligence. Mutations in the TCOF1 gene are the most common cause of the syndrome. Also called Berry syndrome; Frances-
treatment n. 1. the administration of appropriate measures (e.g., drugs, surgery, psychotherapy) that are designed to relieve a pathological condition. 2. the intervention to which some participants in an experimental design (the EXPERIMENTAL GROUP or treatment group) are exposed, in contrast to a CONTROL GROUP, who do not receive the intervention. Also called treatment condition. See treatment LEVEL.

treatment audit a procedure that measures quality assurance in health care. Audit activities include assessment of the structure, process, and outcome of the services provided. Audits occur in a cyclical process, enabling the results of the assessment to be fed back to providers to improve or maintain the services assessed. See also PROGRAM INTEGRITY; PROGRAM MONITORING.

treatment bias 1. the influence of a patient’s personal characteristics (e.g., age, gender, race, class) on the type and quality of treatment provided to him or her. 2. a practitioner’s or researcher’s unrealistically positive or negative attitude toward a particular type of intervention strategy.

2. an overly favorable view held by healthcare consumers toward providers (e.g., physicians) who offer more treatment options even though their benefits may be equivocal.

treatment effect the magnitude of the effect that a treatment (i.e., the INDEPENDENT VARIABLE) has upon the response variable (i.e., the DEPENDENT VARIABLE) in a study. It is usually measured as the difference in standardized units between the level of response under a control condition and the level of response under the treatment condition. See EFFECT SIZE.

treatment effectiveness evaluation an assessment of the success of a treatment (e.g., psychotherapy) in relation to previously established treatment goals or other criteria.

treatment facility a place that offers short- or long-term therapeutic services for a physical or mental disorder, such as a child-guidance clinic, medical clinic, community mental health center, drop-in center, nursing home, psychiatric hospital, or residential treatment center.

treatment integrity see PROGRAM INTEGRITY.

treatment level the specific condition to which a group or participant is exposed in a study or experiment. For example, in a design employing four groups, each of which is exposed to a different dosage of a particular drug, each dosage amount represents a level of the treatment factor.

treatment outcome research research designed to evaluate the efficacy of interventions and to investigate the mechanism by which effective interventions produce change. It is intended to answer such questions as the following: Is treatment better than no treatment? Is one treatment better than another? If a treatment is effective, do some levels of the treatment produce better outcomes than others? Are the benefits of treatment worth the cost? See also THERAPY OUTCOME RESEARCH.

treatment plan the recommended steps of intervention that the therapist or counselor devises after an assessment of the client has been completed. Many MANAGED CARE plans require submission of formal, written treatment plans prior to approving mental health treatment. Compare TREATMENT PROTOCOL.

treatment process research research, usually of a clinical nature, to investigate how interventions activate mechanisms of behavior change. See also TREATMENT OUTCOME RESEARCH.

treatment protocol the formal procedures used in a system of psychotherapy. In some systems, such as EXPERIMENTAL PSYCHOThERAPY, few explicit “rules” apply, whereas in others, such as BEHAVIOR THERAPY, strict adherence to a treatment protocol is often used to guide the work of the therapist. Compare TREATMENT PLAN.

treatment refusal unwillingness on the part of a patient or client to accept medical or psychological intervention. See also RIGHT TO REFUSE TREATMENT.

2. failure of a disease or disorder to respond positively or significantly to treatment, as in treatment-resistant depression. 2. reluctance on the part of an individual to accept psychological or medical treatment or to comply with the therapist’s or physician’s prescribed regimens. In psychotherapy, treatment resistance is the lack of a positive response by a client to the techniques being used and reflects a rupture in the THERAPEUTIC ALLIANCE, which requires the use of other strategies by the therapist to repair the alliance. Examples of treatment resistance are noncompliance with assignments, extended silences, talking about tangential issues, and seemingly pointless debates about the therapist’s approach, suggestions, and interpretations. See also NONADHERENCE.

treatment-seeking behavior the active pursuit of treatment by a person who has a disorder or who wishes to improve his or her general mental or physical functioning. See HELP-SEEKING BEHAVIOR.

treatment trial a research study designed to evaluate the effectiveness of an experimental intervention, its possible adverse effects, and other information that would contribute to the decision to use the intervention in the future. During the trial, the experimental intervention is compared with an existing one, which acts as a control. When the intervention being evaluated is a new drug, the term CLINICAL TRIAL is used instead.

treatment validity the extent to which an instrument is of value in identifying those individuals who are likely to benefit from a particular treatment or intervention. The term is used particularly in the field of special needs education.

2. the INDEPENDENT VARIABLE, whose effect on a DEPENDENT VARIABLE is studied in a research project.

treatment withholding discontinuing medical treatment that has no benefit to the patient in terms of an eventual cure or short-term alleviation of symptoms.

tree n. a type of GRAPH in which there is only one path between any pair of nodes: the graph is undirected and has no cycles. In computer programming, a rooted tree represents a type of ranked nonlist data structure consisting of separate nodes linked in a parent–child hierarchy, with every node, other than the root node, having a single parent. Nodes that share a parent are sibling nodes, and a node with no children is called a leaf node. This data structure is commonly used in database programming to represent hierarchical data and to facilitate search algorithms.

2. a diagram for generating and depicting a probability distribution. It shows all possible outcomes of an event and is used to determine the probability of getting
tremor

specific results when the possibilities are nested, such as in an experimental memory task in which participants view multiple target stimuli one at a time and then determine whether subsequently presented cues are targets or distractors. 2. see DENDROGRAM. 3. more generally, any branching depiction of a process or condition.

tremor n. any involuntary trembling of the body or a part of the body (e.g., the hands) due to neurological or psychological causes. Psychological (or psychogenic) tremor may be mild, due to tension, or violent and uncontrolled in severe disturbances. Toxic effects of drugs or heavy metals may produce a transient tremor. A coarse tremor involves a large muscle group in slow movements, whereas a fine tremor is caused by a small bundle of muscle fibers that move rapidly. Some tremors occur only during voluntary movements (see ACTION TREMOR); others occur in the absence of voluntary movement (see RESTING TREMOR). See also ESSENTIAL TREMOR.

trend analysis any of several techniques designed to uncover systematic patterns (trends) in a set of variables, such as linear growth over time or quadratic increases in response to increases in the level of an independent variable (e.g., increased dosage levels). Such analysis is often used to predict future events. Also called trend test.

trend study a longitudinal design in which data are collected at periodic intervals on samples drawn from a particular population and are used to reveal trends (systematic tendencies or patterns) over time.

trephination n. a surgical procedure in which a disk of bone is removed from the skull with a circular instrument (a trephine) having a sawlike edge. On the basis of evidence found in skulls of Neolithic humans, trephining is believed to be one of the oldest types of surgery. Among the numerous conjectural reasons given for the practice is that it was a treatment for headaches, infections, skull fractures, convulsions, mental disorders, or supposed demonic possession. Also called trepanation. —trephine vb.

treppe n. see STAIRCASE PHENOMENON.

TRH abbreviation for THYROTROPIN-RELEASING HORMONE.

triad n. a set of three people involved in a dynamic relationship, such as a father, mother, and child or a therapist and a couple receiving marital therapy. The three people are presumed to form a triangle with unique group characteristics and internal alliances.

triad training model an approach to training therapists and counselors that is intended to foster understanding of clients from other cultures and develop multicultural counseling competencies. In the model’s didactic simulation, a trainee therapist or counselor from a particular culture is matched with a three-person team: (a) a pro-counselor, representing the trainee’s own culture; (b) a coached client, who is hostile or resistant to the trainee, the therapy, or the trainee’s culture; and (c) a catalyst anticounselor, who represents the client’s ethnic group, religion, or other affiliation. The catalyst serves as a bridge of communication and support for the client, and the dynamic among all parties reveals issues, content, and effective approaches to the trainee. See also MULTICULTURAL THERAPY. [developed by U.S. psychologist Paul Bodholdt Pedersen (1936—)]

triage n. a method of enhancing the effects of treatment that involves the selection and sorting of patients in an orderly and systematic fashion. The patients are then routed to the most appropriate treatment services available.

trial n. 1. in testing, conditioning, or other experimentation, a single performance of a given task (e.g., one run through a maze) or a single presentation of a stimulus (e.g., one viewing of an ordered list of three-letter words). 2. see CLINICAL TRIAL; TREATMENT TRIAL. 3. in parapsychology research, any single attempt by a participant to identify a target by CLAIRVOYANCE or TELEPATHY or to influence a target by PSYCHOKINESIS. In experiments using ZENER CARDS, each turn of a card is therefore a separate trial.

trial-and-error learning a type of learning in which the organism successively tries various responses in a situation, seemingly at random, until one is successful in achieving the goal. Across successive trials, the successful response is strengthened and appears earlier and earlier. MAZE LEARNING, with its eventual elimination of blind-alley entrances, is an example of trial-and-error learning. The term derives from the stimulus–response theory of Edward L. THORNDIKE as an explanation of instrumental or reinforcement learning, although Thorndike initially preferred the more descriptive phrase trial-and-accidental success.

trial consultant a social scientist who assists attorneys with various aspects of a trial in which his or her expertise is relevant. Trial consultation typically includes helping to prepare individuals for testimony, developing surveys to help in jury selection and trial strategy development, and conducting CHANGE OF VENUE surveys. Also called jury consultant.

trial design the strategy or design used to conduct a CLINICAL TRIAL for the purpose of evaluating the efficacy of a new treatment.

trial lesson a diagnostic technique that provides information about a child’s learning style and the individualized teaching approach that would be most effective for that child.

trial marriage an arrangement by which a couple attempt to determine their compatibility and suitability for formal marriage by living together for a period of time.

trial therapy a planned process of temporary treatment, either in the early sessions of therapy or as a set of sessions prior to the initiation of long-term therapy, to test whether the client is suitable or ready for a commitment to the therapeutic process. Trial therapy is also used to assess whether the therapist believes that his or her treatment approach is compatible with the client and can meet the client’s particular needs.

triangular test a test involving sequential analysis that can be stopped when a particular power is reached and results can be evaluated. It is typically used in clinical trials when it is difficult to recruit participants.

triangular theory of love the proposition that the various kinds of love can be characterized in terms of the degree to which they possess three basic components that together can be viewed as forming the vertices of a triangle. The intimacy component refers to feelings of closeness, connectedness, and bondedness, which give rise to the experience of warmth in a loving relationship. The passion component refers to the drives that lead to romance, physical attraction, sexual consummation, and related phenomena in loving relationships. The commitment component refers to the decision that one loves someone and desires to maintain that love; it thus includes the cognitive elements
that are involved in decision making about the existence of and potential long-term commitment to a loving relationship. See COMPANIONATE LOVE; EROTIC LOVE; PASSIONATE LOVE; ROMANTIC LOVE. [advanced in 1986 by U.S. psychologist Robert J. Sternberg (1949—)].

triangulation n. 1. the process of confirming a hypothesis by collecting evidence from multiple sources. There are several different types of triangulation. In data triangulation, various sampling methods are used. The data are collected at different times, from different groups of people, and so forth. Investigator triangulation involves multiple researchers in an investigation; theory triangulation involves using more than one theoretical scheme to interpret a phenomenon; and methodological triangulation involves using a variety of interviews, observations, questionnaires, documents and other data-collection methods.

The data from each source support the hypothesis from a somewhat different perspective and therefore increase confidence in its validity. 2. in family therapy, a situation in which two members of a family in conflict each attempt to draw another member to their side. Triangulation can occur, for example, when two parents are in conflict and their child is caught in the middle. —triangulate vb.

triarchic theory of intelligence a theory of intelligence in which three key abilities—analytical, creative, and practical—are viewed as largely (although not entirely) distinct. According to the theory, intelligence comprises a number of information-processing components, which are applied to experience (especially novel experiences) in order to adapt to, shape, and select environments. The theory is triarchic because it contains three subtheories: one specifying the components of intelligence (see componential subtheory), another specifying the kinds of experience to which the components are applied (see experiential subtheory), and a third specifying how the components should be used in various kinds of environmental contexts (see contextual subtheory). [proposed in 1985 by Robert J. Sternberg (1949—), U.S. psychologist]

Triavil n. a trade name for a combination of the tricyclic antidepressant AMITRIPTYLINE and the antipsychotic PERPHENAZINE, used for the treatment of concurrent anxiety and depression.

triazolam n. a short-acting BENZODIAZEPINE used primarily as a hypnotic and also to manage anxiety associated with dental procedures. Following reports of severe psychological disturbances associated with its use, including behavioral disinhibition, aggression, agitation, and short-term memory impairment (anterograde amnesia), its sale was prohibited in the United Kingdom in 1991. U.S. trade name: Halcion.

tribade n. a woman who achieves sexual pleasure by rubbing her genitals against those of another woman. This activity is known as tribadism, which is also occasionally used as a synonym for lesbianism. —tribadic adj.

tribar n. see PENTROSE TRIANGLE.

TRICARE n. see CIVILIAN HEALTH AND MEDICAL PROGRAM OF THE UNIFORMED SERVICES.

tricho- (trich-) combining form hair or hairlike formation.

trichobezoar n. see TRICHOHAGIA.

trichomegaly-retinal degeneration syndrome a rare disorder of unknown cause marked by abnormally short stature, long eyebrows and eyelashes, poor vision due to retinal pigment degeneration, slow psychomotor development, and intellectual disability. Also called congenital trichomegaly: Oliver–McFarlane syndrome.

trichophagia n. the chronic eating of one’s own or other people’s hair (in contrast to trichophagy, the biting of one’s own hair). Often co-occurring with trichotillomania, trichophagia is a relatively rare disturbance that may result in a potentially life-threatening trichobezoar, a mass of ingested hair in the stomach that interferes with gastrointestinal peristalsis. When the trichobezoar develops a long tail that extends into the small intestine, the condition is referred to as Rapunzel syndrome.

trichotillomania n. a disorder characterized by the persistent pulling of hair from any part of one’s body on which it grows, often with conspicuous hair loss. Feelings of increasing tension before the act and feelings of release or satisfaction on completion are common. Although traditionally considered an impulse-control disorder, trichotillomania is increasingly identified as an obsessive-compulsive condition, as occurs in DSM–5. Also called hair-pulling disorder.

trichromatic theory one of several concepts of the physiological basis of color vision, as derived from experiments on color mixture in which all hues were able to be matched by a mixture of three primary colors. The YOUNG–HELMHOLTZ THEORY OF COLOR VISION is the best known trichromatic theory. Subsequent studies determined that there are three different retinal cone PHOTOPIGMENTS with peak sensitivities roughly corresponding to the three primary colors of trichromatic theory: blue, green, and red. Also called three-component theory. See also OPPONENT PROCESS THEORY OF COLOR VISION.

trichromatism n. normal color vision: the capacity to distinguish the three primary color systems of light–dark, red–green, and blue–yellow, attributable to the presence of all three types of photopigment. Also called trichromatopsia. See also ACHROMATISM; DICROMATISM; MONOCHROMATISM.

tricyclic antidepressant (TCA) any of a group of drugs, developed in the 1950s, that were the original FIRST-LINE MEDICATIONS for treatment of depression. They are presumed to act by blocking the reuptake of monoamine neurotransmitters (serotonin, dopamine, and norepinephrine) into the presynaptic neuron, thereby increasing the amount of neurotransmitter available for binding to postsynaptic receptors. Tricyclic antidepressants have a characteristic three-ring molecular core. They may be tertiary amines (e.g., IMIPRAMINE, AMITRIPTYLNE) or their metabolites, which are secondary amines (e.g., DESIPRAMINE, NORTRIPTYLINE). Other members of the group include CLOMIPRAMINE, PROTriPTYLINE (U.S. trade name: Vivactil), DOXEPIN, and trimipramine (U.S. trade name: Surmontil). Side effects of TCAs include significant anticholinergic effects (e.g., dry mouth, blurred vision, constipation, urinary retention), drowsiness or insomnia, confusion, anxiety, nausea, weight gain, and impotence. They can also cause cardiovascular complications (particularly disturbances in heart rhythm). The tricyclics represented the mainstream of antidepressant treatment from the introduction of imipramine in 1957 until fluoxetine (Prozac)—the first SSRI—was introduced in 1987. Although they are effective as antidepressants, their adverse side effects and—more significantly—their lethality in overdose have led to a profound decline in their use. They remain, however, the standard against which other antidepressants are com-
Tridimensional Personality Questionnaire

pared; no other class of antidepressants has demonstrated more clinical efficacy.

Tridimensional Personality Questionnaire (TPQ) see TEMPERAMENT AND CHARACTER INVENTORY.

tridimensional theory of feeling the theory that feelings can vary along three dimensions: pleasantness-unpleasantness (hedonic quality), excitement—calmness, and arousal—relaxation. The tridimensional theory is used to define different emotions as characterized by different combinations and successions of feelings and by the specific course of change of the feelings along each of the three dimensions. [introduced by Wilhelm Wundt]

trier of fact the person or party in a court of law who hears the evidence and decides the case. This may be either a judge or a jury. Also called fact finder.

trifluoperazine n. a HIGH-POTENCY ANTIPSYCHOTIC of the piperazine PHENOTHIAZINE class. Like other agents of this class, it acts primarily by blocking postsynaptic dopamine D2 receptors. Trifluoperazine is appropriate for the treatment of schizophrenia in both adults and children and of severe, nonpsychotic anxiety in adults only. It may also be used to control behavioral symptoms associated with dementia. Because of its potentially severe side effects (e.g., TARDIVE DYSKINESIA, NEUROLEPTIC MALIGNANT SYNDROME)—and the availability of other, relatively nontoxic anxiolytics (e.g., the benzodiazepines)—it is not recommended for routine use in treating anxiety. U.S. trade name: Stelazine.

trigeminal chemoreception the stimulation of free nerve endings of the trigeminal nerve in the nasal cavity by odorous chemicals, leading to sensations of tickling, stinging, warming, or cooling.

trigeminal nerve the fifth and largest CRANIAL NERVE, which carries both sensory and motor fibers. The motor fibers are primarily involved with the muscles used in chewing, tongue movements, and swallowing. The sensory fibers innervate the same areas, including the teeth and most of the tongue in addition to the jaws. Some fibers of the trigeminal nerve innervate the cornea, face, scalp, and the dura mater of the brain. The trigeminal nerve is also sensitive to the airflow changes that occur during breathing.

trigeminal neuralgia a form of unilateral facial NEURALGIA involving the trigeminal nerve, characterized by paroxysms of excreting pain. Also called tic dououreux.

trigeminal nucleus either of two nuclei associated with the three main roots of each trigeminal nerve. The spinal trigeminal nucleus extends downward in the medulla oblongata to the upper region of the spinal cord and receives fibers from pain and temperature receptors. The principal sensory trigeminal nucleus receives large myelinated fibers from pressure receptors in the skin and relays impulses to the thalamus.

trigeminal rhizotomy see RHIZOTOMY.

trigger 1. n. a stimulus that elicits a reaction. For example, an event could be a trigger for a memory of a past experience and an accompanying state of emotional arousal. 2. vb. to act as a trigger.

trigger feature a specific feature, simple or complex, of a stimulus that may cause a response in a specific neuron. For example, some cells in the visual cortex respond to bars of light with specific orientations, whereas others respond to more complex visual patterns, such as faces.

triggering cause a stimulus or phenomenon that initiates the immediate onset of a behavior problem. See also PRECIPITATING CAUSE. Compare PREDISPOSING CAUSE.

trigger zone a low-threshold region for eliciting a response. In a neuron, the trigger zone for evoking an action potential is the AXON HILLOCK, where POSTSYNAPTIC POTENTIALS summate. In the brain, stimulation of the CHIMERECEPTOR TRIGGER ZONE in the medulla oblongata provokes vomiting.

trigram n. 1. any three-letter combination, particularly a nonsense syllable used in studies of learning and memory. 2. in studies of language processing, a sequence of three words, syllables, or other items in which the identity of the first two items is used as a basis for predicting the third.

trigraph n. see DIGRAPH.

triethylene melamine n. an ANTIHOLERGIC DRUG used in the treatment of drug-induced parkinsonian symptoms, such as those produced with use of conventional antipsychotics, and as an adjunctive treatment for Parkinson’s disease. It acts by exerting a direct inhibitory effect on the parasympathetic nervous system and a relaxing effect on smooth muscle. U.S. tradename: Artane.

triiodothyronine (T3) n. an iodine-containing hormone that, together with THYROIDINE, regulates metabolic activity. See THYROID HORMONE.

Trilafon n. a trade name for PERPHENAZINE.

trimester n. any of the three approximately 3-month periods of a human pregnancy.

trimethoxyamphetamine (TMA) n. a synthetic AMPHETAMINE derivative that is a CNS STIMULANT with purported hallucinogenic properties similar to LSD and the naturally occurring hallucinogen MISCALINE. The side effects and toxicity of TMA and other “designer psychodelics” are similar to those of MDMA.

trimipramine n. see TRICYCLIC ANTIDEPRESSANT.

trimmed mean a mean calculated by averaging the scores in a distribution after removing equal numbers of the highest and lowest values. For example, a researcher may decide to exclude the top and bottom 10% of the distribution; the mean is then calculated on the remaining 90% of scores.

trimming n. 1. the exclusion of a fixed percentage of cases at each end of a distribution before calculating a statistic on the set of data. This is done to eliminate the influence of extreme scores on the estimate. 2. in PATH ANALYSIS, the removal of nonsignificant paths after the first run of analyses. The analysis is then rerun until the best fitting model is obtained. The ultimate model should then be CROSS-VALIDATED on another data set.

trinucleotide repeat a contiguous repetition of the same three NUCLEOTIDES within a nucleic acid (DNA or RNA). The occurrence of extra trinucleotide repeats in certain genes causes dysfunction, including HUNTINGTON’S DISEASE and FRAGILE X SYNDROME.

trip 1. n. slang for an episode of intoxication with LSD or another hallucinogen. A bad trip is slang for a negative intoxication experience, which can range from unpleasant sensations to an acute psychotic episode. Also called acid
triphasic pattern a characteristic sequence of muscle activations—agonist, then antagonist, and finally agonist again—observed in rapid, unidirectional movements toward a target. Also called three-burst pattern.

tripartite model of attitudes a theory of attitude structure proposing that an attitude is based on or consists of affective, cognitive, and behavioral components. The affective component refers to feelings associated with the attitude object, the cognitive component to beliefs about attributes associated with the attitude object, and the behavioral component to past behaviors and future intentions associated with the attitude object.

tripeptide n. any of a class of VASOCONSTRICTOR drugs used in the treatment of migraine headache, the prototype of which is sumatriptan. Triptans exert their therapeutic effect by acting as serotonin agonists at 5-HT1B and 5-HT1D receptors, causing the constriction of cerebral blood vessels. Triptans should not be administered concurrently with monoamine oxidase inhibitors and should be used cautiously with SSRIs to avoid the risk of precipitating a serotonin syndrome.

tripisomy n. see AUTOSOME. —trisomic adj.

trisomy 13 a syndrome involving an extra chromosome 13, resulting in the birth of an infant with a variety of problems, including severe intellectual disability; cleft lip and palate; polydactyly (extra fingers or toes); cerebral anomalies; and ocular abnormalities, such as missing or very small eyes, cataracts, and defects in the iris. Many infants with the syndrome die within their first days or weeks of life, and less than 20% of children with this condition live past their first year. Also called D trisomy syndrome: Patau syndrome.

trisomy 18 a congenital disorder in which a person has a third copy of chromosome 18 instead of the usual two copies. It is characterized by low birth weight with microcephaly, various facial anomalies, a prominent occiput, overlapping of the index finger over the third finger, and visual abnormalities. Less than 10% of children live past their first year, and these children usually have severe intellectual disability. Also called Edwards syndrome: E trisomy.

trisomy 21 see DOWN SYNDROME.

trisomy X see XXX SYNDROME.

tritanopia n. blue-green color blindness in which there is some loss of luminosity in the blue portion of the visual spectrum as a result of a deficiency of short-wavelength pigment. Tritanopia is relatively rare.

triune brain the view, now outmoded, that the brain consists of three layers reflecting its evolutionary development. The first and oldest is the archipallium, or R-complex (meaning reptilian complex and including the brainstem and cerebellum); the second is the paleomammalian system, or limbic system; and the most recently evolved is the neopallium, or neo cortex, also known as the neomammalian brain. [proposed by U.S. physician and neuroscientist Paul D. MacLean (1913–2007)]

troclear nerve the fourth cranial nerve, which contains motor fibers supplying the superior oblique muscle of the eyelid.

trolism n. 1. sexual activity in which one person (a trolist) enjoys observing his or her usual partner in sexual activities with a third person. 2. any sexual activity involving three people simultaneously.

troland (symbol: td) n. the unit of illumination at the retina, defined as the illumination when a light source of 1 cd/m² is viewed through a standard pupil with an area of 1 mm². [named after Leonard T. Troland]

trrophic adj. 1. describing or relating to activities associated with nourishment, including the ingestion of food and metabolism of nutrients. 2. describing or relating to the nourishing and supportive functions of the cell body of a neuron, as distinct from the activity of impulse reception and transmission. See also NEUROTROPHIN.

trophic hormone see TROPIC HORMONE.

trophic nerve any nerve that regulates the nutrition of a tissue.

trophotropic adj. related to or concerning a capacity or propensity for renewal of energy, that is, for rest. Compare ERGOTROPIC.

tropia n. the relative deviation of the visual axes during binocular viewing of a single target, resulting in abnormal alignment of the eyes that convergence cannot correct (see STRABISMUS). The term is most commonly used in compound words, such as exotropia (outward deviation) and esotropia (inward deviation).

tropic hormone (trophic hormone) any of a class of hormones from the anterior pituitary gland that affect the secretion of other endocrine glands. The tropic hormones include THYROID-STIMULATING HORMONE, CORTICO-TROPIN, FOLLICLE-STIMULATING HORMONE, and LUTEINIZING HORMONE.

tropicism n. a form of orientation observed in both plants and nonhuman animals toward or away from a stimulus, such as sunlight or gravity. The flower of a plant may turn gradually to face the sun as it moves across the sky (heliotropism), while its roots follow magnetic lines of force and the pull of gravity. Tropism contrasts with TAXIS, which is a directed movement toward or away from a stimulus. Compare KINESIS. —tropic adj.

troposmia n. a distorted odor perception in the presence of an odorant. Typically, pleasant or neutral stimuli are perceived as unpleasant. See also Dysosmia; Parosmia.

tropotaxis n. see TAXIS.

truancy n. absence from school without permission. Persistent truancy before the age of 13 is an example of a serious violation of major rules, one of the symptoms of CONDUCT DISORDER. Also called school truancy. —truant adj.

true experiment a study in which participants are assigned at random to two or more experimentally manipu-
true–false test

lateral treatment conditions or to a treatment group and a control group. This type of experiment is in contrast to QUASI-EXPERIMENTAL DESIGNS, such as NATURAL EXPERIMENTS and FIELD EXPERIMENTS.

true–false test a test in which the participant must respond to statements, words, and the like with either true or false.

true schizophrenia see NUCLEAR SCHIZOPHRENIA.

true score in CLASSICAL TEST THEORY, that part of a measurement or score that reflects the actual amount of the attribute possessed by the individual being measured.

true self in psychoanalytic theory, the total of an individual’s potentialities that could be developed under ideal social and cultural conditions. The term is used in the context of Erich FROMM’s approach to neurosis as a reaction to cultural pressures and repressed potentialities. It is also used in the CLIENT-CENTERED THERAPY of Carl ROGERS and in the OBJECT RELATIONS THEORY of British psychoanalyst Donald Winnicott (1896–1971). The realization of the true self is a major goal of therapy.

true variance naturally occurring variability within or among research participants. This variance is inherent in the nature of individual participants and is not due to measurement error; imprecision of the model used to describe the variable of interest, or other extrinsic factors. It represents the variance of the TRUE SCORES among the participants taking the measure.

Truman Show delusion a firmly held but erroneous belief that one is the star of a reality television show. Specifically, individuals feel that the people in their lives are actors and that their activities are continuously being broadcast to a worldwide audience. The Truman Show delusion was first proposed in 2006 by psychiatrist Joel Gold and philosopher Ian Gold, brothers who contend that its breadth of mistrust and its potential prevalence among people who otherwise have no diagnosable mental illness are factors that distinguish it from other types of delusions. Critics, however, say the phenomenon’s psychological features overlap with those of other delusions to such an extent that it is not a unique entity but rather a variation of traditionally recognized psychotic themes of grandeur and persecution or surveillance. [coined from The Truman Show, a 1998 film in which the protagonist Truman Burbank discovers that his entire life has been fabricated by the media and that he is the unwitting focus of a television show]

truncated data a set of data in which some values are excluded as a matter of deliberate selection. For example, if the distribution of age being studied focuses on 21 to 65 years, those under 21 and over 65 are excluded as a matter of deliberate selection. For example, if the Truman Show delusion is the rate-limiting step in serotonin synthesis, limited by levels of tryptophan in the brain as well as by levels of activity of neurons that use serotonin as a neurotransmitter.

truncated distribution a set of scores lacking values beyond a specific maximum point, below a specific minimum point, or both. See TRUNCATED DATA.

trust 1. n. reliance on or confidence in the dependability of someone or something. In interpersonal relationships, trust refers to the confidence that a person or group of people has in the reliability of another person or group; specifically, it is the degree to which each party feels that they can depend on the other party to do what they say they will do. The key factor is not the intrinsic honesty of the other people but their predictability. Trust is considered by most psychologists to be a primary component in mature relationships with others, whether intimate, social, or therapeutic. See BASIC TRUST VERSUS MISTRUST; SECURITY, 2, wh to have trust in someone or something.

trust exercise a common procedure in GROUP THERAPY and GROWTH GROUPS intended to help participants learn to trust other people. The trust exercise may involve putting a member in a vulnerable position requiring him or her to depend on other group members for support. See also BLIND WALK.

trust versus mistrust see BASIC TRUST VERSUS MISTRUST.

truth bias the tendency to assume, in the absence of evidence, that interaction partners are telling the truth. The truth bias arises because, more often than not, partners do tell the truth. Researchers believe that truth bias contributes to relationship success by minimizing suspicousness, but makes it more difficult to detect deception in partners who are, in fact, lying.

truth serum a colloquial name for drugs, especially the barbiturates AMOBARBITAL, PENTOBARBITAL, and THIOPENTAL, that are injected intravenously in mild doses to help elicit information by inducing a relaxed, semihypnotic state in which an individual is less inhibited and more communicative. The term is derived from the reported use of such drugs by police to extract confessions from suspects.

truth value in logic and philosophy, the truth or falsity of a proposition. See BIVALENCE; INFINITE-VALUED LOGIC.

tryptamine n. a monoamine alkaloid, derived from TRYPTOPHAN, that is found in plants, fungi, and animals, including in small amounts in the mammalian brain, where it may act as a neurotransmitter. Serotonin and the hormone melatonin are related to tryptamines.

tryptamine derivative any of a group of naturally occurring or synthetic psychoactive substances, derived from tryptamine, that are chemically related to serotonin (5-hydroxytryptamine). They include agents with hallucinogenic effects similar to those of LSD, such as DMT (dimethyltryptamine), BOTENIN, and PSILOCYBE. Tryptamine derivatives may also be classified as substituted indolealkylamines.

tryptophan n. one of the essential amino acids of the human diet. It is a precursor of the neurotransmitter serotonin and of the hormone melatonin and plays a role in general physiological processes. In plants and many animals, it is also a precursor of the B vitamin NICOTINIC ACID. Tryptophan depletion—loss of tryptophan in the brain—may be induced for research purposes.

tryptophan hydroxylase an enzyme that catalyzes the first step in the biosynthesis of SEROTONIN. It uses tetrahydrobiopterin as a coenzyme to transform the dietary amino acid L-tryptophan to 5-HYDROXYTRYPTOPHAN (5-HTP). This reaction is the rate-limiting step in serotonin synthesis, limited by levels of tryptophan in the brain as well as by levels of activity of neurons that use serotonin as a neurotransmitter.

TSA abbreviation for TRANSCORTICAL SENSORY APHASIA.

t-score n. see TACHISTOSCOPE.

T score a type of STANDARDIZED SCORE based on a score distribution that has a mean of 50 and a standard deviation of 10. For example, a RAW SCORE that is 1 standard de-
viation above its mean would be converted to a $T$ score of 60.

**TSCS** abbreviation for TENNESSEE SELF-CONCEPT SCALE.

**TSD** abbreviation for TAY–SACHS DISEASE.

**TSH** abbreviation for THYROID-STIMULATING HORMONE.

**TSP** abbreviation for TRAVELING SALESPERSON PROBLEM.

**$T$-squared test** see HOTELLING’S $T^2$ TEST.

**TSS** symbol for TOTAL SUM OF SQUARES.

**TTA** abbreviation for THRESHOLD TRAITS ANALYSIS.

**TTCT** abbreviation for TORRANCE TESTS OF CREATIVE THINKING.

**$t$ test** any of a class of statistical tests based on the fact that the test statistic follows the $T$ DISTRIBUTION when the NULL HYPOTHESIS is true. Most $t$ tests deal with hypotheses about the mean of a population or about differences between means of different populations, wherein those populations show NORMAL DISTRIBUTIONS and the variances are unknown and need to be estimated. The test can be used with independent groups (e.g., test scores of those who were given training vs. a control group without training) or dependent groups (e.g., test scores before vs. after training). Also called **Student’s $t$ test**.

**TTI** abbreviation for TRAIT–TREATMENT INTERACTION.

**TTM** abbreviation for TRANSTHEORETICAL MODEL.

**TTR** abbreviation for TYPE–TOKEN RATIO.

**TTS** abbreviation for TEMPORARY THRESHOLD SHIFT.

**TTX** abbreviation for TETRODOTOXIN.

**TTY** abbreviation for text telephone. See TELECOMMUNICATION DEVICE.

**tubal ligation** a surgical procedure for female STERILIZATION by cutting, cauterizing, tying, or blocking the FALLOPIAN TUBES. Tubal ligation does not affect sex drive, intercourse, or menstrual cycles. Although the effects of the procedure may sometimes be reversed and the ability to conceive restored, tubal ligation is usually considered permanent.

**tubal pregnancy** a pregnancy in which the fertilized ovum is implanted in the wall of a FALLOPIAN TUBE rather than in the lining of the uterus. It is the most common form of ECTOPIC PREGNANCY. Also called fallopian-tube pregnancy.

**tubectomy** n. see SALPINGECTOMY.

**tuberculosis meningitis** a complication of tuberculosis resulting from the spread of the tubercle bacilli from the lungs to the brain via the bloodstream. Tuberculous lesions in the SUBARACHNOID SPACE rupture to cause inflammation of the middle and innermost meninges (the arachnoid and pia). The symptoms are the same as those associated with other forms of BACTERIAL MENINGITIS, and HYDROCEPHALUS may develop.

**tuberoinfundibular tract** one of the major neural pathways in the brain that use dopamine as their principal neurotransmitter (see DOPAMINERGIC). The cell bodies of this tract, which is a local circuit in the hypothalamus, project short axons to the pituitary gland. The tuberoinfundibular tract is associated with the regulation of hypothalamic function and of specific hormones (e.g., prolactin). Alterations in hormone function involving this tract are often seen in patients taking antipsychotics.

**tuberomammillary nucleus** a nucleus in the HYPOTHALAMUS that contains neurons responsive to HISTAMINE and is involved in maintaining wakefulness and arousal.

**tubular vision** see TUNNEL VISION.

**tufted cell** one of the specialized types of cells involved in the sense of smell. The tufted cells are efferent neurons located in the OLEFACTORY BULB. They synapse with receptor neurons in the glomerular layer (see GLOMERULUS) and exit the bulb in the LATERAL OLEFACTORY TRACT.

**TUI** abbreviation for TANGIBLE USER INTERFACE.

**TUTS** acronym for task-unrelated images and thoughts. See MIND WANDERING.

**Tukey–Kramer procedure** an extension of TUKEY’S HONESTLY SIGNIFICANT DIFFERENCE TEST (HSD test) so that it can be used with samples of unequal size. Whereas the HSD test yields a single critical difference (CD) for each pair of means, the Tukey–Kramer test uses a different CD as required to evaluate the significance of the difference between each pair of means. [John Wilder Tukey (1915–2000) and Clyde Y. Kramer, U.S. statisticians]

**Tukey’s honestly significant difference test** (Tukey’s HSD test) a MULTIPLE COMPARISON procedure that is used to test for significant differences between all possible pairs of mean values on a variable for groups of research participants; it is generally applied after an ANALYSIS OF VARIANCE has determined that there is a significant difference among three or more means. The procedure involves simultaneously comparing all possible pairs of means based on a single quantity, called the honestly significant difference (HSD), such that if the difference between any two group means exceeds the HSD, the corresponding population means are said to be significantly different from each other. Tukey’s HSD test preserves the FAMILY-WISE ERROR RATE by adjusting the overall SIGNIFICANCE LEVEL to take into account the fact that multiple $T$ TESTS are being conducted. Also called **Tukey’s range test**. [John Wilder Tukey]

**Tukey test of additivity** an approach used in a TWO-WAY ANALYSIS OF VARIANCE to assess whether the independent variables are additively related to the EXPECTED VALUE of the dependent variable or whether there is an INTERACTION EFFECT. Also called **Tukey’s one-degree-of-freedom test**: **Tukey test of nonadditivity**. [John Wilder Tukey]

**tulipmania** n. 1. the extraordinary overvaluing of tulip bulbs that occurred in Holland in the 17th century. First introduced into Holland in the late 1500s, bulbs soon became highly prized and costly. Their value escalated over a period of 40 years until some of the rarer bulbs cost as much as a private home; such bulbs were no longer planted but instead displayed as an indication of the owner’s wealth. Some individuals willingly traded all of their possessions and savings to purchase bulbs, which they then hoped to resell for a much higher price as the market price escalated. The price of bulbs plummeted unexpectedly in 1637, causing financial ruin for many who had speculated in the bulb market. Also called **tulipomania**. 2. any investment craze that is marked by a rapid increase in the price of a commodity with relatively little value.

**tumescence** n. a state of swelling or being swollen, as in swelling of the penis or clitoris as a result of sexual stimulation. Compare **DITUMESCENT**. —tumescent adj.
tumor n. 1. see NEOPLASM. 2. swelling, one of the cardinal signs of inflammation.

tuning curve a graph of neuronal response (usually measured in action potentials or spikes per unit time) as a function of a continuous stimulus attribute, such as orientation, wavelength, or frequency. A neuron is said to be “tuned” for the stimulus that evokes the greatest response, and the width of the curve from the half-maximum response on either side of the peak indicates how broadly or narrowly tuned a neuron is for a particular stimulus attribute. In the auditory system, it is a measure of FREQUENCY SELECTIVITY. For example, in recordings from an auditory nerve fiber, the threshold is usually defined as a fixed increase in firing rate in response to a pure tone. Typically, tuning curves are V-shaped with a CHARACTERISTIC FREQUENCY (CF) or best frequency (BF) at which the fiber requires the minimal sound level to reach the threshold response. A psychophysical tuning curve (PTC) shows the relationship between the level and frequency of a pure-tone masker (see AUDITORY MASKING) that is necessary to just mask a probe signal of fixed level and frequency. PTCs bear a strong resemblance to the actual tuning curves measured in auditory nerve fibers. See CRITICAL BAND; TO-NOTOPIC ORGANIZATION.

T-unit n. in linguistics, short for minimal terminable unit. T-units are the shortest grammatically complete units into which a string of written or spoken language can be divided (i.e., by insertion of periods and capital letters). The mean length of T-units is often used as a measure of the structural complexity of student writing. [First described in 1965 by U.S. educationalist Kellogg W. Hunt]

tunnel vision a VISUAL FIELD DEFECT producing the effect of perceiving the world through a long tunnel or tube. Peripheral vision may be entirely lost. Tunnel vision can occur in one or both eyes in uncontrolled glaucoma and retinitis pigmentosa and in both eyes after bilateral injury to visual processing areas beyond the optic chiasm. It may also be a conversion symptom. Also called tubular vision.

turbinate n. any of three bony shelves in the nasal cavity. The turbinates produce turbulence in the airflow passing from the nostrils to the OLFACTORY MUCOSA, and this turbulence distributes air across the OLFACTORY RECEPTORS in the mucosa.

Turing machine a hypothetical machine designed in the 1930s to determine whether an algorithm could be described and used to prove any mathematical problem that was provable. The Turing machine consisted of four components: an alphabet of tokens, a finite-state machine, an infinite tape, and a read–write head that was used for reading and recording information produced by the finite-state machine from and onto the tape. The tape was infinite only in that it was expected that the read–write head would always be supplied with data as well as have space to write new data. There are multiple ways of describing the state of the Turing machine. One approach is with a set of five values, supplied by the alphabet of tokens: (a) the state of the finite-state machine, (b) the token read from the tape, (c) the token written to the tape, (d) the instruction for moving the read–write head, and (e) the next state of the finite-state machine. Sets of these patterns of five tokens make up the program for the machine. When the program is able to be located on the tape of the machine, it is called a universal Turing machine. It was later demonstrated that the Turing machine was an example of a class of maximally powerful machines that could compute any function that was computable. See also GÖDEL’S PROOF. [Alan Mathison Turing (1912–1954), British mathematician]

Turing test a test proposed in 1950 (originally called the imitation game) to determine in what situations a computer program might be said to be intelligent. A person is isolated in a room but is connected to either a computer or another person outside of the room. If the person in the room cannot tell, by asking questions, whether he or she is talking to the computer or to the other person, then the program on the machine must be seen as intelligent. See also CHINESE ROOM ARGUMENT. [Alan Turing]

Turner syndrome a chromosomal disorder, specific to females, marked by the absence of all or a part of one of the two X (female) chromosomes. The effects include gonadal dysgenesis (underdevelopment or absence of primary and secondary sex characteristics), infertility, and various other abnormalities (e.g., short stature, lack of menstruation). Although the disorder is genetic, it is not inherited, occurring instead as a random event during cell division in early fetal development. See also NOONAN SYNDROME. [Reported in 1938 by Henry H. Turner (1892–1970), U.S. endocrinologist]

turnover n. in industrial and organizational settings, the number of employees who leave their jobs during a given period. A distinction is generally made between controllable turnover, as by dismissal or voluntary resignation, and uncontrollable turnover, as by retirement or redundancy. The turnover rate is calculated by dividing controllable turnover by the average number of employees in the organization or unit during this period. This rate can be an indicator of the general level of job satisfaction among employees. Also called labor turnover; staff turnover. See INVOLUNTARY TURNOVER; VOLUNTARY TURNOVER.

turn taking in social interactions, alternating behavior between two or more individuals, such as the exchange of speaking turns between people in conversation or the back-and-forth grooming behavior that occurs among some nonhuman animals. Basic turn-taking skills are essential for effective communication and good interpersonal relations, and their development may be a focus of clinical intervention for children with certain disorders (e.g., autism).

TUTs acronym for task-unrelated thoughts. See MIND WANDERING.

twelfth cranial nerve see HYPOGLOSSAL NERVE.

twelve-step program a distinctive approach to overcoming addictive, compulsive, or behavioral problems that was developed initially in ALCOHOLICS ANONYMOUS (AA) to guide recovery from alcoholism and is now used, often in an adapted form, by a number of other self-help groups. The twelve-step program in AA asks each member to (a) admit that he or she cannot control his or her drinking; (b) recognize a supreme spiritual power, which can give the member strength; (c) examine past errors, a process that is carried out with another member who serves as sponsor; (d) make amends for these errors; (e) develop a new code and style of life; and (f) help other alcoholics who are in need of support. Variations of this model also exist for drug abuse and addiction, gambling addiction, and other problems.

22q11.2 deletion syndrome a disorder caused by the deletion of a small piece of chromosome 22, resulting in heart defects, cleft palate or other palate defects, and mild differences in facial features, among other effects.
Children with the disorder may also have developmental delays, learning disabilities, attention-deficit/hyperactivity disorder, and autism. As they age, they have an increased risk of developing schizophrenia, depression, anxiety, and bipolar disorder. Because the signs and symptoms are so varied, several conditions (e.g., DiGeorge syndrome, Di-George anomaly, velocardiofacial syndrome, Shprintzen syndrome, conotruncal anomaly face syndrome, thymic aplasia syndrome) were once thought to be separate but are now understood to be part of the spectrum of 22q11.2 deletion syndrome.

twilight state a state of clouded consciousness in which the individual is temporarily unaware of his or her surroundings, experiences fleeting auditory or visual hallucinations, and responds to them by performing irrational acts, such as undressing in public, running away, or committing violence. The disturbance occurs primarily in temporal lobe epilepsy, dissociative reactions, and alcoholic intoxication. On regaining normal consciousness, individuals usually report that they felt they were dreaming and have little or no recollection of their actual behavior.

twilight vision see scotopic vision.

twin control in a twin study, a method in which the target twin—that is, the one who has had certain experiences or training or has been exposed to the experimental condition—is compared with the twin who has not had the experiences, training, or treatment and therefore serves as a control. Also called cotwin control.

twinning n. 1. the simultaneous production of two embryos within a single uterus. 2. the production of two symmetrical objects from a single object by division.

twins pl. n. see dizygotic twins; monozygotic twins.

twinship transference in self psychology, a narcissistic transference that, when activated in treatment, results in the patient experiencing the analyst or therapist as very similar in characteristics to himself or herself, thereby enhancing the patient’s experience of being understood and valued. Also called alter-ego transference. Compare idealizing transference, mirror transference. [First described by Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981)].

twin study research utilizing twins. The purpose of such research is usually to assess the relative contributions of heredity and environment to some attribute. Specifically, twin studies often involve comparing the characteristics of identical and fraternal twins and comparing twins of both types who have been reared together or reared apart. For example, two types of study have been used to investigate intelligence in twins: (a) identical twins reared apart—here, the genotypes (genetic makeups) are identical, but as there is no shared environment, any disparity in intelligence must result from the different environments; and (b) comparisons between identical twins reared together and fraternal twins reared together—here, one can assume that each pair of twins shares the same environment, but whereas the identical twins have 100% of their genes in common, the fraternal twins share only 50% of their genes, suggesting that if the identical twins show a greater similarity in intelligence than do the fraternal twins, the genes must play a role in that trait. The assumptions made in these studies, however, are never completely fulfilled. For example, the identical twins reared apart have had some common environment, if only their intrauterine experiences. Moreover, identical twins reared together usually have more similar environments than fraternal twins raised together. These differences can make the estimations of heritability of intelligence open to some doubts.

twitching n. a series of small muscular contractions.

two-by-two contingency table see two-by-two table.

two-by-two factorial design an experimental design in which there are two independent variables each having two levels. When this design is depicted as a matrix, two rows represent one of the independent variables and two columns represent the other independent variable. Also called two-by-two design: two-way factorial design. See factorial design.

two-by-two table a type of two-way table used to display and analyze data for two dichotomous variables. For example, suppose a survey of a group of 100 participants reported information on two variables: (a) gender (male or female) and (b) major in college (social sciences or humanities). The results could be shown in a two-by-two table. Also called fourfold table: two-by-two contingency table.

two-chair technique see empty-chair technique.

two-dimensional leader behavior space see Blake–Mouton managerial grid.

two-factor analysis of variance see two-way analysis of variance.

two-factor design see two-way design.

two-factor theory 1. a theory that avoidance behavior is the result of two kinds of conditioning. Initially, stimuli that precede the presentation of the stimulus to be avoided (e.g., an electric shock) are established as aversive by classical conditioning (Factor 1). Next, the subject learns to terminate the conditional aversive stimulus by means of escape conditioning (Factor 2). [Proposed by O. Hobart Mowrer] 2. a theory that intelligence comprises two kinds of factors: a general factor, whose influence pervades all tests of intelligence, and various specific factors, each of whose influence extends only to a single test in a test battery. [Proposed in 1904 by Charles Spearman]

two-factor theory of emotion see schachter–singer theory.

two-factor theory of work motivation a theory holding that the factors causing worker satisfaction (those addressing higher order psychological needs such as achievement, recognition, and advancement; see motivators) and the factors causing worker dissatisfaction (those addressing basic needs and interpersonal processes, including salary, work conditions, and supervision; see hygiene factors) are not opposites of one another but are, in fact, independent factors. Thus, to improve job attitudes and productivity—that is, work motivation—employers and administrators must evaluate and address both sets of factors separately. [Proposed by U.S. clinical psychologist Frederick Herzberg (1923–2000) in his 1959 book The Motivation to Work]

two-neuron arc see monosynaptic arc.

two-parameter model in item response theory, a model that specifies two parameters affecting an individual’s response to a particular test item: (a) the difficulty level of the item and (b) the item discriminability. See also rasch model; three-parameter model.
two-person psychology

two-person psychology a term used in RELATIONAL PSYCHOANALYSIS to underscore its shift in theory from CLASSICAL PSYCHOANALYSIS, which emphasizes a patient’s intrapsychic life, to a perspective that emphasizes the importance of the dyad between a patient and analyst or therapist for forming self-understanding and relational meaning. Compare ONE-PERSON PSYCHOLOGY.

two-plus-two phenomenon a fallacy of reasoning in which observed or accepted facts are considered to make a certain conclusion so obvious that the logical analysis necessary to justify the conclusion is omitted.

two-point discrimination the ability to sense the contact of a touch stimulus at two different points on the hand at the same time. The two-point discrimination test is used in studies of the effects of parietal lesions of the brain, particularly in patients with open head injuries.

two-point threshold the smallest distance between two points of stimulation on the skin at which the two stimuli are perceived as two stimuli rather than as a single stimulus. Also called spatial threshold.

two-process model of recall the hypothesis that retrieval of a memory can involve two stages: a search that locates material in memory followed by a decision regarding whether this is the information sought. This model was proposed to explain the occurrence of higher rates of accurate memory in the recognition method than in the recall method. Also called generate-recognize model: two-process model of retrieval.

two-sample test any procedure in which data are collected on two samples and then subjected to a test for significant differences between the two samples. Compare SINGLE-SAMPLE TEST.

two-sample t test a type of T TEST in which the mean value on a variable obtained by one group is compared to the mean value obtained by another distinct group. In other words, two discrete experimental groups are evaluated against one another. By contrast, in the SINGLE-SAMPLE T TEST, the results of only one experimental group are compared to some standard of reference.

two-sided message see ONE-SIDED MESSAGE.

two-spirit n. in some Native American cultures, a person who takes on the gender identity of the opposite sex with the approval of the culture. The culture often views such individuals as having a special spiritual or guiding role in the community. In the Navajo culture, such a person is termed a nádle; in the Lakota culture, the term wíŋká is used; and in other cultures, a literal translation of “man-woman” might be used. The traditional scholarly term berdache is now used less frequently because of its negative implications of male prostitution or of a “kept” status.

two-stage memory theory a concept that information acquired by learning is stored first in an IMMEDIATE MEMORY before being transferred into a permanent memory (see LONG-TERM MEMORY; PERMAMOR). For example, a new telephone number might be retained in immediate memory at first, but with REPERTITION it eventually transfers to permanent memory. This transfer is described sometimes in the psychological terms of REHEARSAL and sometimes in the biological terms of memory CONSOLIDATION. See DUAL-STORE MODEL OF MEMORY.

two-stage sampling see MULTISTAGE SAMPLING.

two-stage stopping rule in a CLINICAL TRIAL, comparing two treatments, a strategy in which results are examined after only a fraction of the planned number of participants in each group has completed the trial (usually either half or two thirds of the patients). At this point, the test statistic is computed and the trial stopped if the difference between treatment means is significant at the SIGNIFICANCE LEVEL set for this first stage. If not, the remaining participants in each group are studied, the test statistic is recomputed, and the means compared at a significance level set for the second stage. The significance levels for the two stages should be such that they equal the overall significance level for the trial, usually .05 or .01.

two-tailed hypothesis see NONDIRECTIONAL HYPOTHESIS.

two-tailed test see NONDIRECTIONAL TEST.

two-way analysis of covariance an ANALYSIS OF COVARIANCE in which there are two INDEPENDENT VARIABLES and a COVARIATE whose effects the researcher wishes to bring under statistical control.

two-way analysis of variance an ANALYSIS OF VARIANCE that isolates the MAIN EFFECTS of two independent variables, a and b, and their INTERACTION EFFECT, a × b, on a dependent variable. Also called two-factor analysis of variance.

two-way design a type of FACTORIAL DESIGN in which two INDEPENDENT VARIABLES are manipulated. Also called two-factor design.

two-way factorial design see TWO-BY-TWO FACTORIAL DESIGN.

two-way interaction in a TWO-WAY ANALYSIS OF VARIANCE, the joint effect of both independent variables, a and b, on a dependent variable. A STATISTICALLY SIGNIFICANT two-way interaction indicates that there are differences in the influence of each independent variable at their different levels (e.g., the effect of a₁ on y is different from the effect of a₁ on y₁). See also HIGHER ORDER INTERACTION.

two-way table a table in which the joint FREQUENCY DISTRIBUTION of two INDEPENDENT VARIABLES is arrayed. See also TWO-BY-TWO TABLE.

two-word stage the developmental period, between approximately 18 and 24 months of age, during which children use two words at a time when speaking (e.g., dog bone, mama cup). See PIVOT GRAMMAR; TELEGRAPHIC SPEECH.

Tylenol n. a trade name for ACETAMINOPHEN.

tympanic cavity see MIDDLE EAR.

tympanic membrane a conically shaped membrane that separates the external ear from the middle ear and serves to transform the pressure waves of sounds into mechanical vibration of the OSSICLES. The first ossicle (malleus) is attached to the inner surface of the tympanic membrane. Also called eardrum.

tympanic reflex see TENSOR TYPANIC.

tympanometry n. the measurement of the mobility of the tympanic membrane. It is used in the diagnosis of CONDUCTION DEAFNESS. —tympanometric adj.

tympanoplasty n. surgery to repair the eardrum or the bones of the middle ear.

Type A personality a personality pattern characterized by chronic competitiveness, high levels of ACHIEVEMENT
Type T personality

Type I error the error of rejecting the NULL HYPOTHESIS when it is in fact true. Investigators make this error when they believe they have detected an effect or a relationship that does not actually exist. The projected probability of committing a Type I error is called the SIGNIFICANCE LEVEL or alpha (α) level. Also called alpha error: rejection error.

Type II error the error of failing to reject the NULL HYPOTHESIS when it is in fact not true. Investigators make this error if they conclude that a particular effect or relationship does not exist when in fact it does. The probability of committing a Type II error is called the beta (β) level of a test. Conversely, the probability of not committing a Type II error (i.e., of detecting a genuinely significant difference between samples) is called the POWER of the test, where power = 1 − β. Also called beta error.

Type III error 1. the error that occurs when there is a discrepancy between the research focus and the hypothesis actually tested. For example, a Type III error would have happened if a researcher collected data on individual differences within a sample and determined the causes of variation but the question of interest concerned differences between populations. In other words, a Type III error involves providing the right answer for the wrong question. Also called Type 0 error. 2. the error that occurs when a researcher correctly rejects the NULL HYPOTHESIS of no difference between samples but then makes an incorrect inference about the direction of the difference. Researchers investigating the direction of a relationship (e.g., “Which is more?” or “Which is better?”) will make a Type III error if they use a NONDIRECTIONAL TEST to make a directional decision. 3. in clinical tests, attributing a lack of results to the weakness of a treatment when, in fact, the problem was that the treatment was not administered properly.

type identity theory see IDENTITY THEORY.

Type R conditioning see INSTRUMENTAL CONDITIONING.

Type S conditioning see CLASSICAL CONDITIONING.

type theory any hypothetical proposition or principle for the grouping of people by kind of personality or by personality characteristics. One of the earliest is the HUMORAL THEORY, which held sway in medicine and protopsychology, to one degree or another, from about the 5th century BCE through the 17th century and the rise of empiricism. JUNGIAN TYPOLOGY offers another example of a theoretical system of personality classification.

type–token distinction in semantics and semiotics, the distinction between a general category of items having certain defining features (type) and a particular exemplar of that category (token). A token is taken to possess the essential properties of the type to which it belongs and will thus have a representative function. According to some theories, the type–token distinction plays an important role in semantic memory. [intro by Charles S. Peirce]

type–token ratio (TTR) a comparison, expressed as a ratio, of the number of types (distinct groups or categories of words) to the number of tokens (the total quantity of words) in a particular communication. The type–token ratio is used in linguistics analyses and studies to assess an individual’s verbal diversification. The greater the number of types compared with the number of tokens, the higher the index and therefore the greater the diversification.

Type T personality a personality pattern characterized by the need to seek situations that cause or increase...
arousal, stimulation, thrills, and an adrenaline rush. See SENSATION SEEKING.

**typical antipsychotic** see ANTIPSYCHOTIC.

**typicality effect** the finding that people are quicker to make category judgments about typical members of a category than they are to make such judgments about atypical members. For example, they are more quickly able to judge that a dog is a mammal than they are able to judge that a whale is a mammal.

**typical schizophrenia** see NUCLEAR SCHIZOPHRENIA.

**typing n.** 1. identifying as a type, as in SEX TYPING and GENDER TYPING. 2. representing something in terms of its common or typical characteristics. See CLASSIFICATION.

**typology n.** any analysis of a particular category of phenomena (e.g., individuals, things) into classes based on common characteristics, such as a typology of personality. —typological adj.

**tyramine n.** a BIgenic AMINE found in high concentrations in a variety of sources, including ripe cheese, broad beans, ergot, mistletoe, some wines, and many foodstuffs that are aged or produced via enzymatic action. Tyramine is derived from the amino acid tyrosine and is sympathomimetic, causing an increase in blood pressure and heart action. Foods containing tyramine react with MONOAMINE OXIDASE INHIBITORS, preventing normal metabolism of the tyramine and resulting in significantly elevated blood pressure and possibly a hypertensive crisis.

**tyrosine n.** a nonessential AMINO ACID present in most proteins. It is a precursor of the CATChOLAMINE neurotransmitters dopamine, norepinephrine, and epinephrine, which differ structurally only at one position of the molecule. Tyrosine is derived from the essential amino acid phenylalanine.

**tyrosine hydroxylase** an enzyme that catalyzes the first, and rate-limiting, step in the biosynthesis of the CATChOLAMINE neurotransmitters dopamine, norepinephrine, and epinephrine. It transforms dietary tyrosine, using the coenzyme tetrahydrobiopterin and molecular oxygen, to L-DOPA.
ultimate explanation an account or explanation for a particular behavior in terms of its adaptive value. Compare PROXIMATE EXPLANATION.

ultimate opinion testimony OPINION TESTIMONY by an expert witness that directly informs the court about the issue in dispute. For example, an expert witness who testifies that the defendant is insane is giving ultimate opinion testimony.

ultimatum game an experimental game in which one player (the proposer) makes an offer to another player (the responder) concerning a sum of money that the two must apportion between them, and the responder must then either accept or reject this offer. If the offer is rejected, neither player receives anything. Both players are fully aware of the rules and consequences of the game, which is usually played with real money provided by the experimenter. The ultimatum game is often used in studies of fairness, bargaining, and rational decision making, which typically find that if the responder deems the offer to be unfair (e.g., less than 25% of the total), he or she will reject it rather than accept anything at all. [developed in 1982 by German economists Werner Guth (1944— ), Rolf Schnitberger, and Bernd Schwarze]

Ultiva n. a trade name for remifentanil. See FENTANYL.

ultradian rhythm any periodic variation in physiological or psychological function (see BIOLOGICAL RHYTHM) recurring in a cycle of more than 24 hours, such as the human menstrual cycle. Compare CIRCADIAN RHYTHM; INFRADIAN RHYTHM.

ultrasonic communication among some nonhuman animals, the use of sound frequencies above the range of human hearing (i.e., above 20 kHz) for communication. Ultrasonic communication is commonly used by bats and dolphins, in which ECHolocation is important for navigation or finding prey. High-frequency signals do not travel very far, but, because of their short wavelength, they can provide excellent information about the location of prey and other objects in the environment. Compare INFRASONIC COMMUNICATION.

ultrasonic irradiation a form of psychosurgery in which sound waves of a frequency of 1000 kHz are directed through trephine openings in the skull for up to 14 minutes. It is an alternative to prefrontal lobotomy (see LOBOTOMY) and is rarely used now.

ultrasound n. sound whose frequency exceeds the human audibility range, often used to measure and record structures and structural change within the body in the imaging technique called ULTRASONOGRAPHY (or SONOGRAPHY). Echoes from ultrasound waves reflected from tissue surfaces are recorded to form structural images for diagnostic purposes, such as to examine a growing fetus during pregnancy or to examine internal organs, such as the heart, liver, kidneys, and gallbladder, for signs of health or disease. Compare INFRASOUND.

ultraviolet (UV) n. the portion of the electromagnetic
spectrum between 0.5 nm and 400 nm. The upper range of the ultraviolet portion of the spectrum is just below the wavelengths perceived as blue. Ultraviolet stimuli can be seen by some insects and fish because they have photopigments in their retinas that are sensitive to these wavelengths.

ululation n. a shrill lament or wailing associated with emotional expression and ritual behavior in various cultures.

umami adj. denoting the taste of foods rich in protein (e.g., meats, fish, some vegetables, cheeses), as represented by the taste of monosodium glutamate, which is used primarily to enhance other flavors. Umami is sometimes described as “savory” and is widely considered to be a PRIMARY TASTE quality, joining sweet, salty, sour, and bitter. [Japanese, “delicious”]

unbilical cord a cordlike structure containing two arteries and a vein in a cylindrical membrane that connects the fetus to the PLACENTA during pregnancy.

UMP test abbreviation for UNIFORMLY MOST POWERFUL TEST.

Umweg problem see DETOUR PROBLEM.

Unwelt n. in the thought of German philosopher Martin Heidegger (1889–1976), that aspect of DASEIN (being-in-the-world) that is constituted by a person’s engagement with the world immediately around him or her. The term was introduced into the vocabulary of psychology chiefly through the work of Swiss existential psychologist Ludwig Binswanger (1881–1966). Compare EIGENWELT; MITWELT. [German, literally: “around world”]

unaspirated sound see ASPIRATION.

unattended input any stimulus that is not a focus of attention. In DUAL-TASK PERFORMANCE tests, it is the flow of information that participants do not intend to monitor and of which they are not explicitly aware. See also DUAL-TASK COMPETITION.

unbalanced bilingual a person who speaks two languages but is more proficient in one than in the other. Compare BALANCED BILINGUAL.

unbalanced design an experimental design having multiple INDEPENDENT VARIABLES in which the number of measurements or observations obtained is different for each condition under study. Although BALANCED DESIGNS generally are preferred for their GREATER POWER in statistical analyses, unbalanced designs nonetheless may arise due to participant ATTRITION or other unavoidable factors. For example, if a researcher is investigating how sleep and diet influence academic performance and only 35 of the 40 college undergraduates recruited to participate were able to do so through the full term of the project, certain data will be missing for the five people who left the study prematurely and the design will become unbalanced.

unbiased adj. impartial or without net error. For example, in unbiased procedures, studies, and the like, any errors that do occur are random and therefore self-canceling in the long run.

unbiased estimator a quantity calculated from sample data whose value is representative of the true quantity in the larger population. In other words, when data from samples are used to make inferences about unknown quantities (parameters) in populations, an unbiased estimator is one that over repeated sampling has an average equal to the true value of the parameter in the population. For example, an unbiased estimator of variance provides an accurate index of the variability of measurements for a given phenomenon in a given population of interest based on calculations made from the SAMPLE VARIANCE. Compare BIAS ESTIMATOR.

unbiased sampling selecting individuals for a study using a process that yields a group exemplifying the larger population from which it derives. In practice, no strategy produces a completely unbiased sample but RANDOM SAMPLING yields a good approximation, as it introduces the minimum possible amount of error in representing the population. Compare BIASED SAMPLING.

uncal herniation see TRANSVENTRICAL HERNIATION.

uncertainty n. 1. the state or condition in which something (e.g., the probability of a particular outcome) is not accurately or precisely known. 2. lack of confidence or clarity in one’s ideas, decisions, or intentions. See also UNCERTAINTY PRINCIPLE. —uncertain adj.

uncertainty analysis in an experiment or study, an analysis used to assess the accuracy of measurements and model predictions, taking into account such possible sources of error as instrumentation, methodology, and the presence of CONFOUNDS.

uncertainty-arousal factor in psychological aesthetics, a response to a work of art that reflects autonomic reactions in the viewer, as opposed to cortical arousal. The factor includes simple–complex, clear–indefinite, and disorderly–orderly components, which are said to reflect subjective uncertainty. Compare CORTICAL-AROUSAL FACTOR.

uncertainty avoidance 1. the tendency of a culture to adhere to what is already known, thought, or believed. It contrasts with uncertainty orientation, which is the tendency to seek out new information and ideas and to enjoy exploring and mastering uncertainty. 2. an intolerance of ambiguity or uncertainty and a psychological need for formal rules. See also COGNITIVE STYLE; NEED FOR CLOSURE. [defined by Dutch cultural psychologist Geert Hofstede (1928–)]

uncertainty factor in psychological aesthetics, a dimension of artistic style that is associated with high positive ratings on simple–complex and clear–indefinite scales and high negative ratings on a disorderly–orderly scale.

uncertainty orientation see UNCERTAINTY AVOIDANCE.

uncertainty principle the principle, introduced by German physicist Werner Heisenberg (1901–1976), that it is impossible to measure accurately both the position and the momentum of a particle at a specific moment in time. It arises from the fact that the act of measurement will itself interfere with the system being measured in unpredictable ways. The same principle applies to other paired variables, such as energy and time. The uncertainty principle has implications for philosophy, in that it appears to undermine the laws of cause and effect. Also called Heisenberg principle: indeterminacy principle.

uncertainty reduction theory (URT) a social theory of relationship development proposing that there is a need to gain information about other people through communication (reducing uncertainty) in order to be able to predict and explain the behavior of those individuals better, developed in the early 1970s by U.S. communication theorists Charles R. Berger (1939–) and Richard J. Calabrese]
uncinate fasciculus a bundle of nerve fibers that connects the anterior and inferior portions of the FRONTAL LOBE of each cerebral hemisphere in the brain. It forms a compact bundle as the fasciculus bends around the LATERAL SULCUS and spreads into a fan shape at either end. Research suggests that it has a role in remembering proper names.

unconditional positive regard an attitude of caring, acceptance, and prizing that others express toward an individual irrespective of his or her behavior and without regard to the others’ personal standards. Unconditional positive regard is considered conducive to the individual’s self-awareness, self-worth, and personality growth; it is, according to Carl ROGERS, a universal human need essential to healthy development. The concept is the centerpiece of Rogers’s CLIENT-CENTERED THERAPY and is also emphasized in many other therapeutic approaches. Compare CONDITIONAL POSITIVE REGARD.

unconditioned reflex see UNCONDITIONED RESPONSE.

unconditioned reinforcement see PRIMARY REINFORCEMENT.

unconditioned reinforcer see NATURAL REINFORCER; PRIMARY REINFORCEMENT.

unconditioned response (UCR; UR) the unlearned response to a stimulus. In other words, it is any original response that occurs naturally and in the absence of conditioning (e.g., salivation in response to the presentation of food). The unconditioned response is a REFLEX that serves as the basis for establishment of the CONDITIONED RESPONSE in CLASSICAL CONDITIONING. Also called unconditioned reflex.

unconditioned stimulus (UCS; US) a stimulus that elicits an UNCONDITIONED RESPONSE, as in withdrawal from a hot radiator, contraction of the pupil on exposure to light, or salivation when food is in the mouth. Also called unconditional stimulus. Compare CONDITIONED STIMULUS.

unconditioned stimulus devaluation (US devaluation) the deliberate lessening of the appeal of an UNCONDITIONED STIMULUS, either by allowing the organism access to the stimulus until satiation is achieved or through AVERTION CONDITIONING.

unconditioned stimulus preexposure effect (US preexposure effect) the result of a subject’s exposure to and familiarization with an UNCONDITIONED STIMULUS before the beginning of a conditioning trial. Familiarization slows the development of a conditioned response to the unconditioned stimulus. Compare LATENT INHIBITION.

unconscious (Ucs) 1. n. in psychoanalytic theory, the region of the psyche containing memories, emotional conflicts, wishes, and repressed impulses that are not directly accessible to awareness but that have dynamic effects on thought and behavior. Sigmund FREUD sometimes used the term dynamic unconscious to distinguish this concept from that which is descriptively unconscious but “static” and with little psychological significance. Compare CONSCIOUS; PRECONSCIOUS; SUBCONSCIOUS. See also COLLECTIVE UNCONSCIOUS; PERSONAL UNCONSCIOUS. 2. adj, relating to or marked by absence of awareness or consciousness. Psychologists prefer increasingly to use the term NONCONSCIOUS in this sense, to avoid confusion with the psychoanalytic unconscious. —unconsciousness n.

unconscious cognition cognitive processes, such as thinking, memory processing, and linguistic processing, that are not ordinarily reportable. See COGNITIVE UNCONSCIOUS.

unconscious context processes and structures that shape awareness without themselves being explicitly conscious; for example, beliefs or memories that are taken for granted.

unconscious homosexuality see LATENT HOMOSEXUALITY.

unconscious inference theory the hypothesis that perception is indirectly influenced by inferences about current sensory input that make use of the perceiver’s knowledge of the world and prior experience with similar input. For example, consider two trees of the same height but different distances from the perceiver. The images of the trees that appear on the retina are of different sizes, but the knowledge that one tree is farther away than the other leads the perceiver to infer, without conscious effort, that in actuality the two trees are the same size. [proposed by Hermann von HELMHOLTZ]

unconscious intention a goal that one has not explicitly chosen to pursue or a motivational structure of which one is unaware but that nonetheless influences one’s thought and behavior. Compare CONSCIOUS INTENTION.

unconscious knowledge see TACT KNOWLEDGE.

unconscious learning the acquisition of TACT KNOWLEDGE. See IMPLICIT LEARNING.

unconscious motivation in psychoanalytic theory, wishes, impulses, aims, and drives of which the self is not aware. Examples of behavior produced by unconscious motivation are purposive accidents, slips of the tongue, and dreams that express unfulfilled wishes. See also PARAPRAXIS; PHANTASY.

unconscious perception perception of a stimulus that is below the level of explicit awareness. See SUBLIMAL PERCEPTION. See also PREATTENTIVE PROCESSING.

unconscious plagiarism see CRYPTOMNESIA.

unconscious process 1. in psychoanalytic theory, a psychical process that takes place in the UNCONSCIOUS; for example, REPRESION. 2. in cognitive psychology, a mental process that occurs without a person being explicitly aware of it and that is largely outside of conscious control. Also called subliminal process. Compare CONSCIOUS PROCESS. See also PREATTENTIVE PROCESSING.

unconscious resistance in psychoanalytic theory, RESISTANCE proper, as opposed to CONSCIOUS RESISTANCE.

unconscious transfer a memory distortion that results from confusing the source of the information recalled (see SOURCE CONFUSION). In legal contexts, for example, a witness may mistakenly recognize an individual in a lineup as the perpetrator, when in fact the individual’s face is familiar because it was earlier presented in a photograph. Also called unconscious transference.

uncontrollable turnover see TURNOVER.

uncontrolled variable a characteristic factor that is not regulated or measured by the investigator during an experiment or study; so that it is not the same for all participants in the research. For example, if the investigator collects data on participants with varying levels of education, then education is an uncontrolled variable. If the investigator, however, were to collect data only on participants with
unconventional therapy

college degrees, then education would be identical for all individuals and thus serve as a CONTROL VARIABLE.

unconventional therapy treatment that may be unique, controversial, or both, in that it is not traditionally accepted by the health care professions. See COMPLEMENTARY AND ALTERNATIVE MEDICINE.

uncovering n. in psychotherapy, the process of peeling away an individual’s defenses and passing beyond a focus on symptoms to get to the underlying roots of a problem. Uncovering techniques are used particularly in psychoanalysis and other psychodynamic or depth therapies.

uncriticalness n. a nonjudgmental attitude on the part of the therapist, which is considered essential in Carl Rogers’s nondirective approach (see CLIENT-CENTERED THERAPY) as well as in other forms of psychotherapy. Criticism is held to inhibit clients’ efforts to recognize and revise their self-defeating patterns of thought and behavior.

uncrossed disparity the BINOCULAR DISPARITY produced by images that lie beyond the HOROPTER in visual space. Uncrossed disparity causes the images on both retinas to move nasally relative to the location of images of objects on the horopter, whereas crossed disparity does the opposite. Objects closer than the horopter will move temporally on both retinas, compared to objects on the horopter. See also DEPTH CUE.

uncued panic attack a PANIC ATTACK that occurs unexpectedly rather than being brought on by a specific situation or trigger. It is therefore perceived to have occurred spontaneously. Also called unexpected panic attack. Compare CUED PANIC ATTACK; SITUATIONALLY PREDISPOSED PANIC ATTACK.

uncus n. a hook-shaped part of the rhinal sulcus (cleft) of the hippocampal formation in the RHINENCEPHALON. The LATERAL OLFACTORY TRACT makes connections with the uncus.

underachiever n. a person who consistently achieves below his or her demonstrated capacity. Underachievement may be specific to an area of study or work, or it may be general. It is more prevalent among boys than girls and is quite common in bright and even gifted children. It is also prevalent among average students and children with SPECIAL NEEDS. Compare OVERACHIEVER.

underage adj. see OVERAGE.

underclass n. 1. a SOCIAL CLASS existing beneath the usual socioeconomic scale, often concentrated in the inner cities and usually characterized by poverty, inadequate educational or vocational opportunities, high unemployment or chronic underemployment, violent crime, substance abuse, poor social services, and few community-supporting institutions. 2. broadly, any group without equal or direct access to the economic, educational, legal, medical, or other provisions of a society. For example, the term genetic underclass has been used to identify those who are classified as susceptible to a particular disease following genetic testing and who may as a result encounter discrimination by insurance companies or employers.

underconfidence n. a cognitive bias characterized by an underestimation of one’s ability to perform a task successfully or by an underrating of one’s performance relative to that of others. Compare OVERCONFIDENCE.

underconfidence-with-practice effect in investigations of JUDGMENTS OF LEARNING, the finding that after showing slight overconfidence at a learning task on first exposure (e.g., studying a list of paired associates) participants markedly underestimate their memory performance of the same task during subsequent tries. [identified by Israeli cognitive psychologists Asher Koriat, Limor Sheller, and Hilit Ma’ayan]

underdog n. the rationalizations and self-justifications employed by an individual to allay the sense of guilt or shame arising from an inability to meet the demands of internal moral standards or other rules of conduct (the TOP-DOG). [first described by German-born U.S. psychiatrist Frederick (Fritz) S. Perls (1893–1970)]

underextension n. the incorrect restriction of the use of a word, which is a mistake commonly made by young children acquiring language. For example, a child may believe that the label dog applies only to Fido, the family pet. Compare OVEREXTENSION.

underidentification n. a situation, such as may occur during STRUCTURAL EQUATION MODELING, in which it is not possible to estimate all of the model’s parameters on the basis of the sample data being analyzed. Compare OVERIDENTIFICATION.

underintensity n. a state in which one or all of the following are below the optimal level: arousal, commitment, effort, assertiveness, and attentional focus.

underload n. the situation in which a low level of task demand creates distress in forms such as boredom and fatigue. Compare OVERLOAD.

underlying distribution the THEORETICAL DISTRIBUTION for a given population of interest.

undermatching see MATCHING LAW.

underpayment inequity in industrial and organizational settings, an employee’s perception that he or she is being paid less than is fair, especially in comparison to coworkers. This can lead to dissatisfaction and tension and, in some cases, to lowered productivity. Compare OVERPAYMENT INEQUITY. See EQUITY THEORY.

undershoot n. the portion of an ACTION POTENTIAL that represents the stage when the membrane potential is transiently hyperpolarized relative to the resting potential. Compare OVERSHEOOT.

understaffing n. the condition in which the number of people available for a program or function falls below that required to maintain it. Compare OVERSTAFFING.

understanding n. 1. the process of gaining insight about oneself or others or of comprehending the meaning or significance of something, such as a word, concept, argument, or event. See also APPREHENSION; COMPREHENSION. 2. in counseling and psychotherapy, the process of discerning the connections between a client’s behavior and his or her environment, history, aptitudes, motivation, ideas, feelings, relationships, and modes of expression. 3. in some philosophical writings, the faculty of organizing and interpreting the information acquired from the senses, as opposed to the NOUS or higher reason. See also DIANOIA.

understand vb.

undescended testicle see CRYPTORCHIDISM.

undifferentiated schizophrenia in DSM–IV–TR, a subtype of SCHIZOPHRENIA in which the individual exhibits prominent psychotic features, such as delusions, hallucina-
tions, disorganized thinking, or grossly disorganized behavior, but does not meet the criteria for any of the other subtypes of the disorder. This subtype has been eliminated from DSM–5.

**undifferentiated somatoform disorder** in DSM–IV–TR, a SOMATOFORM DISORDER in which one or more physical complaints persist for 6 months or longer and cannot be explained by a known medical condition. Unlike FACTITIOUS DISORDER or MALINGERING, these symptoms are not intentionally feigned or produced. This disorder has been eliminated from DSM–5.

**undue hardship** a circumstance under which an employer may refuse an employee’s request for REASONABLE ACCOMMODATIONS under the AMERICANS WITH DISABILITIES ACT. Undue hardship includes accommodations that cause excessive financial burden to the business, compromise workplace safety, significantly decrease workplace efficiency, infringe on the rights of other employees, or require other employees to bear more than their share of potentially hazardous or burdensome work.

**undulatio reflexa** reflexive action (Latin): the term used by René DESCARTES to explain bodily movements that are not under volitional control but instead occur as a response to the surrounding environment. The concept arose from Descartes’s notion of the body as a machine that is wholly distinct from the mind (see CARTESIAN DUALISM). It served as a foundation for later psychological theories that took the reflex arc as the basic unit, as well as the basic model, of behavior.

**unexpected panic attack** see UNCIED PANIC ATTACK.

**unexplained variance** see ERROR VARIANCE.

**unfair labor practices** practices by a labor union or employer that are defined as unfair according to the LABOR MANAGEMENT RELATIONS ACT and subsequent amendments. These include the enforcement of CLOSED SHOPS and the use of secondary boycotts and secondary picketing to further a labor dispute.

**unfalsifiable** adj. denoting the quality of a proposition, hypothesis, or theory such that no empirical test can establish that it is false. For Austrian-born British philosopher Karl Popper (1902–1994), a theory or hypothesis that is unfalsifiable is to be judged nonscientific. See FALSIFIABILITY; FALSIFICATIONISM; RISKY PREDICTION.

**unfinished business** in therapy and counseling, the personal experiences that have been blocked or tasks that have been avoided because of feared emotional or interpersonal effects. Many therapists believe that people have an urge to complete unfinished business in order to achieve satisfaction and peace. Those working with the dying and their families believe that dealing with unfinished business is an important aspect of the dying and grieving processes.

**unfinished story** a PROJECTIVE TECHNIQUE in which participants are required to complete a story by role play, discussion, or writing. It is intended to reveal information about the participants’ concerns.

**unfitness** n. 1. the state or condition of lacking physical or mental fitness or health, 2. in biology, the inability of an organism to produce viable offspring in a given environment. Compare FITNESS.

**unfolding** n. a unidimensional SCALING procedure in which respondents evaluate a set of items and their choices are used to construct a continuum along which their relative preferences are placed. For example, consider a scale measuring attitudes toward marijuana sales. A person who wholeheartedly favors the item “The city should legalize the sale of marijuana” would be located at a different point along the continuum from a person who completely opposes the sale of marijuana, and a person who endorses the item to some extent would be located at yet another point along the continuum.

**unidimensionality** n. the quality of measuring a single construct, trait, or other attribute. For example, a unidimensional personality scale, attitude scale, or other scale would contain items related only to the respective concept of interest. Compare MULTIDIMENSIONALITY. See also BIPOLARITY. —unidimensional adj.

**unified positivism** an approach to the problem of the fragmentation of psychology that seeks to unify the field by emphasizing scientific work that integrates disparate findings and thus draws theories and models together. It derives its inspiration from one of the basic assumptions of LOGICAL POSITIVISM: that all science could be unified, on the model of physics, through a strict empiricist approach. See also UNITY OF SCIENCE. [introduced by U.S. psychologist Arthur Staats (1924– )]

**unified theory of cognition** any theory that attempts to provide a single architecture for explaining all cognitive activity, whether in human or nonhuman animals or in artificial intelligence. An example is the SOAR model, proposed by U.S. cognitive and computer scientist Allen Newell (1927–1992).

**Unified Tri-Service Cognitive Performance Assessment Battery** (UTCPAB) a battery of assessment tests compiled in 1984 by a group of experimental research psychologists. It presents computerized, clinically relevant psychomotor and neuropsychological tests for the rapid assessment of the integrity of the nervous system.

**Uniform Crime Reports** a nationwide database of reported crimes that contains information from all local and state law enforcement agencies within the United States. Its purpose is to set a consistent and reliable measure of criminal activity.

**uniform distribution** a theoretical CONTINUOUS DISTRIBUTION in which the probability of occurrence is the same for all values of $x$, represented by $f(x) = 1/(b - a)$, where $a$ is the lower limit of the distribution and $b$ is its upper limit. For example, if a fair die is thrown, the probability of obtaining any one of the six possible outcomes is $1/6$. Since all outcomes are equally probable, the distribution is uniform. If a uniform distribution is divided into equally spaced intervals, there will be an equal number of members of the population in each interval. Also called rectangular distribution.

**Uniform Guidelines for Employee Selection Procedures** a formal set of guidelines developed by the EQUAL EMPLOYMENT OPPORTUNITY COMMISSION that provide employers with advice on how they can comply with civil rights legislation in the hiring of employees. See FOUR-FIFTHS RULE.

**uniformly most powerful test** (UMP test) a statistical test of one hypothesis against another that has the greatest POWER among all tests available at a given ALPHA value. Suppose the two hypotheses are the NULL HYPOTHESIS of no difference between two groups (Sample 1 mean $\neq$ Sample 2 mean) and the ALTERNATIVE HYPOTHESIS of some difference between the groups (Sample 1 mean $=$ Sample 2 mean).
unilateral

mean). Because the latter is actually a composite of several possibilities, a UMP test is one defined by a CRITICAL REGION that is best suited to test the null hypothesis against each of the simple hypotheses comprising the larger alternative hypothesis.

unilateral adj. denoting or relating to one side (e.g., of the body or an organ) or to one of two or more parties.

unilaterally adv.

unilateral couple counseling the counseling of one partner on his or her relationship to the other. Even when only one partner participates in counseling, the focus is on the partners’ relationship. See also COUPLES COUNSELING.

unilateral lesion a lesion on one side or lobe of an organ or part. For example, a unilateral cerebral lesion involves one cerebral hemisphere, left or right, with effects that may vary according to the dominance of the hemisphere and the function affected. The motor and sensory effects of the lesion are generally on the contralateral side—that is, on the side opposite to that of the lesion—unless the lesion occurs in the cerebellum.

unilateral neglect a disorder resulting from damage to the PARietAL LOBE of the brain and characterized by a loss of conscious perception of objects or stimuli on the side of the body (usually the left half) that is opposite the location of the lesion. For example, if approached from the left side, an individual with unilateral neglect may not notice the approaching person, but would respond normally when approached from the right side. The disorder may be accompanied by ALIEN LIMB SYNDROME and other striking neuropsychological features. Also called hemineglect: hemispatial neglect: spatial neglect. See also MOTOR NEGLECT; SENSORY NEGLECT; VISUAL NEGLECT.

unilateral descent in anthropology, a system of descent or inheritance in which descent is traced through the male line only (Patriarchy) or through the female line only (Matrarchy). Also called unilinear descent. Compare bilateral descent. See also DESCENT GROUP.

unilateral rating scale a type of instrument that prompts a respondent to evaluate the degree to which a single quality or attribute is present. For example, consider a scale with the following anchors or benchmarks: (1) not at all satisfied, (2) slightly satisfied, (3) moderately satisfied, (4) very satisfied, and (5) completely satisfied. Because there is no anchor that represents the opposing quality of dissatisfaction, the scale has one pole. Also called unipolar scale. Compare bipolar rating scale.

unipolar stimulation electrical stimulation in which one electrode is placed on or in the tissue and the other is outside the tissue.

unique hue see BINARY HUE.

uniqueness n. in FACTOR ANALYSIS, that part of the variance of a variable that it does not share with any other variable in the system. It is given as 1 – h², where h² is the COMMUNALITY of the jth variable. Each of the observed variables in the data set being analyzed can be expressed as a combination of a common factor shared among all variables plus a unique factor associated with a measurement error or another specific, individual source of variation.

unique trait see IDIOPHAGIC.

unipolar disorder persistent or pervasive depression that does not involve a MANIC EPISODE, a HYPPOMANIC EPISODE, or a MIXED EPISODE. As such, it contrasts with BIPOLAR DISORDER. The term is sometimes used synonymously with MAJOR DEPRESSIVE DISORDER. Also called unipolar depression.

unipolar mania a disorder in which only excitement, overactivity, and similar euphoric symptoms are seen. This is a rare condition, as such MANIC EPISODES tend eventually to be followed by one or more MAJOR DEPRESSIVE EPISODES.

unipolar neuron a neuron that has only a single extension of the cell body. This extension divides into two branches, oriented in opposite directions and representing the axon. One end is the receptive pole, and the other is the output zone. Unipolar neurons transmit touch information from the body surface to the spinal cord. Also called monopolar neuron. Compare bipolar neuron; MULTIPOLAR NEURON.

unipolar mania a disorder in which only excitement, overactivity, and similar euphoric symptoms are seen. This is a rare condition, as such MANIC EPISODES tend eventually to be followed by one or more MAJOR DEPRESSIVE EPISODES.

unipolar neuron a neuron that has only a single extension of the cell body. This extension divides into two branches, oriented in opposite directions and representing the axon. One end is the receptive pole, and the other is the output zone. Unipolar neurons transmit touch information from the body surface to the spinal cord. Also called monopolar neuron. Compare bipolar neuron; MULTIPOLAR NEURON.

unipolar mania a disorder in which only excitement, overactivity, and similar euphoric symptoms are seen. This is a rare condition, as such MANIC EPISODES tend eventually to be followed by one or more MAJOR DEPRESSIVE EPISODES.
division troops in cohort units. It was designed to build unit cohesion, reduce personnel turbulence, and enhance readiness and performance.

**unit normal distribution** see STANDARDIZED DISTRIBUTION.

**unit normal variable** see STANDARD NORMAL VARIABLE.

**unit of analysis** in research, the group of people, things, or entities that is being investigated or studied. For example, in organizational contexts, data can be collected from employees, who in turn are part of departments, which in turn are part of the larger organization, which may have multiple sites in several countries. The unit of analysis chosen influences the methodological and analytical procedures used. For example, studying groups within organizations may require a HIERARCHICALLY NESTED DESIGN. Also called analysis unit.

**unit schedule** see SECOND-ORDER SCHEDULE.

**unity** n. in statistics, a synonym for the value of 1. Statisticians often state that the statistic or value they are working with “approaches unity,” which means it approaches the value of 1.

**unity in variety** the concept that a stimulus with maximal unity and maximal variety is preferred.

**unity of command** a principle of management stating that each employee should have to report to one and only one immediate boss. See LINE MANAGEMENT. Compare MATRIX ORGANIZATION. [proposed by French engineer Henri Fayol (1841–1925) and other classical management theorists]

**unity of consciousness** the concept that at any given moment the contents of consciousness are experienced as a single integrated state, even though they will consist of a multiplicity of perceptions, thoughts, feelings, and so forth. For example, a person may be looking out the window while at the same time listening to jazz, eating chocolate, experiencing a mild pain in the knee, and remembering an earlier conversation, yet these phenomena will be experienced as unified with one another in a single moment of consciousness. See also COCONSCIOUSNESS; DIVIDED CONSCIOUSNESS.

**unity of science** the view that the principles of any and all sciences can be derived from or reduced to the laws of physics. See CONSCIENCE; UNIFIED POSITIVISM.

**univariate adj**. characterized by a single variable. For example, a researcher may collect univariate data by recording how many hours a day students in a particular course spend outside of class on completing their homework. Compare BIVARIATE; MULTIVARIATE.

**univariate analysis** a statistical examination of data for only one variable of interest. For example, a univariate analysis of study habits for a sample of college students would examine habits across all individuals without taking into account whether a particular student was a freshman, sophomore, junior, or senior. Also called univariate statistics. Compare MULTIVARIATE ANALYSIS.

**univariate distribution** a distribution of values on a single RANDOM VARIABLE according to their observed or expected frequency. If this is a NORMAL DISTRIBUTION it is known as a univariate normal distribution. Compare MULTIVARIATE DISTRIBUTION.

**univariate research** research that employs only one DEPENDENT VARIABLE. Compare MULTIVARIATE RESEARCH.

**universal** n. 1. in social psychology; see PSYCHOLOGICAL UNIVERSAL. See also UNIVERSALS. 2. in linguistics, see LANGUAGE UNIVERSAL.

**universal design** a quality of a product or built environment conceived to make it optimally usable and comfortable for people of all ages and abilities. Universal design as a concept goes beyond mere accessibility and removal of barriers, in accordance with the mandates of laws such as the AMERICANS WITH DISABILITIES ACT, by emphasizing the inclusiveness of design to accommodate a wide range of physical and cognitive abilities. Also called TRANSCENDENTAL DESIGN. See also BARRIER-FREE ENVIRONMENT. Compare DESIGN FOR ADJUSTABLE RANGE; DESIGN FOR THE AVERAGE.

**universal grammar** (UG) a theoretical linguistic construct positing the existence of a set of rules or grammatical principles that are innate in human beings and underlie most natural languages. The concept is of considerable interest to psycholinguists who study LANGUAGE ACQUISITION and the formation of valid sentences. Research shows that BROCA’S AREA in the brain is selectively activated by languages that meet the criteria for universal grammar.

**universalism** n. the position that certain aspects of the human mind, human behavior, and human morality are universal and essential and are therefore to be found in all cultures and historical periods. Universalism is thus a form of ESSENTIALISM and is opposed to RELATIVISM. —universalist adj.

**universality** n. the condition of existing everywhere, often in a very similar or identical form. In psychology, universalism is defined more specifically: 1. the tendency to assume that one’s personal qualities and characteristics, including attitudes and values, are common in the general social group or culture. 2. in mob and crowd settings, the tendency for individuals to assume that atypical, unusual behaviors are allowable because many others in the situation are performing such actions (“everybody’s doing it”). See COLLECTIVE BEHAVIOR; SOCIAL CONTAGION; EMERGENT-NORM THEORY. 3. in self-help and psychotherapy groups, a curative factor fostered by members’ recognition that their problems and difficulties are not unique to them but instead are experienced by many of the group members. See also THERAPEUTIC FACTORS.

**universality of emotions** the finding that certain emotional expressions, appraisals, and manifestations are the same or highly similar across cultures and societies. Compare CULTURAL SPECIFICITY OF EMOTIONS. See also PRIMARY EMOTION.

**universalizability** n. in ethics, the principle that particular moral judgments always carry an implied universal judgment. So, for example, to say Daphne shouldn’t have lied to him implies the universal judgment that anybody in the identical situation to Daphne should not have lied. The principle of universalizability is related to that of the CATEGORICAL IMPERATIVE. —universalizable adj.

**universals** pl. n. in philosophy, general qualities, such as blueness or courage, as opposed to the particulars that instantiate them. The status of universals and their relationship to particulars have been a matter of much debate in philosophy. See also ABSTRACT IDEA; PSYCHOLOGICAL UNIVERSAL.
universe

universe n. In statistics, see POPULATION.

universe of discourse 1. The total system of ideas, concepts, terms, and expressions within which a given topic can be analyzed and understood. The universe of discourse defines both what can be said about a subject and how it can be said. Statements that are meaningful within a particular universe of discourse may well be nonsensical within another; to say **The sad skies are weeping**, for example, might be permissible in poetry but would not be so in meteorology. The idea of universes of discourse has also been explored by radical thinkers in the traditions of MARXISM, FEMINISM, and POSTSTRUCTURALISM; such critics argue that by controlling the universe of discourse in a particular society, the power elite controls what can and cannot be said or thought. 2. In the field of artificial intelligence, any set of objects that can be represented within a given domain.

University of Pennsylvania Smell Identification Test (UPSIT) see SMELL IDENTIFICATION TEST.

unlearning n. see DECONDITIONING.

unmyelinated adj. Describing a nerve fiber that lacks a MYELIN SHEATH, such as a C FIBER.

unnumbered graphic rating scale see VISUAL ANALOGUE SCALE.

unobtrusive measure a measure obtained without disturbing the participant or alerting him or her that a measurement is being made. For example, a researcher may observe passersby in a public park from a nearby café and document their activities. The behavior or responses of such participants are thus assumed to be unaffected by the investigative process or the surrounding environment. Also called concealed measure: nonreactive measure. Compare REACTIVE MEASURE.

unplanned comparison see POST HOC COMPARISON.

unpleasantness n. An emotional state that is experienced when an event is incongruent with one’s goals or is associated with pain. See also DIMENSIONAL THEORY OF EMOTION, unpleasant adj.

unpleasure n. In classical psychoanalytic theory, the psychic pain, tension, and ego suffering that is consciously felt when instinctual needs and wishes, such as hunger and sex, are blocked by the ego and denied gratification. [translation of German Unlust, “reluctance” or “listlessness”]

unprepared learning see PREPAREDNESS.

unresolved adj. 1. In psychotherapy, denoting emotional or psychic conflicts not yet sufficiently dealt with and assimilated or understood. See also UNFINISHED BUSINESS. 2. Describing any stimulus whose characteristics cannot be determined by the perceiver.

unrestricted model see FULL MODEL.

unsaturated model see SATURATED MODEL.

unshared environment see NONSHARED ENVIRONMENT.

unsociable adj. Lacking sociability because of a disinclination to interact and form relationships with others.

unspecified mental retardation the diagnosis made when an individual is presumed to have MENTAL RETARDATION but is too severely impaired or uncooperative to be evaluated through the use of standard intelligence tests and adaptive behavior measures. The DSM–IV–TR designation is MENTAL RETARDATION, SEVERITY UNSPECIFIED. In DSM–5, the term is UNSPECIFIED INTELLECTUAL DISABILITY.

unstandardized score see RAW SCORE.

unstructured adj. Denoting an object, situation, or set of ideas that does not have a definite pattern or organization.

unstructured autobiography see AUTOBIOGRAPHY.

unstructured interview an interview that is highly flexible in terms of the questions asked, the kinds of responses sought, and the ways in which the answers are evaluated across interviewers or across interviewees. For example, a human resource staff member conducting an unstructured interview with a candidate for employment may ask open-ended questions so as to allow the spontaneity of the discussion to reveal more of the applicant’s traits, interests, priorities, and interpersonal and verbal skills than a standard predetermined question set would. Also called nondirective interview. Compare PATTERNS INTERVIEW; STRUCTURED INTERVIEW.

unstructured stimulus a vague, poorly organized, and not clearly identifiable stimulus, such as an inkblot in the RORSCHACH INKBLOT TEST. The perception of unstructured stimuli is often thought to be influenced more by the characteristics of the perceiver than by those of the stimulus. Compare STRUCTURED STIMULUS.

unsystematic variance the haphazard or random fluctuation of data for individuals over time. It is one of two types of variance identified in research, the other being systematic variance arising from the effects of the INDEPENDENT VARIABLES studied.

unthought known in OBJECT RELATIONS THEORY, a preverbal awareness of one’s early experiences of important objects (e.g., parents, siblings) that is indescribable in words but that nonetheless influences one’s later thought and behavior. [coined in 1987 by British psychoanalyst Christopher Bollas]

Unusual Uses Test a test that measures DIVERGENT-THINKING ability. In this test, participants are asked to think of unusual uses for common objects, such as a paper clip. The number and novelty of unusual responses contribute to the overall score. [devised by Joy Paul Guilford]

unvoiced adj. Denoting speech sounds that are articulated through breath, without vibration of the vocal cords. The unvoiced (or voiceless) sounds comprise some consonants (e.g., [p], [t], and [f]). Compare VOICED. See BINARY FEATURE.

unweighted means analysis in ANALYSIS OF VARIANCE, a strategy for handling missing data in which the actual sample size in each of the different conditions or levels of the INDEPENDENT VARIABLE is replaced by the average sample size. When participants become ill, withdraw, or otherwise fail to complete a research study, there are no longer equal numbers of cases in each experimental condition. An unweighted means analysis takes this inequality into account by applying an adjusted sample size value across all conditions, thus ensuring that data from all experimental groups contribute equally to the determination of treatment effects. Also called unweighted means procedure.

up-and-down method a strategy in which the administration of a stimulus event or item depends on a partici-
pant’s response to the previous item. The up-and-down method employs fixed, discrete levels and sequential transition rules of moving one level up, moving one level down, or remaining at the current level. **COMPUTER ADAPTIVE TESTING** is an example.

**upper** n. slang for any of various drugs that stimulate the central nervous system, such as amphetamine and methamphetamine. See CNS STIMULANT.

**upper hinge** the point in a distribution of values above which one fourth of the data and below which lie the other three fourths of the data. It is equivalent to the third QUARTILE. Compare LOWER HINGE.

**upper motor neuron** see MOTOR NEURON.

**upper quartile** see QUARTILE.

**upper real limit** see REAL LIMIT.

**upper threshold** the maximum intensity of a stimulus that can be perceived without pain.

**up-regulation** n. the formation of additional RECEPTOR molecules by target cells in response to increased levels of hormones. Compare DOWN-REGULATION.

**UPSIT** abbreviation for University of Pennsylvania SMELL IDENTIFICATION TEST.

**up through** a technique for testing CLAIRVOYANCE in which the participant is asked to state the order of a stacked deck of ZENER CARDS from bottom to top. Compare DOWN THROUGH. See also BASIC TECHNIQUE.

**upward appraisal** in organizations, the evaluation of those in supervisory positions by their subordinates.

**upward communication** written and oral messages that originate with individuals lower in the hierarchy of an organization and that flow upward to those occupying positions higher in the hierarchy. Upward communication is subject to distortions such as the mum effect, in which subordinates are unwilling to convey bad news to their superiors. The more levels in the hierarchy through which a message must pass, the more subject it is to distortion as the result of filtering at each level. Compare DOWNWARD COMMUNICATION; HORIZONTAL COMMUNICATION.

**upward grade homogenization** see GRADE INFLATION.

**upward mobility** the movement of a person or group to a higher social class. Upward mobility tends to be a feature of relatively relaxed class systems operating within expanding economies. Also called SOCIAL ASCENDANCY. See also SOCIAL MOBILITY. Compare DOWNWARD MOBILITY.

**upward Pygmalion effect** an effect in which the expectations of followers or subordinates lead to behavior on the part of the leader or superior that is consistent with these expectations. The behavior of the leader does not reflect his or her true abilities or personality traits but rather the perception of him or her by subordinates. Compare PYGMALION EFFECT. See ROLES EXPECTATIONS; SELF-FULFILLING PROPHECY.

**upward social comparison** see SOCIAL COMPARISON THEORY.

**UR** 1. abbreviation for UNCONDITIONED RESPONSE. 2. abbreviation for UTILIZATION REVIEW.

**ur-** combining form see URO-.

**uracil** (symbol: U) n. a pyrimidine compound in the nucleotides of living organisms. It is one of the four bases found in RNA that constitute the GENETIC CODE, the others being adenine, cytosine, and guanine. In DNA, thymine occurs instead of uracil.

**uranoschisis** n. see CLEFT PALATE.

**urban behavior** the behavior of people living in cities, who appear to be less attentive to the needs of strangers, walk faster, make less eye contact, and are exposed to more violence and aggressive behavior than their rural or suburban counterparts. The prevailing features of the urban environment—its size, density, and pace—led to the theory, proposed by Stanley Milgram, that urban behavior is characterized by adaptation to the INFORMATION OVERLOAD of city life, resulting in anonymity, powerlessness, aggression, indifference to others, and narrow self-interest among city dwellers.

**urban ecology** the study of the dynamics and organization of city life, particularly in relation to population density and the nature of the city environment. Urban ecology is based on principles derived from biology, sociology, psychology, and environmental science. See also URBANIZATION.

**urbanism** n. the way of life characteristic of cities. Urbanism has been a central area of research in sociology (most notably by the CHICAGO SCHOOL) and psychology since the early 20th century. With psychologists principally focused on the implications of urban life for mental health and social norms.

**urbanization** n. 1. the trend toward living in cities, which are defined by the United States Bureau of the Census as having populations of 50,000 or more. 2. the process of becoming a community with urban characteristics. In the early 20th century, psychological research on urbanization initially focused on the impact of urban life on mental health, purporting to find a link between inner-city residence and increased rates of mental illness; this position was later qualified (see DRIFT HYPOTHESIS). Inquiry has since expanded to investigate the psychological, physical, and behavioral consequences of the urban environment (e.g., population density, crowding, noise, pollution) and the social, economic, and cultural dimensions of city life. See also URBAN ECOLOGY. —**urbanize** vb.

**urban legend** an incredible or lurid story, often involving a mixture of horror and humor, that is widely repeated as if true (often as the experience of a “friend of a friend”) but can never be firmly documented. Urban legends differ from myths and folktales in that they nearly always have a contemporary setting and often involve modern technology (e.g., the many such tales about microwave ovens).

**Urban’s weights** see MÜLLER–URBAN WEIGHTS.

**Urecholine** n. a trade name for BETHADECYL.

**urethra** n. a membrane-lined duct that carries urine from the urinary bladder to the exterior. In males, it passes through the CORPUS SPONGIOSUM of the penis and also serves as a channel for semen at ejaculation. In females, the urethra is less than 4 cm long and leads to an opening anterior to the vaginal orifice. —**urethral** adj.

**urethral eroticism** in psychoanalytic theory, sexual pleasure derived from urination. Also called URETHRAL EROTISM. See UROLAGNIA.

**urethritis** n. inflammation of the urethra, with symptoms of painful urination (DYSURIA) and urethral dis-
urge incontinence

charge. The infection may be transmitted by sexual contact, as in cases of GONORRHEA and NONGONOCOCCAL URETHRITIS.

urge incontinence a type of URINARY INCONTINENCE involving a sudden, strong desire to urinate followed by involuntary contractions of the bladder regardless of the amount of urine in the bladder. Because the bladder actually contracts, urine is released quickly, making it difficult for people with urge incontinence to predict or control the occurrence of the problem.

urinary incontinence loss of conscious control of urination due to an organic condition, such as a neurological disorder or age-related changes in the bladder or kidneys. See STRESS INCONTINENCE; URGE INCONTINENCE. Compare ENURISIS.

urination n. the discharge of urine from the bladder, which is effected by voluntary relaxation of the SPHINCTER at the junction of the bladder and urethra and reflex contraction of the bladder wall (see MICTURITION REFLEX). Also called MICTURITION.

urn model a THOUGHT EXPERIMENT in which objects of interest (e.g., people, events) are represented as colored balls placed in an urn or other container. In imagination, the experimenter randomly removes one ball from the urn, notes its color, and places it back before repeating the process; the goal is to determine the probability of drawing one color or another. The urn model is a convenient way to calculate certain basic probabilities using CONDITIONAL PROBABILITIES.

uro- (ur-) combining form urine or the urinary system.

urogenital adj. referring to organs concerned with both excretion and reproduction. Also called urinogenital.

uroagnia n. sexual interest focused on urine and urination. This may involve watching others urinate, being urinated on during sexual activity, urinating on the partner during sexual activity, or drinking one’s own urine. Also called UROPHILIA. See also URETHRAL EROTICISM.

URT abbreviation for UNCERTAINTY REDUCTION THEORY.

urticaria n. see HIVES.

US abbreviation for UNCONDITIONED STIMULUS.

usability engineering a specialty that applies knowledge of human capabilities and limitations to the design of systems (typically human–computer systems) with the goal of ensuring ease of use. This can be achieved by enhancing such attributes as design intuitiveness, learnability, and comprehensibility. See also ENGINEERING PSYCHOLOGY; USER-CENTERED DESIGN.

usable adj. in ergonomics, describing a product or system that is designed to be easy to use with a minimum of frustration, errors, and inconvenience. —usability n.

U.S. Department of Veterans Affairs (VA) an agency of the U.S. government established in 1930 to administer the laws providing benefits and other services to veterans, their dependents, and their beneficiaries. Its mission is to serve U.S. veterans and their families with compassion; to be their principal advocate in ensuring that they receive medical care, benefits, social support, and lasting memorials; and to promote the health, welfare, and dignity of all veterans in recognition of their service to the nation.

US devaluation abbreviation for UNCONDITIONED STIMULUS DEVALUATION.

U.S. Drug Enforcement Administration (DEA) the branch of the U.S. Department of Justice responsible for enforcing the CONTROLLED SUBSTANCES ACT and other drug-related laws and regulations.

use-and-disuse theory see LAMARCKISM.

useful field of view denoting a brief computer-administered test of cognitive selective attention in the visual periphery that predicts accident risk while driving. Performance on the test typically declines with adult age but can be improved through training.

user-centered design in ergonomics, design practice with a central focus on understanding the characteristics of the target group in order to produce USEABLE products or systems. See also ENGINEERING PSYCHOLOGY; USABILITY ENGINEERING.

user-friendly adj. describing a product or system that is easy to understand or use.

U.S. Food and Drug Administration (FDA) the U.S. agency responsible for the regulation and approval of prescription and over-the-counter medications. Following clinical trials on a new agent, drug manufacturers submit to the FDA a New Drug Application that includes trial results, data analyses, and information about the drug’s mechanism of action. An FDA review team evaluates the application to ascertain whether the efficacy of the drug outweighs its side effects; the team then decides whether to approve the drug for the U.S. market. The FDA also regulates vaccines, veterinary medications, medical devices, medical and nonmedical radiation-emitting products (e.g., ultrasound equipment, microwave ovens), food, dietary supplements, cosmetics, and tobacco products.

U-shaped distribution a graphical representation of a FREQUENCY DISTRIBUTION that is shaped more or less like the letter U, with the maximum frequencies at both ends of the range of the variable. For example, the number of people infected by the flu each year may have a U-shaped distribution by age, with those who are very young or very old having the highest frequency of occurrence. In an inverted U-shaped distribution, the most frequent values are in the middle of the distribution and the least frequent values are at the extremes.

Usher syndrome a genetic disorder, inherited as an autosomal recessive trait (see RECESSIVE ALLELE), causing SENSORYNEURAL DEAFNESS, deterioration of vision due to RETINITIS PIGMENTOSA, and in some cases, loss of balance. [Charles Howard Usher (1865–1942), British ophthalmologist]

US preexposure effect abbreviation for UNCONDITIONED STIMULUS PREEXPOSURE EFFECT.

usual, customary, and reasonable fees (UCR fees) see CUSTOMARY, PREVAILING, AND REASONABLE FEES.

us-versus-them effect the tendency of individuals to view the social world in terms of an INGROUP ("us") and an OUTGROUP ("them"). Consequently, people prefer to associate with those who are similar over those who are different, preferentially allocate resources to similar others, and hold more positive beliefs about similar others.

UTCAP abbreviation for UNIFIED TRI-SERVICE COGNITIVE PERFORMANCE ASSESSMENT BATTERY.
uterine orgasm see VULVAL ORGASM.

utero- (uter-) combining form womb (uterus).

uterus n. the hollow muscular organ in female mammals in which the embryo develops from the time of IMPLANTATION until birth. It is connected to the ovaries via the FALLOPIAN TUBES and to the exterior via the vagina, into which the cervix (neck) of the uterus projects. The ENDOMETRIUM (lining) of the uterus undergoes changes during the MENSTRUAL CYCLE. Also called womb. —uterine adj.

U test see MANN–WHITNEY U TEST.

utilitarian function of an attitude the role an attitude can play in obtaining rewards, avoiding punishments, or both. For example, a person might adopt a positive attitude toward a particular product because it is effective and a negative attitude toward its chief competitor because it is ineffective. See also FUNCTIONAL APPROACH TO ATTITUDES.

utilitarianism n. an ethical theory based on the premise that the good is to be defined as that which brings the greatest amount or degree of happiness; thus, an act is considered moral if, compared to possible alternatives, it provides the greatest good for the greatest number of people. The doctrine is often reduced to the single maxim: The greatest good for the greatest number. The classical formulation of utilitarianism is that of British jurist and philosopher Jeremy Bentham (1748–1832), especially as championed by James Mill and popularized by John Stuart Mill. Utilitarianism is heavily influenced by hedonism and eudemonism; it also shares with behaviorism the notion that the fundamental motive for action is pleasure or benefit. Because it rejects the idea that actions may be intrinsically good or bad, irrespective of their consequences, and can provide no objective means of calculating the amount of happiness that derives from particular actions, utilitarianism is in practice a species of ethical relativism. Compare NATURAL LAW THEORY. —utilitarian adj.

utility n. 1. in decision making and economic theory, the subjective value of some outcome to the individual. 2. in industrial and organizational psychology, the value of an intervention or program as judged on the basis of its monetary worth to the organization. For example, there are methodologies for assessing the monetary gains achieved from using particular tests to select employees or particular training programs. 3. in biology, the usefulness of a characteristic in preserving the life of an organism or continuing the species. Both ARTIFICIAL SELECTION and NATURAL SELECTION operate to increase utility. 4. in UTILITARIANISM, the goodness of an act as determined by the amount or degree of happiness derived from it. 5. in general, the capacity of a thing to accomplish its designed purpose, as in the explanatory utility of a psychological theory.

utility standards the information requirements of those for whom an evaluation research study is carried out. These standards include identifying all STAKEHOLDERS, selecting evaluation objectives appropriate to the intended recipients of the findings, providing clear and timely reporting of information, and following procedures that maximize the study’s utilization. See also ACCURACY STANDARDS; FEASIBILITY STANDARDS; PROPRIETY STANDARDS.

utility theory in decision making, any normative theory of utility that attempts to describe rational or optimal choice behavior.

utilization deficiency the inability of individuals to improve task performance by using strategies that they have already acquired and demonstrated the ability to use because they are not spurred to do so by memory. Although historically utilization deficiency has been most frequently studied in children, current research suggests that it may occur at any age as a by-product of diminished working memory capacity. Compare MEDICATION DEFICIENCY; PRODUCTION DEFICIENCY.

utilization-focused evaluation attempts to maximize the usefulness of the results of an evaluation research study for its intended users or STAKEHOLDERS. All aspects of the design and the execution of the evaluation should be directed to this end. See also UTILITY STANDARDS; PARTICIPATORY EVALUATION.

utilization review (UR) a formal review of the necessity and quality of services provided in a hospital or clinic or by an individual provider. Conducted by a specially appointed committee, a utilization review often addresses whether the level of service provided is the most appropriate to the severity of the presenting problem. See also CONTINUED-STAY REVIEW; EXTENDED-STAY REVIEW.

utopia n. an idealized, perfect society. Coined by English statesman and author Thomas More (1478–1535) in his speculative political fiction Utopia (1516), the term is of Greek derivation (literally, “no place”). By contrast, the term dystopia, coined in about 1950, refers to an imaginary society of nightmarish conditions. —utopian adj.

utopianism n. 1. belief in the possibility of establishing an ideal social system (see UTOPIA) on the basis of rational and moral principles. 2. any idealistic approach to political or social questions that is thought to depend on an unrealistic view of human nature.

utricle n. the larger of the two VESTIBULAR SACS in the inner ear, the other being the SACCULE. Like the saccule, the utricle senses not only the position of the head with respect to gravity but also acceleration and deceleration. This is achieved by a special patch of epithelium—the MACULA—inside both the utricle and saccule. —utricular adj.

utterance n. a unit of spoken language, which may be of any length but can usually be identified by conversational turn taking or by clear breaks in the stream of speech. MEAN LENGTH OF UTTERANCE is considered an important index of language development in young children.

UV abbreviation for ULTRA-VIOLET.

uveal tract see EYE.

uvula n. 1. a fleshy appendage that hangs from the SOFT PALATE. It plays an important role as part of the apparatus for sound production of the human voice (see UVULAR). Also called palatine uvula. 2. any similarly shaped structure, such as those located in the urinary bladder and the cerebellum.

uvular 1. adj. of or relating to the UVULA. 2. n. a speech sound produced with the back of the tongue pressing against the uvula, such as the [r] sound in French.

uxoricide n. the murder of a wife by her husband.

uxorilocal adj. see MATRILOCAL.
V abbreviation for VERBAL ABILITY.

V1 VISUAL AREA 1, which in primates is coextensive with the STRIATE CORTEX (primary visual cortex). Neurons in V1 have relatively simple stimulus requirements for maximum activation, unlike the visual areas to which V1 projects, which include V2, V4, and V5. V1 is the preferred name of this cortex for discussions of the functional differences between cortical regions; striate cortex, primary visual cortex, and area 17 are the preferred names for discussions of cortical anatomy.

V2 VISUAL AREA 2, which in primates is a band of cerebral cortex located adjacent and anterior to V1. It is coextensive with Brodmann’s area 18 (see PRESTRIATE CORTEX) and receives its major input from V1.

V3 VISUAL AREA 3, which in primates is located in the PRESTRIATE CORTEX anterior to V2, from which it receives signals. It is specialized for monocromatic pattern perception. The ventral region is also referred to as area VP (ventral posterior area), whereas the dorsal region is often divided into two regions, V3a and V3b. The relationship among these three aspects of V3 is not fully understood.

V4 VISUAL AREA 4, which in primates is located in the occipitotemporal cortex. Most neurons in V4 are sensitive to wavelength, and damage to a similar area in the human brain causes cerebral achromatopsia, a form of cortical color blindness (see ACHROMATOSIS).

V5 VISUAL AREA 5, which in primates is located in the temporal cortex. Most neurons in V5 are sensitive to the rate and direction of motion of a stimulus, and damage to a similar area in the human brain causes AKINETOPSIA (motion agnosia). Also called MT (i.e., middle temporal, because V5 is located toward the back of the MIDDLE TEMPORAL GYRUS; visual area MT).

VA abbreviation for U.S. DEPARTMENT OF VETERANS AFFAIRS.

VABS abbreviation for VINELAND ADAPTIVE BEHAVIOR SCALES.

vACC abbreviation for VENTRAL ANTERIOR CINGULATE CORTEX.

vacuum activity in classical ethology, the occurrence of a FIXED ACTION PATTERN in the absence of the usual external stimulus (the RELEASER, or sign stimulus) that triggers the pattern. This is believed to be caused by a build-up of action-specific or motivational energy that overrides the INNATE RELEASING MECHANISM. Also called vacuum response. [proposed by Konrad LORENZ]

vagabond neurosis see DROMOMANIA.

vagal tone a measure of the variability of the heart rate associated with inhalation and exhalation (see RESPIRATORY SINUS ARRHYTHMIA), which is thought to reflect parasympathetic influence via the VAGUS NERVE.

vagina n. a tubelike structure in female mammals that leads from the cervix (neck) of the uterus to the exterior. The muscular walls of the vagina are lined with mucous membrane, and two pairs of VESTIBULAR GLANDS around the vaginal opening secrete a fluid that facilitates penetration by the penis during coitus. —vaginal adj.

vagina dentata in folklore, a vagina with teeth that can castrate the male partner. In the classical psychoanalytic theory of Sigmund FREUD, for women, it is a fantasy believed to stem from intense PENIS ENVY and a desire to castrate the partner as an act of revenge; for men, it is believed to stem from CASTRATION ANXIETY.

vagina envy a psychological characteristic of men who desire the ability to become pregnant and bear children. See also FEMININITY COMPLEX; WOMB ENVY.

vaginal administration see ADMINISTRATION.

vaginal orgasm 1. female orgasm achieved through vaginal stimulation. 2. in early psychoanalytic theory, the “mature, feminine” orgasm, as opposed to “immature, masculine” orgasms produced from clitoral stimulation. This view has long since been refuted. Indeed, researchers have demonstrated that the clitoris is the focus of female sexual response and that vaginal orgasms are primarily related to indirect stimulation of the clitoris and labia during intercourse. See COTITAL ANORGASMIA.

vaginal plethysmograph see PLETHYSMOGRAPHY.

vaginal sex sexual intercourse by means of vaginal penetration. See COITUS.

vaginismus n. a sexual dysfunction in which spasmodic contractions of the muscles around the vagina occur during or immediately preceding sexual intercourse, causing the latter to be painful or impossible. See also FUNCTIONAL VAGINISMUS.

vagotomy n. surgical cutting or interruption of the VAGUS NERVE, which has motor, sensory, and physiological functions.

vagus nerve the tenth CRANIAL NERVE, a mixed nerve with both sensory and motor fibers that serves many functions. The sensory fibers innervate the external ear, vocal organs, and thoracic and abdominal viscera. The motor nerves innervate the tongue, vocal organs, and—through many ganglia of the PARASYMPATHETIC NERVOUS SYSTEM—the thoracic and abdominal viscera. Also called CRANIAL NERVE X, PNEUMOGASTRIC NERVE.

VAKT abbreviation for visual, auditory, kinesthetic, and tactile (senses). See FERNALD METHOD.

valence n. 1. in the FIELD THEORY of Kurt LEWIN, the subjective value of an event, object, person, or other entity in the LIFE SPACE of the individual. An entity that attracts the individual has positive valence, whereas one that repels has negative valence. 2. in certain theories of motivation, the anticipated satisfaction of attaining a particular goal or outcome.

valence–instrumentality–expectancy theory a theory of WORK MOTIVATION holding that the level of effort exerted by employees will depend on a combination of three variables: (a) the EXPECTANCY of employees that effort will lead to success in the job, (b) the belief of employees
validating marriage a long-lasting marriage in which the partners express mutual respect even when they disagree.

validation n. the process of establishing the truth or logical cogency of something. An example is determining the accuracy of a research instrument in measuring what it is designed to measure. In some forms of psychotherapy, validation may take the form of mirroring of the client’s judgment or experience by the therapist. —validate vb.

validity n. 1. the characteristic of being founded on truth, accuracy, fact, or law. 2. the degree to which empirical evidence and theoretical rationales support the adequacy and appropriateness of conclusions drawn from some form of assessment. Validity has multiple forms, depending on the research question and on the particular type of inference being made. For example, the three major types of test validity are criterion validity, based on correlation with an accepted standard; construct validity, based on the conceptual variable underlying a test; and content validity, based on the subject matter of a test. Other forms of validity prominent in the social sciences include ecological validity, external validity, internal validity, and statistical conclusion validity. —valid adj.

validity check the process of verifying that a data set is free of errors and adheres to standard or intended rules. Performed manually or using software, a validity check may involve such things as verifying the accuracy of calculations and the legitimacy of included values (e.g., impossible values are not present), confirming that information is consistent across records, and confirming that no records are missing.

validity coefficient an index, typically a correlation coefficient, that reflects how well an assessment instrument predicts a well-accepted indicator of a given concept or criterion. For example, if a measure of criminal behavior is valid, then it should be possible to use it to predict whether a person (a) will be arrested in the future for a criminal violation, (b) is currently breaking the law, and (c) has a previous criminal record. A validity coefficient could be used to relate scores on the measure to each of these criteria and thus determine how useful the measure actually is for behavioral forecasting.

validity criterion an external concept or standard of comparison that is used to define the attribute an instrument is purported to measure and that is applied in estimating how well the measurement instrument actually fulfills its intended purpose.

validity generalization the use of meta-analysis and other statistical procedures to assess the evidence of a test’s adequacy and appropriateness in multiple situations and settings. Validity generalization typically involves correcting all of the correlations being examined for methodological and statistical limitations and flaws and providing estimates of correlations or results that would have been obtained in the absence of such limitations.

validity tag see meta-cognitive model of attitudes.

Valium n. a trade name for diazepam.

valor n. see courage.

valproic acid a carboxylic acid (also formulated as valproate sodium; U.S. trade name: Depacon) used as an anticonvulsant and mood stabilizer. Although exact mechanisms of action remain unclear, valproic acid may exert its effects by reducing membrane sodium-channel activity (see ion channel), thereby slowing neuronal activity. It may also stimulate the synthesis of the inhibitory neurotransmitter gamma-aminobutyric acid (GABA). Valproic acid and valproate sodium are officially approved by the U.S. Food and Drug Administration for the management of seizures and of manic episodes associated with bipolar disorders. Although in general less toxic than lithium, these drugs have been associated with fatalities due to liver failure, particularly in children under 2 years of age, as well as pancreatitis; serum monitoring of drug levels and liver function is therefore required, particularly on starting treatment. Valproic acid and valproate sodium should not be taken during pregnancy due to risks of neural tube defects in the fetus; fetal exposure to valproic acid in the first trimester has also been linked to an increased risk of autism. U.S. trade name: Depakene.

VALS n. Values, Attitudes, and Lifestyles: a proprietary method of segmenting consumers according to their personal characteristics. Eight categories of consumers are identified on the basis of responses to proprietary questionnaires.

value n. 1. the mathematical magnitude or quantity of a variable. 2. a moral, social, or aesthetic principle accepted by an individual or society as a guide to what is good, desirable, or important. 3. the worth, usefulness, or importance attached to something.

value analysis a type of content analysis of written material, consisting of a table or other systematic notation documenting the frequency of appearance in the material of all expressions referring to specified values.

value-driven care a federally backed movement to improve quality and reduce costs in U.S. health care by increasing system transparency and encouraging consumer choice. Such an emphasis on quality contrasts with the current volume-driven model of care in which consumers are passive recipients of treatments and providers are reimbursed for the number of cases they handle, regardless of patient outcome or the standard of services rendered. The central premise underlying value-driven care is that informed consumers are active and discriminating decision makers who will examine their available service options and choose those that will be the most beneficial and cost effective, and that this in turn will foster competition among providers to provide better services at reduced costs (e.g., by eliminating waste, improving cooperation and coordination among providers, preventing foreseeable patient complications).

For example, if a person needing an operation is able to review readily available statistics on outcome, price, and so forth, he or she will likely avoid choosing hospitals, procedures, or medical professionals having poor success rates or costing too much. According to the U.S. government,
value-expressive function of an attitude

However, the success of value-driven care requires not only the consistent measurement and public reporting of provider quality and cost information but also the nationwide adoption of standardized, interoperable health information technology and the use of incentives that motivate all parties within the system—payers, patients, providers, and health care facilities—to achieve better care for less money.

value-expressive function of an attitude the role an attitude can play in the expression of core values. For example, a person might adopt a positive attitude toward a religious symbol because that symbol is associated with important religious values. See also functional approach to attitudes.

value-free evaluation see goal-free evaluation.

value judgment an assessment of individuals, objects, or events in terms of the values held by the observer rather than in terms of their intrinsic characteristics objectively considered. In some areas, such as aesthetics or morality, where there often are no objective right or wrong responses, value judgments are common, but in hard and social sciences they are frequently considered undesirable.

Values and Preferences Scale (VPS) a 24-item questionnaire on the importance of certain aspects of daily life to individuals with cognitive impairment, as assessed both from their perspective and that of their caregivers. Each party rates the items on a 1 to 3 scale, ranging from not at all important (1) to very important (3), with the items relating to the recipients’ values and preferences for safety, personal autonomy, financial independence, need for support and assistance, social relationships, spiritual or religious needs, and other concerns of everyday life. The VPS is designed to help clarify the recipients’ current and future care needs. [developed in 2005 by U.S. psychologist Carol J. Whitlatch, U.S. social worker Lynn Friss Feinberg, and Shandra S. Tuck]

Values, Attitudes, and Lifestyles see VALS.

values clarification any process intended to promote an individual’s awareness and understanding of his or her moral principles and ethical priorities and their relationships to behavior in daily life. Individuals may be asked to carry out a series of exercises to this effect in some forms of psychotherapy.

values education 1. instruction that is focused on principles, moral standards, or ethical qualities that are considered desirable, in addition to academic instruction. 2. education focused on socially acceptable or correct living.

value system the moral, social, aesthetic, economic, and religious concepts accepted either explicitly or implicitly by an individual or a particular society.

vampirism n. 1. in folk belief and literature, the practices associated with vampires (“undead” corpses supposed to drink the blood of living beings). In the portrayal of vampirism in literature, sexual pleasure is often associated with sucking blood from another person, a representation of the “love bite.” 2. a paraphilia whereby the drinking of blood elicits sexual arousal or pleasure. Also called Renfield’s syndrome. [first described by German psychiatrist Richard von Krafft-Ebing (1840–1902); named after the lawyer and later insane follower of Dracula in the 1897 novel by Bram Stoker] 3. a rare symptom of schizophrenia, characterized by vampiric or other delusions and the drinking of blood. Both of the last two senses are also called clinical vampirism.

van Buchem’s syndrome an autosomal aberration marked by thickening and osteosclerosis of bones of the face, skull, and trunk, resulting in facial paralysis and loss of hearing and vision. The symptoms usually begin around puberty. [Francis Steven Peter van Buchem (1897–1979), Dutch physician]

vandalism n. willful defacement or destruction of property. A persistent pattern of vandalism is one symptom of conduct disorder.

Vandenbergh effect the effects of chemical communication in influencing age of puberty in rodent populations. Adult males produce an odor that can accelerate puberty in young females, leading to earlier reproduction. However, adult females produce odors that inhibit puberty in females. As a result, in low-density populations with more males than females, young females mature earlier, but in dense populations with many adult females, young females mature more slowly, leading to a regulation of population density. See also Whitten effect. [John G. Vandenbergh (1935– ), U.S. biologist]

vanishing cues methodology a computer-assisted training technique designed to teach new, complex knowledge to individuals with memory impairment. The technique takes advantage of the patient’s preserved ability to respond to partial cues. Initially, as much information is provided as is needed for the patient to make a correct response. Across learning trials, information is gradually withdrawn until the patient can respond correctly in the absence of any cues.

variability n. 1. the quality of being subject to change or variation in behavior or emotion. 2. the degree to which members of a group or population differ from each other, as measured by statistics such as the range, standard deviation, and variance.

variable n. a condition in an experiment or a characteristic of an entity, person, or object that can take on different categories, levels, or values and that can be quantified (measured). For example, test scores and ratings assigned by judges are variables. Numerous types of variables exist, including categorical variables, dependent variables, independent variables, mediators, moderators, and random variables. Compare constant.

variable error see random error.

variable-interval schedule (VI schedule) in free-operant conditioning, a type of interval reinforcement in which the reinforcement or reward is presented for the first response after a variable period has elapsed since the previous reinforcement. Reinforcement does not depend on the number of responses during the intervals. The value of the schedule is given by the average interval length; for example, “VI 3” indicates that the average length of the intervals between potential reinforcements is 3 minutes. This type of schedule generally produces a relatively constant rate of responding. It was formerly known as an aperiodic reinforcement schedule.

variable rate theory a group of theories that describe aging as resulting from individual differences that are affected by internal factors such as disease, genetic mutations, or metabolism and by external factors such as environment, diet, or exercise. Compare genetic programming theory.

variable-ratio schedule (VR schedule) in free-operant conditioning, a type of intermittent reinforcement
in which a response is reinforced after a variable number of responses. The value of the schedule is given by the average number of responses per reinforcer; for example, “VR 10” indicates that the average number of responses before reinforcement is 10.

**variable stimulus** in PSYCHOPHYSICAL RESEARCH, any one of a set of experimental stimuli that are to be systematically compared to a constant stimulus.

**variable-time schedule (VT schedule)** a schedule of stimulus presentation in which stimuli are presented, independently of any behavior, at variable time intervals. The value of the schedule is given as the mean of the intervals. See also NONCONTINGENT REINFORCEMENT.

**variance** (symbol: \( \sigma^2 \)) n. a measure of the spread, or dispersion, of scores within a sample or population, whereby a small variance indicates highly similar scores, all close to the sample mean, and a large variance indicates more scores at a greater distance from the mean and possibly spread over a larger range. See also STANDARD DEVIATION.

**variance-covariance matrix** see COVARIANCE MATRIX.

**variance estimate** an index of variation in a population that has been calculated using a sample of that population. For example, a sample STANDARD DEVIATION is an estimate of the deviation in the larger population.

**variance-stabilizing transformation** in REGRESSION ANALYSIS or ANALYSIS OF VARIANCE, any of a class of mathematical processes that convert data showing HETEROSCEDASTICITY to a different form, so as to enable the application of specific analytical techniques or to simplify considerations.

**variant** n. 1. in a group of objects or events, one that differs from the others in some way while remaining essentially similar to them.

**variate** n. 1. a specific value of a particular VARIABLE. 2. a RANDOM VARIABLE itself.

**variation** n. 1. the existence of qualitative differences in form, structure, behavior, and physiology among the individuals of a population, whether due to heredity or to environment. Both ARTIFICIAL SELECTION and NATURAL SELECTION operate on variations among organisms, but only GENETIC VARIATION is transmitted to offspring. 2. in statistics, the degree of VARIANCE or DISPERSION of values that is obtained for a specific variable.

**variation coefficient** see COEFFICIENT OF VARIATION.

**variations of aging** individual differences in the effects of aging caused either by intrinsic factors (e.g., disease, genetics) or by extrinsic factors (e.g., lifestyle, environment, culture).

**varicella** n. see CHICKEN POX.

**varicella-zoster** n. see CHICKEN POX; HERPES INFECTION.

**varied mapping** in a SEARCH task, a condition in which target and distractor stimuli change roles randomly over the course of an experiment, so that a stimulus may be a target in one trial and a distractor in the next. Compare CONSISTENT MAPPING.

**variety** n. 1. in BIOLOGICAL TAXONOMY, a subdivision of a species comprising those members of the species that are distinct with reference to particular minor characteristics that do not affect their ability to interbreed to produce fertile offspring. The various BREEDS of domestic animals are examples of varieties. 2. in linguistics, a version of a language that is phonologically or grammatically distinct from the STANDARD LANGUAGE and may be associated with such categories as region, ethnicity, or social class. See also DIALECT; REGISTER.

**variform universal** see PSYCHOLOGICAL UNIVERSAL.

**varimax rotation** a statistical procedure applied within FACTOR ANALYSIS and PRINCIPAL COMPONENTS ANALYSIS to simplify solutions and enhance interpretation of the results. It is a type of ORTHOGONAL ROTATION intended to make each factor have a small number of large FACTOR LOADINGS and a large number of zero (or small) factor loadings. Thus, following a varimax rotation, each original variable tends to be associated with a small number of factors, and each factor represents only a small number of variables. See FACTOR ROTATION.

**vaso-** combining form see VASO-

**vascular dementia** severe loss of cognitive functioning as a result of cerebrovascular disease. It can be due to repeated strokes, a single large stroke, or chronic cerebral ischemia. It is one of the most common types of dementia. Also called multi-infarct dementia.

**vascular depression** a MAJOR DEPRESSIVE EPISODE that occurs shortly after the onset or treatment of cardiovascular disease or that is assumed to be caused by cardiovascular disease. Often, this episode is characterized by ANHEDONIA rather than depressed mood.

**vascular insufficiency** failure of the cardiovascular system to deliver an adequate supply of blood to the body tissues. This may involve large regions of the body or a particular organ or area of an organ. ATHEROSCLEROSIS, for example, can reduce the blood supply to the leg muscles, causing cramplike pains and limping; the heart, resulting in angina pectoris; or the brain, causing perceptual abnormalities and stroke.

**vascular sclerosis** thickening of the walls of the blood vessels, possibly related to hypertension. In addition, the condition can lead to hearing loss, often seen as a function of aging (see PRESBYCUSIS).

**vasculitis** n. inflammation of a blood vessel.

**vas deferens** (pl. VASA DEFERENTIA) a duct that conveys spermatozoa from the EPIDIDYMIS and unites with the duct of the SEMINAL VESICLE to form the ejaculatory duct, which leads to the urethra. Also called DUCTUS DEFERENS; SEMINAL DUCT; SPERMATIC DUCT.

**vasectomy** n. a surgical procedure for male STERILIZATION in which the vas deferens, which carries sperm from the testes to the urethra, is removed, segmented, or cut and the resulting openings blocked. The procedure must be regarded as permanent as it cannot always be reversed.

**vase-** (vaso-) combining form 1. blood vessel (e.g., VASODILATION). 2. the vas deferens (e.g., VASECTOMY).

**vasoconstriction** n. narrowing of blood vessels, which is controlled by VASOMOTOR nerves of the sympathetic nervous system or by such agents as VASOPRESSIN or SYMPATHOMIMETIC DRUGS. It has the effect of increasing blood pressure. See also ERGOT DERIVATIVE.

**vasoconstrictor** n. any drug or other agent (e.g., the hormone vasopressin) that causes constriction of blood vessels so that the diameter of the vessels is reduced. The
vasodilation

vasodilation n. widening of blood vessels, as by the action of a VASOMOTOR nerve or a drug, which has the effect of lowering blood pressure.

vasodilator n. any drug or other agent that serves to increase the diameter of blood vessels, generally by relaxing smooth muscle in arterial walls. Vasodilators are commonly used in the treatment of hypertension and angina pectoris.

vasomotor adj. describing or relating to nerve fibers, drugs, or other agents that can affect the diameter of blood vessels, especially small arteries, by causing constriction or relaxation of the smooth muscle of their walls. Fibers of the sympathetic and parasympathetic divisions of the AUTONOMIC NERVOUS SYSTEM have a vasomotor effect.

vasopressin n. a PEPTIDE hormone produced in the PARAVENTRICULAR NUCLEUS and SUPRAOPTIC NUCLEUS of the hypothalamus and released by the posterior PITUITARY GLAND into the blood as controlled by OSMORECEPTORS. It has two forms that differ by a single amino acid—lysine vasopressin (LVP) in pigs and arginine vasopressin (AVP) in humans and all other mammals—and that bind to one of three distinct receptors, called V1a, V1b, and V2. Both forms increase fluid retention in the body by signaling the kidneys to reabsorb water instead of excreting it in urine, and they raise blood pressure by signaling specific smooth muscle cells to contract and narrow small blood vessels. Besides these and other physiological functions, vasopressin modulates complex cognitive functions—such as attention, learning, and the formation and recall of memories—and may also modulate emotion. Additionally, vasopressin and the chemically related peptide hormone OXYTOCIN have been implicated in a range of mammalian social behaviors, such as aggression, territoriality, maternal and paternal care, pair-bond formation and mating, social recognition, attachment, affiliation, and vocalization, as well as components of human-specific social behaviors and disorders (e.g., autism).

Vasopressin itself may be involved in the pathophysiology of anxiety disorders, including posttraumatic stress disorder, and has been implicated in the pathophysiology of depression as well. AVP secretion appears to play a critical role in the stress response through activation of the SYMPATHETIC NERVOUS SYSTEM, and thereby raising blood pressure.

VCP abbreviation for VISUAL COMFORT PROBABILITY.

VD abbreviation for venereal disease. See SEXUALLY TRANSMITTED DISEASE.

vection n. see INDUCED MOVEMENT.

tector n. 1. a mathematical entity with magnitude and direction. Compare SCALAR. 2. in MULTIVARIATE ANALYSIS, a one-dimensional arrangement in which the scores of n individuals on a particular measure are arrayed. 3. in MATRIX ALGEBRA, a column or row of a matrix.

vesicular nucleus

vegetative adj. 1. pertaining to basic physiological functions, such as those involved in growth, respiration, sleep, digestion, excretion, and homeostasis, that are governed primarily by the AUTONOMIC NERVOUS SYSTEM, which is sometimes called the VEGETATIVE NERVOUS SYSTEM. 2. living without apparent cognitive neurological function or responsiveness, as in persistent VEGETATIVE STATE. 3. denoting ASEXUAL reproduction, especially in plants.

vegetative state a condition in which a person appears awake but lacks any self-awareness, environmental awareness, or basic or higher level cognitive functions (e.g., information processing, language comprehension and production, perception). The individual exhibits normal reflexes, circadian rhythms (including SLEEP–WAKE CYCLES), respiration, circulation, and other brainstem- and hypothalamus-governed functions but shows no voluntary behavior or other purposeful response to stimuli. Additionally, ELECTROENCEPHALOGRAPHY often reveals slowed electrical activity. Typically associated with destruction of vast areas of cerebral cortex or its integrating connections as a result of trauma, the condition is most often seen following COMA but also occurs in those who have various degenerative disorders or severe congenital malformations of the nervous system. A persistent vegetative state (PVS, or persistent noncognitive state) is one lasting more than 4 weeks from which there is the possibility—however slim—of recovery, whereas a permanent vegetative state is one lasting more than 3 to 12 months (depending upon cause) from which there is no chance of regaining consciousness. The vegetative state is distinct from both BRAIN DEATH and the MINIMALLY CONSCIOUS STATE but nonetheless is misdiagnosed as the latter nearly half the time.

The assessment of residual cognitive abilities is extremely difficult, and uniform assessment protocols for the vegetative state have yet to be established. However, advanced functional neuroimaging techniques (e.g., EVENT-RELATED POTENTIALS, FUNCTIONAL MAGNETIC RESONANCE IMAGING) are being investigated as a source of information beyond the traditional clinical method to aid diagnosis, and several recently developed measures using structured be-
Velten technique a mood-induction technique that is widely used to put people in a more positive frame of mind. Individuals are asked to read a series of 58 statements about their mood, energy level, achievements, and potential to reflect on the truth of each one as it applies to their own experience. The statements, which are printed on separate cards, are carefully graded so that each one is slightly more positive than the previous ones: The series begins with the statement, “Today is neither better nor worse than any other day,” and ends with the statement, “Wow, I feel great!” The aim is to create an ideal performance state through positive self-talk. [Theodore Velten, U.S. psychologist]

ventricular puncture n. see WHITE COMMISSURE.

ventricular rupture a surgical procedure in which an opening from the outside is made to the lateral ventricle areas of the brain. The procedure may be performed in...
ventricular system

in order to reduce INTRACRANIAL PRESSURE, to inject medications (e.g., antibiotics) directly into the brain, or to obtain cerebrospinal fluid.

**ventricular system** the network of VENTRICLES and passageways in the brain, spinal cord, and subarachnoid space through which the CEREBROSPINAL FLUID circulates as a source of nutrients for tissues of the central nervous system.

**ventricular zone** a region of actively dividing tissue cells lining the cerebral VENTRICLES that provides neurons in early development and generates glial cells (see GLIA) throughout life. See SUBVENTRICULAR ZONE.

**ventriculostomy** see SHUNT.

**ventriculomegaly** n. abnormal enlargement of a ventricle.

**ventriculostomy** n. a treatment for HYDROCEPHALUS in which an opening is created between the floor of the third ventricle of the body to the back (dorsal) region. This opening is called the **hypothalamus**.

**ventro(dorsal) shunt** see SHUNT.

**ventromedial hypothalamic syndrome** a set of symptoms caused by induced lesions in the VENTROMEDIAL NUCLEUS of the hypothalamus in the brain of an experimental animal (e.g., rat). The syndrome consists of two stages. The first (or dynamic) stage is characterized by HYPERPHAGIA (overeating) and subsequent weight gain, resulting in obesity. The second (or static) stage includes stabilization of body weight, resistance to food-getting behavior, and finickiness, such that the animal is willing to eat only easily obtainable and palatable foods. Also called **hypothalamic hyperphagia**. Compare LATERAL HYPOTHALAMIC SYNDROME.

**ventromedial hypothalamic nucleus (VMH)** a region of the hypothalamus primarily associated with feelings of satiety. In studies in which the VMH is lesioned, animals overeat to the point of extreme obesity. The VMH also has a role in thermoregulation.

**ventromedial nucleus** a group of nuclei within the ventromedial hypothalamus that receives input from the AMYGDALA and is associated particularly with eating and sexual behavior. The ventromedial nucleus traditionally has been referred to as the **satiety center** because of its presumed dominance over the cessation of eating (indeed, structural or functional damage results in excessive eating), but it is now known that other neural areas are involved in this function as well. See also VENTROMEDIAL HYPOTHALAMIC SYNDROME.

**ventromedial pathway** any of four major descending groups of nerve fibers within the MOTOR SYSTEM, conveying information from diffuse areas of the cerebral cortex, midbrain, and cerebellum. These pathways include the anterior CORTICOSPINAL TRACT, which descends directly from motor cortex to the anterior horn of the spinal cord; the VESTIBULOSPINAL TRACT, which carries information from the VESTIBULAR NUCLEI for control of equilibrium responses; the TECTOSPINAL TRACT, for control of head and eye movements; and the reticulospinal tract, for maintaining posture.

**ventroposterior nucleus** a nucleus of the THALAMUS in the brain that relays messages from the spinal cord to the PRIMARY SOMATOSENSORY AREA in the anterior parietal cortex. It includes the medial and lateral ventroposterior subnuclei, representing the face and body respectively, and receives input from CUTANEOUS RECEPTORS. The ventroposterior nucleus is part of the **ventroposterior nuclear complex**: this also includes the ventroposterior superior nucleus, which receives input from muscle spindles, and the ventroposterior inferior nucleus, which receives spinohthalamic terminations related to touch, pain, and temperature. Also called **posterior ventral lateral nucleus; postcentral nucleus; ventral posterior lateral nucleus**.

**venue sampling** see TIME–LOCATION SAMPLING.

**VEP** abbreviation for VISUAL EVOKED POTENTIAL.

**verapamil** n. see CALCIUM–CHANNEL BLOCKER.

**veratrine** n. see HELLEBORE.

**verb** n. a word or phrase used to describe an action, occurrence, or state, forming the essential part of the **predicate** of a sentence. The verb is also identifiable as the element of the sentence that marks temporality (TENSE), MOOD, VOICE (see ACTIVE VOICE; PASSIVE VOICE), and number AGREEMENT with the SUBJECT. See also ACTIONAL VERB; AUXILIARY VERB; CAUSATIVE VERB.

**verbal ability** (V) demonstrated skill to comprehend and communicate effectively with words. Sometimes a distinction is made between receptive abilities (comprehension) and productive abilities (fluency). Brain areas necessary for normal speech appear to be distributed over a broad region of the cerebral cortex and can be mapped by electrical stimulation. For right-handed individuals, language is primarily localized in the left hemisphere. See also PRIMARY ABILITY.

**verbal abuse** extremely critical, threatening, or insulting words delivered in oral or written form and intended to demean, belittle, or frighten the recipient.

**verbal alexia** a form of AGNOSIA in which an individual may recognize single letters but not whole words or combinations of letters. See ALEXIA.

**verbal amnesia** a loss of the ability to remember words due to neurological disorder or disease. See NEUROLOGICAL AMNESIA.

**verbal aphasia** another name for expressive **APHASIA**.

**verbal apraxia** see APRAXIA.

**verbal behavior** all behavior that involves words, including speaking, listening, writing, and reading. The term is used by those who favor a behavioristic account of language (see BEHAVIORISM) in which human verbal behavior is thought to be explained by general laws of learning and behavior observable in other species; that is, its reinforcement is socially mediated by the responses of others. This contrasts with the cognitive approach dominant in PSYCHOLINGUISTICS and specifically with the theory of the cognitive TASK SPECIFICITY OF LANGUAGE. [first described by B. F. SKINNER in 1957]
verbal behavior therapy based on the principles of APPLIED BEHAVIOR ANALYSIS and B. F. SKINNER's concept of verbal behavior, a therapy that is primarily used to teach speech to nonverbal children with autism. The therapy uses various reinforcers (food, toys) first to prompt the child to vocalize sounds and then to imitate whole words and phrases. The therapy also aims to improve the child's attentional ability and social and cognitive skills. Also called APPLIED VERBAL BEHAVIOR.

verbal communication see COMMUNICATION.

verbal comprehension an individual's ability to understand the language used by others, as determined by his or her RECEPTIVE VOCABULARY and RECEPTIVE LANGUAGE skills.

Verbal Comprehension Index on the WECHSLER ADULT INTELLIGENCE SCALE and other Wechsler tests, a subset of verbal tests thought to measure verbal knowledge and comprehension more purely than the other tests included in the Verbal IQ.

verbal conditioning the conditioning of a verbal response (such as the use of a specific word) through reinforcement, usually given in the form of attention or praise. For instance, the experimenter might respond “Okay” whenever the participant uses the pronoun I but does not respond to the use of other pronouns. [introduced in 1955 by U.S. behaviorist Joel Greenspoon (1920–2004)]

verbal deprivation hypothesis the hypothesis that children who are denied regular experience of an ELABORATED CODE of language—that is, a more formal use of language involving complex constructions and an unpredictable vocabulary—may develop an educational and even cognitive deficit. The concept is controversial as it has been associated with the view that nonstandard or vernacular language involving complex constructions and an unpredictable vocabulary—may develop an educational and even cognitive deficit. The concept is controversial as it has been associated with the view that nonstandard or vernacular forms of language—that is, a more formal use of language involving complex constructions and an unpredictable vocabulary—may develop an educational and even cognitive deficit. The concept is controversial as it has been associated with the view that nonstandard or vernacular forms of language—that is, a more formal use of language involving complex constructions and an unpredictable vocabulary—may develop an educational and even cognitive deficit.

verbal factor a factor obtained by FACTOR ANALYSIS that represents the latent trait underlying verbal abilities.

verbal fluency test any of a group of tests in which participants are required, within a limited period, to generate words that fit a specific category or have specific characteristics (e.g., may all start with the same letter or be from the same semantic category). Compare DESIGN FLUENCY TEST.

verbal intelligence the ability to use words and combinations of words effectively in communication and problem solving.

verbal IQ a broad measure of verbal ability as obtained on standardized intelligence tests and affected by native verbal skills, experience, education, test taking skills, and test motivation. See IQ.

verbalization n. 1. the expression of thoughts, feelings, and fantasies in words. Verbalization is a common feature of most forms of psychotherapy. Apart from the general communicative ability that occurs between therapist and client as part of the PSYCHOTHERAPEUTIC PROCESS, a particularly striking form of verbalization occurs in the use of FREE ASSOCIATION. 2. in psychiatry, a symptom involving excessive or uncontrolled speech, as in CIRCUMSTANTIALITY or PRESERVED SPEECH.—verbalize vb.

verbal leakage SLIPS OF THE TONGUE, verbal ambiguities, or other aspects of speech thought to reveal information about an individual's motives and behavior that he or she has attempted to conceal. Body language that is similarly revealing is described by some psychologists as NONVERBAL LEAKAGE. See also FREUDIAN SLIP; PARAPRAXIS; SYMPTOMATIC ACT.

verbal learning the process of learning about verbal stimuli and responses, such as letters, digits, nonsense syllables, or words. The methods used include PAIRED-ASSOCIATES LEARNING and SERIAL LEARNING. Researchers in the verbal learning tradition, influenced by Hermann EIBINGHAUS and by ASSOCIATIONISM, sought to uncover basic laws of learning by studying simple materials under controlled conditions. Compare NONVERBAL LEARNING.

verbally governed behavior see RULE-GovernED BEHAVIOR.

verbal masochism a sexual disorder in which an individual enjoys hearing words that are humiliating and insulting and derives sexual excitement from the abuse. According to Theodor REIK, the sexual excitement may depend on the choice and emphasis of words or sentences used.

verbal memory the capacity to remember something written or spoken that was previously learned (e.g., a poem). Compare MOTOR MEMORY; VISUAL MEMORY.

verbal narrative an oral recounting of an event, as when a person describes a recent date to a friend over the telephone. Such spoken-word narratives help provide an individual with a sense of self and of history and often include descriptions of mood, conflicts, stressors, and concerns. They contrast with Visual narratives, which describe events through images, and Textual narratives, which describe events in writing. Research has revealed that the ability to narrate life experiences is significant in understanding and treating certain disorders, particularly POST-TRAUMATIC STRESS DISORDER. The use of such narratives as a specific therapeutic technique is known as NARRATIVE THERAPY.

verbal overshadowing the tendency for the verbal description of a stimulus to impair later accurate memory of the stimulus. For instance, verbally describing a face that has just been seen may reduce later recognition or identification of that face in a picture lineup.

verbal paraphasia a form of PARAPHASIA characterized by the inclusion of inappropriate words and phrases in a person's speech.

verbal protocol a method of eliciting verbal reports of individuals' thoughts as they perform a set of specified research tasks. Participants are asked to describe whatever they are seeing, thinking, doing, and feeling as it occurs during task performance. Rather than capturing mere summaries of a task's results, the method provides the researcher with insight about the cognitive processes involved in task completion and the representations on which they operate.

verbal protocol analysis see PROTOCOL ANALYSIS.

verbal report see REPORTABILITY.

verbal satiation see MASTURBATORY SATIATION.
verbal test

**verbal test** any test or scale in which performance depends upon one’s ability to comprehend, use, or otherwise manipulate words.

**verbal thought** a reasoning process that requires language and thus represents the merging of language and thought. Children first use language to guide thought by speaking out loud; only later does speech go underground to become covert verbal thought. See [EGOGENTRIC SPEECH: INNER LANGUAGE]. [proposed by Lev Vygotsky]

**verbatim recall** recollection of the exact wording of verbal material (e.g., a conversation, poem, or quotation). See also **rote recall**.

**verbatim trace** see **FUZZY TRACE THEORY**.

**verbidation** **n.** apparently meaningless repetition of specific words or phrases. Also called **catalogia: catastrophe**.

**vergence** **n.** a turning movement of the eyes to focus on an item in the depth plane. If they turn toward each other, the movement is **convergence**; if they turn away from each other, it is **divergence**.

**veridical** **adj.** 1. truthful. 2. of mental phenomena, such as memories or beliefs, corresponding to external reality.

**veridical hallucination** in **PARAPSYCHOLOGY**, a hallucination depicting events later proven to be true.

**veridical perception** accurate perception of what is real.

**verification** **n.** the process of establishing the truth or accuracy of something, especially the use of objective, empirical data to test or support the truth of a statement, conclusion, or hypothesis.

**verification time** in studies of cognition, a measure of the time taken by a participant to indicate whether a statement is true or to verify that a particular stimulus meets some prespecified condition.

**verisimilitude** **n.** the appearance of being true. In scientific investigation, a theory or model is said to have verisimilitude if it can be shown to be more consistent with empirically verified fact than its predecessors or competitors.

**vermis** **n.** (pl. **vermes**) the median lobe of the **CEREBELLUM**, which lies between the two cerebellar hemispheres. Also called **vermis cerebelli**. —**vermicular** **adj.**

**vernacular** **n.** the indigenous or characteristic language or **DIALECT** spoken routinely by a particular group of people: everyday language. It usually coexists with an official formal language (see **STANDARD LANGUAGE**) used in schools and government. See **DIGLOSSIA**.

**Versed** **n.** a trade name for **MIDAZOLAM**.

**verstehende Psychologie** understanding psychology (German): an approach to psychology advocated by German philosopher Wilhelm Dilthey (1833–1911). Dilthey argued that psychology belonged to the human sciences (Geisteswissenschaften) as opposed to the natural sciences (Naturwissenschaften) and that its goal was therefore understanding (Verstehen) rather than explanation in terms of natural laws. For psychology, the object of understanding is lived experience (Erlöhnis), and the goal must be articulation of the meaning of the experience from the perspective of the person living it. This approach was influential in the development of **PHENOMENOLOGY**, modern **HERMENEUTICS**, and EXISTENTIAL PSYCHOLOGY. See **GEISTESWISSENSCHAFTLICHE PSYCHOLOGIE: NATURWISSENSCHAFTLICHE PSYCHOLOGIE**.

**vertebral artery** a paired artery that runs upward alongside the vertebrae of the neck. Each vertebral artery enters the skull through the foramen magnum (see **FORAMEN** near the top of the spinal column, where it joins the vertebral artery from the other side to form the **BASILAR ARTERY**.

**vertebral column** see **SPIRAL COLUMN**.

**vertex potential** a brain potential recorded by electrodes placed at the vertex (top) of the skull. The vertex potential seems to be evoked by a variety of stimuli but is closely associated with attention.

**vertical décalage** in **PIAGETIAN THEORY**, the invariable sequence in which the different stages of development (sensorimotor, preoperational, concrete operational, formal operational) are attained. Compare **HORIZONTAL DÉCALAGE**.

**vertical group** a group composed of individuals who come from different social classes. Compare **HORIZONTAL GROUP**.

**vertical–horizontal illusion** see **HORIZONTAL–VERTICAL ILLUSION**.

**vertical job enlargement** see **JOB ENLARGEMENT**.

**vertical loading** see **JOB ENLARGEMENT**.

**vertical mobility** the movement or displacement of individuals or groups from one social class to another. This may take the form of **UPWARD MOBILITY** or **DOWNWARD MOBILITY**. Compare **HORIZONTAL MOBILITY**. See **SOCIAL MOBILITY**.

**vertical transmission** see **HORIZONTAL TRANSMISSION**.

**vertigo** **n.** an unpleasant, illusory sensation of movement or spinning of oneself or one’s surroundings because of neurological disorders, psychological stress (e.g., anxiety), or activities that disturb the labyrinth (which contains the organs of balance) in the inner ear (as in a roller-coaster ride).

**very low birth weight** (VLBW) see **LOW BIRTH WEIGHT**.

**vesicle** **n.** a fluid-filled saclike structure, such as any of the synaptic vesicles in axon terminals that contain neurotransmitter molecules. —**vesicular** **adj.**

**vested interest** the extent to which an ATTITUDE OBJECT is seen as being related to a person’s material self-interest. It is assumed to be a determinant of related constructs, such as the **IMPORTANCE OF AN ATTITUDE** and **IDEO INVOLVEMENT**. It is also a determinant of **ATTITUDE STRENGTH**.

**vestibular adaptation** an effect of repeated stimulation that can result in suppression of the vestibular (balance) function and may be observed in individuals whose daily activities require frequent or repeated turning of the head (e.g., ballet dancers and figure skaters).

**vestibular apparatus** the organ of balance and equilibrium, which is situated in the inner ear and contains receptors that detect the orientation and changes in the position of the head in space. It consists of the **SEMICIRCULAR CANALS** and **VESTIBULAR SACs**. See also **VESTIBULAR SYSTEM**.

**vestibular glands** two pairs of glands situated on either side of the vaginal orifice. Their secretions lubricate the
vulva and vagina and assist penetration by the penis during coitus. The larger pair (the greater vestibular glands) are also called Bartholin’s glands.

**vestibular illusion** a spatial disorientation due to inaccurate vestibular (balance) information, for example, following adaptation of a vestibular receptor.

**vestibular membrane** see REISSNER’S MEMBRANE.

**vestibular nerve** a division of the VESTIBULOCOCHLEAR NERVE that carries nerve fibers from the VESTIBULAR SYSTEM in the inner ear; it is associated with the sense of balance and orientation in space. Fibers of the vestibular nerve terminate in the VESTIBULAR NUCLEI of the brainstem.

**vestibular nuclei** nuclei in the dorsolateral part of the PONS and the MEDULLA OBLONGATA in the brain that receive fibers from the VESTIBULAR NERVE and serve the sense of balance and orientation in space. They send fibers to the cerebellum, reticular formation, thalamus, and the vestibulospinal tract (see VENTROMEDIAL PATHWAY).

**vestibular nystagmus** involuntary eye movements consisting of slow drift in one direction followed by a rapid movement in the opposite direction, caused by stimulation of the vestibular apparatus during rotation of the head. Also called rotational nystagmus. Compare PHYSIOLOGICAL NYSTAGMUS.

**vestibular receptors** nerve cells associated with the sense of balance, located in the cristae of the SEMICIRCULAR CANALS and in the MACULES of the UTRICLE and SACULE. They occur in two similar forms: a HAIR CELL enclosed in a chaliceike nerve ending and a cylindrical hair cell that synapses at its base with a nerve ending.

**vestibular sacs** two sacs in the inner ear—the UTRICLE and SACULE—that, together with the SEMICIRCULAR CANALS, comprise the VESTIBULAR APPARATUS (see also VESTIBULAR SYSTEM). The vestibular sacs respond both to gravity to encode information about the head’s orientation and to linear acceleration.

**vestibular sense** see SENSE OF EQUILIBRIUM.

**vestibular system** a system in the body that is responsible for maintaining balance, posture, and the body’s orientation in space and that plays an important role in regulating locomotion and other movements. It consists of the VESTIBULAR APPARATUS in the inner ear, the VESTIBULAR NERVE, and the various cortical regions associated with the processing of vestibular (balance) information.

**vestibule** n. a chamber that leads to a body cavity or that connects one cavity to another. The vestibule of the vagina is the cavity in the VULVA, between the two LABIA MINORA, into which the vagina, urethra, and greater vestibular glands open. The vestibule of the inner ear is the cavity of the bony LABYRINTH that contains the utricle and sacculle (the VESTIBULAR SACS) and is connected to the semicircular canals and cochlea. —vestibular adj.

**vestibule training** an approach to personnel training in which new employees, before starting their work duties, spend some time learning in a special section (vestibule), apart from the actual work environment, that duplicates as precisely as possible the setting and conditions in which the employees will actually be working once their training is complete. See OFF-THE-JOB TRAINING; ON-THE-JOB TRAINING.

**vestibulocochlear nerve** the eighth cranial nerve: a sensory nerve containing tracts that innervate both the sense of hearing and the sense of balance. It has two divisions, the VESTIBULAR NERVE, originating in the vestibule and the semicircular canals, and the AUDITORY NERVE (acoustic or cochlear nerve), originating in the cochlea. The vestibulocochlear nerve transmits impulses from the inner ear to the medulla oblongata and pons and has fibers that continue into the cerebrum and cerebellum. Also called cranial nerve VIII.

**vestibulo-ocular reflex** (VOR) the involuntary compensatory movement of the eyes that occurs to maintain fixation on a visual target during small, brief head movements. It is triggered by vestibular signals and thus does not depend on visual inputs. Compare OPTOKINETIC REFLEX.

**vestibulospinal tract** a TRACT that sends impulses from the VESTIBULAR NUCLEI to the spinal cord. It is divided into lateral and medial branches and serves to control balance and orientation in space.

**vestigial body image** the subjective or internal image of one’s appearance that is not necessarily modified by changes to one’s external features. For example, individuals who have lost large amounts of weight may continue to have a vestigial body image of themselves as being overweight.

**vested genital apposition** sexual activity in which clothed participants place their genital regions together and thrust or rub against each other, simulating coitus. The activity may or may not be carried to the point of orgasm for one or both partners.

**VFDT** abbreviation for Visual Form Discrimination Test. See VISUAL FORM DISCRIMINATION.

**VI** abbreviation for variable interval. See VARIABLE-INTERVAL SCHEDULE.

**vibration** n. a periodic motion of an object, such as a tuning fork, with a frequency that is usually measured in HERTZ.

**vibration disease** an occupational health hazard resulting from acoustic or mechanical vibration and shock to the body. The extent of the damage depends on the frequencies of vibrations and the duration of exposure. See HAND-ARM VIBRATION SYNDROME.

**vibration environment** an environment in which the oscillations of an operational vehicle in motion are transmitted to humans by supporting seats, floors, walls, and handles. Such vibration can have mechanical effects on the human body that are similar to those caused by acceleration. The magnitude of the vibration effects depends on the frequency range of the vibration force and its relationship to the body’s dynamic response.

**vibration experience** a sensation produced by contact with a pulsating or rapidly vibrating object that stimulates receptors in the skin. The vibration sense can be measured with a mechanical vibrator that can be adjusted for threshold frequencies of the effect.

**vibration receptor** a nerve ending that responds to various ranges of vibration frequencies. Vibration receptors have been identified through histological studies as Pacinian corpuscles, located at depths ranging from the skin surface to the connective tissue covering the surface of a bone. Some vibration receptors seem most sensitive to vibrations between 100 Hz and 500 Hz, whereas others are most sensitive to those below 100 Hz.

**vibration sense** see VIBRATION EXPERIENCE.
vibration white finger

vibration white finger see HAND–ARM VIBRATION SYNDROME.

vibrator n. an appliance containing a small electric motor that produces a vibrating action, used to stimulate the genitals and other sensitive areas during masturbation or sexual activity with a partner. The device may be powered by batteries or by household electric current. Some vibrators strap on the hand, making the fingers vibrate during sexual stimulation. Another type has a vibrating mechanism on which a number of attachments of different sizes, shapes, and textures can be placed, and these stimulate the body directly. Other vibrators are cylinders that can be used externally or inserted into the vagina or anus.

vibrotactile aid see TACTILE SENSORY AID.

vibrotactile masking the interference of one vibrotactile stimulus pattern with another that may occur if the two patterns are presented in close temporal proximity. MASKING may be forward or backward.

vibrotactile threshold the minimum level of stimulation at which a vibration is perceived. Different types of MECHANORECEPTORS are sensitive to different specific frequencies of vibration.

vicarious adj. 1. substitutive or secondhand: applied, for example, to the satisfaction obtained by viewing the experiences of others in television programs. It is widely believed that human conditioning of fear responses can occur through vicarious means and that gratification of needs can be partially accomplished through watching the actions of others. See also OBSERVATIONAL LEARNING. 2. occurring when one organ performs part of the functions normally performed by another.

vicarious brain process see VICARIOUS FUNCTION.

vicarious conditioning see OBSERVATIONAL LEARNING.

vicarious extinction a phenomenon in which behavioral inhibitions are eliminated by observational experiences alone, with accompanying generalized and enduring reductions in fear arousal and avoidance behavior. Vicarious extinction requires exposing observers to stimulus events in which a model repeatedly exhibits approach responses toward a feared object without incurring any aversive consequences. For example, vicarious extinction for a person who is afraid of dogs might involve watching another individual engages with a series of different dogs in a pen and interacts with each one in a way that becomes progressively more involved (e.g., petting, then feeding, then leash walking, then picking up each animal) without being bitten or experiencing other negative consequences.

vicarious function a theory to explain the ability to recover from the effects of brain damage. It is based on evidence that many functions are not strictly localized in the brain and that many brain areas can assume a function previously performed by a brain area that has been damaged. Also called vicarious brain process.

vicarious learning see OBSERVATIONAL LEARNING.

vicarious reinforcement the process whereby a person becomes more likely to engage in a particular behavior (response) by observing another individual being reinforced for that behavior. An important concept in SOCIAL LEARNING THEORY, vicarious reinforcement often leads to imitation: for example, a student who hears the teacher praise a classmate for neat penmanship on an assignment and who then carefully handwrites his or her own assignment is considered to have received vicarious reinforcement. See also OBSERVATIONAL LEARNING.

vicarious traumatization (VT) the impact on a therapist of repeated emotionally intimate contact with trauma survivors. More than COUNTERTRANSFER, VT affects the therapist across clients and situations. It results in a change in the therapist’s own worldview and sense of the justness and safety of the world. Therapist isolation and overinvolvement in trauma work can increase the risk of vicarious traumatization. Also called secondary traumatization.

vicarious circle a situation or behavioral pattern in which an individual’s or group’s problems become increasingly difficult because of a tendency to address or ignore them repetitively through unhealthy defensive reactions that, in fact, compound them.

vicarious circularity the logical problem that is presented by certain kinds of self-referential PARADOX, such as This sentence is a lie, and by certain related cruxes in SET THEORY, notably those arising from the idea that a set can be the member of itself. See also CIRCULAR REASONING.

Vicodin n. a trade name for a combination of HYDROCODONE and ACETAMINOPHEN.

victim n. 1. an individual who is the target of another person’s violent, discriminatory, harassing, or assaultive behaviors. 2. an individual who has experienced an accident or natural disaster. See VICTIMIZATION.

victim blaming see BLAMING THE VICTIM.

victim impact statement a spoken or written statement made during the sentencing phase of a trial by the victim of a crime or, in cases when the crime resulted in death, by the family of the victim, describing the harm and suffering experienced as a result of the defendant’s acts.

victimization n. the act or process of singling someone out for cruel or unfair treatment, typically through physical or emotional abuse.

victimology n. see CRIMINAL PROFILING.

video conferencing see TELECONFERENCING.

video-recall technique a research procedure in which participants review a video recording of their behavior in a previous situation and report what they were thinking, feeling, or otherwise experiencing at that time. The video-recall technique is intended to reduce distortion in SELF-REPORTS, the premise being that reimmersion in the situation generates a more representative set of recollections with less defensive justification than memory alone.

videotape method in clinical psychology and psychiatry, the use of video recordings of therapy sessions for therapeutic, research, or teaching purposes. Recorded sessions are typically reviewed as a part of clinical supervision and are useful in providing trainees with feedback. Occasionally, patients are invited to view the recordings with the therapist and to recall their thoughts and emotions.

Vienna Circle a group of philosophers, logicians, and mathematicians who were based in Vienna in the 1920s and 1930s. The unifying theme of their work was an attempt to systematize the empirical and positivist tradition using the methods of modern SYMBOLIC LOGIC—an approach that became known as LOGICAL POSITIVISM. Prominent members of the group included German philosopher
intellectual disability, or autism and other developmental motor skills—in individuals with dementia, brain injury, or other mobility impairments (e.g., stroke).—violin n.

Vienna Psychoanalytic Society see WEDNESDAY EVENING SOCIETY.

Viennese School a group of early 20th-century practitioners of psychoanalysis, based in Vienna, who followed the theories of Sigmund Freud. Also called Vienna School; Wiener Schule. See also WEDNESDAY EVENING SOCIETY.

Vierordt's law the principle that the two-point threshold for a stimulus is lower in mobile body parts than in those that are less mobile. [Karl von Vierordt (1817–1884), German physiologist]

Vieth–Müller circle a theoretical circle in space in front of an observer containing points that will fall on corresponding retinal locations in the two eyes when a point on the circle is fixated. A Vieth–Müller circle is an example of a HORIZON. [G. U. Vieth; J. P. Müller]

view invariance in RECOGNITION by COMPONENTS THEORY, an unchanging property of three-dimensional elements called GEONS that enables them to be identified when looked at from different angles. Such properties include the curvature of a sphere and the parallel lines of a cube. More broadly, the term view invariant may be used in the context of object recognition, meaning that an object can be identified from any angle. For example, a horse can be identified if it is viewed from above or from the side.

vigilance n. a state of extreme awareness and watchfulness directed by one or more members of a group toward the environment, often toward potential threats (e.g., predators, intruders, enemy forces in combat). In animal behavior, vigilance increases in females after the birth of their young and in response to ALARM CALLS. In large groups, there can be a division of labor, with individuals taking turns in vigilance. In a military context, vigilance tasks (e.g., sentry duty, ship and air traffic control, anti-aircraft and missile defense tracking) demand maximum physiological and psychological attention and readiness to react, characterized by an ability to attend and respond to stimulus changes for uninterrupted periods of time. This level of vigilance can produce significant cognitive stress and occasional physiological stress reactions. Also called vigilant attention. Compare AMBIENT AWARENESS; SITUATION AWARENESS. —vigilant adj.

vigilance decrement in a vigilance task, a decrease in the number of targets detected that occurs after a short period on the task. In many situations, the decrement is due to a shift in the response criterion, although in some cases it reflects a decrease in sensitivity for detecting the target.

vigor n. physical and mental robustness and energy. —vigorous adj.

vindicatory damages a sum of money a defendant is ordered to pay the plaintiff in a civil lawsuit for infringement of the latter’s constitutional rights. For example, a plaintiff who receives $100,000 for false imprisonment by the defendant has been awarded vindicatory damages.

Vineland Adaptive Behavior Scales (VABS) an assessment of four domains of personal and social functioning—communication, daily living skills, socialization, and motor skills—in individuals with dementia, brain injury, intellectual disability, or autism and other developmental problems. A modification and replacement of the Vineland Social Maturity Scale developed in 1936 by Edgar A. Doll, the VABS currently contains items for individuals ranging in age from infancy to 90 years. Data are gathered through a rating form or semistructured interview with each individual’s parents or caregivers. The scales are used not only to diagnose and evaluate the individual but also to formulate educational and treatment (habilitative or rehabilitative) programs. The VABS was originally published in 1984; the most recent version is the VABS–II, published in 2005. [originally developed by psychologists Sara S. Sparrow (1933–2010), David A. Balla, and Domenic V. Cicchetti (1937– )]

violation of assumptions a situation in which the theoretical ASSUMPTIONS associated with a particular statistical or experimental procedure are not fulfilled. Common assumptions for statistical tests include NORMALITY of the distribution, equal VARIANCES within the cells of treatment levels, HOMOGENEITY OF VARIANCE, and LINEARITY. Research designs also need to meet certain assumptions, such as RANDOM SAMPLING and RANDOM ASSIGNMENT, sample REPRESENTATIVENESS, and the like. Because violation of assumptions introduces bias, the validity of assumptions must be confirmed prior to data analysis to ensure that the methods and strategies chosen are appropriate and will yield valid results.

violation-of-expectation method a technique for studying infant cognition, based on habituation and dishabituation procedures, in which increases in an infant’s looking time at an event or other stimulus are interpreted as evidence that the outcome he or she expected has not occurred. For example, while a baby watches, a researcher sometime later retrieves the same toy from a nearby red box (after a CONFEDERATE surreptitiously moved it) and the baby looks longer at that red box, it is assumed that he or she has some understanding of object permanence and was not expecting the toy to be there.

violence n. 1. the expression of hostility and rage with the intent to injure or damage people or property through physical force. See also PATHOLOGICAL AGGRESSION. 2. passion or intensity of emotions or declarations. —violent adj.

viral hypothesis the theory, first suggested in the early 20th century, that psychoses resembling schizophrenia are associated with influenza epidemics. It was later observed that several types of viral ENCEPHALITIS may involve schizophrenia-like symptoms, and many studies have investigated the effect of exposure to viral agents, especially in utero, on subsequent development of schizophrenia. In particular, U.S. psychiatrist E. Fuller Torrey (1937– ) has noted that the viral hypothesis accounts for the greater number of people with schizophrenia born from January to April (see SEASONALITY EFFECT), a period during which there is a high incidence of viral infections. More recently, however, it has been suggested that virus exposure is a risk factor for—rather than a key causative event in—the development of schizophrenia.

viral marketing a form of Internet marketing in which businesses encourage consumers to publicize their products or services by forwarding advertising material in e-mails or posting links on blogs or social media.

viral meningitis see MENINGITIS.

Virchow–Seckel syndrome see SECKEL SYNDROME.

virgin 1. n. a person who has never had sexual intercourse. 2. n. a person who has never had sexual contact of...
virginity n. the state of a person who has not participated in sexual intercourse. Traditionally, a woman was assumed to be a virgin if her hymen was not ruptured, but a ruptured hymen is no longer regarded as prima facie evidence of loss of virginity, as other events can cause this.

virilism n. the presence in a female of secondary sexual characteristics that are peculiar to men, such as muscle bulk and hirsutism. The condition is due to overactivity of the adrenal cortex with excessive secretion of androgen, which can be corrected in some cases. Also called masculinization.

virility n. the state of possessing the qualities of an adult male, especially capacity for coitus. See also maleness; masculinity. —virile adj.

virilocal adj. see patrilocal.

virtual pitch the low pitch of a complex sound. For a complex periodic sound, the virtual pitch generally corresponds to that of the fundamental frequency even when the fundamental is not present in the sound (the phenomenon of the missing fundamental). The terms periodicity pitch and residue pitch are now used synonymously with virtual pitch, although they have different historical antecedents.

virtual reality a simulated three-dimensional environment created through the memory, graphics, and processes of a computer. It is often used to create simulated environments for activities such as flying a plane or exploring space, which are expensive or dangerous to experience directly. Supporting hardware and software tools, including gloves and head monitors with real-time feedback, are often used to immerse and train humans in this virtual reality.

virtual reality therapy a form of in vivo exposure therapy in which clients are active participants in a three-dimensional computer-generated interactive environment that allows them a sense of actual involvement in scenarios related to their presenting problems. This treatment is currently used primarily for anxiety-related disorders, such as fear of flying.

virtual team two or more people in separate locations who work as a group toward a common goal or related goals and who interact electronically via e-mail, teleconferencing, and other means.

virtue n. 1. a quality or characteristic that has positive connotations in a particular society and that is considered beneficial to psychological health. 2. moral goodness. —virtuous adj. —virtuousness n.

virus n. 1. a microscopic parasitic agent that consists of an RNA or DNA core surrounded by a protective protein coat. Because viruses cannot replicate on their own but must invade a living host cell in an organism to do so, they are generally considered nonliving. Viral infection is responsible for many human illnesses and diseases, including influenza, poliomyelitis, mumps, several forms of cancer, and AIDS (see HIV). 2. a computer program designed to disrupt the functioning of other programs or to scramble or destroy computer files. It gains access to programs or systems surreptitiously, often by means of an attachment to an innocent-looking e-mail message. Viruses are typically designed to spread from computer to computer; for that reason, they can be extremely destructive.

viscera pl. n. (sing. viscus) the organs in any major body cavity, especially the abdominal organs (stomach, intestines, kidneys, etc.). —visceral adj.

visceral brain in MacLean’s theory of emotion, the area of the brain that is involved in the neurophysiological control of emotional behavior and experience (including motivated behavior). It is now more commonly known as the limbic system.

visceral drive a drive that is derived from a physiological need. Also called viscerogenic drive. See physiological motive.

visceral learning the use of instrumental conditioning procedures, particularly biofeedback techniques, to enable an individual to deliberately modify physiological processes that are ordinarily and nonconsciously regulated by the autonomic nervous system, such as heart rate and blood pressure.

visceral reaction a response of the visceral (internal or abdominal) organs, such as contractions of the stomach.

visceral sensation see organic sensation.

visceral sense the sense associated with functions of the viscera.

viscerotonia n. the personality type that, according to Sheldon’s constitutional theory of personality, is associated with an endomorphic physique (see endomorph) and is characterized by a tendency toward love of comfort, food, relaxation, and sociability. —viscerotonic adj.

visscus n. see viscera.

visible spectrum see spectrum.

vision n. 1. the sense of sight, in which the eye is the receptor and the stimulus is radiant energy in the visible spectrum. See also visual system. 2. a visual hallucination often involving a religious or mystical experience. 3. a mental image of something or someone produced by the imagination. —visual adj.

vision impairment see visual impairment.

vision rehabilitation the rehabilitation of individuals with visual impairment ranging from blindness to low vision. Services provided include functional assessments of a person’s visual abilities. If any; orientation and mobility training; rehabilitation teaching (e.g., adaptive skills training in managing one’s activities of daily living); instruction in the use of optical devices and assistive technology; career services and training; and psychological counseling.

visitation rights see child visitation.

visiting nurse a registered nurse who provides nursing services to patients in their homes. Visiting nurses are usually employed by a local visiting nurse association.

Vistaril n. a trade name for hydroxyzine.

visual acuity the degree of clarity, or sharpness, of visual perception. It may be measured in several ways; for example, by testing one’s ability to detect very small gaps between two parts of a figure (the minimum separable method), or to discern a fine dark line on a light background or a fine light line on a dark background. See also acuity grating; Landolt circles; Snellen chart.
visual adaptation  the changes that occur in the visual system itself or in visual perception as a result of continuous stimulation. For example, the range of light intensities over which photoreceptors are responsive changes with prolonged exposure to dark, and many visual aftereffects are caused by adaptation of neurons within the visual system. See also dark adaptation; light adaptation.

visual agnosia  loss or impairment of the ability to recognize and understand the nature of visual stimuli. Classically, a distinction between apperceptive and associative forms of visual agnosia has been made. Individuals with the former are said to have deficits in the early stages of perceptual processing, whereas those with the latter either do not display such problems or do so to a degree not sufficient to substantially impair the ability to perform perceptual operations. Subtypes of each form exist based on the type of visual stimulus the person has difficulty recognizing, such as objects (visual object agnosia or visual form agnosia), multiple objects or pictures (simultanagnosia), or colors (color agnosia). See also integrative agnosia; prosopagnosia.

visual agraphe  an impaired ability to write resulting from a failure to recognize letters, numbers, or words. The condition is caused by lesions in the occipitoparietal area of the brain. See aphasia.

visual allesthesias (visual allaeesthesia)  see allaeesthesia.

visual amnesia  loss of the ability to recognize familiar objects, printed words, or handwriting by sight, due to neurological disease or injury.

visual analogue scale  a psychometric instrument used to evaluate subjective characteristics that extend over a range of continuous values. Respondents specify their level of the characteristic of interest by indicating a position along a continuous line, anchored at its end points by word descriptors. For example, a visual analogue scale for performance might have poor on the left end with a blank line across to excellent on the right end. The respondent would mark a place along that line to indicate his or her perceived performance level. Also called unnumbered graphic rating scale.

visual angle  the angle subtended by a visual target at the nodal point of the eye. The width of an adult thumb at arm's length subtends about 1° of visual angle, and there are 360° of visual angle around the entire head.

visual anosmia  failure to name visual stimuli correctly despite intact visual recognition.

visual anognosia  see Antón's syndrome.

visual apperception test  a projective technique in which participants (most often children and adolescents) are presented with a visually oriented task, such as drawing a person, object, or situation; finishing an incomplete drawing; or creating a narrative from a single or multiple visual stimuli.

visual area  any of many regions of the cerebral cortex in which the neurons are primarily sensitive to visual stimulation. Together, all the visual areas comprise the visual cortex. Most visual areas can be distinguished from one another on the basis of their anatomical connections (i.e., their cytoarchitecture) and their specific visual sensitivities. Individual areas are designated by "V" and a number that indicates roughly how distant the area is from striate cortex. See V1; V2; V3; V4; V5.

visual area MT  see V5.

visual association cortex  any of the visual areas in the cerebral cortex that lie outside the striate cortex, including V2, V3, V4, and V5. See also prestriate cortex.

visual attention  the process by which one item (the target) is selected for analysis from among several competing items (the distractors). See also feature-integration theory.

visual attention disorder  any disturbance of a person's ability to detect and attend to visual stimuli. Examples include Balint's syndrome and visual neglect. See also perceptual extinction.

visual aura  see aura.

visual axis  a straight line that extends from the external fixation point through the nodal point of the eye to the fovea. Compare primary line of sight.

visual blurring  the sensation resulting from impairment of the ability to perceive form in the central field region, which is typically associated with poor visual acuity and reduced spatial contrast sensitivity. Visual blurring can occur as a result of retinal disease (e.g., macular degeneration, diabetic retinopathy) or damage to the optic nerve (e.g., associated with multiple sclerosis) or visual cortex; it has also been reported as a side effect of anticholinergic drugs and as a consequence of accommodative spasm. Patients experience difficulties with reading and face perception (especially in black-and-white photographs).

visual cache  see visuospatial sketchpad.

visual capture  the tendency for vision to override the other senses. It is responsible for the ventriloquism effect.

visual cliff  an apparatus to investigate the development of depth perception in nonverbal human infants and in nonhuman animals, and in particular, whether depth perception is an innate ability or learned through visuomotor experience. The apparatus consists of a table with a checkered pattern, dropping steeply down a “cliff” to a surface with the same pattern some distance below the tabletop. The apparatus is covered with a transparent surface, and the participant is positioned on this at the border between the tabletop and the cliff. Reluctance to crawl onto the surface covering the cliff is taken as an indication that the participant can discriminate the apparent difference in depth between the two sides of the apparatus. Most infants as young as 6 months of age will not cross to the side over the cliff, [devised by Eleanor J. Gibson and Richard D. Walk]

visual closure  the ability to identify a familiar object from an incomplete visual presentation.

visual comfort probability (VCP)  a measure of the acceptability of discomfort glare (interference with vision caused by excessive illumination), calculated as the percentage of users who are likely to find the level of glare in a room or work area acceptable.

visual communication  the use of distinctive colors, shapes, or movements that are detected by the visual system as a means of communication between individuals. For example, nonhuman animals may have distinctive colors in the breeding season to indicate reproductive state, fluff out fur to appear larger in a threat context, or gesture with limbs or head in a variety of other contexts.
visual consciousness

visual consciousness those contents of consciousness that have a visual origin. Operationally, such consciousness consists of those visual events that can be reported, distinguished from each other, and acted upon on request. Given these criteria, visual consciousness does not include blindsight.

visual constructional impairment see visuoconstructual impairment.

visual-construction test see visuoconstructive test.

visual cortex the cerebral cortex of the occipital lobe, specifically the STRIATE CORTEX (primary visual cortex). In humans, this occupies a small region on the lateral surface of the occipital pole of the brain, but most is buried in the banks of the calcarine fissure on the medial surface of the brain. The visual cortex receives input directly from the LATERAL GENICULATE NUCLEUS via the OPTIC TRACT and sends output to the multiple visual areas that make up the VISUAL ASSOCIATION CORTEX.

visual cycle the biophysical and biochemical sequence of events that includes the release of all-trans rhodopsin during light stimulation, followed by its conversion to 11-cis retinal in the retinal PIGMENT EPITHELIUM, and then the return of the 11-cis retinal to the photoreceptor for the reconstitution of rhodopsin.

visual discrimination the ability to distinguish shapes, patterns, hidden figures, or other images from similar objects that differ in subtle ways.

visual dominance 1. the phenomenon in which visual stimuli, when presented simultaneously with auditory or other stimuli, tend to dominate awareness. 2. the phenomenon in which the view from one eye dominates the perceiving when viewing a scene with two eyes. See ocular dominance.

visual dyslexia a form of acquired dyslexia characterized by multiple reading errors involving the substitution or transposition of letters within words (see paralexia). The resulting misread words are often very similar to the actual words (e.g., reading wife as life, or buy as dug). [proposed in 1973 by British neuropsychologists John C. Marshall (1939–2007) and Freda Newcombe (1925–2001)]

visual encoding the neural processes by which stimuli seen in the external world are converted into internal (mental) representations that can subsequently be processed and stored in memory. For example, when a person looks at a photograph, photoreceptors in the individual’s retina receive the visual sensory information and convey it to additional neurons, which in turn convey the information to populations of retinal ganglion cells. The cyindrical extensions (axons) of the retinal ganglion cells form the optic nerve, which projects to the lateral geniculate nucleus in the thalamus and the superior colliculus in the midbrain. The sensory input reaches visual areas in the cerebral cortex and ultimately the hippocampus within the medial temporal lobe, where—by mechanisms yet to be explained—it is analyzed and combined with input from the amygdala, entorhinal cortex, and other brain regions into a single abstract representation of the visual experience that is suitable for incorporation into short-term and possibly long-term memory. In other words, visual encoding may be conceptualized as a process intermediate to the extraction of meaning. Parallel neural conversion processes occur for stimuli that are heard [acoustic encoding], smelled (olfactory encoding), tasted (gustatory encoding), or felt (tactile encoding).

visual environment in natural or built settings, the aggregate of external features (e.g., objects) and conditions (e.g., light) that surround an organism and influence its visually guided behavior.

visual evoked potential (VEP) an electric potential recorded from the scalp overlying the visual cortex in response to visual stimulation.

visual extinction a form of VISUAL NEGLECT in which a previously visible stimulus in one half of the visual field is not consciously reported when a second stimulus appears simultaneously in the other half of the visual field. Visual extinction occurs as a result of brain damage, usually to the parieto-occipital cortex contralateral to the visual field in which the extinction occurs.

visual fatigue the fading of visual images, particularly in bright light. Visual fatigue is often experienced by patients with optic neuritis; it can also occur after head injuries, especially following prolonged periods of visual testing or reading, as a result of reduced visual attention.

visual field the extent of visual space over which vision is possible with the eyes held in a fixed position. In humans, the outer limit of vision for each eye extends approximately 60° nasally, 90° temporally, 50° superiorly, and 70° inferi orly. The extent varies with age: Very young children and older people have a smaller visual field. Objects nearest to the fixation point are seen with greatest clarity because visual acuity, spatial contrast sensitivity, and color vision are best in the foveal region.

visual field defect a reduction in the normal extent of the visual field, characterized by partial or total blindness. This is caused by an interruption in the flow of visual impulses between the retina and the visual cortex, which may be caused by a lesion before, after, or in the optic chiasm or in all or a part of the optic radiations; it can involve tracts of one or both eyes. Each possible lesion produces a different effect.

visual field sparing the extent to which normal vision is preserved in a visually impaired or deprived half of a visual field, expressed in degrees of visual angle measured from the fovea. Foveal sparing means that the foveal region (1°) is spared; macular sparing refers to the preservation of the macular region (5°); macular splitting denotes sparing ranging from 1° to 5°.

visual fixation the orientation of the eyes so that the image of a viewed object falls on each fovea, in the central part of the retina.

visual form agnosia see VISUAL AGNOSIA.

visual form discrimination the ability to discriminate visually between different shapes. The Visual Form Discrimination Test (VFDT), a multiple-choice, matching-to-sample test developed in the 1980s by Arthur L. Benton, assesses an individual’s ability to discriminate fine details of visual shapes and is designed to screen for visual perceptual deficits. Each of the 16 test items contains a target with three elements: two large geometric shapes and a peripheral figure. The task is to choose a correct match to the target out of four options presented below the target. Up to 2 points are awarded for responses to each of the 16 test items, with the total score for all items then compared to normative data.
visual function the ability to process visual stimuli.

visual hallucination visual perception in the absence of any external stimulus. Visual hallucinations may be unformed (e.g., shapes, colors) or complex (e.g., figures, faces, scenes). In hallucination associated with psychoses (e.g., paranoid schizophrenia, alcohol- or hallucinogen-induced psychotic disorder), the individual is unaware of the unreality of the perception, whereas insight is retained in other conditions (e.g., pathological states of the visual system). Visual hallucinations may arise in association with lesions of the peripheral or central visual pathway or visual cortical areas; they are often present in temporal-lobe epilepsy or in the visual system.

visual imagery mental imagery that involves the sense of having “pictures” in the mind. Such images may be memories of earlier visual experiences or syntheses produced by the imagination (e.g., visualizing a pink kangaroo). Visual imagery can be used for such purposes as dealing with traumatic events, establishing de-sensitization hierarchies, or improving physical performance. See visualization.

visual impairment partial or total inability to see, or to see normally, due to partial or complete loss or absence of vision or to visual dysfunction. Visual impairment encompasses the continuum from blindness to low vision. It can result from disease or degenerative disorder (e.g., cataract, glaucoma, diabetic retinopathy, macular degeneration), injury, or congenital defects (e.g., refractive errors, astigmatism). The degree of visual impairment is assessed in terms of disability in everyday life. Also called vision impairment. See also adventitious visual impairment.

visual indexing theory see finst theory.

visual induction the influence that one visual stimulus or part of the visual field can have on the perception of an adjacent stimulus or the remainder of the visual field. Color contrast effects are examples of visual induction.

visualization n. 1. the process of creating a visual image in one’s mind (see visual imagery) or mentally rehearsing a planned movement in order to learn skills or enhance performance. 2. in psychotherapy, the intentional formation by a client of mental visual images of a scene or historical incident that may be inhibited or the source of anxiety. The purpose is to bring the visualized scene into the present therapeutic situation where it can be discussed and worked out to reduce its negative implications. See also guided affective imagery. 3. a hypnotic method used to induce or increase relaxation in which the individual is asked to imagine, for example, sitting comfortably at home and then to use all senses in perceiving the scene (e.g., the curtains blowing in the windows, the texture of the armchair). The more fully the individual concentrates on these features, the more deeply relaxed he or she becomes. 4. in consumer psychology, a motivation-research technique using imaginary or fictitious situations or conditions in order to induce consumers to reveal the true reasons for their choice of products. For example, instead of being asked why they like or dislike a product, consumers may be asked to characterize the type of individual they would expect to buy the product. —visualize vb.

visual learning training or conditioning that depends upon visual cues. The brain center for visual learning is believed to be in the inferior temporal cortex, where cortical cells have been demonstrated to be highly active in analyzing visual inputs.

visually guided reaching movements in which concurrent visual information is used to locate a target and avoid obstacles. Visually guided reaching is contrasted with movements to remembered, but unseen, targets and with movements guided by other senses (e.g., touch).

visual masking the ability of one visual stimulus to render another stimulus invisible. See masking.

visual memory the capacity to remember what has previously been seen in the form of visual images. Compare motor memory; verbal memory.

visual memory span see memory span.

visual–motor coordination the ability to synchronize visual information with the movements of different parts of the body.

visual narrative see verbal narrative.

visual neglect a form of neglect in which the individual is unaware of one side of the visual field. This occurs most often in the left visual field following right parietal damage or dysfunction. See also unilateral neglect.

visual object agnosia see visual agnosia.

visual organization in gestalt principles of perception, a visual field that appears to be organized and meaningful.

visual organization test any test that involves the organization of visual, nonverbal stimuli.

visual perception the awareness of visual sensations that arises from the interplay between the physiology of the visual system and the internal and external environments of the observer.

visual perseveration see palinopsia.

visual persistence a sensation of visual stimulation that continues briefly after the actual stimulus is extinguished, perhaps caused by integration lag of visual signals. The light trail of a glowing stick moved rapidly in the dark is an example of visual persistence. Also called persistence of vision.

visual phosphene see photopigment.

visual pigment see photopigment.

visual-placing reflex the reflex act of animals in placing their legs to reach a surface they can see. Animals that have undergone surgical decortication may lose this normally automatic response and fail to stretch their legs toward a visible surface.

visual preference paradigm a research technique for studying visual discrimination in infants in which the amount of time spent looking at different visual stimuli is measured to determine which stimulus the infants prefer. It is assumed that the stimulus looked at most often is the one
visual processing

described by a preference for one of two dimensional figures or by the perception of visual stimulation. The anterior structures of the eye, such as the cornea and lens, focus light on the retina, which transduces photons into neural signals. These are transmitted via the optic nerve and optic tract to nuclei in the thalamus and brainstem. These in turn transmit the signals either to the visual areas of the cerebral cortex for hierarchical processing and conscious analysis or directly to motor centers in the brainstem and spinal cord to produce eye movements.

visual texture an attribute of a two-dimensional figure or a two-dimensional rendering of a three-dimensional object that describes its surface characteristics. Visual texture is related to, but not the same as, texture in the tactile sense. For example, the words shiny or speckled describe visual texture, whereas smooth or wavy can also describe tactile texture. Gradients of visual texture are often used to infer depth in a two-dimensional scene and also indicate slant.

visual threshold 1. the minimum level of stimulation that can be detected visually. 2. any of the thresholds for detecting various aspects of visual stimulation, including intensity, resolution, contrast sensitivity, movement acuities, position acuities, and so on.

visual tracking see VIRTUAL PURSUIT.

visual transduction the biochemical and biophysical process in which light energy is converted to a neural signal in a photosensitive cell containing a retinal photoreceptor. See also ISOMERIZATION; VISUAL CYCLE.

visual word-form dyslexia an acquired dyslexia characterized by difficulties related to analyzing the attributes of written words visually. Its major types include central dyslexia, neglect dyslexia, and spelling dyslexia. Also called peripheral dyslexia; word-form dyslexia. Compare CENTRAL DYSLEXIA.

visual yellow the bleached form of the photopigment rhodopsin, all-trans retinal. Also called xanthopsin. See pigment bleaching.

visual constructional impairment an impairment characterized by difficulty in construction tasks, such as drawing or assembling the various parts of an object into a complete structure. See CONSTRUCTIONAL APRAXIA. Also called visual constructional impairment.

visual constructive test any of a wide range of tests that require a combination of visual and motor skills in the construction of an end product as an evaluation of these nonverbal skills. The most common examples of these tests are drawing tests, BLOCK-DESIGN TESTS, and jigsaw-puzzle tests. Also called visual-construction test.

visual motor ataxia see OPTIC ATAXIA.

visualmotor behavior rehearsal a program of combining PROGRESSIVE RELAXATION and imagery for performance enhancement.

visualspatial agnosia a disorder of spatial orientation, which may be tested by asking the individual to point to objects or other stimuli located in different parts of his or
her visual field. Individuals can report objects in their visual fields but not the spatial relationships of the objects to one another.

**visuospatial function** the ability to perceive the spatial (relational) aspects of a figure or object in two and three dimensions.

**visuospatial sketchpad** in the model of **working memory** proposed in 1974 by British cognitive psychologists Alan D. Baddeley (1934—) and Graham J. Hitch (1946—), a component that briefly holds and manipulates information about the appearance of objects and their location in space. For example, if one tried to determine which of two countries is larger or to rate their proximity to one another, this would involve mentally picturing and comparing both countries within the visuospatial sketchpad. As with the analogous **phonological loop** for sound, the visuospatial sketchpad is divided into two parts: the **visual cache**, specializing in information about form, color, and other aspects of visual identity, and the **inner scribe**, specializing in information about spatial location and movement representation and planning. Although not as extensively researched as the phonological loop, the idea of the sketchpad and its conceptualization as a multidimensional structure is increasingly supported by neuropsychological and functional imaging evidence in addition to experimental findings. Other components of the Baddeley and Hitch working memory model include the **central executive** and the more recently introduced **episodic buffer**.

**visuotopic map** see **retinotopic map**.

**vital capacity** the capacity of the lungs to hold air, measured as the maximum volume of air that can be exhaled after maximum inspiration.

**vital exhaustion** a state characterized by excessive fatigue, lack of energy, increased irritability, sleep disturbances, and feelings of demoralization. It has been associated with increased risk of cardiovascular disease and cardiovascular-related events, particularly myocardial infarction and cardiac arrest. See also **burnout**. [defined and first investigated in the 1980s by Dutch researcher A. Appels and colleagues]

**vital functions** functions of the body (e.g., respiration, blood circulation, excretion) that are necessary to sustain life. Many vital functions are controlled by the brainstem.

**vitalism** n. 1. the theory that the functions of living organisms are determined, at least in part, by a life force or principle. German biologist Hans Driesch (1867–1941) was the chief exponent of this view, holding that life processes are autonomous and purposive and that potentialities for growth and development are realized through the operation of an agent to which he applied the term **entelechy**. French philosopher Henri Bergson (1859–1941) named this creative, vital force the **élan vital**. 2. more generally, any theory that opposes **naturalism** and the reduction of psychological life to biological structures and processes. —vitalist adj., n.

**vitality** n. physical or intellectual vigor or energy: zest. See also **fitness**.

**vital spirits** see **animal spirits**.

**vital statistics** data, such as those compiled in a medical or governmental record, on specific life events (e.g., birth, death, disease, marriage) in a population.
vitreous humor | the thick, transparent fluid filling the cavity (the vitreous body) between the lens of the eye and the retina.

viviparity | n. literally, live birth: reproduction in which the embryo develops within the female until a well-formed individual emerges. Compare OVIPARITY. —viviparous adj.

vivisection | n. dissection performed on a living animal for research or experimental purposes. Many scientists and researchers oppose the practice, questioning its scientific validity and necessity, and numerous others criticize it as inhumane and unethical. See also ANIMAL CARE AND USE; ANIMAL RIGHTS.

Vivitrol | n. a trade name for NALTREXONE.

VLBW | abbreviation for very LOW BIRTH WEIGHT.

VMH | abbreviation for VENTROMEDIAL HYPOTHALAMUS.

VMI | abbreviation for DEVELOPMENTAL TEST OF VISUAL—MOTOR INTEGRATION.

VNO | abbreviation for vomeronasal organ (see VOMERONASAL SYSTEM).

vocabulary growth | the development of vocabulary in children. In estimating vocabulary size, a distinction is commonly drawn between RECEPTIVE VOCABULARY and PRODUCTION VOCABULARY: more recent research has concentrated on the process of vocabulary acquisition and the organization of the child’s MENTAL VOCABULARY.

vocabulary spurt | see NAMING EXPLOSION.

vocabulary test | a test designed to determine the number and level of words that an individual can use (i.e., PRODUCtIVE VOCABULARY) or understand (i.e., RECEPtIVE VOCABULARY).

vocal communication | communication through auditory signals usually produced by a vibrating organ, such as the larynx in the throats of some mammals or the two syrinxes located in the bronchial branches in birds. Vibrations produced by these organs are altered by changing configurations of the tongue and lips and the shape of the oral and nasal cavities. Other sound-producing mechanisms in nonhuman animals include STRIDULATION, the rubbing together of body parts, as in crickets. See also ANIMAL VOCALIZATION.

vocal cords | a pair of tissue folds that project from the walls of the LARYNX. They vibrate, producing sounds, when expired air passes through the narrow space (GLOTTIS) between them. Also called VOCAL FOLDS.

vocal-image voice | audible speech patterns that have been electronically transformed into visual patterns that can be read by people with severe hearing loss.

vocalization | n. the production of sounds by means of vibrations of the vocal cords, as in speaking, babbling, singing, screaming, and so forth. See also ANIMAL VOCALIZATION. —vocalize vb.

c vocal reaction time | in studies of cognition, the time that a participant takes to begin a spoken response to a stimulus. See REACTION TIME.

vocal register | the tonal or pitch range of an individual’s voice. See also CHEST VOICE; FALSETTO; HEAD VOICE.

vocal tract | the structures, collectively, that are involved in vocalization, including the VOCAL CORDS and glottis of the larynx together with the pharynx, nasal cavity, mouth, and ARTICulators.

vocation | n. an occupation or profession to which one is particularly suited, especially one involving a sense of mission or calling. —vocational adj.

vocational adjustment | the degree to which an individual succeeds in choosing the kind of work or career best suited to his or her interests, traits, and talents. The term differs from OCCUPATIONAL ADJUSTMENT in emphasizing the match of career to personal goals and aptitudes, rather than the match of the individual to objective work conditions.

vocational appraisal | the prediction by a vocational counselor of a client’s potential for success and fulfillment in a particular occupation. A vocational appraisal is based on the counselor’s understanding of occupational opportunities in relation to the client’s personality, intelligence, abilities, and interests as revealed in interviews and tests. See VOCATIONAL COUNSELING.

vocational aptitude | the personal abilities and traits required for successful performance of the tasks involved in a particular occupation.

vocational aptitude test | any instrument designed to assess the abilities, interests, personality traits, and other factors deemed essential for success in a particular occupation. Such tests are often used to assess how well the participant’s profile on these dimensions matches the profile of the typical or ideal person in the occupation.

vocational counseling | 1. a service provided to employees who seek guidance on such matters as adjusting to new jobs or roles, developing their careers within organizations, or any personal or other problems affecting job satisfaction or job performance. See also OUTPLACEMENT COUNSELING. 2. see VOCATIONAL GUIDANCE.

vocational education | see VOCATIONAL TRAINING.

vocational guidance | the process of helping an individual to choose an appropriate vocation through such means as (a) in-depth interviews; (b) administration of aptitude, interest, and personality tests; and (c) discussion of the nature and requirements of specific types of work in which the individual expresses an interest. Also called VOCATIONAL COUNSELING.

vocational maturity | a developmentally advanced and competent orientation to issues of employment and occupational choice. A person with high vocational maturity is realistic about his or her options and takes a relatively rational approach to exploring the possibilities and making career decisions.

vocational rehabilitation | a program designed to develop or restore PRODUCTIVITY in individuals with mental or physical disabilities or those who have been injured or ill. A vocational rehabilitation program includes assessment, VOCATIONAL GUIDANCE, and training; it involves helping the individual to develop skills that have been lost or neglected and to find or return to employment in the competitive job market or another setting (see SHELTERED WORKSHOP; TRANSITIONAL EMPLOYMENT). Also called OCCUPATIONAL REHABILITATION. See also WORK REHABILITATION CENTER.

vocational services | VOCATIONAL GUIDANCE, aptitude testing, and VOCATIONAL TRAINING, together with practical
assistance in finding employment, as provided by a school, college, hospital, clinic, or rehabilitation center.

vocational training an organized program of instruction designed to equip individuals with the requisite skills and qualifications for placement in specific jobs or trades. Also called vocational education. See also VOCATIONAL REHABILITATION.

vodun n. see VOODOO.

voice n. 1. the sound produced by the larynx and modified by other elements of the vocal tract (e.g., lips, tongue) before it issues from the mouth. 2. in phonetics, the quality of a VOICED, as opposed to an UNVOICED, speech sound. 3. in linguistics, see ACTIVE VOICE; PASSIVE VOICE. 4. the distinctive tone or quality of a person’s speaking or singing voice.

voice-activated control see SPEECH-ACTIVATED CONTROL.

voice-activated switch an interface between a device and the user that is activated by the user’s voice and is often useful for individuals with certain disabilities. For example, an individual with a motor impairment can use a voice-activated switch to turn lights, appliances, and other household devices on and off.

voiced adj. denoting speech sounds that are articulated with accompanying vibration of the vocal cords. Voiced sounds include all the vowels, semivowels, and diphthongs, as well as a number of consonants. The dichotomy voiced—UNVOICED is an important BINARY FEATURE in English and many other languages.

voice disorder any disorder that affects the pitch, loudness, tone, or resonance of the voice.

voice key an electronic device that interfaces between a microphone and a computer, used for recording vocal response times in language-production tasks, such as word or picture naming. When a stimulus is presented the voice key is activated and begins to monitor the sound level from the microphone; if the sound level then exceeds a specific threshold level, indicating speech, the voice key records the amount of time that has elapsed since it was activated.

voiceless sound see UNVOICED.

voice-onset time (VOT) in phonetics, the brief instant that elapses between the initial movement of the speech organs as one begins to articulate a VOICED speech sound and the vibration of the vocal cord. Voice-onset time has been the subject of research in adult and infant speech perception because of evidence that this continuous acoustic dimension is perceived categorically (see CATEGORICAL PERCEPTION).

voice-output system a system that creates a voice for a computer to provide auditory feedback for individuals with visual impairment. For example, the system may create verbal output describing a computer file.

voiceprint n. a digital image of a voice, produced by electronic recording, that can be used for identification and authentication purposes. Voiceprints may also be used to analyze such vocal and speech characteristics as frequency, duration, and amplitude.

voice–stress analyzer an instrument that detects minute alterations in the voice, undetectable to the human ear, that presumably occur when a person is under stress. It is sometimes used as a lie detector, although its reliability and validity are controversial, and the results are not accepted as evidence in many U.S. courts of law.

voice therapy the diagnosis and remediation of voice disorders by a specialist in the physiology and pathology of voice production. See also SPEECH THERAPY.

voicing n. 1. the use of vocal cord vibrations to produce speech sounds. See VOICED; UNVOICED. 2. giving expression to ideas, observations, opinions, and the like through spoken communication.

voir dire the process of questioning prospective jurors to determine if they hold biases that may reasonably interfere with their ability to act impartially in a particular trial (from Norman French, literally: “to speak the truth”). The questions may be asked in private or in open court and may be posed by the attorneys, the judge, or both. Jurors may be asked to stand down by a CHALLENGE FOR CAUSE or a PEREMPTORY CHALLENGE.

volatile marriage a long-lasting marriage marked by both passionate arguments and expressions of affection, but with more positive than negative interactions.

volition n. 1. the faculty by which an individual decides upon and commits to a particular course of action, especially when this occurs without direct external influence. The term encompasses a crucial set of activities involving the self, including choice and decision, self-control, intentional action, and an active rather than passive response to events. According to SELF-REGULATORY RESOURCES THEORY, volition depends on a limited resource that is expended whenever a person makes a decision or exerts control. 2. the act of exercising this faculty. See also FREE WILL; WILL. —volitional adj.

volitional tremor see ACTION TREMOR.

volley n. a synchronous discharge, as when nerve impulses occur in phase along different fibers of a nerve.

volley theory the principle that individual fibers in an auditory nerve respond to one or another stimulus in a rapid succession of rhythmic sound stimuli, whereas other fibers in the nerve respond to the second, third, or nth stimulus. The result is that successive volleys of impulses are fired to match the inputs of stimuli, yet no single fiber is required to respond to every stimulus. Thus, a nerve can reflect a more rapid frequency of stimulation (e.g., 1000 Hz) than any individual fiber could follow. Also called volley principle. See also HEARING THEORIES. [proposed in 1949 by Ernest Glen WEVER]

volt (symbol: V) n. the SI (International System) unit for measuring the difference of electric potential between two regions.

voltage-gated ion channel an ION CHANNEL that opens or closes in response to the voltage difference across the membrane, such as the voltage-gated sodium (Na+) channel that mediates the ACTION POTENTIAL. Also called voltage-activated gate. Compare LIGAND-GATED ION CHANNEL.

tonibility n. excessive, uncontrollable talkativeness, which is a common symptom of a MANIC EPISODE.

volume color see BULKY COLOR.

volume of distribution (symbol: Vd) the amount of a drug in the body in relation to its concentration in various body fluids (e.g., blood, plasma, extracellular fluid). It is ex-
pressed by the equation $V_d = \text{dose (amount of drug in body)} / \text{concentration in body fluid}$. 

**volumetric thirst** see HYPOVOLUMIC THIRST.

voluntarism n. 1. in psychology, the view that human behaviors are, at least in part, the result of the exercise of volition. See also FREE WILL. 2. the general position that will and choice are important factors in all human activities. For example, in ethics, voluntarism emphasizes that commitment to any moral principle is, in large part, a “will to believe,” over which the person has some control. In epistemology, the same is held to be true of knowledge. In the field of historical studies, voluntarism holds that the exercise of will has been a major factor in the course of human events. It is therefore opposed to such approaches as MARXISM, which emphasizes the role of impersonal economic forces. 3. in metaphysics, the position that will, rather than mind, spirit, or some other substance, is the basis of reality. The best known philosophy of this kind is that of Arthur SCHOPENHAUER.

**voluntary** adj. describing activity, movement, behavior, or other processes produced by choice or intention and under cortical control, in contrast to automatic movements (e.g., reflexes) or action that is not intended (see IDÉOMOTOR ACTIVITY). Compare INVOLUNTARY.

voluntary admission admission of a patient to a psychiatric hospital or other inpatient unit at his or her own request, without coercion. Such hospitalization can end whenever the patient sees fit, unlike INVOLUNTARY HOSPITALIZATION, the length of which is determined by a court or the hospital. Also called voluntary commitment: voluntary hospitalization.

voluntary agencies and organizations nonprofit groups supported in whole or in part by public contributions and devoted to the amelioration of public health or social welfare problems. The term voluntary distinguishes such groups from government agencies.

voluntary attention attention that is deliberately applied and controlled by the individual, as opposed to attention that is spontaneously captured by a stimulus in the environment. Brain-activation studies have investigated the extent to which voluntary and INVOLUNTARY ATTENTION are controlled by separate neural systems. Also called endogenous attention. Compare POSTVOLUNTARY ATTENTION. See also SECONDARY ATTENTION.

voluntary behavior behavior that is intentional in nature (e.g., walking, typing), as opposed to reflexive behavior. See also OPERANT BEHAVIOR.

voluntary commitment see VOLUNTARY ADMISSION.

voluntary dehydration see DEHYDRATION.

voluntary hospitalization see VOLUNTARY ADMISSION.

voluntary muscle see SKELETAL MUSCLE.

voluntary response a deliberately chosen reaction to a stimulus that may require a complex coordination of excitatory and inhibitory impulses with feedback from visual, motor, and other systems.

voluntary retrieval see INVOLUNTARY RETRIEVAL.

voluntary turnover the number of employees who choose to leave an organization or unit during a given period, usually to take a position in another organization. A high rate of voluntary turnover can be an indicator of low job satisfaction. Compare INVOLUNTARY Turnover. See Turnover.

volunteer n. an individual who contributes his or her services through personal choice and without compensation, for example, to a public or private health or social welfare agency or organization.

volunteer bias any systematic difference between individuals who volunteer to be in a study versus those who do not, which may potentially render the resulting group or sample of participants unrepresentative of the larger population.

volunteerism n. the act or practice of donating (i.e., giving without pay) one’s time and energy to activities that contribute to the common good.

vomeronasal system a set of specialized receptor cells that in nonhuman mammals is sensitive to PHEROMONES and thus plays an important role in the sexual behavior and reproductive physiology of these animals. In humans, this system responds physiologically to chemical stimulation and, in turn, excites brain centers, but its role in human olfaction is not known. Also called Jacobson’s organ: vomeronasal organ (VNO).

vomiting n. ejecting the contents of the stomach through the mouth. Normally occurring as an autonomic physiological reaction, vomiting may also be self-induced, as in BULIMIA NERVOSA, as an inappropriate means of managing body weight (see PURGING).

vomiting center a nerve center in the medulla oblongata of the brain that is thought to partially govern vomiting. Another area, the CHEMORECEPTOR TRIGGER ZONE, also contributes to vomiting.

von Domarus principle an explanation of SCHIZOPHRENIC THINKING based on the concept that the individual perceives two things as identical merely because they have identical predicates or properties. [developed by Eilhard von Domarus, 20th-century German psychiatrist]

von Economo’s disease see ENCEFALITIS LETHARGICA. [Constantin von Economo (1876–1931), Austrian neurologist]

von Frey hairs see ESTHESIOLOGY. [Maximilian von Frey (1852–1932), German physiologist]

von Frey specificity theory a 19th-century theory, now disputed, that attempted to explain sensations of coldness, warmth, contact, and pain by linking them to different, specific receptors in the skin. The von Frey theory was premature, because not enough was known about anatomy at the time. [proposed in 1894 by Maximilian von Frey]

von Recklinghausen’s disease see NEUROFIBROMATOSIS. [described in 1882 by Friedrich D. von Recklinghausen (1833–1910), German pathologist]

von Restorff effect see DISTINCTIVENESS EFFECT. [Hedwig von Restorff (1906–1962), German psychologist]

voodoo n. a synthetist religion, practiced chiefly in the Caribbean, in which west African traditions of magic and ancestor worship are combined with rites derived in part from Roman Catholicism. These typically involve the use of singing or chanting, drumbeating, and dancing to induce an ECSTATIC TRANCE, in which it is believed that spirits take possession of the worshippers, speaking and acting
through them. Also called **vodun; voodooism. —voodooistic adj.**

**voodoo death** a CULTURE-BOUND SYNDROME observed in Haiti, Africa, Australia, and islands of the Pacific and the Caribbean. An individual who has disobeys a ritual or taboo is hexed or cursed by a medicine man or sorcerer (often through the pointing of a bone) and dies within a few days. Walter B. CANNON, one of the first researchers of voodoo death, suggested that the individual’s strong belief in the curse caused physiological reactions in the body resulting in death. Also called **bone pointing; thanatomania.** See also PSYCHIC SUICIDE.

**VOR** abbreviation for VESTIBULOCULAR REFLEX.

**VOT** 1. abbreviation for HOOPER VISUAL ORGANIZATION TEST. 2. abbreviation for VOICE-ONSET TIME.

**vowel** n. 1. a VOICED speech sound that is produced when the breath stream vibrating the vocal cords has unobstructed passage through the vocal tract. 2. one of the letters of the alphabet used to represent these sounds in writing. Compare CONSONANT.

**voyeurism** n. a PARAPHILIA in which preferred or exclusive sexual interest and arousal is focused on observing unsuspecting people who are naked, in the act of undressing, or engaging in sexual activity. Although the voyeur seeks no sexual activity with the person observed, orgasm is usually produced through masturbation during the act of "peeping" or later, while visualizing and remembering the event. Also called **inspectionalism.** See also PEERING TOM. —voyeuristic adj.

**vPCC** abbreviation for ventral POSTERIOR CINGULATE CORTEX.

**VPS** abbreviation for VALUES AND PREFERENCES SCALE.

**VR** abbreviation for variable ratio. See VARIABLE-RATIO SCHEDULE.

**Vroom—Yetton—Jago decision model** a model that can be used by leaders in judging how much they should allow followers to participate in decision making in different situations. The model consists of a set of decision rules and a decision tree in which the leader assesses several key situational attributes, such as the nature of the task (e.g., whether high or low in TASK STRUCTURE), the degree of conflict expected among followers over preferred solutions, the degree of confidence that followers will accept decisions they do not agree with, and the extent to which such acceptance is important. On the basis of this assessment, the leader chooses from among several degrees of employee participation, ranging from autocratic decision making by the leader, through consultative approaches, to full participation and delegation. [Victor H. **Vroom** (1932– ), Canadian organizational psychologist; Philip W. **Yetton** (1942– ), Australian management expert; Arthur G. **Jago** (1949– ), U.S. organizational psychologist]

**VT** 1. abbreviation for variable time. See VARIABLE-TIME SCHEDULE. 2. abbreviation for VICARIOUS TRAUMATIZATION.

**vulnerability** n. susceptibility to developing a condition, disorder, or disease when exposed to specific agents or conditions. —vulnerable adj.

**vulnerability factor** a variable that, if experienced or triggered, affects the probability that an individual will develop a condition, disorder, or disease.

**vulva** n. (pl. **vulvae**) the external female genitalia, including the CLITORIS, the LABIA, and the VESTIBULE of the VAGINA. Also called **puendum.** —vulval adj.

**vulval orgasm** orgasm produced from stimulation of the VULVA (including the clitoris and labia). Sex researchers Josephine Singer and Irving Singer proposed in 1974 that there are two types of orgasm, vulval orgasm and uterine orgasm, the latter involving deep vaginal penetration that results in contractions of the uterus during orgasm. Uterine contractions are said not to occur with vulval orgasms; they are also said to result in a more complete or satisfying orgasm from intercourse than from stimulation of the vulva alone. However, many women have reported that whether uterine contractions accompany orgasm does not depend on the type of stimulation or sexual activity but rather on how intense the orgasm is, and that the most intense orgasms occur during activities such as cunnilingus or vibrator stimulation of the clitoris. See also VAGINAL ORGASM.

**vulvectomy** n. the surgical excision of all or part of the VULVA (external female genitalia). A vulvectomy is performed as a form of treatment for cancer of the vulva. It is also traditionally performed for cultural reasons (see FEMALE GENITAL MUTILATION).

**Vygotskian theory of intelligence** the theory that intelligence develops largely as a result of INTERNALIZATION; that is, by children absorbing what they observe in the environment and making it a part of themselves. Development occurs in part through a ZONE OF PROXIMAL DEVELOPMENT, which distinguishes what children can do on their own from what they can do with the assistance of others. [Lev **VYGOTSKY**]

**Vyvanse** n. a trade name for Lisdexamfetamine.
**W** 1. symbol for the COEFFICIENT OF CONCORDANCE. 2. symbol for the statistic obtained from the WILCOXON RANK-SUM TEST.

**Waardenburg’s syndrome** a hereditary disorder marked by a white or gray forelock, abnormal pigmentation of the iris, nerve deafness due to malfunction of the auditory nerves, and lateral displacement of the eyelids that gives the false appearance of the eyes being widely separated. [Juhn Atsushi Wada (1924–  ), Japanese-born Canadian neurologist]

**WAB** 1. abbreviation for WEIGHTED APPLICATION BLANK. 2. abbreviation for WESTERN APHASIA BATTERY.

**Wada test** a technique for determining hemispheric functions, typically memory and language, by injecting a small dose of a barbiturate into the carotid artery on one side of the head. This procedure selectively impairs the cerebral hemisphere on the injected side for 10 to 15 minutes. While each hemisphere is separately anesthetized, various cognitive tasks are administered; impairments on these tasks suggest that these functions are represented in the anesthetized hemisphere. The Wada test may be used prior to TEMPORAL LOBECTOMY in severe and intractable epilepsy. Also called intracarotid amobarbital procedure: intracarotid sodium Amytal test (ISA); Wada dominance test; Wada technique. [Juhn Atsushi Wada (1924–  ), Japanese-born Canadian neurologist]

**wage compression** an INTERNAL INEQUITY that occurs when the salary differential between newly hired employees and established employees is smaller than it should be. If left unchecked, wage compression leads to wage inversion, in which the salary of more recent employees is greater than that of established or more senior employees. **Wage expansion** is the increase in salaries of established employees as a countermeasure to wage compression. Also called salary compression. See also EXTERNAL INEQUITY; OVERPAYMENT INEQUALITY; UNDERPAYMENT INEQUALITY.

**wakeup dance** see BEE COMMUNICATION.

**Wagner Act** see NATIONAL LABOR RELATIONS ACT.

**Wainwright v. Witt** a case resulting in a 1985 U.S. Supreme Court decision that increased the prosecution’s ability to exclude jurors from DEATH-QUALIFIED JURIES. According to this decision, excluded jurors need not be completely opposed to the death penalty: Any doubts they have over the morality of the death penalty may justify their exclusion. This decision therefore altered the criteria for acceptance from those earlier established in Witherspoon v. Illinois (see WITHERSPOON EXCLUDABLES).

**WAIS** abbreviation for WECHSLER ADULT INTELLIGENCE SCALE.

**waist-to-hips ratio** the circumference of the waist divided by the circumference of the hips. This ratio has been widely used in cross-cultural studies of attractiveness.

**waiting-list phenomenon** in psychotherapy and counseling, the unusual occurrence of a cure in a person who is on a waiting list for treatment. Such occurrences suggest that, in and of itself, the anticipation of treatment has profound psychological effects similar to the PLACEBO EFFECT.

**wait-list control group** a group of research participants who receive the same intervention or treatment as those in the EXPERIMENTAL GROUP but at a later time. Wait-list CONTROL GROUPS commonly are used in therapy outcome and similar studies to account for the potential influence of elapsed time on treatment effectiveness; they may also be used to address the ethical ramifications of withholding treatment from individuals.

**wakfulness** n. a condition of awareness of one’s surroundings, generally coupled with an ability to communicate with others or to signal understanding of what is being communicated by others. It is characterized by low-amplitude, irregular, fast-wave electrical activity in the raw electroencephalogram.

**wake-promoting agent** a stimulant pill that contains COFFEEINE as the active ingredient and can be obtained without a doctor’s prescription. It usually contains approximately 100 mg of caffeine, equivalent to the amount in one cup of regular coffee or two cups of strong tea. Formerly known colloquially as a keep awake pill.

**waking center** an obsolete name for an area of the posterior hypothalamus formerly thought to control waking from sleep. It has now been shown that the SLEEP–WAKE CYCLE is governed by a number of areas in the brain, including the hypothalamus and RETICULAR ACTIVATING SYSTEM. See also SLEEP CENTER.

**waking dream** 1. an episode of dreamlike visual imagery that is expected when one is not asleep. The term is sometimes applied to hallucinations, religious visions, and the like. 2. a dreamlike phenomenon occurring in the GANZFEILD. 3. a dream process in the psychoanalytic theory of British psychiatrist Wilfred Bion (1897–1979).

**waking hypnosis** any technique in which hypnotic effects (see HYPNOTIC SUSCEPTIBILITY) are achieved without reference to sleep or a trance. It is induced through an apparently natural but carefully considered choice of simple words, gestures, and directives upon which to focus.

**Walden Two** the title of a 1948 novel by B. F. SKINNER set in a self-reliant experimental community based on operant conditioning principles of behavior change. The name derives from Walden, or Life in the Woods (1854), a series of essays in which U.S. naturalist and writer Henry David Thoreau (1817–1862) describes his experiences of individual self-reliance.

**Wald–Wolffowitz test** a nonparametric test of the NULL HYPOTHESIS that two samples have been taken from identical populations, based on whether the number of runs or sequences in an ordering is random. For instance, consider the following ordering of males (M) and females (F) from 1 to 27 according to their performance on a task:

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27
M M M M M F F F F F M M M M M M M M M M M M M M M M M M M M M M M
```

```text
Ww
```

**Wilcoxon rank-sum test** a nonparametric test of the NULL HYPOTHESIS that two samples have been taken from identical populations, based on whether the number of runs or sequences in an ordering is random. For instance, consider the following ordering of males (M) and females (F) from 1 to 27 according to their performance on a task:

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27
M M M M M F F F F F M M M M M M M M M M M M M M M M M M M M M M M
```
In this data set, there are nine runs. If the two samples are from the same population, then the males and females will be well mixed and the number of runs thus will be large (e.g., close to 25); if the number of runs is small, as in this example, the ordering cannot be caused by chance fluctuation and the null hypothesis thus is rejected. Also called runs test. [Abraham Wald (1902–1950), Hungarian-born mathematician; Jacob Wolfowitz (1910–1981), U.S. psychologist]

walk-in clinic a clinic in which diagnostic or therapeutic service is available without an appointment. See also DROP-IN CENTER.

walk-through performance testing (WTPT) a form of EMPLOYEE EVALUATION in which the employee is observed, interviewed, and rated as he or she performs the tasks required by the position.

Wallerian degeneration see ANTEROGRADE DEGENERATION. [Augustus Waller (1816–1870), British physiologist]

walleye n. see EXOTROPIA.

Walter Reed Army Institute of Research (WRAIR) the oldest school of public health and preventive medicine in the United States and the largest biomedical research organization serving the U.S. Department of Defense. Within its two centers—Infectious Disease Research and Military Psychiatry and Neuroscience Research—clinical trials are conducted in various areas from vaccine development to the effects of sleep deprivation, with the goal of improving soldier fitness and combat effectiveness. Headquartered in Silver Spring, Maryland, the institute was founded in 1893 as the Army Medical School. [named after U.S. Army physician Walter Reed (1851–1902)]

wandering n. a disturbance of motor activity that involves directionless, disoriented movement. This behavior typically occurs in individuals with neurological impairment, dementia, alcohol dependence, or extreme stress.

wandering attention an attention disturbance in which the individual appears fully alert but is distracted by almost any external stimulus. The condition may result from disorders of the central nervous system, such as tumors occurring higher in the neural axis than is the case in DRIFTING ATTENTION.

wanderlust n. (German: “desire for wandering”) a tendency or compulsion to travel or roam. See also DROMOMANIA.

warehousing n. the practice of confining patients with mental disorders to large institutions for long-term, often lifetime, custodial care. This colloquial term implies lack of treatment beyond housing and feeding.

warm-blooded animal see ENDOTHERM.

warm spot any point on the surface of the skin that is particularly sensitive to stimuli producing the sensation of warmth.

warm stimulus a stimulus that is above skin temperature.

warmth n. 1. the sensation experienced on the skin and some internal parts when a stimulus exceeds the normal skin temperature of about 33 °C (91 °F). However, a degree of adaptation may occur, which may cause variations in this temperature. For example, if you put your foot in a hot bath and then into a bowl of warm water, the water in the bowl will feel cool. 2. colloquially, human interest and affection.

warm-up n. 1. the use of a physical routine to prepare the body physiologically for physical exertion. 2. the use of a physical routine to prepare the motor pathways for the performance of specific skills.

warm-up effect a phenomenon observed in learning and motor tasks in which individuals perform inexactley and slowly at the start of a session, even if familiar with the task, but then progress quickly to more proficient performance.

warning coloration bright colors or patterns indicating that an organism is dangerous or palatable. Predators can learn from a single encounter to avoid other organisms with similar markings. Examples include the black and white coloration of skunks; the yellow and black markings of many stinging insects; and the red, yellow, and black bands of a coral snake. Also called aposematic coloration. See Batesian Memory.

warning overload in ergonomics and SAFETY ENGINEERING, the situation in which an operator receives visual, auditory, or other types of warnings that exceed his or her ability to process them and react appropriately. Warning overload may result from excessive visual awareness campaigns in the workplace, overreliance on auditory alerts, or excessive use of visual alerts.

war psychology the application of psychological principles and methods to military settings and operations during wartime. It covers individual and group functioning in a variety of stressful environments, especially during times of crisis. See MILITARY PSYCHOLOGY.

Warrington Recognition Memory Test see recogNITION MEMORY TEST. [Elizabeth Kerr Warrington, British neuropsychologist]

wash-out period the time frame allotted for an administered drug to be eliminated from the body or for a previously administered intervention to become ineffective. Wash-out periods are particularly important in medical and other clinical research because the CARRYOVER EFFECT between treatments might otherwise confound the estimates of treatment effects.

Wason selection task a reasoning task involving four cards, each with a letter on one side and a number on the other, and a rule supposedly governing their correlation (e.g., if the letter is a vowel, then the number is even). One side of each card is shown (e.g., the cards might show E D 3 8), and the solver is asked which cards must be turned over to determine if the rule has been followed. Most participants demonstrate a CONFIRMATION BIAS, failing to check those instances in which the rule could have been breached (e.g., by turning over E and 1). Also called four-card problem. [developed in 1966 by Peter Cathcart Wason (1924–2003), British psychologist]

waterfall illusion see MOTION AFTEREFFECT.

water-jug problem a problem-solving task in which participants are asked how they would measure out a specific amount of water using a number of jugs (often three) of specified capacity. For example, they might be asked to obtain exactly 39 ml of water using jugs that hold 207 ml, 165 ml, and 42 ml. Actual jugs are not usually provided. Also called water-jar problem. [used to investigate the EINSTELLUNG effect by U.S. psychologist Abraham S.
**water on the brain**

**water on the brain** a colloquial name for CEREBRAL EDema of HYDROCEPHALUS.

**water regulation** see Osmoregulation.

**watershed infarction** necrosis (death) of neurons due to interruption of normal blood flow to an area lying at the periphery of a vascular bed, that is, in a WATERSHED ZONE.

**watershed zone** a zone that lies between the vascular distribution areas (vascular beds) of two arteries. Although the cerebral cortex is well supplied by arteries with collateral branches, there are areas at the junction of the parietal and occipital lobes and between the parietal and temporal lobes that are watershed zones. Such areas are particularly sensitive to anoxic injury (see WATERSHED INFARCTION).

**Watson–Glaser critical thinking appraisal** a measure of CRITICAL THINKING in which participants are asked to read and evaluate various statements, such as arguments, theses, problems, and interpretations. [Goodwin B. Watson (1899–1976) and Edward Maynard Glaser (1913–1993), U.S. psychologists]

**wave-interference patterns** in holographic photography, patterns created by light waves that converge from different angles: These can be recorded on film and projected into space to create a three-dimensional image. The phenomenon has been invoked as an analogy for the ability of the mind to store spatial information and to reconstruct a three-dimensional image by recall processes.

**wavelength** n. the distance between successive peaks in a wave motion of a given FREQUENCY, such as a sound wave or a wave of electromagnetic radiation. The wavelength is equal to the speed of propagation of the wave motion divided by its frequency.

**wavelength thresholds** the minimum and maximum light or sound wavelengths that can be perceived. In the human visual system, wavelength thresholds vary somewhat with intensity but are generally around a minimum of 380 nm and a maximum of 760 nm. Rod and cone functions also may be limiting factors, and species differences account for wavelength thresholds beyond human limits. In the human auditory system, wavelength thresholds are generally between 20 Hz and 20,000 Hz. Wavelength thresholds also vary in the auditory system across species and for different intensities of sound.

**wave of excitation** in physiology, the propagation of electrical activity through tissue, as through nerve or muscle tissue.

**waxy flexibility** see CATALEPSY.

**way finding** see ROUTE LEARNING.

**Ways of Coping Questionnaire (WAYS)** a 66-item questionnaire administered to identify thoughts and behaviors that adults use to cope with stressful encounters in everyday life. It consists of statements (e.g., “I talked to someone to find out more”) to which participants must respond using a 4-point Likert scale, ranging from does not apply and/or not used to used a great deal. The WAYS measures coping processes, not coping styles. [developed by U.S. psychologists Susan Folkman (1938– ) and Richard S. Lazarus]

**WBIS** abbreviation for Wechsler–Bellevue Intelligence Scale. See WECHSLER ADULT INTELLIGENCE SCALE.

**WCST** abbreviation for WISCONSIN CARD SORTING TEST.

**weak central coherence** see CENTRAL COHERRANCE THEORY.

**weak ego** see EGO WEAKNESS.

**weak law of effect** see LAW OF EFFECT.

**weak law of large numbers** see LAW OF LARGE NUMBERS.

**weak methods** 1. problem-solving techniques based on general principles rather than specific, domain-relevant knowledge. Such methods can be applied to a wide variety of problems but may be inefficient in many cases. 2. in artificial intelligence, programs based on general principles that do not take into account knowledge specific to any particular application or domain. Compare STRONG METHODS.

**weaning** n. the process of weaning a young child or animal to obtaining all nutrients from sources other than milk. It usually refers to the cessation of breast-feeding. —wean vb.

**weaning aggression** in some species, aggression directed by mothers toward their young at the time of weaning to prevent them from suckling.

**weapon-focus effect** the tendency for eyewitnesses to focus their attention on any weapon present at the scene of a crime, thereby limiting their ability to remember other details of the crime scene, such as the perpetrator’s face.

**weapons effect** increased hostility or a heightened inclination to aggression produced by the mere sight of a weapon. If provoked, individuals who have previously been shown a weapon will behave more aggressively than those who have not. Subsequent research has indicated that this aggressive behavior is primed by the sight or suggestion of weapons (see PRIMING) and that any other object associated with aggression can have the same effect. [identified in 1967 by U.S. psychologists Leonard Berkowitz (1926– ) and Anthony LePage]

**wear-and-tear theory of aging** a theory of biological aging suggesting that aging results from an accumulation of damage to cells, tissues, and organs in the body caused by dietary toxins and environmental agents. This leads to the weakening and eventual death of the cells, tissues, and organs.

**Weber–Fechner law** see FECHNER’S LAW. [Ernst Heinrich WEBER; Gustav Theodor Fechner]

**Weber fraction** the ratio of the just noticeable difference (see DIFFERENCE THRESHOLD) to the intensity of a stimulus. Increases in the intensity of a stimulus that are just noticeably different to the observer are a constant fraction of the stimulus intensity. The size of the Weber fraction varies as a function of stimulus condition and sense modalities. See WEBER’S LAW. [Ernst Heinrich WEBER]

**Weber’s law** a mathematical model of the DIFFERENCE THRESHOLD stating that the magnitude needed to detect physical change in a stimulus is proportional to the absolute magnitude of that stimulus. Thus, the more intense the stimulus, the greater the change that must be made in it to be noticed. This can be expressed as $\Delta I/I = k$, where $\Delta I$ is the difference threshold, $I$ is the original stimulus magnitude, and $k$ is a constant called WEBER’S FRACTION. See also FECHNER’S LAW. [proposed in 1834 by Ernst Heinrich WEBER]
Wechsler Adult Intelligence Scale (WAIS) an intelligence test for individuals 16 to 90 years of age. The WAIS was originally published in 1955 (revised in 1981) as a modification of and replacement for the Wechsler-Bellevue Intelligence Scale (WBI). This consisted of subtests that yielded separate verbal and performance IQs as well as an overall IQ. The third edition (WAIS-III, 1997) included seven verbal subtests (Information, Comprehension, Arithmetic, Similarities, Digit Span, Vocabulary, Letter-Number Sequencing) and seven performance subtests (Digit Symbol, Picture Completion, Block Design, Picture Arrangement, Object Assembly, Matrix Reasoning, Symbol Search). Depending on the specific combination of subtests administered, the test yielded a Verbal Comprehension, a Perceptual Organization, a Processing Speed, and a Working Memory index score: a Verbal IQ, a Performance IQ, and a Full Scale IQ with a mean of 100 and a standard deviation of 15; or both index scores and IQs. The current version, WAIS-IV (2008), retains most of the subtests of the WAIS-III but has modified some and added three new ones (Visual Puzzles, Figure Weights, and Cancellation). Its core battery of 10 subtests yields a Full Scale IQ and index scores on the same four domains of cognitive ability (verbal comprehension, perceptual organization, processing speed, and working memory). [David Wechsler]

Wechsler Intelligence Scale for Children (WISC) an intelligence test developed in 1949 and standardized for children of ages 6 years to 16 years 11 months. It currently includes 10 core subtests (Similarities, Vocabulary, Comprehension, Block Design, Picture Concepts, Matrix Reasoning, Digit Span, Letter-Number Sequencing, Coding, Symbol Search) and five supplemental subtests (Word Reasoning, Information, Picture Completion, Arithmetic, Cancellation) that measure verbal comprehension, perceptual reasoning, processing speed, and working memory capabilities, yielding index scores for each as well as a Full Scale IQ with a mean of 100 and a standard deviation of 15. The most recent version of the test is the WISC-IV, published in 2003. [David Wechsler]

Wechsler Memory Scale (WMS) a collection of tests that assess different memory functions in individuals 16 to 90 years old. It has undergone several revisions since its original publication in 1945, including the Wechsler Memory Scale–Revised (WMS-R, 1987); the WMS-III (1997); and the most current version, the WMS-IV (2009). The latter’s standard battery measures an individual’s memory performance on seven subtests and yields scores on five indexes: Immediate Memory, Delayed Memory, Visual Memory, Visual Working Memory, and Auditory Memory. [David Wechsler]

Wechsler Preschool and Primary Scale of Intelligence (WPPSI) an intelligence test for children ages 2 years 6 months to 7 years 7 months that currently includes two working memory subtests (Picture Memory and Zoo Locations), three processing speed subtests (Bug Search, Cancellation, and Animal Coding), six verbal comprehension subtests (Information, Vocabulary, Receptive Vocabulary, Similarities, Comprehension, Picture Naming), two visual–spatial subtests (Block Design, Object Assembly), and two fluid reasoning subtests (Matrix Reasoning, Picture Concepts). These subtests yield Full Scale IQs, primary index scores, ancillary index scores, and scaled subtest scores. The WPPSI was originally published in 1967; the most recent version is the WPPSI-IV, published in 2012. [David Wechsler]

Wednesday Evening Society an informal group of Sigmund Freud’s disciples who met with him for instruction in psychoanalysis, beginning in 1902. The society evolved into the larger Vienna Psychoanalytic Society in 1910. See also VIENNESE SCHOOL.

weekend alcoholic a person who drinks alcohol to intoxication during weekends but drinks little or not at all during the week. See also BINGE DRINKING.

weekend hospitalization a form of PARTIAL HOSPITALIZATION in which psychiatric patients function in the community during the week but spend the weekend in the hospital.

weight n. 1. heaviness: the extent of downward gravitational force exerted on an object or body. 2. a coefficient or multiplier used in an equation or statistical investigation and applied to a particular variable to reflect the contribution to the data. For example, a weighted sample is one in which different values are applied to its different constituent subgroups to reflect their representation within the larger population from which it was taken. Thus, if a population is 50% male and 50% female but the sample studied is 40% and 60%, respectively, different multipliers could be used to adjust the individual subsample results to match the makeup of the population. Similarly, a weighted least squares regression is a version of ordinary least squares regression in which different variables contribute differentially to the analysis process according to their relative importance. See WEIGHTING.

weight discrimination the ability to distinguish differences in weight among stimuli.

weighted application blank (WAB) in PERSONNEL SELECTION, a scored form used to obtain and evaluate BIOGRAPHICAL DATA on a candidate for employment. The applicant’s response to each question on the form is scored according to both (a) the answer given and (b) the relative importance of the question as a means of differentiating between suitable and unsuitable candidates. Compare STANDARD APPLICATION BLANK.

weighted average an average calculated to take into account the relative importance of the items making up the average: Different values or WEIGHTS are assigned to different data points to reflect their relative contribution. For example, in examining grade-point average, one might give grades A through F the weights of 4, 3, 2, 1, and 0, respectively. One would multiply the number of A grades a student obtained by 4, the number of B grades by 3, and so forth and then divide the resulting sum by the total number of grades to obtain the student’s overall weighted average. Also called weighted mean.

weighted kappa an index of interrater agreement that takes into account the degree of disparity between the categorizations assigned by different observers. Thus, different levels of agreement contribute more or less heavily to the overall value of kappa than others. For example, if two raters differ by two categories, that difference is assigned more importance (i.e., given a greater WEIGHT) in the analysis than if they differ only by one category. See also COHEN’S KAPPA.

weighted mean see WEIGHTED AVERAGE.

weighted multidimensional scaling (WMDS) see INDIVIDUAL-DIFFERENCES SCALING.
weighting

weighting n. the process of multiplying test items, sub-tests, tests that are part of a test battery, or other measures that are components of a total score by a value or weight other than 1. If all components were to be weighted by 1, the result would be equal weighting, which is essentially no weighting.

weight regulation a process, governed by a complex array of neural mechanisms and structures (including the hypothalamus), in which the brain seeks an optimum balance between an organism’s food intake and energy expenditure after a certain body weight is achieved. A number of other factors, such as environmental stimuli, may influence the process as well.

Weight Watchers a widely available weight loss and control program that includes aspects of both SUPPORT GROUPS and SELF-HELP GROUPS.

Weismannism n. see GERM PLASM. [August Weismann (1834–1914), German cytologist]

well-being n. a state of happiness and contentment, with low levels of distress, overall good physical and mental health, and outlook, or good quality of life.

Wellbutrin n. a trade name for BUPROPION.

wellness n. a dynamic state of physical, mental, and social WELL-BEING. Some researchers and clinicians have viewed wellness as the result of four key factors over which an individual has some control: biology (i.e., body condition and fitness), environment, lifestyle, and health care management. The wellness concept is the notion that individual health care and health care programs should actively involve the promotion of good mental and physical health rather than being concerned merely with the prevention and treatment of illness and disease.

wellness program a health care program emphasizing the wellness concept.

Welsh Figure Preference Test (WFPT) a nonverbal personality assessment in which participants indicate like or dislike for each of 400 black-and-white figures varying in complexity from simple line drawings of geometric figures to detailed, multiline abstractions. Initially designed to diagnose psychiatric disorders, the WFPT currently includes several scales intended to measure a variety of constructs, both pathological (e.g., anxiety, repression) and normopathological (e.g., creativity, originality). See also BARRON–WELSH ART SCALE. [originally developed in 1949 by George S. Welsh (1918–1990), U.S. psychologist]

Weltanschauung n. any fundamental understanding of the universe and of humankind’s place within it held by a person, a culture, or a subculture (German, “world-view”). Such a worldview will be influential in the material development of a culture, as well as in those theories and philosophies that a culture may produce. It establishes the UNIVERSE OF DISCOURSE that prevails among its adherents, affecting their practical attitudes and behaviors as well as their theoretical commitments.

Werdnig–Hoffmann disease see SPINAL MUSCULAR ATROPHY. [Guido Werdnig (1862–1919), Austrian neurologist; Johann Hoffmann (1857–1919), German neurologist]

Werner syndrome see AGING DISORDER. [Carl Otto Werner (1879–1936), German physician]

Wernicke–Geschwind model an early theory of speech that integrated the roles of the receptive language cortex (WERNICKE’S AREA) and the language production cortex (BROCA’S AREA). Also called Wernicke’s theory. [first suggested in 1874 by Karl Wernicke (1848–1905), German neurologist; revived and then extended by Norman Geschwind (1926–1984), U.S. neuroscientist]

Wernicke–Korsakoff syndrome a syndrome resulting from chronic alcoholism or nutritional insufficiency. Associated with deficiency of vitamin B1 (thiamine). The syndrome is characterized by an acute confusional stage, ataxia, and oculomotor problems (see WERNICKE’S ENCEPHALOPATHY), followed by chronic changes in mental status and memory (see KORSAKOFF’S SYNDROME). Lesions are centered in the midbrain, cerebellum, and DIENCEPHALON. [Karl Wernicke; Sergei S. Korsakoff (1854–1900), Russian psychiatrist]

Wernicke’s aphasia loss of the ability to comprehend sounds or speech, in particular to understand or repeat spoken language and to name objects or qualities (see ANOMIA). It is a fluent APHASIA in which speech output is typically distorted, incorrect, or inappropriate (see PARAPHASIA). The condition is a result of brain damage, typically in the left posterior lateral temporal lobe, and may be associated with other disorders of communication, including ALEXIA, ACALCULIA, or AGRAPHIA. Also called cortical sensory aphasia: receptive aphasia: sensory aphasia. [Karl Wernicke]

Wernicke’s area a region toward the back of the superior temporal gyrus of the left hemisphere of the cerebrum containing nerve tissue associated with the interpretation of sounds. Also called Wernicke’s speech area. See also SPEECH AREA. [Karl Wernicke, who reported, in 1874, a lack of comprehension of speech in patients who had a brain lesion in that area]

Wernicke’s encephalopathy a neurological disorder caused by a deficiency of vitamin B1 (thiamine). The principal symptoms are confusion, oculomotor abnormalities (GAZE Palsy and SYNVSTAGMUS), and ataxia. The disorder is most frequently associated with chronic alcoholism but is also found in cases of pernicious anemia, gastric cancer, and malnutrition. These symptoms are likely to resolve with thiamine treatment, although most individuals then develop severe retrograde and anterograde AMNESIA as well as impairment in other areas of cognitive functioning, including executive functions (see KORSAKOFF’S SYNDROME). Also called cerebral beriberi; Wernicke’s disease. [first described in 1881 by Karl Wernicke]

Werther syndrome a CLUSTER SUICIDE induced by the suicide of a well-known or popular role model whose death is given extensive coverage by the media. The phenomenon is named for the first identified instance of media-triggered suicide, which occurred in 1774 following the publication of the novel Die Leiden des jungen Werthers (The Sorrows of Young Werther) by Johann Wolfgang von Goethe (1749–1832). The book triggered a fad, in that many young men of the time imitated the eccentric style of dress of the book’s hero, Werther, by dressing in blue and yellow. Some young men also killed themselves in the same way Werther did in the novel, causing the book to be banned in some communities.

Wessex Head Injury Matrix (WHIM) see VEGETATIVE STATE.

Westermann effect the proposal that people who grow up together in the same household do not find one another sexually attractive later in life. It is based on the
observation that people who had extensive contact with one another as children rarely ever married, despite being available as mates. [Edward Westermarck (1878–1976), U.S. pathologist]

**Western Aphasia Battery (WAB)** a test battery that evaluates numerous aspects of language—spontaneous speech, comprehension, repetition, naming, and so on—and is used to determine the severity and type of a language disturbance as well as to assess such skills as writing, reading, and calculation. The current version, *Western Aphasia Battery–Revised (WAB–R)*, was published in 2006. [developed by Canadian neurologist Andrew Kertesz (1935– )]

**Western blot** a method of detecting a particular protein molecule in a mixture (e.g., a sample from a tissue or organ). It involves separating the proteins with **gel electrophoresis**, blotting the separated proteins onto nitrocellulose, then using an isotopically labeled or enzyme-linked antibody to bind to and highlight the protein of interest. [named by analogy with **Southern blot**]

**wet dream** see **nocturnal emission**.

**wet-globe bulb temperature** a measure to account for effects of temperature and humidity and to monitor stress to prevent heat-related injuries or illnesses.

**wet nurse** a lactating woman who nurses an infant other than her own.

**Wever–Bray effect** see ** Cochlear microphonic.** [Ernest Glen Wever, U.S. psychologist; Charles W. Bray (1904–1982), U.S. otologist]

**WF** abbreviation for **WORD FLUENCY**.

**WFPT** abbreviation for **WELSH FIGURE PREFERENCE TEST**.

**WGTA** abbreviation for **WISCONSIN GENERAL TEST APPARATUS**.

**what pathway** see **ventral stream**.

**wheelchair** n. a chair with wheels designed to increase the mobility of individuals unable to walk. One of the oldest **ASSISTIVE TECHNOLOGY** devices, wheelchairs may be manually driven (i.e., self-propelled by the individual in the chair, who manually turns the wheels, or pushed by an assisting individual from behind) or motorized (battery powered).

**wheelchair sport** a type of recreational or rehabilitative activity in which individuals with physical disabilities who use wheelchairs participate in competitive individual and team sports.

**where pathway** see **dorsal stream**.

**WHIM** acronym for **Wessnex Head Injury Matrix**. See **vegetative state**.

**whiplash** n. a painful injury to the soft tissues of the neck, which can persist for months, resulting from a sudden change of motion of the body. This often occurs in car accidents in which the car is struck from behind, causing the head to be snapped back suddenly. Also called **cervical sprain syndrome**.

**Whipple’s disease** see **LIPODYSTROPHY**. [George Hoyt Whipple (1878–1976), U.S. pathologist]

**whipsawing** n. 1. Increasing productivity by pairing two or more individuals or groups on a joint task, often with a competitive orientation. The term derives from the whip-saw, a type of saw with handles on both ends of the cutting blade used by paired workers to saw large timbers. 2. undermining the unity of employees (and their unions) by pitting them against one another in competitive work settings.

**whirl sensation** the sensation of spinning, mediated by the **vestibular system**. See **dizziness; vertigo**.

**whisker barrel** a barrel-shaped column of neurons in the **somatosensory area** of some animals that receives information from a particular whisker.

**white blood cell** see **leukocyte**.

**white-collar crime** nonviolent, opportunistic criminal activities committed by people of high respectability and social status in the course of their jobs. Examples include fraud and embezzlement. [originally defined by U.S. sociologist Edwin Sutherland (1883–1950)]

**white-collar worker** an employee whose work involves very little or no physical labor, especially one in a salaried professional position. Such people have traditionally worked in an office environment. Compare blue-collar worker; pink-collar worker.

**white commissure** a bundle of myelinated fibers, both sensory and motor, that crosses from one side of the spinal cord to the other, linking the ascending and descending columns of **white matter** fibers on either side. It arches around the ventral median fissure of the spinal cord. Also called **anterior white commissure**; **ventral white commissure**.

**white light** 1. light that is a mixture of all of the visible wavelengths in the spectrum. White light can also be produced by a mixture of three single wavelengths of appropriate intensity (i.e., the **primary colors**). 2. a brilliant light reported to be experienced by some people when dying or undergoing near-death experiences. See also **perceptual constancy; brightness constancy**.

**white noise** see **noise**.

**whiteout syndrome** a psychosis occurring in individuals (e.g., arctic explorers and mountaineers) who are exposed to the same white, impoverished environment for long periods of time.

**white rami communicantes** the myelinated fibers of the preganglionic branches running from the **spinal roots** to ganglia of the **sympathetic chain** in the thoracic and upper two lumbar segments.

**whitiko** n. see **Windigo psychosis**.

**Whitten effect** the effect of **chemical communication** in inducing ovulation. In some rodent species, females ovulate when exposed to odors or scents from adult males. Other effects of chemical signals on reproduction include the **Bruc effect** and the **lee–boot effect**. See also **Vandenbergh effect**. [Wesley K. Whitten (1918–2010), Australian reproductive physiologist]

**WHO** abbreviation for **World Health Organization**.
whole-channel

whole-channel adj. denoting or relating to an approach to teaching in which information is taught using methods that engage all of the possible senses.

whole-interval recording a strategy for observing behavior that provides information about the specific timing and duration of the behavior. In whole-interval recording, the length of an observation session is identified (e.g., 1 hour) and then broken down into smaller, equal-length time periods (e.g., 10-minute intervals). An observer then records whether the behavior of interest occurs throughout an entire interval, counts the total number of intervals in which the behavior was present, and calculates what percentage of intervals that number represents. See also PARTIAL-INTERVAL RECORDING.

whole-language approach a top-down approach to teaching reading that emphasizes the reader’s active construction of meaning and often excludes the use of phonics.

whole method of learning a learning technique in which the entire block of material is memorized, as opposed to learning the material in parts. Compare PART METHOD OF LEARNING.

whole object assumption in language development, the tendency of children to suppose that a novel label refers to a whole object rather than to its parts, properties, or attributes. For example, if an adult points in the general direction of an object and uses a novel label for it, a child will assume that the whole object is the referent of the label. Compare MUTUAL EXCLUSIVITY ASSUMPTION; TAXONOMIC ASSUMPTION.

whole report a method used in studies of ICONIC MEMORY in which the participant attempts to recall all of the presented information. Compare PARTIAL REPORT.

whole-word method a widely used method of language and reading instruction based on the idea that students should grasp the meaning of entire words at a time and use complete words when they talk, without focusing on the individual sounds that make up those words. This method is based on learning strategies originally used to teach deaf children to read, although current findings show that such children actually use phonetics for learning and practicing sign language. Also called LOOK-SAY: SIGHT METHOD. Compare PHONICS. [developed by U.S. educator and cleric Thomas H. Gallaudet (1787–1851)]

whooping cough a highly contagious bacterial infection that affects the respiratory tract from the nasopharynx to the bronchioles. It is characterized by spasmodic coughing that commonly ends in a prolonged high-pitched whooping inspiration. Complications can include brain hemorrhage, convulsions, ANOXIA, and damage to vision and hearing. Also called pertussis.

Whorfian hypothesis see LINGUISTIC DETERMINISM. [Benjamin Lee Whorf (1897–1941), U.S. linguist]

WHO (10) Well-Being Index a 10-item questionnaire, commissioned by the World Health Organization, that includes negative and positive aspects of well-being in a single unidimensional scale. The index has been used to examine well-being in patients experiencing chronic diseases.

Wh- question a question that begins with Who, What, Where, When, or How.

Wicca n. see WITCHCRAFT.

Wide Range Achievement Test (WRAT) a standard assessment tool used to obtain a quick, accurate assessment of reading, spelling, and arithmetic skills. The most recent version, the Wide Range Achievement Test–Fourth Edition (WRAT–IV), was published in 2006 for use with children, adolescents, and adults in determining skill deficits as well as appropriate levels of instruction; it can be one component in identifying a learning disability. The Wide Range Achievement Test–Expanded Edition (WRAT–Expanded), published in 2001, is designed to measure academic achievement in children and adolescents. [originally developed in 1936 by Polish-born U.S. psychologist Joseph E. Jastak (1901–1979)]

wide-range test a brief screening instrument administered to gauge ability quickly and determine if a more comprehensive test is needed. Its items vary widely in difficulty so as to measure performance at very broad levels. For example, a wide-range test of vocabulary given to ninth-grade students might include simple words typically known by elementary-school students as well as complex words generally familiar only to college students.

Widow-to-Widow Program a peer support program focusing on bereavement, grief, and mourning in individuals who have lost a spouse. The program draws on the experience and compassion of people who have suffered similar losses, providing support as an alternative or complementary approach to professional GRIEF COUNSELING and therapy and to medical management. U.S. social worker Phyllis R. Silverman started the Widow-to-Widow Program in 1964; it is thought to be the first of its kind and has served as a model for many subsequent organizations.

Wiedemann syndrome see PROTEUS SYNDROME. [Hans Rudolf Wiedemann (1915–2006), German pediatrician]

Wiener Schule see VIENNESE SCHOOL.

wife beating see BATTERED WOMEN.

wife swapping see PARTNER SWAPPING.

windigo psychosis. 

Wilcoxon–Mann–Whitney test a NONPARAMETRIC TEST, used when data are rank ordered, to determine whether two INDEPENDENT SAMPLES have been drawn from the same population, on the basis of a comparison of their median values. It combines the MANN–WHITNEY U TEST and WILCOXON RANK-SUM TEST into a single statistical procedure. [Frank Wilcoxon (1892–1965), Irish-born U.S. statistician; Henry Berthold Mann (1905–2000), Austrian-born U.S. mathematician; Donald Ransom Whitney (1915–2001), U.S. statistician]

Wilcoxon rank-sum test a statistical test of centrality for ranked data that compares the median values of two INDEPENDENT SAMPLES to determine whether they have been drawn from the same population. In this NONPARAMETRIC equivalent of the T TEST, one combines the data points from the different groups into a single pool and ranks their values in ascending order. The ranks that have been assigned are, in turn, used to determine the test statistic, W, which is evaluated for statistical significance. The calculations involved in the Wilcoxon rank-sum test are nearly identical to those for the MANN–WHITNEY U TEST. [Frank Wilcoxon]

Wilcoxon signed-ranks test a NONPARAMETRIC statistical procedure used to determine whether a single sample
is derived from a population in which the median equals a specified value. The data are values obtained using a RATIO SCALE, each is subtracted from the hypothesized value of the population median, and the difference scores are then ranked. The test takes into account the direction of the differences and gives more weight to large differences than to small differences. The symbol for the test statistic is \( T \). Also called Wilcoxon \( T \) test. [Frank Wilcoxon]

**will**

1. The capacity or faculty by which a human being is able to make choices and determine his or her own behaviors in spite of influences external to the person. See FREE WILL; VOLITION.

2. A determined and persistent purpose or intent.

**will disturbance** a deficiency or lack of willpower identified by Eugen Bleuler as a basic symptom of schizophrenia. The person may appear apathetic and lacking in objectives and motivation. Another form of will disturbance is characterized by a high degree of activity that is trivial, inappropriate, or purposeless.

**will-do factors** factors contributing to an employee's performance in a job that are attributable to his or her motivation rather than to his or her knowledge and abilities (can-do factors).

**Wille zur Macht** see WILL TO POWER.

**Williams syndrome** (Williams–Barratt syndrome; Williams–Beuren syndrome) a rare autosomal dominant disorder caused by deletion of a segment of chromosome 7. In addition to the symptom of mild to moderate intellectual disability, it is characterized by FAILURE TO THRIVE, high concentrations of calcium in the blood, narrowing of blood vessels (particularly the aorta, which restricts blood flow from the heart), and unusual facial features (e.g., short nose with a broad tip, wide mouth, small chin). Individuals with Williams syndrome are highly sociable and, although their ability to perform visual–spatial tasks is typically impaired, their verbal skills are superior. Most cases are not inherited but occur randomly during the development of reproductive cells (eggs or sperm) in a parent of an affected individual. [described in the 1960s by J. C. P. Williams, 20th-century New Zealand cardiologist; Brian Gerald Barratt-Boyes (1924–2006), New Zealand cardiologist; and Alois J. Beuren (1919–1984), German cardiologist]

**Williams v. Florida** an influential 1970 U.S. Supreme Court ruling that juries of fewer than 12 people are constitutionally permissible. The court indicated that although the size of a jury is an important factor in its effectiveness, juries having as few as six members could function as effectively as juries of 12 members. This ruling was also notable for upholding the notion that in a criminal trial, the Fifth Amendment does not allow the defendant to refuse to provide to the prosecution details about his or her alibi witnesses.

**Willie M. class action** a class action lawsuit in North Carolina, settled out of court in 1979, that established a special class of children ages 18 years and younger as mandated service recipients of appropriate treatment programs and education if they have emotional, mental, or neurological disabilities and a history of violent or assaultive behavior.

**Willowbrook Consent Judgment** a landmark agreement in 1975 between agencies, parents, and friends of the court (the plaintiffs) and New York State (the defendant), detailing the rights of people with intellectual disabilities who lived at the Willowbrook State School in Staten Island, New York, for several years. It set out standards for the residents’ living environment, evaluation of services, personnel, education, recreation, food and nutrition services, dental services, psychological services, physical therapy services, speech and audiology services, medical and nursing services, safety procedures, treatment and medication, building maintenance, emergencies, records, and movement to community settings. Willowbrook State School was later renamed Staten Island Developmen-
willpower

willpower n. the ability to carry out one's intentions. See SELF-CONTROL.

will psychology see ACTION THEORY.

will therapy a form of psychotherapy based on the theory that neuroses can be avoided or overcome by asserting the will (or “counterwill”) and by achieving independence. According to this theory, will is central to personality formation and to the struggle to separate oneself from the mother psychologically, just as one is physically separated from her during birth. Also called Rankian therapy. See also BIRTH TRAUMA. [developed by Austrian psychoanalyst Otto Rank (1884–1939)]

will to live see WILL TO SURVIVE.

will to meaning the need to find a suitable meaning and purpose for one's life. Will to meaning is the basis and fundamental motivation of LOGOTHERAPY, a technique for addressing problems related to the experience of MEANINGLESSNESS. See EXISTENTIAL VACUUM.

will to power 1. in the individual psychology of Alfred ADLER, the determination to strive for superiority and domination, which he believed to be particularly strong in men who feel a need to escape the feelings of insecurity and inferiority that they associate with femininity. 2. in the thought of Friedrich NIETZSCHE, the determination to affirm oneself through courage, strength, and pride, which necessitates casting off the “slave morality” of Christianity, democracy, and false compassion. The will to power is the motive principle of the SUPERMAN. Also called Wille zur Macht.

will to survive the determination to live in spite of an adverse situation (e.g., a severe illness or disabling disorder) or extreme conditions (e.g., lack of food and water or long-term or harsh imprisonment). Also called will to live.

windigo psychosis a severe CULTURE-BOUND SYNDROME occurring among northern Algonquin Indians living in Canada and the northeastern United States. The syndrome is characterized by delusions of becoming possessed by a flesh-eating monster (the windigo) and is manifested in symptoms including depression, violence, a compulsive desire for human flesh, and sometimes actual cannibalism. The psychosis is also known by numerous variant names and spellings, among them whitiko, wihtigo, witiko, wit-tigo, witiko, and witigo.

windmill illusion an illusion of motion of rotating objects, such as windmills and automobile wheels, which appear to reverse direction intermittently.

wind tunnel a structure designed as a corridor through which air can be blown at controlled velocities and patterns of turbulence. Wind tunnels are mainly used to test the performance of aircraft or other objects or materials in a simulated outdoor environment. They may also be used in experiments to study the effects of wind or changing air pressures on the performance or behavior of humans or nonhuman animals. See also AIR-PRESSURE EFFECTS.

winkte n. see TWO-SPRIT.

win–lose dynamic the conflict-promoting processes that occur in situations in which COMPETITIVE REWARD STRUCTURES cause participants to feel they can only succeed if others fail.

winner effect in many species, the increased likelihood that an individual will win aggressive encounters as a result of having won previous encounters. The winner effect may be associated with increased levels of testosterone. Compare LOSER EFFECT.

Winsorized mean a measure of CENTRAL TENDENCY that is less sensitive to OUTLIERS than is a standard mean. To obtain a Winsorized mean, one replaces the highest and lowest values from a set of data with less extreme values, sums the values in the modified set, and calculates the average. [Charles P. Winsor (1895–1951), U.S. statistician]

Winsorizing n. an IMPUTATION strategy, intended to reduce the influence of OUTLIERS, in which extreme values in a data set are replaced with the highest and lowest remaining values before any calculations are performed. Typically, an equal number of high and low values are replaced, representing 10% to 25% of the total distribution. [Charles P. Winsor]

win–stay, lose–shift strategy in discrimination learning, a mental or behavioral strategy in which an organism continues to give the same response as long as it is being rewarded for doing so but changes the response once it is no longer being rewarded. The opposite win-shift, lose–stay strategy may also be seen: An organism changes responses when rewarded and maintains the response when not rewarded.

wireless adj. denoting or relating to communication (e.g., radio, broadcast television, Internet) without the use of wires to connect the communicating sites. Wireless communication is used both for very long-range transmission (as with communication satellites) and for very short-range transmission (to connect computers within the same building or neighborhood).

WISC abbreviation for WECHSLER INTELLIGENCE SCALE FOR CHILDREN.

Wisconsin Card Sorting Test (WCST) a test that requires participants to deduce from feedback (right vs. wrong) how to sort a series of cards depicting different geometric shapes in various colors and quantities. Once the participant has identified the underlying sorting principle (e.g., by color) and correctly sorts 10 consecutive cards, the principle is changed without notification. Although the task involves many aspects of brain function, it is primarily considered a test of EXECUTIVE FUNCTIONS, particularly abstract reasoning and cognitive flexibility in response to external changes. [originally developed in 1948 by U.S. psychologists David A. Grant (1916–1977) and Estes A. Berg]

Wisconsin General Test Apparatus (WGTA) an apparatus used to study primate learning that consists of a tray on which various objects can be placed and a movable partition over the tray separating the animal from the experimenter. A small piece of food is hidden beneath one of the objects, and the animal must displace that object to obtain the food reward. This basic design has been modified to create a number of learning tasks of varying complexity. [developed by Harry HARLOW]

wisdom n. the ability of an individual to make sound decisions, to find the right—or at least good—answers to difficult and important life questions, and to give advice about the complex problems of everyday life and interpersonal relationships. The role of knowledge and life experience and the importance of applying knowledge toward a com-
mon good through balancing one’s own, others’, and institutional interests are two perspectives that have received significant psychological study.

**wisdom of crowds** the gain in accuracy achieved when many individuals’ estimates are averaged. The phenomenon was first identified by Francis Galton after he examined the responses of contestants attempting to judge the weight of an ox; the average of all of these independent estimates was more accurate than were the individual estimates of experts.

**wish** *n.* 1. in classical psychoanalytic theory, the psychological manifestation of a biological instinct that operates on a conscious or unconscious level. 2. in general language, any desire or longing.

**wish fulfillment** in psychoanalytic theory, the gratification, in fantasy or in a dream, of a wish.

**wishful thinking** a thought process in which one interprets a fact or reality according to what one wishes or desires it to be.

**wit** *n.* 1. a mental function consisting of the ability to make amusing, incisive comments that throw light on a subject or person. 2. in psychoanalysis, a verbal retort, jibe, or pun that suddenly and strikingly releases a repressed or hidden feeling or attitude. —*witty* *adj.*

**witchcraft** *n.* 1. the supposed use of magical powers and practices, particularly to cause harm to other people or their property, including crops and livestock. In Christian countries, witches were believed to derive their powers from a pact with the devil, whom they worshipped in orgiastic rites known as witches’ sabbaths. Such beliefs led to outbreaks of fanatical persecution in the 16th and 17th centuries (so-called witch hysteria or witch mania), in which the great majority of the victims were women (especially poor, old, and illiterate women). Belief in the power of witchcraft remains prevalent in many traditional societies (notably in Africa). 2. a neopagan religion revolving around reverence for nature and goddess worship. Also called Wicca.

**witch doctor** in many traditional societies, a person believed to possess magical powers who uses these chiefly to cure sickness and protect people from the witchcraft of others. See also SHAMAN.

**withdrawal** *n.* see SUBSTANCE WITHDRAWAL.

**withdrawal design** an experimental design in which the treatment or other intervention is removed during one or more periods. A typical withdrawal design consists of three phases: an initial condition for obtaining a baseline, a condition in which the treatment is applied, and another baseline condition in which the treatment has been withdrawn. Often, the baseline condition is represented by the letter A and the treatment condition by the letter B, such that this type of withdrawal design is known as an A-B-A DESIGN. A fourth phase of reapplying the intervention may be added, as well as a fifth phase of removing the intervention, to determine whether the effect of the intervention can be reproduced.

**withdrawal-destructiveness** *n.* in the psychoanalysis of Erich Fromm, a style of relating based on withdrawal and isolation from others, destructive behavior directed toward others, or a combination of the two. Fromm held that this style of relating was motivated by a need to establish emotional distance arising from a fear of dependency.

**withdrawal dyskinesia** distortion of voluntary movements (see DYSKINESIA) associated with withdrawal from drugs or other substances.

**withdrawal reflex** a reflex that may be elicited by any painful stimulus or unexpected threat to the well-being of the individual. It is characterized by sudden movement away from the potentially damaging stimulus, which requires rapid coordination of neuromuscular units.

**withdrawing response** in behavioral psychology, any behavior designed to sever contact with a noxious stimulus. See also ESCAPE BEHAVIOR.

**withdrawn-rejected child** in sociometric measures of peer acceptance, a child who displays fearful or anxious behavior and is often perceived by peers as socially awkward. Such children are at risk for victimization by bullies. Compare AGGRESSIVE-REJECTED CHILD. See also SOCIOMETRIC STATUS.

**Witherspoon excludables** prospective jurors who so strongly oppose the death penalty that they are unwilling to consider it as a sentencing option and are therefore excludable from a DEATH-QUALIFIED JURY. The allusion is to the 1968 U.S. Supreme Court decision in Witherspoon v. Illinois. See also WAINWRIGHT V. WITT.

**within-dimension attitude consistency** the extent to which pieces of ATTITUDE-RELEVANT KNOWLEDGE related to a single underlying dimension (i.e., a distinct category of information) are evaluatively consistent with one another. If the information within each underlying dimension of the attitude is evaluatively consistent (e.g., all positive or all negative), within-dimension attitude consistency is high. However, this type of consistency does not necessarily imply that CROSS-DIMENSION ATTITUDE CONSISTENCY is high. For example, the information related to one dimension could be extremely positive and the information related to a second dimension could be extremely negative, resulting in high within-dimension consistency but low cross-dimension consistency. Likewise, high cross-dimension consistency does not necessarily imply high within-dimension consistency. See also AMBIGUITY OF AN ATTITUDE; COMPLEXITY OF AN ATTITUDE.

**within-groups design** see WITHIN-SUBJECTS DESIGN.

**within-groups variance** variation in experimental scores among identically treated individuals within the same group who experienced the same experimental conditions. It is determined through an ANALYSIS OF VARIANCE and compared with the BETWEEN-GROUPS VARIANCE to obtain an F RATIO. Also called WITHIN-SUBJECTS VARIANCE.

**within-subjects analysis of variance** a variation of the standard ANALYSIS OF VARIANCE that is applied to data from a study in which the independent variable has multiple levels and each participant experiences each treatment level or is otherwise measured more than once (see WITHIN-SUBJECTS DESIGN). Because such designs involve recording multiple responses from the same person, it is necessary to examine how each individual varies in his or her responses, so as to separate such unique fluctuation from variation that is due to the influence of the treatment under investigation. For example, a researcher studying how amount of daily walking (e.g., none, 30 minutes, 60 minutes, 90 minutes) affects quality of sleep might have participants walk each length of time across consecutive weeks and then evaluate the results using a within-subjects analysis of variance. Also called REPEATED MEASURES.
within-subjects design

analysis of variance. Compare BETWEEN-SUBJECTS ANALYSIS OF VARIANCE.

within-subjects design an experimental design in which the effects of treatments are seen through the comparison of scores of the same participant observed under all the treatment conditions. For example, teachers may want to give a pre- and postcourse survey of skills and attitudes to gauge how much both changed as a result of the course. Such a design could be analyzed with a DEPENDENT-SAMPLES T TEST, a WITHIN-SUBJECTS ANALYSIS OF VARIANCE, or an ANALYSIS OF COVARIANCE. Also called related-measures design: repeated measures design: within-groups design. Compare BETWEEN-SUBJECTS DESIGN.

within-subjects factor the independent variable under study in a WITHIN-SUBJECTS ANALYSIS OF VARIANCE. This variable has multiple levels to which each participant is exposed. For example, if a researcher is interested in job performance differences as a function of work shift length (e.g., 8 hours, 12 hours, 24 hours) and has each participant work each shift length during the study, then work shift length is a within-subjects factor. Also called within-subjects variable.

within-subjects variance see WITHIN-GROUPS VARIANCE.

witigo (witiko; wittigo) n. see WINDIGO PSYCHOSIS.

Wittmaack–Ekbom syndrome see EKBM’S SYNDROME. [Theodor Wittmaack (1817–1873), German physician; Karl-Axel Ekbom (1907–1977), Swedish physician]

Witzelsucht n. a type of joking mania (German: “compulsive wisecracking”) that is characterized by a morbid desire to tell poor jokes and meaningless stories and that can be a symptom of damage to the frontal lobe of the brain. See also MORIA.

WLM abbreviation for WOMEN’S LIBERATION MOVEMENT.

WMDSD abbreviation for weighted multidimensional scaling. See INDIVIDUAL-DIFFERENCES SCALING.

WMS abbreviation for WECHSLER MEMORY SCALE.

wobble switch an interface between a device and the user that is similar to a joystick. The switch is activated when the stick is pushed off-center in any direction and has can therefore be activated by the gross body movements of users with physical disabilities.

Wohlwill–Corino Andrade syndrome see ANDRADE’S SYNDROME.

wolf children two girls, Amala and Kamala, who were reported to have been discovered in a wolves’ den in India (in 1920) and who had adopted all of the major lupine life patterns, such as eating raw meat, howling in the night, and ambulating on all fours. When captured, they were approximately 18 months and 8 years old, respectively; Amala died within a year. Kamala lived until about age 17 (dying in 1929), having learned only minimal human behavioral skills, such as walking on two feet in a half-crouch, acquiring a very rudimentary vocabulary, wearing clothes, and running simple errands. The original account was always controversial and treated with some degree of skepticism. In 2007, a French surgeon, Serge Aroles, published a study that debunked much of the veracity of the source and some of the subsequent research. See also WILD BOY OF AVEYRON.

Wolffian duct a rudimentary duct system in the embryo that develops into structures of the male reproductive system (the epididymis, vas deferens, and seminal vesicles). In the female, the Wolffian duct does not develop. Compare MÜLLERIAN DUCT. [Kaspar F. Wolff (1734–1794), German embryologist]

Wolf–Hirschhorn syndrome see CHROMOSOME 4, DELETION OF SHORT ARM. [first described in 1965 independently by Ulrich Wolf, German geneticist, and Kurt Hirschhorn (1926– ), Austrian-born U.S. pediatrician]

Wolf Man in the annals of psychoanalysis, a landmark case reported by Sigmund Freud in 1918. It involved a conversion symptom (constipation), a phobia (for wolves and other animals), a religious obsession (piety alternating with blasphemous thoughts), and an appetite disturbance (anorexia), all of which proved to be reactions to early experiences. Freud saw this case as confirmation for his theory of infantile sexuality.

Wolman’s disease a genetic metabolic disorder characterized by a deficiency of acid lipase, an enzyme needed to break down lipid molecules. The adrenal glands become enlarged and calcified. Psychomotor development in affected infants appears delayed, and intellectual disability may be present but difficult to document because of overriding effects of vomiting, diarrhea, and other signs of acute illness. Also called primary familial xanthomatosis. [Moshe Wolman (1914–2009), Polish-born Israeli pathologist]

woman-centered psychology an approach to psychology that emphasizes the physical, psychological, and social experiences that are particularly characteristic of women. See ENGINEERING PSYCHOLOGY; FEMINIST PSYCHOLOGY.

womb envy in psychoanalytic theory, the envy felt by some men for the reproductive capacity of women, regarded as an unconscious motive that leads them to denigrate women. See also VAGINA ENVY. [proposed by Karen D. HORNEY]

womb fantasy in psychoanalytic theory, the regressive fantasy of returning to the womb or existing in the womb, usually expressed in symbolic form, such as living underwater or being alone in a cavern.

women’s liberation movement (WLM) 1. a SOCIAL MOVEMENT, derived from earlier women’s social activism (e.g., the suffragist movement of the 19th and early 20th centuries), that came into existence in the late 1960s and campaigned for a wide range of feminist goals. These included the securing of (a) equal employment and educational opportunities through legislation and government policy; (b) freedom from male domination through social action against pornography and male violence toward women; and (c) the overthrow of racism, homophobia, and capitalism, which was regarded as essential to achieving gender equality. The movement comprised numerous local women’s groups and benefited from an influx of women from the student movement, the anti–Vietnam War movement, and the Civil Rights movement. 2. more generally, a movement among some women to free themselves from the sexual DOUBLE STANDARD; from total responsibility for child rearing and homemaking; and from the traditional stereotype of women as fragile, passive, dependent individuals who are governed by emotion rather than reason. See also FEMINISM; RADICAL FEMINISM.

Women’s Sexual Interest Diagnostic Interview
word-superiority effect

(WSISD) a structured clinical interview designed to diagnose HYPOACTIVE SEXUAL DESIRE DISORDER. Available in clinician-administered and self-report versions, the WSISD consists of 39 items for evaluating signs of sexual dysfunction, such as lack of desire, arousal difficulties, inability to achieve orgasm, physical pain during intercourse, failure to find sex pleasurable, and personal distress associated with these signs. WSISD was originally developed in 2008 by U.S. psychologist Leonard R. DeRogatis (1938– ); a short form (WSID–SF) was introduced in 2010.

Woodcock–Johnson Psychoeducational Battery an assessment, now in its third edition, that measures cognitive ability and academic achievement in children, young people, or adults. The tests of cognitive ability produce a full-scale intelligence score and determine strengths and weaknesses of information processing. The tests of academic achievement assess abilities in reading, written language, mathematics, and knowledge. They also assess basic skills in each of these areas and the level of application of those skills by the person being assessed. This battery is one of the main diagnostic tools used to evaluate a student for specific learning disabilities. Test results on the cognitive portion, when combined and compared with the results of the achievement portion, reveal the learning style of a student who may have a learning disability, documented by a statistically significant numerical difference between actual performance and cognitive potential. [developed in 1977 by Richard W. Woodcock (1928– ), U.S. psychologist, and his business partner Mary E. Bonner Johnson]

wool-hwa-byung n. see HWA-BYUNG.

word approximation a speech disturbance in which conventional words are used in unconventional or inappropriate ways (as in METONYMY), or new but understandable words are constructed out of ordinary words (e.g., easily for simplify).

word-association test a test in which the participant responds to a stimulus word with the first word that comes to mind. The technique was invented by Francis Galton in 1879 for use in exploring individual differences, and Emil Kraepelin was the first to apply it to the study of abnormality. Carl Jung and other psychoanalysts later adapted it for use as a PROJECTIVE TECHNIQUE.

word attack the method used to break down an unfamiliar word into its basic PHONEMES.

word blindness see ALEXIA.

word count a study of the rate of occurrence or the prevalence of specific words in a designated sample of spoken or written speech, such as in 50 children’s books for third- and fourth-graders or in a particular presidential address.

word deafness see AUDITORY APHASIA.

word fluency (WF) the ability to list words rapidly in certain designated categories, such as words that begin with a particular letter of the alphabet. The ability is associated with a part of the brain anterior to BROCA’S AREA in the dominant frontal lobe. Individuals with lesions in that part of the brain are likely to experience word-fluency deficits in verbal tests and tasks. See also PRIMARY ABILITY.

word-form dyslexia see VISUAL WORD-FORM DYSLEXIA.

word-fragment completion task an indirect way of detecting memory for a word presented previously. A word fragment consists of some of the letters of the word with blank spaces for deleted letters: the participant’s task is to fill in the blanks. Word fragments are frequently used in tests of IMPLICIT MEMORY.

word-frequency study a study in which the frequency of to-be-remembered words is manipulated to investigate the effect of this variable on later memory. Typically, in studies of FREE RECALL, higher frequency words are better remembered, but in studies of RECOGNITION memory, lower frequency words are better remembered. See also FREQUENCY JUDGMENT.

word-gustatory synesthesia see SYNESTHESIA.

word-length effect in a test of MEMORY SPAN, the fact that one can usually remember a greater number of shorter words than longer words. Short-term retention is affected by the length of time it takes to rehearse the words.

word of mouth the unofficial channel of communication in which facts, opinions, rumors, and gossip are transmitted orally from person to person.

word realism see NOMINAL REALISM.

word-recognition skills the cluster of strategies that are used to recognize words in reading, including the instant recognition of SIGHT WORDS, the interpretation of CONTEXT CLUES, and the use of phonics and structural analysis.

word-recognition threshold in tests involving word recognition, the minimum amount of time that a word must be exposed for a person to identify it correctly.

word salad severely disorganized and virtually incomprehensible speech or writing, marked by severe LOOSENING OF ASSOCIATIONS strongly suggestive of schizophrenia. The person’s associations appear to have little or no logical connection. Also called JARGON APHASIA. See also NEOLINGUISTIC JARGON; SCHIZOPHRENIC THINKING.

word-span test a test of one’s ability to remember a list of words in sequential order.

word spurt see NAMING EXPLOSION.

word-stem completion a procedure in which participants are presented with sets of introductory letters and asked to form complete words. For example, a person given the stem de____ might respond with elevate or elephant. Numerous variations of this basic procedure exist, including ones in which only certain target words are considered correct and ones in which the complete words must fulfill certain additional criteria (e.g., be nouns, consist of five to seven letters in total) or must be provided from a previously studied list. Word-stem completion most commonly is used in cognitive research on perceptual PRIMING and IMPLICIT MEMORY. Also called STEM-COMPLETION TASK. See also COMPLETION TEST.

word-superiority effect (WSE) the finding that, when presented briefly, individual letters are more easily identified in the context of a word than when presented alone. A similar but weaker effect is obtained when letters are presented as part of a pronounceable but meaningless vowel-consonant combination, such as deet or pling. Also called REICHER–WHEELER EFFECT. See CONFIGURAL SUPERIORITY EFFECT; OBJECT-SUPERIORITY EFFECT. [first described in 1886 by James McKeen CATTELL and subsequently investigated by U.S. psychologists Gerald M. Reicher (1939– ) and Daniel D. Wheeler (1942– )].
work n. 1. any physical, mental, or emotional activity directed toward accomplishing a task or transforming inputs in the form of physical materials, information, and other resources into goods or services. 2. the tasks or duties involved in earning a livelihood. 3. in physics, the product of a force and the distance through which its point of application moves, measured in joules. —worker n.

workaholism n. the compulsive need to work and to do so to an excessive degree. A workaholic is one who has trouble refraining from work. This type of driven overinvolvement in work is often a source of significant stress, interpersonal difficulties, and health problems. Also called ergomania.

work ethic an emphasis on the importance of work or other forms of effortful activity as a social, moral, and psychological good. Associated attitudes include individualism, competitiveness, and high personal expectations, with an emphasis on self-discipline, self-improvement, and deferred gratification. The term was introduced by German sociologist Max Weber (1864–1920), who drew a celebrated correlation between the emergence of such an ethic in 16th-century Protestant thought and the origins of European capitalism. Also called Protestant work ethic. See also achievement ethic.

work evaluation see employee evaluation.

workflow integration the engineering of work tasks to provide a more efficient coordination of activities among employees involved in interdependent activities.

work-for-pay unit an inpatient or aftercare work facility constituting a component of a comprehensive rehabilitation program for patients with mental disorders. Such units offer prevocational screening and evaluation, vocational training, ego-strength assessment, and simple to complex work-related tasks, performed under supervision, for which patients receive payment. See sheltered workshop.

work group any group of people whose primary objective is to perform a set of assigned tasks. The degree to which this collection becomes a cohesive unit with a distinct identity determines whether a work group becomes a team. See also action group; task-oriented group.

working backward a problem-solving strategy in which the solver begins at the goal state and attempts to find a path back to the problem’s starting conditions. See also backward search.

working forward a problem-solving strategy in which the solver proceeds from the initial conditions to find a path to the desired goal state.

working hypothesis a provisional but empirically testable statement about the relationship between two or more variables that is readily subject to revision upon further experimentation.

working knowledge see attitude-relevant knowledge.

working memory 1. as originally described in 1960 by U.S. cognitive psychologist George Armitage Miller, U.S. experimental psychologist Eugene Galanter (1924– ), and Austrian-born U.S. neuropsychologist Karl H. Pribram, any of various hypothetical systems involved in the brief retention of information in a highly accessible state. The term has evolved, however, to refer primarily to the 1974 model of British cognitive psychologists Alan D. Baddeley (1934– ) and Graham J. Hitch (1946– ) for the short-term maintenance and manipulation of information necessary for performing complex cognitive tasks such as learning, reasoning, and comprehension. According to their multicomponent conceptualization, working memory comprises a phonological loop for temporarily manipulating and storing speech-based information and a visuo-spatial sketchpad that performs a similar function for visual and spatial information. Both are supervised by a limited capacity central executive, a control system responsible for the distribution of attention and general coordination of ongoing processes. A fourth component, the episodic buffer, was added to the model in 2000; it binds together information about the same stimulus or event from the different subsidiary systems to form an integrated representation that is essential to long-term memory storage.

The Baddeley and Hitch working memory model, which introduced an element of assessment and planning into the memory mechanism, has replaced the idea of a unitary short-term memory system and become one of the most influential and well-known concepts within memory psychology, continuing to stimulate research and debate some 40 years after its introduction. Indeed, the model has proved valuable in accounting for experimental data from a wide range of participants under a rich array of task conditions. Current interest focuses most strongly on the link between working memory and long-term memory and on the processes allowing the integration of information from the component subsystems. 2. in animal cognition, a temporally based representation of an object, stimulus, or spatial location that is used within a single trial of an experimental session to guide behavior. Delayed matching to sample, maze running, and various other tasks involving conditional discrimination are commonly used to assess working memory in nonhuman animals. For example, a rat searching a radial maze, the arms of which radiate outward from a center platform like spokes of a wheel, for a single food pellet at the end of each arm relies on working memory to retain information about which arms have already been entered so as to avoid repeating any arm while searching. Compare reference memory. [initially described in 1978 by German-born U.S. psychologist Werner Konstantin Honig (1932–2001) and subsequently elaborated by U.S. physiological psychologist David Stuart Olton (1943–1994) and various colleagues] 3. in computing, see production system.

Working Memory Index an index used in older versions of the wechsler memory scale as well as the Wechsler intelligence tests that evaluates the ability to manipulate and process visual and auditory stimuli in short-term or working memory.

working self-concept see phenomenal self.

working through 1. in psychotherapy, the process by which clients identify, explore, and deal with psychological issues, on both an intellectual and emotional level, through the presentation of such material to and in discussion with the therapist. 2. in psychoanalysis, the process by which patients gradually overcome their resistance to the disclosure of unconscious material: are brought face to face with the repressed feelings, threatening impulses, and internal conflicts at the root of their difficulties; and develop conscious ways to rebound from, resolve, or otherwise deal with these feelings, impulses, and conflicts.

working vocabulary see productive vocabulary.
work–life balance the level of involvement between the multiple roles in a person’s life, particularly as they pertain to employment and family or leisure activities. Achieving a good balance or fit is thought to increase LIFE SATISFACTION. See also QUALITY OF LIFE.

work-limit test a test in which all examinees perform the same task, with scores based on the time required for the performance.

work motivation the desire or willingness to make an effort in one’s work. Motivating factors may include salary and other benefits, desire for status and recognition, a sense of achievement, relationships with colleagues, and a feeling that one’s work is useful or important. A variety of theories of work motivation exist, including the EXISTENCE, RELATEDNESS, AND GROWTH THEORY, the JOB–CHARACTERISTICS MODEL, the PORTER–LAWLER MODEL OF MOTIVATION, the VALENCE–INSTRUMENTALITY–EXPECTANCY THEORY, and the TWO-FACTOR THEORY OF WORK MOTIVATION.

workplace violence physical force or intimidation against workers at or outside a place of employment, including threats, harassment, verbal abuse, physical assaults, and homicide.

work psychology see INDUSTRIAL AND ORGANIZATIONAL PSYCHOLOGY.

work rehabilitation center a facility in which injured employees recuperate and prepare for returning to employment. Rehabilitation efforts focus on an individual’s specific therapeutic needs, include participation in simulated work activities, and incorporate workplace education designed to prevent future injury. See also VOCATIONAL REHABILITATION.

work–rest cycle any fixed or recurring sequence in which time spent performing tasks is interspersed with rest breaks. Researchers have used SCIENTIFIC MANAGEMENT in attempts to determine empirically the ideal work–rest cycle for the optimal performance of tasks.

work-sample test in personnel selection, a job-specific test that replicates the day-to-day tasks required in the job. The applicant may be required to use actual or simulated equipment in a controlled testing situation (e.g., driving a loaded forklift around a standard course) or to respond to typical problems or scenarios that occur at work, as in an IN–BASKET TEST. See also SITUATIONAL INTERVIEW.

work satisfaction see JOB SATISFACTION.

workspace n. the physical area in which an employee performs his or her main work tasks, together with any fixed equipment. Some typical workspaces include a desk with computer, a station on an assembly line, or the cab of a vehicle.

workspace design in HUMAN ENGINEERING, the design of fixed workstations for effective, comfortable, and safe performance of tasks. Aspects of good workspace design include the placement of materials, tools, machines, and controls within easy reach (see REACH ENVIRONMENT) and a comfortable, adjustable seat adapted to the particular task. See also EQUIPMENT DESIGN; TOOL DESIGN.

work-study program any of a variety of educational programs combining classroom study with job experience for the purpose of providing students with financial assistance or practical training.

work system 1. from a traditional time and motion perspective (see TIME AND MOTION STUDY), the structures, operations, and schedules required to meet the demands of a production or process system. 2. from a more holistic, ergonomic perspective, the totality of the technological and environmental factors (physical and social) that are relevant to the human achievement of an organizational objective. See MACROERGONOMICS; SOCIOTECHNICAL SYSTEMS APPROACH; SYSTEMS ENGINEERING.

work therapy the use of compensated or uncompensated work activities as a therapeutic agent for individuals with mental or physical disorders. For example, self-esteem or interpersonal or cognitive skills may be enhanced when these individuals function in a safe, controlled environment, where they may either acquire fundamental training for new skills or receive retraining in skills that have been lost or diminished.

workup n. in health care, a total patient evaluation, which may include laboratory assessments, radiologic series, medical history, and diagnostic procedures.

world design in EXISTENTIAL PSYCHOLOGY, a person’s worldview or fundamental orientation toward life: his or her essential mode of BEING-IN-THE-WORLD. The term and concept come from the work of Swiss existential psychologist Ludwig Binswanger (1881–1966). A person’s world design includes the way in which that person integrates the totality of his or her personality with the world as he or she experiences it. In this approach, understanding a person’s world design is essential in understanding the person.

World Federation for Mental Health an international, nongovernmental association of organizations and individuals formed in 1948 to advance the prevention of mental and emotional disorders, the proper treatment and care of those with such disorders, and the promotion of mental health worldwide. The federation organizes World Mental Health Day.

World Health Organization (WHO) the directing and coordinating authority for health within the United Nations. Founded in 1948, it is responsible for providing leadership on global health matters, shaping the health research agenda, setting norms and standards, articulating evidence-based policy options, providing technical support to countries, and monitoring and assessing health trends worldwide. WHO’s six core functions are (a) promoting development through socioeconomic progress and increased resources; (b) fostering health security with regard to outbreaks of emerging and epidemic-prone diseases; (c) strengthening health care systems; (d) harnessing health-related research, information, and evidence; (e) enhancing partnerships with other international organizations and entities; and (f) improving performance through results-based management. Its headquarters are in Geneva, Switzerland.

world regions in the thought of German philosopher Martin Heidegger (1889–1976), three different aspects of a person’s lived experience characterized as three worlds simultaneously inhabited by DASEIN—the EIGENWELT, or private and subjective world; the MITWELT, or social world; and the UMWELT, or immediate physical environment.

worldview n. see WELTANSCHAUUNG.

worm n. a computer program designed to replicate itself and to pass its self-replicating code from computer to computer. See also VIREN.

worry n. a state of mental distress or agitation due to concern about an impending or anticipated event, threat, or
danger. Difficult to control, persistent and excessive worry is a primary symptom of GENERALIZED ANXIETY DISORDER. See also META-WORRY.

worse-than-average effect see BELOW-AVERAGE EFFECT.

worship n. 1. reverence or adoration for a divine or supernatural being, a person, or a principle. 2. the formal expression of RELIGIOUS FAITH in ritual, prayer, and other prescribed practices.

WPPSI abbreviation for WECHSLER PRECHOOL AND PRIMARY SCALE OF INTELLIGENCE.

WRAP abbreviation for WALTER REED ARMY INSTITUTE OF RESEARCH.

wraparound services a philosophy of care and service provision characterized by a planning process involving a focal person, concerned family members, and service providers. It results in a highly individualized set of closely coordinated community services and natural supports for the person and his or her family, which achieves a variety of intervention outcomes. Wraparound services have been developed in several service sectors, including mental health, child welfare, and developmental disabilities, and have been proven effective as an alternative to residential services for multiproblem individuals and their families.

WRAT abbreviation for WIDE RANGE ACHIEVEMENT TEST.

writer's block inhibited ability to start or continue working on a piece of writing. Such difficulty is attributed primarily to psychological factors (e.g., fear of failure) but may also result from fatigue or BURNOUT. Suggested remedies often include writing spontaneously about an unrelated topic, doing more reading, and changing something about the physical environment to make it more conducive to writing.

writer's cramp a painful spasm of the muscles involved in writing or typing, which may be a form of OCCUPATIONAL CRAMP or a FUNCTIONAL DISORDER. See also REPEETITIVE STRAIN INJURY.

writing disorder any motor, sensory, or language disorder that interferes with the ability to write.

writing test any test designed to sample and measure writing skills, which can include the motor act of writing, spelling, grammar, and content.

wrong number technique a method for assessing individuals' willingness to help members of specific social groups and categories. Researchers call participants on a telephone and emphasize their identity as members of a particular social or ethnic group, such as male or female, Black or White. They claim that they are experiencing a minor emergency (e.g., an automobile breakdown), that they have mistakenly dialed the wrong number from a pay-phone, and that they have now used the last of their coins. The researchers then ask the participants to place a call for them (e.g., to an auto repair shop). Willingness to help is indicated if the participant makes the call. [first used by U.S. psychologists Samuel L. Gaertner (1942– ) and Leonard B. Bickman (1941– ) and described in their 1971 research report]

WSE abbreviation for WORD-SUPERIORITY EFFECT.

WSID abbreviation for WOMEN’S SEXUAL INTEREST DIAGNOSTIC INTERVIEW.

WTPT abbreviation for WALK-THROUGH PERFORMANCE TESTING.

Wundt curve a bell-shaped curve illustrating that as a stimulus intensity (e.g., light) increases from low to moderate levels, its effect is pleasant or rewarding, but that as it increases to higher levels, its effect is unpleasant and even painful. The Wundt curve has been related to theories of human motivation, novelty seeking, and aesthetics, the latter most notably in the work of Daniel E. BERLYNE. See AROUSAL-REDUCTION MECHANISM. [developed by Wilhelm WUNDT]

Wundt illusion an illusion in which straight lines that appear to be curved when viewed through a prism appear to curve in the opposite direction when the prism is removed. [described in 1896 by Wilhelm WUNDT]

Würzburg school a school of psychology developed at the end of the 19th century by Oswald KÜLTE and his associates in Würzburg, Germany. It arose largely as a reaction to the structuralist approach of Edward Bradford TITCHEN, who insisted that conscious experience consisted of images that could be analyzed into basic elements (sensations, feelings). For the Würzburg school, the focus was on intangible mental activities, such as judgments, meanings, and DETERMINING TENDENCIES, which were conscious but had no image quality associated with them (see IMAGELESS THOUGHT). See also AFFURBE.

Wyatt v. Stickney decision a 1972 Alabama District Court decision stipulating that the state could not hold people involuntarily in hospital facilities that did not meet proper standards. These standards include a humane environment, adequate staff, and appropriate treatment.
a letter used to symbolize a variable of interest. For example, in a regression equation, \( x \) may represent a particular predictor or independent variable.

\[ X (X \text{ bar}) \] symbol for sample mean.

\( x' \) symbol for \( x \) prime.

**Xanex** n. a trade name for ALPRAZOLAM.

**xanthine** n. see METHYLXANTHINE.

**xantho-** (xanth-) combining form yellow.

**xanthocyanosis** n. a form of color blindness in which red and green are not perceived and objects are thus seen in shades of yellow or blue.

**xanthomatosis** n. any of several disorders marked by an accumulation of excess lipids, such as cholesterol, in the body due to a metabolic disturbance. This accumulation leads to the formation of foam cells in skin lesions and other symptoms. These disorders include **bubli xanthomatosis**, marked by fatty degeneration of the cornea; **WOLMAN'S DISEASE**, **hypercholesterolemic xanthomatosis**, or Type II hyperlipoproteinemia, associated with accelerated atherosclerosis and premature heart attacks; and normal cholesterol xanthomatosis (see HAND–CHRISTIAN–SCHÜLLER SYNDROME). A related form of xanthomatosis results in cutaneous lesions and other effects in some people with diabetes.

**xanthopsia** n. see CHROMATOPSIA.

**xanthoplasia** n. see VISUAL YELLOW.

**x-axis** n. the horizontal axis on a graph. See ABSCissa.

**X chromosome** the sex chromosome that is responsible for determining femaleness in humans and other mammals. The body cells of normal females possess two X chromosomes (XX), whereas males have one X chromosome and one Y chromosome (XY). In humans, various authorities estimate that the X chromosome carries between 1,000 and 2,000 genes, including many responsible for hereditary diseases (see SEX-LINKED). Abnormal numbers of X chromosomes lead to genetic imbalance and a range of disorders and syndromes. See also fragile X syndrome.

**x-coordinate** n. the horizontal value in a pair of graph coordinates \((x, y)\), which indicates how far to move left or right from the origin along the X-axis. For example, in the ordered pair \((4, 8)\), the x-coordinate is 4 and the corresponding vertical y-coordinate value is 8. See cartesian coordinate system.

**Xenazine** n. a U.S. trade name for TETRABENAZINE.

**xeno-** (xen-) combining form different, strange, or foreign. [from Greek xenos, "stranger"]

**xenoglossophobia** n. a tendency to use strange or foreign words, particularly in a pretentious manner.

**xenoglossy** n. in parapsychology, the ostensible ability of a person to speak or write in a language that is entirely unknown to him or her.

**xenophobia** n. 1. a strong and irrational, sometimes pathological, fear of strangers. 2. hostile attitudes or aggressive behavior toward people of other nationalities, ethnic groups, regions, or neighborhoods. In nonhuman animals, xenophobia is manifested by territorial behavior (see TERRITORIALITY) and is also seen in social groups where intruders are typically attacked and repelled. —xenophobic adj.

**xenorexia** n. the pathological ingestion of inedible objects.

**xeroderma pigmentosum** a syndrome acquired as an autosomal recessive trait (see recessive allele) and marked by extreme photosensitivity. It is caused by a defect in the ability of the body to repair damage to DNA resulting from exposure to ultraviolet light, which leads to cancerous changes in skin cells and increased mortality. Additionally, about 30% of people with this syndrome develop progressive neurological symptoms, including hearing loss, movement problems, loss of intellectual function, and seizures.

**xerophthalmia** n. excessive dryness of the eyes, due to histological changes in the cornea and conjunctiva. Xerophthalmia is a characteristic symptom of **Sjögren's syndrome**, a systemic autoimmune disease with an onset between 40 and 65 years. Xerophthalmia is also one of the ocular effects of vitamin A deficiency.

**x-intercept** n. in an equation representing a straight-line relationship between two variables, the value of variable \( x \) when the value of variable \( y \) equals zero. For example, in the general linear equation format \( x = a + by \), \( a \) represents the x-intercept.

**X-linked** adj. see sex-linked.

**x prime** (symbol: \( x' \)) the predicted or expected value of a given variable of interest, \( x \).

**X-ray** n. an electromagnetic emission of short wavelength produced by bombarding a heavy metal target, such as tungsten, with high-energy electrons in a vacuum tube. X-rays are used for diagnostic purposes to visualize internal body structures; The radiation can penetrate most substances and produce images of objects on photographic film (see radiography) or can cause certain chemicals to fluoresce. Prolonged or unnecessary exposure can be extremely damaging; therefore, when X-rays are used therapeutically for diagnosis or to destroy malignant cells (see radiation therapy), great precautions are taken to limit and target exposure. Also called roentgen ray.

**XX** see sex chromosome.

**XXX syndrome** a rare disorder characterized by the presence of three X (female) chromosomes instead of the normal two X chromosomes (46,XX). The majority of affected females are physically and mentally normal. Delays in mental development, when present, are usually mild. Also called 47,XXX syndrome: triple-X condition: trisomy X.

**XXX syndrome** a disorder in which a female has four X chromosomes instead of the normal two X chromosomes.
XXXXX syndrome

(46,XX). Affected females are likely to have minor physical anomalies and mild developmental delays, but symptoms can also be moderate to severe. Also called 48.XXXX syndrome: tetrasomy X.

XXXXX syndrome a rare disorder in which a female has five X chromosomes instead of the normal two X chromosomes (46,XX). All affected individuals studied had intellectual disability, and some had ocular or other anomalies, such as patent ductus arteriosus (a heart defect), microcephaly, or limb abnormalities. Also called 49,XXXXX syndrome.

XXXXY syndrome a rare disorder in which a male inherits three extra X chromosomes in addition to the normal one X and one Y chromosome (46,XY). Affected individuals have a variety of anomalies, including abnormally small genitalia; a short, broad neck; and hypotonia (flaccid muscles). Most affected individuals have intellectual disability, impaired speech, and short stature. Also called 49,XXXXY syndrome.

XXXY syndrome a relatively rare disorder in which a male inherits the full complement of both male and female sex chromosomes instead of either the normal two X chromosomes (46,XX) for females or the normal one X and one Y chromosome (46,XY) for males. Affected individuals have a normal penis but small testes and prostate, and about half develop enlarged breasts and have intellectual and developmental disabilities. Also called 48,XXXY syndrome.

XXY syndrome see Klinefelter’s syndrome.

XYY syndrome a disorder in which a male is born with a double complement of the normal XY chromosome pair (46,XY). Skeletal deformities, genital anomalies leading to infertility, enlarged breasts, and eunuchoid abdominal and hip fat are among the physical traits. Learning disabilities, especially reading problems, are common, along with delayed development of motor skills. Also called 48,XXXY syndrome.

XY see sex chromosome.

xylene n. a volatile solvent that can cause kidney failure and death when chronically inhaled. See INHALANT.

Xyrem n. a trade name for GH.

XYY syndrome a chromosomal anomaly discovered in 1961 and initially believed to predispose males to aggression and violence. The theory was modified when XYY anomalies were found among normal males. Also called double-Y condition.

XYZ grouping a program in which school administrators assign students in the same grade to classes by virtue of their test scores and school records. Students with similar abilities are placed in “high,” “middle,” or “low” groups or classes; each group follows the same basic curriculum. Students in the middle and lower classes in XYZ programs do not increase their achievement as compared to students in traditional classes, but students in the higher classes in XYZ programs increase their achievement by about one month on a grade-equivalent scale as compared to students in traditional classes. In XYZ classes, self-esteem of lower ability students rises slightly and self-esteem of higher ability students drops slightly. See also ABILITY GROUPING.

XYZ system a mathematically defined theoretical system for specifying colors in terms of three abstract primary colors, X, Y, and Z. The system was developed in 1931 by the International Commission on Illumination (CIE) and is often referred to as CIE XYZ color space.
**y** symbol for a variable of interest. For example, in a regression equation, \( y \) may represent a particular outcome or dependent variable.

\( y' \) symbol for \( Y' \) prime.

**yagé** n. see **ayahuasca**.

**yakee** n. see **ipêna**.

**Yale model** see MESSAGE-LEARNING APPROACH.

**yantra** n. a visual pattern on which attention is focused during Concentrative Meditation. Compare **mantra**.

**Yates’s correction for continuity** an adjustment made to a chi-square test of data from a contingency table having only two columns and two rows of information. The Yates’s correction yields a more conservative chi-square statistic and improves the test’s accuracy by accounting for the fact that it uses a continuous distribution to approximate a discrete distribution. [Frank Yates (1902–1994), British statistician]

**yaupon** n. see **cassina**.

**yawning** n. the act of drawing in through the mouth a volume of air that is much larger than that inhaled in normal respiration, serving to improve oxygen supplies to the brain. Some research indicates that yawning is mediated by the same neurotransmitters in the brain that affect emotions, mood, appetite, and so forth (i.e., serotonin, dopamine, glutamic acid, and nitric oxide). The more of these compounds that are activated in the brain, the greater the frequency of yawns. Yawns can be a form of nonverbal communication in that they are contagious and can indicate boredom or disagreement as well as sleepiness.

**y-axis** n. the vertical axis on a graph. See **ordinate**.

**Y chromosome** the sex chromosome that is responsible for determining maleness in humans and other mammals. The body cells of normal males possess one Y chromosome and one X chromosome (XY). The Y chromosome is much smaller than the X chromosome and is thought to carry just a handful of functioning genes. Hence, males are far more susceptible to sex-linked diseases than females, because the Y chromosome lacks the alleles to counteract any defective genes carried on the X chromosome.

**y-coordinate** n. the vertical value in a pair of graph coordinates \((x, y)\), which indicates how far to move up or down from the origin along the y-axis. For example, in the ordered pair \((4, 8)\), the y-coordinate is 8 and the corresponding horizontal x-coordinate value is 4. See **Cartesian coordinate system**.

**yea-saying** n. answering questions positively regardless of their content, which can distort the results of surveys, questionnaires, and similar instruments. Also called acquiescent response set: response acquiescence. Compare **nay-saying**.

**Yerkes–Dodson law** a law stating that the relation between motivation (arousal) and performance can be represented by an inverted U-curve (see inverted-U hypothesis). [Robert M. Yerkes and John Dillingham Dodson (1879–1955), U.S. psychologists]

**Yerkish** n. a language consisting of geometric forms that has been taught to nonhuman primates in studies of language acquisition and use. There has been some debate about whether animals trained with Yerkish demonstrate true language ability. [developed by U.S. psychologist Duane Rumbaugh (1929– ) and named for Robert M. Yerkes]

**yes–no task** in psychophysics, a signal detection task in which participants undergo a series of trials in which they must judge the presence (yes) or absence (no) of a signal.

**yin and yang** in Chinese philosophy, the two opposite but complementary aspects of the fundamental principle governing the universe. Originally, the words referred to the shady and the sunny side of a hill. The concept is represented by the Chinese symbol (the Taijitu) that also represents Taoism. Yin and yang are the two forces or principles that can be seen at work in all phenomena. Sometimes one is dominant, sometimes the other, and all things ultimately revert to their opposites. In simple terms, yin is characterized as negative, passive, and feminine, among other things, whereas yang is seen as positive, active, and masculine, among other things. Understanding the principles of opposition, interaction, and especially harmony inherent in yin and yang is, however, as important as understanding the particular characteristics associated with each of them.

**y-intercept** n. in an equation representing a straight-line relationship between two variables, the value of variable \( y \) when the value of variable \( x \) equals zero. For example, in the general linear equation format \( y = a + bx \); \( a \) represents the y-intercept.

**Y-linked** adj. see **sex-linked**.

**Y maze** a maze shaped like the letter \( Y \), consisting of a stem that leads to a choice of two goal arms, only one of which is the correct path to the goal box. It is a variant of the \( T \) maze; both are used in experiments of animal cognition.

**yoga** n. a school or tradition of Hindu philosophy and practical teaching that ultimately seeks to achieve mystic union of the self with the Supreme Being, or of the human spirit with the universal spirit, through a prescribed mental discipline and physical exercises. Yoga exercises, including regulation of breathing and the adaptation of bodily postures (see asana), are used as a means of releasing tension and redirecting energy (i.e., prana; see chi) and achieving a state of self-control, physical and mental relaxation, and finally deep contemplation. [Sanskrit, “union” or “yoke”]

**yohimbine** n. a stimulant alkaloid derived from the bark of the African tree Pausinystalia yohimbe and from Rauwolfa serpentina root. It acts as an antagonist at \( \alpha_2 \)-adrenergic receptors (see alpha-adrenergic receptor); at high doses, it is a monoamine oxidase inhibitor and can cause serious adverse effects when taken concomitantly with antidepressants, tyramine-containing foods (e.g., liver, cheeses), or
yoked-control group

over-the-counter products containing phenylpropanolamine, such as nasal decongestants and diet aids. Yohimbine has achieved a reputation as a sexual enhancer in men, but there is little clinical evidence suggesting its efficacy is greater than placebo. It has also been studied as a potential treatment for erectile dysfunction, with contradictory results regarding its effectiveness. Chemically related to reserpine (see RAUNWOLFA DERIVATIVE), yohimbine is a SYMPATHOMIMETIC DRUG and may increase anxiety or produce panic attacks in susceptible individuals. Side effects may include nervousness, irritability, dizziness, skin flushing, or headache. More serious effects, including renal failure, seizures, and death, have also been reported. Yohimbine should not be taken by people with hypotension (low blood pressure), diabetes, or heart, liver, or kidney disease. It is available as an herbal remedy and also in prescription form (U.S. trade name: Yocon).

**young-old adj.** see ADULTHOOD.

**you statement** see I STATEMENT.

**youth counseling** consultation that provides advice, information, and support to young people, usually in adolescence or slightly younger. Youth counseling may focus on any issue that raises concerns or conflicts related to studying, family involvement, sexuality and gender identity, or peer relationships. It may be used to counter low self-image and feelings of inadequacy that are often experienced by young people.

**youth culture** 1. a society that places a high premium on youth, physical health and beauty, and the values, tastes, and needs of young people. Such a society tends to derogate the values, experience, and needs of middle-aged and older people and may produce subtle psychological pressures for older adults to adapt to the culture of youth. 2. the distinctive culture of teenagers and young adults, which often involves forms of dress, speech, music, and behavior that are deliberately at variance with those of the dominant culture. See also COUNTERCULTURE.

**y prime** (symbol: $y'$) the predicted or EXPECTED VALUE of a given variable of interest, $y$.

**Yule's Q** a measure of the strength of the relationship between two DICHOTOMOUS VARIABLES, such as a person's sex (male or female) and graduation from college (yes or no). It ranges from $-1$ to $+1$, with values close to either negative or positive 1 indicating a very strong relation and values around 0 indicating little to no relation. Also called **Yule's coefficient of association.** [George Udny Yule (1871–1951), British statistician]
zaar n. see ZAR.

zaleplon n. a nonbenzodiazepine HYPNOTIC used for short-term treatment of insomnia. It has a rapid onset but short duration of action. Side effects are less frequent compared with other classes of hypnotics but commonly include headache, dizziness, abdominal pain, nausea, and amnesia. Although chemically unrelated to the benzodiazepines, zaleplon acts at the same GABA<sub>A</sub> RECEPTOR and carries a similar potential for abuse. U.S. trade name: Sonata.

zar (zaar) n. a CULTURE-BOUND SYNDROME, occurring in North African and Middle Eastern cultures, that is attributed to spirit possession. Occurring most frequently in women, zar often involves dissociative, somatic, and affective symptoms, such as shouting, laughing, apathy, and refusal to perform daily tasks.

Zarontin n. a trade name for ethosuximide. See Succinimide.

z-axis n. the third dimension in a CARTESIAN COORDINATE SYSTEM or graph. It is perpendicular to both the horizontal x-axis and the vertical y-axis.

Zeigarnik effect the tendency for interrupted, uncompleted tasks to be better remembered than completed tasks. Some theorists relate this phenomenon to certain GESTALT PRINCIPLES OF ORGANIZATION but at the level of higher mental processing (e.g., memory), rather than at the level of pure perception. [described in 1927 by Bluma Zeigarnik]

Zeitgeber n. a cue, such as day length, used to activate or time a BIOLOGICAL RHYTHM. See ENTRAINMENT. [German, “time giver”; first defined scientifically in 1954 by German biologist Jürgen Aschoff (1913–1998)]

Zeitgeist n. German, “spirit of the times”; a term used by German philosopher Georg Wilhelm Friedrich Hegel (1770–1831) to refer to a type of supraindividual mind at work in the world and manifest in the cultural worldview (see Weltanschauung) that pervades the ideas, attitudes, and feelings of a particular society in a specific historical period. Used in this way, the term has a distinctly deterministic flavor. A Zeitgeist theory of history stresses the role of such situational factors as economics, technology, and social influences in contrast to the GREAT MAN THEORY OF HISTORY. The term was first used in English by British poet and literary critic Matthew Arnold (1822–1888) and introduced to psychology in 1929 by Edwin G. Boring, who used the concept as an organizing theme for his discussions of creativity, scientific change, and historiography. See also ORTGEIST.

Zelen’s design a type of RANDOMIZED CLINICAL TRIAL in which patients are assigned to experimental conditions before they have consented to participate in the research. There are two versions of the design, both of which remain ethically controversial: In the single-consent strategy, patients assigned to the experimental treatment are told there is an alternative (the control) available and offered the option to switch; those in the control group are not informed of their study participation. In the double-consent strategy, both the experimental and control groups are offered the option to switch from the treatment to which they initially were assigned. [Marvin Zelen (1927– ), U.S. biostatistician]

zelotypia n. extreme overzealousness in advocating a cause.

Zen Buddhism a Japanese school of BUDDHISM, dating from the 6th century CE, in which enlightenment is sought through direct, intuitive experience rather than through an intellectual approach to the scriptures. One method of preparing the way for such insight is to devote oneself to the solution of an insoluble paradox, such as “What is the sound of one hand clapping?” Another is prolonged, motionless meditation. In both cases, the aim is to transcend rational, instrumental thought and the limitations of human language. Zen Buddhism has become increasingly popular in the West since the 1960s.

Zener cards a standardized set of stimulus materials, similar to a deck of playing cards, designed for use in experiments on EXTRASENSORY PERCEPTION (ESP) and other parapsychological phenomena. The set consists of 25 cards, each of which bears one of five printed symbols (star, wavy lines, cross, circle, or square), with five cards in each category. In a typical test of TELEPATHY, the cards are shuffled (usually mechanically) and a designated SENDER turns the cards over one at a time to inspect the symbol while a RECEIVER attempts to guess the symbol by reading the thoughts of the sender. In an experiment on CLAIRVOYANCE, the receiver might attempt to identify the order of the shuffled deck without any inspection of cards by the sender (see SCREEN TOUCH MATCHING). In an experiment on PSYCHOKINESIS, the participant would attempt to control the outcome of the shuffle directly. Also called ESP cards.

Rhine cards. See also BASIC TECHNIQUE; DOWN THROUGH; ESP FORCED-CHOICE TEST; GENERAL EXTRASENSORY PERCEPTION; UP THROUGH. [named in honor of Karl E. Zener (1903–1964), U.S. perceptual psychologist who designed the symbols, by his colleague Joseph B. Rhine, who devised the deck]

Zeno’s paradoxes several arguments proposed by Greek philosopher Zeno of Elea (early 5th century BCE) against the ideas of plurality and motion. Individuals making a trip must first go halfway to their destination, then cover half of the remaining distance, then half again, in an indefinite sequence of such steps that appears impossible to complete. Alternatively, if Achilles gives a tortoise a head start in a race and attempts to catch up, he must first run to where the tortoise was, then to where it has moved to, and so on for an infinite sequence of such moves, seemingly never catching up with the tortoise.

Zen therapy psychotherapy that is informed by and incorporates the philosophy and practices of ZEN BUDDHISM and that, like EXISTENTIALISM, is concerned with the unique meaning of the client’s life within the universal context, rather than with simple adjustment to or removal of symptoms. Through meditation and intuition, contemplation of human nature and human existence is believed
to lead to a therapeutic alignment of the client with a sense of the oneness of the universe and to spiritual (and, thus, cognitive, affective, and behavioral) transformation. See also MYSTIC UNION.

**zero-delay matching to sample** see DELAYED MATCHING TO SAMPLE.

**zero-order correlation** a simple association between two variables that does not control for the possible influence of other variables. For example, consider the relationship between success selling computers and knowledge of how the Internet works. A zero-order correlation would examine the direct relationship between these two variables without taking into account other explanatory information, such as education level, sales experience, and so forth. Compare PART CORRELATION; PARTIAL CORRELATION.

**zero-sum game** in GAME THEORY, a type of game in which the players’ gains and losses add up to zero. The total amount of resources available to the participants is fixed, and therefore one player’s gain necessarily entails the others’ loss. The term is used particularly in analyses of bargaining and economic behavior but is sometimes also used in other sociocultural contexts (e.g., politics). Compare NON-ZERO-SUM GAME.

**zest** n. see VITALITY.

**ZIFT** acronym for ZYGOTE INTRAFALLOPIONAL TRANSFER.

**zimbo** n. a hypothetical class of zombielike beings (see ZOMBIE) who are behaviorally indistinguishable from humans, responsive to their environment, and capable of complex mental operations but who have no inner life as this is ordinarily understood (i.e., no experience of QUALIA). The concept was introduced by U.S. philosopher Daniel C. Dennett (1942—) as a response to the ZOMBIE ARGUMENT. Dennett’s position is that human beings are, in fact, zimbos.

**zinc** n. an element that is needed in minute amounts in the diet for normal functioning. The zinc ion is required for the activity of many enzymes.

**ZIOF** abbreviation for zone of individual optimal functioning (see ZONE OF OPTIMAL FUNCTIONING).

**Zipf’s law** in linguistics, the observation that the length of words in any language is inversely related to their frequency of usage, so that high-frequency words are generally short, and uncommon words are generally long. Also called Zipfian distribution: Zipf’s distribution. [George Kingsley Zipf (1902–1950). U.S. statistician and linguist]

**ziprasidone** n. an ATYPICAL ANTIPSYCHOTIC that is used for the treatment of schizophrenia and of acute manic or mixed episodes associated with bipolar disorders. It may prolong the Q-T interval of the cardiac cycle (see ELECTROCARDIOGRAPHIC EFFECT) and therefore should not be taken by patients with abnormal heart rhythms or by those who have had a recent heart attack or are taking antiarrhythmic drugs. Common side effects include ORTHOSTATIC HYPOTENSION and sedation. U.S. trade name: Geodon.

**zoanthropy** n. see LYCANTHROPY.

**ZOF** abbreviation for ZONE OF OPTIMAL FUNCTIONING.

**Zolfin** n. a trade name for ONDANSETRON.

**Zöllner illusion** a visual illusion in which parallel lines appear to diverge when one of the lines is intersected by short diagonal lines slanting in one direction, and the other by lines slanting in the other direction. [Johann Karl Friedrich Zöllner (1834–1882). German astrophysicist]

**Zoloft** n. a trade name for SERTRALINE.

**zolpidem** n. a nonbenzodiazepine HYPNOTIC for short-term management of insomnia. Although structurally different from the benzodiazepines, it acts similarly by binding to a specific site on the GABA\(_A\) RECEPTOR. Its side effects are infrequent but may include dizziness, headache, nausea and vomiting, and amnesia. U.S. trade name: Ambien.

**zombie** n. 1. in West African and Haitian folk belief, a corpse that is reanimated by witchcraft and used as a slave. Zombie legends in Haitian VOODOO were long surmised to have been based on a real practice of keeping living persons in a trance-like state by means of certain powerful drugs; this notion is now regarded as discredited. Zombies continue to captivate the imagination, however, particularly as menacing, living-dead stalkers in horror movies and other pop-culture genres. 2. in philosophy of mind, the hypothetical being at the heart of the ZOMBIE ARGUMENT. Also called philosophical zombie (p-zombie). See also ZIMBO. 3. a colloquial term for the drug PCP.

**zombie argument** in philosophy of mind, any of various arguments that focus on the question of how one might distinguish conscious beings (humans) from hypothetical, nonconscious beings (zombies) that are capable of performing all the functions of conscious beings. By asserting that a zombielike organism could behave as if it were conscious but still lack experience containing QUALIA, these arguments attempt to distinguish consciousness as subjective experience from consciousness as evidenced from observable behavior in the physical world: they are usually deployed against the assumptions of BEHAVIORISM and other forms of PHYSICALISM. See also ZIMBO.

**zone of comparison test** a method of positioning questions in a CONTROL QUESTION TEST to facilitate objective analysis of physiological responses on POLYGRAPH charts and to minimize an examinee’s potential to habituate to the question format.

**zone of optimal functioning (ZOF)** the range of physiological AROUSAL within which an individual can perform at the peak of physical, mental, and skillful ability. Also called zone of individual optimal functioning (ZOF).

**zone of potentiality** the range of a student’s capacity for growth, development, or achievement in a particular skill or subject area.

**zone of proximal development** in Lev VYGOTSKY’s sociocultural theory, the difference between a child’s actual level of ability and the level of ability that he or she can achieve when assisted by, or working in cooperation with, older or more experienced partners (e.g., adults or more knowledgeable peers). Vygotsky asserted that what children can do with the assistance of others is even more indicative of their developmental status than what they can do alone. See SOCIOCULTURAL PERSPECTIVE.

**zonules** pl. n. the delicate elastic fibers that connect the capsule of the LENS of the eye to the CILIARY PROCESSES. Also called suspensory ligament: zonules of Zinn. See also CILIARY MUSCLE.

**zoom-lens model of attention** a conceptualization
of visual attention as a variably sized resource that is allocated according to interest, task demands, or other factors. Whereas the spotlight model of attention specifies a fixed size for the focal attention zone, the zoom-lens model considers it to be malleable, able to be constricted into a highly focused beam (subtending as little as a fraction of a degree of angle) or dilated to even distribution over the entire visual field. Because of limited processing capacities, however, there is a tradeoff between size adjustment and detail: An increase in the area attended results in a decrease in the resolution of detail about stimuli within that area. [proposed in 1985 by Charles W. Eriksen, U.S. psychologist, and Yei-Yu Yeh]

zoomorphism n. 1. the attribution of nonhuman animal traits to human beings, deities, or inanimate objects. 2. the use of nonhuman animal psychology or physiology to explain human behavior. Compare anthropomorphism.

zoopharmacognosy n. the ability of nonhuman animals to select plants and plant parts (leaves, pith, etc.) for medicinal purposes to reduce fevers or eliminate parasites. In Tanzania, the plants used by chimpanzees to reduce fever or parasite load are the same as those used by human beings to treat the same ailments.

zoophilia n. a paraphilia in which nonhuman animals are repeatedly preferred or exclusively used to achieve sexual excitement and gratification. An animal, usually a household pet or farm animal, is either used as the object of intercourse or is trained to lick or rub the human partner, referred to as a zoophile. The most commonly used animals in rural settings are pigs and sheep. Also called zoophilism. See also bestiality.

zoosadism n. a paraphilia in which sexual arousal and satisfaction are obtained from torturing a nonhuman animal. This may occur during direct sexual contact with the animal, or the person may masturbate later, using memories of the event as masturbatory fantasies.

z score the standardized score that results from applying a z-score transformation to raw data. For purposes of comparison, the data set is converted into one having a mean of 0 and a standard deviation of 1. For example, consider a person who scored 30 on a 40-item test having a mean of 25 and standard deviation of 5, and 40 on an 80-item test having a mean of 50 and a standard deviation of 10. The resulting z scores would be +1.0 and –1.0, respectively. Thus, the individual performed better on the first test, on which he or she was one standard deviation above the mean, than on the second test, on which he or she was one standard deviation below the mean.

z-score transformation a statistical procedure used to convert raw data into z scores, dimensionless quantities that may be interpreted without reference to the original units of measurement. It is performed by subtracting the reference value (the sample average) from each data point and dividing the difference by the standard deviation of the sample.

z test a type of statistical test that compares the means of two different samples to determine whether there is a significant difference between them (i.e., one not likely to have occurred by chance). Generally, this involves comparing the mean from a sample of a population to the mean for the whole population but may also involve comparing the means of two different populations. The z test is based on the normal distribution and is used when a population’s standard deviation is known or the sample is large (greater than 30). The equivalent t test is used with unknown standard deviations or smaller samples.

z transformation see Fisher’s r to z transformation.

Zuckerman Sensation-Seeking Scale see sensation-seeking scale.

zuclopenthixol n. a conventional antipsychotic of the thioxanthen class. Side effects include sedation, neurologic rigidity, and dystonia, and—like similar agents—it is associated with long-term risk of tardive dyskinesia. Zuclopenthixol is not available in the United States. Canadian trade name: Clopixol.

Zugunruhe n. see migratory restlessness.

Zung Self-Rating Depression Scale (SDS) a widely used adult self-report depression-screening instrument designed to measure the intensity of depressive or mood-related symptoms. It is also a tool for tracking a client’s response to depression treatment over time. The SDS consists of 20 statements to which participants must respond using a 4-point likert scale, ranging from none or little of the time to most or all of the time. Half of the questions are worded positively (e.g., “I have trouble sleeping”) and half are worded negatively (e.g., “I do not feel hopeful”). [originally developed in 1965 by William W. K. Zung, U.S. psychiatrist]

Zurich School a group of psychoanalysts who were early followers of Carl Jung in Zurich, as opposed to the Viennese school of Sigmund Freud’s followers.

Zwaardemaker olfactometer an early olfactometer consisting of a single glass tube open at both ends. One end was inserted into a nostril, and the other end was fitted into a tube filled with an odorant. Sniffing caused the odorant to reach the olfactory epithelium. [Hendrik Zwaardemaker (1857–1930), Dutch physiologist]

Zwaardemaker smell system a system for classifying odor qualities based on a scheme originally developed by Swedish botanist Carolus Linnaeus (1707–1778). According to this system, there are nine primary odor qualities: ethereal, aromatic, fragrant, ambrosial, allaceous, empyreumatic, hircine, foul, and nauseous. These qualities combine to produce the perceptions of smells. [Hendrik Zwaardemaker]

Zyban n. a trade name for bupropion.

Zydis n. a trade name for olanzapine.

zygomaticus n. the set of muscles, innervated by the facial nerve, that activates the movement of the upper lip outward, upward, and backward. Its activity is recorded in studies of emotion.

zygote n. a fertilized egg, or ovum, with a diploid set of chromosomes, half contributed by the mother and half by the father. The zygote divides to become an embryo, which continues to divide as it develops and differentiates—in humans eventually forming a fetus. —zygotic adj.

zygote intrafallopian transfer (ZIFT) a form of in vitro fertilization in which ova and sperm are combined in a laboratory container and the fertilized eggs (zygotes) are implanted into the fallopian tubes. Compare gamete intrafallopian transfer.

Zyprexa n. a trade name for olanzapine.
Biographies

Adler, Alfred (1870–1937) Austrian psychiatrist: the first disciple of Sigmund Freud to break away to found his own school, INDIVIDUAL PSYCHOLOGY, which evolved such concepts as the INFERIORITY COMPLEX and COMPENSATION.

Ainsworth, Mary Dinsmore Salter (1913–1999) U.S. developmental psychologist: collaborated with John Bowlby in formulating the highly influential ATTACHMENT THEORY; she later devised the STRANGE SITUATION, a method of assessing infant–mother interactions.

Allport, George Wilson (1921–2006) U.S. psychologist: a pioneer in community psychology and a major proponent of PRIMARY PREVENTION; he served on mental health commissions for Presidents Dwight D. Eisenhower and Jimmy Carter; a spirited critic of the medicalization of clinical psychology.

Allport, Floyd Henry (1890–1978) U.S. psychologist: a founder of experimental social psychology; his approach emphasized individuals over the group and established a behaviorist framework; brother of Gordon W. Allport.

Allport, Gordon Willard (1897–1967) U.S. psychologist: a major figure in social psychology; the originator of ALLPORT’S PERSONALITY TRAIT THEORY and coauthor of two personality inventories—the ALLPORT–VERNON–LINDZEY STUDY OF VALUES and the Allport A-S Reaction Study; brother of Floyd H. Allport.

Anastasi, Anne (1908–2001) U.S. psychologist: an important contributor to the discussion of the NATURE–NURTURE controversy and to the area of psychological testing.

Angell, James Rowland (1869–1949) U.S. psychologist: a major spokesperson for the development of psychology as a science in the United States and a leading exponent of FUNCTIONALISM.

Aquinas, Thomas (c. 1225–1274) Italian priest, philosopher, and theologian: noted for using the ARISTOTELIAN method in his writings and lectures; perhaps the leading representative of the tradition of SCHOLASTICISM, he played an early role in advancing the concepts of RATIONALISM and EMPIRICISM.

Argyle, Michael (1925–2002) British psychologist: campaigned to establish social psychology as a scientific enterprise and as a necessary perspective for solving social problems.

Aristotle (384–322 B.C.E.) Greek philosopher: a student of Plato, his philosophy formed the basis of medieval SCHOLASTICISM and remains important today; his propositions concerning the PSYCHE and voluntary behavior have particular relevance to psychology.

Asch, Solomon E. (1907–1996) Polish-born U.S. psychologist: best known for his contributions to social psychology, especially in showing how social context influences fundamental processes, such as perception; his studies of CONFORMITY influenced the research of Stanley Milgram.

Atkinson, Richard C. (1929– ) U.S. cognitive psychologist: his research spanned MATHEMATICAL LEARNING THEORY, VISUAL RECOGNITION, and memory systems; in particular, his theory of memory, proposed with U.S. cognitive psychologist Richard M. Shiffrin (1942– ) in 1968, has been widely influential in cognitive science (see INFORMATION-PROCESSING MODEL; MULTISTORE MODEL OF MEMORY).

Bacon, Francis (1561–1626) English philosopher, essayist, and statesman: emphasized the value of EMPIRICISM (particularly the inductive method) and experimentation, thus helping to establish the fundamentals of modern science.

Bain, Alexander (1818–1903) Scottish moral philosopher and psychologist: a transitional figure between the empirical philosophical tradition and the movement to make psychology a science; his work set a precedent for such behaviorist ideas as INSTRUMENTAL CONDITIONING and OPERANT BEHAVIOR; founded Mind, the first psychological journal in English, in 1876.

Baldwin, James Mark (1861–1914) U.S. psychologist: an influential figure in the early development of experimental and professional psychology in the United States; a proponent of FUNCTIONALISM and an early contributor to developmental psychology.

Baltes, Paul B. (1939–2006) German developmental psychologist: helped to define the perspective on which LIFE-Span DEVELOPMENTAL PSYCHOLOGY is based; with his wife, psychologist Margaret M. Baltes (1939–1999), he described SELECTIVE OPTIMIZATION WITH COMPENSATION; with various colleagues, he introduced the TESTING THE LIMITS method to study adult age differences in cognition.

Bandura, Albert (1925– ) Canadian-born U.S. psychologist: best known for his work on SOCIAL LEARNING THEORY; his studies of OBSERVATIONAL LEARNING and SOCIAL-COGNITIVE THEORY were especially influential, in particular those pertaining to self-regulatory processes and their role in motivation and behavior.

Barber, Theodore Xenophon (1927–2005) U.S. psychologist: a prolific and influential researcher in HYPNOSIS; his social-cognitive theory denied that hypnosis was a special state of consciousness; he eventually proposed a reformulation of hypnosis to find common ground with competing theoretical perspectives based on dissociation.

Barclay, Allan G. (1930–2006) U.S. pediatric clinical psychologist: a lifelong advocate for people with developmental disabilities; he influenced federal policy as a consultant to President John F. Kennedy’s Committee on Mental Retardation and to the White House Conference on Children; he was integral to military psychologists’ receiving PRESCRIPTIVE AUTHORITY in the U.S. Department of Defense.

Bartlett, Frederic Charles (1886–1969) British cognitive and experimental psychologist: a pioneer researcher in
the constructive and reconstructive nature of memory and its social and cultural influences; he developed the approaches known as repeated reproduction and serial reproduction.

Baum, Andrew S. (1948–2010) U.S. health psychologist: made significant contributions not only to health psychology but also to environmental psychology and psychoneuroimmunology.

Beck, Aaron T. (1921– ) U.S. psychiatrist: best known for his development of cognitive therapy; he created several scales, among them the widely used Beck Depression Inventory and the Beck Hopelessness Scale, the latter of which is used to assess suicide risk.

Beers, Clifford (1876–1943) U.S. philanthropist: founder of the mental hygiene movement, which helped establish psychology as a discipline in the United States through encouraging the use of mental tests and contributing to the rise of clinical psychology and of industrial and organizational psychology.

Békésy, Georg von (1899–1972) Hungarian-born U.S. physicist: a groundbreaking researcher in auditory science, especially with his studies of mammalian hearing and of the pattern of movement known as the traveling wave in the basilar membrane of the inner ear.

Bekhterev, Vladimir Mikhailovich (1857–1927) Russian neuropathologist: founder of Russia’s first physiopsychological laboratory and first institute for brain research on mental diseases; he is now credited with playing a greater role than Ivan Pavlov in the introduction of conditioning to psychology.

Bentley, Madison (1870–1955) U.S. psychologist: proposed a distinctly psychological science on par with biology; he made significant contributions to psychology through his editorial role in various journals, in particular during his extended editorship of the American Journal of Psychology (1903–1950).

Benussi, Vittorio (1878–1927) Italian psychologist: his research on optical illusions and time perception contributed to Gestalt psychology; his later research on posthypnotic states (e.g., posthypnotic suggestion) sought to provide evidence for Sigmund Freud’s concept of repression.

Berkeley, George (1685–1753) Irish philosopher: a major architect of British empiricism; he is best known for his philosophy of immaterialism and subjective idealism.

Beryle, Daniel E. (1924–1976) British-born Canadian psychologist: his work on curiosity influenced later theories on intrinsic motivation; he helped reestablish experimental aesthetics on its modern scientific footing.

Bernard, Claude (1813–1878) French physiologist: identified the importance of maintaining stability within the internal environment (later named homeostasis by Walter B. Cannon) which has been applied in experimental and physiological psychology research.

Bills, Marion Almira (1889–1970) U.S. industrial and organizational psychologist: carried out research on job retention, articulated the concept of job satisfaction, and developed an early job evaluation program.

Binet, Alfred (1857–1911) French psychologist: often considered the initiator of the modern approach to intelligence testing, especially as the developer with French physician Theodore Simon (1873–1961) of the Binet–Simon Scale (see Stanford–Binet Intelligence Scale).

Bingham, Walter Van Dyke (1880–1952) U.S. psychologist: a founder of industrial and organizational psychology and a key figure in the development of the U.S. Army aptitude and achievement testing program during World War I (see Army tests).

Blatz, William Emet (1895–1964) Canadian child psychologist: studied the Dionne quintuplets from 1935 to 1938 in an attempt to determine environmental influences on heredity; he originated security theory.

Blau, Theodore H. (1928–2003) U.S. clinical and forensic psychologist: after decades as an educator and in private practice, he became a police inspector with a focus on police psychology and forensic psychology; he created important tools for neuropsychological assessment; he was the first independent clinical psychologist to serve as president of the American Psychological Association (1977).

Bleuler, Paul Eugen (1857–1939) Swiss psychiatrist: best known for naming schizophrenia and for his theory of its basic underlying symptomatology; he advocated psychosocial treatments for people with severe mental illness and introduced occupational therapy.

Boring, Edwin Garrigues (1886–1968) U.S. psychologist: a leader in the field of experimental psychology; his influential History of Experimental Psychology (1929; revised 1950) was required reading in psychology graduate programs for several decades.

Bowlby, Edward John Mostyn (1907–1990) British psychiatrist and psychoanalyst: best known for developing attachment theory; he also proposed the internal working model of attachment, partially based on his work on maternal deprivation.

Braid, James (1795–1860) Scottish physician: his investigation of the effects of animal magnetism led to his development of the theory, nomenclature, and method of hypnotism (see hypnosis).

Bray, Douglas W. (1918–2006) U.S. industrial and organizational psychologist: instrumental in the development of the modern-day assessment center, which uses multiple evaluation techniques to identify and empower the best people for critical roles.

Brentano, Franz (1838–1917) German philosopher and psychologist: his research on the INTELLIGENCE OF mental acts later developed into the field of ACT PSYCHOLOGY and contributed to the ARTIFICIAL INTELLIGENCE debate about whether mechanical processes can assume the intentionality of mental acts.

Brett, George Sidney (1879–1944) British-born Canadian physician and psychologist: author of the three-volume History of Psychology (1912–1921), which tied the development of psychology to that of philosophy by assessing the current PHILOSOPHY OF MIND theories and essentially resisting the experimentalist approach.

Breuer, Josef (1842–1925) Austrian physician and psychologist: best remembered for his treatment of ANNA O.; the psychoanalytic technique of FREE ASSOCIATION evolved from the concepts behind Breuer’s methods.

Brunswik, Egon (1903–1955) Hungarian-born U.S. psychologist: recognized for his concept of ECLOGICAL VALIDITY in perception and for the BRUNSWIK RATIO, a mathematical expression of PERCEPTUAL CONSTANCY.

Bugental, James F. T. (1915–2008) U.S. psychotherapist: one of the founders of HUMANISTIC PSYCHOLOGY; also created, with Rollo May, EXISTENTIAL-HUMANISTIC THERAPY.

Bühler, Charlotte Malachowsky (1893–1974) German psychologist: a pioneer of lifespan developmental psychology; she was one of the founders of HUMANISTIC PSYCHOLOGY; married to Karl Bühler.

Bühler, Karl (1879–1963) German physiologist and psychologist: known for developing a sign-based approach to psychology and a CLINICAL INTERVIEW technique that anticipated the structured interview; married to Charlotte Malachowsky Bühler.

Burks, Barbara Stoddard (1902–1943) U.S. psychologist: investigated the genetics of mental and behavioral traits; she carried out large-scale studies, mostly of children, to investigate the role of NATURE–NURTURE in intelligence.

Bugental, James F. T. (1915–2008) U.S. psychotherapist: one of the founders of HUMANISTIC PSYCHOLOGY; also created, with Rollo May, EXISTENTIAL-HUMANISTIC THERAPY.

Cattell, James McKeen (1860–1944) U.S. psychologist: an early and influential journal editor; he devised the first battery of psychological tests of special abilities and co-founded the Psychological Corporation.
Cattell, Raymond Bernard (1905–1998) British psychologist: he developed with colleagues several personality inventories, including the widely used SIXTEEN PERSONALITY FACTOR QUESTIONNAIRE; he also originated a theory of intelligence that was further developed by U.S. psychologist John L. Horn (1928–2006), now called the CATTELL–HORN THEORY OF INTELLIGENCE.

Charcot, Jean-Martin (1825–1893) French neurologist: sometimes called the “father of neurology” for his pioneering research on such disorders as locomotor ataxia, multiple sclerosis, and Parkinson’s disease; his research on hysteria greatly influenced the early work of his students Sigmund Freud and Alfred Binet.

Chomsky, Noam (1928– ) U.S. linguist: known for his revolutionary TRANSFORMATIONAL GENERATIVE GRAMMAR, which remains both influential and controversial.

Claparède, Édouard (1873–1940) Swiss neurologist and child psychologist: a key figure in the CHILD STUDY MOVEMENT and in PROGRESSIVE EDUCATION; he demonstrated the importance of intelligence testing in the educational context; he also contributed significant research on the biology of sleep.

Comte, Auguste (1798–1857) French philosopher: a founder of POSITIVISM and sociology; he was one of the most influential philosophers of the 19th century.

Condillac, Étienne Bonnot de (1715–1780) French philosopher: author of works on logic, language, and philosophy; he built on John Locke’s belief that ideas originate in sensations, proposing that language is the mechanism by which sensations become ideas.

Cronbach, Lee J. (1916–2001) U.S. psychologist: an influential contributor to the topic of test validity and the developer of CRONBACH’S ALPHA.

Csikszentmihalyi, Mihalyi (1934– ) Hungarian-born U.S. psychologist: emigrated to the United States after the Hungarian Uprising of 1956 and became an influential generalist; his work led from the psychology of creativity to the cognitive-emotional concept of the FLOW state (of focused absorption in tasks) and to the genesis of POSITIVE PSYCHOLOGY.

Darwin, Charles R. (1809–1882) British naturalist: his theory of NATURAL SELECTION, published in On the Origin of Species by Means of Natural Selection in 1859, and similar to one proposed at the same time by British naturalist Alfred Russel Wallace (1823–1913), has had significant and ongoing influence in various approaches to psychology, including comparative psychology, evolutionary psychology, and sociobiology.

Dashiell, John Frederick (1888–1975) U.S. psychologist: a pioneer in the experimental study of learning; he published extensively on MAZE LEARNING in rats and was the author of the first laboratory procedures manual for psychology undergraduates and the first introductory textbook of behavioral psychology.

Delboeuf, Joseph-Rémi-Léopold (1831–1896) Belgian philosopher and psychologist: recognized for his investigation of what became known as the DELBOEUF ILLUSION and especially for his 1885 investigation of claims by the SALPETÈRE school that memory loss was a typical result of the hypnotic state.

Descartes, René (1596–1650) French philosopher and mathematician; known to psychologists primarily for his assertion that the mind is wholly distinct from the body (CARTEESIAN DUALISM), for several epistemological concepts, such as the rational subject or ego capable of intuitively knowing truth (CARTEESIAN SELF), and for initiating the philosophical tradition of RATIONALISM in Europe; his influence in the field of mathematics remains impressive—among other credits he is called the “father of analytical geometry.”

Dewey, John (1859–1952) U.S. philosopher, educator, and psychologist: a founder of FUNCTIONALISM; his work deeply influenced the field of education.

Dinsmoor, James (1921–2005) U.S. behavioral psychologist: analyzed DISCRIMINATION LEARNING in two main areas, AVOIDANCE CONDITIONING and OBSERVING RESPONSES; he demonstrated that organisms will not continue responding to signals that provide only negative information.

Dix, Dorothea Lynde (1802–1887) U.S. social reformer: a tireless advocate for the plight of the mentally ill under state care, she was responsible for the founding of over 30 psychiatric hospitals throughout the United States and overseas.

Doll, Edgar Arnold (1889–1968) U.S. psychologist: best known for the development of the Vineland Social Maturity Scale, the antecedent of the now widely used VINELAND ADAPTIVE BEHAVIOR SCALES for assessing a person’s communication, daily living, socialization, and motor skills.

Dollard, John (1900–1980) U.S. social scientist: developer of the FRustrATION–AGGRESSION HYPOTHESIS; he is also known for his work (with Neal E. Miller) on the importance of IMITATION in social behavior and learning.

Donders, Franciscus Cornelis (1818–1889) Dutch physiologist and ophthalmologist: contributed to experimental psychology through his work on color vision, his principle of visual fixation (DONDERS’S LAW), and his procedure for estimating the duration of mental processes (DONDERS’S METHOD).

Dunlap, Knight (1875–1949) U.S. psychologist: developed a neuropsychological model correlating consciousness with neural-motor circuits; he developed a negative practice technique for eliminating stuttering, tics, and similar behavior; and he proposed “response psychology,” a functionalist-oriented approach with practical applications.

Durkheim, Émile (1858–1917) French sociologist: known especially for his theories of suicide and his schematic categorization encompassing four types—egocistic (resulting from a sense of social failure), altruistic (self-sacrifice to save others), anomie (resulting from social alienation), and fatalistic (resulting from excessive social regulation).

Ebbinghaus, Hermann (1850–1909) German psycholo-
gist: a pioneer in the application of quantitative methods to the study of higher mental processes and in establishing experimental psychology as a scientific discipline.

Ehrenfels, Christian von (1859–1912) Austrian philosopher: best known for his 1890 paper on Gestalt qualities, a precursor to Gestalt psychology; he proposed that whole forms are not just the sum of their parts but are perceived to have new qualities of their own.

Eibl-Eibesfeldt, Irenäus (1928– ) Austrian ethologist: his work contributed to the scientific and popular literature on animal behavior, including species-typical phenomena in humans, such as semiotics, time concepts, handedness, adult–infant interactions, and aggression.

Ellis, Albert (1913–2007) U.S. psychotherapist: developed his own approach to psychotherapy, rational emotive behavior therapy, based on his ABC theory.

Engen, Trygg (1926–2009) Norwegian-born U.S. psychologist: originated the psychological study of olfaction; he studied odor hedonics and memory; the role of language, context, and expectation in odor experience; and environmental odor perception.

Erickson, Milton Hyland (1901–1980) U.S. psychiatrist: developed the hypnosis- and metaphor-based therapy known as Ericksonian psychotherapy.

Erikson, Erik H. (1902–1994) German-born U.S. psychologist: preeminent personality theorist and contributor to the field of ego psychology; he is known for his theory of life stages (see Erikson’s eight stages of psychosocial development) and as the originator of the term identity crisis.

Eron, Leonard D. (1920–2007) U.S. psychologist: initiated the Columbia County Longitudinal Study in 1960, which lasted over 40 years and found that violence on television is associated with aggression in children, a finding still considered controversial by some researchers.

Estes, William Kaye (1919–2011) U.S. psychologist: a founder of mathematical psychology and a pioneer (with B. F. Skinner) in the use of conditioned responses involving negative emotions (e.g., fear, anxiety).

Eysenck, Hans Jürgen (1916–1997) German-born British psychologist: made significant contributions to personality theory through his classification of personality types (see Eysenck’s dimensions) and the Eysenck personality inventory; popularized the terms introvert and extravert.

Fanz, Robert L. (1925–1981) U.S. developmental psychologist: established that newborn infants possess well-developed perceptual systems; he developed the preferential looking technique to study infant perceptual abilities.

Fechner, Gustav Theodor (1801–1887) German physician and philosopher: originator of psychophysics; he developed still-used methods to study sensations, including the method of adjustment and the method of constant stimuli; he also developed the mathematical formula called Fechner’s law.

Ferenczi, Sándor (1873–1933) Hungarian psychoanalyst: an early associate of Sigmund Freud, he advocated an active therapy as an alternative to Freud’s psychoanalytic approach; he also advanced the concept of brief psychodynamic psychotherapy with Otto Rank.

Festinger, Leon (1919–1989) U.S. social psychologist: best known for his theory of cognitive dissonance and his research on group cohesion, conformity, and social comparison theory.

Fiedler, Fred (1922–) Austrian-born U.S. psychologist: studied the importance of personality factors and psychological distance in leadership; he developed the prototypical contingency theory of leadership and the cognitive resource theory, as well as the least preferred co-worker scale, a measure of leadership style.

Fisher, Ronald Aylmer (1890–1962) British statistician and geneticist: a major contributor to the study of genetics and evolutionary theory; he is well-known for developing the analysis of variance and the Fisher exact test, among other statistical procedures.

Flavell, John (1928– ) U.S. developmental psychologist: introduced the concept of metacognition into developmental psychology; he notably studied the development of children’s theory of mind.

Flourens, Marie-Jean-Pierre (1794–1867) French physiologist: among his contributions was a sharp critique of phrenology, a holistic model of brain function, and experiments suggesting that the cerebellum is responsible for motor coordination.

Flournoy, Théodore (1854–1920) Swiss physician and psychologist: best known for investigations of paranormal phenomena, most famously captured in From India to the Planet Mars: A Case of Multiple Personality With Imaginary Languages (1900), considered a classic in the field of psychoanalysis because of its implicit emphasis on the unconscious mind at work.

Foucault, Michel (1926–1984) French philosopher and cultural historian; his works Madness and Civilization: A History of Insanity in the Age of Reason (1964) and Discipline and Punish: The Birth of the Prison (1975) were influential in injecting the sensibility of postmodernism into American psychologists’ views of the relation between psychology and society.

Frank, Jerome David (1910–2005) U.S. psychiatrist: author of Persuasion and Healing (1961); its third edition, written with his daughter Julia B. Frank, posited four healing factors shared by different types of psychotherapy: the therapist–patient relationship; the setting; a rationale or myth explaining the patient’s symptoms; and a shared belief in a ritual or procedure to restore the patient’s health.

Frankl, Viktor Emil (1905–1997) Austrian psychiatrist: a chief exponent of existential psychology; his approach to psychological treatment, logotherapy, focuses on crises of meaning and is often referred to as the “third Viennese school of psychotherapy” (after Sigmund Freud’s psychoanalysis and Alfred Adler’s individual psychology).

Franz, Shepherd Ivory (1874–1933) U.S. neuropsychologist: wrote the Handbook of Mental Examination Methods (1912) for use with psychiatric patients and Nervous and Mental Re-Education (1923) on the rehabilitation of brain-injured war veterans and other neurologically impaired patients; he is often considered to be the first U.S. clinical neuropsychologist.

Freud, Anna (1895–1982) Austrian-born British psychoanalyst: her studies on defense mechanisms and pioneering work in child analysis were original contributions to psychoanalysis; the youngest daughter of Sigmund Freud.

Freud, Sigmund (1856–1939) Austrian neurologist and
Gibson, Eleanor Jack (1910–2002) U.S. experimental psychologist: invented psychoanalysis and developed many of its central theoretical concepts (e.g., DEFENSE MECHANISMS, PSYCHOSEXUAL DEVELOPMENT, TRANSFERENCE) and methods of practice, such as FREE ASSOCIATION and DREAM ANALYSIS.

Fromm, Erich (1900–1980) German-born U.S. psychoanalyst, personality theorist, and social philosopher: formulated a broad cultural, yet personal, approach to analysis that focused on the search for meaning, the development of socially productive relationships, individuality, and the need to belong.

Fromm-Reichmann, Frieda (1889–1957) German psychiatrist: developed an approach to working with "unanalyzable" psychotic patients that emphasized a validating, empathic therapeutic relationship; she was the model for "Dr. Fried" in the bestselling book I Never Promised You a Rose Garden (1964) by her former patient Joanne Greenberg, and she was the first woman Fellow of the Center for Advanced Study in the Behavioral Sciences at Stanford University.

Galen (c. 130–c. 210 CE) Greek physician: his huge body of written work, much of it extant, synthesized the doctrines of ancient medicine and demonstrated his all-inclusive psychophysiological system of thought; his works became the source material from which many medieval and early modern scholars developed their psychophysiological theories.

Galton, Francis (1822–1911) British scientist: developed theories about the HERITABILITY and selective breeding of human intelligence, from which emerged the idea of intelligence tests and the movement he later called EUGENICS; he also introduced techniques of statistical CORRELATION; a cousin of Charles Darwin.

Garner, Wendell Richard (1921–2008) U.S. experimental psychologist: introduced SYSTEMS ANALYSIS to psychological research; he shaped research in perception, cognition, and PATTERN RECOGNITION and redefined perceptual stimuli in terms of attributes, alternatives, and attention; his contributions to methodology remain central to many research programs.

Gemelli, Agostino (1878–1959) Italian psychologist: a promoter of practical, applied psychology, he cofounded an influential European academic journal on psychology, neurology, and psychiatry; he was an ordained Franciscan priest.

Gesell, Arnold L. (1880–1961) U.S. psychologist and physician: formalized the first school psychologist position in the United States; he established special education classrooms, pioneered the cotwin technique to study the impact of learning and heredity (see TWIN STUDY), and advanced the concept of SCHOOL READINESS.

Gibson, Eleanor Jack (1910–2002) U.S. experimental psychologist: best known for her research on perceptual learning, especially on the VISUAL CLIFF, which she originated with Richard D. Walk; married to James J. Gibson.

Gibson, James Jerome (1904–1979) U.S. experimental psychologist: a highly influential researcher in the area of visual (and other sense) perception, known especially for developing the theory of ECOLOGICAL PERCEPTION, emphasizing the functional relations between perception and environment; married to Eleanor J. Gibson.

Gilbreth, Lillian Moller (1878–1972) U.S. psychologist: best known, with her husband Frank (an engineer), for developing the set of principles known as MOTION ECONOMY and for TIME AND MOTION STUDIES; she inspired a book and a beloved motion picture of family life, Cheaper by the Dozen, based on the experiences of her own family.

Goddard, Henry Herbert (1866–1957) U.S. psychologist: a founder of intelligence testing in the United States; he was influential in the fields of SPECIAL EDUCATION, intellectual disability, and Army testing; he is also known for a 1921 hereditarian study of moral degeneracy and intellectual disability (see KALLIKAK).

Goldman-Rakic, Patricia (1937–2003) U.S. neuropsychiatrist: investigated the frontal lobe, mapping its connections to other brain regions, as well as the distribution of its neurotransmitters, and demonstrating that it is the site of WORKING MEMORY; she also conducted several studies demonstrating the correlation between frontal activity and schizophrenic symptoms.

Goldstein, Kurt (1878–1965) German-born U.S. neurologist: his investigations of neurological impairments resulted in the influential proposal that manifestations of brain damage (e.g., regression to concrete thinking) are often an individual’s adaptive response to an impaired ability to form a whole perception of the outside world.

Goodenough, Florence (1886–1959) U.S. psychologist: developed widely used tests of intelligence and verbal intelligence in children, adapting the Stanford–Binet Intelligence Scale for use with preschoolers (as the Minnesota Preschool Scale); she formulated the method now known as TIME SAMPLING.

Griffith, Coleman Roberts (1893–1960) U.S. psychologist: known as the “father of sport psychology,” he established the first laboratory in the United States to investigate psychological and physiological problems associated with sports and athletic performance.

Guilford, Joy Paul (1897–1987) U.S. psychologist: best known for his contributions to PSYCHOMETRICS and for his use of FACTOR ANALYSIS in personality, creativity, and intelligence research.

Guilford, Harold (1903–1996) U.S. psychologist: a founder of the PSYCHOMETRIC SOCIETY; he is known for his applications of mathematical methods to psychophysics, learning theory, and attitude measurement, which contributed to advancements in PAIRED COMPARISON scaling and MULTIDIMENSIONAL SCALING.

Guthrie, Edwin Ray (1886–1959) U.S. psychologist: best known for developing a variation in behaviorist theory termed CONTINGENCY LEARNING THEORY; he also pioneered the use of teaching evaluations for college faculties.

Hackman, J. Richard (1940–2013) U.S. psychologist: best known for proposing, with U.S. organizational behav-
iorist Greg R. Oldham (1947– ), the JOB CHARACTERISTICS MODEL, delineating basic parameters of a job as they affect employee motivation, and for designing the JOB DIAGNOSTIC SURVEY, a measure of motivational job components as identified in the model; he also made significant contributions to the study of group behavior, particularly the performance and effectiveness of teams.

Hall, Granville Stanley (1844–1924) U.S. psychologist: a founder and organizer of psychology in the United States and the first president of the American Psychological Association (1892); he launched the CHILD STUDY MOVEMENT, the first organized effort to apply scientific methods to the study of children.

Hamilton, William (1788–1856) Scottish philosopher: his intellectual contributions include the law of REDISTRIBUTION to describe recollection of memory from combined mental associations or partial cues; his understanding of consciousness as a function of cognition, feeling, and desire; his belief in the reality of nonconscious modifications of mind; and his identification of attention as a key feature of intelligence.

Harlow, Harry Frederick (1905–1981) U.S. psychologist: best known for investigations on LEARNING SETS and on mothering that showed that nonhuman animals are capable of higher levels of information processing or META-COGNITION; he also studied social development in rhesus monkeys (see MOTHER SURROGATE).

Hartley, David (1705–1757) British philosopher and psychologist: his Observations on Man: His Frame, His Duty, and His Expectations (1749) attempted to integrate ASSOCIATIONISM with a neurophysiology-based explanation of human experience; it was also the first work in English to use the word psychology in the modern sense.

Hathaway, Starke Rosencrans (1903–1984) U.S. psychologist: developer, in collaboration with neuropsychiatrist John C. McKinley, of the MINNESOTA MULTIPHASIC PERSONALITY INVENTORY; he advocated for the establishment of the PsyD degree in practical clinical psychology.

Head, Henry (1861–1940) British neurologist: remembered chiefly for his taxonomy of aphasia and for his theory characterizing all types of aphasia as cognitive disturbances of symbolic formation and expression; he coined the term SEMANTIC APHASIA.

Hebb, Donald Olding (1904–1985) Canadian psychobiologist: an important contributor to the understanding of the brain–behavior relationship; his proposal of CELL ASSEMBLY remains influential in biological theories of learning and memory.

Heidbreder, Edna (1890–1985) U.S. psychologist: participated in the development of the Minnesota Mechanical Abilities Test; she is best known for her book Seven Psychologies (1913), an analysis of seven systems of psychology (e.g., psychoanalysis, Gestalt), which remains a fundamental text on the history of the field.

Heider, Fritz (1896–1988) Austrian-born U.S. psychologist: a preeminent theorist on interpersonal relations, he established the conceptual foundations for much of social psychology research (e.g., ATTIBUTION THEORY, BALANCE THEORY).

Helmholtz, Hermann Ludwig Ferdinand von (1821–1894) German physiologist and physicist: a founder of psychosensory physiology; his research laid the foundations of modern visual and auditory science (see YOUNG–HELMHOLTZ THEORY OF COLOR VISION).

Helson, Harry (1898–1977) U.S. psychologist: developed ADAPTATION LEVEL theory to describe the effects of context on subjective judgment.

Hering, Ewald (1834–1918) German physiologist: his sensory perception research (see HERING THEORY OF COLOR VISION) influenced the development of German psychology and the school of PHENOMENOLOGY.

Hickok, Laurens Verseus (1798–1888) U.S. philosopher and clergyman: his most important work, Rational Psychology (1849), was the first published example of systematic psychology as a science in America; he also published a college text, Empirical Psychology (1854), an introspective study of the human mind.

Hilgard, Ernest R. (1904–2001) U.S. psychologist: an influential researcher and synthesizer in the fields of conditioning, learning theory, and HYPNOSIS; he also proposed NEO-DISASSOCIATION THEORY.

Hobbes, Thomas (1588–1679) English philosopher: a philosophical source of SOCIAL CONTRACT theory; his belief in MATERIALISM contributed significantly to British EMPIRISM; his emphasis on physiological principles of perception, cognition, and emotion are said to have influenced the later development of some aspects of BEHAVIORISM.

Hollingworth, Harry L. (1880–1956) U.S. psychologist: a pioneer in applied psychology and coauthor of the first textbook in that field; particularly known for his work in ADVERTISING PSYCHOLOGY; married to Leta S. Hollingworth.

Hollingworth, Leta Stetter (1886–1939) U.S. psychologist: a major contributor in educational psychology, clinical psychology, and the psychology of women; her work in education focused on both children with intellectual disabilities and gifted children; married to Harry L. Hollingworth.

Holzman, Philip S. (1922–2004) U.S. clinical psychologist and psychoanalyst: helped establish genetic causation of schizophrenia through research on eye tracking dysfunction (ETD) in patients and their clinically healthy relatives; with his colleagues, he confirmed the link between ETD and a locus on chromosome 6; he also established the concept of cofamilial traits as alternative expressions of schizophrenia genes.

Hooker, Evelyn (1907–1996) U.S. psychologist: conducted the first major controlled study in which groups of gay and heterosexual men were compared on psychological measures of adjustment and not found to be different; her findings influenced the American Psychiatric Association in its decision to remove homosexuality from the Diagnostic and Statistical Manual of Mental Disorders.

Horney, Karen D. (1885–1952) German-born U.S. psychoanalyst: the first great psychoanalytic feminist and a member of the NEO-FREUDIAN school; she stressed culture and disturbed interpersonal relationships as the causes of neuroses, emphasized the importance of focusing on current defenses and inner conflicts over early experience, and is recognized as one of the founders of HUMANISTIC PSYCHOLOGY.

Hovland, Carl Ivor (1912–1961) U.S. psychologist: contributor to the development of NEOBEHAVIORISM—through his research on the generalization of conditioning—and a pioneer in computer studies simulating human concept
formation and thinking; he studied the processes by which persuasive messages change attitudes.

**Howes, Ethel Dench Puffer** (1872–1950) U.S. psychologist: published *The Psychology of Beauty* (1905), based on her research on art and aesthetics; with her career essentially ended after she married in 1908, she became a feminist pioneer, focusing on discrimination by the academic community against women and on the inequality imposed on women in having to choose between motherhood and career.

**Hull, Clark Leonard** (1884–1952) U.S. psychologist: originator of the influential **DRIVE-REDUCTION THEORY** and one of the founders of **NEOBEHAVIORISM**.

**Hume, David** (1711–1776) Scottish philosopher, historian, and political economist: a major figure in the philosophical tradition of **EMPIRICISM**: a proponent of radical **SKEPTICISM**, he posited that the self is a mental construct produced solely by the laws of association and challenged the notion of certainty in science and religion.

**Humphreys, Lloyd Girton** (1913–2003) U.S. psychometrist: trained in FACTOR ANALYSIS, he became a testing specialist and a lifelong champion of accuracy in measurement; he also contributed to the understanding of INDIVIDUAL DIFFERENCES, human ability, and intelligence and to defining **CONSTRUCT VALIDITY**.

**Hunt, Joseph McVicker** (1906–1991) U.S. psychologist: known for his “feeding frustration” studies in rats, which demonstrated a link between early food deprivation and adult HOARDING behavior, and for his A/S ratio (the ratio of association to sensory areas in the brain), which highlighted the importance of **INTRINSIC MOTIVATION**; he laid the conceptual foundations for programs (e.g., HEAD START) emphasizing the value of early childhood education in cognitive development.

**Hunter, Walter S.** (1889–1954) U.S. psychologist: known especially for his studies of animal cognition, such as the DELAYED-RESPONSE phenomenon; he later contributed to the study of MAZE LEARNING in animals and was a major force in establishing psychology’s credibility as an experimental science in the United States.

**Hurvich, Leo M.** (1910–2009) U.S. psychologist: with his wife, U.S. researcher Dorothea Jameson, he validated the **OPPONENT PROCESS THEORY OF COLOR VISION** through studies on the perception of hue, saturation, and brightness under a wide variety of viewing conditions.

**Irion, Arthur L.** (1918–1999) U.S. experimental psychologist: studied REMINISCENCE and RETENTION in learning as a function of rest and practice, as well as other memory-related phenomena.

**Itard, Jean-Marc-Gaspard** (1775–1838) French physician: best known for his work with the so-called **WILD BOY OF AVEYRON**, beginning around 1800 and reported in articles in 1801 and 1807; his intensive educational program with the boy is considered an important early development in the SPECIAL EDUCATION of children with intellectual and developmental disabilities, an effort that was further advanced by Itard’s student, Édouard Séguin.

**Izard, Carroll E.** (1923– ) U.S. psychologist: best known for his groundbreaking research on the psychology of emotions, for his **DIFFERENTIAL EMOTIONS THEORY**, and for his **MAXIMALLY DISCRIMINATIVE FACIAL MOVEMENT CODING SYSTEM** of emotional expressions in infants and young children.

**Jackson, John Henry** (1922–2008) U.S. educational psychologist: published on many topics in school psychology and on minority affairs relevant to schoolchildren and psychologists; he was the first African American recipient of the **American Psychological Association Division of School Psychology’s Distinguished Service Award**.

**Jackson, John Hughlings** (1835–1911) British neurologist and theorist: chiefly remembered for his studies of epilepsy and aphasia; his evolutionary brain theory later influenced Sigmund Freud’s archaeological conception of mind, Kurt Goldstein’s theories of cortical organization, and Paul MacLean’s concept of the **TRIUNE BRAIN**.

**James, William** (1842–1910) U.S. psychologist and philosopher: one of the principal founders of psychology in the United States and, arguably, the most influential of the first generation of American psychologists; his promotion of **FUNCTIONALISM** in psychology and his pioneering contributions to the **PSYCHOLOGY OF RELIGION** had enduring effects; he served two terms as president of the American Psychological Association (1894 and 1904).

**Jameson, Dorothy** (1920–1998) U.S. researcher: with her husband, U.S. psychologist Leo Hurvich, she validated the **OPPONENT PROCESS THEORY OF COLOR VISION** through studies on the perception of hue, saturation, and brightness under a wide variety of viewing conditions.

**Janet, Pierre** (1859–1947) French psychologist and neurologist: his analysis emphasizing observable behavior and the continuity of unconscious and conscious events, largely dismissed by psychoanalysts of his day, has since been seen as a forerunner in the study of traumatic stress and **DISSOCIATION** and a precursor of **INTEGRATIVE PSYCHOTHERAPY**; he was an early teacher of and influence on Sigmund Freud.

**Janis, Irving Lester** (1918–1990) U.S. social and health psychologist: noted for introducing the concept of GROUP THINK; he researched stress and decision making, especially in the contexts of individual personal health and group dynamics.

**Jastrow, Joseph** (1863–1944) Polish-born U.S. experimental psychologist: an early contributor in **PSYCHOPHYSICS**, particularly on how subliminal factors influence psychophysical judgments; he was influential in introducing the new scientific psychology to the American public.

**Jenkins, James J.** (1923–2012) U.S. psychologist: a leading figure in the development of cognitive psychology, he contributed to several areas of research, among them learning and memory, speech perception, aphasia, and perceptual organization.

**Jennings, Herbert Spencer** (1868–1947) U.S. zoologist: his empirical study of the behavior of lower organisms (e.g., protozoa) influenced the **BEHAVIORISM** of John B. Watson, and his emphasis on the primacy of observation and experiment in scientific research anticipated Percy W. Bridgman’s operational analysis (later known as **OPERATIONALISM**).

**Jensen, Arthur R.** (1923–2012) U.S. psychologist: best known for his work on the construct of a general factor (g) of intelligence, for his **LEVEL I–LEVEL II THEORY** of learning ability, and for his controversial article, “How Much Can We Boost IQ and Scholastic Achievement?” (1969), ques-
tioning the efficacy of educational programs (e.g., Head Start) to enhance intellectual development (see DESENSITIZATION) and hypothesizing that individual and group differences in learning potential have both genetic and environmental components.

Jones, Mary Cover (1896–1987) U.S. developmental psychologist; known for her observational study of the development of infant behavior patterns, such as smiling, eye coordination, visual pursuit, and reaching, and for pioneering the use of behavior modification techniques to eliminate fear reactions in children (see IN VIVO DESENSITIZATION); she published the first scientific account of the therapeutic potential of these techniques in 1924.

Judd, Charles Hubbard (1873–1946) U.S. psychologist: published a 1908 study demonstrating the importance of whole-unit understanding of the principles underlying a learning task, asserting a theme that was particularly relevant to Gestalt psychology.

Julesz, Béla (1928–2003) Hungarian-born U.S. visual neuroscientist and theoretical psychologist: his investigation of STEREOPSIS led to his creation of RANDOM-DOT STEREOSGRAMS, which became a ubiquitous feature of vision science; he also established the concept of an inner CYCLOPEAN EYE that is the primal beginning of a cascade of visual processing resulting in conscious sight.

Jung, Carl Gustav (1875–1961) Swiss psychiatrist and psychoanalyst: originator of ANALYTIC PSYCHOLOGY, which emphasized personality dynamics, such as conscious versus unconscious values, introversion versus extraversion tendencies, and rational versus irrational processes; he originated such theoretical constructs as ARCHETYPES, the COLLECTIVE UNCONSCIOUS, and SYNCHRONICITY.

Kagan, Jerome (1929–) U.S. developmental psychologist: preeminent researcher of emotional and cognitive development in children, with a particular focus on studying the origins of temperament and its effects on behavior; he is known especially for his work on BEHAVIORAL INHIBITION and REFLECTION–IMPULSIVITY.

Kahneman, Daniel (1934–) U.S. psychologist, born in British Palestine (now Israel); known for his studies, with psychologist Amos Tversky, of similarity, judgment under uncertainty, and decision making; he won a Nobel Prize in 2002 for his work, much of it with Tversky, incorporating psychological insights into economic science.

Kant, Immanuel (1724–1804) German philosopher: his importance to psychology lies in several areas: his distinction between perception and scientific knowledge, his affirmation of the necessity of COGNITIVE STRUCTURES for coherent human experience, his emphasis on the limits of empirical knowledge, his separation of science from metaphysics, and his legacy in shaping the thought of several personality theorists and the theories of Gestalt psychology and cognitive psychology.

Kantor, Jacob Robert (1888–1984) U.S. psychologist and philosopher: known for his theory of INTERBEHAVIORAL PSYCHOLOGY and for his vision of a psychological science that is naturalistic and ARISTOTELIAN.

Kaplan, Edith (1924–2009) U.S. psychologist: a founder of CLINICAL NEUROPSYCHOLOGY; her modifications of the WISC-SCLER ADULT INTELLIGENCE SCALE and the WISC-SCLER MEMORY SCALE led to development of the PROCESS APPROACH to neuropsychological assessment; she is perhaps best known for her work in test development (e.g., the BOSTON NAMING TEST, among others).

Kastenbaum, Robert J. (1912–2013) U.S. psychologist: renowned expert on the psychology of aging and death, he published the first textbook on the subject, Death, Society, and Human Experience (1977), and established in 1966 the first university-based education and research center on death and dying; he is known also for such concepts as the DEATH SYSTEM and EDGE THEORY.

Keller, Fred Simmons (1889–1996) U.S. psychologist: known primarily for his role in disseminating the concepts of behavior analysis and for creating the first personalized system of instruction, a form of mastery learning also known as the KELLER PLAN.

Kelley, Ann Elizabeth (1954–2007) U.S. psychologist: a preeminent authority on the function of the NUCLEUS ACCUMBENS, studying its role in the intake of highly palatable foods and elucidating the etiology and pathophysiology of eating disorders and obesity; she further studied its role in reward and motivation and in drug abuse.

Kelley, Harold Harding (1921–2003) U.S. social psychologist: especially known for his formulation of ATTRIBUTION THEORY; he conducted pioneering research on communication, persuasion, the social psychology of groups, and interpersonal relations and was the co-developer with John W. Thibaut of SOCIAL EXCHANGE THEORY and INTERDEPENDENCE THEORY.

Kiesler, Charles Adolphous (1914–2002) U.S. social psychologist: with interests in mental health services and particularly inpatient services in psychiatric hospitals, he became a staunch advocate of the DEINSTITUTIONALIZATION movement of the 1980s.

Kimble, Gregory A. (1917–2006) U.S. psychologist and educator: developed an organizing framework of psychology (functional behaviorism) based on an S–R formulation in which S (stimulus) includes a wide array of antecedent conditions, such as historical and genetic antecedents, and R (response) represents the observable consequences.

Kinsey, Alfred (1894–1956) U.S. zoologist and sex researcher; an influential researcher on human sexual behavior, he presented the first statistical data on a large range of sexual behaviors in both sexes, publishing the data in two books in 1948 and 1953 (also known as the “Kinsey reports”); his KINSEY SCALE offers an index of sexual orientation on a continuum from EXCLUSIVELY HOMOSEXUAL to EXCLUSIVELY HETEROSEXUAL.

Klineberg, Otto (1882–1960) Austrian-born British psychoanalyst: a pioneer in CLINICAL ANALYSIS and the first to use PLAY THERAPY as an analytic and treatment technique; her approach emphasized primal conflicts and the primary object relationship with the mother (see OBJECT RELATIONS THEORY).

Klineberg, Otto (1899–1992) Canadian-born U.S. social psychologist: a seminal figure through his research on race, which challenged racial superiority theories and contributed to the U.S. Supreme Court’s 1954 ruling in Brown v. Board of Education; he also focused on cross-cultural studies and international affairs.
Koch, Sigmund

Koch, Sigmund (1917–1996) U.S. psychologist: known for Psychology: A Study of Science (1959–1963), a six-volume survey of conflicting perspectives of psychology in the mid-20th century; he promoted an empirically grounded, rationally defensible investigation in a field that he claimed could never become a single, coherent discipline.

Koffka, Kurt (1886–1941) German Gestalt psychologist: one of the founders of and a chief spokesperson for Gestalt psychology; after his early migration to the United States, he became a major influence on the development of James J. Gibson’s holistic views of perception.

Kohlberg, Lawrence (1927–1987) U.S. psychologist: originator of the groundbreaking KOHLBERG’S THEORY OF MORAL DEVELOPMENT; his promotion and use of interview format was also influential.

Köhler, Wolfgang (1887–1967) German experimental psychologist: one of the founders of Gestalt psychology; he was the most prolific theorist of the Gestalt movement and summarized its aims in The Place of Value in a World of Facts (1938); his contributions in primate learning (see INSIGHT LEARNING) remain influential.

Kraepelin, Emil (1856–1926) German psychiatrist: a founder of modern psychiatry and a pioneer theorist and researcher on serious mental disorder; his development of the concept of DEMENTIA PRECOX was the forerunner of the modern concept of schizophrenia; his taxonomy of mental disorders was an important precursor of modern psychiatric diagnostic systems.

Krasner, Leonard (1924–2007) U.S. experimental psychologist: collaborated with Leonard Ullmann on work on VERBAL CONDITIONING; and on two landmark books on behavior modification; he later focused on behavioral approaches to community psychology, which he called environmental design.

Krech, David (1909–1977) Russian-born U.S. psychologist: a major contributor in physiological psychology (e.g., on the brain–behavior relationship) and social psychology (e.g., on racial prejudice, international conflict).

Kübler-Ross, Elisabeth (1926–2004) Swiss-born U.S. psychologist and thanatologist: best known for her theory of five STAGES OF GRIEF and her explanation of the coping strategies that occur during the dying process, as introduced in On Death and Dying (1969).

Külpe, Oswald (1862–1915) German psychologist and philosopher: established the conceptual foundations of and provided the philosophical context for the WÜRFZERG SCHOOL of experimental research on higher mental processes that anticipated Edmund Husserl’s PHENOMENOLOGY and influenced the Gestalt psychologists.

Ladd-Franklin, Christine (1847–1931) U.S. psychologist and mathematician: an early authority on vision and COLOR THEORIES (see LADD—FRANKLIN THEORY).

La Mettrie, Julien Offray de (1709–1751) French physician and philosopher: his chief arguments were that the soul is a sensory-developed part of the brain, that thinking is a physiological process that is the province of physicians rather than theologians, and ultimately that happiness is the purpose of existence.

Lashley, Karl Spencer (1890–1958) U.S. neuropsychologist: a student of John B. Watson and teacher of Donald O. Hebb, his cortical ablation studies in the 1920s catalyzed the shift from BEHAVIORISM TO COGNITIVE NEUROSCIENCE; also an influential contributor in animal learning, comparative psychology, and neurophysiology, he asserted that, following brain damage, healthy portions of the brain can adapt and take over the work of damaged portions (see EQUIPOTENTIALITY; MASS ACTION).

Lavater, Johann Kaspar (1741–1801) Swiss theologian: known for redefining PHYSIOGNOMY as the study of personality according to facial features and expression, not according to bodily structure as had traditionally been held; his physiognomic ideas influenced the development of PHRINOLOGY.

Lazarus, Richard S. (1922–2002) U.S. psychologist: introduced COGNITIVE APPRAISAL THEORY and extended it to COGNITIVE– MOTIVATIONAL–RELATIONAL THEORY to describe three processes in the generation of emotion (cognitive appraisal, individual motivation, and the relevance of external events); he also helped develop the WAYS OF COPING QUESTIONNAIRE, a popular tool for measuring adult processes in coping with stress.

Leibniz, Gottfried Wilhelm (1646–1716) German philosopher and mathematician: defended the concept of INNATE IDEAS; he delineated APPERCEPTION as governed by innate truths of logic and mathematics; he further proposed the concept of the MONAD, an indivisible unit of existence, incorporating it into his theory of psychophysical PARALLELISM in which various monads combine to form mind and body and to operate in divine PREESTABLISHED HARMONY.

Lewin, Kurt (1890–1947) German-born U.S. social psychologist: the developer of FIELD THEORY, he was particularly known for experiments on leadership styles, GROUP COHESION, and GROUP DYNAMICS (a term he coined); he was a committed advocate of ACTION RESEARCH.

Lindsey, Donald B. (1907–2003) U.S. neuropsychologist and neuropsychologist: a pioneer in measuring brain activity connected with sensory and cognitive function, he was among the first to measure brain activity in children and fetuses; he is also known for research on the RETICULAR ACTIVATING SYSTEM.

Lindsey, Ogden Richardson, Jr. (1922–2004) U.S. behavioral psychologist: performed seminal methodological studies in BEHAVIORAL PHARMACOLOGY, specifically using operant conditioning procedures to measure the effects of psychotropic drugs on the behavior of people with chronic schizophrenia; he also conducted laboratory analyses of social behavior, including studies of cooperation and competition in children.

Lindzey, Gardner (1920–2008) U.S. psychologist: a major influence in social psychology, personality psychol-
ogy, BEHAVIORAL GENETICS, and the study of the history of psychology.

Lloyd Morgan. Conway (1852–1936) British zoologist and comparative psychologist: best known for promoting a rigorous methodology for ANIMAL BEHAVIOR research and for proposing what is now called LLOYD MORGAN’S CANON, the principle that animal behavior should not be interpreted in complex psychological terms if it can be interpreted in simpler concepts.

Locke, John (1632–1704) English philosopher; famed for his proposal, in An Essay Concerning Human Understanding (1690), that the human mind at birth is a “white paper” (or TABULA RASA) upon which knowledge is inscribed through sensory experience and, to a lesser extent, reflection; he advocated the experimental method to validate such knowledge: Essay launched British EMPIRICISM as a systematic approach to philosophy.

Loeb, Jacques (1859–1924) German-born U.S. biophysicist: known especially for his experiments on TROPISM, or “forced movement,” demonstrating an animal’s orientation to external stimuli such as light and electricity; he also conducted seminal, and controversial, work on artificial PARTHENOGENESIS.

Lord, Frederic Mather (1912–2000) U.S. psychometrician: made many significant contributions to the theory and application of mental measurement, including the development of ITEM RESPONSE THEORY.

Lorenz, Konrad Zacharias (1903–1989) Austrian zoologist: Nobel Prize–winning cofounder of ETHOLOGY (with Nikolaas Tinbergen and Karl von Frisch); he developed several major concepts still useful for behavior study, including the FIXED ACTION PATTERN, the RELEASER, and IMPRINTING.

Lotze, Rudolf Hermann (1817–1881) German philosopher, psychologist, and physiologist: explained medical findings in mechanistic, physiological terms yet invoked a teleological idealist philosophy; he was highly regarded as a representative of EMPIRICAL PSYCHOLOGY.

Luborsky, Lester Bernard (1920–2009) U.S. psychologist: a pioneer of empirical research on PSYCHODYNAMIC PSYCHOTHERAPY; his CORE CONFLICTUAL RELATIONSHIP THEME method was a breakthrough in the formalization of clinical psychodynamic concepts; despite this psychodynamic emphasis, he argued that all psychotherapies are equally effective.

Luchins, Abraham S. (1914–2005) U.S. Gestalt psychologist: a pioneer in the field of problem solving and productive thinking, he is well known for his research on the EINSTELLUNG effect.

Luria, Alexander R. (1902–1977) Russian neuropsychologist: a major contributor to research on brain function and brain trauma, he developed a system of neuropsychological assessment to aid in diagnosis, treatment, and rehabilitation of individuals with brain trauma, as well as batteries such as the LURIA–NEBRASKA NEUROPSYCHOLOGICAL BATTERY; he also collaborated early in his career with Lev Vygotsky on a sociocultural theory of language.

Lykken, David T. (1928–2006) U.S. behavioral geneticist: a pioneer in the study of psychopathology and of lie detection; a critic of the POLYGRAPH, he proposed the GUILTY KNOWLEDGE TEST as an alternative; he was also active in twin and family studies and proposed a genetic SET-POINT theory to account for individual differences in happiness.

Mach, Ernst (1838–1916) Czech-born Austrian philosopher and physicist: among his contributions to PSYCO-PHYSICS was his identification of a type of contrast illusion now called MACH BANDS, which facilitate color differentiation through sensory inhibition; his OBJECTIVE PSYCHOLOGY and psychology of science set the stage for both the Gestalt and behaviorist movements in psychology.

Maher, Brendan A. (1924–2009) U.S. psychologist: revolutionized the search for causes of mental illness and transformed the study of psychopathology from a descriptive enterprise to a laboratory science.

Marlatt, G. Alan (1941–2011) Canadian-born U.S. psychologist: a pioneer in addiction research, perhaps best known for refuting the belief that addiction to alcohol or drugs can be managed only through complete abstinence and for advocating HARM REDUCTION and RELAPSE PREVENTION as effective approaches in addiction treatment.

Marx, Karl (1818–1883) German social and economic theorist: his various writings, including Das Kapital, have had a significant but mixed influence on many of the social sciences, including (obliquely) psychology; Soviet use of his ideology generated an ill-defined “Marxist psychology” now best remembered for Lev Vygotsky’s 1927 rejection of it (suppressed until 1982).

May, Rollo (1909–1994) U.S. psychologist and psychoanalyst: a central proponent and spokesperson for HUMANISTIC PSYCHOLOGY and EXISTENTIAL PSYCHOLOGY; emphasized the adaptive and curative qualities of positive human values, such as love, free will, and self-awareness—themes later taken up by POSITIVE PSYCHOLOGY.

McClelland, David (1917–1998) U.S. psychologist: best known for theoretical and empirical contributions to the study of personality and motivation; with John W. Atkinson (1923–2003), he developed a method of scoring the highly popular THEMATIC APPERCEPTION TEST to assess ACHIEVEMENT MOTIVATION.

McCosh, James (1811–1894) Scottish-born U.S. philosopher and psychologist: attempted to integrate philosophy with new findings in the sciences, including psychology, while bringing to the process his own spiritual emphases.

McDougall, William (1871–1938) British-born U.S. psychologist: he championed several controversial ideas, particularly the concept of instinct as an innate, goal-directed
determinant (“motive power”) of perception, feeling, and behavior and as the basis of learned habits; his HARMIC PSYCHOLOGY encompassed human instincts (as identified and defined by him) into a systematic framework to explain social behavior.

McGraw, Myrtle Byram (1899–1988) U.S. developmental psychologist: a noted figure in the psychology of infant learning, she saw development in terms of overlapping, alternating, and interdependent behavior patterns; she also viewed variability in the timing and attainment of motor functions as common and normal.

McGuire, William James (1925–2007) U.S. psychologist: a pioneer in work on social cognition and a leading expert on attitude change, self-concept, and the psychology of persuasion; he is also known for his INOCULATION THEORY.

Mead, George Herbert (1863–1931) U.S. philosopher, social theorist, and psychologist; with John Dewey, he established the CHICAGO SCHOOL OF PRAGMATISM; he was a major exponent of the theory (later named SYMBOLIC INTERACTIONISM) that self-concept is created through interpretation of the gestures, words, actions, and appearance of others during social interaction.

Mehrl, Paul Everett (1920–2003) U.S. psychologist: made numerous contributions in his multifaceted areas of interest and was especially influential in establishing the superiority of actuarial prediction (see CLINICAL PREDICTION) over subjective judgment in clinical settings; both a practicing clinician and a major philosopher of science, he wrote extensively and influentially on the subject of these and other fields, including law.

Meier, Manfred J. (1929–2006) U.S. clinical psychologist: one of the most influential figures in the establishment of CLINICAL NEUROPSYCHOLOGY as a specialty field; he conducted significant neuropsychological research on epilepsy, stroke, and Parkinson’s disease.

Melton, Arthur W. (1906–1978) U.S. psychologist: known for significant research on human memory; he introduced the concepts of ENCODING, STORAGE, and RETRIEVAL; he also discovered the enhanced effect on memory of increasing the intervals between presentations of material to be learned (see LAG EFFECT).

Mesmer, Franz Anton (1734–1815) German physician: developed the theory that “magnetic power” in the body can be summoned (via “magnetic passes” of a physician’s hands over a patient’s body) to cure disease, which he believed to result from blockage of the flow of an invisible “fluid” called ANIMAL MAGNETISM; some of the effects of this approach (e.g., a trancelike state) were similar to those achieved through the later practice of HYPNOSIS; both Mesmer’s technique and hypnosis are sometimes referred to as mesmerism.

Metzger, Wolfgang (1899–1979) German Gestalt psychologist: known especially for exploring the minimal conditions of DEPTH PERCEPTION, using a uniformly lit, finely grained white sphere to create a homogeneous visual field that he called a GANZFELD.

Meyer, Adolf (1866–1950) Swiss-born U.S. psychiatrist: a leading exponent of PSYCHOBIOLOGY; he emphasized the importance of understanding both normal and abnormal behavior, including severe mental illness, in a holistic, biopsychosocial context.

Miles, Walter Richard (1885–1978) U.S. psychologist: best known for creating the elevated, wall-less maze that made possible the study of spatial orientation in rats and for directing the Stanford Later Maturity Study, one of the earliest investigations of its kind on the effects of aging on perceptual, motor, and cognitive skills.

Milgram, Stanley (1933–1984) U.S. social psychologist: best known for his BEHAVIORAL STUDY OF OBEDIENCE; he later pioneered the field of urban psychology.

Mill, James (1773–1836) Scottish philosopher, historian, economist, and political theorist: a champion of UTILITARIANISM and rooted in the tradition of British empiricism; he was a major proponent of the use of associationist principles (see ASSOCIATIONISM) in early education; father of John Stuart Mill.

Mill, John Stuart (1806–1873) British philosopher: like his father James Mill, he championed UTILITARIANISM and was a British empiricist, his work representing in some view the culmination of associationism thought; he held that complex ideas resulted from MENTAL CHEMISTRY and, prefiguring Gestalt theory, proposed that they take on emergent properties that transcend the sum of their parts (see EMERGENTISM).

Miller, George Armitage (1920–2012) U.S. psychologist: known for his work in cognitive psychology, particularly communication and PSYCHOLINGUISTICS; best remembered for a 1956 article, “The Magical Number Seven (Plus or Minus Two): Some Limits on Our Capacity for Processing Information,” in which he identified the constant number of items (SEVEN PLUS OR MINUS TWO) that can be retained in short-term memory at a given time, and for his 1969 American Psychological Association presidential address, in which he urged “giving psychology away”—that is, the increased sharing of psychology’s mature scientific findings with the larger society.

Miller, Neal Elgar (1909–2002) U.S. psychologist: considered the founder of BEHAVIORAL MEDICINE; his work significantly affected the fields of learning, motivation, and clinical psychology.

Millon, Theodore (1928–2014) U.S. psychologist: leading theorist of personality and personality disorders who developed an influential taxonomy of maladaptive personality styles, operationalizing it with empirically grounded assessment instruments (e.g., the widely used MILLON CLINICAL MULTIAXIAL INVENTORY) and personalized therapeutic interventions (e.g., PERSONALITY-GUIDED THERAPY).

Money, John W. (1921–2006) New Zealand–born U.S. psychologist: best known for his research and theoretical contributions in the field of SEXOLOGY; he established a research unit for the long-term psychological study of INTER-SEX and other conditions.

Montessori, Maria (1870–1952) Italian physician and educator: one of the first women to attend medical school in Italy, she developed a psychologically based, and still highly influential, educational system called the MONTESSORI METHOD.

Moreno, Jacob Levy (1889–1974) Romanian-born U.S. psychiatrist: founded SOCIOMETRY and PSYCHODRAMA; he was a major pioneer in group psychotherapy.

Morgan, Clifford Thomas (1915–1976) U.S. psychol-
gist: known for his research on audiogenic seizure, biological drive, and auditory processing; the author of several textbooks, he was also a founder of the PSYCHONOMIC SOCIETY.

Mower, Orval Hobart (1907–1982) U.S. psychologist: best known for his contributions to the fields of learning and LANGUAGE ACQUISITION, which he explained using elementary principles of conditioning; later, he examined the role of guilt in psychological life and wrote extensively on the relation of psychology, psychiatry, and religion.

Müller, Georg Elias (1850–1934) German psychologist and philosopher: known especially for work in psychophysical procedures (see, e.g., the MÜLLER–URBAN PROCESS), memory, and color vision; he also proposed, with German psychologist Alfonso Pilzecker (1865–1949), the PERSEVERATION–CONSOLIDATION HYPOTHESIS.

Müller, Johannes Peter (1801–1858) German anatomist and physiologist; recognized for his research on perception, the central nervous system, endocrinology (discovering, e.g., the role of the MÜLLERIAN DUCT in the development of female reproductive structures in mammalian embryos), hematology, and the lymphatic system; a proponent of VITALISM, he also investigated comparative zoology and anatomy.

Münsterberg, Hugo (1863–1916) German-born U.S. psychologist: a founder of industrial and organizational psychology, he also made early contributions to educational, abnormal, and forensic psychology (e.g., his studies of eyewitness testimony and lie detection).

Murphy, Gardner (1895–1979) U.S. psychologist: an influential experimental and social psychologist; he is also recognized for his guidance of U.S. psychologist Rensis Likert (1903–1981) in the development of the LIKERT SCALE; his expansive vision of the role of psychology in promoting human welfare significantly affected the post–World War II course of the American Psychological Association and of the discipline itself.

Myers, Charles Samuel (1873–1946) British physician and psychologist: founded the British Journal of Psychology in 1904; he wrote an influential textbook on experimental psychology (1911) and, later, a textbook in applied psychology (1920); he also founded the National Institute of Industrial Psychology (1921).

Neisser, Ulric Gustav (1928–2012) German-born U.S. cognitive psychologist: established cognitive psychology as a field through his book Cognitive Psychology (1967), which synthesized decades of material on memory, perception, and thought; a proponent of the study of memory in everyday human contexts, he conceived of humans as “information processors.”

Neugarten, Bernice Levin (1916–2001) U.S. developmental psychologist: known for significantly advancing the study of adult development and aging; she viewed later adulthood as a period of increased activity and self-enhancement and proposed the distinctions of young-old and old-old (see ADULTHOOD).

Newcomb, Theodore Mead (1903–1984) U.S. social psychologist: emphasized the interdisciplinary nature of social psychology (e.g., the integration of behavioral concepts from psychology, anthropology, and sociology); his attitudes and value research focused on real-setting social relations and placed attitude change in the context of norms, group membership, leadership, and friendship.

Newton, Isaac (1642–1727) British physicist and mathematician: a preeminent figure in the history of science whose writings, particularly Philosophiae Naturalis Principia Mathematica (Mathematical Principles of Natural Philosophy: 1687), integrated physics and astronomy to explain planetary motion and the law of gravitation; he later significantly influenced philosophy (e.g., the work of John Locke) and psychology.

Nietzsche, Friedrich Wilhelm (1844–1900) German philosopher: author of a vast body of writings on metaphysics, Christian morality, and ethics that later influenced currents of thought such as EXISTENTIALISM, POSTSTRUCTURALISM, and POSTMODERNISM, as well as the schools of psychology that embraced them.

Nisien, Henry Wieghorst (1901–1958) U.S. comparative psychologist: a leading expert on the biology and behavior of chimpanzees (e.g., in the acquisition of resources, emotional expression, and social interaction); he viewed behavioral sequences as clusters of independent acts, each with its own motivation.

Nolen-Hoeksema, Susan (1959–2013) U.S. psychologist: a pioneer in research on sex differences in depression, she authored a landmark 1987 article in which she cited RUMINATION in women as a significant risk factor for depression that accounts for the greater prevalence of the disorder in women than in men; her later work identified rumination as a risk factor for other disorders as well (e.g., binge eating, alcohol abuse).

Olds, James (1922–1976) U.S. psychologist: performed groundbreaking research that suggested the existence of PLEASURE CENTERS in the brain and that shed light on the nature of motivation, reward, reinforcement, and addiction.

Orne, Martin Theodore (1927–2000) Austrian-born U.S. psychologist and psychiatrist: originator of the concept of TRANCE LOGIC and the REAL–SIMULATOR MODEL; he also posited that participants in experimental research seek to understand the situation they are in through the discernment of DEMAND CHARACTERISTICS—the tendency of participants to try to respond to these cues has been named the ORNE EFFECT.

Osgood, Charles Egerton (1916–1991) U.S. psychologist: a significant theorist and researcher in PSYCHOLINGUISTICS and cross-cultural psychology; he developed (with George J. Suci and Percy H. Tannenbaum) the SEMANTIC DIFFERENTIAL model of determining word meanings.

Parloff, Morris B. (1918–2011) U.S. psychologist: developed and advanced the field of PSYCHOTHERAPY RESEARCH during his 30-year career as a researcher and administrator at the NATIONAL INSTITUTE OF MENTAL HEALTH, as well as through his work as an educator and a practitioner.

Paterson, Donald Gildersleeve (1892–1961) U.S. psychologist: significantly contributed to applied psychology through his studies of individual differences, test construction, personnel selection, educational counseling, and vocational counseling.

Pavlov, Ivan Petrovich (1849–1936) Russian physiologist: best known for experimentation on the physiology of
the digestive system and its control by the nervous system, which yielded the concepts of CLASSICAL CONDITIONING.

**Payton, Carolyn R.** (1925–2001) U.S. psychologist: a powerful advocate of the mental health needs of African Americans; her highly successful Counseling Services program at Howard University was one of the few programs at any African American institution to offer accredited training for Black therapists and counselors.

**Pearson, Karl** (1857–1936) British statistician and biometrician: as a pioneer of BIOSTATISTICS, he defined numerous methods of statistical analysis that became immensely important to various sciences (e.g., the PRODUCT-MOMENT CORRELATION COEFFICIENT); he was also influential as a biographer of Francis Galton, as a philosopher of science, and, controversially, as a proponent of eugenics.

**Peirce, Charles Sanders** (1839–1914) U.S. scientist and philosopher: known for major contributions to the mathematics of probabilities, statistics, logic, astronomy, and epistemology; he was also a founder of SEMIOTICS and, most relevant to psychology, an early exponent of PRAGMATISM.

**Peterson, Christopher M.** (1950–2012) U.S. psychologist: an educator and a founder of POSITIVE PSYCHOLOGY; he developed tests and content analyses for measuring CHARACTER STRENGTHS and well-being and coauthored with U.S. psychologist Martin E. P. Seligman (1942– ) Character Strengths and Virtues: A Handbook and Classification (2004); he was a pioneer in documenting empirical evidence of the link between optimism, physical health, and longevity.

**Piaget, Jean** (1896–1980) Swiss child psychologist and epistemologist: his theoretical and research work on the stages of cognitive development in children was enormously influential (see PIAGETIAN THEORY); he also proposed a stage theory of moral development (see, e.g., AUTONOMOUS STAGE) and was a central proponent of the theoretical perspective known as CONSTRUCTIVISM.

**Pick, Herbert L., Jr.** (1930–2012) U.S. psychologist: during a nearly 50-year career at the University of Minnesota’s Institute of Child Development, he made major contributions to the study of perceptual learning and development and is widely credited for his seminal investigations of SPATIAL COGNITION.

**Plato** (c. 428–347 BCE) Greek classical philosopher, successor to Socrates, and teacher of Aristotle: building on the dialectic methods (see DIALECTIC TEACHING) of his teacher Socrates, Plato articulated a comprehensive philosophy encompassing not only the search for fundamental qualities such as truth and beauty but also mathematics and the practical application of logic to politics and law.

**Plutchik, Robert** (1927–2006) U.S. psychologist: developed a psychoevolutionary theory of emotion, providing a classification system for general emotional responses; he theorized that personality derives from emotions and helped to establish the study of emotion as a concern not only for psychology and psychiatry but also for other social sciences, biology, and the humanities.

**Pribram, Karl Harry** (1919– ) Austrian-born U.S. neuropsychologist and theoretical psychologist: proposed a model of brain activity that he termed holonomic (see HISTORIC BRAIN THEORY) and described cognitive functions as emergent properties of the brain’s reconstitution of holograms from brain waveforms; he is also known for his contributions to the understanding of WORKING MEMORY.

**Ratliff, Floyd** (1919–1999) U.S. physiological psychologist: a preeminent researcher of the neural mechanisms underlying visual perception; he introduced digital technology such as the real-time recording of neuronal responses by computer.

**Reik, Theodor** (1888–1969) Austrian-born U.S. psychoanalyst: played a central role in legitimizing the practice of psychoanalysis by nonphysicians in the United States (see LAY ANALYSIS); he founded the National Psychological Association for Psychoanalysis and placed a strong emphasis on intuition in therapy.

**Rhine, Joseph Banks** (1895–1980) U.S. parapsychologist: the first researcher to investigate a psychical topic scientifically, using ZENER CARDS (also called Rhine cards).

**Ribot, Théodule Armand** (1839–1916) French philosopher and psychologist: a founder of experimental psychology in France; he proposed what is now called RIBOT’S LAW, the principle that the most recently acquired memories are the most vulnerable to disruption from brain damage.

**Rogers, Carl** (1902–1987) U.S. psychologist: as the originator of CLIENT-CENTERED THERAPY, he elucidated such concepts as UNCONDITIONAL POSITIVE REGARD and UNCRITI- CALNESS on the part of the therapist as central to the psychotherapeutic endeavor.

**Rorschach, Hermann** (1884–1922) Swiss psychiatrist: originator of the Rorschach Inkblot Test of personality, which, although still widely used, remains controversial in terms of its validity as an assessment instrument.

**Rosenzweig, Saul** (1907–2004) U.S. psychologist: the first to articulate, in 1916, the COMMON FACTORS idea later advanced in the movement toward psychotherapy integration; he pursued clinical applications of projective methods, culminating in the 1947 publication of the Rosenzweig Picture-Frustration Study: a test of latent hostility; he also developed the personality theory of IDIOY- NAMICS.

**Rotter, Julian Bernard** (1916–2014) U.S. clinical psychologist and personality theorist: best known for his SOCIAL LEARNING THEORY of personality and for the widely used ROTTER INTERNAL–EXTERNAL LOCUS OF CONTROL SCALE.

**Sanford, Edmund Clark** (1859–1924) U.S. experimental psychologist: author of the first English-language laboratory manual in experimental psychology; he was the first psychologist to promote the subsequently common study of MAZE LEARNING in rats.

**Santayana, George** (1861–1952) Spanish-born U.S. philosopher, poet, and cultural critic: a central figure in the era of classical American philosophy of the late 19th and early 20th centuries; a student of William James, he criticized James’s adherence to PRAGMATISM, espousing his own formulation of NATURALISM; he is probably best known for his saying that “those who cannot remember the past are condemned to repeat it.”

**Sarason, Seymour Bernard** (1919–2010) U.S. psychologist: a founder of community psychology; he integrated social-cultural determinants into the study of people with intellectual disabilities and produced a series of empirical studies that provided a foundation for understanding test anxiety; he also cowrote a text that critiqued teacher education and significantly influenced schools of education.
Sarbin, Theodore R. (1911–2005) U.S. clinical and social psychologist: he published on a variety of subjects (e.g., hypnosis, schizophrenia) but is mainly known for evolving a theory of NARRATIVE PSYCHOLOGY and of the self as expressed in social roles (see ROLE-ENACTMENT THEORY).

Schachter, Stanley (1922–1997) U.S. psychologist: an influential theorist and researcher in social and health psychology who focused on such areas as social pressure, attribution theory, and addiction; he is also known for the SCHACHTER–SINGER THEORY of emotion, conceived with U.S. psychologist Jerome E. Singer (1924–2010).

Schiller, Paul Harkai (1908–1949) Hungarian comparative psychologist: his ACTION THEORY emphasized the interplay between organisms and environments; he is known chiefly for his investigations of innate motor patterns in chimpanzees.

Schlosberg, Harold (1904–1964) U.S. experimental psychologist: in the 1950s, he headed the collaborative effort to revise Robert Sessions Woodworth's 1918 textbook Experimental Psychology, a revision that dominated instruction in the field for the next quarter century; he is also remembered for his inventive construction of apparatus for experimental research.

Schneirla, Theodore Christian (1902–1968) U.S. comparative psychologist: one of the foremost 20th-century animal psychologists; he elaborated the APPROACH–AVOIDANCE CONFLICT into biphasic A–W theory, which viewed approach and withdrawal as essential in all behavior—mainly governed by stimulus intensity yet subject to the organism's internal conditions as well as to environmental conditions.

Schopenhauer, Arthur (1788–1860) German philosopher: his emphasis on the will to survive as the basis of all human existence had great influence on the first generation of theorists and practitioners of DEPTH PSYCHOLOGY.

Schopler, Eric (1927–2006) U.S. psychologist: an authority on the diagnosis and treatment of AUTISM SPECTRUM DISORDER; he promoted the now common point of view that autism is a developmental disorder, that its treatment should be educational rather than psychiatric, and that parents can be effective cotherapists in the treatment process.

Schumann, Friedrich (1863–1940) German experimental psychologist: he studied memory, learning, visual illusions, and perception; however, he is better known for his professional associations and mentorships (e.g., he oversaw the postdoctoral work of Wolfgang Köhler and Kurt Koffka).

Schuster, Charles Robert (1930–2011) U.S. psychologist: a pioneer in the scientific study of addiction and one of the founders of BEHAVIORAL PHARMACOLOGY; his research opened the way to a public health approach to substance abuse.

Scott, Walter Dill (1869–1955) U.S. psychologist: a key figure in the development of applied psychology, especially ADVERTISING PSYCHOLOGY and PERSONNEL SELECTION.

Scripture, Edward Wheeler (1864–1945) U.S. psychologist and speech therapist: known for his research on localization of sound and other perceptual phenomena, he studied SPEECH AND LANGUAGE PATHOLOGY and conducted innovative speech therapy that combined psychoanalytic techniques (to address underlying emotional origins) with vocal exercises (to correct faulty speech patterns).

Sears, Pauline Kirkpatrick Snedden (1908–1993) U.S. psychologist: known for rigorous and creative use of quantitative research methods, such as systematic TIME SAMPLING, to study socialization, family processes, and child rearing; her research focused on schoolchildren and the psychological factors affecting academic achievement and performance; married to Robert R. Sears.

Sears, Robert Richardson (1908–1989) U.S. psychologist: best known for research on the influence of parental discipline and other child-rearing practices on children's behavior, especially their levels of aggression and dependency; he was also widely recognized for research on empirical evidence for psychoanalytic theory: he spearheaded the American Psychological Association’s accreditation of clinical doctoral programs following World War II; married to Pauline K. Sears.

Seashore, Carl Emil (1866–1949) Swedish-born U.S. psychologist: a prolific designer and builder of research instruments (e.g., the SEASHORE AUDIOMETER) and creator of the SEASHORE MEASURES OF MUSICAL TALENT; as an influential university administrator, he advanced a comprehensive vision of psychology's interrelations with a spectrum of academic disciplines and scientific specialties.

Sechenov, Ivan Mikhailovich (1829–1905) Russian physiologist: he interpreted psychology, through physiology, as the study of brain reflexes, and he denied the existence of mental causes of behavior; he also described reflexes as tripartite units consisting of a sensory nerve, a central connection, and a motor nerve and proposed that they are modifiable by association from infancy.

Ségui, Edouard (1812–1880) French-born U.S. physician: his pioneering methods of teaching children with severe intellectual and physical disabilities are still influential in many modern SPECIAL EDUCATION programs.

Shakow, David (1901–1981) U.S. psychologist: best known for helping the American Psychological Association professionalize the field of clinical psychology and for helping develop the SCIENTIST-PRACTITIONER MODEL.

Sherif, Muzaffer (1906–1988) Turkish social psychologist: known particularly for his work on group norms (see SOCIAL NORM) and for the ROBBERS CAVE EXPERIMENT, a field study of group competition and cooperation that he conducted with his wife, U.S. social psychologist Carolyn Sherif (1922–1982), and other colleagues; he articulated the notion that perception and behavior are determined in bipolar fashion by external and internal factors, the combined totality of which he termed FRAME OF REFERENCE—this view inspired the development of such novel theories as ADAPTATION LEVEL.

Sherrington, Charles Scott (1857–1952) British physiologist: his research on the mechanics of muscular activation revolutionized neurophysiology; he introduced many basic terms and concepts in neuroscience, among them PROPRIOCEPTION, NEURON, SYNAPSE, SPATIAL SUMMATION, and TEMPORAL SUMMATION.

Shneidman, Edwin S. (1918–2009) U.S. clinical psychologist: almost single-handedly created the field of SUICIDIOLOGY in the United States (coining the term itself); he founded the journal Suicide and Life-Threatening Behavior and coined, among other terms, PSYCHACIDE to capture the mental suffering of people who are suicidal.
behaviorist principles, and he described a behaviorist utopia maintained and improved through the application of behaviourist principles, and he described a behaviorist utopia maintained and improved through the application of behaviorism; he also initiated the field of applied behavior analysis; he was particularly concerned with developing practical ways in which culture could be maintained and improved through the application of behaviorist principles, and he described a behaviorist utopia in Walden Two.

Smith, M. Brewster (1919–2012) U.S. psychologist: advocated for a social psychology that was strongly informed by humanistic psychology; he served as an expert witness in the school desegregation case that, combined with three other cases, led to the historic Brown v. Board of Education decision of the U.S. Supreme Court in 1954.

Smith, Patricia Cain (1917–2007) U.S. industrial and organizational psychologist: best remembered for her contributions to the development of measures of job performance and job satisfaction, including the behaviorally anchored rating scale and the job descriptive index.

Socrates (469–399 BCE) Greek philosopher: one of the founders of Western culture; his primary relevance to psychology lies in his painstaking approach to understanding private experience, his emphasis on the importance of the self, and the so-called Socratic dialogue.

Solomon, Richard Lester (1918–1995) U.S. psychologist: best known for his contributions to learning theory, specifically his work on motivation and emotional states and their influence on behavior (see opponent process theory of acquired motivation).

Spearman, Charles Edward (1863–1945) British psychologist and psychometrician: formulator of the two-factor theory of intelligence that proposed an underlying general factor and multiple specific factors; he is also renowned for his mathematical work, including the development of the Spearman correlation coefficient and the technique of factor analysis.

Spence, Donald Pond (1926–2007) U.S. theoretical psychologist and psychoanalyst: sought to reframe psychoanalysis as a hermeneutic (interpretive) discipline by emphasizing the importance of “narrative smoothing” in the psychoanalytic process, whereby the analyst helps the patient construct a convincing story of events in the patient’s past.

Spence, Kenneth Wartenbee (1907–1967) U.S. experimental psychologist: developer, with Clark L. Hull, of an influential version of the Hull-Spence model—that offered a theoretical system to explain animal learning and motivation on the basis of classical conditioning.

Spencer, Herbert (1820–1903) British philosopher: best known for articulating the now discredited theory of social darwinism; he coined the term survival of the fittest, which Charles Darwin later used as an equivalent for natural selection.

Sperry, Roger Wolcott (1913–1994) U.S. neurobiologist and psychologist: best known for his nerve-regeneration theory and his working out of the implications of research into the specialized functions of the two hemispheres of the brain, which he discovered using split-brain techniques (see commissurotomy); he was awarded the 1981 Nobel Prize in Physiology or Medicine for this work.

Spielberger, Charles D. (1927–2013) U.S. psychologist: best known for his work on personality and health and for his development of the widely used state–trait anxiety inventory, among other assessment instruments.

Spinoza, Baruch (1632–1677) Dutch philosopher, also known by his Latinized name, Benedictus de Spinoza: a major proponent of pantheism; he is perhaps best known for his formulation of the double-aspect theory of the mind–body problem; he is also considered a primary early adherent of rationalism, along with Rene Descartes and Gottfried Wilhelm Leibniz.

Stanley, Julian Cecil, Jr. (1918–2005) U.S. educator: with Donald Campbell, wrote Experimental and Quasi-Experimental Designs for Research (1963), a standard text in the field; he became fascinated with giftedness and initiated programs throughout the United States to identify gifted youth and maximize their educational opportunities.

Stellar, Eliot (1919–1993) U.S. physiological psychologist: coauthor with Clifford T. Morgan of the second edition of Physiological Psychology (1950), which was a standard reference for more than 20 years; he developed (with Nelson Krauss), the Stellar-Krauss stereotaxic instrument, a major innovation in behavioral science research, and made significant contributions to the understanding of the neurobiology of motivation.

Stern, Louis William (1871–1938) German psychologist, usually known as William Stern: best known for developing the concept of the intelligence quotient (see IQ); he was also a pioneer in developmental psychology, applied psychology, and differential psychology.

Stevens, Stanley Smith (1906–1973) U.S. psychologist: extended operationalism to measurement by proposing four scales (nominal, ordinal, interval, and ratio) that have become accepted concepts in statistics; he also discovered incongruities in Fechner’s law that led him to propose Stevens’s law, now a central tenet in psychophysics.

Stone, Calvin Perry (1892–1954) U.S. psychologist: the first comparative psychologist in the United States to focus on the scientific investigation of sexual behavior; he particularly studied neural and hormonal influences and discovered evidence for the importance of subcortical brain regions.

Stout, George Frederick (1860–1944) British philosopher and psychologist: remembered for his considered critique of psychological associationism and for his examinations of perception, which anticipated much of the emphasis on wholeness and totality later taken up in Gestalt psychology.

Stratton, George Malcolm (1865–1957) U.S. psychologist: best known for research on visual phenomena, testing, for example, whether inversion of the retinal image is necessary for the perception of things as being upright; he also studied the social dimensions of individual behavior, particularly as related to culture, religion, and international conflict.

Strong, Edward Kellogg, Jr. (1884–1961) U.S. psychologist: a founder of applied psychology—especially in the areas of personnel selection and occupational analysis—and best known as a codeveloper of the widely used
Troland, Leonard Thompson

STRONG INTEREST INVENTORY (formerly the Strong–Campbell Interest Inventory).

Strupp, Hans H. (1921–2006) German-born U.S. clinical psychologist, psychoanalyst, and psychotherapy researcher: developed a model for framing and evaluating the effectiveness of psychotherapy at three levels of analysis (behavioral, personal well-being, and personality integration and change); he is also recognized for developing, with psychologist Jeffrey L. Binder, a version of brief psychodynamic psychotherapy called time-limited dynamic psychotherapy.

Stumpf, Carl (1848–1936) German experimental psychologist: best known for investigating the psychological factors involved in acoustic perception; his institute launched many famous psychologists, including Kurt Koffka, Wolfgang Köhler, Kurt Lewin, and Max Wertheimer; his pioneering research on emotions proposed a cognitively based theory in which judgments are crucial.

Sullivan, Harry Stack (1892–1949) U.S. psychiatrist: a major contributor to personality theory through his interpersonal theory, which eventually gave rise to interpersonal psychotherapy; his approach derived from Sigmund Freud’s psychoanalysis but emphasized social elements over biological instincts and focused on how key relationships develop and change over time.

Sully, James (1842–1923) British psychologist: studied and wrote about a wide range of topics, including associationism, nativism, perception, sensation, and intuition; he co-founded the BRITISH PSYCHOLOGICAL SOCIETY in 1901.

Sumner, Francis Cecil (1895–1954) U.S. psychologist: the first African American to receive a doctorate in psychology in the United States, he became the head of the psychology department at Howard University and exerted great influence in creating programs to train Black psychologists; his own department trained more Black psychologists than all combined U.S. colleges and universities at this time.

Super, Donald Edwin (1910–1994) U.S. vocational psychologist: wrote extensively on vocational guidance and vocational appraisal; he is also known for his Career Pattern Study, which employed three psychometric instruments still used today: the Work Values Inventory, the Career Development Inventory, and the Adult Career Concerns Inventory.

Taine, Hippolyte (1828–1893) French historian, critic, and philosopher: one of the leading exponents of French positivism; he wrote extensively about the psychology of events in French history, including the psychology of revolutionary crowds.

Terman, Lewis Madison (1877–1956) U.S. psychologist: responsible for the validation of the Binet scales (see Stanford–Binet Intelligence Scale), the development of the Stanford Achievement Test, and the construction of the Army intelligence tests used during World War I (see Army Tests); he is also known for initiating (in the 1920s) an important longitudinal study of some 1,500 gifted children (see Terman’s Giftedness Study).

Teuber, Hans-Lukas (1916–1977) German-born U.S. psychologist: introduced psychophysical methods into clinical neurology in his study of combat-related brain injury; he developed the now standard research procedure of double dissociation and fostered a multidisciplinary approach to psychology that was a precursor of contemporary biological psychology and behavioral neuroscience.

Thelen, Esther (1941–2004) U.S. developmental psychologist: her work on infant motor behavior introduced the principles and methods of dynamic systems theory to developmental psychology, reinvigorated interest in motor development, and provided a theoretical and empirical basis for clinical work in pediatric physical and occupational therapy.

Thibaut, John W. (1917–1986) U.S. social psychologist: codeveloper with Harold H. Kelley of social exchange theory and interdependence theory; he proposed that the benefits derived from taking account of the broader context of behavior underlie the existence of such values as altruism, competitiveness, and fairness.

Thomson, Godfrey Hilton (1881–1955) British mathematician, educational psychologist, and psychometrician: focused his work on psychological measurement and statistical analysis and authored a landmark text on the mathematical foundations of factor analysis.

Thorndike, Edward Lee (1874–1949) U.S. psychologist: an important early contributor to the field of animal intelligence: he developed the concept of trial-and-error learning and the theory of connectionism; later, he became an important figure in the expansion of educational psychology.

Thurstone, Louis Leon (1887–1955) U.S. psychologist: a pioneer in psychometrics; with his wife, psychologist Thelma Gwinn Thurstone (1897–1933), he developed and maintained the examination that was the forerunner of the scholastic assessment test; he further developed the statistical technique of factor analysis to tease out primary abilities.

Titchener, Edward Bradford (1867–1927) British-born U.S. psychologist: a chief exponent of structuralism, which emphasized the use of systematic introspection in laboratory settings to uncover the elements of experience (sensations, images, and feelings).

Tolman, Edward Chace (1886–1959) U.S. psychologist: a founder of neobehaviorism and proponent of the theory of purposive behaviorism; he emphasized such mentalist concepts as purpose and cognitive maps.

Troland, Leonard Thompson (1889–1932) U.S. scientist and psychologist: a significant contributor to visual science; the TROLAND (a unit of retinal illumination) was named in his honor; his promotion of a comprehensive motivational psychology that accommodated feelings as a causal element in behavior anticipated later emphases on
Tryon, Robert Choate

the cognitive–emotional factors in behavior regulation; he was also a co-inventor of the Technicolor process for motion pictures.

Tryon, Robert Choate (1901–1967) U.S. psychologist: widely known for his investigations of individual differences in learning; his breeding of rats based on performance in a standardized maze problem demonstrated the genetic substrate of learning ability; he also developed computerized cluster analysis.

Tucker, Ledyard R. (1910–2004) U.S. psychologist: one of the great pioneers in psychometrics; his seminal work on using factor analytic methods to analyze repeated-measures data laid the foundation for modern latent curve models; he originated major advances in modeling individual differences and linked scaling and factor analysis models in the form of three-mode multidimensional scaling.

Tulving, Endel (1927–) Estonian-born Canadian psychologist: a preeminent expert on memory; among his many contributions are his delineation of episodic memory (recall of things experienced), in contrast to semantic memory (recall of things known), and his elucidation of the encoding specificity principle of memory formulation and retrieval.

Tversky, Amos (1937–1996) U.S. psychologist, born in British Palestine (now Israel); known for his studies, with psychologist Daniel Kahneman, of similarity, judgment under uncertainty, and decision making.

Tyler, Leona E. (1906–1993) U.S. counseling psychologist: author of one of the first (and seminally influential) textbooks on individual differences and of the leading textbook in the mid-20th century on counseling psychology.

Upham, Thomas Cogswell (1799–1872) U.S. mental philosopher: author of the first U.S. textbook on psychology, which appeared in 1827 and remained in use through much of the 19th century.

Verplanck, William Samuel, Jr. (1916–2002) U.S. experimental psychologist: cowrote Modern Learning Theory (1954), a significant step away from Hullian behaviorism to more complex and cognitively oriented behavior theories; he also wrote a glossary (1957) to facilitate cooperation between ethologists and behaviorists.

Vives, Juan Luis (1492–1540) Spanish philosopher: a vigorous supporter of the empirical method, particularly in relation to psychology; he studied and espoused the descriptive observation of human behavior, individual differences in mental activity, and the dynamic relation between the mind and the body (see mind-body problem).

Vygotsky, Lev Semenovich (or Vygotsky; 1896–1934) Russian psychologist: known for his sociocultural theory of cognitive development emphasizing the interaction of children’s natural abilities with the cultural mediators of written and oral language; he held that developmental stages are partially driven by education and that education should take place in the zone of proximal development.

Waldrop, Robert Spurlin (1912–2012) U.S. psychologist: as director of the Veterans Service Bureau at the University of Michigan, he was in charge of providing counseling and other services to more than 12,000 veterans entering the university after World War II; he later played a pivotal role in establishing doctoral-level counseling psychologists in hospitals of the U.S. Department of Veterans Affairs (VA).

Walk, Richard D. (1920–1999) U.S. developmental psychologist: studied cross-species development of depth perception and infant perceptual development, including discrimination learning of various types; he is the originator with Eleanor J. Gibson of the visual cliff.

Ward, James (1843–1925) British psychologist and philosopher: author of a famous article in the 1886 Encyclopedia Britannica that maintained that psychology must examine experience from the standpoint of an active, conscious subject; this belief, elaborated in his 1918 work Psychological Principles, helped to direct the field in Britain away from the associationism and behaviorism of the early 20th century.

Washburn, Margaret Floy (1871–1939) U.S. psychologist: author of the first U.S. textbook of comparative psychology; the second female president of the American Psychological Association (1921) and the second female scientist to be elected to the National Academy of Sciences (NAS).

Watson, John Broadus (1878–1958) U.S. psychologist: best known as the founder of behaviorism, via his 1913 manifesto in the Psychological Review, "Psychology as the Behaviorist Views It."

Watt, Henry Jackson (1879–1925) British experimental psychologist: a student of Oswald Külpe, he published an influential dissertation on thought processes (1905) in which he introduced the importance in problem solving of the Aufgabe; the dissertation is considered one of the foremost contributions of the Würzburg School on thinking in adults.

Weber, Ernst Heinrich (1795–1878) German physiologist: a founder of psychophysics and formulator of Weber’s law; he is also known for his work on two-point discrimination, which led to the formulation of the concept of the difference threshold.

Wechsler, David (1896–1981) Romanian-born U.S. psychologist; developer of the Wechsler–Bellevue Intelligence Scale, which eventually was standardized as the Wechsler adult intelligence scale; the latter and the Wechsler Intelligence Scale for Children remain the dominant psychological tests for measuring cognitive abilities.

Weiss, Albert Paul (1879–1931) German-born U.S. psychologist: developed a biosocial behaviorism, which made a clear distinction between biophysical stimuli (e.g., sound imprinting, and...
waves affecting the cochlea) and biosocial stimuli (physical stimuli with social relevance, e.g., words heard from a friend); he also influenced the early development of behaviorism.

Werner, Heinz (1890–1964) Austrian-born U.S. psychologist: known for his orthogenetic principle of development, his formal parallelism approach to the concept of development, and his description of physiognomic perception.

Wertheimer, Max (1880–1943) German-born U.S. psychologist: a founder of Gestalt psychology whose research added greatly to theories of perception; he is also known for his work on gestalt principles of organization and perhaps best known for his studies of apparent movement.

Wewer, Ernest Glen (1902–1991) U.S. psychologist: a prominent figure in the study of hearing, he proposed the volley theory of audition; he discovered with U.S. otologist Charles W. Bray (1904–1982) the cochlear microphonic, also called the Wewer–Bray effect.

Whipple, Guy Montrose (1876–1941) U.S. educational psychologist: his two-volume Manual of Mental and Physical Tests (1910), which described more than 50 intelligence and personality tests, was the core reference work in the field for almost two decades; he was a strong early advocate for giftedness education.

White, Robert W. (1904–2001) U.S. psychologist: best known for his holistic approach to the study of personality; he argued the case for intrinsic motivation during a time dominated by drive-reduction theory, and he advocated for the case study method over the statistical method of analyzing aggregated data.

White, Sheldon H. (1928–2005) U.S. developmental psychologist: produced a diverse body of research on children and learning that included discrimination learning; he introduced the phrase five-to-seven shift to describe the significant cognitive developmental gains in children between those ages; he also served as a consultant to Head Start and the popular U.S. children’s television program Sesame Street.

Witasek, Stephan (1870–1915) Austrian psychologist affiliated with the University of Graz (see Austrian school): his work centered on spatial perception and aesthetics, particularly perceptual problems and the process that fuses sensory elements into a whole; he developed a theory of the ontology and psychology of aesthetic phenomena.

Witmer, Lightner (1867–1956) U.S. psychologist: often named the founder of clinical psychology in the United States, he is also considered a pioneer of school psychology and a major figure in the development of special education.

Wolf, Montrose M. (1935–2004) U.S. psychologist: a leader in the creation of applied behavior analysis; he studied the reinforcing power of adult attention to children, using groundbreaking methods such as interobserver reliability checks, and he pioneered “microteaching” techniques for children with developmental disabilities; he was also instrumental in the adoption of nonviolent social isolation for problem behavior (the time out).

Wolfe, Harry Kirke (1858–1918) U.S. psychologist: at the University of Nebraska, he mentored many students who became influential psychologists, including three presidents of the American Psychological Association; he founded one of the first U.S. psychology laboratories and served on the editorial board of the first U.S. journal in the field, the American Journal of Psychology.

Woodworth, Robert Sessions (1869–1962) U.S. psychologist: best known for textbooks that shaped the field of experimental psychology; he is also known for his research on motivation, which led to his most important conceptual contribution, S-O-R psychology.

Woolley, Helen Bradford Thompson (1874–1947) U.S. psychologist: a powerful advocate of child welfare; whose studies of young employed children were instrumental in reforming child labor and compulsory education laws in the United States; she was among the first to study the psychological likeness and differences of the sexes.

Wright, Logan (1913–1999) U.S. clinical pediatric psychologist: author of numerous works on pediatric psychology, psychology’s relation to health care, responsible parenting, and behavior therapy; he was the first Native American (Osage Nation) to serve as president of the American Psychological Association (1986).

Wright, Rogers H. (1927–2013) U.S. psychologist: played a major role in shaping the independent practice of psychology through his pioneering work in licensure, in establishing insurance programs for practitioners, in developing research-based professional service review programs, and in cofounding or actively participating in numerous organizations dedicated to the advancement of professional psychology.

Wundt, Wilhelm Max (1832–1920) German psychologist and physiologist: the founder of experimental psychology, establishing the first official psychology laboratory in 1879; his application of introspective and psychophysical methods to such subjects as reaction time, attention, judgment, and emotions had strong international influence.

Yerkes, Robert Mearns (1876–1956) U.S. psychobiologist: a preeminent comparative psychologist, known especially for his work on animal behavior, he founded an important primate research station in Orange Park, Florida, now named the Yerkes National Primate Research Center; he also played a significant role in the development of Army intelligence tests during World War I (see Army Tests).

Young, Paul Thomas (1892–1978) U.S. psychologist: studied the role of pleasure in motivation, emotion, and action (see Hedonic theory); he also performed classic research on auditory localization with a device he called the pseudophone.

Zajonc, Robert B. (1923–2008) Polish-born U.S. social psychologist: a pioneer in social cognition, with research interests particularly in social facilitation; he discovered the mere-exposure effect; he also studied birth order and proposed, with Greg Markus, the controversial Confluence Model of sibling intelligence.

Zubin, Joseph (1900–1990) Lithuanian-born U.S. psychologist: strongly advocated for the use of experimental methods and statistical techniques, especially biostatistics, in the study of mental disorders; he also developed the vulnerability model of schizophrenia, now a commonly cited paradigm for other forms of psychopathology as well (see stress–vulnerability model).
