**mirror neuron** a type of cell in the brains of certain animals (including humans) that responds in the same way to a given action (e.g., grasping an object) whether the animal performs the action itself or sees another animal (not necessarily of the same species) perform the action. This phenomenon is known as mirror imaging. [named and described by Russian-born Italian neurologist Giacomo Rizzolati (1937–)"

**mirror phase** the stage in development occurring around 6 to 18 months of age when the infant becomes able to imagine himself or herself as an autonomous ego in the image of the parent and also starts to recognize his or her reflection in a mirror. That is, the child begins to acquire a self-image. French psychoanalyst Jacques Lacan (1901–1981), who introduced the phrase, saw this as marking the start of the infant’s transition from the realm of the IMAGINARY to that of the SYMBOLIC. See also NAME-OF-THE-FATHER.

**mirror reading** 1. reading in a pattern that is the reverse of that generally followed. 2. a task in which a person must read words that are presented one at a time in mirror image. 3. a preference for reading mirror-reversed rather than normally written words.

**mirror sign** 1. the tendency to look at oneself in a reflecting surface (window, mirror, etc.) frequently and for an extended period of time. [first described in 1927 by French psychologist Paul Abely as an early symptom of schizophrenia] 2. the inability to recognize the reflection of one-
**mirror technique**

self in a mirror, described mainly in moderate or severe dementia, especially Alzheimer’s disease.

**mirror technique** 1. the conscious use of ACTIVE LISTENING by the therapist in psychotherapy, accompanied by reflection of the client’s affect and body language in order to stimulate a sense of empathy and to further the development of the THERAPEUTIC ALLIANCE. 2. in PSYCHODRAMA, a technique in which an AUXILIARY EGO imitates a client’s behavior patterns to show that person how others perceive and react to him or her. Also called mirroring.

**mirror–touch synesthesia** see SYNESTHESIA.

**mirror transference** in SELF PSYCHOLOGY, a NARCISSISTIC TRANSFERENCE technique in which patients’ grandiose selves are reactivated as a replica of the early phase of their lives when their mothers established or undermined their sense of perfection by admiring or devaluing their exhibitions. The patient develops healthy self-esteem. Compare THERAPEUTIC ALIANCE. This “reactivation process” aims to help the patient develop healthy self-esteem by admiring or devaluing their exhibitions. This leads to a sense of self-esteem in the patient.

**mirtazapine** n. an antidepressant whose mechanism of action differs from that of most other antidepressants. It is considered to be a MULTIFUNCTIONAL ANTIDEPRESSANT in that two separate actions result in increased neurotransmission of norepinephrine and serotonin. By binding to presynaptic α2-adrenoceptors (see ALPHA-ADRENERGIC RECEPTOR; AUTORECEPTOR), it enables continued release of norepinephrine from presynaptic neurons. It also acts as a SEROTONIN AGONIST at postsynaptic 5-HT1 receptors. Other actions of mirtazapine include potent antagonism of other serotonin and histamine receptors, but it does not inhibit the reuptake of serotonin or norepinephrine. Sedation and weight gain are common adverse effects of mirtazapine, probably due to its potent ability to block the histamine H1 receptor. Unlike many other antidepressants, in most patients mirtazapine does not cause sexual dysfunction. Rarely, AGRANULOCYTOSIS has been associated with its use.

U.S. trade name: Remeron.

**MIS** 1. abbreviation for Müllerian-inhibiting substance. See MÜLLERIAN-INHIBITING HORMONE. 2. abbreviation for MANAGEMENT INFORMATION SYSTEMS.

**mis-** combining form see ISO-.

**misanthropy** n. hatred or contempt for men. Compare MISOGYNY. —misanthrist n., adj.

**misanthropy** n. a hatred, aversion, or distrust of human beings and human nature. —misanthrope n. —misanthropic adj.

**misarticulation** n. 1. faulty ARTICULATION, resulting in unclear, imprecise speech sounds and poorly understood speech. 2. a poorly articulated sound or utterance.

**misattribution** n. an incorrect inference as to the cause of an individual’s or group’s behavior or of an interpersonal event. For example, misattribution of arousal is an effect in which the physiological stimulation generated by one stimulus is mistakenly ascribed to another source. See also ATTESTATION THEORY.

misattunement n. 1. a lack of rapport between infant and parent or caregiver such that the infant’s efforts at communication and expression are not responded to in a way that allows the infant to feel understood. 2. in psychoanalysis, a lack of empathy by a therapist or analyst toward a patient. Compare ATTUNEMENT; EMPATHIC FAILURE.

**miscarriage** n. see ABORTION.

**miscenogeneration** n. marriage, sexual activity, or reproduction among individuals of different racial or ethnic groups, especially when this is emphasized by marked physical differences (e.g., skin color). The term has traditionally carried a heavy sense of disapproval and is now largely archaic and disfavored. See also EXOGAMY; INTERMARRIAGE; OUTBREEDING. —miscenogenerational adj.

**miscategorization cost** an estimate of the costs that could arise from assigning an incorrect category or status to a situation or condition. For example, it would be worthwhile to estimate the miscategorization cost of prematurely telling the public that previously contaminated town water is now safe to drink, versus waiting longer than needed to let people know they can drink the water. In this case, the miscategorization cost of an early announcement would be much more serious—possibly involving severe illness or even loss of life—than that of a later announcement.

**misdagnosis** n. an incorrect, inaccurate, or incomplete identification of a disease or disorder.

**miseducation** n. teaching information, intentionally or in good faith, that is incorrect. The teaching of history is a common example of this, as historical material is prone to subjectivity, depending on the point of view of the writer and the period during which it was written.

**misidentification** n. failure to identify individuals correctly due to impaired memory or a confused state, as in dementia or alcoholic intoxication or sometimes in mania.

**misidentification syndrome** a disorder characterized by the delusional misidentification of oneself, other people, places, or objects. The misidentification may be expressed as the mistaken belief that a person has altered his or her identity in some way, either physically or psychologically, or that some place or object has undergone transfiguration. Also called DELUSIONAL MISIDENTIFICATION SYNDROME. See also CAPGRAS SYNDROME; FREGOLI’S PHENOMENON; INTERMETAMORPHOSIS SYNDROME.

**misinformation effect** a phenomenon in which a person mistakenly recalls misleading information that an experimenter has provided, instead of accurately recalling the correct information that had been presented earlier. The misinformation effect is studied in the context of EYE-WITNESS MEMORY.

**miso-** (mis-) combining form hatred.

**miscalinia (misocainia)** n. see MISONEMIA.

**misogamy** n. hatred of or aversion to marriage. —misogynist n.

**misogyny** n. hatred or contempt for women. Compare MISANDRY. —misogynist n. —misogynistic adj.

**misology** n. an aversion to speaking or arguing. Also called MISOLOGY.

**misonemism** n. an extreme resistance to change and intolerance of anything new, sometimes expressed as an obsessive desire to maintain routines and preserve the status
mixed distribution

defendant’s youth, personal or family circumstances, or diminished responsibility. Also called mitigating circumstance. Compare aggravating factor.

mitochondrion n. (pl. mitochondria) an organelle that is the main site of energy production in cells. Mitochondria are most numerous in cells with a high level of metabolism. They have their own DNA (mitochondrial DNA). —mitochondrial adj.

mitosis n. (pl. mitoses) the type of division of a cell nucleus that produces two identical daughter nuclei, each possessing the same number and type of chromosomes as the parent nucleus. It is usually accompanied by division of the cytoplasm, leading to the formation of two identical daughter cells. Compare meiosis. —mitotic adj.

mitral cell any of the pyramidal cells that form a layer of the olfactory bulb. Each mitral cell may receive signals from hundreds of olfactory receptors embedded in the olfactory epithelium. See also lateral olfactory tract.

mittelschmerz n. a pain experienced by some females midway through the menstrual cycle—that is, at the time of ovulation (from German, “midpain”). The pain is felt in the region of the ovary and is caused by the rupture of the ovarian follicle and bleeding into the peritoneum.

Mitwelt n. in the thought of German philosopher Martin Heidegger (1889–1976), that aspect of dassein (being-in-the-world) that is constituted by a person’s relationships and interactions with other people. It was introduced into psychology by Swiss existentialist psychologist Ludwig Binswanger (1881–1966). Compare eignewelt; umwelt. [German, literally: “with world”]

mixed deafness see deafness.

mixed design a study that combines features of both a between-subjects design and a within-subjects design. Thus, a researcher examines not only the potential differences between two or more separate groups of participants but also assesses change in the individual members of each group over time. For example, a researcher might use a mixed design to study the influence of different types of music on relaxation. He or she could divide participants into a control group (listening to no music) and two experimental groups (one listening to classical music and the other to music). The researcher could administer a pretest to participants in all groups in order to determine the baseline level of physiological arousal prior to hearing any music and then introduce the music and test participants while they listen. After stopping the music, he or she could administer another test (a posttest) to determine what specific reduction in arousal may have occurred throughout the listening period. In this situation, music type is a between-subjects factor (each participant hears only a single genre of music) and physiological arousal is a within-subjects factor (each participant is evaluated on this variable on multiple occasions and the different assessments compared).

mixed-design analysis of variance see mixed-model analysis of variance.

misregistration a term related to a crime or to a convicted defendant that supports the argument for a more lenient sentence. Examples of mitigating factors are the
variable is abruptly topped off or bottomed out at an arbitrary value for a number of participants in the sample. For example, consider a health researcher studying the effects of a smoking cessation intervention who records the number of days since a participant quit smoking. For those participants who quit, the number of days will reflect an infinite series of potential values, whereas for those who continue to smoke the number of days will be the single finite value of zero.

**mixed dysarthria** see *DYSARTHRIA*.

**mixed-effects design** a vague term used to denote an approach to either research or analysis—the *MIXED DESIGN* or the *MIXED-EFFECTS MODEL*, respectively.

**mixed-effects model** any statistical procedure or experimental design that uses one or more independent variables whose levels are specifically selected by the researcher (FIXED EFFECTS; e.g., gender) and one or more additional independent variables whose levels are chosen randomly from a wide range of possible values (RANDOM EFFECTS; e.g., age). Also called *mixed model*. Compare *FIXED-EFFECTS MODEL*; *RANDOM-EFFECTS MODEL*.

**mixed emotions** two or more emotions, differing in feeling quality and ACTION TENDENCY, elicited by the same event. For example, a father may be happy that his son is getting married but sorrowful if the marriage takes the son away from home; a person may become angry at an insult from a superior and also frightened by the implications for his or her employment. Also called *mixed feelings*. See *AMBIVALENCE*.

**mixed episode** in DSM–IV–TR, an episode of a mood disorder in which symptoms meeting criteria for both a MAJOR DEPRESSIVE EPISODE and a MANIC EPISODE are prominent over the course of the disturbance. One or more mixed episodes may be a feature of *BIPOLAR DISORDER*. In DSM–5, the specifier “with mixed features” is used instead of *mixed episode* to characterize the presence of these symptoms.

**mixed-function antidepressant** see *MULTIFUNCTIONAL ANTIDEPRESSANT*.

**mixed laterality** the tendency to shift preference from the right side of the body to the left side when performing a particular activity, or to perform some acts with a preference for the right-hand side and others with a preference for the left. Also called *lateral confusion*.

**mixed-methods research** a study that combines aspects of both *QUALITATIVE RESEARCH* and *QUANTITATIVE RESEARCH* so as to understand the phenomenon of interest more fully. For example, a researcher studying a disease could conduct a focus group with a set of individuals who would share their experiences in dealing with the disease, and then supplement those qualitative findings by surveying a different set of individuals to obtain quantitative knowledge of risk factors for the disease.

**mixed model** see *MIXED-EFFECTS MODEL*.

**mixed-model analysis of variance** a TWO-WAY ANALYSIS OF VARIANCE in which one independent variable has fixed levels specifically chosen for investigation (e.g., gender) and the other has levels randomly selected from among many possible conditions (e.g., doses of a drug). It is one of many types of *MIXED-EFFECTS MODELS*. Also called *mixed-design analysis of variance*.

**mixed-motive game** any simulation of social interaction that combines opportunities for coordination with antagonistic motivations. The PREPRISONER’S DILEMMA game, for example, is structured so that players can reach their goals either by competing against or by cooperating with others. See also *SOCIAL DILEMMA*; *SOCIAL TRAP*.

**mixed receptive-expressive language disorder** in DSM–IV–TR, a developmental COMMUNICATION DISORDER that combines the symptoms of *EXPRESSIVE LANGUAGE DISORDER* with the symptoms of semantic comprehension problems, leading to difficulty with word associations, categorization, and verbal mediation in general.

**mixed reinforcement schedule** a COMPOUND SCHEDULE of REINFORCEMENT in which two or more schedules alternate. The same stimulus is used for all schedules; therefore no discriminative cues are available (see *DISCRIMINATIVE STIMULUS*).

**mixed schizophrenia** 1. a form of schizophrenia in which both negative and positive symptoms are prominent or neither is prominent. [defined in 1982 by U.S. psychiatrists Nancy C. Andreasen and Scott A. Olsen] 2. historically, a form of schizophrenia that is manifested by symptoms of two or more of the four major types of schizophrenia described by Emil KRAEPELIN and Eugen BLEULER: simple, paranoid, catatonic, and hebephrenic (disorganized).

**mixed-standard scale** a behavior-based rating procedure used in *EMPLOYEE EVALUATION*. Raters are presented with examples of good, average, and bad behaviors for a job and told to evaluate the performance of the employee in terms of whether it is better than, the same as, or poorer than each of the three behaviors. The performance rating is assigned on the basis of the pattern of responses, the highest score being given to employees rated “better than” on all three behaviors and the lowest rating being given to those rated “poorer than” on all three. Compare behaviorally anchored rating scale; behavioral observation scale. See also *CRITICAL-INCIDENT TECHNIQUE*.

**mixed transcortical aphasia (MTA)** a form of *APHASIA* resulting from lesions in both the anterior speech areas (TRANSCORTICAL MOTOR APHASIA) and the posterior speech areas (TRANSCORTICAL SENSORY APHASIA) of the brain. Individuals have poor word comprehension but relatively preserved word repetition, sometimes to the point of *ECHOLALLIA*. Also called *isolation syndrome*.

**mixoscopy** n. a form of *VOYEURISM* in which an orgasm is achieved by observing sexual intercourse between the person one loves and another person.

**mixoscopy bestialis** a type of sexual deviancy in which a person is excited or aroused by watching another individual have coitus with an animal.

**MLD** abbreviation for *MASKING LEVEL DIFFERENCE*.

**MLE** abbreviation for *MAXIMUM LIKELIHOOD* estimation.

**MLHI1** a germ-line mutation located on the short arm of chromosome 3 and associated with hereditary nonpolyposis colorectal cancer (HNPPC). See also *MSH2*.

**MLU** abbreviation for *MEAN LENGTH OF UTTERANCE*.

**MMECT** abbreviation for *MULTIPLE MONITORED ELECTROCONVULSIVE TREATMENT*.

**MMPI** abbreviation for *MINNESOTA MULTIPHASIC PERSONALITY INVENTORY*.

**MMSE** abbreviation for *MINI-MENTAL STATE EXAMINATION*. 

660
MMT abbreviation for MULTIMODAL THERAPY.

M’Naghten rule (McNaghten rule; McNaughten rule; McNaughton rule) a rule for defining INSANITY that focuses on the cognitive state of the defendant at the time of committing the act with which he or she is charged. It states that to plead insanity, the accused must be "laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or if he did know it, he did not know that what he was doing was wrong." The rule was established in 1843 by judges in England after the trial of Daniel M’Naghten, who believed the government was persecuting him and killed prime minister Robert Peel’s secretary. Edward Drummond, after mistaking him for Peel. Also called right-and-wrong test: right-or-wrong test. See also AMERICAN LAW INSTITUTE MODEL PENAL CODE INSANITY TEST; CRIMINAL RESPONSIBILITY; IRRESISTIBLE IMPULSE RULE; PARTIAL INSANITY.

mneme n. see ENGRAM.

mnemonic n. any device or technique used to assist memory, usually by forging a link or association between the new information to be remembered and information previously encoded. For instance, one might remember the numbers in a password by associating them with familiar birth dates, addresses, or room numbers. Also called memory aid: mnemonic system. See also KEY-WORD METHOD; METHOD OF LOC; PEG-WORD MNEMONIC.

mnemonic trace see ENGRAM.

mnemonist n. an individual with exceptional ability to encode and retrieve information from memory. Some mnemonists have well-developed memory strategies that enable them to remember; others have exceptional memories in only certain domains (e.g., numbers or foreign words).

mnestic adj. related to memory.

mob n. a disorderly, unruly, and emotionally charged CROWD. Mobs tend to form when some event, such as a crime, a catastrophe, or a controversial action, evokes the same kind of mood and reaction in a substantial number of people. Early analyses argued that individuals in mobs were so overwhelmed by their emotions and the GROUP MIND that they could no longer control their actions: Unless the situation was diffused, mobs became volatile, unpredictable, and capable of violent action. Contemporary stumblers in a password that members of mobs may respond impulsively but rarely lose cognitive control, that mysterious social or psychological processes do not force them to behave abnormally in such situations, and that mobs tend to be organized and goal-directed rather than irrational and frenzied.

Moban n. a former trade name for MOLINDONE.

mobbing n. a behavior observed in groups of small birds and mammals when threatened by a predator in which group members join together to chase the predator away. Mobbing is usually accompanied by loud, distinctive vocalizations.

mobility n. 1. the capacity to move or be moved, such as the ability of people to transport themselves between home and work or community facilities by such means as walking, driving a car, or traveling by public transportation. See also MOTILITY. 2. the ability of an infant to creep, crawl, walk, or otherwise move through space. 3. in sociology, the extent to which individuals are able to move between localities, occupations, or social classes. See GEOGRAPHICAL MO-

mob psychology CROWD PSYCHOLOGY, as applied to mobs.

MoCA abbreviation for MONTREAL COGNITIVE ASSESSMENT.

MOCC abbreviation for MEMORY-OPERATING CHARACTERISTIC CURVE.

moclobemide n. an antidepressant drug that is a reversible MONOAmine OXIDASE inhibitor and relatively selective for MONOAmine OXIDASE A. It therefore lacks many of the food interactions that limit the use of irreversible, nonselective MAO inhibitors. Moclobemide has not yet been approved for use in the United States.

modafinil n. a CNS STIMULANT used for the treatment of narcolepsy that may serve as an alternative agent for patients who are intolerant of amphetamines and related stimulants. Its exact mechanism of action is unclear, but because it inhibits the CYTOCHROME P450 2C19 enzyme and induces the cytochrome P450 3A4 enzyme, it may have clinically significant interactions with drugs metabolized via those enzymes. U.S. trade name: Provigil. The related drug armodafinil is used in the treatment of narcolepsy, sleep apnea, and shift-work sleep disorder. U.S. trade name: Nuvigil.

modal n. pertaining to a particular MODE, model, technique, or process. In linguistics, modal refers to the mood of a verb; that is, for example, whether it is indicative (states a fact), imperative (expresses an order or command), or subjunctive (expresses a wish or a state of possibility).

modal action pattern (MAP) the typical or most common behavioral pattern expressed in response to a RELEASER. In classical ethology, the term FIXED ACTION PATTERN was used to describe behavioral responses, but this term obscures the variation in behavior typically seen within and between individuals.

modal frequency the number of respondents who have the score that occurs most often in a set of data (i.e., the MODE). For example, in a small sample of college freshmen whose ages are 18, 18, 18, 19, 19, 20, 20, 21, 23, and 25 the modal frequency for age is 3: The most commonly occurring score is 18 and there are three people with such a score.

modality n. 1. a particular therapeutic technique or process (e.g., psychodynamic). 2. a medium of sensation, such as vision or hearing. See SENSE.

modality effect the tendency for the final items of a list to be better recalled if the items are presented auditorily rather than visually.

modal model of memory a generic theory of memory incorporating assumptions common to most models. The modal model includes a SHORT-TERM MEMORY and a LONG-TERM MEMORY and provides details on how information is encoded and later retrieved from memory. See also DUAL-STORE MODEL OF MEMORY; MULTISTORE MODEL OF MEMORY.

mode n. 1. a characteristic manner of behavior or way of doing things, as in a technique. 2. the most frequently occurring score in a set of data, which is sometimes used as a measure of CENTRAL TENDENCY. Also called modal value.

model n. 1. a graphic, theoretical, or other type of representation of a concept or of basic behavioral or bodily processes (e.g., a disorder) that can be used for various
model human processor

investigative and demonstrative purposes, such as enhancing understanding of the concept or process, proposing hypotheses, showing relationships, or identifying epidemiological patterns. 2. See MODELING.

model human processor n. a model of human INFORMATION PROCESSING that is used in evaluating the usability of products and systems. The model, which is derived from empirical findings, consists of three interacting subsystems—perceptual, motor, and cognitive. Estimates of processing capacity and of processing and decay times (see DECIAY THEORY) can be used to quantify human performance under a variety of constraints. See also HUMAN OPERATOR MODELING. [developed in 1983 by U.S. psychologist Stuart K. Card (1943– ), U.S. computer scientist Thomas P. Moran (1942– ), and U.S. cognitive and computer scientist Allen Newell (1927–1992)]

modeling n. 1. a technique used in COGNITIVE BEHAVIOR THERAPY and BEHAVIOR THERAPY in which learning occurs through observation and imitation alone, without comment or reinforcement by the therapist. See also BEHAVIORAL MODELING. 2. the process in which one or more individuals or other entities serve as examples (models) that a child will emulate. Models are often parents, other adults, or other children, but they may also be symbolic (e.g., a book or television character). See also SOCIAL LEARNING THEORY.

modeling effect a type of EXPERIMENTER EFFECT in which a participant is unwittingly influenced to give responses similar to the responses the experimenter would give if the experimenter were a participant.

modeling theory the idea that changes in behavior, cognition, or emotional state result from observing someone else’s behavior or the consequences of that behavior. See OBSERVATIONAL LEARNING; SOCIAL LEARNING THEORY.

model psychosis psychotic symptoms (e.g., delusions, hallucinations, disorientation, disorganized speech) deliberately produced by a PSYCHOTOMIMETIC drug, such as LSD, for purposes of research. This technique was particularly popular during the 1950s and 1960s.

moderate mental retardation an older diagnostic and classification category applying to those with IQs of 35 to 49, comprising about 10% of people with MENTAL RETARDATION. These individuals rarely progress beyond the second grade in academic subjects. Although often poorly coordinated, they can learn to take care of themselves and to develop sufficient social and occupational skills to be able to perform unskilled or semiskilled work under supervision in sheltered and supportive environments, as well as in regular workplaces where accommodations are made.

moderating effect the effect that occurs when a third variable changes the nature of the relationship between a predictor and an outcome, particularly in analyses such as MULTIPLE REGRESSION. For example, STRUCTURAL EQUATION MODELING can be used to assess whether a predicted association between quantitative skill and performance fits equally well across different teaching style groups (e.g., lecture based vs. hands-on learning). If the prediction is different across the two groups, then teaching style is said to have produced a moderating effect. Also called MODERATOR EFFECT.

moderator n. 1. an INDEPENDENT VARIABLE that changes the nature of the relationship between other variables. For example, if a researcher examined the relationship between gender and math performance, a significant difference might emerge. However, if teaching style were taken into account, such that those who learned math by applying, hands-on methods performed better than those who learned with traditional lecture styles, regardless of gender, one could say that teaching style was a moderator of the relationship between gender and math performance. Also called MODERATING VARIABLE. See also MODERATING EFFECT. 2. a variable aspect of consumer behavior associated with different patterns of results. For example, consumer motivation might serve as a moderator of how individuals develop attitudes toward products. With high levels of motivation, consumers tend to base their attitudes on the quality of a product as assessed by detailed thinking about the product’s features. With low levels of motivation, consumers tend to base their attitude toward a product on such factors as the attractiveness of the product endorser. Personality variables often serve as moderators of processes underlying consumer behavior.

modernism n. 1. in philosophy, a set of general characteristics marking the whole period from the 17th century to the present day. Most historians of philosophy see the onset of modernity in the work of René DESCARTES, with its attempt to establish a systematic account of reality on a radically new basis (see CARTESIANISM; CARTESIAN DUALISM; CARTESIAN SELF). Historically, modernism is inseparable from the Enlightenment of the 17th and 18th centuries and its complex legacy over the past 300 years. Its defining characteristics include a sense that religious dogma and classical metaphysics can no longer provide a sure foundation in intellectual matters and a quest for certain knowledge from other sources; the latter is sustained by confidence in absolutes in EPistemology and ETHICS and confidence in the new methods of EXPERIMENTAL PHILOSOPHY, or natural science. Traditional psychology can be seen to be the product of modernism to the extent that it is characterized by faith in scientific method, pursuit of control and prediction of behavior, explanation in terms of laws and principles, and the assumption that human behavior is ultimately rational as opposed to irrational. Some thinkers argue that modernism was superseded by the POSTMODERNISM in the late 20th century; although others would dispute such a claim, 2. a movement in the arts of the early 20th century characterized by the adoption of radically new techniques, forms, approaches, and subjects. Important developments associated with modernism include abstraction in the visual arts, free verse in poetry, and use of the 12-tone scale in music. Many writers and artists of the period were influenced by contemporary developments in psychology and psychoanalysis; a particular instance of this is the use of the STREAM OF CONSCIOUSNESS technique by novelists and poets, such as Irish writer James Joyce (1882–1941), British writer Virginia Woolf (1882–1941), French writer Marcel Proust (1871–1922), and others. For more than a half century now, the concept of postmodernism in the arts has been much discussed. —modernist adj. n.

modernization n. the complex set of processes by which a largely rural and traditional society becomes a developed industrial society. Modernized societies are typically conceived as those societies that tend toward the secular and urbanized and that place a high value on science and technology, education, social mobility, acquired wealth, democratic government, and the rule of law. Modernization is anchored to notions of social and economic progress. It is often contrasted with the TRADITIONALISM of undeveloped or underdeveloped societies, which are often identified as
religious and rural, with limited technology, low social mobility, weak political structures, and so forth. Other conceptualizations of this dichotomy are currently in debate, however, pointing to the highly variable social and psychological adjustments that occur in different societies as they respond to development. —modernize vt.

modern racism a contemporary form of prejudice against members of other racial groups that is expressed indirectly and covertly, typically by condemning the cultural values of the outgroup or by experiencing aversive emotions when interacting with its members but not acting on those negative emotions (see aversive racism). A modern racist, for example, expresses prejudice by condemning another group’s cultural values or by avoiding any contact with members of that group. Changed social attitudes have brought about a decline in the direct expression of racial discrimination and hostility toward minority groups (old-fashioned racism), with a corresponding increase in the less blatant modern racism.

modes of learning different sensory modalities through which information may be presented for learning. See motor learning; verbal learning; visual learning.

modesty n. 1. absence of self-importance or conceit. 2. propriety in appearance, dress, demeanor, and social behavior. —modest adj.

MODE theory Motivation and Opportunity as Determinants theory: a theory of attitude–behavior consistency postulating that the process by which attitudes influence behavior differs according to the amount of deliberation involved. When people are motivated and able to deliberate about their actions, attitudes influence behavior in a manner similar to that postulated by the theory of reasoned action. When people are not motivated or able to deliberate about their actions, attitudes toward the target of the behavior can be activated in memory and affect the way the target is perceived. These perceptions in turn influence how people define the behavioral event (e.g., as a situation in which the target should be approached or avoided). The definition of the behavioral event in turn determines behavior. [originally developed by U.S. psychologist Russell H. Fazio (1952–)].

modified replication see replication. Modified Rhyme Test (MRT) a test to evaluate auditory processing in which the participant listens to a single-syllable word and then identifies it from among several printed alternatives. The response choices are grouped into six-item lists within which the vowels in the words are held constant as either the initial or final consonants change (e.g., beam, bead, beach, beat, beet, bean). [developed in 1965 by Arthur S. House, Carl E. Williams, Michael H. L. Hecker, and psychoacoustician Karl D. Kryter (1914–2013)].

modifier n. 1. in genetics, a gene that appears to have an absence of self-importance or conceit. 2. in grammar, any word or phrase that qualifies or limits the meaning of another word or phrase (e.g., an adjective or adverb).

modularity n. a theory of the human mind in which the various components of cognition are characterized as independent modules, each with its own specific domain and particular properties. It was first proposed by U.S. philosopher Jerry Fodor (1935–) in his book The Modularity of Mind (1983). A related notion had earlier been advanced by Noam Chomsky in his theory of the task specificity of language, which characterizes the human language faculty as a unique “mental organ” differing qualitatively from other aspects of cognition. More recently, evolutionary psychologists have shown interest in the idea that the various modules may be adaptive specializations. Compare cognitive grammar.

modulation n. changes in some parameter of a waveform (e.g., amplitude, frequency, phase) so that the information contained by the variations of this parameter can be transmitted by the wave, which is known as the carrier wave. Amplitude modulation (AM) refers to changes in amplitude that are relatively slow compared to the usually sinusoidal variations in the carrier. In frequency modulation (FM), the frequency of the carrier is varied, but its amplitude remains constant. In phase modulation, the relative phase of the carrier wave is varied in accordance with the amplitude of the signal variations. For most modulated waveforms, the frequency of modulation is much less than the frequency components in the carrier.

modulation threshold see temporal modulation transfer function.

modulatory role the role that some hormones play in maintaining the sensitivity of neural circuits and other structures to hormonal influences.

modulatory site a site on a receptor molecule that, when bound by a ligand (e.g., a drug), alters the receptor’s response on binding of its agonist (e.g., a neurotransmitter) to the usual site.

module n. 1. in cognitive theory, a hypothetical center of information processing that is presumed to be relatively independent and highly specialized in its operations, such as a language module or face-processing module. 2. in neuroscience, a unit of the central nervous system. For example, regions of the neocortex in the brain are divided into cortical columns of basically similar structure. —modular adj.

modulus n. see absolute value.

modus operandi a specific behavioral pattern that may typify a particular individual; the term is often used with respect to criminal behavior but also more generally to signify any individual’s particular behavioral approach or way of acting. [from Latin, “manner of working”]

MOE abbreviation for margin of error.

Mogadon n. a trade name for nitrazepam.

mogigraphia n. a rare name for writer’s cramp.

mogilalia n. difficulty or hesitancy in speaking (e.g., stuttering). Also called molilalia.

moiré interference model see grid cell.

molar adj. characterized by or pertaining to units, masses, and systems in their entirety. Molar analysis (also called global analysis) in psychology is a way of examining behavioral processes as holistic units, extended through time. This approach stresses comprehensive concepts or overall frameworks or structures. Compare molecular.

molecular adj. characterized by or pertaining to the component parts of a phenomenon, process, or system.
molecular genetics

Molecular analysis in psychology is a way of examining behavioral processes in terms of elemental units, sometimes analyzing them in a moment-by-moment or phase-by-phase manner. Compare Molar.

molecular genetics the branch of biology that is concerned with the structure and processes of genetic material at the molecular level.

molecular layer n. see ATOMICISM.

molecularism n. see DENTATE GYRUS.

molestation n. the act of making sexual advances toward a person who does not want them. Molestation generally implies sexual fondling or touching an individual without lawful consent. When the victim of molestation is a child or a person with a mental disability, it may be assumed that he or she does not have the capacity to give lawful consent. See also SEX OFFENSE. —molest vb.

molilalia n. see MOLILALIA.

molindone n. a conventional (typical or first-generation) antipsychotic. Until the advent of the atypical, or second-generation, antipsychotics, it was frequently used, usually in low doses, for the management of psychoses accompanying medical conditions (e.g., HIV-related dementia). Molindone was taken off the U.S. market in 2010. Former U.S. trade name: Moban.

Molyneux’s question the question posed by William Molyneux (1656–1698), a member of the Irish parliament, to John Locke, who later discussed it in his Essay Concerning Human Understanding (1690). Molyneux’s question was whether a man born blind but able to distinguish two distinct shapes by feeling them with his hands would be able to distinguish them by sight alone, without also touching them, if he were suddenly able to see. Locke’s answer—and Molyneux’s as well—was that the person would not be able to distinguish them by sight immediately because the sense modalities act independently and can be integrated only by experience.

moment n. the power to which the EXPECTED VALUE of a RANDOM VARIABLE is raised. Thus, E(x^2) is the 2nd moment of x. The first moment is usually the MEAN of a variable, the second moment refers to VARIANCE, the third moment relates to SKEWNESS, and the fourth moment concerns KURTOSIS. Knowing each of these moments provides a complete picture of the distribution for a set of scores: A researcher knows the center point of the data, how spread out the values are, whether they are lopsided, and whether they are peaked (LEPTOKURTIC) or flat (PLATYKURTIC).

moment about the mean see CENTRAL MOMENT.

mommy track 1. a professional pathway associated with working mothers, typically characterized by flexible working conditions but limited career advancement. 2. the cultural and social circumstances that put girls on the path to early motherhood; poor socioeconomic circumstances and the lack of a strong, present, and positive father figure can influence girls to become mothers earlier in their lives than girls with more advantages.

mono- (mon-) combining form one, single, or alone.

monoa cyl glycerol lipase (MAGL) see ENDOGENOUS CANNABINOID.

monoa mine n. an AMINE that contains only one amine group, —NH2. Monoamines include neurotransmitters such as the CATECHOLAMINES norepinephrine and dopamine and the INDOLEAMINE serotonin. See also MONOAMINE OXIDASE.

monoamine hormone see AMINE HORMONE.

monoamine hypothesis the theory that depression is caused by a deficit in the production or uptake of the AMINE compounds serotonin, norepinephrine, and dopamine. This theory has been used to explain the effects of MONOAMINE OXIDASE INHIBITORS but is now regarded as too simplistic. A related notion, the monoamine neurotransmitter theory, proposes that RUNNER’S HIGH is the result of an increase of norepinephrine and serotonin with exercise.

monoamine oxidase (MAO) an enzyme that breaks down and inactivates MONOAMINES, including several neurotransmitters. It is found in most tissues and, in humans, exists in two forms. MAO-A and MAO-B. MAO-B is the predominant enzyme in the brain, whereas MAO-A is found primarily in the gastrointestinal tract (it accounts for only 20% of brain monoamine oxidase). Drugs that inhibit MAO (see MONOAMINE OXIDASE INHIBITOR) are used to treat depression. There is some evidence that inhibition of MAO-A, which primarily degrades serotonin and norepinephrine, may lead to greater antidepressant effects than inhibition of MAO-B, which primarily degrades dopamine.

monoamine oxidase inhibitor (MAOI) a group of antidepressant drugs that function by inhibiting the activity of the enzyme MONOAMINE OXIDASE in presynaptic neurons, thereby increasing the amounts of monoamine neurotransmitters (serotonin, norepinephrine, and dopamine) available for release at the presynaptic terminal. There are two categories of MAOIs: irreversible and reversible inhibitors. Irreversible MAOIs bind tightly to the enzyme and permanently inhibit its ability to metabolize any monoamine. This may lead to dangerous interactions with foods and beverages containing the amino acid tyrosine or tyramine, particularly those produced by enzymatic action or by aging (e.g., cheeses, preserved meats and fish). A hypertensive crisis (a potentially fatal rise in blood pressure) may result from these interactions, a phenomenon that is sometimes known as the “cheese effect.” Irreversible MAOIs are of two classes: hydrazines related to isoniazid (see ISOCARBONAZID; PHENELZINE) and nonhydrazines, of which tranylcyromine (U.S. trade name: Parnate) has been the only agent used for mental
disorders in the United States until the recent availability of selegiline as a transdermal patch for the treatment of depression; this patch requires no dietary restrictions at lower doses. Reversible inhibitors of monoamine oxidase-A (RIMAs) do not bind irreversibly to the enzyme (its MAO-A form), thereby freeing it to take part in the metabolism of amino acids and other amines. RIMAs may be less prone to producing a hypertensive crisis, which would obviate the need for dietary restrictions on tyramine-containing foods. An example of RIMAs is moclobemide, which is available in Europe but has not yet been approved for use in the United States. The availability of other effective antidepressants lacking the drug–food interactions of the MAOIs has led to a precipitous decline in their use, particularly of the irreversible agents.

**monochorial twins** a set of twins that, in uterus, shared the same outermost embryonic membrane (chorion). Monochorial twins are always identical twins (MONOZYGOTIC TWINS), but identical twins are not necessarily monochorial. Compare DICHIORIAL TWINS.

**monochromatic light** light of a single wavelength. Monochromatic light can be produced by a laser or by a monochromator, which uses a prism to refract the visible spectrum and a slit to restrict the light available to the viewer to a single wavelength.

**monochromatism (monochromacy; monochromasy; monochromatopsia)** n. a partial color blindness in which the eye contains only one type of cone photopigment instead of the typical three: Everything appears in various shades of a single color. See also ACHROMATISM; DICROMATISM.

**monocular** adj. referring to one eye. Also called uniocular. Compare BINOCULAR.

**monocular cell** see BINOCULAR CELL.

**monocular cue** see DEPTH CUE.

**monocular deprivation** the deprivation of light to one eye. Compare BINOCULAR DEPRIVATION.

**monocular rearing** an experimental paradigm in which an animal is raised from birth with vision restricted to one eye by suturing the eyelids closed or by inserting an opaque contact lens in one eye. Monocular rearing during the CRITICAL PERIOD has profound structural and functional consequences for the developing visual system, including a shift in the OCULAR DOMINANCE of cortical neurons to favor the monocular eye and a broadening of the OCULAR DOMINANCE COLUMNS corresponding to the open eye.

**monocular suppression** the tendency of one eye to be dominant while the other is suppressed, resulting in a failure of binocular vision.

**monocular vision** the use of only one eye for sight.

**monodrama** n. in GROUP THERAPY, a role-playing technique in which a member of the group acts out a scene alone. The member’s behavior is then evaluated by the group.

**monogamy** n. 1. a MATING SYSTEM in which two individuals mate exclusively with each other. Recent genetic studies of paternity indicate that some offspring of male–female pairs exhibiting monogamy are not related to the father, leading to a distinction between social monogamy, in which there is an appearance of a close pair bond, and genetic monogamy, in which there is exclusive mating. Many species, including human beings, display serial monogamy, in which there is an exclusive social bond with each of a series of sexual partners at different times during the individual’s life. Compare POLYANDRY; POLYGYNANDRY: POLYGAMY. 2. traditionally, marriage to only one spouse at a time. Compare POLYGAMY. —monogamous adj.

**monomorphism** n. the absence of differences between males and females of a species such that both sexes are similar in body size, coloration, or other features. Compare DIMORPHISM; SEXUAL DIMORPHISM. —monomorphic adj.

**monopediomania** n. sexual interest in and arousal by people who have only one leg.

**monophagism** n. a pathological eating behavior in which the individual habitually eats only one type of food or only one meal a day.

**monophasic sleep** a sleep pattern in which sleeping occurs in one long period once a day, typically at night. Compare POLYPHASIC SLEEP. See also SLEEP–WAKE CYCLE.

**monoplegia** n. paralysis of a single part of the body, for example, one arm, one leg, or one digit. —monoplegic adj.

**monopolar neuron** see UNIPOLAR NEURON.

**monorchidism** n. the condition of having only one testis in the scrotum. The second testis may be present but undescended (see CRYPTORCHIDISM). See also ECTOPIC TESTIS.

**monorchid** adj., n.

**monorhinic** adj. relating to the presentation of an ODORANT to a single nostril via an OLFACTOMETER.

**monosomy 5p** see Cri du Chat Syndrome.

**monosymptomatic** adj. denoting a disorder that is characterized by a single marked symptom.

**monosynaptic** adj. involving a single neuron arc, as in a monosynaptic stretch reflex. See also REFLEX.

**monosynaptic stretch reflex** a reflex in which there is muscle contraction in response to sudden stretching of a tendon, involving only a sensory neuron, a motor neuron, and the synapse connecting them in the spinal cord. The PATELLAR REFLEX is a monosynaptic stretch reflex. See also REFLEX.

**monosynaptic transmission** the transmission of nerve impulses via a single synapse, as in a MONOSYNAPTIC ARC.

**monotherapy** n. the use of a single method or approach to treat a particular disorder or PRESENTING SYMPTOM, as opposed to the use of a combination of methods. An exam-
ple is the use of only pharmacotherapy, instead of pharmacotherapy and psychotherapy in combination, to treat depression.

**monotonic adj.** denoting or relating to the presentation of sound to one ear only. Compare DICHOTIC; BICOTIC.

**monotonic adj.** denoting a variable that either increases or decreases as a second variable either increases or decreases, respectively: The relationship is not necessarily linear but there are no changes in direction. A **monotonically increasing** variable is one that rises consistently as a second variable increases, for example, level of performance in relation to amount of practice if this were observed to be the case. In contrast, depression would be a **monotonically decreasing** variable if its severity were found to fall consistently as a person’s level of perseveration declined.

**monozygotic twins** (MZ twins) twins, always of the same sex, that develop from a single fertilized ovum (zygote) that splits in the early stages of mitosis to produce two individuals who carry the same complement of genes: that is, they are clones, with identical DNA. For every 1,000 pregnancies, there are, on average, 3 to 4 MZ twins. Also called **identical twins**. Compare **DIZYGOTIC TWINS**. See also **TWIN STUDY**.

**Monte Carlo research** a simulation technique in which a large number of samples with specific selected properties (e.g., normality, size, model type) are generated by computer in order to assess the behavior of a statistical procedure or parameter under varying conditions. For example, an investigator might conduct Monte Carlo research with a large number of samples with specific selected properties (e.g., N = 50, 100, 200, 400, 800) in which a structural model is applied to characterize the data. Results would help the researcher determine the conditions under which the model behaves correctly (i.e., fits the data) as well as shows its limits (e.g., not fitting well with sample sizes less than 200). Also called **Monte Carlo method**.

**Montessori method** an educational system that focuses on the development of young children’s initiative and emphasizes self-directed learning. The method is characterized by multiage classrooms, a special set of educational materials, student-chosen work in long time blocks, collaboration, the absence of grades and tests, and individual and small group instruction in both academic and social skills. The system was developed in Italy, with the first American school established in 1911. [Maria MONTESSORI]

**Montreal Cognitive Assessment** (MoCA) a brief screening tool designed to assist clinicians in identifying mild cognitive impairment (MCI) and possible early dementia. Including items that test executive function, visuospatial constructional skills, naming, memory, attention, language, conceptual thinking, and orientation to time and place, the assessment takes approximately 10 minutes to administer; the maximum score is 30 points, with a score of 26 or higher considered normal. MoCA is reported to have greater sensitivity in the detection of both MCI and early dementia than the commonly used mini-mental state examination. [developed in 2005 by Canadian neurologist Ziad S. Nasreddine and colleagues]

**mood** n. 1. any short-lived emotional state, usually of low intensity (e.g., a cheerful mood, an irritable mood). 2. a disposition to respond emotionally in a particular way that may last for hours, days, or even weeks, perhaps at a low level and without the person knowing what prompted the state. Moods differ from emotions in lacking an object; for example, the emotion of anger can be aroused by an insult, but an angry mood may arise when one does not know what one is angry about or what elicited the anger. Disturbances in mood are characteristic of mood disorders.

**mood-altering drug** a substance that changes the affective state of the individual through pharmacological action, usually without clouding of consciousness. Such drugs include certain tranquilizing, sedating, and antidepressant agents.

**mood-as-information theory** a theory postulating that a person often uses his or her current emotional state or mood as a piece of information when making social judgments. The theory also proposes that current affective states can influence the processing strategy that people adopt when making decisions. Specifically, negative affective states indicate something problematic in the current social situation and thus encourage careful and deliberative processing of social information. In contrast, positive affective states indicate that the current social situation is satisfactory and thus encourage less effort in deliberative processing of social information. [originally developed by U.S. psychologists Norbert Schwarz (1953– ), Gerald L. Clore (1939– ), and their colleagues]

**mood-as-resource model** a theory stating that positive moods function as useful tools to individuals by making them better able to process goal-related information, better at coping with negative stimuli, and more flexible and constructive in dealing with situational demands.

**mood congruent** relating to a consistency or agreement between a particular expressed feeling and the general emotional context within which it occurs. Thus, crying at a time of sadness or personal distress is viewed as mood congruent. Similarly, in psychiatric diagnosis, the term relates to a consistency between the expression of a particular symptom or behavior with those characteristics or patterns of ideation or action used to classify a particular mental disorder. In both instances, inconsistencies are described as mood incongruent.

**mood-congruent memory** consistency between one’s mood state and the emotional context of memories recalled. During positive mood states, individuals will tend to retrieve pleasant memories, whereas during negative mood states, negative thoughts and associations will more likely come to mind. However, there is evidence that the effects of these different mood states on memory are asymmetrical, with positive moods having stronger effects on memory retrieval than negative moods. When faced with an unpleasant emotional state, individuals may regulate it by retrieving pleasant thoughts and memories, thus reducing or reversing a negative mood-congruency effect. [first proposed in 1985 by U.S. social psychologist Alice M. Isen (1942–2012)]

**mood-congruent psychotic feature** a DSM-IV-TR and DSM-5 specification for any delusion or hallucination that is thematically consistent with either sadness or mania when it occurs in severe major depressive episodes, manic episodes, or mixed episodes.

**mood-dependent memory** the finding that memory
for an event can be recalled more readily when one is in the same emotional mood (e.g., happy or sad) as when the memory was initially formed. See also CONTEXT-SPECIFIC LEARNING; STATE-DEPENDENT MEMORY.

mood disorder in DSM–IV–TR, a psychiatric condition in which the principal feature is a prolonged, pervasive emotional disturbance, such as a DEPRESSIVE DISORDER, BIPOLAR DISORDER, or SUBSTANCE-INDUCED MOOD DISORDER. Also included are mood disorders due to a general medical condition, in which attendant physiological disruptions are believed to produce the emotional changes, and mood disorder not otherwise specified, which does not meet the diagnostic criteria for any of the specific mood disorders. The term chronic mood disorder is applied when symptoms rarely remit. In DSM–5, mood disorders are divided into two categories: bipolar and related disorders, which include bipolar disorder and its subtypes (e.g., bipolar I, bipolar II, CYCLOTHYMIC DISORDER); and depressive disorders (e.g., MAJOR DEPRESSIVE DISORDER, persistent depressive disorder or DYSTHIMIC DISORDER, PREMENSTRUAL DYSPHORIC DISORDER). Also called affective disorder.

mood incongruent see MOOD CONGRUENT.

mood-incongruent psychotic feature a DSM–IV–TR and DSM–5 specification for any delusion or hallucination that occurs in severe MAJOR DEPRESSIVE EPISODES, MANIC EPISODES, or MIXED EPISODES but whose content does not include themes of sadness or mania.

mood induction any method for producing a negative or positive change in mood, often by selectively reminding individuals of pleasant or unpleasant aspects of their lives. See VELTEN TECHNIQUE.

mood stabilizer any of various drugs used in the treatment of cyclic mood disorders (BIPOLAR DISORDERS and CYCLOTHYMIC DISORDER). Because they reduce the symptoms of mania or manic episodes, mood stabilizers are sometimes known as antimanic drugs. LITHIUM is usually the first-line medication for bipolar I disorder; but ANTICONVULSANTS, such as VALPROIC ACID, CARBAMAZEPINE, and OXCARBAZEPINE, are becoming more commonly used for this condition and are now preferred for other cyclic disorders. The CALCIUM-CHANNEL BLOCKER verapamil is also being investigated as a mood stabilizer. Mood stabilizers are occasionally used in the management of severe affective lability found in some personality disorders (e.g., borderline personality disorder).

mood swing a nonspecific term for any oscillation in mood, particularly between feelings of happiness and sadness. It may range in intensity from normal fluctuations to such pathological disturbances as CYCLOTHYMIC DISORDER or BIPOLAR DISORDER. See also LABILE AFFECT.

moon illusion see SIZE–DISTANCE PARADOX.

moon-phase studies research into the possible relationship between the phases of the moon and episodes of violence or mental disorder. The relationship has long been expressed in folklore, folk medicine, and language itself (e.g., the words lunacy and lunatic). Methodologically sound studies of the effects of moon phase on behavior, however, are infrequent.

moral adj. 1. relating to the distinction between right and wrong behavior. 2. describing a behavior that is considered ethical or proper, or a person or group who adheres to a MORA L CODE. See also MORALS.

moral absolutism the belief that the morality or immanent standard of an action can be judged according to fixed standards of right and wrong. According to Jean PIAGET, moral absolutism is characteristic of young children in the HETEROCHRONOUS STAGE of moral development, who interpret laws and rules as absolute. See MORAL REALISM. Compare MORAL RELATIVISM; SITUATION ETHICS.

moral code a set of rules concerning right and wrong behavior accepted by a society or group as binding on all members or by an individual as binding on himself or herself.

moral commitment in U.S. sociologist Michael P. Johnson’s tripartite model of marital commitment, a form of commitment in which a person feels tied to a relationship because of a sense of moral or ethical obligation or duty. Moral commitment often reflects religious or societal beliefs, but it may also derive from an individual’s values about the importance of acting in a manner that affirms one’s vows, promises, and obligations. Compare PERSONAL COMMITMENT; STRUCTURAL COMMITMENT.

moral consistency a stable, predictable pattern of moral attitudes shown by the same individual in different settings and over time.

moral determinism see ETHICAL DETERMINISM.

moral development the gradual formation of an individual’s concepts of right and wrong, conscience, ethical and religious values, social attitudes, and ethical behavior. Some of the major theorists in the area of moral development are Sigmund FREUD, Jean PIAGET, Erik ERIKSON, and Lawrence KOHLBERG.

moral dilemma see ETHICAL DILEMMA.

morale n. the level of enthusiasm, sense of purpose, or confidence in the worthiness of a goal that can affect a person’s or a group’s overall performance in working toward that goal, especially when under pressure.

moral exclusion a psychological process whereby opponents in a conflict come to view each other as undeserving of morally mandated rights and protections. Moral exclusion can lead to a range of acts, from DISCRIMINATION to TERRORISM and GENOCIDE. See also DEHUMANIZATION.

moral independence the state an older child has achieved when he or she can recognize that an act’s morality may be substantially determined by its motive and other subjective considerations, rather than by its consequences. Moral independence is a mark of the AUTONOMOUS STAGE of moral development. See also MORAL RELATIVISM. Compare MORAL REALISM. [proposed by Jean PIAGET]

morality n. a system of beliefs or set of values relating to right conduct, against which behavior is judged to be acceptable or unacceptable.

morality of constraint the morality of young children (up to roughly age 10), which consists of an unquestioning, unchallenging obedience to the rules laid down by parents. Obedience is based on fear and on the perception that rules established by parents are fixed, eternal, and sure to be valid. Compare Morality of Cooperation. [proposed by Jean PIAGET]

morality of cooperation the morality of children ages 10 to 11, characterized by the perception that rules are social conventions that can be challenged and modified when concerned parties agree. The child willingly accepts rules and adheres to them on the basis of reason and not on the basis of fear or in the spirit of unquestioning obedi-
moral judgment

ence. Compare MORALITY OF CONSTRAINT. [proposed by Jean Piaget]

moral judgment see ETHICAL JUDGMENT.

moral masochism in psychoanalytic theory, the unconscious need for punishment by authority figures caused by unconscious guilt arising from the repressed OEDIPUS COMPLEX. It is a nonsexual form of MASOCHISM.

moral nihilism the assertion that there exist no valid moral principles. This position is distinct from moral RELATIVISM, which merely claims that there are no universally valid moral principles. Also called ethical nihilism.

moral philosophy see ETHICS.

moral realism the type of thinking characteristic of younger children, who equate good behavior with obedience just as they equate the morality of an act only with its consequences. For example, 15 cups broken accidentally would be judged to be a far worse transgression than 1 cup broken mischievously, because more cups are broken. Moral realism shapes the child’s thinking until the age of about 8, when the concepts of intention, motive, and ex- tremating circumstances begin to modify the child’s early MORAL ABSOLUTISM. Compare MORAL RELATIVISM. [postulated by Jean Piaget]

moral relativism the belief that the morality or immorality of an action is determined by social custom rather than by universal or fixed standards of right and wrong. According to Jean Piaget, moral relativism is characteristic of children in the AUTONOMOUS STAGE of moral development, who consider the intention behind an act along with possible extenuating circumstances when judging its rightness or wrongness. Compare MORAL ABSOLUTISM; MORAL REALISM; SITUATION ETHICS.

morals pl. n. the ethical values or principles that people use to guide their behavior. See also MORAL; MORALITY.

moral therapy a form of psychotherapy from the 19th century based on the belief that a person with a mental disorder could be helped by being treated with compassion, kindness, and dignity in a clean, comfortable environment that provided freedom of movement, opportunities for occupational and social activity, and reassuring talks with physicians and attendants. This approach advocating humane and ethical treatment was a radical departure from the prevailing practice at that time of viewing the “insane” with suspicion and hostility, confining them in unsanitary conditions, and routinely abusing them through the use of such practices as mechanical restraint, physical punishment, and bloodletting. Moral therapy originated in the GHEELE COLONY, Belgium, during the 19th century, but it came to fruition in the 19th century through the efforts of Philippe Pinel (see SALPETRÈRE) and Jean Esquirol (1772–1840) in France; William Tuke (1732–1822) in England; and Benjamin Rush (1745–1813), Isaac Ray (1807–1881), and Thomas Kirkbride (1809–1883) in the United States. The THERAPEUTIC COMMUNITY of today has its roots in this movement. Also called moral treatment.

moratorium n. in Erik Erikson’s eight stages of psychosocial development, the experimental period of adolescence in which, during the task of discovering who one is and just how to act, the young person tries out alternative roles before making permanent commitments to an IDENTITY. Adolescents who are unsuccessful at negotiating this stage risk confusion over their role in life. See IDENTITY VERSUS IDENTITY CONFUSION. See also IDENTITY STATUS MODEL.

morbid adj. unhealthy, diseased, or otherwise abnormal.

morbid dependency excessive reliance on or need for another person or situation such that the dependent person has difficulty functioning independently. See DEPENDENCY NEED.

morbid jealousy see DEJUSIONAL JEALOUSY.

morbid jealousy see DELUSIONAL JEALOUSY.

morbid obesity the condition of having a BODY MASS INDEX over 39 or weighing 50% to 100% over one’s ideal weight. Morbid obesity is associated with diabetes mellitus, heart disease, joint pain, sleep apnea, and stroke.

Morita therapy a therapy for SHINKEISHITSU consisting of an initial period of strict and isolated bed rest followed by step-by-step OCCUPATIONAL THERAPY and final reintegration into job and family. A central concept is the attainment of arugama, an attitude of acceptance toward one’s self and one’s feelings. [Shoma Morita (1874–1938), Japanese psychiatrist]

morning-after pill a popular name for postcoital, or emergency, oral contraception. It consists of two doses of a progesterin, or a combined formulation of a progesterin and an estrogen, taken at spaced intervals no later than 72 hours after intercourse.

morning-glory seeds seeds of the plant Rivina humilis, which contain psychoactive agents and have been used as HALLUCINOGENS, notably in 16th-century Mexico.

morning sickness nausea and vomiting experienced by some women during the first months of pregnancy or throughout the entire pregnancy. Although morning sickness usually occurs soon after arising in the morning, some women have the symptoms throughout the day. Also called nausea gravidarum.

moron n. an obsolete name for a person with MILD MENTAL RETARDATION. [first described by Henry Herbert Goddard]

Moro reflex a reflex in which a newborn infant, when startled, throws out the arms, extends the fingers, and often quickly brings the arms back together as if clutching or embracing. In normal, healthy babies, the Moro reflex...
morsicatio buccarum

MORPHOLOGY

morsicatio buccarum n. habitual biting of the inside of the cheeks (buccal mucosa), sometimes causing lesions or the formation of white excess tissue.

mortality n. 1. the state or condition of being subject to illness, decline, and death. 2. the death rate in a population.

mortality effect the degree to which circumstances or behavior increase or decrease the incidence of death. For example, a behavioral health researcher could study the mortality effects of a fatty diet and lack of exercise, which could lead to early death from heart disease.

mortality rate a measure of how often death occurs, usually with respect to a specific illness, characteristic, behavior, or population. For example, a researcher could estimate the mortality rate for individuals who have been diagnosed with cancer.

mortality salience awareness of the inevitability of one’s death. According to Terror Management Theory, mortality salience, coupled with Death Anxiety, is a motivating force behind a diverse set of actions designed to defend oneself or one’s social group when threatened.

mort douce primarily in literary contexts, a peaceful death (French, literally “sweet death”) in which all tensions are released in a manner reminiscent of the fulfillment of sexual intercourse.

mosaic test a PROJECTIVE TECHNIQUE in which the participant, usually a child, is asked to “make anything you like” out of about 400 pieces of different colors and shapes. Mosaic materials are also used in some intelligence tests.

mosaicism n. a condition of genetic abnormality in which an individual is made up of two or more different cell lines derived from a single zygote. In a typical case, an individual with mosaicism will have some cells with the usual number of chromosomes and others with an extra chromosome.

mosaic test n. a PROJECTIVE TECHNIQUE in which the participant, usually a child, is asked to “make anything you like” out of about 400 pieces of different colors and shapes. Mosaic materials are also used in some intelligence tests.

mosaic test n. a PROJECTIVE TECHNIQUE in which the participant, usually a child, is asked to “make anything you like” out of about 400 pieces of different colors and shapes. Mosaic materials are also used in some intelligence tests.

MORPHOGENESIS

mosaicism n. a condition of genetic abnormality in which an individual is made up of two or more different cell lines derived from a single zygote. In a typical case, an individual with mosaicism will have some cells with the usual number of chromosomes and others with an extra chromosome.

mother archetype in Carl Jung’s ANALYTIC PSYCHOLOGY, the primordial image of the generative and sustaining mother figure that has occurred repeatedly in various cultural concepts and myths since ancient times and is located within the COLLECTIVE UNCONSCIOUS.

mother substitute n. a substitute substitute for a real mother or the primary caregiver. Also called mother substitute.

mother substitute n. a substitute substitute for a real mother or the primary caregiver. Also called mother substitute.

mother substitute n. a substitute substitute for a real mother or the primary caregiver. Also called mother substitute.

mother substitute n. a substitute substitute for a real mother or the primary caregiver. Also called mother substitute.

mother substitute n. a substitute substitute for a real mother or the primary caregiver. Also called mother substitute.
mothering

**mothering** n. the process of nurturing, caring for, and protecting a child by a mother or maternal figure.

**Mothers Against Drunk Driving (MADD)** an organization whose mission is to stop people from driving while under the influence (DUI) of alcohol or other drugs and to support the victims of car collisions caused by DUI drivers as well as to aid the victims’ families. Launched as a grassroots effort in 1980 by a group of mothers whose children had been killed by drunk drivers, MADD was known as Mothers Against Drunk Drivers until 1984. Its mission has since expanded to include efforts to prevent underage drinking.

**mother substitute** 1. see MOTHER FIGURE. 2. see MOTHER SURROGATE.

**mother surrogate** a substitute for an individual’s biological mother (e.g., a sister, grandmother, stepmother, adoptive mother), who assumes the responsibilities of that person and may function as a role model and significant attachment figure. Harry Harlow’s classic research demonstrated that young monkeys preferred a mother surrogate covered in cloth to one that was simply a wire frame, even though the latter was the source of food. Also called mother figure: surrogate mother.

**motility** n. the capacity for spontaneous, independent movement. —motile adj.

**motion aftereffect (MAE)** the perception that a stationary object or scene moves following prolonged fixation of a moving stimulus. The illusory movement is in the opposite direction to the movement of the stimulus that induced the effect. The best known example is the waterfall illusion, produced by watching a waterfall for a period and then shifting one’s gaze to the stationary surrounding scenery; the stationary objects appear to move upward.

**motion agnosia** see AKINETOPSIS.

**motion and time study** see TIME AND MOTION STUDY.

**motion detection** the ability to detect movement. Many cells in the visual system act as motion detectors, and some are also sensitive to the direction of movement.

**motion economy** a set of principles for the efficient performance of vocational tasks. Motion economy was developed largely by U.S. engineer Frank Gilbreth (1868–1924) and his wife, U.S. engineer and psychologist Lillian Moller Gilbreth. Its recommendations include simultaneous use of both hands moving in opposite directions; use of continuous, curved movements rather than straight line motions; use of the fewest movements possible; use of such items as jigs and fixtures to relieve hands of unnecessary work as “holding devices”; arrangement of work to permit an easy, natural rhythm; and arrangement of work to avoid long reaches.

**motion in limine** a formal proposal to a court, usually made before a trial begins (Latin *in limine*, “threshold”), requesting that certain statements, questions, or evidence not be introduced into the proceedings.

**motion parallax** the interrelated movements of elements in a scene that can occur when the observer moves relative to the scene. Motion parallax is a DEPTH CUE.

**motion sickness** a type of discomfort marked by nausea, dizziness, headache, pallor, cold sweats, and in some cases vomiting and prostration. The cause is irregular or abnormal motion that disturbs the normal sense of balance maintained by the semicircular canals of the inner ear. The condition may be aggravated or initiated by an emotional disturbance, such as anxiety or grief. Also called kinesia.

**motivated forgetting** a memory lapse motivated by a desire to avoid a disagreeable recollection. It is one of the cognitive mechanisms that have been suggested as a cause of delayed memories of childhood trauma.

**motivation** n. 1. the impetus that gives purpose or direction to behavior and operates in humans at a conscious or unconscious level (see UNCONSCIOUS MOTIVATION). Motives are frequently divided into (a) physiological, primary, or organic motives, such as hunger, thirst, and need for sleep; and (b) personal, social, or secondary motives, such as affiliation, competition, and individual interests and goals. An important distinction must also be drawn between internal motivating forces and external factors, such as rewards or punishments, that can encourage or discourage certain behaviors. See EXTRINSIC MOTIVATION; INTRINSIC MOTIVATION. 2. in CONDITIONING, the variables, collectively, that alter the effectiveness of REINFORCERS. Compare ESTABLISHING OPERATION. 3. a person’s willingness to exert physical or mental effort in pursuit of a goal or outcome. See WORK MOTIVATION. 4. the act or process of encouraging others to exert themselves in pursuit of a group or organizational goal. The ability to motivate followers is an important function of LEADERSHIP. —motivate vb. —motivated adj. —motivational adj.

**motivational enhancement therapy** a transtheoretical treatment, based on the STAGES OF CHANGE, that matches clients to interventions on the basis of individual differences in readiness to change. This treatment was initially applied to substance abuse but has now generalized to other problem behaviors. See also MOTIVATIONAL INTERVIEWING.

**motivational factor** any physiological or psychological factor that stimulates, maintains, and directs behavior. Examples are basic PHYSIOLOGICAL NEEDS, interests, and EXTRINSIC REWARDS.

**motivational hierarchy** see MASLOW’S MOTIVATIONAL HIERARCHY.

**motivational interviewing** a client-centered yet directive approach for facilitating change by helping people to resolve ambivalence and find intrinsic reasons for making needed behavior change. Originally designed for people with substance use disorders, motivational interviewing is now broadly applied in health care, psychotherapy, correctional, and counseling settings. It is particularly applicable when low intrinsic motivation for change is an obstacle. Rather than advocating for and suggesting methods for change, this approach seeks to elicit the client’s own goals, values, and motivation for change and to negotiate appropriate methods for achieving it. See also MOTIVATIONAL ENHANCEMENT THERAPY. [developed by U.S. clinical psychologist William R. Miller (1947– ) and South African-born British clinical psychologist Stephen Rollnick]

**motivational selectivity** an explanation for the different ways that an event or object may be perceived by different people based on the influence of individual motives on cognitive processes. See SELECTIVE PERCEPTION.

**motivational style** the characteristic manner in which an individual seeks or finds the motivation to perform a task. Categories are based on individual differences in motivation, including but not limited to intrinsic–extrinsic mot-
tivation, mastery orientation, and competitiveness. The notion of motivational styles is particularly used in education, business, and sport to help people recognize both strengths and weaknesses and develop strategies to improve learning and performance.

**motivation research** in consumer psychology, research that uses clinical, intensive, and qualitative approaches to reveal the true motives behind the decisions of individuals to purchase a product. Motivation research is also employed to determine why consumers may refuse to buy a certain product.

**motivators** pl. n. in the two-factor theory of work motivation proposed by U.S. clinical psychologist Frederick Herzberg (1923–2000), those aspects of the working situation that can increase satisfaction and motivation. Motivators involve the work itself rather than the work context and are increased by means of job enrichment and vertical loading (see job enlargement). Compare HYGIENE FACTORS.

**motive** n. 1. a specific physiological or psychological state of arousal that directs an organism’s energies toward a goal. See MOTIVATION. 2. a reason offered as an explanation for or cause of an individual’s behavior.

**motoneuron** n. see MOTOR NEURON.

**motor** adj. involving, producing, or referring to muscular movements.

**motor agraphe** a writing disorder resulting from impairment of muscular coordination in the hand.

**motor amusia** see AMUSIA.

**motor apraxia** a form of nonfluent APHASIA characterized by difficulty in producing articulate speech. An example is Broca’s APHASIA, for which motor aphasia is often used as a synonym. See also APHASIA.

**motor agraphia** a form of nonfluent APRAXIA characterized by difficulty in producing articulate speech. An example is Broca’s AGRAPHIA, for which motor agraphia is often used as a synonym. See also AGRAPHIA.

**motor aphasia** a form of nonfluent APHASIA characterized by difficulty in producing articulate speech. An example is Broca’s APHASIA, for which motor aphasia is often used as a synonym. See also APHASIA.

**motor agraphia** a form of nonfluent AGRAPHIA characterized by difficulty in producing articulate speech. An example is Broca’s AGRAPHIA, for which motor agraphia is often used as a synonym. See also AGRAPHIA.

**motor apraxia** a form of nonfluent APRAXIA characterized by difficulty in producing articulate speech. An example is Broca’s APRAXIA, for which motor apraxia is often used as a synonym. See also APRAXIA.

**motor area** an area of the motor cortex that, when stimulated, produces movements of skeletal muscles in various parts of the body. It has SOMATOTOPIC ORGANIZATION, with individual neurons controlling a specific movement direction of an associated body part that might involve coordinated action of several muscles. Also called BRODMANN’S AREA 4.

**motor behavior** 1. aspects of human movement that include MOTOR CONTROL, MOTOR DEVELOPMENT, and MOTOR LEARNING. 2. see MOTOR FUNCTION.

**motor control** the influence of neurophysiological factors on human movement.

**motor conversion symptoms** one of two types of symptoms of CONVERSION DISORDER, the other being SENSORY CONVERSION SYMPTOMS. Examples of motor conversion symptoms include impaired coordination and balance, paralysis or weakness confined to a specific area of the body, difficulty in swallowing, aphony (loss of voice), and urinary retention.

**motor coordination** the cooperative action of reflexive (or involuntary) and voluntary movements to carry out complex activities.

**motor cortex** the region of the frontal lobe of the brain responsible for the control of voluntary movement. It is divided into two parts. The **primary motor cortex**, or MOTOR AREA, is the main source of neurons in the corticospinal tract. The **secondary (or nonprimary) motor cortex**, made up of the premotor area and the supplementary motor area, is specialized for planning upcoming movements and learning new movements. Lesions in the primary motor cortex due to stroke or traumatic injury usually cause initial paralysis that may improve to a condition involving weakness and poor muscle tone. Lesions in the secondary motor cortex usually cause disruptions in MOTOR PLANNING for complex movements (see APRAXIA). Also called **motor strip**.

**motor development** the changes in motor skills that occur over an entire lifespan, which reflect the development and deterioration of muscular coordination and control and are also affected by personal characteristics, the environment, and interactions of these two factors.

**motor disorder** loss of the ability to perform simple or complex acts or skills because of temporary or permanent damage to tissues in the premotor or motor areas of the central nervous system. The cause of the damage may be a congenital or inherited defect, injury, surgical excision, or a psychochemical factor.

**motor disturbance** any disruption of motor behavior, such as hyperactivity, retardation, automatism, repetitive movements, rigid posture, grimacing, or tics.

**motor dominance** the controlling influence of one cerebral hemisphere on the motor activity, such as writing or throwing a ball.

**motor end plate** see END PLATE.

**motor equivalence** the ability to use different movements, produced by either the same or different parts of the body, to perform a task under different conditions. For example, the task of writing one’s name may be performed (a) on paper, with a pen held in the hand, by moving the fingers and wrist; (b) on a blackboard, with chalk held in the hand, by moving the arm; or (c) in the sand, using a toe, by moving the leg.

**motor evoked potential** a type of EVOKED POTENTIAL associated with motor neurons and motor cortex. For example, activity in spinal motor neurons may be studied by directly stimulating motor areas in the brain (see TRANSCRANIAL MAGNETIC STIMULATION) and observing the evoked potential in the spinal cord. Compare SENSORY EVOKED POTENTIAL.

**motor function** any activity that results from stimulation of MOTOR NEURONS, including glandular activity as well as reflexes and voluntary and involuntary muscle contractions. Also called **motor behavior**.

**motor homunculus** a figurative representation, in distorted human form, of the SOMATOTOPIC ORGANIZATION of the MOTOR CORTEX as originally mapped by U.S.-born Canadian neurosurgeon Wilder Penfield (1891–1976). Within this mapping, the size of the brain region associated with a body part reflects the complexity of the activities carried out with that part of the body rather than its actual size. Compare SENSORY HOMUNCULUS.

**motor imitation** the ability, particularly striking in in-
**motor impersistence**

fants and children, to imitate movements, facial expressions, and so forth after viewing them and without practice.

**motor impersistence** a neurologically based inability to sustain a simple act or posture, such as keeping the mouth open or turning the head, for longer than a few seconds. [identified in 1956 by Canadian physician Charles Miller Fisher (1913–2012)]

**motor learning** the process of acquiring and perfecting motor skills and movements, either simple acts or complex sequences of movements, which comes about through varying types of practice, experience, or other learning situations. Motor learning results in *muscle memory*, whereby the acquired motor skill can be performed without conscious effort, as in playing a musical instrument, climbing stairs, or riding a bike. See MOTOR DEVELOPMENT. See also THREE-STAGE THEORY.

**motor memory** knowledge of motor skills: the capacity to remember previously executed movements, such as the steps of a dance or the actions involved in tying one’s shoes. Compare VERBAL MEMORY; VISUAL MEMORY.

**motor milestones** the significant achievements in MOTOR DEVELOPMENT that occur during an infant’s first 2 years. Although individual children vary, on average infants will (a) support their head while prone at 3 months; (b) support their head in other positions at 4 months; (c) sit with props at 5 months; (d) sit supported by their hands and reach with one hand at 6 months; (e) pick up small items, using thumb opposition, and stand if holding onto a railing at 8 months; (f) creep, pull to a standing position, and take side steps while holding onto a support at 10 months; (g) walk alone, throw a ball, and walk backwards, sideways, upstirs, and downstairs with assistance at 16 months; and (h) run and walk up and down steps easily or with minimal assistance at 24 months. See also DEVELOPMENTAL SEQUENCE.

**motor neglect** underutilization of or failure to use motor functions on one side of the body despite the presence of normal strength, reflexes, and sensibility. It results from damage to various cerebral structures, including the thalamus and frontal and parietal lobes.

**motor nerve** any nerve that terminates in a muscle or gland, conveying impulses from the brain or spinal cord.

**motor neuron** a neuron whose axon connects directly to muscle fibers. Because motor neurons are the final stage of output from the nervous system and are the only means of stimulating muscle fibers, they are known as the [final common path]. There are two types: *lower motor neurons* (or *alpha motor neurons*), found in the cranial nerves and the anterior horn of the spinal cord and that are responsible for muscle contraction; and *upper motor neurons* (or *gamma motor neurons*), found in the corticospinal tract and that modulate the sensitivity of muscle spindles, thus influencing activity of the lower motor neurons. Also called *motoneuron*.

**motor neuron disease** any one of a group of degenerative disorders of the lower motor neurons or both the lower and upper motor neurons, marked by progressive weakness and wasting of skeletal muscles and paralysis. This group of disorders includes several forms, but—especially in the United States—the term often is applied specifically to AMYOTROPHIC LATERAL SCLEROSIS.

**motor neuron lesion** any damage to a motor neuron, particularly if it involves the cell body.

**motor neuron pool** a collection of motor neurons whose axons all connect to the same muscle, although the motor neurons may be scattered through a few levels of the spinal cord.

**motor overflow** a condition in which intentional motor behavior in one muscle group is accompanied by unintentional movement in another muscle group as a result of neurological dysfunction. For instance, while performing a fine motor task with the right hand, the left hand may move as well. Also called *synkinesia*: *synkinesis*.

**motor pathway** a neural pathway that originates in the brain or brainstem and descends down the spinal cord to control the motor neurons. The motor pathways can control posture, reflexes, and muscle tone, as well as the conscious voluntary movements associated with the MOTOR SYSTEM. See also GENERALIZED MOTOR PROGRAM.

**motor root** see VENTRAL ROOT.

**Motor scale** see BAYLEY SCALES OF INFANT AND TODDLER DEVELOPMENT.

**motor set** preparatory adjustments or readiness to make a certain response or begin an activity, such as prompted by the call “Ready, Set, Go!” at the start of a foot race.

**motor speech disorder** any of several communication disorders arising from inaccurate production of speech sounds because of lack of strength or coordination of the muscles involved in speaking, as occurs in CEREBELLAR ATAXIA OF PARKINSON’S DISEASE.

**motor strip** see MOTOR CORTEX.

**motor system** the complex of skeletal muscles, neural connections with muscle tissues, and structures of the central nervous system associated with motor functions. Also called *neuromuscular system*.

**motor tension** a state of muscle tension in which the individual is restless and tires easily. This symptom is associated with GENERALIZED ANXIETY DISORDER.

**motor test** any test designed to measure motor skills, ranging from Gross Motor to Fine Motor manipulation.

**motor theory of speech perception** the view that speech perception relies on the processes that are used in speech production, such that listeners interpret a spoken message by nonconsciously computing what motor operations would be required to produce that sequence of sounds. The theory was advanced as an explanation of CATEGORICAL PERCEPTION in the processing of speech sounds. [proposed by U.S. psychologist Alvin M. Liberman (1917–2000)]

**motor tract** any bundle of nerve fibers that convey signals from the higher centers of the brain to the spinal cord.
motor unit a group of muscle fibers that respond collectively and simultaneously because they are connected by nerve endings to a single motor neuron.
mouches volantes see MUSCULAR VOLUNTARIES.
mountain-climber’s syndrome (mountain sickness) see ALTITUDE SICKNESS; ACUTE MOUNTAIN SICKNESS.
mourning n. the process of feeling or expressing grief following the death of a loved one, or the period during which this occurs. It typically involves apathy and dejection, loss of interest in the outside world, and diminution in activity and initiative. These reactions are similar to depression but are less persistent and are not considered pathological. Other mourning reactions may include anger (e.g., toward the deceased for dying); a sense of relief (e.g., that the deceased is no longer suffering); anxiety about the repercussions of losing someone upon whom the bereaved may have depended; and physical signs (e.g., fatigue, loss of appetite). See also Bereavement.
mouse-movement adapter an adaptive device for a computer mouse that is used to control the movement of the pointer on the screen. The device is designed for use by individuals with motor disabilities who are not able to manipulate a standard computer mouse manually.
mouthstick n. for individuals with mobility impairments, a type of physical extension device consisting of a piece fitting into the mouth of the user that is attached to an extension with a tip that may press against, grasp, pull, or point to an object. It may be used, for example, to press an elevator button, turn on a light switch, turn a page in a book, or type on a keyboard.
movement n. a brief, unitary activity of a muscle or body part. A movement is less complex than an act.
movement chaining the generation of complex movement sequences whereby the occurrence of, or feedback from, each movement in the sequence acts as the stimulus to initiate the next. [originally described by Charles Scott Sherrington in relation to sequences of reflexes]
movement disorder any abnormality in motor processes, relating primarily to posture, coordination, or locomotion. See also Medication-induced Movement Disorder.
movement illusion an illusion that an object is in motion when it is not.
movement learning see MOTOR LEARNING; RESPONSE LEARNING.
movement perspective a visual illusion produced by the relative distance of moving objects. For example, a nearby bird flying at 50 kmh (c. 30 mph) may appear to be traveling faster than a jet airliner in the distant sky moving at 960 kmh (nearly 600 mph).
movement sense see KINESTHESIS.
movement-sensitive retinal cells cells, most commonly found in the retinas of lower animals, that respond to various specific movements across the visual field. Examples include the bug-detector cells of amphibians, which respond best to small, dark, moving spots, and cells that adapt quickly to objects moving in a particular direction.
movement therapy a therapeutic technique in which individuals use rhythmic exercises and bodily movements to achieve greater body awareness and social interaction and enhance their psychological and physical functioning. See also DANCE THERAPY.
moving-edge detector any of the cells in the visual system that respond best to a dark–light border moved through the receptive field. A particular speed and direction of movement may be required to elicit the optimum response from a moving-edge detector. See also Feature Detector.
moving-window technique in studies of reading, an experimental technique in which the words on a page are covered up except for a limited number that can be viewed through a “window,” which moves forward through the text at a set rate.
Mowat sensor an aid to ambulation for individuals with visual impairment. It is a lightweight, handheld device, similar to a flashlight, that detects objects by sending out brief pulses of high-frequency sound (ultrasound). The device vibrates when it detects an object, and users can tell how close they are to the object by the rate of vibration. The device ignores everything but the closest object within the beam.
Mozart effect a temporary increase in the affect or performance of research participants on tasks involving spatial–temporal reasoning after listening to the music of Austrian composer Wolfgang Amadeus Mozart (1756–1791). More generally, the term refers to the possibility that listening to certain types of music enhances inherent cognitive functioning. Apart from the neurological research on this effect, some experts propose an Arousal Theory perspective, such that listening to music heightens emotional levels that correspond to higher performance on intelligence tests. The notion of the Mozart effect has entered into popular culture to carry the as-yet-unsupported suggestion that early childhood exposure to classical music benefits mental development or intelligence.
mPOA abbreviation for MEDIAL PREOPTIC AREA.
MPS 1. abbreviation for MUCOPOLYSACCHARIDOSIS. 2. abbreviation for myofascial pain syndrome. See CHRONIC MYOFASCIAL PAIN.
MPTP n. 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine: a by-product of heroin synthesis that is used experimentally to induce symptoms of Parkinson’s disease in laboratory animals. It was discovered accidentally in 1976 when it was synthesized and injected by a recreational drug user who was attempting to produce an analog of MEPERIDINE. This individual developed acute symptoms of Parkinson’s disease, as did other users of the drug. Autopsy revealed massive degeneration of dopamine-containing neurons in the NIGROSTRIATAL TRACT. MPTP is not in itself neurotoxic (damaging to nerve tissue), but it is converted to the methylphenylpyridinium ion (MPP+), a potent neurotoxin at dopamineergic neurons, by the enzyme Monoamine Oxidase B.
MR abbreviation for MENTAL RETARDATION.
MRH abbreviation for Müllerian regression hormone. See Müllerian-Inhibiting Hormone.
MRI abbreviation for MAGNETIC RESONANCE IMAGING.
mRNA abbreviation for MESSENGER RNA.
MRT abbreviation for MODIFIED RHYME TEST.
MS abbreviation for MULTIPLE SCLEROSIS.
MS symbol for MEAN SQUARE.
MSE abbreviation for MENTAL STATUS EXAMINATION.
MSE symbol for MEAN SQUARE ERROR.
testes are not present in the embryo. Compare mammalian embryo and develop into female reproductive system cell (Müllerian-inhibiting hormone). Müllerian ducts from differentiating into the female sex organs. Also called anti-Müllerian hormone (AMH): Müllerian-inhibiting substance (MIS): Müllerian regression hormone (MRH). [Johannes Müller]

Müllerian mimicry a form of mimicry in which two or more species, each of which is toxic or potentially harmful, have similar body shape or coloration. For predators, a single experience with a member of one of these species can lead to learned avoidance of all similar-looking animals, conferring protection on all the mimetic species. [Johann Friedrich Theodor Müller (1822–1897), German zoologist]

Müller-Lyer illusion a geometric illusion in which a difference is perceived in the length of a line depending on whether arrowheads at either end are pointing toward each other or away from each other. Also called arrowhead illusion. [First described in 1889 by Franz Müller-Lyer (1857–1916), German psychiatrist and sociologist]

Müller–Urban process a procedure for calculating the difference threshold for data obtained using the method of constant stimuli. It is based on the assumption that the best measure of the threshold is the median of the best fitting ogive (S-shaped function) for the distribution. [Georg Elias Müller; Frank M. Urban, 20th-century U.S. psychologist]

Müller–Urban weights a set of numerical modifiers used in determining the best value of h (the measure of precision of process) by fitting observations to the normal curve. Also called Urban's weights. [Georg Elias Müller and Frank M. Urban]

multa loca tenens principle a rule stating that if a drug can substitute for or mimic one action of a natural physiological agent, it may be able to simulate other natural functions as well. Because of such multiple effects, the administered drug may compete for receptors, enzymes, and other physiological targets. [Latin, “holding (or substituting at many places”]

multiaxial classification a system of classifying mental disorders according to several categories of factors (e.g., social and cultural influences) as well as clinical symptoms. See DSM-IV-TR.

multicollinearity n. in multiple regression, the state that occurs when several independent variables are extremely highly interrelated, making it difficult to determine separate effects on the dependent variable. For example, if a researcher includes predictors of self-esteem, self-efficacy, and self-concept in an analysis with a dependent variable of achievement, multicollinearity most likely will be present.

multicultural education a progressive approach to education that emphasizes social justice, equality in education, and understanding and awareness of the traditions and language of other cultures and nationalities. Multicultural programs involve two or more ethnic or cultural
groups and are designed to help participants define their own ethnic or cultural identity and to appreciate that of others. The purpose is to promote inclusiveness and cultural pluralism in society.

**multicultural** adj.

- **multiculturalism** n. 1. the quality or condition of a society in which different ethnic and cultural groups have equal status and access to power but each maintains its own identity, characteristics, and mores. 2. the promotion or celebration of cultural diversity within a society. Also called **cultural pluralism**. Compare **CULTURAL MONISM**.

—**multicultural adj.**

**multicultural psychology** an extension of general psychology that recognizes that multiple aspects of identity influence a person’s worldview; including race, ethnicity, language, sexual orientation, gender, age, disability, class status, education, religious or spiritual orientation, and other cultural dimensions, and that both universal and culture-specific phenomena should be taken into consideration when psychologists are helping clients, training students, advocating for social change and justice, and conducting research.

**multicultural therapy** 1. any form of psychotherapy that takes into account not only the racial and ethnic diversity of clients but also their diversity in spirituality, sexual orientation, ability and disability, and social class and socioeconomic status; the potential cultural bias (e.g., racism, sexism) of the practitioner; the history of oppressed and marginalized groups; acculturation issues for immigrants; and the politics of power as they affect clients, advocating for social change and justice, and conducting research.

2. any form of therapy that assesses, understands, and evaluates a client’s behavior in the multiplicity of cultural contexts (e.g., ethnic, national, demographic, social, economic) in which that behavior was learned and is displayed.

**multidetermination** n. the interaction of several different factors in the etiology of a disorder (e.g., biological, psychological, environmental). —**multidetermined adj.**

**multidetermined behavior** the concept that human behavior is influenced by the interaction of multiple factors, past and present. In general, the major influences are genetic, environmental, physiological, and psychological.

**multidimensionality** n. 1. the quality of a **construct** that cannot be adequately described by measuring a single trait or attribute. 2. the quality of a scale, test, or so forth that is capable of measuring more than one dimension of a construct. For example, a psychometrician may be interested in investigating the multidimensionality of a new scale to measure cognitive functioning. Compare **UNIDIMENSIONALITY**. —**multidimensional adj.**

**Multidimensional Scale for Rating Psychiatric Patients** see INPATIENT MULTIDIMENSIONAL PSYCHIATRIC SCALE.

**multidimensional scaling (MDS)** a scaling method that represents perceived similarities among stimuli by arranging similar stimuli in spatial proximity to one another. While disparate stimuli are represented far apart from one another, Multidimensional scaling is an alternative to **FACTOR ANALYSIS** for dealing with large matrices of data or stimuli.

**multidisciplinary approach** see INTERDISCIPLINARY APPROACH.

**multidisciplinary team** a group of individuals, each with expertise in a different field of study, who are brought together to examine a subject area or to assist people.

**multifactorial** adj. consisting or arising out of several factors, variables, or causes.

**multifactorial inheritance** inheritance of a trait, such as height or predisposition to a certain disease, that is determined not by a single gene but by many different genes acting cumulatively. Such traits show continuous, rather than discrete, variation among the members of a given population and are often significantly influenced by environmental factors, such as nutritional status. Also called **polygenic inheritance**.

**multifactorial model** a model of inheritance positing that the genetic and environmental causes of a trait constitute a single continuous variable, the **liability**, and that if that liability is exceeded, the trait will manifest itself.

**multiform layer** see CORTICAL LAYERS.

**multifunctional antidepressant** an antidepressant that acts primarily via more than one major neurotransmitter system. The term is often applied to the SNRIs (e.g., VENLAFAXINE), which inhibit the reuptake of both norepinephrine and serotonin, to distinguish them from the SSRIs (selective serotonin reuptake inhibitors). Also called **dual-action antidepressant**: mixed-function antidepressant.

**multigenerational transmission** the passing on of psychological problems, primarily anxiety, over several generations through family relationships. A central concept in FAMILY SYSTEMS THEORY, the principal process involves the unconscious passing on of a higher level of anxiety, which overrides adaptive thinking and behavior, to members in each succeeding generation. Interventions to change this transmission involve charting family relationships and coaching individuals on how to interact with targeted relatives, usually those who are lowest in anxiety and who function at the most adaptive level. [developed by U.S. psychiatrist Murray Bowen (1913–1990)]

**multigenerational trauma** see INTERGENERATIONAL TRAUMA.

**multigravida** n. a woman who has had two or more pregnancies. Compare PRIMIGRAVIDA.

**multi-infarct dementia** see VASCULAR DEMENTIA.

**multilevel model** see HIERARCHICAL LINEAR MODEL.

**Multilingual Aphasia Examination (MAE)** a neuropsychological test battery used to determine the presence, type, and severity of APHASIA. The 11 subtests, assessing various aspects of expressive and receptive language function, include Visual Naming, Sentence Repetition, a Controlled Oral Word Association Test, Oral Spelling, Written Spelling, Block Spelling, a Token Test, Aural Comprehension of Words and Phrases, Reading Comprehension of Words and Phrases, Rating of Articulation, and Rating of Praxic Features of Writing. The MAE was originally developed in 1978 and is now in its third edition (published in 1994). Despite the implications of its name, the MAE currently is available only in English and Spanish versions. [developed by U.S. psychologists Arthur L. Benton, Kerry deS. Hamsher (1946– ), and Abigail B. Sivan (1943– )]

**multilingualism** n. the sociolinguistic situation in which several languages are used within the same community, usually resulting from geographical, economic, politi-
multimethod approach

cal, or militaristic interactions. Typically, the various languages differ in status and serve different social functions. See diglossia.

multimethod approach a design that uses more than one procedure for measuring the main characteristic or construct of interest. For example, a researcher could use a multimethod approach to understanding relationship satisfaction by simultaneously collecting data from a survey, asking one or both of the partners to give their own self-report, and systematically observing the degree of relationship satisfaction. See also MULTITRAIT–MULTIMETHOD MODEL.

multimethod–multitrait model see MULTITRAIT–MULTIMETHOD MODEL.

multimodal distribution a set of data in which there is more than one MODE or score that occurs most frequently. For example, the ages of a sample of college students would form a multimodal distribution if the largest number of people are either 18, 19, or 20 years old, with the remaining individuals aged 17 or 21 through 70. See also BIMODAL DISTRIBUTION; UNIMODAL DISTRIBUTION.

multimodal therapy (MMT) a form of psychotherapy in which the therapist assesses the client’s significant behaviors. Affective responses. Sensations. Imagery. Cognitions. Interpersonal relationships, and the need for Drugs and other biological interventions. The first letters yield the acronym BASIC ID, which summarizes the seven basic interactive modalities of the approach. MMT posits that these modalities exist in a state of reciprocal transaction and flux, connected by complex chains of behavior and other psychophysiological processes. The therapist, usually in concert with the client, determines which specific problems across the BASIC ID are most salient. MMT uses an eclectic approach drawing mainly from a broad-based social and cognitive learning theory. Also called multimodal behavior therapy. [developed by South African–born U.S. psychologist Arnold Allan Lazarus (1932–2013)]

multimodal treatment a manner of treating a disease, disorder, or syndrome by simultaneously applying several different methods, often from different disciplines or traditions.

multinomial adj. describing a measurement that can have more than two categories or outcomes. For example, a professor assigning grades of A, B, C, D, or F to students in his or her course is making a multinomial decision, whereas assigning grades of pass or fail would be a binomial decision.

multinomial distribution a probability distribution that describes the theoretical distribution of n objects sampled at random from a population of k kinds of things with regard to the number of each of the kinds that appears in the sample. By contrast, a BINOMIAL DISTRIBUTION involves just two variables, categories, or objects.

multinormal distribution see MULTIVARIATE NORMAL DISTRIBUTION.

multiparous adj. 1. describing a woman (a multipara) who has had two or more pregnancies resulting in live births. Compare PRIMIPAROUS. 2. giving birth to more than one offspring at a time. —multiparity n.

multipayer system see ALL-PAYER SYSTEM.

multophilia n. interest in multiple, short-term sexual relationships, with no desire for long-term relationships or commitment.

multiple-aptitude test a battery of separate tests designed to measure a wide range of relatively independent functions and to yield a profile of a person’s abilities in different areas, as contrasted with a single global IQ. Different batteries measure different patterns of abilities. An example is the battery comprising the DIFFERENTIAL APTITUDE TESTS, primarily for use in educational and vocational counseling.

multiple baseline design an experimental approach in which two or more behaviors are assessed to determine their initial, stable expression (i.e., baseline) and then an intervention or manipulation is applied to one of the behaviors while the others are unaffected. After a period, the manipulation is then applied to the next behavior while the remaining behaviors are unaltered, and so forth until the experimental manipulation has been applied in sequential fashion to all of the behaviors in the design. In successively administering a manipulation to different behaviors after initial behaviors have been recorded, a multiple baseline design allows for inferences about the effect of the intervention.

multiple causation the view that events, including behaviors, seldom result from single causes but instead from multiple causes working in complex combinations. Multiple causation contrasts with SIMPLE CAUSATION and, often, with LINEAR CAUSATION.

multiple-choice experiment an experiment in which a participant decides which of several possible choices is correct, usually on the basis of a specific cue that must be learned.

multiple-choice question see FIXED-ALTERNATIVE QUESTION.

multiple classification the ability to classify items in terms of more than one dimension simultaneously, such as shape and color. According to PIAGETIAN THEORY, this ability is not achieved until the CONCRETE OPERATIONAL STAGE.

multiple comparisons a set of comparisons made between samples to identify significant differences among their mean values. Multiple comparisons are generally done in a post hoc manner (i.e., are unplanned) in order to keep the TYPE I ERROR rate controlled at a prespecified level. Also called multiple contrasts.

multiple comparison test any of various statistical procedures used to follow up on a significant result from an ANALYSIS OF VARIANCE by determining which groups in particular differ in their mean values. Examples include DUNCAN’S MULTIPLE RANGE TEST, the FISHER LEAST SIGNIFICANT DIFFERENCE TEST, the REGWQ TEST, the SCHEFFE TEST, and TUKEY’S HONESTLY SIGNIFICANT DIFFERENCE TEST. See also POST HOC COMPARISON.

multiple correlation coefficient (symbol: R) a numerical index of the degree of relationship between a particular variable and two or more other variables. Its value ranges from \(-1\) to \(+1\), with the former indicating a strong negative relationship and the latter a strong positive relationship. Also called multiple R.

multiple correlation coefficient squared see COEFFICIENT OF MULTIPLE DETERMINATION.

multiple cutoff model of selection in PERSONNEL SELECTION, a model in which an applicant for a job must
meet a minimum score on each of several selection instruments (i.e., tests and inventories) in order to be hired. Unlike the MULTIPLE HURDLE MODEL OF SELECTION, the multiple cutoff procedure does not require applicants to take and pass the selection instruments in any particular order.

**multiple delusions** concurrent DELUSIONS, not necessarily interconnected.

**multiple determination** see OVERDETERMINATION.

**multiple discriminant analysis (MDA)** a MULTIVARIATE statistical procedure for examining the relationship between a set of more than two categories representing an outcome variable and a set of predictor variables. It is often used to verify that the predictors (e.g., family history, self-esteem, number of sleeping hours) are accurately classifying individuals into the appropriate categories of the outcome variable (diagnosis of depression). Also called **multiple classification analysis (MCA)**.

**multiple drafts hypothesis** the theory that conscious perception involves a gestation in the brain rather than through many approximations (drafts) of sensory input that are widely distributed over the sensory cortex. [proposed by U.S. philosopher Daniel C. Dennett (1942– ) and Austrian-born U.S. neurologist Marcel Kinsbourne (1931– )]

**multiple family therapy** a form of GROUP THERAPY in which two or more family members meet with two or more therapists at once. See also COTHERAPY.

**multiple hurdle model of selection** in PERSONNEL SELECTION, a model in which applicants for a job are required to pass each of a series of selection instruments (i.e., tests and inventories) before they are evaluated on the next instrument. The number of applicants is therefore reduced at each “hurdle.” See also RANDBAND.

**multiple-impact therapy** a treatment method in which a group of mental health professionals works with a client family during an intensive, limited period.

**multiple imputation** a method for addressing missing data in which several possible simulated values are inserted into a data set to replace omitted values, and then the mean and STANDARD DEVIATION of the set are calculated to arrive at an estimate to substitute for the missing value. Multiple imputation is considered less biased than other missing values procedures, such as LISTWISE DELETION, PAIREDWISE DELETION, and single imputation.

**multiple-intelligences theory** the idea that intelligence is made up of eight distinct categories: linguistic, musical, bodily-kinesthetic, logical-mathematical, spatial, naturalist, intrapersonal, and interpersonal. [proposed in 1983 by U.S. psychologist Howard Gardner (1943– )]

**multiple linear regression** a statistical technique for examining the linear relationship between a continuous DEPENDENT VARIABLE and a set of two or more INDEPENDENT VARIABLES. It is often used to predict a single outcome variable from a set of predictor variables. For example, an educational psychology researcher could use multiple regression to predict college achievement (e.g., grade-point average) from the variables of high school grade-point average, Scholastic Assessment Test (SAT) reading score, SAT mathematics score, and SAT writing score. When a single predictor and a single outcome are involved, the process is known as LINEAR REGRESSION. Also called **multiple linear regression**.

**multiple regression model of selection** a statistically based model of PERSONNEL SELECTION in which the applicant is measured on each of several predictors and these scores are weighted to reflect the GOODNESS OF FIT between the predictor and performance on a given JOB CRITERION. The model assumes that the predictors are linearly related to the job criterion and that they are additive and can compensate for one another.

**multiple reinforcement schedule** a COMPOUND SCHEDULE OF REINFORCEMENT in which two or more schedules alternate and each schedule is associated with a different EXTEROCEPTIVE STIMULUS. For example, under a multiple fixed-interval extinction schedule, a tone could be present while the fixed-interval schedule is in effect and absent when extinction is in effect.

**multiple relationship** see DUAL RELATIONSHIP.

**multiple-resource model** a model that views attention as comprising many pools of resources, each pool being specific to one stimulus modality or type of response. Different tasks place varying demands on different resources, and performance suffers less if two tasks draw on different resource pools than if they draw on the same pool. For example, talking while riding a bicycle presents fewer problems than trying to have two conversations at once. See MULTIPLE-TASK PERFORMANCE. Compare UNITARY-RESOURCE MODEL.
multiple-role playing  a MANAGEMENT DEVELOPMENT technique involving group ROLE PLAY. A large group is broken up into smaller groups, each of which comprises three people sitting in one row and the three people sitting directly behind them. Each six-person group is then given the same problem, with each member assigned one of six roles in the decision-making process. The solutions derived by each group are then reported to the entire body. See also BUSINESS GAME; CASE METHOD; CONFERENCE METHOD; SCENARIO ANALYSIS.

multiple roles in persuasion  a postulate in the ELABORATION-LIKELIHOOD MODEL holding that variables can influence persuasion in one or more of five possible roles. When elaboration is likely to be low, a variable can influence persuasion by possibly serving as a PERIPHERAL CUE. When situational and dispositional factors do not cause elaboration to be extremely high or low, a variable can influence persuasion by determining the amount of elaboration. When elaboration is likely to be high, a variable can serve as an ARGUMENT if it is directly relevant to evaluating the ATTITUDE OBJECT, or as a BEASING FACTOR in elaboration, or as a SELF-VALIDATION FACTOR in elaboration.

multiple sclerosis (MS)  a disease of the central nervous system (brain and spinal cord) characterized by inflammation and multifocal scarring of the protective MYELIN SHEATH of nerves, which damages and destroys the sheath and the underlying nerve, disrupting neural transmission. The initial symptom of MS is often a visual disturbance, such as blurred or double vision, red-green color distortion, or blindness in one eye. Later symptoms include fatigue, weakness in the hands and feet, numbness, stiffness or muscular spasms, muscle and back pain, difficulties with coordination and balance, loss of bladder or bowel control, and depression. Some individuals also experience cognitive impairments, such as difficulties with concentration, attention, memory, and judgment. The onset is usually between the ages of 20 and 40, and, with periods of remission, the disease may continue for 25 years or more. Rapid progression to death is rare. The cause of MS, which occurs twice as frequently in females as in males, is unknown. However, the destruction of myelin may be due to an autoimmune response (see AUTOIMMUNITY).

multiple selves  a psychoanalytic concept of the self as composed of many different self-states with different affective, perceptual, and cognitive features. In normal development, the self-states are thought to be sufficiently compatible to allow for internal conflicts of wishes and desires within the person. In pathological development, or as a result of trauma, the self-states are thought to become defensively dissociated from each other, sometimes resulting in DISASSOCIATIVE IDENTITY DISORDER. Also called multiple self-states.

Multiple Sleep Latency Test (MSLT)  an inpatient test performed in a SLEEP LABORATORY in which the individual is monitored during a series of five 20-minute nap periods scheduled 2 hours apart. The object is to assess daytime sleep tendency by measuring the number of minutes it takes the individual to fall asleep. Electrodes are used to measure brain waves, eye movements, heartbeat, and muscle tone. The test is used in the diagnosis of PRIMARY HYPERSONNIA and NARCOLEPSY.

multiple-spike recording  the recording and analyzing of potentials from rapidly firing neurons using MICRO-ELECTRODES connected to computer equipment.

multiple-task performance  a scenario in which a person must perform two or more tasks either simultaneously or contemporaneously. Success will depend on the degree to which the person can divide his or her attentional resources between tasks. See MULTIPLE-RESOURCE MODEL; UNITARY-RESOURCE MODEL. See also PERFORMANCE-OPERATING CHARACTERISTIC.

multiple trace hypothesis  the hypothesis that when a stimulus is presented on multiple occasions, each occasion creates an entirely new record in memory rather than strengthening or otherwise updating an already existing record.

multiplex  n. a method of coding information that enables two or more messages or data streams to be transmitted simultaneously over the same communication channel.

multiplication rule  a rule stating that the joint PROBABILITY of two independent events occurring together or in succession is equal to the probability of the first event times the probability of the second event. For example, the multiplication rule would indicate that the probability of drawing a heart followed by the probability of drawing a spade is equal to 13/52 \times 13/52 = .25 \cdot .25 = .0625. Also called and rule; multiplication law; multiplicative law. Compare ADDITION RULE.

multiplicative model  a description of the effect of two or more predictor variables on an outcome variable that allows for INTERACTION EFFECTS among the predictors. This is in contrast to an ADDITIVE MODEL, which sums the individual effects of several predictors on an outcome. For example, a health researcher could use a multiplicative model to examine the interaction effect of number of cigarettes smoked per day and length of smoking habit on the onset of cancer; the results might be compared to those obtained from an additive model that examines the separate effects of amount of cigarettes and length of a smoking habit on cancer onset.

multiplicity-versus-unity dimension  the degree to which a work of art is characterized by complexity (multiplicity) versus harmony (unity). Arousal in the viewer is heightened by complexity factors and lowered by elements of harmony. Multiplicity in art is sometimes held to be associated with historical periods of political or economic insecurity, when tensions are reflected in “deformation” of art styles.

multipolar neuron  a neuron that has many dendrites and a single axon extending from the CELL BODY. Also called multipolar cell. Compare Bipolar Neuron; Unipolar Neuron.

multisensory learning  learning in which the material of interest is presented through several sensory modalities (e.g., seeing, hearing, touching) rather than through only one modality.

multisensory method  an approach to teaching reading and spelling that incorporates the visual, auditory, kinesthetic, and tactile modalities. See FERNALD METHOD.

multiskilled (multiskil)  adj. 1. displaying a level of proficiency in more than one area of expertise. 2. having the ability to perform more than one task at the same time.

multistage sampling  a technique in which samples are drawn first from higher order groupings (e.g., states) and then from successively lower level groupings (e.g., counties within states, towns within counties) in order to
multistore model were U.S. cognitive psychologists Richard C. Atkinson and Richard M. Shiffrin (1968— ) in 1968 (see INFORMATION-PROCESSING MODEL), with other researchers subsequently proposing their own such models as well. Also called storage-and-transfer model of memory. See DUAL-STORE MODEL OF MEMORY: MODAL MODEL OF MEMORY.

multistage theory any theory concerning a process that posits a series of steps or stages operating serially to accomplish that particular process.

multistate information system (MSIS) an automated record-keeping system designed to provide comparative statistics for evaluation of programs and treatment procedures in U.S. mental hospitals and community mental health facilities.

multistore model of memory any theory hypothesizing that information can move through and be retained in any of several memory storage systems, usually of a short-term and a long-term variety. The first to propose a multistore model were U.S. cognitive psychologists Richard C. Atkinson and Richard M. Shiffrin (1968— ) in 1968 (see INFORMATION-PROCESSING MODEL), with other researchers subsequently proposing their own such models as well. Also called storage-and-transfer model of memory. See DUAL-STORE MODEL OF MEMORY: MODAL MODEL OF MEMORY.

multitrait–multimethod matrix (MTMM) a matrix showing correlations among two or more measurement techniques used to assess two or more constructs or traits, as obtained from a MULTITRAIT–MULTIMETHOD MODEL. It includes correlations among the same traits with different methods (i.e., montrait–heteromethod) and among different traits with the same method (i.e., heteroind–monoind). The former are expected to be the largest, thus demonstrating CONVERGENT VALIDITY, whereas the latter are expected to be smallest, demonstrating DISCRIMINANT VALIDITY.

multitrait–multimethod model (MTMM) a procedure for examining CONSTRUCT VALIDITY that assesses the correlations among two or more characteristics where these are each measured in two or more ways. For example, a researcher studying self-concept and achievement as measured by both self-reports and teacher evaluations could use a multitrait–multimethod model to evaluate the associations between the self-reports and teacher evaluations on each one of the characteristics. The set of correlations resulting from such an analysis is displayed in a MULTITRAIT–MULTIMETHOD MATRIX. Also called multitrait–multimethod analysis.

multivariate adj. consisting of or otherwise involving a number of distinct variables. For example, a multivariate study of ability could involve multiple measures of intelligence and achievement. Compare univariate. See also BIVARIATE.

multivariate analysis 1. a set of statistical procedures for studying the relationships between one or more predictors and several outcome or dependent variables. Examples include CANONICAL CORRELATION ANALYSIS for assessing the relationships among two sets of variables; FACTOR ANALYSIS for assessing the relationships among a large set of measures and a small set of underlying factors; MULTIVARIATE ANALYSIS OF VARIANCE and MULTIVARIATE ANALYSIS OF COVARIANCE for assessing potential group differences on several dependent variables; and STRUCTURAL EQUATION MODELING, which examines a theoretically based pattern of relationships among multiple independent, dependent, and even mediating variables. Also called multivariate statistics. Compare univariate analysis. 2. more generally, any procedure for understanding any large set of variables, whether dependent or independent.

multivariate analysis of covariance (MANCOVA) a statistical procedure for assessing possible group differences on a set of outcome or dependent variables, after taking into account the scores on one or more covariates. For example, a researcher could conduct a multivariate analysis of covariance to assess whether two groups of participants in a teaching style study differ significantly on a set of achievement variables—such as quiz scores, homework scores, exam scores, and project scores—after taking into account the initial grade-point average of each of the participants. It is an extension of the univariate ANALYSIS OF COVARIANCE, which examines a single dependent variable.

multivariate analysis of variance (MANOVA) a statistical procedure for assessing possible group differences on a set of outcome or dependent variables. For example, a researcher could conduct a multivariate analysis of variance to assess whether a group of participants who receive a new educational method differ significantly from another group of participants who are taught with a traditional method on a set of achievement variables, such as quiz scores, homework scores, exam scores, and project scores. It is an extension of the univariate ANALYSIS OF VARIANCE, which examines a single dependent variable.

multivariate distribution the arrangement of scores obtained on several variables. For example, a health researcher may want to examine the multivariate distribution of scores on level of exercise, cholesterol level, and blood pressure in a sample of individuals at risk for heart disease. Compare univariate distribution.

multivariate normal distribution a pattern of values on several variables in which a graph of the data forms a bell-shaped NORMAL DISTRIBUTION. Evidence for a multivariate normal distribution may be obtained using a QUAN

TILE–QUANTILE PLOT. If the plot shows a series of points along a diagonal line, indicating a lack of any discrepant scores (i.e., any multivariate OUTLIERS), then the data have a multivariate normal distribution. Also called multinormal distribution.

multivariate normality the situation in which the values for a set of variables have an even distribution, with most scores falling in the middle of the range and a smaller number of high and low scores. In other words, a set of scores demonstrating multivariate normality follows a MULTIVARIATE NORMAL DISTRIBUTION and lacks OUTLIERS or extreme scores.

multivariate research a study conducted to simultaneously assess the relationships among multiple dependent variables and independent variables. Compare univariate research.

multivariate statistics see multivariate analysis.

multivariate test any of various statistical procedures involving two or more outcome or dependent variables. An example is the MULTIVARIATE ANALYSIS OF VARIANCE, which extends the ANALYSIS OF VARIANCE examining one dependent variable to include additional dependent varia
mum effect

bles. FACTOR ANALYSIS and MULTIPLE REGRESSION sometimes are considered multivariate tests as well, even though the former involves a single set of variables that are not necessarily independent or the latter allows for multiple INDEPENDENT VARIABLES but only one outcome.

mum effect see UPWARD COMMUNICATION.

Münchausen syndrome a severe and chronic form of FACTITIOUS DISORDER characterized by repeated and elaborate fabrication of clinically convincing physical symptoms and a false medical and social history (see PSEUDOLEGEND). Other features are PERSEVERATION and recurrent hospitalization, and there may be multiple scars from previous (unnecessary) investigative surgery. The patient’s motivation is a psychological need to assume the SICK ROLE. See also PATHOMIMICRY. [Baron Karl Friedrich Hieronymus von Münchhausen (1720–1797), German soldier-adventurer famous for his tall tales but not for having the disorder itself]

Münchausen syndrome by proxy (MSP) a psychological disorder in which caregivers fabricate or intentionally cause symptoms in those they are caring for in order to seek and obtain medical investigation or treatment (i.e., to assume the SICK ROLE by proxy). Typically, the caregiver is the mother, who behaves as if distressed about her child’s illness and denies knowing what caused it; She is believed to be motivated by the hope that she will be seen as an exceptionally attentive parent, and her behavior may be an attempt to arouse sympathy. Also called factitious disorder by proxy.

mundane realism the extent to which an experimental situation resembles a real-life situation or event. See also EXPERIMENTAL REALISM.

Munsell color system a method of color notation devised for use mainly in science, industry, and technology. The system uses numerical designations for hue, saturation, and brightness of color for accurate identification and specification. See COLOR VALUE. [Albert H. Munsell (1858–1918), U.S. artist]

mu opioid receptor see OPIOID RECEPTOR.

murder n. the unlawful killing of one person by another, particularly when the act involves premeditation. See also HOMICIDE.

murder–suicide the intentional killing of another person followed by the suicide of the killer. See also EXTENDED SUICIDE.

muscae volitantes particles or specks seen as floating before the eyes. Also called mouches volantes. [Latin, literally, “flying flies”]

muscine n. a toxic alkaloid, isolated from FLY AGARIC (Amanita muscaria) and some other fungi, that stimulates certain types of acetylcholine receptors (the MUSCARINIC RECEPTORS) in smooth muscle, cardiac muscle, endocrine glands, and the central nervous system. See also NICOTINE, muscarinic adj.

muscinic receptor (mACHR) a type of ACETYLCHOLINE RECEPTOR that responds to MUSCARINE as well as to acetylcholine. Muscarinic receptors are found in smooth muscle, cardiac muscle, endocrine glands, and the central nervous system and chiefly mediate the inhibitory activities of acetylcholine. Compare NICOTIC RECEPTOR.

muscinol n. see FLY AGARIC; GABA AGONIST; IBIOTIC ACID.

muscle n. contractile tissue that generates force and moves parts of the body. The main types of muscle are SMOOTH MUSCLE, SKELETAL MUSCLE, and CARDIAC MUSCLE.

muscle action potential a wave of electric potential that sweeps across a muscle when it is stimulated. See ACTION POTENTIAL.

muscle contraction a shortening of the MUSCLE FIBERS in response to electrical stimulation from a MOTOR NEURON by which a muscle exerts force on the tissues to which it is attached. This stimulation initiates an electrochemical sequence in which myosin filaments, powered by ATP (adenosine triphosphate), detach from a nearby actin filament, swing forward to reattach further along the actin filament, and then swing back causing the actin and myosin filaments to slide in opposite directions. When this process is repeated in many muscle fibers, the overall muscle becomes shorter but thicker. See ISOMETRIC CONTRACTION; ISOTONIC CONTRACTION.

muscle-contraction headache a headache arising from increased muscle tension, frequently in the neck. Also called muscle-tension headache.

muscle dysmorphia a form of BODY DYSMORPHIA characterized by chronic dissatisfaction with one’s muscularity and the perception that one’s body is inadequate and undesirable, although objective observers would disagree with such an assessment. This condition often leads to excessive exercising, steroid abuse, and eating disorders. It is typically found in males, especially bodybuilders. Also called bigorexia; reverse anorexia.

muscle fiber a microscopic strand of muscle tissue that functions as a molecular machine converting chemical energy into force. Thousands of muscle fibers are linked by connective tissue into a muscle. Each fiber is, in turn, composed of millions of longitudinally aligned protein filaments. It is the interaction of actin and myosin protein molecules (sometimes together referred to as actomyosin) in these filaments that creates MUSCLE CONTRACTION.

muscle memory see MOTOR LEARNING.

muscle relaxant any of various drugs used in the management of spasms of skeletal muscle generally resulting from mechanical injury, stroke, cerebral palsy, or multiple sclerosis. Most act on the central nervous system or its associated structures to reduce muscle tone and spontaneous activity. Although the precise mode of action varies with the drug, muscle relaxants generally act by depressing spinal reflexes without loss of consciousness. Common muscle relaxants include BENZODIAZEPINES, BACLOFEN, DANTROLENE, and botulinum toxin. Others used for localized muscle spasms include CARISOPRODOL, CYCLOBENZAPRINE, METHOCARBAMOL, and ORPHENADRINE.

muscle relaxation the release of tension from muscle; that is, the alteration of the state of the muscle on a continuum from full contraction to flaccidity.

muscle sensation a kinesthetic awareness of movements and tensions in muscles, tendons, and joints. See KINESTHETIC FEEDBACK.

muscle spindle a receptor that lies within skeletal muscle, parallel to the main contractile MUSCLE FIBERS, that sends impulses to the central nervous system when the muscle is stretched.

muscle-tension gradient the rate of change of mus-
muscle tension during performance of a task. It is measured by electromyography.

**muscle tonus** see tonus.

**muscle twitch** a small, sudden, and brief involuntary contraction of a muscle, as opposed to sustained contraction.

**muscular dystrophy (MD)** any of a group of inherited disorders marked by degeneration of the muscles, which gradually weaken and waste away due to abnormalities in the muscle structural protein dystrophin and in a series of glycoproteins that are critical to maintaining the structural integrity of muscle fibers. There are various kinds of muscular dystrophy, each differentiated by pattern of inheritance, age of onset, rate of progression, and distribution of weakness. One of the most common and severe types is **Duchenne muscular dystrophy** (pseudohypertrophic muscular dystrophy). This is inherited as a sex-linked recessive trait and is therefore restricted to boys. It typically begins before the age of 6 with delayed walking and loss of muscle strength, first in the pelvic girdle followed by weakness in the shoulder girdle. Individuals with this disorder have difficulty in rising to a standing position and often fall. They usually are unable to walk by the age of 12 and frequently die from complications before the age of 20.

**muscular rigidity** stiffness in muscles that is resistant to changes in position. Individuals may misinterpret this symptom as weakness, but the condition usually occurs in the presence of normal strength. See cogwheel rigidity; lead-pipe rigidity.

**muscular type** a constitutional type characterized by dominance of the muscular and locomotor systems over other body systems (see Rostan types). It corresponds to the athletic type in kretschmer typology.

**musculocutaneous nerve** a nerve that innervates the muscles of the upper arm and cutaneous receptors of the lateral forearm.

**musculoskeletal disorder** any disease, injury, or significant impairment of muscles, bones, joints, and supporting connective (soft) tissues.

**musculoskeletal system** the system of skeletal muscles and bones that generally function together to move the body and its parts and to maintain its general form.

**musical intelligence** in the multiple-intelligences theory, the skills used in writing, playing, remembering, and understanding music.

**musical interval** the pitch or frequency spacing between two sounds. Two sounds that are an octave apart (i.e., with an interval of an octave) have a 2:1 ratio of their fundamental frequencies. See also cent.

**musician's cramp** a type of occupational cramp experienced by musicians, usually in the arm or hand, that prevents them from performing. The condition may be due to electrolyte imbalance. See also repetitive strain injury.

**musicogenic epilepsy** a type of reflex epilepsy in which seizures are precipitated by music.

**music therapy** the use of music as an adjunct to the treatment or rehabilitation of individuals to enhance their psychological, physical, cognitive, or social functioning. Music therapy involves singing, writing music, performing music, listening to music, and lyric analysis, among other techniques.

**mussitation n.** unintelligible muttering, or moving the lips without producing speech.

**mutsturbation** n. the belief by some individuals that they must absolutely meet often perfectionist goals in order to achieve success, approval, or comfort. Cognitive and behavioral therapies may be useful in bringing awareness and perspective to such maladaptive cognitions. See also rational emotive behavior therapy. [defined by Albert Ellis]

**musty adj.** denoting one of the seven classes of odorants in the stereocchemical smell theory.

**mutation n.** a permanent change in the genetic material of an organism. It may consist of an alteration to the number or arrangement of chromosomes (a chromosomal mutation) or a change in the composition of DNA, generally affecting only one or a few bases in a particular gene (a point mutation). Mutations can occur spontaneously; but many are due to exposure to agents (mutagens) that significantly increase the rate of mutation; these include X-rays and other forms of radiation and certain chemicals. A mutation occurring in a body cell (i.e., a somatic mutation) cannot be inherited, whereas a mutation in a reproductive cell producing ova or spermatozoa (i.e., a germ-line mutation) can be transmitted to an individual’s offspring. Most mutations either have no discernible effect or have a deleterious effect; however, a tiny minority are beneficial and thus give an individual and his or her descendants a selective advantage. Genetic testing of families or groups at high risk for single-gene disorders ascertains the presence or absence of mutations responsible for these disorders.

**mutilation n.**
1. the destruction or removal of a limb or an essential part of the body.
2. a destructive act causing a disfiguring injury to the body. See also self-mutilation.

**mutism** n. lack or absence of speaking due to physical or psychogenic factors. The condition may result from a structural defect in the organs necessary for speech, congenital or early deafness in which an individual’s failure to hear spoken words inhibits the development of speech, neurological damage or disorder, psychological disorders (e.g., conversion disorder, catatonic schizophrenia), or severe emotional disturbance (e.g., extreme anger). The condition may also be voluntary, as in monastic vows of silence or the decision to speak only to selected individuals. See also akinetic mutism; alalia; selective mutism; stupor.

**muttering delirium** a type of delirium in which an individual’s speech is marked by low utterances, slurring, iteration, dysarthria, perseveration, or any combination of these. Typically, the individual’s movements are dominated by restlessness and trembling.

**mutual exclusivity assumption** in language development, the tendency of children to suppose that an object has only one category label. If a child already knows a label for a whole object and hears a novel label applied, the assumption of mutual exclusivity will block the possibility that the novel label refers to the whole object. The child will then consider other possible referents of the novel label, such as a part of the object. Compare taxonomic assumption; whole object assumption.

**mutual gaze** see eye contact.

**mutual help** a form of self-help that is not professionally guided and that involves joining with others similar to
mutualism

one'self to explore ways to cope with life situations and problems. Mutual help can occur in person, by telephone, or through the Internet.

mutualism n. an interaction in which two species live together in close association, to the mutual benefit of both. See also SYMBIOSIS. Compare COMMENSALISM; PARASITISM.

mutuality n. 1. the tendency of relationship partners to think of themselves as members of a DYADIC RELATIONSHIP rather than as distinct individuals. As close relationships, particularly romantic ones, develop over time, partners display increasing levels of mutuality, which may influence their affect, cognition, and behavior. For example, when mutuality is high, people tend to think of their partners' characteristics and resources as their own. 2. in INTERDEPENDENCE THEORY, the tendency of partners to depend equally on each other's behavior for the attainment of desirable outcomes. In asymmetric relationships, one partner plays a larger role than the other in determining what outcomes each partner receives, but in relationships characterized by mutuality, their power and influence are approximately equivalent.

mutually exclusive events. two or more events that have no common elements. See also DISJOINT SETS. 2. in probability theory, two or more events that cannot co-occur: The occurrence of one precludes the simultaneous or subsequent occurrence of the other(s). For example, the alternatives "heads" and "tails" in a single toss of a coin are mutually exclusive events.

mutual masturbation 1. sexual activity in which two individuals stimulate each other's genitals at the same time for the purpose of sexual gratification. This is more properly considered a type of PETTING BEHAVIOR, as masturbation is defined as self-stimulation. 2. sexual activity in which two or more individuals stimulate their own genitals while jointly viewing erotic materials.

mutual pretense an interaction pattern in which all participants try to act as if they are unaware of the most crucial facts in a situation (e.g., a situation in which one of the participants is terminally ill). This pattern is often regarded by therapists and researchers as an anxiety-driven strategy that inhibits communication, increases tension, and leads to missed opportunities for meaningful mutual support. [First described in Awareness of Dying (1965) by U.S. sociologists Barney G. Glaser (1930– ) and Anselm L. Strauss (1916–1996)]

mutual reward theory see REWARD THEORY.

mutual storytelling technique a PLAY THERAPY technique for communicating metaphorically with children. The therapist instructs a child to tell a fictional story that has a moral or lesson and then assesses the feelings and conflicts communicated in the story. The therapist then makes up a similar story but attempts to introduce a more adaptive resolution to the conflict in the story. [Developed by U.S. psychiatrist Richard A. Gardner (1931–2003)]

mutual support group a group composed of individuals who meet on a regular basis to help one another cope with a shared life problem. This term is sometimes used by researchers and practitioners instead of the traditional term SELF-HELP GROUP, as it emphasizes the mutual, interdependent nature of self-help group processes.

myasthenia n. muscular weakness or lack of muscular endurance.

myasthenia gravis an autoimmune disorder (see AUTOIMMUNITY) in which the body produces antibodies against ACETYLCHOLINE RECEPTORS, causing faulty transmission of nerve impulses at neuromuscular junctions. Affected muscles—initially those of the face and neck—are easily fatigued and may become paralyzed temporarily (e.g., muscles involved in eating may fail to function normally toward the end of a meal, speech may become slurred after a period of talking). The disease is progressive, eventually affecting muscles throughout the body.

mydriasis n. excessive dilation (widening) of the pupil of the eye caused by anticholinergic drugs (e.g., atropine and scopolamine) acting on NICOTinic RECEPTORS or by opioid withdrawal. —mydriatic adj., n.

myel- combining form see MEYelo-.

myelencephalon n. see MEDULLA OBLONGATA.

myelin n. the substance that forms the insulating sheath around the axons of many neurons. It consists mainly of phospholipids, with additional myelin proteins, and accounts for the whitish color of WHITE MATTER.

myelinated fiber a nerve fiber that is covered by a MYELIN SHEATH. The insulating properties of the myelin sheath enable myelinated fibers to conduct nerve impulses much faster than nonmyelinated fibers (see SALTATORY CONDUCTION).

myelination n. the formation and development of a MYELIN SHEATH around the axon of a neuron, which is effected by neuroglia, such as SCHWANN CELLS. Researchers look to anomalies in this process to explain some forms of severe mental illness (e.g., schizophrenia). Also called axonal myelination; medullation: myelinization.

myelin sheath the insulating layer around many axons that increases the speed of conduction of nerve impulses. It consists of myelin and is laid down by GLIA, which wrap themselves around adjacent axons. The myelin sheath is interrupted by small gaps, called NODES OF RANVIER, which are spaced about every millimeter along the axon. Also called medullary sheath.

myelitis n. inflammation of the spinal cord.

myelo- (myel-) combining form spinal cord or bone marrow.

myeloarchitecture n. the development and distribution of the fiber processes of the nerve cells of the brain, particularly the myelinated fibers. See also CORTICALLAYERS.

myeloclele n. protrusion of the nerve cells of the brain, particularly the myelinated fibers. See also MENINGOCELE.

myelomeningocele n. see MENINGOMYELOCELE.

myenteric plexus a network of nerve fibers and neuron cell bodies located between the inner and outer muscle layers of the digestive tract, including the esophagus, stomach, and intestines. Together with other enteric plexuses, it controls the responses of the digestive tract.

Myers–Briggs Type Indicator (MBTI) a personality test designed to classify individuals according to their expressed choices between contrasting alternatives in certain categories of traits. The categories, based on JUNGIAN TYPOLOGY, are (a) Extraversion–Introversion, (b) Sensing–In-
tuitition, (c) Thinking–Feeling, and (d) Judgment–Perceiving.

The participant is assigned a type (e.g., INTJ, ESFP), according to the pattern of choices made. The test has little credibility among research psychologists but is widely used in educational counseling and human resource management to help improve work and personal relationships, increase productivity, and identify interpersonal communication preferences and skills. [Isabel Briggs Myers (1897–1980), U.S. personologist, and her mother Katharine Cook Briggs (1875–1968)]

**myesthesia** n. the muscle sense; that is, the sensation felt in muscle contractions and the awareness of movement in muscles and joints. See also KINESIS.

myo- (my-) combining form muscle.

**myocardial infarction** see INFRction.

myoclonic adj. of, relating to, or characterized by MYOCLONUS.

myoclonic epilepsy epilepsy characterized by MYOCLONIC SEIZURES or MYOCLONUS in conjunction with other types of seizure. Also called myoclonus epilepsy.

myoclonic movements movements characterized by rapid, involuntary muscle jerks.

myoclonic seizure a rare type of GENERALIZED SEIZURE characterized by rapid, involuntary muscle jerks.

myoclonus n. rapid, involuntary contraction of a muscle or group of muscles. This may occur normally, as when a limb or other part of the body suddenly jerks while falling asleep (see NOCTURNAL MYOCLOUS), or abnormally, as in CRUTZFELDT–JAKOB DISEASE and other neurological disorders.

**myoclonus epilepsy** see MYOCLONIC EPILEPSY.

**myoelectric prosthesis** an artificial limb (see PROSTHESIS), such as a myoelectric arm, that can be manipulated by nerve impulses generated by voluntary muscle movements. The nerve impulses are received by an electronic transducer that amplifies and converts them into appropriate movements of the prosthesis through tiny electric motors.

**myofascial pain syndrome (MPS)** see CHRONIC MYOFASCIAL PAIN.

**myography** n. a technique that utilizes apparatus to record aspects of muscle activity. Some devices record the small electric potential that accompanies contraction of the muscle fibers. A myograph is an instrument that records the extent, force, or duration of ISOTONIC CONTRACTIONS or the tension and duration of ISOMETRIC CONTRACTIONS. A myogram is a graphic record of the velocity and intensity of muscle contractions. —myographic adj.

**myoneural junction** see NEUROMUSCULAR JUNCTION.

myopathy n. any disease or disorder of the muscles, hereditary or acquired. The term is usually qualified by an adjective that specifies the type of myopathy or its cause. For example, ACUTE ALCOHOLIC MYOPATHY and hereditary myopathy suggest a cause, whereas ocular myopathy defines the affected area as the muscles that control eye movements, and neuromyopathy refers to a disorder of the nerves and muscles combined.

myopia n. nearsightedness, a REFRACTIVE ERROR due to an abnormally long eye: The retinal image is blurred because the focal point of one or both eyes lies in front of, rather than on, the retina. Specific types include chronic myopia, marked by defective color perception of distant objects: progressive myopia, a gradual loss of accommodation for distant vision associated with aging; and prodromal myopia, in which accommodation changes permit a return of normal sightedness after a period of myopia. Compare EMETROPIC; HYPEROPIC.

**myosin** n. see MUSCLE FIBER.

**myosis** n. see MYOSIS.

myositis n. inflammation of a muscle.

**myotatic reflex** see STRETCH REFLEX.

myotonia n. increased tone and contractility of a muscle, with slow or delayed relaxation. —myotonic adj.

myotonic disorder any disease, generally inherited, in which voluntary muscles show increased tone and contractility but relax slowly and with great difficulty. The condition often affects the muscles of the hands or is manifested by general muscle stiffness.

**myotonic muscular dystrophy** a type of MUSCULAR DYSTROPHY marked by increased muscle tone and contractility (myotonia) and muscle wasting, most noticeably in the face and hands, and often accompanied by cataracts and cardiac abnormalities. It is an autosomal dominant disorder (see DOMINANT ALLELE) that is usually first noted in adolescence or early adulthood, although age of onset can vary. Also called dystrophia myotonica: Steinert’s disease.

**myriachit** n. a CULTURE-BOUND SYNDROME found in Siberian populations. Similar to LATAH, it is characterized by indiscriminate, apparently uncontrolled imitations of the actions of other people encountered by the individual. Also called ikota; irkunii; menkeiti: alan. See also IMU; JUMPING FRENCHMEN OF MAINE SYNDROME.

**Mysoline** n. a trade name for PRIMIDONE.

**mysophilia** n. a pathological interest in dirt or filth, often with a desire to be unclean or in contact with dirty objects. Myophilia may be expressed as a PARAPHILIA in which the person is sexually aroused by a dirty partner.

**mytical participation** a mode of engagement or type of mental activity in which the boundaries between the natural and the spiritual, and between oneself and one’s environment, are either overcome or not established in the first place. The term was introduced by French philosopher and ethnologist Lucien Levy-Bruhl (1857–1939), who held that mystical participation is a characteristic of so-called primitive cultures.

**mysticism** n. 1. the view that there are real sources of knowledge and truth other than sensory experience and rational deduction. It is held that such knowledge comes through inspiration, revelation, or other experiences that are not strictly sensory, although there may be a sensory component. A common implication is that such knowledge cannot readily be shared with or conveyed to others but must be individually achieved. Mysticism thus carries a connotation of subjectivism. 2. the belief that an immediate knowledge of, or union with, the divine can be achieved through personal religious experience. Accounts of mystical experiences in the writings of various spiritual tradi- tions typically describe a state of intense, trance-like contemplation in which a sense of profound insight is accompanied by feelings of ecstatic self-surrender. —mystic n., adj. —mystical adj.
**mystic union** the feeling of spiritual identification with God, nature, or the universe as a whole. See BUDDHISM; OCEANIC FEELING; TRANSCENDENTAL MEDITATION; YOGA; ZEN THERAPY.

**Mytelase** n. a trade name for AMBENONIUM.

**mythology** n. 1. a body of traditional stories (myths) associated with the early history of a particular culture. Such stories generally involve supernatural beings and events and often seek to explain particular natural or cultural phenomena (e.g., the cycle of the seasons, a specific custom) in terms of their supposed origins. Myths are often distinguished from LEGENDS as having little or no basis in historical events. 2. the study of myths. Sigmund FREUD compared myths to DREAMS, which contain hidden meanings, and believed they throw unique light on the cultures from which they stem, and in some instances, as in the myth of Oedipus, on human nature in general. 3. in Carl JUNG’S ANALYTIC PSYCHOLOGY, primordial images, or archetypes, that are stored in the collective unconscious. —mythological adj.

**mythomania** n. 1. a tendency to elaborate, exaggerate, and tell lies, including reports of imagined experiences, often involving self-deception. See also FACTITIOUS DISORDER; PATHOLOGICAL LYING. 2. an abnormal interest in myths, in which the individual may believe fantasy to be reality, and a tendency to fabricate incredible stories. Also called pseudologia fantastica.

**myxedema** n. a metabolic disorder that develops in adulthood due to a deficiency of thyroid hormone (see HYPOTHYROIDISM). The condition is characterized by subnormal heart rate, circulation, body temperature, and most other metabolic activities. Affected individuals tend to be fatigued, listless, and overweight but usually respond to administration of thyroxine. —myxedemic adj.

**MZ twins** abbreviation for MONOZYGOTIC TWINS.
n 1. symbol for the number of scores or observations obtained from a particular experimental condition or subgroup. 2. symbol for REFRACTIVE INDEX.

N abbreviation for NUMERICAL ABILITY.

N symbol for the total number of cases (participants) in an experiment or study.

N1 component the first negative component of an EVENT-RELATED POTENTIAL, occurring approximately 100 ms after stimulus onset. The N1 component is usually larger for attended stimuli than for unattended stimuli, a phenomenon known as the N1 attention effect. Hence, it is thought to reflect the initial sensory and attentional processing of a stimulus by specific areas of the cerebral cortex.

N=1 design see SINGLE-CASE DESIGN.

NA 1. abbreviation for NARCOTICS ANONYMOUS. 2. abbreviation for Negative Affect within the POSITIVE AND NEGATIVE AFFECT SCHEDULE.

NAB abbreviation for NEUROPSYCHOLOGICAL ASSESSMENT BATTERY.

nabiblone n. a synthetic cannabinoid, closely related to TETRAHYDROCANNABINOL, that is used clinically to manage nausea and vomiting in patients recovering from surgical anesthesia or undergoing chemotherapy. U.S. and Canadian trade name: Cesamet.

n-Ach abbreviation for NEED FOR ACHIEVEMENT.

nAChR abbreviation for NICOTINIC RECEPTOR.

nadle n. see TWO-SPIRIT.

NAEP abbreviation for NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS.

Nafe pattern theory a theory claiming that the pattern of firing of neurons is responsible for the quality of cutaneous sensations. [John Paul Nafe (1886–1970), U.S. psychologist]

n-Aff abbreviation for NEED FOR AFFILIATION.

Naglieri Nonverbal Ability Test (NNAT) a test of nonverbal reasoning and problem-solving ability for students in kindergarten through Grade 12, regardless of language and educational or cultural background. It consists of 38 abstract matrix designs measuring pattern completion, reasoning by analogy, serial reasoning, and spatial visualization. The test can be used to screen for learning disabilities or as an assessment tool for students who lack verbal skills, have English only as a second language, or possess limited English abilities. An extension and modification of the 1985 Matrix Analogies Test, the NNAT was originally developed in 1997. The second edition, NNAT2, was released in 2007. [Jack A. Naglieri (1950– ), U.S. psychologist]

naikin n. a Japanese therapy that emphasizes character building through rigorous self-reflection upon (a) what the client has received from others, (b) what the client has returned to others, and (c) how the client’s actions may have hurt others. Through this process of self-reflection, guided by the therapist, the client acquires a sense of responsibility for his or her actions and an appreciation of the positive influences in his or her life. [introduced by Japanese Buddhist of the Jodo Shinshu sect Yoshimoto Ishin (1916–1988)]

nail biting the compulsive habit of chewing on one’s fingernails, usually thought to be a means of releasing tension.

naive analysis of action in Attribution Theory, a process of reasoning or intuiting by which laypersons determine whether another person (an “actor”) caused a certain action. Also called lay psychology; naive psychology. See CORRESPONDENT INERENCE THEORY. [postulated in 1958 by Fritz Heider]

naive hedonism see PRECONVENTIONAL LEVEL.

naive observer 1. an observer who has little or no prior information about the events that he or she is observing or the people involved in them. In psychology experiments, the reactions of a naive observer may be highly revealing when contrasted with those of other observers who have been given selected pieces of information (or misinformation) about the observed situation or the actors in it (e.g., that a particular individual has a criminal conviction). 2. in philosophy; an observer who adopts a position of NAIVE REALISM.

naive participant a participant who has not previously taken part in a particular research study and has not been made aware of the experimenter’s hypothesis.

naive personality theories a set of ideas that laypeople tend to hold about how specific personality traits cluster together within a person. Such theories, which are often held implicitly rather than explicitly, are a major concern of Attribution Theory. Also called implicit personality theories: layperson personality theories. See NAIVE ANALYSIS OF ACTION. See also IMPLICIT SELF THEORY.

naive psychology see NAIVE ANALYSIS OF ACTION.

naive realism 1. the belief or assumption that one’s sense perceptions provide direct knowledge of external reality; unconditioned by one’s perceptual apparatus or individual perspective. Since the advent of CARTESIANISM, most philosophy has assumed that such a position is untenable. The cognitive development theory of Jean Piaget stresses the child’s progress away from naive realism and toward conceptualization and logical reasoning. As conceptualization and reasoning develop, naive realism is presumed to diminish. Also called direct realism; phenomenal absolutism. 2. in social psychology, the tendency to assume that one’s perspective of events is a natural, unbiased reflection of objective reality and to infer bias on the part of anyone who disagrees with one’s views. See FALSE-CONSENSUS EFFECT.

Nalline test a test to determine abstinence from opiates, in which the subject is given an injection of the opioid ANTAGONIST nalorphine (Nalline). This precipitates with-
nalnepene

drawal symptoms if opiates have been used recently. It is not currently in general use.

**nalnepene** _n._ see OPIOID ANTAGONIST.

nalorphine _n._ see OPIOID ANTAGONIST.

naloxone _n._ a morphine-derived OPIOID ANTAGONIST that prevents the binding of opioids to OPIOID RECEPTORS, having primary activity at the mu opioid receptor. Like other opioid antagonists, it can quickly reverse the effects of opioid overdose and is useful in emergency settings to reverse respiratory depression. It has poor oral and sublingual bioavailability and must be dosed parenterally (U.S. trade name: Narcan). In combination with BUPRENORPHINE, it is used as an alternative to METHADONE MAINTENANCE THERAPY (U.S. trade name: Suboxone).

naltrexone _n._ an OPIOID ANTAGONIST that, like the shorter-acting NALOXONE (but with better enteral bioavailability), prevents the binding of opioid agonists to opioid receptors. Accordingly, both drugs may precipitate a rapid withdrawal syndrome. If naltrexone is taken prior to use of opiate drugs, it will prevent their reinforcing effects and can therefore be used for the management of opioid dependence in individuals desiring abstinence. Naltrexone is also appropriate as an adjunctive treatment in the management of alcoholism, either in oral or in long-term injectable formulations. The long-term injectable is also approved for opioid dependence. U.S. trade name: ReVia; Vivitrol.

**name-of-the-father** _adj._ in the theory of French psychoanalyst Jacques Lacan (1901–1981), denoting the stage at which the infant first enters the realm of the SYMBOLIC. The child’s ability to “name the father” as a symbol for the absence of the mother represents his or her first use of symbolization and the first recognition that the father is a rival. See OEDIPUS COMPLEX. See also MIRROR PHASE.

NAMI abbreviation for NATIONAL ALLIANCE ON MENTAL ILLNESS.

**naming** _n._ an association disturbance observed in schizophrenia, in which the individual relates to the external world solely by naming objects and actions (e.g., naming furniture or other objects in an examining room).

**naming explosion** a stage in language development, usually occurring during a child’s 2nd year, when a marked increase occurs in the rate at which new words are added to the child’s productive vocabulary. This stage marks a change in the cognitive and linguistic underpinnings of children’s language use: It indicates their increased understanding that words are symbols that refer to actual things in the world, and it is thought to explain why nouns in particular are acquired at a rapid rate. Also called VOCABULARY SPURT: WORD SPURT.

**naming task** a task in which an individual is required to name an object from its picture or its description or simply to produce names from a certain category (e.g., birds). Naming tasks are used to assess language impairments and difficulties recalling general knowledge from SEMANTIC MEMORY.

**nanometer** (symbol: nm) _n._ $10^{-9}$ m (i.e., one billionth of a meter). The wavelengths in the visible range of the electromagnetic spectrum extend from approximately 400 to 700 nm.

**nanosomia body type** see PYGMIISM.

Narcan _n._ a trade name for NALOXONE.

**narcissism** _n._ 1. excessive self-love or egocentrism. 2. in psychoanalytic theory, the taking of one’s own ego or body as a sexual object or focus of the LIBIDO or the seeking or choice of another for relational purposes on the basis of his or her similarity to the self. See BODY NARCISISM; PRIMARY NARCISISM; SECONDARY NARCISISM. —narcissist _n._ —narcissistic _adj._

**narcissistic character** see NARCISSISTIC PERSONALITY.

**narcissistic object choice** in psychoanalytic theory, selection of a mate or other love object similar to oneself. Compare ANALYTIC OBJECT CHOICE.

**narcissistic personality** a pattern of traits and behaviors characterized by excessive self-concern and overevaluation of the self. Also called NARCISSISTIC CHARACTER.

**narcissistic personality disorder** in DSM–IV–TR and DSM–5, a personality disorder with the following characteristics: (a) a long-standing pattern of grandiose self-importance and an exaggerated sense of talent and achievements; (b) fantasies of unlimited sex, power, brilliance, or beauty; (c) an exhibitionistic need for attention and admiration; (d) either cool indifference or feelings of rage, humiliation, or emptiness as a response to criticism, indifference, or defeat; and (e) various interpersonal disturbances, such as feeling entitled to special favors, taking advantage of others, and inability to empathize with the feelings of others. [originally formulated by psychoanalysts Wilhelm Reich (1897–1957), Otto Kernberg (1928– ), and Heinz Kohut (1913–1981) and psychologist Theodore MILLON]

**Narcissistic Personality Inventory** (NPI) a forced-choice self-report instrument commonly used in social psychological research on self-love and egocentrism (i.e., NARCISSISM). Although several forms of the NPI exist, each with different numbers of items and different underlying factor structures, the most popular version is that developed in 1988 by psychologists Robert N. Raskin and Howard Terry, consisting of 40 dyadic statements intended to reflect narcissistic sentiments (e.g., “I am embarrassed by compliments” vs. “I enjoy compliments”; “I am average” vs. “I am special”). An individual chooses from each pair of statements the one that best describes him or her, and the pattern of responses is believed to reveal the degree to which the person possesses each of the following seven characteristics: authority, entitlement, exhibitionism, exploitativeness, self-sufficiency, superiority, and vanity. These traits represent a mix of adaptive and maladaptive attributes that reflect one’s capacity to maintain a positive self-image and sense of personal agency. The original NPI—developed in 1979 by Raskin and U.S. psychologist Calvin S. Hall (1909–1985)—was designed as a research instrument to evaluate individual differences in narcissism in the general (i.e., nonclinical) population. It was not intended, nor are subsequent versions of the NPI intended, as a diagnostic assessment tool for NARCISSISTIC PERSONALITY DISORDER.

**narcissistic transference** in SELF PSYCHOLOGY, any one of a set of transf erences that involve, and are used in treatment to activate, the narcissistic needs of the patient in relation to significant others; this contrasts with the classical psychoanalytic concept of transference as a transposition of one’s needs (from various stages of PSYCHO-SEXUAL DEVELOPMENT earlier in life) to a person who can fulfill them. Narcissistic transferences include IDEALIZING TRANSFERENCE, MIRROR TRANSFERENCE, and TWINSHIP TRANSFERENCE.
narratophilia

TRANSFERENCE. Also called self-object (or selfobject) transference. [first described by Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981)]
narcissistic type see LIBIDINAL TYPES.
narcoanalysis n. a form of psychoanalysis in which injections of drugs (often opioids) are used to induce a semi-hypnotic state in order to facilitate exploration and ventilation of feelings, uncover repressed traumatic memories, and, through the analyst’s review and interpretation with the patient afterward, promote the patient’s insight into the unconscious forces that underlie his or her symptoms. The technique was developed initially to treat COMBAT STRESS REACTIONS in the 1940s and is rarely if ever used now.
narcolepsy n. a disorder consisting of excessive daytime sleepiness accompanied by brief “attacks” of sleep during waking hours. These sleep attacks may occur at any time or during any activity, including in potentially dangerous situations such as while driving an automobile. The attacks are often associated with HYPNAGOGIC hallucinations, SLEEP PARALYSIS, and CATAPLEXY and are marked by immediate entry into REM sleep without going through the usual initial stages of sleep. Also called paroxysmal sleep.
—narcoleptic adj.
narcolepsy–cataplexy syndrome a symptom pattern consisting of sudden, repeated loss of muscle tone (see CATAPLEXY) and recurrent sleep attacks (see NARCOLEPSY).
narcomania n. 1. a pathological desire for narcotic drugs to relieve pain or discomfort. 2. an obsolete name for narcotic dependence.
narcosynthesis n. a treatment technique that involves the administration of narcotic drugs to stimulate recall of emotional traumas, followed by “synthesis” of these experiences with the patient’s emotional life through therapeutic discussions in the waking state. [developed during World War II by U.S. psychiatrists Roy Richard Grinker (1901–1993) and John P. Spiegel (1911–1991)]
narcotization n. psychotherapy conducted while the patient is in a semi-conscious state induced by narcotic drugs, such as amobarbital (Amytal) or thiopental. For example, narcotization was used with individuals experiencing COMBAT STRESS REACTIONS during and after World War II. See also NA, NARCOMANIA, NARCOSYNTHESIS.
narcotic 1. n. originally, any drug that induces a state of stupor or insensibility (narcosis). More recently, the term referred to strong opioids used clinically for pain relief, but this usage is now considered imprecise and pejorative: the term is still sometimes used in legal contexts to refer to a wide variety of abused substances. 2. adj. of or relating to narcotics or narcosis.
narcotic agonist see OPIOID AGONIST.
narcotic analgesic see OPIOID ANALGESIC.
narcotic antagonist see OPIOID ANTAGONIST.
narcotic dependence see OPIOID DEPENDENCE.
Narcotics Anonymous (NA) a self-help organization for those who seek assistance with a drug addiction, based on a TWELVE-STEP PROGRAM and modeled after ALCOHOLICS ANONYMOUS. The only requirement for membership is the desire to stop using addictive drugs.
narcotic stupor a state of lethargy or limited mobility and decreased responsiveness to stimulation due to the effects of an opioid drug. This state may border on loss of consciousness and may be followed by coma in extreme cases.
Nardil n. a trade name for PHENELZINE.
NARHC abbreviation for NATIONAL ASSOCIATION OF RURAL HEALTH CLINICS.
narrative analysis a type of QUALITATIVE ANALYSIS in which a researcher collects and examines stories from individuals about a variety of concrete life situations, ranging from first romantic involvements to divorce, aging, and life satisfaction. The goal is to understand how individuals experience certain events, structure them into coherent sequences, and give them subjective meaning. Also called narrative inquiry; narrative research.
narrative method 1. a method of questioning eyewitnesses to an event that reconstructs the event using both the known facts and personal accounts of the experience. 2. a method of presenting either opening or closing arguments to the jury in a way that tells a story, with events placed in chronological order and including vivid details. See also STORY MODEL.
narrative inquiry: narrative research.
narrative therapy a field in psychology that investigates the value of stories and storytelling in giving meaning to individuals’ experiences—shaping their memory of past events, their understanding of the present, and their projections of future events—and in defining themselves and their lives. The term was introduced by Theodore R. SARBIN, whose edited volume Narrative Psychology. The Storied Nature of Human Conduct (1986) defined narrative as an integral feature in the scientific enterprise: he referred to narrative as a “root metaphor” for psychology—that is, a metaphor for examining and interpreting human behavior. Numerous other people in personality and social psychology, memory research, and other areas of inquiry have subsequently contributed to this field.
narrative theory a theoretical approach to the study of narratives and their structures. Narrative theory emerged as a branch of literary studies but has since been extended to various questions in psychology, notably the ways in which established narratives can shape our social and subjective experiences. See also DISCOURSE ANALYSIS.
narrative therapy treatment for individuals, couples, or families that helps them reinterpret and rewrite their life events into true but more life-enhancing narratives or stories. Narrative therapy posits that individuals are primarily meaning-making beings who are the linguistic authors of their lives and who can reauthor their life stories by learning to deconstruct them, by seeing patterns in their ways of interpreting life events or problems, and by reconstruing problems or events in a more helpful light. See also CONSTRUCTIVISM; CONSTRUCTIVIST PSYCHOTHERAPY; DECONSTRUCTION.
narratophilia n. sexual interest and arousal obtained from speaking or hearing sexually explicit words during sexual activity. It most commonly occurs in telephone or online computer sex, in which partners talk or write while masturbating. There are commercial services that employ people to engage in narratophilia with clients for a fee. In some cases of narratophilia, however, people prefer to make obscene phone calls to strangers or randomly selected numbers, as the involvement of a nonconsenting person adds to their pleasure. —narratophile n.
NAS abbreviation for NATIONAL ACADEMY OF SCIENCES.

nasal 1. adj. of or relating to the nose. 2. adj. denoting a speech sound produced by letting all or most of the airstream pass through the nasal (rather than the oral) cavity; for example, [n]g in sing, or the sound of -on in the French wordbon. 3. n. a nasal speech sound.

nasal cavity the space within the nose, divided into two halves by the nasal septum, that communicates with the exterior via the two nostrils and leads to the NASOPHARYNX. Separated from the oral cavity by the hard palate, it is lined with mucous membrane containing OLFACTORY EPITHELIUM and also forms part of the VOCAL TRACT.

NASA Task Load Index (NASA TLX) a subjective rating procedure that enables raters to assess the total workload of operatives in a variety of HUMAN–MACHINE SYSTEMS. An overall workload score is derived from a weighted average of ratings on six subscales: mental demands, physical demands, temporal demands, own performance, effort, and frustration.

nasopharynx n. the portion of the PHARYNX that lies above the level of the SOFT PALATE. The nasopharynx is closed off from other parts of the pharynx during swallowing and speaking by reflex raising of the soft palate.

NASPSPA abbreviation for NORTH AMERICAN SOCIETY FOR THE PSYCHOLOGY OF SPORT AND PHYSICAL ACTIVITY.

NASW abbreviation for NATIONAL ASSOCIATION OF SOCIAL WORKERS.

natality n. see BIRTH RATE.

National Academy of Sciences (NAS) a private, nonprofit society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for general welfare. Its headquarters are in Washington, DC. The NAS was founded by the U.S. Congress in 1863 and expanded to include the National Research Council in 1916, the National Academy of Engineering in 1964, and the Institute of Medicine in 1970. Collectively, the four organizations are known as the National Academies.

National Alliance on Mental Illness (NAMI) a network of SELF-HELP GROUPS that provides emotional and educational support for relatives and individuals affected by mental illness. As an organization, NAMI also advocates for better access to mental health services and for mental health research. Formerly called National Alliance for the Mentally Ill.

National Assessment of Educational Progress (NAEP) a set of assessments conducted periodically of U.S. students’ knowledge of mathematics, reading, science, writing, the arts, civics, economics, geography, U.S. history, and technology and engineering. The results are based on a representative sample of students in Grades 4, 8, and 12 for the main assessments and at ages 9, 13, or 17 years for long-term trend assessments. These grades and ages were chosen because they represent critical junctures in academic achievement. Aggregate scores are provided for subject-matter achievement, instructional experiences, and school environment for populations of students (e.g., all fourth graders) and groups within those populations (e.g., female students, Hispanic students) but not for individual students or schools. The largest nationally representative and continuing assessment of its kind, NAEP is intended to provide a clear picture of academic progress across all states and in selected urban districts over time.

National Association of Rural Health Clinics (NARHC) an organization that seeks to promote, expand, improve, and protect the delivery of quality, cost-effective health care services in underserved rural areas. NARHC actively engages in the legislative and regulatory process with the U.S. Congress, federal agencies, and rural health organizations.

National Association of Social Workers (NASW) the world’s largest organization of professional social workers. Founded in 1955, NASW is dedicated to promoting the professional development of its members and setting ethical and professional standards of practice. The organization’s certification programs are the ACADEMY OF CERTIFIED SOCIAL WORKERS and the Diplomate in Clinical Social Work. Chief among its publications is the journal Social Work.

national character the general personality characteristics attributed to the people of a nation. Although culture has a recognized effect on character formation, the idea of a national character is not generally considered a useful construct, as it invariably consists of an unexamined STEREOTYPE. See also CULTURAL DETERMINISM.

National Chronic Fatigue Syndrome and Fibromyalgia Association (NCFSEA) an organization, headquartered in Kansas City, Missouri, with the goal of providing information and educating the public about chronic fatigue syndrome, fibromyalgia syndrome, and related disorders.

National Committee for Quality Assurance (NCQA) a national nonprofit organization, founded in 1990, that reviews and accredits MANAGED CARE plans and measures the quality of care offered by them.

National Eating Disorders Association (NEDA) a nonprofit organization headquartered in Seattle, Washington, that provides education, support groups, and other assistance to individuals with eating disorders, their family members, and their friends. Formed in 2001 from the merger of the American Anorexia/Bulimia Association and Eating Disorders Awareness and Prevention, Inc., NEDA seeks to promote research into and enhance the prevention and treatment of eating disorders. Its many activities include holding an annual conference; conducting public outreach and other media campaigns; developing and distributing toolkits for educators, parents, and other individuals; operating a nationwide information and referral helpline; and advocating for policy change.

National Health Interview Survey (NHIS) a questionnaire that is the principal source of information on the health of the civilian noninstitutionalized population of the United States and one of the major data-collection programs of the National Center for Health Statistics (NCHS). The survey includes core questions and sometimes questions relating to specific initiatives (e.g., aging, healthy people, AIDS).

National Institute of Mental Health (NIMH) an agency of the federal government established in 1949 to improve understanding of the mind, the brain, and behavior and reduce the burden of mental illness through research. It is committed to scientific programs to educate and train future mental health researchers, including those in molecular science, cognitive and affective neuro-
science, and other disciplines required for the study of mental illness and the brain.

nationalism  n. 1. strong, often excessive, feelings of pride in and allegiance to one’s nation (usually the nation in which one is a citizen, although sometimes a nation with which one has ties via ETHNICITY or HERITAGE) and its culture or belief in its superiority. 2. a goal or policy of national independence, especially in relation to a dominant colonial or occupying power. —nationalist n., adj. —nationalistic adj.

National Labor Relations Act legislation passed by the U.S. Congress in 1935 that legalized the rights of employees to form and operate unions, engage in COLLECTIVE BARGAINING, and strike. It also identified and prohibited certain UNFAIR LABOR PRACTICES of employers and created the National Labor Relations Board to administer and enforce the provisions of the act. Sponsored by German-born U.S. politician Robert F. Wagner (1877–1953), it is also known as the Wagner Act. See also LABOR MANAGEMENT RELATIONS ACT.

National Mental Health Association (NMHA) the former name for MENTAL HEALTH AMERICA.

National Parent Teachers Association (NPTA) see PARENT TEACHERS ASSOCIATION.

National Practitioner Data Bank (NPDB) a computerized database, established through Title IV of Public Law 98-660 (the Health Care Quality Improvement Act of 1986) and maintained and operated by the U.S. Department of Health and Human Services, that contains information on physicians and other health care professionals against whom MALPRACTICE claims have been paid or certain disciplinary actions taken. The database is primarily an alert or flagging system intended to facilitate a comprehensive review of health care practitioners’ professional credentials.

National Register of Health Service Providers in Psychology a national, nonprofit CREDENTIALING organization for professional psychologists, founded in 1974 to advance psychology as a profession and improve the delivery of health services to the public.

National Research Council see NATIONAL ACADEMY OF SCIENCES.

National Science Foundation (NSF) an independent agency of the U.S. government, established by the National Science Foundation Act of 1950. Its mission is to promote the progress of science; to advance national health, prosperity, and welfare; and to secure the defense of the nation. Activities that fall within its purview include the initiation and support of scientific and engineering research; exchange of information among scientists; technological development; distribution of federal monies to universities and other research organizations; and political advocacy for national policies and research in science and engineering.

native adj. see INNATE.

Native American a member of any of various indigenous peoples of the western hemisphere whose ancestors populated that territory prior to European colonization. When referring to the indigenous peoples of North America, the term AMERICAN INDIAN is also used.

native speaker a person who speaks a particular language as a mother tongue rather than as a second or foreign language.

nativism  n. 1. the doctrine that the mind has certain innate structures and that experience plays a limited role in the creation of knowledge. See also NATIVE IDEAS; NATIVISTIC THEORY. Compare CONSTRUCTIVISM; EMPIRICISM. 2. the doctrine that mental and behavioral traits are largely determined by hereditary, rather than environmental, factors. See NATURE–NURTURE. 3. the theory that individuals are born with all perceptual capabilities intact, although some capabilities may depend on the biological maturation of perceptual systems to reach adult levels. —nativist adj., n. —nativistic adj.

nativistic theory in linguistics, the theory that human beings are born with an innate knowledge of language that enables them to structure and interpret the data they encounter as language learners. Although certain theories about the origins of human language in prehistory have been termed nativistic (see LANGUAGE-ORIGIN THEORY), the term is now mainly associated with Noam CHOMSKY’s theory of language acquisition in young children. See LANGUAGE ACQUISITION DEVICE; LANGUAGE UNIVERSAL.

natural category see BASIC-LEVEL CATEGORY.

natural child 1. a biological offspring of a parent, in contrast to an adopted child. 2. one of the child ego states in TRANSACTIONAL ANALYSIS, characterized as carefree, fun-loving, creative, impulsive, and impatient. Compare ADAPTED CHILD.

natural childbirth a method of labor and child delivery that does not include (or is designed to eliminate) the need for medical interventions, such as anesthesia. The mother receives preparatory education in areas such as breathing and relaxation coordination, exercise of the muscles involved in labor and delivery, and postural positions that make labor more comfortable and allow for conscious participation in delivery. See also LAMAZE METHOD.

natural consequences a form of discipline in which parents do not intervene in their children’s actions but let the results of the actions serve as a punishment or lesson. For example, a lesson is learned by children when a toy they have failed to bring indoors during a rainstorm is ruined.

natural experiment the study of a naturally occurring situation as it unfolds in the real world. The researcher does not exert any influence over the situation but rather simply observes individuals and circumstances, comparing the current condition to some other condition. For example, an investigator might evaluate the influence of a new community policing program by observing neighborhood activities after it has been implemented and comparing the outcome to that for neighborhoods in which the policy has not been implemented. Since such real-life events cannot be manipulated or prearranged, natural experiments are QUASI-EXPERIMENTAL DESIGNS rather than true experiments. Also called naturalistic design; naturalistic research.

natural family planning avoiding pregnancy by the use of natural techniques of birth control, such as the RHYTHM METHOD, as opposed to the use of oral contraceptives, intrauterine devices, diaphragms, and similar methods.

natural fertility in physiology, the reproductive capacity of animals; in humans specifically, the reproductive ca-
natural group

N

pacity when unaffected by contraception or induced the behavior of chimpanzees and a developmental psychologist’s observation of playing children. Compare analogue
abortion.
observation; self-monitoring observation; structured
natural group 1. any group formed through natural so- observation.
cial processes, particularly when compared to ad hoc laboratory groups created by researchers in their studies of naturalist intelligence in the multiple-intelligences
group processes. Examples include an audience, board of theory, the intelligence involved in detecting patterns and
directors, clique, club, committee, crowd, dance troupe, regularities in natural phenomena, which is used, for exfamily, gang, jury, orchestra, sorority or fraternity, and sup- ample, in identifying varieties of plants or birds.
port group. Also called bona fide group. 2. a group
natural killer cell (NK cell) a type of lymphocyte
whose members are united through common descent or
that destroys infected or cancerous cells. Unlike the B and T
custom, such as a family or tribe.
lymphocytes, natural killer cells do not require the target
natural high a state of well-being and happiness that is cells to display on their surface foreign antigens combined
often associated with ordinary physical or mental exertion, with host histocompatibility proteins.
in contrast to similar mood states artificially induced by
natural language a language that has evolved natudrugs.
rally among humans, as opposed to an artificial lannaturalism n. 1. in philosophy, the doctrine that reality guage, such as that used in computer programming.
consists solely of natural objects and that therefore the
natural language category a class of things, people,
methods of natural science offer the only reliable means to
or the like that is defined as a category distinct from other
knowledge and understanding of reality. Naturalism is
categories by the semantic structure of a particular natuclosely related to physicalism and materialism and explicral language, rather than by an extralinguistic (scientific
itly opposes any form of supernaturalism or mysticism
or logical) system of classification. Systems of categorizathat posits the existence of realities beyond the natural and
tion can vary widely from one language to another (see
material world. 2. in literature and the other arts, a movelinguistic determinism; linguistic relativity). Some rement that developed in the late 19th century, often seen as
searchers believe that each natural language category is
arising out of realism, the literary movement and style
defined by a prototype and that membership in the catethat generally preceded it. Naturalistic writers aimed to degory is determined by an entity’s degree of resemblance to
pict life without idealistic illusions or literary artifice and
this prototype. For example, the category “birds” is defined
often chose challenging or taboo subjects, such as divorce
by a prototype consisting of a set of features (has a beak,
or prostitution. The plays and novels often show a strong
has feathers, can fly, etc.) representing the ideal or typical
leaning toward psychological determinism, with the bebird; an entity that has all or most of these features will be
havior of the characters being explained in terms of their
accepted as belonging to this category.
heredity or environment. Leading exponents of naturalism
included French writers Émile Zola (1840–1902), Al- natural law 1. in science and natural philosophy, a funphonse Daudet (1840–1897), and Guy de Maupassant damental truth about the observed regularities of the nat(1850–1893), Norwegian dramatist Henrik Ibsen (1828– ural world, such as the law of gravity. See law. See also
1906), and German dramatist Gerhart Hauptmann causal law. 2. in ethics and political philosophy, an ethi(1862–1946). See also positivism. —naturalistic adj.
cal principle reflecting a presumed natural or divine truth
that is not derived from human reason or experience and
naturalistic environment a type of laboratory envi- that is universal in its application. A natural law is thus
ronment that attempts to include many of the features
seen to provide a norm that should be reflected in human
found in natural environments. Examples are underethical and legal systems.

conditioned or secondary reinforcers, which are initially neutral stimuli (e.g., tones, lights) that become desirable through training (see secondary reinforcement).

natural selection the process by which such forces as competition, disease, and climate tend to eliminate individuals who are less well adapted to a particular environment and favor the survival and reproduction of better adapted individuals, thereby changing the nature of the population over successive generations. This is the fundamental mechanism driving the evolution of living organisms and the emergence of new species, as originally proposed independently by British naturalists Charles Darwin and Alfred Russel Wallace (1823–1913). See DARWINISM; EVOLUTIONARY THEORY; SELECTION; SURVIVAL OF THE FITTEST. Compare ARTIFICIAL SELECTION.

natural work module a unit of work in which an employee or team of employees produces a whole item or otherwise completes a meaningful sequence of tasks from start to finish. Such an approach has been found to yield greater task identity and therefore greater motivation than one in which employees perform their tasks with little or no sense of context.

natural work team a group of employees who perform related or complementary tasks working together as a cooperative unit. It has been found that creating such teams has a positive effect on work motivation.

nature n. 1. the entirety of physical reality. 2. the phenomena of the natural world, including plants, nonhuman animals, and physical features, as opposed to human beings and their creations. 3. the fundamental or inherent qualities of something. See ESSENCE. 4. the innate, presumably genetically determined, characteristics and behaviors of an individual. In psychology, the characteristics most often and traditionally associated with nature are temperament, body type, and personality. Compare nurture. —natural adj.

nature–nurture the dispute over the relative contributions of hereditary and environmental factors (nature and environmental factors) to the development of an individual. Nativists emphasize the role of heredity, whereas environmentalists emphasize sociocultural and ecological factors, including family attitudes, child-rearing practices, and economic status. Most scientists now accept that there is a close interaction between hereditary and environmental factors in the ontogeny of behavior (see EPIGENESIS). Also called heredity–environment controversy; nature–nurture issue; nature–nurture problem.

naturopathy n. an alternative health care system that aims to prevent disease and promote physical and mental health by using natural and physiologically based therapies (e.g., dietary measures, acupuncture, massage) to address underlying disease processes. See also COMPLEMENTARY AND ALTERNATIVE MEDICINE.

Naturwissenschaftliche Psychologie one of two approaches to the study of psychological problems and issues identified by German psychologists in the late 19th century. This approach (translated literally as “natural science psychology”) adopted the experimental method and laboratory techniques as appropriate and useful for certain classes of phenomena, such as perceptual phenomena. These techniques were regarded as inappropriate for studying higher mental processes, language, and social phenomena, for which a different approach (see GEISTESWISSENSCHAFTLICHE PSYCHOLOGIE) was required.

nausea gravidarum see MORNIG SICKNESS.

nauseous adj. in the ZWAARDEMAER SMEL SYSTEM, denoting an odor quality that is smelled in feces and carrion flowers.

nautilus eye the eye of the nautilus mollusk, which is of particular value in studies of vision. It consists mainly of a spherical cavity lined with photosensitive cells that respond to light entering through a small hole at the top. This eye is thus virtually a pinhole camera made of living tissue.

Navane n. a trade name for thiothixene. See THIOXANThINE.

navigation n. the mechanisms used by an organism to find its way through the environment, such as to a migration site or its home site. A variety of navigational cues have been documented in nonhuman animals, including using the sun or stars as a compass (see SUN COMPASS) and responding to magnetic lines, olfactory cues, visual cues (e.g., rivers or coastlines), and wind-shear effects from air masses crossing mountain ranges.

nay-saying n. answering questions negatively regardless of their content, which can distort the results of surveys, questionnaires, and similar instruments. Compare YEA-SAYING.

NBAS abbreviation for Neonatal Behavioral Assessment Scale. See BRAZELTON NEONATAL BEHAVIORAL ASSESSMENT SCALE.

NCFSFA abbreviation for NATIONAL CHRONIC FATIGUE SYNDROME AND FIBROMYALGIA ASSOCIATION.

NCLB abbreviation for NO CHILD LEFT BEHIND ACT.

NCQA abbreviation for NATIONAL COMMITTEE FOR QUALITY ASSURANCE.

NE abbreviation for NORPINEPHRINE.

near-death experience (NDE) an image, perception, event, interaction, or feeling (or a combination of any of these) reported by some people after a life-threatening episode. Typical features include a sense of separation from the body, often accompanied by the ability to look down on the situation; a peaceful and pleasant state of mind; and an entering into light, sometimes following an interaction with a spiritual being. Frightening NDEs have been reported as well. There is continuing controversy regarding the existence, cause, and nature of NDEs. Spiritual, biomedical, and contextual lines of explanation are still in play, and there is no solid evidence to support the proposition that NDEs prove survival after death. See also DEATHBED ESCORTS AND VISIONS. [term coined in 1975 by U.S. philosopher, psychologist, and physician Raymond A. Moody (1944— ) in his book Life After Life]

near miss in hearing studies, a small deviation from WEBER’S LAW in which the WEBER FRACTION for intensity discrimination decreases over a wide range of intensities of the standard. The near miss is observed for sounds with a restricted bandwidth and is thought to result from nonlinear growth of excitation in the cochlea.

near point the shortest distance at which an object is in focus for a single eye. Also called near point of accommodation. Compare far point.

near point of convergence the shortest distance at
nearsightedness

which an object is in focus when viewed by both eyes without appearing as a double image.

nearsightedness n. see MYOPIA.

necessary condition see CONDITION.

Necker cube a line drawing of a cube in which all angles and sides can be seen, as if it were transparent. It is an AMBIGUOUS FIGURE whose three-dimensionality fluctuates when viewed for a prolonged period of time. [Louis Albert Necker (1730–1804), Swiss crystallographer]

neck–eye reflex a reflex involving compensatory movements of the eyes to maintain fixation on a target while the head moves. It is important for maintaining image stability.

necro- (necro-) combining form death or dissolution.

necromancy n. 1. a form of DIVINATION in which a person supposedly conjures up the spirits of the dead to gain knowledge of future events. 2. more generally, black magic or sorcery. —necromancer n. —necromantic adj.

necromania n. a morbid preoccupation with corpses, usually including sexual desire for dead bodies, and a morbid interest in funerals, mortuaries, autopsies, and cemeteries.

necrophilia n. 1. sexual interest in or sexual contact with dead bodies. It is a rare PSYCHOPHILIA seen almost exclusively in men. In some cases, they kill the victim themselves, but most frequently they gain access to corpses via funeral parlors, mortuaries, morgues, or graves. Numerous explanations have been offered for the behavior since it was first described by German psychiatrist Richard von Krafft-Ebing (1840–1902) in his 1886 book Psychopathia Sexualis, many of which were psychoanalytically oriented and have now generally been abandoned. More recent explanations have received some empirical support and suggest that necrophilia involves desire for a partner who is incapable of resistance or rejection, desire to exercise power over others as a means of enhancing self-esteem, and desire to counteract feelings of isolation. 2. as described in 1964 by Erich Fromm, an attraction to death, decay, and sickness. He considered this attraction to be a fundamental yet pathological orientation within certain individuals’ characters that reveals itself through increasing tendencies toward greed, narcissism, destruction, cruelty, and murder and a growing attachment to mechanical (i.e., nonliving) artifacts. According to Fromm, necrophilia stems from a person’s desire to compensate for a lack of authenticity and self-identity. —necrophile n. —necrophilic adj.

necrophilic fantasies male (and occasionally female) fantasies about viewing or having heterosexual or same-sex intercourse with a corpse as a means of achieving sexual excitement. Such fantasies are sometimes acted out with the aid of prostitutes who satisfy necrophilic clients by simulating lifeliness.

necrophobia n. a persistent and irrational fear of corpses. See also THANATOPHOBIA.

necrosis n. the death of cells (e.g., neurons, muscle cells) from any of a variety of causes, including disease, injury, toxins, and obstruction of blood supply to an affected body part. —necrotic adj.

NEDA abbreviation for NATIONAL EATING DISORDERS ASSOCIATION.

need n. 1. a condition of tension in an organism resulting from deprivation of something required for survival, wellbeing, or personal fulfillment. 2. a substance, state, or any other thing (e.g., food, water, security) whose absence generates this condition.

need arousal a motivational technique, used primarily by advertisers, in which a consumer is induced to feel that he or she needs a particular product because it represents some sought-after quality such as status, health, beauty, or security. Perception of a need for a product is the first stage of BUYING BEHAVIOR.

need–fear dilemma 1. a simultaneous need for and fear of close relationships with others. 2. a conflicting set of conditions facing those who need structured control but have an aversion to external control or influence. In its marked form, it is a characteristic condition in schizophrenia, particularly in terms of both greatly needing and greatly fearing other people.

need for achievement (n-Ach) a strong desire to accomplish goals and attain a high standard of performance and personal fulfillment. People with high need for achievement often undertake tasks in which there is a high probability of success and avoid tasks that are either too easy (because of lack of challenge) or too difficult (because of fear of failure). The need for achievement was proposed by Henry Alexander MURRAY and investigated extensively by David McCLELLAND.

need for affect an individual difference reflecting variation in the motivation to approach or avoid emotion-inducing situations. According to one study, people with a strong need for affect tend to be extreme in their attitudes about various concerns and to be highly attentive to emotional events, such as the death of a public figure. See also NEED FOR COGNITION. [proposed by Canadian psychologists Gregory R. Maio and Victoria M. Esses]

need for affection the degree to which a person wants to be close or distant in a relationship with another. In intimate relationships, need for affection is often expressed concretely as a desire to be touched or held or to be commended verbally.

need for affiliation (n-Aff) the desire to have personal relationships with other individuals, which manifests itself in the urge to form friendships and attachments and to join organizations and enjoy social gatherings. People with a high need for affiliation often seek the approval and acceptance of others. Stressful situations typically intensify the need for affiliation; this is especially so when others are undergoing the same stress, perhaps because being part of a group helps reduce the unpleasantness of the situation. See also AFFILIATION; BELONGING; GREGARIOUSNESS. [proposed in 1938 by Henry Alexander MURRAY and extensively researched by David McCLELLAND]

need for closure 1. the motivation to achieve finality and absoluteness in decisions, judgments, and choices, often prematurely. A person with a high need for closure will often have a low tolerance for ambiguity and uncertainty and may be attracted to dogmatic political or religious views. In 1994, psychologists Donna M. Webster and Ari W. Kruglanski (1939–) developed the Need for Closure Scale, a 42-item self-report inventory, to assess stable individual differences in the desire for closure. 2. the need to achieve a sense of finality at the close of a painful or difficult episode in one’s life. Some estranged couples, for example, feel a need to obtain a formal divorce for emotional as well as practical reasons.
need for cognition a personality trait reflecting a person’s tendency to enjoy engaging in expansive cognitive activity. This trait primarily reflects a person’s motivation to engage in cognitive activity rather than his or her actual ability to do so. Individuals high in need for cognition tend to develop attitudes or take action based on thoughtful evaluation of information. [originally investigated by U.S. psychologists John T. Cacioppo (1951– ) and Richard E. Petty (1951– )]

need for control see control.

need for intimacy (n-Int) the dispositional tendency to seek warm, positive relationships with others. It is one of the primary social needs, along with the need for achievement and the need for affiliation. [investigated extensively by U.S. developmental psychologist Dan P. McAdams (1954– )]

need for power (n-Pow) the dispositional tendency to seek control over other people. It has been hypothesized that people with a high need for power experience severe stress in the face of actual or anticipated social events that thwart their need to exert control or to achieve recognition for power-oriented behaviors. [investigated extensively by David McCLELLAND]

need-hierarchy theory see MASLOW’S MOTIVATIONAL HIERARCHY.

needle exchange program a program to reduce the sharing and reuse of needles by people who take illegal drugs intravenously. Drug users are given the opportunity to trade their used needles and syringes for new, unused equipment without fear of arrest; in some cases, users can receive the clean equipment without trading anything in. These programs often provide drug counseling, HIV testing, and other services as well. They have been shown to reduce the transmission of HIV and hepatitis, but they are criticized by people who believe that they tacitly condone drug abuse. Also called syringe exchange program.

need–press theory in the personology of Henry Alexander MURRAY, an explanation of behavior in terms of the influence, or press, of both the present environment and past experiences on the expression and activation of a need.

need reduction the decrease of a need, often achieved through a consummatory response. Also called need gratification. See DRIVE-REDUCTION THEORY.

needs assessment 1. the identification of currently unmet service needs in a community or other group done prior to implementing a new service program or modifying an existing one. The perceived needs are generally assessed from multiple perspectives, including those of community or group leaders and each individual in the community or group. 2. the identification of areas that should be the focus of a PERSONNEL TRAINING program. Needs assessment involves analyses in three key areas: (a) the knowledge, skills, abilities, and other characteristics of employees; (b) the requirements of the tasks performed by employees; and (c) the requirements of the organization. See also PERSON-NEEDS ANALYSIS.

need to belong the motivation, rooted in both biology and social norms, to be part of relationships, to belong to groups, and to be accepted by others. See also LOVE NEED.

need to evaluate a personality trait reflecting a person’s tendency to engage in extensive evaluative thinking when encountering people, issues, or objects. People who are high in need to evaluate tend to form attitudes and categorize objects spontaneously along a positive–negative scale. People who are low in need to evaluate tend to think of objects in evaluative terms only when the context encourages such categorization. [originally investigated by U.S. psychologists William Blair Gage Jarvis and Richard E. Petty (1951– )]

nefazodone n. a MULTIFUNCTIONAL ANTIDEPRESSANT chemically related to TRAZODONE but with some important pharmacological distinctions. It is an antagonist at 5-HT 2 receptors and an inhibitor of both serotonin and norepinephrine reuptake. This combination of actions is thought to be related to the lack of SSRI-like side effects associated with its antidepressant properties. Its sedative effects may be useful in the treatment of depression-related anxiety and insomnia; however, due to the risk of serious hepatic injury associated with nefazodone, it is now rarely used.

negation n. in PIAGETIAN THEORY, a mental process—a form of reversibility—in which one realizes that any operation can always be negated or inverted. Also called inversion. See identity, negation, reciprocal, and relative operations. —negate vb.

negative n. in linguistics, the form of a sentence used to make a negative assertion about something rather than an affirmative statement or a question (see interrogative). In modern English, negatives are nearly always formed using not or no and an auxiliary verb (usually be, have, or do). The structural relationship between positive and negative forms of a statement (e.g., between I went and I did not go) is of major interest in GENERATIVE GRAMMAR and PSYCHOLINGUISTICS.

negative acceleration a situation in which the rate of increase in a given activity or function slows down as a result of practice or training. For example, successive practice trials may produce smaller and smaller gains in learning or performance. See LEARNING CURVE. Compare POSITIVE ACCELERATION.

negative adaptation a gradual loss of sensitivity or weakening of response due to prolonged stimulation.

negative affect the internal feeling state (affect) that occurs when one has failed to achieve a goal or to avoid a threat or when one is not satisfied with the current state of affairs. The tendency to experience such states is known as negative affectivity.

Negative Affect Scale see POSITIVE AND NEGATIVE AFFECT SCHEDULE.

negative affect syndrome see GENERAL NEUROTIC SYNDROME.

negative afterimage see AFTERIMAGE.

negative afterpotential the small additional negative membrane potential (hyperpolarization) shown by nerve and muscle cells during recovery from an action potential. The nerve or muscle is less excitable during the negative afterpotential.

negative attitude in psychotherapy and counseling, the client’s feeling of rejection or disapproval of the therapist or counselor, of the therapeutic or counseling process, of another person, or of himself or herself. Compare positive attitude.

negative conditioned stimulus in CLASSICAL CONDITIONING, a stimulus that, when presented in the context of
negative contingency

CONDITIONED STIMULUS–UNCONDITIONED STIMULUS pairings, is not followed by an unconditioned stimulus.

**negative contingency** see CONTINGENCY.

**negative contrast** see BEHAVIORAL CONTRAST.

**negative correlation** a relationship between two variables in which the value of one variable increases as the value of the other decreases. For example, in a study about babies crying and being held, the discovery that those who are held more tend to cry less is a negative correlation. Also called **inverse correlation**. Compare **POSITIVE CORRELATION**.

**negative discriminative stimulus** (symbol: S₀ or S⁻) in OPERANT CONDITIONING, a stimulus signifying that a given response will not be reinforced, implying that there is at least one other stimulus circumstance in which the response will be reinforced. Compare **DISCRIMINATIVE STIMULUS**.

**negative emotion** an unpleasant, often disruptive, emotional reaction designed to express a **aversive stimulus**. Negative emotion is not conducive to progress toward one’s goals. Examples are anger, envy, sadness, and fear. Compare **POSITIVE EMOTION**.

**negative eugenics** see EUGENICS.

**negative exercise addiction** an inordinate attraction to habitual physical exercise that has a detrimental effect on physical, psychological, or social well-being. Also called **exercise obsession**. Compare **POSITIVE EXERCISE ADDICTION**.

**negative feedback** 1. an arrangement whereby some of the output of a system, whether mechanical or biological, is fed back to reduce the effect of input signals. Such systems, which measure the deviation from a desired state and apply a correction, are important in achieving **HOMEOSTASIS**, whereas systems employing **POSITIVE FEEDBACK** tend to amplify small deviations and become highly unstable. See **FEEDBACK SYSTEM**. 2. nonconstructive criticism, disapproval, and other negative information received by a person in response to his or her performance.

**negative hallucination** a false perceptual experience characterized by failure to see something while looking directly at it, as in failing to perceive a certain person in a group in response to hypnotic suggestion. Compare **POSITIVE HALLUCINATION**.

**negative imagery** mental images that incorporate sensations of performance errors, unwanted outcomes, **DEMO-**

**negative incentive** an object or condition that constitutes an **aversive stimulus** and therefore facilitates avoid-

**negative induction** a reduction in the response to one stimulus, in circumstances in which conditions remain fixed, as a result of a reduction of response brought about in another experiment in which stimuli were alternated. See also **BEHAVIORAL CONTRAST**.

**negative priming** the ability of a preceding stimulus to inhibit the response to a subsequent stimulus. This is measured by the detectability of the second stimulus or the time taken to make a response to the second stimulus. The most striking examples occur when the participant is instructed to ignore a feature of the first stimulus (e.g., its color) and then to attend to that same feature in the second stimulus. **PRIMING** effects are usually facilitative.

**negative punishment** punishment that results because some stimulus or circumstance is removed as a consequence of a response. For example, if a response results in a subtraction of money from an accumulating account, and the response becomes less likely as a result of this experience, then negative punishment has occurred. Compare **POSITIVE PUNISHMENT**.

**negative recency** in recalling a list of items, the tendency to recall fewer of the final items of the list than the middle and early items. Negative recency contrasts with the enhanced recall of final items seen in the **RECENTY EFFECT**. Also called **NEGATIVE RECENCY EFFECT**.

**negative reference group** a group with which a person does not want to be identified and whose norms and standards he or she consciously rejects.

**negative reinforcement** the removal, prevention, or postponement of an **aversive stimulus** as a consequence of a response, which, in turn, increases the probability of that response. Compare **POSITIVE REINFORCEMENT**.

**negative relationship** an association in which one variable decreases as the other variable increases, or vice versa. Also called **INVERSE RELATIONSHIP**. See also **INDIRECT RELATIONSHIP**. Compare **DIRECT RELATIONSHIP**.

**negative response** a response that involves avoidance of or withdrawal from a stimulus.

**negative schizophrenia** a form of schizophrenia characterized by a predominance of **NEGATIVE SYMPTOMS**, suggesting deficiency or absence of behavior normally present in a person’s repertoire, as shown in apathy, blunted affect, emotional withdrawal, poor rapport, and lack of spontaneity. Compare **POSITIVE SCHizophrenia**. [defined in 1982 by U.S. psychiatrists Nancy C. Andreasen and Scott A. Olsen]

**negative self-talk** see SELF-TALK.

**negative skew** see **SKEWNESS**.

**negative-state-relief model** the hypothesis that **HELPING** behavior is used by some people in stressful situations and periods of boredom and inactivity to avoid or escape negative moods.

**negative stereotype** a STEREOTYPE that purports to describe the undesirable, objectionable, or unacceptable qualities and characteristics of the members of a particular group or social category. Compare **POSITIVE STEREOTYPE**.

**negative suggestion** a statement intended to deter or suppress a feeling, thought, or action on the part of another person.

**negative symptom** a deficit in the ability to perform the normal functions of living—for example, logical thinking, self-care, social interaction, and planning, initiating, and carrying out constructive actions—as shown in apathy, blunted affect, emotional withdrawal, poor rapport, and lack of spontaneity. In schizophrenia, a predominance of negative symptoms is often associated with a poor prognosis. Compare **POSITIVE SYMPTOM**. See **NEGATIVE SCHizophrenia**.

**negative transfer** 1. a process in which previous learning obstructs or interferes with present learning. For instance, tennis players who learn racquetball must often unlearn their tendency to take huge, muscular swings with
the shoulder and upper arm. See also TRANSFER OF TRAINING. Compare POSITIVE TRANSFER. 2. see LANGUAGE TRANSFER.

**negative transference** in psychoanalysis, a patient’s transfer onto the analyst or therapist of feelings of anger or hostility that the patient originally felt toward parents or other significant individuals during childhood. Compare POSITIVE TRANSFERENCE.

**negative triad** see COGNITIVE TRIAD.

**negative tropism** the orientation of an organism away from a particular source of stimulation. See TROPISM.

**negativism** n. 1. an attitude characterized by persistent resistance to the suggestions of others (passive negativism) or the tendency to act in ways that are contrary to the expectations, requests, or commands of others (active negativism), typically without any identifiable reason for opposition. In young children and adolescents, such reactions may be considered a healthy expression of self-assertion. Negativism may also be associated with a number of disorders (extreme negativism is a feature of CATATONIC SCHIZOPHRENIA), and it can be an expression of opposition, withdrawal, or anger or a method of gaining attention. Also called **negativistic response**. See also OPPOSITIONAL DEFIANT DISORDER; PASSIVE-AGGRESSIVE PERSONALITY DISORDER. 2. any philosophy or doctrine based on negation, such as nihilism or skepticism. —negativistic adj.

**negativistic personality disorder** see PASSIVE-AGGRESSIVE PERSONALITY DISORDER.

**negativistic response** see NIGMATISM.

**negativity bias** see TRAIT NEGATIVITY BIAS.

**neglect** n. 1. failure to provide for the basic needs of a person in one’s care. The neglect may be emotional (e.g., rejection or apathy), material (e.g., withholding food or clothing), or service-oriented (e.g., depriving of education or medical attention). See CHILD NEGLECT; ELDER NEGLECT. See also MALTRAVEMENT. 2. a neurological syndrome characterized by lack of awareness of a specific area of the visual field (VISUAL NEGLECT) or side of the body (UNILATERAL NEGLECT). This is most often associated with an injury to the right cerebral hemisphere with corresponding left-sided neglect. Neglect has also been found in auditory, tactile, and proprioceptive tasks. See also MOTOR NEGLECT; SENSORY NEGLECT.

**neglect dyslexia** a type of VISUAL WORD-FORM DYSLEXIA associated with VISUAL NEGLECT, a condition in which a person is unaware of half of the visual field as a result of neurological damage. Either the initial parts of words are misread (left neglect) or the terminal parts of words are misread (right neglect), and the errors are not simple deletions but typically guesses of real though incorrect words with approximately the right number of letters.

**neglected child** 1. see CHILD NEGLECT. 2. see SOCIOMETRIC STATUS.

**negligence** n. failure to fulfill a duty or to provide some response, action, or level of care that is appropriate or reasonable to expect. In ergonomics, for example, negligence involves the failure to take reasonable care to protect human safety or equipment in the design, development, or evaluation of a system. A variety of different types of negligence exist in law. See also MALPRACTICE. —negligent adj.

**negligent hiring** a basis for a civil lawsuit against an employer in which a person claims that he or she suffered injury, loss, or harm as a result of actions by an incompetent employee who would not have been hired had the organization followed responsible hiring practices.

**negotiation** n. a reciprocal communication process in which two or more parties to a dispute examine specific issues, explain their positions, and exchange offers and counteroffers in an attempt to identify a solution or outcome that is acceptable to all parties. Compare BARGAINING. —negotiate vb.

**neighborhood control** a group of individuals selected from the same region or area as that of a targeted study group in order to serve as a comparison group. The assumption is that such a group will share similar experiences, risk exposure, and other relevant characteristics with the study group, given their geographical proximity. Used in epidemiological or clinical research, neighborhood controls generally are chosen according to some rule-based procedure and matched to members of the target group on certain attributes, such as age or sex. For example, a researcher investigating cancer might go to every second house on the same city block as that of each person in the study group to identify similar individuals who do not have the disease to become part of a neighborhood control. Also called community control.

**Neil v. Biggers** a case resulting in an influential 1972 U.S. Supreme Court decision in which the court identified factors that should be considered when assessing the validity of eyewitness identification. These factors are (a) certainty as to the identification, (b) delay between the witnessed event and identification, (c) ability to clearly view the witnessed event, (d) level of attention paid to the witnessed event, and (e) the accuracy of the witness’s initial description of the individual involved in the event.

**Nelson–Denny Reading Test** a multiple-choice test of vocabulary, reading rate, and reading comprehension for high school and college students as well as adults. The vocabulary section consists of 80 one-sentence statements requiring participants to choose the proper meaning of a specific word used in that sentence from among four options. The reading rate and reading comprehension sections are combined; the former requires participants to read as much of a given narrative passage as possible within 1 minute, whereas the latter requires participants to answer questions about that same passage and six others. Originally developed in 1929, the Nelson–Denny Reading Test is in its fifth edition (published in 1993). [M. J. Nelson (1894–1970) and E. C. Denny (1887–1984). U.S. educators]

**Nembutal** n. a trade name for PENTOBARBITAL.

**neobehaviorism** n. an approach to psychology influenced by LOGICAL POSITIVISM that emphasized the development of comprehensive theories and frameworks of behavior, such as those of Clark L. HULL and Edward C. TOLMAN, through empirical observation of behavior and the use of consciousness and mental events as explanatory devices. It thus contrasted with classical BEHAVIORISM, which was concerned with freeing psychology of mentalistic concepts and explanations. According to Sigmund KOCH, neobehaviorism replaced classical behaviorism as the dominant 20th-century program for experimental psychology around 1930; its influence began to wane in the 1950s. See also RADICAL BEHAVIORISM. —neobehaviorist adj., n.

**neocerebellum** n. the dorsal and most recently evolved
neocortex

part of the CEREBELLUM, which appears only in mammals. It contains fibers that communicate with nuclei of the PONS. Compare ARCHCEREBELLUM; PALEOCEREBELLUM.

neocortex n. regions of the CEREBRAL CORTEX that are the most recently evolved and contain six main layers of cells. Neocortex, which comprises the majority of human cerebral cortex, includes the primary sensory and motor cortex and association cortex. Also called neopallium. Compare ALLOCORTEX. —neocortical adj.

neo-Darwinism n. see DARWINISM.

neodissociation theory a theory that explains the dissociative phenomena of hypnosis as a result of DIVIDED CONSCIOUSNESS. For example, HYPNOTIC ANALGESIA can produce subjective relief from pain while physiological measures indicate that some pain response is still being registered. See also HIDDEN OBSERVER. [proposed by Ernest R. HILGARD]

neo-Freudian 1. adj. denoting an approach that derives from the CLASSICAL PSYCHOANALYSIS of Sigmund Freud but with modifications and revisions that typically emphasize social and interpersonal elements over biological instincts. The term is not usually applied to the approaches of Freud’s contemporaries, such as Alfred ADLER and Carl JUNG, who broke away from his school quite early. Erik ERIKSON, Erich FROMM, Karen D. HORN, Harry Stack SULIVAN, and ego psychologists such as Austrian-born U.S. psychoanalyst Heinz Hartman (1894–1970) are considered to be among the most influential neo-Freudian theorists and practitioners. 2. n. an analyst or theoretician who adopts such an approach.

neolalia n. the abnormal tendency to use NEOLOGISMS when speaking. Also called neolallism.

neolocal adj. denoting a living arrangement in which a newly married couple begin a new household separate from their kin, or a culture in which this is the norm. Compare MATRILOCAL; PATRILOCAL.

neologism n. a newly coined word or expression. In a neurological or psychopathological context, neologisms, whose origins and meanings are usually nonsensical and unrecognizable (e.g., klipno for watch), are typically associated with aphasia or schizophrenia. See also PORTMANTEAU NEOLOGISM. —neologic adj.

neologic jargon unintelligible speech containing a mixture of inappropriately combined words and bizarre expressions coined by the speaker. Also called neologistic paraphasia. See JARGON APHASIA; WORD SALAD.

neo-Malthusian adj. denoting the contemporary doctrine or movement that supports population control, especially by the use of family planning and contraception, to ensure adequate resources and protect the environment. See MALTHUSIAN THEORY.

neomammalian brain see TRIUNE BRAIN.

neonatal adj. referring to a newborn child or to the period shortly after childbirth.

Neonatal Behavioral Assessment Scale (NBAS) see BRAZELTON NEONATAL BEHAVIORAL ASSESSMENT SCALE.

neonatal drug dependency syndrome a syndrome in which a baby is born with drug dependence due to the mother’s drug abuse (most often opioid abuse) during the latter part of pregnancy. Such babies are often of low birth weight. Other severe problems that accompany drug abuse by pregnant women include increased risk of intrauterine death, premature delivery, and increased neonatal mortality.

neonatal imitation the ability of newborn babies to reproduce some behavior, such as a facial expression, that they see in others. See also ACTIVE INTERMODAL MAPPING.

neonatal period in human development, the period from birth to approximately 1 month of age for infants born after a full-term pregnancy (for infants born prematurely, the period is longer). Among nonhuman species, the neonatal period varies depending on the species. For example, in dogs the period extends from birth to approximately 12 to 14 days of age; for some rats it lasts approximately 21 days. See also DEVELOPMENTAL LEVELS.

neonate n. a newborn human or nonhuman animal. Human infants born after the normal gestational period of 36 weeks are known as full-term neonates; infants born before the end of this period are known as preterm neonates (or, colloquially, as preemies).

neonaticide n. the killing of an infant who is less than 24 hours old. See also FELICIDE; INFANTICIDE.

neonativism n. the belief that much cognitive knowledge, such as OBJECT PERMANENCE and certain aspects of language, is innate, requiring little in the way of specific experiences to be experienced. Neonativists hold that cognitive development is influenced by biological constraints and that individuals are predisposed to process certain types of information. Also called structural constraint theory. —neonativist adj., n.

neopallium n. see NEOCORTEX.

NEO Personality Inventory (NEO-PI) a personality questionnaire designed to assess the factors of the FIVE-FACTOR PERSONALITY MODEL. First published in 1985 and revised in 1992 (NEO-PI-R) and 2010 (NEO-PI-3), the inventory takes its name from three factors of the model: neuroticism, extraversion, and openness to experience. It is available in two versions (Form S for self-reports and Form R for observer ratings), each comprising 240 statements to which participants respond using a 5-point LIKERT SCALE format, ranging from strongly disagree to strongly agree. [developed by U.S. psychologists Paul T. Costa Jr. (1942– ) and Robert R. McCrae (1949– )]

neophasia n. a complex language system created by and idiiosyncratic to a person, with its own vocabulary and rules of grammar.

neophenomenology n. an approach to psychology that emphasizes the role of the individual’s phenomenological (immediate and conscious) experience in the determination of action. See PERSONALISTIC PSYCHOLOGY; PHENOMENOLOGY. [attributed to U.S. psychologists Donald Snigg (1904–1967) and Arthur W. Combs (1912–1999)]

neophilia n. a strong desire for anything new or different, such as new foods. The term is increasingly used as a synonym for NOVELTY SEEKING.

neophobia n. 1. a persistent and irrational fear of change or of anything new, unfamiliar, or strange. 2. the avoidance of new stimuli, especially foods. —neophobic adj.

neoplasm n. a new, abnormal growth: that is, a benign or malignant tumor, although the term is generally used to specify a malignancy (see CANCER). A neoplasm usually grows rapidly by cellular proliferation but generally lacks
structural organization. A malignant neoplasm is usually invasive, destroying or damaging neighboring normal tissues, and can spread to distant sites by the process of metastasis; benign neoplasms are usually encapsulated and do not spread but may damage neighboring tissues by compression. —neoplastic adj.

Neoplatonism n. a school of philosophy based on a particular understanding of the teachings of Greek philosopher Plato, especially as interpreted by Alexandrian philosopher Plotinus (204–270 CE). Neoplatonism retains Plato’s view that there is another perfect and eternal world in which the kidneys are unable to produce a normal concentration of urine because the kidney tubules do not re-
educe acute distress, and significantly interferes with one’s nervousness or other mental disorder that has a sudden onset, produces a lay term for a state of severe fatigue due to emotional strain. See also NEUASTHENIA.

nervous adj. 1. in a transient emotional state of anxious apprehension. 2. of an excitable, highly strung, or easily agitated disposition. 3. referring to the structures or functions of the nervous system. See also NEURAL.

Nervous breakdown a lay term for an emotional illness or other mental disorder that has a sudden onset, produces acute distress, and significantly interferes with one’s functioning. Also called nervous prostration.

nervous exhaustion a lay term for a state of severe fatigue due to emotional strain. See also NEUASTHENIA.

nervous habit stereotyped behavior, such as nail biting or tics, presumed to be caused by anxiety and performed to reduce tension.

nervous impulse see NERVE IMPULSE.

nervousness n. a state of restless tension and emotion-
nervous prostration

ality characterized by trembling, feelings of apprehensiveness, or other signs of anxiety or fear.

**nervous prostration** see NERVOUS BREAKDOWN.

**nervous system** the system of NEURONS, NEURVE TRACTS, and associated tissues that, together with the endocrine system, coordinates activities of the organism in response to signals received from the internal and external environments. The nervous system of higher vertebrates is often considered in terms of its divisions, principally the CENTRAL NERVOUS SYSTEM, the PERIPHERAL NERVOUS SYSTEM, and the AUTONOMIC NERVOUS SYSTEM. See also CONCEPTUAL NERVOUS SYSTEM.

**nervous tissue** see NERVE TISSUE.

**nervus terminalis** a collection of unmyelinated nerve fibers that emanates from ganglia and terminates in the nasal mucosa. It has been demonstrated to be involved in the release of LUTENIZING HORMONE and is therefore thought to play a role in reproduction.

**NES**

1. abbreviation for NEUROLOGICAL EVALUATION SCALE.

2. abbreviation for NONEPILEPTIC SEIZURE.

**nest building** a form of parental behavior, observed mainly in fish, birds, and nonhuman mammals, that involves finding and preparing a site for laying eggs or giving birth to young. The forms of nest building vary widely, but generally all are associated with hormonal activity induced in the female by changes in day length, temperature, courtship with a male, or the presence of offspring. In species with biparental care, such as many monogamous birds and rodents, nest building may be done by both sexes. In some fish, males are the exclusive nest builders. Nest building in nonpregnant female mammals can be induced by exposure to young animals (see CONCAVEATION).

**nested design** see HIERARCHICALLY NESTED DESIGN.

**nested model** see HIERARCHICAL MODEL.

**nesting** n. in an experimental design, the appearance of the levels of one factor (the nested factor) only within a single level of another factor. For example, classrooms are nested within a school because each specific classroom is found only within a single school; similarly, schools are nested within school districts. See HIERARCHICALLY NESTED DESIGN.

**network** n. any system of interconnected units or elements. The term is applied broadly in psychology, referring, for example, to participants in social relationships or interactions (as in SOCIAL NETWORK, COMMUNICATION NETWORKS), to neural processes (as in NEURAL NETWORK), or to entities of linguistic meaning (see SEMANTIC NETWORK).

**network analysis** the study of the relationships among sampling units (e.g., individuals) within an interconnected group of such units (e.g., a friendship network) and the implications of these networks for the system in which they occur. In organizational contexts, for example, network analysis involves identifying patterns of communication, influence, liking, and other interpersonal behaviors and attitudes among employees and quantifying them in statistical and graphical models. Properties of systems are assumed to be emergent, that is, not immediately predictable from a knowledge of networks among individuals. See also SOCIOLOGY.

**network-analysis evaluation** a method of studying networks of services from the vantage point of either agencies within a system or the flow of service recipients through the system.

**network effect** the impact that the system or network of interpersonal interactions and relationships in an individual’s environment has on the development of psychopathology in that individual. [defined by German-born psychoanalyst Sigmund Heinrich Foulkes (1898–1976)]

**networking** n. 1. establishing contacts and relationships inside and outside one’s place of work with the intent of advancing one’s career. 2. forming networks of computing resources by connecting computers via communication systems. See COMPUTER NETWORK.

**network-memory model** the concept that LONG-TERM MEMORY is made up of a series of knowledge representations that are connected or linked together. The strength of the connections is determined by experience factors, such as repetition and associations. See also CONNECTIONIST MODEL, SPREADING ACTIVATION.

**network sampling** a sampling technique in which members of a study group recruit their peers to participate in the research. It is similar in process, benefits, and drawbacks to SNOWBALL SAMPLING but distinct in that new participants are acquired directly by existing ones according to certain rules (e.g., no more than four recruits per person) and that various incentives are provided for participation and recruitment.

**network therapy** individual psychotherapy or FAMILY THERAPY in which an attempt is made to involve not only immediate family members but also other relatives, friends, and neighbors as sources of emotional support and possible vocational opportunity. See also SOCIAL-NETWORK THERAPY.

**Neudexta** n. a trade name for DEXTROMETHORPHAN in combination with quinidine.

**neur** combining form see NEURO-

**neural** adj. pertaining to the nervous system, its parts, and its functions.

**neural arc** the pathway followed by nerve impulses from a RECEPTOR to an EFFECTOR. In a REFLEX ARC, a sensory neuron (or bundle of neurons) is connected either directly or via one or more INTERNEURONS to one or more MOTOR NEURONS; in more complex behaviors, the pathways are longer and the connections are more complicated.

**neural axis** 1. the CENTRAL NERVOUS SYSTEM as a whole. 2. the structures of the central nervous system that lie along the midline, including the spinal cord and brainstem but excluding the cerebral hemispheres and the cerebellar hemispheres. Also called neuraxis.

**neural chain** a simple type of NEURAL CIRCUIT in which neurons are attached end to end.

**neural circuit** an arrangement of NEURONS and their interconnections. Neural circuits, such as NEGATIVE FEEDBACK circuits, POSITIVE FEEDBACK circuits, and OSCILLATOR CIRCUITS, often perform particular limited functions. In a local circuit, the neurons are all contained within a level of brain organization of a particular region.

**neural coding** the rules and mechanisms by which neurons communicate; specifically, the unique pattern, temporal relationship, amplitude, and other characteristics of pulses (i.e., ACTION POTENTIALS) or other signals that carry out a particular sensory or other function in the nervous
system. Researchers can utilize a variety of theoretical models to analyze and understand the neural coding that underlies, for example, how birds sing or how humans perceive color. See also NEURAL REPRESENTATION.

neural conduction the passage of a NERVE IMPULSE along a nerve fiber. See CONDUCTION, Compare NEUROTRANSMISSION.

neural constructivism the theory that brain development, and thus cognitive development, proceeds as a dynamic interaction between the development of the NEURAL SUBSTRATE and the environment.

neural correlate an association between a physical occurrence in the nervous system and a mental state or event. In the cerebellum, for example, the neural correlate of fear memory is provided by a LONG-TERM POTENTIATION of the excitatory synapses between the PARALLEL FIBERS and the PURKINJE CELLS. The existence of neural correlates suggests potential biological bases for a variety of complex cognitive, emotional, and behavioral phenomena, including consciousness (awareness), perception, learning and memory, judgments and decisions, attitudes, and motivation.

neural crest an embryonic structure consisting of a ridgelike area of ectodermal tissue on either side of the NEURAL TUBE that develops into the spinal ganglia and various structures within the sympathetic and peripheral nervous systems.

neural Darwinism a neurobiological theory that uses Darwinian NATURAL SELECTION to account for brain development and functioning in terms of selectionist amplification, pruning, and strengthening of neurons, synapses, and dynamic signaling. During brain development, billions of neurons emerge and send axonal cones to target other neurons and make connective synapses. Both neurons and their synapses are then pruned so that only the most functional cells and connections survive. When neuronal pathways are established, a similar amplification and pruning process occurs among active connections. Critics of the theory have argued that natural selection cannot apply without reproduction. To this, its supporters argue that the dynamic reentry of signaling (functional mapping) among neural connections established during earlier selection is equivalent to reproduction. Also called neuronal group selection: selectionist brain theory. [proposed by U.S. neuroscientist Gerald M. Edelman (1929–2014) in 1987]

neural facilitation see FACILITATION.

neural fibril see NEUROFIBRIL.

neural folds in the developing embryo, ridges of ectoderm on the NEURAL PLATE that form around the neural groove and fuse to form the NEURAL TUBE.

neuralgia n. pain, typically recurrent, sharp, and spasmodic, that occurs along the course of a nerve or a group of nerves. See TRIGEMINAL NEURALGIA. —neuralgic adj.

neural groove see NEURAL FOLDS.

neural impulse see NERVE IMPULSE.

neural induction the influence of a neuron or group of neurons on the development of other cells, particularly other neurons.

neural integration a process during which the electrochemical weighing of competing and canceling MEMBRANE POTENTIALS is resolved, leading to a neuron firing (excitatory) or not firing (inhibitory or subthreshold).

neural irritability a property of NERVE TISSUE that makes it sensitive to stimulation and capable of responding by transmitting ACTION POTENTIALS. It is dependent on rapid, transient movement of ions through ion channels in the plasma membrane, causing a reversible DEPOLARIZATION of the membrane.

neural network 1. a technique for modeling the neural changes in the brain that underlie cognition and perception in which a large number of simple hypothetical neural units are connected to one another. 2. an ARTIFICIAL INTELLIGENCE system used for learning and classifying data and applied in research on pattern recognition, speech recognition, machine translation of languages, and financial prediction, among other areas. Neural networks are usually abstract structures modeled on a computer and consist of a number of interconnected processing elements (nodes), each with a finite number of inputs and outputs. The elements in a network can have a “weight” determining how they process data, which can be adjusted according to experience. In this way, the network can be trained to recognize patterns in input data by optimizing the output of the network. The analogy is with the supposed action of neurons in the brain. In addition, neural networks are often structured into layers, including an input layer (in which properties of input parameters are encoded), possibly multiple hidden layers (in which generalizations of the input parameters are reflected), and an output layer (in which the response of the neural network system is reported to the environment). The connectivity of these layers often differs, usually reflecting the algorithms the neural network uses for learning. There are multiple families of algorithms used for learning patterns in data, including Hebbian learning and back-propagation learning. See also PERCEPTRON.

neural parenchyma the essential functioning tissue of the nervous system, as distinguished from the structural or supporting elements.

neural pathway any route followed by a nerve impulse through central or peripheral nerve fibers of the nervous system. A neural pathway may consist of a simple REFLEX arc or a complex but specific route, such as that followed by impulses transmitting a specific wavelength of sound from the COCHLEA to the auditory cortex. Also called nerve pathway. See also AFFERENT PATHWAY; EFFERENT PATHWAY; MOTOR PATHWAY.

neural plasticity the ability of the nervous system to change in response to experience or environmental stimulation. For example, following an injury remaining neurons may adopt certain functions previously performed by those that were damaged, or a change in reactivity of the nervous system and its components may result from constant, successive activations. Also called neuroplasticity.

neural plate a specific region of the outer primary cell layer (ectoderm) on the dorsal surface of an embryo that develops ultimately into the central nervous system. As development proceeds, the neural plate folds into the NEURAL TUBE. See also NEURULATION.

neural progenitor cell (NPC) a stemlike cell capable of developing into a neuron or other nervous system cell. Although NPCs are also sometimes called neural stem cells, they differ from STROM CELLS in two significant ways: They can only differentiate into nervous system cells, and they
are capable of only a limited number of replications. As people age, their NPC biomarker levels decrease, suggesting that they are producing fewer neurons.

**neural quantum theory** a theory to explain linear psychophysical functions, which are sometimes obtained instead of the ogival (S-shaped) form, whereby changes in sensation are assumed to occur in discrete steps and not along a continuum, based on the all-or-none law of neural activity. In this context, *quantum* refers to a functionally distinct unit in the neural mechanisms that mediate sensorimotor functions—that is, a perceptual rather than a physical unit. Also called *quantal hypothesis*; *quantal theory.*

**neural receptor** see NEURORECEPTOR.

**neural regeneration** regrowth of injured neurons, which occurs at a very slow rate. Complete replacement of injured neurons is rare in mammals but common in some fish and amphibians. Even in mammals, severed axons in the peripheral nervous system regrow readily. Sprouts of the growing axons are guided by CELL ADHESION MOLECULES. Also called *neuronal regeneration*; *regeneration of nerves.*

**neural reinforcement** the strengthening of a neuron’s response by the simultaneous or contingent activity of a second neuronal response.

**neural representation** the brain’s model of the outside world, based on the overall NEURAL CODING that occurs in the brain and on which parts of the brain are activated during a particular mental experience. This representation includes content (what is being seen, felt, heard, remembered, thought, etc.) and function (the role of the neural signals in the organism’s response to a stimulus). Research is ongoing to plot the neural representations of odor memories, semantic processing in bilingual people, and various emotions, for example.

**neural reserve** see BRAIN RESERVE.

**neural retina** see RETINA.

**neural satiation** a period of lessened reactivity or the inhibition of a neuronal response following strong stimulation of an area or adjacent regions.

**neural set** a disposition, often temporary, of a NEURAL PATHWAY to respond in a certain way.

**neural stem cell** see NEURAL PROGENITOR CELL.

**neural substrate** the part of the nervous system that mediates a particular behavior.

**neural synchrony** the simultaneous firing or activation of neurons in multiple areas of the brain, particularly in response to the same stimulus. Many motor and higher level cognitive processes (see EXECUTIVE FUNCTIONS) appear to be based on the coordinated interactions of large numbers of neurons distributed within and across different specialized brain areas. Additionally, recent research suggests dysfunctions in neural synchrony may be associated with several psychological disorders, including AUTISM SPECTRUM DISORDERS.

**neural transmission** see NEUROTRANSMISSION.

**neural tube** a structure formed during early development of an embryo, when folds of the NEURAL PLATE curl over and fuse. Cells of the neural tube differentiate along its length on the anterior–posterior axis to form swellings that correspond to the future FOREBRAIN, MIDBRAIN, and HIND-
system can be explained in terms of basic chemical concepts.

**neurocognition** n. 1. cognitive processes or functioning understood in relation to the specific neural mechanisms by which they occur in the brain and any impairment of these mechanisms. 2. see COGNITIVE NEUROSCIENCE. —neurocognitive adj.

**neurocontrol** n. 1. the control of electronic devices by energy transformed from neural output. Such devices have been developed for the use of people with paralysis or other severe impairments of bodily function. See BIOENGINEERING, 2. more generally, any method of controlling an automated system or device that is modeled on the neuronal architecture in human beings. Such methods have been developed in advanced robotics and in such high-tech applications as spacecraft navigation.

**neurocrine** adj. referring to neurons that secrete agonists, especially NEUROTTRANSMITTERS, at synapses, or to those agonists themselves.

**neurodegenerative disease** any disease characterized by progressive nervous system dysfunction and loss of neural tissue. Alzheimer’s disease, amyotrophic lateral sclerosis, and Parkinson’s disease are all examples of neurodegenerative diseases. Also called neurodegenerative disorder.

**neurodermatitis** n. an eczematous skin lesion that may be associated with psychological stress and is exacerbated by rubbing or scratching the skin.

**neurodevelopmental hypothesis** a prominent theory stating that schizophrenia results from an early brain lesion, either fetal or neonatal, that disrupts normal neurologic development and leads to abnormalities and later psychotic symptoms. Consequences of this early disruption appear in childhood and adolescence, prior to the actual onset of schizophrenic symptoms, as subtle differences in motor coordination, cognitive and social functioning, and temperament. There is evidence that supports this hypothesis, and risk factors operating in early life (e.g., obstetric complications) have been shown to be associated with the later development of schizophrenia. [originally proposed in 1987 by U.S. neuropsychiatrist Daniel Roy Weinberger]

**neurodidactics** n. see NEUROEDUCATION.

**neuroeconomics** n. a rapidly emerging field that focuses on understanding how the brain assesses the costs and benefits of the possible outcomes of specific actions and then uses this information to make choices. Combining perspectives and techniques from neuroscience, psychology, and economics, the field addresses the physiological basis of strategic thinking and decision making under uncertainty and examines brain function when individuals perform such choice-behavior tasks as formulating or expressing preferences and beliefs, evaluating decisions, categorizing risks and rewards, computing value, and delaying gratification. Neuroeconomics challenges the assumption that decision making is a logical, analytical process—a simple matter of utility maximization—suggesting instead that it often involves emotion and other psychological variables. For example, individuals making buying decisions tend to show overactivation in the “wanting” or reward area of the brain, whereas individuals making decisions about money during times of economic volatility show strong activation in the areas of the brain associated with fear.

**neuroeducation** n. the study of the activities that occur in the brain when individuals learn and the application of this knowledge to improve classroom instructional practices and optimize curriculum design. This emerging field represents the intersection of the broader areas of neuroscience, psychology, and education, integrating research on neuronal functioning with educational improvement to understand how the brain enables learning, working memory, intelligence, and creative thinking. For example, a neuroeducational investigation of the relationship between young children’s insight into spatial structures and the development of spatial and number sense might result in a series of classroom activities to stimulate children’s acquisition of spatial and number skills. However, such investigations are not without their critics. Many researchers point to the gap separating microscopic neural processes from macroscopic classroom behaviors as a major obstacle to establishing the neuroscience–education bridge. Prominent among these critics is U.S. philosopher and cognitive scientist John T. Bruer, who argues that the study of brain–behavior relationships is too far removed from the development of learning strategies and teaching methods to offer any useful benefits. Also called brain-based learning; educational neuroscience: mind–brain–education (MBE); neurodidactics; neuropsychology.

**neuroeffector junction** the functional connection between a neuron and a muscle or a gland. See also NEUROMUSCULAR JUNCTION.

**neuroeffector transmission** the transmission of nerve impulses from neurons through NEUROEFFECTOR JUNCTIONS to the two general types of effectors, muscles and glands.

**neuroendocrinology** n. the study of the relationships between the nervous system—especially the brain—and the endocrine system. Some cells within the nervous system release hormones into the local or systemic circulation; these are called neuroendocrine (or neurosecretory) cells. The HYPOTHALAMUS, for example, produces RELEASING HORMONES that regulate secretion of pituitary hormones. Certain substances, such as NORADRENALINE, act both as hormones and as neurotransmitters. See also PSYCHONEUROENDOCRINOLOGY. —neuroendocrinological adj. —neuroendocrinologist n.

**neuroethics** n. a rapidly growing subspecialty of BIOETHICS that focuses on the moral, social, and public policy implications of conducting NEUROSCIENCE research and of translating the findings into clinical practice. The explosive increase in knowledge about the biology of human behavior, cognition, and emotion and the growing ability to monitor and even intervene in their functioning—through the use of brain imaging, psychopharmacology, neurosurgery, and other techniques—have led not only to new diagnostic capabilities and therapeutic innovations but also to numerous concerns. These include issues relating to INFORMED CONSENT; personal responsibility; free will; conceptions of health and well-being; and predictions of disease, behavior, and other factors. For example, TRANSCRANIAL MAGNETIC STIMULATION shows promise for treating certain movement and psychological disorders but could also potentially be used for nontherapeutic purposes, such as cognitive enhancement to directly manipulate attention, memory, mood, or other psychological capacities to make a “better” brain. See also NEUROLAW.

**neuroethology** n. a branch of biology that studies non-
neurofeedback

human animal behavior in relation to neural processes and structures. See ETHIOTOLOGY.

neurofeedback n. a type of biofeedback training intended to enable people to alter their brain waves by using information from a video display or auditory signal of electroencephalograph (EEG) recordings of their brain-wave characteristics. Neurofeedback has been used with mixed results in the treatment of attention-deficit/hyperactivity disorder and epilepsy and is being investigated as a possible intervention for other conditions as well (e.g., headaches, insomnia, anxiety). Also called EEG biofeedback: neurobiofeedback: neurotherapy. See ALPHA-WAVE TRAINING.

neurofibril n. a fine fiber found in the cytoplasm of a neuron. It is composed of microscopic protein filaments and microtubules. Abnormal formation of neurofibrils leads to the development of neurofibrillary tangles, which are characteristic of Alzheimer’s disease. Also called neural fibril.

neurofibrillary tangles twisted strands of abnormal filaments within neurons that are associated with Alzheimer’s disease. The filaments form microscopically visible knots or tangles consisting of tau protein, which normally is associated with microtubules. If the structure of tau is rendered abnormal, the microtubule structure collapses, and the tau protein collects in neurofibrillary tangles.

neurofibroma n. a tumor of peripheral nerves caused by abnormal proliferation of schwann cells. A neurofibroma is very similar to a schwannoma but is distinguished by its lack of a capsule.

neurofibromatosis n. an autosomal dominant neurological disorder that is characterized by tumors of the peripheral nervous system (neurofibromas). The tumors may be firm subcutaneous nodules or soft cutaneous lumps that form a pocket when pressed. Three subtypes have been identified: Type 1 (also called von Recklinghausen’s disease) is present at birth with pigmented (pale brown) patches on the skin and deformed bones; Type 2 begins in adolescence with ringing in the ears, poor balance, and eventual hearing loss; and schwannomatosis, the rarest form, causes intense, chronic pain and other neurological symptoms such as tingling, numbness, and weakness in the fingers and toes. Neurofibromatosis can be either an inherited disorder or the product of a gene mutation.

neurofilament n. a small, rodlike structure found in the axons of neurons. Neurofilaments are involved in the transport of materials along the axon. See AXONAL TRANSPORT.

neurogenesis n. the production of new neurons during early nervous system development and throughout the lifespan. The failure or interruption of neurogenesis is implicated in neurological diseases such as Alzheimer’s and Parkinson’s, as well as in psychiatric disorders such as depression, bipolar disorder, and schizophrenia.

neurogenic adj. pertaining to a condition or event caused or produced by a component of the nervous system.

neurogenic communication disorder any speech or language problem due to nervous system impairment that causes some difficulty or inability in exchanging information with others.

neuroglia n. see GLIA. —neuroglial adj.

neuroglioma n. see GLIOMA.

neurogram n. 1. see ENGRAM. 2. a wavelike tracing, either printed or displayed on a monitor, that represents the electrical impulses of neurons. 3. a three-dimensional image of nerves in the brain provided by a specialized magnetic resonance imaging technique.

neurohormone n. a hormone produced by neural tissue and released into the general circulation. See NEUROENDOCRINOLOGY.

neurohypophysis n. see PITUITARY GLAND: POSTERIOR PITUITARY.

neuroimaging n. the use of various technologies to noninvasively study the structures and functions of the brain. These technologies include magnetic resonance imaging, functional magnetic resonance imaging, computed tomography, and positron emission tomography.

neurokinin n. a neurotransmitter family comprising three related neuropeptides: SUBSTANCE P, neurokinin A, and neurokinin B. They appear to play roles in emotion and in pain perception.

neurolaw n. a rapidly growing field representing the intersection of neuroscience and the legal system. It encompasses not only the study of the neural workings of the human brain as they relate to issues of crime, guilt, and punishment but also the emerging applications of imaging technologies within courtroom proceedings. For example, in a murder trial a defense attorney might use a brain scan showing a tumor pressing on the defendant’s amygdala to argue that he or she couldn’t control his or her behavior and should be absolved of any criminal responsibility for the act. Similarly, in civil litigation a lawyer might introduce a scan as evidence that his or her client has a traumatic brain injury.

Despite its increasing popularity and prevalence, neurolaw remains controversial. Many argue that using neuroimaging—originally developed as a diagnostic tool for medical professionals—to “prove” unobservable psychological attributes (e.g., thoughts, feelings, intentions) through brain activity is an invasion of privacy and infringement of freedom of thought that is devoid of scientifically demonstrated accuracy and validity. Others question the implications of neurolaw for such traditional notions as free will, rational choice, and voluntary conduct (actus reus). Proponents, however, point out potential benefits of applying neuroscience findings and techniques to law, such as developing more accurate methods for lie detection and criminal behavior prediction, developing more effective means of criminal rehabilitation, improving sentencing procedures, and detecting stereotypes or biases unconsciously held by potential jurors. See also NEUROETHICS.

neuroleptic n. see ANTIPSYCHOTIC.

neuroleptic malignant syndrome a rare complication of therapy with conventional (typical or first-generation) antipsychotics, characterized by fever, inability to regulate blood pressure, difficulty in breathing, and changes in consciousness (including coma); mortality rates approaching 25% have been observed. It occurs primarily at the start of treatment or with a sudden increase in dose. The incidence of the syndrome, which was never high, has declined further with the abandonment of megadose pharmacotherapy with conventional antipsychotics and the advent of second-generation atypical antipsychotics.

neuroleptic syndrome the series of effects observed in individuals who have taken antipsychotics. It is charac-
terized by reduced motor activity and emotionality, an indifference to external stimuli, and a decreased ability to perform tasks that require good motor coordination. With high doses, patients may become cataleptic.

Neurolinguistic programming (NLP) a set of techniques and strategies designed to improve interpersonal communications and relationships by modifying the “mental programs,” or mental models of the world, that individuals develop and use to respond to and interact with the environment and other people. This approach uses principles derived from NEUROLINGUISTICS and presumes that these mental programs, as well as the behaviors they influence, result from interactions among the brain, language, and the body. In order to achieve desired change, one must first understand subjective experience and the structures of thought (i.e., mental programs) underlying the experience, and then learn to modify those programs as needed. For example, one might use NLP to enhance adaptive behavior across a variety of situations or to attain excellence in personal performance. Although originally applied to psychotherapy and counseling, neurolinguistic programming has uses in other fields, such as business management, artificial intelligence, and education. [developed in the United States in 1976 by U.S. mathematician and therapist Richard Bandler (1950–) and U.S. linguist John Grinder (1940–)]

Neurolinguistics n. the branch of linguistics that investigates how language organization and language processing are encoded in the brain.

Neurological amnesia a loss or impairment of memory due to disease or injury of the nervous system.

Neurological evaluation analysis of the data gathered by an examining physician of an individual’s mental status and sensory and motor functioning. The examination typically includes assessment of cognition, speech and behavior, orientation and level of alertness, muscular strength and tone, muscle coordination and movement, tendon reflexes, cranial nerves, pain and temperature sensitivity, and discriminative senses.

Neurological Evaluation Scale (NES) an assessment instrument originally developed in 1989 to provide a standardized tool for the evaluation of neurological abnormalities and impairments associated with schizophrenia. It is often used in researching other severe mental illnesses (e.g., bipolar disorders) as well. [developed by U.S. psychiatrists Robert W. Buchanan and Douglas W. Heinrichs]

Neurological impairment any condition marked by disruption of the nervous system as a result of disease, injury, or the effects of a drug or other chemical.

Neurology n. a branch of medicine that deals with the nervous system in both healthy and diseased states. The diagnosis and treatment of diseases of the nervous system is called clinical neurology; neurologists diagnose and treat patients with stroke, dementia, headaches, and back pain, among other disorders. —neurological adj.

Neuromarketing n. a subdiscipline of marketing research that examines changes in brain activity as they relate to product liking and purchasing and other consumer behavior. Measures commonly used in neuromarketing to reveal the frequency, location, and timing of neuronal activity include ELECTROENCEPHALOGRAPHY, ELECTROMYOGRAPHY, FUNCTIONAL MAGNETIC RESONANCE IMAGING, MAGNETOENCEPHALOGRAPHY, and SKIN CONDUCTANCE monitoring. For example, researchers may analyze blood flow to different regions of the brain or record the brain’s electrical activity as volunteers watch television advertisements or shop in supermarkets to help determine why those individuals prefer certain brands or how they make decisions to buy specific items. Some people criticize neuromarketing as an invasion of privacy—a peering into the mind to examine neurophysiological responses and emotional reactions that may not consciously be registered—with potentially exploitative applications. Practitioners, however, note that the purpose of neuromarketing is only to provide insight and that their research complements already extant techniques (e.g., focus groups, surveys, interviews) that are used to create more effective products, services, and advertising campaigns. Also called consumer neuroscience. [coined in 2002 by Dutch cognitive neuroscientist Ale Smidt]

Neuromatrix theory the theory that pain is produced by patterns of nerve impulses, or neurosignatures, that can be triggered not only by painful stimuli but also by other means, such as chronic stress. The theory attempts to account for such phenomena as PHANTOM LIMB pain and chronic pain syndromes. See also GATE-CONTROL THEORY. [proposed by Canadian psychologist Ronald Melzack (1929–)]

Neuromodulator n. a substance that modulates the effectiveness of a neurotransmitter by influencing its release or receptor response to it. See TAURINE.

Neuromuscular disorder any pathologic condition that involves the nerves and muscles. Common symptoms include weakness, cramps, and paralysis. Examples of such disorders include MUSCULAR DYSTROPHY, MYASTHENIA GRAVIS, and the MYOPATHIES.

Neuromuscular junction the junction between a motor neuron and the muscle fiber it innervates. In skeletal muscle, the muscle-cell plasma membrane (sarcolemma) is greatly folded in the region opposite the terminus of a motor axon, forming a motor END PLATE. When impulses arrive at the axon terminus, a neurotransmitter diffuses across the gap separating the axon and motor end plate. The neurotransmitter binds to receptors in the sarcolemma and causes an end-plate potential, which can trigger muscle contraction. Also called myoneural junction: neuromuscular synapse.

Neuromuscular system see MOTOR SYSTEM.

Neuromyopathy n. see MYOPATHY.

Neuron (neurone) n. the basic cellular unit of the nervous system. Each neuron is composed of a CELL BODY; fine, branching extensions (DENDRITES) that receive incoming nerve signals; and a single, long extension (AXON) that conducts nerve impulses to its branching terminal. The axon terminal transmits impulses to other neurons or to effector organs (e.g., muscles and glands) via junctions called SYNAPSES or NEUROMUSCULAR JUNCTIONS. Neurons can be classified according to their function as MOTOR NEURONS, SENSORY NEURONS, or INTERNEURONS. There are various structural types, including UNIPOLAR NEURONS, BIPOLAR NEURONS, and MULTIPOLAR NEURONS. The axons of vertebrate neurons are often surrounded by a MYELIN SHEATH. In contrast to other cell types, neurons possess the capacity to modify their structure and function based on the receipt of information and stimuli from their immediate environment (see NEURAL PLASTICITY). Also called nerve cell. [term coined by German physician Heinrich Wilhelm von Waldeyer-Hartz (1836–1921)] —neuronal adj.
neuronal cell death the selective, genetically programmed death of nerve cells that occurs during development of the nervous system. See also PROGRAMMED CELL DEATH.

neuronal differentiation the final stage in the development of neurons, during which they increase in size, produce more dendrites, extend their axons farther away from the cell body, and form new connections with other cells. In humans, neuronal development begins when the fetus is about 20 weeks old and continues after birth and throughout the lifespan.

neuronal group selection see NEURAL D ARWINISM.

neuronal regeneration see NEURAL REGENERATION.

neuronal transmission see NEUROTRANSMISSION.

neuron doctrine the principle that the nervous system is composed of individual cells (neurons) that make contact with each other but do not interpenetrate. Before this doctrine was accepted, many assumed that the nervous system consisted of continuous tubelike units. Also called neuron theory. [presented in 1891 by German physician Heinrich Wilhelm von Waldeyer-Hartz (1836–1921)]

neurone n. see NEURON.

Neurontin n. a trade name for GABAPENTIN.

neuroparalytic ophthalmia see OPHTHALMIA.

neuropathic pain pain caused by damage to peripheral nerves.

neuropathology n. the study of diseases of the nervous system. —neuropathological adj. —neuropathologist n.

neuropathy n. disease of the nervous system, particularly the peripheral nerves. See PERIPHERAL NEUROPATHY. —neuropathic adj.

neuropedagogy n. see NEUROEDUCATION.

neuropeptide n. any of several peptides that are released by neurons as NEUROTRANSMITTERS of NEUROHORMONES. They include the ENDOGENOUS OPIOIDS (e.g., enkephalin, endorphin); peptides found in both the brain and the peripheral nervous system (e.g., SUBSTANCE P, NEUROTENSIN); hypothalamic RELEASING HORMONES (e.g., thyrotropin-releasing hormone); pituitary hormones (e.g., GROWTH HORMONE, PROLACTIN); and other circulating peptides (e.g., atrial natriuretic peptide, bradykinin).

neuropeptide Y a neuropeptide transmitter found in the brain, heart, and adrenal glands that stimulates vasoconstriction and regulates feeding behavior. Some research suggests that it may have a role in Alzheimer’s disease.

neuropsychology n. the scientific study of the effects of drugs on the nervous system. —neuropsychological adj. —neuropsychologist n.

neuropharmacology n. the scientific study of the effects of drugs on the nervous system. —neuropsychological adj. —neuropsychologist n.

neurophysiology n. a branch of NEUROSCIENCE that is concerned with the normal and abnormal functioning of the nervous system, including the chemical and electrical activities of individual neurons. —neurophysiological adj. —neurophysiologist n.

neuropil n. a weblike network of AXON and DENDRITE filaments that forms the bulk of the GRAY MATTER of the central nervous system. The CELL BODIES of neurons are embedded in the network of fibers.

neuroplasticity n. see NEURAL PLASTICITY.

neuroprotective adj. denoting agents, such as drugs and hormones, that are believed to prevent damage to the brain or spinal cord.

neuropsychological assessment an evaluation of the presence, nature, and extent of brain damage or dysfunction derived from the results of various NEUROPSYCHOLOGICAL TESTS.

Neuropsychological Assessment Battery (NAB) an integrated battery consisting of 33 tests for assessing cognitive skills in adults (ages 18–97) with a variety of neurological disorders. The tests are organized in six modules, including five domain-specific modules (comprised of tests for attention, language, memory, spatial ability, and executive functions) and a screening module. Among the tests included in the domain-specific modules are five whose cognitive demands resemble those in the everyday environment so as to assess cognitive daily living skills: Driving Scenes (in the Attention module), Bill Payment (Language module), Daily Living Memory (Memory module), Map Reading (Spatial module), and Judgment (Executive Functions module). [published in 2003 by U.S. neuropsychologists Robert A. Stern and Travis White]

neuropsychological test any of various clinical instruments for assessing cognitive impairment, including those measuring memory, language, learning, attention, and visuospatial and visuoconstructive functioning. Examples are the TRAIL MAKING TEST, STROOP COLOR–WORD INTERFERENCE TEST, and COMPLEX FIGURE TEST.

neuropsychology n. the branch of science that studies the physiological processes of the nervous system and relates them to behavior and cognition, in terms both of their normal function and of the dysfunctional processes associated with brain damage. See also CLINICAL NEUROPSYCHOLOGY; COGNITIVE NEUROPSYCHOLOGY; COMPARATIVE NEUROPSYCHOLOGY; EXPERIMENTAL NEUROPSYCHOLOGY; PEDIATRIC NEUROPSYCHOLOGY; REHABILITATION NEUROPSYCHOLOGY; SCHOOL NEUROPSYCHOLOGY. —neuropsychological adj. —neuropsychologist n.

neuroreceptor n. a molecule located in a neuron cell membrane that binds molecules of a particular neurotransmitter, hormone, drug, or the like and initiates a particular response within the neuron. Also called neuronal receptor; neurotransmitter receptor; receptor molecule.

neuroregulator n. any of various chemical substances that act on neurons and that are generally classified as NEUROHORMONES, NEUROMODULATORS, and NEUROTTRANSMITTERS.

neuroscience n. the scientific study of the nervous system, including NEUROANATOMY, NEUROBIOLOGY, NEUROCHEMISTRY, NEUROPHYSIOLOGY, and NEUROPHARMACOLOGY, and its applications in psychology, psychiatry, and neurology. See also BEHAVIORAL NEUROSCIENCE; CLINICAL NEUROSCIENCE; COGNITIVE NEUROSCIENCE.

neurosecretion n. 1. the secretion of substances, such as hormones or neurotransmitters, by neural tissue. 2. a substance secreted in this way.

neurosecretory cell see NEUROENDOCRINOLOGY.

neurosignature n. see NEUROMATRIX THEORY.

neurosis n. any one of a variety of mental disorders characterized by significant anxiety or other distressing
emotional symptoms, such as persistent and irrational fears, obsessive thoughts, compulsive acts, dissociative states, and somatic and depressive reactions. The symptoms do not involve gross personality disorganization, total lack of insight, or loss of contact with reality (compare PSYCHOSIS). In psychoanalysis, neuroses are generally viewed as exaggerated, unconscious methods of coping with internal conflicts and the anxiety they produce. Most of the disorders that used to be called neuroses are now classified as ANXIETY DISORDERS. Also called psychoneurosis. —neurotic adj., n.

neurosurgery n. surgical procedures performed on the brain, spinal cord, or peripheral nerves for the purpose of restoring functioning or preventing further impairment. See also PSYCHOSURGERY. —neurosurgeon n. —neurosurgical adj.

neurosphils n. a late manifestation of untreated or inadequately treated syphilis, usually occurring years after the initial infection, in which the causative bacterium, Treponema pallidum, damages and destroys the brain and spinal cord. This results in blindness and severe neurological deficits, including memory impairment, inability to concentrate, and behavioral deterioration. See ASYMMETRIC NEUROSPHILS; GENERAL PARASIS; LOCOMOTOR ATAXIA.

neurotensin (NT) n. a NEUROPEPTIDE released from the hypothalamus into the circulation and widely distributed throughout the central nervous system.

neurotherapy n. see NEUROFEEDBACK.

neurotic anxiety in psychoanalytic theory, anxiety that originates in unconscious conflict and is maladaptive in nature; it has a disturbing effect on emotion and behavior and also intensifies resistance to treatment. Neurotic anxiety contrasts with REALISTIC ANXIETY about an external danger or threat and with moral anxiety, which is guilt posited to originate in the superego.

neurotic character see CHARACTER, NEUROSIS.

neurotic conflict 1. in psychoanalytic theory, an INTRAPSYCHIC CONFLICT that leads to persistent maladjustment and emotional disturbance. 2. in the approach of Karen D. HORNEY, the clash that occurs between opposing NEUROTIC NEEDS, such as an excessive need for power and independence and an excessive need for love and dependence. See also NEUROTIC TENDENCY.

neurotic depression a less common name for REACTIVE DEPRESSION or DYSTHYMIC DISORDER.

neurotic inventory a questionnaire designed to reveal a person’s tendency toward NEUROTICISM. Statements are taken from case histories and related material, and the participant indicates agreement or disagreement with each statement. Theoretically, the more statements in which a person exhibits neuroticism, the greater the tendency toward neuroticism.

neuroticism n. 1. the state of being neurotic or a proneness to NEUROSIS. 2. a mild condition of neurosis. 3. one of the dimensions of the FIVE-FACTOR PERSONALITY MODEL and the BIG FIVE PERSONALITY MODEL, characterized by a chronic level of emotional instability and proneness to psychological distress. 4. in EYSENCK’S DIMENSIONS, one of three major dimensions, the others being extraversion and psychoticism. See also FACTOR THEORY OF PERSONALITY.

neurotic need in psychoanalytic theory, an excessive drive or demand that may arise out of the strategies individuals use to defend themselves against BASIC ANXIETY. Karen D. HORNEY enumerated 10 neurotic needs: for affection and approval, for a partner to take over one’s life, for restriction of one’s life, for power, for exploitation of others, for prestige, for admiration, for achievement, for self-sufficiency and independence, and for perfection. When an individual’s personality is dominated by a few neurotic needs, he or she may exhibit a NEUROTIC TENDENCY.

neurotic solution a method of resolving a NEUROTIC CONFLICT by removing it from awareness. [proposed by Karen D. HORNEY]

neurotic trend in the theory of Karen D. HORNEY, any one of three basic tendencies stemming from an individual’s choice of strategies to counteract BASIC ANXIETY. These strategies generate insatiable NEUROTIC NEEDS and include (a) moving toward people, or clinging to others (see COMPLAINT CHARACTER); (b) moving away from people, or insisting on independence and self-dependence (see DETACHED CHARACTER); and (c) moving against people, or seeking power, prestige, and possessions (see AGGRESSIVE CHARACTER).

neurotoxicology n. the study of the effects of toxins and poisons on the nervous system. —neurotoxicological adj.

neurotoxin n. any substance that is destructive to the central or peripheral nervous system, causing temporary or permanent damage. Heavy metals such as lead and mercury; some pesticides and industrial or cleaning solvents, some drugs (e.g., those used in chemotherapy), and snake venom are examples of substances with the capacity (neurotoxicity) to produce this effect. —neurotoxic adj.

neurotransmission n. the process by which a signal or other activity in a neuron is transferred to an adjacent neuron or other cell. Synaptic transmission, which occurs between two neurons via a SYNAPSE, is largely chemical, occurring through the release and binding of NEUROTRANSMITTER, but it may also be electrical (see ELECTRICAL SYNAPSE). Neurotransmission also occurs between a neuron and an effector organ or gland and between a neuron and a skeletal muscle cell (see NEUROMUSCULAR JUNCTION). Also called neural transmission; neuronal transmission.

neurotransmitter n. any of a large number of chemicals that can be released by neurons to mediate transmission of nerve signals across the junctions (SYNAPSES) between neurons. When triggered by a nerve impulse, the neurotransmitter is released from the terminal button (see AXON), travels across the SYNAPTIC CLEFT, and binds to and reacts with RECEPTOR molecules in the postsynaptic membrane. Neurotransmitters include amines (e.g., NOREPI- NESPHINE, SEROTONIN) and amino acids (e.g., GLUTAMATE, GLYCINE). Some neurotransmitters can be categorized as generally excitatory (e.g., glutamate, glycine) or generally inhibitory (e.g. GAMMA-AMINOBUTYRIC ACID). Excitatory neurotransmitters exert a facilitatory or activating downstream effect on postsynaptic neurons. That is, they depolarize the postsynaptic neurons, resulting in a greater likelihood of an ACTION POTENTIAL. Inhibitory neurotransmitters hyperpolarize the postsynaptic neurons—thereby making the intracellular space more negative, and hence, requiring a greater positive charge to overcome—resulting in a smaller likelihood of an action potential. However,
some neurotransmitters have both excitatory and inhibitory receptors; these include ACETYLCHELINE and DOPAMINE. Also called chemical transmitter; synaptic transmitter.

neurotransmitter receptor see neurotransmitter.

neurotransmitter receptor see NEURORECEPTOR.

neurotrophin n. any of various proteins that promote the development and survival of specific populations of neurons. Neurotrophins include nerve growth factor, deficits in the axonal transport of which have been linked to Alzheimer’s disease, and brain-derived neurotrophic factor, which plays a crucial role in cognition, learning, and memory formation by modulating synaptic plasticity. Also called neurotrophic factor.

neurulation n. the process of development of the rudimentary nervous system in early embryonic life, including formation of the neural tube from the neural plate.

neutral color a less common name for an achromatic color.

neutrality n. an approach that is nonjudgmental, as exhibited, for example, by a therapist who refrains from expressing judgments of right and wrong or suggesting what is proper behavior on the part of the client.

neutralization n. in classical psychoanalytic theory, the use of sexual or aggressive energy in the service of the ego—that is, in functions such as problem solving, creative imagination, scientific inquiry, and decision making—rather than for gratification of the instincts. Sublimation uses neutralized energy. Also called taming of the instinct. See also desexualization, neutralize vb.

neutralizer n. a member of a therapy group who plays a role of modifying and controlling impulsive, aggressive, or destructive behaviors of other members of the group. [first described by Russian-born U.S. psychotherapist Samuel Richard Slavson (1890–1981)]

neutral monism a position holding that there is a single substance to reality, but that this is neither physical (body) nor mental (mind). It seeks to avoid both idealism and materialism and the philosophical problems that attend them. William James advocated such a position (see radical empiricism), as did British philosopher Bertrand Russell (1872–1970). However, it has been difficult to convey satisfactorily what the nature of such a substance might be. Compare IDEALISTIC MONISM; NATURAL MONISM. See also MIND–BODY PROBLEM.

neutral point the single wavelength of visible light that appears uncolored (white or gray) to a person with trichromatism (someone with only two cone photopigments, rather than three). The specific wavelength of the neutral point varies according to which photopigment is missing. Those with normal color vision (trichromatism) and three cone photopigments have no neutral point.

neutral stimulus in classical conditioning, a stimulus that does not elicit a response of the sort to be measured as an index of conditioning. For example, the sound of a bell has no effect on salivation, therefore it is a neutral stimulus with respect to salivation and a good candidate for conditioning of that response.

Nevo syndrome see sotos syndrome.

New Age therapy any of a number of popular treatments that lack a sound scientific basis and are generally not accepted by health professionals as valid, effective therapeutic practice. Support for such therapies does not come from independent scientific studies but typically is derived primarily from the “insights” and observations of their founders or from participant feedback. An example of a New Age therapy is rebirthing.

new-look theory a version of cognitive dissonance theory postulating that cognitive dissonance is a result of behavior that causes aversive consequences. The dissonance occurs when a person assumes responsibility for these consequences and experiences physiological arousal that he or she perceives to be negative and a result of the consequences. [originally proposed by U.S. psychologists Joel Cooper (1943– ) and Russell H. Fazio (1952– )]

Newman–Keuls multiple comparison test a statistical procedure in which sets of means are compared following a significant result from an analysis of variance. The mean values of all experimental groups are arranged in order of size and formed into pairs, and the differences between members of each pair are evaluated against a critical value known as the studentized range statistic. Also called Newman–Keuls multiple range test; Newman–Keuls test. [D. Newman, British statistician; M. Keuls, Dutch horticulturalist]

Newtonian view see MAXWELLIAN VIEW. [Isaac Newton]

Newton’s law of color mixture the principle that color mixtures appearing identical to one another will produce the same perceived color when they are mixed with one another. [Isaac Newton]

nexus n. 1. a bond or connection, especially between members of a group or series. 2. a connection of mutual dependence or causality between variables.

Neyman–Pearson theory an approach to formulating two competing hypotheses (the null hypothesis and an alternative hypothesis) and identifying appropriate statistical procedures for choosing between them. It focuses on identifying critical regions, minimizing errors in estimation, and obtaining an appropriate balance in the probability of committing type I errors and type II errors. [Jerzy Neyman (1894–1981), Russian-born U.S. statistician; Egon S. Pearson (1895–1980), British statistician]

NGF abbreviation for nerve growth factor.

NGRI abbreviation for NOT GUILTY BY REASON OF INSANITY.

NGT abbreviation for NOMINAL GROUP TECHNIQUE.

NGU abbreviation for nongonococcal urethritis.

NI abbreviation for null hypothesis.

NHS abbreviation for national health interview survey.

NHST abbreviation for null hypothesis significance testing.

niacin n. see nicotinic acid.

nicotine n. an alkaloid obtained primarily from the tobacco plant (Nicotiana tabacum). Today, nicotine is one of the most widely used psychoactive drugs; it is the primary active ingredient in tobacco and accounts for both the acute pharmacological effects of smoking or chewing tobacco (e.g., a discharge of epinephrine; a sudden release of glucose; an increase in blood pressure, respiration, heart rate, and cutaneous vasoconstriction) and the dependence that develops (see NICOTINE DEPENDENCE; NICOTINE WITH-
nicotine withdrawal. The behavioral effects of the drug include enhanced alertness, decreased reaction time, improved attention, and feelings of calm. Nicotine produces multiple pharmacological effects on the central nervous system by activating nicotinic receptors as well as cannabinoïd and other receptors, thus facilitating the release of several neurotransmitters, particularly dopamine (a reaction similar to that seen with such drugs as cocaine and heroin). In large doses, it is highly poisonous, producing effects such as dizziness, diarrhea, vomiting, tremors, spasms, unconsciousness, heart attack, and potentially death via paralysis of the muscles of respiration. Nicotine was isolated from the tobacco plant in 1828 and was named for the French diplomat Jean Nicot, who introduced tobacco in France in 1560. —nicotinic adj.

nicotine dependence in DSM–IV–TR, a pattern of repeated or compulsive use of nicotine despite significant nicotine-related behavioral, physiological, and psychosocial problems, with tolerance and characteristic withdrawal symptoms if use is suspended (see nicotine withdrawal). The equivalent term in DSM–5 is tobacco use disorder. See also substance dependence.

nicotine withdrawal a characteristic withdrawal syndrome that develops after cessation of (or reduction in) prolonged, heavy nicotine consumption. Two or more of the following are required for a DSM–IV–TR diagnosis of nicotine withdrawal: dysphoria or depressed mood; insomnia; irritability, frustration, or anger; anxiety: difficulty in concentrating; restlessness; decreased heart rate; and increased appetite or weight gain. The equivalent term in DSM–5 is tobacco withdrawal.

nicotinic acid a vitamin of the B complex that serves as an essential precursor of the coenzyme NAD (nicotinamide adenine dinucleotide) and related coenzymes, which are vital for energy metabolism. In 1937, U.S. biochemist Conrad Arnold Elvehjem (1901–1962) discovered that nicotinic acid can prevent or cure pellagra. Also called niacin.

nicotinic acid deficiency see pellagra.

nicotinic receptor (nAChR) a type of acetylcholine receptor that responds to nicotine as well as to acetylcholine. Nicotinic receptors mediate chiefly the excitatory activities of acetylcholine, including those at neuromuscular junctions. There are several nicotinic receptor subtypes, which have various roles; for example, both the α4β2 and α7 nicotinic subtypes have roles in memory. The latter, α7, is being studied as a potential target for the treatment of Alzheimer’s disease and schizophrenia. Also, a large reduction in the α6β3* subtype has been found in Parkinson’s disease. Compare muscarinic receptor.

nictitating membrane a fold of transparent or semi-transparent membrane, present in many vertebrates, that can be drawn laterally over the eye like a third eyelid, independently of the other eyelids. This “blink” (the nictitating membrane response) can be conditioned in a nonhuman animal (e.g., a rabbit) by pairing a puff of air (the unconditioned stimulus) with a light or tone (the conditioned stimulus).

NIDDM abbreviation for noninsulin-dependent diabetes mellitus.

Niemann–Pick disease an inherited group of lipid storage disorders generally marked by a deficiency of the enzyme acid sphingomyelinase and accumulation of lipids in brain tissue and visceral organs. Massive liver and spleen enlargement (hepatomegaly and splenomegaly) may occur. In type A, progressive deterioration of the nervous system, blindness, and death before adulthood are common. In type B, the nervous system is not affected and individuals may live into adulthood. Types C1 and C2 usually appear in childhood but can appear in infancy or adulthood. They are characterized by severe liver disease, jaundice, breathing difficulties, developmental delay, seizures, poor muscle tone, lack of coordination, problems with feeding, and an inability to move the eyes vertically. Type A occurs more frequently among individuals of Ashkenazi (eastern and central European) Jewish descent and is caused by mutations in the NPC1 gene. Also called sphingomyelin lipidosis. See also lipid metabolism disorders. [Albert Niemann (1880–1921) and Ludwig Pick (1868–1944), German physicians]

night blindness a visual impairment marked by partial or complete inability to see objects in a dimly lighted environment. Night blindness can be inherited or due to defective dark adaptation or a dietary deficiency of vitamin A. Also called nctalopia.

night-eating syndrome an eating disorder characterized by insomnia, nocturnal hyperphagia, and morning anorexia that persist for at least 3 months. Recent research suggests night-eating syndrome is related to hormonal irregularities and a disturbed circadian rhythm of food intake, although chronic stress may also be a contributing factor. This type of eating disorder is estimated to affect 1.5% of the global population and is thought to occur in 10%–25% of obese individuals. [first described in 1955 by U.S. psychiatrist Albert J. Stunkard (1922–2014)]

night hospital a unit within a hospital in which patients receive psychiatric care at night but spend the day in the community. See also partial hospitalization.

nightmare n. a frightening or otherwise disturbing dream in which fear, sadness, despair, disgust, or some combination thereof forms the emotional content. Nightmares contain visual imagery and some degree of narrative structure and typically occur during REM sleep. The dreamer tends to awaken suddenly from a nightmare and is immediately alert and aware of his or her surroundings. See nightmare disorder, sleep terror disorder. —nightmarish adj.

nightmare-death syndrome the unexpected and mysterious nocturnal death of an apparently healthy individual that occurs among southeast Asian refugees, especially Hmong, in the United States. It is attributed by some Hmong to a nocturnal spirit encounter and is similar to the Filipino concept of bangungut. Also called sudden unexpected nocturnal-death syndrome.

nightmare disorder in DSM–IV–TR and DSM–5, a sleep disorder characterized by the repeated occurrence of frightening dreams that lead to awakenings from sleep. It was formerly known as dream anxiety disorder. See parasomnia.

night terror see sleep terror disorder.

nigrostriatal tract the neural pathway that extends from the substantia nigra to the striatum of the basal ganglia. It contains dopaminergic neurons and is associated with the production of voluntary movement.

nihilism n. 1. the delusion of nonexistence: a fixed belief
that the mind, body, or the world at large—or parts thereof—no longer exists. Also called **delusion of negation; nihilistic delusion.** 2. the belief that existence is without meaning or value. —nihilistic adj.

**nilutamide** n. see ANTIANDROGEN.

NIMH abbreviation for NATIONAL INSTITUTE OF MENTAL HEALTH.

n-Int abbreviation for NEED FOR INTIMACY.

**ninth cranial nerve** see GLOSSOPHARYNGEAL NERVE.

**nirvana** n. 1. in HINDUISM, a state of liberation or illumination, characterized by the extinction of individual consciousness as it merges into brahman, the eternal Absolute. Nirvana frees one from suffering, death and rebirth, and all brahman consciousness as it merges into

ninth cranial nerve characterized by the extinction of individual consciousness as it merges into

instinct in classical psychoanalytic theory, which Sigmund Freud believed to be universal.

Nissl bodies microscopic particles, consisting of granular endoplasmic reticulum and ribosomes, found in large numbers in the cell bodies of neurons. Nissl bodies can be stained by toluidine blue (**Nissl stain**), which allows measurement of cell-body size and the density of neurons in different regions of the nervous system. Also called **Nissl granules:** Nissl substance; tigroid bodies. [Franz Nissl (1860–1919), German neuropathologist] Nissl method any one of certain techniques used to stain neurons for microscopic examination, especially the use of Nissl stain to reveal Nissl bodies. [Franz Nissl]

nitisus n. in the system of Gottfried Wilhelm Leibniz, the inherent tendency in all monads to strive toward the perfect realization of their innate and appropriate ends. See also ENTелеCHY. [Latin, literally: “effort”]

Nitamin n. a Canadian trade name for TETRABENAZINE.

nitrazepam n. a long-acting BENZODIAZEPINE with a half-life of more than 24 hours, used as a hypnotic. Though nitrazepam has no active metabolic products, its lengthy half-life may cause unwanted accumulation with daily dosing. It is not currently marketed in the United States. Canadian trade name: **Nitoman**.

nitric oxide a compound present in numerous body tissues, where it has a variety of functions. It is synthesized in the body by the enzyme nitric oxide synthase from arginine, nitric oxide adenine dinucleotide phosphate (NADPH), and oxygen. In the brain and other parts of the central nervous system, nitric oxide functions as a neurotransmitter, or as an agent that influences neurotransmitters. In peripheral tissues, it is involved in the relaxation of smooth muscle and thus acts as a vasodilator, as a bronchodilator, and as a relaxant of smooth muscle in the penis and clitoris, being involved in erection and other components of the sexual response.

nitrous oxide an analgesic gas that is commonly used in outpatient dental procedures and as an adjunct in surgical anesthesia. It is also used as a propellant in aerosolized foods (e.g., whipped cream). In low doses, nitrous oxide produces sensations of giddiness, elation, and euphoria. This property was apparent when it was initially synthesized in 1772 by British chemist Joseph Priestley (1733–1804), and nitrous oxide has long been known colloquially as laughing gas. Its euphoriant effects make nitrous oxide a popular inhalant in social settings. Also called dinitrogen monoxide.

Nizoral n. a trade name for KETOCONAZOLE.

**NK cell** abbreviation for NATURAL KILLER CELL.

NLD abbreviation for NONVERBAL LEARNING DISORDER. NMDA N-methyl-D-aspartate: an agonist that binds to a class of GLUTAMATE RECEPTORS that are both ligand-gated and voltage-sensitive (see NMHA receptor).

**NMDA receptor** a type of GLUTAMATE RECEPTOR that binds NMDA as well as glutamate. NMDA receptors are coupled to LIGAND-GATED ION CHANNELS, and are also voltage-sensitive, which enables them to participate in a variety of information-processing operations at synapses where glutamate is the neurotransmitter. The drugs of abuse KETAMINE and PCP are antagonists at NMDA receptors, preventing the influx of calcium ions at CALCIUM CHANNELS, which may cause the hallucinogenic effects of these drugs. Excessive flow of calcium ions into the presynaptic neuron via the NMDA receptor is thought to contribute to glutamate toxicity. A hypothesis on the etiology of schizophrenia involves dysfunction of the NMDA glutamate receptor (see GLUTAMATE HYPOTHESIS). Compare AMPA RECEPTOR.

**N-methyl-D-aspartate** n. see NMDA.

NMHA abbreviation for National Mental Health Association. See MENTAL HEALTH AMERICA.

NMR abbreviation for NUCLEAR MAGNETIC RESONANCE.

NNAT abbreviation for NAGLIERI NONVERBAL ABILITY TEST.

**noble savage** a conceit positing that people from nondustrial or nontechnological societies were the most noble of human beings because they were untouched by civilization, which was viewed as a degrading influence on human thought and behavior. Historically, the conceit is associated with ROMANTICISM. [proposed by French philosopher and author Jean-Jacques Rousseau (1712–1778)]

**nocebo** n. an adverse or otherwise unwanted physical or emotional symptom caused by the administration of a PLACEBO.

**No Child Left Behind Act (NCLB)** U.S. federal legislation enacted in 2001 with the intention of raising academic standards, closing achievement gaps, encouraging more school accountability, and offering to families and students more choices in the form of better schools. In order to receive federal educational funding, states are now required to administer standardized tests that measure progress toward achievement of these goals.

nocepetin n. see ENDOGENOUS OPIOID; OPIOID RECEPTOR.

**noception** n. see PAIN PERCEPTION. —noceptive adj.

noceptive reflex a defensive reflex evoked by a painful stimulus or a stimulus that threatens damage to the organism.

**noceceptor** n. a sensory RECEPTOR that responds to stim-
null that are generally painful or detrimental to the organism. Also called pain receptor.

**noctambulation** n. see SLEEPWALKING DISORDER.

**nocti-** (noct-) combining form night.

**noctiphilia (noctophilia)** n. see NYCTOPHILIA.

**nocturia** n. the need to urinate during the night. The condition may simply be the result of excessive fluid intake before going to sleep, but it can also be a sign of a disease of the heart, liver, or reproductive or urinary systems.

**nocturnal adj.** active or occurring during the dark period of the daily cycle. Compare DIURNAL.

**nocturnal emission** an involuntary ejaculation that occurs during a nocturnal dream, known popularly as a wet dream. Studies show that the majority of males experience a nocturnal emission before the age of 21. Orgasm as part of nocturnal dreams is rare among adolescent females but increases among mature females.

**nocturnal enuresis** see ENURESIS.

**nocturnal myoclonus** involuntary jerking of the limbs (MYOCOLONUS) that occurs when a person is falling asleep. The involuntary spasms may occur repeatedly and with sufficient activity to awaken the person. Nocturnal myoclonus is not necessarily a sign of a neurological disorder.

**nodal behavior** in group psychotherapy, a period of increased activity, which may be interpersonally challenging, aggressive, or disorderly, followed by a relatively quiet period of antinodal behavior.

**nodal point** the point in the optical axis of the eye that connects locations in the visual field with their projections on the retina.

**node** n. 1. a point in a graph, tree diagram, or the like at which lines intersect or branch. 2. a single point or unit in an associative model of memory. Nodes typically represent a single concept or feature, are connected to other nodes (usually representing semantically related concepts and features) by links in an associative network, and may be activated or inhibited to varying degrees depending on the conditions. 3. in artificial intelligence, see NEURAL NETWORK. —nodal adj.

**node of Ranvier** any of successive regularly spaced gaps in the MYELIN SHEATH surrounding an axon. The gaps permit the exchange of ions across the plasma membrane at those points, allowing the nerve impulse to leap from one node to the next in so-called SALTATORY CONDUCTION along the axon. [Louis A. Ranvier (1835–1922), French pathologist]

**noëogenesis** n. the production of new knowledge from sensory or cognitive experience. There are three laws of noëogenesis: (a) the apprehension of experience (by which new stimuli are encoded), (b) the eduction of relations (by which the nature of relations between stimuli is inferred), and (c) the eduction of correlates (by which a relation previously inferred is applied in a new context). [proposed in 1923 by Charles Spearman] —noëgenetic adj.

**noesis** n. 1. in philosophy, the exercise of the higher reason or NOUS, especially in its role of apprehending truths that cannot be derived from experience. Compare DIANOIA. 2. in psychology, the functioning of the intellectual or cognitive processes.

**noetic adj.** describing a state of knowledge or memory in which there is awareness of the known or remembered thing but not of one’s personal experience in relation to that thing. Noetic consciousness is a kind of consciousness in which one is aware of facts, concepts, words, and meanings but not of any connection to one’s own experience. Compare ANÉSTIC; AUTONÉTIC. [defined by Endel Tulving]

**no excuse** in REALITY THERAPY, the concept that there are no acceptable reasons to condone irresponsible behavior or attribute it to another source. According to this concept, all behavior stems directly from the client and the client is therefore completely and solely responsible for his or her behavior. [devised by U.S. psychiatrist William Glasser (1925–2013)]

**N-of-1 design** see SINGLE-CASE DESIGN.

N/O/FQ abbreviation for nociceptin/orphanin FQ. See ENDOGENOUS OPiOID; OPIoid ReCEPTOR.

**noise** n. 1. any unwanted sound or, more generally, any unwanted disturbance (e.g., electrical noise). 2. a random or aperiodic waveform whose properties are described statistically. There are many types of noise, which are distinguished by their spectral or statistical properties. White noise has equal energy at all frequencies; broadband noise has energy over a relatively wide frequency range (e.g., 50 Hz to 10 kHz for audition); pink noise has energy that is inversely proportional to frequency; and Gaussian noise has instantaneous values that are determined according to a normal probability density function. 3. anything that interferes with, obscures, reduces, or otherwise adversely affects the clarity or precision of an ongoing process, such as the communication of a message or signal.

**noise abatement** the application of legislation or technology to reduce the level of noise pollution. Noise abatement may require the redesign of automobile or aircraft engines, ordinances that prohibit use of airports at night, or the routing of traffic away from residential areas. See also NOISE EFFECTS.

**noise dose** a percentage indicating the amount of noise to which a person is exposed in his or her working environment relative to permissible levels of noise exposure. It is used to determine points at which the employer must apply ENGINEERING CONTROLS or ADMINISTRATIVE CONTROLS.

**noise effects** physiological stress responses to noise, especially if it is prolonged or occurs during demanding cognitive or physical tasks. Noise interferes with the performance of complex tasks and can produce LEARNED HELPlessness, prevent or disturb sleep, and—with provocation—heighten aggression. See also ENVIRONMENTAL STRESS.

**noise-induced hearing loss** hearing loss that develops over time due to continuous exposure to noise. See EXPOSURE DREADNESS.

**noise pollution** any environmental noise (e.g., traffic sounds) that is unwanted or detrimental to one’s health or welfare.

**nomadism** n. 1. a pathological tendency to wander from place to place and repeatedly change one’s residence and occupation, often giving rise to instability and social MALADJUSTMENT. In milder form, this tendency may be an attempt to escape from a distressing situation or from responsibility, but in extreme form, it may be associated with brain damage, epilepsy, intellectual disability, or psychosis. See also DROMOMANIA; PORiOMANIA. 2. the lifestyle...
nomifensine

of a group of people with no fixed residence, characterized by frequent movement from place to place, often in search of resources or in accordance with seasonal changes.

nomifensine n. an antidepressant that is structurally different from any in current use. It blocks the synaptic reuptake of norepinephrine and dopamine but not of serotonin. Due to severe, sometimes fatal, drug reactions, including acute hemolytic anemia, it was withdrawn worldwide in 1986. However, it is still used in research with nonhuman animals. Former U.S. trade name: Merital.

nominal adj. denoting a number that indicates membership in a category, such as coding political party affiliations with a 0 for Democrat, a 1 for Republican, and a 2 for Independent. A nominal value is not an indication of rank order or magnitude. Compare Cardinal; Ordinal.

nominal aphasia see Anomia.

nominal classification see Conceptual Classification.

nominal data numerical values that represent membership in specific categories. For example, the category male could be labeled 0 and the category female labeled 1, with each person in the population of interest (e.g., a particular town) assigned the number corresponding to their sex. Nominal data are similar to Categorical data, and the two terms are often used interchangeably.

nominal group a presumptive, “in name only” group lacking the usual features of a group, such as interaction among members, shared goals, and Group Structure. Such groups are used in experimental studies of group productivity as controls for determining the influence of group interaction on performance.

nominal group technique (NGT) a structured technique of group problem solving that aims to improve the quality of group decisions by reducing the pressures on group members to conform. Individuals first state their ideas privately and anonymously, and these ideas are posted for discussion and clarification. The group votes anonymously on the ideas and then goes through another round of discussion and clarification, followed by another round of voting. The intent is to reach a consensus on the relative merits of the ideas generated by the group.

nominalism n. in medieval philosophy (see Scholasticism), the position that only concrete particulars have real substantial existence, while universals (i.e., general qualities, such as “redness” or “beauty”) are mere names with at most a mental existence. Compare Platonism; Realism. —nominalist adj.

nominal leader an individual who is named to direct and guide a group but does not perform the activities associated with that role. Compare Functional Leader.

nominal realism a young child’s conviction that the name of an object is not just a symbol but an intrinsic part of the object. The tendency toward this conviction also occurs in adults, as shown, for example, in one study in which adult participants refused food that was identified as toxic with a label they knew to be false. Also called word realism. See also Magical Thinking. [First described by Jean Piaget]

nominal scale a sequence of numbers that do not indicate order, magnitude, or a true zero point but rather identify items as belonging to mutually exclusive categories. For example, a nominal scale for the performance of a specific group of people on a particular test might arbitrarily use the number 1 to denote pass and the number 2 to denote fail. Since the numbers represent category labels, they cannot be manipulated mathematically or otherwise quantitatively compared. A nominal scale is one of four types of measurement scale, the others being an Ordinal scale, an Interval scale, and a Ratio scale. See also Categorical scale.

nominal stimulus in stimulus–response experiments, the stimulus as defined and presented by the experimenter. This may be different from the Functional Stimulus experienced by the organism.

nominal variable a variable whose possible values are unordered categories or labels. For example, choice of college major is a nominal variable.

nominative n. the case of a noun, pronoun, or noun phrase that forms the Subject of a clause or sentence. Compare Accusative; Dative; Genitive.

nominative self the self as knower of the self, rather than the self so known. In the psychology of William James, the nominative self, or “I,” is contrasted with the Empirical Self, or “me.”

nomological network a conceptual network: a broadly integrative theoretical framework that identifies the key constructs associated with a phenomenon of interest and the associations among those constructs. For example, psychopathy is a complex notion involving a significant nomological network of knowledge and speculations about components, causes, correlates, and consequences as well as their interrelationships and means of measurement or evaluation.

nomological validity the degree to which a measure assesses the specific construct it is designed to assess, as formulated from the Nomological Network for the construct being measured. See Construct Validity.

nomology n. 1. the science or study of law and lawfulness. 2. the branch of science concerned with the formulation of Natural Laws, especially Causal Laws. A nomological approach is one that strives for causal explanations of phenomena, rather than merely classifying them. See Deductive-Nomological Model. —nomological adj.

nomothetic adj. relating to the formulation of general laws as opposed to the study of an individual case. A nomothetic approach involves the study of groups of people or cases for the purpose of discovering those general and universally valid laws or principles that characterize the average person or case. Compare Idiographic.

nomothetic score a score on a dimension that is common to all people tested (e.g., general intelligence), which implicitly or explicitly compares the individual receiving the score with other individuals receiving a score.

nonaccidental properties visual characteristics of objects that are unaffected by the viewpoint of the observer and therefore provide useful cues for object recognition.

nonactional verb see Actional Verb.

nonadaptive trait a trait that has no specific value with respect to Natural Selection, being neither useful nor harmful for Reproductive Success. In human beings, eye color, earlobe size, and the ability to curl one’s tongue are nonadaptive traits.
nonadditive adj. describing values or measurements that cannot be meaningfully summarized through addition because the resulting total does not correctly reflect the underlying properties of and associations between the component values. For example, if two variables $a$ and $b$ interact to influence another variable $y$, the addition of the separate effects of $a$ and $b$ will not equal the total effect since the contribution of the interaction needs to be included. Compare ADDITIVE.

**nonadherence** n. failure of an individual to follow a prescribed therapeutic regimen. Although nonadherence has traditionally been ascribed to oppositional behavior, it is more likely due to inadequate communication between the practitioner and the individual, physical or cognitive limitations that prevent the patient from following therapeutic recommendations (e.g., physical disabilities), or adverse effects that are not being adequately addressed. A primary aspect of HEALTH PSYCHOLOGY involves methods of reducing nonadherence and increasing adherence. Also called noncompliance.

**nonaggressive society** a culture or subculture whose goal is one of peaceful isolation from or coexistence with its neighbors. Socialization in such societies is marked by de-emphasis of achievement or power needs, disapproval of aggression, and affirmation of basic pleasures.

**nonassociative learning** a process in which an organism’s behavior toward a specific stimulus changes over time in the absence of any evident link to (association with) consequences or other stimuli that would induce such change. Nonassociative learning is thus based on FREQUENCY. There are two major forms of nonassociative learning: HABITUATION and SENSITIZATION. Compare ASSOCIATIVE LEARNING.

**nonattitude n.** an extremely weak attitude that has little persistence over time and minimal resistance to persuasion. Such attitudes have little impact on information processing and behavior. In extreme cases, nonattitudes may be reports of attitudes that reflect no meaningful evaluation of the ATTITUDE OBJECT. See also ATTITUDE STRENGTH [originally proposed by U.S. political scientist Philip E. Converse (1928–1)]

**noncardiac chest pain** recurrent chest pain that cannot be attributed to heart disease. It is commonly caused by problems with the esophagus, such as gastroesophageal reflux disease or esophageal spasm, or by musculoskeletal disorders, especially fibromyositis (muscle inflammation). Anxiety and panic attacks can also produce pain that resembles cardiac chest pain. See also PSEUDOANGINA.

**noncentral distribution** a DISTRIBUTION in which the NONCENTRALITY PARAMETER is not equal to zero: In statistical SIGNIFICANCE TESTING, such a distribution is obtained when the NULL HYPOTHESIS under test is false. The noncentral version of a distribution has a different mean, skewness, and VARIANCE (among other properties) than its corresponding central distribution, as well as a larger proportion of numbers beyond the CRITICAL VALUES. For example, the CHI-SQUARE DISTRIBUTION, F DISTRIBUTION, and T DISTRIBUTION all have corresponding noncentral versions signified by a noncentrality parameter that is not equal to zero.

**noncentrality parameter** in many PROBABILITY DISTRIBUTIONS used in SIGNIFICANCE TESTING, a PARAMETER that has a value different from zero when the NULL HYPOTHESIS under test is false. This parameter is important in determining the POWER of a statistical procedure. See NONCENTRAL DISTRIBUTION.

**noncommunicating hydrocephalus** HYDROCEPHALUS associated with blockage of the ventricular system, which interferes with the normal flow and reabsorption of cerebrospinal fluid. It is typically caused by a tumor. Also called OBSSTRUCTIVE HYDROCEPHALUS. Compare COMMUNICATING HYDROCEPHALUS.

**noncompetitive adj.** in pharmacology, referring to a drug that affects a neurotransmitter RECEPTOR while binding at a site other than that bound by the endogenous LI-GAND.

**noncompliance** n. see NONADHERENCE.

**non compos mentis** in law, mentally deficient or legally insane and therefore not responsible for one’s conduct. See INCOMPETENCE; INSANITY. Compare COMPOS MENTIS.

**nonconformity n.** expressing opinions, making judgments, or performing actions that are inconsistent with those of other people or of the normative standards of a social group or situation. Nonconformity can reflect individuals’ ignorance of the group’s standards, an inability to reach those standards, independence (as when individuals retain their preferred position despite group pressure to change it), or the ANTI-CONFORMITY of individuals who deliberately disagree with others or act in atypical ways. Compare CONFORMITY.

**nonconscious adj.** 1. describing that which is not explicitly in the contents of conscious experience. 2. describing any cognitive process or event that is not available to introspection or report. 3. a synonym for UNCONSCIOUS. Compare PRECONSCIOUS; SUBCONSCIOUS.

**nonconscious processes** cognitive processes that do not themselves reach consciousness, although they may have consciously experienced outcomes. Highly practiced automatisms (habit components) are an example.

**noncontingent reinforcement** the process or circumstances in which a stimulus known to be effective as a REINFORCER is presented independently of any particular behavior. Because contingencies may arise by accident (see ACCIDENTAL REINFORCEMENT), behavior-independent presentation of stimuli cannot guarantee that no contingency exists between a response and the stimuli. See REINFORCEMENT.

**nondeclarative memory** a collection of various forms of memory that operate automatically and accumulate information that is not accessible to conscious recollection. For instance, one can do something faster if one has done it before, even if one cannot recall the earlier performance. Nondeclarative memory includes PROCEDURAL LEARNING and PRIMING. It does not depend on the MEDIAL TEMPORAL LOBES and is preserved in individuals with MEDIAL TEMPORAL AMNESIA. Compare DECLARATIVE MEMORY.

**nondecremental conduction** the propagation of a nerve impulse along an axon in which the amplitude of the impulse is maintained as it progresses. Compare DECREMENTAL CONDUCTION. See also ALL-OR-NONE LAW.

**nondemand pleasuring** caressing a partner’s body for the sensual pleasure involved, with no expectation of sexual arousal. In sex therapy, this practice, which excludes any touching of breasts or genitals, is often prescribed to eliminate performance anxiety: It allows a
couple with a sexual dysfunction to begin to enjoy physical relations with each other without the risk of experiencing another coital failure. Also called nondemanding pleasuring.

**nondirected discussion method** a discussion between two or more people about a specific topic without guidelines or restrictions or the intervention of a leader, whose only role is to assign the topic. The goal is to generate participant-directed discussion.

**nondirectional hypothesis** a hypothesis that one experimental group will differ from another without specification of the expected direction of the difference. For example, a researcher might hypothesize that college students will perform differently from elementary school students on a memory task without predicting which group of students will perform better. Also called nondirectional alternative hypothesis: two-tailed (alternative) hypothesis. Compare DIRECTIONAL HYPOTHESIS.

**nondirectional test** a statistical test of an experimental hypothesis that does not specify the expected direction of an effect or a relationship. Also called nondirectional alternative hypothesis: two-tailed test. See NONDIRECTIONAL HYPOTHESIS. Compare DIRECTIONAL TEST.

**nondirective approach** an approach to psychotherapy and counseling in which the therapist or counselor establishes an encouraging atmosphere and clarifies the client’s ideas rather than directing the process. The client leads the way by expressing his or her own feelings, defining his or her own problems, and interpreting his or her own behavior. This approach is a cornerstone of client-centered therapy. [originally advocated by Carl Rogers]

**nondirective counseling** see CLIENT-CENTERED THERAPY.

**nondirective interview** see UNSTRUCTURED INTERVIEW.

**nondirective play therapy** a form of PLAY THERAPY based on the principle that a child has the capacity to revise his or her own attitudes and behavior. The therapist provides a variety of play materials and either assumes a friendly, interested role without giving direct suggestions or interpretations or engages the child in conversation that focuses on the child’s present feelings and present life situations. The therapist’s accepting attitude encourages the child to try new and more appropriate ways of dealing with problems.

**nondirective teaching model** a person-oriented teaching model, associated with Carl Rogers’s approach, that is primarily concerned with helping a student develop the capacity for self-instruction while emphasizing self-discovery, self-understanding, and the realization of the student’s innate potential.

**nondirective therapy** see CLIENT-CENTERED THERAPY.

**nondiscriminated avoidance** see DISCRIMINATED AVOIDANCE.

**nondisjunction** n. the failure of pairs of chromosomes to separate during cell division, with the result that both chromosomes move to the nucleus of one daughter cell.

**non-Duchenne smile** see DUCHENNE SMILE.

**nonepileptic seizure** (NES) an episode that resembles an epileptic seizure but is not produced by an abnormal electrical discharge in the brain. According to the Epilepsy Foundation, such seizures may be classified as physiologic nonepileptic seizures, which are associated with metabolic disturbances (e.g., changes in heart rhythm or sudden drops in blood pressure) and include SYNCOPE and TRANSIENT ISCHEMIC ATTACKS, or as PSYCHOGENIC NONEPILEPTIC SEIZURES. Nonepileptic seizures are also called nonepileptic events (or attacks), pseudoseizures, or pseudosepilepsy, although use of the latter two terms is now discouraged.

**nonequivalent-groups design** a QUASI-EXPERIMENTAL DESIGN in which the responses of a treatment group and a control group are compared on measures collected at the beginning and end of the research. In psychology and other social sciences, these designs often involve self-selection, in which the members of the treatment group are those who volunteer or otherwise seek the treatment whereas the comparison group members do not. Since participants are not assigned to conditions at random, the two groups are likely to exhibit preexisting differences on both measured and unmeasured factors that must be taken into account during statistical analyses. Also called nonequivalent comparison-group design: nonequivalent control-group design.

**nonexperimental adj.** denoting a research project that is lacking manipulation of INDEPENDENT VARIABLES by a researcher or RANDOM ASSIGNMENT of participants to treatment conditions, as in OBSERVATIONAL STUDIES and QUASI-EXPERIMENTAL DESIGNS.

**nonexperimental research** see QUASI-EXPERIMENTAL RESEARCH.

**nonfluency** n. a type of speech that involves disturbances such as dysprosody (altered speech rhythms or intonation), dysarthria (impaired articulation), and oftenagramatism (deviation from grammatical rules).

**nonfluent aphasia** see APHASIA.

**nongenetic inheritance** the transmission of behavioral or physiological functions between generations without any direct genetic basis. For example, because dominant female macaques intervene more frequently and successfully on behalf of their offspring than do subordinate females, the offspring inherit the status of their female parents. The type of maternal care a young rodent or monkey receives can lead to permanent physiological and neurological changes that affect its own parental behavior.

**nongonococcal urethritis** (NGU) an infection of the genital tract, usually sexually transmitted, caused by an agent other than the gonococcus (responsible for gonorrhea), often a strain of chlamydia. The symptoms typically include inflammation of the urethra and sometimes a pus-like discharge (see URETHRITIS). Also called non-specific urethritis (NSU).

**nongraded school** 1. a school that groups students by academic achievement, mental and physical ability, or emotional development rather than by age or grade level. 2. a place of learning that does not use letter or number grades to reflect the quality of a student’s work.

**noninsulin-dependent diabetes mellitus** (NIDDM) see DIABETES MELLITUS.

**nonintentional learning** see INCIDENTAL LEARNING.

**noninvasive adj.** 1. denoting procedures or tests that do not require puncture or incision of the skin or insertion of an instrument or device into the body for diagnosis or treatment. 2. not capable of spreading from one tissue to
another, as in the case of a benign tumor. Compare INVASIVE.

nonjudgmental approach in psychotherapy, the presentation or display of a neutral, noncritical attitude on the part of the therapist to encourage the client to give free expression to ideas and feelings. See also NEUTRALITY.

nonlanguage test see NONVERBAL TEST.

nonlinear adj. describing any relationship between two variables (x and y) that cannot be expressed in the form y = a + bx, where a and b are numerical constants. The relationship therefore does not appear as a straight line when depicted graphically. Compare LINEAR.

nonlinear model any model that attempts to relate the values of an outcome or dependent variable to the explanatory or independent variables using an equation that involves exponents. Compare LINEAR MODEL.

nonlinear regression a procedure for analyzing the relationship between an INDEPENDENT VARIABLE (x) and a DEPENDENT VARIABLE (y) wherein the REGRESSION EQUATION involves exponential forms of x. That is, the changes in y are not consistent for unit changes in the x variable(s) but are a function of the particular values of x. For example, a nonlinear regression model is given by y = a + b1x1 + b2x2 + ... + e, where a indicates the place where the line of BEST FIT crosses the y-axis, b1 indicates the number of units that y changes when x is changed by 1 point, and e is error. Also called CURVILINEAR REGRESSION. Compare LINEAR REGRESSION. See REGRESSION ANALYSIS.

nonlinear relationship an association between two variables in which the direction and rate of change fluctuate. That is, the amount of change in a DEPENDENT VARIABLE (y) varies as a function of the particular value or level of the INDEPENDENT VARIABLE (x). Compare LINEAR RELATIONSHIP.

nonlinear transformation a TRANSFORMATION of a data set that uses a function to change the linear relationship between variables. For example, a normalizing transformation creates a new set of scores that approximate a NORMAL DISTRIBUTION from the original nonnormal data set, and a LOGARITHMIC TRANSFORMATION may be used to convert raw data into a form that more closely matches the ASSUMPTIONS required in particular statistical analyses. Compare LINEAR TRANSFORMATION.

nonliterate adj. 1. denoting a culture or social group that has not developed a written language. 2. see PRELITERATE.

nonmetric adj. describing data that are NOMINAL or ORDINAL, as opposed to INTERVAL DATA or RATIO DATA. Such data cannot be precisely quantified. Examples include yes/no answers or a list ranking individuals on some attribute.

nonmonotonic logic a mathematical reasoning system in which information previously considered correct can be revised and removed in the light of new information. This means that any other information believed to be correct on the basis of the removed information must also be reconsidered. The system is said to be nonmonotonic because information considered correct does not remain the same or grow larger with further reasoning. Nonmonotonic systems are often controlled by “belief revision” or “truth maintenance” algorithms.

nonnormative adj. not conforming to or not reflecting an established NORM more specifically, deviating from a specific standard of comparison for a person or group of people, particularly a standard determined by cultural ideals of how things ought to be. This general term is used in a variety of contexts, referring, for example, to socially deviant or otherwise distinct behavior, ordinary life events happening at unusual times (e.g., a 78-year-old man earning his bachelor’s degree), or statistical results that do not reflect the standard of a measured group (i.e., values well above or below the mean or other measure of CENTRAL TENDENCY). Compare NORMATIVE.

nonnutritive sucking the sucking by infants of objects that do not provide milk (e.g., a thumb, pacifier), in order, for example, to induce calm or aid sleep. The SUCKING REFLEX thus plays a part in the development of emotional control and self-regulation. Nonnutritive sucking has been used in research studies as a way of inferring infant preferences, by observing differences in sucking rate as infants are presented with different stimuli.

nonoffspring nursing see ALLONURSING.

nonovert appeal in marketing and advertising, a technique in which the advertising message is presented by apparently ordinary people who make no obvious attempt to persuade. In nonovert appeals, consumers may be given the impression that they are “overhearing” an independent endorsement of a product. Nonovert appeals are commonly used in television SLICE-OF-LIFE COMMERCIALS.

nonparametric adj. describing any analytic method that does not involve making ASSUMPTIONS about the data of interest. Compare PARAMETRIC.

nonparametric regression a form of REGRESSION ANALYSIS in which the relationship between an outcome or DEPENDENT VARIABLE and one or more predictors or INDEPENDENT VARIABLES is analyzed without the assistance of a preexisting model. In contrast to traditional regression, in which the structure of the REGRESSION EQUATION is known and only the REGRESSION COEFFICIENTS are estimated from the data set, nonparametric regression requires that both the equation and coefficients be determined from the data.

nonparametric statistics statistical procedures in which the nature of the data being analyzed is such that certain common assumptions about the distribution of the attribute(s) in the population being tested (e.g., normality, homogeneity of variance) are not necessary or applicable. Compare PARAMETRIC STATISTICS.

nonparametric test a type of HYPOTHESIS TEST that does not make any assumptions (e.g., of normality or homogeneity of variance) about the population of interest. Nonparametric tests generally are used in situations involving NOMINAL or ORDINAL data. Also called DISTRIBUTION-FREE TEST; NONPARAMETRIC HYPOTHESIS TEST. Compare PARAMETRIC TEST.

nonprescription drug see OVER-THE-COUNTER.

nonprimary motor cortex see MOTOR CORTEX.

nonprimary sensory area see SECONDARY SENSORY AREA.

nonprobability sampling nonrandom selection: any process of choosing a subset of participants or cases from a larger population in which it is impossible to precisely determine each unit’s likelihood of being selected. Examples include CONVENIENCE SAMPLING and QUOTA SAMPLING. Nonprobability sampling makes it difficult to determine
nonrandomized clinical trial

how well the target population is represented by the subset, thus limiting the generalizability of findings. Compare probability sampling.

nonrandomized clinical trial a type of clinical trial in which the participants are not assigned by chance to the different treatment groups or interventions. For example, if participants choose whether to receive a new treatment or an existing standard of care, then the trial would be nonrandomized. Compare randomized clinical trial.

nonrandomized design any of a large number of research designs in which participants or cases are not assigned to experimental conditions via a chance process. For example, field experiments often are nonrandomized. Compare randomized design.

nonrapid-eye-movement sleep see NREM SLEEP.

nonrational adj. 1. incapable of being validated by reason. For example, in the opinion of most modern philosophers, it is impossible to confirm the proposition that God exists. A nonrational belief is not necessarily irrational. 2. describing actions or behaviors that cannot easily be explained in terms of the rational self-interest of the actor.

nonreactive measure see obnitive measure.

nonreassuring fetal status see fetal distress.

nonrecursive model a set of relationships in which a particular variable is sometimes a cause and sometimes an effect, thus suggesting there is a reciprocal relationship between that variable and others in the model. For example, high job satisfaction may lead to increased pay and job responsibility, which in turn may further enhance job satisfaction. Compare recursive model.

nonregulatory drive any generalized state of arousal or motivation that serves functions that are not related to preserving physiological homeostasis and thus are not necessary for the survival of the individual organism (e.g., sex, achievement). Also called general drive. Compare regulatory drive.

non-REM sleep see NREM SLEEP.

nonresponse n. a participant’s failure to answer one or more survey, questionnaire, or test items or to provide a measurement on some study variable. If data values are missing completely at random, then nonresponse does not distort results. In most research situations, however, nonresponse is not a purely random phenomenon; participants who do not answer questions differ in some important, systematic way from those who do answer. The basic method for compensating for such nonresponse (or nonresponder) bias involves estimating the probability that each sample case will become a respondent.

nonresponse rate see refusal rate.

nonreversal shift in discriminations involving two alternatives, a change in contingencies such that stimuli that were irrelevant in the initial phase of training become the relevant stimuli in a later phase. For example, in initial training involving the presentation of squares, circles, and other shapes, white shapes might be designated correct and black ones incorrect. In a following condition, squares might be designated correct and circles incorrect. Compare reversal shift.

nonsedating antihistamine see antihistamine.

nonsense figure a figure that appears to have no meaning since it does not correspond to any common or familiar object and is not a recognizable geometric form, such as a circle or triangle.

nonsense syllable any three-letter nonword used in learning and memory research to study learning of items that do not already have meaning or associations with other information in memory. See also consonant tri-gram. [introduced in 1885 by Hermann ebbinghaus]

non sequitur 1. in logic, a conclusion that does not follow from the premises of an argument; this conclusion may be either true or false. 2. in general usage, any statement that appears puzzlingly unrelated to previous statements. [Latin, literally: “it does not follow”]

nonshared environment in behavior genetic analyses, aspects of an environment that individuals living together (e.g., in a family household) do not share and that therefore cause them to become dissimilar to each other. Examples of nonshared environmental factors include different friends or teachers that siblings in the same household might have at school or elsewhere outside of the home. Also called unshared environment. Compare shared environment.

nonsignificant adj. see not significant.

nonspecific effect a result or consequence whose specific cause or precipitating factors are unknown. An example would be the effect on a patient of the belief that he or she has received medication or some other intervention when no true treatment has been given (see placebo effect).

nonspecificity theory see pattern theory.

nonspecific urethritis (NSU) see nongonococcal urethritis.

nonstriate visual cortex the many regions of cortex that surround the striate cortex and participate in the processing of visual stimuli beyond the simple analysis of features that occurs in striate cortex. The nonstriate visual cortex includes parietal regions associated with visuospatial functions, temporal regions important for object recognition, and cortical areas that contribute to eye movements. It is thus somewhat more extensive than prestriate cortex.

nonsyphilitic interstitial keratitis see Cogan’s syndrome.

nontraditional education 1. an educational plan that does not conform to the accepted or customary ideas of an ordinary educational system and that may include innovative approaches to teaching, curriculum, grading, or degree requirements. 2. an educational plan that allows an individual to gain credentials without going through the usual channels.

nontraditional marriage a marriage that deviates from the traditional patterns of marriage in a society. In the United States and western Europe, such marriages may
include those that permit the partners to have sexual relations with other people. Compare TRADITIONAL MARRIAGE.

nonulcer dyspepsia see DYSPEPSIA.

nonverbal ability the ability to understand and manipulate nonverbal stimuli, such as colors, patterns, and shapes.

nonverbal auditory agnosia see AUDITORY AGNOSIA.

nonverbal auditory perception test a test that evaluates nonverbal auditory skills, such as the analysis of rhythm and tone and the recognition of nonverbal sounds (e.g., bell, train, mooing cow).

nonverbal behavior actions that can indicate an individual’s attitudes or feelings without speech. Nonverbal behavior can be apparent in facial expressions, gaze direction, INTERPERSONAL DISTANCE, posture and postural changes, and gestures. It serves a number of functions, including providing information to other people (if they can detect and understand the signals), regulating interactions among people, and revealing the degree of intimacy between those present. Nonverbal behavior is often used synonymously with NONVERBAL COMMUNICATION, despite the fact that nonverbal actions are not always intended for, or understood by, other people.

nonverbal communication (NVC) the act of conveying information without the use of words. Nonverbal communication occurs through facial expressions, gestures, body language, tone of voice, and other physical indications of mood, attitude, approbation, and so forth, some of which may require knowledge of the culture or subculture to understand. See also NONVERBAL BEHAVIOR.

nonverbal intelligence an expression of intelligence that does not require language. Nonverbal intelligence can be measured with tests such as RAVEN’S PROGRESSIVE MATRICES and the TEST OF NONVERBAL INTELLIGENCE.

nonverbal leakage see VERBAL LEAKAGE.

nonverbal learning the process of learning about nonverbal materials, such as pictures or drawings, odors, or nonlanguage sounds. Compare VERBAL LEARNING.

nonverbal learning disorder (NLD) a LEARNING DISORDER that is characterized by limited skills in critical thinking and deficits in processing nonverbal information. This affects a child’s academic progress as well as other areas of functioning, which may include social competencies, visual-spatial abilities, motor coordination, and emotional functioning.

nonverbal reinforcement any form of NONVERBAL COMMUNICATION, such as a gesture, facial expression, or body movement, that increases the frequency of the behavior that immediately precedes it. For example, a parent’s smile following a desired response from a child, such as saying “thank you,” reinforces the child’s behavior. See also SOCIAL REINFORCEMENT.

nonverbal test a test in which the questions or problems as well as the answers or solutions are not conveyed in words. Mazes and PERFORMANCE TESTS are examples. Also called nonlanguage test.

nonverbal vocabulary test a test of vocabulary that does not require a verbal response, such as a test in which the participant is required to point to a picture associated with a printed word. An example is the PEABODY PICTURE VOCABULARY TEST.

non-Western therapies alternatives or complements to traditional Western forms of and approaches to treatment that emphasize the body (e.g., acupuncture, yoga) and the interdependency of all beings and de-emphasize individualism and rigid autonomy. These therapies have typically developed outside of Europe and North America. See also COMPLEMENTARY AND ALTERNATIVE MEDICINE.

non-zero-sum game in GAME THEORY, a situation in which the rewards and costs experienced by all players do not balance (i.e., they add up to less than or more than zero). In such a situation, unlike a zero-SUM GAME, one player’s gain is not necessarily another player’s loss.

noology n. the science of the human mind (from Greek nous, “mind, reason”). See NOUS. [coined by Viktor E. Frankl]

Noonan syndrome a genetic disorder that involves the skin, heart, gonads, and skeleton and is transmitted as an autosomal dominant trait. Affected individuals often have short stature, cardiovascular defects, and deafness. Intellectual development varies: Some have above-average intelligence, and most have normal intelligence, but a small percentage have special educational needs or intellectual disability. Male patients are seldom fertile. Also called familial Turner syndrome, Ulrich–Noonan syndrome. [reported in 1963 by Jacqueline Noonan (1928– ), U.S. pediatrician]

nootropic n. an obsolete name for COGNITIVE ENHANCER.

noradrenergic adj. responding to, releasing, or otherwise involving norepinephrine (noradrenaline). For example, a noradrenergic neuron is one that employs norepinephrine as a neurotransmitter.

noradrenergic receptor any of certain receptors in the central nervous system and sympathetic nervous system that bind and respond to norepinephrine (noradrenaline) or substances that mimic its action. See ADRENERGIC RECEPTOR.

norepinephrine (NE) n. a catecholamine NEUROTRANSMITTER and hormone produced mainly by brainstem nuclei and in the adrenal medulla. Also called noradrenaline.

Norflex n. a trade name for ORPHENADRINE.

norm n. 1. a standard or range of values that represents the typical performance of a group or of an individual (of a certain age, for instance) against which comparisons can be made. 2. a conversion of a raw score into a scaled score that is more easily interpretable, such as a percentile or an IQ score. —normative adj.

normal adj. relating to what is considered standard, average, typical, or healthy. This general meaning is applied in a variety of different contexts, including statistics (referring to scores that are within the usual or expected range), biology (referring to the absence of malformation or other pathology), and development (referring to progression and growth that are comparable to those seen in others of similar ages). However, the term is most often applied to behavior that conforms to a culturally accepted norm, especially as an indication that a person is mentally healthy and does not have a psychological disorder.

normal distribution a THEORETICAL DISTRIBUTION in which values pile up in the center at the MEAN and fall off into tails at either end. When plotted, it gives the familiar bell-shaped curve expected when variation about the mean value is random. The normal distribution has several pri-
normality

**n.** 1. a broad concept that is roughly the equivalent of MENTAL HEALTH. Although there are no absolutes and there is considerable cultural variation, some flexible psychological and behavioral criteria can be suggested: (a) freedom from incapacitating internal conflicts; (b) the capacity to think and act in an organized and reasonably effective manner; (c) the ability to cope with the ordinary demands and problems of life; (d) freedom from extreme emotional distress, such as anxiety, despondency, and persistent upset; and (e) the absence of clear-cut symptoms of mental disorder, such as obsessions, phobias, confusion, and disorientation. 2. in statistics, the condition in which a data set presents a NORMAL DISTRIBUTION of values.

**normalization principle** the concept that people with mental or physical disability should not be denied social and sexual relationships and participation in community life merely because of their disability. Social and sexual relationships can include a wide range of emotional and physical contacts, from simple friendship to sexual stimulation and satisfaction. Participation in community life includes engaging in typical everyday activities, such as work and recreation. See also SOCIAL ROLE VALORIZATION. [introduced in 1969 by Swedish psychologist Bengt Nirje (1924–2006)]

**normalize** vb. to apply a TRANSFORMATION to data to produce a new set of scores that approximately follow the NORMAL DISTRIBUTION.

**normal-pressure hydrocephalus (NPH)** HYDROCEPHALUS associated with ventricular enlargement but normal intracranial pressure. NPH is classically associated with the symptom triad of dementia, gait disturbances, and urinary incontinence. Most common in older adults, the condition frequently benefits from shunting procedures, though complications may occur.

**normal random variable** any RANDOM VARIABLE whose values are theoretically infinite but follow a NORMAL DISTRIBUTION that is centered around the MEAN for the population and that has a STANDARD DEVIATION matching that of the population. A STANDARD NORMAL VARIABLE is similar but has a mean of 0 and a standard deviation of 1.

**normal saline** see PHYSIOLOGICAL SALINE.

**normal science** a science at the stage of development when it is characterized by a PARADIGM consisting of universal agreement about the nature of the science and its practices, assumptions, and methods, as well as satisfaction with its empirical progress. Compare IMMATURE SCIENCE; PREPARADIGMATIC SCIENCE. See PARADIGM SHIFT; SCIENTIFIC REVOLUTION. [proposed by U.S. philosopher of science Thomas Kuhn (1922–1996)]

**normal score** see STANDARDIZED SCORE.

**normal variable** see NORMAL RANDOM VARIABLE.

**Norman and Shallice model** see CONTROL OF ACTION MODEL. [Donald A. Norman (1935– ), U.S. cognitive scientist; Timothy Shallice (1940–)]. British neuropsychologist

**normative adj.** relating to a NORM; pertaining to a particular standard of comparison for a person or group of people, often as determined by cultural ideals regarding behavior, achievements or abilities, and other concerns. For example, a normative life event such as marriage or the birth of a child is expected to occur during a similar period within the lifespans of many individuals, and normative data reflect group averages with regard to particular variables or factors, such as the scores of females on a specific test or the language skills of 10-year-olds. Compare NONNORMATIVE.

**normative crisis** see MATURATIONAL CRISIS.

**normative ethics** see ETHICS.

**normative influence** the personal and interpersonal processes that cause individuals to feel, think, and act in ways that are consistent with SOCIAL NORMS, standards, and conventions. Normative influence is partly personal, because individuals who have internalized their group’s norms will strive to act in ways that are consistent with those norms. It is also interpersonal, because groups place direct and indirect pressure on members to comply with their norms. Those who consistently violate the group’s norms are often subjected to negative interpersonal consequences (e.g., ostracism, ridicule, punishment), whereas those who conform are typically rewarded. Also called normative social influence. Compare INFORMATIONAL INFLUENCE; INTERPERSONAL INFLUENCE.

**normative male alexithymia** a subclinical form of ALEXITHYMIA found in boys and men reared to conform to traditional masculine norms that emphasize toughness, teamwork, stoicism, and competition and that discourage the expression of vulnerable emotions. [proposed in 1992 by U.S. clinical psychologist Ronald F. LeVant (1942– )]

**normative-reeducative strategy** in social psychology, the idea that societal change should be based on active reeducation of people within the framework of their cultural milieu. Normative-reeducative strategy holds that a program for social change based only on rational appeal is inadequate because behavioral patterns are largely determined by traditional attitudes and cultural norms. See also EMPIRICAL-RATIONAL STRATEGY; POWER-COERCIVE STRATEGY.

**normative research** research conducted for the purpose of ascertaining NORMS.

**normative scale** any evaluative instrument on which the respondent provides ratings for a series of items or chooses scores to indicate his or her agreement with a series of statements. Unlike an IPSATIVE SCALE, there is no requirement for these scores to sum to a particular total (e.g., 100%). For example, a supervisor using a normative scale to assess an employee’s job performance might be asked to choose a number from 1 to 5 to indicate how well the employee performed in each of several areas, such as communication, timekeeping, and quality of work. The scores
given in any area would not be affected by those given in any of the others (e.g., the supervisor could award all 5s or all 1s if he or she thought this was merited).

**normative science** a scientific approach concerned with establishing norms or typical or desirable values for behavior, education, health, or other cultural or societal factors. In contrast to **descriptive science**, which attempts to characterize behavior and other phenomena as they actually exist, normative science attempts to determine what they should be in order to satisfy various criteria.

**normative social influence** see **normative influence**.

**norm group** see **standardization group**.

**norm of reaction** all possible phenotypic outcomes, or observable characteristics of an individual, that could theoretically result from a given genotype in relation to its environment. See **gene–environment interaction**.

**normosplanchnic type** a constitutional body type that corresponds roughly to the **athletic** type in **Kretschmer** typology. [described by Italian physician Giacinto Viola (1870–1943)]

**normotensive adj.** describing individuals whose blood pressure is within the normal range for their age.

**normotype n.** a constitutional body type that is morphologically average (**eumorphic**).

**norm-referenced test** any assessment in which scores are interpreted by comparison with a **norm**, generally the average score obtained by members of a specified group. For example, a teacher might administer a norm-referenced reading test to the students in his or her classroom, with each person's score indicating how well that test taker reads relative to other examinees of that age. Thus, if a student obtains a score of 70% but the standard test score (norm) for those of the same age is 90%, then the student has done relatively poorly. See also **criterion-referenced test; domain-referenced test**.

**Norpramin n.** a trade name for **Desipramine**.

**Norrie disease** a type of congenital blindness that is inherited in an X-linked recessive pattern or, rarely, is caused by a spontaneous genetic mutation and almost always affects males. Progressive hearing loss is seen in about one third of cases, and more than half of affected individuals experience developmental delays in motor skills such as sitting up and walking. Additional problems associated with this disease are mild to moderate intellectual disability; psychiatric classification nosology—nosological

**nose** n. the organ that contains the sensory tissue (about 600 mm²) that underlies olfactory sensitivity (see **olfactory epithelium**). The major functions of the nose are to modulate the temperature and adjust the humidity of inspired air and to direct that air toward the sensory tissue in the nasal cavity.

**nosocomial** combining form (nos-), nosological—nosological

**nosocomial adj.** denoting or relating to a hospital-acquired infection that is unrelated to the patient's primary illness.

**nosogenesis** see **pathogenesis**.

**nosological approach** a method or procedure that focuses on the naming and classifying of disorders, the identification of their **pathognomonic** signs and symptoms, and their grouping into syndromes for diagnostic purposes. In psychology and psychiatry, the nosological approach contrasts with the **psychodynamic approach**, which emphasizes causal factors.

**nosology** n. the scientific study and classification of diseases and disorders, both mental and physical. See also **psychiatric classification**.

**nosomania** n. a rarely used term for an unfounded, abnormal belief that one is suffering from a particular disease. See **homothesia**.

**nostalgia** n. 1. a longing to return to an earlier period or condition of life recalled as being better than the present in some way. 2. a longing to return to a place to which one feels emotionally bound (e.g., home or a native land). See also **homosickness**.

**no-suicide contract** a specific agreement made between a therapist and a client who is a suicide risk that the client will not take his or her own life. The therapist often establishes this agreement as an intermediary measure (e.g., until the next therapy session). See also **contract**.

**not guilty by reason of insanity** (NGRI) 1. a final judgment made in a court of law that the defendant has been found to lack the mental capacity to be held criminally responsible for his or her actions. See **criminal responsibility**.

**nothingness** n. in **existentialism**, the void associated with the belief that nothing structures existence. Within
Nothnagel's acroparesthesia

this theoretical framework, the nothingness or meaninglessness of human existence is thought to be the primary cause of existential anxiety or anguish.

Nothnagel's acroparesthesia see acroparesthesia. [Carl Wilhelm Hermann Nothnagel (1841–1905), German neurologist]

not me in the self-system theory of Harry Stack Sullivan, the part of the personified self that is based on past interpersonal experiences evoking overwhelming anxiety, dread, and horror and that may lead to nightmares, emotional crises, and schizophrenic reactions. Compare BAD ME; GOOD ME.

not otherwise specified (NOS) in DSM–IV–TR, denoting a broad-based diagnostic category chosen when the patient’s problems seem to fall into a particular family of disorders (e.g., depressive disorders, anxiety disorders) but do not precisely meet the criteria established for specific diagnoses within that family. DSM–5 has replaced this designation with two alternatives—either other specified disorder or unspecified disorder—for clinicians to use when describing a patient whose presenting symptoms do not meet formal criteria for a specific diagnosis; for example, a clinician may describe an individual as having an “unspecified depressive disorder.”

no-treatment control group a control group whose members are not exposed to any experimental manipulation or intervention, thus serving as a neutral comparison for study groups receiving the treatment under investigation. For example, a researcher investigating the effectiveness of a new antidepressant might divide participants into a treatment group that receives the new medication and a separate no-treatment control group that receives no medication whatsoever, and then compare the outcomes of each group to identify any significant differences. In contrast, an ordinary control group may be administered some standard treatment instead of the experimental one.

not significant (NS) denoting a result from a statistical hypothesis-testing procedure that does not allow the researcher to conclude that differences in the data obtained for different samples are meaningful and legitimate. In other words, a result that is not significant does not permit the rejection of the null hypothesis; any observed differences are considered to be due to chance or random factors. Also called nonsignificant.

noumenon n. (pl. noumena) in the philosophy of Immanuel Kant, a thing in itself as contrasted with a thing known through the senses and human understanding (see PHENOMENON). Although the noumena are the causes of one’s experience, they can never themselves be experienced, as they lie outside time and space; nor can they be apprehended by speculative reason, because the general concepts of quantity, quality, relation, and so forth apply only to phenomena. The ideas of God, freedom, and immortality belong to the noumenal realm but are accessible to human beings through their experience as moral agents.

—noumenal adj.

nous n. in classical Greek philosophy, reason or intellect. Plato considered nous to be the highest form of reason, permitting the apprehension of the fundamental and unchanging principles of reality. Aristotle likewise distinguished between nous, which enables understanding of the essential and nonaccidental, and the knowledge gained from experience, which enables understanding of the temporary and contingent. In later Platonic and Neoplatonic thought, nous was sometimes identified with the rational principle governing the universe itself (see NEOPATONISM).

novel antipsychotic see antipsychotic; atypical antipsychotic.

novelty n. the quality of being new and unusual. It is one of the major determining factors directing attention. The attraction to novelty has been shown to begin as early as 1 year of age; for example, when infants are shown pictures of visual patterns, they will stare longer at a new pattern than at a pattern they have already seen. In consumer behavior, the attraction to novelty is manifested as a desire for a change, even in the absence of dissatisfaction with the present situation. For example, despite satisfaction with a particular product, many consumers will switch to a different brand just because it is new.

novelty preference task a task in which an infant is shown a new object simultaneously with a familiar one. It is used in studies of infant cognition, based on the fact that infants will visually inspect a new object in preference to looking at a familiar object. The duration of the infant’s visual gaze is used to quantify attention, surprise, and novelty versus familiarity. This preference has also been called the discrepancy principle.

novelty seeking 1. a personality trait characterized by a strong interest in having new experiences: it is often associated with risk-taking behavior, and hence the term may be used synonymously with sensation seeking. It is also increasingly the preferred term for NEOPHILIA. 2. see CLINGER’S PSYCHOBIOLOGICAL MODEL OF PERSONALITY; TEMPERAMENT AND CHARACTER INVENTORY.

noxious stimulus an aversive stimulus that can serve as a negative reinforcer of behavior, in severe cases because it causes pain or damage to the experiencing organism and in lesser cases because it is unpleasant.

NPC abbreviation for NEURAL PROGENITOR CELL.

NPDB abbreviation for NATIONAL PRACTITIONER DATA BANK.

NPH abbreviation for NORMAL-PRESSURE HYDROCEPHALUS.

NPI abbreviation for NARCISSISTIC PERSONALITY INVENTORY.

n-Pow abbreviation for NEED FOR POWER.

NPTA abbreviation for National Parent Teachers Association. See PARENT TEACHERS ASSOCIATION.

NREM sleep nonrapid-eye-movement sleep; four SLEEP STAGES in which there is an absence of rapid eye movement (REM) and dreams are relatively uncommon (and usually cannot be recalled upon awakening). The increasing appearance of DELTA WAVES, particularly in Stages 3 and 4, is another prominent index of NREM sleep. Also called non-REM sleep; synchronized sleep. Compare REM SLEEP.

NSAID nonsteroidal anti-inflammatory drug: any of a large class of analgesic and anti-inflammatory agents that includes aspirin, ibuprofen, naproxen, and many others. They achieve their effects by blocking the synthesis of prostaglandins involved in inflammation and the pain response. Concurrent administration of NSAIDs and LITHIUM may result in increased serum levels of lithium.

NSF abbreviation for NATIONAL SCIENCE FOUNDATION.
nuisance variable

NIST abbreviation for nucleus of the solitary tract. See SOLITARY NUCLEUS.

NSU abbreviation for nonspecific urethritis. See NONGONOCOCAL URETHRITIS.

nubile adj. 1. describing a girl or young woman who is of marriageable age, ready for marriage, or going through puberty. 2. describing a sexually attractive young woman. —nubility n.

nuchal rigidity rigidity along the back of the neck, which can be associated with injury or brain disease.

nuclear complex 1. a set of interconnected nuclei in parts of the brain, as in the ventroposterior nuclear complex of the thalamus (see VENTROPOSTERIOR NUCLEUS). 2. a central conflict or problem that is rooted in infancy, such as feelings of inferiority (according to Alfred Adler) or the OEDIPUS COMPLEX (according to Sigmund Freud).

nuclear envelope see NUCLEOPLEASM.

nuclear family a family unit consisting of two parents and their dependent children (whether biological or adopted). With various modifications, the nuclear family has been and remains the norm in developed Western societies. Compare EXTENDED FAMILY; PERMEABLE FAMILY.

nuclear imaging imaging that involves scanning for emissions from radioactive isotopes injected into the body. Techniques include POSTION EMISSION TOMOGRAPHY and SINGLE PHOTON EMISSION COMPUTED TOMOGRAPHY. These forms of scanning yield information not only about the anatomy of an organ but also about its functions; they are therefore valuable for medical diagnosis and research. See also BRAIN IMAGING.

nuclear magnetic resonance (NMR) the response of atomic nuclei to changes in a strong magnetic field. The atoms give off weak electric signals, which can be recorded by detectors placed around the body and used for imaging parts of the body, including the brain. See BRAIN IMAGING; MAGNETIC RESONANCE IMAGING.

nuclear schizophrenia a type of schizophrenia in which the defining features, including social inadequacy and withdrawal, blunted affect, and feelings of depersonalization and derealization, are highly similar to those described by Emil Kraepelin for dementia praecox. It is of early, insidious onset and is associated with a degenerative, irreversible course and poor prognosis. This term is often used interchangeably with TRUE SCHIZOPHRENIA. Also called TRUE SCHIZOPHRENIA: TYPICAL SCHIZOPHRENIA. Compare SCHIZOPHRENIFORM PSYCHOSIS. [proposed in the late 1930s by Norwegian psychiatrist Gabriel Langfeldt (1895—1983)]

Nuclear Surety Personnel Reliability Program a special assessment program to achieve safety consistent with operational readiness and to minimize the effects of accidents, incidents, and deficiencies in handling nuclear weapons. At least two authorized people must be present whenever a task is performed with a nuclear weapon. Individuals qualified under the program are trained to perform these duties and to make the appropriate judgments.

nuclear warfare the use of nuclear weapons in combat, which causes enormous destruction with potentially both physical and psychological effects on the survivors.

nuclei pl. n. see NUCLEUS.

nucleic acid a large molecule that consists of a chain of NUCLEOTIDES. Nucleic acids are of two types, DNA and RNA, and are important constituents of living cells.

nucleolus n. (pl. nucleoli) a structure within a cell’s NUCLEUS that is the site of assembly of RIBOSOMES. —nucleolar adj.

nucleoplasm n. the material contained within the NUCLEUS of a cell. It is bound by the nuclear envelope, which separates it from the CYTOPLASM.

nucleotide n. a compound consisting of a nitrogenous base, a sugar, and one or more phosphate groups. Nucleotides such as ATP are important in metabolism. The nucleic acids (DNA and RNA) comprise long chains of nucleotides (i.e., polynucleotides).

nucleus n. (pl. nuclei) 1. a large membrane-bound compartment, found in the cells of nonbacterial organisms, that contains the bulk of the cell’s genetic material in the form of chromosomes. 2. in the central nervous system, a mass of CELL BODIES belonging to neurons with the same or related functions. Examples are the amygdaloid nuclei (see AMYGDALA), the basal nuclei (see BASAL GANGLIA), the thalamic nuclei (see THALAMUS), and the NUCLEUS ACCUMBENS. Compare GANGLION.

nucleus accumbens one of the largest of the septal nuclei (see SEPTAL AREA), which receives dopaminergic innervation from the VENTRAL TGMENTAL AREA. Dopamine release in this region may mediate the reinforcing qualities of many activities, including drug abuse.

nucleus basalis magnocellularis see BASAL NUCLEUS OF MEYNET.

nucleus cuneatus the NUCLEUS in the medulla oblongata that is the termination of the CUNEATE FASCICULUS in the dorsal columns of the spinal cord. Also called CUNEATE NUCLEUS.

nucleus gracilis the NUCLEUS in the medulla oblongata that is the termination of the GRACILE FASCICULUS in the dorsal columns of the spinal cord. Also called GRACILE NUCLEUS.

nucleus of the raphe see RAPHÉ NUCLEUS.

nucleus of the solitary tract (NST) see SOLITARY NUCLEUS.

nuisance parameter in statistical hypothesis testing, a population PARAMETER of secondary interest that must be accounted for in order to obtain an estimated value for a parameter of primary interest. For example, assume a researcher wishes to determine whether male and female schoolchildren differ in their mathematics ability. He or she might administer a math test to a sample of children at a particular school and use that data to estimate male and female means for all children. If, however, the researcher needed to calculate the variance of the scores before attempting to determine the means, the former would be a nuisance parameter.

nuisance variable a type of EXTRANEOUS VARIABLE that does not differ systematically across levels or conditions of the independent variable under investigation but whose variation nonetheless may contribute to an increase in experimental error. Participant characteristics and environmental conditions often are nuisance variables. For example, individuals in a learning study who are distracted by noise in a nearby room may not perform as well as they would otherwise.
null distribution in statistical testing, the probability distribution of values for a particular test statistic that is obtained when the null hypothesis is true. For example, the F ratio from an analysis of variance follows the F distribution if the null hypothesis is correct. Also called null hypothesis distribution. Compare alternative hypothesis distribution.

null finding the situation in which the outcome of a statistical hypothesis-testing procedure indicates that there is no relationship, or no significant relationship, between experimental variables. Also called null result.

null hypothesis (NH; symbol: $H_0$) a statement that a study will find no meaningful differences between the groups or conditions under investigation, such that there is no relationship among the variables of interest and that any variation in observed data is the result of chance or random processes. For example, if a researcher is investigating a new technique to improve the skills of those children who receive the intervention and gating a new technique to improve the skills of children with numerical competence, a component of such a test might be: 6, 9, 13, (e.g., a significant difference between sample means, a correlation that is significantly different from zero). Statistical procedures are applied to research data in an attempt to disprove or reject the NH at a predetermined significance level. See hypothesis testing.

null hypothesis significance testing (NHST) see significance testing.

null result see null finding.

null set see empty set.

number n. in linguistics, a grammatical classification of nouns, pronouns, and any words in agreement with them according to whether they are singular or plural (or in some languages, dual). In English, number is most commonly expressed by the plural noun ending -s (e.g., boy, boys) and in the inflection of the verb to agree with the number of the subject (e.g., The boy runs; The boys run).

number-completion test an intelligence test, or a component of one, in which the subject is required to supply a missing item in a series of numbers or to continue the series. A component of such a test might be: 6, 9, 13, 18, ____ (the next number is 24).

number factor an intelligence factor that is measured by tests of ability to handle numerical problems. See factor theory of intelligence: primary ability.

numbsense n. the ability of some people who have lost feeling in part or all of their body to respond to tactile stimuli in the insensible area. Such individuals insist that they are not aware of any tactile sensations but can nevertheless discriminate between stimuli and point to where they have been presented. See also blindsight; deaf hearing.

numerical ability (N) one of Louis L. Thurstone’s seven primary abilities. Thurstone measured this ability with arithmetic computation problems and relatively simple word problems.

numerical competence the ability of some nonhuman animals to identify the cardinal numbers associated with differing quantities of objects and to arrange these numbers in correct order. Some parrots and chimpanzees can count the number of items presented to them, and some can rank numbers, as in the ascending sequence 1, 5, 8.

numerical variable see quantitative variable.

numerology n. the study of the significance of numbers beyond their numeric value: that is, the mystical or occult meaning of numbers. For example, the date of someone’s birth or a figure derived from the letters of his or her name may be interpreted in terms of its supposed influence on that person’s character and future. See also gematria.

numerosity perception the perception of number (i.e., of constituent elements or of separate objects) by means of visual, auditory, or other sensory systems. See subitize.

Nuremberg code a set of 10 guidelines for conducting research with human participants that was established in 1949 following public discovery of the atrocities committed by Nazi scientists during World War II. The Nuremberg code introduced several important principles, including informed consent and the right of individuals to withdraw participation at any time. See institutional review board: research ethics.

nurse practitioner a registered nurse who has undergone extensive postgraduate training (often in a specialty area, such as internal medicine or pediatrics) and is licensed to perform some of the activities of a physician, including the prescription of medicine. Nurse practitioners generally function under the supervision of physicians but not in their presence.

nursery school see school readiness.

nurse’s aide a person who works in a hospital or nursing home, has completed at least a brief course of health care training, and assists nursing staff in providing care for patients. Also called nurse’s assistant.

nursing n. 1. a health care profession that focuses on the protection and promotion of health through the alleviation and treatment of illness, injury, disease, and physical suffering. Nurses practice in a variety of contexts, including hospitals, nursing and independent-living homes, schools, workplaces, and community centers, among others. In the United States, nurses must graduate from a state-approved school of nursing (a 4-year university program, a 2-year associate degree program, or a 3-year diploma program) and pass a state licensing examination. See also licensed practical nurse; registered nurse. 2. the provision of nourishment by a female for her young offspring until they are capable of obtaining their own food. Nursing in mammals (including humans, in whom it is called breast-feeding) primarily involves the secretion of milk from the mammary glands, as stimulated by the hormone prolactin and oxytocin. Other vertebrates exhibit different forms of nursing behavior. For example, some birds produce a milklike substance (crop milk) within their digestive system that is regurgitated to feed young chicks. The length of the nursing period varies across animals, ranging from mere days (e.g., Sprague–Dawley rats) to several years (e.g., bottlenose dolphins). Regardless of its form or duration, however, successful nursing is critical to survival and often depends on maternally emitted odors (mammary pheromones) to enable the young to locate the nipple and initiate suckling.

nursing home a long-term care facility that provides 24-hour nursing care and supportive services for people
with chronic disability or illness, particularly older people who have mobility, eating, and other self-care problems.

**nurturance n.** 1. the provision of affectionate attention, protection, and encouragement to others. 2. the need or tendency to provide such nurturance.

**nurture 1. n.** the totality of environmental factors that influence the development and behavior of a person, particularly sociocultural and ecological factors such as family attributes, parental child-rearing practices, and economic status. Compare NATURE. See also NATURE–NURTURE. 2. vb. to provide nurturance.

**nutmeg n.** the seed of the trees *Myristica acuminata* and *M. fragrans*, which are indigenous to the Moluccas (Indonesia) and cultivated in South America, the Philippines, and the West Indies. It has a history of folk use as a remedy for stomach and gastrointestinal complaints. Nutmeg has volatile oils containing elemecin, myristicin, and other active ingredients that in sufficient doses produce intoxicating effects, some of which have been compared to those produced by CANNABIS. In larger doses, nutmeg is poisonous; signs of toxicity include abnormally dilated or contracted pupils, hallucinations, severe nausea and vomiting, and rapid heartbeat. See also MACE.

**nutrient n.** any substance required as part of the diet for growth, maintenance, and repair of the body's tissues or as a source of energy. Nutrients include CARBOHYDRATES, fats (see FATTY ACID), PROTEINS (see also AMINO ACID), VITAMINS, and some minerals (e.g., calcium, sodium, potassium).

**nutritional disorder** any medical or psychological condition that results from MALNUTRITION. Such disorders include obesity and vitamin deficiency disorders. See also EATING DISORDER.

**Nuvigil n.** a trade name for armodafinil. See MODAFINIL.

**nux vomica** the seed of a plant, *Strychnos nux vomica*, that grows in tropical Asia and has been used as an emetic (the name means literally “a nut that causes vomiting”). Nux vomica contains two substances, STRYCHNINE and BRUCINE, which are CNS STIMULANTS and highly poisonous, causing powerful, painful convulsions and eventually death from paralysis of respiratory muscles. In low doses, nux vomica increases glandular secretion in the gastrointestinal tract, and it has been used as a homeopathic remedy to stimulate digestion and treat a variety of gastrointestinal conditions.

**NVC** abbreviation for NONVERBAL COMMUNICATION.

**NVD** abbreviation for nausea, vomiting, and diarrhea.

**nyakwana** see EPENA.

**nyctalopia n.** see NIGHT BLINDNESS.

**nyctophilia n.** a strong preference for darkness or night. Also called noctiphilia: noctophilia: scotophilia.

**nympholepsy n.** 1. a type of PEDOPHILIA in which the individual has a strong preference or obsessive desire for young girls who are sexually precocious (*nymphets*: a word coined by Vladimir Nabokov in his 1955 novel *Lolita*). Also called *Lolita complex*. 2. a mania or frenzy, especially of an erotic nature, characterized by a desire for some unattainable ideal. The name is derived from myths in which an individual glimpses a nymph and becomes possessed by a demonic frenzy in pursuit of her.

**nymphomania n.** in females, excessive or uncontrollable desire for sexual stimulation and gratification. The word is often used loosely to denote a high degree of sexuality in a woman, reflecting negative cultural attitudes toward female sexuality. —nymphomaniac n., adj.

**nystagmus n.** involuntary, rapid movement of the eyeballs. The eyeball motion may be rotatory, horizontal, vertical, or a mixture. See also PHYSIOLOGICAL NYSTAGMUS; VESTIBULAR NYSTAGMUS.
**Oo**

O in psychophysical testing, abbreviation for OBSERVER.

OA abbreviation for OVEREATERS ANONYMOUS.

OAEs abbreviation for OTOLACOUSTIC EMISSIONS.

O&M abbreviation for orientation and mobility. See ORIENTATION AND MOBILITY TRAINING.

Obamacare n. see PATIENT PROTECTION AND AFFORDABLE CARE ACT.

obedience n. behavior in compliance with a direct command, often one issued by a person in a position of authority. Examples include a child who cleans his or her room when told to do so by a parent and a soldier who follows the orders of a superior officer. Obedience has the potential to be highly destructive and ethically questionable, however, as demonstrated in the BEHAVIORAL STUDY OF OBEDIENCE. See CONSTRUCTIVE OBEDIENCE; DISTRUPTIVE OBEDIENCE. —obedient adj.

obesity n. the condition of having excess body fat resulting in overweight, variously defined in terms of absolute weight, weight–height ratio (see BODY MASS INDEX), distribution of subcutaneous fat, and societal and aesthetic norms. The basic causes are genetic, environmental, behavioral, or some interaction of these. Overeating may have a psychological cause (see BINGE-EATING DISORDER; FOOD ADDICTION; NIGHT-EATING SYNDROME), but in some cases, it may be due to an organic disorder (see HYPERPHAGIA). Obesity predisposes one to heart disease, diabetes, and other serious medical conditions (see MORBID OBESITY), and obese individuals may develop emotional and psychological problems relating to BODY IMAGE. Therapeutic approaches to obesity include diets, exercise programs, nutritional education, drug therapy, BEHAVIOR MODIFICATION of eating patterns, hormonal treatment when indicated, group support, HYPNOTHERAPY, and PSYCHODYNAMIC PSYCHOTHERAPY focused on insight into the nonconscious purposes served by the individual’s excessive food intake. Bariatric surgery, or gastrointestinal surgery to reduce weight loss, may also be performed in individuals with morbid obesity. —obese adj.

object n. 1. an entity in the environment (i.e., a thing, person, or condition) that acts as a stimulus and elicits a response from an organism; that is, a stimulus object. 2. the focal TARGET of attention, perception, or some other process. 3. the “other” that is, any person or symbolic representation of a person that is not the self and toward whom behavior, cognitions, or affects are directed. 4. in psychoanalytic theory, the person, thing, or part of the body through which an INSTINCT can achieve its aim of gratification. See OBJECT CATHESIS; OBJECT RELATIONS. 5. the person (real or imagined) who is loved by an individual’s ego; his or her love OBJECT. 6. in linguistics, a noun, pronoun, or complex noun that is governed by an active transitive verb or a preposition, such as dinner in I ate dinner or I came after dinner. Objects of verbs can be divided into direct objects (e.g., cake in Mary ate the cake) and indirect objects (e.g., Mary in John gave Mary the cake).

Object Assembly test a performance subtest in the WECHSLER ADULT INTELLIGENCE SCALE that assesses the ability of the participant to construct an object from component pieces that only fit together properly if joined in the correct sequence.

object-based attention a mode of visual attention operating primarily on objects rather than on spatial locations. Compare SPACE-BASED ATTENTION.

object cathexis in classical psychoanalytic theory, the investment of LIBIDO or PSYCHIC ENERGY in objects outside the self, such as a person, goal, idea, or activity. Also called object libido. See CATHESIS.

object choice in psychoanalytic theory, the selection of a person toward whom LIBIDO or PSYCHIC ENERGY is directed. See ANALYTIC OBJECT CHOICE; NARCISSISTIC OBJECT CHOICE.

object color color attributed to a solid object, as opposed to a FILM COLOR, which has no object associated with it.

object constancy 1. in OBJECT RELATIONS THEORY, the ability of an infant to maintain an attachment that is relatively independent of gratification or frustration, based on a cognitive capacity to conceive of a mother who exists when she is out of sight and who has positive attributes when she is unsatisfying. Thus, an infant becomes attached to the mother herself rather than to her tension-reducing ministrations; she comes to exist continuously for the infant and not only during instances of need satisfaction. This investment by an infant in a specific libidinal object indicates that he or she no longer finds people to be interchangeable. 2. see PERCEPTUAL CONSTANCY.

object display a single display that uses a meaningful shape to present different types of information simultaneously. Object displays usually take the form of polygons, changes in the shape of which provide an indication of the status of the system (see EMERGENT FEATURE). Also called configural display.

object identity see IDENTITY.

objectification n. see REIFICATION.

objective 1. adj. having verifiable existence in the external world, independently of any opinion or judgment. 2. adj. impartial or uninfluenced by personal feelings, interpretations, or prejudices. Compare SUBJECTIVE. 3. n. something that is to be obtained or worked toward. See AIM. 4. n. in linguistics, see ACCUSATIVE. 5. n. the lens or lens system in an optical instrument, such as a microscope. Also called object glass; objective lens; object lens.

objective anxiety see REALISTIC ANXIETY.

objective competitive situation a situation in which one or more people evaluate the performance of an individual or team by comparing it either with the performance of another individual or team or with some standard of excellence.

objective elaboration the tendency to generate particular evaluative responses based on the strength of the AR-
object of consciousness

**gumments** contained in a message rather than on factors external to the arguments. See also **BIASED ELABORATION; BIASING FACTOR; ELABORATION.**

**objective indicator** a marker or other measure of an entity, condition, emotion, or behavior that is free of subjective bias; that is, it is not an opinion or rating but an independent measure. An objective indicator is generally viewed as more reliable than a subjective assessment.

**objective prior** see **PRIOR DISTRIBUTION.**

**objective psychology** an approach to psychology that focuses on measurement of behavioral processes or other observable phenomena. Compare **SUBJECTIVE PSYCHOLOGY.**

**objective psychotherapy** a treatment procedure developed primarily for use with institutionalized patients and patients with mild to moderate emotional disturbances. To reduce the subjectivity resulting from a personal relationship with the therapist, all therapeutic communication is carried out in writing. The patient answers written autobiographical questions, relates and comments on dreams, and reacts to assigned readings. In return, the therapist gives interpretations and points out underlying motivations in written memoranda, including a **memorandum as a whole,** which summarizes all the insights reached in the process. [developed by U.S. psychoanalyst Benjamin Karpman (1886–1962)]

**objective reality** the **EXTERNAL WORLD** of physical objects, events, and forces that can be observed, measured, and tested. See **REALITY.**

**objective reference** 1. the activity or condition by which one term or concept is related to another or to objects in the world. 2. the actual object or sensation that is perceived by the senses.

**objective responsibility** in the moral judgment typical of children under the age of 10, the idea that the rightness or wrongness of an act is based almost exclusively on its material result, without consideration of the individual's motives for doing it. For example, accidentally breaking five cups is worse than deliberately breaking one. Compare **SUBJECTIVE RESPONSIBILITY.** [proposed by Jean Piaget]

**objective scoring** scoring a test by means of a key or formula, so that different scorers will arrive at the same score for the same set of responses. It is contrasted with **subjective scoring,** in which the score depends on the scorer's opinion or interpretation of participant responses to items.

**objective self-awareness** a reflective state of self-focused attention in which a person evaluates himself or herself and attempts to attain correctness and consistency in beliefs and behaviors. This involves the viewing of oneself as a separate object, acknowledging limitations and the existing disparity between the ideal self and the actual self. Objective self-awareness is often a necessary part of self-regulation.

**objective set** a **GESTALT PSYCHOLOGY** factor in which the original grouping seen in a display based on objective factors, such as spatial location, will be maintained as the display changes and will continue to be seen when the grouping is objectively ambiguous. See **PERCEPTUAL SET.**

**objective test** a type of assessment instrument consisting of a set of items or questions that have specific correct answers (e.g., **How much is 2 + 2?**), such that no interpretation, judgment, or personal impressions are involved in scoring. **TRUE–FALSE TESTS** are an example. In contrast, short-answer and essay examinations are **SUBJECTIVE TESTS.**

**objectivism** n. 1. the position that judgments about the external world can be established as true or false independent of personal feelings, beliefs, and experiences. 2. in ethics, the position that the ideals, such as “the good,” to which ethical propositions refer are real. Objectivism holds that ethical prescriptions do not reduce to mere statements of personal or cultural preference. Compare **SUBJECTIVISM.**

—**objectivist** n., adj.

**objectivity** n. 1. the tendency to base judgments and interpretations on external data rather than on subjective factors, such as personal feelings, beliefs, and experiences. 2. a quality of a research study such that its hypotheses, choices of variables studied, measurements, techniques of control, and observations are as free from bias as possible. Compare **SUBJECTIVITY.**

**objectivity illusion** the tendency of people to see themselves as more impartial, more insightful, and less biased than others. For example, someone who likes a particular song might think that his or her opinion is based on objective reasoning and assume that the opinion of someone who dislikes the song is subjective and biased. Various studies have shown that people are aware of the objectivity illusion and can recognize it in others yet fail to identify the phenomenon in their own judgments. See also **BIAS BLIND SPOT.**

**object language** a type of computer programming language that emphasizes data rather than processes. Unlike imperative languages, with programs that consist primarily of commands to perform specified actions, object languages support programs that consist primarily of general commands that enable data objects to modify themselves (e.g., **change their values**).

**object learning** the process of making a connection or association between one aspect of an object (e.g., the color of dark chocolate) and another (e.g., the taste of dark chocolate).

**object libido** see **OBJECT CATHEXIS.**

**object-location memory** the ability to remember the location of objects in the environment (e.g., where one put one's car keys).

**object loss** in psychoanalytic theory, the actual loss of a person who has served as a **GOOD OBJECT,** which precedes **INTRODUCTION** and is involved in **SEPARATION ANXIETY.** Anxiety about the possible loss of a good object begins with the infant's panic when separated from its mother. In this perspective, adult grief and mourning are related to object loss and separation anxiety in infancy and childhood, which often intensifies and complicates the grief reaction.

**object love** in psychoanalytic theory, love of a person other than the self. It is a function of the **EGO** and not the instincts, as in **OBJECT CATHEXIS.** See **LOVE OBJECT.**

**object of consciousness** 1. the perceived object as distinct from the perceiver. The separation of observer and observed is criticized as artificial in some phenomenological philosophies (see **PHENOMENOLOGY**). In **BUDDHISM** and **VIJAYANTA** philosophy, there is a related notion that the distinction between the perceived object and the perceiving self is illusory. 2. anything of which the mind is conscious, including perceptions, mental images, emotions, and so forth, as well as the observing ego, or “I,” of subjective experience. Compare **SUBJECT OF CONSCIOUSNESS.**
object of instinct in classical psychoanalytic theory, that which is sought (the external aim, such as a person, object, or behavior) in order to achieve satisfaction (the internal aim). See AIM OF THE INSTINCT.

object permanence knowledge of the continued existence of objects even when they are not directly perceived. According to Jean Piaget, object permanence develops gradually in infants during the sensorimotor stage of cognitive development. Milestones that indicate the acquisition of object permanence include reaching for and retrieving a covered object (about 8 months), retrieving an object at Location B even though it was previously hidden several times at Location A (the A-not-B task; about 12 months), and removing a series of covers to retrieve an object, even though the infant only witnessed the object being hidden under the outermost cover (invisible displacement; about 18 months). Recent research using nonreaching tasks suggests that infants display some knowledge of object permanence at an earlier age than that suggested by Piaget.

object play play that involves the manipulation of items in the environment, such as banging toys together, throwing them around, or arranging them in specific configurations. It is one of three traditionally identified basic types of play (the others being locomotor play and social play) and may occur in a solitary or social context.

object relations 1. an individual’s relationship to his or her entire external world. 2. in psychoanalysis, an individual’s relationships to his or her objects (real and imagined), that is, the persons, activities, or things that function as sources of connection as well as libidinal or aggressive gratification.

object relations psychotherapy a form of psychoanalysis derived from object relations theory; it recognizes the importance of an individual’s early fantasies of and experiences with significant others (objects), especially parents, and aims to identify the internalized objects within the patient.

object relations theory any psychoanalytically based theory that views the need to relate to objects as more central to personality organization and motivation than the unconscious mind, especially when these appear to contradict a given set of political, social, or religious convictions. 2. a deliberate or strategic failure to be clear and lucid in the expression of knowledge or opinion. —obscurantist adj.

observation 1. the careful, close examination of an object, process, or other phenomenon for the purpose of collecting data about it or drawing conclusions. See CONTROLLED OBSERVATION; NATURALISTIC OBSERVATION; PARTICIPANT OBSERVATION. 2. a piece of information (see DATA). —observational adj.

observational learning 1. the acquisition of information, skills, or behavior through watching the performance of others, either directly or via such media as films and videos. Also called vicarious learning. 2. the conditioning of an animal to perform an act that it observes in a member of the same or a different species. For example, the mockingbird can learn to imitate the song patterns of other kinds of birds. Also called vicarious conditioning. See also MODELING THEORY.

observational study research in which the experimenter passively observes the behavior of the participants without any attempt at intervention or manipulation of the behaviors being observed. Such studies typically involve observation of cases under naturalistic conditions rather than the random assignment of cases to experimental conditions: Specially trained individuals record activities, events, or processes as precisely and completely as possible without personal interpretation. Also called observational design; observational method; observational research. See also NATURALISTIC OBSERVATION.

observation coding system a scheme or list of mutually exclusive labels, categories, and so forth—each of which characterizes a coherent dimension of interest—used for classifying information obtained by observing others. It is an essential component of any OBSERVATIONAL STUDY as it clarifies what data should be collected and how, providing definitions of each code along with examples. For instance, a researcher investigating infant behavior might develop the following observation coding system: (1) quiet alert, (2) crying, (3) fussing, and (4) sleeping. Thus, for every time during a specific observation period that an observer sees the baby acting alert, he or she would record...
a 1 on his or her data form; for every time the observer sees the baby crying, he or she would record a 2, and so forth.

**observation delusion** see DELUSION OF OBSERVATION.

**observation hold** the confinement of a person to a hospital by a court order for a limited period of observation, usually to determine COMPETENCY TO STAND TRIAL OR OVERALL LEGAL COMPETENCE.

**observed-score equating** see SCORE EQUATING.

**observed variable** see MANIFEST VARIABLE.

**observer** 1. one who makes or records an OBSERVATION. 2. one who is the subject of, and who attends to presented stimuli in, psychophysical testing. In this sense, the term is abbreviated O. See also IDEAL OBSERVER. 3. in TELEPATHY experiments, a participant who is neither the designated SENDER nor the designated RECEIVER. His or her function is often to guard against EXPERIMENTER BIAS or other methodological errors.

**observer bias** any expectations, beliefs, or personal preferences of a researcher that unintentionally influence his or her recordings during an OBSERVATIONAL STUDY. See EXPERIMENTER EFFECT.

**observer drift** gradual, systematic changes over a period of time by a particular observer in his or her application of criteria for recording or scoring observations. See EXPERIMENTER DRIFT.

**observer memory** an autobiographical memory that one remembers from the perspective of an outside observer. When retrieving an observer memory, the person sees himself or herself as an actor in the event. Also called third-person perspective memory. Compare FIELD MEMORY.

**observing response** behavior that results in the presentation or clarification (e.g., enhanced view) of DISCRIMINATIVE STIMULI.

**obsession** n. a persistent thought, idea, image, or impulse that is experienced as intrusive or inappropriate and results in marked anxiety, distress, or discomfort. Obsessions are often described as EGOCENTRIC in that they are experienced as alien or inconsistent with one's self and outside one's control (though this is not necessarily the case in children). Common obsessions include repeated thoughts about contamination, a need to have things in a particular order or sequence, repeated doubts, aggressive or horrific impulses, and sexual imagery. Obsessions can be distinguished from excessive worries about everyday occurrences in that they are not concerned with real-life problems. The response to an obsession is often an effort to ignore or suppress the thought or impulse or to neutralize it by a COMPULSION. See OBSESSIVE-COMPULSIVE DISORDER. —obsessional adj. —obsessional adj.

**obsessional type** see LIBIDINAL TYPES.

**obsessive behavior** behavior characteristic of obsessive-compulsive personality disorder or obsessive-compulsive disorder, such as persistent brooding, doubting, ruminating, worrying over trifles, or cleaning up and keeping things in perfect order.

**obsessive-compulsive disorder (OCD)** a disorder characterized by recurrent intrusive thoughts (OBSSESSIONS) that prompt the performance of neutralizing rituals (COMPULSIONS). Typical obsessions involve themes of contamination, dirt, or illness (fearing that one will contract or transmit a disease) and doubts about the performance of certain actions (e.g., a preoccupation that one has neglected to turn off a home appliance). Common compulsive behaviors include repetitive cleaning or washing, checking, ordering, repeating, and hoarding. The obsessions and compulsions—which are recognized by affected individuals (though not necessarily by children)—are time consuming (more than 1 hour per day), cause significant distress, and interfere with functioning. Although OCD has traditionally been considered an ANXIETY DISORDER, it is increasingly thought to be in a separate diagnostic category: DSM–5 classifies it under the category OBSESSIVE-COMPULSIVE AND RELATED DISORDERS, along with BODY DYSMORPHIC DISORDER, HOARDING, TRICHOTILLOS...
change in a mental or material condition provides God with the occasion to produce a change in some other mental or material condition. Thus, the material or mental phenomena that might appear to be real and direct causes are merely OCCASIONAL CAUSES. Extreme forms of occasionalism reject causal influence of any mental or material phenomena on any others. Occasionalism was first formulated by French philosopher Nicolas Malebranche (1638–1715), largely as a response to the MIND–BODY PROBLEM arising from CARTESIAN DUALISM. —occasionalist adj.

occasion setter in CLASSICAL CONDITIONING, a stimulus that is differentially paired with a stimulus–stimulus contingency. For example, after presentation of a light, a tone might be followed by the delivery of food. In the absence of the light, the tone is not followed by food. If the tone is effective in eliciting salivation only after the light is presented, the light is designated as an occasion setter.

occasion setting pairing of cues so that one signals when the other will be reinforced. Also called facilitation.

occipital cortex the CEREBRAL CORTEX of the occipital lobe of the brain. See VISUAL CORTEX.

occipital lobe the most posterior (rearward) subdivision of each cerebral hemisphere, roughly shaped like a pyramid and lying under the skull’s occipital bone. It contains several VISUAL AREAS that receive and process visual stimuli, and it is involved in basic visual functions (e.g., visual acuity; contrast sensitivity; perception of color, form, and motion) as well as higher level ones (e.g., figure–ground segregation based on textural cues). A region of this lobe, the OCCIPITAL FACE AREA (OFA), has been identified as crucial to face recognition. See also FUSIFORM GYRUS.

occlusion n. 1. an obstruction or closure. Occlusion of a cerebral artery may cause a thrombotic or embolic STROKE. 2. the simultaneous firing of two branches of the same neuron, which may result in a total output that is less than the sum of the separate responses. —occlusive adj.

occult adj. mysterious, incomprehensible, or secret. The term is mainly applied to certain esoteric traditions of magical belief and practice (see MAGIC) but is sometimes used in reference to other alleged phenomena that cannot be explained in either everyday or scientific terms, such as PREMONITORY DREAMS, CLAIRVOYANCE, and telepathic communications (see TELEPATHY). —occultism n. —occultist n.

occupation n. 1. a family of jobs that involve the performance of similar tasks and have similar requirements in terms of skills, training, and personal attributes. For example, accounting jobs in different organizations will differ to some extent in the tasks performed and level of skill required, but there is enough commonality to place them in the same occupation. See also PROFESSION. 2. in rehabilitation, see OCCUPATIONAL THERAPY. 3. more generally, any activity or pastime. —occupational adj.

occupational ability the ability to perform vocational or professional tasks, generally measured by a series of OCCUPATIONAL TESTS.

occupational adjustment the degree to which an individual’s abilities, interests, and personality are compatible with a particular occupation. The term differs from VOCATIONAL ADJUSTMENT in its emphasis on the interaction between an individual’s personal characteristics and the objective requirements, conditions, and opportunities associated with the job.

occupational analysis the systematic collection, processing, and interpretation of information concerning specific occupations.

occupational biomechanics see BIOMECHANICS.

occupational counseling an early 20th-century approach to vocational guidance. Three steps were identified in the process: (a) relevant knowledge of self; (b) realistic knowledge of occupations, and (c) true reasoning in making sensible choices. [proposed by U.S. educator Frank Parsons (1854–1908)]

occupational cramp painful spasm of the muscles, usually in the hand or arm, that prevents the individual from engaging in an occupation, such as writing, driving, sewing, playing a musical instrument, or firing a gun. It is a form of DYSTONIA. See MUSICIAN’S CRAMP; WRITER’S CRAMP. See also REPETITIVE STRAIN INJURY.

occupational culture a distinctive pattern of thought and behavior shared by members of the same occupation and reflected in their language, values, attitudes, beliefs, and customs. For example, police officers can be regarded as having a distinct culture of this kind. See also ORGANIZATIONAL CULTURE.

occupational disease any disease arising from factors involved with an individual’s job.

occupational ergonomics a specialty area of ERGONOMICS that attempts to make work systems and processes within particular occupations more responsive to the physical, cognitive, and psychosocial characteristics of workers.

occupational health psychology a specialty within psychology devoted to first understanding workplace sources of health, illness, and injury and then applying this knowledge to improve the physical and mental well-being of employees.

occupational interest measure see INTEREST TEST.

occupational neurosis a psychogenic inhibition in which the individual experiences distress and increasing aversion to work, which may be expressed as poor work performance or reactive symptoms of illness (e.g., fatigue, vertigo) that increase in severity as the individual continues to work. In some cases, there is a specific inhibition that interferes with the ability to work, often affecting an essential function necessary for that work, such as WRITTER’S CRAMP, SEAMSTRESS’S CRAMP, or CARDIAC TUNNEL SYNDROME. These inhibitions were originally believed to be CONVERSION symptoms reflecting inner conflicts but have increasingly been found to have a medical explanation. Also called OCCUPATIONAL INHIBITION.

occupational norm the average or typical score obtained from tests of a particular ability, trait, or interest among members of a particular occupation.

occupational psychology see INDUSTRIAL AND ORGANIZATIONAL PSYCHOLOGY.

occupational rehabilitation see VOCATIONAL REHABILITATION.

Occupational Safety and Health Administration (OSHA) a federal agency of the U.S. Department of Labor created to enforce the Occupational Safety and Health Act of 1970 and to establish occupational safety and health standards for all places of employment involved in interstate commerce.

occupational segregation the extent to which people
of the same gender or ethnicity are employed in some occupations to the exclusion of others. For example, the fact that a high proportion of nurses are women could suggest that this may be a sex-segregated occupation.

**occupational status** the degree of esteem accorded to members of an occupation by society. Occupations that are viewed positively are high-status occupations, whereas occupations that are viewed negatively are low-status occupations.

**occupational stress** a physiological and psychological response to events or conditions in the workplace that is detrimental to health and well-being. It is influenced by such factors as autonomy and independence, decision latitude, workload, level of responsibility, job security, physical environment and safety, the nature and pace of work, and relationships with coworkers and supervisors.

**occupational test** a test designed to measure potential ability or actual proficiency in a given occupation. See EMPLOYMENT TEST; WORK-SAMPLE TEST.

**occupational therapy (OT)** for individuals who have been injured or who have an illness, impairment, or other mental or physical disability or disorder, a therapeutic, rehaerbilative process that uses purposeful tasks and activities to improve health; prevent further injury or disability; enhance quality of life; and develop, sustain, or restore the highest possible level of independence. It typically includes assessment of an individual’s FUNCTIONAL STATUS, the development and implementation of a customized treatment program, and recommendations for adaptive modifications in home and work environments as well as training in the use of appropriate ASSISTIVE TECHNOLOGY devices. The term occupation is used by practitioners of the therapy to denote three broad categories of human activity: (a) ACTIVITIES OF DAILY LIVING, (b) work and productive activities, and (c) play or leisure activities.

**OCD** abbreviation for OBSESSIVE-COMPULSIVE DISORDER.

**oceanic feeling** an expansion of consciousness beyond one’s body (limitless extension) and a sense of unlimited power associated with identification with the universe as a whole. According to psychoanalytic theory, this feeling originates in the earliest period of life, before the infant is aware of the outside world or the distinction between the ego and nonego. Oceanic feelings may be revived later in life as a delusion or as part of a religious or spiritual experience.

**oceanic state** a condition of perceived boundlessness of the self, sometimes involving a feeling of omniscience. It may be an ecstatic state, a state of altered awareness, a state of interpersonal connection or spiritual union, or a dissociative experience. See also ALTERED STATE OF CONSCIOUSNESS; COSMIC CONSCIOUSNESS. [introduced by French writer Romain Rolland (1866–1944) and developed by Sigmund FREUD]

**O’Connor v. Donaldson** a 1975 lawsuit in the U.S. Supreme Court in which it was determined that people cannot be involuntarily committed to a facility on the basis of mental illness alone if they are not dangerous to themselves or others and are able to survive safely outside the facility. A lower court ruling in this case cited an Alabama District Court in its final ruling in Wyatt v. Stickney (1972) regarding right to treatment with involuntary commitment (see FORCED TREATMENT; WYATT V. STICKNEY DECISION).

**octave** the interval between two sounds that have a frequency ratio of 2:1. See CENT; MUSICAL INTERVAL.

**octave effect** in conditioning, the phenomenon in which a nonhuman animal, after experiencing reinforcement at one sound frequency, will react to a new frequency an octave away from the original frequency because it is more similar to the original than a frequency within the octave would be.

**ocul-** combining form see **OCULO-**.

**ocular** 1. adj. relating to the eye. 2. n. the eyepiece of a microscope.

**ocular accommodation** see **ACCOMMODATION**.

**ocular apraxia** see **OCULOMOTOR APRAXIA**.

**ocular dominance** a response characteristic of neurons in the STRIATE CORTEX. Many neurons respond more vigorously to stimulation through one eye than they do to stimulation through the other eye.

**ocular dominance column** a vertical slab of STRIATE CORTEX in which the neurons are preferentially responsive to stimulation through one of the two eyes. It is important for binocular vision. Ocular dominance columns for each eye alternate in a regular pattern, so that an electrode inserted tangentially to the cortical surface encounters neurons that are responsive to stimulation through first theipsilateral eye, then the contralateral eye, then back to the ipsilateral eye: vertical electrode penetration of one column encounters neurons in all layers in which the response is dominated by stimulation through the same eye. Compare ORIENTATION COLUMN. See also MONOCULAR REARING. [first described in the 1960s by U.S. neurophysiologist David Hubel (1926–2013) and Swedish neurophysiologist Torsten Wiesel (1924– )]

**ocular dominance histogram** a graph that portrays the strength of response of a neuron to stimuli presented to either the left eye or the right eye. It is used to determine the effects of manipulating visual experience.

**ocular dysmetria** inability to direct saccadic eye movements (see SACCADe) to targets. Eye movements may either fall short of the target (undershooting: **ocular hypometria** or go beyond it (overshooting: **ocular hypermetria**). Ocular dysmetria may be due to an oculomotor deficit (e.g., paralysis of eye muscles), defective visual localization, or impaired visuomotor coordination. Also called saccadic dysmetria.

**ocular flutter** a rapid horizontal oscillation occurring in both eyes when gazing straight ahead. Flutter may also appear following a SACCade (flutter dysmetria). Ocular flutter is typically caused by injury to the cerebellum.

**ocular hypertelorism** see **HYPERTELORISM**.

**ocular myopathy** see **MYOPATHY**.

**ocular palsy** see **OCULOMOTOR PALSY**.

**ocular pursuit** see **VISUAL PURSUIT**.

**oculo-** (ocul-) combining form eye.

**oculocerebral-hypopigmentation syndrome** a rare hereditary disorder marked by eye anomalies, absence of hair and skin pigmentation, intellectual disability, and spasticity. First identified in 1967 in three siblings of an Old Order Amish family, the syndrome is believed to be due to an autosomal recessive trait that becomes manifest through consanguinity (relationship by blood).
oculocerebrorenal syndrome a rare X-linked recessive disorder affecting male children and marked by renal-tubule dysfunction and eye disorders, including congenital glaucoma, cataracts, and distension of the eyeball because of fluid accumulation. The renal disorders include acidosis, hypophosphatemia, and excess amino acids in the urine. Many individuals with the syndrome have delayed development, and intellectual ability ranges from normal to severely impaired. Neurological deficits vary from absence of brain abnormalities to HYDROCEPHALUS and cerebral atrophy. Also called Lowe oculocerebrorenal syndrome: Lowe syndrome.

oculogravic illusion an illusory displacement of an object that may occur when the direction of gravity changes (e.g., a line may appear to tilt in an aircraft during a roll).

oculogyral illusion the apparent movement of a stationary faint light in a dark room when the observer rotates around it, due to involuntary, rapid movements of the eyeballs (VESTIBULAR NYSTAGMUS).

oculogyric crisis prolonged fixation of the eyeballs in a single position for minutes to hours. It may result from encephalitis or be produced by certain antipsychotic drugs. Also called oculogyric spasm.

oculomotor apraxia a condition in which willed (i.e., purposeful) eye movements are impaired. Affected individuals appear to have lost the ability to move their eyes. SMOOTH-PURSUIT EYE MOVEMENTS and SACCades are impaired or even absent when elicited by a target stimulus and when the individual is asked to follow a target. A particular form of oculomotor apraxia is lid apraxia, the inability to close the eyes. Also called ocular apraxia. See also CONGENITAL OCULOMOTOR APRAxia.

oculomotor changes a broad category of effects induced by alteration of the visual environment, such as the adaptation in movement trajectory that occurs with prolonged viewing of the world through prism goggles that invert or displace the visual image.

oculomotor nerve the third CRANIAL NERVE, which contains both motor and sensory fibers and innervates most of the muscles associated with movement and accommodation of the eye and constriction of the pupil (i.e., all the muscles of the eye except the external rectus and superior oblique muscles). Also called cranial nerve III.

oculomotor nucleus a nucleus in the brainstem that is associated with either of the OCULOMOTOR NERVES.

oculomotor palsy paralysis of any of the extrinsic EYE MUSCLES. This may be due to damage to the muscle itself (myogenic), the motor end plate (neuromuscular), or the third, fourth, or sixth cranial nerves (neurogenic). The most common causes are diabetes, hypertension, and multiple sclerosis. Also called ocular palsy.

oculosympathetic paralysis see HORNER’S SYNDROME.

oculovestibular response eye movements that occur when the head is moved. They are used to test integrity of the RETICULAR ACTIVATING SYSTEM after brain injury.

Od n. see REICHENBACH PHENOMENON.

OD 1. n. a colloquial name (an abbreviation) for an OVERDOSE, most often of an opioid or a sedative. 2. vb. to take an overdose. 3. abbreviation for ORGANIZATIONAL DEVELOPMENT.

O data other data: information about an individual gathered from the observations, judgments, and evaluations of third parties who know him or her personally, such as family and friends. See also L DATA; Q DATA; T DATA.

odd–even reliability a method of assessing the reliability of a test by correlating scores on the odd-numbered items with scores on the even-numbered items. The CORRELATION COEFFICIENT between the two halves is adjusted using the SPEARMAN–BROWN PROPENCY FORMULA, which accounts for the decreased size of the odd and even item sets compared to the test as a whole. Odd–even reliability is a special case of SPLIT-HALF RELIABILITY.

odity from sample a procedure similar to MATCHING TO SAMPLE except that reinforcement is arranged for responding to a stimulus that does not match the sample stimulus. Also called oddity learning.

odity problem a learning task in which a nonhuman animal is required to choose an object or stimulus that is in some way different from a target or other possible choices. The purpose is to test the animal’s ability to perceive relationships and differences among a number of similar objects.

odds n. the ratio of the probability of an event occurring to the probability of the event not occurring, usually expressed as the ratio of two integers (e.g., 3:2).

odds ratio (OR) the quotient of two odds. For example, in a study on a drug, the odds ratio is calculated as the odds of an effect in a treated group divided by the odds of the same effect in a control group. A measure of EFFECT SIZE, it varies from 0 to infinity, with a value of 1 indicating no effect and a value of less than 1 indicating a negative effect.

odor n. the property of an odorant that is perceptible as a sensory experience produced by stimulation of the olfactory nerve. See SMELL.

odorant n. an airborne volatile substance that produces an odor sensation. Odorants may differ in both intensity and quality.

odorant-binding protein any one of a small family of proteins that bind to odorants and are carriers of the odorant molecules to the mucus-covered neurons in the OLFACTORY EPITHELIUM.

odorimetry n. see OLFACTOMETRY.

odor prism see HENNIG’S ODOR PRISM.

odorvector n. the vapor of an odorant, which produces sensations of smell. The odorvector may be sensed via the nose (see ORTHONASAL Olfaction) or via the nasopharynx (see RETRONASAL Olfaction). Also called odorivector.

Odyle n. see REICHENBACH PHENOMENON.

oeidal conflict see OEDIPUS COMPLEX.

oeidal phase in the classical psychoanalytic theory of Sigmund Freud, the later portion of the PHALLIC STAGE of psychosexual development, usually between ages 3 and 5, during which the OEDIPUS COMPLEX manifests itself. Also called oeidal stage.

Oedipus complex in classical psychoanalytic theory, the erotic feelings of the son toward the mother, accompanied by rivalry and hostility toward the father, during the PHALLIC STAGE of psychosexual development. Sigmund Freud derived the name from the Greek myth in which Oedipus unknowingly killed his father and married his
mother. Freud saw the Oedipus complex as the basis for neurosis when it is not adequately resolved by the boy’s fear of castration and gradual identification with the father. The corresponding relationship involving the erotic feelings of the daughter toward the father, and rivalry toward the mother, is referred to as the female Oedipus complex, which is posited to be resolved by the threat of losing the mother’s love and by finding fulfillment in the feminine role. Although Freud held the Oedipus complex to be universal, most anthropologists question this universality because there are many cultures in which it does not appear. Contemporary psychoanalytic thought has decentralized the importance of the Oedipus complex and has largely modified the classical theory by emphasizing the earlier, primal relationship between child and mother. Also called oedipal conflict: oedipal situation. See also CASTRATION COMPLEX: NUCLEAR COMPLEX.

OEP abbreviation for olfactory evoked potential. See CHEMOSENSORY EVENT-RELATED POTENTIAL.

OFA abbreviation for occipital face area. See OCCIPITAL LOBE.

off cells (OFF cells) neurons in the visual system, particularly the retina, that depolarize when stimulated by light cessation. See OFF RESPONSE. Compare ON CELLS.

off-center bipolar cell a retinal bipolar cell that is inhibited by light in the center of its receptive field but is excited by light in the surround. See also OFF RESPONSE. Compare ON-CENTER BIPOLAR CELL.

off-center ganglion cell a retinal ganglion cell that is inhibited by light in the center of its receptive field but is excited by light in the surround. See also OFF RESPONSE. Compare ON-CENTER GANGLION CELL.

off-center/on-surround referring to a concentric receptive field in which stimulation of the center inhibits the neuron of interest, whereas stimulation of the surround excites it. See CENTER–SURROUND ANTAGONISM. Compare ON-CENTER/OFF-SURROUND.

off-label adj. denoting or relating to the clinical use of a drug for a purpose that has not been approved by the U.S. Food and Drug Administration. Manufacturers cannot promote drugs for off-label uses, although medical literature may support such uses.

off-line group a group that meets face to face in a conventional setting and uses traditional methods of communication rather than computer-based technology. Compare ONLINE GROUP.

off response (OFF response) the depolarization of a neuron in the visual system that occurs in response to light decrement. Neurons with off responses in the center of their receptive fields are often called OFF CELLS. See also CENTER–SURROUND ANTAGONISM. Compare ON RESPONSE.

off-the-job training interventions to increase the knowledge, skills, and abilities of employees that occur away from the workstation or workplace, often in classroom settings. Compare ON-THE-JOB TRAINING. See also VESTIGIAL TRAINING.

off-time life events events that occur at a nontraditional or unexpected point in the lifespan for members of a given population. Examples are cancer in a child and marriage for a 90-year-old. Compare ON-TIME LIFE EVENTS.

ogive n. the somewhat flattened S-shaped curve typically obtained by graphing a CUMULATIVE FREQUENCY DISTRIBUTION. Consider the example of test results from students in a classroom. Cumulative frequency values would be given along the vertical y-axis and obtained test scores along the horizontal x-axis. The plot would increase slightly at either end, indicating that few students received very low or very high scores, but rise much more steeply in the center, indicating that the majority of students received average scores.

‘ohana n. the family unit in the Hawaiian culture, characterized by a value system that emphasizes multigenerational kinship, including the prescription of age-appropriate roles, connection to one’s ancestors, respect for the wisdom of elders, promotion of the welfare of children, and the overall sustenance of the family system. Similar ways of conceptualizing family are found in other Polynesian cultures.

6-OHDA abbreviation for 6-HYDROXYPYRAMINE.

Ohm’s law the principle that the ear can analyze complex tones into a series of individually perceptible pure tones. [Georg Simon Ohm (1787–1854), German physicist]

-oid suffix likeness or similarity (e.g., ANTHROPOID).

oikofugic adj. having or relating to an urge to travel or wander from home. See DROMOMANIA: NOMADISM.

oikomania n. see ECOMANIA.

oikotopic adj. affected with homesickness or nostalgia for home.

OKR abbreviation for OPTOKINETIC REFLEX.

olan n. see MYRIACHT.

olanzapine n. an ATYPICAL ANTI精神病IC used for the treatment of acute mania, schizophrenia, and other psychotic disorders in adults. It is closely related to clozapine but lacks the latter drug’s association with agranulocytosis. Common side effects are sedation, lethargy, weight gain, and ORTHOSTATIC HYPOTENSION. Rarely, like all antipsychotics, it may be associated with tardive dyskinesia or neuroleptic malignant syndrome. U.S. trade names: Zyprexa, Zydis.

Older Adult Resources and Services a questionnaire used as a community assessment tool to determine the level of functioning of older adults in five areas: mental health, physical health, social resources, economic resources, and ACTIVITIES OF DAILY LIVING. It must be administered by a trained individual. Either the entire questionnaire or one or more segments are given. The questionnaire can be used to evaluate existing services or the need for services for individuals or communities.

oldest old see ADULTHOOD.

old-fashioned racism see MODERN RACISM.

old-old adj. see ADULTHOOD.

Oleptro n. a trade name for TRAZODONE.

olfactie n. a unit for measuring odor intensity, used to calibrate early Olfactometers. It is equal to the intensity of an odorant that just exceeds the ABSOLUTE THRESHOLD.
olfaction

olfaction n. the sense of smell, involving stimulation of receptor cells in the olfactory epithelium (located in the nasal passages) by airborne volatile substances called odorants. Specifically, olfactory receptors extend numerous cilia into the olfactory mucosa in the roof of the nasal cavity; these cilia, together with villi of supporting tissue cells, form a layer of hairlike projections. Molecules of odorants are absorbed into nasal mucus and carried to the olfactory epithelium, where they stimulate the receptor sites of the cilia. The olfactory receptors carry impulses in axonal bundles through tiny holes in the cribriform plate, the bony layer separating the base of the skull from the nasal cavity. On the top surface of the cribriform plate rests the olfactory bulb, which receives the impulses and sends them on to the primary olfactory cortex. —olfactory adj.

olfactometer n. an instrument used to regulate the presentation of odorants. An olfactometer may have tubes that are inserted into the nostrils, or the odorant may be emitted more diffusely into the air surrounding the nose. See blast olfactometer; stream olfactometer.

olfactometry n. the measurement of the acuity of smell. Also called odormetry.

olfactophilia n. sexual interest in and arousal by body odors, especially those from the genital areas.

olfactorium n. a test chamber devised for precise measurement of olfactory function, especially odor sensitivity. The highly controlled environment of the chamber prevents pure air or odorant-bearing air. The testee typically bathes and then puts on a protective suit prior to entering the chamber.

olfactory adaptation a decrease in olfactory sensitivity subsequent to stimulation of the sense of smell. This temporary phenomenon is measured by increases in odor thresholds and reported declines in odor intensities.

olfactory area a brain structure associated with the sense of smell. See periamygdaloid cortex; pyriform area.

olfactory brain see pyriform area; rhinencephalon.

olfactory bulb a bulblike ending on the olfactory nerve in the anterior region of each cerebral hemisphere. This first synapse in the olfactory system picks up excitation from the nose, specifically from the cilia in the olfactory epithelium. See also tufted cell.

olfactory cell see olfactory receptor.

olfactory cillum a hairlike structure arising from an olfactory receptor.

olfactory cortex a three-layered area of cerebral cortex at the base of the temporal lobe that is attached to the olfactory bulb and devoted to the sense of smell. The olfactory cortex receives and interprets information from olfactory receptors in the nasal cavity and is involved in the identification of odors.

olfactory cross-adaptation a reduction in sensitivity to an odor following adaptation to another odor. Unlike other senses, there are usually no changes in the perceived quality of single odorants following adaptation to other single odorants. Cross-adaptation is observed, however, in an odorant mixture that contains the single odorant adapting stimulus.

olfactory dysfunction any alteration in the perception of odor quality or odor sensitivity, such as anosmia, hyposmia, dysosmia, and troposmia.

olfactory encoding see visual encoding.

olfactory epithelium an area of olfactory receptors in the lining of the upper part of the nose. The epithelium is separated from the olfactory bulb by the cribriform plate, through which the receptor cells synapse with cells in the olfactory bulb.

olfactory eroticism pleasurable sensations, particularly of an erotic nature, associated with the sense of smell.

olfactory evoked potential (OEP) see chemosensory event-related potential.

olfactory hallucination a false perception of odors, which are usually unpleasant or repulsive, such as poison gas or decaying flesh.

olfactory mucosa the superior portion of the nasal cavity containing mucus-secreting cells and subsuming the olfactory epithelium, the olfactory nerve, and supporting cells.

olfactory nerve the first cranial nerve, which carries sensory fibers concerned with the sense of smell. It originates in the olfactory lobe and is distributed to olfactory receptors in the nasal mucous membrane. Also called cranial nerve I.

olfactory receptor a spindle-shaped receptor cell in the olfactory epithelium of the nasal cavity that is sensitive to odorants. Cilia at the base of the olfactory receptors contain receptor sites for odorants. The receptors themselves collectively form the olfactory nerve, which synapses with cells in the olfactory bulb. Also called olfactory sense organ. See olfactory stimulation.

olfactory reference syndrome a cluster of symptoms that include an excessive and irrational fear that one is emitting an unpleasant or offensive body odor, typically accompanied by frequent compulsions (e.g., excessive bathing or use of deodorant). These symptoms cause significant distress or impairment in social, occupational, or other important areas of functioning. Olfactory reference syndrome is considered by many to be a form of either body dysmorphic disorder or obsessive-compulsive disorder. Also called autodysmorphia; bromosis. See also Tajik kyotusho.

olfactory sense organ see olfactory receptor.

olfactory stimulation the excitation of the cilia of olfactory receptors in the nasal cavity by inhaled odorants, which are absorbed into nasal mucus. There is little agreement on the precise mechanism involved in this excitation.

olfactory sulcus a groove on the surface of each cerebral hemisphere, on the inferior (lower) side of the frontal lobe.

olfactory system the primary structures and processes involved in an organism’s detection of and responses to odorants. The olfactory system includes several million olfactory receptors in the nasal cavity, the olfactory epithelium and vomeronasal system, olfactory transduction, neural impulses and pathways (see olfactory nerve), and associated brain areas and their functions.

olfactory tract a band of nerve fibers that originates in the olfactory bulb and extends backward along the bot-
tom side of the frontal lobe of the brain to a point called the olfactory trigone, at which point the tract divides into three strands leading to the medial and lateral olfactory gyri and the olfactory tubercle. See also LATERAL OLFACTORY TRACT.

olfactory transduction the sequence of events by which the chemical molecules of an odorant are detected by Olfactory receptors and transformed by the olfactory nerve into electrical signals perceived as smells by the olfactory bulb. As in other sense systems, the conjoint activation of many receptors and the modulating effects of second messengers play important roles in olfactory transduction.

olfactory tubercle a small oval elevation near the base of the olfactory tract that contains auxiliary olfactory nerve fibers and cells. The olfactory tubercle is particularly prominent in nonhuman animals that depend on a sense of smell to survive.

oligarchy n. 1. rule by a small elite group. 2. those who constitute such a group. —oligarchic adj.

oligo- (olig-) combining form few or deficient.

oligodendrocyte n. a type of nonneuronal central nervous system cell (GLIA) that forms MYELIN SHEATHS around axons. Also called oligodenroglia.

oligodendrogloma n. see GLIOMA.

oligohydramnios n. a deficiency of amniotic fluid, which can result in mechanical interference with fetal movements and possible congenital defects, such as clubfoot, torticollis, muscular dystrophy, or brain damage.

oligospermia n. an abnormally low content of spermatozoa in a sample of semen. Oligospermia is one of several factors responsible for male INFERTILITY. The usually accepted minimum level of sperm needed to ensure fertility is 20 million per milliliter.

olisbos n. see DILDO.

olivary nucleus an olive-shaped mass of gray matter in the medulla oblongata, comprised of two sets of nuclei: the inferior olivary complex (or inferior olivary nucleus or inferior olive), which lies on the ventral part of the medulla oblongata and is believed to be involved in motor control; and the superior olivary complex (or superior olivary nucleus or superior olive), which lies in the pons just above the inferior olivary complex and plays a significant role in the perception and localization of sound. Also called olivary body; olivary complex.

Oliver–McFarlane syndrome see TRICHE–MILLER–MELAS SYNDROMES. [first described in 1965 by ophthalmologist Glen L. Oliver (d. 2002) and D. C. McFarlane]

olivocochlear bundle a tract of centrifugal or efferent fibers extending from the superior olivary complex through the descending neural pathways to the cochlear hair cells.

olivopontocerebellar atrophy a slowly progressive neurological disorder characterized by degeneration of neurons in the pons, cerebellum, and olivary nucleus. Symptoms are highly variable across individuals but typically include ataxia, difficulties with balance and walking, tremors, and dysarthria. In many cases, onset is in middle adulthood and death occurs within 10 to 20 years.

-ology suffix see -LOGY.

ololiuqui n. the seed of a Latin American vine. Rivea corymbosa, which contains substances chemically related to LSD but less potent. Ololiuqui was first described in the reports of the 16th-century Spanish physician Francisco Hernández while studying the indigenous peoples of Mexico, who used it for both medicinal and religious purposes.

OLS abbreviation for ordinary least squares. See LEAST SQUARES REGRESSION.

OLSAT acronym for OTIS–LENNON SCHOOL ABILITY TEST.

ombudsman n. a person or program responsible for investigating consumer complaints and grievances and acting as a consumer advocate in resolving problems (e.g., in a health care facility).

omega squared (symbol: $\omega^2$) a measure of the strength of association based on the proportion of variance in one measure predictable from variance in other measures. In analysis of variance, it indicates how much variation in a dependent variable can be explained by variation in one or more independent variables.

omen n. an event that is regarded, rationally or not, as a portent of future good or ill fortune. The study of supernatural omens is known as AUGURY.

omission training see DIFFERENTIAL REINFORCEMENT OF OTHER BEHAVIOR.

omitted variable bias the situation in which values calculated from a statistical model systematically overestimate or underestimate a degree of relationship or other quantity of interest because an important variable has been left out of the model. For example, a researcher could hypothesize a linear regression equation in which stressful life events and lack of social support predict depression. If coping skills also are highly relevant to predicting depression, the researcher’s failure to include that element in his or her conceptualization would create an omitted variable bias. The exclusion of important variables from models may constrain the validity of study findings. See also BIASED ESTIMATOR.

omnibus test 1. any statistical test of significance in which more than two conditions are compared simultaneously or in which there are two or more independent variables. The analysis of variance is an example. For instance, assume a researcher collects data from an experimental design having two independent variables, each of which has three different levels or conditions. He or she could conduct an analysis of variance to concurrently examine the mean values for all levels of each of the variables (and their combinations) in order to determine whether there are any significant differences among them. 2. a type of exam that simultaneously measures several different abilities. For example, a mathematics omnibus test may include items assessing numeracy, algebraic skills, geometric proficiency, and trigonometric competency.

omnipotence n. in psychology, the delusion that one can personally direct, or control, reality outside of the self by thought or wish alone. Psychology generally considers feelings of omnipotence to fall anywhere between neurosis, in its milder forms, and psychosis, when the delusion is expressed as alienation from or outright denial of reality. In psychoanalytic theory, the main emphasis is on the infant’s feeling that he or she is all-powerful, which is thought to arise (a) out of satisfaction of the child’s slightest gesture; (b) out of increasing cognitive and physical abilities; and (c) as a reaction formation to feelings of helplessness.
omnipotent therapist

and anxiety. See also MEgalomania; PRIMARY Narcissism.
—omnipotent adj.

omnipotent therapist see PREstige SUGgEston.

Onanism n. COtitus INTerruptus or MAsturbation. Onanism is named for the biblical character Onan, who "went to his brother's wife and spilled it [his seed] on the ground" (Genesis 38:9).

On cells (ON cells) neurons in the visual system, particularly the retina, that depolarize when the retina is stimulated by light onset. See ON RESPONSE. Compare OFF CELLS.

On-center bipolar cell a RETINAL BIPOLAR CELL that is excited by light in the center of its RECEPTIVE FIELD but is inhibited by light in the surround. See also ON RESPONSE. Compare OFF-CENTER BIPOLAR CELL.

On-center ganglion cell a RETINAL GANGLION CELL that is excited by light in the center of its RECEPTIVE FIELD but is inhibited by light in the surround. See also ON RESPONSE. Compare OFF-CENTER GANGLION CELL.

On-center/off-surround referring to a concentric RECEPTIVE FIELD in which stimulation of the center excites the neuron of interest, whereas stimulation of the surround inhibits it. See CENTER–SURROUND ANTAGONISM. Compare OFF-CENTER/ON-SURROUND.

Oncology n. the study and treatment of benign and malignant tumors (see NEOPLASM). This branch of medicine and of behavioral or population sciences deals with cancer and is subdivided into medical, radiation, surgical, behavioral, and epidemiological subtypes. —oncologist n.

Ondansetron n. a SEROTONIN ANTAGONIST at the 5-HT 3 serotonin receptor that is used for the prevention and treatment of nausea resulting from chemotherapy or anesthesia. When combined with appropriate behavior therapy, it may also be an effective adjunctive agent in managing certain types of alcoholism, although it is not officially approved by the U.S. Food and Drug Administration for such treatment. U.S. trade name: Zofran.

One-factor analysis of variance see ONE-WAY ANALYSIS OF VARIANCE.

One-group pretest–posttest design a variation of the PRETEST–POSTTEST DESIGN in which only a single set of participants is measured on a DEPENDENT VARIABLE of interest, exposed to a treatment or intervention, and then measured again to determine the change or difference between the initial (pre-) and second (post-) measurement. The lack of a CONTROL GROUP in this type of research design makes it difficult to attribute gains in the posttest score to the intervention, as other elements (e.g., participant MATURATION) may have contributed to any change observed. Also called one-group pre–post design.

Oneirism n. a dreamlike state that occurs during wakefulness. —oneiric adj.

Oneiro- (onei-) combining form dreams.

Onei rodynia n. a form of dreaming characterized by nightmares or unpleasant dreams.

Oneiromancy n. the art or practice of divining the future from dreams. See DIVINATION. See also CLAIRVOYANT DREAM; PREMONITORY DREAM.

Oneirop hrenia n. a dreamlike, hallucinatory state resembling schizophrenia in certain symptoms, such as disturbances of emotion and associations, but distinguished from schizophrenia by disturbances of the senses and clouding of consciousness. It is associated with prolonged sleep deprivation, sensory deprivation, or drug use, but it is not widely considered a distinct clinical entity. [first described in the 1950s by Hungarian-born U.S. psychiatrist Ladislas von Meduna (1896–1964)]

One-parameter model see RASCH MODEL.

One-person psychology in RELATIONAL PSYCHOANALYSIS, a term used to characterize CLASSICAL PSYCHOANALYSIS as a perspective that focuses on the patient's intrapsychic life and assumes that the analyst's or therapist's role is largely as an objective observer of manifestations of the patient's dynamics. Compare TWO-PERSON PSYCHOLOGY.

One-sample test see SINGLE-SAMPLE TEST.

One-sample t test see SINGLE-SAMPLE T TEST.

One-shot case study a research design in which a single group is observed on a single occasion after experiencing some event, treatment, or intervention. Because there is no CONTROL GROUP against which to make comparisons, it is a weak design; any changes noted are merely presumed to have been caused by the event.

One-sided message a message containing arguments that solely advocate one side of an issue. It is contrasted with a two-sided message, which predominantly advocates one side but also acknowledges—and sometimes refutes—the other side of an issue. One-sided messages tend to be most effective when recipients are unlikely to generate arguments on the other side of the issue. Two-sided messages are most successful when recipients are likely to generate opposing arguments.

One-tailed hypothesis see DIRECTIONAL HYPOTHESIS.

One-tailed test see DIRECTIONAL TEST.

One-trial learning the mastery of a skill after the first training trial.

One-way analysis of covariance an ANALYSIS OF COVARIANCE in which there is a single INDEPENDENT VARIABLE and one or more COVARIATES whose potential influence needs to be accounted for statistically. For example, assume a researcher is evaluating how three types of instructional methods (three levels of the independent variable) affect scores on an academic achievement test (the DEPENDENT VARIABLE). If the researcher believes general intelligence, gender, and other unmeasured factors could also affect scores, he or she might use a one-way analysis of covariance to control for such covariates when assessing the experimental data.

One-way analysis of variance an ANALYSIS OF VARIANCE that evaluates the influence of different levels or conditions of a single INDEPENDENT VARIABLE upon a DEPENDENT VARIABLE. The mean values of two or more samples are examined in order to determine the probability that they have been drawn from the same population. Also called one-factor analysis of variance.

One-way design an experimental design in which a single INDEPENDENT VARIABLE is manipulated to observe its influence on a DEPENDENT VARIABLE. For example, a researcher could use a one-way design to examine the effect of different amounts of daily exercise (e.g., 0 minutes, 30 minutes, 60 minutes) on mood. Also called single-factor design.
approximately 10 and 18 months, when children use one word at a time when speaking. Complex ideas are sometimes expressed with a single word, accompanied by gestures and emphasis. For example, depending on the context and how the word is spoken, milk may mean That is milk, I want more milk, or I spilled the milk. Also called holophrastic stage. See HOLOPHRASE.

onioamania n. compulsive shopping, or an uncontrollable impulse to spend money and to buy without regard to need or use.

online group a group whose members communicate with one another solely or primarily through computer-based information technologies rather than through face-to-face interactions. Compare OFFLINE GROUP.

online self-help group a group of individuals who communicate over the Internet on a regular basis to help one another cope with a shared life problem. Online groups overcome some of the barriers to participation in traditional SELF-HELP GROUPS, including lack of local group availability and transportation constraints.

online social network a set of interconnected individuals who interact using computer-based technologies rather than through face-to-face interactions. An example is a community of Internet video gamers, the members of which each have defined roles and relationships.

online therapy see E-THERAPY.

on–off cell a type of neuron in the visual system, particularly the retina, that depolarizes when the retina is stimulated with either light onset or light offset.

onomatopoeia n. the formation of a word whose sound replicates to a recognizable degree the sound of the thing or action that it represents, such as hiss, smack, or cuckoo. See also ICONIC SYMBOL. —onomatopoeic adj.

on response (ON response) the depolarization of a neuron in the visual system that occurs in response to light increment. Neurons with on responses in the center of their receptive fields are often called ON CELLS. See also CENTER–SURROUND ANTAGONISM. Compare OFF RESPONSE.

onset insomnia see INITIAL INSOMNIA.

onset of action the point at which the activity of a drug is apparent, generally measured in terms of the time elapsed between administration and the appearance of its pharmacological effects.

on-the-job training training provided in the workplace during regular working hours for the purpose of developing or enhancing the knowledge, skills, and abilities of employees. Compare OFF-THE-JOB TRAINING. See also VESTIBULAR TRAINING.

on-time life events events that occur at the typical or expected point in the lifespan for members of a given population. Examples are marriage in young adulthood and retirement in later adulthood. Compare OFF-TIME LIFE EVENTS.

ontoanalysis n. a form of EXISTENTIAL ANALYSIS that probes the ultimate nature of being.

ontogenetic fallacy the false assumption that anything that looks like a common pattern of change with age is a basic, normative process of aging. An example is the assumption that because disability is often seen in the elderly it is a natural, universally experienced outcome of the aging process. [proposed by 21st-century U.S. sociologist Dale Dannefer]

ontogenetic psychology the study of the psychological aspects of the biological development of the individual (see ONTOGENY) as opposed to that of the species (see PHYLOGENY). Also calledontogenic psychology.

ontogeny n. the biological origin and development of an individual organism from fertilization of the egg cell until death. Also called ontogenesis. Compare PHYLOGENY. See also RECAPITULATION THEORY. —ontogenic adj.

ontogeny of conscious experience the developmental emergence of consciousness in an organism. See INFANT CONSCIOUSNESS.

ontological confrontation the keen and immediate awareness of personal mortality that can occur when an individual’s usual defenses against death awareness are pierced by circumstances or evoked memories. See also DEATH ANXIETY; TERROR MANAGEMENT THEORY.

ontology n. the branch of philosophy that deals with the question of existence itself. From some philosophical perspectives, ontology is synonymous with METAPHYSICS, in that both ask fundamental questions about what reality is. However, from the perspective of contemporary EXISTENTIALISM and HERMENEUTICS, ontology implies a concern with the meaning of existence that is largely lacking in traditional metaphysics. Whereas metaphysics asks “What is there?” or “What is fundamental?” the question of ontology is often posed as “What does it mean to be ‘at all?’” For example, to say that Smith is a professor is to rely on a very different sense of the verb be than is present in a statement that Smith is hungry. Likewise, Smith is not a professor in the same way that a painting is beautiful. Contemporary approaches to ontology often take their analytical point of departure from the work of German philosopher Martin Heidegger (1889–1976). In this tradition, psychology is the pursuit of an adequate understanding of the ontology of human beings. It asks, or ought to ask, “What does it mean to be a human being?” See BEING-IN-THE-WORLD: BEAUS; EXISTENTIAL PHENOMENOLOGY. —ontological adj.

oocyte n. a cell in the ovary from which an ovum (egg cell) develops in the process of OOGENESIS.

oogenesis n. the process by which germ cells divide and differentiate to produce female gametes (ova). In human females, primary oocytes are formed in the ovary during embryonic development by the proliferation and differentiation of precursor cells called oogonia (sing. oogonium). The primary oocytes enter into the first division of MEIOSIS but then remain suspended at this stage of cell division until puberty. Thereafter, roughly once a month until menopause, one primary oocyte resumes meiosis, and completes the first meiotic division to produce two unequally sized daughter cells: The larger one is the secondary oocyte, and the smaller is a polar body. Following OVULATION, the secondary oocyte undergoes the second meiotic division to produce an ovum and another polar body. The first polar body might also divide to produce two tiny cells, resulting in three polar bodies, which are normally non-functional and degenerate.

ophorectomy n. see OVARIECTOMY.

opaque adj. unable to transmit light: neither transparent nor translucent.

open adoption see ADOPTION.

open call system a system of vocal communication in which new vocalizations can be added throughout life. Whereas many songbirds rarely show change in song
open-classroom design

structure after the end of a critical period, other birds, including parrots, starlings, mynahs, and mockingbirds, can acquire new calls and songs throughout their lives. Few mammals have an open call system, but some dolphins and whales show evidence of acquiring new calls throughout life. Compare closed call system.

open-classroom design a design for classrooms that provides a study environment based on results of behavior mapping. The open physical construction of the classroom, occasionally without walls, creates an environment suitable for less formal learning styles. In addition, an instructor may opt to arrange desks in a circular formation to facilitate discussion or arrange workstations of six or for small group work, as opposed to the traditional classroom design in which rows of desks are arranged in parallel lines.

open-classroom method an approach to teaching and learning that emphasizes the student’s right to make decisions and that views the teacher as a facilitator of learning rather than a transmitter of knowledge. The open-classroom method may include grouping of students across grades, independent study, individualized rates of progression, open-plan schools without interior walls, or unstructured time and curricula.

open class society a society that permits or encourages social mobility. Compare fixed class society.

open-class words in a language, a category of words that readily admits new members, such as those arising through borrowing, word formation, or technological innovation. In practice, this category is virtually identical with the category of content words because it usually excludes grammatical function words. Compare closed-class words.

open design see open-classroom design; open-office design.

open-door hospital see open hospital.

open economy an experimental design used in operant-conditioning experiments in which an organism’s intake of food or water includes not only that provided during experimental sessions but also that provided in supplemental amounts independent of behavior in the home cage. This ensures that a particular level of body weight, or some other measure of deprivation, is maintained. Compare closed economy.

open-ended interview an interview in which the interviewee is asked questions that cannot be answered with a simple yes or no. For example, a human resources staff member interviewing a candidate for employment might ask, “What were the major responsibilities of your most recent job?” Open-ended interviews encourage interviewees to talk freely and extensively, thus providing information that might not be obtained otherwise. The general questions and their order may be planned in advance (see standardized interview), or a single initial question can be planned and the subsequent discussion allowed to pursue various areas of interest as they arise (see unstructured interview).

open-field chamber an enclosed space in which research animals can move freely while their ambulatory and defecatory behavior is observed and measured. See also animal open-field behavior.

open-field test an experimental technique for measuring (quantifying) behaviors and physiological reactions (e.g., those indicative of anxiety) in rats and other small animals. The animal is placed in a space divided into squares so that the researcher may observe the number of squares the animal traverses in a specified time period.

open group a group to which new members may be admitted. In counseling or therapy, the term refers to a group that allows new members during the course of therapy. Also called continuous group. Compare closed group.

open head injury a head injury, such as a gunshot wound, in which the skull is penetrated or broken open. Also called penetrating head injury. Compare closed head injury.

open hospital a psychiatric hospital without locked doors or physical restraints. Also called open-door hospital.

opening technique the means by which a therapist establishes initial rapport and trust at the beginning of a professional relationship with a client in therapy or at the beginning of each session in individual or family therapy. Also called opening moves.

open-label study a clinical trial in which both the researcher and the participant know the treatment the participant is receiving.

open-loop system 1. a system that requires constant external inputs, as opposed to one that continually recycles the initial input. 2. a system that will continue to follow a particular set of commands, irrespective of adverse results or altered conditions, because it has no capacity to monitor or regulate itself through feedback. An example is a garden sprinkler system that is set to come on at specific times, even if it is raining. Compare closed-loop system.

open marriage 1. a marriage in which both partners allow and encourage each other to grow and change over the years. Compare closed marriage. 2. a marital arrangement (formal or common-law) in which the partners permit each other to have sexual relations with other people. See also nontraditional marriage.

openmindedness n. a personality trait reflecting a relative lack of dogmatism. Compare closedmindedness. —openminded adj.

openness to experience a dimension of the big five personality model and the five-factor personality model that refers to individual differences in the tendency to be open to new aesthetic, cultural, or intellectual experiences.

open-office design a type of office design consisting of a large area with very few partitions between work spaces. A premium is placed on flexibility and visual accessibility, which are believed to support innovation and communication. Evidence indicates mixed results, with positive responses for team activities but problems with distraction and lack of privacy. There also appear to be individual differences in tolerance for open-plan spaces. See also landscaped office.

open question 1. in a test or survey, an item that does not come with any multiple-choice options for the respondent. Compare fixed-alternative question. 2. in an interview, a question that encourages the respondent to answer freely in his or her own words, providing as much or as little detail as desired. For example, a candidate in a job interview may be asked the open question, “How would you describe yourself?”

open shop a work arrangement in which union mem-
bership is voluntary and is not required as a condition of employment. Compare CLOSED SHOP. See also AGENCY SHOP; UNION SHOP.

**open skill** any motor skill that is performed under varying conditions on each occasion, as in making a jump shot in a game of basketball. Compare CLOSED SKILL.

**open society** a form of social organization characterized by a respect for human rights, the freedom to voice dissenting opinions, an elective government, and the rule of law. Essential to this concept is an awareness of the imperfect nature of government and the need for constant critical evaluation of social policy so that it evolves with changing circumstances or new insights. A closed society, by contrast, is one characterized by inflexible social structures and a fixed ideology that cannot accept criticism or tolerate difference. See also DEMOCRACY. [described by French philosopher Henri Bergson (1859–1941) and later developed by Austrian-born British philosopher Karl Popper (1902–1994)]

**open study** a research project in which new participants can be added after the project has begun.

**open system** 1. a system with permeable boundaries that permit exchange of information or materials with the environment. 2. a biological system in which growth can occur without conforming to laws of thermodynamics or a demonstrated constancy of energy relations. Compare CLOSED SYSTEM.

**open system theory** a theoretical perspective that views an organization as open to influence from the environment. The organization is viewed as transforming human and physical resources from the environment into goods and services, which are then returned to the environment.

**open ward** a hospital ward or unit in which the doors are not locked.

**open word** see PIVOT GRAMMAR.

**operandum** n. in OPERANT CONDITIONING, a device that a nonhuman animal operates or manipulates to produce automatic recording of a response. For example, in a simple conditioning experiment for a rat, a lever that the rat can press will be the operandum. See also MANIPULANDUM.

**operand** n. a class of responses that produces a common effect on the environment. An operand is defined by its effect rather than by the particular type of behavior producing that effect. A distinction may be made between the behavior required to achieve the effect and those alternative forms of behavior that constitute the class and may also occur. In the former, the class might include all forms of behavior that result in a lever being moved 4 mm downward (see DESCRIPTIVE OPERANT). In the latter case, the class includes all forms of behavior that become more probable; for example, a rat’s two-handed lever presses might increase in probability, but one-handed presses might not (see FUNCTIONAL OPERANT). Compare RESPONDENT.

**operand behavior** behavior that produces an effect on the environment and whose likelihood of recurrence is influenced by consequences (see OPERANT). Operand behavior is nearly synonymous with VOLUNTARY BEHAVIOR.

**operand chamber** an apparatus for the laboratory study of OPERANT BEHAVIOR. It typically consists of a small enclosure and is equipped so that all stimuli are presented, and all responses are detected and recorded, automatically. See OPERANT CONDITIONING CHAMBER.

**operant conditioning** the process in which behavioral change (i.e., learning) occurs as a function of the consequences of behavior. Examples are teaching a dog to do tricks and rewarding behavioral change in a misbehaving child (see BEHAVIOR THERAPY). The term is essentially equivalent to INSTRUMENTAL CONDITIONING. Also called OPERANT LEARNING. See BEHAVIOR MODIFICATION; SHAPING. [first described by B. F. SKINNER]

**operant conditioning chamber** an apparatus used to study FREE-OPERANT behavior. Generally, it provides a relatively small and austere environment that blocks out extraneous stimuli. Included in the environment are devices that can present stimuli (e.g., reinforcers) and measure free-operant responses. For example, the apparatus for a rat might consist of a 25 cm³ space containing a food tray, which can be filled by an automatic feeder located outside the space, and a small lever that the rat may press to release food from the feeder. Measurement of behavior and presentation of stimuli in the apparatus are usually automatic. The apparatus was initially developed in the 1930s by B. F. SKINNER. It later became known colloquially as the Skinner box, although Skinner himself disliked this term.

**operant conditioner therapy** a therapeutic approach that relies on the use of antecedents, behaviors, and consequences. For example, REINFORCEMENT through rewards may be used to improve behaviors in everyday situations.

**operant learning** see OPERANT CONDITIONING.

**operant level** a baseline probability or frequency of behavior that occurs naturally, before REINFORCEMENT is arranged, as in the amount of lever pressing by a rat before any food reward or other reinforcer is introduced.

**operant paradigm** 1. the experimental arrangement of a CONTINGENCY between a response and a consequence, such as reinforcement. 2. more generally, the assumption that much human behavior is controlled by its consequences.

**operant response** a single instance from an OPERANT class. For example, if lever pressing has been conditioned, each single lever press is an operant response.

**operation** n. 1. a type of cognitive SCHEME that is mental (i.e., requires symbols), derives from action, exists in an organized system in which it is integrated with all other operations (structures of the whole), and follows a set of logical rules, most importantly that of REVERSIBILITY. [postulated by Jean PIAGET] 2. a surgical procedure.

**operational analysis** analysis of the decision-making processes underlying the accomplishment of complex tasks. Generally, the tasks involve the tracing of inputs through a process and the tracking of outputs. The analysis usually involves mathematical modeling and statistical techniques and aims at maximizing the effectiveness of the process.

**operational definition** a description of something in terms of the operations (procedures, actions, or processes) by which it could be observed and measured. For example, the operational definition of anxiety could be in terms of a test score, withdrawal from a situation, or activation of the sympathetic nervous system. The process of creating an operational definition is known as operationalization.
operationalism

operationalism n. the position that the meaning of a scientific concept depends upon the procedures used to establish it, so that each concept can be defined by a single observable and measurable operation. An example is defining an emotional disorder as a particular score on a diagnostic test. This approach was mainly associated with radical behaviorism. Also called operationalism.

operational research see OPERATIONS RESEARCH.

operational sex ratio the relative number of males and females available at the time when reproduction is possible. In nonhuman mammals with internal gestation and lactation, there are often fewer females receptive to copulation than available males, creating an operational sex-ratio bias toward males, even though adults of both sexes may be present in equal numbers. In polygynous species (see polygyny), there might be more receptive females than available males, creating an operational sex-ratio bias toward females.

operational thought In Piagetian theory, the type of thought characteristic of the last two stages of a child’s cognitive development, the concrete operational stage and formal operational stage.

operationalism n. see OPERATIONALISM.

operationist view of consciousness the notion that conscious experiences may be reduced to publicly observable events, such as discriminative responses. [championed by Stanley Smith Stevens and Edwin G. Boring]

operation span (OSpan) a widely used task to assess working memory capacity, in which participants try to remember sequentially presented words in their correct order while simultaneously solving simple math equations. In the standard OSpan, the task is divided into several trials that consist of between 2 and 6 successively presented equation-word pairs (e.g., $8 + 4 + 3 = ?$ moon). As rapidly as possible, participants read each equation aloud, say the answer (5), and then read aloud the word printed beside the equation (moon). At the end of each set of equations, the participant verbally recalls each of the words from the set in the correct serial order. Various modifications of the task also exist, including one in which answers are supplied for the equations and participants verify their correctness, one in which all equations are presented prior to the to-be-remembered words, and one in which participants identify the target words from lists and indicate their correct order of presentation. OSpan performance is highly correlated with performance on other cognitive tasks indexing such higher level abilities as abstract reasoning, attentional orienting, general fluid intelligence, language comprehension, and problem solving, presumably because these activities also require individuals to store and mentally process information simultaneously. See also MEMORY SPAN. [developed in 1989 by U.S. psychologists Marilyn L. Turner and Randall W. Engle (1946– )].

operations research the application of advanced analytical methods—such as mathematical modeling, optimization, and computer simulation—to the study of complex situations so as to obtain a comprehensive understanding that allows for accurate predictions of outcomes and estimates of risk and enables more rational, effective decision making. It is used particularly in management science and business contexts. Also called operational research.

operative knowledge knowledge acquired in the process of performing operations, thought to be more basic and more predictive of later intellectual functioning than figurative knowledge (e.g., factual knowledge). [postulated by Jean Piaget]

operators pl. n. the mental processes involved in comprehending the effect of different manipulations on quantity, as in knowing that adding an orange to a bowl of oranges changes the number, whereas rearranging the oranges does not. Compare ESTIMATORS. [first used in this sense by U.S. statistician Andrew Gelman]

ophidiophilia n. an abnormal fascination with snakes.

ophidiophobia n. see SNAKE PHOBIA.

ophthalmia n. severe inflammation of the eye that may affect either the conjunctiva or deeper structures. Mucous (or catarral) ophthalmia is a form of conjunctivitis with a purulent secretion; electric ophthalmia is produced by exposure to the light of an electric welding torch and neuro-paralytic ophthalmia is a corneal inflammation with possible ulceration associated with lesions of the trigeminal nerve. See also TRACHOMA.

ophthalmic nerve a division of the TRIGEMINAL NERVE that mediates sensation of the orbit of the eye, the anterior part of the nasal cavity, and the skin of the nose and forehead.

ophthalmology n. the medical specialty concerned with the study of the eye and the diagnosis and treatment of eye disease. A physician who specializes in ophthalmology is called an ophthalmologist. Compare OPTOMETRY.

ophthalmometer n. see KERATOMETER.

ophthalmplegia n. paralysis of one or more of the internal or external muscles of the eye (see OCULOMOTOR PALSY). See also PROGRESSIVE SUPRANUCLEAR PALSY.

ophthalmplegia externa see BALLET’S DISEASE.

ophthalmoscope n. a handheld device used to examine the structures of the eye, especially the fundus (back). This examination may be direct, with the eye at close range so as to observe an erect image, or indirect, by use of a lens that produces an inverted image of the fundus. Compare RETINOSCOPE.

-opia suffix defect of vision or the eyes (e.g., ANOPIA; MYOPIA).

opiate n. any of a variety of natural and semisynthetic compounds derived from OPIUM. They include the alkaloids MORPHINE and CODEINE and their derivatives (e.g., HEROIN [diacetylmorphine]). Opiates, together with synthetic compounds having the pharmacological properties of opiates, are known as OPIOIDS.

opinion n. an attitude, belief, or judgment.

opinion leader an individual to whom others turn for advice or on whom others model their behavior. To be effective, the opinion leader needs to have social ties with other members of the group.

opinionnaire n. a type of measure for assessing the attitudes or beliefs of an individual about particular topics. It comprises a list of various statements that the respondent is asked to endorse or reject.

opinion survey a technique in which a large number of people are polled to determine their collective views, beliefs, or attitudes about a particular topic of interest. Information so obtained often is extrapolated to a broader popula-
tion with a given margin of error. For example, during an election year one might conduct an opinion survey of preferences for potential U.S. presidential candidates in different states. Also called opinion poll.

opinion testimony court evidence that includes inferences or conclusions rather than actual facts observed or experienced. Opinion testimony is usually allowed only from expert witnesses, because they have specialized knowledge that will aid the judge or jury in reaching a decision. See ultimate opinion testimony. See also learned treatise exception.

opioi n. any of a group of compounds that include the naturally occurring opiates (e.g., morphine, codeine) and their semisynthetic derivatives (e.g., heroin); the synthetic opioid agonists (e.g., meperidine, methadone). Opioid antagonists (e.g., naloxone, naltrexone), and mixed agonist–antagonists (e.g., butorphanol) and the endogenous opioids. The effects of opioids include analgesia, drowsiness, euphoria or other mood changes, respiratory depression, and reduced gastrointestinal motility. Opioids are used clinically as pain relievers, anesthetics, cough suppressants, and antidiarrheal drugs, and many are subject to abuse and dependence.

opiod abuse in DSM–IV–TR, a pattern of opioid use marked by recurrent significant adverse consequences related to the repeated ingestion of an opioid, such as morphine, heroin, or substances with morphinlike effects (e.g., codeine, oxycodone). This diagnosis is preempted by the diagnosis of opioid dependence: If the criteria for opioid abuse and opioid dependence are both met, only the latter diagnosis is given. In DSM–5, however, both have been subsumed into opioid use disorder and are no longer considered distinct diagnoses. See also substance abuse.

opiod agonist any drug with enhancing effects at opioid receptors in the central nervous system. Opioid agonists may be complete (pure) or partial agonists. Morphine is a pure opioid agonist; other examples include codeine, heroin, methadone, meperidine, and laam. Opioid partial agonists (e.g., buprenorphine) have lower levels of activity than complete opioid agonists at the same receptors and consequently have less analgesic activity. Also called narcotic agonist.

opiod analgesic any opioid used clinically to reduce both the sensation of pain and the emotional response to pain. This analgesia results from agonist activity at the mu opioid receptor. Codeine, dihydrocodeine, propoxyphene, and hydrocodone are among opioids used for the relief of mild to moderate pain; severe pain is managed with more potent agents, such as morphine, meperidine, oxycodone (U.S. trade name: OxyContin), and levorphanol. Methadone, fentanyl, and buprenorphine are potent analgesics that have additional uses. Side effects associated with opioid analgesics include nausea and vomiting, constipation, sedation, and respiratory depression; many also have the potential for abuse and dependence. Also called narcotic analgesic.

opiod antagonist any agent that acts as an antagonist at opioid receptors. Generally, opioid antagonists are synthetic derivatives of morphine that, as a result of structural changes in the molecule, bind to opioid receptors but do not produce the effects of euphoria, respiratory depression, or analgesia that are observed with opioid agonists. Opioid antagonists may be complete (pure) or mixed. Complete antagonists, such as naloxone, naltrexone, nalmefene (U.S. trade name: Revex), and naltorphine, are generally used to reverse the effects of opiate overdose (notably respiratory depression). Mixed agonist–antagonist opioids, such as butorphanol and pentazocine (U.S. trade name: Talwin), were developed in attempts to produce opioid analgesics that did not possess the abuse potential of opioid agonists. Also called narcotic antagonist.

opiod blockade the inhibition of the euphoric effects of such opioids as heroin by administration of a blocking agent, especially methadone, as maintenance treatment for drug abuse. See methadone maintenance therapy; opioid antagonist.

opiod dependence in DSM–IV–TR, a pattern of repeated or compulsive use of opioids (e.g., morphine, heroin) despite significant opioid-related behavioral, physiological, and psychosocial problems and tolerance or characteristic withdrawal symptoms if use is suspended (see opioid withdrawal). In DSM–5, opioid dependence and opioid abuse have been subsumed into opioid use disorder and are no longer considered distinct diagnoses. Also called narcotic dependence. See also substance dependence.

opiod intoxication in DSM–IV–TR and DSM–5, a reversible syndrome due to the recent ingestion of an opioid (e.g., morphine, heroin). It includes clinically significant behavioral or psychological changes (e.g., initial euphoria followed by apathy, dysphoria, psychomotor agitation or psychomotor retardation, impaired judgment, and impaired social or occupational functioning), as well as one or more signs of physiological involvement (e.g., pupillary constriction, drowsiness or unconsciousness, slurred speech, respiratory depression).

opiod neurotransmitter see endogenous opioid.

opiod receptor a receptor that binds opioids (including endogenous opioids) and mediates their effects via G proteins. It is generally agreed that there are at least three classes: mu (μ), kappa (κ), and delta (δ) opioid receptors. Opioid receptors are widely distributed in the brain, spinal cord, and periphery, and each type of receptor is differentially distributed. Mu opioid receptors are largely responsible for the analgesic and euphoric effects associated with opioid use. Most exogenously administered opioids bind to mu opioid receptors, which also mediate the respiratory depression, sedation, and reduced gastrointestinal motility associated with opioids. Kappa opioid receptors are localized primarily in the dorsal root ganglia of the spinal cord. Stimulation of these receptors produces more modest analgesia and dysphoric responses and may also be responsible for some of the perceptual and cognitive effects of opioids. Delta opioid receptors may potentiate activity of opioids at the mu opioid receptor site and have a less direct involvement in the production of analgesia. The more recently discovered nociceptin/orphanin FQ (N/OFQ) receptor, included in the opioid receptor family, has not been completely characterized.

opiod system the combination of delta, kappa, and mu opioid receptors found in the nervous system and gastrointestinal tract. Strongly involved in the experience of reward and the control of pain, this system is triggered both by opioids produced in the body (see endogenous opioid) and by naturally occurring or synthetic opioids administered exogenously.

opiod use disorder in DSM–5, a diagnostic category reflecting disordered use of natural opioids (e.g., mor-
opiod withdrawal

phine), semisynthetic derivatives (e.g., heroin), and synthetic compounds with morphineline effects (e.g., oxycodeone). It combines DSM–IV–TR’s separate abuse and dependence diagnoses for these substances, thereby removing opioid abuse and opioid dependence as distinct entities. Mild, moderate, and severe cases of opioid use disorder are determined according to the number of symptoms that individuals using these substances may present (e.g., craving; drug-seeking behavior; social and other dysfunction caused by opioid use; tolerance; withdrawal; etc.); the number ranges from a minimum of two symptoms for mild cases to more than six for severe.

opiod withdrawal in DSM–IV–TR and DSM–5, a characteristic withdrawal syndrome that develops after cessation of (or reduction in) prolonged, heavy consumption of opioids (e.g., morphine, heroin). Features may include dysphoria or anxiety, nausea or vomiting, muscle aches, dilation of the pupils, piloerection (goose flesh) or sweating, diarrhea, fever, and insomnia. See also SUBSTANCE WITHDRAWAL.

Opitz G/BBB syndrome a genetic disorder marked by widely spaced eyes; a high nose bridge; defects of the larynx, trachea, and esophagus that make breathing or swallowing difficult; and a urethral opening on the ventral side of the penis. Mild intellectual disability occurs in fewer than 50% of cases, most likely caused by structural defects in the brain. About half of affected individuals also have cleft lip with or without a cleft palate. The condition is genetically heterogeneous, with an X-linked form and an autosomal form considered to be among the 2,201.1.2 deletion syndrome spectrum disorders. Also called Opitz BBB (or BBB/G) syndrome (from the names of the affected families originally reported); Opitz–Frias syndrome, [reported in 1969 by U.S. geneticist John M. Opitz (1935– ) and Chilean-born U.S. geneticist Jaime L. Frias]

opium n. the dried resin of the unripe seed pods of the opium poppy, Papaver somniferum. Opium contains more than 20 alkaloids (opium alkaloids), the principal one being MORPHINE, which accounts for most of its pharmacological (including addictive) properties; other opium alkaloids include CODINE, THEBAIN, and PAPAVERINE. Natural and synthetic derivatives of opium (see OPIATE; OPIOID) are eaten, smoked, injected, sniffed, and drunk. Their action, due mainly to their morphine content, is to induce analgesia and euphoria and to produce a deep, dreamless sleep from which the user can be easily aroused.

opponent cell a type of neuron in the visual system that depolarizes when a particular stimulus (e.g., red light) comes on in the center of the neuron’s receptive field and when the “opposite” stimulus (e.g., green light) is extinguished in the surrounding zone of the receptive field. Double-opponent cells depolarize when the red light comes on or the green light is extinguished in the center of the receptive field, whereas the same stimuli produce the opposite effects in the receptive field surround.

opponent process theory of acquired motivation a theory that a stimulus or event simultaneously arouses a primary affective state, which may be pleasurable or aversive, and an opponent (opposite) affective state, which serves to reduce the intensity of the primary state: These two states together constitute emotional experience. According to this theory, the opponent state has a long latency, a sluggish course of increase, and a sluggish course of decay after the initiating stimulus is removed, all of which lead to its domination for a period following removal of the stimulus. In contrast to the primary state, it is also strengthened through use and weakened through disuse. This theory sought to account for such diverse acquired motives as drug addiction, love, affection and social attachment, and cravings for sensory and aesthetic experiences. Also called opponent process theory of emotion: opponent process theory of motivation. [originated by Richard L. Solomon]

opponent process theory of color vision any one of a class of theories describing color vision on the basis of the activity of mechanisms, which may correspond to cells, that respond to red–green, blue–yellow, or black–white. The Hering theory of color vision, the most highly developed opponent process theory, contrasted with the young–helmholtz theory of color vision, which relied on receptors sensitive to specific regions of the spectrum. Although both theories explained many phenomena, both had deficiencies. In the 1950s, Leo Hurvich and Dorothea Jameson suggested that both theories were correct, the Young–Helmholtz model describing a first stage of processing in the visual system whose outputs were then fed into an opponent process. This combined theory is known as the dual process theory of color vision. All three theories were proposed long before physiological studies of retinal neurons had been carried out, yet they were successful in predicting the responses of cells under most conditions.

opportunism n. the ability to exploit a variety of resources as they become available in changing environmental conditions or different locations. Some species are able to utilize new food resources rapidly: Kelp gulls introduced in Argentina rapidly expanded in numbers by feeding on refuse from fish factories and subsequently learned to attack and eat flesh from whales calves and nursing young in nearby waters. Other species show no opportunism and cannot exploit novel habitats or food resources.

opportunity class 1. an educational system that provides special-needs students with high-quality academic teaching in a stable, supportive environment with all the elements of a specialized curriculum. 2. an instructional setting that provides guidance and counseling to promote each individual student’s intellectual, social, emotional, and physical growth. 3. a class in the pull-out program for students who do not fit the norm, such as gifted, emotionally challenged, or at-risk students.

opportunity sampling see convenience sampling.

opportunity structure a matrix that relates personal characteristics (e.g., age, disability, race, gender, education, financial status) to the cultural and social opportunities and options that are available to an individual throughout his or her life. According to some psychologists, barred or restricted access to legitimate opportunities for success, due to economic or social disadvantage, leads some individuals to seek success by illegitimate means (an “illegitimate opportunity structure”), such as delinquency or other criminal activity. Also called opportunity matrix.

opposites test see antonym test.

oppositional defiant disorder in DSM–IV–TR, a behavior disorder of childhood characterized by recurrent disobedient, negativistic, or hostile behavior toward authority figures that is more pronounced than usually seen in children of similar age and that lasts for at least 6 months. It is manifest as temper tantrums, active defiance of rules, dawdling, argumentativeness, stubbornness, or being easily annoyed. The defiant behaviors typically do
not involve aggression, destruction, theft, or deceit, which distinguishes this disorder from CONDUCT DISORDER. Oppositional defiant disorder should be distinguished from ATTENTION-DEFICIT/HYPERACTIVITY DISORDER, with which it often co-occurs. In DSM–5, the symptom characteristics have largely been retained but are divided into subgroups of mood (e.g., angry, irritable), behavior (e.g., argumentative, defiant), and vindictiveness.

**opsin n.** the protein component of visual PHOTOPIGMENTS. There is one opsin for all rods (rod opsin, or scotopsin), which together with retinal forms the rod photopigment RHODOPSIN. There are three different cone opsins (photopsins), which convey different peak wavelength sensitivities to each of the three different cone photopigments (see iodopsin).

**optic axis** a theoretical line that passes through the center of an optical system. In the case of the eye, it passes through both the cornea and the lens.

**optic ataxia** inability to direct the hand to an object under visual guidance, typically caused by damage to the cortex of the parietal lobe. It is a feature of Bálint’s syndrome. Also called visuomotor ataxia.

**optic atrophy** degeneration of fibers of the optic nerve, as occurs in locomotor ataxia, lead or methyl alcohol poisoning, or multiple sclerosis.

**optic chiasm** the location at the base of the brain at which the optic nerves from the two eyes meet. In humans, the nerve fibers from the nasal half of each retina cross, so that each hemisphere of the brain receives input from both eyes. This partial crossing is called a partial decussation.

**optic disk** the area of the retina at which the axons of the RETINAL GANGLION CELLS gather before leaving the retina to form the optic nerve. Because this region contains no photoreceptors, it creates a BLIND SPOT in the visual field.

**optic flow** in the retinal image of the eye, the pattern and velocity of observed visual information about the motion of objects in an external scene relative to the motion of the observer. Optical flow patterns play an important role in locomotion; in the orientation, coordination, and balance of the body moving in space; and in the perception of movement in the outside environment. Also called optical flow. See also ECOLOGICAL PERCEPTION. [First investigated by James J. Gibson]

**optic nerve** the second CRANIAL NERVE, which carries the axons of RETINAL GANGLION CELLS and extends from the retina to the OPTIC CHIASM. Also called cranial nerve II.

**optic neuritis** inflammation of the optic nerve, which may lead to sudden, painful loss of vision in one eye.

**optic radiations** nerve fibers that project from the LATERAL GENICULATE NUCLEUS to the VISUAL CORTEX in the occipital lobe and to the pretectum, a structure in the midbrain important for the reflexive contraction of the pupils in the presence of light. As the optic radiations sweep around the lateral ventricles, they are called Meyer’s loop.

**optics** n. the study of the physics of light, including its relations to the mechanisms of vision.

**optic tectum** the portion of the TECTUM in the midbrain that serves the visual system. See SUPERIOR COLICULUS.

**optic tract** the bundle of optic nerve fibers that contains the retinal fibers. The major targets of the optic tract are the LATERAL GENICULATE NUCLEUS in the thalamus and the SUPERIOR COLICULUS in the midbrain.

**optimal adjustment** the ideal degree and quality of coping with life or with a specific stressful event.

**optimal apparent motion** the perception of movement that occurs when the conditions used to produce APPARENT MOVEMENT are ideal. For example, in the production of beta movement, the timing and spacing of individual stationary stimuli can be manipulated to produce optimal apparent motion.

**optimal arousal theory** see PRINCIPLE OF OPTIMAL STIMULATION.

**optimal design** an approach to experimental design in which the conditions to be studied and the assignment of participants to those conditions are determined so as to best fulfill particular statistical criteria.

**optimal distinctiveness theory** a conceptual analysis that assumes individuals strive to maintain a balance between three basic needs: the need to be assimilated by groups to which they belong, the need to be connected to friends and loved ones, and the need for autonomy and differentiation. [Proposed in 1991 by U.S. social psychologist Marilyn Brew (1942– )]

**optimal foraging theory** a theory of foraging behav-
ior arguing that NATURAL SELECTION has created optimal strategies for food selection (based on nutritional value and costs of locating, capturing, and processing food) and for deciding when to leave a particular patch to seek resources elsewhere. Many aspects of optimal foraging theory have been studied empirically using OPERANT CONDITIONING with different SCHEDULES OF REINFORCEMENT and reward quality. See also MARGINAL VALUE THEOREM.

**optimal functioning** the highest possible level of functioning, especially in relationships, work, education, and subjective well-being.

**optimal level** the maximum (highest) level of complexity of a skill that an individual can control, which can be attained only in the most supportive environment. It has been suggested that when acquiring a skill an individual moves from the optimal level, at which the skill can be performed with assistance from others, to the functional level, at which the skill can be performed independently but possibly at a lower than optimal level. See SKILL THEORY. [proposed by U.S. psychologist Kurt W. Fischer (1943–)]

**optimal outbreeding** see INBREEDING AVOIDANCE.

**optimal scaling** see DUAL SCALING.

**optimal stimulation principle** see PRINCIPLE OF OPTIMAL STIMULATION.

**optimism** n. hopefulness: the attitude that good things will happen and that people's wishes or aims will ultimately be fulfilled. **Optimists** are people who anticipate positive outcomes, whether serendipitously or through perseverance and effort, and who are confident of attaining desired goals. Most individuals lie somewhere on the spectrum between the two polar opposites of pure optimism and pure pessimism but tend to demonstrate relatively stable situational tendencies in one direction or the other. See also EXPECTANCY-VALUE MODEL. —optimistic adj.

**optimization** n. a statistical process in which ALGORITHMS are applied to data from a SAMPLE so as to obtain the best estimate of a value for a PARAMETER of interest in the broader population.

**optimize** vb. to create conditions that produce the best possible (optimum) outcome of something in the face of existing constraints.

**opto-** (opt-) combining form vision or the eyes.

**optogram** n. the physical image produced on the retina by the bleaching of RHODOPSIN by a visual stimulus (see PIGMENT BLEACHING). In the 19th century, optograms were obtained by rapidly removing the retina of experimental animals after they had viewed a bright stationary stimulus and, in several instances, by examining the retinas of human prisoners immediately after execution.

**optokinetic effect** 1. any of a broad class of perceptual and motor responses to movement of the eyes. 2. the movements of the eyes themselves in response to various moving stimuli.

**optokinetic reflex** (OKR) the involuntary compensatory eye movements that allow the eyes to maintain fixation on a visual target as it moves by an observer. The optokinetic reflex is driven by signals from neurons in the retina. Compare VESTIBULO-OCULAR REFLEX.

**optometry** n. the clinical field concerned primarily with the optics of the eye and the devices and procedures that can correct optical defects. **Optometrists** can prescribe corrective lenses and exercises but are generally prohibited from prescribing drugs or performing eye surgery. Optometrists are more clinically oriented than **opticians**, who make spectacle lenses, but have fewer clinical privileges than ophthalmologists (see OPHTHALMOLOGY).

OR abbreviation for ODDS RATIO.

**oral** combining form see ORO-.

**oral administration** see ADMINISTRATION.

**oral-aggressive personality** see ORAL PERSONALITY.

**oral behavior** activities involving the mouth, such as thumb sucking, smoking, eating, kissing, nail biting, talking, and oral sex.

**oral-biting phase** in classical psychoanalytic theory, the second phase of the ORAL STAGE of psychosexual development, from about the 8th to the 18th month of life. During this phase, the child begins to feel that he or she is an autonomous person, develops ambivalent attitudes toward the mother, and expresses hostility by biting her breast or the nipple of the bottle. In later childhood, the urge to bite may take the form of nail biting, spitting, sticking out the tongue, or chewing on a pencil or gum. Also called oral-sadistic phase. Compare ORAL-SUCKING PHASE. See ORAL SADISM. [identified by German psychoanalyst Karl Abrah am (1877–1925)]

**oral character** see ORAL PERSONALITY.

**oral coitus** see FELLATIO.

**oral contraceptive** a tablet taken regularly by women to prevent pregnancy. Most oral contraceptives are combined formulations of a synthetic estrogen and a progestin; some are progestin-only formulations. The synthetic hormones in these pills alter the normal menstrual activities so that ovulation and related functions are prevented. Introduced in 1960, this type of contraceptive became known popularly simply as “the Pill.”

**oral eroticism** in psychoanalytic theory, the pleasure derived from oral activities such as smoking, drinking, chewing, biting, talking, kissing, and oral-genital activity. Also called oral eroticism: oral gratification. See also ORALITY.

**Oralet** n. a trade name for FENTANYL.

**oral–genital contact** see OROGENITAL ACTIVITY.

**oral gratification** see ORAL EROTICISM.

**oral history** personal background information provided by an individual during an interview. Oral histories may describe perceptions and thoughts, experiences of important events, family relationships, and other personal details. They can be collected, transcribed, and analyzed as part of research studies.

**oralism** n. a method of improving the communication skills of individuals with hearing loss that focuses on the use of residual hearing, lipreading, and speech and de-emphasizes or prohibits the use of sign language and other manual forms of communication. Also called oral method.

**orality** n. in psychoanalytic theory, the oral factor in EROTICISM or neurosis, ranging from pleasure in biting, sucking, smoking, or oral sex to such habits as overeating and alcoholism.
oral–lingual dyskinesia see BUCCOLINGUAL MASTICATORY SYNDROME.
oral method see ORALISM.
oral–motor feeding problem a severe difficulty with sucking and swallowing typically seen in children who are born prematurely (related to immature motor development) or in children with motor disorders such as cerebral palsy. Compare FEEDING PROBLEM.
oral personality in classical psychoanalytic theory, a pattern of personality traits derived from fixation at the ORAL STAGE of psychosexual development. If the individual has experienced sufficient sucking satisfaction and adequate attention from the mother during the ORAL-SUCKING PHASE, he or she is posited to develop an oral-receptive personality marked by friendliness, optimism, generosity, and tolerance of dependency on others, allowing the individual to move on to later stages of psychosexual development. If the individual does not get enough satisfaction during the sucking and biting phases (see ORAL-BITING PHASE), he or she is posited to develop an oral-aggressive personality marked by tendencies to be hostile, critical, envious, and exploitative. Also called oral character. [identified by German psychoanalyst Karl Abraham (1877–1925)]
oral phase see ORAL STAGE.
oral-receptive personality see ORAL PERSONALITY.
oral sadism in classical psychoanalytic theory, the primitive urge to use the mouth, lips, and teeth as instruments of aggression, mastery, or sadistic sexual gratification. This impulse is believed to originate in the ORAL-BITING PHASE of infancy.
oral-sadistic phase see ORAL-BITING PHASE.
oral sex stimulation of the external genitals by the partner’s mouth. Oral sex may be carried out to the point of orogenital activity, including oral stimulation of the external genitals by the partner’s mouth. Oral sex is frequently carried out to the point of oral stimulation of the external genitals by the partner’s mouth.
oral stage in the classical psychoanalytic theory of Sigmund Freud, the first stage of PSYCHOSEXUAL DEVELOPMENT, occupying the 1st year of life, in which the LIBIDO is concentrated on the mouth as the principal erotic zone. The stage is divided into the early ORAL-SUCKING PHASE, during which gratification is achieved by sucking the nipple during feeding, and the later ORAL-BITING PHASE, when gratification is also achieved by biting. Fixation during each of these phases is posited to cause a particular type of ORAL PERSONALITY. Also called ORAL PHASE. See also ORAL EROTICISM.
oral-sucking phase in classical psychoanalytic theory, the earliest part of the ORAL STAGE of psychosexual development, in which the nursing infant is posited to feel that he or she is ingesting the mother’s being along with the milk swallowed (see INCORPORATION). This phase is believed to lay the foundation for feelings of closeness and dependence, as well as for possessiveness, greed, and voraciousness. Compare ORAL-BITING PHASE. [identified by German psychoanalyst Karl Abraham (1877–1925)]
Orap n. a trade name for PIMZOIDE.
ora serrata the most anterior portion of the retina, located adjacent to the ciliary body. The normal retinal layers are attenuated in the ora serrata. Also called ORA TERMINALIS.
Orbison illusion any one of a group of GEOMETRIC ILLUSIONS in which a figure or a line with straight edges, or a circle, appears distorted by a background pattern of repeated lines. [William Dillard Orbison (1911–1952), U.S. psychologist]
orbitofrontal cortex the CEREBRAL CORTEX of the ventral part of each FRONTAL LOBE, having strong connections to the HYPOTHALAMUS. Lesions of the orbitofrontal cortex can result in loss of inhibitions, forgetfulness, and apathy broken by bouts of euphoria, as in the well-known case of PHINEAS GAGE.
orchidectomy n. the surgical removal of a testis. An orchidectomy may be performed when a testis is injured or diseased, as when the male reproductive system has been affected by cancer. It does not necessarily cause impotence but may reduce the desire for coitus. Orchidectomy performed before puberty can affect the development of secondary male sex characteristics. Also called ORCHIOECYTOMY. See also CASTRATION.
order n. in BIOLOGICAL TAXONOMY, a main subdivision of a CLASS, containing a group of similar, related FAMILIES.
ordered scale see ORDINAL SCALE.
order effect 1. in WITHIN-SUBJECTS DESIGNS, the influence of the order in which treatments are administered, such as the effect of being the first administered treatment (rather than the second, third, and so forth). As individuals participate in first one and then another treatment condition, they may experience increased fatigue, boredom, and familiarity with or practice with reacting to the independent variable. Any of these conditions could affect the participants’ responses and CONFUSE the results of the study. Researchers often use COUNTERBALANCING to control for order effects. See also CARRYOVER EFFECT; SEQUENCE EFFECT. 2. the influence of the order in which items or statements are listed on surveys and questionnaires. Three basic types of question order effect have been identified: (a) unconditional, in which the answer to a subsequent question is affected by the individual having responded to the prior question but not by the response given on that prior question; (b) conditional, in which the answer to a subsequent question depends on the response given to the prior question; and (c) associational, in which the correlation between the prior and subsequent questions changes depending on which is asked first. Order effects make it difficult to know whether change over time reflects legitimate respondent differences or question effects.
orderliness n. the tendency to be neat and tidy and to keep everything in place. Excessive orderliness may be a symptom of OBSESSIVE-COMPULSIVE DISORDER OR OBSESSIVE-COMPULSIVE PERSONALITY DISORDER.
order of magnitude the approximate degree or strength of a number or value within a range, usually to the nearest power of 10. For example, 2,500 (2.5 x 10^3) and 4,300 (4.3 x 10^3) are of the same order of magnitude, but both are one order of magnitude greater than 240 (2.4 x 10^2).
ordinal adj. pertaining to rank, order, or position in a series. Compare CARDINAL; NOMINAL.
**ordinal data**

**ordinal data** numerical values that represent rankings along a continuum from lowest to highest, as in a judge’s assignment of a 2 to denote that a particular athlete’s performance was fair and a 3 to denote that a subsequent athlete’s performance was better. Ordinal data may be counted (i.e., how many athletes obtained a 2, how many a 3, etc.) and arranged in descending or ascending sequence but may not be manipulated arithmetically—such as by adding, subtracting, dividing, or multiplying any rank by any other—because the actual difference in performance between adjacent values is unspecified and may vary. In other words, one does not know how much better a rank of 3 is than a 2, and the difference between a 2 and a 3 may not be the same as the difference between a 3 and a 4.

**ordinality n.** a basic understanding of “more than” and “less than” relationships.

**ordinal scale** a sequence of numbers that do not indicate magnitude or a true zero point but rather reflect a rank ordering on the attribute being measured. For example, an ordinal scale for the performance of a specific group of people on a particular test might use the number 1 to indicate the person who obtained the highest score, the number 2 to indicate the person who obtained the next highest score, and so on. It is important to note that an ordinal scale does not provide any information about the degree of difference between adjacent ranks (e.g., it is not clear what the actual point difference is between the rank 1 and 2 scores). Compare INTERVAL SCALE; NOMINAL SCALE; RATIO SCALE.

**ordinal variable** a variable whose possible values have a clear rank order. For example, attitude is an ordinal variable as it may be denoted with ordered points indicating increasing or decreasing values, such as 1 = strongly disagree, 2 = disagree, 3 = agree, and 4 = strongly agree. Values on an ordinal variable indicate that one data point is higher or lower than another but do not define the extent of the difference between them. Compare INTERVAL VARIABLE.

**ordinary creativity** see EVERYDAY CREATIVITY.

**ordinary least squares regression** see LEAST SQUARES REGRESSION.

**ordinate n.** the vertical coordinate in a graph or data plot; that is, the y-axis. See also ABSISSA.

**Orestes complex** in classical psychoanalysis, a son’s repressed impulse to kill his mother, which may result in the actual act of matricide. The name is derived from the Greek myth of Orestes, who killed his mother, Clytemnestra, and her lover, Aegisthus.

**orexin** n. any of a group of proteins, expressed in the LATERAL HYPOTHALAMUS, that trigger feeding and have also been implicated in NARCOLEPSY.

**orexis** n. the affective, appetitive character of an activity or behavior, as opposed to the cognitive aspects. Also called orexia. orecdic adj.

**organelle** n. a specialized, membrane-bound structure within a cell, such as a MITOCHONDRION or the GOLGI APPARATUS.

**organic adj.** 1. denoting a condition or disorder that results from structural alterations of an organ or tissue. In psychology and psychiatry, the term is equivalent to somatic or physical, as contrasted with FUNCTIONAL or PSYCHOPHARMACOTHERAPY. 2. relating to the fundamental, or essential, make-up of a thing, situation, or phenomenon and to the interworking of its components.

**organic amnesia** see AMNESIA.

**organic approach** the perspective that all mental disorders have a physiological basis, resulting from structural brain changes or alterations in other bodily organs. Also called organicism.

**organic defect** a congenital defect that is not the result of a genetic anomaly. For example, a mental or physical defect in offspring can result from maternal illness or other conditions in pregnancy, including preeclampsia, viral infections (e.g., rubella), sexually transmitted infections, protozoan infections (e.g., toxoplasmosis), dietary deficiencies, or drug abuse (e.g., alcoholism).

**organic disorder** any disorder resulting from a demonstrable abnormality in the structure or biochemistry of body tissues or organs. Also called organic disease. Compare PSYCHOPHARMACOTHERAPY.

**organic hallucinations** hallucinations associated with a specific brain-based factor. Stimulation or irritation of part of the brain or a sensory pathway may be a factor, and precipitating causes include aneurysm, tumor, epilepsy, drug use (including some prescribed drugs), and abuse of alcohol, cocaine, amphetamines, or similar substances.

**organicism n.** see ORGANIC APPROACH.

**organicity n.** a former term for brain damage or dysfunction.

**organicity test** an obsolete name for a cognitive or behavioral test that has been shown to be differentially sensitive to the effects of brain damage or dysfunction. See NEUROPSYCHOPHARMACOTHERAPY.

**organic paralysis** loss of function of voluntary muscles due to structural lesions of the nervous or muscular system. Compare CONVERSION PARALYSIS.

**organic retardation** failure of an organ or organ system to develop normally because of a genetic defect, dietary deficiency, or hormonal disorder.

**organic selection** see BALDWIN EFFECT.

**organic sensation** a sensation that arises from deep within the body (e.g., a rumbling stomach). Also called visceral sensation.

**organic therapies** somatic treatments for serious or recalcitrant mental disorder, among which are ELECTROCONVULSIVE THERAPY, PSYCHOPHARMACOTHERAPY, and PSYCHOSURGERY.

**organic variable** a process or state within an organism that combines with a stimulus to produce a particular response. For example, a headache may be an organic variable, and the response may be an irritable reaction to a stimulus (e.g., noise in the neighborhood). Also called O variable.

**organ inferiority** the sense of being deficient or somehow less than others as a result of negative feelings about any type of real or imagined abnormality of organ function or structure. See INFERIORITY COMPLEX. [defined by Alfred Adler]

**organism n.** an individual living entity, such as an animal, plant, or bacterium, that is capable of reproduction and growth.
organismic adj. having components (organs) serving various functions that interact to produce the integrated, coordinated total functioning that characterizes an organism.

organismic model the theory that development is directed by constraints inherent in the relationship among elements within the organism as they act upon themselves and each other. Not only are biological processes (e.g., maturation) seen as critical in directing development, but so also are the behaviors of the organism. See developmental systems approach.

organismic personality theory an approach to personality theory in which personal functioning is understood in terms of the action of the whole, coherent, integrated organism, rather than in terms of psychological variables representing one versus another isolated aspect of body or mind. [developed by Kurt Goldstein and Hungarian psychologist Andras Angyal (1902–1960)]

organismic psychology an approach to psychology that emphasizes the total organism, rejecting distinctions between mind and body. It embraces a gestalt approach that takes account of the interaction between the organism and its environment. See holism; holistic psychology.

organismic valuing process in client-centered therapy, the presumed healthy and innate internal guidance system that a person can use to achieve self-actualization. One goal of treatment within the client-centered framework is to help the client listen to this inner guide. See client-centered therapy.

organismic variable one of the four factors considered in behavioral assessment using the sorc system, referring to the physiological and psychological features of the organism that influence behavior.

organization n. 1. a structured entity consisting of various components that interact to perform one or more functions. Business, industrial, and service entities are constituted in this way. 2. in gestalt psychology, an integrated perception composed of various components that appear together as a single whole, such as a face. See gestalt principles of organization. 3. in memory research, the structure discovered in or imposed upon a set of items in order to guide memory performance. 4. in piagetian theory, the coordinated biological activities of the organism as determined by genetic factors, interactions with the environment, and level of maturation. Inherent in this theory is the concept that every intellectual operation is related to all other acts of intelligence. Such mental processes become increasingly organized, initially developing through reflex behavior and responses to immediate stimulation and gradually becoming self-sustaining, self-generating, and capable of reflecting the child's own thoughts. See functional invariant. —organismic adj.

organizational approach in the study of emotion, a conceptual framework, based on general systems theory, that emphasizes the role of emotions as regulators and determinants of both intrapersonal and interpersonal behaviors, as well as stressing the adaptive role of emotions. The organizational approach also emphasizes how perception, motivation, cognition, and action come together to produce important emotional changes.

organizational assessment activities involved in evaluating the structure, process, climate, and other environmental factors that influence the effectiveness of an organization and the morale and productivity of employees. General or specific evaluations (e.g., of readiness to change, job satisfaction, turnover) may be performed by practitioners from a variety of disciplines, including consulting psychology and industrial and organizational psychology.

organizational behavior management (OBM) the application of applied behavior analysis to individuals and groups in business, industry, government, and human service settings. OBM focuses on organizational problems such as lack of knowledge and skills, occupational injuries, and productivity improvement. Interventions include those that are antecedent-based, such as task clarification, equipment modification, goal setting, and training, and those that are consequence-based, such as information feedback, praise, and monetary and nonmonetary rewards.

organizational career see protean career.

organizational citizenship behavior (OCB) an action taken by an employee to benefit the organization that is not formally required by the job or that exceeds the formal requirements (e.g., voluntarily helping a coworker with a computer problem).

organizational climate the general character of the total organizational environment as perceived by those who work within it. It is an expression of the organizational culture.

organizational commitment an employee’s dedication to an organization and wish to remain part of it. Organizational commitment is often described as having both an emotional or moral element (affective commitment) and a more practical element (continuance commitment).

organizational culture a distinctive pattern of thought and behavior shared by members of the same organization and reflected in their language, values, attitudes, beliefs, and customs. The culture of an organization is in many ways analogous to the personality of an individual. See also attraction–selection–attrition model; occupational culture.

organizational culture analysis a comprehensive organizational development intervention in which groups of managers and employees meet to describe the organizational culture and identify those aspects of the culture that are helpful to achieving the goals of the organization and those that are hindrances. [developed by Swiss-born U.S. psychologist Edgar H. Schein (1928– )]

organizational development (OD) a subfield within industrial and organizational psychology concerned with the planned improvement of organizational effectiveness through analyzing organizational structures and climates, maximizing the satisfaction of individuals and work groups, and facilitating organizational change. See also change management.

organizational dynamics those forces and processes that stimulate growth, development, and change within an organization. See group dynamics; social dynamics.

organizational effect a long-term effect of hormonal action typically occurring in fetal development or the early postnatal period that leads to permanent changes in behavior and neural functioning. For example, the presence of testosterone in young male rats leads to long-term male-typical behavior, and female rats can be masculinized by neonatal exposure to testosterone. Compare activation effect.

organizational effect
organizational effectiveness  a multidimensional construct defining the degree of success achieved by an organization. According to a GOAL-ATTAINMENT MODEL, effectiveness is the extent to which the organization is able to achieve its goals in an efficient manner. According to a SYSTEM MODEL OF EVALUATION, effectiveness is the organization’s ability to achieve long-term survival, which involves acquiring resources, adapting to changes in the environment, and maintaining the internal health of the system. From an ecological perspective, effectiveness is the ability of the organization to minimally satisfy the expectations of its strategic constituencies. All of these factors and more could be included in an assessment of an organization’s effectiveness.

organizational efficiency  see efficiency.

organizational hierarchy  the chain of command in an organization, defining levels of authority and responsibility. Individuals occupying higher positions in the hierarchy have greater power than those lower in the hierarchy.

organizational hypothesis  the hypothesis that steroids produced by the newly formed testis during development masculinize the developing brain to alter behavior by individuals in an organization or other type of workplace. A growing body of evidence indicates that organizational identification underpins a range of important outcomes in work settings.

organizational identification  a form of GROUP IDENTIFICATION in which an employee defines himself or herself in terms of involvement or membership in a particular corporation or other type of workplace. A growing body of evidence indicates that organizational identification underpins a range of important outcomes in work settings.

organizational justice  employee perceptions of how fair an organization is. It consists of perceptions of the fairness of outcomes that employees receive (distributive justice) and the fairness of the procedures used in distributing these outcomes (procedural justice). See also EQUITY THEORY.

organizational politics  behavior by individuals in an organization that is intended to further their own interests or the interests of a particular unit or department over the interests of other individuals or units.

organizational psychology  see INDUSTRIAL AND ORGANIZATIONAL PSYCHOLOGY.

organizational structure  the arrangement and interrelationship of the various parts or elements of an organization. Organizational structures can be described on several dimensions, including simple versus complex, centralized versus decentralized, and hierarchical versus non-hierarchical. A distinction can also be made between the FORMAL ORGANIZATIONAL STRUCTURE and the informal structures of an organization.

organized offender  the type of offender who carefully plans his or her crimes and who is typically more intelligent and less socially isolated than a DISORGANIZED OFFENDER. This distinction is useful when profiling violent offenders (see CRIMINAL PROFILING).

organ language  in the context of classical psychoanalytic explanations of PSYCHOSOMATIC illness, the bodily expression of emotional conflict or disturbance. Some believe that understanding the significance to the patient of the organ affected by the illness is essential for accurate diagnosis and treatment. For example, chronic lumbago (lower backache) with no identifiable organic cause may mean that the patient is feeling put upon, is being a martyr, or is aiming too low in life. Also called organ speech.

organ of Corti  a specialized structure that sits on the BASILAR MEMBRANE within the cochlea in the inner ear. It contains the HAIR CELLS (the sensory receptors for hearing), their nerve endings, and supporting cells. See also DEITERS CELLS; TECTORIAL MEMBRANE. [Alfonso Corti (1822–1876), Italian anatomist]

organogenesis  n. 1. the formation of organs during development. 2. see SOMATOGENESIS. —organogenic or organogenetic adj.

organ speech  see ORGAN LANGUAGE.

organum vasculosum of the lamina terminalis (OVLT)  one of the CIRCUMVENTRICULAR ORGANS where the BLOOD–BRAIN BARRIER is weak, enabling neurons there to monitor substances in the blood.

orgasm  n. the climax of sexual stimulation or activity, when the peak of pleasure is achieved, marked by the release of tension and rhythmic contractions of the perineal muscles, anal sphincter, and pelvic reproductive organs. In men, orgasm is also accompanied by the emission of semen (EJACULATION); in women, it is accompanied by contractions of the wall of the outer third of the vagina. See also SEXUAL-RESPONSE CYCLE. —orgasmic or orgasmic adj.

orgasmic dysfunction  an inability to reach orgasm in general or with certain forms of sexual stimulation. Principally occurring in women, it may be primary, in which a woman has never been able to achieve an orgasm with any type of stimulation, with or without a partner; secondary, in which a woman had previously been but is currently unable to attain orgasm through physical contact; or situational, in which a woman is unable to experience orgasm with a particular partner or in a particular situation. See also FEMALE ORGASMIC DISORDER; MALE ORGASMIC DISORDER; PREMATURE EJACULATION.

orgasmic phase  see SEXUAL-RESPONSE CYCLE.

orgasmic platform  the vascular tissue at the outer portion of the vagina and the labia minora that becomes engorged during sexual arousal or coitus.

orgasmic reconditioning  a behavioral treatment aimed at altering the deviant sexual preferences of individuals who commit SEX OFFENSES, including rape, pedophilia, and child molestation. The technique has been inappropriately applied to alter homosexual behavior as well. In the treatment as initially formulated in 1970 by clinical psychologist John N. Marquis, participants masturbate to deviant materials (e.g., pictures, videos) and just prior to orgasm switch to nondeviant material. Individuals gradually introduce the nondeviant imagery earlier and earlier in the process, so as to eventually associate only the nondeviant theme with the pleasurable experience of orgasm and to supplant deviant sexual arousal patterns altogether. Several variations of the original procedure exist, including one in which masturbation occurs in a laboratory and physiological responses (e.g., changes in penile tumescence and heart rate) to stimuli are measured; one in which deviant and nondeviant themes are alternated weekly or daily; and one in which deviant imagery is omitted entirely. Despite its promotion by some clinicians as a useful technique for treating sexual deviance, orgasmic reconditioning has little empirical support; there is limited evidence to suggest its success as one component of a comprehensive behavioral change program. Also called masturbatory reconditioning.

orgastic potency  the ability of a man or woman to
achieve full orgasm during the sex act. [first used by Wilhelm Reich (1897–1957), Austrian psychoanalyst]

**orgone** n. the “life energy” and creative force in nature that was believed by Austrian psychoanalyst Wilhelm Reich (1897–1957) to pervade the universe. According to Reich, orgone was emitted by energy vesicles called bioms, which he claimed to find in organic material. He also posited that it related to cosmic radiation and speculated that it might be responsible for the origin of life from earth and water (biogenesis), as well as the formation of weather patterns and the sexual potency of human beings.

**orgone therapy** the therapeutic approach of Austrian psychoanalyst Wilhelm Reich (1897–1957), based on the concept that the achievement of “full orgastic potency” is the key to psychological well-being. Reich believed the orgasm to be the emotional-energy regulator of the body, the purpose of which is to dissipate sexual tensions that would otherwise be transformed into neuroses. He further held that the orgasm derives its power from a hypothetical cosmic force. **Orgone** energy, which accounts not only for sexual capacity but also for all functions of life. The psychoanalytic community largely rejected Reich’s highly unorthodox theories and approaches. Also called [vegetotherapy](https://en.wikipedia.org/wiki/Vegetotherapy).

**orgy** n. a type of social gathering at which a number of people engage in unrestrained sexual activity, often with other forms of revelry, including singing, dancing, and drinking. —orgastic adj.

**oriental nightmare-death syndrome** see [bangungut](https://en.wikipedia.org/wiki/Bangungut).

**orientation** n. 1. awareness of the self and of outer reality; that is, the ability to identify one’s self and to know the time, the place, and the person one is talking to. See also [reality orientation](https://en.wikipedia.org/wiki/Reality.Orientation). 2. the act of directing the body or of moving toward an external stimulus, such as light, gravity, or some other aspect of the environment. 3. in vision, the degree of tilt of the long axis of a visual stimulus. For example, a vertical bar is oriented at 0°; a horizontal bar is oriented at 90°. Many neurons in the visual system respond most vigorously to a stimulus of a certain orientation: They are said to be [orientation selective](https://en.wikipedia.org/wiki/Orientation_selectivity). See also [orientation column](https://en.wikipedia.org/wiki/Orientation_column). 4. relative position or alignment, for example, of a body part or an atom in a chemical compound. 5. the process of familiarizing oneself with a new setting (e.g., a new home, neighborhood, city) so that movement and use do not depend upon memory cues, such as maps, and eventually become habitual. 6. an individual’s general approach, ideology, or viewpoint. 7. the process of introducing a newcomer to a job, company, educational institution, or other environment. —orient vb.

**orientation and mobility training** (O&M training) guided instruction in the cognitive and motor skills necessary for people with visual impairment to orient themselves in space and to move safely in the environment (sidewalk, street corner, crosswalk, stairwell, kitchen, bathroom, classroom, office building, etc.). O&M training includes instruction in the use of the long cane or the handling of a service animal (e.g., guide dog), as well as in the use of available senses, including any residual vision, to enable the individual to navigate safely. O&M training is a key component of [vision rehabilitation](https://en.wikipedia.org/wiki/Vision_rehabilitation) and is usually provided by professional O&M specialists.

**orientation column** a vertical slab of striate cortex in which all the neurons are maximally responsive to stimuli of the same orientation. Adjacent columns have slightly different orientation preferences, so that electrode penetration tangential to the cortical surface that passes through many columns would encounter neurons with orientation preferences that shift smoothly around a reference axis. Compare [ocular dominance column](https://en.wikipedia.org/wiki/Ocular_dominance_column). [first described in the 1960s and 1970s by U.S. neurophysiologist David Hubel (1926–2013) and Swedish neurophysiologist Torsten Wiesel (1924–2013)]

**orienting response** 1. a behavioral response to an altered, novel, or sudden stimulus, such as turning one’s head toward an unexpected noise. Physiological components of the orienting response have been identified as well, including dilation of pupils and blood vessels and changes in heart rate and electrical resistance of the skin. [described in 1927 by Ivan Pavlov](https://en.wikipedia.org/wiki/Ivan_Pavlov) 2. any response of an organism in relation to the direction of a specific stimulus. Also called [orienting reflex](https://en.wikipedia.org/wiki/Orienting_reflex). See [taxii](https://en.wikipedia.org/wiki/Taxii); [tropism](https://en.wikipedia.org/wiki/Tropism).

**original cause** the first or primary cause of a phenomenon: that is, the first in a sequence of causes producing a particular effect. See [causal chain](https://en.wikipedia.org/wiki/Causal_chain); [remote cause](https://en.wikipedia.org/wiki/Remote_cause).

**originality** n. see [creativity](https://en.wikipedia.org/wiki/Originality).

**original sin** in the Judeo-Christian tradition, a state of sin held to be innate in all humankind as a result of the first sin committed by Adam and Eve, which led to their expulsion from the Garden of Eden. Although modern theologians tend to interpret this story symbolically rather than historically, the idea that there is a kind of hereditary stain or fundamental flaw in human nature remains important in Christian thought. The doctrine of original sin has sometimes been reinterpreted in psychological, existential, or socioeconomic terms.

**Orne effect** the tendency for typical study participants to try to discern the wishes or intent of an experimenter and to try to respond in accordance with these wishes or intent. See [demand characteristics](https://en.wikipedia.org/wiki/Demand_characteristics). [Martin T. Orne]

**ornithine** n. an excess of the amino acid ornithine in the blood, possibly due to an inborn error of amino acid metabolism or to liver disease.

**oro-** (or-) combining form mouth.

**orofacial apraxia** see [apraxia](https://en.wikipedia.org/wiki/Apraxia).

**orofacial dyssnesia** behavior characterized by abnormal chewing, mouthing, and tongue movements that resemble symptoms of [tardive dyskinesia](https://en.wikipedia.org/wiki/Tardive_dyskinesia).

**orogenital activity** stimulation of the genitalia by the mouth or tongue. The activity may be performed by heterosexual or homosexual couples, either as a precoital form of stimulation or carried to orgasm. Application of the mouth to the male genitalia is called [fellatio](https://en.wikipedia.org/wiki/Fellatio); application of the mouth to the female genitalia is known as [cunnilingus](https://en.wikipedia.org/wiki/Cunnilingus). Also called [buccal intercourse; oral–genital contact](https://en.wikipedia.org/wiki/Buccal_intercourse). See also [oral sex](https://en.wikipedia.org/wiki/Oral_reception_of_penetration).

**oropharynx** n. the portion of the [pharynx](https://en.wikipedia.org/wiki/Pharynx) at the back of the mouth, extending from the level of the hyoid bone (at the base of the tongue) to the [soft palate](https://en.wikipedia.org/wiki/Soft_palate). It contains the functional crossing of the alimentary and respiratory canals. —oropharyngeal adj.
orphanin FQ  see ENDOSTROPHIC OPIOID; OPIOID RECEPTOR.

orphenadrine n.  an ANTICHOLINERGIC DRUG used in the treatment of drug-induced parkinsonian symptoms, such as those produced by conventional antipsychotics, and for the relief of localized muscle spasms (see MUSCLE RELAXANT). Orphenadrine is sold in combination with ANALGESICS (e.g., with aspirin and caffeine as Norgesic in the United States). U.S. trade name: Norflex.

or rule see ADDITION RULE.

Ortgeist n.  German, “spirit of a place”; the influence of the physical or cultural environment on the development of social, economic, and artistic life in a particular place. See also ZEITGEIST.

orthergasia n.  see EUERGASIA.

ortho- (orth-) combining form 1.  straight or perpendicular (e.g., ORTHOGENESIS). 2.  correct or corrective (e.g., ORTHOPTICS).

orthodox psychoanalysis  see CLASSICAL PSYCHOANALYSIS.

orthodox sleep  a less common name for NREM SLEEP.

orthogenesis n.  1.  the theory that the evolution of a species follows a direction determined by factors inherent to its organisms and that successive generations follow the same plan irrespective of NATURAL SELECTION. 2.  the theory that all cultures pass through the same sequential stages. —orthogenetic adj.

orthogenetic principle  the hypothesis that development of all aspects of functioning (including cognition, perception, etc.) progresses from lack of differentiation to increasing differentiation, articulation, and hierarchic integration. [proposed in 1957 by Heinz Werner]

orthogonal adj.  1.  describing a set of axes at right angles to one another, which in graphical representations of mathematical computations (such as FACTOR ANALYSIS) and other research indicates uncorrelated (unrelated) variables. Compare OBLIQUE. 2.  denoting a research design in which there are an equal or proportional number of participants across study conditions. See ORTHOGONAL DESIGN.

orthogonal coding  see CONTRAST CODING.

orthogonal contrast  in a FACTORIAL ANALYSIS OF VARIANCE, a set of nonredundant comparisons among the mean values for different samples. In other words, the set contains no overlapping information, so that the results from one comparison provide no information about the results of the second comparison. Also called ORTHOGONAL COMPARISON.

orthogonal design  an experimental design involving multiple INDEPENDENT VARIABLES in which each level of one variable is combined with each level of every other and in which all of the resulting conditions contain an equal or proportional number of participants or observations.

orthogonal rotation  a transformational system used in FACTOR ANALYSIS in which the different underlying or LATENT VARIABLES are required to remain separated from or uncorrelated with one another. It is one of two types of FACTOR ROTATION used to identify a simpler structure pattern or solution, the other being OBLIQUE ROTATION. Also called RIGID ROTATION.

orthographic distinctiveness effect  see DISTINCTIVENESS EFFECT.

orthography n.  1.  the formal writing system of a language. 2.  the study of the conventions of spelling in such a system. —orthographic adj.

orthokinesis n.  an increase (positive orthokinesis) or decrease (negative orthokinesis) in the speed or frequency of movement, particularly in relation to increases or decreases in stimulation. —orthokinetic adj.

orthomolecular medicine  a form of COMPLEMENTARY AND ALTERNATIVE MEDICINE that uses MEGAVITAMIN THERAPY and other nutritional approaches to prevent or treat physical and mental disorders. Proponents of this approach believe that biochemical imbalances in the body are a contributing factor to disease and that using vitamins, minerals, and other substances natural to the body corrects these imbalances. Also called ORTHOMOLECULAR THERAPY. [conceived in 1968 by U.S. biochemist Linus Pauling (1901–1994)]

orthonasal olfaction  sensations of smell arising via the introduction of an odorant through the nostrils. This is the common route for olfactory sensation. Compare RETRONASAL OLFAC TION.

orthopedic cane  see CANE.

orthopsychiatry n.  an interdisciplinary approach to mental health in which psychiatrists, psychologists, social workers, pediatricians, sociologists, nurses, and educators collaborate on the early treatment of mental disorders, with an emphasis on their prevention. —orthopsychiatric adj. —orthopsychiatrist n.

orthoptics n.  1.  the study and treatment of faulty binocular vision. 2.  the use of eye exercises to coordinate the vision in the left and right eyes of individuals with EXTRINSIC EYE MUSCLE imbalance. —orthoptic adj. —orthoptist n.

orthoptoscope n.  see AMBLYOSCOPE.

Ortho-Rater n.  a portable visual testing device used for the rapid assessment of visual acuity, color vision, and depth perception. It is commonly used in the United States to test the vision of individuals applying for a driver’s license.

orthorexia nervosa  an obsessive concern with eating a healthy or “pure” diet that is typically very restrictive and more focused on wellness than weight loss. Individuals may insist on eating only certain foods (e.g., those grown locally) or avoid certain food groups altogether (e.g., meat, eggs, dairy, wheat products), often resulting in extremely low caloric intake, risk of malnutrition, and in extreme cases, death. There is some debate about whether orthorexia nervosa is a distinct disorder or a form of ANOREXIA NERVOSA or OBSESSIVE-COMPULSIVE DISORDER. [described in 1997 by U.S. physician Steven Bratman]

orthostatic hypotension  a drop in blood pressure when moving from a lying or sitting position to a standing position. Blood pressure is normally maintained during changes in position by activation of BARORECEPTORS in the walls of the heart and the major arteries. Activation of these receptors in turn activates ALPHA-ADRENERGIC RECEPTORS in peripheral blood vessels, leading to arterial constriction and maintenance of blood pressure. Numerous psychotropic drugs (e.g., antidepressants, antipsychotics) block the activity of peripheral alpha-adrenergic receptors, leading to orthostatic hypotension and an increased risk of falls, particularly in older adults. Orthostatic hypotension can also be caused by such disorders as diabetes mellitus,
Ostwald color system

amyloidosis, and Parkinson’s disease. Also called postural hypotension.

orthotics n. a medical specialization concerned with the fitting and use of braces and other orthopedic (supportive or corrective) devices. Compare PROSTHETICS.

oscillator circuit a circuit that produces a repeating pattern of output. Unlike an ENDGENOUS OSCILLATOR, it is not necessarily biological. For example, oscillator circuits can be found in computers, and the term itself is often associated with artificial NEURAL NETWORKS.

oscillatory interference model see GRID CELL.

oscillograph n. an instrument, often used in studies of bodily functions, that makes graphic recordings of wave forms of electrical energy.

oscillometer n. an instrument for measuring oscillations (variations or fluctuations), especially those associated with bodily functions, such as variations in arterial pulsation.

oscilloscopy n. the sensation of perceiving oscillating movement of the environment. This illusory movement can be caused by (bilateral) vestibular cerebellar injury, paralysis of extrinsic eye muscles, or nystagmus, but it may also be due to cerebral disorders (e.g., seizures, occipital lobe infarction).

oscilloscope n. an electronic device that records and displays visually an electrical or sound wave on a fluorescent screen of a cathode ray tube.

OSHA abbreviation for OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION.

-osis suffix 1. diseased condition (e.g., NEUROSIS). 2. process or state (e.g., METAMORPHOSIS). 3. formation or development (e.g., GLOSIS).

osmolagia n. sexual interest in and pleasure derived from smells emanating from the body, especially from the genitals.

osmolality n. the concentration of an osmotic solution, measured in osmoles per liter of solution.

osmometer n. 1. an instrument for measuring OSMOTIC PRESSURE or the amount of osmotic action (passage across a membrane of solutes from higher to lower concentrations) in different liquids. 2. an early type of OLFACTOMETER involving a sealed chamber containing an ODORANT. The participant opened the chamber, inhaled, and reported the odor detected.

osmometric thirst thirst resulting from a loss of cellular fluids and a relative increase in OSMOTIC PRESSURE. Also called INTRACELLULAR THIRST. osmotic thirst. Compare HYPOVOLEMIC THIRST.

osmoreceptor n. a hypothetical receptor in the HYPOTHALAMUS that responds to changes in the concentrations of various substances in the body’s extracellular fluid and to cellular dehydration. It also regulates the secretion of VASOPRESSIN and contributes to thirst.

osmoregulation n. a complex mechanism for maintaining the optimum content of water and electrolytes in the body cells and extracellular fluid of an organism. Also called WATER REGULATION.

osmosis n. the passive movement of solvent molecules through a differentially permeable membrane (e.g., a cell membrane) separating two solutions of different concentrations. The solvent tends to flow from the weaker solution to the stronger solution. —osmotic adj.

osmotic pressure the pressure required to prevent the passage of water (or other solvents) through a semipermeable membrane (e.g., a cell membrane) from an area of low concentration of solute to an area of higher concentration. It results from the spontaneous movement of molecules that occurs when different concentrations are separated by a semipermeable membrane.

OSPA abbreviation for OPERATION SPAN.

osphresiolagnia n. sexual arousal or erotic experience produced by odors.

osphresiphilia n. an abnormal attraction to odors.

osseous labyrinth see LABYRINTH.

ossicles pl. n. any small bones, but particularly the auditory ossicles: the chain of three tiny bones in the middle ear that transmit sound vibrations from the tympanic membrane (eardrum) to the OVAL WINDOW of the inner ear. They are the malleus (or hammer), which is attached to the tympanic membrane; the incus (or anvil); and the stapes (or stirrup), whose footplate nearly fills the oval window. The ossicles allow efficient transmission of sound from air to the fluid-filled cochlea.

osteomalacia n. see CALCIUM-DEFICIENCY DISORDERS.

osteopathy n. a health care system based on the belief that many disorders are caused by structural defects in the musculoskeletal system. It focuses on primary care, prevention, a HOLISTIC HEALTH approach, and—especially— manipulation of the affected joints and muscles (particularly of the spine) in conjunction with traditional medical, surgical, and pharmacological treatment to address underlying disease processes. Also called OSTEOPATHIC MEDICINE. See also COMPLEMENTARY AND ALTERNATIVE MEDICINE. —osteopath n. —osteopathic adj.

osteopetrosis n. a rare genetic disorder characterized by increased bone density, which may lead to abnormalities in bone shape or size, due to abnormal resorption (breakdown, removal, and replacement) of bone. Although the bones are highly dense, they are brittle and liable to fracture.

osteoporosis n. see CALCIUM-DEFICIENCY DISORDERS.

-ostomy suffix see -STOMY.

ostracism n. an extreme form of rejection in which one is excluded and ignored in the presence of others. Ostracism has powerful negative effects on psychological well-being and is detrimental to multiple domains of self-functioning. Specific consequences include not only sadness, hurt feelings, and changes in social perception (e.g., increased likelihood of interpreting ambiguous situations as threatening) but also decreased satisfaction of four fundamental human needs: belonging, control, self-esteem, and meaningful existence. Evidence from both human and nonhuman animal research suggests that ostracism activates the ANTERIOR CINGULATE CORTEX, the same area of the brain involved in experiencing both physical and psychological pain.

Ostwald color system a method of organizing chromatic and achromatic samples. The system consists of 24 hues arranged around the outside of a circle, with the complementary colors for each hue located along the circle’s diameters. By combining adjacent colors, any color on
the Ostwald scale can be produced. [Wilhelm Ostwald (1853–1912), German chemist and physicist]

OT abbreviation for OCCUPATIONAL THERAPY.

ot- combining form see OTO-.

OTC abbreviation for OVER-THE-COUNTER.

Othello syndrome see DELUSIONAL JEALOUSY. [derived from the name of the protagonist in William Shakespeare’s tragedy Othello]

other-directed adj. describing or relating to people whose values, goals, and behavior stem primarily from identification with group or collective standards rather than with individually defined standards. Also called OUTER-DIRECTED. Compare INNER-DIRECTED: TRADITION-DIRECTED. [introduced by U.S. sociologist David Riesman (1909–2002)]

other–total ratio (OTR) a formula for predicting the level of self-awareness experienced by individuals in social settings, based on the assumption that they will become more self-attentive and thus more concerned with matching standards of appropriate behavior as the relative size of their subgroup decreases. It is given as OTR = the number of other people who are not part of (i.e., who oppose) the target subgroup/the total number of people in the overall group. Thus, the OTR for a single minority member facing a five-person majority would be 5/6, or .83. [derived in 1983 by U.S. social psychologist Brian Mullen (1979–2006)]

otic adj. pertaining to the ear.

Otis–Lennon School Ability Test (OLSAT) a multiple-choice assessment of verbal and nonverbal reasoning abilities that are predictors of success in school. Available in different levels for students in kindergarten through Grade 12, it currently consists of various tasks (e.g., defining words, detecting likenesses and differences, following directions, recalling words and numbers) designed to measure verbal comprehension and verbal, pictorial, figural, and quantitative reasoning. The OLSAT was originally published in 1979 as a modification and replacement of the earlier Otis–Lennon Mental Ability Test, which itself was a revision of the Otis Quick Scoring Mental Ability Tests (originally published in the mid-1930s). Now in its eighth edition (published in 2003), the OLSAT is usually administered in groups. [Arthur S. Otis (1856–1963) and Roger T. Lennon (1916–1985). U.S. psychologists]

otitis media an inflammation or infection of the middle ear commonly associated with sinusitis, upper respiratory infections, or allergies. It can result in a conductive hearing loss (see CONDUCTION DEAFNESS) that generally resolves with symptom treatment. Acute otitis media is common in young children, resulting from viral or bacterial infection. In serous otitis media, a thick fluid fills the middle ear. In adhesive otitis media, permanent adhesions develop in the middle ear due to the continued presence of fluid after the infection itself has been controlled. These adhesions can damage the OSSICLES.

oto- (oto-) combining form ear.

otoacoustic emissions (OAEs) weak sounds produced by the COCHLEA that are recorded using a microphone placed in the EXTERNAL AUDITORY MEATUS. Spontaneous otoacoustic emissions (SOAEs) are recorded in the absence of externally presented sound. Evoked otoacoustic emissions (EOAEs) are responses to sounds, typically transients (clicks), sustained pure tones, or pairs of tones. EOAEs are not the result of reflections, and thus the alternative term cochlear echo is not technically correct. All OAEs appear to require normal cochlear function and provide strong evidence for an active mechanical process occurring within the cochlea, probably mediated by movement of the outer HAIR CELLS. Measurement of EOAEs is becoming widespread in audiological assessment. Also called cochlear emissions.

otoconium n. (pl. otoconia) see OTOLUM. otoconium otoconia.

otohemineurasthenia n. a unilateral deafness for which no organic cause can be found.

otolaryngology n. the medical discipline concerned with the assessment and treatment of diseases of the ears, nose, and throat and associated structures of the head and neck.

otolith n. any of numerous tiny calcium particles embedded in the gelatinous matrix of the VESTIBULAR SACS of the inner ear. See MACULA. Also called otoconium; statococcus.

ontology n. the medical discipline concerned with the study, diagnosis, and treatment of disorders of the ear. —ontological adj. —ontologist n.

-otmy suffix see -otomy.

otoneurology n. the study of neurology as related to audition. —otoneurological adj. —otoneurologist n.

otopalatodigital spectrum disorders a group of related X-linked dominant disorders caused by mutations in the FLNA gene. The disorders include otopalatodigital syndrome Types 1 and 2, frontometaphyseal dysplasia, and Melnick–Needles syndrome. In general, these disorders involve hearing loss resulting from malformed ossicles, cleft palate or other problems in the development of the roof of the mouth, and skeletal abnormalities in the fingers and toes. Males have more severe symptoms than do females, and males with otopalatodigital syndrome Type 2 or Melnick–Needles syndrome do not live beyond their 1st year.

otosclerosis n. a formation of spongy bone that develops in the middle ear and immobilizes the stapes at the point of attachment to the oval window facing the inner ear. Oto-sclerosis is marked by progressive deafness as the ossicles fail to transmit vibrations from the tympanic membrane to the inner ear. It is considered hereditary. —otosclerotic adj.

ototoxic adj. damaging to the ears, especially the structures for hearing and balance within the inner ear. —oto-toxicity n.

OTR abbreviation for OTHER–TOTAL RATIO.

ought self in analyses of self-concept, a mental representation of a set of attributes that one is obligated to possess according to social norms or one’s personal responsibilities.

Ouija board trade name for a board marked with numbers and letters on which a movable pointer (planchette), touched by the participants, spells out messages under the supposed guidance of spirits. The process can be seen as a form of AUTOMATIC WRITING. [from a blend of the French and German words for yes: oui and ja]

outbreeding n. 1. the mating of humans who are unrelated or who originate from different groups. It is thus the converse of INBREEDING. 2. the mating of a nonhuman animal with an unrelated or distantly related member of the
same species. This may produce hybrid vigor. Also called crossbreeding.

outcome n. 1. the result of an experiment, treatment, intervention, or other event. For example, the test scores of students in a classroom who have been taught with a new lecture method comprise an outcome, as does a client’s condition after psychotherapy. 2. in Game Theory, the factor determining a particular set of payments, one set being paid to each participant. 3. in Interdependence Theory, the net profit or loss one derives from an interaction after all of one’s benefits and costs are considered. 4. in Equity Theory, the benefits people receive from their activities (e.g., pay, intrinsic gratification, recognition).

outcome dependence a social situation in which one person’s outcomes, including the rewards or punishments experienced, are determined in whole or in part by the actions of another person. Compare Outcome Interdependence. [based on the Social Exchange Theory of John W. Thibaut and Harold H. Kelley as described in their book The Social Psychology of Groups (1959)]

outcome evaluation a process used to decide whether a program has achieved its stated goals and had the desired impact on the participants. Also called payoff evaluation. See also impact analysis; summative evaluation.

outcome expectancies cognitive, emotional, and behavioral outcomes that individuals believe are associated with future, or intended, behaviors (e.g., alcohol consumption, exercise) and that are believed to either promote or inhibit these behaviors.

outcome interdependence a social situation in which two or more people have mutual influence over one another’s outcomes. Compare Outcome Dependence. [based on the Social Exchange Theory of John W. Thibaut and Harold H. Kelley as described in their book The Social Psychology of Groups (1959)]

outcome measures assessments of the effectiveness of an intervention on the basis of measurements taken before, during, and after the intervention.

outcome research a systematic investigation of the effectiveness of a type or technique of intervention (e.g., a new form of psychotherapy for treating depression) or of the comparative effectiveness of different intervention types or techniques (e.g., cognitive behavior therapy vs. drug therapy for depression). In other words, outcome research focuses on determining whether participants benefit from receiving an intervention. Compare Process Research.

outcome variable see dependent variable.

outercourse n. noncoital sexual activity, which may include achieving orgasm by manual stimulation of the genitals or by oral sex.

outer-directed adj. see other-directed.

outer ear see external ear.

outer hair cells see hair cell.

outer nuclear layer the layer of cell bodies of the rods and cones in the retina. Also called outer granular layer.

outer plexiform layer the synaptic layer in the retina in which contacts are made between photoreceptors, retinal bipolar cells, and retinal horizontal cells.

outer psychophysics an attempt to establish the direct relationship between the physical intensity of sensory stimuli and the intensity of the related mental experience. Compare Inner psychophysics. See psychophysical law. [introduced by Gustav Theodor Fechner]

outgroup n. 1. in general, any group to which one does not belong or with which one does not identify. 2. a specific rival group that INGROUP members ridicule, derogate, and sometimes are aggressive toward. Also called they-group. [defined in 1906 by U.S. sociologist William G. Sumner (1840–1910)]

outgroup extremity effect the tendency to describe and evaluate OUTGROUP members, their actions, and their products in extremely positive or extremely negative ways. Compare INGROUP EXTREMITY EFFECT. See also linguistic intergroup bias.

outgroup homogeneity bias the tendency to assume that the members of other groups are very similar to each other, particularly in contrast to the assumed diversity of the membership of one’s own group. See also group attribution error; group fallacy.

outing n. revealing to others one's own or another person's homosexual orientation. The term refers to coming out of the closet (see closet homosexual). —out vb.

outlier n. an extreme observation or measurement, that is, a score that significantly differs from all others obtained. For instance, assume a researcher administered an intelligence test to a group of people. If most individuals obtained scores near the average IQ of 100 yet one person had an IQ of 150, the latter score would be an outlier. Outliers can have a high degree of influence on summary statistics (e.g., the mean and standard deviation) can be pulled severely toward outliers and on estimates of parameter values, and they may distort research findings if they are the result of error.

out-of-body experience a dissociative experience during which the individual imagines or feels that his or her mind, soul, or spirit has left the body and is acting or perceiving independently. Such experiences are sometimes reported by those who have recovered from a near-death experience; they have also been reported by those using hallucinogens or under hypnosis. A significant number have been reported as occurring when the reporter was asleep or falling asleep. Certain occult or spiritualistic practices may also attempt to induce such experiences. See Astral projection.

outpatient n. a person who obtains a diagnosis, treatment, or other service at a hospital, clinic, physician’s office, or other health care facility without overnight admission. See also ambulatory care. Compare inpatient.

outpatient commitment a form of court-ordered psychiatric or psychological treatment in which individuals are allowed to remain in the community so long as they are closely monitored and continue to receive treatment.

outpatient services health care services performed for registered ambulatory patients in hospital units, clinics, doctors’ offices, and mental health centers.

outplacement counseling practical and psychological assistance given to workers whose employment with an organization has been terminated. It can include vocational guidance and coaching in job-hunting skills as well as psychological help in dealing with the transition. The program is usually conducted by specialty firms outside the organization. See also vocational counseling.
output

output n. In computing contexts, the information a computer produces. Compare INPUT.

output interference n. Disruption in the recall of learned material during which the act (or process) of retrieving one item interrupts the ability to recall other items. For example, in the attempt to recall a finite set of items (e.g., words on a list, the names of people in a group), the retrieval of some items can interfere with the retrieval of other items in the same set.

outreach n. Activity that brings clinical (e.g., medical or mental health consultation), educational (e.g., class modules providing health information), or practical services (e.g., transportation to clinics or schools) to a community or population that may otherwise have easy or any access to the services.

ova n. See OVUM.

oval window n. A membrane-covered opening in the bony wall of the cochlea in the ear (see Scala Vestibuli). Vibration of the stapes (see Ossicles) is transmitted to the oval window and into the cochlear fluids.

O variable n. See ORGANIC VARIABLE.

ovarian follicle n. See Graafian follicle.

ovariectomy n. The surgical removal of an ovary. This procedure may be performed when the ovaries are diseased or injured. Under some circumstances, as when a woman is at very high risk for ovarian cancer, it may be carried out prophylactically (see PROPHYLACTIC SURGERY). Removal of ovaries in premenopausal women will induce menopause. Also called oophorectomy.

ovary n. The female reproductive organ, which produces ova (egg cells) and sex hormones (estrogens and progesterone). In humans, the two ovaries are almond-shaped organs normally located in the lower abdomen on either side of the upper end of the uterus, to which they are linked by the Fallopian tubes. The ovaries of the prepubertal human female contain about 350,000 immature oocytes, of which fewer than 400 will develop into mature ova to be released at a rate of about one per month between menarche (first menstruation) and menopause. See Oogenesis. See also Graafian follicle; Menstrual cycle. —ovarian adj.

overachiever n. A person, such as a student, who achieves above his or her capacity as calculated and predicted by aptitude and general-intelligence tests. Some prefer to refer to overachievement as “achievement above predicted expectations.” Compare UNDERACHIEVER.

overactivity n. Excessive, restless activity that is usually less extreme than hyperactivity.

overage adj. Describing a person who is beyond the average or usual age associated with a given behavior or trait. The term is sometimes applied to a child or student who is chronologically older than the others in his or her grade. Underage describes a student who is younger than his or her classmates.

overattribution bias n. See FUNDAMENTAL ATTRACTION ERROR.

overbreathing n. See HYPERVENTILATION.

overclassification n. A phenomenon in which, at levels ranging from local schools to national patterns of education, children who are members of ethnic minority groups are at heightened risk of being classified as SPECIAL EDUCATION students.

overcompensation n. See COMPENSATION. —overcompensate vb.

overconfidence n. A cognitive bias characterized by an overestimation of one’s actual ability to perform a task successfully, by a belief that one’s performance is better than that of others, or by excessive certainty in the accuracy of one’s beliefs. Compare UNDERCONFIDENCE. —overconfident adj.

overcontrolled adj. Denoting behavior that is inhibited and constrained, often driven by shyness or fear of rejection. The word is typically used to describe the behavior of children thought to be at risk for depression, but it may also refer to similar behavior in adults.

overcorrection n. In therapy, a technique in which a therapist asks a client who has exhibited inappropriate behavior to repeat the behavior in an appropriate but exaggerated way. Also called positive practice.

overcrowding n. A higher concentration of organisms per unit of space than is customary for a given species. Experimental overcrowding significantly increases abnormal behavior and aggression in rats, even when sufficient resources preclude the need for competition. In human societies, overcrowding is associated with stress but does not inevitably lead to increased aggression. See also DENSITY; OVERPOPULATION.

overdetermination n. In psychoanalytic theory, the concept that several unconscious factors may combine to produce one symptom, disorder, or aspect of behavior. Because drives and defenses operate simultaneously and derive from different layers of the personality, a single symptom may serve more than one purpose or fulfill more than one unconscious wish. Also called multiple determination. —overdetermined adj.

overdispersion n. In CATEGORICAL DATA ANALYSIS, a situation in which obtained observations display more variation (dispersion) than is predicted by a model. Overdispersion distorts STANDARD ERROR and CONFIDENCE INTERVAL estimates and is often associated with OUTLIERS or model MISSPECIFICATION.

overdose (OD) 1. n. The ingestion of an excessive amount of a drug, with resulting adverse and potentially lethal effects. The precise toxic effects differ according to many factors, including the properties and dosage of the drug, the body weight and health of the individual, and the individual’s tolerance for the drug. Overdose may occur with almost any legal or illegal drug and with some vitamins and food supplements. 2. vb. To take an excessive amount of a drug.

Overeaters Anonymous (OA) A voluntary organization of men and women who seek to help each other understand and overcome compulsive eating disorders through a TWELVE-STEP PROGRAM. See also SELF-HELP GROUP.

overexpectation n. In CLASSICAL CONDITIONING, a decrease in responding to two (or presumably more) conditioned stimuli individually after they have been joined into a compound stimulus and then paired with the unconditioned stimulus previously used to establish each part of the compound as an independent conditioned stimulus.

overextension n. The tendency of very young children
to extend the use of a word beyond the scope of its specific meaning, such as by referring to all animals as “doggie.” Compare UNDEREXTENSION.

**overgeneralization n.** 1. a cognitive distortion in which an individual views a single event as an invariable rule, so that, for example, failure at accomplishing one task will predict an endless pattern of defeat in all tasks. 2. the process of extending something beyond the circumstances to which it actually applies. It is a common linguistic tendency of young children to generalize standard grammatical rules to apply to irregular words (e.g., pluralizing foot to feet). See OVEREXTENSION; OVERGENERALIZATION.

**overheating n.** excessive ambient temperature. See HEAT EFFECTS.

**overidentification n.** in STRUCTURAL EQUATION MODELING and similar statistical techniques, the presence of more parameters in a model than are required to correctly specify the relationships among the variables of interest. In other words, the number of known parameters exceeds the number of free parameters, allowing one or more values to be estimated in more than one way. Compare UNDERIDENTIFICATION.

**overinclusion n.** failure of an individual to eliminate ineffective or inappropriate responses associated with a particular stimulus.

**overintensity n.** a state in which one or more of the following are above the optimal level for an individual’s performance: arousal, commitment, effort, assertiveness, and attentional focus. See INTENSITY.

**overjustification effect** a paradoxical effect in which rewarding (or offering to reward) a person for his or her performance can lead to lower, rather than higher, interest in the activity. It occurs when the introduction of an EXTRINSIC REWARD weakens the strong INTRINSIC MOTIVATION that was the key to the person’s original high performance. Compare INSUFFICIENT JUSTIFICATION EFFECT.

**overlapping psychological tasks** in psychological testing, two tasks that overlap in time. A common finding is that performance of the second task is slowed when the stimulus for it is presented shortly after the stimulus for the first task. See PSYCHOLOGICAL REFRACTORY PERIOD.

**overlapping waves theory** the proposition that during development children rely on a variety of old and new information-processing strategies concurrently, with these strategies waxing and waning over time. [proposed by U.S. developmental psychologist Robert S. Siegler (1949–)]

**overlearning n.** practice that is continued beyond the point at which the individual knows or performs the task as well as can be expected. The benefits of overlearning may be seen in increased persistence of the learning over time or better retention and memory. —overlearned adj.

**overload n.** a psychological condition in which situations and experiences are so cognitively, perceptually, and emotionally stimulating that they tax or even exceed the individual’s capacity to process incoming information. Compare UNDERLOAD. See COGNITIVE OVERLOAD; INFORMATION OVERLOAD; SENSORY OVERLOAD; STIMULUS OVERLOAD.

**overload principle** a concept stating that to increase the size or functional ability of MUSCLE FIBERS, they must be pushed close to the limit of their current ability to respond.

**overmatching n.** 1. unnecessary MATCHING: the pairing of research participants on an excessive number of characteristics or on characteristics having little or no potential influence upon the outcome of interest. For example, a researcher investigating a new drug treatment for cancer might create two groups whose members are of the same age and sex, administering the drug to one group and a placebo to the other group. Such group comparability would allow the researcher greater validity in attributing any changes between them to the treatment rather than to sex or age differences. If, however, the researcher were to pair the groups on such additional factors as area of residence and household income, overmatching would be present and likely to mask the true nature of the relationship under investigation and lead to statistical BIAS, such as by reducing the POWER and EFFICIENCY of analyses. 2. see MATCHING LAW.

**overmedication n.** see MEDICATION.

**overpayment inequity** an employee’s perception that he or she is being paid at a rate that exceeds what is fair, especially in comparison with coworkers. This can lead to dissatisfaction, tension with coworkers, and efforts to restore equity. Compare UNDERPAYMENT INEQUITY. See EQUITY THEORY.

**overpopulation n.** a POPULATION DENSITY that is higher than desirable and may result in OVERCROWDING and stress. Evidence from animal behavior supports the view that overcrowding increases aberrant behavior and aggression. However, some human societies with very high population density have correspondingly low rates of violence and social pathology, suggesting that the negative effects of overpopulation may have social as well as biological origins.

**overproduction n.** the condition in which a species produces too many offspring for the available food, space, or other vital resources.

**overprotection n.** the process of sheltering a child to such an extent that he or she fails to become independent and may experience later adjustment and other difficulties.

**overreaction n.** a response, typically an emotional one, that exceeds an appropriate level.

**overregularization n.** a transient error in linguistic development in which the child attempts to make language more regular than it actually is. An example is saying breaked instead of broken. See also OVEREXTENSION; OVERGENERALIZATION.

**oversampling n.** a sampling strategy in which certain subsets of participants are overrepresented in a study group compared to the larger population from which they are drawn. Oversampling involves deliberately selecting greater numbers of such participants than would be obtained via RANDOM SAMPLING so as to enhance the accuracy of PARAMETER values estimated through statistical procedures. For example, a researcher selecting firefighters from a candidate pool might include equal numbers of males and females to ensure a sufficient sample of females for statistical analysis, even though males comprise the majority of firefighters in the pool.

**overshadowing n.** in CLASSICAL CONDITIONING, a decrease in conditioning with one conditioned stimulus because of the presence of another conditioned stimulus. Usually, a stronger stimulus will overshadow a weaker stimulus. —overshadow vb.

**overshoot n.** the portion of an ACTION POTENTIAL that represents the stage when the membrane potential is tran-
overshooting

siently depolarized relative to the resting potential. Compare UNDESHOOT.

overshooting n. in vision, the tendency for the SACCADEs of the eyes to move to a position beyond that needed to fixate a target.

overstaffing n. a situation in which management judges that more people than necessary are being employed by an organization or one of its subunits. Compare UNDERSTAFFING.

overt adj. 1. denoting anything that is not hidden or that is directly observable, open to view, or publicly known. Compare COVERT. 2. deliberate or attracting attention.

overt behavior behavior that is explicit, that is, observable without instruments or expertise.

over-the-counter (OTC) adj. able to be purchased without a doctor’s prescription, referring to various nonprescription drugs (e.g., acetaminophen, aspirin, some sleeping aids).

overt homosexuality gay or lesbian tendencies that are consciously recognized and expressed in sexual contact, in contrast to LATENT HOMOSEXUALITY.

overt integrity test see INTEGRITY TESTING.

overtone n. see HARMONIC.

overtraining syndrome in the context of sport or exercise, the unwanted physical and mental effects, collectively, of training beyond the individual’s capacities. Characteristic symptoms include decreased performance, increased ease of tiring, loss of motivation, emotional instability, inability to concentrate, and increased susceptibility to injury and infection. See BURNOUT.

overt response any observable or external reaction, such as pointing to indicate one’s preference from among a set of objects or answering yes to a question. Compare COVERT RESPONSE.

overvalued idea a false or exaggerated belief that is maintained by an individual (e.g., the idea that one is indispensable in an organization). It is less rigidly and persistently held than a delusion, and its presence implies a nonconscious motivation that, if made conscious, would reduce its importance and corresponding dysfunctions.

overweight adj. the condition of having more body fat than is considered normal or healthy for an individual of a particular age, body type, or build. Overweight individuals may lie anywhere on a spectrum from mildly overweight to seriously overweight (see OBESITY; MORBID OBESITY). One of the most frequently used standards for assessing the percentage of body fat is the BODY MASS INDEX.

oviduct n. the tube in female animals through which egg cells from the ovary are conveyed to other parts of the reproductive system. In mammals, it is called the FALLOPIAN TUBE.

oxiparity n. reproduction in which fertilized eggs are laid and hatch outside the mother’s body. Compare VIVIPARITY. —oxiparous adj.

OVLIT abbreviation for ORGANUM VASCULOSUM OF THE LAMINA TERMINALIS.

ovulation n. the production of a mature secondary oocyte (see OOGENEISIS) and its release from a GRAAFIAN FOLLICLE at the surface of the ovary. Rupture of the follicle causes the oocyte to be discharged into a fallopian tube. See also OVUM.

ovulatory cycle the cyclical changes in the ovary associated with the development of a GRAAFIAN FOLLICLE. See MENSTRUAL CYCLE.

ovum n. (pl. ova) a single female GAMETE that develops from a secondary oocyte following its release from the ovary at OVULATION. Also called EGG CELL. See also OOGENEISIS.

oxazepam n. a short-acting BENZODIAZEPINE that is the final active product of DIAZEPAM. Oxazepam possesses the advantage of having no metabolic products; it therefore has a predictable HALF-LIFE and elimination time and requires minimal processing in the liver. Because of this, some consider it to be the preferred agent in the management of alcohol withdrawal. However, the need for close monitoring of dosing schedules leads others to prefer longer-acting agents for this condition. U.S. trade name: Serax.

oxidation n. a chemical reaction in which a substance combines with oxygen or in which electrons are lost. In DRUG METABOLISM, oxidation is a common mechanism of Phase I metabolism, in which drugs are made more polar (i.e., more water soluble) by the addition of an oxygen atom, often via the action of CYTOCHROMES P450 enzymes.

O-X-O shorthand for a ONE-GROUP PRETEST–POSTTEST DESIGN, in which the researcher observes and measures a single set of participants (O), introduces an intervention (X), and then measures the participants (O) again to determine whether the intervention resulted in any change.

oxycephaly n. a high, pointed condition of the skull. Also called ACROCEPHALY. —oxycephalic adj.

oxycodeone n. see OPIOID ANALGESIC.

oxytocic n. any of a group of drugs capable of stimulating contractions of the uterine muscles and used clinically to induce labor and elective or therapeutic abortion and to control postpartum bleeding. Oxytocics include ERGOT DERIVATIVES (e.g., ergonovine) and some PROSTAGLANDINS.

oxytocin n. a PEPTIDE produced in the hypothalamus and released by the posterior PITUITARY GLAND into the blood, where it acts as a hormone, or into the central nervous system, where it acts as a neurotransmitter and binds to oxytocin receptors to influence behavior and physiology. Although perhaps best known for its role in stimulating contractions of smooth muscle in the wall of the uterus to facilitate labor and in the mammary glands to facilitate expression of milk—the so-called MILK LETDOWN REFLEX—oxytocin is present and serves important functions in both sexes. It has earned a reputation as a facilitator of social affiliation, and the TEND-AND-BEFRIEND RESPONSE in particular, and it has been shown to influence sexual pleasure, reproductive functions, and parental behavior (especially maternal behavior). Additionally, research with nonhuman animals suggests that oxytocin—and the structurally similar compound VASOPRESSIN—is important for PARTNERSHIP formation, MATE GUARDING, and recognition of social stimuli. A possible reason for the varied roles that oxytocin appears to play is that it has dual pathways and purposes. It has been theorized that when operating during times of low stress, oxytocin physiologically rewards, with feelings of well-being, those who maintain good social bonds. When operating during times of high stress or pain, however, it may produce physiological changes that encourage individuals to seek contact with others.
Paced Auditory Serial Addition Test (PASAT) a neuropsychological test measuring information-processing speed, working memory, and sustained and divided attention. Developed in New Zealand in the 1950s for experimental purposes by cognitive psychologist Hubert Sampson, the PASAT was first used clinically in the early 1970s by Sampson and clinical neuropsychologist Dorothy M. A. Gronwall to evaluate cognitive deficits in patients with mild head injury. It later became widely used for patients with multiple sclerosis and in recent years has been used to assess the cognitive effects of other neurological conditions. In the original version of the test, a random sequence of 61 digits is presented in audiotoed format, and the participant must add each digit to the immediately preceding digit. For example, a sequence of 1, 5, and 7 would result in the responses 6 (1 + 5) and 12 (5 + 7). Four trials are used, differing in the rate of digit presentation: 2.4, 2.0, 1.6, and 1.2 seconds, respectively. Mean numbers of correct responses for each of the four trials are compared. Several revisions of the original test exist, with variations in methodology and in technology (e.g., computerized digit presentation).

pacemaker n. a natural or artificial device that helps establish and maintain certain biological rhythms. Unqualified, the term usually refers to a CARDIAC PACEMAKER. Natural pacemakers include the sinoatrial node, which regulates heart rhythm, and the THALAMIC PACEMAKER.

pacchygyria n. see LISSENCEPHALY.

Pacinian corpuscle a type of cutaneous receptor that is sensitive to contact and vibration. It consists of a nerve-fiber ending surrounded by concentric layers of connective tissue. Pacinian corpuscles are found in the fingers, the hairy skin, the tendons, and the abdominal membrane. Also called Pacinian body: Pacini's corpuscle: Vater's corpuscle. [Filippo Pacini (1812–1883), Italian anatomist]

package insert see LABELING.

package testing a form of product testing that investigates the effects of package design on consumer purchasing decisions. For example, a package-testing study might find that 30% of female purchasers of cosmetics changed brands when a similar product was offered with a better package and that 50% of purchasers said they would be willing to pay a higher price for the original product in a more convenient package.

padded cell a room in a psychiatric hospital or ward that is lined with heavy cushioning on the floor and walls to prevent a violent or self-destructive patient from injuring himself or herself or others. In most institutions, padded cells have been replaced by some combination of physical restraints, psychological interventions, and tranquilizing medications.

PAG abbreviation for PERIAQUEDUCTAL GRAY.

pain n. an unpleasant sensation resulting from damage to nerve tissue, stimulation of free nerve endings, or excessive stimulation (e.g., extremely loud sounds). Physical pain is elicited by stimulation of pain receptors, which occur in groups of myelinated or unmyelinated fibers throughout the body but particularly in surface tissues. Pain that is initiated in surface receptors generally is perceived as sharp, sudden, and localized; pain experienced in internal organs tends to be dull, longer lasting, and less localized. Although pain is generally considered a physical phenomenon, it involves various cognitive, affective, and behavioral factors: It is an unpleasant emotional as well as sensory experience. It may also be a feeling of severe distress and suffering resulting from acute anxiety, loss of a loved one, or other psychological factors (see PSYCHIC PAIN). Because of these various factors, as well as previous experience in pain response, individual reactions vary widely. Psychologists have made important contributions to understanding pain by demonstrating the psychosocial and behavioral factors in the etiology, severity, exacerbation, maintenance, and treatment of both physical and psychic pain. See also CHRONIC PAIN; GATE-CONTROL THEORY.

pain disorder in DSM–IV–TR, a SOMATOFORM DISORDER characterized by severe, prolonged pain that significantly interferes with a person’s ability to function. The pain cannot be accounted for solely by a medical condition, and there is evidence of psychological involvement in its onset, severity, exacerbation, or maintenance. Although not feigned or produced intentionally (compare FACTITIOUS DISORDER; MALINGERING), the pain may serve such psychological ends as avoidance of distasteful activity or gaining extra attention or support from others. Pain disorder was formerly referred to as psychogenic pain disorder or somatoform pain disorder. The diagnosis has been eliminated from DSM–5, although the new term SOMATIC SYMPTOM DISORDER retains mention of such a disorder “with predominant pain.”

pain drawing a diagnostic tool for identifying the amount, severity, and type of pain experienced by an individual. A front and back view of the human body is provided, and the individual is given instructions to identify the location and type of pain using specified symbols.

p symbol for PROBABILITY.

P abbreviation for perceptual speed. See PRIMARY ABILITY.

P4P (PPP) abbreviation for PAY-FOR-PERFORMANCE.

p53 n. a tumor-suppressor gene that regulates an organism’s cell cycle and protects the cell’s DNA from damage. Mutations in p53 cause cells to become malignant. Germ-line mutations in p53 are responsible for most cases of Li-Fraumeni syndrome, and in families with this syndrome, carriers of p53 mutations have a 90% lifetime risk of developing one or more kinds of cancer.

P200 n. see P2 COMPONENT.

P300 n. see P3 COMPONENT.

PA 1. abbreviation for PHYSICIAN ASSISTANT. 2. abbreviation for Positive Affect within the POSITIVE AND NEGATIVE AFFECT SCHEDULE.

Paced Auditory Serial Addition Test
painful bruising syndrome

**painful bruising syndrome** see GARDNER–DIAMOND SYNDROME.

**painful sexual intercourse** discomfort during coitus, which may range from irritation to severe pain. Possible causes in women include insufficient foreplay and lubrication, urinary tract disease, vaginal atrophy during menopause, and vaginal muscle disorders. Although painful sexual intercourse is more common in women, it can occur in men, with possible causes including sexually transmitted diseases, conditions of the penis (e.g., Peyronie’s disease), and dermatitis. See also DYSpareunia.

**pain management** the prevention, reduction, or elimination of physical or mental suffering or discomfort, which may be achieved by pharmacotherapy (e.g., administration of opioids or other analgesics), psychological interventions, neurologic and anesthesiologic methods (e.g., nerve blocks, self-administered pumps), complementary or alternative methods (e.g., ACHNURPUNCTURE, ACUPRESSURE), or a combination of these. Among psychological interventions, BIOFEEDBACK and relaxation have been used alone and in conjunction with cognitive techniques to treat chronic headaches and facial pain. HYPNOTHERAPY has been used successfully to treat acute pain and pain associated with burns and metastatic disease. Cognitive and behavioral COPING-SKILLS TRAINING, training in external ATTENTIONAL FOCUS and in the use of neutral or positive IMAGERY, approaches designed to improve problem-solving and communication skills, and psychotherapeutic approaches have been combined with physical modalities in the treatment of CHRONIC PAIN syndromes.

**pain mechanisms** neural mechanisms that mediate pain. These extend from peripheral nerve endings to the cerebral cortex, especially the CINGULATE CORTEX. Some investigators propose that sharp pain sensations are transmitted by rapidly conducting A FIBERS and dull pain sensations are transmitted by slowly conducting C FIBERS. See also GATE-CONTROL THEORY.

**pain pathway** any neural pathway that mediates sensations of pain. Afferent pain pathways include rapidly conducting myelinated A FIBERS and slowly conducting unmyelinated C FIBERS, ascending tracts in the ANTEROLATERAL SYSTEM, the PERIQUADUCTAL GRAY matter, the RETICULAR FORMATION, and many thalamic and cerebral cortical areas, especially the CINGULATE CORTEX. There are also efferent pathways that inhibit pain signals at various levels down to spinal synapses, including release of ENDOGENOUS OPIOIDS that inhibit pain.

**pain perception** the perception of physiological pain, usually evoked by stimuli that cause or threaten to cause tissue damage. In some cases, such as PHANTOM LIMB pain and CAUSALGIA, the persistence of pain cannot be explained by stimulation of neural pathways. Pain perception can be measured in terms of its intensity and can be classified according to several categories: These include sharp or dull, focal or general, and chronic or intermittent or transitory. Also called NOCEPTION.

**pain receptor** see NOCICEPTOR.

**pain scale** a standardized rating scale for judging the intensity and perception of pain. It may take the form of verbal self-description, numerical ratings, or graphical depictions of expressive faces.

**pain sense** a sense, involving free nerve endings on the body surface and in some internal organs, that yields a specific effect identified as pain, especially when tissue injury occurs.

**pain threshold** the intensity at which a stimulus is experienced by an individual as hurtful.

**paint sniffing** a type of substance abuse involving the inhalation of the fumes of paint thinners and other volatile solvents. See INHALANT ABUSE.

**pair bond** a relationship between two individuals characterized by close affiliative behavior, emotional reaction to separation or loss, and increased social responsiveness on reunion. Pair bonds are important in species with biparental care, providing the female with increased likelihood of male cooperation in the care of the young and the male with increased CERTAINTY OF Paternity.

**paired-associates learning** a technique used in studying learning in which participants learn syllables, words, or other items in pairs and are later presented with one half of each pair to which they must respond with the matching half. Also called paired-associates method.

**paired associations** [introduced by Mary W. CALKINS]

**paired comparison** 1. a systematic procedure for comparing a set of stimuli or other items. A pair of stimuli is presented to an individual, who is asked to compare them on a particular dimension, such as size, loudness, or brightness; the process is continued until every item in the set has been compared with every other item. The method is mainly associated with research into psychophysical judgments but has also been used to study preferences between works of art or different personality characteristics. 2. in industrial and occupational settings, a method of EMPLOYEE EVALUATION in which each worker in a selected group is compared with every other worker on a series of performance measures. Employees are then rated on the basis of the number of favorable comparisons they receive.

**paired sample** any research sample in which each participant is matched on a particular variable to a participant in a second sample. This helps ensure that any differences on an outcome variable are not due to differences between participants on the matching variables. A simple example of a paired sample is a PRETEST–POSTTEST DESIGN, in which a variable is measured before and after an intervention; in this case, the participant is matched to himself or herself. More frequently, paired samples are achieved by matching individuals on personal characteristics, such as age and gender. See MATCHED-PAIRS DESIGN.

**paired-samples t test** see MATCHED-PAIRS T TEST.

**pairing** n. in behavioral studies, the juxtaposing of two events in time. For example, if a tone is presented immediately before a puff of air to the eye, the tone and the puff have been paired.

**pairing hypothesis** the hypothesis that the crucial feature of CLASSICAL CONDITIONING is the temporal conjunction (i.e., PAIRING) between a conditioned stimulus and an unconditioned stimulus.

**pairmate** n. either of the individuals involved in a PAIR BOND.

**PAIR Project** Processes of Adaptation in Intimate Relationships Project: one of the earliest and most influential longitudinal studies of marriage. The PAIR Project followed 168 Pennsylvania couples from their newlywed days to 14 years after marriage. Its initial goal was to examine how social and psychological factors present in courtship would
predict adaptation to marriage. Later studies examined these and other factors as predictors of marital deterioration and divorce. See also EARLY YEARS OF MARRIAGE PROJECT. [begun in 1981 by U.S. psychologist Ted L. Huston]

**pairwise comparison** in a FACTORIAL DESIGN with a variable of interest having more than two levels, a procedure in which the data obtained from each level of the variable are compared separately to the data from every other level. For example, if a researcher is assessing the differences in student achievement resulting from three different types of content presentation, statistical tests would be used to evaluate the different outcomes of each pair of content methods (i.e., Method 1 and Method 2, 1 and 3, and 2 and 3). DUNNETT’S MULTIPLE COMPARISON TEST, TUKKY’S HONESTLY SIGNIFICANT DIFFERENCE TEST, and the NEWMAN–KEULS MULTIPLE COMPARISON TEST all involve pairwise comparisons. See also MULTIPLE COMPARISONS.

**pairwise deletion** a method in which data for a variable pertinent to a specific assessment are included, even if values for the same individual on other variables are missing. For example, consider a researcher studying the influence of age, education level, and current salary on the socioeconomic status of a sample of employees. If assessing specifically how education and salary influence socioeconomic status of a sample of employees. If assessing specifically how education and salary influence socioeconomic status, he or she could include all participants regardless of its prognosis.

**pairwise deletion** a method in which data for a variable pertinent to a specific assessment are included, even if values for the same individual on other variables are missing. For example, consider a researcher studying the influence of age, education level, and current salary on the socioeconomic status of a sample of employees. If assessing specifically how education and salary influence socioeconomic status, he or she could include all participants regardless of its prognosis.

**palinopha** n. the persistence or reappearance of a visual image after the stimulus has been removed. Palinopha is associated with posterior brain injury, drug effects, and seizures. Also called palinopia: palipha: visual perseveration. See also AFTERIMAGE: VISUAL ILLUSION.

**palinprasia** n. involuntary repetition of words or phrases in speaking. Also called paliphrasia. See also PALILALLA.

**palliative care** 1. terminal care that focuses on symptom control and comfort instead of aggressive, cure-oriented intervention. This is the basis of the HOSPICE approach pioneered by British nurse, social worker, and physician Cicely Saunders (1918–2005). Emphasis is on careful assessment of the dying patient’s condition throughout the end phase of life in order to provide the most effective preventive treatment (e.g., medications) to relieve pain and manage other symptoms (e.g., respiratory distress, nausea, anxiety). 2. care intended to relieve suffering and distress in patients at any stage of a serious illness.

**palliative sedation** see SLOW EUTHANASIA.

**pallidotomy** n. a neurosurgical technique in which electrodes are used to selectively lesion the GLOROUS PALLIDUS. Pallidotomy is sometimes used for the management of disorders involving damage to the EXTRAPYRAMIDAL TRACT, as in patients with Parkinson’s disease for whom other treatments (e.g., with LEVODOPA) have proved ineffective.

**palmar adj.** 1. in humans, referring to the palms of the hands, 2. in nonhuman primates, referring to the palm of any limb.

**palmar conductance** the electrical conductivity of the skin of the palm of the hand. See SKIN CONDUCTANCE.

**palmar reflex** a reflex in which the fingers are flexed in nonhuman primates, referring to the palm of any limb.

**palmarization** n. the study of certain psychological processes in contemporary humans that are believed to have originated in earlier stages of human and, perhaps, nonhuman animal evolution. These include unconscious processes, such as the COLLECTIVE UNCONSCIOUS. The term was introduced in this sense by Carl JUNG. —<i>palmist adj.</i>

**palpebral fissure** n. the bony portion (see SOFT PALATE). Also called CLEFT PALATE. See also CLEFT PALATE.

**palmar** adj. 1. in humans, referring to the palms of the hands, 2. in nonhuman primates, referring to the palm of any limb.

**palmar reflex** a reflex in which the fingers are flexed in nonhuman primates, referring to the palm of any limb.

**palmarization** n. the study of certain psychological processes in contemporary humans that are believed to have originated in earlier stages of human and, perhaps, nonhuman animal evolution. These include unconscious processes, such as the COLLECTIVE UNCONSCIOUS. The term was introduced in this sense by Carl JUNG. —<i>palmist adj.</i>
pancreas n. a gland, located near the posterior wall of the abdominal cavity, that is stimulated by SECRETIN to secrete pancreatic juice, which contains various digestive enzymes. In addition, small clusters of cells within the pancreas (see ISLETS OF LANGERHANS) function as an ENDOCRINE GLAND, secreting the hormones INSULIN and GLUCAGON.

pancreatitis n. an inflammation of the pancreas, marked by severe abdominal pain and caused by biliary tract disorders (e.g., gallstones), alcoholism, viral infection, or reactions to certain drugs (e.g., some antipsychotic agents).

pandemic 1. adj. widespread or universal: affecting significant proportions of many populations over a large area (e.g., several countries), particularly with reference to a disease or disorder. Compare ENDEMIC; EPIDEMIC. 2. n. a disease or disorder affecting many people over a large area.

panel data observations on multiple phenomena collected over multiple time periods for the same group of individuals or other units. Repeated observations permit the researcher to study the dynamics of change using techniques such as TIME-SERIES ANALYSIS. Panel data have characteristics of both LONGITUDINAL DATA and cross-sectional data (see CROSS-SECTIONAL ANALYSIS). For example, the values of the gross annual income for each of 500 randomly chosen households in New York City collected for each of 10 years would be panel data.

panel study see LONGITUDINAL DESIGN; PANEL DATA.

panentheism n. see PANTHEISM.

panic n. a sudden, uncontrollable fear reaction that may involve terror, confusion, and irrational behavior, precipitated by a perceived threat (e.g., earthquake, fire, being stuck in an elevator).

panic attack a sudden onset of intense apprehension and fearfulness in the absence of actual danger, accompanied by the presence of such physical symptoms as heart palpitations, difficulty breathing, chest pain or discomfort, choking or smothering sensations, sweating, and dizziness. The attack occurs in a discrete period of time and often involves fears of going crazy, losing control, or dying. Attacks may occur in the context of any of the ANXIETY DISORDERS as well as in other mental disorders (e.g., mood disorders, substance-related disorders) and in some general medical conditions (e.g., hyperthyroidism). Also called anxiety attack. See also CURED PANIC ATTACK; SITUATIONALLY PREEMPTED PANIC ATTACK; UNCURED PANIC ATTACK.

panic control treatment a COGNITIVE BEHAVIOR THERAPY for panic disorder focusing on education about panic, training in slow breathing, and graded IN VIVO EXPOSURE to cues associated with panic. [developed by U.S. clinical psychologists Michelle G. Craske (1959–) and David H. Barlow (1942–)]

panic disorder (PD) in DSM–IV–TR, an ANXIETY DISORDER characterized by recurrent, unexpected PANIC ATTACKS that are associated with (a) persistent concern about having another attack, (b) worry about the possible consequences of the attacks, (c) significant change in behavior related to the attacks (e.g., avoiding situations, engaging in SAFETY BEHAVIOR, not going out alone), or (d) a combination of any or all of these. Panic disorder associated with significant avoidance is classified as PANIC DISORDER WITH AGORAPHOBIA (see AGORAPHOBIA). In DSM–5, panic disorder and agoraphobia are treated as separate entities with separate criteria; their combined presence is considered two diagnoses.

panpsychism n. the view that all elements of the natural world possess some quality of soul (psyche) or some form of sentience. Some equate this view with HYLOZORISM, which holds that all natural objects possess the quality of life, whereas others distinguish between life and soul or sentience. Also called PSYCHISM. See also ANIMISM; MIND STUFF; SPIRITUALISM.

pansexualism n. the view that all human behavior is motivated by the sexual drive. Sigmund Freud has been popularly associated with such a view; although he emphasized the power of the sexual instinct, Freud also recognized nonsexual interests, such as the self-preservative drives (e.g., hunger, thirst) and the aggressive drive associated with the DEATH INSTINCT. —pansexual adj.

pantheism n. the doctrine that all of reality constitutes a unity and that this unity is divine. Thus, everything is part of God. Modern pantheism was first systematically pronounced by Baruch SPINOZA, who proposed that God and nature are coequivalent. Such a position is incompatible with traditional THEISM because it entails a God who is no more than the sum total of his creation. Some thinkers make a distinction between pantheism and PANENTHEISM, which maintains that God is everywhere in his creation but not coequivalent with it. —pantheist adj., n.

pantomime n. 1. an expression of feelings and attitudes through gestures rather than words. 2. a nonverbal therapeutic technique sometimes employed when verbal expression is blocked.

pantry-check technique an inspection of the kitchen shelves or cabinets of households to determine whether the subjects of advertising research actually use the products they claim to prefer. Interviews alone often prove inadequate: Some market-research control studies have shown that as many as 15% of individuals interviewed may claim to use, prefer, or at least be acquainted with a particular product that has never been marketed or advertised. See also RECOGNITION TECHNIQUE.

Panum phenomenon a visual illusion produced by binocular fusion of separate images presented to the left and right eyes, with the fused image appearing closer to the eyes than the stimuli. [Peter Ludwig Panum (1820–1885), Danish physiologist]

Panum’s fusional area the region in space surrounding a HOROPTER in which images that appear at different points on the two retinas appear as single images. If visual targets appear outside this area (either in front of or behind it), they will appear as double images, and the observer will experience double vision. [Peter Ludwig Panum]

papaverine n. an OPium alkaloid first isolated in the 1840s. It has no psychopharmacological activity but is a potent vasodilator. It is occasionally used to increase blood flow in the cerebral arteries in the treatment of angina pectoris, or—when injected into the corpora cavernosa (see CORPUS CAVERNOSUM) of the penis—to produce erection in the management of impotence. U.S. trade name: Para-Time S.R.

Papez circuit a circular network of nerve centers and fibers in the brain that is associated with emotion and memory. It includes the hippocampus, fornix, mammillary body, anterior thalamus, cingulate cortex, and para-hippocampal gyrus. Damage to any component of this
system leads to amnesia. Also called Papez circle. [first described in 1937 by James W. Papez (1883–1958), U.S. neuroanatomist]

**Papez–MacLean theory of emotion** see MacLean’s theory of emotion.

**Papez’s theory of emotion** a modification of the Cannon–Bard theory proposing that the Papez circuit is the site of integration and control of emotional experience in the higher brain centers. See also MacLean’s theory of emotion. [James W. Papez]

**papilla** n. (pl. papillae) any of the four types of swellings on the tongue. In humans, some 200 fungiform papillae are toward the front of the tongue; 10 to 14 foliate papillae are on the sides; 7 to 11 circumvallate papillae are on the back; and filiform papillae, with no taste function, cover most of the tongue’s surface. Also called lingual papilla.

**papilledema** n. a swelling of the optic disk caused by an increase in intracranial pressure. The condition occurs because the meningeal membranes of the brain are continuous with the sheaths of the optic nerve, so that pressure is transmitted to the eyeball. Also called choked disk.

**PAQ** abbreviation for position analysis questionnaire.

**para-** (par-)** prefix 1. beside, near, or resembling (e.g., paraprofessional). 2. abnormal or beyond (e.g., parapsychology).

**parabiosis** n. the joining of two individuals so their circulatory systems interconnect, as in the case of some joined twins.

**parabiotic preparation** the surgical connection of two genetically similar animals at some anatomical structure, resulting in a shared circulation of blood. Parabiotic preparations are used for a variety of research purposes.

**paracentral scotoma** a small island of blindness in the central visual field surrounding, but not including, the fovea centralis. Monocular paracentral scotoma (affecting one eye) results from impairment of the peripheral visual system, such as from glaucoma or optic nerve atrophy; homonymous paracentral scotoma (affecting both eyes) arises from injury to the central visual system posterior to the lateral geniculate nucleus. Patients with homonymous paracentral scotoma typically have difficulties with reading (hemianopic dyslexia). See also scotoma.

**paracentral vision** a form of vision that utilizes the retinal area immediately surrounding, but not including, the fovea centralis. Compare central vision; peripheral vision.

**paracetamol** n. see acetaminophen.

**parachlorophenylalanine** n. a substance that blocks the synthesis of serotonin from tryptophan, resulting in depletion of serotonin from brain cells.

**parachromatopsia** n. partial color blindness. Also called parachromopsia. See also dichromatopsia.

**paracinesia** n. see parakinesia.

**paracontrast** n. a form of forward masking in which the perception of a visible stimulus (the target) is altered by the prior presentation of another visual stimulus (the mask) in a different spatial location. The target is often a small dot, whereas the mask is a ring that surrounds it.

Each stimulus is presented very briefly (10–100 ms), at intervals that are varied systematically, and the quality of the target’s percept is measured. Compare metacontrast.

**paracrine adj.** describing or relating to a type of cellular signaling in which a chemical messenger is released from a cell and diffuses to a nearby target cell, on which it exerts its effect through the intervening extracellular space. Compare autocrine; endocrine.

**paracusia** n. 1. partial deafness, especially to low-pitched tones. 2. any abnormality of hearing other than simple deafness, such as paracusia localis, an impairment in determining the direction from which a sound comes.

**paracyclesis** n. see ektopia; pregnancy.

**paradigm** n. 1. a model, pattern, or representative example, as of the functions and interrelationships of a process, a behavior under study, or the like. 2. a set of assumptions, attitudes, concepts, values, procedures, and techniques that constitutes a generally accepted theoretical framework within, or a general perspective of, a discipline. 3. an experimental design or plan of the various steps of an experiment. 4. in grammar, the set of all the inflectional forms of a word.

**paradigm clash** in science or philosophy, the conflict that occurs when a new set of fundamental assumptions about reality or human knowledge proves incompatible with an established set of such assumptions. For example, the doctrine of organic evolution challenged established thinking about the origin and nature of the living world and ultimately replaced previous theories.

**paradigm shift** in the influential 1962 analysis of scientific revolutions by U.S. philosopher of science Thomas S. Kuhn (1922–1996), a substantial and fairly rapid change in the whole pattern of ideas and assumptions defining the nature of a science and determining the methods and procedures used.

**paradox** n. a surprising or self-contradictory statement that may nevertheless be true. In philosophy, paradoxes are traditionally classified as logical or semantic. A logical paradox occurs when apparently valid arguments lead to a conclusion that seems contradictory or absurd. For example: God is omnipotent: Omnipotent beings can do anything: Therefore, God can make a stone so big He cannot move it: Therefore, He is not omnipotent. A semantic paradox arises from the words in a proposition. For example: This sentence is not true. The language of paradox is particularly common in poetry and religion, where it may be used to disrupt conventional ways of thinking and perceiving. See also vicious circularity. —paradoxical adj.

**paradoxical cold** an effect produced in thermal nerve endings that are sensitive to both cold and heat. The nerve fibers have double peaks, including one for heat that is above the threshold of pain. Thus, touching a hot object that fires a hot and cold receptor can produce an illusion of cold.

**paradoxical directive** an instruction by a therapist to a client to do precisely the opposite of what common sense would dictate in order to show the absurdity or self-defeating nature of the client’s original intention. See also paradoxical technique.

**paradoxical intention** a psychotherapeutic technique used for anxiety disorders in which the individual is asked to magnify a distressing, unwanted symptom. For example, an individual who is afraid of shaking in a social situation
paradoxical motion

would be instructed to imagine the feared situation and purposely exaggerate the shakiness. The aim is to help such individuals distance themselves from their symptoms, often by appreciating the amorous aspects of their exaggerated responses. In this way, they can learn that the predicted catastrophic consequences attributed to their symptoms are unlikely to occur. [originally developed by Viktor E. Frankl for the treatment of phobias]

paradoxical motion the global perception of movement in a motion aftereffect even though the individual elements in the image do not appear to move.

paradoxical reaction in pharmacology, a drug reaction that is contrary to the expected effect. An example is toxicity that is implicated in sleep.

paradoxical sleep see REM SLEEP.

paradoxical technique a therapeutic technique in which a client is directed by the therapist to continue undesired, symptomatized behavior, and even increase it, to show that the client has voluntary control over it. Also called paradoxical intervention. See also PARADOXICAL DIRECTIVE.

paradoxical thinking cognition marked by contradiction of typical logical processes. Although this type of thinking can be associated with distorted thought processes, such as those present in schizoid personality disorder or some forms of schizophrenia, it can be used as a way of reframing problems or negative beliefs in a positive manner. This approach is often embraced to promote creativity and personal, familial, and organizational change.

paradoxical warmth a sensation of warmth produced when a cold object of approximately 30 °C (86 °F) stimulates a cold receptor.

paradox of freedom a fundamental paradox that arises under assumptions of DETERMINISM in human behavior. Although specific behaviors can be attributed to specific antecedent causes, humans almost universally experience a sense of being free to perform or refrain from performing any given action at the point of action (see FREE WILL). HARD DETERMINISM resolves this paradox by insisting that the sense of free choice is illusion; whereas SOFT DETERMINISM argues that such a sense is not in fact incompatible with causal explanations.

parafovea n. the region of the retina immediately surrounding the Fovea CENTRALIS.

parageusia n. 1. a distorted sense of taste. 2. a GUSTATORY HALLUCINATION. See also DYSGEUSIA.

paragigantocellular nucleus (PGN) a region of the brainstem reticular formation that is implicated in sleep.

paragrammatism n. a symptom of APHASIA consisting of substitutions, reversals, or omissions of sounds or syllables within words or reversals of words within sentences. Paragrammatic speech may be unintelligible if the disturbance is severe. —paragrammatic adj.

paragraphe n. a condition in which writing is distorted by transposition or omission of letters and words or by insertion of incorrect and irrelevant words.

paragraph-meaning test an intelligence test, or a component of one, in which the participant is asked to explain the basic point, gist, or meaning of a paragraph.

parahippocampal gyrus a ridge (gyrus) on the medial (inner) surface of the TEMPORAL LOBE of cerebral cortex, lying over the HIPPOCAMPUS. It is a component of the LIMBIC SYSTEM thought to be involved in spatial or topographic memory. A region of it, the parahippocampal place area (PPA), has been shown to have significant activity in response to complex visual scenes (e.g., city streets, rooms, landscapes) and may aid in place recognition. Also called parahippocampal cortex.

parakinesia (paracinesia) n. awkwardness or clumsiness of movement.

paralysis n. 1. in parapsychology, the movement of objects at a rate and trajectory disproportionate to the contact made with them. The phenomenon is closely related to that of PSYCHOKINESIS, which involves manipulation of objects by thought alone. 2. in medicine, an occasional synonym for PARAKINESIA.

paralalia n. 1. a speech disorder or disturbance that involves the substitution of one sound for another (e.g., saying “wabbit” for rabbit or “lellow” for yellow). See also LALLING. 2. a rarely used term for speech disorders generally.

paralanguage n. the vocal but nonverbal elements of communication by speech. Paralanguage includes not only suprasegmental features of speech, such as tone and stress, but also such factors as volume and speed of delivery, voice quality, hesitations, and nonlinguistic sounds, such as sighs, whistles, or groans. These paralinguistic cues (or paralinguistic features) can be enormously important in shaping the total meaning of an utterance; they can, for example, convey the fact that a speaker is angry or sarcastic when this would not be apparent from the same words written down. In some uses, the term is extended to include gestures, facial expressions, and other aspects of BODY LANGUAGE.

paraldehyde n. a sedative and hypnotic drug formerly used in the treatment of agitation or delirium tremens. It was relatively toxic, with a noted side effect of producing a characteristic breath odor, and has been abandoned in favor of safer alternatives. U.S. trade name: Paral.

paralexia n. the substitution or transposition of letters, syllables, or words during reading. See also VISUAL DYSLEXIA.

paralinguistic cue (paralinguistic feature) see PARALANGUAGE.

parallax n. an illusion of movement of objects in the visual field when the head is moved from side to side. Objects beyond a point of visual fixation appear to move in the same direction as the head movement; those closer seem to move in the opposite direction. Parallax provides a monocular cue for DEPTH PERCEPTION.

parallel distributed circuit an interactive network that encompasses several different circuits at the same time to process the same stimuli. It is a relatively recent development in computers but an ancient property of nervous systems.

parallel distributed processing (PDP) any model of cognition based on the idea that the representation of information is distributed as patterns of activation over a richly interconnected set of hypothetical neural units that function interactively and in parallel with one another. See DISTRIBUTED PROCESSING; PARALLEL PROCESSING. See also GRACEFUL DEGRADATION.
parallel fiber any of the axons of the granule cells that form the outermost layer of the cerebellar cortex.

parallel form see alternate form.

parallel-forms reliability see alternate-forms reliability.

parallel-groups design a research design that compares two conditions or treatments (e.g., relaxation training vs. no training) such that both groups of participants are studied simultaneously and each participant receives one treatment only. A parallel-groups design thus contrasts with a crossover design, in which each individual participates in each condition.

parallelism n. 1. in general, the quality or condition of being parallel, being structurally similar, or having corresponding features. 2. in philosophy, the proposition that, although mind and body constitute separate realities, they function in parallel such that their responses seem holistic and the two realms seem to assert causal control over each other. See mind–body problem. See also occasionalism; preestablished harmony. 3. in anthropology, see cultural parallelism.

parallel play see social play.

parallel processing information processing in which two or more sequences of operations are carried out simultaneously by independent processors. A capacity for parallel processing in the human brain would account for people's apparent ability to carry on different cognitive functions at the same time, such as driving a car while also listening to music and having a conversation. The term is usually reserved for processing at a higher, symbolic level, as opposed to the level of individual neural units described in models of parallel distributed processing. Also called simultaneous processing. Compare serial processing.

parallel search in a search task, the process of searching for many items at the same time, with no decrease in efficiency. Compare serial search.

paralogia n. insistently illogical or delusional thinking and verbal expression, sometimes observed in schizophrenia. Eugen Bleuler cited the example of a patient who justified his insistence that he was Switzerland by saying "Switzerland loves freedom. I love freedom. I am Switzerland." Also called paralogical thinking: perverted logic: perverted thinking. See also evasion.

paralogism n. a fallacy or invalid argument, especially one that is unintentional and difficult to detect.

paralysis n. loss of function of voluntary muscles. A common cause is a lesion of the nervous or muscular system due to injury, disease, or congenital factors. The lesion may involve the central nervous system, as in a stroke or spinal cord injury, or the peripheral nervous system, as in guillain–barré syndrome. See also flaccid paralysis; spastic paralysis. —paralytic adj.

paralysis agitans an archaic name for parkinson's disease.

paralytic dementia see general paresis.

paramedic n. a health care professional who is specially trained and certified to assist medical professionals and, especially, to provide a wide range of emergency services prior to and during transportation to a hospital.

parameter n. 1. a characteristic of a population, such as the mean or standard deviation, that is described or estimated by a statistic obtained from sample data. For example, the mean score on a national exam for a sample of colleges provides an estimate of this parameter in the population of colleges. 2. any of the variables in a statistical model that is studied or used to explain an outcome or relationship. 3. an argument of a function.

parameter space the set of experimental variables that are used as input into a model and serve as the basis for estimation of parameters in a population.

parametric adj. describing any analytic method that makes assumptions about the data of interest. Compare nonparametric.

parametric statistics statistical procedures that are based on assumptions about the distribution of the attributes in the population being tested (e.g., that there is a normal distribution of values). Compare nonparametric statistics.

parametric test a hypothesis test that involves one or more assumptions about the underlying arrangement of values in the population from which the sample is drawn. Common parametric tests include analysis of variance, regression analysis, chi-square tests, t tests, and z tests. Also called parametric hypothesis test. Compare nonparametric test.

paramimia n. the use of gestures inappropriate to or incongruent with one's underlying feelings.

paramnesia n. see false memory.

paranoia n. 1. a paranoid state. 2. a former diagnosis for a relatively rare disorder, distinct from paranoid schizophrenia, in which the person reasons rightly from a wrong premise and develops a persistent, well-systematized, and logically constructed set of persecutory delusions, such as being conspired against, poisoned, or maligned. It is equivalent to persecutory-type delusional disorder. 3. historically, any psychiatric disorder characterized by persistent delusions. See also classical paranoia. 4. in ancient times, any mental disorder or delirium. —paranoiac adj.

paranoia querulans see litigious paranoia.

paranoid adj. 1. relating to or exhibiting extreme distrust or suspiciousness. See also paranoid personality disorder. 2. relating to or characterized by delusions. See also delusional disorder; paranoid schizophrenia.

paranoid condition see paranoid state.

paranoid delusion loosely, any of a variety of false personal beliefs tenaciously sustained even in the face of incontrovertible evidence to the contrary. These include delusions of grandeur, delusional jealousy, or, most frequently, delusions of persecution.

paranoid disorder see delusional disorder.

paranoid ideation thought processes involving persistent suspiciousness and beliefs of being persecuted, harassed, or treated unfairly by others.

paranoid litigious state see litigious paranoia.

paranoid personality disorder in DSM–IV–TR, a personality disorder characterized by (a) pervasiveness, unwarranted suspiciousness and distrust (e.g., expectation of trickery or harm, overconcern with hidden motives and meanings); (b) hypersensitivity (e.g., being easily slighted or offended, readiness to counterattack); and (c) restricted
paranoid pseudocommunity

affectivity (e.g., emotional coldness, no true sense of humor). The diagnosis has been retained in DSM–5.

paranoid pseudocommunity see PSEUDOCOMMUNITY.

paranoid psychosis a psychotic condition characterized by persecutory delusions without personality disorganization or deterioration. See DELUSIONAL DISORDER; PARANOID STATE.

paranoid-schizoid position in the OBJECT RELATIONS THEORY of Melanie Klein, the period from birth to the 6th month of life during which infants perceive the world in terms of PART-OBJECTS and develop a fear of annihilation and persecutory anxiety due to the power of their DEATH INSTINCT. Infants use various primitive DEFENSE MECHANISMS against these fears, including (a) the PROJECTION of aggression onto an external object; (b) directing their own aggression against the imagined persecutory object; and (c) INTRODUCTION and SPLITTING of the breast into a good object and a bad object (see BAD BREAST; GOOD BREAST). The paranoid-schizoid position is a lifelong possibility, manifested in later life by an inability to accept that anyone can be both bad and good and by certain pathologies (e.g., paranoia, psychosis) that are believed to be marked by a chronic tendency to be stuck in this position. Compare DEPRESSIVE POSITION.

paranoid schizophrenia in DSM–IV–TR, a subtype of schizophrenia, often with a later onset than other types, characterized by prominent delusions or auditory hallucinations. Delusions are typically persecutory, grandiose, or both; hallucinations are typically related to the content of the delusional theme. Cognitive functioning and mood are affected to a much lesser degree than in other types of schizophrenia. This subtype has been eliminated from DSM–5.

paranoid state a condition characterized by delusions of persecution or grandiosity that are not as systematized and elaborate as in a PARANOID CONDITION. Also called paranoid condition.

paranormal adj. denoting any purported phenomenon involving the transfer of information or energy that cannot be explained by existing scientific knowledge. See also Extrasensory Perception; Occult; Parapsychology; Preternatural; Supernatural.

paranormal cognition see Extrasensory Perception.

paranoic gain see PRIMARY GAIN.

paraphasia n. a speech disturbance characterized by the use of incorrect, distorted, or inappropiate words or sounds, which in some cases resemble the correct word in sound or meaning and in other cases are irrelevant or nonsensical. For example, a wheelchair may be called a "spinning wheel," and a hypodermic needle might be called a "tie pin." The disorder occurs in a variety of forms (e.g., LITERAL PARAPHASIA, SEMANTIC PARAPHASIA) and is seen most commonly in neurological disorders (e.g., PICK'S DISEASE). Also called paraphrasis. —paraphasic adj.

paraphemia n. a speech disorder marked by the habitual introduction of inappropriate words or by the meaningless combination of words.

paraphilia n. in DSM–IV–TR, any of a group of disorders in which unusual or bizarre fantasies or behavior are necessary for sexual excitement. The fantasies or acts persist over a period of at least 6 months and may take several forms: preference for a nonhuman object, such as animals or clothes of the opposite sex; repetitive sexual activity involving real or simulated suffering or humiliation, as in whipping or bondage; or repetitive sexual activity with nonconsenting partners. Paraphilias include such specific types as FETISHISM, FROTTEURISM, PEDOPHILIA, EXHIBITIONISM, VOYEURISM, SEXUAL MASOCHISM, SEXUAL NARKISM, and NECROPHILIA. In DSM–5, a paraphilia is considered a PARAPHILIC DISORDER only if it causes distress or impairment to the individual or if its practice has harmed or risked harming others. —paraphilic adj.

paraphonia n. an abnormal change in voice quality.

paraphrase vb. to express the meaning of a text or utterance in different words, often for the sake of clarity or brevity. See also INTERPRET.

paraphrasis n. see PARAPHASIA. —paraphasic adj.

paraphrasic error an error that results in incoherent speech, most often from combining existing words, eliminating syllables from words, or creating new words.

paraphrenia n. 1. a late-onset psychotic condition that is marked by delusions and hallucinations but is distinct from schizophrenia by virtue of the absence of generalized intellectual impairment and distinct from degenerative demen- tias by virtue of the absence of a progressively deteriorating course. See also LATE PARAPHRENIA. [First described by Emil Kraepelin] 2. any of various mental disorders that are associated with transitional periods of life (e.g., adolescence, old age). [Defined in 1863 by German physician Karl Ludwig Kahlbaum (1828–1899)] 3. loosely, any of a variety of conditions, such as LATE-ONSET SCHIZOPHRENIA, PARANOID SCHIZOPHRENIA, or certain PARANOID STATES.

paraplegia n. paralysis of the legs and lower part of the trunk. See also SPASTIC PARAPLEGIA. —paraplegic adj.

parapraxis n. an error that is believed to express unconscious wishes, attitudes, or impulses. Examples of such errors include slips of the pen, SLEPS OF THE TONGUE and other forms of VERBAL LEAKAGE, forgetting significant events, mislaying objects with unpleasant associations, unintentional puns, and motivated accidents. Also called para-praxis. See also FREUDIAN SLIP; SYMPTOMATIC ACT.

paraprofessional n. a trained but not professionally credentialed worker who assists in the treatment of patients in both hospital and community settings.

parapsychology n. the systematic study of alleged psychological phenomena involving the transfer of information or energy that cannot be explained in terms of presently known scientific data or laws. Such study has focused largely on the various forms of Extrasensory Perception, such as TELEPATHY and CLAIRVOYANCE, but also encompasses such phenomena as Poltergeist activity and the claims of MEDIUMS. Although parapsychologists are committed to scientific methods and procedures, the field is still regarded with suspicion by most scientists, including most psychologists. This can perhaps be attributed to three main reasons: (a) Admitting even one instance of paranormal causation would potentially lead to the reexamination and reframing of numerous established laws and principles of science; (b) even the best-documented positive findings in this area have proved impossible to replicate; and (c) some researchers have been duped by charlatans. —parapsychological adj. —parapsychologist n.

parareaction n. an abnormal or exaggerated reaction to
a relatively minor incident (e.g., tripping), which may become the basis for a delusion.

parasite n. a species that depends on another for survival but generally does not kill it. There are many intestinal parasites that are of value in the digestion of food for their hosts. Some parasites induce illness or debilitation but do not weaken the host so severely that it (and therefore the parasite) will die. Others will survive only if they can find an alternative host before the death of their current host; some of these parasites can alter the behavior of their hosts to make transfer to another host more likely. —parasitic adj.

parasitism n. 1. in biology, an interspecies interaction in which one organism (the parasite) lives on or in an organism of another species (the host). The arrangement is beneficial to the parasite but often harmful to the host. Compare commensalism; mutualism. 2. by analogy, a social relationship in which one individual habitually benefits from the generosity of another without making any useful return.

parasomnia n. a sleep disorder characterized by abnormal behavior or physiological events during sleep or during the transitional state between sleep and waking. Examples include nightmare disorder, sleep terror disorder, sleepwalking disorder, restless-legs syndrome (see KLEHM'S SYNDROME), and confusional arousal, among others. The parasomnias recognized in DSM–IV–TR form one of two broad groups of primary sleep disorders, the other being dyssomnias. Those recognized in DSM–5 are part of a larger category of sleep–wake disorders. See also dysfunctions associated with sleep, sleep stages, or partial arousals.

parasuicide n. a range of behaviors involving deliberate self-harm that may or may not be intended to result in death. Passive suicide is an example.

parasympathetic drug see cholinergic drug.

parasympathetic nervous system one of two branches of the autonomic nervous system (ANS), the other being the sympathetic nervous system. Anatomically it comprises the portion of the ANS whose preganglionic fibers leave the central nervous system from the brainstem via the oculomotor, facial, glossopharyngeal, and vagus nerves and from the spinal cord via three sacral nerves (see spinal nerve). It is defined functionally as the system controlling rest, repair, enjoyment, eating, sleeping, sexual activity, and social dominance, among other functions. The parasympathetic nervous system stimulates salivary secretions and digestive secretions in the stomach and produces pupillary constriction, decreases in heart rate, and increased blood flow to the genitalia during sexual excitement. Also called parasympathetic division.

parasympatholytic drug see anticholinergic drug.

parasympathomimetic drug see cholinergic drug.

paratactic distortion in psychoanalytic theory, a distorted perception or judgment of others on the basis of past experiences or of the unconscious. Also called transference distortion. [introduced by Harry Stack Sullivan]

parataxis n. 1. broadly, a lack of integration among components of personality, cognitive style, or emotions. The term is now infrequently used. 2. in language, joining syntactic units (e.g., words, phrases) without the use of conjunctions, as in I came; I saw; I conquered.

parathyroid gland a small, paired endocrine gland found in the area of the thyroid gland. It secretes parathyroid hormone, which takes part in the control of calcium and phosphate metabolism.

parathyroid hormone a hormone secreted by the parathyroid glands when blood-calcium levels are low. It promotes dissolution of bone tissue and absorption of calcium by the intestine, thereby increasing the concentration of calcium (and phosphate) in the blood. Thus, together with calcitonin, it participates in calcium regulation. Also called parathyrin.

Para-Time S.R. a trade name for papaverine.

paratype n. the totality of environmental influences that act on an organism to produce individual expression of a genetic trait or character. See also genotype; phenotype.

paratypic adj. referring to the acquired properties (as opposed to genetic endowments) of an organism that result from exposure to environmental forces.

paraventricular nucleus (PVN) a particular collection of neurons in the hypothalamus that synthesize numerous hormones, among them oxytocin and vasopressin.

paraverbal therapy a method of psychotherapy, introduced in the 1970s, for children who have difficulty communicating verbally (e.g., due to trauma, hyperactivity, autism, withdrawal, language disturbances). Assuming that these children would feel more intrigued and less threatened by a nonverbal approach, the therapy uses various expressive media, including the components of music (tempo and pitch), mime, movement, and art to help the children express themselves. [developed by child psychotherapist Evelyn P. Heimlich]

paraworld n. a hypothetical world of ideal conditions that serves as a basis for formulating a model of some system or process believed to be true in the actual world. Such model building can be an important strategy in science.

paregoric n. a medication containing a tincture of opium that is administered to control severe cases of diarrhea. It relieves pain and discomfort and reduces intestinal motility. It is also used to treat opioid withdrawal in neonates and may be used as well with children and adults. Besides opium, paregoric contains camphor, benzoic acid, glycerin, anise oil, and alcohol. It was developed in the early 18th century. Also called camphorated tincture of opium.

parenchyma n. the functioning tissues of an organ or gland, as distinguished from supporting or connecting tissues. —parenchymatous adj.

parens patriae a doctrine promoting the power and interest of the government (Latin, “parent of the country”) in caring for and protecting minors and individuals who are unable to care for themselves or to provide for their own basic needs, even if implementing this doctrine necessitates restricting their rights. In the United States, this power and interest is vested with the individual states.

parental alienation syndrome (PAS) a child’s experience of being manipulated by one parent to turn against the other (targeted) parent and resist contact with him or her. This alignment with one parent and rejection of the other most often arises during child custody disputes following divorce or separation proceedings, particularly when the litigation is prolonged or involves significant an-
a parent–child relationship characterized by a disproportionate negative focus on one parent and a corresponding positive focus on the other parent. The term was first used by Richard Graber in 1985 and has since become widely recognized in family law and psychology. Parental alienation is often used in cases where one parent tries to undermine the connection between the child and the other parent, leading to a strained relationship between the child and the targeted parent. Parents often use this defense mechanism to protect themselves from further negative interactions with the court system. However, the presence of parental alienation can have serious consequences for the child’s emotional and psychological well-being. It can lead to feelings of isolation, decreased self-esteem, and increased stress levels. The issue of parental alienation is complex and requires a multidisciplinary approach to address the needs of the child and the families involved.
tween parents and children by improving parents’ problem-solving and communication skills in child rearing. [introduced in 1962 by U.S. psychologist Thomas Gordon (1918–2002)]

parenting n. all actions related to the raising of offspring. Researchers have described different human parenting styles—ways in which parents interact with their children—with most classifications varying on the dimensions of emotional warmth (warm vs. cold) and control (high in control vs. low in control). One of the most influential of these classifications is that of U.S. developmental psychologist Diana Baumrind (1927– ), involving four types of styles: authoritarian parenting, in which the parent or caregiver is accepting and affirming; authoritative parenting, in which the parent or caregiver encourages a child’s autonomy yet still places certain limitations on behavior; permissive parenting, in which the parent or caregiver is accepting and affirming, makes few demands, and avoids exercising control; and rejecting–neglecting parenting, in which the parent or caregiver is unsupportive, fails to monitor or limit behavior, and is more attentive to his or her needs than those of the child.

Parenting Stress Index (PSI) an instrument used to assess stress in parent–child interactions and to identify potentially dysfunctional parenting behaviors or potential behavior problems in the child. It currently consists of 120 questionnaire items to which parents respond using a 5-point Likert scale format, ranging from strongly agree to strongly disagree. Originally published in 1983, the PSI is now in its fourth edition. [developed by U.S. educational psychologist Richard R. Abidin (1938– )]

parenting style see PARENTING.

parenting training any program that instructs parents and other caregivers in techniques for effectively dealing with problem behavior in their children. Also called parent training. See also FAMILY INTERVENTION.

parent management training (PMT) a treatment approach based on the principles of OPERANT CONDITIONING. Parents use antecedents, behaviors, and consequences to change child and adolescent behavior at home, at school, and in other settings. The goals are to help children develop prosocial behaviors and to decrease oppositional, aggressive, and antisocial behaviors. See also PROBLEM-SOLVING SKILLS TRAINING. [developed by U.S. clinical child psychologist Alan E. Kazdin (1945– )]

parent–offspring conflict in animal behavior, a conflict that arises when parents cease providing care for current offspring and invest in producing the next set of offspring. The parents will benefit in terms of reproductive success by breeding again as soon as the current offspring have a high probability of surviving independently. The offspring, however, will gain more by continued investment from their parents, creating the conflict. Parent–offspring conflict is manifested through aggressive behavior, including tantrums, by the older offspring and through SIBLING RIVALRY.

Parents Anonymous a peer-led, professionally facilitated group for parents who would like to learn more effective methods of childrearing, thus strengthening families and providing a means of preventing child abuse.

Parents Without Partners an international organization providing mutual social support, educational programs, and activities for single parents and their children.

parent teachers association (PTA) an organization consisting of instructors and the parents of students. Its aims are to assist parents with parenting skills, to support and create a forum for students in the community and government, and to encourage public and parental involvement in public schools. The National Parent Teachers Association (NPTA) is a not-for-profit organization whose goal is to improve the welfare of children and young people. Its primary activities include public education, strengthening schools in large cities, and preventing substance abuse among students. It has also worked in many areas of child health and safety through various educational projects.

parergasia n. 1. a symptom of schizophrenia in which the individual performs an action that is not intended, such as opening the mouth when asked to close the eyes. [defined by Emil KRAEPELIN] 2. a former name for schizophrenia, introduced by Adolf MEYER to replace DEMENTIA Praecox, since he believed this disorder is best described in terms of disorganized behavior and distorted thought processes. —paresthetic adj.

paretic adj. relating to or experiencing parasias.

paretic paralysis n. partial or incomplete paralysis.

paresthesia n. an abnormal skin sensation, such as tingling, tickling, burning, itching, or prickling, in the absence of external stimulation. Paresthesia may be temporary, as in the “pins and needles” feeling experienced after having sat with one’s legs crossed too long, or chronic and due to such factors as neurological disorder or drug side effects. —parestheti adj.

Pareto principle 1. in economics, the principle that 80% of the wealth in any society will be owned by 20% of the population. 2. more generally, the rule of thumb that 80% of any given output is produced by 20% of input. For example, in any retail organization, 80% of the sales will be accounted for by 20% of the customers. Also called 80:20 rule. [Vilfredo Pareto (1848–1923), Italian economist and sociologist]

parica n. see EPIENA.

parietal cortex the cerebral cortex of the PARIETAL LOBE.

parietal drift see POSTURAL ARM DRIFT.

parietal lobe one of the four main subdivisions of each cerebral hemisphere. It occupies the upper central area of each hemisphere, behind the FRONTAL LOBE, ahead of the OCCIPITAL LOBE, and above the TEMPORAL LOBE. Parts of the parietal lobe participate in somatosensory activities, such as the discrimination of size, shape, and texture of objects; visual activities, such as visually guided actions; and auditory activities, such as speech perception.

parieto-occipital sulcus a groove (sulcus) that runs upward along the medial (inner) side of each cerebral hemisphere, extending from a junction with the CALCARINE FISSURE at a point posterior to the SPLENIUM, and forming the border between the CUNEUS and PRECUNIEUS regions.

Paris Medical School a group of doctors and students at the Salpêtrière Hospital in Paris who advanced the hypotheses and research of Jean-Martin CHARCOT, particularly with regard to his neurological studies of a positive
Parkes–Weber syndrome is a progressive neurodegenerative disease caused by the death of dopamine-producing neurons in the pars compacta region of the substantia nigra of the brain, which controls balance and coordinates muscle movement. Symptoms typically begin late in life with mild tremors (see resting tremor), increasing rigidity of the limbs, and slowness of voluntary movements. Later symptoms include postural instability, impaired balance, and difficulty walking (see festinating gait). Dementia occurs in some 20% to 60% of patients, usually in older patients in whom the disease is far advanced, and depression and anxiety are often observed as well. [first described in 1817 by James Parkinson (1755–1824), British physician]

Parolédil n. a trade name for bromocriptine.

parole n. 1. in psychology and psychiatry, a method of maintaining supervision of a patient whose treatment is mandated by the court and who has not been discharged but who is away from the confines of a restrictive setting, such as a mental institution or halfway house. A patient on parole may be returned to confinement at any time without formal action by a court. 2. supervised release from confinement in a correctional facility.

parorexia n. a pathological compulsion to consume unusual foods or nonnutritive substances. See also cisca: pica.

parosmia n. a disorder of the sense of smell in which a person is unable to distinguish odors correctly. For example, when presented with an odor of beer, the person might say it smells of bleach. Also called parosphemia. See also dysosmia: troposmia.

paroxetine n. an antidepressant of the SSRI class. Like other SSRIs, it is used to treat depression, panic disorder, social phobia, and obsessive-compulsive disorder. It differs from other SSRIs in that most patients find it to be sedating rather than activating and thus better taken in the evening rather than on rising. It should not be taken by patients who are already taking monoamine oxidase inhibitors. Paroxetine is available in immediate- and controlled-release preparations. U.S. trade name: Paxil.

paroxysm n. 1. the sudden intensification or recurrence of a disease or an emotional state. 2. a convulsion, spasm, or seizure. —paroxysmal adj.

paroxysmal sleep see narcolepsy.

parse vb. 1. in vision, to deconstruct a complex stimulus into its component features and attributes. 2. in linguistics, to analyze a sentence into its constituent parts, such as subject, verb, object, and the like, in order to map its syntactic structure.

parsimony n. see law of parsimony.

part correlation the association between two variables, x and y, with the influence of a third variable, z, removed from one (but only one) of the two variables. This can help a researcher to get a clearer understanding of the relationship between x and y. Also called semipartial correlation. Compare partial correlation; zero-order correlation.

parthenogenesis n. literally, virgin birth: the production of offspring without fertilization of the egg cells by sperm. It is the usual means of reproduction in some species. —parthenogenetic adj.

partial n. any frequency component in a complex tone. A partial is not necessarily a harmonic.

partial agonist a substance that binds to a receptor but fails to produce the same degree of response as a full agonist at the same receptor site or exerts only part of the action exerted by the endogenous neurotransmitter that it mimics. Partial agonists may exhibit the same affinity for the receptor site as do full agonists and may act as competitive inhibitors of full agonists. Minor variations in the chemical structure of either the receptor or the binding substance may dictate whether the substance acts as a full or partial agonist at any particular receptor site.

partial agraphia an older, less common name for agraphia.

partial correlation the association between two variables, x and y, with the influence of one or more other variables (z₁, z₂) statistically removed, controlled, or held constant: the effect of the z variable is removed from both x and y. For example, the partial correlation between salary and education level can be examined after the effects of age on each are removed. It is often of interest to learn whether a correlation is significantly reduced in magnitude once a third variable is removed. Also called higher order correlation: higher order partial correlation. Compare partial correlation; zero-order correlation.

partial decussation see optic chiasm.

partialization n. an approach to the statistical control of the influence of a variable or set of variables on other variables of interest (typically, the dependent and independent variables). Partialing helps clarify a specific relationship by excluding the effects of other variables that may also be associated. In a multiple regression model, for example, a researcher may want to remove the effects of a set of covariates before examining the final regression coefficients of interest. Also called partialing out.

partial insanity a borderline condition in which mental impairment is present but is not sufficiently severe to render the individual completely irresponsible for his or her acts. In legal proceedings, a conclusion of partial insanity may arise when there is evidence that a mental disorder was probably a contributing cause to a defendant’s criminal actions or that the disorder rendered the individual incapable of deliberation, premeditation, malice, or another mental state usually requisite for first-degree offenses; in

764
such circumstances, it may lead to conviction for a lesser offense. See also DIMINISHED RESPONSIBILITY: INSANITY; M’NAGHTEN RULE.

partial instinct see COMPONENT INSTINCT.

partial-interval recording a method for measuring or coding instances of behavior within particular time periods of observation. For frequently occurring behaviors or behaviors with a long duration, a researcher can identify time intervals in advance of the coding and have judges indicate whether a particular behavior occurs (or not) within each period. For example, in videos of mock job interviews, the method could be used to record whether the candidate had eye contact with the interviewer during different periods of the interview. See also WHOLE-INTERVAL RECORDING.

partialism n. a type of PARAPHILIA in which a person obtains sexual satisfaction from contact with a partner’s body part other than the usual erotic areas such as lips, breasts, and genitals (e.g., a leg). Partialism is distinguished from FETISHISM in which an object, such as a shoe, replaces the sexual partner.

partial least squares regression a statistical procedure that generalizes and combines features from PRINCIPAL COMPONENTS ANALYSIS and MULTIPLE REGRESSION. It is used when a researcher wants to estimate the outcomes on a set of dependent variables from a (very) large set of predictors, especially when these predictors have a high degree of MULTICOLLINEARITY or exceed the number of obtained observations.

partial lipodystrophy a form of LIPODYSTROPHY marked by the loss of adipose tissue from the face, extremities, or other parts of the body. See also TOTAL LIPODYSTROPHY.

partially ordered scale a scale that falls partway between a NOMINAL SCALE and an ORDINAL SCALE, in that the scaling units can be ranked from lowest to highest in most but not all cases.

partial reinforcement see INTERMITTENT REINFORCEMENT.

partial reinforcement effect (PRE) increased RESISTANCE TO EXTINCTION after intermittent reinforcement rather than after continuous reinforcement. Also called partial reinforcement extinction effect (PRE).

partial replication a REPLIATION of an empirical study in which only a subset of the study’s design and methodology are repeated. Often, a researcher will choose to conduct a partial replication to show that the general findings of a study remain the same, despite the methodological changes.

partial report a method of testing memory in which only some of the total information presented is to be recalled. For example, if several rows of letters are shown to the participant, a cue given afterward may prompt recall of only one particular row. Partial report methods are used to minimize OUTPUT INTERFERENCE in studies of ICONIC MEMORY. Compare WHOLE REPORT.

partial schedule of reinforcement see INTERMITTENT REINFORCEMENT.

partial seizure a seizure that begins in a localized area of the brain, although it may subsequently progress to a GENERALIZED SEIZURE. Simple partial seizures produce no alteration of consciousness despite clinical manifestations, which may include sensory, motor, or autonomic activity. Complex partial seizures may produce similar sensory, motor, or autonomic symptoms but are also characterized by some impairment or alteration of consciousness during the event. Partial seizures of both types are most commonly focused in the temporal lobe. Also called focal seizure.

partial sight see LOW VISION.

participant n. a person who takes part in an investigation, study, or experiment, such as by performing tasks set by the experimenter or by answering questions set by a researcher. In an experimental design, the person may be further identified as an experimental participant (see EXPERIMENTAL GROUP) or a control participant (see CONTROL GROUP). Participants may also be referred to as SUBJECTS, particularly by those who wish to avoid the implication that experimentees are involved in the construction, design, conduct, and analysis of the experiment. See also RESPONDENT.

participant modeling a procedure for changing behavior in which effective styles of behavior (e.g., of coping) are demonstrated step-by-step and analyzed by a therapist for an individual, who then practices the modeled behavior. Various aids are introduced to help the individual master the behavior, such as videotaped enactments of effective and ineffective behavioral responses to prototypical situations in a variety of social contexts (e.g., at school or work). By contrast, symbolic modeling is a procedure in which the individual only observes, but does not also practice, a modeled behavior as enacted in film, videotape, or other media. [developed by Albert BANDURA]

participant observation a QUASI-EXPERIMENTAL RESEARCH method in which a trained investigator studies a preexisting group by joining it as a member, while avoiding a conspicuous role that would alter the group processes and bias the data. The researcher’s role may be known or unknown to the other members of the group. Cultural anthropologists become participant observers when they enter the life of a given culture to study its structure and processes. Also called participatory research; participatory research.

participants’ rights in a study approved by an INSTITUTIONAL REVIEW BOARD, a set of conditions relating to participants in the study and their role in the research. Participants normally should be informed about the purpose of the study (but see DECEPTION RESEARCH). Its procedures (i.e., what specifically is expected to occur) and the associated costs and benefits; that their data from the study will be kept confidential; whom they can contact if they have any concerns about the study; and that they can leave the study at any time without penalty. Also called SUBJECTS’ RIGHTS. See also INFORMED CONSENT; RESEARCH ETHICS.

participation n. 1. taking part in an activity, usually one that involves others in a joint endeavor. 2. the interaction of two or more systems that mutually influence each other. 3. in PIAGETIAN THEORY, the tendency of children to confuse their wishes, fantasies, or dreams with reality. —participate vb.

participative decision making (PDM) the management practice of allowing employees to participate in the decision-making process. The extent of participation can vary from a relatively low level, in which employees provide input or consult with decision makers, to the highest level, in which employees are fully involved and actually
participative leadership

make the decisions. See INDUSTRIAL DEMOCRACY; QUALITY CIRCLE; SCANLAN PLAN.

participative leadership n. a LEADERSHIP STYLE in which followers are allowed to become involved in decision making and are given autonomy in performing their tasks.

participative management n. a style of management that allows employees to be involved in the governance, management, or decision-making processes of an organization.

participative research see PARTICIPANT OBSERVATION.

participatory action research n. a form of ACTION RESEARCH that emphasizes collaboration between researchers and members of the disadvantaged community of interest.

participatory design n. in ergonomics, design practice that supports direct input from end users during the DEVELOPMENT CYCLE.

participatory ergonomics n. a process in which employees at all levels within an organization are directly and actively involved in developing or enhancing ergonomic practices to improve worker health and safety.

participatory evaluation n. a type of PROGRAM EVALUATION in which the individuals who provide a service (e.g., professional staff) take a direct role in evaluating the service or program; clients of the service provided may also be involved. The official evaluator facilitates proceedings rather than actually conducting the appraisal. Also called COLLABORATIVE EVALUATION: EMPowerment evaluation.

participatory research see PARTICIPANT OBSERVATION.

particularism n. 1. in philosophy, a solution to the so-called CRITERION PROBLEM, which states that one cannot know whether one has knowledge because to recognize particular bits of knowledge one would need to know the criteria by which they are judged to be knowledge, and in order to know the criteria, one would already have to be able to recognize bits of knowledge. Particularism resolves this problem by stating that no general criteria are necessary to determine particular bits of knowledge. 2. in ethics, the doctrine that there are no general moral principles and that judgments of moral behavior cannot be made on the basis of such principles. Moral judgments must instead take account of many particular factors in a person’s background and current situation. This position tends toward moral RELATIVISM. See also MORAL NIHILISM; SUBJECTIVISM. —particularist adj.

partition 1. vb. in statistics and measurement, to divide VARIANCE observed in the DEPENDENT VARIABLE into component elements on the basis of its nature and origin. 2. n. a specific component of the observed variance (e.g., variance due to a treatment effect and variance due to RANDOM ERROR).

part-list cuing inhibition n. in a RECALL test, impairment of the capacity to recall individual items if some of the other items in the list studied are provided as retrieval CUES. That is, studying some of the items in a list may impair retrieval of other, nonstudied items in the same list. Also called PART-SET CUING INHIBITION.

part method of learning n. a learning technique in which the material is divided into sections, each to be mastered separately in a successive order. Compare WHOLE METHOD OF LEARNING.
arousal and usually sexual passion are prominent features; along with COMPANIONATE LOVE, it is one of the two main types of love identified by social psychologists. Passionate lovers typically are greatly preoccupied with each other, want their feelings to be reciprocated, and are usually greatly distressed when the relationship seems awry. See also LIMERENCE; ROMANTIC LOVE; TRIANGULAR THEORY OF LOVE.

passionflower  n. a climbing herb, Passiflora incarnata, indigenous to the southeastern United States and other subtropical areas but also cultivated as an ornamental plant. Parts of the plant have been used both externally and internally for a variety of medicinal purposes, ranging from treatment of burns and hemorrhoids to the alleviation of neuralgia and spasms or seizures. Passionflower tea has long been a folk remedy for the relief of nervous tension. Although some studies suggest passionflower has sedative properties and it has been approved in Germany for treatment of insomnia and anxiety, definitive clinical evidence of this effect has not been established. Adverse reactions are rare but may include nausea, vomiting, and rapid heart rate.

passive  adj. 1. acted upon rather than acting. 2. describing a personality pattern that is submissive, compliant, easily influenced by external forces, and dependent on others. See also DEPENDENT PERSONALITY DISORDER. 3. in grammar, denoting the PASSIVE VOICE of a verb.

passive-aggressive  adj. characteristic of behavior that is seemingly innocent, accidental, or neutral but that indirectly displays an unconscious aggressive motive. For example, a person who constantly keeps people waiting and then is baffled at why they resent this behavior is passive-aggressively disavowing an unconscious wish to be special and to provoke those who fail to acknowledge the specialness.

passive-aggressive personality disorder a personality disorder of long standing in which AMBIVALENCE toward the self and others is expressed by such means as procrastination, dawdling, stubbornness, intentional inefficiency, forgetting appointments, or misplacing important materials. These maneuvers are interpreted as passive expressions of underlying NEGATIVISM. The pattern persists even when more adaptive behavior is clearly possible; it frequently interferes with occupational, domestic, and academic success. This disorder was classified in the appendix of DSM–IV–TR and given an alternative name, negativistic personality disorder, in accordance with the theoretical proposals of Theodore MILLON. Its mention has been retained in DSM–5.

passive attention see PRIMARY ATTENTION.

passive avoidance a type of OPERANT CONDITIONING in which the individual must refrain from an explicit act or response that will produce an aversive stimulus. Compare ACTIVE AVOIDANCE.

passive-avoidance learning a commonly used misnomer for PUNISHMENT. It is usually used in situations in which the behavior that is punished occurs without specific training, as when a mouse on a platform learns to avoid stepping down onto an electrified grid after receiving a shock from it.

passive coping a stress-management strategy in which a person absolves himself or herself of responsibility for managing a stressor and instead relinquishes control over its resolution to external resources, such as other people and environmental factors. Individuals who cope passively often withdraw from interpersonal relationships and instead engage in such activities as hoping, praying, or avoiding the stressor. This type of COPING STRATEGY generally is considered maladaptive, having been associated with increased depression, poorer psychological adjustment, and other adverse consequences. It is similar to the earlier conceptualization of EMOTION-FOCUSED COPING but distinguished by its focus on external factors and abdication of personal responsibility. Compare ACTIVE COPING. [Identified in 1987 by Gregory K. Brown and Perry M. Nicassio (1947– ), U.S. clinical psychologists]

passive deception the withholding of certain information from research participants, such as not informing them of the true focus of the study. As long as certain conditions are met (e.g., debriefing), this approach is generally considered acceptable, because researchers may not want to reveal their hypotheses to study participants in case this leads them—consciously or nonconsciously—to adjust their behavior. Compare ACTIVE DECEPTION.

passive-dependent personality see DEPENDENT PERSONALITY DISORDER.

passive euthanasia the intentional withholding of treatment that might prolong the life of a person who is approaching death. It is distinguished from ACTIVE EUTHANASIA, in which direct action (e.g., a lethal injection) is taken to end the life. Courts have ruled that physicians do not have to try every possible intervention to prolong life, but opinions differ on where the line should be drawn. There is also controversy regarding the significance of the passive–active distinction, since both approaches result in shortening the life.

passive joy see joy.

passive learning 1. learning that may occur without the intention to learn, through exposure to information or behavior. See INCIDENTAL LEARNING. 2. learning that occurs without active Mnemonic involvement, as in DRILL and ROTE LEARNING.

passive listening in psychotherapy and counseling, attentive listening by the therapist or counselor without intruding upon or interrupting the client in any way. See also ACTIVE LISTENING.

passive management by exception a style of management in which the manager intervenes and takes charge only if subordinates fail to meet work standards.

passive negativism see NEGATIVISM.

passive noise protection see ACTIVE NOISE PROTECTION.

passive recreation a form of RECREATIONAL THERAPY in which the emphasis is on an individual’s amusement or entertainment, such as attending a musical concert. Compare ACTIVE RECREATION.

passive rehearsal a strategy for retaining information in short-term memory in which a person includes few (usually one) unique items per REHEARSAL set. Compare CUMULATIVE REHEARSAL.

passive resistance resistance to a government, policy, or law through nonviolent means, such as fasting, demonstrating, or CIVIL DISOBEDIENCE.

passive suicide ambiguous behavior that tends to be
passive touch

self-destructive, but not actively so, and is sometimes thought to reflect suicidal intentions. Examples of this behavior include failing to feed oneself or to engage in rudimentary self-care.

passive touch a form of touch characterized by sensory experiences that occur when the observer does not move. In passive touch, stimulation is imposed on the skin of the individual. Compare ACTIVE TOUCH.

passive transport the movement of substances across a cell membrane without expenditure of energy by the cell. It includes simple diffusion of ions through ion channels and facilitated diffusion of larger molecules assisted by transport proteins. Compare ACTIVE TRANSPORT.

passive voice in linguistics, the category of a verb used when the PATIENT of the action appears as the grammatical SUBJECT of the clause or sentence and the AGENT appears as the grammatical OBJECT. The passive voice, which is much less common than the standard ACTIVE VOICE, is illustrated by the sentence The purse was stolen by the thief, as opposed to The thief stole the purse.

passivism n. an attitude of submissiveness, especially in sexual relations (e.g., male passivism).

passivity n. a form of adaptation, or maladaptation, in which the individual adopts a pattern of submissiveness, dependence, and retreat into inaction.

passivity phenomena phenomena in which individuals feel that some aspect of themselves is under the control of others. These aspects can include acts, impulses, movements, emotions, or thoughts; patients typically report feeling that they are being made to do or think things by someone else or that they are experiencing the behaviors or emotions of someone else.

PASS model a model of intelligence based on the theory of Alexander Luria, according to which intelligence comprises separate abilities for simultaneous and successive processing. The four elements of the model are planning, attention, simultaneous processing, and successive processing. [developed by Canadian psychologist Jagannath Prasad (J.P. Das (1931– ) and U.S. psychologist Jack A. Naglieri (1950– )]

past-life regression a highly controversial HYPNOTIC REGRESSION technique in which a person is encouraged to move back in time to reexperience a supposed previous existence. Therapists who conduct past-life regression believe that the psychological and physical problems (e.g., phobias, insomnia) individuals currently have can be understood and resolved by discovering their origins in the experiences (e.g., traumas, unresolved conflicts, mistakes) of previous lives. Most hypnototherapists are skeptical of the practice and do not recognize it as a legitimate therapeutic tool. They claim that individuals’ memories of past lives are the product of fantasy, imaginative role playing, the expectations and suggestions implicitly conveyed to them by the hypnotist, or unconsciously produced confabulations constructed from personal knowledge, familiar places, events, television shows, novels, and other sources. Although the idea of reincarnation is accepted in numerous cultures, clinicians generally consider actual past-life enactments to be manifestations of psychopathology. Also called past-life regression therapy: past-life therapy. See also AGE REGRESSION.

pastoral counseling a form of counseling or psychotherapy in which insights and principles derived from theology and the behavioral sciences are used to help individuals, couples, families, and groups achieve healing and growth. Pastoral counseling is centered in theory and research on the interaction of religion and science, spirituality and health, and spiritual direction and psychotherapy. A pastoral counselor receives advanced training in one or several of the behavioral sciences (often psychology specifically) in addition to religious training, theological training, or both. Also called pastoral psychotherapy.

past-pointing n. see POINTING.

PAT acronym for PROGRESSIVE ACHIEVEMENT TESTS.

Patau syndrome see TRISOMY 13. [German-born U.S. geneticist Klaus Patau (1908–1975)]

patch-clamp technique the use of very fine-bore pipette MICROELECTRODES, clamped by suction onto tiny patches of the plasma membrane of a neuron, to record the electrical activity of a single square micrometer of the membrane, including single ION CHANNELS. [devised in the 1980s by German neuroscientists Erwin Neher (1944– ) and Bert Sakmann (1942– ).]

patellar reflex a reflex in which tapping the tendon beneath the knee causes an upward kick of the leg. Also called knee-jerk reflex.

paternal attitudes attitudes of a father toward his children, particularly those attitudes that play an important role in his children’s health, character formation, emotional adjustment, and self-image, as well as in his own self-perception as a father.

paternal behavior actions by males, especially among nonhuman animals, that are directed toward care of their young. Direct paternal behavior consists of such actions as feeding, carrying, or otherwise nurturing the offspring; it is thought to be rare, given that many males lack CERTAINTY OF PATERNITY. Indirect paternal behavior consists of acquiring resources or defending the group from harm, which indirectly leads to increased survival of the young. Males of species with biparental care undergo some hormonal changes similar to those in males: increased secretion of PROLACTIN and ESTROGEN. Early experience with young offspring is important for competent paternal behavior in many species. See also MATERNAL BEHAVIOR; PATERNAL BEHAVIOR.

paternalism n. a policy or attitude in which those having authority over others extend this authority into areas usually left to individual choice or conscience (e.g., smoking, sexual behavior), usually on the grounds that this is necessary for the welfare or protection of the individuals concerned.— paternalist adj.

path analysis a type of STRUCTURAL EQUATION MODELING used to examine a set of simultaneous LINEAR RELATIONSHIPS between variables. Results are displayed using a figure in which boxes denote measured variables, bidirectional arrows show correlations, directional arrows show causal or predictive relations, and arrows coming from nowhere show error associated with the prediction model. Each variable is expressed as a linear FUNCTION of the preceding variable as well as by a unique LATENT VARIABLE; the weights and STANDARD ERRORS for each coefficient provide information about the size of the PARAMETER. GOODNESS OF FIT is tested by comparing models with more pathways to models with fewer pathways. Also called path modeling. See PATH DIAGRAM.
path coefficient in path analysis, any of a set of weights that reflect the strength of the different facets of the relationships among manifest variables in a system. For example, if the model indicates that \(A \rightarrow B \rightarrow C\), there would be a path coefficient for the relationship between \(A\) and \(B\) and another for the relationship between \(B\) and \(C\); these would be direct effects, whereas the relationship between \(A\) and \(C\) would be an indirect effect, working through the impact of \(B\).

path constraint any restriction on how one may proceed in solving a problem. For example, in the tower of Hanoi puzzle, two path constraints are that the solver must move one disk at a time and may not place a larger disk on a smaller one.

path diagram a figure describing the hypothesized relations tested in an analysis of simultaneous linear relationships among measured or manifest variables; the object is to identify the causal relationships or logical ordering among variables. Each measured variable is designated by a box, and latent variables are represented by ovals. Covariances or correlations between exogenous variables and between errors are represented by curved lines with arrowheads at both ends. Paths are represented by straight lines with an arrowhead pointing from the independent variable toward the dependent variable. Associated with each path is either an asterisk or a number. The asterisks indicate free parameters, whose values will be estimated from the data, whereas the numbers indicate fixed parameters, whose values do not change as a function of the data. Also called path model. See also Path analysis.

path-goal theory of leadership a leadership theory stating that leaders will be effective insofar as they make it clear to followers how they can achieve goals and obtain rewards. By doing so, leaders enhance their followers’ expectancy that hard work will lead to task success and that task success will lead to valued rewards. The four basic leadership styles proposed in this theory are instrumental (directive), supportive, participative, and achievement-oriented leadership. Each of these styles can be effective or ineffective depending on the nature of the work environment and the characteristics of subordinates. See also valence–instrumentality–expectancy theory.

path modeling see path analysis.

patho- (path-) combining form suffering or disease.

pathoclisis n. 1. sensitivity to particular toxins. 2. the tendency of particular toxins to target certain organs or systems of organs.

pathogen n. any agent (e.g., bacterium, virus) that contributes to disease or otherwise induces unhealthy structural or functional changes. —pathogenic n.

pathogenesis n. the origin and development of a mental or physical disease or disorder. Also called nosogenesis; pathogeny. —pathogenetic adj.

pathogenic family pattern negative or harmful family attitudes, standards, and behavior that lay the groundwork for mental and behavioral disorder. Examples are parental rejection; triangulation of the child into the marital relationship between the parents; and excessively harsh, excessively lenient, or inconsistent discipline.

pathogeny n. see pathogenesis.

pathognomonic adj. describing a sign, symptom, or a group of signs or symptoms that is indicative of a specific physical or mental disorder and not associated with other disorders.

pathognomy n. the recognition of feelings, emotions, and character traits, particularly when they are signs or symptoms of disease.

pathological aggression 1. aggression that is violent, explicitly directed against individuals or property, and either part of a longstanding repertoire of destructive or hurtful behavior or a sudden, paroxysmal reaction to a real or perceived provocation. It may be a manifestation of psychiatric disorder (e.g., psychosis, posttraumatic stress disorder, antisocial personality disorder, some impulse-control disorders); neurological disease or injury; substance abuse (e.g., of alcohol); and some sexual behaviors (e.g., sexual sadism). 2. felonious assault with intent to harm or kill.

pathological aging changes that occur because of age-related disease, as distinct from changes associated with normal healthy aging.

pathological doubt 1. abnormal concern about having failed to perform a particular action, such as locking the door upon leaving the house. It is a common feature of obsessive–compulsive disorder. 2. a negative belief about one’s ability or future that often results in the inhibition of behavior and is commonly associated with a major depressive episode.

pathological fallacy an overgeneralization in which the pathological or abnormal characteristics of an individual or small group are attributed to the general population.

pathological gambling in DSM–IV–TR, an impulse-control disorder characterized by chronic, maladaptive wagering, leading to significant interpersonal, professional, or financial difficulties. DSM–5 characterizes this behavioral pathology as a nonsubstance-related addiction and refers to it as gambling disorder. Also called compulsive gambling.

pathological grief see complicated grief.

pathological inertia 1. the inability to switch sets or show flexibility due to a brain injury or psychological condition. 2. severely impaired initiative, drive, or motivation sometimes associated with brain damage, particularly to the frontal lobes. See abulia.

pathological intoxication see idiosyncratic intoxication.

pathological jealousy see delusional jealousy.

pathological lying a persistent, compulsive tendency to tell lies out of proportion to any apparent advantage that can be achieved. This often occurs among people with alcohol dependence or brain damage, but it is most common among individuals with antisocial personality disorder, who in some cases do not seem to understand the nature of a falsehood. See also pseudologia fantastica.

pathology n. 1. the scientific study of functional and structural changes involved in physical and mental disorders and diseases. 2. more broadly, any departure from what is considered healthy or adaptive. —pathological adj. —pathologist n.

pathomimicry n. conscious or unconscious mimicking, production, or feigning of symptoms of disease or disorder. Also called pathomimesis. See factitious disorder; lasthénie de perjol syndrome; malingering.
pathomorphosis

pathomorphosis n. a patient’s minimization or denial of illness.

pathomorphism n. any abnormal or extreme body build. —pathomorphic adj.

pathophysiology n. the functional alterations that appear in an individual or organ as a result of disease or disorder, as distinguished from structural alterations. —pathophysiological adj.

pathway n. a route or circuit along which something moves. Also called path. See NEURAL PATHWAY.

-pathy suffix 1. disease or disorder (e.g., psychopathy). 2. therapy or treatment (e.g., homopathy). 3. perception or feeling (e.g., empathy).

patient n. 1. a person receiving health care from a licensed health professional. See INPATIENT; OUTPATIENT. See also PATIENT–CLIENT ISSUE. 2. in linguistics, the entity that is affected by or undergoes the main action described in a clause or sentence, such as door in James opened the door or James knocked on the door. The patient is usually the grammatical object and is easiest to identify when this is the case; however, door is both subject and patient in such constructions as The door was opened by James (see PASSIVE VOICE). The door swung open, and (in some analyses) The door is open. In CASE GRAMMAR, the term EXPERIENCER is sometimes used for a patient who is a sentient being, such as Angus in Angus felt threatened or Angus saw it all. Compare AGENT; INSTRUMENTAL.

patient abuse harm caused by treatment providers to those in their care by exploiting their patients’ vulnerability and their own position of influence and trust to engage in inappropriate, unprofessional behavior. Such abuse, which sometimes takes the form of sexual involvement with a patient, is usually grounds for legal and professional action against the practitioner. Also called client abuse. See also PROFESSIONAL ETHICS; PROFESSIONAL STANDARDS.

patient-centered medical home see HEALTH HOME.

patient–client issue the dilemma of how to identify the recipient of psychological services or intervention (i.e., the nomenclature used for the recipient). Psychiatrists, many clinical psychologists, and some other mental health providers tend to follow the traditional language of the medical model and refer to the people seeking their services as patients. Counseling psychologists, some clinical psychologists, social workers, and counselors tend to avoid the word patient, which is associated with illness and dysfunction, and instead use the word client to refer to the person seeking their services.

patient history 1. in therapy and counseling, a systematic account of an individual’s development from birth to the present, including meaningful aspects of his or her emotional, social, and intellectual development. The account is kept by the therapist or counselor directly from the individual and may additionally be derived from autobiographical material or reports from family members. See ANAMNESIS. 2. see CASE HISTORY.

Patient Protection and Affordable Care Act (PPACA) legislation, signed into law in 2010, that ensures that all citizens of the United States have access to quality, affordable health care. In addition to mandating universal health insurance coverage, the law includes provisions for improving the quality and efficiency of health care by linking payment to outcomes; increasing support for prevention and public health innovation; and enhancing health care workforce education and training. Because it was spearheaded by and passed under the administration of President Barack Obama, the law is also called Obamacare.

patients’ rights any statement, listing, summary, or the like that articulates the rights that health care providers (e.g., physicians, medical facilities) ethically ought to provide to those receiving their services. These rights include (a) the provision of adequate information regarding treatment benefits, risks, costs, and alternatives; (b) fair treatment (e.g., respect, responsiveness, timely attention to health issues); (c) autonomy over medical decisions (e.g., obtaining full consent for medical interventions); and (d) confidentiality.

patient variable any characteristic of an individual in treatment, such as gender, age, personality, attitude, race, ethnicity, socioeconomic status, religious background, and cognitive status (e.g., intellectual disability), that may influence the process and outcome of treatment. Also called patient characteristic.

patient violence intentional physical force with the potential for causing death, disability, or injury by a patient against a mental health provider, staff member, another patient, or himself or herself. In the United States, mental health practitioners have a DUTY TO PROTECT third parties from a patient’s intended act of violence. See also DUTY TO WARN; TASAHOFF DECISION.

patriarchy n. 1. a society in which descent and inheritance is patrilineal, that is, traced through the male only. See UNILATERAL DESCENT. See also DESCENT GROUP. 2. more loosely, a family, group, or society in which men are dominant. Compare Matriarchy. —patriarchal adj.

patricide n. 1. the murder of one’s own father. 2. a person who murders his or her own father. Compare Matricide. —patricidal adj.

patrilineal adj. see PARIARCHY.

patrilocal adj. denoting an arrangement in which a married couple resides with or in proximity to the husband’s father or relatives, or a culture in which this is the norm. Also called virilocal. Compare Matrilocal; Neolocal.

pattern n. a spatial or temporal arrangement of separate elements to make a complex whole.

pattern analysis a class of methods (e.g., cluster analysis, factor analysis, discriminant analysis) used by researchers to recognize and find systematic regularity within a much larger data set. Often, these methods use computer modeling and simulation approaches and involve data mining, image processing, and the study of networks.

pattern coding the coding of information in sensory systems based on the temporal pattern of action potentials.

pattern discrimination the ability of humans and other animals to distinguish differences in patterns of visual, auditory, or other types of stimuli. See also PATTERN RECOGNITION.

patterned interview a type of interview, often used in personnel selection, that is designed to cover certain specific areas (e.g., work history, education, home situation) but at the same time to give the interviewer the chance to steer the dialogue into sidechannels and ask questions on points that need to be clarified. Also called semistructured interview. Compare STRUCTURED INTERVIEW; UNSTRUCTURED INTERVIEW.
neural activity from the evoking stimulus. Taste quality is coded in the shape of the pattern serves as the neural representation of the pattern theory a theory maintaining that the nerve impulse pattern for pain is produced by intense stimulation of nonspecific receptors, since there are no specific fibers or endings exclusively for the experience of pain. According to this theory, the nerves involved in detecting and reporting pain are shared with other senses, such as touch, and the most important feature of pain is the amount of stimulation involved. Also called nonspecificity theory. Compare GATE-CONTROL THEORY: SPECIFICITY THEORY. pattern theory of taste coding a theory postulating that each gustatory stimulus evokes a unique pattern of neural activity from the taste-cell population and that this pattern serves as the neural representation of the evoking stimulus. Taste quality is coded in the shape of the evoked pattern, whereas intensity is represented by the total discharge rate. Compare Labeled-Line Theory of Taste Coding. pattern vision the ability to discriminate between shapes, sizes, and other features of objects in the environment by visual patterns. Pattern vision is lost following a lesion or excision of the striate cortex, where many of the elements of visual patterns are processed. patulous eustachian tube see Autophony. pause n. in linguistics, a rest or delay in speech. Short (often barely distinguishable) pauses are used to mark the juncture between linguistic units, such as syllables, words, and sentences, whereas longer pauses may be used for deliberative effect or may indicate psychological activity in the speaker. The analysis of the location of pauses in speech is an active area of research. —pausal adj. Pavlovian conditioning see CLASSICAL CONDITIONING. [Ivan Pavlov] pavor n. a frightening dream characterized by its realism and residual feelings of terror on waking. Pavor nocturnus occurs during the night (see SLEEP TERROR DISORDER); pavor diurnus may occur in young children during a daytime nap. See also NIGHTMARE. Paxil n. a trade name for paroxetine. Paxipam n. a trade name for halazepam. pay equity see COMPARABLE WORTH. pay-for-performance (P4P; PFP) adj. 1. denoting a method of payment for health care services in which physicians, hospitals, and other providers receive financial rewards for delivering good patient care, as assessed by patient self-reports and various process-based measures (e.g., rates of adherence to treatment, rates of preventive care, use of information technology). Intended to improve the quality and value of health care, P4P programs are expanding rapidly worldwide and take a variety of forms according to their sponsor type (e.g., health plan, employer group), reward size, reward distribution method, and other factors. There is, however, limited empirical evidence of P4P effectiveness and growing concern about possible unintended consequences, such as provider avoidance of poorer or sicker patients, provider neglect of activities in areas not targeted for financial rewards, and provider discounting of patients’ treatment preferences. Critics also claim that P4P incentives largely reward those providers with higher performance at baseline, who already are eligible to receive bonuses and therefore have little motivation to improve further. Additionally, the majority of existing P4P programs target general medical care—primary care physicians in particular—and have yet to significantly influence behavioral health. Compare Fee-for-service. 2. more generally, describing any system of compensation based on measures of work quality or productivity. For example, P4P has a long history in industrial settings, and a growing trend in schools has been the development of systems of accountability designed to enhance the quality of education. Payne v. Tennessee a case resulting in a 1991 U.S. Supreme Court decision establishing that the admissibility in court of VICTIM IMPACT STATEMENTS must be considered on a case-by-case basis and that such statements are not permissible excluded from all sentencing proceedings. payoff evaluation see Outcome Evaluation. payoff matrix a schedule or table that lists the costs and benefits arising from every possible course of action that could be chosen by an individual—for example, by a player in a game or a business manager developing a new product. Ideally, the individual will show shifts in decision criteria that maximize the payoff. PBA abbreviation for PSEUDOBULBAR AFFECT. PCA abbreviation for PRINCIPAL COMPONENTS ANALYSIS. PCC abbreviation for POSTERIOR CINGULATE CORTEX. P-cell n. any of various small neurons in the four dorsal layers of the six-layered LATERAL GENICULATE NUCLEUS. P-cells are the origin of the parvo cellular system. The RETINAL GANGLION CELLS that provide input to the P-cells of the lateral geniculate nucleus are called P-ganglion cells. See also M-CELL. PChE abbreviation for pseudocholinesterase. See CHOLINESTERASE. PCIT abbreviation for PARENT–CHILD INTERACTION THERAPY. P1 component the first positive component of an EVENT-RELATED POTENTIAL, occurring approximately 100 ms after stimulus onset. The P1 component is usually larger for attended stimuli than for unattended stimuli, a phenomenon known as the P1 attention effect. Hence, it is thought to reflect the initial sensory and attentional processing of a stimulus by specific areas of the cerebral cortex. P2 component the second positive component of an EVENT-RELATED POTENTIAL, occurring approximately 200 ms after stimulus onset. An electrophysiological index of attention-related cerebral processing, the P2 component is thought to reflect feature analysis, goal-directed action selection (intention), and other higher order perceptual and motivational processes. It also is involved in a variety of
other cognitive activities, including the allocation and modulation of information-processing resources, the evaluation of the emotional significance of stimuli, language processing, and memory (e.g., working memory, recognition). Also called **P200**.

**P3 component**

the third positive component of an **EVENT-RELATED POTENTIAL**, which appears approximately 300 ms after stimulus onset. First reported in 1965, the P3 component is thought to reflect attentional resource allocation and memory-updating operations and has become a major focus of research into event-related potentials. Also called **P300**.

**PCP** 1. n. 1-(1-p-n-cyclohexyl) piperidine (phencyclidine): a hallucinogenic drug sometimes referred to as a “psychedelic anesthetic” because it was originally developed as an amnestic analgesic for use in surgical contexts and was later found to produce a psychedelic or dissociative reaction. Its medical use was discontinued because of adverse reactions, including agitation, delirium, disorientation, and hallucinations. High doses may induce stupor or coma. PCP has a complex mechanism of action. It binds as an ANTAGONIST to the NMDA RECEPTOR; it also acts as a DOPAMINE-RECEPTOR AGONIST and blocks the reuptake of dopamine, norepinephrine, and serotonin, among other actions. Because intoxication with PCP can produce symptoms resembling both the positive and negative symptoms of schizophrenia, some consider it to be a useful model of that disorder. PCP became common as an illicit drug in the 1970s. It can be smoked (often in combination with marijuana or tobacco), insufflated (inhaled nasally), or taken orally or intravenously (see ANGEL DUST). Despite speculation about its potential to damage nerve tissue, PCP remains a popular illicit drug. It is still used in veterinary medicine, primarily as an immobilizing anesthetic during surgical procedures. See also HALLUCINOCENEN. 2. abbreviation for PRIMARY CARE PROVIDER.

**PCR** abbreviation for POLYMERASE CHAIN REACTION.

**Pcs** abbreviation for PRECONSCIOUS.

**PD 1.** abbreviation for PANIC DISORDER. 2. abbreviation for PARKINSON’S DISEASE. 3. abbreviation for PERSONALITY DISORDER. 4. abbreviation for PSYCHOLOGICAL DEBRIEFING.

**PDAT** abbreviation for PRESENILE DEMENTIA OF THE ALZHEIMER’S TYPE.

**PDE** abbreviation for PRINCIPLE OF DOUBLE EFFECT.

**PDF** abbreviation for PROBABILITY DENSITY FUNCTION.

**PDM** 1. abbreviation for PARTICIPATIVE DECISION MAKING. 2. abbreviation for PSYCHODYNAMIC DIAGNOSTIC MANUAL.

**PDP** 1. abbreviation for PARALLEL DISTRIBUTED PROCESSING. 2. abbreviation for PROCESS-DESOCIATION PROCEDURE.

**Peabody Picture Vocabulary Test (PPVT)** a norm-referenced screening, diagnostic, and progress-monitoring test in which sets of four full-color drawings are presented to the participant, who selects the one that corresponds to a word uttered by the examiner. There are 228 stimulus words in two parallel forms (A and B) that are administered individually. The test, now in its fourth edition (**PPVT-4**; 2007), may be used with individuals ages 2 years 6 months to over 90 years to assess receptive vocabulary and verbal ability. Originally developed in 1959 by psychologists Lloyd M. Dunn (1917–2006) and Leota M. Dunn (1917–2001) at **Peabody** College of Vanderbilt University. [Nashville]

**peak clipping** the elimination of high-amplitude portions of speech waves by electronic means, causing some loss of quality but little, if any, loss of intelligibility. Peak clipping makes it possible to reduce high-intensity noise and enable a hearing aid or public address system to make the best use of its available power.

**peak experience** in the humanistic psychology of Abraham MASLOW, a moment of awe, ecstasy, or sudden insight into life as a powerful unity transcending space, time, and the self. Peak experiences may at times occur for individuals in their pursuit of SELF-ACTUALIZATION. See also BEING CONSCIOUS; TIMELESS MOMENT; TRANSPERSONAL PSYCHOLOGY.

**peak performance** performance of a task at the optimum level of an individual’s physical abilities, mental capabilities, or both.

**peak procedure** a procedure, used in behavioral studies, in which repetitions of a **FIXED-INTERVAL SCHEDULE** of reinforcement are interspersed with periods, usually two or three times as long as the fixed interval, in which reinforcement is omitted.

**peak shift 1.** a phenomenon in **STIMULUS GENERALIZATION** that occurs after **DISCRIMINATION TRAINING** involving two stimuli along a common dimension (e.g., brightness). The peak of the response gradient (i.e., the point at which the organism shows maximum response) is shifted in a direction away from the less favorable stimulus (e.g., a dim light) to a point beyond the value of the stimulus associated with reinforcement (e.g., beyond the value of a bright light to that of a very bright light). 2. in aesthetics, the phenomenon in which a **SUPERNORMAL STIMULUS** is preferred over the normal form of that stimulus.

**Pearson product-moment correlation coefficient** see **PRODUCT-MOMENT CORRELATION COEFFICIENT.** [Karl PEARSON]

**Pearson’s r** see **PRODUCT-MOMENT CORRELATION COEFFICIENT.** [Karl PEARSON]

**pecking order** regular patterns of dominance (pecking, threatening, chasing, fighting, avoiding, crouching, and vocalizing) in chickens and other animals. This term has been extended to denote any (usually linear) sequence of authority, status, and privilege that prevails in some organizations and social groups. See also DOMINANCE HIERARCHY.

**pectus carinatum** a malformation of the chest wall in which the sternum (breastbone) protrudes prominently. The condition may be a symptom of such disorders as rickets and **MARFAN’S SYNDROME.** Also called **pigeon breast.**

**ped-** combining form see **pedar-.**

**pedagogy** n. the activity or profession of imparting knowledge or instruction. —pedagogical adj.

**pederasty** n. sex, usually anal intercourse, between an adult male (**pederast**) and a boy or young man (see **CATAMITE**).

**pedestrian movement** the generally regular and predictable flow of pedestrian traffic in a public area, such as a shopping mall, plaza, or street intersection. Despite apparently random patterns of foot traffic, pedestrians usually follow the most direct route to a destination, which may or may not conform to the pathways planned and constructed for pedestrian movement.

**pediatric adj.** pertaining to the health and medical care
of children or to child development. **Pediatrics** is the medical specialty dealing with wellness care and treatment of disease in infants, children, and adolescents.

**Pediatric neuropsychology** a specialty that studies the behavior and cognitive abilities of children in terms of the neural mechanisms that underlie brain activity, especially in cases of brain damage or other neurological disorder. **Clinical pediatric neuropsychology** is the application of such study to the assessment and treatment of children with autism, attention-deficit/hyperactivity disorder, language or learning difficulties, problems in motor skills development, and similar challenges. Age-appropriate tests of ability are used to draw conclusions relating specifically to the brain–behavior relationship in these individuals. See also clinical neuropsychology; school neuropsychology.

**Pediatric psychology** an interdisciplinary field of research and practice that addresses physical, behavioral, and emotional development as it interacts with health and illness in children, adolescents, and families. Related to the larger field of health psychology, pediatric psychology focuses on the child in the contexts of the family, school, and health care settings. It tends to take a normative developmental view of adaptation based on physical conditions, medical treatment, and psychosocial interactions with family and peers, rather than a psychopathological view of adjustment to disease and disorders.

**Pediatric psychopharmacology** the branch of pharmacology that involves the study of drugs used to treat mental and behavioral disorders of childhood and adolescence. It helps determine the choice of drug according to the age of the child, the diagnosis, the duration and severity of the disorder, and the availability of the patient for behavioral and laboratory monitoring of drug effects.

**Pediatric therapy** services such as occupational therapy, physical therapy, and speech therapy that are provided to children with sensory integration dysfunction or other neurological deficits.

**Pedigree** n. 1. in medical genetics, a pictorial representation of the history of an illness in a family. It depicts the relationship of family members and—for each member—current status (alive or not), the date of diagnosis, kind of relevant illness, age at diagnosis, and other data. By reviewing this pedigree, geneticists can often estimate other family members’ likelihood of developing the illness. 2. family lineage or ancestry, especially when this is regarded as distinguished or notable. 3. the line of descent of a purebred animal, or a record of such descent.

**Pedigree method** the study of family history and genealogy as a means of tracing traits that might be inherited. The method was applied by Francis Galton in his studies of genius and by Henry Herbert Goddard in his studies of intellectual disability.

**Pedo**- (ped-; paedo-; paed-) combining form children.

**Pedology** n. an early 20th-century educational movement in Europe whose stated purpose was the scientific study of the physical and mental development of children. Interest in pedology manifested itself especially within the emerging Soviet psychology of the 1920s, and Lev Vygotsky was among its supporters. Because of its emphasis on ability testing and examination of individual differences, however, it was banned by the Soviets as a “false science” in 1936.
from members of a child’s peer group (e.g., school class members).

**peer review** the evaluation of scientific or academic work, such as research or articles submitted to journals for publication, by other qualified professionals practicing in the same field.

**peer tutoring** the teaching of one student by another who has displayed sufficient competency in a subject to help a fellow student learn a skill or concept. Peer tutors often receive minimal training or guidance by the teacher.

**pegboard test** a test of manual dexterity and fine motor speed in which the participant—first with the dominant hand, then with the nondominant hand, and finally with both hands—inserts pegs in a series of holes as rapidly as possible. One of the best known examples is the *Purdue Pegboard Test* (developed at Purdue University, West Lafayette, Indiana).

**peg-word mnemonic system** a MNEMONIC strategy used to remember lists, whereby each item is associated in imagination with a number–word pair (the *peg*). For example, if the pegs are the rhyming pairs “one is a bun, two is a shoe,” the first item to be remembered would be associated with a bun, the second with a shoe.

**Pelizaeus–Merzbacher disease** a rare, progressive degenerative disorder of the central nervous system marked by involuntary, rapid eye movements (see Nystagmus), muscular incoordination (see Ataxia), and spasticity. It is caused by a mutation in the gene that controls the production of a specific myelin protein. Severity and onset vary widely, depending on the type of mutation, and extend from the mild, adult-onset, spastic paraplegia form to the severe form with onset at infancy and death in early childhood. [Friedrich Pelizaeus (1850–1917), German neurologist; Ludwig Merzbacher (1875–1942), German physician]

**pellagra** n. deficiency of the B vitamin NICOTINIC ACID (niacin), marked by weakness, gastrointestinal disturbances, skin disorders, and neurological symptoms, such as apathy, confusion, disorientation, and neuritis. Also called nicotinic acid deficiency.

**pemoline** n. a nonamphetamine CNS STIMULANT used for the management of attention-deficit/hyperactivity disorder. Its effects resemble those of the AMPHETAMINES and METHYLPHENIDATE, and its mechanism of action includes blockade of dopamine reuptake. Pemoline has been associated with rare but occasionally fatal liver failure and with the development of Tourette’s disorder. Safety concerns led to its withdrawal from the Canadian market in 1999 and the U.S. market in 2005. Former U.S. trade name (among others): Cylert.

**PEN** acronym for psychotism, extraversion, neuroticism. See ESSENCE’S DIMENSIONS.

**penalty function** a WEIGHT applied to a statistic or index that lowers its value because of some undesired characteristic. In STRUCTURAL EQUATION MODELING, for example, several indices used to assess GOODNESS OF FIT include such a mechanism to downweight the index when a researcher’s model exhibits a high level of complexity.

**pendular knee jerk** an abnormal PATILLAR REFLEX observed in patients with a lesion of the cerebellum, in which the leg continues to move several times after the initial reflex.

**pendulum problem** a PIAGETIAN TASK used to assess cognitive development. The participant is asked to work out what governs the speed of an object swinging on a piece of string. The ability to systematically examine the variables (length, weight, force of drop, height of drop) generally appears in early adolescence and is evidence of HYPOTHETICO-DEDUCTIVE REASONING, which marks the FORMAL OPERATIONAL STAGE of development.

**penetration** n. the entry of the penis into the vagina. In the United States, legal definitions in cases of rape or illicit intercourse vary from state to state, but penetration is generally considered to have occurred if the glans penis passes beyond the labia majora. In some states, if penetration has not occurred during sexual assault, there cannot be a charge of rape. In such cases, the crime is some variety of felonious sexual assault, which usually has lower penalties than rape.

**penile plethysmograph** see PLETHYSMOGRAPHY.

**penile prosthesis** an implanted device that is used to restore male sexual potency. Such devices typically are made of malleable material or are inflatable, and their insertion requires surgery.

**penis** n. the male organ for urination and for INTROMISSION, during which it enters the female’s vagina to deliver semen. The urethra runs through the penis, which is composed largely of erectile tissue (see CORPUS Cavernosum; CORPUS SPONGIOSUM) and has a mushroom-shaped cap (GLANS PENIS). —penile adj.

**penis envy** in the classical psychoanalytic theory of Sigmund Freud, the hypothesized desire of girls and women to possess the male genital organ. Freud believed that it originated in the PHALIC STAGE, between ages 3 and 6, when the girl discovers that she lacks this organ, and he further posited that the girl feels “handicapped and ill-treated,” blames her mother for the loss, and wants to have her penis back. Karen D. Horney, among others, later argued that penis envy is not an envy of the biological organ itself but represents women’s envy of men’s superior social status. In any sense, the concept has been actively disputed from the beginning and is rarely considered seriously in current psychology. See also CASTRATION COMPLEX.

**Pennhurst Consent Decree** a judicial decree ordering the closure of the Pennhurst State School and Hospital in Philadelphia, Pennsylvania, and the movement of its residents with intellectual disability to least restrictive environments within the community. The decree further ordered team planning for individual movement to the community, provision of case management, and establishment of individual habilitation plans. The decree was based on the court’s determination that conditions at the facility were dangerous to the well-being of residents and violated the due process and equal protection clauses of the U.S. Constitution and other federal and state legislation. The
Perceived Fraudulence Scale (PFS) see IMPOSTOR PHENOMENON.

perceived reality a person’s subjective experience of reality, in contrast to objective, external reality.

perceived risk see RISK PERCEPTION.

perceived self the subjective appraisal of personal qualities that one ascribes to oneself.

perceived self-efficacy see SELF-EFFICACY.

perceived simultaneity the integration of stimuli into a single, conscious percept despite discrepancies in their actual time of arrival, so that they are perceived as occurring simultaneously.

perceived susceptibility a subjective estimate of the likelihood of personally contracting a disease. Also called perceived vulnerability.

percentage reinforcement in operant conditioning, a procedure in which a fixed percentage of scheduled reinforcers is omitted.

percentile n. the location of a score in a distribution expressed as the percentage of cases in the data set with scores equal to or below the score in question. Thus, if a score is said to be in the 90th percentile, this means that 90% of the scores in the distribution are equal to or lower than that score.

percentile reinforcement in operant conditioning, a procedure in which the likelihood that a response will be reinforced depends on the response exceeding (or being less than) a value based on a distribution from previous responses. Usually, the distribution is based on some set of the most recent responses, and it is updated with each response. For example, the current response might be eligible for reinforcement if its peak force falls above the 90th percentile of the distribution of forces from the previous 50 responses. The most recent force then replaces the earliest one in the distribution so that the distribution remains based on 50 entries.

percept n. the product of PERCEPTION; the stimulus object or event as experienced by the individual.

perception n. the process or result of becoming aware of objects, relationships, and events by means of the senses, which includes such activities as recognizing, observing, and discriminating. These activities enable organisms to organize and interpret the stimuli received into meaningful knowledge and to act in a coordinated manner.

perception deafness the inability to analyze or perceive sounds normally, due to some impairment of the inner ear or auditory nerve pathways leading to the brain.

perception of spatial relations an awareness of the static or dynamic spatial properties of an object, such as its extent or shape, and the relative location and orientation of stationary or moving objects in space.

perceptive adj. describing an individual who is sensitive and discriminating, especially in the judgment of people, works of art, and so forth.—perceptiveness or perceptivity n.

perceptron n. a connected network of input and output nodes that acts as a useful model of associative NEURAL NETWORKS. A simple (single-layer) perceptron might stand for two connected neurons, whereas more complicated perceptrons have additional hidden layers between input and
output. The connections between the inputs and outputs can be weighted to model the desired output. The goal is to develop a theoretical understanding of the way neural connections process signals and form associations (memories). Back-propagation (backprop) algorithms describe the most common process by which the weightings between input and output are adjusted. The output is compared to a desired endpoint, and changes needed in the strengths of the connections are transmitted back through the perception.

**perceptual** adj. relating to the awareness of sensory stimuli.

**perceptual aftereffect** see AFTEREFFECT.

**perceptual anchoring** 1. the process in which the qualities of a stimulus are perceived relative to another reference stimulus. 2. see SYMBOL GROUNDING.

**perceptual classification** in classification tasks, the grouping of items on the basis of their perceptual characteristics. Compare COMPLEMENTARY CLASSIFICATION; CONCEPTUAL CLASSIFICATION; IDIOSYNCRATIC CLASSIFICATION.

**perceptual closure** the process by which an incomplete stimulus (e.g., a drawing of a circle with a segment missing) is perceived to be complete (e.g., an entire circle).

**perceptual constancy** the phenomenon in which an object or its properties (e.g., size, shape, color) appear unchanged despite variations in the stimulus itself or in the external conditions of observation, such as object orientation or level of illumination. Examples of perceptual constancy include BRIGHTNESS CONSTANCY, COLOR CONSTANCY, SHAPE CONSTANCY, and SIZE CONSTANCY.

**perceptual cues** 1. features of a stimulus that are perceived and used by an organism in a particular situation or setting to identify and make judgments about that stimulus and its properties. 2. features of a situation that indicate the expected behavior. See DEMAND CHARACTERISTICS.

**perceptual cycle hypothesis** the theory that cognition affects perceptual exploration but is in turn modified by real-world experience, creating a cycle of cognition, attention, perception, and the real world in which each influences the others. Thus, sensory experience is neither totally internal nor totally external. [proposed in 1976 by Ulric Neisser]

**perceptual defense** in psychoanalytic theory, a misperception that occurs when anxiety-arousing stimuli are unconsciously distorted. If taboo words are rapidly presented, they may be misinterpreted; for example, if the stimulus word anal is presented, individuals may report seeing the innocuous canal.

**perceptual deficit** an impaired ability to organize and interpret sensory experience, causing difficulty in observing, recognizing, and understanding people, situations, words, numbers, concepts, or images. Also called perceptual defect.

**perceptual development** the acquisition of skills that enable a person to organize sensory stimuli into meaningful entities during the course of physical and psychological development.

**perceptual distortion** skewed perceptual experience. Examples include the distorted images produced by dreams or hallucinogenic drugs, geometric illusions (e.g., the MÜLLER-LYER ILLUSION), visions occurring in states of sensory deprivation or dehydration, and distortions produced by modifying auditory stimuli. Perceptual distortion may also occur as a consequence of acquired brain injury. See also METAMORPHOPSIA.

**perceptual disturbance** a disorder of perception, such as (a) recognizing letters but not words, (b) inability to judge size or direction, (c) confusing background with foreground, (d) inability to filter out irrelevant sounds or sights, (e) a body-image distortion, or (f) difficulty with spatial relationships (e.g., misperceiving the difference between a straight line and a curved line). Also called perceptual disorder.

**perceptual expansion** 1. the development of the ability to recognize, interpret, and organize intellectual, emotional, and sensory data in a meaningful way; 2. the enriched understanding of experience that takes place in psychotherapy when greater INSIGHT is achieved through the therapeutic process and dynamic.

**perceptual extinction** an effect of lesions in the parieto-occipital region of the brain in which a stimulus, usually tactual or visual, is not detected. If a single stimulus is presented on either side of the midline, it is detected; however, when two stimuli are presented at the same time, one on each side of the midline, the stimulus on the side of the body opposite the location of the lesion is not detected. This phenomenon is utilized in neuropsychological research on attention mechanisms. Also called sensory extinction; sensory inattention.

**perceptual field** in GESTALT PSYCHOLOGY, the totality of the environment that an individual perceives at a particular time; that is, all of the aspects of the environment of which the person is aware at a given time.

**perceptual filtering** the process of focusing attention on a selected subset of the large number of stimuli that are present at any one time. Perceptual filtering is necessary because the cognitive and physical capacity of an individual to process and respond to multiple sources of information is limited. See also BOTTLENECK MODEL.

**perceptual fluency** the ease with which a visual target is processed. The perceptual fluency theory of VISUAL ATTENTION holds that the repeated presentation of a given target between presentations of distractors in successive trials increases the perceptual fluency for that target, thus making it easier to distinguish from the distractors.

**perceptualization** n. in schizophrenia, the transformation of abstract concepts into specific perceptions. For example, an individual who thinks poorly of himself or herself may later experience hallucinations that bad odors are emanating from his or her body; the rotten personality becomes the rotten body that smells. Perceptualization is the most advanced level of ACTIVE CONCRETIZATION. [defined by Italian-born U.S. psychiatrist Silvano Arieti (1914–1982)]

**perceptual learning** learning to perceive the relationships between stimuli and objects in the environment or the differences among stimuli.

**perceptual maintenance** in environmental design, the construction of an environment to facilitate sensory functions (e.g., seeing, hearing) and to provide an appropriate level of perceptual stimulation for the activity carried out (e.g., the lighting and soundproofing of a recording studio).

**perceptual masking** see MASKING.
perceptual measure any test to evaluate sensory responses to stimuli. Examples include the STROOP COLOR–WORD INTERFERENCE TEST and the ROD-AND-FRAME TEST.

perceptual–motor coordination the use of perceptually derived information (e.g., from vision, touch) in the control of ongoing movements.

perceptual–motor learning the learning of a skill that requires linking the perceptual discrimination of important stimuli with appropriate motor responses (e.g., hitting a ball, driving an automobile).

perceptual–motor match the ability to correlate perceptual data with a previously learned set of motor responses. An individual with brain damage may have to touch everything he or she sees because of an inability to make the perceptual–motor match automatically.

perceptual neglect see SENSORY NEGLIGENT.

perceptual organization the process by which the elements of visual and other sensory information are structured into a coherent whole. According to traditional GESTALT PSYCHOLOGY, the parts of a group are organized to form whole figures that constitute more than the parts separately (see GESTALT PRINCIPLES OF ORGANIZATION). Later research more precisely defined the properties that enable such organized tasks. Artists have traditionally used the principles of perceptual organization to create desired moods or feelings and to challenge viewers’ expectations.

perceptual organizational deficit a phenomenon in which a subset of people with schizophrenia have particular difficulty visually integrating the parts of an object and seeing them as an ensemble. For example, if looking at a watch, they will perceive the hands, the dial, and the numbers as separate forms but will have difficulty processing the watch face as a whole. [coined by U.S. psychologist Steven M. Silverstein (1962–1987)]

perceptual representation system (PRS) a MEMORY SYSTEM whose function is to identify objects and words, allowing quick recognition of previously encountered stimuli. Perceptions are specifically recognized in the form previously experienced (e.g., a word as seen vs. a word as heard). The PRS does not recognize the meaning of stimuli, which is handled by SEMANTIC MEMORY.

perceptual restructuring the process of modifying a perception to accommodate new information.

perceptual rivalry the incompatibility of different perceptions of the same object. When an AMBIGUOUS FIGURE that allows two different perceptual interpretations is viewed, only one perceptual diagnosis can be made at any one time, so that perception alternates between the two rival interpretations. This switching between perceptions is primarily involuntary.

perceptual schema a mental model that provides a FRAME for interpreting information entering the mind through the senses or for activating an expectation of how a particular perceptual scene may look. See SCHEMA.

perceptual segregation the separation of one part of a PERCEPTUAL FIELD from the whole by physical boundaries or attention-diverting methods. See FIGURE–GROUND.

perceptual sensitization the lowering of an individual’s sensory thresholds for events that are emotionally sensitive or threatening.

perceptual set 1. a temporary readiness to perceive certain objects or events rather than others. For example, a person driving a car has a perceptual set to identify anything in the car or on the road that might affect his or her safety. See SELECTIVE PERCEPTION, 2. a Scham or FRAME that influences the way in which a person perceives objects, events, or people. For example, an on-duty police officer and a painter might regard a crowded street scene with very different perceptual sets.

perceptual speed see PRIMARY ABILITY.

perceptual style the characteristic way in which an individual attends to, selects, alters, and interprets sensory stimuli.

perceptual synthesis 1. the integration of experience from all the senses to establish knowledge of the external world and one’s interactions with it and to eliminate unessential information about both. 2. in auditory perception, a phenomenon in which people perceive missing sounds or faint sounds when the gap created by them is filled with white noise.

perceptual test a memory test that involves processing the surface features of a stimulus. Perceptual tests can be used to measure implicit memory, as in WORD-STEM COMPLETION in which participants are given sets of introductory letters and asked to form complete words using the first words that come to mind. Such tests can also be used to measure explicit memory, as in the GRAPHIC CUE-RECALL TEST in which participants are given cues that are similar in physical appearance to the target item but differ in meaning (e.g., fickle as a cue for freckle). Compare CONCEPTUAL TEST.

perceptual training a method of enhancing an individual’s ability to interpret perceived objects or events in concrete terms. For example, the ability of a child to recognize letters of the alphabet may be enhanced when he or she traces the outlines of the letters.

perceptual transformation 1. any modification in a percept produced by (a) an addition to, deletion from, or alteration in a physical stimulus or (b) a novel interpretation of the stimulus, a change in a SET or attitude, or a sudden insight concerning the material. 2. a change in the way a problem, event, or person is perceived by the inclusion of new information or a different perspective.

perceptual user interface an interface that enables a computer system to “perceive,” interpret, and respond appropriately to the facial expressions, speech, gestures or movements, and other perceptually based patterns of communication typical of users. The intent is to provide realistic, interactive encounters similar to those experienced among people in the real world. Compare GRAPHICAL USER INTERFACE; TANGIBLE USER INTERFACE.

perceptient 1. adj. capable of perception. 2. n. in parapsychology, the alleged recipient of telepathic communications or other extrasensory impressions. Compare AGENT. See also RECEIVER.

per-comparison error rate see TESTWISE ERROR RATE.

percutaneous umbilical cord blood sampling (PUBS) a method of diagnosing chromosomal abnormalities, blood disorders, or infection in a fetus. A fine needle is inserted through the mother’s abdominal wall into the uterus, enabling the collection of fetal blood directly from the umbilical cord for analysis. Because the procedure carries a higher risk of causing a miscarriage than other prenatal tests, it is performed only in high-risk pregnancies.
when the results from AMNIOCENTESIS or CHORIONIC VILLUS SAMPLING are inconclusive or when results are needed very rapidly, with some PUBS results available in as few as 2 hours. Also called cordocentesis.

**perform**

**performance** n. 1. any activity or collection of responses that leads to a result or has an effect on the environment. 2. the behavior of an organism (the **performer**) when faced with a specific task. 3. in linguistics, see competency. 4. performance anxiety apprehension and fear of the consequences of being unable to perform a task or of performing it at a level that will raise expectations of even better task achievement. **Test anxiety** is a common example of performance anxiety. Other examples include fear of public speaking, participating in classes or meetings, playing a musical instrument in public, and eating in public. If the fear associated with performance anxiety is focused on negative evaluation by others, embarrassment, or humiliation, the anxiety may be classified as a social phobia. 5. **Performance appraisal** see performance review. 6. **Performance assessment** 1. see performance review. 2. an appraisal of growth or deterioration in learning, memory, or both during performance on ability and achievement tests. 7. **Performance contract** a formal agreement between an employer and an employee regarding the work outcomes expected of the employee and the compensation and other rewards provided for these outcomes. 8. **Performance enhancement** the act or process of increasing one’s level of achievement at a task or activity by building one’s physical and mental capacity or endurance for it through exercise, positive self-talk, the use of imagery, and other means. See performance enhancing drug. 9. **Performance enhancing drug** a substance taken inappropriately or illegally (i.e., without a prescription) to build muscle, boost stamina, and increase speed for the purpose of achieving a heightened level of performance in competitive sports or to improve concentration for the purpose of achieving better performance in activities requiring sustained attention (e.g., studying, taking tests, conducting research, long-haul truck driving). The substances most often identified as performance enhancing drugs are anabolic-androgenic steroids (for enhanced physical functioning) and stimulant medications such as Adderall and Ritalin (for enhanced mental functioning), the latter used off-label from their prescribed purpose in treating attention-deficit/hyperactivity disorder and narcolepsy. Anabolic-androgenic steroids and similar substances are specifically called appearance and performance enhancing drugs when used to improve one’s body image or fitness or to alter one’s appearance in order to succeed in professions where performance is based on appearance (e.g., bouncers). Also called performance enhancement drug. 10. **Performance evaluation** 1. see performance review. 2. generally, any process of comparing the expected, planned, or ideal level of accomplishment or outcome for a particular activity or goal with the actual level of accomplishment or outcome. 11. **Performance goal** 1. in the motivational theory of U.S. personality psychologist Carol S. Dweck (1946–), the goal of demonstrating to others who may be evaluating one’s performance that one possesses a particular ability or other attribute. This is in contrast to a learning goal, in which one aims to develop an ability or attribute. 2. a goal that is set in terms of a specific level of achievement, such as running a mile in 5 minutes 30 seconds. See also goal setting. 12. **Performance imagery** the use of imagery to cognitively recreate all the sensations of a performance. See mental rehearsal. 13. the use of imagery during a performance as a cue to tell the body what to do, such as imaging an explosion under the foot at the moment of takeoff for a high jump. 14. **Performance intensity** see intensity. 15. **Performance IQ** see IQ. 16. **Performance management** a system for improving individual, work team, and organizational results. It relies on a continuous process that provides formal goal setting, timely and structured feedback, regular performance review, and opportunities for employee development and training. [developed in the 1970s by U.S. clinical psychologist Aubrey C. Daniels (1935—)]. 17. **Performance-operating characteristic (POC) the measure of performance on one task plotted against the measure of simultaneous performance on a second task. The POC shows how improvements in performance on one of the tasks might trade with performance decrements in the other task.**

**performance review** a formal appraisal of an employee’s job performance, typically conducted by his or her su-
perinatal herpes-virus infection a herpes simplex Type 2 infection that is transmitted from a pregnant woman to her fetus. The fetal infection may develop into a severe blood disorder and can also result in a fatal form of encephalitis. The complication is most likely to develop in late pregnancy. See herpes infection.

period n. 1. the interval of time between the same point in successive cycles, such as sunset to sunset. 2. see frequency. 3. see menstruation.

period effect any outcome associated with living during a particular time period or era, regardless of how old one was at the time. Certain historical events, such as war, the introduction of social media, or the events occurring on September 11, 2001, may affect responses of participants in research studies. Period effects may be difficult to distinguish from age effects and cohort effects in research.

periodicity n. the state of recurring more or less regularly (i.e., at intervals). Phenomena that exhibit periodicity include the cycle of the seasons, human circadian rhythms, and consumer spending.

periodicity pitch see virtual pitch.

periodicity theory the theory that pitch is encoded in the temporal structure of the neural responses to sounds, specifically in the timing of neural discharges ("spikes"). For periodic sounds, the discharges of auditory nerve fibers tend to occur at integer multiples of the period of the sound. See phase locking. Compare place theory.

periodic reinforcement see fixed-interval schedule.

period prevalence see prevalence.

peripheral adj. 1. in the nervous system, located or taking place outside the brain and spinal cord. Compare central. 2. in vision, toward the margins of the visual field, rather than close to the center. The onset of a peripheral stimulus tends to draw attention to that location. 3. situated on the surface of a body. 4. situated away from a center and toward the outside edge. 5. incidental or superficial.

peripheral anticholinergic syndrome see anticholinergic syndrome.

peripheral auditory system see auditory system.

peripheral cue a factor that is external to the merits of an argument and that can be used to provide a relatively low-effort basis for determining whether an attitude object should be positively or negatively evaluated. See also elaboration-likelihood model: peripheral route to persuasion.

peripheral dysarthria see dysarthria.

peripheral dyslexia see visual word-form dyslexia.

peripheral dysostosis with nasal hypoplasia a congenital abnormality characterized by short, wide hands and feet and a short, flat nose with nostrils bent forward. Most affected individuals show some degree of intellectual disability and learning difficulties. Because of foot anomalies, learning to walk may be delayed. Also called acrodysostosis.

peripheralism n. the view of some behaviorists that emphasizes events at the periphery of an organism, such as the skeletal and laryngeal muscles and sex organs, rather than the functions of the central nervous system. For example, John B. Watson believed (falsely) that thinking was not a function taking place in the brain but involved minute movements of the vocal apparatus (subvocal speech) and thus was an objective behavior. Also called peripheralistic psychology. Compare centralism.

peripheral nerve fiber classification the classification of peripheral nerve fibers (axons) according to their diameters, speeds of conduction, and locations. They fall into three main classes. A fibers vary from 1 to 20 μm in diameter; they are myelinated fibers and conduct rapidly. B fibers occur in the preganglionic autonomic nervous system; they are myelinated but of relatively small diame-
ter, and they conduct more slowly than A fibers. C fibers vary from 0.2 to 1.5 μm in diameter; they are unmyelinated and conduct slowly. See also VELOCITY OF CONDUCTION.

**Peripheral nervous system** (PNS) the portion of the nervous system that lies outside the brain and spinal cord—that is, all parts outside the CENTRAL NERVOUS SYSTEM. Afferent fibers of the PNS bring messages from the sense organs to the central nervous system; efferent fibers transmit messages from the central nervous system to the muscles and glands. The PNS includes the CRANIAL NERVES, SPINAL NERVES, and parts of the AUTONOMIC NERVOUS SYSTEM.

**Peripheral neuropathy** a neuromuscular disorder of the extremities caused by damage to the peripheral nervous system and usually characterized by weakness, numbness, clumsiness, and sensory loss. Causes are numerous and include diabetes, nutritional deficiencies, injury or trauma, and exposure to toxic substances (see ALCOHOLIC NEUROPATHY).

**Peripheral route to persuasion** the process by which attitudes are formed or changed as a result of using peripheral cues rather than carefully scrutinizing and thinking about the central merits of attitude-relevant information. See also ELABORATION: ELABORATION-LIKELIHOOD MODEL. Compare CENTRAL ROUTE TO PERSUASION.

**Peripheral vision** vision provided by retinal stimulation outside the Fovea CENTRALIS. Compare CENTRAL VISION; PARACENTRAL VISION.

**Periphery** n. in vision, the part of the visual field outside the Fovea CENTRALES.

**Perirhinal cortex** a structure in the MEDIAL TEMPORAL LOBE adjacent to the hippocampus that plays an important role as an interface between visual perception and memory.

**Perisylvian language zone** the area of the brain that is responsible for language. It consists of the region around the LATERAL SULCUS (Sylvian fissure) of the left hemisphere and includes BROCA’S AREA and WERNICKE’S AREA. Damage to the zone causes various forms of aphasia. Also called perisylvian area: perisylvian language area.

**Peritraumatic dissociation** a transient dissociative experience (see DISSOCIATION) that occurs at or around the time of a traumatic event. Affected individuals may feel as if they are watching the trauma occur to someone else, as if in a movie, or they may feel “spaced out” and disoriented after the trauma. The occurrence of peritraumatic dissociation is a predictor for the later development of POSTTRAUMATIC STRESS DISORDER.

**Periventricular white matter** tissue consisting largely of myelinated nerve fibers (i.e., WHITE MATTER) that surrounds the lateral cerebral ventricles.

**Perky effect** the tendency for an imagined stimulus to interfere with seeing an actual target stimulus when the imagined form is close to that of the target. In one study, for example, a participant was positioned in front of a blank screen and asked to imagine a leaf, while simultaneously, without the participant’s knowledge, a blurry picture of a leaf was projected onto the screen, gradually becoming brighter; the intensity of the picture was well above the threshold for detection before the participant reported seeing it. [Described in 1910 by Cheves West Perky (1874–1940), U.S. psychologist]
permutation test see RANDOMIZATION TEST.

peroneal muscular atrophy see CHARCOT–MARIE–TOOTH DISEASE.

perphenazine n. a conventional ANTIPSYCHOTIC agent of the pipеразине PHENOTHIAZINE class. It is used for the treatment of schizophrenia, and its efficacy and side effects are similar to those of other phenothiazines. As with all phenothiazines, long-term use may be associated with the production of tardive dyskinesia or other neuromuscular deficits. U.S. trade name: Trilafon.

persecution delusional disorder a type of DELUSIONAL DISORDER in which the central delusion is persecutory (e.g., that one is being plotted against).

persecutory delusion see DELUSION OF PERSECUTION.

per se exclusion rule see STATE V. MACK.

perseverance n. see PERSISTENCE.

perseverance effect the phenomenon in which people’s beliefs about themselves and others persist despite a lack of supporting evidence or even a contradiction of supporting evidence.

perseveration n. 1. in general, persistence in doing something to an exceptional level or beyond an appropriate point. 2. in neuropsychology, the inappropriate repetition of behavior that is often associated with damage to the frontal lobe of the brain. 3. an inability to interrupt a task or to shift from one strategy or procedure to another. Perseveration may be observed, for example, in workers under extreme task demands or environmental conditions (mainly stress). 4. according to the PERSEVERATION–CONSOLIDATION HYPOTHESIS, the repetition, after a learning experience, of neural processes that are responsible for memory formation, which is necessary for the consolidation of long-term memory. 5. in speech and language, the abnormal or inappropriate repetition of a sound, word, or phrase, as occurs in stuttering. 6. the persistence or prolongation of a speech mode beyond the particular developmental stage at which it is typical or accepted, such as baby talk continuing into later childhood or adulthood. —perseverate vb.

perseveration–consolidation hypothesis the hypothesis that information passes through two stages in memory formation. During the first stage, the memory is held by perseveration (repetition) of neural activity and is easily disrupted. During the second stage, the memory becomes fixed, or consolidated, and is no longer easily disrupted. The perseveration–consolidation hypothesis guides much contemporary research on the biological basis of long-term learning and memory. Also called consolidation hypothesis; consolidation–perseveration hypothesis. See also DUAL TRACE HYPOTHESIS. [originally proposed in 1900 by German psychologists Georg Elias Müller and Allons Filzeker (1865–1949)]

perseverative error the continuing recurrence of an error, such as continuing to call a square a circle even after feedback that the name is wrong, or repeating the same answer to a series of different questions.

persistence n. 1. continuance or repetition of a particular behavior, process, or activity despite cessation of the initiating stimulus. 2. the quality or state of maintaining a course of action or keeping at a task and finishing it despite the obstacles (such as opposition or discouragement) or the effort involved. Also called persistence. See CLONING, INGER’S PSYCHOBIOLOGICAL MODEL OF PERSONALITY; TEMPERAMENT AND CHARACTER INVENTORY. 3. continuance of existence, especially for longer than is usual or expected. —persistence adj.

persistence of an attitude the extent to which an attitude is stable over time and remains constant in the absence of a direct challenge. See also ATTITUDE STRENGTH.

persistence of vision see VISUAL PERSISTENCE.

persistent complex bereavement disorder in DSM–5, a proposed diagnosis labeled “for further study” and based on a combination of symptoms, such as preoccupation with the deceased, marked difficulty accepting the death of a loved one, a desire to die to be with the deceased, difficulty trusting other individuals since the death, and clinically significant distress or impairment; for this diagnosis, at least 12 months (adults) or 6 months (children) must have passed since the death.

persistent depressive disorder see DYSTHYMIC DISORDER.

persistent noncognitive state see VEGETATIVE STATE.

persistent puberty a condition in which secondary sexual characteristics become arrested in development and individuals remain, in effect, pubescent for the duration of their lives.

persistent vegetative state (PVS) see VEGETATIVE STATE.

persona n. in the ANALYTIC PSYCHOLOGY of Carl Jung, the public face an individual presents to the outside world, in contrast to more deeply rooted and authentic personality characteristics. This sense has now passed into popular usage. The term is taken from the mask worn by actors in Roman antiquity.

personal adjustment 1. adaptation by an individual to conditions in his or her family and community, especially in social interactions with those with whom regular personal contact is necessary. 2. the degree to which a person is able to cope with the demands of life.

personal attribution see DISPOSITIONAL ATTRIBUTION.

personal audit an oral or written interview or questionnaire designed to encourage individuals to assess their own personal strengths and weaknesses.

personal-care attendant a person hired by an individual with a disability to provide assistance with ACTIVITIES OF DAILY LIVING (e.g., dressing, eating).

personal commitment 1. an individual’s adherence to a cause, attitude, or belief. Personal commitment does not necessarily reflect cultural values, attitudes, or beliefs. See also POSTCONVENTIONAL LEVEL. 2. in U.S. sociologist Michael E. Johnson’s tripartite model of marital commitment, a form of commitment based on the desire to continue a relationship because it is satisfying, enjoyable, or personally rewarding. It is considered the strongest type of commitment because it is based on the individual’s personal wishes and is experienced as voluntary. Compare MORAL COMMITMENT; STRUCTURAL COMMITMENT.

personal construct in personality theory, one of the concepts by which an individual perceives, understands, predicts, and attempts to control the world. See REPERTORY GRID. [formulated by George A. KELLY]

personal construct therapy a therapy based on the
concept of the PERSONAL CONSTRUCT. The essence of the approach is to help individuals test the usefulness and validity of their constructs and to revise and elaborate them as necessary to enhance their positive interpretations of and interactions with the world. [developed in the 1950s by George A. Kelly]

personal data sheet a questionnaire used by organizations to obtain biographical facts about current or potential employees, including their date of birth, sex, education, occupational history, interests, and health history.

personal disjunction an individual’s feeling or perception of dissimilarity or discrepancy between what is or might be and the objective reality or likelihood.

personal disposition Gordon W. Allport’s term for a PERSONALITY TRAIT: any of a number of enduring characteristics that describe or determine an individual’s behavior across a variety of situations and that are peculiar to and uniquely expressed by that individual. Personal dispositions are divided into three categories according to their degree of influence on the behavior of the person possessing them. Cardinal dispositions (or cardinal traits), such as a thirst for power, are so pervasive that they influence virtually every behavior of that person; central dispositions (or central traits), such as friendliness, are less pervasive but nonetheless generally influential and easy to identify; and secondary dispositions (or secondary traits), such as a tendency to keep a neat desk, are much more narrowly expressed and situation specific. Compare COMMON TRAIT.

personal distance zone the DISTANCE ZONE adopted by those interacting with friends and personal acquaintances. The personal distance zone is defined as the area 0.5 to 1.5 m (1.5 to 4 ft) from a person. Compare INTIMATE ZONE; PUBLIC DISTANCE ZONE; SOCIAL ZONE. See also PROXEMICS.

personal documents writings (diaries, letters, essays, etc.), recordings, and similar material produced by a person that, when examined in personal-document analysis, may provide insights into that person’s personality, values, attitudes, beliefs, fears, and so forth.

personal equation 1. the difference in performance attributed to INDIVIDUAL DIFFERENCES. 2. historically, a difference in reaction time between two observers.

personal fable a belief in one’s uniqueness and invulnerability, which is an expression of ADOLESCENT EGOCENTRISM and may extend further into the lifespan. Also called invincibility fable. [first described by U.S. developmental psychologist David Elkind (1931–)]

personal-growth group a small group of individuals that uses “encounter” methods, such as games, confrontation, and reenactment, for self-discovery and the development of the members’ potential. See also ENCOUNTER GROUP; HUMAN-POTENTIAL MOVEMENT.

personal-growth laboratory a SENSITIVITY TRAINING course that seeks to develop the participants’ capabilities for constructive relationships, creative effort, leadership, and understanding of others. This is achieved by various methods, such as art activities, intellectual discussions, sensory stimulation, and emotional interactions.

personal-history questionnaire a questionnaire that records information about a person’s special abilities, interests, extracurricular activities, family life, and any medical, emotional, or other problems relating to performance of activities or social adjustment.

personal identity see IDENTITY.

personal involvement see EGO INVOLVEMENT.

personalism n. 1. the philosophical position that human personality is the sole means through which reality can be understood or interpreted. At the core of this perspective is the concept of the person as a unique living whole, irreducible in value or worth, who is striving toward goals and is simultaneously self-contained yet open to the surrounding world. Personalism reorients the material of psychology around an experiencing individual as a systematic focal point. Thus, the findings of psychology can be organized only by reference to such a unique, living individual as the originator, carrier, and regulator of all psychological states and processes. This position reflects that of the school of PERSONALISTIC PSYCHOLOGY. 2. a tendency to believe that another person’s actions are directed at oneself rather than being an expression of that individual’s characteristics.

personalistic psychology a school of psychology that emphasizes personality as the core of the field (see PERSONALISM), the uniqueness of every human being, and the study of an individual’s traits (and organization of traits) as the key to personal understanding and adjustment to the environment. Personalistic psychology originated with German psychologists Eduard Spranger (1882–1963) and William Stern, as well as other Europeans, and was developed in the United States by Gordon W. Allport.

personality n. the enduring configuration of characteristics and behavior that comprises an individual’s unique adjustment to life, including major traits, interests, drives, values, self-concept, abilities, and emotional patterns. Personality is generally viewed as a complex, dynamic integration or totality shaped by many forces, including hereditary and constitutional tendencies; physical maturation; early training; identification with significant individuals and groups; culturally conditioned values and roles; and critical experiences and relationships. Various theories explain the structure and development of personality in different ways, but all agree that personality helps determine behavior. See also PERSONALITY DEVELOPMENT; PERSONALITY PSYCHOLOGY; PERSONALITY STRUCTURE.

personality assessment the evaluation of such factors as intelligence, skills, interests, aptitudes, creative abilities, attitudes, and facets of psychological development by a variety of methods and techniques. These include (a) observational methods that use behavior sampling, interviews, and rating scales; (b) personality inventories, such as the MINNESOTA MULTIPHASIC PERSONALITY INVENTORY; and (c) projective techniques, such as the RORSCHACH INKBLOT TEST and THEMATIC APPERCEPTION TEST. The uses of personality assessment are numerous, including in the clinical evaluation of children and adults; in educational and vocational counseling; in industry and other organizational settings; and in rehabilitation.

personality-based integrity test see INTEGRITY TESTING.

personality change a modification of psychological functioning in relation to personality, such as a change in the degree to which one is shy versus socially open or a shift in the way one views events and behavior as internally controlled versus externally determined.

personality correlates 1. personality traits that are associated with a particular condition, illness, or disorder.
For example, personality correlates of stress sensitivity may include introversion, obsession, and dependency. 2. variables that correlate with measures of personality. Correlations between personality traits and observed behaviors, for example, provide evidence for the validity of measures of such traits.

**personality cult** see CULT OF PERSONALITY.

**personality deterioration** a progressive decline in an individual’s sense of personal identity, self-worth, motivational forces, and emotional life to the point at which he or she appears to be a changed person or even a “nonperson.”

**personality development** the gradual development of personality in terms of characteristic emotional responses or temperament, a recognizable style of life, personal roles and role behaviors, a set of values and goals, typical patterns of adjustment, characteristic interpersonal relations and sexual relationships, characteristic traits, and a relatively fixed self-image.

**personality disintegration** fragmentation of the personality to such an extent that the individual no longer presents a unified, predictable set of beliefs, attitudes, traits, and behavioral responses. The most extreme examples of disintegrated, disorganized personality are found in the schizophrenias.

**personality disorder (PD)** any in a group of disorders involving pervasive patterns of perceiving, relating to, and thinking about the environment and the self that interfere with long-term functioning of the individual and are not limited to isolated episodes. DSM–IV–TR recognizes 10 specific personality disorders organized within three clusters: Cluster A includes paranoid, schizoid, and schizotypal; Cluster B includes antisocial, borderline, histrionic, and narcissistic; and Cluster C includes avoidant, dependent, and obsessive-compulsive; each disorder has its own entry in the dictionary. These constructs emerged from different theoretical perspectives of the early 20th century. They do not, however, exhaust the list of possible clinically significant maladaptive personality traits, and many of the DSM–IV–TR disorders are themselves often difficult to diagnose reliably: indeed, research has shown that many people diagnosed with a PD qualify for more than one. Conversely, **personality disorder not otherwise specified**, a residual category included within the DSM–IV–TR classification, is a highly common PD diagnosis in clinical settings. Applied to patients whom clinicians determine to have a personality disorder but who do not meet the diagnostic criteria for any of the 10 disorders within the classification, DSM–5 retains the same clusters of disorders, as well as the same diagnostic criteria for them, but includes, for “further study,” a new model for PD classification, proposing impaired personality functioning and pathological personality traits as the main criteria for identifying the presence of a personality disorder.

**personality dysfunction** any manner in which a personality operates maladaptively. The term is sometimes used as a synonym for PERSONALITY DISORDER.

**personality-guided therapy** a therapeutic framework that considers an understanding of each individual’s unique cognitive, affective, and behavioral traits to be essential for effective clinical treatment. According to this approach, psychopathology emerges from poorly functioning personality systems. Thus, to best facilitate a client’s long-term recovery and return to healthy functioning, the approach does not address symptoms per se but rather focuses on changing the underlying ways of thinking, feeling, perceiving, and relating that are associated with the pathology. Once a practitioner becomes familiar with the whole person, he or she may then selectively apply various therapeutic techniques and perspectives (cognitive behavioral, humanistic, psychodynamic, etc.) if and when appropriate to a given personality system. For example, a nurturing, supportive approach to treating depression would be appropriate for clients with dependent personalities (who feel helpless and fear abandonment) but not for those with antisocial personalities (who are exploitative and impulsive). [introduced in 1999 by Theodore MILLON]

**personality inventory** a personality assessment device that usually consists of a series of statements covering various characteristics and behavioral patterns to which the participant responds by choosing among fixed answers, such as true, false, always, often, seldom, or never, as applied to himself or herself. The scoring of such tests is objective, and the results are interpreted according to standardized norms. An example is the MINNESOTA MULTIPHASIC PERSONALITY INVENTORY.

**personality processes** the dynamics of personality functioning that change over time and across situations as the individual interacts with different people and events in the environment. Personality processes are usually contrasted with PERSONALITY STRUCTURE, or the stable, enduring elements of an individual’s personality.

**personality profile** 1. a graphic presentation of results from psychological testing that provides a summary of a person’s traits or other unique attributes and tendencies. Because various scores appear in one display, a researcher can see the pattern of high and low scale scores for a given person. For example, a profile of an individual’s test results from the MINNESOTA MULTIPHASIC PERSONALITY INVENTORY would display his or her scores on measures of depression, hysteria, masculinity/femininity, paranoia, social introversion, and other attributes. 2. a summary of traits and behavioral tendencies that are believed to be typical of a particular group or category of individuals (e.g., people with a particular disorder; people employed in a particular profession).

**personality psychology** the branch of psychology that systematically investigates the nature and definition of personality as well as its development, its structure and trait constructs, its dynamic processes, its variations (with emphasis on enduring and stable individual differences), and its maladaptive forms (i.e., personality disorders). The field rests on a long history of theoretical formulation (e.g., trait theories, psychoanalytic theories, role theories, learning theories, type theories) that has aimed to synthesize cognitive, emotional, motivational, developmental, and social elements of human individuality into integrative frameworks for making sense of the individual human life. It has also developed numerous tests and assessments to measure and understand aspects of personality.

**personality structure** the organization of the personality in terms of its basic, enduring components and their relationship to each other. Structural theories vary widely according to their key concepts and include, for example, the PERSONAL DISPOSITIONS proposed by Gordon W. Allport; the surface traits and source traits in CIFFTLELL’S PERSONALITY TRAIT THEORY; the ID, EGO, and SUPEREGO in Sigmund Freud’s theory; the individual style of life posited by Alfred Adler; and the needs and motivations in Maslow’s MOTIVATIONAL HIERARCHY.
personality study

The study of the dynamic structure and processes that determine individuals' emotional and behavioral adjustments to their environment. Such research has focused on the structure of major trait constructs, on how traits affect actions and selection of social settings, and on the stability of traits throughout the life span. For example, a researcher might be interested in understanding how conscientiousness manifests itself from adolescence to late adulthood.

personality test

Any instrument used to help evaluate personality or measure personality traits. Personality tests may collect self-report data, in which participants answer questions about their personality or select items that describe themselves, or they may take the form of projective tests (see PROJECTIVE TECHNIQUE) to measure both the conscious and unconscious aspects of a participant’s personality.

personality trait

A relatively stable, consistent, and enduring internal characteristic that is inferred from a pattern of behaviors, attitudes, feelings, and habits in the individual. The study of personality traits can be useful in summarizing, predicting, and explaining an individual’s conduct, and a variety of personality trait theories exist among them ALLPORT’s PERSONALITY TRAIT THEORY and CATTELL’s PERSONALITY TRAIT THEORY. However, because such theories do not explain the proximal causes of behavior or provide a developmental account, they must be supplemented by dynamic and processing concepts, such as those involving motives, schemas, plans, and life stories.

personality type

Any of the specific categories into which human beings may be classified on the basis of personality traits, attitudes, behavior patterns, physique (see CONSTITUTIONAL TYPE), or other outstanding characteristics. Examples are Carl JUNG’s INTROVERSION–EXTRAVERSION distinction and FUNCTIONAL TYPES and Erich FROMM’s character types, such as the EXPLORATIVE ORIENTATION and MARKETING ORIENTATION.

Personalized Implicit Association Test

An IMPLICIT ATTITUDE MEASURE designed to eliminate the potential influence of extrapersonal associations on responses. In this procedure, the relatively normative category labels of pleasant and unpleasant are typically replaced with the more personalized category labels of I like and I don’t like, and no feedback is given regarding classification errors. It is a variation of the IMPACT ASSOCIATION TEST. [developed by U.S. psychologists Michael A. Olson and Russell H. Fazio (1952– )]

personalized instruction

1. teaching focused on the exact level of students’ needs in a subject, regardless of curriculum or grade designations. 2. a process of imparting knowledge that emphasizes a one-on-one relationship between student and instructor. This process enables a student to ask in-depth questions and to gain a clear understanding of concepts introduced by the instructor.

Personal Orientation Inventory

An inventory developed in 1966. It consists of 150 items that each contain two statements descriptive of values or behavior. For each item, the participant selects the statement most descriptive of himself or herself. The POI is scored for two major scales (time ratio, support ratio) plus 10 sub-scales: self-actualizing value, existentiality, feeling reactivity, spontaneity, self-regard, self-acceptance, nature of man, syn-ergy, acceptance of aggression, and capacity for intimate contact. [developed by U.S. psychologist Everett L. Shos- trom (1921–1992)]

personal plan

1. a conception of one’s future that includes goals to be achieved. 2. in psychotherapy, a written plan of intervention developed for a client with the participation of all parties concerned. Usually compiled with reference to diagnostic and other data relevant to the client’s situation, it identifies a continuum of treatment by outlining progressive steps to be achieved by the client.

personal probability

See SUBJECTIVE PROBABILITY.

personal projects

The aims of an individual that involve an organized set of activities of personal relevance over an extended period. [analyzed by Canadian personality psychologist Brian R. Little]

personal protective equipment

Gear, such as gloves, face masks, or hearing protection, that acts as a barrier to reduce or eliminate an individual’s exposure to a hazard (e.g., dangerous chemicals, high levels of noise). See also ADMINISTRATIVE CONTROLS; ENGINEERING CONTROLS.

personal space

An area of defended space around an individual. Personal space differs from other types of defended space (e.g., territory) by being a surrounding “bubble” that moves with the individual (see BUBBLE CONCEPT OF PERSONAL SPACE). It may have been used by various species throughout evolutionary history to protect the individual organism against intraspecies aggression and threats to personal autonomy. Because human use of personal space varies among cultures, it is a learned behavior, at least in part. See PROXEMICS.

personal space invasion

The intrusion by one person into the personal space of another. The intruder inappropriately and uncomfortably crowds the other person. See PROXEMICS.

personal strivings

Personal goal systems that involve multiple interrelated aims, some of which may support one another, whereas others may be in conflict. [analyzed by U.S. personality psychologist Robert A. Emmons (1958– )]

personal unconscious

In the ANALYTIC PSYCHOLOGY of Carl JUNG, the portion of each individual’s unconscious that contains the elements of his or her own experience as opposed to the COLLECTIVE UNCONSCIOUS, which contains the ARCHETYPES universal to humankind. The personal unconscious consists of everything subliminal, forgotten, and repressed in an individual’s life. Some of these contents may be recalled to consciousness, as in Sigmund FREUD’s notion of the PRECONSCIOUS, but others cannot and are truly unconscious. The personal unconscious also contains COMPLEXES based on the individual’s personal experience. In Jung’s view, the personal unconscious must be integrated into the conscious EGO for INDIVIDUATION to occur.

person-centered planning

A process that, in the planning of services for an individual, focuses on his or her particular strengths, preferences, achievements, and unique circumstances. In the case of a person with a developmental disability, for example, emphasis is placed on the person, his or her family members, and the supports needed to enable the person to make choices, participate in the community, and achieve dignity. The process requires an extended commitment from participants and the development of an action-oriented plan.

person-centered team

A group of people who meet periodically to develop plans for supports and services to
enrich the lifestyle and self-determination of an individual with a disability (e.g., an intellectual or developmental disability). The team uses methods based on principles of person-centered planning. Team participants are invited by the person with the disability or his or her advocate, rather than by a service organization or agency, and they need not be trained professionals in human services.

**person-centered therapy** see **client-centered therapy**.

**person–environment interaction** the relationship between a person’s psychological and physical capacities and the demands placed on those capacities by the person’s social and physical environment. Quality of life is influenced by person–environment congruence. Too few or too many environmental demands can lead to poorer quality of life. See also **environmental press–competence model**.

**personification** *n.* 1. in the approach of Harry Stack Sullivan, the pattern of feelings and attitudes toward another person that arises out of interpersonal relations with him or her. 2. a figure of speech in which personal or human characteristics are attributed to an object or abstraction, as in saying *fortune smiled on her*. 3. a person viewed as representing or embodying some quality, thing, or idea. —**personify** vb.

**person in the patient** in the psychosomatic approach to therapy, the role of the patient’s personality, character, and emotions as causative agents.

**person–machine system** see **human–machine system**.

**person-needs analysis** in industrial and organizational settings, a component of needs assessment in which data are collected to determine whether employees need training, which employees need training, and whether they are ready for training.

**personnel** *n.* see **human resources**.

**personnel data** 1. information on newly hired employees derived from application forms, interviews, employment tests, physical examinations, and letters of reference, to be used in matching individuals and jobs. See also **biographical data**. 2. information on employees held by a personnel or human resources department. This will usually include personal details, posts held within the organization, salary and other benefits, performance reviews, and employee evaluations.

**personnel placement** see **job placement**.

**personnel psychology** the branch of industrial and organizational psychology that deals with the selection, placement, training, promotion, evaluation, and counseling of employees.

**personnel selection** the process of selecting employees best suited for particular jobs by using such procedures as the assembly and analysis of biographical data, employment interviews, and employment tests.

**personnel specification** a list of certain precisely defined attributes that will be required in the successful candidate for a particular job, including educational or other qualifications, training, work experience, physical characteristics (e.g., strength, fitness), and specific work-related abilities. More general criteria, such as interests and personality traits, may also be included in the specification. Because these attributes are considered to be predictors of successful job performance, they will be emphasized in publicity and may be tested during **personnel selection**. Also called **job specification**. See **job dimensions**; **job requirements**; **knowledge, skills, abilities, and other characteristics**. See also **bona fide occupational qualification**.

**personnel test** any test used in personnel selection, in the placement of newly hired or existing employees, or in employee evaluation. Such tests include (a) aptitude tests, which measure basic abilities and skills; (b) achievement tests, which measure job-specific abilities such as typing skill; and (c) personality and interest inventories, which are used as predictors of job performance. See **employment test**; **occupational test**.

**personnel training** in industrial and organizational settings, a program designed to achieve such goals as orientation of new employees, development of knowledge and skills, or modification of supervisor or employee attitudes. The learning procedures used in personnel training may include classes or lectures (see **lecture method**), use of audiostream media, or simulator devices (see **simulation training**), role play, laboratory training, case discussions (see **case method**), behavioral modeling, business games, or programmed instruction. The training may be provided inside or outside the usual work setting (see **on-the-job training**; **on-the-job training**; **vocational training**). Also called **employee training**. See also **executive coaching**; **management development**.

**personology** *n.* 1. the study of personality from the holistic point of view, based on the theory that an individual’s actions and reactions, thoughts and feelings, and personal and social functioning can be understood only in terms of the whole person. 2. the theory of personality as a set of enduring tendencies that enable individuals to adapt to life, proposed by Henry Alexander Murray. According to Murray, personality is also a mediator between the individual’s fundamental needs and the demands of the environment.

**person perception** the processes by which people think about, appraise, and evaluate other people. An important aspect of person perception is the attribution of motives for action (see **attribution theory**).

**person-years** *pl. n.* the sum of the number of years that each individual in a population has been affected by an event, occurrence, or condition (e.g., a particular disorder or disease, a certain treatment protocol).

**perspective** *n.* 1. the ability to view objects, events, and ideas in realistic proportions and relationships. 2. the ability to interpret relative position, size, and distance of objects in a plane surface as if they were three-dimensional. 3. the capacity of an individual to take into account and potentially understand the perceptions, attitudes, or behaviors of himself or herself and of other individuals. 4. a particular way of looking at events or situations: a stance or philosophical position.

**perspective taking** looking at a situation from a viewpoint that is different from one’s usual viewpoint. This may involve adopting the perspective of another person or that associated with a particular social role, as in role play exercises. The term is synonymous with **role taking**. See also **empathy**.

**perspective theory** a theory postulating that self-reports of attitudes on rating scales depend on the content and perspective of a person’s attitude. **Content** refers to the evaluative responses that a person actually associates with...
perspectivism

an ATTITUDE OBJECT. Perspective refers to the range of possible evaluative responses that a person considers when rating an attitude object. A self-report of an attitude can change as a result of a change in content or perspective, that is, an actual change in the attitude or in what a person defines as an extremely positive or negative attitude. [originally proposed by U.S. psychologists Harry S. Upshaw (1926–2012) and Thomas M. Ostrom (1936–1994)]

perspectivism n. a philosophical position in which it is assumed that there is no objective, context-independent truth. Perspectivism is sometimes applied to psychotherapy. [derived from the work of Friedrich Nietzsche]

perspiration n. see SWEATING.

persuasion n. an active attempt by one person to change another person’s attitudes, beliefs, or emotions associated with some issue, person, concept, or object. See also DUAL PROCESS MODEL OF PERSUASION. —persuasive adj.

persuasion therapy a type of SUPPORTIVE PSYCHOTHERAPY in which the therapist attempts to induce the client to modify faulty attitudes and behavior patterns by appealing to the client’s powers of reasoning, will, and self-criticism. The technique was advocated by Alfred ADLER and others, notably Swiss-born French physicians Paul-Charles Dubois (1848–1918) and Joseph Jules Déjerine (1849–1917), as a briefer alternative to RECONSTRUCTIVE PSYCHOTHERAPY.

persuasive arguments theory an analysis of GROUP POLARIZATION that assumes that the opinions of group members discussing an issue or choice will tend to become more extreme when a majority of the members favor a particular position, because the group will generate more arguments favoring the majority position. See also CHOICE SHIFT.

persuasive communication information that is intended to change or bolster a person’s attitude or course of action and is presented in written, audio, visual, or audio-visual form.

pertinence model 1. a model of attention in which various stimuli or sources of information are weighted in terms of their relevance. 2. a model of perception according to which a stimulus that is highly relevant can attract attention even if it is weak.

perturbation n. 1. an anxious or distressed mental state. In the context of an attempted or completed suicide, it is a measure of the extent to which a person is (or was) upset or disturbed. 2. an influence or activity that causes an interruption or interference in a mental or physical phenomenon or system.

pertussis n. see WHOOPING COUGH.

pervasive developmental disorder in DSM–IV–TR, any of a class of disorders characterized by severe and widespread impairment in social interaction and verbal or nonverbal communication or by the presence of stereotypes, behaviors, interests, and activities. These disorders are frequently apparent from an early age; they include ASPERGER’S DISORDER, AUTISM, CHILDHOOD DISINTEGRATIVE DISORDER, and RETT SYNDROME. In DSM–5, these disorders have been subsumed under AUTISM SPECTRUM DISORDER.

perversion n. a culturally unacceptable or prohibited form of behavior, particularly sexual behavior. See SEXUAL PERVERSION.

perverted logic (perverted thinking) see PARALOGIA.

pessimism n. the attitude that things will go wrong and that people’s wishes or aims are unlikely to be fulfilled. Pessimists are people who expect bad things to happen to them and to others or who are otherwise doubtful or hesitant about positive outcomes. Most individuals lie somewhere on the spectrum between the two polar opposites of pure OPTIMISM and pure pessimism but tend to demonstrate relatively stable situational tendencies in one direction or the other. See also EXPECTANCY–VALUE MODEL. —pessimistic adj.

PET 1. acronym for PARENT EFFECTIVENESS TRAINING. 2. acronym for POSITION EMISSION TOMOGRAPHY.

pet-assisted therapy see ANIMAL-ASSISTED THERAPY.

petechial hemorrhage a minute HEMORRHAGE, often of pinpoint size.

Peter principle the theory that people in an organization will rise to their level of incompetence; that is, employees will continue to receive promotions and additional responsibilities until they can no longer successfully perform their work. [proposed in 1969 in a book of the same title by Lawrence J. Peter (1919–1990), Canadian-born U.S. educationalist]

pethidine n. see MEPERIDINE.

pet mal seizure see ABSENCE SEIZURE.

petrification n. see FOSSIL.

pet therapy see ANIMAL-ASSISTED THERAPY.

petting behavior sexual activity that may not continue to orgasm or may be foreplay engaged in prior to orgasm. Petting behavior may include kissing, caressing the breasts and genitals, oral sex, and placing the genitals in opposition.

peyote n. a small, spineless cactus, Lophophora williamsii, that grows wild in Mexico and southern Texas. The name is derived from the Aztec word peyotl, which describes the plant as resembling a caterpillar’s cocoon. The principal active ingredient is the hallucinogen MESA LINA, found on the crown of the plant in discoid protuberances called mescal buttons. These buttons are cut from the roots and dried, then chewed or soaked in water to produce an intoxicating liquid. From earliest recorded time, peyote has been used by indigenous peoples of northern Mexico and the southwestern United States as a part of their religious ceremonies; it is still incorporated into the rituals of the Native American Church. Both peyote and mescaline are classified by the U.S. Drug Enforcement Administration as Schedule I controlled substances (see SCHEDULED DRUG). Peyote’s future is threatened by overharvesting for use as a recreational drug.

P factor analysis see P-TECHNIQUE FACTOR ANALYSIS.

Pfaundler–Hurler syndrome see HURLER SYNDROME.

Pfeiffer’s syndrome an inherited disorder marked by premature fusion of the cranial bones, causing a skull deformity (see CRANIOSYNOSTOSIS SYNDROME). Individuals also have facial deformities with protruding, widely spaced eyes (which often show signs of STRABISMUS), large thumbs, and large great toes. Some affected individuals have below average intelligence. The syndrome is inherited as a dominant trait (see ACROCEPHALOSYNDACTYLY). Also called ACROCEPHALOSYNDACTLY TYPE V. [Emil Pfeiffer (1846–1921), German physician]
bles the shape of the lens of the eye to be observed, as well and hanged herself. Phaedra, wife of Theseus. When her stepson, Hippolytus, rejected her love, Phaedra accused him of violating her for her stepson. The name derives from the Greek myth of vacuole then fuses with a membrane, forming a vacuole within the phagocyte. The substances are first surrounded by a membrane, forming a vacuole within the phagocyte. The vacuole then fuses with a lysosome, an organelle containing enzymes that digest the engulfed contents. Certain white blood cells act as phagocytes as part of the immune response.

phagocytosis n. the process by which bacteria, viruses, nutrients, other cells, and cell debris are engulfed by cells called phagocytes. The substances are first surrounded by a membrane, forming a vacuole within the phagocyte. The vacuole then fuses with a lysosome, an organelle containing enzymes that digest the engulfed contents. Certain white blood cells act as phagocytes as part of the immune response.

phagocytosis n. a hereditary disorder characterized by the growth of benign nodulike tumors of the brain, eye, and skin. Types of phakomatosis include von Recklinghausen’s disease (see neurofibromatosis), cerebrorenal angiomatosis, tuberous sclerosis, and encephalotrigeminal angiomatosis.

phakoscopy (phacoscope) n. an instrument that enables the shape of the lens of the eye to be observed, as well as the changes in its shape that occur during accommodation.

phallic adj. of, relating to, or resembling the penis.

phallic character see PHALLIC PERSONALITY.

phallicism n. reverence for the male genitalia, especially when regarded as symbolizing the creative forces of nature. Also called phallism: phallus worship. See also PHALLOCENTRIC.

phallic mother in classical psychoanalytic theory, the fantasy that the mother has a penis, or symbolically, the experience of a mother with masculine personality traits.

phallic personality in classical psychoanalytic theory, a pattern of narcissistic behavior exemplified by boastfulness, excessive self-assurance, vanity, compulsive sexual behavior, and in some cases competitive, aggressive, or exhibitionistic behavior. Also called phallic character; phallic-narcissistic character (or personality).

phallic phase see PHALLIC STAGE.

phallic pride in classical psychoanalytic theory, the sense of superiority and power experienced by boys when they discover that they have a penis and girls do not. These feelings are believed to help master intense CASTRATION ANXIETY.

phallic sadism in classical psychoanalytic theory, aggression that is associated with the child’s PHALIC STAGE of psychosexual development. The child interprets sexual intercourse as a violent, aggressive activity on the part of the man and particularly on the part of the penis. See also PRIMAL SCENE; SADISM.

phallic stage in the classical psychoanalytic theory of Sigmund Freud, the third stage of PSYCHOSEXUAL DEVELOPMENT beginning around age 3, when the LIBIDO is focused on the genital area (penis or clitoris) and discovery and manipulation of the body become a major source of pleasure. During this period, boys are posited to experience CASTRATION ANXIETY, girls to experience PENIS ENVY, and both to experience the OEDIPUS COMPLEX. Also called phallic phase.

phallic symbol any object that resembles or might be taken as a representation of the penis, such as a cigar, pencil, tree, skyscraper, snake, or hammer.

phallism n. see PHALLICISM.

phallocentric adj. 1. denoting a culture or belief system in which the phallus (penis) is regarded as a sacred giver of life, source of power, or symbol of fertility and which consequently privileges men and masculinity. See PHALLICISM: PHALLOCENTRIC. 2. more generally, focused or fixated on the penis as a symbol of male potency. —phallicentrism n.

phallus n. (pl. phalli) the penis or an object that resembles the form of the penis. As a symbolic object, the phallus often represents fertility or potency.

phallus worship see PHALLICISM.

phanerothyme adj. a term coined by British writer Al-dous Huxley (1894–1964) to describe the effect of mind-altering drugs, such as LSD (from Greek phanein, “to reveal,” and thymos, “mind, soul”). He first used the term in a letter (1956) to his friend Humphry Osmond (1917–2004), who counterproposed the term psychedelic, which has the same etymological sense of “mind-revealing.” See also HALLUCINOGEN.

phantasm n. an illusion or apparition, often of an absent person appearing in the form of a spirit or ghost. The observer may recognize it as being imaginary or illusory, unlike a true hallucination, which is associated with lack of insight on the part of the observer.

phantasmagoria n. a shifting series of confused or deceptive images, as in a dream or hallucination. [from the name of a 19th-century theatrical show, in which magic lantern effects were used to create images of ghosts and specters] —phantasmagoric adj.

phantasticum n. (pl. phantastica) a category of drugs identified in the 1920s as capable of producing hallucinatory experiences. These drugs are now known as HALLUCINOGENS. [named by German toxicologist Louis Lewin (1830–1929)]

phantasy n. in the OBJECT RELATIONS THEORY of Melanie KLEIN, one of the unconscious constructions, wishes, or impulses that are presumed to underlie all thought and feeling. The ph spelling is used to distinguish this from the everyday form of FANTASY, which can include conscious daydreaming.
phantom n. 1. an illusion without material substance. 2. the feeling that an amputated body part (e.g., a limb or breast) is still present. See BREAST-PHANTOM PHENOMENON; PHANTOM LIMB; PSEUDOESTHESIA.

phantom breast see BREAST-PHANTOM PHENOMENON.

phantom color a color perceived during stimulation with a black and white pattern, such as a BENHAM’S TOP.

phantom limb the feeling that an amputated limb is still present, often manifested as a tingling or, occasionally, painful sensation in the area of the missing limb (phantom limb pain). It is thought that the brain’s cortical representation of the limb remains intact and continues to signal the presence of the amputated limb in the absence of normal somesthetic stimulation. See also BREAST-PHANTOM PHENOMENON.

phantom-lover syndrome a type of EROTIC DELUSION elaborated around a person who in fact does not exist. [defined in 1978 by Canadian psychiatrist Mary V. Seeman]

phantosmia n. perception of an odor when no smell stimulus is present (i.e., an olfactory hallucination). See also DYSSOMIA.

pharmacodynamics n. the study of the effects of drugs on the body and their mechanisms of action. Basic studies investigate the activity of drugs at the receptor sites to which the drugs attach as well as the changes in cell function and behavior that result. —pharmacodynamic adj.

pharmacodynamic tolerance a form of drug TOLERANCE in which the chemistry of the brain becomes adjusted to the presence of the drug, which in turn loses its capacity for modifying brain activity. Neurons adapt to continued drug presence by reducing the number or sensitivity of receptors available to the drug (i.e., down-regulation). This cellular-adaptive tolerance is associated with the use of many drugs, including sedative-hypnotics and psychostimulants, and may be followed by withdrawal symptoms when regular doses of the drug are interrupted. Pharmacodynamic tolerance may be contrasted with metabolic tolerance, in which the body reacts to continued presence of the drug by metabolizing it at an increased rate. Both forms of tolerance lead to higher doses of the drug being needed to produce the same effects.

pharmacogenetics n. the study of genetic factors that influence the response of individuals to different drugs and to different dosages of drugs. Inherited variations in enzymes or other metabolic components can affect the efficacy of a drug or cause adverse reactions to normal doses. For example, some 40% to 70% of Caucasians have an enzyme variant that causes them to metabolize the antituberculosis drug isoniazid very slowly. They require only a fraction of the standard dose. Also, there are genetic variants of various CYTOCHROME P450 enzymes that can predict rapid or poor drug metabolism. See also PHARMACOGENOMICS.

pharmacogenomics n. the study of how gene variations influence an individual’s response to medications. This study as applied to psychotropic medications is called PSYCHIATRIC PHARMACOGENOMICS. Clinically, pharmacogenomic information offers a means of individualizing drug treatment through genetic testing to predict an individual’s response to various drugs and thereby to prescribe medication that is the most appropriate, with the fewest side effects, for that individual. Pharmacogenomics and PHARMACOGENETICS are increasingly used synonymously.

pharmacokinetics n. the study of how pharmacological agents are processed within a biological system, in vivo or in vitro, including factors that influence the absorption, distribution, metabolism, and elimination of a substance or its metabolic products. The study of this process in infants and children is called DEVELOPMENTAL PHARMACOKINETICS.

pharmacological antagonism see ANTAGONIST.

pharmacology n. the branch of science that involves the study of substances that interact with living organisms to alter some biological process affecting the HOMEOSTASIS of an organism. Therapeutic (or medical) pharmacology deals with the administration of substances to correct a state of disease or to enhance well-being. —pharmacological or pharmacologic adj.

pharmacopeia (pharmacopoeia) n. a book, usually issued by a recognized authority, that lists drugs and their chemical properties, preparations, recommended dosages, methods of administration, side effects, dangers, and other information.

pharmacotherapeutic regimen a plan for the treatment of a condition through the use of medication, outlining, for example, the type of drug or drugs to be used, dosage requirements, schedule of administration, and expected duration of use.

pharmacotherapy n. the treatment of a disorder by the administration of drugs, as opposed to such means as surgery, psychotherapy, or complementary and alternative methods. Also called DRUG THERAPY. See PSYCHOPHARMACOTHERAPY.

pharynx n. the muscular and membranous tube running from the mouth and nostrils to the entrance to the esophagus (gullet) that acts as the passage for food and respiratory gases. It consists of three major sections: the lower LARYNGO PHYRNX, the middle OROPHYRNX, and the upper NASOPHYNX. —pharyngeal adj.

phase n. 1. a stage in the development of life, such as puberty or adulthood. 2. a recurrent state of any cyclical process.

phase locking the tendency for a neural ACTION POTENTIAL to occur at a certain phase of a PURE-TONE stimulus. Typically, an action potential will not occur on every cycle, but when it is generated, it tends to occur at the same point or phase in the stimulus. More generally, phase locking refers to the ability of a neuron to synchronize or follow the temporal structure of a sound. In the auditory nerve, fibers can phase lock to frequencies below 4 to 5 kHz. Phase locking underlies the ability to localize sounds based on interaural phase differences or interaural time differences (see BINURAL CUE). Its role in monaural hearing is uncertain, but it has been proposed as a mechanism for the coding of pitch.

phase modulation see MODULATION.

phase shift 1. a disruption of the normal sleep–wake cycle, with the result that the individual is alert during a usual sleeping period and sleepy when he or she should be alert. See CIRCADIAN RHYTHM SLEEP DISORDER; DISORDERS OF THE SLEEP–WAKE CYCLE SCHEDULE. 2. a change in the diurnal or CIRCADIAN RHYTHM brought about, for example, by changes in daylight exposure or changing time zones.

phase spectrum see SOUND SPECTRUM.

phasic activation a pattern of brain activation, associated with attention mechanisms, that is related to the dif-
phenomenology

**fuse thalamic projection system** and is transitory rather than prolonged or persistent in nature. Compare tonic activation.

**phasic receptor** a receptor cell that shows a rapid fall in the frequency of discharge of nerve impulses as stimulation is maintained. Compare tonic receptor.

**phatic communication** spoken or written communication that is intended primarily to establish or maintain social relationships rather than to convey information.

**phenocopy** from the interaction of an environmental factor and a genetic object are therefore to be analyzed in terms of actual or possible sensory experiences. The position is compatible with certain forms of idealism, in that physical entities are defined in terms of mental experience, but also with empiricism and positivism. —phenomenalist adj.

**phenomenal motion** motion that may not be real but is perceived or experienced as being real. See apparent movement. See also phenomenal space.

**phenomenal self** the self as experienced by the individual at a particular time. Only a small portion of self-knowledge is active in working memory or consciousness at any time. The same person might have a very different phenomenal self at different times, without any change in actual self-knowledge stored in long-term memory; simply because different views are brought into awareness by events. Also called working self-concept.

**phenomenal space** the environment as experienced by an individual at a given time. The term refers not to objective reality but to personal and subjective reality, including everything within one’s field of awareness. In the phenomenological personality theory of Carl Rogers, it is also known as the phenomenal field. Also called phenomenal field.

**phenomenistic causality** in Piagetian theory, an inference of causality between events, drawn only on the basis of spatial or temporal contiguity. Such inferences are typical of the thought processes of a young child. For example: It is dark outside because I am sleepy.

**phenomenological analysis** an approach to psychology in which mental experiences are described and studied without theoretical presuppositions or speculation as to their causes or consequences. In general, such an approach will favor observation and description over interpretation; it will also attempt to understand a person’s experience from the point of view of that person, rather than from some abstract theoretical perspective. See also phenomenology.

**phenomenological death** the subjective sense that one has become inert, insensitive, and unresponsive. Phenomenological death occurs in some psychotic conditions. Individuals may speak of themselves as dead and behave (although inconsistently) in accord with that belief. Phenomenological death is conceived as the extreme point on a continuum of self-assessment; it is not necessarily a condition that is permanent.

**phenomenological field** see phenomenal space.

**phenomenological theory** an approach to personality theory that places questions of individuals’ current experiences of themselves and their world at the center of analyses of personality functioning and change. See also personal construct. [proposed by George A. Kelly]

**phenomenological therapy** any form of therapy, perhaps best exemplified by client-centered therapy, in which the emphasis is on the client’s process of self-discovery rather than on the therapist’s interpretation of the individual’s underlying psychodynamics, as occurs in psychoanalysis.

**phenomenology** n. a movement in European philosophy initiated by German philosopher Edmund Husserl (1859–1938). In his writings of the 1910s and 1920s, Husserl argued for a new approach to human knowledge in which both the traditional concerns of philosophy (such as metaphysics and epistemology) and the modern concern with scientific causation would be set aside in favor of a careful attention to the nature of immediate conscious ex-
periphery. Mental events should be studied and described in their own terms, rather than in terms of their relationship to events in the body or in the external world. However, phenomenology should be distinguished from introspection as it is concerned with the relationship between acts of consciousness and the objects of such acts (see INTENTIONALITY). Husserl's approach proved widely influential in psychology (especially GESTALT PSYCHOLOGY) and the social sciences; it also inspired the work of German philosopher Martin Heidegger (1889–1976), whose EXISTENTIAL PHENOMENOLOGY provided the basis for EXISTENTIALISM and EXISTENTIAL PSYCHOLOGY. —phenomenological adj. —phenomenologist n.

phenomenon n. (pl. phenomena) 1. an observable event or physical occurrence. 2. in philosophy, something perceived by the senses. In Greek philosophy, most notably that of Plato, phenomena are the sensible things that constitute the world of experience, as contrasted with the transcendent realities that are known only through reason. Immanuel Kant used the term phenomenon to refer to things as they appear to the senses and are interpreted by the categories of human understanding. For Kant, knowledge of phenomena is the kind of knowledge available to human beings; in contrast, knowledge of noumena, or things in themselves, remains beyond human experience or reason. 3. an occurrence or entity that defies explanation. —phenomenal adj. —phenotypic.

phenothiazine n. any of a group of chemically related compounds that are mostly used as ANTIPSYCHOTIC drugs, having been originally developed as such in the 1950s. Divided into three subgroups—aliphatic, piperazine, and piperidine—the drugs in this class of conventional antipsychotics were the first effective antipsychotic medications and at one time were the most widely used agents for the treatment of schizophrenia. They are also used for the treatment of acute mania, psychotic agitation, and nausea and vomiting, as well as for preanesthesia sedation. It is commonly assumed that their therapeutic effects are produced by blockade of dopamine D2 receptors (see Dopamine-Receptor antagonist); they also block acetylcholine, histamine, and norepinephrine receptors. A variety of adverse side effects is associated with their use, including EXTRAPYRAMIDAL SYMPTOMS, TARDIVE DYSKINSIAS, sedation, and ANTICHOLINERGIC EFFECTS.

phenotype n. the observable characteristics of an individual, such as morphological or biochemical features and the presence or absence of a particular disease or condition. Phenotype is determined by the expression of the individual’s genotype coupled with the effects of environmental factors (e.g., nutritional status, climate). See also PARATYPE. —phenotypic adj.

phentermine n. an APPETITE SUPPRESSANT with a mechanism of action similar to the AMPHETAMINES. Like other appetite suppressants, it is effective only for short-term weight loss; long-term results require concurrent adherence to effective behavioral weight-loss strategies. Phentermine was previously marketed in combination with fenfluramine or dexfenfluramine—a combination known as “phent-len”—which was taken off the market after cases of pulmonary hypertension and heart-valve disease were reported in users. These serious side effects may also occur with the use of phentermine alone. It should not be given in combination with monoamine oxidase inhibitors and should be used with caution in individuals taking SSRI anti-depressants. U.S. trade names: Adipex, Ionamin.

phenolamine n. an alpha-ADRENERGIC BLOCKING AGENT with direct action on heart and smooth muscle. It is a potent vasodilator used in the management of severe hypertension associated with catecholamine excess, as in patients with PHENEOCHROMOCYTOMAS. It is in infrequent clinical use. U.S. trade name: Regitine.

phenylalkylamine n. any of a group of natural and synthetic drugs that can produce hallucinogenic effects. They include the PHENYLETHYLAMINES, such as MISCALINE, and the phenylisopropylamines (substituted phenylethylamines), such as MDMA.

phenylcyclohexyl derivative any in a category of drugs introduced in 1960 as general anesthetics but discontinued because they caused serious psychological disturbances in patients. The prototype drug, PCP, produces sensory deprivation effects similar to those observed in some cases of schizophrenia. Drugs of this series are considered to be HALLUCINOGENS but may be used as anesthetics and analgesics in veterinary medicine.

phenylethylamine n. any of a group of drugs with hallucinogenic effects and a common basic chemical structure. The prototype is MISCALINE, an alkaloid first isolated from the PEYOTE cactus in 1896. Mescaline is one of the least potent of the hallucinogens, but potency is increased by adding methyl groups to the basic molecule, thereby creating substituted phenylethylamines. The latter include the amphetamine derivatives DOM, MDA, and MDMA. See also PHENYLALKYLAMINE.

phenylketonuria (PKU) n. an inherited metabolic disease transmitted as an autosomal recessive trait and marked by a deficiency of an enzyme (phenylalanine hydroxylase) needed to utilize the amino acid phenylalanine. Unless it is diagnosed in early infancy and treated by a restricted dietary intake of phenylalanine, phenylketonuria leads to intellectual and developmental disabilities. Women who have been treated for the disease must adopt a restricted diet during pregnancy to prevent neurological damage to their children (see MATERNAL PKU).

phenylpyruvic acid an intermediate product of the metabolism of phenylalanine. In patients with PHENYLKE

phenylpyruvic acid an intermediate product of the metabolism of phenylalanine. In patients with PHENYLKETONURIA, phenylalanine is not converted to the normal end-product, tyrosine, but only to phenylpyruvic acid, which is excreted in their urine.

phenytoin n. an ANTICONVULSANT drug; the prototype of the HYDANTOINS. Phenytoin is prescribed mainly for the management of partial and tonic–clonic seizures but is also used in the treatment of some cases of migraine and neuralgia. It is occasionally used to manage behavioral disturbances in children. U.S. trade name (among others): Dilantin.

pheochromocytoma n. a small tumor that usually develops in the adrenal medulla but may occur in tissues of the sympathetic paraganglia. Because it is composed of adrenal tissue, it can secrete epinephrine and norepinephrine, producing excessive levels of these catecholamines. Effects include hypertension with headaches, tachycardia, visual blurring, and other symptoms. It is believed to be an inherited disorder.

pheromone n. a chemical signal that is released outside the body by members of a species and that influences the behavior of other members of the same species. For example, it may serve to attract a mate or to act as an alarm. In nonhuman animals, sensitivity to pheromones occurs via
the VOMERONASAL SYSTEM. The existence of true pheromones in humans is controversial, although scents (e.g., perfumes, body odors) may play a role in sexual attraction and arousal. Pheromones have also been suggested as a cause of MENSTRUAL SYNCHRONY. Also called ectohor-
none. Compare ALLOMONE.

phi coefficient (symbol: $\phi$) a measure of association for two dichotomous or binary RANDOM VARIABLES. The phi coefficient is the PRODUCT-MOMENT CORRELATION COEFFICIENT when both variables are coded (0, 1). For example, the phi coefficient could be used to examine the relationship be-
tween gender (male [0] and female [1]) and left- (0) or right-handedness (1). A table could be constructed to re-
cord the frequency of people with a 0 on both variables
(i.e., left-handed males), a 1 on both variables (i.e., right-
handed females), a 0 on the first variable and a 1 on the
other (i.e., right-handed males), and vice versa (i.e., left-
handed females). The pairs of responses on the variables
could then be analyzed and a phi coefficient calculated to
determine whether any relationship exists. See also CRAMER’S $\phi$; TETRACHORIC CORRELATION COEFFICIENT.

phi–gamma function (symbol: $\phi(y)$) for the METHOD OF CONSTANT STIMULUS a plot of response probability based
on stimulus magnitude that takes the ogival (S-shaped)
form of the cumulative normal distribution.

-philia suffix abnormal craving or attraction (e.g., NECRO-
PHILIA).

Phillips Rating Scale of Premorbid Adjustment in Schizophrenia a method of analyzing the PREMOR-
BID ADJUSTMENT of patients with schizophrenia as part of a
determination of their prognosis. It is based on questions
derived by a researcher from case-history information. Also
called Phillips Scale: Phillips Scale of Premorbid Ad-
justment. [developed in 1953 by psychopharmacologist Leslie Phillips]

philos- (phil-) combining form love of or interest in.

philology n. 1. the study of the history of languages
and of their relationships with one another, usually with
a focus on the analysis of textual records. See also COM-
PARATIVE LINGUISTICS; DIACHRONIC LINGUISTICS; GENETIC LINGUISTICS. 2. originally, love of learning or literature.

—philological adj.

philopatry n. attachment to the place where an individ-
ual was born or hatched. In species with sex-biased
sal, the nondispersing sex is said to show philopatry. If
males typically leave the natal group to join other groups,
the species shows female philopatry.

philosophical psychology the branch of psychology
that studies the philosophical issues relevant to the disci-
pline and the philosophical assumptions that underlie its
theories and methods. It approaches psychology from a
wide perspective informed by a knowledge of metaphysics,
epistemology, ethics, the history of ideas, the philosophy
of science, and the tools of formal philosophical analysis.
Philosophical psychologists tend to concentrate on the
larger issues arising from the field rather than on model
building and data gathering. See also RATIONAL PSYCHOL-
LOGY.

philosophical psychotherapy psychotherapy based on
philosophical principles relating to cognition, emotion,
and behavior or based on the principles of a particular
philosophical perspective (e.g., EXISTENTIAL PSYCHOTHER-
APY). Training in philosophy without appropriate training
in the mental health field, however, is deemed inadequate
for offering psychotherapy or counseling services.

philosophical zombie (p-zombie) see ZOMBIE.

philosophy n. the intellectual discipline that uses careful
reasoned argument to elucidate fundamental questions,
notably those concerning the nature of reality (METAPHYS-
ICS), the nature of knowledge (EPistemology), and the na-
ture of moral judgments (ETHICS). As such, it provides an
intellectual foundation for many other disciplines, includ-
ing psychology. Psychology as a scientific discipline has
its roots in the epistemological preoccupations of 18th-
and 19th-century philosophy and continues to be influ-
enced by philosophical ideas. See PHILOSOPHICAL PSYCHOL-
GY. —philosopher n. —philosophical adj.

philosophy of mind the branch of philosophy con-
cerned with questions about the nature and functioning of
mind and consciousness and the relationship of mind and
mental activity to body and the external world (see MIND–BODY PROBLEM). It is deeply concerned with the
relationships among language, thought, and action.

philosophy of science the branch of philosophy de-
voted to the study and understanding of science and its
development. It is concerned with such matters as the
methods of science, the nature of scientific knowledge and
scientific explanation, and the meaning of the scientific en-
terprise.

phimosis n. a condition, congenital or acquired, in which
the foreskin of the penis cannot be retracted over the glans.
Phimosis may be corrected by circumcision. The acquired
form of phimosis is usually due to an infection (sexually
transmitted or otherwise) or edema.

Phineas Gage (1823–1860) an individual, often fea-
tured in introductory psychology textbooks, who was made
famous when an explosion caused a metal rod to pass
through and damage anterior parts of the frontal lobes of
his brain. He exhibited no apparent cognitive deficits but
later showed changes in behavior and personality. Sources
differ about the extent and chronicity of these changes:
Some report that the changes were severe and permanent,
whereas others indicate that Gage recovered from his in-
jury or at least adapted well to its effects.

phi phenomenon 1. an illusion of APPARENT MOVE-
MENT seen when two lights flash on and off about 150 m
apart. The light appears to move from one location to the
other. The phi phenomenon is a form of beta movement. 2. a
sensation of pure movement independent of any other
attributes of the stimulus, such as its form.

phlebotomy n. removal of blood from the body for diag-
nostic or therapeutic purposes. This is ordinarily achieved
by inserting a needle or catheter into a vein and then ap-
plying negative pressure. Through the early and mid-19th
century, this practice was known as bleeding and in-
volved the removal of considerable quantities of blood as a
means of curing or preventing disease. Also called vene-
section.

phlegmatic type one of the original constitutional body
types based on the four humors associated with Hip-
pocrates (c. 460–c. 377 BCE) and described by GALEN, who
attributed the apathetic character of the phlegmatic type
to the dominance of phlegma, or mucus, over other body
fluids, or humors. See CARUS TYPOLOGY; HUMORAL THEORY.

PHO abbreviation for PHYSICIAN–HOSPITAL ORGANIZATION.
-phobia

-phobia suffix irrational fear or dislike (e.g., claustr-o-phobia).

phobia n. a persistent and irrational fear of a specific situation, object, or activity (e.g., heights, dogs, water, blood, driving, flying), which is consequently either strenuously avoided or endured with marked distress. See SPECIFIC PHOBIA. See also SOCIAL PHOBIA. —phobic adj.

phobic anxiety anxiety that focuses on or is directed toward objects or situations (e.g., insects, telephone booths, open areas) that represent the real fear but pose little if any actual danger themselves.

phobic attitude a behavior pattern apparently characterized by disruptions in the awareness of and attention to experience in the present. An example is engaging in a fantasy of the future to escape a painful present reality. [defined by German-born U.S. psychiatrist Frederick (Fritz) S. Perls (1893–1970)]

phobic avoidance the active evasion of feared objects or situations by individuals with phobias.

phobic character in psychoanalytic theory, an individual who tends to deal with anxiety by extreme or fearful avoidance. [first used in 1945 by Austrian psychoanalyst Otto Fenichel (1897–1946)]

phocomelia n. congenital absence of the proximal portion of a limb or limbs, the hands or feet being attached to the trunk by a small, irregularly shaped bone.

Phoenix House an organization devoted to the treatment and prevention of substance abuse in adolescents and adults. Phoenix House offers both residential and outpatient programs, as well as other services related to or in support of the treatment process. See also THERAPEUTIC COMMUNITY.

phon n. see LOUDNESS.

phon- combining form see PHONO-.

phonasthenia n. 1. voice fatigue, which may be attributable to overuse, general weakness, or old age. 2. see BREATHY VOICE.

phonation n. the production of VOICED sounds by means of vibrations of the vocal cords.

phone n. a single speech sound.

phoneme n. in linguistics, a speech sound that plays a meaningful role in a language and cannot be analyzed into smaller meaningful sounds, conventionally indicated by slash symbols: /b/. A speech sound is held to be meaningful in a given language if its contrast with other sounds is used to mark distinctions of meaning. In English, for example, /p/ and /b/ are phonemes because they distinguish between [pan] and [ban] and other such pairs (see MINIMAL PAIR). —phonemic adj.

phoneme-grapheme correspondence the relationship between PHONEMES and their graphic representation (see GRAPHEME) in a particular language. A high level of regularity in this correspondence is thought to facilitate early reading.

phonemic awareness the ability to recognize and distinguish between the different PHONEMES in spoken words. It is a subcategory of PHONOLICAL AWARENESS.

phonemic disorder a disturbance involving PHONEMES, the speech sounds that distinguish words from one another.

phonemic restoration effect a psycholinguistic phenomenon whereby a person listening to speech recordings in which PHONEMES have been replaced by white noise or have otherwise been made inaudible does not notice the interruption. It is assumed that the listener’s perceptual mechanism must have restored the missing phonemes. This is considered strong evidence for an active process of speech perception.

phonemics n. the branch of linguistics concerned with the classification and analysis of the PHONEMES in a language. Whereas PHONETICS tries to characterize all possible sounds represented in human language, phonemics identifies which of the phonetic distinctions are considered meaningful within a given language. See EMIC–ETIC DISTINCTION.

phonetics n. the branch of linguistics that studies the physical properties of speech sounds and the physiological means by which these are produced and perceived (placing the tongue or lip in contact with the teeth, directing the airstream against the hard palate, etc.). See EMIC–ETIC DISTINCTION.

phonetic symbolism the hypothesis that there is a correspondence of some kind between the sounds of words and their REFERENTS, as opposed to an arbitrary relationship. Most schools of modern linguistics are based on the premise that words are essentially ARBITRARY SYMBOLS, the only exceptions being a small number of onomatopoetic coinages (see ONOMATOPOEIA). However, it is an observable fact that most languages contain clusters of words (mainly monosyllables) in which a similarity of sound seems to reflect a similarity of reference; an example in English would be the large cluster truck, trail, train, trajge, tramp, travel, and so on. Believers in phonetic symbolism would argue that, for English speakers (at least), the sound [tr] and the physical actions involved in articulating it must have a deep psychological correspondence with the ideas of travel and laborious movement. Others would dismiss such speculations entirely, arguing that these word clusters can be explained by shared etymology, simple association of ideas, and coincidence. Also called sound symbolism.

phonics n. 1. a method of teaching reading, popularly known as sounding out, that concentrates on the sounds of the letters or letter combinations in a word rather than on the word as a unit. The speaker or reader thus tries to match GRAPHMES and PHONEMES. Also called phonic method. Compare WHOLE-WORD METHOD. 2. a former name for ACOUSTICS.

phonism n. a form of SYNESTHESIA in which a sensation of hearing is effected through another sense—that is, by something that is seen, smelled, tasted, or felt.

phono- (phon-) combining form voice, speech, or sound.

phonogram n. a graphic or symbolic representation of a phoneme, syllable, or word.

phonological awareness the ability to recognize and distinguish between the sounds used in spoken language, including syllables, rhymes, and PHONEMES. See also PHONEMIC AWARENESS.

phonological buffer see PHONOLICAL LOOP.

phonological disorder in DSM–IV–TR, a communication disorder characterized by failure to develop and consistently use speech sounds that are appropriate for the child’s age. It most commonly involves misarticulation of the later
phonological disorder is termed DSM–5 (e.g., cleft palate), or a neurological disorder. In excess of those normally associated with hearing loss, final consonants). These problems are not due to, or are in the production of sounds (e.g., [t] for [k]) or omission of sounds (e.g., [h]).

Baddeley and Hitch working memory model include the phonological loop. It comprises a phonological store or phonological buffer (or acoustic or articulatory store) within which memory traces fade after 2 seconds unless an articulatory control process (or articulatory rehearsal system) refreshes them by subvocal rehearsal. The phonological store thus acts as an “inner ear” by remembering speech sounds in their temporal order, whereas the articulatory control process acts as an “inner voice” by repeating the series of words on a loop to prevent them from decay. Additionally, it has been suggested that the phonological loop is important to reading comprehension and may in fact function primarily as a language learning device, rather than a mechanism for the comprehension and may in fact function primarily as a language learning device, rather than a mechanism for the translation of written symbols into sounds and words. Also called articulatory loop.

photometer n. a device that measures the intensity of light (e.g., radiant energy, usually in the form of a laser or xenon-arc beam, to condense protein material in a tissue. Photocoagulation is used in the treatment of detached retina after surgery, benign skin tumors, and degeneration of peripheral tissues.

photophobia n. the use of photographs or other images (e.g., DVDs) depicting aspects of a client’s life to obtain insight into his or her behavior and needs and also to increase the rapport between the client and the therapist.

photogenic epilepsy a form of reflex epilepsy in which seizures are precipitated by a particular kind of visual aberration, such as a flickering light.

photographic memory exceptionally detailed and highly accurate recollection of information or visual experiences. Photographic memory is widely but mistakenly considered synonymous with an eidetic image.

photometry n. the practice of sun worship.

photometer n. a device that measures the intensity of light, taking into account the sensitivity of the human vis-

acquired speech sounds, such as [l], [r], [s], [z], [zh], [sh], or [th] (see LALLING; LISP), but it may also include substitution of sounds (e.g., [t] for [k]) or omission of sounds (e.g., final consonants). These problems are not due to, or are in excess of those normally associated with, hearing loss, structural deficits in the mechanism of speech production (e.g., cleft palate), or a neurological disorder. In DSM–5, phonological disorder is termed speech sound disorder. Formerly called developmental articulation disorder.

chronophotography 1. the use of photographs or other images (e.g., DVDs) depicting aspects of a client’s life to obtain insight into his or her behavior and needs and also to increase the rapport between the client and the therapist.

photogenic epilepsy a form of reflex epilepsy in which seizures are precipitated by a particular kind of visual aberration, such as a flickering light.

photographic memory exceptionally detailed and highly accurate recollection of information or visual experiences. Photographic memory is widely but mistakenly considered synonymous with an eidetic image.
photometry

Iodopsins

Day length.

Photoperiodism in animals is involved in the timing of day length or in the intensity of light in the environment. Photoperiodism in plants is usually in response to the direction of change in day length (i.e., increasing or decreasing) rather than absolute day length.

Photophobin an extreme and often painful sensitivity to light. It may be associated with migraine headaches or with certain types of brain trauma. —photophobic adj.

Photopic relating to vision in conditions of bright illumination, especially daylight.

Photopic luminosity the relative effectiveness of various wavelengths of light for visual acuity under light-adapted conditions.

Photopic-sensitivity curve a graph of visual threshold as a function of wavelength under light-adapted conditions. The peak of the human photopic-sensitivity curve falls at approximately 555 nm, which means that less stimulus energy is needed for detection at this wavelength than at any other wavelength under daylight conditions. See PHOTOPIC VISION.

Photopic vision visual stimulation under daylight conditions.

Photostimulation visual stimulation under daylight conditions.

Phototaxis movement toward or away from a light source. Positive phototaxis is movement toward light; negative phototaxis is movement away from light. Some insects display a relationship between muscular activity and light orientation: When the left eye of a fly or bee is shaded or blinded, the legs on the left side of the body work to keep the body turned toward the light that can be seen only with the right eye. See also TAXIS.

Phototheraphy exposure to ultraviolet or infrared light used for treating certain medical conditions (e.g., jaundice, psoriasis, depression, and other disorders. For example, in phototherapy for Seasonal Affective Disorder, a specially designed lamp that delivers 5,000 to 10,000 lx of light is shone on the retina, and a signal is transmitted via the optic nerve to the pineal gland, which secretes MELATONIN in response to darkness. Inhibition of melatonin release by bright light relieves the symptoms of SAD. Also called bright light therapy.

Photophobia an extreme and often painful sensitivity to light. It may be associated with migraine headaches or with certain types of brain trauma. —photophobic adj.

Phototaxis movement toward or away from a light source. Positive phototaxis is movement toward light; negative phototaxis is movement away from light. Some insects display a relationship between muscular activity and light orientation: When the left eye of a fly or bee is shaded or blinded, the legs on the left side of the body work to keep the body turned toward the light that can be seen only with the right eye. See also TAXIS.

Phototherapy exposure to ultraviolet or infrared light used for treating certain medical conditions (e.g., jaundice, psoriasis, depression, and other disorders. For example, in phototherapy for Seasonal Affective Disorder, a specially designed lamp that delivers 5,000 to 10,000 lx of light is shone on the retina, and a signal is transmitted via the optic nerve to the pineal gland, which secretes MELATONIN in response to darkness. Inhibition of melatonin release by bright light relieves the symptoms of SAD. Also called bright light therapy.

PHR abbreviation for POINT–HOUR RATIO.

Phrase a constituent of a sentence that is larger than a word but smaller than a clause. Phrases can be classified as noun phrases, verb phrases, prepositional phrases, and so on, according to their function within the clause. —phrasal adj.

Phrase marker see BRANCHING.

Phrase-structure grammar (PSG) a type of generative grammar in which a system of phrase-structure rules (or rewrite rules) is used to describe a sentence in terms of the grammatical structures that generate its form and define it as grammatical. In practice, such a description will also be a constituent analysis of the sentence in question. The phrase-structure rules used in this type of analysis are usually set out in the form X → Y + Z, in which the arrow is an instruction to reformulate (“rewrite”) X in terms of its immediate constituents (Y + Z). For example, the sentence The dogs chase the cats can be described by the following set of rules:

sentence (S) → noun phrase (NP) + verb phrase (VP)
NP → determiner (det) + noun (N)
VP → verb (V) + NP
det → the
N → cats, dogs
V → chase

The same set of rules could also be shown pictorially as a
tree diagram or phrase marker (see BRANCHING). In the late 1950s, formal phrase-structure analysis of this kind was developed by Noam CHOMSKY, who also pointed out its limitations as a description of how language works. Chomsky’s TRANSFORMATIONAL GENERATIVE GRAMMAR added an important new dimension by proposing that sentences have a DEEP STRUCTURE as well as the linear SURFACE STRUCTURE described in phrase-structure grammar and that the relationship between the two levels can be described through a system of transformational rules.

**phratry** n. a social unit with common kinship bonds, typically composed of multiple CLANS claiming UNILATERAL DESCENT. See DESCENT GROUP.

**phrenic nerve** a nerve that originates in the CERVICAL Plexus of the neck and sends sensory and motor branches to the heart, diaphragm, and other parts of the chest and abdomen.

**phrenology** n. a theory of personality formulated in the 18th and 19th centuries by German physician Franz Josef Gall (1758–1828) and Austrian philosopher and anatomist Johann Caspar Spurzheim (1776–1812). It stated that specific abilities or personality traits are represented by specific areas of the brain: The size of these brain areas determines the degree of the corresponding skill or trait. Proponents of the theory argued that the size of such locations could be indicated by bumps and hollows on the skull surface, based on the observation that the contours of the brain follow the skull contours. Although wrong in most respects, the theory suggested the idea of LOCALIZATION OF FUNCTION. Also called craniology. See also PHYSIOGNOMY. —phrenological adj. —phrenologist n.

**phthalate** n. a chemical compound that is used to soften plastics and that may be found in medications, foods, toys, cosmetics, paints, inks, lubricants, and many other products. Exposure to phthalates has been associated with premature births, reduced sex and thyroid hormones, and decreased sperm quality. Due to health concerns, the use of certain phthalates has been banned from toys in the United States. See also ENDOCRINE DISRUPTOR.

**phthaloid adj.** denoting a variety of the asthenic constitutional body type in KRETSCHEMER TYPOLOGY in which the physique is underdeveloped and usually characterized by a flat, narrow chest.

**phthisic type** a body type characterized as slender and flat-chested, as from a wasting disease such as tuberculosis (which was formerly called phthisis). See CARUS TYPOLOGY.

**phylogenetic principle** the now-disproven theory that ONTOGENY recapitulates PHYLENOGENY in the development of an organism: In humans, this supposes that human life, across development from embryo to adult, repeats the stages of organic and social evolution.

**phylogeny** n. 1. the evolutionary origin and development of a particular group of organisms. Also called PHYLOGENESIS. Compare ONTOGENY. 2. a diagram that shows genetic linkages between ancestors and descendents. Also called phylogeenetic tree. —phylogenetic adj.

**phyllum** n. (pl. phyla) in BIOLOGICAL TAXONOMY, a main subdivision of a KINGDOM, containing a group of similar, related CLASSES.

**physiatry (physiatry)** n. see PHYSICAL MEDICINE AND REHABILITATION.
physical map a type of chromosome map that depicts the actual physical location of genes and genetic markers on the chromosome, with distances measured in base pairs, kilobases, or similar units. Various techniques are used in constructing physical maps, including positional cloning and DNA sequencing. The Human Genome Project has provided a complete physical map of all human chromosomes. See also GENE MAPPING.

physical medicine and rehabilitation the branch of medicine that specializes in the diagnosis and treatment of physical impairments and disability and that emphasizes the use of therapeutic exercise, massage, pain management, and medical devices such as prostheses, braces, or other daily living aids to improve patient functioning. Also called physiatry: physiatry: rehabilitation medicine.

physical modality a therapeutic intervention that involves the use of a physical agent, such as heat or ice, to treat bodily injury or pain.

physical symbol system hypothesis a proposition asserting that a necessary and sufficient condition for a computational system to exhibit general intelligent action is that it be a physical symbol system. “Necessary” means that any physical system that exhibits general intelligence will be an instance of a physical symbol system. “Sufficient” means that any physical symbol system can be organized further to exhibit general intelligent action. This hypothesis has been a driving factor for much research in artificial intelligence and cognitive science. [proposed in 1976 by U.S. cognitive and computer scientist Allen Newell (1922–1992) and Herbert A. Simon]

physical therapy (PT) 1. the treatment of pain, injury, or disease using physical or mechanical methods, such as exercise, heat, water, massage, or electric current (diathermy). The treatment is administered by a trained physical therapist. Also called physiotherapy. 2. a branch of medicine and health care that identifies, corrects, alleviates, and prevents temporary, prolonged, or permanent movement dysfunction or physical disability.

physician assistant (PA) a licensed professional who provides health care services under the direction of a supervising physician.

physician-assisted suicide see ASSISTED DEATH.

physician–hospital organization (PHO) an organization formed, owned, and governed by one or more hospitals and physician groups to obtain payer contracts and to further mutual interests.

physiogenic adj. pertaining to a disorder that is physiological in origin.

physiognomic perception the tendency to see expressive properties in objects, such that, for example, dark objects may be perceived as gloomy or bright ones may be perceived as happy. Initially described by Heinz Werner in children, this perceptual tendency has since been investigated by others in adults.

physiognomy n. 1. the form of a person’s physical features, especially the face. 2. the attempt to read personality from facial features and expression, assuming, for example, that a person with a receding chin is weak or one with a high forehead is bright. The idea dates back to Aristotle and was later developed into a pseudoscientific system by Johann Lavater and subsequently by Italian criminologist and psychiatrist Cesare Lombroso (1835–1909). Also called physiognomics. See also CHARACTEROLOGY: CRIMINAL ANTHROPOLOGY: PHRENOLOGY.

physiological age a measurement of the level of development, health, or deterioration of an individual in terms of functional norms for various body systems.

physiological antagonism see ANTAGONIST.

physiological arousal aspects of Arousal shown by physiological responses, such as increases in blood pressure and rate of respiration and decreased activity of the gastrointestinal system. Such primary arousal responses are largely governed by the sympathetic nervous system, but responses of the parasympathetic nervous system may compensate or even overcompensate for the sympathetic activity. Physiological arousal includes but is not limited to sexual arousal. See also AUTONOMIC NERVOUS SYSTEM.

physiological assessment evaluation of the function of the body, a tissue, or an organ, including physical and chemical factors and processes.

physiological correlate an association between a physiological measure and a behavioral measure. The existence of a physiological correlate may suggest a causal relation, but it does not establish a cause.

physiological cycle a series of regularly recurring changes in body activities, such as the sleep–wake cycle. See also BIOLOGICAL RHYTHM.

physiological dependence see PHYSICAL DEPENDENCE.

physiological factors factors pertaining to the functions of a living organism and its parts as well as to the chemical and physical processes involved in this functioning.

physiological measure any of a set of instruments that convey precise information about an individual’s bodily functions, such as heart rate, skin conductance, skin temperature, cortisol level, palmar sweat, and eye tracking. Studies using these tools typically obtain measurements before and after the introduction of a stimulus condition as a way to document an individual’s response to that stimulus.

physiological motive a motive resulting from a basic physiological need, such as the need for food. See also DEFICIENCY MOTIVE.

physiological need any of the requirements for survival, such as food, water, oxygen, and sleep. Physiological needs make up the lowest level of Maslow’s Motivational hierarchy. Also called basic need: fundamental need. Compare PSYCHOLOGICAL NEED. See also PRIMARY NEED.

physiological nystagmus the normal small, rapid movement of the eyes that permits sustained viewing of a scene. Compare VESTIBULAR NYSTAGMUS.

physiological paradigm the concept that mental disorders are caused by abnormalities in neurological structures and processes. This perspective, which underlies the field and practice of psychiatry, holds that mental disorders can be treated with drugs, surgery, or other techniques ordinarily used to correct malfunctioning of the body.

physiological psychology a term used interchangeably with biological psychology or psychophysiology.

physiological response specificity the principle that an individual’s physiological responses to a range of
different stimuli will be of the same type. For example, one individual may tend to respond to many different stimuli with increases in heart rate, whereas another individual may respond to the same stimuli with breathing changes. [proposed by U.S. psychophysicist John I. Lacey (1915–2004)]

physiological saline a mixture of water and salt (sodium chloride) in which the concentration of salt is 0.9% w/v, approximately equal in osmolarity to mammalian extracellular fluid. Also called normal saline.

physiological zero the temperature at which an object in contact with the skin feels neither warm nor cold. Physiological zero is about 32 °C (90 °F) for an object in contact with the hands or feet.

physiologic nonepileptic seizure see nonepileptic seizure.

physiology n. 1. the science of the functions of organisms, including the chemical and physical processes involved and the activities of the cells, tissues, and organs, as opposed to static anatomical or structural factors. 2. the processes and functions characteristic of or identifiable in a particular organism. —physiological adj. —physiologist n.

physiopathology n. the study of pathophysiology.

physiotherapy n. see physical therapy. —physiotherapist n.

physique type the basic physical structure, build, and body type of an individual, particularly as related to his or her constitutional type.

physostigmine n. a CHOLINERGIC DRUG—an alkaloid derived from the dried seed of an African vine—used in the treatment of glaucoma and to cause the pupil of the eye to contract. It is also employed as a cholinesterase inhibitor to reverse the toxic effects on the central nervous system of overdoses of ANTICHOLINERGIC DRUGS. U.S. trade names: Antilirium: Isopto Eserine.

phytoestrogen n. see estrogen.

P.I. 1. abbreviation for prescribing information. See labeling. 2. abbreviation for PROACTIVE INTERFERENCE. 3. abbreviation for progressive interval. See progressive-interval schedule.

pia-arachnoid n. the inner two coverings of the brain and spinal cord—the PIA MATER and ARACHNOID MATER—considered as a single structure. See meninges.

Piagetian task any of a variety of tasks developed by Jean Piaget to assess the cognitive abilities of infants, children, or adolescents. Examples include, in infancy, OBJECT PERMANENCE tasks and DEFERRED IMITATION; in childhood, CONSERVATION, tests of perceptual perspective taking (e.g., the THREE-MOUNTAINS TEST), and CLASS INCLUSION; and in adolescence, the PENDULUM PROBLEM.

Piagetian theory the theory proposed by Jean Piaget that a child's cognitive development occurs in four major stages. In the SENSORIMOTOR STAGE (roughly 0–2 years of age), the child develops from a newborn capable only of basic reflexes (e.g., sucking, eye movements) to an infant with increasingly complex repetitive behavior (CIRCULAR REACTION) that eventually becomes goal directed; between 8 and 18 months of age, the child gradually develops the ability to recognize OBJECT PERMANENCE, and at around 18 months, the child begins to engage in problem solving and other forms of MENTAL COMBINATION. During the PREOPERATIONAL STAGE (roughly 2–7 years), the child is both egocentric, showing little awareness of the perspective of others, and single-minded (see CENTRATION); language and rudimentary number-system abilities develop as the child becomes able to understand symbols and to represent experience symbolically through speech, movement, or other means (see SYMBOLIC FUNCTION). The CONCERTED OPERATIONAL STAGE (roughly 7–12 years) is characterized by the development of more logically and conceptually based thinking and by a move away from egocentrism toward a centered understanding of others' perceptions and of multiple aspects of a problem or situation (see DECENTRATION); children in this stage become capable of such mental operations as REVERSIBILITY, CATEGORIZATION, and CONSERVATION. Finally, in the FORMAL OPERATIONAL STAGE (roughly 12 years and beyond), abstract logical reasoning (i.e., HYPOTHETICO-DEDUCTIVE REASONING) and moral reasoning develop.

According to this theory, each stage builds on the preceding one. Piaget held that although the age of onset for each stage might vary because of cultural and historical factors, the order of the stages (DECALAGE) is the same for all cultures. He did not believe it was feasible to hurry children through the unfolding of these stages. Passage through them is facilitated by a balance of two processes: assimilation, in which new information is incorporated into an already existing cognitive structure (SCHEMA or SCHEME); and accommodation, in which already existing structures are changed to accommodate new information. Piaget also proposed a stage theory of moral development (see AUTONOMOUS STAGE; HETEROGENOUS STAGE; PREMORAL STAGE).

pia mater a delicate membrane that covers the surface of the brain and spinal cord; it is the innermost layer of the three MENINGES. The cranial portion of the pia mater is richly supplied with blood vessels and closely follows the contours of the cerebral cortex, extending into the fissures and sulci.

p.i. basis abbreviation for per-inquiry basis. See coupon-return technique.

piblokto n. a CULTURE-BOUND SYNDROME observed primarily in female Inuit and other arctic populations. Individuals experience a sudden dissociative period of extreme excitement in which they often tear off clothes, run naked through the snow, scream, throw things, and perform other wild behaviors. This typically ends with convulsive seizures, followed by an acute coma and amnesia for the event. Also called arctic hysteria: pibloktoq.

pica n. a rare eating disorder marked by a persistent craving for unnatural, nonnutritive substances, such as plaster, paint, hair, starch, or dirt. In DSM–IV–TR, it is classified with the FEEDING AND EATING DISORDERS OF INFANCY OR EARLY CHILDHOOD; in DSM–5, it falls within a broader category of feeding and eating disorders that can affect individuals at any age. Onset of the disorder does, however, most commonly occur in children, and it can have serious consequences, depending on the substance ingested. Studies on rats and monkeys have also demonstrated that lead pica can be induced by calcium deficiency. Animals with normal nutrition learn that lead ingestion is aversive, but calcium-deficient animals do not learn aversions to lead.

797
**Pick’s disease**

**Pick’s disease** a type of **FRONTOTEMPORAL DEMENTIA** marked by progressive degeneration of the frontal and temporal areas of the brain and by the presence of particles called **Pick bodies** in the cytoplasm of the neurons. The disease is characterized by personality changes and deterioration of social skills and complex thinking; symptoms include problems with new situations and abstractions, difficulty in concentrating, loss of memory, lack of spontaneity, gradual emotional dullness, loss of moral judgment, and disturbances of language. [described in 1892 by Arnold Pick (1851–1924), Czech psychiatrist and neuroanatomist]

**Pickwickian syndrome** a syndrome in people with **MORbid OBEsity** that is associated with **SLEEP APNEA**, cyanosis, congestive heart failure, and muscle twitching and is thought to result from the physical pressure of extreme weight on the respiratory system. The name of the syndrome is derived from the character of Joe the Fat Boy, who constantly falls asleep in Charles Dickens’s *Pickwick Papers* (1836–1837).

**picrotoxin** *n.* a **CNS STIMULANT** derived from the berries of a southeast Asian shrub, *Anamirta cocculus*. Originally used as a fish poison, picrotoxin was introduced in the 1930s as a therapy for barbiturate overdose. It is a convulsant agent and acts as a **GABA ANTAGONIST** by binding to a specific site on the GABA<sub>A</sub> receptor complex, blocking the effects of GABA agonists (e.g., the benzodiazepines). Picrotoxin has no modern clinical applications but may be used to induce seizures in nonhuman animals for research purposes.

**picture-world test** a **PROJECTIVE TECHNIQUE** for children in which the participant composes a story about realistic scenes, adding objects or figures as he or she wishes. The child is instructed to picture either a world that actually exists or one that he or she would like to exist.

**pidgin** *n.* an improvised **CONTACT LANGUAGE** incorporating elements of two or more languages, often devised for purposes of basic commerce, such as trading. Pidgins are characterized by simple rules and limited vocabulary. Compare **CREOLE**.

**piecewise regression** a variant on ordinary **LEAST SQUARES REGRESSION** in which a **REGRESSION LINE** consisting of several different lines is fitted to the data. The several pieces have different slopes and meet at nodal points to form a continuous line. This approach is very useful for identifying abrupt changes or discontinuities in a process. For example, piecewise regression might be appropriate when a researcher is studying a group of participants before treatment, during treatment, and after treatment. Also called **segmented regression**.

**piecework** *n.* work for which employees are paid per unit of productivity. In a differential piece-rate system, the rate of compensation for each unit produced increases once the employee has surpassed the level of productivity that work studies determine to be the standard. See **SCIENTIFIC MANAGEMENT**.

**pie chart** a graphic display in which a circle is cut into wedges, with the area of each wedge being proportional to the percentage of cases in the category represented by that wedge. For example, a researcher might use a pie chart to present the results of a survey on the sources of psychology-related literature used by the general public, with each wedge representing the percentage of respondents citing a particular source, such as an advice column, the Internet, a self-help book, a popular magazine, and academic literature. A pie chart generally works best when there are not many categories (with thin wedges) being shown. A downside of the graphic is that it is not very efficient because it uses significant space to show the frequencies of a single variable.

**Pierre Robin sequence** a congenital condition present at birth that is characterized by micrognathia (abnormally small jaw) and a tongue that falls backward into the pharynx (glossoptosis), interfering with breathing and feeding. The condition may occur alone or with a variety of other symptoms, most commonly cleft palate, hearing loss, and language delays. Also called **Pierre Robin malformation; Pierre Robin syndrome**. [initially reported in 1923 by Pierre Robin (1867–1950), French pediatrician]

**pigeon breast** see **PECTUS CARINATUM**.

**pigment bleaching** the change in the photopigment **RHODOPSIN** that occurs when it absorbs photons. The color of the pigment changes from purple (**VISUAL PURPLE** to a transparent light yellow (**VISUAL YELLOW**). See also **VISUAL CYCLE**.

**pigment epithelium** the single layer of pigmented cells that abuts the tips of the photoreceptors in the retina. The pigment in the cells reduces light scatter by absorbing photons that elude the **PHOTOPIGMENTS** in the photoreceptors. The pigment epithelium is also critical for the health of the photoreceptors because it phagocytoses (engulfs) discarded disks of membrane that are continually shed by the
photoreceptors. Also called retinal pigment epithelium (RPE).

**pigment regeneration** the reconstitution of functional rhodopsin following PIGMENT BLEACHING after visual stimulation. See also VISUAL CYCLE.

**Pike’s Peak model** a competencies-based approach to training professionals in the delivery of psychological services to older adults. The model provides nonmandatory guidelines that allow individuals from the doctoral to the postlicensure level of training to obtain professional development in this domain. [Delineated during the 2006 National Conference on Training in Professional Geropsychology in Colorado Springs, Colorado]

**pilocarpine** n. an alkaloid derived from several tropical American plants but mainly from Pilocarpus jaborandi. Pilocarpine is a powerful parasympathomimetic agent, affecting postsynaptic cholinergic receptors (see CHOLINERGIC DRUG). It is used in the treatment of glaucoma and to contract the pupil of the eye. U.S. trade names (among others): Isopto Carpine; Piloric; Pilostat.

**pilocytic astrocytoma** see GLIOMA.

**piloerection** n. a temporary raising of the hairs covering the surface of the skin caused by contraction of the piloerector muscles, which are attached to the individual FOLLICLES from which each hair arises. Piloerection is involuntary, being directed by the SYMPATHETIC NERVOUS SYSTEM, and elicited by cold, fear, or a startling stimulus. In mammals with a thick, visible covering of hair (e.g., cats), piloerection serves a protective function: The resulting “fluffed up” appearance makes the animal seem larger and may deter attack by others. In humans, whose skin has only a sparse covering of hair, piloerection creates a temporary roughness as the muscles pucker the surrounding skin, giving rise to such colloquial names for the effect as goose bumps, goose flesh, and goose pimples. Also called pilomotor response (or effect).

**pilot selection** the assessment of a candidate to determine whether he or she possesses the aptitudes, dexterity, and psychomotor skills needed to become an aircraft pilot.

**pilot study** a small, preliminary study designed to evaluate procedures and measurements in preparation for a subsequent, more detailed research project. Although pilot studies are conducted to reveal information about the viability of a proposed project and to implement necessary modifications, they may also provide useful initial data on the topic of study and suggest avenues or offer implications for future research.

**Piltz’s reflex** an automatic and involuntary increase in the size of the pupil when attending to an object or event. [Jan Piltz (1870–1931), Polish neurologist]

**pimozide** n. a conventional ANTAGONISTIC class of the diphenylbutylpiperidine class. Like other conventional antipsychotics, it blocks postsynaptic dopamine D2 receptors. In the United States, it is officially approved by the U.S. Food and Drug Administration only for the management of vocal and motor tics associated with Tourette’s disorder, although it is widely used as an antipsychotic drug in Europe and South America. Pimozide has been associated with potentially lethal disturbances of heart rhythm, and it should not be used in patients with histories of arrhythmias or in doses exceeding 10 mg/day. Because pimozide has no apparent special advantages over similar antipsychotics that are less damaging to the heart (e.g., haloperidol), it should be used to treat Tourette’s disorder only if other medications have failed to produce the desired response. U.S. trade name: Orap.

**pincer grip** the manner of grasping an object between the thumb and forefinger. See also POWER GRIP; PRECISION GRIP.

**pineal gland** a small, cone-shaped gland attached by a stalk to the posterior wall of the THIRD VENTRICLE of the brain; it is part of the EPITHALAMUS. In amphibians and reptiles, the gland appears to function as a part of the visual system. In mammals, it secretes the hormone MELATONIN and is an important component of the circadian system regulating BIOLOGICAL RHYTHMS. Because it is an unpaired organ located in the middle of the brain, Rene DESCARTES believed it was the seat of the RATIONAL SOUL and the connection between mind and body. Also called pineal body.

**Pinel’s system** a classification of mental disorders and symptoms outlined in the 18th century. The four major categories were melancholias, manias with delirium, manias without delirium, and dementia or mental deterioration. [Philippe Pinel (1745–1826), French psychiatrist]

**pink-collar worker** an employee who does what is traditionally considered women’s work, such as being a teacher, secretary, nurse, day care worker, florist, or maid. Pink-collar jobs are often low in status, pay, and opportunities for advancement and are seen as echoing domestic responsibilities, thus reinforcing a sexual division of labor. Compare BLUE-COLLAR WORKER; WHITE-COLLAR WORKER.

**pink noise** see NOISE.

**pinna** n. (pl. pinnae) the funnel-shaped part of the external ear that projects beyond the head. Consisting of cartilage, it collects and focuses sounds toward the EXTERNAL AUDITORY MEATUS (auditory canal). Also called auricle.

**piperidinedione** n. any of a class of chemically related drugs formerly used for daytime sedation or the management of insomnia but no longer in common clinical use. Their mechanism of action and toxicity are similar to the BARBITURATES. The prototype of the class is GLUTETHIMIDE.

**Piper’s law** the principle that for a uniformly stimulated retinal area peripheral to the fovea, the threshold for LUMINANCE is inversely proportional to the square root of the area stimulated. Compare RICO’S LAW. [Hans Edmund Piper (1877–1915), German physiologist]

**piform area** see PYRIFORM AREA.

**pitch** n. the subjective attribute that permits sounds to be ordered on a musical scale. The primary theories concerning the basis for pitch perception are the PLACE THEORY and the PERIODICITY THEORY. The MEL has been proposed as a quantitative measure of the extent of pitch perception.

**pitch discrimination** see AUDITORY DISCRIMINATION.

**pithiatism** n. a name (from Greek pithanotes, “persuasiveness”) proposed in 1918 by French neurologist Joseph F. Babinski (1857–1932) as a substitute for HYSTERSIA. It was based on the theory that some hysterical symptoms are produced by suggestion and can therefore be eliminated by suggestion.

**Pitres’ rule** a generalization stating that when a multilingual person recovers from APHASIA caused by a stroke or cerebral injury, the language recovered first is usually the one most used by the person prior to the onset of the apha-
pituitary

sia. Other languages are reestablished in a slower and often less complete manner. Also called Pitres’ law. Compare RIBOT’S LAW. [proposed in 1895 by Jean Albert Pitres (1848–1927), French neurologist]

pituitarism n. disordered functioning of the pituitary gland, which may be overactive (hyperpituitarism) or underactive (hypopituitarism).

pituitary adenoma see ADENOMA.

pituitary gland a gland (pea-sized in humans) that lies at the base of the brain and is connected by a stalk (the infundibulum) to the HYPOTHALAMUS. The pituitary gland is divided into an anterior and a posterior lobe, which differ in function. The anterior lobe (adenohypophysis) produces and secretes tropic hormones (i.e., thyroid-stimulating hormone, follicle-stimulating hormone, corticotropin, and luteinizing hormone), growth hormone, prolactin, and melanocyte-stimulating hormone in response to releasing hormones from the hypothalamus. The posterior lobe (neurohypophysis) secretes two hormones, vasopressin and oxytocin, which are synthesized in the hypothalamus and transported down axons in the infundibulum to the neurohypophysis in response to direct neural stimulation. The pituitary’s role particularly in secreting tropic hormones, which regulate the production of other hormones, has resulted in its designation as the “master gland of the endocrine system.” Also called hypophysis; hypophysis cerebri.

pituitectomy n. see HYPOPHYSECTOMY.

pituri n. an Australian shrub, Duboisia hopwoodii, whose leaves have traditionally been used for their stimulant, analgesic, and hallucinogenic effects by members of Aboriginal tribes. The primary active ingredient is NICOTINE. Although some indigenous peoples still use pituri, it was most popular during the 19th and early 20th centuries. The leaves were cured, powdered, and then rolled into a quid to be chewed or smoked.

pity n. a feeling of sorrow and compassion for people who are unhappy, suffering, or otherwise unfortunate or in distress.

pivotal variable a quantity that is a function of a statistic (e.g., sample mean, sample size) and a parameter (e.g., population mean, variance) and that is used in inferential tests based on a normal distribution. The Z SCORE, T SCORE, and F RATIO are all examples of pivotal variables.

pivot grammar a type of simple grammar displayed in the early stages of language development (especially the two-word stage). Pivot grammar is characterized by two-word utterances in which one word (the pivot word) is typically a function word, such as a determiner or preposition, and the other (the open word) is a content word, such as a noun or verb. A small child has relatively few pivot words in his or her vocabulary but uses them often and always in the same position relative to the open word. Open words are used less frequently, but the child learns more of them and can use them anywhere in a phrase. More juice, light off, and all gone are typical examples of pivot grammar: More, off, and all are pivot words; juice, light, and gone are open words.

PK abbreviation for PSYCHOKINESIS.

PKU abbreviation for PHENYLKETONURIA.

place attachment feelings of connection or affiliation with a geographic location that provides security and comfort and contributes to identity. Individually and collectively, people become attached to certain places, such as their homes or their neighborhoods. See also TERRITORIALITY.

placebo n. (pl. placebos) 1. a pharmacologically inert substance, such as a sugar pill, that is often administered as a control in testing new drugs. Placebos used in double-blind trials may be DUMMIES or ACTIVE PLACEbos. Formerly, placebos were occasionally used as diagnostic or psychotherapeutic agents, for example, in relieving pain or inducing sleep by suggestion, but the ethical implications of deceiving patients in such fashion makes this practice problematic. 2. any medical or psychological intervention or treatment that is believed to be “inert,” thus making it valuable as a control condition against which to compare the intervention or treatment of interest. See PLACEBO EFFECT.

placebo control group a group of participants in a study who receive an inert substance (placebo) instead of the active drug under investigation, thus functioning as a CONTROL GROUP against which to make comparisons regarding the effects of the active drug. See also PLACEBO EFFECT.

placebo controlled trial a clinical research design that incorporates a placebo control group. Compare ACTIVE CONTROL TRIAL.

placebo effect a clinically significant response to a therapeutically inert substance or nonspecific treatment (placebo), deriving from the recipient’s expectations or beliefs regarding the intervention. It is now recognized that placebo effects accompany the administration of any drug (active or inert) and contribute to the therapeutic effectiveness of a specific treatment. For example, patients given a placebo to relieve headaches may report statistically significant reductions in headaches in studies that compare them with patients who receive no treatment at all. This term is also used more generally in nonclinical studies to indicate any effect arising from participants’ expectations regarding the study.

placebo group see PLACEBO CONTROL GROUP.

place cell a neuron in the HIPPOCAMPUS that fires selectively when an animal is in a particular spatial location or moving toward that location. Place cells were first discovered in 1971.

place conditioning see CONDITIONED PLACE PREFERENCE.

place learning 1. the learning of locations or physical positions of goals (e.g., where food can be found). Compare RESPONSE LEARNING. [defined by Edward C. TOLMAN] 2. in conditioning, learning an association between a place and an unconditioned stimulus, such as food or poison. See CONDITIONED PLACE PREFERENCE.

placement counseling 1. services designed to advise and assist individuals to find suitable or optimal employment. Placement counseling may include coaching or training for job interviews, procedures for filling out applications, and assistance with other activities relevant to obtaining a job. These services may be offered as part of the VOCATIONAL REHABILITATION of people with disabilities, or they may be provided to anyone in the general public who is searching for a job (e.g., recent college graduates, the long-term unemployed). 2. in education, a service that pro-
vides guidance to students in deciding upon an appropriate educational program, class, or level of instruction. In foster care, services provided to help children and their adoptive parents adjust to adoptive placement.

**placement test** a test used by educational institutions to place students in classes appropriate to their abilities, achievements, and interests.

**placenta** *n.* the specialized organ produced by the mammalian embryo that attaches to the wall of the uterus to permit removal of waste products and to provide nutrients, energy, and gas exchange for the fetus via the maternal circulation. —**placental** adj.

**place theory** the theory that (a) sounds of different frequencies stimulate different places along the **basilar membrane** and (b) pitch is coded by the place of maximal stimulation. The first proposition is strongly supported by experimental evidence and stems from the fact that the mammalian auditory system shows **tonotopic organization**. The second hypothesis remains controversial. See HILMOLTZ THEORY. Compare **periodicity theory**.

**Placidyl** *n.* a trade name for **etilchlopyynol**.

**placing** *n.* a reflex movement in which a baby lifts his or her foot onto a surface, which occurs during the first 3 months of life.

**plain English law** 1. in some states in the United States, a law requiring attorneys to use less arcane, more comprehensible language in drafting documents. 2. a law written in a way that strives for simplicity of expression. Plain English laws reduce reliance on legal jargon, enabling them to be more easily understood by the general public.

**plan** *n.* in cognitive psychology, a **mental representation** of an intended action, such as an utterance or a complex movement, that is presumed to guide the individual in carrying it out. See **preparation**.

**PLAN** acronym for **program for learning in accordance with needs**.

**Planck’s principle** the notion that new scientific theories do not gain acceptance by a systematic process of validation that convinces opponents of their truth. Instead, as opponents of a new theory grow old and die, they are replaced by a new generation of scientists, who were exposed to the theory early in their careers and have come to accept it. This notion is a direct challenge to both VERIFICATION and falsificationism. [Max Planck (1858–1947), German physicist]

**plan-continuation bias** the tendency of people to continue with an original course of action that is no longer viable. An example would be an airline pilot who unexpectedly encounters bad weather at the scheduled destination but decides to land anyway rather than divert to another location. Plan-continuation bias appears to be particularly strong toward the end of the activity and has been theorized to result from the interaction of such factors as cognitive load, task demands, and social influences. See also **entrapment**.

**plane symmetry** see **symmetry**.

**planned behavior** behavior that is under the organism’s direct control, as opposed to reflexive behavior. See **theory of planned behavior**.

**planned comparison** see **A priori comparison**.

**planned group** see **formal group**.

**planned obsolescence theory** see **Genetic Programming Theory**.

**Planned Parenthood Federation of America (PPFA)** an organization that promotes comprehensive reproductive and complementary health care services; advocates public policy that guarantees access to such services and the privacy and rights of individuals using them; and supports research and technology in reproductive health care, as well as education on human sexuality. The organization, which was founded as the American Birth Control League (ABCL) by U.S. birth control pioneer Margaret Sanger (1883–1966) in 1921, adopted its current name in 1942.

**planning fallacy** the tendency to underestimate the amount of time needed to complete a future task, due in part to the reliance on overly optimistic performance scenarios. [identified by Amos Tversky and Daniel Kahneman]

**plantar reflex** the involuntary flexing of the toes of a healthy child when the sole of the foot is stroked. The plantar reflex appears around age 2 and replaces the earlier **Babinski reflex**.

**planum temporale** a region of the superior temporal cortex of the brain, adjacent to the primary auditory cortex, that includes part of **Wernicke’s area**. In most people, it is larger in the left cerebral hemisphere than in the right hemisphere.

**plaque** *n.* a small patch of abnormal tissue on or within a bodily structure, formed as the result of an accumulation of substances or as the result of localized damage. Examples of the former type include the **amyloid plaques** of Alzheimer’s disease, arising from clumps of beta-amyloid protein, and the atheromatous plaques of atherosclerosis, consisting of lipid deposits on the lining of arterial walls. Examples of the latter type include the demyelination plaques on the protective nerve sheaths of individuals with multiple sclerosis.

**-plasia** suffix development or growth (e.g., **hyperplasia**).

**plasticity** *n.* flexibility and adaptability. Plasticity of the nervous or hormonal systems makes it possible to learn and register new experiences. Early experiences can also modify and shape gene expression to induce long-lasting changes in neurons or endocrine organs. See also **functional plasticity; neural plasticity**. Compare **rigidity**.

**plastic surgery** a branch of surgery that specializes in the restoration, reconstruction, and repair of damaged or diseased tissue to improve the form or function of a body structure or area. Plastic surgery is commonly used in reconstruction of the female breast (e.g., after surgical removal for cancer), facial features (e.g., the nose, a cleft lip or palate), and genital features (e.g., the vagina or penis in sex-reversal surgery). See also **cosmetic surgery; postreconstructive surgery; reconstructive surgery**.

**plastic tonus** a state of voluntary muscles such that a limb can be passively moved into positions that are retained, sometimes for hours. It is characteristic of **catatonia**.

**plateau** *n.* a period in learning when the **learning curve** flattens because the rate of increase has stopped temporarily, often because of fatigue, boredom, loss of motivation, or a change in the level of skill required.
Play is a cultural universal and typically regarded as an immediate aftereffect, consisting of a black and white spiral rotated around its central point. Depending on the direction of rotation, the spiral will appear to expand or contract when steadily viewed while it is rotating. However, when the spiral is stopped, it will appear to move in the opposite direction, producing a perception of expansion or contraction. Moreover, the illusionary expansion or contraction will apply to any other stationary object viewed immediately after stopping the spiral. [Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]

Plateau's spiral a stimulus used to create a vivid motion aftereffect, consisting of a black and white spiral rotated around its central point. Depending on the direction of rotation, the spiral will appear to expand or contract when steadily viewed while it is rotating. However, when the spiral is stopped, it will appear to move in the opposite direction, producing a perception of expansion or contraction. Moreover, the illusionary expansion or contraction will apply to any other stationary object viewed immediately after stopping the spiral. [Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]

Plateau's spiral a stimulus used to create a vivid motion aftereffect, consisting of a black and white spiral rotated around its central point. Depending on the direction of rotation, the spiral will appear to expand or contract when steadily viewed while it is rotating. However, when the spiral is stopped, it will appear to move in the opposite direction, producing a perception of expansion or contraction. Moreover, the illusionary expansion or contraction will apply to any other stationary object viewed immediately after stopping the spiral. [Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]

Plateau's spiral a stimulus used to create a vivid motion aftereffect, consisting of a black and white spiral rotated around its central point. Depending on the direction of rotation, the spiral will appear to expand or contract when steadily viewed while it is rotating. However, when the spiral is stopped, it will appear to move in the opposite direction, producing a perception of expansion or contraction. Moreover, the illusionary expansion or contraction will apply to any other stationary object viewed immediately after stopping the spiral. [Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]

However, when the spiral is stopped, it will appear to move in the opposite direction, producing a perception of expansion or contraction. Moreover, the illusionary expansion or contraction will apply to any other stationary object viewed immediately after stopping the spiral. [Joseph Antoine Ferdinand Plateau (1801–1883), Belgian physicist]
Pleasure n. the emotion or sensation induced by the enjoyment or anticipation of what is felt or viewed as good or desirable.

Pleasure center any of various areas of the brain (including areas of the hypothalamus and limbic system) that, upon intracranial self-stimulation (see intracranial stimulation), have been implicated in producing pleasure. The existence of pure pleasure centers has not been definitively established, particularly because the self-stimulation response rate varies according to such factors as the duration and strength of the electrical stimulation. Also called reward center. [proposed by James Olds]

Pleasure principle the view that human beings are governed by the desire for gratification, or pleasure, and for the discharge of tension that builds up as pain or "unpleasure" when gratification is lacking. In the classical psychoanalytic theory of Sigmund Freud, the pleasure principle is the psychic force that motivates people to seek immediate gratification of instinctual, or libidinal, impulses, such as sex, hunger, thirst, and elimination. It dominates the id and operates most strongly during childhood. Later, in adulthood, it is opposed by the reality principle of the ego. Also called pleasure–pain principle.

-plegia suffix paralysis (e.g., quadriplegia).

Pleniloquence n. a compulsion to talk incessantly. —pleniloquent adj.

Plenasm n. a form of verbal redundancy in which an excess of words is used to express an idea, as in a great big giant.

Plenoxia n. 1. an abnormal greediness or desire for the acquisition of objects. 2. an abnormal intake of oxygen.

Plethysmography n. the process of recording and measuring volume or volume changes in organs or body tissues, such as the blood supply flowing through an organ. The instrument used in this process is called a plethysmograph. Examples include the penile plethysmograph, which records changes in the size of the penis and thus measures blood flow and erection, and the vaginal plethysmograph, which records changes in the amount of blood in the walls of the vagina and thus measures sexual arousal.

Plexiform layer one of the two synaptic layers in the retina. See inner plexiform layer; outer plexiform layer.

Plexiform molecular layer see cortical layers.

Plexus n. a network of similar structures (e.g., nerves, blood vessels) that are functionally or anatomically interconnected, such as the brachial plexus, cervical plexus, orceliac plexus.

PLISSIT n. acronym for a model that is used in counseling clients about sexual problems. The model offers successive levels of communication or intervention: (a) Permission, in which the client is told it is acceptable to talk openly about a given sexual problem; (b) Limited Information, in which the client is given information limited to that directly relevant to his or her concern; (c) Specific Suggestions, in which actions to treat the problem are specified; and (d) Intensive Therapy, which may be required if the client has a complex problem (usually involving referral to another therapist). [developed in 1976 by U.S. psychologist Jack S. Annon (1929–2005)]

Plosive 1. adj. denoting a speech sound in which the air-stream is partially or totally obstructed and suddenly released. A plosive sound may be voiced (e.g., [b], [d], [g]) or unvoiced (e.g., [p], [t], [k]). 2. n. a plosive speech sound. Also called obstruent: stop.

Plummer’s disease see thyrotoxicosis. [Henry Stanley Plummer (1874–1936), U.S. surgeon]

Pluralism n. 1. the idea that any entity has many aspects and that it may have a variety of causes and meanings. 2. in philosophy, the belief that ultimate reality is composed of more than one substance or fundamental kind of entity. Compare dualism; monism. 3. the existence in a society of people having different religions, ethnic origins, and cultural backgrounds. —pluralist adj.

Pluralistic ignorance the state of affairs in which virtually every member of a group privately disagrees with what are considered to be the prevailing attitudes and beliefs of the group as a whole. It has been suggested that apparently sudden changes in social mores (e.g., with regard to sexual behavior) can be explained by the gradual recognition by many individuals that others in the group think the same as themselves. [proposed in the 1920s by Floyd H. Allport]

Plural marriage polygamy, especially in the form associated with the Mormon community. See also group marriage.

Plus maze a cross-shaped apparatus to assess learning and memory in rodents and other nonhuman animals. It has four arms radiating at right angles to one another from a central point. The animal is required to use visual cues to perform a particular task within the maze, such as identifying and entering a specific arm to obtain a food reward. See also elevated plus maze.

Plutomania n. an inordinate striving for money and possessions.

PM abbreviation for primary memory.

PMS abbreviation for premenstrual syndrome.

PMT abbreviation for parent management training.

PNC abbreviation for preferred noise criterion.

PNES abbreviation for psychogenic nonepileptic seizure.

Pneumo- combining form 1. air or gas (e.g., pneumonecephalography). 2. the lungs (e.g., pneumography).

Pneumoencephalography n. a diagnostic technique used from 1918 until the mid-1980s to examine the cerebral ventricles and subarachnoid space of the brain by injecting air into the cerebrospinal fluid. Because of the difference in opacity between the air and brain tissues, the air appears as a dark shadow on the resulting radiographic image (X-ray), which is known as a pneumoecephalogram. The development of computed tomography and magnetic resonance imaging has eliminated the need for this test.

Pneumogastric nerve see vagus nerve.

Pneumograph n. an instrument that records the movements or volume change of the lungs. The record is produced either by electric monitoring of the rate and extent of respiratory movements or by X-ray imaging of the lungs...
PNS

after they have been injected with a gas to improve the visual contrast between tissue areas. Also called pneumograph: stethograph.

PNS abbreviation for PERIPHERAL NERVOUS SYSTEM.

POC abbreviation for PERFORMANCE-OPERATING CHARACTERISTIC.

POE abbreviation for POSTOCCUPANCY EVALUATION.

poetry therapy a form of BIBLIOThERAPY that uses the reading or writing of poetry to facilitate emotional expression in an individual and foster healing and personal growth.

Poetzl phenomenon see POETZL PHENOMENON.

Poggendorf illusion a visual illusion in which the two ends of a straight diagonal line seem to be offset from one another when the line appears to pass behind a figure with parallel vertical borders, such as a bar. [Johann Christian Poggendorf (1796–1877), German physicist]

POI abbreviation for PERSONAL ORIENTATION INVENTORY.

poikilotherm n. seeECTOTHERM. —poikilothermic adj. —poikilothermy n.

point biserial correlation coefficient (symbol: $r_{pbis}$) a numerical index reflecting the degree of relationship between two random variables, one CONTINUOUS and one dichotomous (binary). An example is the association between the propensity to experience an emotion (measured using a scale) and gender (male or female). Also called point biserial: point biserial r. Compare RANK BISERIAL CORRELATION COEFFICIENT.

point estimate a single estimated numerical value, determined from a sample, of a given population PARAMETER. Point estimates can often be tested for statistical significance if their STANDARD ERRORS are also known. Compare INTERVAL ESTIMATE.

point–hour ratio (PHR) the average numerical grade earned by a student, determined by dividing earned GRADE POINTS by the total number of class hours attended in a semester or quarter. Also called grade-point average (GPA).

pointing n. a test in which the participant, with the eyes open, extends a forefinger and touches the forefingers of the examiner. Knowing the location of the examiner’s fingers, the participant should then be able to touch them with eyes closed. Failure to do so is called past-pointing.

point-light display a display used in studies of BIOLOGICAL MOTION perception and consisting of a dozen or so small lights attached to various joints and other parts of the body of an individual, with the body itself not visible. The movement of just the small lights (or a computer reproduction thereof) produces a compelling impression of the individual in motion. However, without movement, the lights are perceived as random and not as the individual. [devised in the 1970s by Swedish psychologist Gunnar Johansson (1911–1998)]

point localization the ability to locate a point on the skin that is stimulated. The point-localization test is a somatosensory test in which a skin area, usually on the hand, is touched twice with an intervening period of 1 second. The participant is required to determine whether the points touched were in the same place. Also called tactual localization.

point method a method of evaluating jobs for the purpose of setting wage or salary levels in which a number of COMPENSABLE JOB FACTORS are identified, each factor is divided into degrees or levels, and points are assigned to each level; jobs can then be rated according to their total point score. The technique, which is essentially a development of the FACTOR-COMPARISON METHOD, is now the most widely used form of JOB EVALUATION. Also called point factor method. Compare CLASSIFICATION METHOD; HAY METHOD; JOB-COMPONENT METHOD; RANKING METHOD.

point mutation see MUTATION.

point of subjective equality (PSE) the value of a comparison stimulus that, for a given observer, is equally likely to be judged as higher or lower than that of a standard stimulus.

point prevalence see PREVALENCE.

point scale any scale for measuring some construct or attribute in which participants’ responses to a series of multiple-choice questions are given numerical values (points). The final score is the total points earned. See also LIKERT SCALE; SEMANTIC DIFFERENTIAL.

Poisson distribution a discrete distribution that generates the probability of occurrence of rare events that are randomly distributed in time or space. It is a type of THEORETICAL DISTRIBUTION. Count variables, such as the number of aggressive acts observed on a playground or the number of times a person attempts to stop smoking, take this form. When a variable is distributed in this way, a researcher needs to consider specialized statistical models. [Siméon D. Poisson (1781–1840), French mathematician]

Poisson regression an analytic model that has as its dependent variable a count variable and any of a number of predictor variables; in other words, it is used when the outcome variable has a POISSON DISTRIBUTION. For example, a researcher may hypothesize that dyadic adjustment, number of years as a couple, and personality characteristics predict the number of times that one member of a couple interrupts the other during a problem-solving task. [Siméon D. Poisson]

polar body see OOGENESIS.

polar continuum a series of values or elements whose end points are opposites, such as hot–cold.

polarization n. 1. a difference in electric potential between two surfaces or two sides of one surface because of chemical activity. Polarization occurs normally in living cells, such as neurons and muscle cells, which maintain a positive charge on one side of the plasma membrane and a negative charge on the other. See POLARIZED MEMBRANE. 2. a condition in which light waves travel in parallel paths along one plane.

polarized membrane a membrane with a positive electrical charge on one surface and a negative charge on the other surface. All living cells maintain a potential difference across their plasma membrane—the MEMBRANE POTENTIAL. In the resting condition, the outside of the membrane is positive in relation to the inside. See RESTING POTENTIAL.

polarized thinking see DICHOTOMOUS THINKING.

police psychology a branch of psychology that provides specialized assistance to law enforcement. Typical du-
ties of a police psychologist may involve the screening and selection of recruits, fitness for duty evaluations, and counseling.

**policy analysis** a collection of techniques for synthesizing information (a) to specify alternative policy and program choices in cost–benefit terms, (b) to assess organizational goals in terms of input and outcome, and (c) to guide decision making. Policy analysis is a useful approach for examining the implications of different potential scenarios. For example, an organization considering a flexible time policy for its employees might choose to analyze the costs and benefits of the policy before implementing it.

**policy research** empirical studies conducted to guide the formulation of corporate, organizational, or public policies. For example, a nonprofit organization might investigate how to help students from lower income urban areas gain access to higher education.

**polio** *n.* see poliomyelitis.

**poliomyelitis** *n.* inflammation of the gray matter of the brain, due to an infectious disease.

**poliomyelitis** *n.* an inflammatory process due to viral infection. In minor cases, it is characterized by fever, headache, sore throat, and vomiting that typically disappear within 72 hours. In major cases, the inflammation affects the gray matter of the spinal cord and may lead to muscular weakness and paralysis, which can affect the muscles controlled by autonomic nerves, as well as skeletal muscles, so that breathing, swallowing, or similar functions are disrupted. Cognitive problems may arise as a secondary result of breathing difficulties. Also called infantile paralysis, polio.

**politeness** *n.* the process by which a speaker attempts to avoid harm to a listener’s public image or private self-concept through the use of nonthreatening or face-saving forms of speech. Politeness involves steering clear of content or forms of language that might embarrass listeners, make them feel uncomfortable, or lessen their self-respect. It also involves actively using language that maintains or enhances the listener’s dignity, prestige, and autonomy. For example, a speaker might preface the request for a favor by saying, “I’m sorry to bother you, and feel free to say no, but I wonder if you would . . . .” Politeness is one aspect of facework.

**political correctness** advocacy of or conformity to the belief that anything, particularly language, that may be offensive to or discriminate against anyone on the basis of race, ethnicity, gender, sexuality, disability, or physical appearance should be avoided. The term is usually used disparagingly to connote dogmatism on the one hand and excessive sensitivity on the other.

**political genetics** any of various attempts to derive political theories or practices from the science of genetics. Most such attempts have been repugnant, ranging from the policies of selective breeding and population control advocated by Social Darwinism to Nazi conceptions of a master race. See also beyondism.

**political psychology** 1. the study of political issues, processes, and dynamics, at both the individual and group levels, from the perspective of psychological principles. 2. the application of psychological principles and knowledge to the formation of public policy, particularly as related to mental health and associated issues. See also public service psychology.

**political science** the study of governments, particularly at the national level. Incorporating aspects of economics, philosophy, psychology, and sociology, political science has several focal subareas, including policymaking, international relations, voting behavior, and public opinion.

**political socialization** the transmission of political norms through social agents, such as schools, parents, peers, or the mass media. See social transmission.

**political sociology** an interdisciplinary field that examines the social basis of and social influences on political institutions, political movements, political power, and public policy.

**pollution** *n.* the presence of toxins or contaminants in the environment. See air-pollution adaptation.

**poltergeist** *n.* an alleged paranormal phenomenon in which an unseen “presence” disturbs a household by noisy and destructive pranks, such as slamming doors, rapping on walls, upsetting furniture, and breaking crockery. Parapsychologists often approach such manifestations with the idea that they may be caused by conscious or unconscious psychokinesis rather than being independent phenomena. [German, “noisy ghost”]

**poly- combining form** 1. many or much (e.g., polygyny). 2. excessive (e.g., polydipsia).

**polyandry** *n.* 1. among nonhuman animals, a mating system in which a female mates with more than one male but a male mates with only one female. The female mates with and forms a social relationship with multiple males during one reproductive cycle. Cooperative-breeding tamarins are thought to exhibit facultative polyandry, in which a female mates with multiple males who share in the care of young when a new social group is formed, but once the group is established and has many helpers, the same female will become monogamous with one of the males. 2. marriage of a woman to more than one husband at the same time, which is an accepted custom in certain cultures. Compare monogamy; polygamy; polygyny; —polyandrous adj.

**polychoric correlation coefficient** an index showing the degree of association between two variables that are scored as ordered categories but assumed to be manifestations of underlying continuous random variables. It is an alternative to the product-moment correlation coefficient that is applied to ordered polychotomous variables. For example, a researcher might use a polychoric correlation coefficient to assess the relationship between teacher ratings of student interest in a topic (none, moderate, substantial) and student self-reports of interest.

**polychotomous variable** a variable having more than two possible categories, either ordered or unordered. For example, college matriculation could be described as a polychotomous variable: freshman, sophomore, junior, or senior. Also called polytomous variable. See also dichotomous variable.

**polydipsia** *n.* extreme thirst, manifest as excessive drinking. It commonly results from diabetes and can be an important diagnostic sign of the condition, or—in the case of psychogenic polydipsia—it may be related to psychological factors (e.g., psychogenic nocturnal polydipsia). It may also be induced by conditioning procedures (schedule-induced polydipsia). Compare ADIPSIA.
polydrug abuse

polydrug abuse n. SUBSTANCE ABUSE involving more than one drug.

polydrug dependence n. dependence (physical, psychological, or both) on more than one drug of abuse. Also called polynormal dependence. See SUBSTANCE DEPENDENCE.

polyesthetic adj. See ESTHETIC.

polyethism n. the division of labor, especially among colonies of SOCIAL INSECTS, in which each individual has a specific job, such as care of larvae, foraging for food, defense of the colony, or nest construction. In some species, there is an age-biased polyethism such that individuals progress through several tasks as they become older.

polygamy n. marriage to more than one spouse at the same time, which is an accepted custom in certain cultures. See also BIGAMY; GROUP MARRIAGE; PLURAL MARRIAGE; POLYANDRY; POLYGYNY. Compare MONOGAMY.

—polygamous adj. —polygamous n.

polyeneric adj. relating to two or more genes.

polygenic inheritance n. see MULTIFACTORIAL INHERITANCE.

polygenic trait n. an attribute that is determined by numerous genes rather than only one. An example is a person’s height. Also called polygenic trait. See MULTIFACTORIAL INHERITANCE.

polyglot n. see LINGUIST.

polyglot reaction n. recovery from APHASIA in which a multilingual person first regains use of a language other than his or her native language. See also PITRES’ RULE; BIBL’S LAW.

polygraph n. a device that measures and records several physiological indicators of stress, such as heart rate, blood pressure, and GALVANIC SKIN RESPONSE. The instrument has been widely used in the interrogation of criminal suspects and in employee screening to measure marked physiological reactions to questions about such issues as theft, sexual deviation, or untruthfulness. It has been colloquially referred to as a lie detector, although no one has ever documented a close relation between physiological patterns and deceptive behavior. The accuracy of polygraph examinations is controversial, and the results are not accepted as evidence in many U.S. courts of law. [invented in 1917 by U.S. experimental psychologist William Marston (1893–1947)]

polygynandry n. a MATING SYSTEM in which females mate with multiple males and males mate with multiple females. Compare MONOGAMY; POLYANDRY; POLYGYNY.

polygyny n. 1. among nonhuman animals, a MATING SYSTEM in which a male mates with more than one female but a female mates with only one male. See also HAREM; RESOURCE DEFENSE POLYANDRY. 2. marriage of a man to more than one wife at the same time, which is an accepted custom in certain cultures. Compare MONOGAMY; POLYANDRY; POLYGYNY; POLYGYNANDRY. —polygynous adj.

polymerase chain reaction (PCR) n. a method for reproducing a particular RNA or DNA sequence manifold, allowing amplification for sequencing or manipulating the sequence. It is useful for examining gene expression in a variety of tissues and organisms.

polynemicrygia n. see LISSENCEPHALY.

polymodal adj. involving several sensory modalities.

polymorphic fusiform layer n. see CORTICAL LAYERS.

polymorphic layer n. see DENTATE GYRUS.

polymorphism n. 1. in biology, the condition of having multiple behavioral or physical types within a species or population. In some fish species, there are two distinct sizes of males: Larger males defend territory and attract females to mate with them; much smaller males, often with the physical appearance of females, stay close to the large male and inseminate some of the eggs. Peppered moths in England exist as black morphs (forms) in polluted areas and white morphs in nonpolluted areas. 2. in genetics, the presence in a population of two or more variants of a gene (i.e., ALLELES) at a given genetic locus. For example, the variety of human blood groups is due to polymorphism of particular genes governing the characteristics of red blood cells. See also SINGLE-NUCLEOTIDE POLYMORPHISM. —polymorphic adj.

polymorphous perversity n. in the classical psychoanalytic theory of Sigmund Freud, the response of the human infant to many kinds of everyday activities posited to provide sexual excitation, such as touching, smelling, sucking, viewing, exhibiting, rocking, defecating, urinating, hurting, and being hurt.

polyneuritis n. inflammation of several nerves at the same time, usually involving peripheral nerves as a result of infection. Symptoms include intense pain, muscle atrophy, and paralysis.

polyneuropathy n. any disorder that affects many or all of the peripheral nerves. See PERIPHERAL NEUROPATHY.

polynomial n. a mathematical expression consisting of multiple terms, each of which is the product of a constant (a) and a variable (x) raised to a whole number exponent: $a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$. Polynomial contrast a comparison of mean values for more than two different levels or time points of an INDEPENDENT VARIABLE to determine whether they follow a particular mathematical pattern, such as linear, quadratic, cubic, or quartic. For example, a researcher might have a specific prediction about how clients’ average degree of motivation to attend therapy will differ over the course of treatment (e.g., will decrease, then increase, and then decrease again), and he or she could use a polynomial contrast to determine whether this is indeed the case. See also REPEATED CONTRAST.

polynomial regression n. a type of LINEAR REGRESSION analysis in which the relationship between an explanatory or INDEPENDENT VARIABLE and an outcome or DEPENDENT VARIABLE is modeled as a POLYNOMIAL. Polynomial regression is appropriate for expressing higher order NONLINEAR effects among variables (via quadratic or cubic functions such as $y = \beta_0 + \beta_1x + \beta_2x^2 + \beta_3x^3 + \ldots$) while retaining all other aspects of linear approaches.

polypenia n. the formation of multiple images of one object on the retina due to a refractive error of the eye, brain injury (see PALINOPSIA), fatigue, or PSYCHOSOMATIC DISORDER. See VISUAL ILLUSION.

polyorchidism n. the condition of having three or more testicles. —polyorchid adj., n.

polypeptide n. a molecule consisting of numerous (usually more than 10–20) AMINO ACIDS linked by PEPTIDE bonds. The synthesis of polypeptides in living cells takes
place at **ribosomes** according to the genetic instructions encoded in the cell’s DNA. Polypeptides are assembled by the cell into **proteins**.

**Polyphagia** n. an abnormal compulsion to eat excessive quantities of food.

**Polypharmacy** n. the simultaneous use of a variety of drugs of the same or different classes with the intent of producing a more robust therapeutic response. Polypharmacy for mental disorders may, for example, involve the administration of two or more antidepressants in the hope that agents with different mechanisms of action will produce greater clinical improvement than that seen with any one drug alone. Polypharmacy is often criticized because of the lack of well-controlled studies supporting its use and the greater likelihood of adverse drug interactions when two or more drugs are used simultaneously. However, for those individuals unsuccessfully treated with several trials of monotherapy, or for whom monotherapy achieves suboptimal results, polypharmacy may be therapeutically indicated and appropriately managed.

**Polyphasic activity** see **type a personality**.

**Polyphasic sleep** a pattern in which sleep occurs in relatively short naps throughout a 24-hour period. A human infant may begin life with a polyphasic sleep rhythm that consists of half a dozen sleep periods. The rhythm becomes monophasic, with one long, daily sleep period, by about school age. **Biphasic sleep** patterns, which include one daytime nap period in addition to the long, typically nocturnal, period of sleep, are seen in a variety of cultures (e.g., the siesta) and in older adults. Compare **monophasic sleep**. See also **segmented sleep**; **Sleep—Wake Cycle**.

**Polysemy** n. the condition in which a word has more than one meaning, as in **dear** meaning “loved” or “expensive.” Psycholinguistic experiments to probe the structure of the **mental lexicon** frequently make use of polysemy. See also ambiguity; homonymy; pun. —**polysemic** adj.

**Polysensory unit** a neuron in the central nervous system or a sensory receptor that normally responds to more than one type of stimulus, such as cutaneous sensory receptors that mediate prick-pain impulses and also produce sensations of itching.

**Polysomnography** n. the recording of various physiological processes (e.g., eye movements, brain waves, heart rate, respiration) throughout the night for the diagnosis of sleep-related disorders. —**polysomnograph** n.

**Polysubstance dependence** see **polydrug dependence**.

**Polytomy** n. a procedure in which several independent estimated values of a population characteristic are averaged, with or without **weights**, to obtain a single value. For example, the pooled **variance** is a single value for a variable’s dispersion produced by combining several independent estimates of that dispersion. Consider a researcher who uses **multiple imputation** to fill in missing data when examining correlations between children’s educational performance and maternal depression. He or she could calculate the value of the variance using the data set that exists at each stage of the imputation procedure and then average
poor premorbid schizophrenia

each of those individual variances to obtain a single overall value.

poor premorbid schizophrenia see PROCESS SCHIZOPHRENIA.

pop-out n. in visual search tasks, a target that is different from the DISTRACTORS. One or more basic features will mark the pop-out as distinct from the other stimuli, hence allowing the target to be easily detected and identified regardless of the number of distractors.

popular child see SOCIOMETRIC STATUS.

popular psychology 1. psychological knowledge as understood by members of the general public, which may be oversimplified, misinterpreted, and out of date. See also COMMONSENSE PSYCHOLOGY; FOLK PSYCHOLOGY. 2. psychological information intended specifically for use by the general public, such as self-help books and television and radio advice programs.

population n. 1. the total number of individuals (humans or other organisms) in a given geographical area. 2. in statistics, a theoretically defined, complete group of objects (people, nonhuman animals, institutions) from which a SAMPLE is drawn to obtain empirical observations and to which results can be generalized. Also called universe.

population correlation coefficient (symbol: ρ) an index expressing the degree of association between two continuously measured variables for a complete POPULATION of interest. For example, a researcher could obtain income and education information for all families in a town and calculate a population correlation coefficient for the entire town. In contrast, the SAMPLE CORRELATION COEFFICIENT indexes the association for a specific subset of those cases (e.g., every fourth family from a list of all those in the town).

population density the number of people or other organisms per unit of space.

population distribution the arrangement of scores or responses on a variable for a complete POPULATION of interest. For example, a researcher could graph the income distribution of all families in a town; in contrast, the SAMPLE DISTRIBUTION would show the incomes of only a specific subset of families.

population mean (symbol: μ) the average (MEAN) value on a variable for a complete POPULATION of interest. In many research settings, this value is estimated using the SAMPLE MEAN, but in situations when information is known for all the units of interest, it can be calculated directly. For example, the mean household income for an entire town may be determined by averaging the responses from a survey returned by all of the households in the town.

population psychology a subfield of psychology that studies the relationships between the characteristics and dynamics of human populations and the attitudes and behavior of individuals and groups. Representing an interface between psychology and DEMOGRAPHY, population psychology is particularly concerned with family planning and fertility regulation (i.e., reproductive behavior), high population density, and public policy development. Additional research topics include family formation and structure, migration, urbanization, mortality, and population education. Population psychology also encompasses the conceptualization of specific theoretical frameworks and methodological approaches for the study of population.

population research the study of the numbers, and changes in the numbers, of people and other organisms, focusing on the reasons for growth and decline, the migration patterns and spatial distribution of the organisms, and related issues. Also called DEMOGRAPHIC RESEARCH. See also DEMOGRAPHY.

population standard deviation (symbol: σ) a value indicating the DISPERSION of scores in a complete POPULATION of interest, that is, how narrowly or broadly the scores deviate from the MEAN. In many research settings, the population standard deviation is estimated from the sample STANDARD DEVIATION, but when information about the full set of units is known, it can be calculated directly. See also POPULATION VARIANCE.

population stereotype in ergonomics, generalizations about the perceptual, cognitive, or physical characteristics of a group of users, such as a cultural group, that are relevant to the design of systems or products for that group. For example, in the United States, users have a right bias (a tendency to move right, select doors on the right, etc.) and see the color red as carrying connotations of "stop," "danger," or "turn off." See CULTURAL ERGONOMICS.

population validity the degree to which study results from a sample can be generalized to a larger target group of interest (the POPULATION). For example, consider an educational researcher wishing to characterize the academic motivation of students. If he or she conducts a study of only urban students, then the investigator would need to demonstrate that the findings apply beyond the sample used in the study to the broader set of all students as a whole. Population validity is a type of EXTERNAL VALIDITY.

population variance (symbol: σ²) the square of the POPULATION STANDARD DEVIATION. It is a measure reflecting the spread (DISPERSION) of scores in a complete POPULATION of interest (e.g., the test scores of all students at a school).

population vector the mechanism used in the MOTOR CORTEX to encode the direction of an intended movement. The activity in each neuron increases when the intended movement is close to its preferred direction. The direction of the intended movement is derived from the activity across the population of neurons.

POR abbreviation for PROBLEM-ORIENTED RECORD.

porencephaly n. see CEREBRAL DYSELSPIA.

poromania n. an irresistible impulse to run away or wander off, either consciously or in a state of amnesia. The condition may occur in some types of epilepsy and dementia. Also called poriomanic fugue. See also FUGUE; NOMADISM.

pornographomania n. 1. a morbid impulse to write obscene letters. 2. sexual arousal associated with writing obscenities.

pornography n. writings or images (e.g., illustrations, films) with blunt, often exploitative sexual content designed solely to arouse a sexual response and to satisfy the sexual urges of the beholder. Although legal interpretations of pornography vary, they tend to focus on it as a violation of community standards, with no redeeming artistic value. See also EROTICA. —pornographic adj. [from Greek pornographos, literally: “writing about prostitutes”]

pornolagnia n. an obscure term for attraction to prostitutes as sexual partners, in preference to partners who choose to have sex out of mutual interest.
porphyria n. a metabolic disorder involving the excretion of excessive or abnormal porphyrins (breakdown products of hemoglobin) in the urine. The acute intermittent form is characterized by abdominal pain, nausea, weakness or paralysis of the extremities, and psychiatric symptoms, such as irritability, depression, agitation, and delirium.

PORT acronym for SCHIZOPHRENIA PATIENT OUTCOMES RESEARCH TEAM.

portal-systemic encephalopathy see HEPATIC ENCEPHALOPATHY.

Porter–Lawler model of motivation a model of work motivation that integrates the VALENCE–INSTRUMENTALITY–EXPECTANCY THEORY with other theoretical perspectives, including EXISTENCE, RELATEDNESS, AND GROWTH THEORY, EQUITY THEORY, and theories of INTRINSIC MOTIVATION. [Lyman W. Porter (1930– ), Edward E. Lawler III (1938– ), U.S. management theorists]

Porter's law the principle that the CRITICAL FLICKER FREQUENCY increases with the logarithm of the brightness of the stimulus, independent of the stimulus wavelength. Also called Ferry–Porter law. [Thomas Cunningham Porter (1860–1933), British scientist; Edwin Sidney Ferry (1868–1956), U.S. physicist]

Porteus Maze Test one of the original paper-and-pencil intelligence tests, devised in 1913 to assess the ability to plan ahead and apply reasoning to the solution of a problem. In its various forms, the Porteus Maze Test consists of a complex set of straight pathways that turn abruptly at right angles and run into numerous blind alleys. Only one pathway leads directly through the maze. [Stanley D. Porteus (1883–1972), Australian-born U.S. psychologist]

Portman Clinic a major British clinic set up in 1933 in Portman Square, London, by three psychoanalysts to assess, diagnose, and research delinquency. This led to the study and treatment of all mental and behavioral abnormalities and disorders. The clinic joined the TAVISTOCK CLINIC in the Tavistock and Portman National Health Service Trust in 1994. The trust provides a range of clinical mental health services as well as professional education and training.

portmanteau neologism a new word formed by combining parts of existing words, such as stagnation, from stagnation and inflation. See BLENDING; NEOLOGISM.

port-wine stain a permanent birthmark consisting of a bluish red discoloration. A diffuse port-wine stain on the face may be a symptom of STURGE–WEBER SYNDROME.

positional alcohol nystagmus (PAN) a form of horizontal NYSTAGMUS that persists following a horizontal change in head position (e.g., with the individual supine, head turned right or left) and is produced by alcohol intoxication.

positional cloning a technique to locate a gene that causes a disease, utilized when little is known about the biochemical basis of the disease.

Position Analysis Questionnaire (PAQ) a standardized, structured JOB ANALYSIS questionnaire that analyzes the type and level of work behaviors required by a job rather than the tasks or technologies involved. It consists of 194 items organized in six sections: information input; mental processes involved; relationships with others; job context (physical and social); work output; and other characteristics. A statistical analysis of data from the PAQ can be used in JOB EVALUATION for the purpose of setting pay rates (see JOB-COMPONENT METHOD) or in estimating the predictive validity of PERSONNEL TESTS (see JOB-COMPONENT VALIDITY). [developed in the 1970s by U.S. industrial and organizational psychologists Ernest J. McCormick (1911–1990), Paul R. Jeanneret (1940– ), and Robert C. Mechem]

position effect 1. the difference a gene's position on a chromosome makes to that gene's expression. 2. in para-psychology experiments using ZENER CARDS or similar targets, an effect in which the position of the target in a temporal series or a spatial array appears to influence the accuracy of the participant's "calls" or guesses. See also DECLINE EFFECT; DIFFERENTIAL EFFECT; FOCUSING EFFECT; PREFERENCES EFFECT; SHEEP–GOAT EFFECT.

position power a capacity to influence others based on their acceptance that the influencer occupies a formal position in the organization or group that gives him or her the right to make decisions and to demand compliance. In other words, the power is associated with the position itself and is not dependent on the person in that position. See LEGITIMATE POWER.

positive acceleration a situation in which the successive gains as a result of learning or practice increase across trials. See LEARNING CURVE. Compare NEGATIVE ACCELERATION.

positive addiction a concept that some activities in which a person feels a need or urge to participate, such as meditation or exercising, are positive even though they may possibly become a form of addiction. Positive addictions are considered healthy therapeutic alternatives relative to negative addictions, such as drug abuse, alcohol dependence, or cigarette smoking. [developed by U.S. psychiatrist William Glasser (1925–2013)]

positive affect the internal feeling state (AFFECT) that occurs when a goal has been attained, a source of threat has been avoided, or the individual is satisfied with the present state of affairs. The tendency to experience such states is called positive affectivity.

Positive Affect Scale see POSITIVE AND NEGATIVE AFFECT SCALE.

positive attitude in psychotherapy and counseling, the
positive contingency

client’s feelings of acceptance and approval of the therapist or counselor, of the therapeutic or counseling process, of another person, or of himself or herself. Compare NEGATIVE ATTITUDE.

positive contingency see CONTINGENCY.

positive contrast see BEHAVIORAL CONTRAST.

positive correlation a relationship between two variables in which both rise and fall together. For example, one would expect to find a positive correlation between study hours and test performance. Also called direct correlation. Compare NEGATIVE CORRELATION.

positive discrimination see REVERSE DISCRIMINATION.

positive discriminative stimulus (symbol: S+) a stimulus associated with a contingency of POSITIVE REINFORCEMENT.

positive emotion an emotional reaction designed to express a POSITIVE AFFECT, such as happiness when one attains a goal, relief when a danger has been avoided, or contentment when one is satisfied with the present state of affairs. Compare NEGATIVE EMOTION.

positive eugenics see EUGENICS.

positive exercise addiction an inordinate attraction to habitual physical exercise that brings about an enhanced sense of physical and psychological well-being. Compare NEGATIVE EXERCISE ADDICTION.

positive family history a family history with disease characteristics sufficient enough to consider that the family has a genetic syndrome or inherited disorder. A family history of colon cancer, for example, is evaluated according to the AMSTERDAM CRITERIA to determine whether the family has hereditary nonpolyposis colorectal cancer (HNPPC).

positive feedback 1. an arrangement whereby some of the output of a system, whether mechanical or biological, is fed back to increase the effect of input signals. Positive feedback is rare in biological systems. See FEEDBACK SYSTEM. 2. acceptance, approval, affirmation, or praise received by a person in response to his or her performance. Compare NEGATIVE FEEDBACK.

positive hallucination a false perceptual experience characterized by perception of something that is not there. In general, positive hallucinations are exaggerations of normal perception. Although they are a hallmark of psychotic disturbances, such as schizophrenia, these perceptual experiences can also be generated by hypnosis. Compare NEGATIVE HALLUCINATION.

positive hit rate 1. the number of instances in which the choice of a particular alternative proved correct divided by the total number of instances in which that alternative was chosen. 2. in PERSONNEL SELECTION, the proportion of people hired who actually succeed on the job.

positive illusion a belief about oneself that is pleasant or positive and that is held regardless of its truth. The most common positive illusions involve exaggerating one’s good traits (see BENEFICENCE), overestimating one’s degree of control over personally important events (see ILLUSION OF CONTROL), and sustaining unrealistic optimism (see REPRESSIVE COPING STYLE).

positive incentive an object or condition that constitutes a desired goal and may result in GOAL-DIRECTED BEHAVIOR. Compare NEGATIVE INCENTIVE.

positive motivation the impulse to engage in behaviors that result in desired outcomes, such as wanting to work hard in order to obtain praise or promotion from an employer.

positive–negative asymmetry the tendency of people to give disproportionate weight and consideration to negative information and events in decision making and perception. For example, voters are more inclined to reject a candidate on the basis of the negative information they receive about that person than they are inclined to accept a candidate on the basis of the positive information they receive. The effect can be cognitive, influencing thinking and judgment, or affective, influencing emotions. In either case, negative information requires more processing and the recipient typically demands more justification and input than he or she would from positive information. See also BAD IS STRONGER THAN GOOD. [first described in 1971 by Belgian psychologist Guido Peeters]

positive practice see OVERCORRECTION.

positive psychology a field of psychological theory and research that focuses on the psychological states (e.g., contentment, joy), individual traits or CHARACTER STRENGTHS (e.g., intimacy, integrity, altruism, wisdom), and social institutions that enhance SUBJECTIVE WELL-BEING and make life most worth living. A manual, Character Strengths and Virtues: A Handbook and Classification, serves this perspective in a manner parallel to the Diagnostic and Statistical Manual of Mental Disorders for the categorization of mental illness. [term coined by Abraham MASLOW and adapted by U.S. psychologist Martin E. P. Seligman (1942–)]

positive punishment punishment that results because some stimulus or circumstance is presented as a consequence of a response. For example, if a response results in presentation of a loud noise and the response becomes less likely as a result of this experience, then positive punishment has occurred. Compare NEGATIVE PUNISHMENT.

positive regard feelings of warmth, caring, acceptance, and importance expressed by someone toward another. Positive regard is considered necessary for psychological health and the development of a consistent sense of self-worth and is also a cornerstone of certain therapeutic approaches, particularly that of Carl ROGERS. See also CONDITIONAL POSITIVE REGARD; UNCONDITIONAL POSITIVE REGARD.

positive reinforcement 1. an increase in the probability of occurrence of some activity because that activity results in the presentation of a stimulus or of some circumstance. 2. the procedure of presenting a positive reinforcer after a response. Compare NEGATIVE REINFORCEMENT.

positive relationship see DIRECT RELATIONSHIP.

positive reward theory see REWARD THEORY.

positive schizophrenia a form of schizophrenia in which POSITIVE SYMPTOMS predominate, as evidenced in bizarre behavior, illogical speech or writing, or expression of hallucinations and delusions. Although more dramatically evident than NEGATIVE SCHIZOPHRENIA, the positive aspect is usually less challenging to treat. [defined in 1918 by U.S. psychiatrists Nancy C. Andreasen and Scott A. Olsen]

positive self-talk see SELF-TALK.

positive skew see SKEWNESS.

positive stereotype a STEREOTYPE that purports to describe the admirable, desirable, or beneficial qualities and
characteristics of the members of a particular group or social category. Although stereotypes about other groups are often negative, generalizations about one’s own groups tend to be positive. Compare NEGATIVE STEREOTYPE.

**positive symptom** a symptom of schizophrenia that represents an excess of distortion of normal function, as distinct from a deficiency in or lack of normal function (compare NEGATIVE SYMPTOM). Positive symptoms include delusions or hallucinations, disorganized behavior, and manifest conceptual disorganization. They are more dramatic and less distinctive of schizophrenia than are negative symptoms: Eugen Bleuler regarded them as SECONDARY SYMPTOMS. See POSITIVE SCHIZOPHRENIA.

**positive transfer** 1. the improvement or enhancement of present learning by previous learning. For instance, learning to drive a car could facilitate learning to drive a truck. See also TRANSFER OF TRAINING. Compare NEGATIVE TRANSFER.

**positive transference** in psychoanalysis, a patient’s transfer onto the analyst or therapist of those feelings of attachment, love, idealization, or other positive emotions that the patient originally experienced toward parents or other significant individuals during childhood. Compare NEGATIVE TRANSFERENCE.

**positive tropism** the orientation of an organism toward a source of stimulation. An example is the turning of a flower to face the sun. See TROPISM.

**positivism** n. a family of philosophical positions holding that all meaningful propositions must be reducible to sensory experience and observation and thus that all genuine knowledge is to be built on strict adherence to empirical methods of verification. Positivism first became an explicit position in the work of French thinkers Auguste Comte and Claude Henri de Rouvroy, Comte de Saint-Simon (1760–1825), although it is implicit to varying degrees in most earlier forms of EMPIRISM. Its effect is to establish science as the model for all forms of valid inquiry and to dismiss the truth claims of religion, metaphysics, and speculative philosophy. Positivism, particularly LOGICAL POSITIVISM, was extremely influential in the early development of psychology and helped to form its commitment to empirical methods. It continues to be a major force in contemporary psychology. See also MACHIAN POSITIVISM.

—positivist adj.

**positivist criminology** an approach that seeks to explain criminal behavior not as an exercise of free will or choice (as is the case in classical CRIMINOLOGY) but rather as a consequence of various internal factors (e.g., biological, psychological) and external factors (e.g., cultural, social) that affect human behavior. See also CRIMINAL ANTHROPOLOGY.

**positivity effect** an increasing tendency for older adults, compared to younger people, to attend to, recall, and process positive information to a greater degree than they do negative information. [first proposed in the 1990s by U.S. psychologist Laura L. Carstensen]

**positron emission tomography (PET)** an imaging technique using radiolabeled tracers, such as 2-deoxyglucose labeled with fluorine-18, that emit positively charged particles (positrons) as they are metabolized. Used to evaluate cerebral metabolism and blood flow as well as the binding and transport of neurotransmitter systems in the brain. PET enables documentation of functional changes that occur during the performance of mental activities. It is also used to detect damage or disease (e.g., cancer) in other organs of the body.

**possession n.** see DEMONIC POSSESSION.

**possession trance** see DISSOCIATIVE TRANCE DISORDER.

**possessiveness** n. 1. in general, excessive striving to claim possession or ownership. 2. an abnormal tendency to control or dominate others, generally involving the restriction of their social relationships. In its most extreme form, this pattern of behavior is often associated with abusive relationships.

**possible self** a mental representation of what one could become. Possible selves are cognitive manifestations of enduring goals, aspirations, fears, and threats that provide plans and strategies for the future. They may be positive, providing an image of something to strive for, or negative, providing an image of something to be avoided. An individual is free to create any variety of selves, yet the pool of possible selves derives from the categories made salient by the individual’s particular sociocultural and historical context and from the models, images, and symbols provided by the media and by the individual’s immediate social experiences. [proposed in 1985 by U.S. social psychologist Hazel Rose Markus]

**postcaptive health problems** health problems that develop after a period of captivity, especially in PRISONERS OF WAR, and that may include injuries, posttraumatic stress reactions, affective reactions, or a combination of these. Many former captives may show POSTTRAUMATIC STRESS DISORDER in the years following release, sometimes with a delayed onset.

**postcentral area** a sensory region of the PARIETAL LOBE of the brain, posterior to the CENTRAL SULCUS, that has neurons involved in the perception of touch, proprioception, kinesthesia, and taste.

**postcentral gyrus** a ridge in the PARIETAL LOBE of the brain, just behind the CENTRAL SULCUS, that is the site of the PRIMARY SOMATOSENSORY AREA.

**postchiasmatic visual deficit** a visual impairment caused by damage to visual processing areas posterior to (i.e., beyond) the OPTIC CHIASM, such as the OPTIC RADATIONS OR STRIATE CORTEX. Postchiasmatic injury or disease affects vision in both eyes (see HOMONYMOUS HEMIANOPIA). Also called retrochiasmatic visual deficit.

**postcognition n.** see RETROCOGNITION. —postcognitive adj.

**postcolonialism** n. the multidisciplinary (e.g., historical, linguistic, political, philosophical) study or analysis of the experience and the local and global effects of colonization. Whereas historical colonialism emphasized the differences between the colonizers and the colonized, usually marginalizing the latter, postcolonialism represents an attempt to bring the two cultures together, such as when indigenous writers of previously colonized lands explain aspects and values of their traditional cultural identity in the language of the colonizers.

**postcompetition anxiety** the apprehension created after a competition as a result of not meeting goals during its course, the perceived reaction of others to the performance or outcome, or the perceived expectations of others and oneself because of the performance or outcome.

**postconcussion syndrome** persistent and pervasive
postconventional level

Changes in cognitive abilities and emotional functioning that occur as a result of diffuse trauma to the brain during concussion. An individual with this syndrome may appear to be within normal limits neurologically but experience persistent depression, fatigue, impulse-control problems, and difficulties with concentration and memory. Postconcussion syndrome is frequently seen in individuals who have been repeatedly beaten on the head and face, such as children or women who have been abused (see battered-child syndrome; battered-woman syndrome).

postconventional level in Kohlberg’s Theory of Moral Development, the third and highest level of moral reasoning, characterized by an individual’s commitment to moral principles sustained independently of any identification with family, group, or country. This level is divided into two stages: the earlier social contract orientation (Stage 5 in Kohlberg’s overall theory), in which moral behavior is that which demonstrates an understanding of social morality; balancing general individual rights with public welfare and democratically agreed upon societal rights; and the later ethical principle orientation (Stage 6), in which moral behavior is based upon self-chosen, abstract ethical standards. Also called postconventional morality. See also conventional level; preconventional level.

postcopulatory behavior among nonhuman animals, activity that immediately follows copulation. Male rats, for example, are inactive but produce an ultrasonic vocalization after ejaculation. In many species, males remain alert and guard their mate to prevent other males from attempting to copulate with her. In some species, females can eject or remove sperm or keep it, engaging in postcopulatory mate selection.

postcreolization continuum see decrEolization.

postdictive validity see retrospective validity.

postemployment services 1. in vocational rehabilitation, follow-up assistance or programs designed to help recently employed individuals with disabilities adjust to their new job situation. Examples include counseling, financial support, and continuing medical treatment and care. 2. services provided to help individuals who are economically disadvantaged (e.g., those receiving public assistance in the form of welfare) develop various work-related skills essential to sustained long-term employment and enhance their potential for wage increases and career advancement. Services may provide access to and assistance with child care and transportation; on-the-job training; continuing education classes; and mentoring programs designed to help newly hired individuals adjust to the workplace.

postencephalitic amnesia a memory disorder that occurs in some patients who have recovered from viral encephalitis. The symptoms include a gross defect of recent memory and partial amnesia for events preceding the encephalitis; intelligence, however, is unimpaired.

postencephalitis syndrome a pathological condition that occurs following or as a result of encephalitis. An example is postencephalitic Parkinsonism, which developed in patients who recovered from the 1915 to 1926 epidemic of encephalitis lethargica. The onset of symptoms in some cases was not observed until 10 years after recovery from the disease.

posterior adj. in back of or toward the back. In reference to two-legged upright animals, this term sometimes is used interchangeably with dorsal to mean toward the back surface of the body. Compare anterior.

posterior cerebral artery an artery of the brain that arises from the terminal bifurcation of the basilar artery and passes above the oculomotor nerve to curve around the midbrain above the level of the tentorium cerebelli. Its branches supply blood to the region of the third ventricle, including the thalamus and choroid plexus, the occipital lobe and the inferior surface of the temporal lobe, and the lingual, fusiform, and inferior temporal gyri.

posterior chamber see eye.

posterior cingulate cortex (PCC) the back, more flattened part of the cingulate cortex, a structure in the forebrain that forms a collar around the corpus callosum. Like the anterior cingulate cortex, the PCC also is divided into two sections, referred to as the dorsal posterior cingulate cortex (dPCC) and the ventral posterior cingulate cortex (vPCC), respectively. Although its precise characteristics and mechanisms are not yet fully understood, the PCC has been shown to play a role in numerous processes, including episodic memory, spatial attention, preattentive processing, sensory processing (visual processing, auditory processing, etc.), sensory integration, motor intention, emotional responses, and self-reflection and other self-referential processing. Additionally, it is a key component of the limbic system and forms part of the recently identified default-mode network, a set of specific brain regions whose activity predominates in the resting state and is inhibited during cognitively demanding and externally cued perceptual tasks. Structural and functional alterations of the PCC appear to underlie several disorders, including Alzheimer’s disease, autism, depression, dyslexia, and schizophrenia. For example, several studies have revealed atrophy and decreased metabolic activity (hypometabolism)—particularly of the enzyme cytochrome oxidase—within the PCC of individuals who display mild cognitive impairment and subsequently develop Alzheimer’s disease, as well as reduced connectivity between the PCC, hippocampus, and other brain regions.

posterior commissure see commissure.

posterior communicating artery an artery that arises from the internal carotid artery and passes just ventrally to the optic tract to merge with the posterior cerebral artery, thus completing the circle of Willis at the base of the brain. Branches of the posterior communicating artery supply the optic tract and part of the optic chiasm, the genu of the corpus callosum, the posterior hypothalamus, parts of the internal capsule, the third ventricle, and anterior and ventral nuclei of the thalamus.

posterior cortex the occipital cortex of mammals, including the striate cortex (Brodmann area 17) and prestriate cortex (area 18).

posterior cranial fossa see fossa.

posterior distribution in Bayesian approaches, an estimated arrangement of values for a population characteristic of interest that is obtained by combining empirical data with prior expectations based on existing knowledge or opinion (the prior distribution).

posterior horn 1. the backmost division of each lateral ventricle in the brain. 2. see dorsal horn.

posterior nucleus see lateral posterior nucleus.
posterior pituitary the posterior lobe of the pituitary gland. Also called neurohypophysis.

posterior probability the probability that a certain event will occur given that other related events have been observed. For example, assume that Basket A contains 10 white cards and 20 red cards, while Basket B contains 20 white cards and 10 red cards. If one selects a card from a basket at random, without noting the color, the probability that it will be from Basket A is .5; since the only possibilities are A or B. If, however, the color of the card is noted, then one must take this additional information into account in determining the probability that the card came from Basket A. For example, the probability that a white card will be pulled from Basket A would be revised downward from .5 according to Bayes’ Theorem: Since there are fewer white cards in A, a white card is more likely to be drawn from B instead. See also prior probability.

posterior rhizotomy see rhizotomy.

posterior root see dorsal root.

postfigurative culture a society or culture in which the young learn chiefly from their parents, grandparents, and other adults. Compare configurative culture, prefigurative culture. [coined by U.S. anthropologist Margaret Mead (1901–1978)]

postformal thought the complex ways in which adults structure their thinking based on the complicated nature of adult life. It is an extension of Jean Piaget’s concept of formal operations (see formal operational stage), which are developed in adolescence, to adult cognition and includes an understanding of the relative, nonabsolute nature of knowledge; an acceptance of contradiction as a basic aspect of reality; the ability to synthesize contradictory thoughts, feelings, and experiences into more coherent, all-encompassing wholes; and the ability to resolve both ill- and well-defined problems.

postganglionic autonomic neuron any neuron of the sympathetic nervous system whose cell body lies in a ganglion of the sympathetic chain. Such neurons innervate certain target organs, such as the kidneys, ovaries, and salivary glands. Compare preganglionic autonomic neuron.

postherpetic neuralgia see herpetic neuralgia.

post hoc comparison any examination in which two or more quantities are compared after data have been collected and without prior plans to carry out the particular comparison. For example, after obtaining a significant F ratio for a data set, a researcher may perform post hoc comparisons to follow up on and help explain the initial findings. Different statistical tests are required for post hoc comparisons than for a priori comparisons. Also called a posteriori comparison (or contrast); post hoc contrast; unplanned comparison (or contrast).

post hoc test a statistical procedure conducted on the basis of the findings obtained from previous analyses. Most commonly, the phrase refers to comparisons of the mean values obtained on a variable by different study groups, with these comparisons made only after an overall analysis of variance has revealed a significant F ratio, indicating that there is some effect or difference across the groups that should be examined further. Also called follow-up test. See post hoc comparison.

posthypnotic amnesia an individual’s inability to remember what transpired during a period of hypnosis. Typically, this is induced by instruction of the hypnotist.

posthypnotic suggestion a suggestion made to a person during hypnosis that he or she acts out after the hypnotic trance. The suggested act may be carried out in response to a prearranged cue, and the person may not know why he or she is performing the action.

postictal adj. following a sudden attack, especially a seizure or a stroke. During the postictal period of a seizure, the individual may be confused, disoriented, and unable to form new memories. The length of the postictal period may vary from less than a second to many hours and depends on the type of seizure.

postlingually deafened becoming deaf after the acquisition of language.

postmodernism n. 1. a number of related philosophical tendencies that developed in reaction to classical modernism during the late 20th century. Most postmodern positions reject traditional metaphysics for its pursuit of a reality independent of the world of lived experience, traditional epistemology for its pursuit of certain knowledge and objectivity, and traditional ethical theories because of their reliance on metaphysics and epistemology. More specifically, they see the ideal of objective truth that has been a guiding principle in the sciences and most other disciplines since the 17th century as basically flawed. There can be no such truth, only a plurality of “narratives” and “perspectives.” Postmodernism emphasizes the construction of knowledge and truth through discourse and lived experience, the similar construction of the self, and relativism in all questions of value. It is therefore a form of radical skepticism. See also poststructuralism. 2. in the arts, a general movement away from the tenets and practices of modernism that became apparent in the late 20th century. Postmodern culture is often held to be characterized by a free merging of genres and styles, a spirit of irony and pastiche, and a recognition of the importance of pop culture and the mass media. —postmodern adj.

postmortem examination see autopsy.

postnatal period see postpartum period.

postoccupancy evaluation (POE) the measurement of user responses to a building or facility following its construction. POEs are a valuable source of information for designers, providing feedback on the validity of assumptions about how the built environment fulfills users’ needs and affects their behaviors. POEs can also inform architectural programming.

postpartum blues see baby blues.

postpartum depression a major depressive episode or, less commonly, minor depressive disorder that affects some women within 4 weeks to 6 months after childbirth. Compare baby blues.

postpartum period the period of about 6 weeks following childbirth during which the mother’s reproductive system gradually returns to its prepregnant state. Also called postnatal period: puerperium.

postpartum psychosis delusions, hallucinations, or other symptoms of impaired reality testing that occur in some women shortly after childbirth, often associated with postpartum depression.

postpositivism n. 1. the general position of U.S. psychology since the mid-20th century, when it ceased to be
dominated by LOGICAL POSITIVISM, HYPOTHETICO-DEDUCTIVE METHODS, and OPERATIONALISM. Postpositivist psychology is a broader and more human endeavor, influenced by such philosophers of science as Thomas Kuhn (1922–1996) and by such developments as SOCIAL CONSTRUCTIONISM and the Continental tradition of PHENOMENOLOGY and EXISTENTIALISM. More generally, any approach to science and the PHILOSOPHY OF SCIENCE that has moved away from a position of strict POSITIVISM.—postpositivist adj., n. —post-
positivistic adj.

postreconstructive surgery surgery performed after RECONSTRUCTIVE SURGERY. It is often required to achieve optimal functioning and may involve the transfer of muscle or tendon fibers between body areas or the redirection of nerve fibers. See also COSMETIC SURGERY: PLASTIC SURGERY.

postreinforcement pause in operant conditioning, the period of time that elapses from the end of REINFORCEMENT until the occurrence of the next response from the class that is being reinforced.

postrotational nystagmus the involuntary, rapid eye movements (see NYSTAGMUS) that occur when rapid rotation of the body ceases.

postschizophrenic depression a depressive episode that may follow an ACUTE SCHIZOPHRENIC EPISODE. Postschizophrenic depression is viewed variously as a routine event in recovery from schizophrenic decompensation, as a mood disturbance that existed previously and was masked by the schizophrenic episode, or as a side effect to drug treatment for schizophrenia.

poststructuralism n. a broad intellectual movement that developed from French STRUCTURALISM in the late 1960s and 1970s. It is represented by the work of Jacques Derrida (1930–2004) in philosophy and criticism. Jacques Lacan (1901–1981) in philosophy and psychoanalysis. Michel Foucault (1926–1984) in the history of ideas, and Hélène Cixous (1937– ) and Julia Kristeva (1941– ) in feminist theory, among others. Although these thinkers are diverse, they share a starting point in the structuralist account of language given by Swiss linguist Ferdinand de Saussure (1857–1913), which holds that linguistic SIGNS acquire meaning only through structural relationships with other signs in the same language system. Poststructuralism endorses the arbitrariness of the sign, but from this basis it proceeds to question the whole idea of fixed and determinate meaning. In the DECONSTRUCTION of Derrida, structures and systems of meaning are found to be unstable, contradictory, and endlessly self-subverting. This skepticism extends to the idea of personal identity itself, according to Derrida, the self is merely another “text” to be deconstructed.

In psychology, poststructuralism is mainly significant because of its influence on the radical psychoanalytical theories of the 1960s and 1970s. Lacan, who trained and practiced as a psychiatrist and psychoanalyst, rejected the idea of a stable autonomous id and reinterpreted the Freudian UNCONSCIOUS in terms of Saussure’s structural linguistics. His unconventional ideas and methods led to his exclusion from the International Society of Psychoanalysts in 1963. Both Kristeva (another practicing psychoanalyst) and Cixous were deeply influenced by Lacan’s ideas of sexuality, consciousness, and language, which are given a radical feminist twist in their writings. The best known work of Foucault, who worked in a psychiatric hospital as a young man, is his Folie et déraison: Histoire de la folie à l’âge classique (1961; translated in 1965 as Madness and Civiliza-
tion: A History of Insanity in the Age of Reason), which gives a tendentious history of Western attitudes to insanity, arguing that the categories of madness and reason are themselves oppressive.—poststructuralist adj.

postsynaptic adj. 1. of or relating to the region of a neuron within a SYNAPSE that receives and responds to a neurotransmitter. 2. of or relating to a neuron that receives a signal via a synapse. Compare PRESYNAPTIC.

postsynaptic potential (PSP) the electric potential at a dendrite or other surface of a neuron after an impulse has reached it across a SYNAPSE. Postsynaptic potentials may be either EXCITATORY POSTSYNAPTIC POTENTIALS or INHIBITORY POSTSYNAPTIC POTENTIALS.

postsynaptic receptor any receptor that is located on the cell membrane or in the interior of a postsynaptic neuron. Interaction with an effector substance (e.g., a neurotransmitter), released either by the presynaptic neuron or from another site, initiates a chain of biochemical events contributing, for example, to excitation or inhibition of the postsynaptic neuron.

posttest 1. n. an assessment carried out after the application of some intervention, treatment, or other condition to measure any changes that have occurred. Posttests often are used in research contexts, in conjunction with PRE-

POSTTESTS, to isolate the effects of a variable of interest. For example, in a study examining whether a new therapy helps to alleviate depression, participants might receive the therapy and then complete a short symptom inventory, the results of which would be compared to those from an inventory taken prior to the treatment. 2. vb. to administer a posttest.

posttest counseling a type of GENETIC COUNSELING that occurs following disclosure of genetic test results. Posttest counseling focuses on the individual’s understanding of the meaning of the test results and of the options for SCREENING. Considerable attention is given to the psychological status of the individual and to assessing whether he or she needs further medical or psychological services. Compare PRETEST COUNSELING.

posttest-only control-group design a research design in which an EXPERIMENTAL GROUP and a CONTROL GROUP are compared on a POSTTEST measure only. It is assumed that participants’ results on any PRETEST administered before the introduction of the experimental manipulation would be essentially equivalent across the groups due to the RANDOM ASSIGNMENT of individuals to conditions. A posttest-only control-group design is distinct from a posttest-only design, in which all groups receive some treatment and there is no neutral comparison.

posttetanic potentiation (PTP) the increase in POSTSYNAPTIC POTENTIAL elicited in target neurons by a single action potential subsequent to the induction of a tetanus (a rapid series of action potentials) in the presynaptic neuron. It is a well-known example of NEURAL PLASTICITY.

posttraumatic amnesia (PTA) a disturbance of memory following a physical injury (e.g., a concussion) or a psychologically upsetting experience (e.g., combat, sexual abuse). The traumatic event itself, or events following the trauma, may be forgotten. The period of forgetting may be continuous, or the person may experience vague, incomplete recollections of the traumatic event.

posttraumatic disorders emotional or other disturbances whose symptoms appear after an individual has en-
dured a traumatic experience. Common posttraumatic disorders include POSTTRAUMATIC STRESS DISORDER, ACUTE STRESS DISORDER, the DISASSOCIATIVE DISORDERS, and some types of PHOBIAS and ANXIETY DISORDERS, as well as DEPRESSIVE DISORDER and SITUATIONAL PSYCHOSIS.

**posttraumatic epilepsy** epileptic seizures that occur as a complication of traumatic brain injury. The seizures may occur either soon after the injury or, in some cases, months or years later.

**posttraumatic personality disorder** a personality disorder occasionally observed after a severe head injury. Some individuals become indifferent and withdrawn, but most are irritable, impulsive, petulant, extremely selfish, and irresponsible. Older individuals and those with frontal-lobe damage may show impaired memory with CONFABULATION.

**posttraumatic stress disorder (PTSD)** in DSM-IV-TR, a disorder that may result when an individual lives through or witnesses an event in which he or she believes that there is a threat to life or physical integrity and safety and experiences fear, terror, or helplessness. The symptoms are characterized by (a) reexperiencing the trauma in painful recollections, flashbacks, or recurrent dreams or nightmares; (b) avoidance of activities or places that recall the traumatic event, as well as diminished responsiveness (emotional anesthesia or numbing), with disinterest in significant activities and with feelings of detachment and estrangement from others; and (c) chronic physiological arousal, leading to such symptoms as an exaggerated startle response, disturbed sleep, difficulty in concentrating or remembering, and guilt about surviving the trauma when others did not (see SURVIVOR GUILT). Subtypes are CHRONIC POSTTRAUMATIC STRESS DISORDER and DELAYED POSTTRAUMATIC STRESS DISORDER. When the symptoms do not last longer than 4 weeks, a diagnosis of ACUTE STRESS DISORDER is given instead. Changes in PTSD criteria from DSM-IV-TR to DSM-5 include the following: Exposure to the traumatic event may be secondhand if the event happens to a loved one or if there is repeated exposure to aversive details (e.g., as with first responders performing their work in the case of a disaster); the subjective criterion requiring that the person feel fear, terror, or helplessness has been eliminated; symptom clusters have been recategorized, with additional symptoms; and separate criteria have been developed for children age 6 years or younger.

**posttreatment follow-up** a periodic check on the progress of people who have received some form of psychotherapeutic or medical treatment. In research studies, posttreatment follow-up is used to see if the effects of treatment are maintained or if relapse occurs. If the effects of treatment are maintained, it is inferred that the treatment has lasting rather than temporary effects.

**postulate** n. see AXIOM.

**postural aftereffect** a change in posture that arises as an aftereffect of prior stimulation. For example, when viewing a moving scene, a person typically leans in the direction of the motion. When viewing ends, body posture returns to a vertical position and then, briefly, leans in the opposite direction.

**postural arm drift** the drift of the arms from their original position when an individual is required to hold them outstretched and in a static position, with the eyes closed. The drift, if it occurs, is usually toward the midline and may be an indication of a parietal lesion. Also called **parietal drift**.

**postural control** the ability to control the position of one’s body. The first landmark in the development of postural control occurs at about 3 weeks of age, when a prone infant is first able to lift the head and raise the chin. Within a few weeks, further steps in postural control are achieved, such as holding the head erect and turning it and sitting with and then without support.

**postural hypotension** see ORTHOSTATIC HYPOTENSION.

**postural mirroring** the mimicking of another individual’s stance, gestures, or other nonverbal behaviors, whether fully or partially. For example, if one person crosses his or her arms during a conversation and the other person subsequently does the same, then postural mirroring has occurred. The phenomenon tends to be nonconscious and may even induce affective similarities in participants (e.g., a person mirroring the posture of someone who is anxious may then feel anxious, too). Also called **postural echo**. See MIRROR NEURON.

**postural reflex** any of a variety of automatic movements that serve to maintain body posture. See also STANCE REFLEX.

**postural set** a body position, characterized by increased muscle tone, that is adopted in preparation for a response, such as a baseball batter’s stance before a pitch.

**postural tremor** see ACTION TREMOR.

**posture** n. 1. the position or bearing of the body. Types of posture include erect (upright), recumbent (reclining), prone (lying face down), and supine (lying face up). Movement typically involves coordinated changes in posture (e.g., to maintain balance or distribute forces). 2. a rationalized mental position or attitude. —**postural adj.**

**posturing** n. the assumption of a bizarre or inappropriate body position or attitude for an extended period of time. It is commonly observed in CATATONIA.

**postvention** n. support services offered to the bereaved survivors (e.g., family, friends, classmates, coworkers) of those who have died by suicide or as a result of trauma. [defined by Edwin S. Shneidman]

**postventral nucleus** see VENTROPOSTERIOR NUCLEUS.

**postvoluntary attention** attention that has been captured by an absorbing and meaningful activity and that can be sustained enjoyably and productively for long periods of time. Such attention differs from INVOLUNTARY ATTENTION in not being passive and from VOLUNTARY ATTENTION in not being experienced as effortless. See also EFFORTLESS ATTENTION; FLOW.

**pot** n. slang for marijuana. See CANNABIS.

**potassium channel** see ION CHANNEL.

**potency** n. 1. the ability of a male to perform sexual intercourse, that is, to maintain an erection and achieve ejaculation. Compare IMPOTENCE. 2. in pharmacology, see DOSE–RESPONSE RELATIONSHIP. —**potent adj.**

**potential** n. 1. the capacity to develop or come into existence. 2. electric potential, measured in volts: a property of an electric field equal to the energy needed to bring one unit of electric charge from infinity to a given point. The potential difference between two points is the driving force that causes a current to flow. Because messages in the n-
potential-stress score

vous system are conveyed by electrochemical potentials, many kinds of potential are of importance in neuroscience and biological psychology, including the ACTION POTEN-
TIAL, AFTERPOTENTIAL, GRADED POTENTIAL, LOCAL POTEN-
TIAL, MEMBRANE POTENTIAL, POSTSYNAPTIC POTENTIAL, and
RESTING POTENTIAL. 3. in philosophy, see ACTUAL.

potential-stress score see LIFE-CHANGE UNIT.

potentiation n. a form of DRUG INTERACTION in which the addition of a second drug intensifies certain properties of the first drug administered. It often refers to the ability of a nontoxic drug to render more severe the effects of a toxic drug than when the toxic agent is administered singly.

potlatch n. a ceremony among some Native Americans of the northwestern United States that involves a feast and the giving of gifts for the redistribution and reciprocity of wealth. The status of families is established not by what they have but by what they share.

Pötzl phenomenon (Pötzl phenomenon) the claim that words or images that are presented subliminally may appear in imagery or dreams a short time later. It is cited as an example of SUBLIMINAL PERCEPTION. [Otto Pötzl (1877–1962), Austrian neurologist and psychiatrist]

Pötzl's syndrome a form of pure ALEXIA associated with visual field defects and disturbances of the color sense. The syndrome is believed to be the result of a lesion in the medullary layer of the LINGUAL GYRUS of the dominant hemisphere of the brain, with damage to the CORPUS CALLOSUM. [Otto Pötzl]

poverty of content of speech speech that is adequate in quantity but too vague, repetitious, and lacking in content to be qualitatively adequate. It is frequently observed in schizophrenia and is distinct from POVERTY OF SPEECH, in which the quantity of speech is diminished.

poverty of ideas a thought disturbance, often associated with schizophrenia, dementia, and severe depression, in which there is reduced spontaneity and productivity of thought as evidenced by speech that is vague or full of simple or meaningless repetitions or stereotyped phrases. The term is sometimes used interchangeably with INTELLECTUAL IMPOVERISHMENT.

poverty of speech excessively brief speech with few elaborations that occurs in schizophrenia or occasionally in a major depressive episode. It is distinct from POVERTY OF CONTENT OF SPEECH, in which the quality of speech is diminished.

P.O.W. abbreviation for PRISONER OF WAR.

power n. 1. the capacity to influence others, even when they try to resist this influence. Social power derives from a number of sources: control over rewards (REWARD POWER) and punishments or other force (CORRECTIVE POWER); a right to require and demand obedience (LEGITIMATE POWER); others' identification with, attraction to, or respect for the powerholder (REFERENT POWER); others' belief that the powerholder possesses superior skills and abilities (EXPERT POWER); and the powerholder's access to and use of informational resources (INFORMATIONAL POWER). 2. a measure of how effective a statistical procedure is in identifying real differences between populations: It is the probability that use of the procedure will lead to the NULL HYPOTHESIS of no effect being rejected when the ALTERNATIVE HYPOTHESIS is true. For example, if a given statistical test has a power of .70, then there is a 70% probability that its use will result in the null hypothesis correctly being rejected as false, with a corresponding 30% chance that its use will lead to a TYPE II ERROR. Power ranges from 0 to 1, with values of .80 or above generally considered acceptable. 3. a mathematical notation that indicates the number of times a quantity is multiplied by itself.

power analysis the process of determining the number of cases or observations that a study would need to achieve a desired level of POWER with a certain EFFECT SIZE and a certain SIGNIFICANCE LEVEL. This information is particularly important because it enables a researcher to plan what resources will be needed to enroll or select the desired number of individuals.

power base the interpersonal origin of one individual's capacity to influence other individuals. For example, REWARD POWER is based on the influencer's control over valued resources, and LEGITIMATE POWER is based on a licit right to require and demand compliance. [proposed in 1959 by U.S. social psychologists John R. P. French Jr. (1922–2006) and Bertram Raven (1926–)]

power-coercive strategy in social psychology, the uses of economic, social, and political power to effect societal change, usually through nonviolent measures (e.g., organized boycotts, strikes, sit-ins, demonstrations, registration drives, lobbying). See also EMPIRICAL-RATIONAL STRATEGY: NORMATIVE-REEDUCATIVE STRATEGY.

power distance the degree to which a culture accepts an unequal distribution of power in organizations, institutions, or society at large. Individuals in high power distance cultures are more accepting of large power differentials than are those in low power distance cultures. [introduced by Dutch cultural psychologist Geert Hofstede (1928–)]

power elite the concept of a small number of powerful individuals, especially corporate, political, religious, or military leaders, who hold the highest positions of authority in their respective institutions and share a common outlook and values. This elite not only controls vast economic resources but also is thought to shape the agendas of government, business, education, and the media through its actions and attitudes. Most sociologists reject the idea of a single power elite, arguing that developed societies have a complex of overlapping elites, which often have competing values and interests. However, it is in the interests of the various groups of elites to consolidate power by building consensus among themselves. [coined by U.S. sociologist C. Wright Mills (1916–1962)]

power function 1. a relationship in which the values for one variable vary according to the values of another variable raised to a power. In mathematics, it is expressed by the equation \( y = ax^n \), where \( x \) and \( y \) are the variables and \( a \) and \( b \) are numerical constants. Power functions have been used to characterize the scales relating perceived and physical intensity, for example, as well as to characterize the relationship between response speed and practice. 2. a formula relating different factors, such as sample size, EFFECT SIZE and SIGNIFICANCE LEVEL, to the likelihood that use of a particular statistical procedure will lead to rejection of the NULL HYPOTHESIS when it is in fact false (see POWER). For example, a researcher may plan to use a specific statistical test to detect a medium-sized effect, evaluate the effect at the .001 significance level, and reach a desired statistical power level of .80. Using a power function, the researcher could determine the sample size needed under those conditions. Power functions may be presented in tabular form or shown graphically as POWER CURVES.
power grip the manner of grasping an object between the pads of the fingers and the palm (e.g., when using a hammer). See also PINCER GRIP; PRECISION GRIP.

power law 1. see STEVENS LAW. 2. a generalization demonstrated by a LEARNING CURVE in which each increment in the performance variable (e.g., learning, memory) corresponds with a logarithmic increase in the practice variable. For instance, if the successive units of practice are 1 trial, 10 trials, and 100 trials, the resulting learning curve is a straight line.

powerlessness n. a state in which individuals either lack or believe that they lack control or influence over factors or events that affect their health (mental or physical), personal lives, or the society in which they live.

power of the situation a basic premise of social psychology that assumes people’s thoughts, actions, and emotions are influenced substantially by the social setting. For example, the responses of participants in the BEHAVIORAL STUDY OF OBEDIENCE are attributed to the power of the social situation created by researcher Stanley MILGRAM rather than to the dispositional characteristics of the participants. See also STANFORD PRISON STUDY.

power play an aggressive technique or strategy used to achieve an end, often through the coercion of others.

power spectral density see SPECTRUM LEVEL.

power spectrum see SOUND SPECTRUM.

power test a type of test intended to calculate the participant’s level of mastery of a particular topic under conditions of little or no time pressure. The test is designed so that items become progressively more difficult. Compare SPEED TEST.

power transformation a class of Transformations used to make the distribution of values on a variable more closely resemble that of a normal DISTRIBUTION and have more stable VARIANCE. In this approach, the obtained values are raised to some exponential quantity (e.g., squared), which preserves their original order. The BOX–COX TRANSFORMATION is an example of a power transformation.

P-O-X triads see BALANCE THEORY.

PPA 1. abbreviation for parahippocampal place area. See PARAHIPPOCAMPAL GYRI. 2. abbreviation for PREFERRED PROVIDER ARRANGEMENT.

PPACA abbreviation for PATIENT PROTECTION AND AFFORDABLE CARE ACT.

PPFA abbreviation for PLANNED PARENTHOOD FEDERATION OF AMERICA.

PPO preferred provider organization; a formally organized entity created by contractual arrangements among hospitals, physicians, employers, insurance companies, or third-party administrators to provide health care services to subscribers at a negotiated, often discounted price.

P–P plot abbreviation for probability–probability plot. See PROBABILITY PLOT.

PPVT abbreviation for PEABODY PICTURE VOCABULARY TEST.

PQ4R n. a set of study methods developed on the basis of research in cognitive psychology. The set represents six steps required for acquiring information: preview, question, read, reflect, recite, and review.

PR abbreviation for progressive ratio. See PROGRESSIVE-RATIO SCHEDULE.

practical intelligence the ability to apply one’s intelligence in practical, everyday situations. In the TRIARCHIC THEORY OF INTELLIGENCE, it is the aspect of intelligence that requires adaptation to, shaping of, and selection of new environments. Compare ANALYTICAL INTELLIGENCE; CREATIVE INTELLIGENCE.

practical intelligence task a task requiring the display of practical know-how, such as consulting a map to find a location or using arithmetic to compute the prices of tickets to an athletic event. Such tasks also may require tacit knowledge that typically is not explicitly taught and that often is not even verbalized—that is, knowledge about adapting to, shaping, or selecting an environment. Compare ACADEMIC INTELLIGENCE TASK.

practical significance the extent to which a study result has meaningful applications in real-world settings. An experimental result may lack STATISTICAL SIGNIFICANCE or show a small EFFECT SIZE and yet potentially be important nonetheless. For example, consider a study showing that the consumption of baby aspirin helps prevent heart attacks. Even if the effect is small, the finding may be of practical significance if it saves lives over time. Also called substantive significance. See also CLINICAL SIGNIFICANCE; PSYCHOLOGICAL SIGNIFICANCE.

practice n. repetition of an act, behavior, or series of activities, often to improve performance or acquire a skill. For example, members of sports teams may engage in a preplanned series of activities organized for such purposes as learning a pattern of play or increasing physical fitness. See also DISTRIBUTED PRACTICE; MasseD PRACTICE.

practice effect any change or improvement that results from practice or repetition of task items or activities. The practice effect is of particular concern in experimentation involving WITHIN-SUBJECTS DESIGNS, as participants’ performance on the variable of interest may improve simply from repeating the activity rather than from any study manipulation imposed by the researcher.

practice guidelines criteria and strategies designed to assist health and mental health care providers in the recognition and treatment of specific disorders and diseases, as well as to outline ethical practice. Such guidelines are often based on the latest and best available scientific research or the considered judgment of expert committees representing specific professions or subdisciplines. See also CLINICAL PRACTICE GUIDELINES.

practice theory of play see PLAY.

practice trial the first of a series of opportunities to respond to a test or an experimental setting, which is given to participants to acquaint them with the procedures used and is therefore not scored. The use of practice trials is believed to ensure that the initial measurements of the study proper will provide more accurate assessments of participants’ performance.

practicum n. supervised clinical experience offered as part of a course of study for the purpose of on-site, in-person professional training. In clinical psychology, graduate students generally complete a practicum prior to entering a full-time supervised internship program. Practicums may occur in inpatient, correctional, or residential settings or in outpatient settings such as private practices, mental health centers, and social service agencies. See also FIELD WORK.
Prader–Willi syndrome

Prader–Willi syndrome (PWS) a congenital spectrum disorder marked by short stature, hypotonia (laxid muscles), hypogonadism (underdeveloped sex organs), obesity, insensitivity to pain, short hands and feet, mild to moderate intellectual impairment, and learning disabilities. Most cases (about 70%) occur when a segment of the paternal chromosome 15 is deleted in each cell. Another 25% of cases have two copies of the maternal chromosome 15 instead of one copy from each parent. Affected individuals have an excessive appetite and are constantly eating. When diabetes mellitus is associated with the condition, it is called Royer’s syndrome. Also called Prader–Labbart–Willi syndrome: Prader–Labbart–Willi–Fanconi syndrome. [Reported in 1956 by Andrea Prader (1919–2001) and Heinrich Willi (1900–1971), with Alexis Labhart (1916–1994), Swiss pediatricians]

pragmatic aphasia a group of disorders caused by damage to the right hemisphere of the brain that particularly affect an individual’s ability to communicate appropriately in specific contexts or situations.

pragmatic language language that is used appropriately in a specific context or situation.

pragmatic reasoning schema theory a model of CONDITIONAL REASONING stating that people use generalized sets of context-specific, goal-dependent rules to make inferences about situations or problems. Each set of rules is abstracted from past experience and defined in terms of a specific type of pragmatic reasoning schema. For example, the obligation schema is a set of inference rules for situations in which the occurrence of a condition necessitates an action (e.g., if a miner gets lung cancer; then the company must pay compensation), whereas the permission schema applies to situations in which a precondition must be satisfied before a desired action is taken (e.g., if a customer is drinking an alcoholic beverage, then he or she must be over 21 years of age). According to the theory, the inference being tested is mapped onto different pragmatic schemata depending on the characteristics of the situation; the applicable schema then becomes the basis for reasoning. Such that different schemata encourage different conclusions and different patterns of behavior. See also WASON SELECTION TASK. [Introduced in 1985 by Hong Kong-born U.S. cognitive psychologist Patricia W. Cheng (1952–) and Canadian-born U.S. cognitive psychologist Keith J. Holyoak (1950–)]

pragmatics n. in linguistics, the analysis of language in terms of its functional communicative properties (rather than its formal and structural properties, as in PHONOLOGY, SEMANTICS, and GRAMMAR) and in terms of the intentions and perspectives of its users. See also FORM–FUNCTION DISTINCTION; FUNCTIONAL GRAMMAR.

pragmatism n. a philosophical position holding that the truth value of a proposition or a theory is to be found in its practical consequences: If, for example, the hypothesis of God makes people virtuous and happy, then it may be considered true. Although some forms of pragmatism emphasize only the material consequences of an idea, more sophisticated positions, including that of William James, recognize conceptual and moral consequences. Arguably, all forms of pragmatism tend toward RELATIVISM, because they can provide no absolute grounds—only empirical grounds—for determining truth, and no basis for judging whether the consequences in question are to be considered good or bad. See also INSTRUMENTALISM. [Coined by Charles S. Peirce] —pragmatist adj., n.

Prägnanz n. one of the GESTALT PRINCIPLES OF ORGANIZATION. It states that people tend to perceive forms as the simplest and most meaningful, stable, and complete structures that conditions permit. Also called law (or principle) of Prägnanz. [German: “terseness”]

prana n. see CHI.

prandial drinking intake of fluids that is stimulated by eating.

praxiology n. 1. the study of human conduct, or the science of efficient action (from Greek praxis, “to do”). 2. psychology as the study of human actions and overt behavior, to the exclusion of consciousness and metaphysical concepts. [Employed by Knight Dunlap]

praxis n. 1. a medical name for MOTOR PLANNING. Inadequate praxis is APRAxia. 2. practice, as opposed to theory. ARISTOTLE contrasted praxis, or practical activity, with theoretical or rational activity. The term is sometimes used to denote knowledge derived from and expressed chiefly in practical or productive activity, as opposed to theoretical or conceptual knowledge.

prayer n. communication (voiced or contemplative) with a deity or other such entity, generally for the purposes of praise, thanksgiving, supplication, or self-examination or to seek forgiveness, guidance, or serenity. The behavior has been studied periodically at least since William James (see PSYCHOLOGY OF RELIGION), with varied results. For instance, researchers and practitioners have noted, on the one hand, that prayer can be used as a defense or escape from the exploration of painful issues and as a form of magical thinking and, on the other hand, that it can be both cognitively meaningful and therapeutically beneficial in some conditions for those with specific religious beliefs or SPIRITUALITY. Much work has been done since the late 1970s, by a growing body of researchers to integrate religious values and practices with psychotherapy. In appropriate circumstances, prayer may be explicitly used by some therapists as a component of intervention and treatment. The therapist and client may pray individually or together for such goals as personal or interpersonal healing, forgiveness, and the ability to examine problems freely and with discernment.

pre  abbreviation for PARTIAL REINFORCEMENT EFFECT.

preatesolescence n. the period of childhood preceding adolescence, comprising approximately the 2 years preceding the onset of puberty. Also called prepubertal stage: prepuberty: prepubescence. —preadolescent adj., n.

p preferefence n. a central brain process in which the somatosensory area is primed to expect the particular sensory inputs (sights, sounds, etc.) that are predicted as the consequence of an intended motor action. It is the means by which, for example, a person turning his or her head understands immediately that the motion perceived is in the body and not in the external world. Prefereference has also been proposed as a neural basis for what is experienced subjectively as ATTENTION or EXPECTANCY. Compare REAFFERENCE. See also BRAIN COMPARATOR; COROLLARY DISCHARGE; REAFFERENCE PRINCIPLE. [Described by U.S. neuroscientist Walter J. Freeman III (1927–)]

preattentive processing cognitive processing of a stimulus that occurs nonconsciously before attention has focused on this particular stimulus from among the array of those present in a given environment. Preattentive processing is thought to identify basic stimulus features in parallel, with high capacity. Also called preattentive
preconventional level

analysis; prepereceptual processing. See also PARALLEL PROCESSING.

preaversive stimulus in conditioning, a stimulus that precedes the presentation of an AVERSIVE STIMULUS. See CONDITIONED SUPPRESSION.

precategorical acoustic storage (PAS) a SENSORY MEMORY that momentarily retains auditory information before it is interpreted and comprehended; a theoretical explanation of the phenomenon of ECHOIC MEMORY. PAS is regarded as a parallel store to the visual system’s ICONIC MEMORY. [proposed in 1969 by U.S. psychologist Robert George Crowder (1939–2000) and British psychologist John Morton (1933–)]

precausal thinking the tendency of a young child (under the age of 8) to perceive natural phenomena, such as rain, wind, and clouds, in terms of intentions and willful acts, that is, in anthropomorphic rather than mechanical terms. See also ANIMISM. [first described by Jean Piaget]

precedence effect 1. a phenomenon in which perception of the source of a sound precludes or interferes with attention to reflections of this sound from different locations. For example, if a sound is produced by a particular source and is then reflected off the walls, the listener only perceives the first source, provided that the sound from the second source arrives within a short period of time (less than 70 ms). 2. the tendency for global features of a stimulus to dominate local features in performance tasks.

precentral gyrus a ridge in the FRONTAL LOBE of the brain, just in front of the CENTRAL SULCUS, that is crucial for motor control, being the site of the MOTOR AREA.

prechiasmatic visual deficit a visual impairment caused by damage to the part of the visual system anterior to (i.e., earlier in visual processing than) the OPTIC CHIASM. This can affect one eye (e.g., in cases of disease or injury to the eye or optic nerve) or both eyes (e.g., in cases involving the optic chiasm itself). See also HETERONYMOUS HEMIANOPIA; CHIASMAL SYNDROME.

precipitating cause the particular factor, sometimes a traumatic or stressful experience, that is the immediate cause of a mental or physical disorder. A single precipitating event may turn a latent condition into the manifest form of the disorder. Compare PREDISPOSING CAUSE.

precision n. a measure of accuracy. In statistics, an estimate with a small STANDARD ERROR is regarded as having a high degree of precision. —precise adj.

precision grip the manner of grasping an object between the opposed tactile pads of the thumb and fingertips (e.g., when using a pen). See also PINCH GRIP; POWER GRIP.

precision of process (symbol: h) an index of proximity of a series of psychophysical measures to the mean. It is the reciprocal of the VARIANCE, that is, $h = 1/\sigma^2$.

preclinical psychopharmacology investigation that precedes the actual clinical application of a new psychotropic drug on an individual patient or patient population. It usually includes laboratory studies of the pharmacological mechanisms of the drug, extrapolation of research data into human-use terms, and evaluation of possible interactions with current drugs or in patients with various medical conditions.

preclinical level in KOHLBERG’S THEORY OF MORAL DEVELOPMENT, the first level of moral reasoning, characterized by the child’s evaluation of actions in terms of material consequences. This level is divided into two stages: the earlier PUNISHMENT AND OBEDIENCE ORIENTATION (Stage 1 in Kohlberg’s overall theory), in which moral behavior is that which avoids punishment; and the later NAIVE HEDONISM (or INSTRUMENTAL RELATIVIST ORIENTATION: Stage 2), in which moral behavior is that which obtains re-
ward or serves one’s needs. Also called preconventional morality. See also CONVENTIONAL LEVEL; POSTCONVENTIONAL LEVEL.

precue n. a piece of advance information available from the environment, both in real-life and experimental situations, giving partial details that can be used to constrain planning for an upcoming movement. Studies of how precues reduce the time necessary for MOTOR PLANNING once the full movement specification is made available have been considered a form of capture of prey. Predatory aggression is more properly conceived as aggression directed toward the prey, affecting both current numbers of prey and their survival for reproduction.

determinism

dischordism

precuneus n. an area on the medial (inner) surface of the PARIETAL LOBE of each cerebral hemisphere in the brain. Located between the PARIETO-OCcipital SULCUS and the CINGULATE SULCUS, it is involved in a variety of cognitive functions. Immediately behind the precuneus is the wedge-shaped CUNiNEUS. Precuneate adj.

precursor n. in biochemistry, a compound from which another is formed by a chemical reaction. For example, TYROSINE is a precursor of the catecholamine neurotransmitters (e.g., norepinephrine, dopamine).

predation n. the act or practice in which one nonhuman animal (the predator) stalks, captures, and kills another animal (the prey) for food. Prey choice can be broad or highly specific, and some species store captured prey for future use or share it with young or other group members. Prey possess numerous defenses, however, some of which are restricted to a few populations (e.g., physical features such as the quills of porcupine) whereas others are seen in multiple populations (e.g., VIGILANCE, DEATH FERGING). Predation is an important mechanism of NATURAL SELECTION, as both predators and prey continuously adapt to more effectively attack and evade one another, respectively. —predator n. —predatory adj.

predator n. 1. a nonhuman animal that naturally preys on others to obtain its food. 2. a person or organization whose behavior is rapacious or exploitative. —predatory adj.

predator pressure the influence of predators on their prey, affecting both current numbers of prey and their survival for reproduction.

predatory aggression aggression directed toward the capture of prey. Predatory aggression is more properly considered a form of FORAGING than aggression per se.

predatory paraphilia sexual interest and arousal focused on an activity that involves an unwilling individual rather than a consenting partner. Examples include EXHIBITIONISM and FROTTEURISM.

predecisional negative shift that component of the READINESS POTENTIAL that precedes any conscious awareness of a wish to act. Investigations with electroencephalography suggest that it can be detected some 350 ms before the individual reports a decision to make a movement and some 550 ms before the movement occurs. The finding is controversial because it implies that behavior is instigated nonconsciously and hence that FREE WILL is illusory; the ECOLOGICAL VALIDITY of such experiments has also been questioned. [reported by U.S. physiologist Benjamin Libet (1916–2007)]

predestination n. in Christian theology, the belief or doctrine that God has foreordained salvation for certain chosen individuals, not for any merit of their own but purely according to his grace. This doctrine was taught systematically by early Church father Augustine of Hippo (354–430) and revived by 16th-century reformers Martin Luther (1483–1546) and John Calvin (1509–1564). Calvin’s system is sometimes described as one of double predestination, as it maintains that God also foreordained a portion of humankind to damnation, an idea that raises particular moral difficulties. Predestination is a form of theological DETERMINISM, as it effectively denies human FREE WILL and moral responsibility. The concept has always been the subject of intense debate and is now rejected by most mainstream Christian thinkers. See CALVINISM.

predicate n. 1. in linguistics, the part of a sentence or clause that is not the SUBJECT but asserts a property, action, or condition of the subject. The predicate of a sentence may range from a single intransitive VERB (as in She smiled) to a long and complex construction. See also COMPLEMENT. 2. in logic, a property or characteristic that is attributed to the subject of a proposition. In Aristotelian and Scholastic logic (see SCHOLASTICISM), a predicate is a second term that is stated to have a particular relation to the subject of a proposition, as, for example, man in Edward is a man or mortal in Man is mortal. —predicative adj.

predicate analysis the system of SYMBOLIC LOGIC that is concerned with the relationships between the elements within individual propositions, as well as with the relationships between propositions as wholes. Also called predicate calculus. Compare PROPOSITIONAL ANALYSIS.

predicate thinking a thought process in which objects are considered similar or even identical because they share a particular attribute. Jean Piaget considered such thinking to be typical of the PREOPERATIONAL STAGE of early cognitive development. Psychoanalysis associates it with the PRIMARY PROCESS thinking that manifests itself in dreams and fantasies and dominates the ID.

prediction n. 1. an attempt to foretell what will happen in a particular case, generally on the basis of past instances or accepted principles. A theoretical prediction gives the expected results of an experiment or controlled observation in accordance with the logic of a particular theory. In science, the use of prediction and observation to test hypotheses is a cornerstone of the empirical method (see FALSEFIABILITY; FALSEIFICATIONISM; RISKY PREDICTION). By their very nature, the theories, constructs, and explanatory models current in psychology are not always open to direct validation or falsification in this way; however, in psychological assessment, personality tests and other psychometric instruments can often predict participants’ behaviors or other characteristics with an impressive level of accuracy. See also PROBABILITY; PSYCHO-SCIENCE. 2. in parapsychology and the occult arts, see DIVINATION; PRECOGNITION. —predict vb. —predictable adj. —predictive adj.

predictive discriminant analysis a multivariate procedure that distinguishes between two or more categories of a future outcome on the basis of several current assessments of predictor or explanatory variables. More specifically, the technique combines variables measured at one point in time to produce the highest possible association with different levels or categories of an outcome measured at a subsequent point in time. For example, a researcher might measure daily levels of exercise, cholesterol, and average stress and use this information to predict which individuals will have a diagnosis of serious, mild, or
no heart disease 6 months later. Compare DESCRIPTIVE DISCRIMINANT ANALYSIS.

**predictive efficiency** 1. the number or proportion of correct predictions that can be made from a particular test or model. 2. the gain in utility (explanatory information) obtained by adding more predictor or independent variables to a REGRESSION EQUATION. For example, the accuracy of a student’s predicted college grade-point average may be increased if one considers high school grade-point average in addition to Scholastic Assessment Test score.

**predictive research** empirical research concerned with forecasting future events or behavior; the assessment of variables at one point in time so as to predict a phenomenon assessed at a later point in time. For example, a researcher might collect high school data, such as grades, extracurricular activities, teacher evaluations, advanced courses taken, and standardized test scores, in order to predict such college success measures as grade-point average at graduation, awards received, and likelihood of pursuing further education. Compare EXPLORATORY RESEARCH.

**predictive testing** see PREDISPOSITION.

**predictive validity** evidence that a test score or other measurement correlates with a variable that can only be assessed at some point after the test has been administered or the measurement made. For example, the predictive validity of a test designed to predict the onset of a disease would be strong if high test scores were associated with individuals who later developed that disease. It is one of three types of CRITERION VALIDITY. Also called **predictive criterion-related validity; prospective validity.** See also CONCURRENT VALIDITY; RETROSPECTIVE VALIDITY.

**predictive value** 1. the ability of a test or scale to correctly classify items into mutually exclusive categories or states. Predictive value often is determined using DECISION THEORY methods, such as RECEIVER-OPERATING CHARACTERISTIC CURVES. 2. the percentage of times that the obtained value on a given test is the true value. Also called **predictive power.**

**predictor variable** a variable used to estimate, forecast, or project future events or circumstances. In personnel selection, for example, predictors such as qualifications, relevant work experience, and job-specific skills (e.g., computer proficiency, ability to speak a particular language) may be used to estimate an applicant’s future job performance. In vari- tant work experience, and job-specific skills (e.g., computer selection, for example, predictors such as qualifications, rele-

**preestablished harmony** a principle invoked by Gottfried Wilhelm Leibniz to explain how MONADS behave in a coordinated and orderly fashion, even though each is independent and follows its own preestablished end. The same principle is held to explain the coordinated interaction between the physical and nonphysical realms (see MIND–BODY PROBLEM). According to Leibniz, God is the origin of the preestablished harmony.

**preexperimental design** a research design or study with no CONTROL GROUP and no random assignment of participants to experimental conditions. Examples include the ONE-SHOT CASE STUDY and the ONE-GROUP PRETEST–POSTTEST DESIGN. Although such a design is of minimal value in establishing causality, it may be used when it is not possible to identify an appropriate control and circum-

**preference** n. 1. in conditioning, the probability of occurrence of one of two or more concurrently available responses, usually expressed as either a RELATIVE FREQUENCY (compared to the frequency of all the measured responses) or as a ratio. 2. more generally, the act of choosing one alternative over others. —**preferential adj.**

**preference for consistency** a personality trait reflecting the extent to which a person desires to maintain consistency among elements in his or her cognitive system. See also COGNITIVE DISSONANCE; COGNITIVE DISSONANCE THEORY. [originally proposed by U.S. psychologists Robert B. Cialdini (1945– )], Melanie R. Trost, and Jason T. Newsom (1965– )]

**preference test** any measure used in research to determine an individual’s choice between two or more alternatives and what that choice might indicate behaviorally or affectively. An example might be a test in which an infant is required to choose between a toy with a smiling face and one with a frown in order to assess the child’s affect; another would be a marketing study in which consumers are asked to select between competing products, such as two or more soft drinks.

**preferential effect** in parapsychology experiments, the finding that a participant’s “calls,” or guesses, are more accurate for one set of TARGETS in an experiment (e.g., die
preferential looking technique

faces with high values, ZENER CARDS with stars) than for another (e.g., die faces with low values. Zener cards with crosses) or even for one type of testing condition over another (e.g., die faces with low values, Zener cards with high values, etc.).

preferential looking technique an experimental method for assessing the perceptual capabilities of nonverbal individuals (e.g., human infants, nonhuman animals). Infants will preferentially fixate a “more interesting” stimulus when it is presented at the same time with a “less interesting” stimulus, but only if the stimuli can be distinguished from one another. To minimize bias, on each trial the investigator is positioned so that he or she can observe the infant and make a judgment about which stimulus the infant fixates, but the stimuli themselves are visible only to the infant. To assess visual acuity, for example, on the first trial a coarse ACUTY GRATING is paired with a homogeneous gray stimulus of the same mean luminance. The infant preferentially looks at the grating. On successive trials, the SPATIAL FREQUENCY of the grating is increased (the bars are made narrower) and the position of the grating versus the homogeneous field is randomized. When the grating can no longer be discriminated by the infant, the likelihood that the grating will be chosen for fixation will drop to chance. [developed by Robert L. Fantz]

preferential matching in an ESP FREE-RESPONSE TEST, the use of a judge to evaluate a participant’s “calls,” or guesses, regarding their similarity to possible TARGETS.

preferred noise criterion (PNC) a noise level set for steady ambient noise in enclosed spaces and used to determine or test for allowable background noise levels.

preferred provider arrangement (PPA) a contractual arrangement between a health care insurer and a health care provider or group of providers who agree to offer services at reduced or prenegotiated rates.

preferred provider organization see PPO.

prefigurative culture a society or culture in which people typically learn from those younger than themselves. Because of the extremely rapid rate of social and technological change in the modern world, it has been proposed that contemporary Western society may be moving toward a prefigurative culture in which the young possess a keener intuition of the present than do their elders. Compare CONFIGURATIVE CULTURE; POSTFIGURATIVE CULTURE. [coined by U.S. anthropologist Margaret Mead (1901–1978)]

prefix n. in linguistics, a MORPHEME that is added to the beginning of a word to create a derived form, such as un- in unlikely or ex- in ex-wife. See AFFIXATION; INFIX; SUFFIX.

preformism n. the biological theory, now discredited, that development consists of the emerging into mature form of the traits and capacities that exist in prototypical form in the germ cell. An early example of preformism was the 16th- and 17th-century notion of the HOMUNCULUS, a minute but completely formed human body believed to exist in the spermatozoon. Preformism contrasts with the epigenetic principle of successive differentiation in complex and cumulative stages of development (see EPIGENESIS).

prefrontal cortex the most anterior (forward) part of the cerebral cortex of each frontal lobe in the brain. Divided into a dorsolateral region and an orbitofrontal region (see ORBITOFRONTAL CORTEX), the prefrontal cortex functions in attention, planning, working memory, and the expression of emotions and appropriate social behaviors: its development in humans parallels improvement in cognitive control and behavioral inhibition as an individual grows into adulthood. By contrast, damage to the prefrontal cortex leads to emotional, motor, and cognitive impairments. Also called FRONTAL ASSOCIATION AREA.

prefrontal lobe the furthest forward area of each cerebral hemisphere of the brain, which is concerned with such functions as memory and learning, emotion, and social behavior. See also FRONTAL LOBE.

prefrontal lobotomy see LOBOTOMY.

preganglionic autonomic neuron any neuron of the sympathetic nervous system whose cell body is located in the central nervous system and that sends its axon to a ganglion in the sympathetic chain. Here it may connect to a POSTGANGLIONIC AUTONOMIC NEURON, which can innervate such organs as the kidneys.

pregenital organization in the classical psychoanalytic theory of Sigmund Freud, the organization of LIBIDO functions before the GENITAL STAGE of psychosexual development.

pregenital phase in the classical psychoanalytic theory of Sigmund Freud, the period of psychosexual development that precedes the organization of the LIBIDO around the genital zone. This period encompasses the ANAL STAGE, the ORAL STAGE, and according to some theorists, the PHALIC STAGE. Other theorists use the term synonymously with the PREOEDIPAL phase.

pregnancy n. the state of a woman who is carrying a developing embryo or fetus, which normally lasts about 266 days from conception until the birth of the baby (see PREGNANCY PERIOD). Embryonic development normally occurs within the uterus, but occasionally it may be extraterine (see ECTOPIC PREGNANCY). Also called FETATION; GRAVITY. See also ADOLESCENT PREGNANCY; PSEUDOCYESIS.

pregnancy brain see BABY BRAIN.

prehension n. the act of grasping, clasping, or seizing an object or supporting the body, usually with an appendage adapted for that purpose. For example, the hands of human beings and other primates and the tails of certain New World monkeys are prehensile.

prejudice n. 1. a negative attitude toward another person or group formed in advance of any experience with that person or group. Prejudices include an affective component (emotions that range from mild nervousness to hatred), a cognitive component (assumptions and beliefs about groups, including STEREOTYPES), and a behavioral component (negative behaviors, including DISCRIMINATION and violence). They tend to be resistant to change because they distort the prejudiced individual’s perception of information pertaining to the group. Prejudice based on racial grouping is RACISM; prejudice based on sex is SEXISM; prejudice based on chronological age is AGEISM; and prejudice based on disability is ABLEISM. 2. any preconceived attitude or view, whether favorable or unfavorable.

prekindergarten n. see SCHOOL READINESS.

prelingually deafened being congenitally deaf or becoming deaf prior to the acquisition of language.

prelinguistic adj. denoting or relating to the period of an infant’s life before he or she has acquired the power of speech. The PRELINGUISTIC PERIOD includes the earliest infant
vocalizations as well as the babbling stage typical of the second half of the first year. Holophrases usually emerge around the time of the child’s first birthday.

**preliterate adj.** denoting a child who has not yet acquired the ability to read and write. Also called nonliterate.

**preloading n.** an experimental procedure in which food, water, or some other nutritive substance is introduced into the stomach or another part of a nonhuman animal’s digestive system prior to giving the animal access to food or water. The effect of preloading on the animal’s eating or drinking behavior is then measured.

**prelogical thinking** in psychoanalytic theory, primitive thought processes that are characteristic of early childhood, when thought is under the control of the *pleasure principle* rather than the *reality principle*. Such thinking may also occur later in life, as in daydreaming, in which wish fulfillment is dominant, or in psychosis. See also **magical thinking**; **primary process**.

**Premack’s principle** the view that the opportunity to engage in behavior with a relatively high baseline probability will reinforce behavior of lower baseline probability. For example, a hungry rat may have a high probability of eating but a lower probability of pressing a lever. Making the opportunity to eat depend on pressing the lever will result in reinforcement of lever pressing. Also called **Premack’s rule**. [David Premack (1925–). U.S. psychologist]

**premarital counseling** educational and supportive guidance to individuals planning marriage. Provided by a member of the clergy trained in counseling, a therapist, or some other appropriately qualified person, premarital counseling may address such matters as the timing of marriage, spousal rights and responsibilities, birth-control methods, and sexual intimacy and may use assessment instruments to identify and thereby address potential conflicts in the marriage.

**premarital sex** sexual relations before marriage. See also **fornication**.

**premature adrenarche** see **adrenarche**.

**premature aging** accelerated aging caused by environmental factors (e.g., sun exposure, smoking) or by genetic syndromes or other disease. See **aging disorder**.

**premature ejaculation** a sexual dysfunction in which ejaculation occurs with minimal sexual stimulation, before, on, or shortly after penetration or simply earlier than desired. The diagnosis takes into account such factors as age, novelty of the sexual partner, and the frequency and duration of intercourse. The diagnosis does not apply if the disturbance is due to the direct effect of a substance (e.g., withdrawal from opioids). See also **squeeze technique**.

**premature termination** see **termination**.

**prematurity n.** a state of underdevelopment, particularly in an infant born before it has completed the full gestational period of a normal pregnancy. Premature (preterm) infants have low birth weight and are at risk for such complications as **respiratory distress syndrome** and **jaundice**. See also **prenatal stress**.

**premeditation n.** a deliberate resolve to commit a crime, especially a violent crime, as revealed by evidence of planning or other forethought. A premeditated crime is often considered more serious than the same offense committed intentionally but without prior resolve. See **malice aforethought**. —**premeditated adj.**

**premenstrual dysphoric disorder** a mood disorder in women that begins in the week prior to the onset of menstruation and subsides within the first few days of menstruation. Women experience mood swings, including markedly depressed mood, anxiety, feelings of helplessness, and decreased interest in activities. In contrast to **Premenstrual Syndrome**, the symptoms must be severe enough to impair functioning in social activities, work, and relationships. Only a small percentage of women with premenstrual syndrome meet criteria for this disorder. Also called **late luteal phase dysphoric disorder**.

**premenstrual syndrome (PMS)** a collection of psychological and physical symptoms experienced by women during the week prior to the onset of menstruation and subsiding within the first few days of menstruation. Symptoms can include mood swings, irritability, fatigue, headache, bloating, abdominal discomfort, and breast tenderness. In contrast to the more severe **Premenstrual Dysphoric Disorder**, premenstrual syndrome has a less distinctive pattern of symptoms and does not involve major impairment in social and occupational functioning. Also called **Premenstrual Stress Syndrome**: **premenstrual tension**.

**premise n.** a proposition forming part of a larger argument: a statement from which a further statement is to be deduced, especially as one of a series of such steps leading to a conclusion.

**premonitory dream** a dream that appears to give advance notice or warning of some future event. See also **clairvoyant dream**.

**premoral stage** 1. in Jean Piaget’s theory of moral development, the stage at which young children (under the age of 5) are unaware of rules as cooperative agreements; that is, they are unable to distinguish right from wrong. Compare **autonomous stage**; **heteronomous stage**. 2. the stage that precedes the **preconventional level** in Kohlberg’s theory of moral development and corresponds to infancy (birth to roughly 18 months).

**premorbid adj.** characterizing an individual’s condition before the onset of some disease or disorder. —**premorbid adj.**

**premorbid abilities** see **premorbid functioning**.

**premorbid adjustment** a measure of the level of a person’s functioning before the onset of an acute psychological disorder. The measure, as used in the **Phillips Rating Scale of Premorbid Adjustment in Schizophrenia**, has been found to be of value in predicting the course of schizophrenia.

**premorbid functioning** an individual’s cognitive functioning prior to a neurological trauma or disease, as estimated to determine the degree of loss or impairment caused by the damage. This estimate is based on testing and assessments conducted after the damage has occurred; it may include consideration of such factors as educational level, occupational history, and individual and family reports. Also called **baseline functioning**: **premorbid abilities**.

**premorbid personality** 1. personality traits that existed before a physical injury or other traumatic event or before the development of a disease or disorder. 2. person-
premortal clarity

Gravity strengths and weaknesses that predispose an individual to mental health and well-being or to a particular mental disorder (e.g., depression, schizophrenia) or that affect the speed or likelihood of recovery from a disorder. Also called primary personality.

premortal clarity mental alertness, following a period of confusion or withdrawal, that sometimes occurs in a dying individual just prior to death. Premortal clarity may have consequential importance, such as the utterance of last words and the affirmation or modification of wills and testaments.

premotor area an area of the MOTOR CORTEX concerned with motor planning. In contrast to the SUPPLEMENTARY MOTOR AREA, input to the premotor area is primarily visual, and its activity is usually triggered by external events. Also called Brodmann's area 6: intermediate precentral area: premotor cortex.

premotor theory of attention a theory proposing that attention is a consequence of the mechanisms that generate actions or motor responses. It is based on neurophysiological evidence that space is coded in several cortical circuits that have specific motor purposes. Those circuits that represent space for programming eye movements are considered to play the primary role in spatial attention. Preparing to move the eyes to a specific location increases the readiness to act in that region of space and facilitates the processing of stimuli located in that region.

prenatal adj. prior to birth: pertaining to that which exists or occurs between conception and birth.

prenatal care health care and educational services provided to or obtained by a woman during pregnancy. Such services are intended to prevent complications and decrease the risk of maternal or fetal mortality.

prenatal counseling counseling given to couples or to single women who are expecting a baby or planning a pregnancy. It involves the mother's stress level during pregnancy. Also called prenatal stress, stress on the mother, pregnancy stress, stress during pregnancy.

prenatal developmental anomaly a congenital abnormality that originates in the course of development before birth. Examples include cleft palate and spina bifida.

prenatal diagnosis determination of a pathological condition or the presence of disease or genetic abnormalities in a fetus. See ALPHA-FETOPROTEIN; AMNIOCENTESIS; CHORIONIC VILLUS SAMPLING; ULTRASOUND.

prenatal influence any adverse influence on fetal development. Prenatal influences include radiation effects, maternal diseases (e.g., rubella, toxoplasmosis) and behaviors (e.g., alcohol or drug use, excessive smoking), blood incompatibility, nutritional deficiency, and stress. See also FETAL PROGRAMMING.

prenatal masculinization the masculinizing effects of androgens on fetal sexual anatomy and on neural pathways in the fetal brain prior to birth.

prenatal period the developmental period between conception and birth, in humans commonly divided into the GERMINAL STAGE (approximately the first 2 weeks), the EMBRYONIC STAGE (the following 6 weeks), and the FETAL STAGE (from 2 months to birth).

prenatal stress stress in a pregnant woman, marked by elevation of stress hormones and other biological changes, with an increased likelihood of intrauterine infection. Prenatal stress is related to the first stages of psychosocial development, before the development of the OEDIPUS COMPLEX during the PHALIC STAGE. During this phase, the mother is the exclusive love object of both sexes and the father is not yet considered either a rival or a love object. More generally, denoting organization or functions before the onset of the Oedipus complex. See also PREPHALIC.

preoperational stage the second major period in the PIAGETIAN THEORIES OF COGNITIVE DEVELOPMENT, occurring approximately between the ages of 2 and 7, when the child becomes able to record experience in a symbolic fashion and to represent an object, event, or feeling in speech, movement, drawing, and the like. The child's thought processes tend to be intuitive and prelogical. During the later 2 years of the preoperational stage, egocentrism diminishes noticeably with the emerging ability to adopt the point of view of others. Also called symbolic stage. See also CONCRETE OPERATIONAL STAGE; FORMAL OPERATIONAL STAGE; SENSORIMOTOR STAGE.

preoptic area a region of the HYPOTHALAMUS lying above and slightly anterior to the OPTIC CHIASM. Nuclei here are involved in temperature regulation and in the release of HYPOTHALAMIC HORMONES. See also MEDIAL PREOPTIC AREA.

preorgasmic adj. 1. relating to the state immediately before orgasm. It is characterized by increased breathing, heart rate, and blood pressure; semispastic muscle contractions; and maximum increase in the size of the glans penis, testes, and upper vaginal walls. 2. denoting the status of a person who has never experienced orgasm. See ORGASMIC DYSFUNCTION.

preparadigmatic science a science at a primitive stage of development, before it has achieved a PARADIGM and established a consensus about the true nature of the subject matter and how to approach it. Psychology has been considered a preparadigmatic science by many theorists, in contrast to physics and chemistry (regarded as normal sciences). See also IMMATURE SCIENCE; PARADIGM SHIFT; SCIENTIFIC REVOLUTION. [proposed by U.S. philosopher of science Thomas Kuhn (1922–1996)]
preparation n. in cognitive psychology, the process of increasing readiness for an activity, such as by planning or imagining a movement before executing it. See PLAN.
—prepare vb.

preparatory adjustment the changes made by the brain and body that indicate readiness to perform a task and that contribute to improved performance. A period of about 500 ms is typically needed for optimal preparation. See also MENTAL SET; PRAEFERENCE.

preparatory response any response (except the final one) in a series of behaviors that leads to a goal or reinforcement. Preparatory responses themselves are not immediately goal directed.

preparatory set a special alertness or readiness to respond in a particular manner to an expected stimulus, action, or event. A preparatory set may be manifested physically, as when a tennis player prepares to receive a serve, or experienced mentally, as when a chess player anticipates an opponent’s next move. See MENTAL SET; PERCEPTUAL SET; SET.

preparedness n. the biological predisposition to quickly learn associations between stimuli, responses, and reinforcers that can be explained by their fit with genetic traits that evolved to enhance the chances of a species’ survival. For example, it has been suggested that humans readily learn certain phobias (e.g., fear of snakes) because of a predisposition to fear anything that could pose a threat to their survival. Preparedness (or prepared learning) also has been proposed as an explanation for why both human and nonhuman animals readily learn to associate certain foods with gastric illness and are more likely to avoid such foods in the future. In experiments to establish CONDITIONED TASTE AVERSION, for instance, rats readily learn to associate a distinctive taste with illness; it has been proposed that they have an inherent preparedness to make this association, whereas they do not easily learn to make an association between a tone or light stimulus and illness because such contraprepared learning is incompatible with their evolutionary history. Along the continuum of preparedness—highly prepared, easily formed associations on one end and contraprepared, poorly formed associations on the other—unprepared associations are intermediate occurrences; these are associations formed through unprepared learning that occurs despite the lack of a biological predisposition to form them. See also PRINCIPLE OF BELONGINGNESS. [introduced by U.S. psychologist Martin E. P. Seligman (1942–)]

preperceptual processing see PREATTENTIVE PROCESSING.

prephallic adj. in the classical psychoanalytic theory of Sigmund Freud, the stages of psychosexual development preceding the PHALIC STAGE (i.e., the ORAL STAGE and the ANAL STAGE). See also PREGENITAL PHASE; PREPUBERTAL.

pre-post design see PRETEST–POSTTEST DESIGN.

prepotency n. 1. the quality or state of possessing greater power, influence, or force. 2. the capacity for one parent to transmit more of his or her genetic characteristics to an offspring than the other parent. —prepotent adj.

prepotent response a response that takes priority over other potential responses (e.g., a pain response).

prepotent stimulus any stimulus that is dominant over any other competing stimulus in that it is more likely to gain attention or elicit a response.

prepsychotic panic a stage in the development of schizophrenia in which self-image is disordered; individuals feel guilty, unlovable, humiliated, or otherwise different but have not yet acquired symptoms of delusions and hallucinations. [defined by Italian-born U.S. psychiatrist Silvano Arieti (1914–1982)]

prepsychotic personality characteristics and behavior of a person, such as eccentricities, withdrawal, littleness, apathy, or hypersensitivity, that may be indicative of later development of a psychotic disorder.

prepubertal stage see PREADOLESCENCE.

prepuberty n. see PREADOLESCENCE.

prepubescence n. see PREADOLESCENCE.

prepuce n. a covering fold of skin, especially the skin covering the glans penis (see FORESKIN) in males and the clitoris (see CLITORAL HOOD) in females. Also called preputium.
—preputial adj.

prepulse inhibition diminution of a reflex response by presenting a weak stimulus just before the strong stimulus that elicits the response. For example, a loud noise can elicit a startle reaction, but presentation of a tone before the noise will diminish the startle reaction.

preputium n. see PREPUCE.

prepyriform area the olfactory PROJECTION AREA at the base of the temporal lobe of the brain.

presbycusis n. the gradual diminution of hearing acuity associated with aging. See also VASCULAR SCLEROSIS.

presbyopia n. a normal, age-related change in vision due to decreased lens elasticity and accommodative ability, resulting in reduced ability to focus vision on near tasks (e.g., reading). Usually beginning in middle age, presbyopia is correctable with reading glasses or glasses with bifocal or trifocal lenses.

preschool program an educational curriculum for children who are under the required minimum age for participation in regular classroom work. Preschool programs for children with intellectual or emotional difficulties are designed to develop social skills and provide stimulation at levels appropriate for each child.

prescribing n. 1. ordering the use of a medication. 2. in psychotherapy and medicine, advising or telling a patient what to do in specific situations.

prescribing information (PI) see LABELING.

prescribing psychology an emerging area of clinical psychology in which licensed, appropriately trained practitioners are legally authorized to prescribe medications for the treatment of emotional and mental disorders (see PSYCHOACTIVE DRUG). This integration of medication management with psychological practice is controversial. Within the United States, only New Mexico, Louisiana, and Illinois have enacted laws permitting it, in 2002, 2004, and 2014, respectively. In addition to fulfilling all other requirements required for professional licensure as a practicing clinician, prescribing psychologists in these states must complete a postdoctoral psychopharmacology training program and pass a national certification exam. New Mexico also requires a supervised 400-hour, 100-patient practicum. Also
Prescription drug

called medical psychology. See also prescriptive authority.

Prescription drug a medication that can be legally acquired only from a pharmacy and only on the basis of a written, faxed, telephoned, or electronically submitted order (the prescription or script) from a physician.

Prescription privilege the legal right to prescribe medications necessary for the treatment of medical or mental health disorders.

Prescriptive authority (RxP) the legally recognized right of specially trained psychologists to dispense psychoactive drugs to their clients. The practice is highly controversial, both within the United States and abroad: of the states that have introduced RxP legislation, few have passed it. RxP opponents cite concerns that psychologists lack the requisite medical knowledge and training to prescribe safely. Opponents also fear that psychologists trained in psychopharmacology will abandon emotional, interpersonal, and behavioral interventions in favor of medication management, rather than combining approaches. RxP supporters say that it can be done safely and will enable psychologists to provide improved care. Supporters also cite such benefits as enhancing the quality and accessibility of health care in underserved communities; facilitating communication between psychologists and primary care providers; and improving management of the psychological concomitants of health problems. Despite the heated debate surrounding RxP, many universities and independent training facilities are seeking to establish postdoctoral training programs that meet the criteria of the American Psychological Association’s Recommended Postdoctoral Training in Psychopharmacology for Prescription Privilege. Additionally, the affiliated College of Professional Psychology has developed the Psychopharmacology Examination for Psychologists for use by U.S. and Canadian licensing boards. See also prescribing psychology.

Prescriptive eclectic psychotherapy see eclectic psychotherapy.

Prescriptive grammar an approach to grammar in which a series of rules is used to distinguish proper from improper usage and a standard version of the language is identified and promoted (see Standard Language). It is often contrasted with descriptive grammar, in which the goal is to provide an accurate account of language use without specification as to correctness. Prescriptive grammarians seek to correct nonstandard forms, such as I can’t get no satisfaction, whereas descriptive grammarians seek to characterize the rule system that produces such utterances.

Prescriptive norm see injunctive norm.

Prescriptivism n. in linguistics, the practice of using prescriptive grammar to inculcate certain forms and varieties of language and to stigmatize others.

Preselection n. 1. In vitro fertilization, the choosing of one embryo over others because it is assessed as having a higher likelihood of developing into a healthy, viable fetus. 2. The choosing of traits for future progeny through genetic analysis and manipulation. Preselection of traits—for example, sex (see sex preselection), intelligence, beauty, and various talents—is highly controversial, with the potential for preselecting designer children raising serious ethical considerations. 3. A family’s subjective assignment of the role of mutation carrier to one or more family members prior to knowledge of their actual genetic status. Family members often treat the preselected person in a special way, assuming that he or she is a mutation carrier.

Presenile dementia see DEMENTIA.

Presenile dementia of the Alzheimer’s type (PDAT) an older name for dementia of the Alzheimer’s type with onset before age 65.

Presenilin n. any member of a family of transmembrane proteins, mutations in which are associated with early-onset familial Alzheimer’s disease.

Presentation n. 1. The way in which materials are set before an individual, often for the purpose of learning or understanding. 2. The act of exposing a human or nonhuman animal to stimuli or learning materials during an experiment. 3. In psychoanalytic theory, the means or vehicle through which an instinct is expressed. 4. In interpersonal relations and social interaction, the way in which an individual behaves or expresses himself or herself. 5. In animal behavior, see presenting.

Presenteeism n. 1. The practice of coming to work when one is ill, injured, or otherwise unable to function at full capacity on the job. The resulting reduction in productivity is a growing financial and safety concern for employers, particularly since research suggests presenteeism is much more prevalent and damaging than absenteeism. Factors that drive presenteeism include a large workload (often involving multiple tasks and demands from several departments), fear of missing deadlines, fear of disciplinary action or job loss, missed pay, the desire to conserve leave for future use (for vacations, emergencies, child care, family problems, etc.), loyalty to coworkers (i.e., “I’ve got to get in because my colleagues are depending on me and nobody else can cover for me”), company loyalty, and job satisfaction. 2. Less commonly, the practice of staying at work beyond the expected hours to the point at which one is no longer effective because of fatigue, boredom, or lack of useful tasks to perform.

Presenting n. animal behavior in which a female turns its back toward a male and raises its posterior, which allows the male to mate. LORDOSIS is a specific form of presenting seen in many rodents during mating. The posture also occurs outside of a mating context, as when both male and female subordinate animals present to dominant animals.

Presenting symptom a symptom or problem that is offered by a client or a patient as the reason for seeking treatment. In psychotherapy, for example, a client may present with depression, anxiety, panic, anger, chronic pain, or family or marital problems; such symptoms may become the focus of treatment or may represent a different, underlying problem that is not recognized or regarded by the client as requiring help. Also called presenting problem.

Presentist 1. adj. denoting a perspective that attributes the influence of past events on present behavior to a representation of these events that exists in the present. See aahistorical. 2. n. a person holding such a position.

—Presentism n.

Present State Examination (PSE) a structured interview comprising about 400 items representing a wide range of symptoms likely to be manifested during an acute episode of one of the functional psychoses. The PSE was developed for the International Pilot Study of Schizophrenia.

Presolution variability the variability observed in be-
behavior prior to arriving at a successful solution to a difficult problem.

**prespeech development** development of the earliest forms of perceptual experience, learning, and communication, which precedes actual speech and is necessary for its development. For example, babies attend to sound at birth and can differentiate the human voice from other sounds within the 1st month. Cross-cultural studies reveal that mothers routinely use techniques that help their infants acquire language; for example, they shorten their expressions, stress important words, simplify syntax, and speak in a higher register and with exaggerated distinctness. See **BABBLING; INFANT-DIRECTED SPEECH; INFANTILE SPEECH**.

**press** n. in the PERSONOLOGY of Henry Alexander Murray, an environmental stimulus, such as a person or situation, that arouses a need. Examples are the birth of a sibling, parental discord, feelings of social inferiority, or the sight of food when hungry. See NEED—PRESS THEORY.

**pressor effect** the effect of **VASOCONSTRICTORS**, such as **VASOPRESSIN**.

**pressure** n. 1. the exertion of force or weight on a surface (e.g., skin, tissue). 2. excessive or stressful demands, imagined or real, made on an individual to think, feel, or act in particular ways. The experience of pressure is often the source of cognitive and affective discomfort or disorder, as well as of maladaptive coping strategies, the correction of which may be a mediate or end goal in psychotherapy.

**pressured speech** accelerated and sometimes uncontrolled speech that often occurs in the context of a **HYPOMANIC EPISODE** or a **MANIC EPISODE**. Also called **pressure of speech**.

**pressure gradient** a gradual reduction in pressure extending in all directions when a stimulus is applied to the skin.

**pressure of activity** compulsive and occasionally uncontrolled activity and **PSYCHOMOTOR AGITATION**, usually occurring in the context of a **MANIC EPISODE**.

**pressure of ideas** a characteristic symptom of **MANIA** in which there is increased spontaneity and productivity of thought: Numerous, widely varied ideas arise quickly and pass through the mind rapidly. It is usually manifested as **PRESSURED SPEECH** or **PRESSURE OF ACTIVITY**. Also called **thought pressure**.

**pressure of speech** see **PRESSURED SPEECH**.

**pressure sense** the sensation of stress or strain, compression, expansion, pull, or shear, usually caused by a force in the environment. Pressure receptors may interlock or overlap with pain receptors so that one sensation is accompanied by the other. The pressure sense is similar to the sensation of contact.

**pressure spot** any of the points on the body surface that are particularly sensitive to pressure stimuli. Also called **pressure-sensitive spot**.

**pressure-threshold test** a sensory test in which pressure sensitivity is measured with a series of hairs of graded stiffness.

**pressure ulcer** a localized area of cellular death (**NECROSIS**) affecting individuals with limited mobility. Pressure ulcers derive from increased pressure on small areas of tissue due to prolonged sitting or lying in one position and most commonly form where bones are close to the skin, such as at the ankles, heels, shoulder blades, elbows, and hips. If untreated, sepsis can develop, which is potentially fatal. Pressure ulcers are the third leading cause of death in individuals with **SPINAL CORD INJURY**. Also called **bedsore; decubitus ulcer; pressure sore**.

**prestige** n. the degree of respect, regard, and admiration afforded an individual by his or her peers or the whole community. Prestige derives from various sources, including success, achievement, rank, reputation, authority, illustriousness, or position within a social structure. **—prestigious adj.**

**prestige suggestion** 1. a message whose persuasiveness derives from its delivery by or attribution to a person of recognized status. 2. a method of supportive, **SYMPTOMATIC TREATMENT** that relies on the prestige of the therapist in the eyes of the patient to reduce or eliminate symptoms. The so-called **omnipotent therapist** may be able to abolish undesirable symptoms, at least temporarily, by suggestion.

**prestiate cortex** visually responsive regions in the cerebral cortex outside the **STRIATE CORTEX**. The prestriate cortex includes **BRODMANN’S AREAS** 18 and 19, as determined by **CYTOARCHITECTURE** and additional areas in the temporal and parietal lobes. On the basis of function and connectivity, the prestriate cortex has been divided into multiple **VISUAL AREAS**, including **V2, V1, V4, and V5**. Also called **circumstriate cortex; extrastriate cortex; prestriate area**.

**presupposition** n. in linguistics, a **PROPOSITION** that underlies an utterance but is not stated explicitly within it. For example, the question *Has Simone finally given up smoking?* presupposes that Simone is, or used to be, a smoker. Compare **IMPLIED**.

**presynaptic** adj. 1. referring to the region of a neuron within a **SYNAPSE** that releases neurotransmitter. 2. referring to a neuron that is transmitting a signal to one or more other neurons via its synapses. Compare **POSTSYNAPTIC**.

**pretend play** see **FANTASY PLAY**.

**preterm infant** see **PREMATURITY; PRENATAL STRESS**.

**preterm viability** the ability of a fetus to survive outside the uterus before the full **TERM** of pregnancy is completed. A human fetus may be viable from around 20 weeks after conception.

**preternatural** adj. describing phenomena that appear to be inexplicable in terms of the known laws of the physical universe. Compare **SUPERNATURAL**.

**pretest** n. an initial assessment designed to measure existing characteristics (e.g., knowledge, ability) before some intervention, condition, manipulation, or treatment is introduced. Pretests often are given to research participants before they take part in a study. For example, in a study examining whether training helps math performance, participants might be administered a short math test to assess their original knowledge prior to undergoing the training. See also **POSTTEST**. 2. n. a test administered before the main study to ensure that participants understand the instructions and procedures. See **PILOT STUDY; PRACTICE TRIAL**. 3. vb. to administer a pretest.

**pretest counseling** a type of **GENETIC COUNSELING** that an individual undertakes before deciding whether to undergo genetic testing. Pretest counseling includes educat-
ing the individual about the contribution of genetics to the etiology of disease, taking a family history and creating a PEDIAGREE, estimating risk, and discussing the risks, benefits, and limitations of genetic testing. Compare POSTTEST COUNSELING.

**pretest–posttest design** a research design in which the same assessment measures are given to participants both before and after they have received a treatment or been exposed to a condition, with such measures used to determine if there are any changes that could be attributed to the treatment or condition. A more complete version in which participants are randomly assigned to a treatment group or a CONTROL GROUP is a pretest–posttest control-group design: All individuals are assessed at the beginning of the study, the intervention is presented to the treatment group but not the control, and then all individuals are measured again. The presence of the control group allows the researcher to identify any preexisting disparities between the groups and thus to more definitely attribute differences between the pre- and posttest scores to the treatment of interest. Also called before–after design: pre–post design.

**pretest sensitization** an effect in which the administration of a PRETEST affects the subsequent responses of a participant to experimental treatments. For example, if a researcher administers a mood measure prior to treatment conditions, participants may realize that the study is about mood and be more attuned to the mood induction occurring as part of the experimental condition. Pretest sensitization is important to consider in the interpretation of research findings, as it may make a treatment appear more effective than it actually is.

**pretraumatic stress disorder** a condition characterized by prolonged, significant anxiety about a potential threatening or otherwise devastating event, such as a terrorist attack or wartime violence. The individual remains in a constant state of worry and heightened stress at his or her perceived helplessness to prevent the expected future trauma and often mentally experiences the dreaded event again and again. For example, a soldier soon to be deployed for the first time may repeatedly visualize his friends wounded in a combat-zone explosion and mentally hear their cries for help. The resulting symptoms (e.g., fear, anger, vulnerability, uncertainty, irritability, concentration difficulties, insomnia, appetite disturbances) are so intense as to negatively affect daily functioning. Also called **pretraumatic stress syndrome**. [named by analogy with POSTTRAUMATIC STRESS DISORDER]

**pretrial publicity** media coverage of a case that occurs prior to the trial and can lead prospective jurors to form opinions about the case before hearing evidence in court. See CHANGE OF VENUE.

**prevalence** n. the total number or percentage of cases (e.g., of a disease or disorder) existing in a population, either at a given point in time (point prevalence) or during a specified period (period prevalence). For example, health researchers may want to investigate the prevalence of a new disease in an area, whereas education researchers may be interested in the prevalence of bullying or cheating among students of a certain age group. See also INCIDENCE.

**prevention** n. behavioral, biological, or social interventions intended to reduce the risk of disorders, diseases, or social problems for both individuals and entire populations. See PRIMARY PREVENTION; SECONDARY PREVENTION; TERTIARY PREVENTION.

**prevention design** in ergonomics, the design of tools or systems so as to reduce the possibility of HUMAN ERROR. See ENGINEERING CONTROLS. See also EXCLUSION DESIGN; FAIL-SAFE.

**prevention research** research directed toward finding interventions to reduce the likelihood of future pathology (e.g., cancer, substance abuse). Such research often concentrates on individuals or populations considered to be particularly at risk of developing a condition, disease, or disorder. It involves one or more of the following: (a) analyzing risk and protective factors and assessing susceptibility; (b) identifying markers for those at risk and developing screening methods; (c) developing and implementing interventions to promote health and prevent pathology; and (d) conducting **prevention analysis**, the methodological and statistical evaluation of the effects of such interventions.

**preventive care** medical care that aims to prevent disease or its consequences, emphasizing early detection and early treatment of conditions and generally including routine physical examination, immunizations, and well-person care. See also PRIMARY PREVENTION.

**preventive coping** a stress-management strategy in which one prepares for possible events in the long term by building up resources to help minimize the severity of their impact. Examples of such events that may or may not occur in the distant future include job loss, forced retirement, crime, illness, or poverty. The perceived ambiguity stimulates a broad range of behaviors intended to accentuate one’s psychological strengths and accumulate wealth, social bonds, and skills “just in case” (e.g., maintaining a savings account, locking the doors when away from home, carrying health insurance). Preventive coping is not born out of an acute stress situation but rather from reasonable concern about the inherent hazards of daily living and is one of four types of coping proposed by German psychologists Ralf Schwarzer (1943– ) and Nina Knoll. See also ANTICIPATORY COPING; PROACTIVE COPING; REACTIVE COPING.

**preventive counseling** counseling that aims to prevent anticipated problems or conflicts. A school-based preventive counseling program, for example, may focus on educating and providing guidance to adolescents about such issues as bullying and school violence, substance abuse, teen pregnancy, sexually transmitted diseases, eating disorders, and suicide, with the goal of reducing their vulnerability to these and similar problems that often occur in this particular age group.

**preventive stress management** an intervention that provides information on stressors, coping strategies, and opportunities to practice these strategies prior to the occurrence of anticipated stressful situations.

**preverbal** adj. before the acquisition of language. Preverbal children communicate using nonword sounds and gestures.

**preverbal construct** a concept that may have been formulated before one acquired language but that, even without a verbal symbol, may still be used to construe one’s experiences in later life. [proposed by George A. Kelly]

**prevocational training** programs designed to help individuals prepare to enter a competitive work environment. Training is not career- or position-specific but rather focuses on helping individuals develop good work habits and
gain the basic skills and abilities essential for employment in any field, such as following directions and being punctual. Prevocational training may be provided to any individual who has not had actual work experience in a competitive job market, such as a college student nearing graduation or an adult entering the workforce late in life, but it is most often offered to adolescents and to adults with disabilities as part of a VOTATIONAL REHABILITATION program.

prey n. see PREDATION.

priapism n. 1. persistent penile erection that occurs independently of sexual arousal or that continues long after orgasm has occurred and sexual activity has ceased. Immediate causes may be thrombosis, cancer, hemorrhage, inflammation, lesions involving nerve tracts between the brain and the urethra, or an overdose of drugs to treat RECTICLE DISFUNCTION. The condition is also associated with leukemia and sickle-cell anemia and is usually painful. 2. another name for SATYRIASIS. Priapism is named for Priapus, the Greco-Roman god of procreation and of the generative force in nature, who was the basis of a cult that worshipped the phallus. See also PHALLOCENTRIC.

price-quality relationship the real or perceived relationship between the price and the quality of an item or experience. In general, consumers think that higher prices mean higher quality.

Price Waterhouse v. Hopkins a case resulting in a 1989 U.S. Supreme Court ruling that any employment decision made (even in part) on the basis of sex is discriminatory. In this case, the plaintiff was a woman who was denied partnership in an accounting firm because her conduct at work was judged to be excessively masculine.

prick experience the sensation produced when a pin, needle, or small electrical stimulus is applied to a receptor area of the skin. A prick experience may resemble other somatic sensations, such as an itch, a tickle, a pain, or a pressure, depending on how the stimulus is applied.

pride n. a SELF-CONSCIOUS EMOTION that occurs when a goal has been attained and one’s achievement has been recognized and approved by others. It differs from joy and HAPPINESS in that these emotions do not require the approval of others to be experienced. Pride also has expressive reactions that differ from joy, such as puffing up of the chest and directing attention to others or an audience. False pride can become GRANDIOSITY if the sense of accomplishment is not deserved or the reaction is excessive. See also HUBRIS. —proud adj.

primacy effect the tendency for facts, impressions, or items that are presented first to be better learned or remembered than material presented later in the sequence. This effect can occur in both formal learning situations and social contexts. For example, it can result in a first-impression bias, in which the first information gained about a person has an inordinate influence on later impressions and evaluations of that person. Also called law (or principle) of primacy. Compare RECENCY EFFECT.

prima facie at first sight: on the face of things (Latin, literally: “first face”). Prima facie evidence is evidence that, although not conclusive, is considered sufficiently strong to support an inference of fact in the absence of evidence to the contrary.

primal anxiety in psychoanalytic theory, the most basic form of anxiety; first experienced when the infant is separated from the mother at birth and suddenly has to cope with the flood of new stimuli. See also PRIMAL TRAUMA.

primal envy in the OBJECT RELATIONS THEORY of Melanie KLEIN, envy that is first expressed in the infant’s coveting of the mother’s breast, leading to the child’s fantasized desire to spoil or destroy the good object that the breast represents (see GOOD BREAST).

primal fantasy in classical psychoanalytic theory, any of a range of fantasies used by children to fill gaps in their knowledge of sexual experience, especially one about conception and birth, parental intercourse, or castration.

primal father the head of a hypothetical primitive tribe who is slain and devoured by his sons (or other younger men) and later revered as a god, as described by Sigmund FREUD in Totem and Taboo (1912–1913). The crime has a tragic effect on the sons and becomes enshrined in the culture of the tribe as a TOTEM.

primal-horde theory Sigmund FREUD’s speculative reconstruction in Totem and Taboo (1912–1913) of the original human family, which comprised a dominant male (the PRIMAL FATHER) holding sway over a subordinate group of females and younger men or sons. Freud used the theory to account for the origin of EXOGAMY, the INCEST taboo, guilt, and totemism (see TOTEM).

primal repression see PRIMARY REPRESSION.

primal sadism in classical psychoanalytic theory, an aspect of the DEATH INSTINCT that is identical with MASOCHISM and remains within the person, partly as a component of the LIBIDO and partly with the self as an OBJECT.

primal scene in classical psychoanalytic theory, the child’s first observation, in reality or fantasy, of parental intercourse or seduction, which is interpreted by the child as an act of violence (see PHALIC SADISM). See also PRIMAL FANTASY.

primal therapy a therapeutic technique in which the client is encouraged to reexperience traumatic early childhood (even peri- and prenatal) experiences and react vocally and physically to release the psychic pain associated with them. The technique, sometimes popularly and erroneously known as primal scream therapy, has received little scientific validation and is not advocated by most psychotherapists or counselors. [developed in the 1960s and 1970s by U.S. psychologist Arthur Janov (1924— )]

primal trauma in psychoanalytic theory, a painful situation to which an individual was subjected in early life that is presumed to be the basis of a neurosis in later life. See also PRIMAL ANXIETY.

primary ability any of the seven unitary factors revealed by factor analysis to be essential components of intelligence: VERBAL ABILITY (V), WORD FLUENCY (WF), NUMERICAL ABILITY (N), SPATIAL INTELLIGENCE (S), MEMORY (M), perceptual speed (P), and REASONING (R). These factors are measured by the Primary Mental Abilities Test. Also called primary mental ability. [proposed in about 1936 by Louis L. THURSTONE]

primary aging changes associated with normal aging that are inevitable and caused by intrinsic biological or genetic factors. Examples include the loss of melanin, which causes gray hair, and decreased skin elasticity. However, some age-related processes are accelerated by environmen-
primary amenorrhea

tal influences, making the distinction between primary aging and SECONDARY AGING imprecise.

**primary amenorrhea** see AMENORRHEA.

**primary anxiety** in psychoanalytic theory, anxiety experienced as a spontaneous response to any stimulus that causes dissolution of the BD. Compare SIGNAL ANXIETY.

**primary appraisal** in the COGNITIVE APPRAISAL THEORY of emotions, the initial evaluation of a situation’s relevance to one’s moral norms and personal preferences and to the likelihood of reaching one’s goals. The situation (or other stimulus) is identified as a threat, harm, or challenge and is followed by SECONDARY APPRAISAL. See also RELATIONAL THEMES. [proposed by Richard S. Lazarus]

**primary attention** attention that does not require conscious effort, such as attention to an intense, powerful, or arresting stimulus. In classical psychology, the term is used to denote the basic kind of attention that is common to all animals and the first to develop in humans. Also called PASSIVE ATTENTION: REFLEX ATTENTION. Compare SECONDARY ATTENTION. See also INVENTORIALLY ATTENTION.

**primary auditory cortex (A1)** see AUDITORY CORTEX.

**primary behavior disorder** any of various behavior problems in children and adolescents, including habit disturbances (e.g., nail biting, temper tantrums), bed-wetting, conduct disorders (e.g., vandalism, fire setting, alcohol or drug use, sex offenses, stealing), and school-centered difficulties (e.g., truancy, school phobia, disruptive behavior).

**primary care** the basic or general health care a patient receives when he or she first seeks assistance from a health care system. General practitioners, family practitioners, internists, obstetricians, gynecologists, and pediatricians are known as PRIMARY CARE PROVIDERS. Also called PRIMARY HEALTH CARE. Compare SECONDARY CARE: TERTIARY CARE.

**primary caregiver** see CAREGIVER.

**primary care provider (PCP)** a physician who provides PRIMARY CARE services and may act as the GATEKEEPER controlling patients’ access to the rest of a health care system through referrals. PCPs are usually generalist physicians (e.g., internists, pediatricians, family physicians, general practitioners) and obstetricians and gynecologists. Also called PRIMARY PHYSICIAN.

**primary care psychology** a specialty within health, clinical, and counseling psychology that involves providing psychologically oriented preventive and treatment services under the auspices of medical professionals in such settings as clinics, hospitals, and private practices, either on site or on a consultation basis. A physician, for example, might engage a PRIMARY CARE PSYCHOLOGIST to further evaluate a patient with hypertension whose presenting symptoms also include anxiety and to offer both counseling to address the anxiety and behavioral interventions (e.g., relaxation training) to help the patient manage stress.

**primary caretaker standard** a standard of evaluation used in CHILD CUSTODY disputes that awards custody of the child to the parent who has previously assumed the most responsibility for and spent the most time with the child. See also TENDER YEARS DOCTRINE.

**primary cause** a condition or event that predisposes an individual to a particular disorder, which probably would not have occurred in the absence of that condition or event. Sexual contact, for example, is a common primary cause of a sexually transmitted disease.

**primary circular reaction** in PIAGETIAN THEORY, a type of repetitive action that represents the earliest nonreflexive infantile behavior. For example, in the first months of life, a hungry baby may repeatedly attempt to put a hand in the mouth. This does not result in effective goal-oriented behavior, but it does indicate a primitive link between goal (easing hunger) and action (attempting to suck on the hand). Primary circular reactions develop in the SENSORMOTOR STAGE, following the activation of such basic reflexes as sucking, swallowing, crying, and moving the arms and legs. See also SECONDARY CIRCULAR REACTION: TERTIARY CIRCULAR REACTION.

**primary colors** the basic colors from which all the various hues can be produced by mixing different combinations. Some investigators believe human color perception involves combinations of the three primary colors (i.e., blue, green, and red); others contend that yellow, violet, or both should be included because of visual color sensitivity peaks found at those wavelengths.

**primary consciousness** sensory experience. The descriptor implies that sensory experience emerged early in the EVOLUTION OF CONSCIOUSNESS. [proposed by U.S. neuroscientist Gerald M. Edelman (1929–2014)]

**primary control** behavior that is aimed at producing a sense of control through an individual’s direct alteration of the environment. Compare SECONDARY CONTROL. See LOCUS OF CONTROL.

**primary coping** a stress-management strategy in which a person actively seeks to alter external conditions, including environmental events and other people’s behavior, to bring them into line with his or her wishes. Primary coping encompasses a variety of different actions, such as seeking support, expressing one’s emotions, or regulating one’s emotions. It is a dynamic, approach-oriented COPING STRATEGY that provides an important sense of control over environmental circumstances. Also called PRIMARY CONTROL COPING. Compare SECONDARY COPING. [Identified in 1982 by Fred M. Rothbaum (1949–2011) and John R. Weisz (1945–), U.S. clinical and developmental psychologists, and Samuel S. Snyder, U.S. developmental psychologist]

**primary cortex** any of the regions of the CEREBRAL CORTEX that receive the main input from sensory receptors or send the main output to muscles. Examples are the primary MOTOR CORTEX, primary visual cortex (see STRIATE CORTEX), primary TASTE CORTEX, and PRIMARY SOMATOSENSORY AREA. The primary motor cortex has a lower threshold for elicitation of motor responses than do adjacent motor cortical regions. Most neurons in primary sensory regions have more direct sensory input than do neurons in adjacent sensory cortical regions.

**primary data** 1. information cited in a study that was gathered directly by the researcher from his or her own experiments or from first-hand observation. Compare SECONDARY DATA. 2. original experimental or observational data, that is, RAW DATA.

**primary deviance** in theories of deviance and identity, an initial rule-breaking act (such as NONCONFORMITY or disobedience) performed by an otherwise socially compliant individual. In most cases individuals amend their behaviors in response to social pressure, but if they continue to violate social norms (SECONDARY DEVIANCE), other people may label them as deviant. See also LABELING THEORY.
primary drive an innate drive, which may be universal or species-specific, that is created by deprivation of a needed substance (e.g., food) or by the need to engage in a specific activity (e.g., nest building in birds). Compare SECONDARY DRIVE.

primary emotion any one of a limited set of emotions that typically are manifested and recognized universally across cultures. The list of primary emotions varies across different theorists. They often include FEAR, ANGER, JOY, SADNESS, DISGUST, CONTEMPT, and SURPRISE; some theorists also include SHAME, SHYNESS, and GUILT. Also called basic emotion: core emotion. Compare SECONDARY EMOTION.

primary empathy an approach to CLIENT-CENTERED THERAPY in which the therapist actively tries to experience the client’s situation and then to restate it from the client’s point of view and emotional standpoint.

primary environment an environment that is central in one’s life and in which personal or family interactions can be sustained, such as one’s home. See also PRIMARY TERRITORY. Compare SECONDARY ENVIRONMENT.

primary factor see FIRST-ORDER FACTOR.

primary familial xanthomatosis see WOLMAN’S DISEASE.

primary gain in psychoanalytic theory, the basic psychological benefit derived from possessing neurotic symptoms, essentially relief from anxiety generated by conflicting or unexpressed impulses. Also called parasomic gain. Compare SECONDARY GAIN.

primary group any of the small, long-term groups characterized by face-to-face interaction and high levels of GROUP COHESION, solidarity, and GROUP IDENTIFICATION. These groups are primary in the sense that they are the initial socializers of the individual members, providing them with the foundation for attitudes, values, and a social orientation. Families, partnerships, and long-term psychotherapy groups are examples of such groups. Compare SECONDARY GROUP.

primary gustatory cortex see TASTE CORTEX.

primary health care see PRIMARY CARE.

primary hypersomnia in DSM–IV–TR, a sleep disorder characterized by excessive sleepiness (evidenced by prolonged episodes of sleep, daytime episodes of sleep on an almost daily basis, or both), the severity and persistence of which cause clinically significant distress or impairment in functioning. The disorder is not caused by a general medical condition or the effects of a substance and is not exclusively an aspect of another sleep disorder or mental disorder. In DSM–5, it is known as hypersomnia disorder. See DYSSOMNIA. See also DISORDERS OF EXCESSIVE SOMNOLENCE. Compare PRIMARY INSOMNIA.

primary identification in psychoanalytic theory, the first and most basic form of IDENTIFICATION, which occurs during the ORAL STAGE of psychosexual development when the infant experiences the mother as part of himself or herself. After weaning, the infant begins to differentiate between the self and external reality and then becomes capable of SECONDARY IDENTIFICATION. Primary identification is closely tied to oral INCORPORATION. Also called primary narcissistic identification.

primary insomnina in DSM–IV–TR, a sleep disorder characterized by difficulty in initiating or maintaining a restorative sleep to a degree in which the severity and persistence of the sleep disturbance causes clinically significant distress, impairment in a significant area of functioning, or both. The disorder is not caused by a general medical condition or the effects of a substance and is not exclusively an aspect of another sleep disorder or mental disorder. It is termed insomnina disorder in DSM–5. See DYSSOMNIA. Compare PRIMARY HYPERSONMIA.

primary line of sight a line connecting a target of fixation with the center of the pupil of the eye. Compare VISUAL AXIS.

primary masochism in psychoanalytic theory, the portion of the DEATH INSTINCT or AGGRESSIVE INSTINCT that is directed toward the self after the LIBIDO has absorbed it emotionally and directed a large portion of it toward the external world. Also called erotogenic masochism.

primary maternal preoccupation in the OBJECT RELATIONS THEORY of British psychoanalyst Donald Winnicott (1896–1971), a state immediately following childbirth in which a mother becomes preoccupied with her infant to the exclusion of everything else, which permits a heightened sensitivity to the child’s needs.

primary memory (PM) memory that retains a few items for only several seconds, in contrast to SECONDARY MEMORY. The term was used in DUAL-STORE MODELS OF MEMORY before being replaced by SHORT-TERM MEMORY. [introduced by William James]

primary mental ability see PRIMARY ABILITY.

primary microcephaly a congenital disorder in which MICROCEPHALY is the primary, and usually the only, evidence of anomalous fetal development. The most common characteristic is a normal-size face combined with a small cranium. The forehead is low and narrow but recedes sharply. The back of the head is flat, and the vertex often is pointed. Intellectual disability and spasticity of limbs occur as neurological deficits.

primary mood disorder a prolonged, pervasive emotional disturbance that is a diagnostic entity of its own and that does not occur in the context of another disorder.

primary motivation motivation created by the presence of a PRIMARY NEED. Compare SECONDARY MOTIVATION.

primary motor cortex see MOTOR CORTEX.

primary narcissism in psychoanalytic theory, the earliest type of NARCISISM, in which the infant’s LIBIDO is directed toward his or her own body and its satisfaction rather than toward the environment or OBJECTS. At this stage, the child forms a narcissistic EGO-IDEAL, stemming from his or her sense of OMNIPOTENCE. Compare SECONDARY NARCISISM. See also BODY NARCISISM.

primary narcissistic identification see PRIMARY IDENTIFICATION.

primary need an innate need that arises out of biological processes and leads to physical satisfaction, such as the need for water and sleep. See also PHYSIOLOGICAL NEEDS: SECONDARY NEED.

primary obsessional slowness an uncommon and severe subtype of OBSESIVE-COMPULSIVE DISORDER characterized by an excessive orderliness and by routine self-care (e.g., washing, brushing teeth, getting dressed) that takes many hours to complete. [first described in 1974 by psychologist Stanley Rachman (1934— )]

primary odor in various theories of odor perception, any of a number of posited odor qualities that somehow
combine to produce the perception of an odor. See CROCKER—HENDERSON ODOR SYSTEM; HENNING’S ODOR PRISM; ZWAARDemaker SMELL SYSTEM.

**primary oocyte** see OOGENSEIS.

**primary personality** 1. the original personality, as opposed to a SECONDARY PERSONALITY or secondary personalities, of an individual with dissociative identity disorder. 2. see PREMORRID PERSONALITY.

**primary physician** see PRIMARY CARE PROVIDER.

**primary position** in vision, the position for binocular fixation that is looking straight ahead when the body and head are upright.

**primary prevention** research and programs, designed for and directed to nonclinical populations or populations at risk, that seek to promote and lay a firm foundation for mental, behavioral, or physical health so that psychological disorders, illness, or disease will not develop. Compare SECONDARY PREVENTION; TERTIARY PREVENTION.

**primary process** in psychoanalytic theory, unconscious mental activity in which there is free, uninhibited flow of psychic energy from one idea to another. This mental process operates without regard for logic or reality, is dominated by the pleasure principle, and provides hallucinatory fulfillment of wishes. Examples are the dreams, fantasies, and magical thinking of young children. These processes are posited to predominate in the id. Also called primary process thinking. See also PRELOGICAL THINKING.

**primary quality** in the philosophy of John Locke, a sensible quality of an object that is a physical property, or the result of a physical property, of the object itself, such as weight, size, or motion. Locke contrasted such properties with so-called secondary qualities, such as color, taste, and smell.

**primary reinforcement** 1. in OPERANT CONDITIONING, the process in which presentation of a stimulus or circumstance following a response increases the future probability of that response, without the need for special experience with the stimulus or circumstance. That is, the stimulus or circumstance, known as an unconditioned or primary reinforcer, functions as effective reinforcement without any special experience or training. 2. the contingent occurrence of such a stimulus or circumstance after a response. Also called unconditional reinforcement. Compare secondary reinforcement.

**primary reinforcer** see NATURAL REINFORCER; PRIMARY REINFORCEMENT.

**primary relationship** a person’s closest relationship, in terms of the time, energy, and priority given to it. A primary relationship will typically include high degrees of intimacy, attraction, and commitment.

**primary repression** in psychoanalytic theory, the first phase of repression, in which ideas associated with instinctual wishes are screened out and prevented from becoming conscious. Primary repression contrasts with repression proper, in which the repressed material has already been in the realm of consciousness. Also called primal repression.

**primary reward** any stimulus that is innately reinforcing, such as water to a thirsty person. Compare SECONDARY REWARD.

**primary sensory area** any area within the neocortex of the brain that acts to receive sensory input—for most senses, from the thalamus. The primary sensory area for hearing is in the temporal lobe, for vision in the occipital lobe (see STRIATE CORTEX), and for touch and taste in the parietal lobe (see PRIMARY SOMATOSENSORY AREA; TASTE CORTEX). See also SECONDARY SENSORY AREA.

**primary sensory ending** see ANNULAR SPIRAL ENDING.

**primary sex characteristic** see SEX CHARACTERISTIC.

**primary skin senses** the sensations of heat, cold, touch (i.e., contact), and pain. Other sensations from the skin, such as wetness, are considered sensory blends (see TOUCH BLENDS).

**primary sleep disorder** see SLEEP DISORDER.

**primary somatosensory area** (S1) an area of the cerebral cortex, located in a ridge of the anterior parietal lobe just posterior to the central sulcus, where the first stage of cortical processing of tactile information takes place (see SOMATOSENSORY AREA). It receives input from the ventroposterior nuclear complex of the thalamus (see VENTROPOSTERIOR NUCLEUS) and projects to other areas of the parietal cortex. See also SECONDARY SOMATOSENSORY AREA.

**primary spermatocyte** see SPERMATOGENESIS.

**primary stuttering** dysfluency in the speech of young children without accompanying signs of awareness, stress, or emotion. This simple, nonanxiety-producing dysfluency is not accepted as true stuttering by some speech and language pathologists. Compare SECONDARY STUTTERING.

**primary suggestibility** 1. a form of suggestibility that responds to overt influence, as in ideomotor suggestion. Some tests have indicated that this form of suggestibility does not correlate strongly with indirect or secondary suggestibility. Also called direct suggestibility. See also TERTIARY SUGGESTIBILITY. [proposed by Hans Eysenck] 2. an individual’s suggestibility in the absence of hypnosis or similar methods.

**primary symptoms** 1. symptoms that are a direct result of a disorder and essential for its diagnosis. 2. symptoms that appear in the initial stage of a disorder. 3. see FUNDAMENTAL SYMPTOMS. Compare SECONDARY SYMPTOMS.

**primary task** in ergonomics, the priority task in a situation requiring MULTIPLE-TASK PERFORMANCE. The operator is expected to allocate sufficient mental resources to the primary task to maintain an acceptable level of performance: He or she will then allocate remaining resources to other tasks. Compare SECONDARY TASK.

**primary taste** any of certain qualities posited as being basic to the entire sense of TASTE, in that all taste sensations are composed of them. The number of proposed primary tastes has ranged historically from 2 to 11, but sweet, salty, sour, and bitter, now joined by umami, are the most widely accepted. However, the evidence that primary tastes exist is not definitive.

**primary taste cortex** see TASTE CORTEX.

**primary territory** 1. a space controlled by and identified with the person or group who uses it exclusively and to whom it is essential, such as an apartment or house. Primary territory is similar to primary environment. Compare PUBLIC TERRITORY; SECONDARY TERRITORY. See also PROXEMICS. 2. in animal behavior, a defended space. See TERRITORIALITY.

---

832
primary thought disorder: a disturbance of cognition, observed primarily in schizophrenia, characterized by incoherent and irrelevant intellectual functions and peculiar language patterns (including bizarre syntax, neologisms, and word salad). See schizophrenic thinking.

primary tone: see combination tone.

primary visual cortex (V1): see striate cortex.

primary visual system: the major visual pathway in primates, in which processing of visual information is done by the fovea centralis, enabling careful analysis of stimulus properties. Signals pass from the retina to the optic nerve, optic tract, lateral geniculate nucleus, and optic radiations, terminating in the striate cortex. It is the phylogenetically more recent visual system and functions poorly in newborns. Compare secondary visual system.

primate: n. a member of the Primates, an order of mammals that includes the lemurs, monkeys, apes, and humans. Characteristics of the order include an opposable thumb (i.e., a thumb capable of touching the other four digits on the same hand), a relatively large brain, and binocular vision. The young are usually born singly and mature over an extended period.

primidone: n. a barbiturate anticonvulsant drug that is the primary metabolic product of which is phenobarbital. It is used primarily for the treatment of partial and tonic–clonic seizures but has been largely supplanted by newer, safer agents. U.S. trade name: Mysoline.

primigravida: n. a woman who is pregnant for the first time. Also called gravida 1. Compare multigravida.

priming: n. 1. In cognitive psychology, the effect in which recent experience of a stimulus facilitates or inhibits later processing of the same or a similar stimulus. In repetition priming, presentation of a particular sensory stimulus increases the likelihood that participants will identify the same or a similar stimulus later in the test. In semantic priming, presentation of a word or sign influences the way in which participants interpret a subsequent word or sign. 2. In animal behavior, the ability of a pheromone to gradually alter the behavior of another member of the same species. —prime vb.

primiparous: adj. describing a woman who has been pregnant and given birth once. Such a woman is called a primipara, or para 1. Also called uniparous. Compare multiparous.

primitive: adj. 1. Belonging to the earliest stages of the development of something, such as a language, a species, or a technology. 2. Describing a society or culture that is nonliterate and economically and technologically undeveloped and that appears to be characterized by relatively simple forms of social organization. The term in this sense is now generally avoided by social scientists, as it implies acceptance of the discredited view that all societies pass through the same stages of development and that certain cultural practices belong to an “earlier” stage of human evolution (see cultural epoch theory, social darwinism). Note also that technologically undeveloped societies may be highly developed in other respects, having complex religious and kinship systems. See also modernization, traditionalism.

primitive defense mechanism: in psychoanalytic theory, any defense mechanism that protects against anxiety associated with the death instinct. Primitive defense mechanisms include denial, splitting, projection, and idealization and are the first to occur developmentally.

primitive reflex: in infants, a muscle reaction (e.g., the grasp reflex) that happens automatically in response to a certain type of stimulation but that disappears as the child grows older. The continued presence or reemergence of such a reflex later in life can be a sign of brain damage or damage to the nervous system. Also called infant reflex.

primitive superego: in object relations theory, an early superego that is formed in the pregensal phase by the introjection of especially harsh and terrifying bad objects. [first used in 1934 by British psychoanalyst James Strachey (1887–1967)]

primitivization: n. in psychoanalytic theory, the regression of higher ego functions, such as objective thinking, reality testing, and purposeful behavior, with a return to primitive stages of development characterized by magical thinking (e.g., wish-fulfilling fantasies and hallucinations), helplessness, and emotional dependence. Primitivization occurs primarily in traumatic neuroses, in which higher functions are blocked by the overwhelming task of meeting the emergency, and in advanced schizophrenia, in which the ego breaks down and psychic energy is withdrawn from external reality and concentrated on a narcissistic fantasy life. [first used in 1950 by Austrian psychoanalyst Ernst Kris (1900–1957)]

primordial image: see archetype.

principal-axis factor analysis: in exploratory factor analysis, an extraction method in which the coefficient of multiple determination of one variable with all other variables in the system is used as the initial communality estimate for that variable.

principal components analysis (PCA): a data reduction approach in which a number of independent linear combinations of underlying explanatory variables are identified for a larger set of original observed variables. PCA reproduces all of the information in the original correlation matrix and does not assume that variables are measured with any degree of error. Thus, the result is a new set of variables (called principal components) that are uncorrelated with each other and ordered in terms of the percentage of the total variance for which they account. The technique is similar in its aims to factor analysis but has different technical features. Also called principal-components factor analysis.

principal components regression: a prediction model that uses a set of uncorrelated variables obtained from a principal components analysis as predictor or independent variables. The benefit of this approach is that the original set of predictors in the model may have been so highly interrelated as to result in collinearity. The drawback is that if the uncorrelated variables are not interpretable, then the problem of collinearity is not solved.

principal factor analysis: an approach to identifying the dimensions underlying associations among a set of variables by using a covariance matrix of estimated communalities as input. Principal factor analysis assumes that all variables have been measured with some degree of error and requires that dimensions be extracted in a particular way. Specifically, the first dimension extracted must account for the maximum possible variance, having the highest squared correlation with the variables it underlies.
principle

the second dimension must account for the next maximal amount of variance and be uncorrelated with the previously extracted dimension; and so forth. The researcher retains a certain number of dimensions based on various criteria, including interpretations of factor loadings.

principle n. 1. a fundamental rule, standard, or precept, especially in matters of morality or personal conduct. 2. a proposition deemed to be so fundamental and obvious as to need no defense or support. See axiom. 3. in the empirical sciences, a statement of an established regularity, similar to a law.

principled negotiation a procedure to resolve the conflict between individuals or groups that strives for a mutually beneficial resolution while acknowledging the value of ongoing relationships. The procedure has four main components: (a) separating interpersonal problems from the more substantive issues between the parties and dealing with each issue individually, (b) focusing on the parties’ real interests rather than on what they initially say they want, (c) developing possible solutions that benefit all parties, and (d) insisting on objective criteria for the parties decisions. [first described in 1981 by Roger Fisher (1922–2012) and William L. Ury. U.S. experts on negotiation]

principle of belongingness 1. the learning principle that connections between items are more readily formed if the items are related in terms of sense (i.e., they “belong together”) rather than proximity or contiguity. For example, in “Mary is 12, Sasha is 13, and Alfre is 14,” the 12–Sasha proximity bond is weaker than the 12–Mary belongingness bond. [proposed by Edward L. THORNDIKE] 2. the idea that associations between some stimuli and responses are readily acquired because of evolutionary predispositions. See PREPAREDNESS.

principle of beneficence in research ethics, the requirement of institutional review boards that studies “do good” with respect to the work being conducted, the benefits to society at large, and the treatment of participants. Thus, the researcher should maximize the possible benefits of each study and consider its potential impact in the broadest sense. For example, in a study of implicit attitudes, a researcher might note that understanding more about the measurement of attitudes toward sensitive topics may lead to reduced societal prejudice.

principle of closure see CLOSURE.

principle of common fate see COMMON FATE.

principle of common region see COMMON REGION.

principle of constancy in classical psychoanalytic theory, the idea that all mental processes tend toward a state of equilibrium and the stability of the inorganic state. Also called constancy law; law of constancy. See also DEATH INSTINCT; NIRVANA PRINCIPLE.

principle of continuity see GOOD CONTINUATION.

principle of double effect (PDE) in ethics, the justification for an act undertaken with good intentions but with a foreseeable harmful side effect, even though it would not be ethical to bring about the harmful effect intentionally. For example, an end of life decision to provide a terminally ill patient with morphine for pain management and sedation has the potential to hasten the patient’s death. Also called doctrine of double effect (DDE); rule of double effect. [from Summa Theologica (II–II, Qu. 64, Art. 7) by Thomas AQUINAS]

principle of economy see LAW OF PARSIMONY.

principle of equipotentiality see EQUIPOTENTIALITY.

principle of good continuation see GOOD CONTINUATION.

principle of good shape see GOOD SHAPE.

principle of inclusiveness see INCLUSIVENESS.

principle of independent assortment see MENDELIAN INHERITANCE.

principle of least effort the basic behavioral hypothesis that an organism will choose a course of action that appears to require the smallest amount of effort or expenditure of energy. Also called law of least action: least effort principle.

principle of mass action see MASS ACTION.

principle of nonmaleficence in research ethics, the requirement of institutional review boards that studies “do no harm” to participants. When a person considers taking part in a study, there is an expectation that he or she will leave the study in a state that is no worse than when the study began. Where negative consequences are not entirely avoidable—as in an experiment in which a participant is required to recall painful memories, for example—researchers have a duty to minimize the impact of such consequences.

principle of optimal stimulation 1. a learning theory that organisms tend to learn those responses that result in a preferred level of stimulation or excitation. Also called optimal stimulation principle. 2. a motivational theory that an individual maintains contact with various stimuli so as to achieve and maintain a preferred level of stimulation. Also called optimal arousal theory.

principle of parsimony see LAW OF PARSIMONY.

principle of Prägnanz see PRÄGNANZ.

principle of primacy see PRIMACY EFFECT.

principle of proportionality the fundamental judicial principle that the severity of a punishment should be directly related to the seriousness of the crime. Harsh punishments for repeat offenders who commit minor offenses may be considered to violate this principle.

principle of proximity see PROXIMITY.

principle of recency see RECENCY EFFECT.

principle of segregation see MENDELIAN INHERITANCE.

principle of similarity see SIMILARITY.

principle of symmetry see SYMMETRY.

print enlargement system a system for individuals with low vision that enlarges and displays printed text or graphics on a computer or other monitor or screen. The system may be designed for use with a video camera and television or with a personal computer and scanner, or it may be a stand-alone device incorporating all necessary components into a single unit. See also closed-circuit television system.

prion n. an aberrant counterpart of a normal cellular protein that acts as the infectious agent in certain brain diseases, notably CREUTZFELDT–JAKOB DISEASE.

prion disease any of a group of fatal neurodegenerative diseases caused by self-replicating abnormal prion proteins.
in the brain. Symptoms include gait disturbance, lack of coordination, muscle tremors and jerks, and difficulty in swallowing. Human varieties include Creutzfeldt–Jakob disease, Fatal Familial Insomnia, Gerstmann–Straussler–Scheinker syndrome, and Kuru. These diseases are also known as spongiform encephalopathies because of the postmortem appearance of the brain.

**prior distribution** a probability distribution of possible values for an unknown population characteristic that is formulated before one obtains any current data observations about the phenomenon of interest. It may be a subjective prior (based on a researcher’s knowledge of the specific field) or an objective prior (based on evidence obtained from other studies). In Bayesian methods, the prior distribution is combined with the likelihood function to yield the posterior distribution from which inferences are made.

**prior entry** see law of prior entry.

**prior probability** in Bayesian methods, the likelihood of a certain event occurring as determined from current accumulated knowledge about the phenomenon. For example, a researcher could calculate the prior probability of a couple divorcing within 5 years of marriage based on estimates obtained from census data and previously conducted studies. See also Bayes theorem: posterior probability.

**prisoner abuse** physical or psychological harm perpetrated on an incarcerated individual by those in authority over him or her. Such abuse may include sleep deprivation; refusal of health care; threatened harm to family members; beatings, torture, and other forms of violent coercion; sexual abuse and humiliation; and “enhanced” interrogation techniques utilizing coercive means to extract information from a prisoner or detainee. Particularly since the events in 2003 and 2004 at Abu Ghraib, Iraq, where American military guards used harsh interrogation methods on Iraqi prisoners, there has been debate about the role of psychologists in military-run interrogations of prisoners or detainees (including those at Guantanamo Bay, Cuba). In 2007, the American Psychological Association issued a statement specifically prohibiting psychologists from participating in 19 interrogation techniques (e.g., waterboarding, forced nudity) and asserting that no psychologist should be either directly or indirectly involved in treatment of prisoners that could lead to their physical or psychological harm.

**prisoner of war (POW)** a person held captive by an enemy during a war. Reactions to wartime captivity vary greatly from individual to individual but can include (a) depression due to loss of freedom and identity; (b) paranoia; (c) inertia and loss of interest due to confinement and debilitating conditions; (d) the effects of coercive persuasion, particularly if brainwashing is involved; (e) loss of ego strength; and (f) occasionally, death. See also post-captivity health problems.

**prisoner’s dilemma** a mixed-motive game used in investigations of competition and cooperation. Each participant in the game must choose between a self-beneficial course of action that could be costly for the other players and an action that would bring a smaller individual payoff but would lead to some benefits for all the players. The name derives from a police tactic, used when incriminating evidence is lacking, in which two suspects are separated and told that the one who confesses will go free whereas the other will receive a heavy sentence. If both confess, both will receive a moderate sentence; if neither confesses, lack of evidence means that they will both escape with a light sentence. Each prisoner may choose silence (the cooperative strategy), hoping that the other does the same but risking a long sentence if the other confesses. Alternatively, either prisoner may confess (the competitive strategy), hoping to improve his or her own situation even though this will be at the expense of the other prisoner. Each prisoner has an incentive to confess regardless of what the other does. However, if both parties choose the competitive option, both will do worse than if they together choose the cooperative strategy. The prisoner’s dilemma has implications for social exchange theory and the study of social dilemmas.

**prison psychologist** a psychologist specializing in correctional psychology.

**prison psychosis** see Ganser syndrome.

**privacy** n. 1. the state in which an individual’s or a group’s desired level of social interaction is not exceeded. 2. the right to control (psychologically and physically) others’ access to one’s personal world, such as by regulating others’ input through use of physical or other barriers (e.g., doors, partitions) and by regulating one’s own output in communication with others. 3. the right of patients and others (e.g., consumers) to control the amount and disposition of the information they divulge about themselves. See privileged communication. —private adj.

**private acceptance** see conversion.

**private adoption** see adoption.

**private event** an activity or stimulus that is apparent only to the person engaged in or experiencing it. It usually denotes private behavior (e.g., imagining) or private stimuli (e.g., a headache). See also covert behavior.

**private mental hospital** a hospital for patients with mental disorders that is organized and run by a group of health care professionals (e.g., psychiatrists, psychologists). Typically, a private mental hospital is considerably smaller than a public mental hospital, has a higher doctor–patient ratio, and offers specialized, intensive treatment rather than chronic care.

**private practice** 1. the practice of a medical or mental health care professional who operates as a self-employed individual. 2. in the United Kingdom, any medical practice outside the National Health Service.

**private self** the part of the self that is known mainly to oneself, such as one’s inner feelings and self-concept. It may be similar to or different from the public self that one reveals to others. See also social identity.

**private self-consciousness** see self-consciousness.

**private speech** spontaneous self-directed talk in which a person “thinks aloud,” particularly as a means of regulating cognitive processes and guiding behavior. In the theorizing of Lev Vygotsky, private speech is considered equivalent to egocentric speech.

**privilege** n. 1. the legal right of an individual to confidentiality of personal information obtained by a profes-
privileged access

personal in the course of their relationship, as between a patient and a health care professional during the course of treatment or diagnosis. See PRIVILEGED COMMUNICATION. 2. a favor, benefit, or advantage provided to a person or group in return for something, such as cooperation or good behavior.

privileged access the relationship that an individual has with his or her private, subjective, conscious experience, which is accessible to and observable by only that person.

privileged communication confidential information, especially as provided by an individual to a professional in the course of their relationship, that may not be divulged to a third party without the knowledge and consent of that individual. This protection applies to communications not only between patients and physicians, clinical psychologists, psychiatrists, or other health care professionals but also between clients and attorneys, confessors and priests, and, in most instances, spouses.

proactive aggression see assertion. See also aggression.

proactive coping a stress-management strategy that reflects efforts to build up resources that facilitate promotion toward challenging goals and personal growth. Proactive individuals are motivated to meet challenges, and they reflect efforts to build up resources that facilitate promotion toward challenging goals and personal growth.

active interference (PI) INTERFERENCE in new learning due to previous learning of similar or related material. For example, study of French in high school may proactively interfere with college learning of Spanish. Also called proactive inhibition. See also release from proactive interference. Compare retroactive interference.

proactive interference behavior that is consistent with an attitude. Having a positive attitude toward a political candidate and agreeing to donate money to that candidate’s political campaign is an example of proactive interference. See also attitude–behavior consistency. Compare countereffectual behavior.

probabilism n. 1. in psychology and other empirical sciences, the concept that events or sequences of events can be predicted with a high, though not perfect, degree of probability and validity on the basis of rational and empirical data. In statistical hypothesis testing associated with empirical research, probabilism is fundamental to the practice of attaching a probability to the truth or falsity of the NULL HYPOTHESIS. See also stochastic. 2. in ethical theory, the notion that when solutions to ethical questions are unclear, one should follow the course with the greatest estimated probability of being ethically correct. It is thought that evidence of a high probability of being correct can be found in agreement among persons of respected moral judgment. —probabilist adj. —probabilistic adj.

probabilistic functionalism 1. a theory of perception proposing that environmental cues are at best approximate indices of the objects they refer to, that organisms select the cues that are most useful for responding, and that the veracity of perceptions should therefore be considered probabilistic rather than certain. [proposed by Egon Brunswik] 2. the view that behavior is best understood in terms of its probable success in attaining goals.
though this probability need not be the same for all individuals. Compare NONPROBABILITY SAMPLING.

**probability table** 1. a chart showing all possible outcomes of a situation under specified conditions and their likelihoods of occurrence. For example, one could create a probability table for the number of boys born into a family. 2. a display of critical values for various statistical tests (e.g., Z TEST, T TEST, F TEST, CHI-SQUARE TEST) at different significance levels and with different degrees of freedom. Probability tables traditionally were presented as appendices in the back of statistics textbooks but currently are widely available via computer software.

**probability theory** the branch of mathematics and statistics concerned with the study of probabilistic phenomena.

**probability value** see PROBABILITY LEVEL.

**probabilogical model** a theory of attitude and belief structure postulating that beliefs can be viewed as interconnected networks of syllogisms. These networks have vertical structure in that a syllogism containing two beliefs (i.e., the premises) can logically imply a third belief (i.e., the conclusion). They have horizontal structure in that the conclusion for one syllogism can serve as the conclusion for other syllogisms. [originally proposed by William J. McGuire]

**proband** n. the family member whose possible genetic disease or disorder forms the center of the investigation into the extent of the illness in the family. He or she is the person around whom a pedigree is drawn and from whom the information about other family members is obtained. Also called **index case**.

**probation** n. a criminal sentence in which an offender is not committed to a correctional facility but instead remains in the community under the supervision of a probation officer. Probation is typically accompanied by various conditions intended to control the offender’s conduct (e.g., no use of alcohol or drugs, no association with known criminals). See also **SHOCK PROBATION**.

**probe technique** a memory test in which the participant is asked to recall whether a particular item was among a series of presented items. For example, if the participant hears 1, 3, 5, 7, the probe might be “Was 6 in the list?”

**probing** n. in psychotherapy, the use of direct questions intended to stimulate discussion in the hope of uncovering relevant information or helping the client come to a particular realization or achieve a particular insight.

**probit** n. probability unit: the inverse of the normal cumulative probability distribution. It is used in probit analysis and other techniques for modeling values of binary variables.

**probit analysis** a type of regression analysis in which a dichotomous outcome variable is related to any of a number of different predictor or independent variables. The technique assumes that a latent process generated the observed binary data and often produces very similar results to logistic regression. Also called **probit regression**.

**problem behavior** any conduct that is maladaptive, destructive, or antisocial.

**problem box** a problem-solving test consisting of a box with latches, strings, or other fastenings that the participant must learn to manipulate in such a way as to get in or, in some cases, get out.

**problem checklist** a type of self-report scale listing various personal, social, educational, or vocational problems. The participant indicates the items that apply to his or her situation.

**problem drinking** an informal and broad term referring to alcohol use with negative consequences, ranging from occasional drunkenness leading to missed days of work to a full **ALCOHOL USE DISORDER**.

**problem finding** the skills involved in locating problems worth solving. Research by psychologists Jacob W. Getzels (1912–2001) and Mihaly Csikszentmihalyi has suggested that expert artists tend to be better problem finders than are less expert artists; research by sociologist Harriett Zuckerman (1937– ) has indicated that the same distinction applies to scientists.

**problem-focused coping** a stress-management strategy in which a person directly confronts a stressor in an attempt to decrease or eliminate it. This may involve generating possible solutions to a problem, confronting others who are responsible for or otherwise associated with the stressor, and other forms of instrumental action. For example, a student who is anxious about an upcoming examination might cope by studying more, attending every class, and attending special review sessions to ensure he or she fully understands the course material. It has been proposed that problem-focused coping is used primarily when a person appraises a stressor as within his or her capacity to change. Compare emotion-focused coping. [identified in 1984 by Richard S. Lazarus and Susan Folkman (1938– ), U.S. psychologists]

**problem isomorphs** problems that have the same underlying structure, so that they require essentially the same operations to achieve a solution. Such problems may vary enormously in their surface structure and in the degree of difficulty experienced by solvers. See ISOMORPHISM.

**problem-oriented record (POR)** a form of patient-care record that has four components: (a) a database of standardized information on a patient’s history, physical examination, mental status, and so forth; (b) a list of the patient’s problems, drawn from the database; (c) a treatment plan for each problem; and (d) progress notes as related to the problems and to the patient’s response to each treatment. Also called **problem-oriented medical record (POMR)**.

**problem representation** a scheme, often a drawing, that represents the relations among elements of a problem. For example, a table might be used to express the relations among two sets of elements, or a flow chart might be used to express the series of steps to be followed in solving a problem.

**problems in living** concrete problems with which patients with chronic mental illness (e.g., schizophrenia) frequently struggle (e.g., inability to keep a job or a place of residence), which are believed to be the most useful focus of treatment after symptoms stabilize with medication. Problems in living are often addressed in day treatment or in aftercare following hospitalization. See **PSYCHOSOCIAL REHABILITATION**. [proposed by Hungarian-born U.S. psychiatrist Thomas S. Szasz (1920–2012)]

**problem solving** the process by which individuals attempt to overcome difficulties, achieve plans that move
**problem-solving approach**

thems from a starting situation to a desired goal, or reach conclusions through the use of higher mental functions, such as reasoning and CREATIVE THINKING. Problem solving is seen in nonhuman animals in laboratory studies involving mazes and other tests as well as in natural settings to obtain hidden foods. Many animals display problem-solving strategies, such as the WIN–STAY, LOSE–SHIFT STRATEGY, which allows an animal to solve a new problem quickly based on whether the first response was successful or unsuccessful. In terms of CONDITIONING, problem solving involves engaging in behavior that results in the production of DISCRIMINATIVE STIMULI in situations involving new contingencies.

**problem-solving approach** 1. the process whereby difficulties, obstacles, or stressful events are addressed through the use of COPING STRATEGIES. 2. the theoretical assumption underlying many therapies in the cognitive-behavior tradition (e.g., PROBLEM-SOLVING THERAPY) that posits that the symptoms of psychopathology can often be understood as the negative consequences of ineffective or maladaptive coping.

**problem-solving interview** 1. an EMPLOYMENT INTERVIEW in which the interviewee is presented with a problem that must be solved. The idea is that such an approach will reveal the applicant’s analytical, creative, and problem-solving abilities under pressure. See also PATTERNCED INTERVIEW: STRUCTURED INTERVIEW; UNSTRUCTURED INTERVIEW. 2. an interview that is focused on specific job-related problems, with the aim of working with the interviewee on reaching constructive and mutually acceptable solutions to deficits in performance. This technique is used both with supervisors and with other employees.

**problem-solving skills training** (PSST) an intervention that focuses on the distortions and deficiencies in cognitive processing in children with DISRUPTIVE BEHAVIOR DISORDERS and that teaches them a step-by-step approach to solving their interpersonal problems by directing their attention to certain aspects of each problem in such a way as to lead to an effective solution. By developing problem-solving skills in these children, PSST aims to lessen the frustrations that lead to disruptive behaviors. Prosocial behaviors are fostered through modeling and direct reinforcement as part of the problem-solving process. Also called COGNITIVE PROBLEM-SOLVING SKILLS TRAINING. See also PARENT MANAGEMENT TRAINING. [developed by U.S. clinical child psychologist Alan E. Kazdin (1945– )]

**problem-solving therapy** (PST) an evidence-based cognitive behavior intervention to improve an individual’s ability to cope with stressful life experiences by enhancing his or her problem-solving skills. The skills that the therapy aims to augment are (a) problem orientation (the way one approaches and recognizes problems); (b) problem definition in concrete terms; (c) generation of possible solutions; (d) decision making (evaluating the consequences of alternative solutions and selecting ones that are most optimal); and (e) solution implementation and evaluation of a solution’s outcome after implementation. PST has been effective in the treatment of various psychological and behavioral problems, such as depression, anxiety, and conduct disorder, and of distress associated with chronic medical conditions, such as coronary heart disease, cancer, and HIV/AIDS. **Adult problem-solving training.** Also called PROBLEM-SOLVING TRAINING. [developed in the 1980s by U.S. clinical psychologists Thomas J. D’Zurilla (1938– ), Arthur M. Nezu (1952– ), and Christine Maguth Nezu (1952– )]

**problem space** the mental representation of a problem and of all the possible paths to solving it.

**procaine** n. a local anesthetic used primarily in medical and dental procedures. Procaine was introduced in 1905 as the first synthetic substitute for cocaine.

**procedural justice** 1. in legal proceedings, the use of methods and procedures that are fair and impartial, as distinct from the making of just decisions. The various rules governing how witnesses are questioned and what evidence is admitted into court are examples of the application of procedural justice within the legal system. 2. see ORGANIZATIONAL JUSTICE.

**procedural knowledge** see PROCEDURAL MEMORY.

**procedural learning** the process of acquiring skill at a task, particularly a task that eventually can be performed automatically (i.e., without attention), as opposed to acquiring a DECLARATIVE MEMORY or FACTUAL KNOWLEDGE about it.

**procedural memory** long-term memory for the skills involved in particular tasks. Procedural memory is demonstrated by skilled performance and is often separate from the ability to verbalize this knowledge (see DECLARATIVE MEMORY). Knowing how to type or skate, for example, requires procedural memory. Also called SENSORIMOTOR MEMORY.

**procedural rationality** the rationality of the processes used in arriving at a decision, as opposed to the rationality of the decision itself. Compare SUBSTANTIVE RATIONALITY.

**proceptivity** n. the period during MATING BEHAVIOR when females actively solicit males for copulation. Proceptivity is distinguished from the more passive RECEP TIVITY to indicate the female’s active role in mating.

**process analysis** 1. in psychotherapy, the examination of the interaction between the therapist and the client and of their evolving relationship, as opposed to the content of their discussions. 2. in evaluation research, an analytic procedure that focuses on each element of a program in order to identify ways of improving program operations. See also IMPLEMENTATION EVALUATION.

**process approach** a method of NEUROPSYCHOLOGICAL ASSESSMENT that emphasizes observing, scoring, and analyzing the qualitative aspects of patient behavior in a systematic manner, in addition to obtaining test scores during the evaluation. For example, a clinician would carefully analyze a patient’s approach to items on a BLOCK-DESIGN TEST, in addition to obtaining the patient’s total score on the measure. Also called BOSTON PROCESS APPROACH. [first advanced by Edith KAPLAN and her colleagues at the Boston VA Health Care System]

**process conflict** see INTRAGROUP CONFLICT.

**process consultation** an ORGANIZATIONAL DEVELOPMENT intervention in which work groups are observed by a consultant, who provides feedback on how to improve the effectiveness with which members work together.

**process-dissociation procedure** (PDP) a method for separating conscious (or intentional) and unconscious (or automatic) uses of memory and for producing estimates of the isolated contributions of RECOLLECTION and FAMILIARITY to memory performance. Based on the idea that no test of memory is process pure—that is, performance on any test is likely to result from both conscious
and nonconscious memory processes—the PDP works by placing these two processes in opposition. After an initial study phase, the PDP uses an inclusion test, during which participants are instructed to respond to the cues (e.g., word stems) with previously studied words, and an exclusion test, during which participants are instructed to respond to the cues with any word that comes to mind except the previously studied words. It is assumed that both recollection, which is intentional, and familiarity, which is automatic, contribute to memory performance on the inclusion test, but that the production of a previously studied item on the exclusion test must result only from familiarity. Using a series of equations, estimates for recollection and familiarity can be obtained. In addition to this general logic, the PDP depends on several assumptions (e.g., that the two processes are independent). Also called method of opposition: process-dissociation method. [developed by U.S. psychologist Larry L. Jacoby (1944– )]

Processes of Adaptation in Intimate Relationships Project see PAIR Project.

process evaluation in evaluation research, an in-house function in which the evaluator quickly moves into the situation to be evaluated, conducts the evaluation, feeds findings back to the program administrator for immediate program modification (if necessary), then repeats the process for as long as required. See also FORMATIVE EVALUATION.

process experiential psychotherapy an approach to psychotherapy that focuses on the client’s moment-to-moment experience and guides his or her cognitive and affective processing in the direction of client-defined goals. The THERAPEUTIC ALLIANCE, internal patterns of viewing the self and others, and an emphasis on therapeutic process over content are core elements of this therapy. See also CLIENT-CENTERED THERAPY; GESTALT THERAPY; HUMANISTIC THERAPY. [proposed by South African-born Canadian psychologist Leslie S. Greenberg (1945– )]

processing-efficiency theory a theory that attempts to explain the relationship between anxiety and performance (see AROUSAL–PERFORMANCE RELATIONSHIP). It suggests that anxiety serves two functions: (a) It increases worry and takes attentional resources, and (b) the worry created serves a monitoring function by identifying a task as important, so that the individual increases effort at the task, which overcomes the depleted attentional capacity (see CAPACITY MODEL).

Processing Speed Index an index from more recent versions of the WECHSLER ADULT INTELLIGENCE SCALE and other Wechsler tests that measures the speed of nonverbal processing.

process loss in the social psychology of groups, any action, operation, or dynamic that prevents the group from reaching its full potential, such as reduced effort (SOCIAL LOAFING), inadequate coordination of effort (COORDINATION LOSS), poor communication, or ineffective leadership. See also COLLECTIVE EFFORT MODEL; RINGELMANN EFFECT; SOCIAL INTERFERENCE; SUCKER EFFECT.

process model of emotion regulation a model proposing that EMOTION REGULATION may occur at two different points in the emotion-generative process: ANTICIPATED-FOCUSED EMOTION REGULATION is evoked at the front end, or very early in the process, whereas RESPONSE-FOCUSED EMOTION REGULATION occurs at the back end, or after an emotional response has been triggered. [proposed in 1998 by U.S. clinical psychologist James J. Gross]

process observer 1. in groups, the member who observes and comments on the group’s functioning. This role may be formally designated or taken on informally by one or more group members. 2. a consultant who helps groups to improve their performance by observing the unit as it works and discussing these observations with the unit.

processor n. 1. in INFORMATION THEORY, any device or system that can perform specific operations on data that have been presented to it in proper format. 2. in computer science, a computer or its principal operating part. See CENTRAL PROCESSOR.

process-reactive adj. relating to a disease model of schizophrenia based on the distinction between gradual and acute onset of symptoms. PROCESS SCHIZOPHRENIA is marked by a long-term gradual deterioration before the disease is manifest, whereas reactive schizophrenia is associated with a rapid onset of symptoms after a relatively normal premorbid period.

process research the study of various psychological mechanisms or processes of psychotherapy as they influence the outcome of treatment or the reactions that the therapist or client may have during treatment. A basic goal of such research is to identify therapeutic methods and processes that are most effective in bringing about positive change, as well as any inadequacies or other limitations. In other words, process research focuses on the means by which participants benefit from receiving an intervention. Compare OUTCOME RESEARCH. See also PSYCHO THERAPY RESEARCH.

process schizophrenia a form of schizophrenia that begins early in life, develops gradually, is believed to be due to endogenous (biological or physiological) rather than environmental factors, and has a poor prognosis. Psychosocial development before the onset of the disorder is poor; individuals are withdrawn, are socially inadequate, and indulge in excessive fantasies. This term is often used interchangeably with NUCLEAR SCHIZOPHRENIA. Also called POOR PREMORBID SCHIZOPHRENIA. Compare REACTIVE SCHIZOPHRENIA. [proposed in 1959 by U.S. psychologists Norman Garmezy (1918–2009) and Elliot H. Rodnick (1911–1999)]

process study any investigation undertaken to assess the mechanisms and variables that contribute to and influence the outcome of a particular activity. For example, a process study of GROUP THERAPY sessions may seek to determine characteristics of the therapeutic interaction that are associated with positive, neutral, or negative changes individually and across the group. See also PROCESS RESEARCH.

process variable 1. any set of PSYCHOLOGICAL FACTORS that has an effect on the development or modification of a process over time. 2. an interpersonal, affective, cognitive, or behavioral factor that is operative during the course of psychotherapy or counseling and influences the progress or the course of behavior.

prochlorperazine n. a low-potency PHENOTHIAZINE used for the treatment of nausea and vomiting and occasionally for the control of anxiety. It was formerly used as an antipsychotic agent. U.S. trade name (among others): Compazine.

pro-choice adj. supporting a woman’s right to freely
make informed decisions regarding her reproductive options, including the right to choose safe, legal abortion or to choose to have children. Compare PRO-LIFE.

procreative sex sexual activity that can result in pregnancy. In some cultures and religions, this is the basis for what is considered to be normal sex, as opposed to deviant or sinful sexual activity.

Procrustes analysis in statistical analysis, an approach in which empirical data are superimposed onto some fixed target matrix or other structure of theoretical interest. The name derives from the robber in Greek mythology who forced his victims to fit his bed by stretching them or cutting off their limbs.

procyclidine n. an ANTICHOLINERGIC DRUG that is used in the treatment of Parkinson’s disease and drug-induced extrapyramidal symptoms. U.S. trade name: Kemadrin.

prodigy n. an individual, typically a child, who displays unusual or exceptional talent or intelligence, often in a discrete area of expertise, such as mathematics, music, or chess. Even if naturally endowed with such exceptional abilities, prodigies still require the opportunity and dedication to train and develop their gifts. They do not always develop into accomplished adults: There appears to be an important transition between the two, and only a proportion of prodigies successfully negotiate this transition. See also GIFTEDNESS.

prodromal myopia see MYOPIA.

prodromal syndrome a set of traits, symptoms, or neurological deficits that may signal the onset of a psychological or neurological disorder.

prodrome n. an early symptom or symptoms of a mental or physical disorder. A prodrome frequently serves as a warning or premonitory sign that may, in some cases, enable preventive measures to be taken. Examples are the AURAS that often precede epileptic seizures or migraine headaches and the headache, fatigue, dizziness, and insidious impairment of ability that often precede a stroke. Also called prodromic phase. —prodromic adj. —prodromal adj.

prodrug n. a drug that is either biologically inert or of limited activity until metabolized to a more active derivative.

product appeal see APPEAL.

product champion an individual who supports an innovation (e.g., a new technology) and provides information regarding its benefits so that the target user groups will adopt the innovation. Such individuals are held to play a key role in INNOVATION DIFFUSION and CHANGE MANAGEMENT.

product image in consumer psychology, the associations evoked by a particular brand. Product image is established usually on the basis of careful psychological studies and aims to instill in consumers a receptive feeling for the product. For example, some brands of coffee are identified as mountain-grown in Latin America, hand-picked by experts with Hispanic names, and carefully roasted to yield a rich, dark beverage, although the brand may actually contain coffees from Africa or Indonesia. Also called brand image.

production deficiency in problem solving, failure to find the right or best strategy for completing a task (sometimes even after successful instruction), as opposed to failure in implementing it. Compare MEDIATIONAL DEFICIENCY; UTILIZATION DEFICIENCY.

production effect the finding that when people speak a word aloud during study, they generally remember that word better than if they read it silently.

production method see MAGNITUDE PRODUCTION.

production rules the if–then statements describing the conditions under which a rule relating to a cognitive skill is to be applied (if . . . ) and the action to be implemented (then . . . ). See PRODUCTION SYSTEM.

production system a rule-based computer program that makes decisions or solves problems (see RULE-BASED SYSTEM). It operates according to a set of if–then (i.e., state–action) rules, such that if a certain state occurs, then an associated action is executed, thus altering the state, which produces a new action, and so on. A production system consists of three components: (a) the production memory; represented as sets of if–then rules; (b) the working memory, which contains information related to the present state of the problem solving, represented as patterns to be submitted to the production memory; and (c) a control regime that takes the patterns (representing the current state of the problem solving) from working memory to the set of production rules. When a production rule matches this pattern, it “fires” and produces a new pattern (reflecting the new state of the problem solving), which is then placed in working memory. This cycle continues until no patterns in working memory match the production rules. The production system approach is used as a COGNITIVE ARCHITECTURE by many researchers in cognitive science. See also ADAPTIVE PRODUCTION SYSTEM; SOAR.

production task 1. a cognitive test in which the participant is required to generate as many items as possible that adhere to specified criteria. Production tasks may take a variety of different forms. For example, in a word-production task, individuals may be asked to list as many exemplars from a given subject category (e.g., flower names) as possible, whereas in a sentence-production task, individuals may be asked to create as many unique sentences as possible that contain certain elements (e.g., a transitive verb, a noun, and a target stimulus word). 2. any test of linguistic development in which the participant is required to speak or write rather than to demonstrate understanding of material spoken or written by others. For example, in an experiment assessing foreign-language acquisition, native-English speakers studying German might be asked to read aloud a series of German sentences.

productive language see EXPRESSIVE LANGUAGE.

productive love in psychoanalytic theory, the capacity of healthy individuals to establish close, interdependent relationships without abridging their individuality. Respect, care, responsibility, and knowledge of the other are essential components. According to Erich Fromm, productive love is accomplished through active effort and is an aspect of the PRODUCTIVE ORIENTATION.

productive orientation in psychoanalytic theory, a personality pattern in which the individual is able to develop and apply his or her potentialities without being unduly dependent on outside control. Such an individual is highly active in feeling, thinking, and relating to others and at the same time retains the separateness and integrity of his or her own self. [introduced by Erich Fromm]
thinking in which a given question or issue is considered with objectivity as well as respect and concern for the problem as a whole. It is a feature of the productive orientation.

productive vocabulary an individual’s vocabulary as defined by the words that he or she regularly uses, as opposed to those that he or she can understand when used by others. Also called active vocabulary: working vocabulary. Compare receptive vocabulary.

productivity n. 1. the relationship between the quantity or quality of output (goods created or services provided) and the input (time, materials, etc.) required to create it. 2. the capacity to produce goods and services having exchange value. Vocational rehabilitation programs often use the productivity of people with disabilities as a major measure of the effectiveness of the programs. 3. according to Roger Brown, one of the formal properties of all language, consisting of the ability to combine individual words to produce an unlimited number of sentences. See semiotic.

product-moment correlation coefficient (symbol: r) an index of the degree of linear relationship between two variables. Devised by Karl Pearson, it is often known as the Pearson product-moment correlation coefficient (Pearson’s r) and is one of the most commonly used sample correlation coefficients.

product rule see durham rule.

product testing the testing of consumer response to a new product before or after it has been offered for sale. In the United States, such tests are usually conducted on a limited scale in certain markets, such as in Omaha, Nebraska, or Rochester, New York, which have been studied intensively and have populations with known consumer characteristics. Large-scale advertising campaigns are based on results of the localized product testing, which also may influence changes in product or package design.

proecological behavior behavior that promotes the quality of the natural environment. Examples include recycling, efficient use of energy, and use of mass transportation. Among topics examined in the analysis of these behaviors are environmental attitudes, economic and political impediments, and sociodemographic factors. See also social trap.

proestrus n. the period that immediately precedes estrus.

profession n. an occupation requiring specialized training and skills that meet the established qualifications for entrance into the profession and that match subsequent performance criteria. Among other requirements is adherence to the profession’s rules of conduct governing general business practices and ethical relations between members of the profession and their colleagues and clients. See professional ethics; professional licensing; professional standards. See also vocation. —professional adj., n. —professionalize vb.

professional-aptitude test any test used for selecting candidates for professional training. Typical aptitudes tested include the mental capacity, ability to acquire information and skills, and cognitive style needed for general higher education and proficiency in specific professions, such as psychology, law, science, nursing, engineering, dentistry, medicine, accounting, theology, and teaching.

professional-client sexual relations a boundary violation (see boundary issues) in which a health care professional engages in sexual relations with a patient under his or her care.

professional development the continuing education or training that is often expected or required of people employed in a profession. Professional organizations often assist the professional development of their members by providing courses, conferences, literature, and other services. See also career development; management development.

professional ethics rules of acceptable conduct that members of a given profession are expected to follow. See boundary issues; code of ethics; ethics; professional standards; standards of practice.

professional labeling see labeling.

professional licensing the imposition of state-regulated minimal standards for legal employment as a member of a given profession. Professional licensing usually consists of three parts: provisional certification, full certification, and recertification. See license.

professional manager a person occupying a managerial position in an organization who has been extensively prepared and trained for that position and thus possesses specialized knowledge of important principles, practices, and procedures.

professional standards the levels of performance and conduct required or expected in a particular profession. See also code of ethics; professional ethics; standards of practice.

profile n. 1. a graphical representation of the scores of an individual (or the means of groups of individuals) on multiple measures. The x-axis of the graph usually represents the various measures, whereas the y-axis is the score of the individual on the corresponding measure. Usually the points are connected by short line segments. See personality profile; test profile. 2. a group of characteristics indicating that a particular type of person is likely to engage in a certain behavior. See criminal profiling.

profile analysis a multivariate statistical technique that compares independent groups of individuals across several constructs or dimensions (e.g., of personality) that are measured on the same scale in terms of their mean level or elevation, their shape, and their scatter or variability. The data can be depicted graphically with the scale name on the x-axis, the scale score on the y-axis, and different lines reflecting the different groups being examined.

profile matching system a method of personnel selection in which decisions to hire or reject candidates for employment are based on the degree of fit between an applicant’s characteristics and a profile of the ideal or typical employee in the position. See also interviewer stereotype.

profile of a disorder a drawn or mechanically generated outline, often a graph, representing the symptoms and characteristics of a disorder.

Profile of Mood States (POMS) a brief self-report instrument measuring six dimensions of transient and fluctuating mood states over time: tension or anxiety, depression or dejection, anger or hostility, vigor or activity, fatigue or inertia, and confusion or bewilderment. Participants indicate on a 5-point scale ranging from not at all to extremely whether each of the 65 adjectives listed (e.g., confused,
profiling

n. 1. see CRIMINAL PROFILING. 2. in sport, an exercise in which athletes first identify the most important physical and mental components necessary for optimal performance and then assess the degree to which they possess each of these components.

profound mental retardation an older diagnostic category for those with IQs below 20, comprising about 1% of people with MENTAL RETARDATION. It is due to sensori-motor abnormalities as well as intellectual factors; typical developmental attainments include rudimentary speech and limited self-care, and affected individuals require lifelong supervision in highly structured environments.

program effectiveness conclusions drawn about PROGRAM OUTCOMES from testing an intervention as it is actually executed in the context of routine everyday service delivery. This method contains several threats to internal validity because it must rely on procedures that are not scientifically controlled. Compare PROGRAM EF FICACY.

program efficacy conclusions drawn about PROGRAM OUTCOMES from testing an intervention under closely controlled scientific conditions, which may narrowly define the type of individual receiving services, the nature of services offered, and so forth. Because this method involves the provision of services under conditions that are very different from everyday real-world service delivery, there are dangers that it may not achieve a high degree of external validity. Compare PROGRAM EFFECTIVENESS.

program evaluation an appraisal process that contributes to decisions on installing, continuing, expanding, certifying, or modifying social programs, depending on their effectiveness. Program evaluation also is used to obtain evidence to rally support or opposition for the organization providing services and to contribute to basic knowledge in the social and behavioral sciences about social interventions and social experimentation. See EVALUATION RESEARCH.

Program for Learning in Accordance With Needs (PLAN) an individualized instructional system covering language arts, mathematics, science, and social studies in Grades 1 through 12. It is based on learning objectives developed by the teacher and the student together. This system illustrated how programmed learning and, ultimately, computers could play an important and integral role in individualizing education. [developed in the 1960s by U.S. psychologist John C. Flanagan (1906–1996)]

program impact the effects of a program designed to produce some type of good or service, measured in terms of success or failure in achieving these objectives.

program integrity the extent to which an intended program is actually delivered. Also called TREATMENT INTEGRITY.

programmed cell death the orderly death and disposal of surplus tissue cells, which occurs as part of tissue remodeling during development, or of worn-out and infected cells, which occurs throughout life. Also called apoptosis.

programmed instruction a learning technique, used for self-instruction and in academic and some applied settings, in which the material is presented in a series of sequential, graduated steps, or frames. The learner is required to make a response at each step: if the response is correct, it leads to the next step; if it is incorrect, it leads to further review of the material presented in the prior step. Also called programmed learning. See TEACHING MACHINE.

programmed practice the homework component of IN VIVO EXPOSURE, in which a client directly confronts feared stimuli outside of therapeutic sessions. Programmed practice is used as a concomitant strategy to the primary treatment with the therapist, and clients often are instructed to keep a behavioral diary of all self-directed exposure practice. Some practitioners and researchers, however, use the term more generally as a synonym of EXPOSURE THERAPY itself.

program monitoring the use of key indicators to measure program performance. The purposes and regularity of this activity vary widely and include PROCESS EVALUATION, information provided from management information systems, and performance measurement that identifies program outcomes. Typically, these methods do not assess the impact of the program. See also PROGRAM EFFECTIVENESS; PROGRAM IMPACT.

program outcome any or all of the effects that arise from the implementation of a program. Also called program output.

Progressive Achievement Tests (PAT) 1. assessment tests that provide information on the reading vocabulary,
reading comprehension, and mathematics achievement of students in comparison with national norms. Progressive Achievement Tests are generally used for diagnostic purposes at the beginning of a school year and are available for Grades 4 through 10. They were developed by the New Zealand Council for Educational Research. 2. see CALIFORNIA ACHIEVEMENT TESTS.

**progressive bulbar palsy** see BULBAR PARALYSIS.

**progressive education** a broad educational approach originally associated with John Dewey’s philosophy. It emphasizes experimentalism as opposed to dogmatism in teaching, learning by doing, recognition of individual rates of learning, latitude in selecting areas of study according to interest, and a close relationship between academic learning and experience in the world outside the classroom.

**progressive-interval schedule (PI schedule)** in conditioning, an arrangement in which the presentation of each reinforcer is dependent on the first response that occurs after a fixed interval of time has passed, with this interval increasing after each reinforcement. The amount by which the interval increases can be based on any of various functions. For example, a progressive-interval schedule might begin with an interval of 30 seconds, which is then increased by 30 seconds after each subsequent reinforcement.

**progressive lipodystrophy** see LIPODYSTROPHY.

**Progressive Matrices** see RAVEN’S PROGRESSIVE MATRICES.

**progressive muscle relaxation** see PROGRESSIVE RELAXATION.

**progressive muscular atrophy** see SPINAL MUSCULAR ATROPHY.

**progressive myopia** see MYOPIA.

**progressive-ratio schedule (PR schedule)** in conditioning, an arrangement in which each reinforcer is presented on the completion of a particular number of responses and the number of responses required increases after each reinforcement. The amount by which the number increases can be determined by any of various functions, although most commonly the number increases by a fixed amount from reinforcement to reinforcement. Progressive-ratio schedules are often used to measure the effectiveness of reinforcers.

**progressive relaxation** a technique in which the individual is trained to relax the entire body by becoming aware of tensions in various muscle groups and then relaxing one muscle group at a time. In some cases, the individual consciously tenses specific muscles or muscle groups and then releases tension to achieve relaxation throughout the body. Also called Jacobson relaxation method: progressive muscle relaxation. [developed by U.S. physician Edmund Jacobson (1888–1933)]

**progressive spinal muscular atrophy** see SPINAL MUSCULAR ATROPHY.

**progressive supranuclear palsy** a progressive neurological disorder usually starting in the 6th decade of life and characterized by OCULOMOTOR PALSY, with downward gaze particularly affected. The condition may be accompanied by PARKINSONISM, postural instability, speech and swallowing difficulties, DYSTONIA, personality changes, and typically mild cognitive impairment. Pathology often shows loss of neurons and gliosis in various regions of the brainstem, basal ganglia, and midbrain. Also called Steele–Richardson–Olszewski syndrome; supranuclear palsy.

**progressive teleologic regression** the purposive return of a person with schizophrenia to the PRIMARY PROCESS level, in an attempt to avoid tension, stress and anxiety, and a self-image that has become bizarre, threatening, and frightening. The regression is progressive because it fails to accomplish its purpose and becomes more extreme. [first described by Italian-born U.S. psychiatrist Silvano Arieti (1914–1982)]

**projected jealousy** a type of behavior in which individuals who are unfaithful, or who repress impulses to be unfaithful, accuse their partners of infidelity, thereby projecting their own impulses.

**Project Follow Through** a U.S. government-funded program to develop and evaluate a variety of effective models for educating primary-school children from low-income families. A complement to HEAD START, Project Follow Through began in 1967, involved more than 100,000 students, and lasted 10 years. Direct instruction was shown by various measures of achievement, cognitive skills, and self-esteem to be the most effective method of teaching. Psychologists had major responsibilities in all phases of Project Follow Through: planning the project, administering it, designing and implementing programs, reviewing and critiquing the total effort, and evaluating outcomes.

**Project Head Start** see HEAD START.

**projection** n. 1. in psychoanalytic and psychodynamic theories, the process by which one attributes one’s own individual positive or negative characteristics, affects, and impulses to another person or group. This is often a defense mechanism in which unpleasant or unacceptable impulses, stressors, ideas, affects, or responsibilities are attributed to others. For example, the defense mechanism of projection enables a person conflicted over expressing anger to change “I hate him” to “He hates me.” Such defensive patterns are often used to justify prejudice or evade responsibility; in more severe cases, they may develop into paranoid delusions in which, for example, an individual who blames others for his or her problems may come to believe that those others are plotting against him or her. In classical psychoanalytic theory, projection permits the individual to avoid seeing his or her own faults, but modern usage has largely abandoned the requirement that the projected trait remain unknown in the self. 2. in linear algebra and EXPLORATORY FACTOR ANALYSIS, the mapping of a set of points in multidimensional space. →_projection_ vb.

**projection area** an area of the cerebral cortex that receives inputs from a particular sense organ. Each sense sends messages to two or more projection areas.

**projection fiber** a nerve fiber that carries impulses from the cerebral cortex to subcortical structures (e.g., the thalamus, hypothalamus, basal ganglia).

**projection neuron** a neuron with a long axon extending some distance from the cell body. Also called Golgi Type I neuron. Compare LOCAL CIRCUIT NEURON.

**projective device** in consumer psychology, a word-association technique used in MOTIVATION RESEARCH. Key words are mixed with neutral background words and individuals are asked to make associations without being aware of which terms are the key words. Such techniques
projective doll play

enable advertisers to learn which words are likely to be most attractive to consumers when used in advertising copy. Some versions also include cartoon characters or scenes for which individuals are asked to provide a dialogue.

**projective doll play** see DOLL PLAY.

**projective play** a variation of PLAY THERAPY in which dolls and other toys are used by children to express their feelings, which can be helpful in diagnosing mental disturbances.

**projective psychotherapy** a treatment procedure in psychotherapy in which selected responses on various projective tests are fed back to the client, who associates with them in much the same way that psychoanalytic patients make FREE ASSOCIATIONS. [developed by U.S. psychologist Molly Harrower (1906–1999)]

**projective technique** any assessment procedure that consists of a series of relatively ambiguous stimuli designed to elicit unique, sometimes highly idiosyncratic, responses that reflect the personality, cognitive style, and other psychological characteristics of the respondent. Examples of this type of procedure are the RORSCHACH INKBLOT TEST and the THAMATIC APPERCEPTION TEST, as well as sentence-completion, word-association, and drawing tests. The use of projective techniques has generated considerable discussion among researchers, with opinions ranging from the expressed belief that personality assessment is incomplete without data from at least one or more of these procedures to the assertion that such techniques lack important psychometric features such as RELIABILITY and VALIDITY. Also called projective method.

**project method** a teaching structure in which students work alone or together to initiate, develop, and carry out learning projects with a minimal amount of direct guidance from the teacher.

**project team** see CROSS-FUNCTIONAL TEAM.

**prolactin** n. a PEPTIDE hormone both synthesized and released into the bloodstream by specialized cells in the anterior PITUITARY GLAND called lactotrophs. Although generally known for its originally described role in initiating and maintaining LACTATION—prolactin levels rise significantly in women during pregnancy, stimulating the MAMMARY GLANDS to grow and subsequently produce milk—prolactin also performs many other essential reproductive, homeostatic, and behavioral functions in both sexes. These include such activities as preserving the CORPUS LUTEUM and enhancing its secretion of PROGESTERONE, modulating sexual arousal and the orgasmic REFRACTORY PHASE, influencing SPERMATOGENESIS, regulating PROSTATE gland development, regulating the IMMUNE RESPONSE, regulating water and electrolyte concentrations (OSMOREGULATION), modulating OLIGODENDRYCTE precursor production, and inhibiting EXTRAMETABOLISM. Prolactin also is associated with mammalian and avian parental behavior, with prolactin variation possibly explaining individual differences in parental choices and the initiation of parental interactions. Given such versatility of action, it is not surprising that prolactin receptors are found throughout the body, including within the HYPOTHALAMUS, HIPPOCAMPUS, AMYGDALA, and other areas of the central nervous system; the THYMUS and LYMPHOCYTES of the immune system; and the liver, kidney, prostate, testis, ovary, uterus, mammary glands, and numerous other organs. Also called lactogenic hormone: lactotropic hormone: lactotropin; luteotropic hormone (LTH); luteotropin.

**prolapsed intervertebral disk** see SLIPPED DISK.

**pro-life** adj. denoting a position or social movement that opposes or aims to limit the right to legal abortion, often on religious grounds. Compare PRO-CHOICE.

**proliferation** n. rapid reproduction or multiplication, particularly of new or diseased cells. Both benign and malignant tumors, for instance, experience a high rate of cell division and growth.

**Prolixin** n. a trade name for FLUPHENAZINE.

**PROLOG** n. PRO(gramming) LOG(ic): a high-level computer language that is important in ARTIFICIAL INTELLIGENCE research. Inference in PROLOG is a form of deduction but is not mathematically sound due to several pragmatic compromises, including the use of “cut” to control backtracking and “negation” as the failure to find correct results. A strength of the language is a powerful pattern matcher based on unification, for use in PRODUCTION SYSTEM applications.

**prolonged exposure therapy** a form of COGNITIVE BEHAVIOR THERAPY for posttraumatic stress disorder in adults. Based on EMOTIONAL PROCESSING THEORY, it is a brief treatment, involving 9 to 12 sessions of 60 to 90 minutes each conducted once or twice weekly. The first two sessions are devoted to information gathering, explanation of treatment rationale, treatment planning, and BREATHING RETRAINING. During the remaining sessions, clients relive their traumatic experiences by imagining them as vividly as possible and describing them aloud in the present tense (i.e., IMAGINAL EXPOSURE), including their thoughts, feelings, and physical sensations at the time. These narratives are recorded, and clients are instructed to listen to the recordings as homework. They are also instructed to confront, as homework, situations and stimuli that trigger distressing memories and thoughts and then have been avoided (i.e., IN VIVO EXPOSURE). The homework assignments and imaginal exposure are reviewed in session: Clients discuss their emotions, cognitions, and other responses to the activity, while the therapist uses nondirective statements to validate and normalize the clients’ experiences and reactions. The exposure exercises are intended to teach clients that traumatic memories are in fact not harmful and that they can cope with them; the in-session discussion seeks to help clients change their erroneous beliefs about the trauma and reevaluate their feelings about
promethazine n. a PHENOTHIAZINE used for the treatment of nausea, motion sickness, and allergies and as a sedative. Its mechanism of action includes blockade of H1 HISTAMINE receptors and of dopamine receptors in the MESOLIMBIC SYSTEM. U.S. trade name: Phenergan.

promiscuity n. transient, casual sexual relations with a variety of partners. In humans, this type of behavior is generally regarded unfavorably; however, it has been argued that there can be healthy promiscuity in the simple enjoyment of casual, consensual, nonexploitative relationships. Among nonhuman animals, bonobos (pygmy chimpanzees) engage in frequent sexual activity both between and within sexes in exchange for resources (e.g., food) or to calm tensions. In many species, females appear to display promiscuity to prevent CERTAINTY OF PATERNITY but often mate with the most dominant or successful male at the time when conception is most likely. —promiscuous adj.

prompt n. see RETRIEVAL CUE.

prompting n. in psychotherapy, suggesting or hinting at topics by the therapist to encourage the client to discuss certain issues. Prompting may include reminding the client of previously discussed material, tying previously discussed topics together, or finishing a sentence or thought for the client to aid in his or her understanding of an issue.

pronation n. 1. the act of turning the arm and hand so that the palm faces downward and the two long bones of the forearm are crossed, or the condition resulting from this action. 2. the act of turning the foot so that the sole faces outward and the lateral (outer) margin is raised (as in walking on the inside of one’s feet), or the condition resulting from this action. 3. the state or condition of being prone (see POSTURE). Compare SUPINATION. —pronate vb.

prone adj. see POSTURE.

pronoun n. in linguistics, a word that substitutes for a noun, noun phrase, or larger nominal unit, usually to avoid repetition. English pronouns include the personal pronouns (I, you, she, etc.), the demonstrative pronouns (this, that, etc.), and the relative pronouns (that, which, etc.). See ANAPHORA; ANTECEDENT. —pronomial adj.

pronoun reversal a speech phenomenon observed in children with AUTISM, in which the child refers to himself or herself in the second or third person (e.g., you, him, she) while identifying others by first-person pronouns (e.g., me). Also called pronominal reversal.

proof n. 1. the establishment of a proposition or theory as true, or the method by which it is so established. There is much debate as to whether propositions or theories can ever be truly proven. In logic and philosophy, even a valid argument can be untrue if its first premise is false. For example, it is a valid argument to say that All trees are pines: I have a tree in my garden: Therefore my tree is a pine. In empirical sciences such as psychology, both logical and methodological problems make it impossible to prove a theory or hypothesis true. Disciplines that rely on empirical science must settle for some type of PROBABILITY based on empirical support of its theories and hypotheses. See also FALSIFIABILITY. 2. in mathematics and logic, a sequence of steps formally establishing the truth of a theorem or the validity of a proposition. 3. in law, evidence that establishes and supports the truth of claims made by either party in a dispute. Only evidence presented at trial can constitute proof; the TRIER OF FACT must then decide whether such evidence constitutes adequate proof. In criminal cases, the standard of proof required to obtain a conviction is proof BEYOND REASONABLE DOUBT.

proofreader’s illusion a visual error in which a mis-spelling, omission, extra letter, transposition, or the like is overlooked, owing to TOP-DOWN PROCESSING in which the context and other cues outweigh the impact of the word or phrase as literally spelled or misspelled.

propiomelanocortin (POMC) n. a protein, synthesized in the pituitary gland, that is the precursor of several hormones. It can be cleaved by enzymes at different positions to yield biologically active compounds, including BETA-ENDORPHIN, ALPHA-MELANOCTYE STIMULATING HORMONE, and CORTICOTROPIN.

propaedeutic n. 1. introductory instruction provided by a teacher to a student before formal instruction of a full concept or idea begins. 2. an introduction to any art or science.

propaganda n. a method of social control that attempts to strengthen or change the beliefs, attitudes, and actions of others by presenting highly biased information or sometimes DISINFORMATION. It usually involves an appeal to emotion that is designed to win support for an idea or course of action or to belittle or disparage the ideas or programs of others. See also CARD-STacking; FEAR APPEAL; GLITTERING GENERALITIES; SUBLIMINAL PROPAGANDA.

propaganda analysis a study of the techniques, appeals, content, and effectiveness of propaganda.

propanediol n. any of a group of chemically related compounds derived from propyl alcohol and originally developed as antianxiety drugs. Their pharmacological actions include muscle relaxation, depression of the central nervous system, and a calming effect through interference with autonomic reactions. The prototype of the group is MEPROMATE. Due to their toxicity in overdose, propanediols have largely been supplanted as anxiolytics by benzodiazepines and other sedative-hypnotics; CARISOPRODOL, a precursor of mepromilate, is currently used as a muscle relaxant.

propensity n. a strong tendency toward a behavior or action.

prophase n. the first stage of cell division, during which chromosomes shorten and thicken, dividing along their length into chromatids, and the nuclear envelope dissolves. In MEIOSIS, homologous pairs of chromosomes associate to form bivalents (pairs).

prophecy formula see SPEARMAN–BROWN PROPHECY FORMULA.

prophylactic maintenance see MAINTENANCE THERAPY.

prophylactic surgery the removal of an organ prior to the expected onset of cancer in that organ, usually because the individual has a POSITIVE FAMILY HISTORY of the disease or is a CARRIER of a predisposing mutation. For example, women who carry mutations in genes BRCA1 or BRCA2 (see BRCA1 and BRCA2) or PS3 are at greatly increased risk of breast and ovarian cancer and may consider prophylactic surgery. Prophylactic mastectomy is the surgical re-
mortal or both breasts prior to a diagnosis of breast cancer. Prophylactic ovariectomy is the surgical removal of the ovaries prior to a diagnosis of ovarian cancer. Prophylactic thyroidectomy is the surgical removal of the thyroid gland prior to the onset of medullary thyroid cancer in individuals at increased risk for MEN2 (multiple endocrine neoplasia, Type 2), a hereditary cancer syndrome. The emotional impact of prophylactic surgery in such patients is under study.

**prophylaxis** n. the use of methods or procedures designed to avoid or prevent mental or physical disease or disorder. —prophylactic adj., n.

**propinquity** n. the physical and sometimes psychological nearness of two or more people to each other, an element in the formation of close relationships. See also PROXEMICS.

**propinquity effect** the tendency of individuals to form close relationships with people they repeatedly encounter. That is, the more often one comes into contact with another person, the more likely it is that one will form a friendship or romantic relationship with that person. For example, next-door neighbors often are friends with one another, as are classmates and coworkers, respectively. The propinquity effect possibly is related to the MERE-EXPOSURE EFFECT, first theorized in 1950 by U.S. psychologists Leon Festinger and Stanley Schachter and Austrian-born U.S. sociologist Kurt Wolfgang Back (1920–1999), following a study of students living in the Westgate Apartments at the Massachusetts Institute of Technology.

**proportional** adj. having a constant ratio between quantities, such that the overall relationship does not change. For example, consider a researcher who is examining the differences between two treatments among males and females as follows: 10 males in Treatment A and 20 males in Treatment B; 20 females in Treatment A and 40 females in Treatment B. Although there are unequal numbers of people in each treatment condition, the ratio or proportion between them remains the same—twice as many females as males. In UNBALANCED DESIGNS, the presence or absence of such proportional cell frequency is critical to a researcher’s choice of analytic strategy.

**proportional hazards model** see COX REGRESSION ANALYSIS.

**proportional sampling** a form of STRATIFIED SAMPLING in which one draws cases for study from certain groups (e.g., gender, race/ethnicity) in the proportions that are observed in the larger population. For example, if a university has 60% female students and 40% male students, a researcher would obtain a sample comprising the same percentages or proportions, such as 120 females and 80 males in a 200-student subset. Also called proportionalate sampling.

**proportion of variance index** any of several measures describing the amount of variability in an outcome variable that is explained by the independent variables. In MULTIPLE REGRESSION, for example, the COEFFICIENT OF MULTIPLE DETERMINATION is a commonly used proportion of variance index.

**proposita** n. a female PROBAND. Compare PROPOSITUS.

**proposition** n. 1. in philosophy, anything that can be asserted or denied and that is capable of being either true or false; that is, the content of a typical declarative sentence, such as Grass is green or Lenin was a great man. 2. in linguistics, a formal statement representing the underlying meaning of a sentence or sentence component, irrespective of its form. For example, the sentences I scored the goal and The goal was scored by me represent the same proposition, as would a translation of either sentence into a different language. —propositional adj.

**propositional analysis** the system of SYMBOLOGIC LOGIC that is concerned only with the logical relationships between propositions as wholes, and not with relationships between the elements within individual propositions. Also called propositional calculus. Compare PREDICATE ANALYSIS.

**propositional knowledge** the abstract representation of knowledge, words, or images. Propositions are the smallest units of meaningful thought, and knowledge is represented as a series of propositional statements or as a network of interconnected propositions.

**propositional network** a diagram in which the terms of a proposition and the relations between them are represented as nodes linked to form a network.

**propositus** n. a male PROBAND. Compare PROPOSITA.

**propoxyphene** n. a synthetic OPIOID ANALGESIC that has approximately half the pain-control efficacy of codeine. It was generally marketed in combination with a nonsteroidal anti-inflammatory agent, such as aspirin, for the management of moderate pain. In 2010, it was withdrawn from the U.S. market due to its risk of causing potentially fatal arrhythmia. Former U.S. trade names: Darvocet (in combination with acetaminophen); Darvon.

**propranolol** n. a beta blocker used primarily to treat hypertension. In low doses, it is used as an adjunctive agent in the treatment of certain forms of social phobia, such as fear of public speaking or performance, predominantly due to its ability to control certain peripheral symptoms of anxiety, such as tremor and vocal quavering. Because it produces a nonspecific blockade of BETA-ADRENERGIC RECEPTORS, it should not be taken by individuals with asthma or reactive airway disease, due to its ability to constrict bronchial smooth musculature and thereby induce breathing difficulties. U.S. trade name: Inderal.

**propriate striving** the final stage in the development of the PROPRION. According to Gordon W. Allport, who originated the concept, propiate striving emerges in adolescence with the search for identity and includes the experimentation common to adolescents before making long-range commitments. In contrast to childhood, adolescence is considered especially significant as the time when conscious intentions and future-oriented planning begin to motivate the personality.

**proprietary drug** any chemical used for medicinal purposes that is formulated or manufactured under a name that is protected from competition by TRADEMARK or patent. The ingredients, however, may be components of generic drugs that have the same or similar effects.

**propriety standards** the legal and ethical requirements of an evaluation research study. These standards include having formal or written agreements between parties in the study, protecting the rights of participants, avoiding conflicts of interest by both program evaluators and participants, conducting complete and fair program assessments, fully reporting all findings, and maintaining fiscal soundness. See also ACCURACY STANDARDS; FEASIBILITY STANDARDS; UTILITY STANDARDS.
**propiroception** *n.* the sense of body movement and position, resulting from stimulation of PROPRIOCEPTORS located in the muscles, tendons, and joints and of VESTIBULAR RECEPTORS in the labyrinth of the inner ear. Proprioception enables the body to determine its spatial orientation without visual clues and to maintain postural stability. Also called **propiroceptive sense.** —**propiroceptive** *adj.*

**propiroceptive stimulus** a stimulus that arises from within an organism based on stimulation from PROPRIOCEPTORS, the receptors that detect body position. Compare EXTEROCEPTIVE STIMULUS; INTEROCEPTIVE STIMULUS.

**propiroceptor** *n.* a receptor that is sensitive to body movement and position, including motion of the limbs. Examples are MUSCLE SPINDLES and GOLGI TENDON ORGANS. See PROPRIOCEPTION.

**proprium** *n.* a concept of the self—or that which is consistent, unique, and central in the individual—that was developed by Gordon W. ALLPORT. According to Allport, the proprium incorporates body sense, self-identity, self-esteem, self-extension, rational thinking, self-image, PROPRIATE STRIVING, and knowing.

**propulsive gait** see FESTINATING GAIT.

**prosencephalon** *n.* see FOREBRAIN.

**prosocial** *adj.* denoting or exhibiting behavior that benefits one or more other people, such as providing assistance to an older adult crossing the street. Compare ALTRUISM; HELPING.

**prosocial aggression** any act of instrumental AGGRESSION that has socially constructive and desirable consequences, such as intervening to prevent a theft or demonstrating against an unjust regime. Compare ANTISOCIAL AGGRESSION.

**prosodic** *adj.* see SUPRASEGMENTAL.

**prosody** *n.* a phonological feature of speech, such as stress, intonation, intensity, or duration, that pertains to a sequence of PHONEMES rather than to an individual SEGMENT. See PARALANGUAGE; SUPRASEGMENTAL.

**ProSom** *n.* a trade name for ESTAZOLAM.

**prosopagnosia** *n.* a form of VISUAL AGNOSIA in which the ability to perceive and recognize faces is impaired, whereas the ability to recognize other objects may be relatively unaffected. The term was originally limited to impairment following acute brain damage, but a congenital form is now recognized. Prosopagnosia can be distinguished from PROSOPAMNESIA, which is an abnormal difficulty in remembering faces, even though they are perceived normally: The condition may be congenital or acquired.

**prospective memory** remembering to do something in the future, such as taking one’s medicine later. Prospective memory contrasts with RETROSPECTIVE MEMORY, or remembering past events.

**prospective research** research that starts with the present and follows participants forward in time to examine trends, predictions, and outcomes. Examples include randomized experiments and LONGITUDINAL DESIGNS. Also called **prospective study.** Compare RETROSPECTIVE RESEARCH.

**prospective sampling** a sampling method in which cases are selected for inclusion in experiments or other research on the basis of their exposure to a risk factor. Participants are then followed to see if the condition of interest develops. For example, young children who were exposed to lead in their drinking water and those who were not exposed to this risk factor could be included in a study and then followed through time to assess health problems that emerge when they are adolescents. Compare RETROSPECTIVE SAMPLING.

**prospective validity** see PREDICTIVE VALIDITY.

**prospect theory** a theory of decision making that attempts to explain how people’s decisions are influenced by their attitudes toward risk, uncertainty, loss, and gain. In general, it asserts that people are influenced by a systematic inability to evaluate probabilities correctly and in most cases are motivated more strongly by the fear of loss than by the prospect of making the equivalent gain. See ANTICIPATORY REGRET; REGRET THEORY. See also MENTAL ACCOUNTING. [Formulated by Daniel KAHNEMAN and Amos TVERSKY]

**prostaglandin (PG)** *n.* any of a group of chemically related substances that act as local hormones in animal tissue and cause a variety of physiological effects. There are several basic types, designated by capital letters with subscript numbers indicating the degree of saturation of fatty acid side chains (e.g., PGE2, PGH2). Among their many activities, they influence blood pressure, cause stimulation of smooth muscle, and promote inflammation.

**prostate** *n.* a gland in male mammals, walnut-sized in humans, that surrounds the urethra immediately beneath the urinary bladder. It secretes a thin, alkaline fluid that increases in volume during sexual stimulation and becomes part of semen during ejaculation.

**prosthesis** *n.* (pl. prostheses) an artificial device that is attached to or implanted in the body to replace a missing body part or to improve a dysfunctional one. Prostheses include artificial limbs, artificial joints, and plastic heart valves. Recent work has produced neuroprosthetic devices that allow, for example, control of prosthetic limbs through voluntary neural impulses. Also called **prosthetic device.** —**prosthetic** *adj.*

**prosthetics** *n.* a medical specialization concerned with the design and construction of artificial body parts. Compare ORTHOTICS.

**Prostigmin** *n.* a trade name for NEOSTIGMINE.

**prostitution** *n.* a sex service that is based on the payment of money or the exchange of other property or valuables. Prostitution may involve heterosexual or same-sex services provided by male or female PROSTITUTES. The service may be simple coitus, other common sexual acts (e.g., fellatio, cunnilingus, masturbation), or acts leading to gratification of PARAPHILIAS.

**prot-** combining form see PROTO-.

**protagonist** *n.* in PSYCHODRAMA, the person selected as the central character in the drama.

**protanomaly** *n.* a type of red color blindness in which the red-sensitive retinal cones do not function normally, although some red sensitivity may be present.

**protanopia** *n.* red–green color blindness in which the red-sensitive retinal cones do not function normally, though some red sensitivity may be present. See also DEUTERANOPA.
The protean career is a career pattern that is characterized by a high degree of mobility between organizations, functions, and settings and that is shaped primarily by the needs, goals, and choices of the individual rather than by any external structure. The protean career is often contrasted with the organizational career, in which an individual makes a long-term commitment to an organization in return for an implied promise of job security and steady advancement.

The protected class under U.S. antidiscrimination law, groups that cannot be unfairly excluded from some process or opportunity (e.g., in job hiring, education, housing) on the basis of sex, age, familial status, race, ethnicity, religion, national origin, physical or mental handicap, or prior military service.

The protected relationship any professional provider–client contact that is subject to ethical standards regarding confidentiality of records and other information provided by the client, information about sessions with the client, and the existence of the relationship itself.

The protected t test see FISHER LEAST SIGNIFICANT DIFFERENCE TEST.

The protective factor a clearly defined behavior or constitutional (e.g., genetic), psychological, environmental, or other characteristic that is associated with a decreased probability that a particular disease or disorder will develop in an individual, that reduces the severity of an existing pathological condition, or that mitigates the effects of stress generally. For example, exercising regularly can serve as a protective factor by decreasing the likelihood or severity of coronary heart disease, hypertension, and depression. Likewise, supportive social networks and positive coping skills are examples of protective factors that reduce the effects of stressful life events and enhance mental health. Compare RISK FACTOR.

The protective reflex the reflex withdrawal of the body or a part away from painful or annoying stimulation. Also called protective response.

The protein a molecule that consists of a long-chain polymer of AMINO ACIDS. Proteins are involved in virtually every function performed by a cell; they are the principal building blocks of living organisms and, in the form of ENZYMES, the basic tools for construction, repair, and maintenance. Proteins play an essential role in human nutrition, including the provision of all of the essential amino acids that humans cannot produce themselves. PROTEIN DEFICIENCY leads to a variety of symptoms and conditions. Excess protein can cause overreaction of the immune system and liver dysfunction and is implicated in obesity. See also PEPTIDE.

The protein deficiency lack of a normal quantity of proteins in the diet or body tissues. It may lead to fatigue, retarded growth, loss of muscle mass, hair loss, insulin resistance, and hormonal irregularities. It may occur as a result of a lack of carbohydrates or fats in the diet, a condition that causes the body to consume its own proteins as a source of energy. If this self-digestion process is not controlled, irreversible damage to vital organs results. See also KWASHIORROR; MARASMUS.

The protein hormone any of a class of substances secreted into the bloodstream that regulate processes in distant target organs and tissues and that consist of a long-chain polymer of AMINO ACIDS. Examples are PARATHYROID HORMONE, PROLACTIN, GROWTH HORMONE, and INSULIN.

The protein kinase any of a class of enzymes that add one or more phosphate groups (PO₄) to protein molecules.

The protein metabolism all the biochemical reactions involved in the manufacture and breakdown of proteins. The body makes a large variety of complex proteins from AMINO ACIDS, including enzymes, antibodies, certain hormones (e.g., insulin), and structural proteins, such as keratin, collagen, and the actin and myosin molecules of muscle. Proteins are broken down into their constituent amino acids during the basic turnover of cell proteins as well as for the elimination of toxic peptides and abnormal proteins. In case of severe energy starvation, with depletion of the body’s fat reserves, protein can be broken down to provide carbon to make glucose, but this impairs normal body functions.

The protensity n. the temporal attribute of a mental process: temporality (i.e., duration spread) considered as an essential aspect of all conscious experience. [introduced by Immanuel KANT]

The Protestant work ethic see WORK ETHIC.

The Proteus syndrome a rare genetic disorder characterized by excessive and asymmetric growth of bones, skin, or organs. The overgrowth becomes evident in infants after about 6 months of age and progresses in severity with age. Neurological symptoms may be present, including intellectual disability, seizures, and vision loss. Proteus syndrome is caused by a random mutation in the AKT1 gene and is not inherited. Also called Wiedemann syndrome. See ELEPHANT MAN’S DISEASE. [after the Greek god of the sea, PROTEUS, who could change his shape at will]

The prothetic adj. describing a sensory dimension along which stimuli vary in degrees of magnitude or quantity but not in quality. Compare METATHETIC.

The proto- (prot-) combining form 1. ancestral or original (e.g., PROTOCOLANGUAGE). 2. first (e.g., PROTOANOPIA).

The protocol n. 1. the original notes of a study or experiment recorded during or immediately after a session or trial, particularly as recorded from participant’s verbalizations during the process. See also RESEARCH PROTOCOL; VERBAL PROTOCOL. 2. a case history and WORKUP. 3. a treatment plan.

The protocol analysis a methodology in which people are encouraged to think out loud as they perform some task. Transcripts of these sessions (THINK-ALOUD PROTOCOLS) are then analyzed to investigate the cognitive processes underlying performance of the task. Also called verbal protocol analysis.

The protolanguage n. in GENETIC LINGUISTICS, a posited common ancestor of the members of a language family. Most protolanguages have been partially reconstructed through comparison among different members of a language family. The most celebrated protolanguage is Proto-Indo-European, the unrecorded prehistoric language that is presumed to be the ancestor of all Indo-European languages. See SOUND CHANGE.

The protopathic adj. denoting or relating to peripheral nerve fibers responsive to gross sensory stimulation, particularly pain, temperature extremes, and strong touch. Compare EPICRITICAL.

The protoplasm n. all the living contents of a cell, consisting of the CYTOPLASM and NUCLEOPLASM. —protoplasmic adj.

The prototypal approach to classification the process
of classifying abnormal behavior on the assumption that there are combinations of characteristics (prototypes of behavior disorders) that tend to occur together regularly.

**prototype** n. 1. In CONCEPT FORMATION, the best or average exemplar of a category. For example, the prototypical bird is some kind of mental average of all the different kinds of birds of which a person has knowledge or with which a person has had experience. 2. more generally, an object, event, or person that is held to be typical of a category and comes to represent or stand for that category. See prototype model.

**prototype model** a theory of CATEGORIZATION proposing that people form an average of the members of a category and then use the average as a prototype for making judgments about category membership.

**prototypicality** n. the degree to which something is typical or exemplary of the category to which it belongs.

**protriptyline** n. see TRICYCLIC ANTIDEPRESSANT.

**Proust phenomenon** the sudden, involuntary evocation of an AUTobiographical memory, including a range of related sensory and emotional expressions. The term is named for French writer Marcel Proust (1871–1922), who described, in the first section of his multivolume novel A la recherche du temps perdu (In Search of Lost Time), how the experience of eating a madeleine (a small, shell-shaped sponge cake) transported him into memory back to childhood. Also called Proustian memory. See involuntary retrieval; recollection; redintegration.

**proverb** test a verbal test in which the participant attempts to explain the meaning of proverbs. The test is used most often to measure intelligence but has also been used to measure wisdom.

**provider** n. a professional (e.g., physician, psychologist) or facility (e.g., hospital, skilled nursing facility) that provides health care services to patients. See primary care provider. See also PPO, preferred provider arrangement.

**Provigil** n. a trade name for MODAFINIL.

**provocative testing** any type of testing in which symptoms of a condition are intentionally caused or reproduced in a patient or another person present for evaluation. This can be done to test the effectiveness of treatments for the condition, to rule in or rule out the possibility of a similar diagnosis, or in the case of psychological disorders, to test the veracity of the condition. For example, provocative testing has been used somewhat controversially in distinguishing nonepileptic seizures from neurologically based epileptic seizures.

**provocative victim** a target of bullying who is likely to be aggressive himself or herself and to respond aggressively to bullying behavior. [First described in 1973 by Swedish psychologist Dan Olweus (1931– )]

**proxemics** n. the study of interpersonal spatial behavior. Proxemics is concerned with TERRITORIALITY, INTERPERSONAL DISTANCE, spatial arrangements, CROWDING, and other aspects of the physical environment that affect behavior.

**proximal** adj. 1. situated near or directed toward the trunk or center of an organism. 2. near or mostly closely related to the point of reference or origin. Compare distal.

**proximally** adv.

**proximal response** a response that occurs within an organism (e.g., a glandular or muscular response). Compare distal response.

**proximal stimulus** the physical energy from a stimulus as it directly stimulates a sense organ or receptor, in contrast to the distal stimulus in the actual environment. In reading, for example, the distal stimulus is the printed page of a book, whereas the proximal stimulus is the light energy reflected by the page that stimulates the photoreceptors of the retina.

**proximate cause** the most direct or immediate cause of an event. In a CAUSAL CHAIN, it is the one that directly produces the effect. For example, the proximate cause of Smith’s aggression may be an insult, but the remote cause may be Smith’s early childhood experiences. In law, proximate cause is important in liability cases where it must be determined whether the actions of the defendant are sufficiently related to the outcome to be considered causal, or if the actions set in motion a chain of events that led to an outcome that could have been reasonably foreseen.

**proximate explanation** an explanation for behavior in terms of physiological mechanisms or developmental experiences. Compare ultimate explanation.

**proximity** n. one of the gestalt principles of organization. It states that people tend to organize objects close to each other into a perceptual group and interpret them as a single entity. Also called law (or principle) of proximity.

**proximity compatibility** in ergonomics, a design principle stating that a control should be placed next to or close to the area of the display that is activated by the control. See also display–control compatibility.

**proximodistal** adj. from the central to the peripheral. The term typically is used in the context of maturation to refer to the tendency to acquire motor skills from the center outward, as when children learn to move their heads, trunks, arms, and legs before learning to move their hands and feet. Compare cephalocaudal.

**proxy variable** a variable, b, used in place of another, a, when b and a are substantially correlated but scores are available only on variable b. often because of the difficulty or costs involved in collecting data for variable a. In other words, b is a substituted measure of a. For example, rather than reporting the precise income levels of their parents or guardians, survey respondents instead may be asked to indicate the highest level of education of each parent or guardian; in this case, education is a proxy for income. Also called surrogate variable.

**Prozac** n. a trade name for FLUOXETINE.

**PRP** abbreviation for PSYCHOLOGICAL REFRACTORY PERIOD.

**PRS** abbreviation for PERCEPTUAL REPRESENTATION SYSTEM.

**prudence** n. farsighted and deliberate concern for the consequences of one’s actions and decisions. It is a form of practical reasoning and self-management that resists the impulse to satisfy short-term pleasures at the expense of long-term goals. —prudent adj.

**prudery** n. the quality of being excessively modest or priggish, particularly in having a negative view of sexual matters. —prude n. —prudish adj.

**pruning** n. during various phases of brain development
prurient interest

through the onset of puberty, the process in which excess or redundant neurons and synaptic connections are eliminated to enable more efficient neural processing. See SYNAPTIC PRUNING.

prurient interest in obscenity law, a morbid, degrading, or excessive interest in sexual matters. Material is judged to be obscene only if it is held to appeal predominantly to a prurient rather than a nonprurient interest in sex.

pruritus n. itching that may result from physiological or psychological conditions. See also PSYCHOGENIC PRURITUS. —pruritic adj.

PSE 1. abbreviation for POINT OF SUBJECTIVE EQUALITY. 2. abbreviation for PRESENT STATE EXAMINATION.

pseudosthesia n. see PSEUDOSTHESIA.

pseudo- (pseud-) combining form false or spurious.

pseudoachondroplasia n. a form of short-limb autosomal dominant dwarfism that is usually diagnosed at 2 to 3 years of age. Individuals have normal head size and facial features, short arms and legs, a waddling walk, and early-onset osteoarthritis. Intelligence is not affected. It was once believed to be related to ACHONDROPLASIA, but without the characteristic enlarged head size seen in that disorder. Pseudoachondroplasia is now considered a separate disorder. Also called pseudoachondroplastic spondyloepiphysial dysplasia.

pseudoangina n. 1. chest pain that resembles the pain (angina pectoris) of a heart attack but for which there is no clinical evidence of heart disease. 2. chest pain that resembles angina pectoris but originates from damage to the spinal roots in the neck (cervical) region. Compression of the root of the seventh cervical nerve by a prolapsed intervertebral disk (see SLIPPED DISK) is commonly identified as the cause. Also called cervical angina. See NONCARDIAC CHEST PAIN.

pseudoasthma n. a physical condition with symptoms and findings that suggest asthma, although no organic basis can be found. Differences between pseudoasthma and true asthma are detected during physical examination. For example, the patient generally has difficulty breathing in rather than breathing out, the respiratory attack is resolved quickly rather than gradually, and the severity of the attack decreases in the presence of distraction rather than remaining constant.

pseudobulbar affect (PBA) a neurological disorder characterized by episodes of extreme emotional liability, particularly uncontrolled crying or laughter, that occurs in the absence of, or out of proportion to, a precipitating event. Pseudobulbar affect often accompanies other neurological disorders, such as Alzheimer’s disease, Parkinson’s disease, multiple sclerosis, amyotrophic lateral sclerosis, and stroke or other brain trauma. When manifested as excessive crying, it is often misdiagnosed and treated as depression.

pseudocholinesterase (PChE) n. a synonym of butyrylcholinesterase. See CHOLINESTERASE.

pseudochromesthesia n. see CHROMESTHESIA.

pseudocommunication n. distorted attempts at communication or vestiges of communication in the form of fragments of words, apparently meaningless sounds, and unfathomable gestures. The condition is sometimes observed in individuals with different types of schizophrenia.

pseudocommunity n. a group of real or imagined persons believed, in a persecutory delusion, to be organized for the purpose of conspiring against, threatening, harassing, or otherwise negatively focusing upon one. Also called paranoid pseudocommunity. [first described by 20th-century U.S. psychiatrist and clinical psychologist Norman A. Cameron]

pseudoconditioning n. in circumstances of CLASSICAL CONDITIONING, elicitation of a response by a previously neutral stimulus when it is presented following a series of occurrences of a conditioned stimulus. For example, after flinching in response to each of several presentations of electric shock, a person is likely to flinch if a loud tone is then presented.

pseudoconversation n. see COLLECTIVE MONOLOGUE.

pseudoconvulsion n. an older name for a type of NON-EPILEPTIC SEIZURE in which the person collapses and experiences muscular contractions, although other signs (e.g., pupillary signs, loss of consciousness, amnesia) are not observed.

pseudocyesis n. a condition in which a woman shows many or all of the usual signs of pregnancy when conception has not taken place. In some cases, the condition is psychogenic, whereas in others it is due to a medical condition (e.g., a tumor, an endocrine disorder). Also called false pregnancy; pseudopregnancy.

pseudodementia n. 1. deterioration or impairment of cognitive functions in the absence of neurological disorder or disease. The condition may occur, reversibly, in a major depressive episode—particularly among older adults, in which case the preferred term is dementia syndrome of depression—or as a psychological symptom of FACTITIOUS DISORDER. It may also occur as a result of a vitamin B deficiency or from delirium. 2. see GANSER SYNDROME.

pseudoephedrine (pseudephedrine) n. an alkaloid that is an active constituent of EPHEDRA and an ingredient in over-the-counter decongestants. Because it can be used in the manufacture of METHAMPHETAMINE, its sale is subject to legal restrictions and storage and record-keeping requirements.

pseudoepilepsy n. see NONEPILEPTIC SEIZURE.

pseudesthesia n. an illusory sensation, such as a feeling of irritation in a limb that has been amputated. Also called pseudesthesia. See PHANTOM LIMB.

pseudoforgiveness n. the external expression of forgiveness for an offender while still internally harboring anger, a desire for retribution, or other negative feelings toward the offender.

pseudogroup n. a group of participants in a research procedure who are led to believe that they are working on tasks together, although in fact they are working individually. This procedure is used to study the psychological effect of group membership.

pseudohallucination n. a vivid, nonpsychotic hallucination, usually visual, that the individual recognizes as hallucinatory.

pseudohermaphroditism n. a congenital abnormality in which one or more contradictions exist in the morphological criteria of sex characteristics. In female pseudohermaphroditism, the individual is a genetic and gonadal female with partial masculinization, such as an enlarged clitoris resembling a penis and labia majora re-
seemingly a scrotum. In male pseudohermaphroditism, the individual is a genetic and gonadal male with incomplete masculinization, including a small penis, perineal HYPOSPADIAS, and a scrotum that lacks testes. —pseudohermaphroditic adj.

pseudohermaphroditism n. See SILVER–RUSSELL SYNDROME.

pseudohydrocephalus n. See SILVER–RUSSELL SYNDROME.

pseudohypertrophic muscular dystrophy see MUSCULAR DYSTROPHY.

pseudohyoparathyroidism n. A condition that resembles hypoparathyroidism (deficiency of PARATHYROID HORMONE) but fails to respond to parathyroid hormone treatment. Patients have a round face and thick-set figure and seem to have impaired senses of smell and taste. In most cases, they have mild to moderate intellectual disability. The disease is believed to be due to a genetic defect that blocks normal response to parathyroid hormone by receptor tissues. See also ALBRIGHT’S HEREDITARY OSTEOEDEMOPHY.

pseudoidentification n. A DEFENSE MECHANISM in which individuals adopt or identify with the opinions, values, or orientations of others in order to protect themselves against attack or criticism.

pseudoinsonnia n. INSOMNIA reported by an individual who actually sleeps an adequate number of hours. The reason for reporting the complaint is often obscure and may involve a subtle misperception of sleep or dreaming of a sleepless night; pseudoinsonmia may also be a symptom of anxiety or depression.

pseudoisochromatic charts a set of color plates used for testing color vision. See HARDY–RAND–RITTLE PSEUDOISOCROMATIC PLATES; ISHIHARA TEST FOR COLOR BLINDNESS.

pseudologia fantastica a clinical syndrome characterized by elaborate fabrications, which are usually concocted to impress others, to get out of awkward situations, or to give the individual an ego boost. Unlike the fantasies of CONFEABULATION, these fantasies are believed only momentarily and are dropped as soon as they are contrary to evidence. Typical examples are the tall tales told to impress others, to get out of an awkward situation, or to give the individual an ego boost. Unlike the fantasies of CONFEABULATION, these fantasies are believed only momentarily and are dropped as soon as they are contrary to evidence. Typical examples are the tall tales told by people with antisocial personality disorder, although the syndrome is also found among malingerers and individuals with factitious disorders, neuroses, and psychoses. See also PATHOLOGICAL LYING.

pseudomemory n. A fake memory, such as a spurious recollection of events that never took place, as opposed to a memory that is merely inaccurate. Pseudomemory is a cause of particular concern when using hypnosis to help eyewitnesses retrieve memories (see HYPERMNESIA). It was formerly called PSEUDOMNESIA. See also CONFEABULATION; FALSE MEMORY; RECOVERED MEMORY.

pseudomutuality n. A family relationship that has a superficial appearance of mutual openness and understanding although in fact the relationship is rigid and depersonalizing. Family theories of schizophrenia and other forms of major psychopathology have identified pseudomutuality as a critical etiological factor.

pseudoneurological adj. Suggesting a neurological condition. The term is generally used in reference to SOMATIZATION DISORDER: According to DSM-IV-TR, at least one pseudoneurological symptom must be present in order to diagnose this disorder.

pseudoneurotic schizophrenia an outdated term describing a disorder characterized by all-pervasive anxiety and a wide variety of neurotic symptoms (persistent and irrational fears, obsessive thoughts, compulsive acts, dissociative states), with underlying psychotic tendencies (delusions, hallucinations, disorganized speech, thought, or behavior) that at times emerge very briefly, typically in response to stress (see MICROPYSYCHOSES). Pseudoneurotic schizophrenia is primarily considered to be a personality disorder rather than a type of schizophrenia, and individuals exhibiting such symptoms tend to be diagnosed with SCHIZOTYPAL PERSONALITY DISORDER or BORDERLINE PERSONALITY DISORDER. [described in 1949 by German-born U.S. psychiatrist Paul H. Hoch (1902–1964) and psychiatrist Phillip Polatin (1905–1980) and used in clinical practice and research for the next 25 years]

pseudonomania n. An abnormal urge to lie or to falsify information.

pseudoparalysis n. Loss of limb movement or limb power due to pain, with no identifiable structural or functional etiology within the nervous system.

pseudoparkinsonism n. See PARKINSONISM.

pseudopersonality n. A fictitious persona contrived by an individual in an effort to conceal facts about his or her true self from others.

pseudophone n. An instrument used in studying the localization of sound. It diverts to the left ear those sounds that would normally enter the right ear, and vice versa. [invented by Paul Thomas Young]

pseudoprecocious puberty see PRECOCIOUS PUBERTY.

pseudopregnancy n. See PSEUDOCYSIS.

pseudoprogidy n. An individual who develops an exceptionally high degree of skill or knowledge, usually at an early age and primarily as a result of overtraining by overzealous parents or teachers. Pseudoprogidies typically burn out at an early age.

pseudopsychology n. An approach to understanding or analyzing the mind or behavior that uses unscientific or fraudulent methods. Examples include PALMISTRY, PHYSIOLOGY, and PHYSIOGNOMY. See PSEUDOSCIENCE. See also PARAPSYCHOLOGY. —pseudopsychological adj.

pseudopsychopathic schizophrenia a disorder in which psychotic tendencies characteristic of schizophrenia are masked or overlaid by antisocial tendencies, such as pathological lying, sexual deviations, and violent or other uninhibited behavior. Pseudopsychopathic schizophrenia is primarily considered to be a personality disorder rather than a type of schizophrenia; individuals exhibiting such symptoms tend to be diagnosed with SCHIZOTYPAL PERSONALITY DISORDER or BORDERLINE PERSONALITY DISORDER.

pseudorandom adj. Describing a process that is close to being RANDOM but is not perfectly so. For example, so-called RANDOM NUMBER GENERATORS are often described as pseudorandom because their algorithms do not achieve the ideal of producing a flawlessly random process. Also called QUASIRANDOM.

pseudoretardation n. Slow intellectual development, usually consistent with mild intellectual disability, due to adverse cultural or psychological conditions rather than congenital factors. Among these conditions are maternal deprivation, intellectual impoverishment, severe emotional disturbance, and perceptual deficits. The term may be a
pseudoscience

misnomer as it can be applied to individuals whose performance is consistent with intellectual disability that may not be alleviated by educational intervention. Also called psychosocial mental retardation: psychosocial mental developmental delay.

pseudoscience n. a system of theories and methods that has some resemblance to a genuine science but that cannot be considered such. Examples include Astrology, Numerology, and esoteric Magic. Various criteria for distinguishing pseudosciences from true sciences have been proposed, one of the most influential being that of falsifiability. On this basis, certain approaches to psychology and psychoanalysis have sometimes been criticized as pseudoscientific, as they involve theories or other constructs that cannot be directly or definitively tested by observation (see Prediction: Risky Prediction). See also Parapsychology.—pseudoscientific adj.

pseudoscope n. an optical instrument designed to create visual illusions by transposing images between the left and right eyes and inverting distance relations so that solid objects appear hollow and hollow objects solid.

pseudoseizure n. see Nonepileptic seizure.

pseudosenility n. see reversible dementia.

pseudoword n. a pronounceable nonword, such as flirp. Unlike Nonsense syllables and trigrams, which are restricted to three letters and not necessarily pronounceable, pseudowords may be any length and must conform to orthographic and phonological conventions. Pseudowords are used both experimentally to study learning of items that do not already have meaning or associations with other information in memory and clinically to identify children with reading disabilities.

PSG abbreviation for Phrase-structure grammar.

psi n. 1. the Greek letter ψ. Often used to symbolize psychology. 2. the phenomena or alleged phenomena studied in Parapsychology, including extrasensory perception, precognition, and psychokinesis.

PSI 1. abbreviation for Parenting Stress Index. 2. abbreviation for Psychological Screening Inventory.

Psi Beta the national honor society in psychology for 2-year colleges in the United States, founded in 1981 and affiliated with the American Psychological Association in 1988. It promotes professional development through recognition of scholarship, leadership, research, and community service. Psi Beta is the sister honor society to Psi Chi.

Psi Chi the international honor society in psychology for senior colleges and universities, founded in the United States in 1929 to encourage, stimulate, and maintain excellence in scholarship and to advance the science of psychology. It consists of a federation of over 1,000 chapters and is affiliated with the American Psychological Association. It is the sister honor society to Psi Beta.

psi-hitting n. in parapsychology experiments, performance on a test that is significantly above chance expectations. Compare PSI-MISSING.

psilocin n. an indolealkylamine hallucinogen that is the principal psychoactive compound in “magic mushrooms” of the genus Psilocybe, which were used by the Aztecs for religious and ceremonial purposes. Psilocybin, first isolated in 1958, differs from psilocin only in having an additional phosphate group; it is rapidly metabolized in the body and converted to psilocin. Like other indolealkylamine hallucinogens (e.g., LSD, DMT), psilocin is active at various serotonin receptors: Agonism at 5-HT1A and 5-HT2A receptors in the cerebral cortex of the brain appears to be responsible for the psychoactive effects of these drugs.

psi-missing n. in parapsychology experiments, performance on a test that is significantly below chance expectations. Compare PSI-HITTING. See also consistent missing. psittacism n. the mechanical repetition of words, phrases, or ideas with no understanding of their meaning. [from Latin psittacus, “parrot”]

PSP abbreviation for Postsynaptic Potential.

PSST abbreviation for Problem-Solving Skills Training.

PST 1. abbreviation for Problem-Solving Therapy. 2. abbreviation for Psychological Skills Training.

psychache n. intense psychological pain that is sometimes thought to be a risk factor for suicide. [coined by Edwin S. Shneidman]

psychalgia n. 1. an obsolescent term denoting pain or discomfort, usually in the head, that accompanies mental activity of a psychiatric nature (e.g., obsessions, hallucinations) and that is identified by the patient as emotional in origin. 2. a nonspecific psychogenic pain disorder. Also called psychalgia. See also Algopsychalia: Psychic Pain. [coined in 1884 by Scottish psychiatrist Thomas Smith Clouston (1840–1915)]

psychasthenia n. an archaic term for any of the anxiety disorders. It is still in use as the name of one of the primary scales of the Minnesota Multiphasic Personality Inventory.

psychic n. in psychology, the mind in its totality, as distinguished from the physical organism. The term, which historically had come to refer to the soul or the very essence of life, derives from the character of Psyche in Greek mythology, a beautiful princess who, at the behest of her divine lover, Eros, son of Aphrodite, is made immortal by Zeus.

psychodelic drug see Hallucinogen; Phanerophyme.

psychodelic therapy the use of hallucinogens (or psychodelic drugs) in the treatment of some types of mental or physical illness. LSD was used in the 1950s and 1960s in combination with psychotherapy to assist patients in enhancing their awareness of cognitive and psychological processes; it was also used in the management of a number of significant conditions, such as schizophrenia and alcoholism. MDMA was similarly used in the 1980s. However, various studies revealed no lasting benefit; indeed, some patients claimed to have been harmed by such treatments. These findings, coupled with reclassification of these drugs as illegal, ended for a time the use of such agents in therapy. More recently, MDMA has been studied for a potential role in the treatment of posttraumatic stress disorder and inogaing for the treatment of substance dependence and withdrawal symptoms.

psychiatric classification the grouping of mental disorders and other psychological problems into diagnostic categories, as in the Diagnostic and Statistical Manual of Mental Disorders (see DSM-IV—TR; DSM-5) and in the International Classification of Diseases. Classification serves the purpose of organizing symptomatic states and abnormal functioning to enhance the treatment of disorders and
research aimed at understanding causes. Also called psychiatric nosology.

**psychiatric diagnosis** the diagnosis of mental disorders based on current systems of psychiatric classification. See also CLINICAL DIAGNOSIS.

**psychiatric disability** chronic loss or impairment of function due to a mental disorder, resulting in severe difficulties in meeting the demands of life.

**psychiatric disorder** see MENTAL DISORDER.

**psychiatric evaluation** 1. an assessment, based on present problems and symptoms, of an individual’s biological, mental, and social functioning, which may or may not result in a diagnosis of a mental illness. See PSYCHOLOGICAL EXAMINATION. 2. an assessment to determine legal competency. See FORENSIC ASSESSMENT. 3. an evaluation to determine the need for involuntary commitment, as in the case of an individual threatening suicide.

**psychiatric hospital** a public or private institution providing inpatient treatment to individuals with mental disorders. Also called mental hospital. See also PRIVATE MENTAL HOSPITAL; PSYCHIATRIC UNIT; PUBLIC MENTAL HOSPITAL.

**psychiatric illness** see MENTAL DISORDER.

**psychiatric nosology** see PSYCHIATRIC CLASSIFICATION.

**psychiatric nursing** a specialty within the field of nursing that provides holistic care to individuals with mental disorders or behavioral problems so as to promote their physical and psychosocial well-being. It emphasizes the use of interpersonal relationships as a therapeutic agent and considers the environmental factors that influence mental health. Thus, psychiatric nurses not only provide physical care but also socialize and communicate with their patients to create a safe, comfortable environment that promotes positive change. Their specific responsibilities often include assisting patients with ACTIVITIES OF DAILY LIVING, administering psychotropic medication and managing side effects, assisting with crisis management, observing patients to evaluate their progress, offering guidance and other forms of interpersonal support to patients, participating in recreational activities with patients, educating patients and their families about mental health issues and lifestyle choices, and conducting group therapy. Registered nurses wishing to become psychiatric nurses must complete additional training in pharmacology and the behavioral and social sciences. They practice in a variety of settings—including general and psychiatric hospitals, assisted living facilities, long-term care centers, physicians’ offices, correctional facilities, community mental health centers, rehabilitation centers, and private homes (see HOME CARE)—in conjunction with psychiatrists, psychologists, social workers, and other mental health professionals. Psychiatric nurses are distinct from psychiatric nurse practitioners, who have obtained master’s or doctoral degrees and more advanced training to practice privately and perform additional assessment, diagnostic, and therapeutic functions, including conducting individual psychotherapy and prescribing medication. Also called mental health nursing.

**psychiatric pharmacogenomics** see PHARMACOGENOMICS.

**psychiatric rehabilitation** see PSYCHOSOCIAL REHABILITATION.

**psychiatric unit** a unit of a general hospital organized for inpatient treatment of individuals with acute psychiatric conditions. Such units usually provide emergency coverage and admission; treatment with psychotropic drugs or electroconvulsive therapy; group therapy; psychological examinations; and adjunctive modalities, such as social work services, occupational therapy, art therapy, movement therapy, music therapy, and discussion groups.

**psychiatrist** n. a physician who specializes in the diagnosis, treatment, prevention, and study of mental, behavioral, and personality disorders. In the United States, education for this profession consists of 4 years of premedical training in college; a 4-year course in medical school, the final 2 years of which are spent in clerkships studying with physicians in at least five specialty areas; and a 4-year residency in a hospital or agency approved by the American Medical Association. The 1st year of the residency is spent as a hospital intern, and the final 3 in psychiatric residency, learning diagnosis and the use of psychiatric medications and other treatment modes. After completing residency, most psychiatrists take a voluntary examination for certification by the American Board of Psychiatry and Neurology.

**psychiatry** n. the medical specialty concerned with the study, diagnosis, treatment, and prevention of mental, behavioral, and personality disorders. As a medical specialty, psychiatry is based on the premise that biological causes are at the root of mental and emotional problems, although some psychiatrists do not adhere exclusively to the biological model and additionally treat problems as social and behavioral ills. Training for psychiatry includes the study of psychopathology, biochemistry, genetics, psychopharmacology, neurology, neuropathology, psychology, psychoanalysis, social science, and community mental health, as well as the many theories and approaches advanced in the field itself. —psychiatric adj.

**psychic** 1. adj. denoting phenomena associated with the mind. Ivan PAVLOV referred to conditioned responses as “psychic reflexes” because the idea of the physical stimulus evoked the reflexive response. 2. adj. denoting a class of phenomena, such as TELEPATHY and CLAIRVOYANCE, that appear to defy scientific explanation. The term is also applied to any putative powers, forces, or faculties associated with such phenomena. See PSI. 3. n. a MEDIUM, SENSITIVE, or other person with alleged paranormal abilities.

**psychic apparatus** in classical psychoanalytic theory, mental structures and mechanisms. Sigmund FREUD initially (1900) divided these into unconscious, preconscious, and conscious areas or systems and later (1923) into the ID, EGO, and SUPEREGO: The id is described as unconscious, and the ego and superego as partly conscious, partly preconscious, and partly unconscious. Also called mental apparatus. See also STRUCTURAL MODEL; TOPOGRAPHIC MODEL.

**psychic blindness** see FUNCTIONAL BLINDNESS.

**psychic conflict** see INTRAPSYCHIC CONFLICT.

**psychic determinism** the position, associated particularly with Sigmund FREUD, that mental (psychic) events do not occur by chance but always have an underlying cause that can be uncovered by analysis. See DETERMINISM. See also FREUDIAN SLIP.

**psychic energizer** a drug that has an antidepressant effect. The name, now rarely used, was introduced in the late
psychic energy

1950s by U.S. psychiatrist Nathan S. Kline (1916–1983) to identify MONOAMINE OXIDASE INHIBITORS derived from iproniazid, which had been developed for control of tuberculosis. Iproniazid was discontinued as a tuberculosis drug because of its powerful effects on the central nervous system.

**psychic energy** in classical psychoanalytic theory, the dynamic force behind all mental processes. According to Sigmund Freud, the basic sources of this energy are the INSTINCTS or drives that are located in the ID and seek immediate gratification according to the PLEASURE PRINCIPLE. Carl Jung also believed that there is a reservoir of psychic energy, but he objected to Freud's emphasis on the pleasurable gratification of biological instincts and emphasized the means by which this energy is channeled into the development of the personality and the expression of cultural and spiritual values. Also called mental energy. See also LIBIDO.

**psychic healing** the treatment of physical or mental illness by parapsychological or spiritualistic means. See also CRYSTAL HEALING; PATH HEALING.

**psychic link** in parapsychology and spiritualism, a direct connection between one mind and another, not mediated by any sensory channel. See AGENT; PERCIPIENT; TELEPATHY.

**psychic numbing** a posttraumatic symptom pattern in which the individual feels incapable of emotional expression, love, or closeness to others. See ALEXITHYMIA.

**psychic pain** intolerable pain caused by intense psychological suffering (rather than physical dysfunction). At its extreme, prolonged psychic pain can lead to suicide attempts. See also ALGOPSychalia; PSYCHALGIA.

**psychic paralysis of visual ideation** a cluster of visual deficits comprising difficulty in spatial localization, difficulty in executing SACSades or tracking a moving object, and a tendency for visual perception to be dominated at any one time by an object. This symptom is associated with BALINT'S SYNDROME, but there is evidence to suggest it can occur in isolation.

**psychic reality** the internal reality of fantasies, wishes, fears, dreams, memories, and anticipations, as distinguished from the external reality of actual events and experiences.

**psychic seizure** a type of COMPLEX PARTIAL SEIZURE marked by psychological disturbances, such as illusions, hallucinations, affective experiences, or cognitive alterations (e.g., déjà vu).

**psychic suicide** a purported form of self-destruction in which the individual decides to die and actually does so without resorting to a physical agency. See also VOODOO DEATH.

**psychic tension** emotional strain experienced in emergencies or other situations that generate inner conflict or anxiety.

**psychic trauma** an experience that inflicts damage on the psyche, often of a lasting nature. Examples are sexual assault and child abuse.

psyching out the use of various techniques to create fear, apprehension, and doubt in another person. This colloquialism probably originated in sport with reference to the psyching out of a competitor but has become generalized to numerous other situations.

psyching up undertaking a series of activities for the purpose of getting into an IDEAL PERFORMANCE STATE for an event, such as a competition or an examination.

**psychism** n. see PANPSYCHISM.

**psycho-** combining form mind.

**psychoacoustics** n. the scientific study of the physical effects of sound on biological systems, including the sensations produced by sounds and problems of communication. A branch of PSYCHOPHYSICS, this interdisciplinary study includes physiology, physics, audiology, psychology, music, engineering, and otolaryngology.

**psychoactive drug** any drug that has significant effects on psychological processes, such as thinking, perception, and emotion. Psychoactive drugs include those deliberately taken to produce an altered state of consciousness (e.g., HALLUCINOGENS, OPIOIDS, INHALANTS, CANNABIS) and therapeutic agents designed to ameliorate a mental condition; these include ANTIDEPRESSANTS, MOOD STABILIZERS, SEDATIVES, HYPNOTICS, and ANXIOLYTICS (which are CNS depressants), and ANTIPSYCHOTICS. Psychoactive drugs are often referred to as psychotropic drugs (or psychotropics) in clinical contexts.

**psychoanalysis** n. an approach to the mind, personality, psychological disorders, and psychological treatment originally developed by Sigmund Freud at the beginning of the 20th century. The hallmark of psychoanalysis is the assumption that much mental activity is unconscious and that understanding people requires interpreting the unconscious meaning underlying their overt, or manifest, behavior. Psychoanalysis (often shortened to analysis) focuses primarily, then, on the influence of such unconscious forces as repressed impulses, internal conflicts, and childhood traumas on the mental life and adjustment of the individual. The foundations on which CLASSICAL PSYCHOANALYSIS rests are (a) the concept of INFANTILE SEXUALITY; (b) the OEDIPUS COMPLEX; (c) the theory of INSTINCTS or drives; (d) the PLEASURE PRINCIPLE and the REALITY PRINCIPLE; (e) the threefold structure of the psyche into ID, EGO, and SUPEREGO; and (f) the central importance of anxiety and DEFENSE MECHANISMS in neurotic reactions. By contrast, contemporary psychoanalysis and other forms such as OBJECT RELATIONS THEORY, SELF PSYCHOLOGY, and RELATIONAL PSYCHOANALYSIS share a belief in a dynamic unconscious but with minimal or no attention directed to drives or to structural theory. Psychoanalysis as a therapy seeks to bring about basic modifications in an individual's personality by investigating his or her TRANSFERENCE with the analyst or therapist and thereby eliciting and interpreting the unconscious conflicts that have produced the individual's neurosis. The specific methods used to achieve this goal are FREE ASSOCIATION, DREAM ANALYSIS, analysis of RESISTANCES and defenses, and working through the feelings revealed in the transference and COUNTERTRANSFERENCE process. Also called Freudian approach; Freudianism. See also ANALYTIC PSYCHOLOGY; EGO PSYCHOLOGY; INDIVIDUAL PSYCHOLOGY; NEO-FREUDIAN. —psychoanalytic adj.

**psychoanalyst** n. a therapist who has undergone special training in psychoanalytic theory and practice and who applies to the treatment of mental disorders the techniques developed by Sigmund Freud and others whose theories were built on Freud's belief in unconscious processes. In the United States, psychoanalysts are usually trained first as psychiatrists, clinical psychologists, or other mental health professionals and then undergo extensive training
at a psychoanalytic institute. Those institutes that believe psychoanalysis is an independent discipline accept other interested and qualified professionals for psychoanalytic training. All recognized training centers require a thorough study of the works of Freud and others in the field, supervised clinical training, a training analysis, and a personal program of psychoanalysis. See also ANALYST.

**Psychoanalytic group psychotherapy** group therapy in which basic psychoanalytic concepts and methods, such as free association, analysis of resistances and defenses, and dream analysis, are used in modified form with the assumption that group members will manifest transference to each other as well as to the therapist, allowing multiple transferences to be explored and analyzed. The most prominent exponent of this therapy was British psychoanalyst Wilfred Bion (1897–1979).

**Psychoanalytic play technique** a method of child analysis developed by Melanie Klein during the 1920s, in which play activity is interpreted as symbolic of underlying fantasies and conflicts and substitutes for free association. The therapist provides toys for the child and encourages free, imaginative play in order to reveal the child’s unconscious wishes and conflicts.

**Psychoanalytic psychotherapy** therapy originally conceived in the form of classical psychoanalysis or in one of the generally shorter approaches to treatment that evolved from the classical form, such as psychodynamic psychotherapy. Generally, it involves a systematic one-on-one interaction between a therapist and a patient that emphasizes the importance of unconscious motives and conflicts as determinants of human behavior while helping the patient overcome abnormal behavior or adjust to the problems of life. The use of free association and therapist interpretation, as well as the development of a therapeutic alliance, are common techniques. More contemporary forms of the therapy are influenced by postclassical psychoanalytic concepts of interpersonal dynamics and the self, as emphasized, for example, in relational psychoanalysis and self psychology.

**Psychoanalytic theory** the diverse complex of assumptions and constructs underlying the approach known as psychoanalysis. Classically, the term refers specifically to the formulations of Sigmund Freud, but it now also applies to such offshoots and counterapproaches as analytic psychology, individual psychology, object relations theory, self psychology, and others that are based on psychodynamic theory.

**Psychobiography** n. a form of biographical literature that offers a psychological profile or analysis of an individual’s personality in addition to the usual account of his or her life and experiences.—psychobiographical adj.

**Psychobiology** n. 1. a school of thought in the mental health professions in which the individual is viewed as a holistic unit and both normal and abnormal behavior is explained in terms of the interaction of biological, sociological, and psychological determinants. Also called ergasiology. [developed by Adolph Meyer; 2. see Biological psychology.—psychobiological adj.

**Psychocardiology** n. see Cardiac psychology.

**Psychochemistry** n. the study of the relationships between chemicals, behavior (including the genetic or metabolic aspects of behavior), and psychological processes.

**Psychocutaneous disorder** any skin (dermatological) disorder in which psychological factors are believed to play an important role. In some cases (e.g., HIVES, PSYCHOGONIC PRURITUS), the disorder appears to be caused or exacerbated by psychological factors; in others (e.g., acne, psoriasis, eczema, dermatitis), there is a predisposition to the condition, which is precipitated by stress factors (see DIATHESIS–STRESS MODEL).

**Psychodiagnosis** n. 1. any procedure designed to discover the underlying factors that account for behavior, especially disordered behavior. 2. diagnosis of mental disorders through psychological methods (e.g., structured, semistructured, or unstructured psychodiagnostic interviews) and tests.

**Psychodrama** n. a method of psychotherapy in which clients enact their concerns to achieve new insight about themselves and others. Its central premise is that spontaneity and creativity are crucial for the balanced, integrated personality and that humans are all improvising actors on the stage of life. Clients may role play in a variety of scenes either lived or imagined. The process involves (a) a protagonist, the client or central figure in the drama; (b) a director, or therapist, who guides this process and assists the client with alternative enactments and interpretations; and (c) auxiliary egos, therapeutic actors who assist the protagonist in completing his or her interaction with significant others in the drama. When psychodrama is used in a group, these actors are other group members, serving as therapeutic agents by sharing common themes or experiences touched on in the drama. In individual treatment, the protagonist takes the needed roles, although some therapists become involved in the action. Various special techniques are used to advance the therapy, among them role reversal, soliloquy, doubling (see double), and future exploration. See also hypnodrama; sociodrama; theater of spontaneity. [developed in the 1920s by Jacob L. Moreno]

**Psychodynamic approach** the psychological and psychiatric approach that views human behavior from the standpoint of unconscious motives that mold the personality, influence attitudes, and produce emotional disorder. The emphasis is on tracing behavior to its origins, as contrasted with the nosological approach, which concentrates on overt signs and symptoms of disorder. See dynamic psychology; psychodynamic psychotherapy.

**Psychodynamic Diagnostic Manual (PDM)** a handbook for the diagnosis and treatment of mental health disorders as defined within a broader framework of understanding about individual personality and emotional, social, and interpersonal functioning in both healthy and maladaptive forms. Published in 2006 by a task force of the American Psychoanalytic Association, the International Psychoanalytic Association, Division 39 (Psychoanalysis) of the American Psychological Association, the American Academy of Psychoanalysts and Dynamic Psychiatry, and the National Membership Committee on Psychoanalysis in Clinical Social Work, the PDM is meant to serve as a complement to the Diagnostic and Statistical Manual of Mental Disorders (see DSM–IV–TR; DSM–5) and the international classification of diseases. Although based on current neuroscience and treatment outcome research, the classification adapts many concepts from psychodynamic theory. The diagnostic framework describes (a) healthy and disordered personality functioning; (b) individual profiles of mental functioning, including patterns of relating, comprehending, and expressing emotions, coping with stress and anxiety, self-observation of emotions
psychodynamic group psychotherapy

and behaviors, and forming moral judgments; and (c) symptom patterns, including differences in each individual’s experience of his or her symptoms.

psychodynamic group psychotherapy Psychodynamic psychotherapy with groups, in which members provide each other with support and modeling for gaining awareness of previously disregarded or unconscious aspects of their personality and behavior.

psychodynamic psychotherapy Those forms of psychotherapy, falling within or deriving from the psychoanalytic tradition, that view individuals as reacting to unconscious forces (e.g., motivation, drive), that focus on processes of change and development, and that place a premium on self-understanding and making meaning of what is unconscious. Most psychodynamic therapies share certain features, such as emphasis on dealing with the unconscious in treatment and on analyzing transference. Also called dynamic psychotherapy.

psychodynamics n. 1. any system or perspective emphasizing the development, changes, and interaction of mental and emotional processes, motivation, and drives. 2. the pattern of motivational forces, conscious or unconscious, that gives rise to a particular psychological event or state, such as an attitude, action, symptom, or mental disorder. These forces include drives, wishes, emotions, and defense mechanisms, as well as biological needs (e.g., hunger, sex). See also dynamic psychology. —psychodynamic adj.

psychodynamic theory A constellation of theories of human functioning that are based on the interplay of drives and other forces within the person, especially (and originating in) the psychoanalytic theories developed by Sigmund Freud and his colleagues and successors, such as Anna Freud, Carl Jung, and Melanie Klein. Later psychodynamic theories, while retaining concepts of the interworking of drives and motives to some degree, emphasize the process of change and incorporate interpersonal and transactional perspectives of personality development. See psychodynamic approach: psychodynamics.

psychoeducational diagnostician A specialist trained in the diagnosis and assessment of children with learning disabilities.

psychoeducational problems Academic problems substantial enough to cause significant emotional or psychological distress. See school psychology.

psychoendocrinology n. the study of the hormonal system to discover sites and processes that underlie and influence biological, behavioral, and psychological processes. It is often concerned with identifying biochemical abnormalities that may play a significant role in the development of mental disorders.

psychogalvanic reflex (PGR) See galvanic skin response.

psychogenesis n. 1. the origin and development of personality, behavior, and mental and psychic processes. 2. the origin of a particular psychic event in an individual. See psychogenic. —psychogenetic adj.

psychogenetics n. the study of the inheritance of psychological attributes. —psychogenetic adj.

psychogenic adj. Resulting from mental factors. The term is used particularly to denote or refer to a disorder that cannot be accounted for by any identifiable physical dysfunction and is believed to be due to psychological factors (e.g., a conversion disorder). In psychology and psychiatry, psychogenic disorders are improperly considered equivalent to functional disorders.

psychogenic amnesia See dissociative amnesia; functional amnesia.

psychogenic cardiovascular disorder Any disorder of the heart or circulation that cannot be accounted for by any identifiable physical dysfunction or a general medical condition and is thought to be related to psychological factors. It can include a racing heart and chest pain or tightness.

psychogenic disorder Any disorder that cannot be accounted for by any identifiable biological dysfunction and is believed to be due to psychological factors, such as emotional conflict or stress. In psychology and psychiatry, psychogenic disorders are improperly considered equivalent to functional disorders. Compare organic disorder.

psychogenic hypersonmia Episodes of excessive sleep precipitated by psychological factors, such as a wish to escape from a threatening or other anxiety-provoking situation. See also hypersonmia.

psychogenic mutism Loss of speech due to psychological rather than physical factors. See also mutism.

psychogenic nocturnal polydipsia Excessive nighttime thirst with a psychological rather than physiological or physical basis. It is most often seen in patients with schizophrenia and is recognized as a dangerous and potentially life-threatening disorder, because chronic overconsumption of substantial amounts of water can fatally damage the body’s fluid balance.

psychogenic nonepileptic seizure (PNES) A behavioral or emotional manifestation of psychological distress, conflict, or trauma that resembles an epileptic seizure but is not produced by abnormal electrical activity in the brain. Most PNESs are conversion nonepileptic seizures, but they may also be associated with factitious disorder or malingering. Also called psychogenic seizure.

psychogenic pain disorder See pain disorder.

psychogenic polydipsia See polydipsia.

psychogenic pruritus A psychosomatic skin disorder characterized by itching that resists treatment. Psychogenic pruritus often occurs in individuals with anxiety, obsessive-compulsive disorder, or depression.

psychogenic purpura See gardner-diamond syndrome.

psychogenic seizure See psychogenic nonepileptic seizure.

psychogenic vertigo An unpleasant, illusory sensation of movement of oneself or the environment that cannot be accounted for fully by any identifiable neurological or other physical dysfunction and is thought to be related to psychological factors. Psychogenic vertigo is common in a number of psychological disorders, including panic disorder, agoraphobia, somatiform disorder, and schizophrenia.

psychographics n. In marketing or advertising, an extended form of demographic analysis that surveys the values, activities, interests, and opinions of populations or population segments (psychographic segmentation) to predict consumer preferences and behavior. Psychographic profiling is generally carried out with proprietary tech-
psychological determinism the general position that psychological phenomena, including behaviors, are fixed, resulting from physical and other factors outside the control of the person. See DETERMINISM; IDENTITY THEORY; PHYSICAL DETERMINISM.

psychological disorder see MENTAL DISORDER.

psychological distance the degree of a person’s detachment or disengagement from emotional involvement with one or more other people.

psychological distress a set of painful mental and physical symptoms that are associated with normal fluctuations of mood in most people. In some cases, however, psychological distress may indicate the beginning of major depressive disorder, anxiety disorder, schizophrenia, somatization disorder, or a variety of other clinical conditions. It
is thought to be what is assessed by many putative self-report measures of depression and anxiety.

**psychological dysfunction** impaired or abnormal mental functioning and patterns of behavior.

**psychological examination** an investigation by means of interviews, observations of behavior, and administration of psychological tests that evaluates an individual’s personality, adjustment, abilities, interests, and functioning in important areas of life and that assesses the presence or severity of any psychological problems that the individual may have. It may contribute to the diagnosis of mental disorder and help to determine the type of treatment required.

**psychological factors** functional factors—as opposed to biological (constitutional, hereditary) factors—that contribute to the development of personality, the maintenance of health and well-being, and the etiology of mental and behavioral disorder. A few examples of psychological factors are the nature of significant childhood and adult relationships, the experience of ease or stress in social environments (e.g., school, work), and the experience of trauma.

**psychological factors affecting medical condition** in *DSM–IV–TR*, a clinical category, classified under “Other Conditions,” comprising psychological and behavioral factors that adversely affect the course, treatment, or outcome of a general medical condition (e.g., by exacerbating symptoms or delaying recovery). The factors include mental disorders and psychological symptoms (e.g., major depressive disorder, anxiety), personality traits (e.g., hostile, denying), physiological response to stress, and behavior patterns detrimental to health (e.g., overeating, excessive alcohol consumption). A wide range of medical conditions can be affected by psychological factors: cardiovascular, gastrointestinal, neurological, and rheumatological disorders; cancers; and many others. In *DSM–5*, this category is labeled psychological factors affecting other medical conditions and is classified under somatic symptom and related disorders.

**psychological field** in the social psychology of Kurt Lewin, the individual’s life space or environment as he or she perceives it at any given moment. See also field theory.

**psychological intervention** see intervention.

**psychological kidnapping** depriving a person of the free functioning of his or her personality. The term is sometimes used to describe the psychological mind control attributed to cults. See also brainwashing.

**psychological masquerade** a medical condition that can present as a psychological disorder. Examples include hypothyroidism, epilepsy, multiple sclerosis, dementia, and brain tumors.

**psychological maturity** the ability to deal effectively and resiliently with experience and to perform satisfactorily in developmental tasks (biological, social, cognitive) characteristic of one’s age level.

**psychological me** see empirical self; me.

**psychological model** 1. a theory, usually including a mechanism for predicting psychological outcomes, intended to explain specific psychological processes. See also construct. 2. a representation of human cognitive and response characteristics used to approximate and evaluate the performance of an actual individual in a complex situation, such as a novel aircraft cockpit.

**psychological moment** 1. in general usage, the best possible moment for producing a particular effect on another person or other people, as in He put in his counteroffer at the psychological moment. 2. the lived present as it is experienced. See spurious present; timeless moment.

**psychological need** any need that is essential to mental health or that is otherwise not a biological necessity. It may be generated entirely internally, as in the need for pleasure, or it may be generated by interactions between the individual and the environment, as in the need for social approval, justice, or job satisfaction. Psychological needs comprise the four higher levels of Maslow’s motivational hierarchy. Compare physiological need.

**psychological network** the set of individuals, families, and social groups with whom people interact in personally meaningful ways, whose opinions are of some concern to them, and who provide emotional support for them.

**psychological rapport** 1. Carl Jung’s term for transference, which he defined as an intensified tie to the analyst that acts as a compensation for the patient’s defective relationship to present reality. Jung saw this as an inevitable feature of every analysis. 2. more generally, a kind of agreement or affinity between individuals in their typical ways of thinking, affective responses, and behaviors.

**psychological reactance** see reactance theory.

**psychological refractory period** (PRP) the period after response to a stimulus during which response to a second stimulus, presented shortly after the first, is delayed. Reaction time for the second task is increased when the stimulus for it occurs immediately (i.e., within one fourth of a second) after the stimulus for the first task. This PRP effect has been attributed to a response-selection bottleneck.

**psychological rehabilitation** the development or restoration of an effective, adaptive identity in an individual with a congenital or acquired physical impairment through such approaches as individual or group therapy, counseling, ability assessment, and drug therapy. The object is to help the individual to develop or regain his or her self-image, ability to cope with emotional problems, competence, and autonomy.

**psychological resilience** see resilience.

**psychological scale** 1. a system of measurement for a cognitive, social, emotional, or behavioral variable or function, such as personality, intelligence, attitudes, or beliefs. 2. any instrument that can be used to make such a measurement. A psychological scale may comprise a single item measured with a variety of response formats (e.g., semantic differential, multiple choice, checklist) or be a collection of items with similar formats. Also called psychometric scale. See also psychometric test.

**Psychological Screening Inventory** (PSI) a quick screening device used to identify persons who should receive a more extensive mental health evaluation. Designed to be completed in about 15 minutes, the PSI contains 130 true–false items across five scales. Three basic scales include the Alienation (AI) scale, which screens for major psychiatric disorder; the Social Nonconformity (SN) scale for significant antisocial behavior; and the Discomfort (Di) scale for general psychological distress. The remaining two scales include the Expression (Ex) scale, which assesses the
personality dimension of extraversion–introversion, and the Defensiveness (De) scale, which assesses the degree of an individual’s personal defensiveness in responding to the items. [published in 1973 by U.S. psychologist Richard L. Lanyon (1937–)]

**psychological significance** the extent to which an effect found in a research study is relevant to the attitudes, cognitions, beliefs, and behavior of humans. For example, a finding that describes how individuals function in a variety of different settings would have psychological significance. See also CLINICAL SIGNIFICANCE; PRACTICAL SIGNIFICANCE; STATISTICAL SIGNIFICANCE.

**psychological skills training** (PST) a program of instruction and practice in the use of relaxation, concentration, imagery, goal setting, and energizing to enhance athletic performance.

**psychological social psychology** see SOCIAL PSYCHOLOGY.

**psychological statistics** the area within psychology and the behavioral sciences that is concerned with research design and methodology, addressing issues of measurement. SAMPLING, data collection, data analysis, and reporting of findings. See also QUANTITATIVE PSYCHOLOGY.

**psychological test** any standardized instrument, including scales and self-report inventories, used to measure behavior or mental attributes, such as attitudes, emotional functioning, intelligence and cognitive abilities (reasoning, comprehension, abstraction, etc.), aptitudes, values, interests, and personality characteristics. For example, a researcher might use a psychological test of emotional intelligence to examine whether some managers make better decisions in conflict situations than do others. Also called Psychometric test.

**psychological testing** see PSYCHOMETRICS.

**psychological time** the subjective estimation or experience of time. This is mainly dependent on the processing and interpretation by the brain of time-related internal or external stimuli (see TIME SENSE), but it can be influenced by other factors. In general, time is experienced as passing more slowly when one is bored or inactive and more rapidly when one is engaged in an absorbing activity. Certain PEAK EXPERIENCES can produce a sense of time dissolving or being suspended (see TIMELESS MOMENT). Drugs and hypnosis can also be used to alter the perception of time. See also TACHYPSYCHIA.

**psychological treatment** various forms of treatment and psychoeducation—including psychotherapy and behavior modification, among others—aimed at increasing an individual’s adaptive and independent mental and behavioral functioning. Psychological treatment is the specific purview of trained mental health professionals and incorporates diverse theories and techniques for producing healthy and adaptive change in an individual’s actions, thoughts, and feelings. It stands in contrast to treatment with medication, although medication is sometimes used as an adjunct to various forms of psychological treatment (see ADJUNCTIVE THERAPY).

**psychological tremor** see TREMOR.

**psychological universal** a psychological feature that occurs and is recognized across diverse cultures, albeit sometimes in different forms. In 1980, U.S. psychologist Walter J. Lonner (1934–) proposed a seven-level structure to categorize ideas and concepts that may qualify as psychological universals: (a) **simple universals** (e.g., the absolute facticity of human aggression); (b) **variable universals** (e.g., aggression takes on various forms in different cultures, but it always occurs); (c) **functional universals** (societal variations that have the same social consequences but are equilibrated for local relevance); (d) **diachronic universals** (universals of behavior that are temporally invariant but interpreted differently); (e) **ethologically oriented universals** (those with phylogenetic, Darwinian links); (f) **systematic behavioral universals** (various subcategories in psychology); and (g) **cocktail-party universals** (those things that all people feel but can only discuss as phenomena that defy measurement).

**psychological warfare** a broad class of tactics designed to influence the attitudes, beliefs, and behavior of soldiers and civilians with regard to military operations. These include attempts to bolster the attitudes and morale of one’s own people as well as to change or undermine the attitudes and morale of an opposing army or civilian population.

**psychologism** n. any position or theoretical perspective that holds one or more of the following: (a) that the rules of logic are reflective of the way the mind works, so that logic is persuasive only because it “fits” the working of the mind; (b) that truth is established by verifying the correspondence of external facts to ideas in the mind; (c) that epistemological questions can be answered by an understanding of the laws by which the mind works; and (d) that the meanings of words are established by the ideas corresponding to them. The term is generally used as a criticism of particular approaches or theories on the grounds that they make psychological processes that are accidental and contingent the foundation of knowledge: Because it takes the contingent to be fundamental, psychologism will be led toward epistemological relativism. This critical use of the term was introduced by German philosopher Gottlob Frege (1848–1925), whose work in mathematical logic can be seen as a rigorous attempt to eliminate psychologism. It was later taken up by the logical positivists (see LOGICAL POSITIVISM) and, from a different perspective, by German phenomenologist Edmund Husserl (1859–1938), who used it to criticize the British traditions of EMPIRICISM and ASSOCIATIONISM. The term was later turned against Husserl’s own work by German philosopher Martin Heidegger (1889–1976); see EXISTENTIAL PHENOMENOLOGY.

**psychologist** n. an individual who is professionally trained in one or more branches or subfields of PSYCHOLOGY. Training is obtained at a university or a school of professional psychology, leading to a doctoral degree in philosophy (PhD), psychology (PsyD), or education (EdD). Psychologists work in a variety of settings, including laboratories, schools (e.g., high schools, colleges, universities), social agencies, hospitals, clinics, the military, industry and business, prisons, the government, and private practice. The professional activities of psychologists are also varied but can include psychological counseling, involvement in other mental health care services, educational testing and assessment, research, teaching, and business and organizational consulting. Formal CERTIFICATION OF PROFESSIONAL LICENSING is required to practice independently in many of these settings and activities.

**psychologistic** adj. 1. superficially resembling psychology. 2. characterized by an overuse of psychological explanation and jargon in dealing with some issue. 3. having the qualities or characteristics of PSYCHOLOGY.
psychology n. 1. the study of the mind and behavior. Historically, psychology was an area within philosophy and emerged from it (see EPistemology). It is now a diverse scientific discipline comprising several major branches of research (e.g., experimental, biological, cognitive, lifespan developmental, personality, social), as well as several sub-areas of research and applied psychology (e.g., clinical, industrial/organizational, school and educational, human factors, health, neuropsychology, cross-cultural). Research in psychology involves observation, experimentation, testing, and analysis to explore the biological, cognitive, emotional, personal, and social processes or stimuli underlying human and animal behavior. The practice of psychology involves the use of psychological knowledge for any of several purposes: to understand and treat mental, emotional, physical, and social dysfunction; to understand and enhance behavior in various settings of human activity (e.g., school, workplace, courtroom, sports arena, battlefield); and to improve machine and building design for human use. 2. the supposed collection of behaviors, traits, attitudes, and so forth that characterize an individual or a group (e.g., the psychology of women). —psychological adj.
personality characteristics, interests, or other mental factors.

psychometric adj. 1. of or relating to PSYCHOMETRICS. 2. of or relating to PSYCHOPHYSICS.

psychometric examination a series of psychological tests administered to determine intelligence, manual skills, personality characteristics, interests, or other mental factors.

psychometric function see PSYCHOPHYSICAL FUNCTION.

psychometrician n. 1. an individual with a theoretical knowledge of measurement techniques who is qualified to develop, evaluate, and improve psychological tests. 2. an individual who is trained to administer psychological tests and interpret their results, under the supervision of a licensed psychologist. Also called psychometrist.

psychometric model any theoretical and statistical framework describing how respondents generate their answers to items on a scale or instrument and explaining ascriptive or descriptive components. For example, psychometric research could be used to determine whether a new scale is appropriately administered and scored in a specific subgroup of respondents.

psychometric research studies in the field of psychological measurement. Such research includes the development of new measures and appropriate methods for their scoring, the establishment of RELIABILITY and VALIDITY evidence for measures, the examination of item and scale properties and their dimensions, and the evaluation of differential item functioning across subgroups. For example, psychometric research could be used to determine whether a new scale is appropriately administered and scored in a specific subgroup of respondents.

psychometrics n. the branch of psychology concerned with the quantification and measurement of mental attributes, behavior, performance, and the like, as well as with the design, analysis, and improvement of the tests, questionnaires, and other instruments used in such measurement. Also called psychometric psychology: psychometry.

psychometric scale see PSYCHOLOGICAL SCALE.

psychometric scaling the creation of an instrument to measure a psychological concept through a process of analyzing responses to a set of test items or other stimuli. It involves identifying item properties, noting whether responses match theoretical formats, reducing the larger set of items into a smaller number (e.g., through EXPLORATORY FACTOR ANALYSIS), and determining appropriate scoring methods.

Psychometric Society an international nonprofit professional organization founded in 1935 to promote the advancement of quantitative measurement practices in psychology, education, and the social sciences. It publishes the journal Psychometrika.

psychometric test see PSYCHOLOGICAL TEST.

psychometric theories of intelligence theories of intelligence based on or tested by scores on conventional tests of intelligence, such as number-series completions and verbal analogies. These theories are often, but not always, based on FACTOR ANALYSIS; that is, they specify a set of factors alleged to underlie human intelligence. Among the most famous of such theories are Charles Spearman’s TWO-FACTOR THEORY and Louis L. Thurstone’s theory of PRIMARY ABILITIES. See also RATION THEORY OF INTELLIGENCE; THIRTEEN-STRATUM MODEL OF INTELLIGENCE.

psychometry n. 1. see PSYCHOMETRICS. 2. in parapsychology, the reputed ability of some people to hold an object in their hands and become aware of facts about its history or about people who have been associated with it. There is, however, no verified evidence of such an ability.

psychonemic adj., n. see PSYCHOMIMETIC.

psychomimic syndrome a condition in which an individual who lacks physical evidence of an illness develops symptoms of an illness experienced by another person, who may have died of the disorder. The symptoms usually occur around the anniversary of the death of the other person. See also ANNIVERSARY REACTION.

psychomotility n. a motor action or habit (e.g., a tic, handwriting, guilt, stammering, dysarthria) that is influenced or controlled by a mental process and that may be an indicator of psychomotor disturbance.

psychomotor adj. relating to movements or motor effects that result from mental activity.

psychomotor agitation restless physical activity arising from mental tension or disturbance. It includes pacing, hand wringing, and pulling or rubbing clothing and other objects and is a common symptom of both MAJOR DEPRESSIVE EPISODES and MANIC EPISODES. Also called psychomotor excitement.

psychomotor disorder 1. a disturbance in the psychological control of movement. 2. a motor disorder precipitated by psychological factors. Examples include epileptic seizures brought on by stress, PSYCHOMOTOR RETARDATION associated with depression, and hyperactivity exhibited during a MANIC EPISODE.
psychomotor domain see BLOOM’S TAXONOMY.

psychomotor epilepsy an old name for a form of epilepsy characterized by COMPLEX PARTIAL SEIZURES.

psychomotor excitement see PSYCHOMOTOR AGITATION.

psychomotor hallucination the sensation that parts of the body are being moved to different areas of the body.

psychomotor retardation a slowing down or inhibition of mental and physical activity, manifest as slow speech with long pauses before answers, slowness in thinking, and slow body movements. Psychomotor retardation is a common symptom of MAJOR DEPRESSIVE EPISODES.

psychomotor seizure see COMPLEX PARTIAL SEIZURE.

psychomotor skill any ability (e.g., handwriting, drawing, driving a car) whose performance draws on a combined and coordinated set of cognitive and motor processes.

psychomotor test a test requiring a coordination of cognitive and motor activities, as in the TRAIL MAKING TEST.

psychoneuroendocrinology n. the study of the relations among psychological factors, the nervous system, and the endocrine system in determining behavior and health. It focuses on the effects of psychological stress on these neuroendocrine systems (see NEUROENDOCRINOLOGY) and the effects that changes in these systems have on behavior in normal and psychopathological states.

psychoneuroimmunology n. the study of how the brain and behavior affect immune responses. [originated by U.S. psychologist Robert Ader (1932–2011)] —psycho-neuroimmunological adj.

psychoneuromuscular theory a theory postulating how the use of mental imagery of an activity can improve the subsequent motor performance of that activity. It states that, during the processing of imagery, the brain sends impulses to the muscles. These impulses are identical to those that cause muscle contraction with movement but are of lower intensity. The neural pathways are thereby strengthened, facilitating the learning and performance of motor skills. Also called ideomotor principle. See also MENTAL PRACTICE. [originally proposed in 1874 by British physiologist William Benjamin Carpenter (1813–1885)]

psychoneurosis n. see NEUROSIS.

psychonomic adj. denoting an approach to psychology that emphasizes quantitative measurement, experimental control, and OPERATIONAL DEFINITIONS, especially in the area of experimental, laboratory psychology. The word was coined to provide a name for the PSYCHONOMIC SOCIETY, which was created in 1959 by a number of experimental psychologists who were opposed to what they regarded as a swing in the AMERICAN PSYCHOLOGICAL ASSOCIATION toward an emphasis on the mental health concerns of psychology. See EXPERIMENTAL PSYCHOLOGY.

psychonics n. 1. the science of the laws governing the mind. 2. the science of the environmental factors that influence development. See NOMOLOGY.

Psychonomic Society a professional organization founded in 1959 to promote the communication of scientific research in psychology and allied sciences. It publishes six scholarly journals in psychology, mainly concerned with learning, behavior, and cognition.

psychonosology n. the systematic classification of mental disorders. See PSYCHIATRIC CLASSIFICATION.

psychoneurology n. the study of psychological, behavioral, and psychosocial factors involved in the risk, detection, course, treatment, and outcome (in terms of survival) of cancer. The field examines responses to cancer on the part of patients, families, and caregivers at all stages of the disease. —psychoneurological adj. —psychoneurologist n.

psychopath n. a former name for an individual with ANTISOCIAL PERSONALITY DISORDER. —psychopathic adj.

psychopathia sexualis the name for SEXUAL DEVIANC e coined by German psychiatrist Richard von Krafft-Ebing (1840–1902) and used as the title of his classic work on the subject, first published in 1886.

psychopathic personality see ANTISOCIAL PERSONALITY DISORDER.

psychopathology n. 1. the scientific study of mental disorders, including their theoretical underpinnings, etiology, progression, symptomatology, diagnosis, and treatment. This broad discipline draws on research from numerous areas, such as psychology, biochemistry, pharmacology, psychiatry, neurology, and endocrinology. The term in this sense is sometimes used synonymously with ABNORMAL PSYCHOLOGY. 2. the behavioral or cognitive manifestations of such disorders. The term in this sense is sometimes considered synonymous with MENTAL DISORDER itself. —psychopathological adj. —psychopathologist n.

psychopathy n. 1. a synonym for ANTISOCIAL PERSONALITY DISORDER. 2. formerly, any psychological disorder or mental disease. —psychopathic adj.

psychopharmacological drug any medication used in the treatment of mental or behavioral disorders.

psychopharmacology n. the study of the influence of drugs on mental, emotional, and behavioral processes. Psychopharmacology is concerned primarily with the mode of action of various substances that affect different areas of the brain and nervous system, including drugs of abuse. See also CLINICAL PSYCHOPHARMACOLOGY; GERIATRIC PSYCHOPHARMACOLOGY; PEDIATRIC PSYCHOPHARMACOLOGY; PRECLINICAL PSYCHOPHARMACOLOGY. —psychopharmacological adj. —psychopharmacologist n.

psychopharmacotherapy n. the use of pharmacological agents in the treatment of mental disorders. For example, acute or chronic schizophrenia is treated by administration of antipsychotic drugs or other agents. Although such drugs do not cure mental disorders, they may—when used appropriately—produce significant relief from symptoms.

psychophysical adj. of or relating to the relationship between physical stimuli and mental events.

psychophysical dualism see DUALISM: MIND–BODY PROBLEM. See also CARTESIAN DUALISM.

psychophysical function a psychometric relationship between a stimulus and judgments about the stimulus, as expressed in a mathematical formula. In the METHOD OF CONSTANT STIMULI, it is the proportion of yes responses (i.e., that the stimuli were perceived) as a function of physical magnitude of the stimuli. Also called PSYCHOMETRIC FUNCTION.
psychophysical law (n.) a mathematical relationship between the strength of a physical stimulus and the intensity of the sensation experienced. Psychophysical laws were first developed from the empirical research conducted by Ernst Heinrich Weber and Gustav Theodor Fechner, chiefly at the University of Leipzig. This work, aimed at direct scientific investigations of the Mind-Body Problem, established the foundation of psychology as an experimental science. Also called psychophysical relationship. See also INNER PSYCHOPHYSICS; OUTER PSYCHOPHYSICS.

psychophysical method (n.) any of various standard techniques used in investigating psychophysical problems, such as the METHOD OF ADJUSTMENT, the METHOD OF EQUAL-APPEARING INTERVALS, and the METHOD OF LIMITS.

psychophysical parallelism (n.) see PARALLELISM.

psychophysical properties (n.) in Daniel E. Berlyne’s theory of aesthetic preference (see AROUSAL POTENTIAL), factors (e.g., intensity, pitch, saturation) that are intrinsic to a stimulus.

psychophysical relationship (n.) see PSYCHOPHYSICAL LAW.

psychophysical research (n.) empirical studies, often conducted in a laboratory setting, linking properties of a physical stimulus to a sensory response. For example, in a study of hearing, a participant might be requested to distinguish a number of different sounds by their loudness.

psychophysical scaling (n.) any of the techniques used to construct scales relating physical stimulus properties to perceived magnitude. For example, a respondent in a study may have to indicate the roughness of several different materials that vary in texture. Methods are often classified as direct or indirect, based on how the observer judges magnitude.

psychophysical tuning curve (n.) see TUNING CURVE.

psychophysics (n.) a branch of psychology that studies the relationship between the objective physical characteristics of a stimulus (e.g., its measured intensity) and the subjective perception of that stimulus (e.g., its apparent brightness).

psychophysiological assessment (n.) the use of physiological measures via electroencephalography, electrocardiography, electromyography, and electrooculography to infer psychological processes and emotion. Also called psychophysiological monitoring.

psychophysiological research (n.) empirical studies, often conducted in a laboratory setting using functional magnetic resonance imaging and other neuroscientific tools, that link an individual’s bodily responses (e.g., change in heart rate, palmar sweat, eye blink) and mental processes (e.g., memory, cognitive processing, brain function). For example, in addition to collecting data on several performance measures, a psychophysiological researcher might examine cortisol levels in adolescents with a diagnosis of conduct disorder and compare them to levels in those without the disorder.

psychophysiology (n.) the study of the relation between the chemical and physical functions of organisms (physiology) and cognitive processes, emotions, and behavior (psychology). Also called physiological psychology. See also APPLIED PSYCHOPHYSIOLOGY; CLINICAL PSYCHOPHYSIOLOGY. —psychophysiological (adj.) —psychophysiologist (n.)

psychopolitics (n.) 1. the study of the psychological aspects of political behavior and political structures, such as the effects of different types of system (democratic, fascist, socialist, etc.) on a society and its members. 2. the use of psychological tactics or strategies to achieve a political objective. —psychopolitical (adj.)

psychoscience (n.) any science that deals with the mind and mental behavior, with mental diseases and disorders, and with their treatment and cure. In particular, it refers to PSYCHOLOGY, PSYCHIATRY, and COGNITIVE SCIENCE.

psychosexual (adj.) relating to or denoting any aspects of human sexuality that are based on or influenced by psychological factors, as opposed to genetic, chemical, and other biologically based (organic) aspects.

psychosexual development (n.) in the classical psychoanalytic theory of Sigmund Freud, the step-by-step growth of sexual life as it affects personality development. Freud posited that the impetus for psychosexual development stems from a single energy source, the LIBIDO, which is concentrated in different organs throughout infancy and helps produce the various psychosexual stages: the ORAL STAGE, the ANAL STAGE, the GENITAL STAGE, and the LATENCY STAGE. Each stage gives rise to its own characteristic erotic activities (e.g., sucking and biting in the oral stage), and the early-expressions may lead to “perversion” activities later in life, such as SADISM, MASOCHISM, VOYEURISM, and EXHIBITIONISM. Moreover, the different stages leave their mark on the individual’s character and personality, especially if sexual development is arrested in a fixation at one particular stage. Also called libidinal development.

psychosexual disorders (n.) see SEXUAL AND GENDER IDENTITY DISORDERS.

psychosexual dysfunction (n.) see SEXUAL DYSFUNCTION.

psychosexual stages (n.) see PSYCHOSEXUAL DEVELOPMENT.

psychosexual trauma (n.) a frightening, degrading, or otherwise traumatic sexual experience in earlier life that is related to current emotional problems. Examples include incest or other forms of child SEXUAL ABUSE, SEXUAL ASSAULT, and DATE RAPE.

psychosis (n.) 1. an abnormal mental state involving significant problems with REALITY TESTING. It is characterized by serious impairments or disruptions in the most fundamental higher brain functions—perception, cognition and cognitive processing, and emotions or affect—as manifested in behavioral phenomena, such as delusions, hallucinations, and significantly disorganized speech. See PSYCHOTIC DISORDER. 2. historically, any severe mental disorder that significantly interferes with functioning and ability to perform activities essential to daily living.

psychosocial (adj.) describing the intersection and interaction of social, cultural, and environmental influences on the mind and behavior.

psychosocial deprivation (n.) lack of adequate opportunity for social and intellectual stimulation. It may be a significant factor in emotional disturbance and delayed mental development or intellectual disability in children. Also called sociocultural deprivation. See PSYCHOPATHIC DEMENTIA.

psychosocial development (n.) 1. according to Erik Erikson, personality development as a process influenced by social and cultural factors throughout the lifespan. See ERIKSON’S EIGHT STAGES OF PSYCHOSOCIAL DEVELOPMENT. 2.
the development of both prosocial behavior (e.g., cooperation) and antisocial behavior (e.g., aggression). Psychosocial development involves changes not only in children’s overt behavior but also in their social cognition. For example, they become able to take the perspective of others and to understand that other people’s behavior is based on their knowledge and desires.

**psychosocial factors** social, cultural, and environmental phenomena and influences that affect mental health and behavior. These influences include social situations, relationships, and pressures, such as competition for education, health care, and other social resources; rapid technological change: work deadlines; and changes in social roles and status (e.g., of women and minority groups).

**psychosocial mental retardation** see pseudoretardation.

**psychosocial rehabilitation** the process of enhancing the recovery of individuals with severe mental illness by teaching or restoring psychological, behavioral, social, and vocational skills that will enable them to function in their community and by facilitating that endeavor through a continuum of services such as psychotherapy, family psychoeducation, illness management, and supported employment. The services may be initiated just before a patient’s discharge from residential treatment and provided on an ongoing basis thereafter, but they are also available to individuals with severe mental illness who have not been institutionalized. The services are usually provided by specialized professionals (e.g., therapists, vocational counselors, employment specialists, social workers) who use focused programs and techniques to assist these individuals in achieving functional independence. Also called psychiatric rehabilitation.

**psychosocial stressor** a life situation that creates an unusual or intense level of stress that may contribute to the development or aggravation of mental disorder, illness, or maladaptive behavior. Examples of psychosocial stressors include divorce, the death of a child, prolonged illness, unwanted change of residence, a natural catastrophe, or a highly competitive work situation.

**psychosocial support** a broad term describing a range of services offered by mental health professionals to those in pressing need. Whether designed to help individuals cope with a serious illness or to alleviate distress in whole communities following a disaster (see disaster psychology), such services may range from mental health counseling, psychoeducation, and group support to spiritual support and other assistance and are provided by psychologists, social workers, and pastoral counselors, among others. See also social support.

**psychosocial therapy** psychological treatment designed to help an individual with emotional or behavioral disturbances adjust to situations that require social interaction with members of the family, work group, community, or any other social unit.

**psychosomatic** adj. 1. of or relating to the role of the mind (psyche) in diseases or disorders affecting the body (soma): specifically, the role of psychological factors (e.g., anxiety, depression) in the etiology and course of pathology in bodily systems. 2. characterizing an approach based on the belief that a psychological component operates in the cause of somatic disturbances. 3. of or referring to any interaction between mind and body.

**psychosomatic disorder** a type of disorder in which psychological factors are believed to play an important role in the origin or course (or both) of the disorder. See also psychological factors affecting medical condition.

**psychosomatic medicine** a branch of medicine that emphasizes the role of psychological factors in causing and treating disease.

**psychostimulant** n. see CNS stimulant.

**psychosurgery** n. the treatment of a mental disorder by surgical removal or destruction of selective brain areas. The most well-known example of psychosurgery is prefrontal lobotomy, historically used particularly for schizophrenia but also for a variety of other disorders. Psychosurgery was most popular from 1935 to 1960 and is among the most controversial of all psychiatric treatments ever introduced. Contemporary psychosurgery approaches (e.g., cingulotomy) are far more precisely targeted and confined in extent than the early techniques, employing high-tech imaging and a variety of highly controllable methods of producing adequate lesions. Additionally, they are used only as a last resort and only for a handful of specific psychiatric disorders—major depressive disorder, bipolar disorder, obsessive-compulsive disorder, and generalized anxiety disorder—that have been resistant to other available therapies.

**psychosynthesis** n. in psychoanalysis, an attempt to unify the various components of the unconscious, such as dreams, fantasies, and instinctual strivings, with the rest of the personality. This “constructive approach” was advocated by Carl Jung, who contrasted it with what he saw as Sigmund Freud’s “reductive approach.” —psychosynthetic adj.

**psychotechnics** n. 1. the practical application of psychological principles, as in economics, sociology, and business. 2. the application of psychological principles to alter or control the behavior of an individual.

**psychotechnology** n. 1. the body of psychological facts and principles involved in the practical applications of psychology. 2. the application of such knowledge.

**psychotherapeutic process** whatever occurs between and within a client and therapist during the course of psychotherapy. This includes the experiences, attitudes, emotions, and behavior of both client and therapist, as well as the dynamic or interaction between them. See also process research.

**psychotherapy** n. any psychological service provided by a trained professional that primarily uses forms of communication and interaction to assess, diagnose, and treat dysfunctional emotional reactions, ways of thinking, and behavior patterns. Psychotherapy may be provided to individuals, couples (see couple’s therapy), families (see family therapy), or members of a group (see group therapy). There are many types of psychotherapy, but generally they fall into four major categories: psychodynamic psychotherapy, cognitive therapy or behavior therapy, humanistic therapy, and integrative psychotherapy. The psychotherapist is an individual who has been professionally trained and licensed (in the United States by a state board) to treat mental, emotional, and behavioral disorders by psychological means. He or she may be a clinical psychologist, psychiatrist, counselor, social worker, or psychiatric nurse. Also called therapy, talk therapy. —psychotherapeutic adj.
psychotherapy by reciprocal inhibition

Psychotherapy by reciprocal inhibition a type of behavior therapy in which emphasis is placed on weakening the bond between anxiety responses and anxiety-provoking stimuli by conditioning the anxiety response to an incompatible response, such as muscle relaxation. See reciprocal inhibition; systematic desensitization.

Psychotherapy integration see integrative psychotherapy.

Psychotherapy matching see matching patients.

Psychotherapy research the use of scientific methods to describe, explain, and evaluate psychotherapeutic techniques, processes, and effectiveness.

Psychotic adj. of, relating to, or affected by psychosis or a psychotic disorder.

Psychotic disorder any of a number of severe mental disorders, regardless of etiology, characterized by gross impairment in reality testing. The accuracy of perceptions and thoughts is incorrectly evaluated, and incorrect inferences are made about external reality, even in the face of contrary evidence. Specific symptoms indicative of psychotic disorders are delusions, hallucinations, and markedly disorganized speech, thought, or behavior; individuals may have little or no insight into their symptoms. Some examples of psychotic disorders are schizophrenia, schizoaffective disorder, bipolar disorder, delusional disorder, brief psychotic disorder, and psychotic disorders due to a substance (see substance-induced psychotic disorder) or to a medical condition.

Psychotic episode a period during which an individual exhibits psychotic symptoms, such as hallucinations, delusions, and disorganized speech. See also acute psychotic episode.

Psychotic feature any clinical symptom that entails a marked loss of contact with reality, notably including delusions, hallucinations, disorganized speech, or disorganized behavior. See mood-congruent psychotic feature; mood-incongruent psychotic feature.

Psychoticism n. a dimension of personality in eysenck’s dimensions characterized by aggression, impulsivity, aloofness, and antisocial behavior, indicating a susceptibility to psychosis and psychopathic disorders (see antisocial personality disorder). It was originally developed as a factor for distinguishing between normal individuals and those with schizophrenia or bipolar disorders, using tests of judgment of spatial distance, reading speed, level of proficiency in mirror drawing, and adding rows of numbers.

Psychotogenic 1. adj. describing a drug-induced state resembling psychosis, marked, for example, by sensory illusions or distortions, hallucinations, delusions, and behavioral and emotional disturbances. 2. n. an agent, such as a hallucinogen, that induces such a state. Also called psychotogen.

Psychotomimetic 1. adj. tending to induce hallucinations, delusions, or other symptoms of psychosis. 2. n. one of a group of drugs originally used in laboratory experiments to determine if they could induce psychoses, or states mimicking psychoses, on the basis of their effects. The group includes LSD and amphetamine. Also called psychomimetic.

Psychotoxic adj. denoting or relating to agents that cause brain damage, such as excess alcohol, certain drugs and heavy metals, volatile solvents, and pesticides.

Psychotropic drug see psychoactive drug.

PT abbreviation for physical therapy.

PTA 1. abbreviation for parent teachers association. 2. abbreviation for posttraumatic amnesia.

PTC abbreviation for psychophysical tuning curve.

P-technique factor analysis a method in exploratory factor analysis for understanding the major underlying dimensions of variables for a given person over time. In this approach, a single individual or unit is measured repeatedly on a broad range of variables, the variables are correlated over the series of occasions sampled, and the correlation factor is analyzed. For example, a set of memory tests may be administered to a person at several points in his or her life; P-technique factor analysis could then be used to identify dimensions of change or patterns of covariation among the variables across occasions. Also called P-factor analysis. Compare Q-TECHNIQUE FACTOR ANALYSIS; R-TECHNIQUE FACTOR ANALYSIS.

Ptolemaic theory see geocentric theory.

Ptosis n. (pl. ptoses) the sinking or dropping of an organ or part of the body, especially drooping of the eyelid. This may be caused by injury to the third cranial (oculomotor) nerve or the eye muscles. It is also a characteristic sign of myasthenia gravis and Horner’s syndrome. —ptotic adj.

PTP abbreviation for posttetanic potentiation.

PTSD abbreviation for posttraumatic stress disorder.

Ptyalism n. 1. the excessive production of saliva. Normal production of the parotid, submaxillary, and sublingual salivary glands is between 1,000 and 1,500 ml per day for an adult human. Ptyalism may be associated with epilepsy, encephalitis, certain medications, high blood pressure, intense emotion, or high anxiety. Also called sialorrhea. 2. a condition in which saliva production is normal but the person is unable to swallow the saliva as fast as it is secreted, as in cases of parkinsonism, bulbar or pseudobulbar paralysis, and bilateral facial-nerve palsy.

Pubertas praecox see precocious puberty.

Puberty n. the stage of development when the genital organs reach maturity and secondary sex characteristics begin to appear, signaling the start of adolescence. It is marked by ejaculation of sperm in the male, onset of menstruation and development of breasts in the female, and, in both males and females, growth of pubic hair and increasing sexual interest. See also precocious puberty; persistent puberty. —pubertal adj.

Puberty rite the initiation into adult life of a pubescent member of a community through ceremonies, cultural-pedagogical indoctrination, and similar customs. For young men in traditional societies, this may involve a physical and psychological ordeal in which they experience pain, hardship, and fear. For young women in traditional cultures, this rite often involves seclusion, spiritual activities, and special ceremonies. See rite of passage.

Pubescence n. the period or process of reaching puberty. —pubescent adj.

Pubescent growth spurt the rapid development of bone and muscle in response to increased secretion of growth hormone at puberty. There is usually a dramatic increase in height and weight, accompanied by develop-
ment of the reproductive organs and secondary sex characteristics. Also called adolescent growth spur.

public adoption see ADOPTION.

publication bias the tendency for study results that are published in journals or other outlets to differ from study results that are not published. In particular, published studies are more likely to show positive or statistically significant findings. Thus, when conducting a META-ANALYSIS, it is important to gather the full range of available research, both published and unpublished, to ensure that the analysis does not provide unrepresentatively large EFFECT SIZES. See file-drawer problem.

publication ethics the principles and standards associated with the process of publishing the results of scientific research or scholarly work in general. These include such requirements as giving the appropriate credit and authorship status to those who have earned it; ensuring that appropriate citations are given to ideas, methodology, or findings from another study; not submitting the same article to more than one journal simultaneously; and not submitting results for republication without indicating that they have already been published elsewhere.

Publication Manual of the American Psychological Association a reference book offering guidelines on how to present written material in the behavioral and social sciences clearly and effectively. Based on the special requirements of psychology but applicable to sociology, business, economics, nursing, social work, criminology, and other disciplines as well, the Publication Manual describes the editorial style established by the American Psychological Association (APA) and used in all of the books and journals that it publishes (i.e., APA Style). Besides guidance on the content and organization of a manuscript, the Publication Manual offers direction on such points as grammar and the mechanics of writing, the uniform use of punctuation and abbreviations, the construction of tables and figures, the selection of headings, the citation and formatting of references, and the presentation of statistics. The forerunner of the Publication Manual was a brief article published in the February 1929 issue of the APA journal Psychological Bulletin. A revised and expanded version of these instructions was published as a first edition of the Publication Manual in 1952. The second edition was published in 1974, the third in 1983, the fourth in 1994, the fifth in 2001, and the sixth in 2010. The first electronic version was made available in 2013.

public distance zone the DISTANCE ZONE adopted by people in highly formal, official, or ceremonial interactions. The public distance zone is defined as an area between 3.5 and 7.5 m (11½–24½ ft) from a person. Compare intimate zone; personal distance zone; social zone. See also PROXEMICS.

public health approach a community-based approach to mental and physical health in which agencies and organizations focus on enhancing and maintaining the well-being of individuals by ensuring the existence of the conditions necessary for them to lead healthy lives. The approach involves such activities as monitoring community health status; identifying and investigating health problems and threats to community health; ensuring the competency of health care providers and personnel; disseminating accurate information and educating individuals about health issues; developing, modifying, and enforcing policies and other regulatory measures that support community health and safety; and ensuring the accessibility of quality health services. The approach involves various levels of disease and disorder prevention (primary, secondary, tertiary), the expansion and appropriate use of the scientific knowledge base, and the development and utilization of partnerships within and among communities.

public health nurse a REGISTERED NURSE or NURSE PRACTITIONER who has received additional training in social and public health sciences and services. Public health nurses are usually employed by government health departments and engaged in educational, informational, and preventive activities.

public health services 1. services intended to protect and improve community health. 2. in some countries, health services provided by the state and financed mainly by general taxation.

public mental hospital a hospital for patients with mental disorders that is organized and run by the state, the county, or the U.S. Department of Veterans Affairs. Compare private mental hospital.

public residential facility any residential setting directly operated by state or local government for individuals with intellectual or developmental disabilities. The term generally refers to large institutions, such as developmental centers (formerly called training schools or state schools), but the number of smaller residential settings, such as community residences, that are publicly operated now greatly exceeds the number of remaining large public facilities.

public self information about the self, or an integrated view of the self, that is conveyed to others in actions, self-descriptions, appearance, and social interactions. An individual's public self may vary depending on the target or audience of such impressions. The public self is often contrasted with the private self, which may be similar to or different from the self one reveals to others. See also social identity; social self.

public self-consciousness see SELF-CONSCIOUSNESS.

public service psychology an area of psychology defined by the activities of psychologists employed in public sector agencies (e.g., community mental health centers, state hospitals, correctional facilities, police and public safety agencies) and by the psychological condition of people served by these agencies. Particular interests include advocacy, access to services, education and training, public policy formulation, research and program evaluation, and prevention efforts.

public sociology a multidisciplinary, practice-oriented specialization in the field of sociology that works with individuals and community groups to develop problem-focused research projects that offer concrete help in generating needed social change. Formerly called clinical sociology.

public-speaking anxiety fear of giving a speech or presentation in public because of the expectation of being negatively evaluated or humiliated by others. This is a common fear, associated with social phobia.

public territory a public space temporarily used by a person or group (e.g., park bench, bus seat). Compare PRIMARY TERRITORY; SECONDARY TERRITORY. See proxemics.

PUBS abbreviation for PERCUTANEOUS UMBILICAL CORD BLOOD SAMPLING.
pudendal nerve

ductal nerve a combined sensory and motor nerve that carries fibers to the muscles and skin of the perineal region from branches of the second, third, and fourth sacral nerves (see spinal nerve). It terminates as the dorsal nerve of the penis or clitoris.

pudendum n. (pl. pudenda) human external genitalia, especially those of the female. See vulva. —pudendal adj.

puer aeternus the archetype of eternal youth. [Latin, “eternal boy”; introduced by Carl Jung]

puerilism n. immature, childish behavior.

puerperal disorder a disorder occurring in a woman during the puerperium, which extends from the termination of labor to the return of the uterus to its prepregnant condition. Symptoms include psychotic and depressive reactions and, occasionally, manic episodes or delirious states precipitated by biological, psychosocial, or environmental factors. See postpartum depression; postpartum psychosis.

puerperium n. (pl. puerperia) see postpartum period. —puerperal adj.

Puerto Rican syndrome see mal de pitea.

Pulfrich effect an illusion of depth that occurs when a swinging pendulum is viewed by one eye normally, but through a dimming filter by the other eye. The difference in the timing of the visual signals created by this situation is interpreted by the brain as binocular disparity, and the pendulum appears to be traveling in an ellipse rather than back and forth. Also called Pulfrich phenomenon. Compare Mach–Dvorak stereoeillusion. [Carl Pulfrich (1858–1927), German scientist]

pull model a psychological theory emphasizing how positive experience draws a person to establish meaning or to set goals. Compare push model.

pull-out program an educational plan in which students who spend most of the day in traditional classrooms are, for a portion of the day, taken to a separate class for specialized work, either above or below the standard of instruction in their regular classrooms. See also opportunity class.

pulmonary embolism the lodging of a blood clot or other obstructing material (see embolism) in a pulmonary artery with consequent obstruction of blood supply to the lung tissue. The clot most commonly derives from deep vein thrombosis.

pulse n. 1. the pressure waves caused by rhythmic contraction and relaxation of the walls of arteries as blood is pumped from the heart. The pulse, which can be detected manually at superficial arteries, provides a measure of the heart rate. The strength of the pulse at various points in the body (e.g., the ankle) gives an indication of the adequacy of circulation. 2. an increase followed by a decrease in magnitude of a signal.

pulvinar n. a large nucleus in the brain that forms the dorsal posterior region of the thalamus. It has afferent and efferent connections with the cingulate cortex and is also connected to the superior colliculus. It has a role in eye movements.

pun n. an expression that makes deliberate use of verbal ambiguity, generally for humorous effect; an example is “That’s the psychologist who went for a walk and fell into a depression.” Many puns exploit the phenomenon of homophony, in which words sounding the same (or nearly the same) have different meanings. See also polysemy.

punch-drunk adj. see dementia pugilistica.

punctate sensitivity the variable distribution of sense receptors in the skin, with the result that some points are more sensitive to certain types of stimuli than others. On most parts of the skin, pain spots are more densely distributed than touch, cold, and warm spots, in that order.

punctuated equilibrium a theory of evolution proposing that periods of rapid change, resulting in the development of new species, are separated by longer periods of little or no change. Proposed in 1972 by U.S. paleontologists Niles Eldredge (1943–) and Stephen Jay Gould (1941–2002), the theory subsequently inspired similar models of change as applied to other processes. In a model of group development, for example, U.S. behavioral scientist Connie J. Gersick proposed in 1988 that groups go through three stages of development: (a) a preliminary stage of setting deep structures (i.e., establishing how the group will be organized and what activities it will carry out); (b) an equilibrium period during which the deep structures are maintained; and (c) a revolutionary period of rapid change (usually resulting from environmental pressures) during which the deep structures are undone and superseded by new ones.

pungent adj. denoting one of the seven classes of odors in the stereochemical smell theory.

punishment n. 1. a physically or psychologically painful, unwanted, or undesirable event or circumstance imposed as a penalty on an actual or perceived wrongdoer. 2. in operant conditioning, the process in which the relationship, or contingency, between a response and some stimulus or circumstance results in the response becoming less probable. For example, a pigeon’s pecks on a key may at first occasionally be followed by presentation of food: this will establish some probability of pecking. Next, each peck produces a brief electric shock (while the other conditions remain as before). If pecking declines as a result, then punishment is said to have occurred, and the shock is called a punisher. —punish vb.

punishment and obedience orientation see preconventional level.

punitive damages a sum of money a defendant is ordered to pay to the plaintiff in a civil lawsuit when the goal of the court is to punish the defendant for malicious or evil acts and to deter others from engaging in similar conduct. Also called exemplary damages. Compare compensatory damages.

punitive parenting a parent’s habitual use of punishment to teach or control a child, often involving harsh or coercive practices such as yelling at, threatening, pushing, grabbing, hitting, or verbally disparaging the child.

pupil n. the aperture through which light passes on entering the eye. It is located immediately in front of the lens. The size of the opening is controlled by a circle of muscle (the iris) innervated by fibers of the autonomic nervous system.

pupillary reflex the automatic change in size of the pupil in response to light changes. The pupil constricts in response to bright light and dilates in dim light. Also called light reflex. See also accommodation.
pupillary-skin reflex see CUTANEOUS-PUPILARY REFLEX.

pupillometry n. 1. the scientific measurement of the pupil of the eye, using a pupillometer (or coreometer) to measure the pupil’s diameter. Also called pupilometrics. 2. a research method in which pupillary responses to stimuli (usually visual images) are measured in order to determine the participant’s interest in the stimuli. [devised by U.S. psychologist Ekhard Hess (1916–1986)]

puppetry therapy the use of puppets as a projective form of PLAY THERAPY. See also PROJECTIVE PLAY.

puppy love a type of ROMANTIC LOVE that flourishes during adolescence but is often unstable and transient. Puppy love is regarded as marking a step toward emotional maturation.

Purdue Pegboard Test see PEGBOARD TEST.

pure alexia see ALEXIA.

pure color a sensation of color induced by monochromatic light, that is, light that contains a single wavelength.

pure consciousness awareness without content. It is a central concept in VEDANTA philosophy.

pure research see BASIC RESEARCH.

pure science see BASIC SCIENCE.

pure-stimulus act a behavioral response that does not move an organism toward its goal but that serves solely as a stimulus for other responses. It operates by activating proprioceptive stimuli that in turn initiate the appropriate goal-directed response. Also called pure-stimulus response. [first defined in 1930 by Clark L. HULL]

pure tone a sound whose instantaneous SOUND PRESSURE is a sinusoidal function of time. A pure tone has only one frequency component. Also called simple tone: sinusoid. Compare COMPLEX TONE.

pure-tone audiometry see AUDIBILITY RANGE; AUDIOGRAM.

pure word deafness a type of AUDITORY AGNOSIA in which an individual is unable to understand spoken language but can comprehend nonverbal sounds and read, write, and speak in a relatively normal manner. The syndrome is considered “pure” in the sense that it is relatively free of the language difficulties encountered in the APHASIAS.

purging n. the activity of expelling food that has just been ingested, usually by vomiting or the use of laxatives. Purging often occurs in conjunction with an eating binge in ANOREXIA NERVOSA or BULIMIA NERVOSA; its purpose is to eliminate or reduce real or imagined weight gain.

purging disorder a disturbance in which individuals feel a loss of control after eating only a small amount of food and recurrently vomit up or otherwise expel their meals. It is differentiated from BULIMIA NERVOSA by the absence of binging. Studies indicate that purging disorder affects between 1.1% and 5.3% of women in their lifetimes and that the typical age of onset is late adolescence (18–20 years old). The condition is associated with a greater release of the hormone CHOLECYSTOKININ, which controls feelings of fullness, and lower levels of the protein LEPTIN, which conveys information about body-fat levels. [originally described in 2005 by clinical psychologist Pamela K. Keel and colleagues]

purkinje afterimage see BIDWELL’S GHOST. [Jan Evangelista Purkinje (also spelled Purkyně: 1787–1869), Czech physiologist and physician]

purkinje cell a type of large, highly branched cell in the CEREBELLAR CORTEX of the brain that receives incoming signals about the position of the body and transmits signals to spinal nerves for coordinated muscle actions. [Jan Evangelista Purkinje]

purkinje figures the observation of one’s own network of retinal blood vessels, best seen by shining a bright light through the sclera at the margin of the eye. [Jan Evangelista Purkinje]

purkinje–Sanson images three reflected images of a fixed object produced by the surface of the cornea and the front and back of the lens. [Jan Evangelista Purkinje; Louis Joseph Sanson (1790–1841), French surgeon]

purkinje shift a visual phenomenon in which colors appear to change with the level of illumination. A rose, for example, may appear bright red and its leaves bright green at the beginning of twilight, then gradually change to a black flower with light gray leaves as the level of daylight declines. The Purkinje shift affects the brilliance of the red end of the spectrum before the blue end. [Jan Evangelista Purkinje]

purple n. a color that results from mixing short and long wavelengths of light. See EXTRASPECTRAL HUE.

purpose n. 1. the reason for which something is done or for which something exists. 2. a mental goal or aim that directs a person’s actions or behavior. 3. persistence or resolution in pursuing such a goal.

purposeful behavior behavior with a specific goal, as opposed to aimless or random behavior. See GOAL-DIRECTED BEHAVIOR.

purpose in life the mental sense of a goal or aim in the process of living or in existence itself. This concept is of special significance in EXISTENTIAL PSYCHOTHERAPY, in which its development is considered to be central to the treatment of anxiety, depression, and related negative emotional states.

purposeless hyperactivity a symptom of certain brain or mental disorders manifest as prolonged periods of excessive activity that has no purpose.

purposive accident an accidental event that in fact was caused deliberately. It may have been motivated by psychological factors, such as unacknowledged wishes or needs. Also called INTENTIONAL ACCIDENT. See PARAPRAXIS.

purposive behaviorism a cognitive theory of learning postulating that behavioral acts have a goal or purpose that selects and guides the behavioral sequence until the goal or purpose is attained. Purposive behaviorism incorporates the gestalt concepts of FIELD THEORY and contrasts with behavioral learning theories, which reduce behavior to smaller units of learned stimuli and responses. See also S–S LEARNING MODEL. [proposed by Edward C. TOLMAN]

purposive psychology an approach to psychology that makes the primary assumption that organisms usually have conscious goals that motivate and organize their behavior. See also HORMIC PSYCHOLOGY; PURPOSES BEHAVIORISM; TELEOLOGY.

purposive sampling a SAMPLING method that focuses on very specific characteristics of the units or individuals
purposivism

chosen. For example, a researcher investigating a specific type of amnesia may select for study only those individuals who have specific lesions in their brains. Although the final subset of cases is extreme and not random, valuable information nonetheless may be obtained from their study. See NONPROBABILITY SAMPLING.

purposivism n. any approach that emphasizes goals or purposes to explain actions or behavior. See PURPOSIVE BEHAVIORISM.

pursuitmeter n. 1. any instrument that measures the ability of a test participant to follow a moving target. 2. an older term for a PURSUIT ROTOR.

pursuit rotor a device to test VISUAL—MOTOR COORDINATION that consists of a small target embedded in a disk. The participant attempts to keep a stylus above the target, which moves as the disk rotates at varying speeds.

push-down stack a model of memory that compares its storage procedures to stacks of cafeteria trays in spring-loaded compartments. New items in memory are like trays added to the top of the stack, with other items being pushed down to accommodate them. Access to memory items is only from the "top." The model originated in computing but is now often applied to SHORT-TERM MEMORY in humans.

push model a psychological theory emphasizing how negative experience impels a person to establish meaning or to set goals. Compare PULL MODEL.

push switch a single- or multiple-button switch that can be activated by direct pressure from almost any body part and is therefore operable by users with disabilities.

putamen n. a part of the lenticular nucleus in the BASAL GANGLIA of the brain. It receives input from the motor cortex and is involved in control of movements.

putrid adj. denoting one of the seven classes of odorsants in the STEREOCHEMICAL SMELL THEORY.

puzzle box in experimental research, a box in which a nonhuman animal must manipulate some type of device, such as a latch, to escape from the box or to get a reward. It was originally used in 1898, in the form of the THORDIKE Puzzle Box (a wooden box with slatted sides and a door that could be opened by the animal itself), by Edward L. THORDIKE in studying animal learning and intelligence.

p value n. see PROBABILITY LEVEL.

PVS abbreviation for persistent vegetative state.

PWS abbreviation for PRADER—WILLI SYNDROME.

pycndysostosis (pyknodysostosis) n. an autosomal recessive, lysoosomal storage disease caused by mutation of the CTSK gene and characterized by moderately short stature (affected individuals rarely reach an adult height of 5 ft); increased bone density; underdeveloped fingertips with absent or small nails; delays in the closing of skull sutures; an abnormal collarbone (clavicle); and distinctive facial features, including a large head with a small face and chin, underdeveloped facial bones, a high forehead, and dental abnormalities.

Pygmalion effect a consequence or reaction in which the expectations of a leader or superior engender behavior from followers or subordinates that is consistent with these expectations: a form of self-fulfilling prophecy. For example, raising manager expectations of the performance of subordinate employees has been found to enhance the performance of those employees. Compare UPWARD PYGMALION EFFECT.

pygmalionism n. the act of falling in love with one's own creation. The term is derived from Greek mythology, in which Pygmalion fell in love with a statue of Aphrodite that he had sculpted.

pygmyst n. a constitutional hereditary anomaly consisting of a dwarfed but well-proportioned body, roughly equivalent to the primordial nanosomia body type. This body build is typical for certain groups of people, particularly in central Africa. Communities of similar small people have been described in myths and the literature of ancient Europe.

pyknictype a body type characterized by a short, thickset, stocky physique. According to KRETSCHMER TYPOLOGY, such individuals tend to be jovial, extraverted, and subject to mood swings (in extreme cases, manic depressive). See also CONSTITUTIONAL TYPE.

pyknody sostosis n. see PYKNODYSOSTOSIS.

pyknolepsy n. see CHILDHOOD ABSENCE EPILEPSY.

pyloric stenosis see STENOSIS.

pyr- combining form see PYRO-.

pyramid n. a bulge on the front of the MEDULLA OBONGA where fibers of motor neurons from higher centers cross from one side of the brain to the opposite side of the spinal cord. See also PYRAMIDAL TRACT.

pyramidal cell a type of large neuron that has a roughly pyramid-shaped cell body and is found in the cerebral cortex. See also CORTICAL LAYERS.

pyramidal tract the primary pathway followed by motor neurons that originate in the motor area of the cortex, the premotor area, the somatosensory area, and the frontal and parietal lobes of the brain. Fibers of the pyramidal tract communicate with fibers supplying the peripheral muscles. Because of the contralateral relationship between left and right brain hemispheres and motor activity on the opposite sides of the body, pyramidal-tract fibers cross in the PYRAMIDS of the medulla oblongata. The pyramidal tract includes the CORTICOSPINAL TRACT, and the two terms are occasionally used synonymously. Also called PYRAMIDAL MOTOR SYSTEM: PYRAMIDAL SYSTEM. See also EXTRAPYRAMIDAL TRACT.

pyramidotomy n. the surgical process of cutting the pyramidal (motor) tract in the brain.

pyriform area (piriform area) a pear-shaped region of the RHINENCEPHALON, at the base of the medial temporal lobe of the brain, that contains clumps of STELLATE CELLS and PYRAMIDAL CELLS. Part of the Olfactory Cortex, it receives Olfactory Tracts of the second order as well as input from the inferior temporal lobe and relays impulses to the HIPPOCAMPAL FORMATION. Also called pyriform lobe.

pyro- (pyr-) combining form 1. fire or burning (e.g., pyromania). 2. fever (e.g., pyrogen). pyrogen n. any agent that causes an increase in body temperature. —pyrogenic adj.

pyroclagnia n. the arousal of sexual excitement by watch-
ing or setting large fires or conflagrations. Also called 

**erotic pyromania.**

**pyromania n.** an impulse-control disorder characterized by (a) repeated failure to resist impulses to set fires and watch them burn, without monetary, social, political, or other motivations; (b) an extreme interest in fire and things associated with fire; and (c) a sense of increased tension before starting the fire and intense pleasure, gratification, or release while committing the act.

**p-zombie** short for philosophical ZOMBIE.
topics and asked to sort them into categories. Compare which participants are given statements about people and specific for the probability of failure in a "plans projects in advance of due dates") would have factor loadings on each of the underlying person factors. Also called inverse factor analysis: Q factor analysis.

QALYs acronym for QUALITY ADJUSTED LIFE YEARS.

q 1. symbol for STUDENTIZED RANGE STATISTIC. 2. symbol for the probability of failure in a BINARY TRIAL: $q = 1 - p$.

Q 1. see COCHRAN Q TEST. 2. see YULE’S Q. 3. symbol for a specific QUARTILE (e.g., $Q_1$, first quartile; $Q_3$, third quartile).

QALYs acronym for QUALITY ADJUSTED LIFE YEARS.

Q test see COCHRAN Q TEST.

QTL abbreviation for QUANTITATIVE TRAIT LOCUS.

Quaalude n. a trade name for METHAQUALONE.

quack 1. n. an unqualified person who makes false claims about, or misrepresents his or her ability or credentials in, medical, mental, or behavioral diagnosis and treatment. 2. adj. describing a treatment for which false or exaggerated claims are made. —quackery n.

quadrant n. 1. one of four divisions of a two-dimensional $x$–$y$ plot of psychological variables. The quadrants correspond to positive scores on both dimensions (upper right corner of plot), negative scores on both dimensions (lower left corner of plot), and positive scores on one dimension and negative scores on the other dimension (upper left corner and lower right corner, respectively, of the plot). 2. one of four divisions of the visual field.

quadrantanopia n. loss of vision in one fourth, or one quadrant, of the visual field. Homonymous quadrantanopia is the loss of vision in both (upper or lower) quadrants of the same half (right or left) of the visual field of each eye (e.g., left upper quadrantanopia); it is caused by postchiasmatic brain injury (see POSTCHIASMATIC VISUAL DEFICIT). Also called quadrantanopia: quadrantanopsia: quadrantic hemianopia.

quadrant sampling a method for selecting units of analysis (e.g., participants, organizations) from different areas of a space. The space is divided into four sections and units are drawn from each. In psychology, units may be drawn from psychological space, such as personality variables that are thought of as arrayed in two-dimensional space. See QUADRANT.

quadrature n. the numerical computation of an integral of a function, either by traditional rules or by an adaptive process involving approximation. It is used extensively during estimation in modeling approaches, such as ITEM RESPONSE THEORY and GENERALIZED LINEAR MODELS.

quadriplegia n. paralysis of all four limbs, associated with neurological injury or disorder. Also called tetraplegia. —quadriplegic adj.

quadriparesis n. muscle weakness or partial paralysis in all four limbs, associated with neurological injury or disorder. Also called tetraparesis.

qualia pl. n. (sing. quale) 1. characteristics or qualities that determine the nature of a mental experience (sensation or perception) and make it distinguishable from other such experiences, so that, for example, the experience differentiates between the sensations of heat and cold. Qualia bear some conceptual relationship to the empiricist notion of PRIMARY QUALITIES and SECONDARY QUALITIES; in some
systems, however, they take on the quality of basic or fundamental units of experience. Other thinkers, primarily those in the materialist tradition, reject the notion of qualia as an unnecessary construct with little explanatory value. 2. the phenomenal, conscious states or feelings specific to each emotion. The ineffable phenomenal states of anger, happiness, fear, sadness, and so on are qualia of AFFECT.

**qualitative adj.** referring to a variable, study, or analysis that involves a method of inquiry based on descriptive data without the use of numbers. Compare QUANTITATIVE.

**qualitative analysis** the investigation of open-ended material and narratives by researchers or raters who describe dominant themes that emerge in the data. In many cases, specialized computer programs are used to identify these themes with researcher-provided search terms. A major component of describing the data is trying to understand the reasons behind the observed themes. Compare QUANTITATIVE ANALYSIS.

**qualitative data** information that is not expressed numerically, such as descriptions of behavior, thoughts, attitudes, and experiences. If desired, qualitative data can often be expressed quantitatively through CODIFICATION. Compare QUANTITATIVE DATA.

**qualitative evaluation** an evaluation method that yields narratives gathered primarily from unstructured methods of data collection, naturalistic observation, and existing records. As an initial or divergent phase of PROGRAM EVALUATION, it seeks to allow maximum opportunity to frame EVALUATION OBJECTIVES. This approach is usually associated with a GOAL-FREE EVALUATION rather than a GOAL-BASED EVALUATION. Compare QUALITATIVE EVALUATION.

**qualitative observation** a formal description of a phenomenon that takes into account the context in which that phenomenon occurs but does not rely on numbers in the description.

**qualitative research** a method of research that produces descriptive (non-numerical) data, such as observations of behavior or personal accounts of experiences. The goal of gathering this QUALITATIVE DATA is to examine how individuals can perceive the world from different vantage points. A variety of techniques are subsumed under qualitative research, including CONTENT ANALYSIS of narratives, IN-DEPTH INTERVIEWS, FOCUS GROUPS, PARTICIPANT OBSERVATION, and CASE STUDIES, often conducted in naturalistic settings. Also called qualitative design; qualitative inquiry; qualitative method; qualitative study. Compare QUANTITATIVE RESEARCH.

**qualitative variable** a descriptive characteristic or attribute, that is, one that cannot be numerically ordered. Examples are gender, eye color, and preferred sport. Compare QUANTITATIVE VARIABLE.

**quality n.** 1. a characteristic or feature of something, be it physical or abstract. See PRIMARY QUALITY; SECONDARY QUALITY. See also QUALIA. 2. the essential character or nature of something.

**quality adjusted life years** (QALYs) a measure that combines the quantity of life, expressed in terms of survival or life expectancy, with the quality of life. The value of a year of perfect health is taken as 1; a year of ill health is worth less than 1; death is taken as 0. The measure provides a method to assess the benefits to be gained from medical procedures and interventions.

**quality adjusted survival analysis** in controlled clinical trials, a type of SURVIVAL ANALYSIS that not only predicts time to an event (e.g., number of years to death, time to relapse) but also recognizes aspects of the treatment that affect a patient’s quality of life. For example, the analysis would identify a treatment condition (e.g., introduction of a new drug) that might lead to longer but much lower quality of life for the patient.

**quality assurance** in health administration or other areas of service delivery, a systematic process that is used to monitor and provide continuous improvement in the quality of health care services. It involves not only evaluating the services in terms of effectiveness, appropriateness, and acceptability but also offering feedback and implementing solutions to correct any identified deficiencies and assessing the results.

**quality circle** a form of PARTICIPATIVE MANAGEMENT in which a small group of employees are given the task of improving the quality and reducing the costs of the goods or services produced in their jobs and resolving any other production and productivity problems. Employees in a quality circle are typically given autonomy in how they approach this task and may be trained in STATISTICAL PROCESS CONTROL. See also SCANLON PLAN.

**quality control** processes associated with research, production, or services that are designed to reduce the number of defective measurements and products.

**quality of care** the extent to which health services are consistent with professional standards and increase the likelihood of desired outcomes.

**quality of life** the extent to which a person obtains satisfaction from life. The following are important for a good quality of life: emotional, material, and physical well-being; engagement in interpersonal relations; opportunities for personal (e.g., skill) development; exercising rights and making self-determining lifestyle choices; and participation in society. Enhancing quality of life is a particular concern for those with chronic disease or developmental and other disabilities, for those undergoing medical or psychological treatment, and for the aged.

**Quality of Life in Alzheimer’s Disease Scale** (Qol-AD) a 13-item self-report questionnaire in which older adults with Alzheimer’s disease or their caregivers rate, on a scale of 1 (poor) to 4 (excellent), the patients’ quality of life along several dimensions: their physical health; energy level; mood; living situation; memory; relationships with family, spouse, and friends; feelings about themselves; ability to do chores; ability to have fun; concerns about their financial situation; and life as a whole. Total scores range from 13 to 52. [developed in the 1990s by U.S. psychologist Rebecca G. Logsdon and colleagues]

**quality of worklife** (QWL) the extent to which a person obtains satisfaction from his or her job and feels a sense of ORGANIZATIONAL COMMITMENT. Several factors are important for a good quality of worklife, including salary, benefits, safety, and efficiency, as well as variety and challenge, responsibility, contribution, and recognition.

**quality weighting** the WEIGHTING of each of the studies in a META-ANALYSIS by the quality of its design, execution, and analysis.

**quantal hypothesis (quantal theory)** see NEURAL QUANTUM THEORY.

**quantification** n. the process of expressing a concept or...
variable in numerical form, which may aid in analysis and understanding.

**quantifier** n. in linguistics, a DETERMINER used to express the notion of quantity, such as many, most, some, or all.

**quantile** n. a value in a series of values in ascending order below which a given percentage of values lies; for example, a 50% quantile (also called a MEDIAN) is the point at which 50% of the values fall below that value (and 50% above). Other types of quantile are QUARTILES, dividing the series into four equal-sized groups; DECILES, dividing it into 10 groups; and PERCENTILES (or centiles), dividing it into 100 groups. Also called fractile.

**quantile–quantile plot (Q-Q plot)** a plot of the QUANTILES of one set of data against the quantiles of a second set, used to determine if the two data sets follow a common distribution. A 45° line on the plot shows where a perfect match of distributions would be.

**quantitative** adj. involving the use of a numerical measurement system to analyze data. Compare QUALITATIVE.

**quantitative analysis** the investigation of data empirically using numerical variables. Quantitative analysis includes both DESCRIPTIVE STATISTICS—such as summaries of MEANS and STANDARD DEVIATIONS of variables—and INFERENCEAL STATISTICS—such as ANALYSIS OF VARIANCE, REGRESSION ANALYSIS, FACTOR ANALYSIS, and HIERARCHICAL LINEAR MODELS. Compare QUALITATIVE ANALYSIS.

**quantitative data** information expressed numerically, such as test scores or measurements of length or width. These data may or may not have a real zero, but they have order and often equal intervals. Compare QUALITATIVE DATA.

**quantitative electroencephalograph (qEEG)** a version of the electroencephalograph that generates numerical results that can be statistically analyzed. See ELECTROENCEPHALOGRAPHY.

**quantitative evaluation** an evaluation method that yields numerical indices gathered primarily from formal (objective) methods of data collection, systematic and controlled observation, and a prescribed research design. As a final or convergent phase of PROGRAM EVALUATION, it seeks to provide precise answers to already defined EVALUATION OBJECTIVES. This approach is usually associated with a GOAL-BASED EVALUATION rather than a GOAL-FREE EVALUATION. Compare QUALITATIVE EVALUATION.

**quantitative psychology** the study of methods and techniques for the measurement of human attributes, the statistical and mathematical modeling of psychological processes, the design of research studies, and the analysis of psychological data. Researchers in this area develop new methodologies and evaluate existing methodologies under particular conditions (e.g., with small samples).

**quantitative research** a method of research that relies on measuring variables using a numerical system, analyzing these measurements using any of a variety of statistical models, and reporting relationships and associations among the studied variables. For example, these variables may be test scores or measurements of reaction time. The goal of gathering this QUANTITATIVE DATA is to understand, describe, and predict the nature of a phenomenon, particularly through the development of models and theories. Quantitative research techniques include experiments and surveys. Also called QUANTITATIVE DESIGN: QUANTITATIVE INQUIRY: QUANTITATIVE METHOD: QUANTITATIVE STUDY. Compare QUALITATIVE RESEARCH.

**quantitative score** a number that represents the number of correctly fulfilled requirements for a given test or class.

**quantitative semantics** see CONTENT ANALYSIS.

**quantitative trait loci (QTL)** locations in the GENOME containing a number of genes that contribute to variation in a given quantitative (continuously distributed) trait, such as height.

**quantitative variable** a characteristic or attribute that can be measured numerically using a score obtained from any of a variety of data sources. Examples are age, height, and weight. Compare QUALITATIVE VARIABLE.

**quantum** n. (pl. quanta). 1. in physics, a unit of radiant energy. 2. in neuroscience, the minimal amount of neurotransmitter released by a neuron at a given time.

**quantum mind** an extension of NEURAL QUANTUM THEORY proposing that quantum-level neuronal events are a basic mechanism of consciousness. Also called QUANTUM HYPOTHESIS OF CONSCIOUSNESS.

**quantum theory** see NEURAL QUANTUM THEORY.

**quartile** n. one of the three values in a series of values that divide it into equal-sized fourths. For example, the first (or lower) quartile of a distribution is the data value below which are the lowest 25% of scores, the second quartile is the data value below which are 50% of scores, and the third (or upper) quartile is the data value below which are 75% of scores (or, conversely, above which are 25% of scores). These values provide information to researchers about the relative spread of the distribution. See Q; QUANTILE.

**quartile deviation** a measure of DISPERSION that is defined as the value halfway between the first and third quartiles (i.e., half the INTERQUARTILE RANGE). Also called SEMI-INTERQUARTILE RANGE.

**quartimax rotation** in FACTOR ANALYSIS, an ORTHOGONAL ROTATION that maximizes the variance across the rows of the factor matrix by raising the loadings to the fourth power; the effect is to make large loadings especially large and small loadings especially small. The objective is to increase the interpretability of a factor solution by satisfying the SIMPLE STRUCTURE ideal.

**quasi-experimental control group** in a QUASI-EXPERIMENTAL DESIGN, any group of participants who are assigned to a condition in which the treatment is not introduced. These individuals will receive the standard of care, receive a placebo, or participate in an activity that involves them in the study but does not include the treatment in any way.

**quasi-experimental design** an experimental design in which assignment of participants to an EXPERIMENTAL GROUP or to a CONTROL GROUP cannot be made at random for either practical or ethical reasons; this is usually the case in FIELD RESEARCH. Assignment of participants to conditions is usually based on self-selection (e.g., employees who have chosen to work at a particular plant) or selection by an administrator (e.g., children are assigned to particular classrooms by a superintendent of schools). Such designs introduce a set of assumptions or threats to INTERNAL VALIDITY that must be acknowledged by the researcher when interpreting study findings. A study using this design
is called a quasi-experiment. Examples include studies that investigate the responses of large groups to natural disasters or widespread changes in social policy.

quasi-experimental research research in which the investigator cannot randomly assign units or participants to conditions, cannot generally control or manipulate the independent variable, and cannot limit the influence of extraneous variables. Field research typically takes the form of quasi-experimental research. Also called nonexperimental research. See QUASI-EXPERIMENTAL DESIGN.

quasi–F-ratio in analysis of variance and regression analysis, a substitute for the F-ratio that can sometimes be obtained when the denominators for an exact F-ratio cannot be completed. The quasi–F-ratio is obtained by determining the mean squared error using certain estimated components of variation when these cannot be calculated directly.

quasigroup n. a collective with some, but not all, of the defining features of a true group.

quasi-independence n. in a contingency table, the situation in which only a subset of entries or frequencies are independent or uninfluenced by one another. Entries may not be independent for a variety of reasons: They may be invalid, missing, or not counted in the analysis.

quasi-independent variable in experimental design, any of the personal attributes, traits, or behaviors that are inseparable from an individual and cannot reasonably be manipulated. These include gender, age, and ethnicity. Such attributes may be modeled and treated as statistically independent but are not subject to random assignment, as are independent variables.

quasi-interval scale a rating scale that classifies responses by using ordered options but that lacks equal distances between scale points. For example, some response items could show equal distances between scale points, whereas for other items respondents could have a difficult time differentiating among options, leading to compression or stretching between scale points. See INTERVAL SCALE.

quasi-likelihood function a formula used to obtain estimates for count or binary data that show more dispersion than the statistical model can handle. An advantage of quasi-likelihood models is that they permit an increased flexibility in the data types and research situations to which they may be applied. A limitation is that the function does not derive from a known population distribution.

quasined n. in the social psychology of Kurt Lewin, a tension state that initiates goal-directed activity and that has an origin in intent or purpose rather than in a biological deficit.

quasi-observation n. 1. the process of collecting data about a person from a close source, rather than directly from the subject. An example is asking an individual to report on the job satisfaction of his or her partner. 2. the use of mechanical means, such as video surveillance or audiotaping, to record behaviors as a substitute for real-time observation and questioning by a researcher. In marketing research, an example would be the use of surveillance cameras to monitor shopper behavior in stores. This would cost less than paying a trained researcher to observe and interview shoppers in situ. There is also the advantage that such data can be viewed, stored, and analyzed at the researcher’s convenience.

quasirandom adj. see PSEUDORANDOM.

quasirandom sampling see SYSTEMATIC SAMPLING.

quasi-vegetative state see MINIMALLY CONSCIOUS STATE.

quaternity n. Carl Jung’s fourfold concept of personality, in which there are four functions of the ego: feeling, thinking, intuiting, and sensing (see FUNCTIONAL TYPES). For Jung, the quaternity is an archetype exemplified in myriad ways, such as the four points of a compass and the four points of a cross.

quazepam n. a benzodiazepine used as a hypnotic agent. It is of medium potency and is highly lipid soluble, enabling rapid penetration of the blood–brain barrier and resulting in rapid onset of effects. Because its metabolic products are eliminated slowly, quazepam may accumulate in the body, leading to unwanted daytime sedation. U.S. trade name: Doral.

queer adj., n. controversial slang, in the main pejorative, referring to gays and lesbians or relating to homosexual orientation. The original and still common use of the word, to describe anything that is odd or strange, was extended to refer to gays in the late 19th and throughout much of the 20th century, when it acquired a predominantly negative connotation. During the late 1960s and onward (see sexual revolution), it was appropriated by some members within the gay community as a term of identification that carried no negative connotation and, indeed, became a label of pride and self-respect. This usage is not embraced, however, by all members of the gay community.

queer rights movement see GAY LIBERATION.

querulent adj. quarrelsome, complaining, irritable, and suspicious.

questionnaire n. a set of questions or other prompts used to obtain information from a respondent about a topic of interest, such as background characteristics, attitudes, behaviors, personality, ability, or other attributes. A questionnaire may be administered with pen and paper, in a face-to-face interview, or via interaction between the respondent and a computer or website.

quetiapine n. an atypical antipsychotic used for the management of psychosis and schizophrenia. As with conventional antipsychotics, its therapeutic effects are in part related to its ability to block D2 dopamine receptors (see dopaminergic receptor antagonist); however, it differs from the older agents in its ability to also block 5-HT2, serotonin receptors. It is also approved for treatment of bipolar disorder and (in its extended-release formulation) as an adjunct to antidepressant drugs for unipolar depression. Sedation is a common adverse effect; thyroid dysfunction, weight gain, and electrocardiographic effects are more rarely observed. U.S. trade name: Seroquel.

queue n. a file of people who are waiting for some service, commodity, or opportunity. Although the members of the queue are often strangers who will likely not meet again, they nonetheless comply with social norms that determine the order in which members will receive service.

quick-and-dirty adj. describing a research design or data analysis that is admitted to be informal and imperfect. The researcher who adopts such an approach recognizes that there is a more refined way to set up the experiment or to analyze the findings. In research, a quick-and-dirty approach is more informal than a pilot study; in data analy-
sis, it is regarded as a first peek at data from a specific analysis.

Quick Test (QT) a 50-item intelligence test used for screening purposes and for individuals with severe disabilities who may respond to test items by pointing or nodding without using words. Participants are presented with a set of four black-and-white drawings and must indicate which one best represents a target word. The words vary from easy to hard, and each has an assigned approximate difficulty level. [developed in 1962 by U.S. psychologists Robert Bruce Ammons (1920–1999) and Carol H. Ammons (1927– )]

quick trajectory see trajectories of dying.

quid pro quo an advantage given in return for something done or promised (from Latin, literally: “one thing for another”). The phrase has come to be associated with a form of sexual harassment in which sexual demands are made with the explicit or implicit suggestion that compliance will have positive consequences (e.g., a job promotion), whereas failure to comply could have the opposite effect (e.g., termination of employment).

Quincke's disease (Quincke's edema) see angioedema. [Heinrich Irenaeus Quincke (1842–1922), German physician]

Quinian bootstrapping (Quinean bootstrapping) a theory that humans build complex concepts out of primitive ones through a bootstrapping process. According to this idea, infants learn conceptual symbols separately and later relate these symbols to one another, which leads them to infer larger concepts. For instance, young children eventually understand that numbers match up to the sequentially occurring words one, two, three, and so on, and this allows them to make the conceptual leap to understanding that numbers have a sequential order that constitutes counting. In time, these concepts become robust enough to allow comprehension of a variety of complex phenomena. [coined by U.S. developmental psychologist Susan E. Carey (1942– ) after U.S. philosopher Willard Van Orman Quine (1908–2000)]

quintile n. one of four values in a score distribution that divides it into five equal parts. For example, the first quintile of a distribution is the value below which are the lowest 20% of scores. See quintile.

quota control in survey methodology, an approach that imposes a limit on the number of respondents that are obtained either in the total sample or in substantively meaningful subgroups, such as those defined by gender or ethnicity. The approach is efficient because it does not overuse resources, such as respondent time or good will, by obtaining more individuals than are needed for a study. It also allows a researcher to obtain a desired balance of sample sizes across groups for statistical testing. Most computerized surveys include an automatic quota control function.

quota sampling a method of forming a sample in which a prespecified number of individuals with certain background characteristics, such as a particular age, race, ethnicity, sex, or education, are selected for inclusion. Often, participants are recruited as they arrive; once the quota for a given demographic group is filled, the researcher stops recruiting subjects from that group. A researcher who uses this approach can obtain a final study sample that has the same proportional characteristics as the target population, enabling statistical testing to be performed on a subset of cases that is appropriately representative of the larger group of interest. See deliberate sampling. See also quota control.

quotient hypothesis an adaptation of Weber's law suggesting that the quotients or ratios of two successive difference thresholds in a given sensory series are equal. QWL abbreviation for quality of worklife.
Rr

r symbol for sample correlation coefficient, which is typically in the form of a product-moment correlation coefficient.

R² symbol for coefficient of determination.

R abbreviation for reasoning. See primary ability.

R² symbol for multiple correlation coefficient.

R², adj symbol for adjusted R².

rabbit–duck figure an ambiguous figure that appears to be either the head of a duck or the head of a rabbit, but never both simultaneously.

rabies n. an infectious viral disease of the central nervous system that can be transmitted to humans, usually through the bite of an infected animal (e.g., raccoon). It causes pain, fever, excessive salivation, agitation, and paralysis or contractions of muscles, particularly those of the respiratory tract. Aversion to water is a major symptom, especially in later stages of the disease, due to painful spasms associated with swallowing. Unless vaccine is administered before symptoms appear, death occurs within 2 to 10 days. Rabies was previously called hydrophobia.

race n. a socially defined concept sometimes used to designate a portion, or “subdivision,” of the human population with common physical characteristics, ancestry, or language. The term is also loosely applied to geographic, cultural, religious, or national groups. The significance often accorded to racial categories might suggest that such groups are objectively defined and homogeneous; however, there is much heterogeneity within categories, and the categories themselves differ across cultures. Moreover, self-reported race frequently varies owing to changing social contexts and an individual’s possible identification with more than one race. See also ethnic identity; racism. —racial adj.

race norming in personnel selection, the use of different cutoff scores for applicants from different racial groups. Race norming has been declared illegal in U.S. federal civil rights legislation. See also banding.

rachischisis n. a congenital fissure of the spinal column, as in spina bifida.

racial and ethnic minority psychology see ethnic psychology.

racial discrimination the differential treatment of individuals because of their membership in a particular racial group. Discrimination is in most cases the behavioral manifestation of prejudice and therefore involves unfair, negative, hostile, or injurious treatment. See also racism.

racial identity an individual’s sense of being defined, in part, by membership in a particular racial group. The strength of this sense depends on the extent to which an individual has processed and internalized the psychological, sociopolitical, cultural, and other contextual factors related to membership in the group. Given the socially constructed nature of racial categories, racial identifications can change over time in different contexts. For example, a mixed-race person might identify as mixed race in one context and Black in another. See also ethnic identity.

racial memory thought patterns, feelings, and traces of experiences held to be transmitted from generation to generation and to have an influence on individual minds and behavior. Carl Jung and Sigmund Freud both embraced the concept of a phylogenetic heritage (see phylogeny) but focused on different examples. Freud cited religious rituals designed to relieve feelings of anxiety and guilt, which he explained in terms of the oedipus complex and his primal-horde theory. Jung cited images, symbols, and personifications that spontaneously appear in different cultures, which he explained in terms of the archetypes of the collective unconscious. Also called racial unconscious.

racial prejudice see racism.

racial socialization see racial memory.

racism n. a form of prejudice that assumes that the members of racial categories have distinctive characteristics and that these differences result in some racial groups being inferior to others. Racism generally includes negative emotional reactions to members of the group, acceptance of negative stereotypes, and racial discrimination against individuals; in some cases it leads to violence. See aversive racism; everyday racism; institutionalized racism; modern racism. See also ethnocentrism. —racist adj., n.

radex theory of intelligence a psychometric theory of intelligence postulating that the organization of mental abilities forms a radial order of complexity (or radex). The radex comprises two parts: (a) a simplex, which is the relative distance from the center of a circle, with abilities that are closer to the center of the circle therefore being closer to the construct of general intelligence, which is at dead center; and (b) a circumplex, which is the relative distance around the circle, with abilities that are more highly correlated therefore being located closer to each other. Thus, the system identifies abilities through a set of polar coordinates (rather than the Cartesian coordinates used by other systems). [proposed by U.S. psychologist Louis Guttman (1916–1997)]

radial glia a type of nonneuronal cell (glia) that forms early in development, spanning the width of the emerging cerebral hemispheres to guide migrating neurons.

radial maze a type of maze that has a central starting point with several arms (typically six to eight) extending from the center. A nonhuman animal might be required to
radial nerve

learn to find food only in particular arms or to search systematically through each arm without entering the same arm twice. Radial mazes have been used extensively to study spatial memory and learning. See also sunburst maze.

radial nerve the combined sensory and motor nerve that innervates the medial (inner) side of the forearm and hand, including the thumb. Its fibers are derived from the fifth through eighth cervical spinal nerves and the first thoracic spinal nerve, and they pass through the brachial plexus.

radiation n. 1. energy transmitted in the form of waves, such as electromagnetic radiation (e.g., heat, light, microwaves, short radio waves, ultraviolet rays, X-rays), or in the form of a stream of nuclear particles (e.g., alpha particles, beta particles, gamma rays, electrons, neutrons, protons). Such waves or particles are used for diagnostic, therapeutic, or experimental purposes (see radiation therapy). 2. in neuroscience, the spread of excitation to adjacent neurons. 3. more generally, the outward spread of something from a central point.

radiation necrosis tissue death due to exposure to radiation.

radiation therapy the use of radiation (e.g., X-rays) in the treatment of diseases. Radiotherapy is used mainly in the destruction of cancer cells by implanting radioactive isotopes in the body of the patient or delivering a known dose of radiation to a specific tissue area. Side effects may include fatigue, soreness and redness of the irradiated area, nausea and vomiting, loss of appetite, and a decreased white blood cell count. Also called radiotherapy.

radical behaviorism the view that behavior, rather than consciousness and its contents, should be the proper topic for study in psychological science. This term is often used to distinguish classical behaviorism, as originally formulated in 1913 by John B. Watson, from more moderate forms of neobehaviorism. However, it has evolved to denote as well the form of behaviorism later proposed by B. F. Skinner, which emphasizes the importance of reinforcement and its relationship to behavior (i.e., the environmental determinants of behavior). Skinner conceded the existence of private events, such as thinking, feeling, and imagining, but believed them to be irrelevant, viewing them not as causes of behavior but as behavior in need of explanation or as private stimuli that function according to the same laws as public stimuli. See behavior analysis: descriptive behaviorism.

radical empiricism 1. a metaphysical position propounded by William James in 1904 holding that reality consists not of subject and object (mind and matter) but of pure experience. The position is therefore one of neutral monism. 2. the associated position, also propounded by William James, that the whole of human experience is the legitimate domain for psychological investigation. This is in contrast to the tendency of certain schools of psychology, such as structuralism, to define the subject much more narrowly. The methodological implication of radical empiricism is that psychology should not be restricted to a single method, but that it should employ methods appropriate to the study of any phenomenon that forms part of human experience. 3. the general position that (a) empirical methods provide the only reliable sources of knowledge, and (b) only propositions that can be tested by such methods have real meaning. See empiricism; logical positivism; positivism.

radical feminism a branch of feminist thought that is based on the following premises: that (a) the oppression of women is a fundamental issue of concern; that (b) the oppression of women is systemic and ubiquitous, sweeping social change is the only remedy radical enough to overcome it; (c) traditional gender roles are constraining to both sexes and ought to be overcome; (d) biology should not determine the destiny or shape the lives of women; and (e) consciousness raising, in which women come to see their personal problems as symptomatic, is the beginning of liberation. These tenets have been adopted in one form or another by many strains of feminism.

radical hysterectomy see hysterec-tomy.

radicalism n. 1. any position that goes to the heart of an idea or issue. A radical criticism is one that strikes at the most fundamental aspect of its target; a radical theory is one that challenges the fundamental assumptions and implications of rival theories. 2. a political or social position that calls for extreme or fundamental change to remedy a perceived problem. Compare reformism. —radical adj.

radical therapy any clinical intervention that focuses on the harmful psychological effects of social problems on individuals and that encourages individuals to help themselves by changing society. This approach was actively advanced by some psychologists and psychiatrists in the 1970s and 1980s.

radiculitis n. inflammation of a spinal root, particularly the portion between the spinal cord and the intervertebral canal. Symptoms commonly include pain or weakness or loss of sensation in the part of the body served by the affected spinal nerve.

radiculopathy n. any disorder of a spinal root. Radiculopathies are often due to vertebral compressing the nerve roots, as in the condition popularly known as slipped disk.

radioactive isotope an isotope of a chemical element that emits radiation during its decay to a stable form. Different isotopes of an element all have the same number of nuclear protons but different numbers of neutrons. The radiation emitted by a radioactive isotope consists of alpha or beta particles or gamma rays, which are produced as the isotope decays into simpler atoms and loses energy while gaining stability. Radioactive isotopes are widely used in diagnostic, research, and therapeutic techniques; they affect photographic film, produce an electric charge in the surrounding air, produce fluorescence with certain other substances, and have the ability to destroy or alter cells or microorganisms. Also called radioisotope.

radioactive tracer a chemical compound labeled with a radioactive isotope, such as 45Ca (calcium) or 14C (carbon), so that its metabolic pathway can be traced through body tissues. Radioactive tracers may be used for diagnostic, therapeutic, or research purposes. For example, in tobacco research, nicotine molecules can be tagged with radioactive tracers, and the path of the alkaloid can be traced through the lungs and bloodstream.

radiography n. the technique of producing negative-image film records (radiographs or radiograms) using radiation, usually X-rays or gamma rays. It is widely used as a diagnostic aid. See also radiology. —radiographer n. —radiographic adj.

radioimmunoassay (RIA) n. an immunological technique to measure the concentration of a substance of in-
terest (e.g., a hormone) in a sample of blood or a tissue. A mixture of the substance and a form of the substance tagged with a radioactive isotope are allowed to react with an antibody specific to that substance. The amount of radioactivity that is bound by the antibody inversely reflects the amount of substance in the sample: The greater the concentration of the substance in the sample, the less radioactivity will be bound.

radioisotope n. see radioactive isotope.

radiology n. the medical discipline or specialty in which radiographic imaging techniques (see radiography) are used to diagnose disease (diagnostic radiology) and radioactive substances and other forms of radiation are used to treat disease (therapeutic radiology). The latter is more commonly referred to as radiation therapy. —radiological adj. —radiologist n.

radiotherapy n. see radiation therapy.

RAE abbreviation for radiation therapy.

rage n. intense, typically uncontrolled anger. It is usually differentiated from hostility in that it is not necessarily accompanied by destructive actions but rather by excessive expressions. In nonhuman animals, rage appears to be a late stage of aggression when normal deterrents to physical attack, such as submissive signals, are no longer effective. It generally includes rapid respiration; thrusting and jerking of limbs; and clawing, biting, and snarling.

rage disorder any disturbance characterized by one or more episodes of extreme anger and aggression, such as any clinical disorder in which episodes of rage are a primary symptom (e.g., intermittent explosive disorder).

railway lines illusion see Ponzo illusion.

railway spine see erichsen’s disease.

raloxifene see antiestrogen.

rami communicantes the nerve fibers that connect the ganglia of the sympathetic chain to spinal nerves. They include both the gray rami communicantes (see gray ramus) and the white rami communicantes.

ramp movement a slow, sustained movement that is thought to be generated in the basal ganglia. Also called smooth movement.

ramus n. (pl. rami) 1. a branch of a blood vessel or a nerve. 2. any of the large branches of a spinal nerve after it emerges from the spinal column, notably the anteriorly directed ventral ramus and the posteriorly directed dorsal ramus. These distribute motor and sensory nerve fibers to other, smaller nerves. 3. any of the short nerve branches that arise from the ventral ramus and communicate with sympathetic ganglia (see rami communicantes).

Rana pipiens a species of frog used in studies of neurophysiology and neuroanatomy.

random adj. 1. without order or predictability. 2. determined by chance alone, as in random sampling or a random error.

random activity behavior that has no apparent goal or specific eliciting stimulus but may have an intrinsic purpose.

random assignment in experimental design, the assignment of participants or units to the different conditions of an experiment entirely at random, so that each unit or participant has an equal likelihood of being assigned to any particular condition. In clinical trials, this decreases the confounding of the treatment factor with other factors by making the treatment and control groups approximately comparable in all respects except for the treatment. Also called random allocation: randomization. See also randomized design.

random classification see idiosyncratic classification.

random control a control condition for classical conditioning in which the conditioned stimulus and the unconditioned stimulus are presented with equal probability but independently of each other. Such an arrangement results in a zero contingency.

random-dot stereogram a type of stereogram consisting of two images, each composed of black and white dots (or squares). Many of the dots are identical in both images, but a subset of dots in one image is offset horizontally. The images appear to consist of random dots, but when the separate images are simultaneously presented to the separate eyes, they are fused by the visual system, and the horizontal disparity of the subset of dots is interpreted as stereoscopic depth. [first devised in 1959 by Béu Julesz]

random effect an effect arising from an independent variable in an experimental design whose values or levels are drawn randomly from some larger (conceptual) population of levels that could (in principle) have been selected. For example, a health researcher investigating the relationship between exercise and weight may select a few levels of daily exercise for study (e.g., 0 hours, between 0 and 1 hour, between 1 and 2 hours, between 2 and 3 hours) from a wide range of possible options. Results involving a random effect can be generalized to values beyond those observed and modeled in the study analysis. Also called random factor. Compare fixed effect.

random-effects analysis of variance a statistical procedure in which the variability of an outcome (typically a continuously measured variable) is accounted for by several different factors or predictors, each of which reflects a sampling of possible factor levels. The focus in a random-effects analysis of variance is on identifying differences in the mean values obtained on an outcome variable at the different levels of the predictors sampled. Compare fixed-effects analysis of variance.

random-effects model any statistical procedure or experimental design that involves random effects. For example, a researcher wishing to investigate the effects of temperature on the frequency of aggressive behavior could not easily examine each temperature value and so instead examines a random sample of such values and their effects. Although random-effects models tend to be less powerful than fixed-effects models, they enable generalization to levels of the independent variable not actually employed in the study. Also called random model. Compare mixed-effects model.
random error error that is due to chance alone. Random errors are nonsystematic and occur arbitrarily when unknown or uncontrolled factors affect the variable being measured or the process of measurement. Such errors are generally assumed to form a normal distribution around a true score. Also called variable error. See also absolute error; constant error. Compare systematic error.

random event generator (REG) see random number generator.

random factor see random effect.

random-interval schedule (RI schedule) in conditioning, an arrangement in which the first response after an interval has elapsed is reinforced, the duration of the interval varies randomly from reinforcement to reinforcement, and a fixed probability of reinforcement over time is used to reinforce a response. For example, if every second the probability that reinforcement would be arranged for the next response was .1, then the random-interval schedule value would be 10 seconds (i.e., RI 10 seconds).

randomization n. see random assignment.

randomization test an inferential approach that combines observed data across all participants and experimental conditions and then randomly sorts the data into new samples (groups). A test of statistical significance is performed, and the value obtained is compared with the value that was obtained when the data were in their original form. This process is repeated many times. For example, suppose there were 1,000 recalculated mean differences between the experimental (E) and control (C) groups, derived from 1,000 permutations. Comparison of the 1,000 recalculated means to the original means provides an exact probability of getting the original means. If 25% of the mean differences between the E and C groups is expected, then the probability value for the original mean difference is p = .25. A randomization test is a nonparametric approach; that is, it does not make assumptions about the distribution of the data. Also called permutation test.

randomized block design (RBD) an approach to assigning participants to treatment conditions in which meaningful discrete strata within the sample (e.g., gender, experience) are used to identify homogeneous subsamples: individuals from each subsample or “block” are then assigned randomly to the different conditions. In this way, participants are initially matched on a “blocking” variable that the researcher wishes to control. The acknowledgment of heterogeneity within the sample enables the researcher to reduce within-group variance and to use that information when evaluating treatment effects. The variable on which participants are stratified is assessed prior to the study.

randomized clinical trial (RCT) an experimental design in which patients are randomly assigned to a group that will receive an experimental treatment, such as a new drug, or to one that will receive a comparison treatment, a standard-of-care treatment, or a placebo. The random assignment occurs after recruitment and assessment of eligibility but before the intervention. There may be multiple experimental and comparison groups, but each patient is assigned to one group only. Also called randomized controlled trial. Compare nonrandomized clinical trial.

randomized design any of various experimental designs in which individual participants are assigned to different conditions (groups) using a purely chance process, such as rolling a die. A crucial assumption underlying randomized designs is that any systematic differences between treatment groups will be due to the experimental conditions themselves and not to any other unmeasured factors. Also called randomized group design. Compare nonrandomized design.

randomized-response technique (RRT) a procedure for reducing social desirability bias when measuring sensitive attitudes (e.g., racial attitudes) or behaviors (e.g., drug use, eating behavior) at an aggregate group level. Respondents are presented with a pair of questions that have dichotomous response options (e.g., agree or disagree, yes or no), one question being the target question (sensitive question) and the other an innocuous filler question. They are instructed to roll a die (or use a similar randomization procedure) to determine which question they should answer; they then answer that question but do not tell the interviewer which one it is. The ambiguity regarding which question has been answered is assumed to reduce participants’ concerns about the social desirability of their answers. Despite the fact that the interviewer does not know which question each person has answered, probability theory can be used to estimate the distribution of responses to the target question in the population.

random mating mating behavior without mate selection. Many early behavioral ecology theories were based on the idea of random mating, but it is now recognized that most animals select specific mates and often show assortative mating.

random model see random-effects model.

random noise see noise.

random number generator (RNG) a device or system used to produce a patternless output of numbers. These random digits have various experimental uses, including the random assignment of participants to treatment conditions, thereby taking the decision of assignment out of the hands of the researcher. Additionally, in parapsychology experiments, RNGs are used to test the supposed ability of certain psychics to influence random systems by mental intention (see psychokinesis). Most current RNGs operate by computer program; strictly speaking, such programs produce a pseudorandom output because the algorithms that they use rely on a nonrandom system. Also called random event generator (REG).

random observation any observation that results from a chance process (such as a flip of a coin), is uncontrollable, or is not part of a schedule or pattern of organized observation.

random process a process that relies on chance alone, such that outcomes may be analyzed according to their probability but not otherwise predicted. See stochastic.

random-ratio schedule (RR schedule) in conditioning, an arrangement in which the number of responses required for each reinforcement varies randomly from reinforcement to reinforcement. It is usually arranged by having the same probability of reinforcement for each response regardless of the history of reinforcement for prior responses. For example, a random-ratio 100 schedule would result from a reinforcement probability of .01 for any given response.

random sampling a process for selecting a sample of
study participants from a larger potential group of eligible individuals, such that each person has the same fixed probability of being included in the sample and some chance procedure is used to determine who specifically is chosen. A group selected in this way is known as a random sample. The main value of this form of probability sampling is its positive impact on generalizability and external validity.

random selection a procedure for random sampling of a set of participants or units from a larger set that relies on the use of a chance process to minimize risk of researcher bias, either conscious or nonconscious.

random variable a variable that takes on different values according to a chance process. These values cannot be predicted with certainty and are assumed to vary across studies; however, their frequency can be described in terms of probability. Also called stochastic variable. Compare fixed variable.

random variation differences in a dependent variable that are due to chance rather than to the factors being studied. Causes of random variation in test results may include respondent factors, such as health, motivation, attention, concentration, and fatigue; situational factors, such as room temperature, noise, and working environment; and respondent-by-situation factors, such as a respondent not being prepared for a specific rating task. Researchers try to estimate the extent to which random variation may be involved in the study to understand the true impact of the factors being assessed. See also chance difference.

random walk a series of values plotted over time that reflects the workings of a chance process, such that each value has an unpredictable relationship to the preceding value and the series has no definable pattern. The concept is used in many research settings, including simulation studies and models of price movements on the stock market. Compare Markov chain. See also stochastic.

random walk model a model of reaction time and accuracy in which the evidence mounts in discrete steps, causing one to incline toward or away from alternative response criteria. A response is made when the evidence, or “walk,” reaches one of the criteria.

R & T play abbreviation for rough-and-tumble play.

range n. a measure of dispersion obtained by subtracting the lowest score in a distribution from the highest score. For example, if the highest score on a test is 100 and the lowest score is 10, then the range is \(100 - 10\) = 90 points. Because it describes a raw discrepancy between the low and high scores, range is generally perceived as less informative than other measures of dispersion, such as the standard deviation.

range effect in visual pursuit, a tendency to make movements too large when the target motion is small and too small when the target motion is large.

range fractionation a hypothesis of perception of stimulus intensity, stating that a wide range of intensity values can be encoded by a group of cells, each of which is a specialist for a particular range of stimulus intensities.

range of attention the span or spread of attention. See attention span, scope of attention.

range of audibility see audibility range.

range of motion (ROM) the degree of movement of a joint that can be achieved without tissue damage, such as how far a person can turn his or her neck. It is determined by the contour of the joint, the restraining bones, and the ligaments of the capsule surrounding the joint.

range restriction see restriction of range.

rank 1. n. a relative position along an ordered continuum. See rank order. 2. vb. to arrange items in a graded order, such as from highest to lowest value. In a peer nomination study, for example, a child might be asked to order individuals in a class from most disruptive to least disruptive. See also ordinal data. 3. n. the maximum number of linearly independent row vectors or column vectors in a correlation matrix; These values are always equal. For example, a \(10 \times 10\) correlation matrix of personality scores might have a rank of 6, indicating that there are less than 10 independent pieces of information present in the 10 scores.

rank biserial correlation coefficient an index of association between a dichotomous variable and an ordinal variable. Its interpretation is the same as for other standardized measures of association. For example, a researcher might relate experimental condition (experimental vs. control group) to an ordinal measure of task performance. Compare point biserial correlation coefficient. See biserial correlation coefficient.

rank correlation coefficient a numerical index reflecting the degree of relationship between two variables that have each been arranged in ascending or descending order of magnitude (i.e., ranked). It does not reflect the association between the actual values of the variables but rather that between their relative positions in the distribution. For example, placement in a marathon race could be correlated with the runners’ heights, but in this case the two variables—race outcome and height—would take the form first place, second place, and so on, and tallest, next tallest, and so on, respectively (rather than actual times run in the race and specific heights in feet and inches). Two of the most commonly used such indexes are the spearman correlation coefficient and kendall’s tau. Also called rank-order correlation coefficient.

ranked data see ordinal data.

ranked distribution a set of values on a variable sorted in magnitude from lowest to highest. The entries in a cumulative frequency table are an example of a ranked distribution.

Rankian therapy see will therapy.

ranking experiment a study in which the researcher asks participants to make a series of comparisons among stimuli (such as pictures, words, or emotions) so that the stimuli can be ordered on some dimension of interest (e.g., size, preference, cost, importance). For example, a researcher conducting a marketing study might ask respondents to indicate their preferences among certain products by ranking them from most likely to buy to least likely to buy, or by comparing two products at a time and indicating which would be preferred.

ranking method 1. in industrial and organizational settings, a method of evaluating jobs for the purpose of setting wages or salaries: jobs are ranked according to their overall value to the company. The advantage of the method is that it is fast and simple; the disadvantage is that such whole-job comparisons tend to be subjective and become more difficult as the number of jobs in the organization in-
rank order

creases. Compare CLASSIFICATION METHOD; FACTOR-COM-
PARISON METHOD; JOB-COMPONENT METHOD; POINT METHOD.
2. an EMPLOYEE COMPARISON TECHNIQUE in which the em-
ployees in a selected group are ranked from the highest to
the lowest on one or more CRITERION DIMENSIONS.

rank order the arrangement of a series of items (e.g.,
scores, individuals) in order of magnitude on a particular
criterion.

rank-order data see ORDINAL DATA.

rank-order method a procedure in which a partici-
patant sorts various study stimuli (e.g., cards, pictures,
words, people) from highest to lowest on a dimension of
interest. See RANKING EXPERIMENT.

rank-order scale see ORDINAL SCALE.

rank-order statistic test any NONPARAMETRIC TEST
that allows researchers to evaluate hypotheses related to
group differences or associations between ranked variables.
Such tests make use of a RANK CORRELATION COEFFICIENT,
such as the SPEARMAN CORRELATION COEFFICIENT or KEND-
ALL’S TAU.

rank regression a type of REGRESSION ANALYSIS in
which independent variables are used to predict the rank
(as opposed to the actual value) of a dependent or response
variable. This approach is particularly useful for distribu-
tions of errors that lack NORMALITY in their end values. See
NONPARAMETRIC REGRESSION.

rank-sum test any NONPARAMETRIC TEST that involves
combining the data points from two or more samples in a
single data set and ranking these values in ascending order.
See MANN–WHITNEY U TEST; WILCOXON–MANN–WHITNEY
TEST; WILCOXON RANK-SUM TEST.

rank transformation a class of TRANSFORMATION in
which a participant’s score on a variable is replaced by the
rank position of the score relative to the other scores in the
data set. For example, an instructor might modify an origi-
nal distribution of exam scores for a class into a listing that
is ordered from highest to lowest. Rank transformations
serve as the basis for a wide variety of NONPARAMETRIC
TESTS.

rape n. the nonconsensual oral, anal, or vaginal penetra-
tion of an individual by another person with a part of the
body or an object, using force or threats of bodily harm or
taking advantage of the individual’s inability to deny con-
sent. In the United States, laws defining rape vary by state,
but the crime of rape is no longer limited to female victims,
to vaginal penetration, or to forcible situations, and the ex-
clusion of spouses as possible perpetrators of rape has been
dropped.

rape counseling provision of guidance and support for
victims of rape and sexual assault. Rape crisis centers offer
expert counseling for the psychological trauma that indi-
viduals typically experience following a sexual assault; both
the affected individuals and their families are counseled.
Community education and prevention outreach programs are
increasingly included in this area of counseling.

rape-trauma syndrome the symptoms of POSTTRAU-
MATIC STRESS DISORDER (PTSD) experienced by an individ-
ual who has been sexually assaulted (the term was coined
prior to the wide acceptance and use of the more inclusive
concept of PTSD). The symptoms, which may include fear
of being alone, phobic attitudes toward sex, VAGINISMUS,
erection dysfunction, or repeated bathing, may persist for a
year or more.

raphe nucleus a group of SEROTONERGIC neurons in the
midline of the brainstem that project widely to the spinal
cord, thalamus, basal ganglia, and cerebral cortex. Raphe
nuclei are involved in alertness and sleep–wake states. Also
called nucleus of the raphe; raphe.

rapid alternating movements changing hand posi-
tions rapidly in a sequenced pattern as a measure of a motor
control and coordination (i.e., cerebellar functioning). Fail-
ure to perform this task is called DYSDIADOCHOKINESIS.

rapid cycling mood disturbance that fluctuates over a
short period, most commonly between manic and depress-
sive symptoms. In DSM–IV–TR and DSM–5, the term is a
specifier applied to BIPOLAR DISORDER characterized by four
or more mood episodes over a 12-month period; the epi-
sodes must be separated by symptom-free periods of at least
2 months or must be delimited by switching to an episode
of opposite polarity (e.g., a major depressive episode
switches to a manic, mixed, or hypomanic episode). [coined
in 1974 by U.S. psychiatrists David L. Dunner and Ronald
R. Fieve]

rapid eye movement (REM) the large, sweeping eye
movements behind closed lids that occur during REM SLEEP.

rapid neuroleptization see MEGADOSE PHARMACO-
THERAPY.

rapid sequential visual presentation (RSVP) in
psychophysical testing, a methodology in which a series of
visual stimuli, such as shapes or words, are presented in a
very short time span, often just a few milliseconds per item.

rapport n. a warm, relaxed relationship of mutual under-
standing, acceptance, and sympathetic compatibility be-
tween or among individuals. The establishment of rapport
with a client in psychotherapy is frequently a significant
mediating goal for the therapist in order to facilitate and
depthen the therapeutic experience and promote optimal
progress and improvement.

rapprochement n. 1. generally, a state of cordial rela-
tions between individuals or groups. 2. in the theory of
SEPARATION–INDIVIDUATION of Hungarian-born U.S. child
psychoanalyst Margaret Schönberger Mahler (1897–
1985), a subphase, after about 18 months of age, in which
the child makes active approaches to the mother. This con-
trasts with the preceding subphase in which the child
struggles with the first efforts of psychological individu-
ization from the mother.

Rapunzel syndrome n. see TRICHOPHAGIA.

RAS abbreviation for RETICULAR ACTIVATING SYSTEM.

Rasch model in ITEM RESPONSE THEORY, a model in
which only one parameter, item difficulty, is specified. This
is thought to be a parsimonious way to describe the rela-
tion between an item response and an underlying dimen-
sion and is thus preferred in some cases. Also called
one-parameter model. See TWO-PARAMETER MODEL; THREE-PARAMETER MODEL. [proposed in 1960 by Danish
statistician Georg Rasch (1901–1980)]

rate coding a type of neural plotting of the frequency at
which ACTION POTENTIALS occur. Compare TEMPORAL COD-
ING.

rate dependence effect see LAW OF INITIAL VALUES.

rate dependency in behavioral pharmacology, the phe-
nomenon in which the magnitude or direction (or both) of a drug's effect on response rate depends on the response rate observed when the drug is not present. Typically, low response rates are increased by a drug, and high rates are either increased less or decreased.

rate law the principle that the strength of a stimulus is indicated by the rate of firing of the nerve impulses it elicits.

rate of change the amount of change in a variable per unit time divided by the value of the variable before the change. If a score rises from 20 to 30 in unit time, for example, the rate of change is \((30 - 20)/20 = 10/20 = 0.5\).

count current monetary and future addiction costs and then weigh them against the benefits of the drug-induced high. [proposed by U.S. economists Kevin M. Murphy and Gary S. Becker (1930–2014)]

rational authority see authority.

rational-economic man a construct introduced in the work of Scottish economist Adam Smith (1723–1790): The rational-economic man makes decisions based on the rational analysis of potential and desired outcomes and acts in his (or her) own rational self-interest. This assumption lies behind the classical economic theories of capitalism and the classical political philosophies of liberalism. Its influence can also be seen in psychology, most theories and models of which assume a human being capable of reason and highly motivated to act out of self-interest. Recent research suggests that people are often ruled more by emotional and cognitive biases than by rational self-interest when making economic and other decisions. See EUDENOMISM; HEDONISM. See also BEHAVIORAL ECONOMICS; BOUNDED RATIONALITY.

rational emotive behavior therapy (REBT) a form of COGNITIVE BEHAVIOR THERAPY based on the concept that an individual's self-defeating beliefs influence and cause negative feelings and undesirable behaviors. Specifically, a person's problems are seen as the result of turning healthy desires for success, approval, and pleasure into demands (e.g., "I must achieve outstandingly well in one or more important respects or I am an inadequate person"). Because of its emphasis on thinking, feeling, and acting as integrated and holistic processes, REBT uses a variety of cognitive, emotional, and behavioral techniques to directly and emphatically interrupt clients' irrational beliefs and encourage them to think and act in more effective, self-enhancing (i.e., rational) ways. Originally called rational therapy (RT) and subsequently rational emotive therapy (RET), it became known by its current name during the 1990s. See also ABC THEORY.

rationalism n. 1. any philosophical position holding that (a) it is possible to obtain knowledge of reality by reason alone, unsupported by experience, and (b) all human knowledge can be brought into a single deductive system. This confidence in reason is central to classical Greek philosophy, notably in its mistrust of sensory experience as a source of truth and the preeminent role it gives to reason in epistemology. However, the term rationalist is chiefly applied to thinkers in the Continental philosophical tradition initiated by René DESCARTES, most notably Baruch SPINOZA and Gottfried Wilhelm LEIBNIZ. Rationalism is usually contrasted with EMPIRICISM, which holds that knowledge comes from or must be validated by sensory experience. Psychoanalytical approaches, humanistic psychology, and some strains of cognitive theory are heavily influenced by rationalism. 2. in religion, a perspective that rejects the possibility or the viability of divine revelation as a source of knowledge. 3. in general, any position that relies on reason and evidence rather than on faith, intuition, custom, prejudice, or other sources of conviction. —rationalist adj., n.

rationality n. 1. the quality of being reasonable or RATIONAL or of being open to reason. 2. a rational action, belief, or desire.

rationality of emotions the proposition that emotions show an impecable logic, in that they follow from APPRAISALS made by the individual as inevitably as logical
conclusions follow from axioms and premises. This view, which counters the traditional idea that emotions and reason are in opposition to one another, is linked to the work of U.S. psychologist Richard S. Lazarus and Swiss-born Canadian–British philosopher Ronald B. De Sousa (1940– ).

**rationalization** n. an ego defense in which apparently logical reasons are given to justify unacceptable behavior that is motivated by unconscious instinctual impulses. In psychoanalytic theory, such behavior is considered to be a defense mechanism. Examples are “Doesn’t everybody cheat?” or “You have to spank children to toughen them up.” Rationalizations are used to defend against feelings of guilt, maintain self-respect, and protect oneself from criticism. In psychotherapy, rationalization is considered counterproductive to deep exploration and confrontation of the client’s thoughts and feelings and their effect on behavior.

—rationalize vb.

**rational knowledge** knowledge gained through reason or arrived at by logical argument.

**rational learning** meaningful learning that involves a clear understanding of the learned material and the relationships between its components.

**rationally based persuasion** see cognitively based persuasion.

**rational problem solving** problem solving based on reasoning that is generally agreed to be correct, optimal, or logical.

**rational psychology** an approach to the study and explanation of psychological phenomena that emphasizes philosophy, logic, and deductive reason as sources of insight into the principles that underlie the mind and that make experience possible. This approach is in sharp contrast to that of empirical psychology. See also philosophical psychology. [proposed by Laurens Perseus Hickok]

**rational soul** in the thought of Aristotle, the type of soul possessed by human beings. Unlike the vegetative soul and the sensitive soul, the rational soul has the capacity for rational thought. See also Nous.

**rational suicide** a controversial concept that ending one’s own life can be a reasoned, understandable response to a situation such as terminal illness, severe pain, or mental deterioration.

**rational thinking** thinking according to logical rules, which is considered by many theorists to be a central part of intelligence.

**rational type** in the analytic psychology of Carl Jung, one of the two major categories of functional type. It comprises the thinking type and the feeling type. Compare irrational type.

**ratio reinforcement** in operant conditioning, reinforcement presented after a prearranged number of responses, in contrast to reinforcement delivered on the basis of a time schedule only. In such schedules (e.g., fixed-ratio schedule, progressive-ratio schedule), the rate of reinforcement is a direct function of the rate of responding. Also called ratio schedule of reinforcement. Compare interval reinforcement.

**ratio scale** a measurement scale having a true zero (i.e., zero on the scale indicates an absence of the measured attribute) and a constant ratio of values. Thus, on a ratio scale an increase from 3 to 4 (for example) is the same as an increase from 7 to 8. The existence of a true zero point is what distinguishes a ratio scale from an interval scale.

**ratio strain** in operant-conditioning experiments, the occurrence of long periods of inactivity in the experimental animal when fixed-ratio schedules are very large.

**ratio variable** a variable that is measured with a ratio scale (e.g., height, weight). See ratio data.

**Rat Man** a landmark case that Sigmund Freud described in “Notes Upon a Case of Obsessional Neurosis” (1909). The name was applied to a patient of Freud’s, a 30-year-old lawyer whose obsessional fear of rats was traced to repressed death wishes toward his father generated by oedipal conflicts. One example of the patient’s obsession was his belief that a rat that appeared to come out of his father’s grave had eaten the corpse; another was a fantasy that a rat had been placed in his father’s anus and had eaten through his intestines. Freud’s analysis of these reactions laid the groundwork for the psychoanalytic interpretation of obsessional neurosis. See also oedipus complex.

**rauwolfia derivative** any of a group of alkaloids obtained from plants of the genus Rauwolfia, primarily R. serpen-tina, the ancient Hindu snakeroot. They have sedative and antihypertensive actions and have been used in neuropsycho pharmacology since about 1000 BCE by Hindu healers. The genus was named for 16th-century German botanist Leonhard Rauwolf, who reported its tranquilizing effect in 1575 while traveling in India. The prototype drug of the group is reserpine, which acts by depleting stores of catecholamine neurotransmitters in the central and peripheral nervous systems. Rauwolfia derivatives were initially used in the management of psychosis but were erroneously thought to induce depression and therefore abandoned for this use in the 1950s.

**Raven’s Progressive Matrices** a nonverbal test of mental ability consisting of abstract designs, each of which is missing one part. The participant chooses the missing component from several alternatives to complete each design. The test comprises 60 designs arranged in five groups of 12: the items within each group become progressively more difficult. Scales of different levels of difficulty are available for children and adults, but all require some degree of logic and analytic ability. The test, published in 1938, is often viewed as the prototypical measure of general intelligence. A version of this test, Raven’s Colored Progressive Matrices, comprises 36 designs printed on colored backgrounds and arranged in three groups of 12. Designed especially for children and older adults, the items within each group become progressively more difficult but overall are simpler and easier to solve than those on the standard matrices. [John C. Raven (1902–1970), British psychologist]

**RAVLT** abbreviation for Rey auditory verbal learning test.

**raw data** the original measurements on a variable as collected by the researcher, prior to data cleaning, recoding, transformations, and quantitative or qualitative analysis. For example, a survey may ask respondents to enter their annual income in dollars. The figures supplied by respondents would be the raw data. For the purposes of analysis, however, the data may be cleaned to account for improbable entries or individuals who prefer not to answer and recoded to create a smaller set of income categories.

**raw score** a participant’s score on a test before it is converted to other units or another form or subjected to quan-
reactive or qualitative analysis. For example, a score may be transformed into a percentage (e.g., 45 correct answers out of 50 = 90%) or into a standardized metric such as a z score (mean of 0; standard deviation of 1) or a t score (mean of 50; standard deviation of 10). Also called unstandardized score.

\textbf{Rayleigh equation} a statement of the proportion of red and green stimuli needed for a normal human eye to perceive yellow. Observers who are red-green or green-blue require different proportions than normal observers. [John William Strutt, Baron \textit{Rayleigh} (1842–1919), British physicist]

\textbf{Rayleigh scattering} the scattering of sunlight by molecules in the atmosphere. The amount of scattering is dependent on the wavelength of the light, with short wavelengths producing stronger scattering than long wavelengths. The blue color of the sky is caused by the relatively large amount of Rayleigh scattering of short-wave-length light by the Earth's atmosphere. [Lord Rayleigh]

\textbf{Raynaud's disease} a disorder characterized by episodes of painful vasocstriction of the blood vessels in the extremities, especially the fingers and toes. The attacks, usually lasting up to 15 minutes, are precipitated by cold exposure or, in one third of cases, by emotional stress. \textit{Raynaud's phenomenon} refers to similar symptoms caused by another disease—for example, rheumatoid arthritis—or by toxic agents, such as vinyl chloride. Drug therapy and behavioral treatment (with thermal biofeedback) have proven effective in relieving the attacks. [identified in 1854 by Maurice \textit{Raynaud} (1834–1881), French physician]

\textbf{Razadyne} n. a trade name for \textit{Galantamine}.

\(r_b\) symbol for \textit{Biserial Correlation Coefficient}.

\textbf{RBC theory} abbreviation for \textit{Recognition by Components Theory}.

\textbf{RBD} 1. abbreviation for \textit{Randomized Block Design}. 2. abbreviation for \textit{Rem Behavior Disorder}.

\(r_{bc}\) symbol for \textit{Biserial Correlation Coefficient}.

\(R_c\) symbol for \textit{Canonical Correlation Coefficient}. A further subscript may be added to show which canonical variates are being correlated.

\textbf{rCBF (RCBF)} abbreviation for \textit{Regional Cerebral Blood Flow}.

\textbf{RCFT} abbreviation for \textit{Rey Complex Figure Test}.

\textbf{RCMAS} abbreviation for \textit{Revised Children's Manifest Anxiety Scale}.

\textbf{RCT} abbreviation for \textit{Randomized Clinical Trial}.

\textbf{RdA} abbreviation for \textit{Reading Age}.

\textbf{RDC} abbreviation for \textit{Research Diagnostic Criteria}.

\textbf{RDD} 1. abbreviation for \textit{Random-Digit Dialing}. 2. abbreviation for \textit{Regression-Discontinuity Design}.

\textbf{reach envelope} in ergonomics, the area that an operator can reach from a seated or standing position. It is used in \textit{Workplace Design} to determine the placement of displays and tools to be used by the operator.

\textbf{reactance theory} a model stating that in response to a perceived threat to—or loss of—a behavioral freedom, a person will experience \textit{psychological reactance} (or, more simply, \textit{reactance}), a motivational state characterized by distress, anxiety, resistance, and the desire to restore that freedom. According to this model, when people feel coerced into a certain behavior, they will react against the coercion, often by demonstrating an increased preference for the behavior that is restrained, and may perform the behavior opposite to that desired. [proposed in 1966 Jack W. \textit{Brehm}]

\textbf{reaction} n. a response to a stimulus.

\textbf{reactional biography} 1. in employment interviews, an applicant’s account of his or her employment history or other experience that sheds significant light on how he or she reacted to workplace events. A skillful interviewer will attempt to elicit such information in addition to the factual data; similarly, a skillful interviewee will know how to present his or her experiences in terms of positive lessons learned or challenges overcome. 2. in the \textit{Interbehavioral Psychology} of Jacob Robert \textit{Kantor}, an organism’s history of interactions with and responses to environmental stimuli, which influences that organism's subsequent psychological development and behavior.

\textbf{reaction formation} in psychoanalytic theory, a \textit{Defense Mechanism} in which unacceptable or threatening unconscious impulses are denied and are replaced in consciousness with their opposite. For example, to conceal an unconscious prejudice, an individual may preach tolerance; to deny feelings of rejection, a mother may be over-indulgent toward her child. Through the symbolic relationship between the unconscious wish and its opposite, the outward behavior provides a disguised outlet for the tendencies it seems to oppose.

\textbf{reaction potential} in \textit{Hull’s Mathematically-Deductive Theory of Learning}, the probability that a stimulus will facilitate a particular response. It is a multiplicative function of an organism’s \textit{Habit Strength} and \textit{Drive Strength}.

\textbf{reaction time (RT)} the time that elapses between the onset or presentation of a stimulus and the occurrence of a specific response to that stimulus. There are several types, including \textit{Simple Reaction Time} and \textit{Choice Reaction Time}. Reaction time can be used to assess various psychological constructs. To assess negative affect, for example, a researcher might measure the time between presentation of various words with emotional connotations and a participant’s indication that each word is either “positive” or “negative.” Also called \textit{response latency; response time}.

\textbf{reaction type 1} any of the categories into which a psychiatric syndrome can be classified in terms of its predominant symptoms. For example, Adolf \textit{Meyer} distinguished affective, delirious, deteriorated, disguised-conflict, organic, and paranoid reaction types. See \textit{Schizophrenic Reaction}. 2. in reaction-time experiments, a particular type of SET, or readiness of the participant or participants: motor (prepared to respond), sensory (prepared to receive a stimulus), or mixed.

\textbf{reactivation of memory} the \textit{Retrieval} of a memory, which may be triggered by stimuli or environmental conditions similar to those present when the memory was originally formed. See also \textit{Priming}.

\textbf{reactive} adj. associated with or originating in response to a given stimulus or situation. For example, a psychotic episode that is secondary to a traumatic or otherwise stressful event in the life of the individual would be considered reactive and generally associated with a more favorable prognosi-
reactive aggression

sis than an ENDGENOUS episode unrelated to a specific trigger.

reactive aggression see AGGRESSION.

reactive attachment disorder in DSM–IV–TR, a disorder of infancy and early childhood characterized by disturbed and developmentally inappropriate patterns of social relating that are not due to intellectual disability or pervasive developmental disorder. It is evidenced either by persistent failure to initiate or respond appropriately in social interactions (inhibited type) or by indiscriminate sociability without appropriate selective attachments (disinhibited type). There must also be evidence of inadequate care (e.g., neglect of the child’s basic physical or emotional needs, frequent changes of primary caregiver), which is assumed to be responsible for the disorder. In DSM–5, the term refers only to the inhibited type; the disinhibited type is now termed disinhibited social engagement disorder. Also called attachment disorder.

reactive coping a stress-management strategy that involves efforts to deal with a past or present stressful situation (e.g., marital dissolution, losing one’s job) by compensating for or accepting the associated harm or loss. Reactive coping may also involve efforts to readjust goals, find benefit, or search for meaning. One of four types of coping proposed by German psychologists Ralf Schwarzer (1943– ) and Nina Knoll, reactive coping may be problem-focused, emotion-focused, or social-relation-focused. See also ANTICIPATORY COPING; PREVENTIVE COPING; PROACTIVE COPING.

reactive depression a MAJOR DEPRESSIVE EPISODE that is precipitated by a distressing event or situation, such as a career or relationship setback. Also called exogenous depression. Compare ENDOGENOUS DEPRESSION.

reactive disorder an older name for a mental condition that is apparently precipitated by severe environmental pressure or a traumatic event.

reactive inhibition in HULL’S MATHEMATICO-DEDUCTIVE THEORY OF LEARNING, a tendency for response magnitude to decrease with increasing practice or fatigue.

reactive jealousy a form of JEALOUSY in response to a specific, actual threat to the future of a relationship. Compare SUSPICIOUS JEALOUSY.

reactive mania a HYPOMANIC EPISODE or MANIC EPISODE that is precipitated by an external event.

reactive measure a measure that alters the response under investigation. For example, if participants are aware of being observed, their reactions may be influenced more by the observer and the fact of being observed than by the stimulus object or situation to which they are ostensibly responding. Compare UNOBTRUSIVE MEASURE.

reactive psychosis see SITUATIONAL PSYCHOSIS.

reactive schizophrenia an acute form of schizophrenia that develops in response to precipitating environmental factors, such as extreme stress. The prognosis is generally more favorable than for PROCESS SCHIZOPHRENIA. [proposed in 1959 by U.S. psychologists Norman Garmezy (1918–2009) and Eliot H. Rodnick (1911–1999)]

reactivity n. the condition in which a participant being observed is changed in some way by the act of observation. Within an experimental setting, reactivity is viewed as a threat to INTERNAL VALIDITY because the change in behav-ior is not due to the experimental manipulation. See also REACTIVE MEASURE.

readability level 1. the level at which a child is able to read successfully. It is a relative measure of skill, identified in terms of grade level. Also called READING LEVEL. 2. the potential ease with which a passage can be read and understood, based on factors such as legibility of the printed page, vocabulary, sentence length and structure, human interest, and general intelligibility.

readership-survey technique a research method used in advertising to determine how thoroughly a consumer has read the copy in a print advertisement. The consumer is shown a list of products, brand names, or company names. If the consumer claims to have seen an advertisement for any of them in a particular magazine or newspaper, he or she is asked to recall information about the content of the advertising copy. See also RECOGNITION TECHNIQUE.

readability n. 1. a state of preparedness to act or to respond to a stimulus. See MENTAL SET; PREFEERENCE; PREPARATORY ADJUSTMENT. 2. a state of receptivity to an experience or activity, such as school readiness or readiness to change substance use behaviors.

reading potential (RP) an electrical brain potential that precedes volitional muscular movement. It is detectable some 500 to 600 ms before motion occurs. Also called Bereitschaftspotential (BP). See PREDECISIONAL NEGATIVE SHIFT. See also LATERALIZED READING POTENTIAL; EVENT-RELATED POTENTIAL. [first reported in 1964 by German neurologists Hans Helmut Kornhuber and Lüder Deecke (1938– )]

reading test a test designed to predict how well an individual is prepared to profit from instruction in a particular field, especially reading, mathematics (arithmetic, algebra, geometry), and foreign languages.

reading age (RdA) the reading abilities of a student as reflected in a scale stating the age group to which the student’s reading abilities are equivalent. A child who reads well may have a reading age significantly above his or her chronological age.

reading disability difficulty understanding the associations between letters and sounds. It is associated with neurological damage or impairment, typically in language processing and visual reasoning areas of the brain.

reading disorder in DSM–IV–TR, a LEARNING DISORDER that is characterized by a level of reading ability substantially below that expected for a child of a given age, intellectual ability, and educational experience. The reading difficulty—which involves faulty oral reading, slow oral and silent reading, and often reduced comprehension—interferes with achievement and everyday life and is not attributable to neurological impairment, sensory impairment, intellectual disability, or environmental deprivation. In DSM–5, the disorder has been subsumed within a category labeled SPECIFIC LEARNING DISORDER and is no longer considered a distinct entity. Also called DEVELOPMENTAL READING DISORDER.

reading epilepsy a type of REFLEX EPILEPSY in which reading precipitates a seizure.

reading ladder 1. a means of advancing a student’s
reading abilities to a higher level, beginning with easy reading and progressing in a prescribed order through increasingly difficult material. This process was developed to encourage students to expand their reading skills. 2. a list of titles on a similar theme arranged in order of difficulty, with the easiest at the bottom and the most difficult at the top.

**reading level** see READING LEVEL.

**reading machine** a device for individuals with visual impairment that uses an optical scanner and character-recognition software and a SPEECH SYNTHESIZER to convert printed text into speech. Reading machines can be stand-alone units or can be created by adding the appropriate components to a computer.

**reading quotient** a child’s reading ability as determined by dividing reading age test scores by chronological age.

**reading readiness** the development of the prerequisite skills and abilities for reading, such as auditory and visual discrimination and cognitive abilities.

**reading retardation** the state of having a reading achievement level 2 or more years below the MENTAL AGE.

**reading span** 1. the amount of written or printed material that a person can apprehend during a single fixation of the eye during reading. The greater the reading span, the fewer times the eye needs to stop along a line of text. A span of 7 to 10 characters is considered typical. Also called **eye span**; **recognition span**. See also EYE–VOICE SPAN. 2. in memory tests, the number of words a person can remember on being asked to recall the last word of each sentence in a passage that he or she has just read.

**readmission** n. the admission to a hospital, clinic, or other institution of a patient who has been admitted previously for the same or a related condition. Also called rehospitalization. See also REVOLVING-DOOR PHENOMENON.

**reafference** n. sensory signals that occur as a result of the movement of the sensory organ. For example, when the eye moves, the image of a stationary stimulus moves across the retina. This reafferent signal of motion is compared by the brain to that which would be expected as a result of the intended movement, and adjustments are made as necessary. Compare PRAAFFERENCE. See also BRAIN COMPARATOR; COROLLARY DISCHARGE. —reafferent adj.

**reafference principle** a concept developed to explain the regulation and interaction of internal signals and sensory signals in directing and coordinating bodily movements. It requires storage of a copy of each spontaneous activation of a motor unit by the processing unit (see COROLLARY DISCHARGE). This copy fixes the reference value of the parameters required to execute the movement, which guides the response until the REAFFERENCE from a sensory unit to the processing unit indicates an accordance with the reference value or set point. The reafference principle has also been used to explain some perceptual phenomena. For example, a corollary discharge signal from neural units controlling how the eye moves has been hypothesized to be used in combination with reafferent motion signals from the retina to determine the motion of objects in the world. See also PRAAFFERENCE.

**Real** n. the realm of nature or reality: one of three aspects of the psychoanalytic field defined by French psychoanalyst Jacques Lacan (1901–1981). The Real is posited to be unknown and unknowable—in effect, unreal—because all that individuals ultimately possess are images and symbols. The other realms are the IMAGINARY and the SYMBOLIC.

**real-ideal self congruence** the degree to which the characteristics of a person’s ideal self match his or her actual characteristics. The discrepancy (or incongruence) between the two, when large enough, creates psychological pain; it is theorized to be a motivating force for entering psychotherapy and is the focus of treatment in CLIENT-CENTERED THERAPY. In research studies, it can be measured by having participants sort cards describing themselves as they would like to be and as they are (see SELF–IDEAL Q-SORT).

**realism** n. 1. the philosophical doctrine that objects have an existence independent of the observer. Compare IDEALISM. See also NAIVE REALISM. 2. the older philosophical doctrine that UNIVERSALS, such as general terms and abstract ideas, have a greater genuine reality than the physical particulars to which they refer, as in so-called PLATONIC IDEALISM. Compare NOMINALISM. 3. in literature and the visual and performing arts, any mode of representation that seeks to present human experience and society in a way that is true to life. The quest for verisimilitude usually involves both a sensitive, complex delineation of the psychology of characters and a detailed description of social contexts. The term **realism** is particularly applied to a broad movement of this kind in 19th-century fiction, as represented by the work of French novelists Honoré de Balzac (1799–1850) and Gustave Flaubert (1821–1880); Russian novelists Ivan Turgenev (1818–1883), Fyodor Dostoevsky (1821–1881), and Leo Tolstoy (1828–1910); and American novelist William Dean Howells (1837–1920). Literary **NATURALISM** is usually considered an offshoot of literary realism. —realist adj., n.

**realism factor** in psychological aesthetics, the dimension of artistic style that involves accurate representation of objects. See ABSTRACT–VERSUS–REPRESENTATIONAL DIMENSION.

**realistic anxiety** anxiety in response to an identifiable threat or danger. This type of anxiety is considered a normal response to danger in the real world and serves to mobilize resources to protect the individual from harm. Also called **objective anxiety**.

**realistic group conflict theory** a conceptual framework predicated on the assumption that intergroup tensions will occur whenever social groups must compete for scarce resources (e.g., food, territory, jobs, wealth, power, natural resources) and that this competition fuels prejudice and other antagonistic attitudes that lead to conflicts such as rivalries and warfare. Also called **realistic conflict theory**.

**realistic job preview (RJP)** see JOB PREVIEW.

**realistic thinking** thinking that is based or focused on the objective qualities and requirements that pertain in different situations. Realistic thinking permits adjustment of thoughts and behavior to the demands of a situation; it depends on the ability to interpret external situations in a fairly consistent, accurate manner. See also REALITY TESTING.

**reality** n. in philosophy, that which genuinely exists, usually in contrast to that which only seems to exist. See ABSOLUTE REALITY; OBJECTIVE REALITY. See also ACTUAL. —real adj.
reality awareness

reality awareness the perception of external objects as different from the self and from each other. Also called reality contact.

reality confrontation an activity in which a therapist raises the possibility that the patient has misconstrued events or the intentions of others.

reality monitoring a specific aspect of source monitoring that refers to the process of discriminating between external (real) and internal (imagined) events. A failure or impairment in this process is said to account for such phenomena as false memory and hallucinations. [coined by U.S. psychologist Marcia K. Johnson (1943–)]

reality orientation an intervention originally developed for the rehabilitation of cognitively impaired veterans and now often used for individuals with dementia to decrease their confusion, increase their awareness of time, place, and self, and improve their overall cognitive, behavioral, and social functioning. It is usually applied in residential settings (e.g., long-term care facilities), with practitioners continually reminding the individual who and where he or she is: what day, month, or year it is; and what is happening at a given moment in time or is about to take place. Clocks, calendars, newspapers, family photographs, and the like are often used to facilitate this process.

reality principle in classical psychoanalytic theory, the regulatory mechanism that represents the demands of the external world and requires the individual to forgo or modify instinctual gratification or to postpone it to a more appropriate time. In contrast to the pleasure principle, which is posited to dominate the life of the infant and child and govern the id, or instinctual impulses, the reality principle is posited to govern the ego, which controls impulses and enables people to deal rationally and effectively with the situations of life.

reality testing any means by which an individual determines and assesses his or her limitations in the face of biological, physiological, social, or environmental actualities or exigencies. It enables the individual to distinguish between self and nonself and between fantasy and real life. Defective reality testing is the major feature of psychosis.

reality therapy treatment that focuses on an individual’s ineffective or maladaptive behavior and the development of the ability to cope with the stresses of reality and take greater responsibility for the fulfillment of his or her needs (i.e., discover what he or she really wants and the optimal way of achieving it). To these ends, the therapist plays an active role in examining the client’s daily activities, suggesting healthier, more adaptive ways for the client to behave. Reality therapy tends to be of shorter duration than traditional psychotherapies. [developed by U.S. psychiatrist William Glasser (1925–2013)]

real-life test a period during which people seeking sex reassignment are required to live as the sex with which they identify, usually for 1 or 2 years, before any surgical procedures are performed. It involves changing names as well as clothing, hair, and other aspects of physical appearance. The real-life test is used to determine if the individual will be able to cope with, and benefit from, sex-reassignment surgery.

real limit the lower or upper value for a continuous variable measured on a ratio scale. For example, a test score of 95 has the lower real limit of 94.5 and the upper real limit of 95.4 since any value within that range will equal 95 when rounded to a whole number.

real self an individual’s true wishes and feelings and his or her potential for further growth and development. See also actual self; true self. [defined by Karen D. Horney]

real–simulator model an experimental design in which some participants are instructed to simulate hypnosis while other participants are genuinely experiencing it. The experimenter is usually unaware of which participants are experiencing the state and which are simulators. [originated by Martin T. Orne]

real-time amplification a technique of auditory feedback to improve voice quality and diction, in which individuals speak into a microphone attached to an amplifier that feeds back voice and speech patterns without time lapse. The amplifier filters out background noises outside of the bandwidth (typically set to 100–80,000 Hz), allowing the speaker to experience optimal auditory feedback as he or she is talking in real time.

reason 1. n. consecutive thought, as in deduction or induction. Although at one time reason was considered a mental faculty, this meaning is typically not intended in current usage. See deductive reasoning; inductive reasoning. 2. n. in philosophy, the intellect (or nous) regarded as the source of true knowledge. See rationalism. 3. n. soundness of mind. 4. n. a statement offered to justify an action or decision or to explain the occurrence of an event. 5. vb. see reasoning.

reasonable accommodations adjustments made within an employment or educational setting that allow an individual with a physical, cognitive, or psychiatric disability to perform essential functions. These adjustments might include installing ramps in an office cafeteria for wheelchair accessibility, altering the format of a test for a person with learning disabilities, or providing a sign language interpreter for a person with hearing loss. Provisions for reasonable accommodations must be made by employers and educators according to the 1990 Americans With Disabilities Act and the 1973 Rehabilitation Act. See undue hardship.

reasonable doubt see beyond reasonable doubt.

reasonable person standard in law, a standard often used to judge the appropriateness of a person’s actions by comparing them against the actions of a hypothetical reasonable person in the same situation. This standard is often invoked in cases involving allegations of negligence.

reasoned action model see theory of reasoned action.

reasoning n. 1. thinking in which logical processes of an inductive or deductive character are used to draw conclusions from facts or premises. See deductive reasoning; inductive reasoning. 2. the sequence of arguments or proofs used to establish a conclusion in this way. —reason vb.

reasoning test a test of skills in inductive thinking, deductive thinking, or both. Examples include number series and classification of words (induction) as well as various kinds of syllogisms (deduction). See inductive reasoning; deductive reasoning.

reassociation n. in hypnosis, a process of reviewing a forgotten or inhibited traumatic event so that the ex-
experience will be integrated with the individual’s personality and consciousness.

**reassurance** n. a supportive technique used in many forms of psychotherapy and counseling to encourage a client to explore new relationships and feelings and to diminish the client’s anxiety during this process.

**rebelliousness** n. resistance to authority, especially parental authority or its equivalent. —rebellious adj.

**rebirth** n. 1. the therapeutic use of continuous, focused breathing and reflection, initially under the guidance of a rebirthing practitioner (a rebirther), to release tension, stress, and intense emotions and attain a state of deep peace and total relaxation that leads to personal growth and positive changes in health, consciousness, and self-esteem (i.e., a personal and spiritual “rebirth”). This type of therapy is increasingly being termed breathwork or rebirthing breathwork. [developed in the 1970s by California-based New Age guru Leonard Orr (1937–1999)].

2. a highly controversial form of therapy, now largely discredited (both scientifically and ethically), in which an individual attempts to reexperience being born (e.g., through hypnotic age regression) in order to resolve supposed prenatal conflicts and emotions and to develop a new attitude about life.

**rebound phenomenon** 1. an effect in which an activity or occurrence previously suppressed or prevented increases once the restrictions imposed on it are removed. The term is used particularly to denote the temporary reappearance of symptoms following abrupt discontinuation of a medication used for treatment. An example is rebound insomnia, in which the discontinuation of hypnotic agents, particularly short-acting benzodiazepines, results in a transitory return of insomnia, possibly of increased severity. Also called rebound effect. 2. a test that demonstrates loss of the ability of the cerebellum to control coordinated movement: If the individual extends the forearm against resistance and the resistance is suddenly removed, the hand or fist will snap back toward the chest. Also called Holmes’s phenomenon.

**reboxetine** n. a drug that inhibits the reuptake of norepinephrine but has little or no effect on neurotransmission of serotonin, dopamine, acetylcholine, or histamine. It was the first selective norepinephrine reuptake inhibitor developed for clinical use as an antidepressant. It is not available in the United States.

**REBT** abbreviation for RATIONAL EMOTIVE BEHAVIOR THERAPY.

**rebus writing** the use of symbols to represent the sounds of language. If each phonetic sound is assigned its own unique symbol, the number of symbols needed within a writing system is substantially reduced.

**recall** vb. 1. to transfer prior learning or past experience to current consciousness: that is, to retrieve and reproduce information; to remember. 2. n. the process by which this occurs. See also FREE RECALL, RECALL METHOD.

**recall bias** the type of bias that often occurs when an individual reports a past behavior or event. Although such retrospective reporting may have accurate features, it also tends to include inaccurate aspects, such as a systematic undercount or overcount of the frequency with which a certain behavior occurred. This type of distortion has ramifications in survey methodology and eyewitness testimony.

**recall method** a technique of evaluating memory in terms of the amount of learned material that can be correctly reproduced, as in an essay exam or in reproducing a list of words. Recall can be tested immediately after learning (see IMMEDIATE RECALL TEST) or after various delay intervals. Also called recall test. Compare RECOGNITION METHOD.

**recall score method** a technique in which the capacity to remember is given a numerical value according to the number of items or the proportion of items that can be recalled. Some memory tests, such as the CALIFORNIA VERBAL LEARNING TEST, produce recall scores that can be compared with normative values.

**recall test** see RECALL METHOD.

**recapitulation theory** 1. the hypothesis that the stages of embryological development of an organism mirror the morphological stages of evolutionary development characteristic of the species; that is, ONTOGENY recapitulates PHYLLOGENY. The theory was abandoned early in the 20th century when embryology showed no consistent correspondence between ontogeny and phylogeny. [proposed by German biologist Ernst H. Haeckel (1834–1919)].

2. the extension of the principle of recapitulation to a child’s mental and behavioral development. [proposed by G. Stanley Hall].

**receiver** n. 1. in COMMUNICATION THEORY, a device or process, such as a radio receiver or the sensory apparatus of hearing, that translates a signal into an intelligible message. In psychological applications of INFORMATION THEORY, the human being has sometimes been treated as a receiver; this analogy has motivated various aspects of research (e.g., the ability to cope with noise). 2. in TELEPATHY experiments, the participant who attempts to receive information transmitted by the sender. See also PERCIPIENT.

**receiver-operating characteristic curve (ROC curve)** in a detection, discrimination, or recognition task, the relationship between the proportion of correct yes responses (hit rate) and the proportion of incorrect yes responses (false-alarm rate). This is plotted on a graph to show an individual’s sensitivity on the particular task: The axes are hit and false-alarm rates, points are marked to denote the different rates obtained under different conditions, and the points are connected to form a smooth arc. For example, a ROC curve may be used to indicate how well a person detects a specific tone in the presence of noise. A single quantitative INDEX of performance may be calculated from the curve as well. Also called ISOSSENSITIVITY FUNCTION: RESPONSE-OPERATING CHARACTERISTIC CURVE. See also D’PRIME.

**receiving hospital** a health facility that is equipped and staffed to handle new patients requiring diagnosis and preliminary treatment, such as people with a suspected mental disorder.

**recency effect** a memory phenomenon in which the most recently presented facts, impressions, or items are learned or remembered better than material presented earlier. This effect can occur in both formal learning situations and social contexts. For example, it can result in inaccurate ratings of a person’s abilities due to the inordinate influence of the most recent information received about that person. Also called LAW OF RECENCY, PRINCIPLE OF RECENCY, RECENCY ERROR. Compare NEGATIVE RECENCY, PRIMACY EFFECT.

**receptive amimia** see AMIMIA.
receptive amusia

receptive amusia see AMUSIA.

receptive aphasia see APHASIA; WERNICKE'S APHASIA.

receptive character in the psychoanalytic theory of Erich FROMM, a passive, dependent, and compliant, or conforming, personality type. It is roughly equivalent to the oral-receptive personality (see ORAL PERSONALITY) or the passive-dependent personality (see DEPENDENT PERSONALITY DISORDER) described by others. Such an individual is said to be of a receptive orientation.

receptive field the spatially discrete region and the features associated with it that can be stimulated to cause the maximal response of a sensory cell. In vision, for example, the receptive field of a retinal ganglion cell is the area on the retina (containing a particular number of photoreceptors) that evokes a neural response. An auditory neuron has a receptive field that can be described either by the range of tones to which it responds or by the receptors that cause this response. Also called receptor field.

receptive language the language perceived and mentally processed by a person, as opposed to that which he or she normally uses. Also called receptive vocabulary.

receptive vocabulary an individual’s vocabulary as defined by the words that he or she can understand rather than the words that he or she normally uses. Also called passive vocabulary: recognition vocabulary. Compareproductive vocabulary.

receptivity n. the period of time when a female is responsive to sexual overtures from a male, typically (but not exclusively) around the time of ovulation. Receptivity has a connotation of passive female acceptance or tolerance of male sexual overtures. In contrast, PROCEPTIVITY conveys active solicitation of males by females. —receptive adj.

receptor n. 1. the cell in a sensory system that is responsible for stimulus TRANSDUCTION. Receptor cells are specialized to detect and respond to specific stimuli in the external or internal environment. Examples include the RETINAL RODS and RETINAL CONES in the eye and the HAIR CELLS in the cochlea of the ear. Also called receptor cell. 2. a SENSE ORGAN, such as the eye or the ear. See also NEURORECEPTOR.

receptor adaptation the tendency of a receptor to stop responding to a constant stimulus.

receptor cell see RECEPTOR.

receptor field see RECEPTIVE FIELD.

receptor molecule see NEURORECEPTOR.

receptor potential the electric potential produced by stimulation of a receptor cell, which is roughly proportional to the intensity of the sensory stimulus and may be sufficient to trigger an ACTION POTENTIAL in a neuron that is postsynaptic to the receptor. Also called generator potential.

receptor site a region of specialized membrane on the surface of a cell (e.g., a neuron) that contains receptor molecules that receive and react with particular messenger molecules (e.g., neurotransmitters).

recessive allele the version of a gene (see ALLELE) whose effects are manifest only if it is carried on both members of a HOMOLOGOUS pair of chromosomes. Hence, the trait determined by a recessive allele (the recessive trait) is apparent only in the absence of another version of that same gene (the dominant allele). The term autosomal recessive is used to describe patterns of inheritance in which characteristics are conveyed by recessive alleles. For example, Tay–Sachs disease is an autosomal recessive disorder.

recidivism n. relapse. The term typically denotes the repetition of delinquent or criminal behavior, especially in the case of a habitual criminal, or repeat offender, who has been convicted multiple times. —recidivist n., adj. —recidivistic adj.

recidivism rate the frequency with which delinquent or criminal behavior recurs or patients relapse. It is sometimes used as a marker of the effects of interventions; for example, the percentage of people who commit rape following treatment intended to reduce the likelihood of committing this crime would indicate the effectiveness of the treatment.

recipient factors characteristics of a person receiving a persuasive message that influence the extent to which he or she is persuaded. Recipient factors include such characteristics as intelligence, self-esteem, and NEED FOR COGNITION.

reciprocal n. the number that when multiplied by another number gives a result of 1. The reciprocal of $x$ is therefore $1/x$ and that of $1/x$ is $x$. So, for example, $1/4$ is the reciprocal of 4.

reciprocal altruism a form of HELPING behavior that is sustained when one individual (A) helps another (B) and at some future time B helps A or A’s offspring. The requirements of reciprocal altruism are (a) that the participants are able to identify each other individually, (b) that they are able to remember past actions and who helped whom, (c) that the cost to the helper is less than the gain to the recipient, and (d) that there is a mechanism to protect against CHEATING. GAME THEORY provides a theoretical system for understanding reciprocal altruism. See also ALTRUISM.

reciprocal determinism a concept that opposes exclusive emphasis on environmental determination of responses and asserts that a reciprocal relationship exists among environment, behavior, and the individual. That is, instead of conceptualizing the environment as a one-way determinant of behavior, reciprocal determinism maintains that the environment influences behavior, behavior influences the environment, and both influence the individual, who also influences them. This concept is associated with SOCIAL LEARNING THEORY.

reciprocal inhibition 1. a technique in BEHAVIOR THERAPY that aims to replace an undesired response (e.g., anxiety) with a desired one by COUNTERCONDITIONING. It relies on the gradual substitution of a response that is incompatible with the original one and is potent enough to neutralize the anxiety-evoking power of the stimulus. See also SYSTEMATIC DESENSITIZATION. [devised by Joseph wolpe] 2. in neuroscience, the inhibition of one SPINAL REFLEX when another is elicited. [proposed by Charles Scott Sherrington] 3. a neural mechanism that prevents opposing muscles from contracting at the same time. 4. the inability to recall two associated ideas or items because of their interference with each other.

reciprocal innervation the principle of motor NERVOUS SYSTEM activity stating that when one set of muscles receives a signal for a reflex action, the antagonistic set of muscles receives a simultaneous signal that inhibits action. See RECIPROCAL INHIBITION.
reciprocal liking the attraction and cordial attitude that people have to others who are attracted to them.

reciprocal punishment a punishment that fits the crime. For example, a child who consistently neglects to feed his or her pet might be punished by forgoing a meal. In this way, the child gains insight into the consequences of the act. Compare EXEMPLARY PUNISHMENT.

reciprocal relationship 1. a correlation between two variables such that the value of one variable is the RECIPROCAL of the value of the other. For example, if a researcher is studying the average time taken to complete a task, then tasks completed per unit time (e.g., 2 per hour) have a reciprocal relationship with unit time taken per task (0.5 hours). 2. the situation in which two variables can mutually influence one another; that is, each can be both a cause and an effect.

reciprocal roles the characteristic behavior patterns displayed by occupants of a particular position in a group or society in response to the behavior patterns of occupants of other positions.

reciprocal-teaching procedure an instructional process designed to facilitate dialogue between a teacher and student or among groups of students to increase reading comprehension. The teacher and students take turns leading the dialogue using four cognitive strategies: summarization, generation of questions, clarification, and prediction.

reciprocal transformation a TRANSFORMATION of raw data that involves (a) replacing the original data units with their reciprocals and (b) analyzing the modified data. It can be used with nonzero data and is commonly used when distributions have skewness or clear OUTLIERS. For example, if the original unit of a study variable is time, a researcher might transform the raw data to produce an analysis of rate. Unlike other transformations, a reciprocal transformation changes the order of the original data. Also called inverse transformation.

reciprocity n. 1. the quality of an act, process, or relationship in which one person receives benefits from another and, in return, provides an equivalent benefit. 2. in PIAGETIAN THEORY, see COMPENSATION. —reciprocal adj.

reciprocity law a general principle that the magnitude of sensation is the product of the duration of the stimulus multiplied by its intensity. BLOCH’S LAW is an example of this principle for vision. Also called reciprocity principle.

reciprocity norm the social standard that people who help others will receive equivalent benefits from them in return. The expectation of reciprocity is common in many interpersonal encounters and relationships. Compare SOCIAL JUSTICE NORM; SOCIAL RESPONSIBILITY NORM.

recoding n. 1. the translation of material from one form into another. For example, to facilitate memory, a series of random digits (e.g., 239812389712) could be recoded as a series of four-digit prices ($23.98, $12.38, $97.12), thereby making the series much easier to recall. See CHUNKING; ELABORATION. 2. a manipulation of an original variable in a data set so that it can be used in a different way in future analysis (e.g., reverse keying items, collapsing many categories into a few). See also TRANSFORMATION. —recode vb.

recognition n. 1. a sense of awareness and familiarity experienced when one encounters people, events, or objects that have been encountered before or when one comes upon material that has been learned in the past. See also RECOGNITION METHOD. 2. the acknowledgment of an achievement by bestowing awards or words of praise.

recognition by components theory (RBC theory) the theory that perception and recognition of objects entail their decomposition into a set of simple three-dimensional elements called GEONS, together with the skeletal structure connecting them. [proposed by U.S. psychologist Irving Biederman (1939—)]

recognition memory the ability to identify information as having been encountered previously. For example, a few days after taking a foreign language vocabulary test, a student might recognize one of the test words on a homework assignment yet be unable to recall its meaning. Recognition memory pertains only to declarative knowledge—factual material that is deliberately and consciously accessed—rather than to nondeclarative knowledge or other implicitly known information. Although the HIPPOCAMPUS conventionally is associated with memory, functional magnetic resonance imaging (fMRI) studies have suggested that the PARIETAL CORTEX may play a role in recognition memory. Activity in the lateral parietal cortex is correlated with the subjective impression that an item is old; it also increases with the amount of information retrieved. Existing models of recognition view the assessment of old–new similarity as a core process, and DUAL PROCESS THEORIES in particular posit that recognition is driven by a fast, automatic response based on stimulus FAMILIARITY and a slower, deliberate RECOLLECTION that involves episodic components, such as where and when the stimulus was seen. Interestingly, individuals may “recognize” stimuli they in fact have never experienced before, as in FALSE MEMORIES and other phenomena.

Recognition Memory Test (RMT) a verbal and nonverbal memory test that is used to detect neuropsychological deficits. In the Recognition Memory for Words subtest of the RMT, participants are presented with 50 stimulus words, one every 3 seconds, and must respond whether they consider each pleasant or unpleasant. Following the presentation of all 50 stimuli, each word is presented again with a distractor item, and participants must choose which of the two words was presented previously. The procedure is the same for the Recognition Memory for Faces subtest, in which the stimuli used are photographs of unfamiliar faces. Also called Warrington Recognition Memory Test. [originally developed in 1984 by British neuropsychologist Elizabeth Kerr Warrington]

recognition method a technique of measuring the amount of material learned or remembered by testing a person’s ability to later identify the content as having been encountered. During recognition testing, previously studied items are presented along with new items, or LURES, and the participant attempts to identify those items that were studied and those that were not. Also called recognition test. Compare RECALL METHOD.

recognition span see READING SPAN.

recognition technique a type of READERSHIP-SURVEY TECHNIQUE in which consumers are asked to recall information about a product they say they recognize from previous exposure to its advertisements. Consumers also may be asked questions about advertisements that have never appeared in order to determine their suggestibility or false-recognition level. See also PANTRY-CHECK TECHNIQUE.
recognition test  see RECOGNITION METHOD.

recognition threshold  the shortest exposure to a stimulus at which recognition of that stimulus can occur. The shortest exposure at which words, for example, will be recognized is typically between 10 and 40 ms.

recognition vocabulary  see RECEPTIVE VOCABULARY.

recognitionary assimilation  a type of SENSORIMOTOR INTELLIGENCE characterized by the selective use of a SCHEME. For example, an infant applies a sucking scheme to a nipple for nursing and to various nonnutritive objects (e.g., a thumb) for comfort, to aid sleep, or for some other purpose.

recollected memory see REMEMBER–KNOW PROCEDURE.

recollect  vb. instrumental in producing emotional disturbance.

reconstructed family  see STEPFAMILY.

reconstruction  n. 1. in psychoanalysis, the revival and analytic interpretation of past experiences that have been instrumental in producing emotional disturbance. 2. the logical recreation of an experience or event that has been only partially stored in memory. —reconstruct vb.

reconstructive memory  the process of remembering conceived as involving the recreation of an experience or event that has been only partially stored in memory. When a memory is retrieved, the process uses general knowledge and SCHEMAS for what typically happens in order to reconstruct the experience or event. See CONSTRUCTIVE MEMORY; REPEATED REPRODUCTION.

reconstructive psychological evaluation see PSYCHOLOGICAL AUTOPSY.

reconstructive psychotherapy  psychotherapy directed toward basic and extensive modification of an individual’s character structure by enhancing his or her insight into personality development, unconscious conflicts, and adaptive responses. Examples are Freudian PSYCHOANALYSIS, Adlerian INDIVIDUAL PSYCHOLOGY, Jungian ANALYTIC PSYCHOLOGY, and the approaches of Karen D. HORNEY and Harry Stack SULLIVAN.

reconstructive surgery  the surgical specialty or procedure concerned with the restoration or rebuilding of or improvement in shape and appearance of body structures that are missing, defective, diseased, damaged, or not considered aesthetically pleasing. See also COSMETIC SURGERY; PLASTIC SURGERY; POSTRECONSTRUCTIVE SURGERY.

record keeping  an essential aspect of therapy, in which clinical notes about patients or clients are preserved for future reference, training purposes, or both. The extent of detail in record keeping varies with the situation, but some degree of record keeping is deemed standard procedure for all clinicians.

recovered memory  the subjective experience of recalling a prior traumatic event, such as sexual or physical abuse, that has previously been unavailable to conscious recollection. Before recovering the memory, the person may be unaware that the traumatic event occurred. The existence of the phenomenon is controversial, particularly in the area of recovered memories of childhood sexual abuse. Because such recoveries may occur while the person is undergoing therapy, there is debate about the role that the therapist may have in suggesting or otherwise arousing them. Also called repressed memory. See also DISASSOCIATIVE BARRIERS; FALSE MEMORY; POSTTRAUMATIC AMNESIA; PSEUDOMEMORY.

recovered memory therapy  a form of treatment specifically designed to elicit from the client forgotten or repressed memories of traumatic childhood events, such as sexual abuse. Therapeutic techniques include HYPNOSIS and GUIDED IMAGERY. The therapy is controversial, provoking accusations and even legal disputes about the veracity of the memories retrieved and about the clinical validity and efficacy of the methods used.

recovery  n. 1. consistent progress in the measurable return of abilities, skills, and functions following illness or injury. 2. a state of ongoing sobriety following long-term substance abuse.

Recovery, Inc.  a SELF-HELP GROUP for individuals with serious mental health problems that focuses on will-training techniques for controlling temperamental behavior and changing members’ attitudes toward their problems. Founded in 1937 by U.S. neuropsychiatrist Abraham A. Low (1891–1954), it is one of the oldest self-help organizations in the world.

recovery of function  partial or full restoration of an ability that has previously been impaired as a result of damage (through disease or trauma) to the central or peripheral nervous system or to an organ or body part.

recovery ratio see DISCHARGE RATE.

recovery time  1. the time required for a neural unit (e.g., a neuron or muscle cell) to recover from a response before it is capable of responding again. See REFRACTORY PERIOD. 2. the time required for a physiological process to return to a baseline state after it has been altered by the response to a stimulus. An example is the REFRACTORY PHASE of the sexual-response cycle.

recreation  n. rejuvenating and pleasurable pastimes or sports. —recreational adj.
recreational drug any substance that is used in a non-therapeutic manner for its effects on motor, sensory, or cognitive activities or on emotional state.

recreational therapy the use of individualized recreational activities (arts and crafts, sports, games, group outings, etc.) as an integral part of the rehabilitation or therapeutic process for individuals with physical or psychological disabilities or illnesses.

recruitment n. 1. in neurophysiology, an increase in the number of neurons that respond as a stimulus is maintained or increased in strength. 2. in auditory perception, a rapid increase in loudness after a stimulus exceeds the auditory threshold. It is characteristic of SENSORINEURAL DEAFNESS.

recruitment bias see SAMPLING BIAS.

rectal administration the administration of a drug by rectal insertion, usually in the form of a SUPPOSITORY, for absorption via the rectal mucosa.

rectal reflex see DEFECTION REFLEX.

rectangular distribution see UNIFORM DISTRIBUTION.

recumbent adj. see POSTURE.

recreative therapy a traditional but contested theory that the function of sleep is to allow recovery from mental or physical fatigue, to regenerate resources, or to reestablish internal HOMEOSTASIS.

recurrent adj. occurring repeatedly or reappearing after an interval of time or a period of remission. It is often applied to disorders marked by chronicity, relapse, or repeated episodes (e.g., recurrent depressive symptoms).

recurrent circuit a network of neurons and synapses in which a nerve impulse can make a complete path back to its starting point. This occurs in both positive feedback circuits and negative feedback circuits. See also SELF-EXCITING CIRCUIT.

recurrent collateral inhibition a negative-feedback system that prevents rapid, repeated firing of the same MOTOR NEURON. To accomplish this, one branch of an axon loops back toward the cell body of the neuron and communicates with an inhibitory RENSHAW CELL. The Renshaw cell, in turn inhibits the neuron.

recurrent dream a dream that occurs repeatedly. Sigmund FREUD saw recurrent dreams as punishment dreams—rather than wish fulfillment dreams—and linked them to a masochistic need for self-criticism arising from fantasies of excessive ambition. Carl JUNG regarded recurrent dreams as more revealing of the unconscious than single dreams, and he believed that in a dream series the later dreams often throw light on the earlier ones (see SERIAL INTERPRETATION). Other psychologists see recurrent dreams as an attempt to come to terms with disturbing experiences.

recurring-figures test a test of memory in which a person is shown a series of cards featuring generally nonsensical figures or geometric forms. Some figures appear on more than one card, and the participant must try to remember whether a figure has appeared on a previous card.

recursion n. in GENERATIVE GRAMMAR, a process in which certain grammatical rules can be repeatedly applied, with the output of each application being input to the next, in principle indefinitely. An example is the rule S→S and S, where S denotes a sentence; the rule is recursive because it can be used to generate a potentially infinite string of sentences conjoined by and. A well-known example of recursion is the nursery rhyme “The House That Jack Built” (This is the dog that worried the cat that killed the rat that ate the malt . . .).

recursive adj. describing a rule or procedure that is applied repeatedly for a finite number of times, with the output of each application becoming the input to the next. For example, a recursive algorithm might be used to help identify the set of predictors that relate maximally to the outcome variable.

recursive model a set of relationships in which the effects flow in one direction only and there are no feedback loops such that effects are sometimes also causes. In STRUCTURAL EQUATION MODELLING, for example, a recursive model in which independent variables lead to dependent variables without feedback loops is generally more easily estimated. Compare NONRECURSIVE MODEL.

red-green blindness a form of color blindness in which certain shades of red and green are confused. See also DEUTERANOPHIA.

red-green responses a concept of color vision in which certain retinal cone receptors have excitatory responses whereas others have inhibitory responses to the same wavelength of light. Because red and green are at opposite ends of the spectrum, it is assumed that a red excitatory response is accompanied by a green inhibitory response.

redintegration n. 1. the process of reorganizing, or re-integrating, mental processes after they have been disorganized by a psychological condition, particularly a psychosis. 2. more generally, restoration to health or to normal condition and functioning. 3. the process of recovering or recollecting memories from partial cues or reminders, as in recalling an entire song when a few notes are played. 4. the elicitation of a response by a part of the stimulus complex that was involved in the initial learning. Also called reintegrative.—redintegrative adj.

redirected behavior actions that do not appear relevant to the context in which they are performed. See DISPLACEMENT BEHAVIOR.

red nucleus a nucleus in the brainstem that receives input from the cerebellum and gives rise to the RUBROSPINAL TRACT. In lower vertebrates, it is important in the control of limb movement. In humans, it has a role in crawling in infancy.

redout n. a condition resulting from blood being pushed into the head and eyes by negative g-forces. Capillaries in the eyes engorge and some may burst, causing the visual field to appear red. Redout is experienced, for example, by fighter pilots. Compare BLACKOUT.

red reflex the red color reflected through a person’s pupil when light is directed toward the retina along the LINE OF REGARD of the observer’s eye. It occurs because the light is reflected by the vascular retina; the absence of a red reflex may indicate lens opacities (cataract) or retinal abnormalities.

red sage a bushy shrub, Salvia miltiorrhiza, whose roots are known to Chinese herbalists as dan shen and have traditionally been used (powdered or whole) to treat cardiac and vascular disorders, including heart attacks, stroke, and atherosclerosis. Red sage has been shown in some studies to decrease the clotting capability of blood; it should not be
reduced model

taken in combination with prescribed blood thinners, as bleeding problems may result. Other studies suggest red sage may interfere with the development of scarlike fibers in the liver (associated primarily with chronic hepatitis and consumption of large quantities of alcohol) and may be effective in preventing the growth of cancer cells and the replication of the HIV virus, but these potential uses have not been confirmed. Side effects of red sage are mild and may include itching, stomach upset, and decreased appetite. The active compounds are miltirone and other dipterene quinones, which act as PARTIAL AGONISTS at the benzodiazepine–GABA receptor complex (see GABA RECEPTOR). Because red sage is a partial agonist, it may enhance the sedative effects of drugs that are full BENZODIAZEPINE AGONISTS, leading to extreme drowsiness.

reduced model in the GENERAL LINEAR MODEL, a model that has fewer parameters than the most highly parameterized model in a set of models to be compared. Usually, the smaller model is said to be “nested” within the larger, more highly parameterized model.

reductio ad absurdum 1. a form of valid logical argument in which either (a) a premise is disproved by showing that it leads to a contradiction and is thus absurd or (b) a premise is indirectly proved by showing that its negation leads to a contradiction and is thus absurd. 2. in general language, a persuasive technique in which a position is presented in its most extreme or absurd form in order to discredit it. Such a move belongs more to SOPHISTY than to logic. [Latin, literally: “reduction to the absurd”]

reductionism n. the strategy of explaining or accounting for some phenomenon or construct by claiming that, when properly understood, it can be shown to be some other phenomenon or construct, where the latter is seen to be simpler, more basic, or more fundamental. The term is mainly applied to positions that attempt to explain human culture, society, or psychology in terms of animal behavior or physical laws. In psychology, a common form of reductionism is that in which psychological phenomena are reduced to biological phenomena, so that mental life is presented as merely a function of biological processes. Compare EMERGENTISM. See also EPIPHENOMENON; IDENTITY THEORY; MATERIALISM.

reduction to essence rule in FUZZY TRACE THEORY, the assumption that people of all ages are biased to extract the gist from a message.

redundancy n. 1. the property of having more structure than is minimally necessary. Biological systems or structures often have redundancy so that impairment or failure of a unit will not prevent adequate functioning of the whole. See also DISTRIBUTATIONAL REDUNDANCY. 2. in linguistics and information theory, the condition of those parts of a communication that could be deleted without loss of essential content. In this sense, redundancy includes not only obvious puffing, such as repetitions, tautologies, and polite formulas, but also the multiple markings of a given meaning that are required by many conventions of grammar and syntax. For example, in the sentence All three men were running, the plurality of the subject is signaled four times; by all, three, and the plural forms men and were. It is largely owing to redundancies of this kind that one can so often guess the correct content of messages that have been only partially heard. Redundancy has been estimated to constitute roughly 50% of most written and spoken English. —redundant adj.

redundancy analysis a multivariate statistical model for examining the degree to which one set of variables or scores may maximally relate to a second such set. A researcher derives a number of weighted, linear combinations of interest from the first set of variables and examines the relation between these combinations and the variance in the second set. Redundancy analysis is an alternative to CANONICAL CORRELATION ANALYSIS.

redundant coding in ergonomics, coding a display or control on two or more physical dimensions, such as by both shape and color. Redundant coding enhances CONTROL DISCRIMINABILITY.

redundant prepuce an excessive growth of prepuce (foreskin). The condition may be pathological if the excess foreskin prevents the prepuce from being drawn back over the glans, which may be necessary to prevent inflammation from trapped smegma or urine.

replicated babbling babbling in which the same syllable is repeated (e.g., ba-ba-ba-ba-ba). It is characteristic of infants between about 8 and 10 months of age.

redundative paramnesia a false memory or delusion characterized by the subjective certainty that a familiar person or place has been duplicated, such as the belief that the hospital where one is treated has been duplicated and relocated to another site. Patients may believe they are simultaneously in the two locations. This condition can be caused by a variety of neurological disorders. Brain lesions commonly involve the frontal lobes, the right hemisphere, or both. See also CAPGRAS SYNDROME.

reeducation n. 1. training that focuses on replacing maladaptive cognitions, affects, or behaviors with healthier, more adaptive ones or on relearning forgotten skills. 2. a form of psychological treatment in which the client learns effective ways of handling and coping with problems and relationships through a form of nonreconstructive therapy, such as RELATIONSHIP THERAPY, BEHAVIOR THERAPY, PERSUASION THERAPY, nonanalytic group therapy, or REALITY THERAPY. Also called REEDUCATIVE THERAPY.

reenactment n. in some forms of psychotherapy, the process of reliving traumatic events and past experiences and relationships while also reexperiencing the original emotions associated with them. See also ABREACTION.

reentrant adj. in neuroscience, relating to or describing the two-way exchange of signals between neural arrays, enabling the integration of activity in different regions of the brain.

reentry n. 1. the return of an individual to the community after experiencing life in an institution (e.g., psychiatric hospital, prison). 2. the return of a mental health professional or other worker from a disaster site after assisting victims suffering from trauma and other forms of psychological stress.

reevaluation counseling a therapeutic approach involving COCOUNSELING between individuals. In the process, two people take turns counseling and being counseled. The process starts with one individual (acting as counselor) asking the other (acting as client) a provocative question and continues with other steps, such as asking the client to cite two or three minor upsets that have recently occurred. The client is encouraged to respond emotionally, to work through the emotions, and then to act as the counselor for the other person. Also called REEVALUATION COUNSELING.
reference group a group or social aggregate that individuals use as a standard or frame of reference when selecting and appraising their own abilities, attitudes, or beliefs. Reference groups include formal and informal groups that the individual identifies with and admires, statistical aggregations of noninteracting individuals, imaginary groups, and even groups that deny the individual membership. See also aspirational group; social comparison theory. Compare membership group.

reference group theory a general conceptual framework that assumes that individuals’ attitudes, values, and self-appraisals are shaped, in part, by their identification with, and comparison to, reference groups. A reference group theory of self-concept, for example, assumes that individuals compare their economic, intellectual, social, and cultural achievements to those attained by members of their reference group. Similarly, a reference group theory of values suggests that individuals adopt the values expressed by the majority of the members of their reference group. [proposed in 1942 by U.S. sociologist Herbert H. Hyman (1918–1985)]

reference memory in animal cognition, the representation of an association between objects, spatial locations, or other stimuli that remains consistent across several trials of an experimental session and is used to guide behavior. Matching to sample and various other tasks involving simultaneous or successive discrimination are commonly used to assess reference memory in nonhuman animals. For example, a pigeon presented with both a green and a red disk is rewarded with a food pellet for pecking the green one. If the green disk remains the correct choice across all trials in which the two objects are presented, the pigeon relies on reference memory to retain this information and choose the correct disk. Compare working memory. [initially described in 1978 by German-born U.S. psychologist Werner Konstantin Honig (1932–2001) and subsequently elaborated by U.S. physiological psychologist David Stuart Olton (1943–1994) and various colleagues]

reference population 1. a subset of a target population that serves as a standard against which research findings are evaluated. For example, consider an investigator examining the effectiveness of eating disorder prevention programs at 4-year colleges and universities in the United States. In such a situation, the educational institutions that have not implemented any program would serve as the comparison reference population. 2. the target population itself.

referent n. in linguistics, the thing (or process or situation) in the external physical world to which a word or phrase refers. In the structuralist account of language (see structuralism), verbal signs (words) are held to consist of a signifier (physical form) and signified (concept indicated by the signifier), with no need for any external referent.

referential attitude an expectancy attitude sometimes observed in certain individuals with schizophrenia or other forms of psychopathology who are seeking justification, via environmental aspects, for their ideas of reference or delusions of reference.

referential signal a communication signal given by a nonhuman animal that appears to provide information about specific objects or events in the environment. Vervet monkeys have different types of calls specific to eagles, leopards, and snakes, three major predators. Many species of birds and monkeys have calls that are specific to the presence of food. Some researchers argue that referential signals are a form of symbolic communication and might be the primitive basis of words in language.

referent power a capacity to influence others that is based on their identification with, attraction to, or respect for the influencer.

referral n. 1. the act of directing a patient to a therapist, physician, agency, or institution for evaluation, consultation, or treatment. 2. the individual who is so referred.

—refer vb.

referred sensation a sensation (e.g., pain, cold) that is localized (i.e., experienced) at a point different from the area stimulated. For example, when the elbow is struck, the mechanical stimulation of the nerve may cause tingling of the fingers.

reflect n. symbol for effect-size correlation.

reflectance n. the ratio of the intensity of light reflected from a surface (reflected flux) to the intensity of light shining on a surface (incident flux). The reflectance spectrum of a surface describes the percentage of reflected photons at each wavelength in the visible spectrum.

reflected appraisals beliefs about how one is regarded by others based on the evaluative feedback that one receives from others. Some theories of self have treated reflected appraisals as the most important basis for self-concept, claiming that people learn about themselves chiefly from others. See looking-glass self; symbolic interactionism.

reflected glare see direct glare.

reflection–impulsivity n. a dimension of cognitive style based on the observation that some people approach tasks impulsively, preferring to act immediately on their first thoughts or impressions, whereas others are more reflective, preferring to consider a range of alternatives before acting. This aspect of cognitive style—conceptual tempo—can be assessed using the matching familiar figures test. Also called reflectivity–impulsivity. [first described in 1963 by Jerome Kagan]

reflection of feeling a statement made by a therapist or counselor that is intended to highlight the feelings or attitudes implicitly expressed in a client’s communication and to draw them out so that they can be clarified. Also called reflection response.

reflection response 1. in the roschach inkblot test, a testee’s response that an inkblot represents a bilateral reflection of one half of the card. That is, the image is perceived not as a single entity across both halves of the card but as two entities in the two halves, one entity being a mirror image of the other. 2. see reflection of feeling.

reflective adj. describing or displaying behavior characterized by significant forethought and slow, deliberate examination of available options. Compare impulsive. See reflection–impulsivity. —reflectivity n.

reflective abstraction the ability to arrive at new knowledge by reflecting on knowledge one already possesses without the need for additional information. [postulated by Jean Piaget]
**reflective consciousness** aspects of consciousness that enable it to refer to its own activities. Also called self-consciousness: self-reflection.

**reflective functioning** see MENTALIZATION.

**reflectivity–impulsivity** n. see REFLECTION–IMPULSIVITY.

**reflex** n. any of a number of automatic, unlearned, relatively fixed responses to stimuli that do not require conscious effort and that often involve a faster response than might be possible if a conscious evaluation of the input were required. An example is the PUPILLARY REFLEX. The concept of a reflex was first proposed by René Descartes, who supposed, before the distinction between sensory and motor nerves had been made, that the sensory impulses flowed to the spinal cord, where they were reflected back down to the muscles.

**reflex arc** a NEURAL CIRCUIT that is involved in a reflex. In its simplest form, it consists of an afferent, or sensory, neuron that conducts nerve impulses from a receptor to the spinal cord, where it connects directly or via an INTERNEURON to an efferent motor neuron that carries the impulses to an effector, that is, a muscle or gland. See also DISYNAPTIC ARC; MONOSYNAPTIC ARC; POLYSYNAPTIC ARC.

**reflex attention** see PRIMARY ATTENTION.

**reflex epilepsy** a type of epilepsy marked by seizures that are triggered by sensory input, such as sound, touch, or light (e.g., MUSICOCENE EPILEPSY, PHOTOCENE EPILEPSY).

**reflex inhibition** the reduction or prevention of a reflex because an incompatible reflex is occurring or has just occurred.

**reflex integration** the combining of two reflexes into a single, more complex response.

**reflexive behavior** responses to stimuli that are involuntary or free from conscious control (e.g., the salivation that occurs with the presentation of food) and therefore serve as the basis for CLASSICAL CONDITIONING. Compare PLANNED BEHAVIOR; VOLUNTARY BEHAVIOR.

**reflexivity** n. 1. a bidirectional relationship of cause and effect. 2. see STIMULUS EQUIVALENCE. 3. in QUALITATIVE RESEARCH, the self-referential quality of a study in which the researcher reflects on the assumptions behind the study and especially the influence of his or her own motives, history, and biases on its conduct.

**reflex latency** the time that elapses between application of a stimulus and the start of a reflex response. See also CENTRAL REFLEX TIME.

**reflexogenous zone** an area of the body that when stimulated by particular stimuli elicits a particular reflex. For example, the sole of the foot is the reflexogenous zone for the BABINISKI REFLEX.

**reflexology** n. 1. a school of psychology based on research dealing solely with the outwardly observed and fixed manifestations and reactions of the human being. It is credited to Vladimir M. Bekhterev, who taught that all behavior could be constructed from simple reflexes as the elementary units or building blocks. 2. the physiological study of involuntary automatic responses to stimuli, particularly as they affect the behavior of humans and other animals. 3. a form of COMPLEMENTARY AND ALTERNATIVE MEDICINE based on the principle that there are reflex points or zones in the feet and hands that correspond to every part of the body and that manipulating and pressing on these points have a variety of beneficial health effects. — reflexologist n.

**reflex reserve** a repertoire of responses that are implanted and accumulate within an organism through reinforcement but are emitted only after reinforcement is withdrawn and extinction takes place. [proposed in 1938 by B. F. Skinner]

**reflex strength** the potential strength of a response to a reflex stimulus (e.g., the potential for a STARTLE RESPONSE if an organism is touched), often measured by REFLEX LATENCY.

**reflex sympathetic dystrophy** overactivity of the SYMPATHETIC NERVOUS SYSTEM, which may occur following local injury, usually to a limb, that is associated with damage to nerves and blood vessels. It results in pain; limb disuse; shiny; thin skin; loss of hair; and bone demineralization.

**reformatory paranoia** a type of MEGALOMANIA expressed as a personality trait in individuals who concoct plans to reform the world and try to convince others to follow their ideas.

**reformism** n. any position that advocates change in an institution, law, practice, or theory without challenging its fundamental characteristics or tenets. Reformists accept the need for modernization and the correction of abuses but tend to decry violent or extreme change; their methods may include publicity, education, and lobbying. Compare RADICALISM. — reformist n., adj.

**refraction** n. 1. the bending of light rays as they pass from one medium to another, such as from air into water. 2. the bending of light as it passes through the cornea and lens of the eye so that it is focused on the retina. 3. the clinical description of the efficacy of the refractive process for an individual eye.

**refractive error** (refractive disorder) a defect in the eye such that it does not refract, or bend, incident light into perfect focus on the retina, thus reducing visual acuity. Examples include ASTIGMATISM, HYPEROPIA, and MYOPIA. Correction requires the use of glasses, contact lenses, or surgery. Also called error of refraction.

**refractive index** (symbol: n) a measure of the extent to which a ray of light is bent ( refracted) in passing from one transparent medium to another. The refractive index of a transparent medium is equal to the ratio of the speed of light in a vacuum to the speed of light in that medium. The value of n can vary with the wavelength of the light.

**refractory** adj. 1. resistant to control, as in a disease or disorder that fails to respond to a typically efficacious therapy. 2. in neurophysiology, describing a neuron or muscle cell that is unable to respond to a stimulus. See REFRACTORY PERIOD. 3. stubborn, uncooperative, or unmanageable. — refractoriness n.

**refractory period** a period of inactivity after a neuron or muscle cell has undergone excitation. As the cell is being repolarized, it will not respond to any stimulus during the early part of the refractory period, called the absolute refractory period. In the subsequent relative refractory period, it will respond only to a stronger than normal stimulus.

**refractory phase** the period following orgasm during which further sexual arousal or orgasm is not possible. It
occurs only in the male sexual-response cycle; females can have immediate further arousal and multiple orgasms. The length of the refractory phase increases with age.

reframing n. a process of reconceptualizing a problem by seeing it from a different perspective. Altering the conceptual or emotional context of a problem often serves to alter perceptions of the problem’s difficulty and to open up possibilities for solving it. In psychotherapy, for example, the manner in which a client initially frames a problem may be self-defeating. Part of the therapist’s response might be to reframe the problem and the thoughts or feelings that the client associates with it, so as to provide alternative ways to evaluate it. Compare restatement.

refusal rate the proportion of potentially eligible respondents for a survey or study who choose not to participate for a variety of reasons (e.g., survey takes too much time, respondent lacks interest in topic). The refusal rate must be taken into account when calculating the likely response rate for a survey. Also called nonresponse rate.

refutability n. see falsifiability.

refutation n. in logic and philosophy, the act or process of showing that a statement, theory, or claim is false or invalid. In this sense, denying an argument or claim is not the same as refuting it. —refute vb. —recessive adj.

REG abbreviation for random event generator. See random number generator.

regeneration of nerves see neural regeneration.

regenerative medicine a branch of research and applied medicine that studies the body’s capacities for and processes of self-healing, as well as the ability to create new tissues for transplant. See also stem cell.

regimen n. a particular course of action designed to achieve a specific goal. In medicine, it often refers to a detailed treatment program involving diet, exercise, rest, medication, and other therapeutic measures. Various forms of psychotherapy, such as cognitive behavior therapy, may also make use of regimens during the course of treatment. Such programs typically include a schedule and specify the components, methods, and duration of the program.

regional cerebral blood flow \((rCBF, RCBF)\) the rate of flow of blood through a particular area of the brain, measured by brain imaging techniques such as positron emission tomography and single photon emission computed tomography. It is used to assess the involvement of different brain regions in various cognitive functions.

regional localization theory the theory that the cerebral cortex has specialized regions that involve specific sensory and motor functions. Localization tends to become less specific in more frontal regions of the brain.

register n. a form of a language associated with specific social functions and situations or with particular subject matter. Examples include the different types of language considered appropriate for a scientific meeting, a kindergarten class, or a barroom story. Register differs from dialect in that it varies with social context rather than with the sociological characteristics of the user. See elaborated code.

registered nurse (RN) a professional nurse who has completed an accredited educational program and passed a state licensing examination. Registered nurses provide services such as observing and recording patient symptoms and reactions, developing a treatment plan in consultation with the attending physician, administering medication, and educating the patient or family about self-care methods.

Regitine n. a trade name for phentolamine.

regression n. a return to a prior, lower state of cognitive, emotional, or behavioral functioning. This term is associated particularly with psychoanalytic theory, denoting a situation in which the individual reverts to immature behavior or to an earlier stage of psychological development when threatened with overwhelming external problems or internal conflicts. —regress vb. —regressive adj.

regression analysis any of several statistical techniques that are used to describe, explain, or predict (or all three) the variance in an outcome or dependent variable using scores on one or more predictor or independent variables. Regression analysis is a subset of the general linear model. It yields a regression equation as well as an index of the relationship between the dependent and independent variables. For example, a regression analysis could show the extent to which 1st-year grades in college (outcome) are predicted by such factors as standardized test scores, courses taken in high school, letters of recommendation, and particular extracurricular activities.

regression artifact an experimental finding that has been distorted by extreme measurements and the associated influence of regression toward the mean.

regression coefficient in a regression analysis, the weight associated with a unit change in a specific independent (predictor) variable on the dependent (outcome) variable, given the relationship of that predictor to other independent variables already in the model. This value may be standardized (see standardization) with a variance equal to 1 (in which case, it is called a beta coefficient), or it may be unstandardized and expressed in the units of the outcome variable being measured (in which case, it is called a B coefficient). Also called regression weight.

regression constant the value of a response or dependent variable in a regression equation when its associated predictor or independent variables equal zero (i.e., are at baseline levels). Graphically, this is equivalent to the y-intercept, or the point at which the regression line crosses the y-axis.

regression diagnostics a set of graphical and numerical techniques routinely used by researchers to check for violations of assumptions in the application of regression analysis to particular data sets. For example, it is assumed that the relationship between the independent variables and the dependent variable is linear, that the variables have been measured accurately, and that any prediction errors resulting from the regression equation are independent and normally distributed with equal variance and a mean of zero. If the data do not possess such characteristics, the analysis may not be appropriate and thus its results may not be valid. See diagnostics; residual analysis.

regression-discontinuity design (RDD) a type of quasi-experimental design in which a specific threshold value or cutoff score is used to assign participants to treatment conditions. Theoretically, individuals near the threshold value are comparable and only differ on the basis
regression effect

of their treatment assignment, which enables a researcher to estimate treatment effects. For example, a researcher might use a regression-discontinuity design to investigate worker performance, assigning employees who work more than a certain number of hours to receive a reward while those below that threshold do not. The analysis of such a design involves examining the regression lines for those receiving the treatment (i.e., receiving a reward) versus those not receiving the treatment (i.e., no reward). A continuous straight line for the two groups indicates no effect of reward on performance, whereas any break or jump (discontinuity) in the line across the groups indicates a treatment effect.

regression effect see REGRESSION TOWARD THE MEAN.

regression equation the mathematical expression of the relationship between a dependent (outcome or response) variable and one or more independent (predictor) variables that results from conducting a REGRESSION ANALYSIS. It often takes the form \( y = a + bx + e \), in which \( y \) is the dependent variable, \( x \) is the independent variable, \( a \) is the INTERCEPT, \( b \) is the REGRESSION COEFFICIENT, and \( e \) is the ERROR TERM. Also called regression formula: regression model.

regression in the service of the ego in psychoanalytic theory, the adaptive circumvention of normal ego functioning in order to access primitive material (see PRIMARY PROCESS), often associated with the creative process. [First described by Swiss-born U.S. psychoanalyst Ernst Kris (1900–1957)].

regression line a straight or curved line fitting a set of data points and usually obtained by a LEAST SQUARES REGRESSION. A regression line is a graphic representation of the REGRESSION EQUATION expressing the hypothesized relationship between an outcome or DEPENDENT VARIABLE and one or more predictors or INDEPENDENT VARIABLES; it summarizes how well the proposed model actually fits the sample data obtained. Data points that do not fall exactly on the line indicate deviations in model fit.

regression model see REGRESSION EQUATION.

regression sum of squares (symbol: \( SS_{\text{regression}} \)) a number indicating the amount of variance in a DEPENDENT VARIABLE that can be explained by the variance in one or more associated INDEPENDENT VARIABLES. It thus describes how well a particular model fits the observed data. For example, in LINEAR REGRESSION it is used to calculate a COEFFICIENT OF DETERMINATION or a COEFFICIENT OF MULTIPLE DETERMINATION, and in ANALYSIS OF VARIANCE it is used to determine the total SUM OF SQUARES and calculate an F RATIO. Compare ERROR SUM OF SQUARES.

regression toward the mean the tendency for extremely high or extremely low scores to become more moderate (i.e., closer to the MEAN) upon retesting over time. In experimental studies, this tendency threatens INTERNAL VALIDITY in that shifts of scores may occur for reasons unrelated to study manipulations or treatments. For example, regardless of the interventions a researcher is investigating to improve mathematics performance (e.g., extra study sessions, providing positive or negative reinforcement), low scoring students will tend to perform slightly better on the next math exam, whereas high scoring students will tend to perform slightly worse. RANDOM ASSIGNMENT to treatment and control conditions may be used to minimize the influence of regression toward the mean on experimental results. Also called regression effect. See REGRESSION ARTIFACT.

regression tree a diagram displaying a set of conditions and their associations with a particular outcome variable as determined via a REGRESSION ANALYSIS. An initial node contains the outcome of interest (e.g., annual income under $15,000), from which branches extend to additional nodes according to the values of a studied predictor variable (e.g., level of education). Further branches extend from these subnodes based on additional predictors (e.g., area of residence, type of employment), with the process continuing until no more predictors are available in the data set or until a predetermined number of nodes is obtained. Regression trees provide a convenient, visually appealing method for examining large amounts of data. See also CART ANALYSIS.

regressive weight see REGRESSION COEFFICIENT.

regressive reconstructive approach a technique in psychotherapy in which the client is encouraged to reexperience traumatic situations with their full emotional intensity. Through such concurrent or subsequent mechanisms as TRANSFERENCE and INTERPRETATION, the approach is posited to help bring about development of greater emotional adaptation and maturity in the client.

regress on to determine the extent to which a given DEPENDENT VARIABLE (\( y \)) can be explained or predicted by a number of INDEPENDENT VARIABLES (\( x \)). For example, a researcher may be interested in learning how scores on a measure of relationship commitment vary as a function of age, relationship status, time in relationship, and shared experiences. That is, the researcher may regress \( y \) on \( x \). See REGRESSION ANALYSIS.

regret n. an emotional response to remembrance of a past state, condition, or experience that one wishes had been different.

regret theory a model of decision making that states that people’s fear of, and previous experience with, regretting poor choices plays a large role in motivating or deterring their behavior in situations involving uncertainty. For example, a person who regrets buying, on the advice of a good friend, a used car that subsequently requires expensive repairs likely will disregard the friend’s advice in the future in order to avoid the potential for similar regret. Within this framework, regret is considered to have two distinct components—the wish that one had chosen differently and the self-recrimination involved in believing one made an error in judgment. Associated with BEHAVIORAL ECONOMICS, regret theory is a parallel to PROSPECT THEORY. See also ANTICIPATORY REGRET. [originally proposed in 1982 by British economists Graham C. Loones (1930–) and Robert Sugden (1949–)].

regular adj. in linguistics, denoting a word or a form of a word that conforms to the usual patterns of INFLECTION in a language. Compare IRREGULAR.

regulation of consciousness any activity aimed at managing or changing the state and contents of CONSCIOUSNESS, including pain avoidance, pleasure seeking, and variety seeking. Self-destructive activities, such as self-mutilation and chemical intoxication, have also been interpreted as efforts to regulate states of consciousness.

regulatory behavior the actions of an organism that are geared to maintaining physiological balance by meeting PRIMARY NEEDS.
regulatory drive any generalized state of arousal or motivation that helps preserve physiological homeostasis and thus is necessary for the survival of the individual organism, such as hunger and thirst. Compare nonregulatory drive.

regulatory focus theory a conceptual framework for motivation and behavior that considers people to be fundamentally either promotion oriented or prevention oriented when making decisions and taking action in pursuit of a goal. According to the theory, promotion-focused self-regulation is concerned with nurturance and accomplishment needs and is focused on the pursuit of wishes and aspirations. As such, it results in sensitivity to positive outcomes and to relative pleasure from gains. Conversely, prevention-focused self-regulation is concerned with safety and security needs and is focused on meeting duties and obligations. As such, it results in sensitivity to negative outcomes and to relative pain from losses. One’s disposition toward either obtaining gains or avoiding losses influences one’s dominant motivations, which in turn affect one’s behavioral choices. For example, in addressing the issue of smoking cessation, regulatory focus theory suggests that a smoker may be motivated either to approach desired end states (e.g., improved lung capacity) or to avoid undesired end states (e.g., illness). Thus, antismoking messages framed to match the smoker’s particular regulatory focus should be more effective in convincing him or her to quit smoking than those that do not match. Indeed, regulatory focus theory has numerous implications for designing informative and persuasive messages. Other areas in which the theory has been applied include communication more generally, administration, and organizational management, and athletic performance. [proposed in 1997 by U.S. psychologist E. Tory Higgins (1946–)]

regulatory system a group of interacting mechanisms that act to maintain homeostasis or any other stable state in an organ or organism.

REGWQ test Ryan–Einot–Gabriel–Welsch multiple range test: a procedure used to evaluate if there are statistically significant differences between independent groups in a one-way analysis of variance of a balanced design. It is one of many such multiple comparison tests. Also called Ryan’s method. [Thomas A. Ryan Jr., U.S. statistician; Israel Einot, Israeli statistician; K. Ruben Gabriel (1929–2003), German-born U.S. statistician; Roy E. Welsch, U.S. statistician]

rehabilitation n. the process of bringing an individual to a condition of health or useful and constructive activity, restoring to the fullest possible degree his or her independence, well-being, and level of functioning following injury, disability, or disorder. It involves providing appropriate resources, such as treatment or training, to enable such a person (e.g., one who has had a stroke) to redevelop skills and abilities he or she had acquired previously or to compensate for their loss. Compare HABILITATION.

rehabilitation center a facility devoted to restoring individuals with mental or physical disorders or impairments, including those with multiple problems, to an adequate level of functioning. Rehabilitation centers provide services such as vocational training, occupational and physical therapy, educational therapy, recreational therapy, and psychological therapy and counseling.

rehabilitation counseling a profession requiring specialized training to assess the needs of individuals with physical, mental, or emotional disabilities, to provide (or facilitate the provision of) services designed to meet those needs, and to assist such individuals in achieving independent, productive lives. Among the services that rehabilitation counselors provide are diagnosis and treatment planning; mental health counseling; career counseling, job-placement services, and other vocational guidance or support; life care planning; assistive technology consultation; case management and service coordination; and advocacy for the rights of those with disabilities to have access to opportunity (in education or work), appropriate environmental accommodations (e.g., in housing, schools, offices), and community life.

rehabilitation engineering a discipline that integrates multiple areas of research and techniques from various fields to develop products, processes, and environments to improve the quality of life for people with disabilities. See also Bioengineering.

rehabilitation medicine see PHYSICAL MEDICINE AND REHABILITATION.

rehabilitation neuropsychology a specialty area that studies and treats cognitive, behavioral, emotional, and social disturbances in individuals following stroke, traumatic brain injury, spinal cord injury, and other conditions involving neurological damage. The goal of rehabilitation neuropsychologists is to optimize the health, independence, and quality of life of their clients by (a) evaluating their executive functions and other abilities through observation of their behavior and administration of assessment instruments (e.g., neuropsychological tests); (b) providing cognitive retraining and other clinical interventions to facilitate skill reacquisition or substitution; (c) training and educating other professionals involved in their clients’ treatment; (d) participating in the development of public policy and other programs to benefit their clients; and (e) advocating on behalf of their clients (e.g., with insurance providers). The field is cross-disciplinary in nature, having relevance to such areas as community psychology, clinical psychology, counseling psychology, family medicine, health psychology, neurology, and psychiatry. See also CLINICAL NEUROPSYCHOLOGY; COGNITIVE REHABILITATION.

rehabilitation program the overall system of rehabilitation services provided in support of an individual with an illness, injury, or physical or mental disability, disorder, or impairment. A program is typically customized to meet the specific needs of each individual and may include physical therapy, recreational therapy, occupational therapy, psychotherapy; educational and vocational programs; and appropriate specialty services, such as speech therapy and orientation and mobility training.

rehabilitation psychology a specialty branch of psychology devoted to the application of psychological knowledge and understanding to the study, prevention, and treatment of disabilities and chronic health conditions across the lifespan. Using a team-based approach, rehabilitation psychologists working in settings such as hospitals, inpatient and outpatient rehabilitation centers, nursing homes, and sports-injury centers consider the various factors (biological, psychological, social, environmental, and political) that affect functioning to help individuals attain optimal physical, psychological, and interpersonal independence. They also play a leading role in preventive care, caregiver support, and health care policy issues.
rehearsal n. 1. preparation for a forthcoming event or confrontation that is anticipated with some level of discomfort or anxiety. By practicing what is to be said or done in a future event the individual may lessen the stress of the event itself. Rehearsal may be carried out in psychotherapy with the therapist coaching or role-playing to help the individual practice for the event. See also BEHAVIOR REHEARSAL; MENTAL REHEARSAL; ROLE PLAY. 2. the repetition of information in an attempt to maintain it longer in memory. According to the DUAL-STORE MODEL OF MEMORY, rehearsal occurs in SHORT-TERM MEMORY and may allow a stronger trace to then be stored in LONG-TERM MEMORY. Although rehearsal implies a verbal process, it is hypothesized to occur in other modalities as well. See also DEPTH-OF-PROCESSING HYPOTHESIS.

rehospitalization n. see READMISSION.

Reichenbach phenomenon an energy field allegedly emanating from crystals, magnets, and living things (both plants and animals). Adherents claim that it can be made visible by KIRLIAN PHOTOGRAPHY but is otherwise discernible only by certain “sensitive” individuals. The phenomenon was first described by the Austrian chemist and metallurgist Baron Karl von Reichenbach (1788–1869), who held it to be a manifestation of an all-pervading physical force that he named Od or Odylie after the Norse god Odin. Reichenbach considered this force to be distinct from electricity and magnetism but similar to the ANIMAL MAGING of Franz Anton Mesmer. These ideas later influenced the Austrian psychoanalyst Wilhelm Reich (1897–1957) and his theory of ORGONE energy. The Reichenbach phenomenon is now mainly cited by advocates of CRYSTAL HEALING. See also AURA; EFFLUVIA.

Reicher–Wheeler effect see WORD-SUPERIORITY EFFECT. [Gerald M. Reicher (1939– ) and Daniel D. Wheeler (1942– ), U.S. psychologists]

Reichian analysis a highly controversial and largely discredited system of psychotherapy, developed by Austrian psychoanalyst Wilhelm Reich (1897–1957), in which ORGASTIC POTENCY is emphasized as the criterion of mental health. Notwithstanding the widespread judgment of the approach as alternative (see ALTERNATIVE PSYCHOTHERAPY) and unsupported by research, Reich made early contributions to psychology in his theories concerning character analysis, emotional catharsis, and authoritarianism.

reification n. treating an abstraction, concept, or formulation as though it were a real object or material thing. For instance, the statement You can’t fool nature would be an example of reification if taken literally. In logical argument, reification is regarded as a FALLACY. Also called OBJECTIFICATION.

reiki n. a complementary therapy that aims to promote physical, emotional, and spiritual healing through the therapist’s placement of hands slightly off of or lightly touching the body; a technique that is believed to improve the flow of life energy in the patient. See also COMPLEMENTARY AND ALTERNATIVE MEDICINE. [Japanese, “universal life energy”]

reincarnation n. the doctrine found in some early Greek philosophy, in BUDDHISM and HINDUISM, and in some spiritualist traditions that the human psyche survives death and is reborn in other bodies (in most forms of the doctrine, in other human bodies). See FUTURE LIVES; METEMPSYCHOSIS.

reinforce vb. to enhance or increase the probability of a response by arranging a dependent relationship, or contingency, between the response and a REINFORCER.

reinforced practice a learning procedure in which participants receive incentives for performing specific desired behaviors. For example, children with a fear of the dentist may become more cooperative when praised and rewarded for allowing dental instruments in their mouths for several brief periods before the dentist actually begins work. The technique has been shown to be effective with a variety of behaviors in numerous experimental and real-world situations. The reinforcement need not be complex to be effective and may even be provided automatically, such as a computer screen showing a smiley face when a student presses the button for the correct answer to a study question. In OPERANT CONDITIONING, the term generally denotes the process of SHAPING.

reinforcement n. 1. in OPERANT CONDITIONING, a process in which the frequency or probability of a response is increased by a dependent relationship, or contingency, with a stimulus or circumstance (the REINFORCER). See REINFORCEMENT CONTINGENCY. 2. the procedure that results in the frequency or probability of a response being increased in such a way. 3. in CLASSICAL CONDITIONING, the presentation of an unconditioned stimulus after a conditioned stimulus. See also NEGATIVE REINFORCEMENT; POSITIVE REINFORCEMENT; SCHEDULE OF REINFORCEMENT.

reinforcement contingency the contingency (relationship) between a response and a REINFORCER. The contingency may be positive (if the occurrence of the reinforcer is more probable after the response) or negative (if it is less probable after the response). Reinforcement contingencies can be arranged by establishing dependencies between a particular type of response and a reinforcer (as when a rat’s lever presses are followed by presentation of food), or they can occur as natural consequences of a response (as when a door opens when pushed) or by accident (see ACCIDENTAL REINFORCEMENT). Also called response-reinforcement contingency.

reinforcement counseling a behavioral approach to counseling based on the idea that behavior is learned and can be predictably modified by various techniques that strengthen or weaken it through schedules of positive or negative reinforcement. See also REINFORCEMENT THERAPY.

reinforcement delay the time between a response and the occurrence of a REINFORCER.

reinforcement of alternative behavior a procedure that involves eliminating reward or reinforcement for an undesired behavior and instead rewarding a desired behavior. Also called rewarded alternative method.

reinforcement schedule see SCHEDULE OF REINFORCEMENT.

reinforcement sensitivity theory (RST) as originally described in 1970 by British psychologist Jeffrey Alan Gray (1934–2004), a model in which personality reflects the functioning of three major biological systems that operate independently of one another through distinct neuroanatomical structures. The BEHAVIORAL APPROACH
by U.S. psychologists Joseph R. Cautela (1927–1999) and behaviors or decrease negative behaviors. [developed in 1967 patients organize contingencies that increase positive be-

ment form that elicits information about activities, stimuli, or contingency , with a response. Also called reinforc-

ship traits of impulsivity and anxiety. The third system, the fight-flight system (FFS), responds to unconditioned un-

able goals or threatening stimuli that cannot be avoided. It is seen as responding to all reinforcing stimuli, whether con-

sital psychology to understand the mechanisms underlying depression, disorders, anxiety disorders, substance abuse, and other psychopathology.

Reinforcement Survey Schedule (RSS) an assessment form that elicits information about activities, stimuli, and situations that a person finds rewarding or pleasurable. This information is used by behavior therapists to help patients organize contingencies that increase positive behaviors or decrease negative behaviors. [developed in 1967 by U.S. psychologists Joseph R. Cautela (1927–1999) and Robert A. Kastenbaum]

reinforcement therapy a therapeutic process based on operant conditioning and the use of positive rein-

forcement to initiate and maintain behavioral change. See also reinforcement counseling.

reinforcer n. a stimulus or circumstance that produces reinforcement when it occurs in a dependent relation-

ship, or contingency, with a response. Also called reinforcing stimulus. See natural reinforcer.

reinforcer effect a situation in which one variable strengthens the relationship between two other variables. For example, if performance on a free recall task is en-

hanced when participants studying words for the memory task are in a positive mood, positive mood has demon-

strated a reinforcer effect on study recall. See also interaction effect; mediator. Compare suppressor effect.

reinforcing cause a condition that tends to maintain a healthy or maladaptive behavior or behavioral pattern in an individual. An example is when special attention is given to a person who is ill, which can contribute either to a speedy recovery or to a delayed recovery. It is typical, however, to use the term in relation to negative or mal-

adaptive consequences.

reinforcing stimulus see reinforcer.

reinstatement following extinction the return of a response to an extinguished conditioned stimulus due to exposure to an unconditioned stimulus. For example, a person who gets a headache from using earbuds may de-

velop an aversion to using them. This aversion may be-

come extinguished after the person tries using earbuds again a few times without getting a headache. However, if the person then gets a headache (for any reason), the aver-

sive response to using earbuds may return (or be reinstated).

reintegration n. see redintegration.

reintegrative stage see schae’s stages of cognitive development.

Reissner’s membrane a thin layer of tissue within the auditory labyrinth that separates the scala vestibuli from the scala media inside the cochlea. Also called vestibular membrane. [Ernst Reissner (1824–1878), German anatomist]

Reitan Indiana Aphasia Screening Test a 32-item test developed to evaluate language, constructional praxis, calculation, and right–left orientation. It is part of the halstead–reitan neuropsychological battery. [Ralph M. Reitan (1922– ), U.S. psychologist]

Reitan–Klove Sensory Perceptual Examination a sensory examination, developed as part of the halstead–reitan neuropsychological battery, that includes measures of tactile, visual, and auditory sensory function on both sides of the body. Also called Sensory Perceptual Examination. [Ralph M. Reitan; Hallgrim Klove (1927–2010), Norwegian neuropsychologist]

Reiz lumen (RL) the German name for absolute threshold.

rejected child see sociometric status.

rejecting-neglecting parenting see parenting.

rejection n. 1. denial of love, attention, interest, or approval. 2. an antagonistic or discriminatory attitude to-

ward a group of people.

rejection error see type I error.

rejection method a technique that uses an algorithm to generate and select random values for a study. Values are automatically included in or excluded from the study sample depending on whether they fall within a particular range. Also called rejection sampling.

rejection region see critical region.

rejection value see critical value.

relapse n. the recurrence of a disorder or disease after a period of improvement or apparent cure. The term also re-

fers to recurrence of substance abuse after a period of ab-

stinence.

relapse prevention use of various procedures to reduce the risk of relapse of a condition, disease, or disorder. For example, clients or patients might be taught cognitive and behavioral skills before the termination of therapy. Relapse prevention has a particular role in disorders, such as addiction and depression, with high relapse rates. See also tertiary prevention.
relapse rate

relapse rate the incidence of clients or patients who had recovered or improved but who later experienced a recurrence of their disorder or disease.

related-measures design see WITHIN-SUBJECTS DESIGN.

relatedness n. a feeling of connection with other people, often accompanied by affection, trust, and a sense of personal security. —related adj.

relatedness needs see EXISTENCE, RELATEDNESS, AND GROWTH THEORY.

related samples see DEPENDENT SAMPLES.

related-samples t test see DEPENDENT-SAMPLES T TEST.

relation n. 1. any kind of meaningful connection between two or more events or entities. The specific nature of this connection varies with the context and discipline. In science, for example, a relation is primarily a causal relation. See CAUSALITY; RELATIONSHIP. 2. an individual connected to another by blood, marriage, or adoptive ties. See also KINSHIP.

relational aggression behavior that manipulates or damages relationships between individuals or groups, such as bullying, gossiping, and humiliation.

relational discrimination in conditioning, a DISCRIMINATION based on the relationship between or among stimuli rather than on absolute features of the stimuli. For example, a nonhuman animal can be trained to respond to the larger of two stimuli, regardless of their absolute size.

relational frame a hypothesized unit that permits one to describe the relationships between new entities based on previous experience. Entities can stand in several relationships to one another, such as the relationship of sameness or the relationship of larger than. Through experience with such relationships, frames are learned into which new entities can be placed. For example, after many experiences with conditions in which one thing is larger than another, and having learned in those situations to say, for example, “The cow is bigger than the dog,” one then knows to say “My cat is bigger than yours” when comparing the two animals for the first time.

relational frame theory (RFT) a psychological theory of human language and cognition that is derived from the principles of BEHAVIOR ANALYSIS and forms the theoretical basis for ACCEPTANCE AND COMMITMENT THERAPY (ACT). According to the theory, and in the words of its originator: “STIMULUS EQUIVALENT is a special case of arbitrarily applicable relational responding based on sameness.” The theory draws on two central ideas. One proposes, and experimental findings confirm, that humans and nonhumans can respond to nonarbitrary relations between stimuli, but some organisms may also bring relational responding under the control of context. Such abstracted relational responding would then be arbitrarily applicable to any events, needing only contextual cues to occur. The second idea is the behavior analytic account of GENERALIZED ImitATION, grammatical frames, and other phenomena, proposing that organisms can learn overarching behavioral classes containing virtually unlimited numbers of members. Although stimulus equivalence and similar phenomena seem to show novel performances, RFT proposes that such performances may be learned; that is, the action of relating two arbitrary stimuli itself has a history. It also proposes, among other concepts, that VERBAL BEHAVIOR is a particular kind of relating—that is, a contextually situated and learned ability to relate events arbitrarily. It is through this concept of verbal behavior that the theory particularly informs ACT. [proposed by U.S. psychologist Steven C. Hayes (1948– )]

relational learning learning to differentiate among stimuli on the basis of relational properties (e.g., the larger of two stimuli) rather than absolute properties (e.g., the stimulus that has a given size).

relational mapping the ability to apply what one knows about one set of elements to a different set of elements. For example, knowing the relation of A to B, one can deduce that C is related to D in the same way that A is related to B.

relational primacy hypothesis the hypothesis that ANALOGICAL THINKING is available early in infancy; that is, young infants can comprehend or solve a problem in one event by comparing it with another. See also RELATIONAL SHIFT.

relational psychoanalysis a psychoanalytic approach incorporating aspects of several theoretical perspectives, such as OBJECT RELATIONS THEORY and INTERPERSONAL THEORY. It focuses on an individual’s sense of self and patterns of relating to others as developed in early relationships, and in treatment it emphasizes the importance of the relationship between a patient and analyst or therapist in helping the patient understand those patterns and form new ones. See also ONE-PI ESON PSYCHOLOGY; TWO-PI ESON PSYCHOLOGY.

relational research see CORRELATIONAL RESEARCH.

relational self the aspect of SELF-CONCEPT derived from connections and role relationships with significant others. [first described in 1996 by U.S. social psychologists Marilyn B. Brewer and Wendi Gardner]

relational shift the developmental change in ANALOGICAL THINKING that occurs when the child moves from focusing on perceptual similarity to focusing on relational similarity when solving problems.

relational turbulence 1. the disorder, doubts, and problems relationship partners may experience as they transition from casual dating to more committed forms of involvement. Relationship turbulence is caused by the disruption of ordinary routines, lifestyles, and plans that occur when people become interdependent, spending more time together and beginning to coordinate their activities and goals. It also reflects uncertainty and possible ambivalence about the relationship. Relationship turbulence usually abates as partners become settled in their routines and more confident about their future as a couple. 2. the cognitive, emotional, and behavioral disruption that occurs in a relationship during a significant life transition, such as when one partner returns from deployment or when a couple copes with infertility.

relational word see FUNCTION WORD.

relational world in psychoanalysis, particularly OBJECT RELATIONS’ THEORY and SELF PSYCHOLOGY, an individual’s contextual orientation to and understanding of others based on his or her early relationships.

relationship n. 1. an association or connection between objects, events, variables, or other phenomena. See also CORRELATION. 2. a continuing and often committed association between two or more people, as in a family, friendship, marriage, partnership, or other interpersonal link in
which the participants have some degree of influence on each other’s thoughts, feelings, and actions. In psychotherapy, the therapist–patient relationship is thought to be an essential aspect of patient improvement. As with other relationships in life, therapeutic relationships characterized by trust, warmth, respect, and understanding are more likely to result in positive outcomes for the patient.

**relationship conflict** see INTRAGROUP CONFLICT.

**relationship leader** see SOCIAL-EMOTIONAL LEADER.

**relationship-motivated** adj. denoting a LEADERSHIP style in which the leader concentrates on building and maintaining good relationships within the group, minimizing friction, and providing support and encouragement so that group and individual morale remains high. It can be assessed using the LEAST PREFERRED COWORKER SCALE. Also called **relationship-oriented**. Compare TASK-MOTIVATED.

**relationship role** one of a set of GROUP ROLES adopted by members whose performance of particular behaviors maintains or enhances interpersonal relationships within the group. Also called **socioemotional role**. Compare TASK ROLE.

**relationship system** the system of interpersonal bonds recognized in a particular culture, society, or group. The term is broader than **KINSHIP NETWORK** or kinship system as it includes relationships that are not based on blood or **AFFINITY**.

**relationship therapy** 1. any form of psychotherapy that emphasizes the nature of the relationship between client and therapist and views it as the primary therapeutic tool and agent of positive change. Relationship therapy is based on providing emotional support and creating an accepting atmosphere that fosters personality growth and elicits attitudes and past experiences for examination and analysis during sessions. 2. any form of psychotherapy focused on improving the relationship between individuals by helping them resolve interpersonal issues and modify maladaptive patterns of interactions, thereby fostering the healthy psychosocial growth of all parties. It is an umbrella term encompassing COUPLES THERAPY and FAMILY THERAPY. [first described by U.S. social worker Jessie Taft (1882–1960) and child psychiatrist Frederick H. Allen (1890–1964)]

**relationship training** any set of techniques designed to improve relations between people, as in HUMAN RELATIONS TRAINING.

**relative accommodation** the amount of ACCOMMODATION of the eyes that is possible when CONVERGENCE is kept constant.

**relative deprivation** the perception by an individual that the amount of a desired resource (e.g., money, social status) he or she has is less than some comparison standard. This standard can be the amount that was expected or the amount possessed by others with whom the person compares himself or herself. The concept was introduced as a result of studies of morale in the U.S. Army during World War II; conducted by U.S. sociologist Samuel A. Stouffer (1900–1960) and colleagues, the studies indicated that soldiers were dissatisfied if they believed they were not obtaining as many military rewards and benefits as their peers. In 1966, British sociologist Walter Garrison Runciman (1934–) distinguished between **egoistic relative deprivation**, the perceived discrepancy between an individual’s own current position and the comparison standard, and **fraternalistic relative deprivation**, the perceived discrepancy between the position that the person’s ingroup actually has and the position the person thinks it ought to have. According to some research, social unrest tends to be greatest in areas with high levels of relative deprivation. See also **EQUITY THEORY**; **SOCIAL COMPARISON THEORY**; **SOCIAL EXCHANGE THEORY**.

**relative efficiency** 1. for two tests (A and B) of the same hypothesis operating at the same SIGNIFICANCE LEVEL, the ratio of the number of cases needed by Test A to the number needed by Test B for each to have the same statistical POWER. The relative efficiency value enables a researcher to determine whether there is a preferred statistical approach for evaluating a particular phenomenon. 2. for two parameter ESTIMATES (A and B), a value reflecting the ratio of the STANDARD ERROR of Estimate A to the standard error of Estimate B.

**relative frequency** the frequency of a type or category of event expressed as a proportion of the total frequency of all types or categories. For example, if 47 out of 100 participants answered Yes to a particular question on a survey, the relative frequency of yes responses would equal .47 (i.e., the number of yes responses divided by the total number of yes, no, and I don’t know responses).

**relative frequency distribution** a tabular display of the number of observations at each level of a variable compared to the total number of observations obtained. For example, suppose a researcher asks 200 participants to describe their level of extraversion on a 5-point scale and obtains the following results: 32 individuals indicate they are extremely introverted; 24 individuals indicate they are somewhat introverted; 50 individuals indicate they are neither introverted nor extraverted; 38 individuals indicate they are somewhat extraverted; and 56 individuals indicate they are extremely extraverted. In the corresponding relative frequency distribution, these values can be expressed both as proportions—the number of observations per level divided by all observations (i.e., .16, .12, .25, .19, and .28)—and as percentages—the number of observations per level divided by all observations multiplied by 100 (i.e., 16%, 12%, 25%, 19%, and 28%). This type of table is useful in identifying which scores or values are most likely to occur at which variable level. Also called **relative distribution**: **relative frequency table**. See FREQUENCY DISTRIBUTION.

**relative judgment** see COMPARATIVE JUDGMENT.

**relative measurement** a context-specific assessment approach in which the value of an individual score depends on its comparison to other scores within a group or subgroup. For example, one might evaluate beauty by assigning a person a number that reflects his or her attractiveness compared to others of the same age, the same occupation, and so forth. Compare ABSOLUTE MEASUREMENT.

**relative pitch** the ability to identify the pitch of a sound accurately by mentally comparing it to a known reference pitch. Compare ABSOLUTE PITCH.

**relative position** see INTERPOSITION.

**relative refractory period** see REFRACTORY PERIOD.

**relative risk** see RISK RATIO.

**relative scotoma** see SCOTOMA.

**relative sensitivity** the capacity to discriminate differ-
Release-inhibiting hormone (or factor) that inhibits the nor-
term. For example, the...n contraction.

vb. The return of a muscle to its resting condition after a period

training.

duce relaxation and reduce stress. Also called relaxation

release phenomenon.

Relativism

ervation in stimuli (e.g., in terms of intensity or quality) when
one stimulus is judged in relation to another. When only
one stimulus is presented at a time, sensitivity to stimulus
differences is reduced.

Relativism n. Any position that challenges the existence
of absolute standards of truth or value. In epistemology,
relativism is the assertion that there are no absolute
grounds for truth or knowledge claims. Thus, what is con-
sidered true will depend on individual judgments and local
conditions of culture, reflecting individual and collective
experience. Such relativism challenges the validity of sci-
ence except as a catalog of experience and a basis for ad
hoc empirical prediction. In ethics, relativism is the claim
that no moral absolutes exist. Thus, judgments of right and
wrong are based on local culture and tradition, on per-
sonal preferences, or on artificial principles. Standards of
conduct vary enormously across individuals, cultures, and
historical periods, and it is impossible to arbitrate among
them or to produce universal ethical principles because
there can be no means of knowing that these are true. In
this way, relativism in epistemology and relativism in ethics
are related. See also moral nihilism; particularism; post-
modernism. —relativist adj.

Relaxation n. 1. Abatement of intensity, vigor, energy, or
tension, resulting in calmness of mind, body, or both. 2. The
return of a muscle to its resting condition after a period
of contraction. —relax vb.

Relaxation technique any therapeutic technique to in-
duce relaxation and reduce stress. Also called relaxation
training.

Relaxation therapy use of muscle-relaxation tech-
niques to aid in the treatment of emotional tension. Also
called therapeutic relaxation. See also differential relax-
lation; progressive relaxation.

Relay nucleus a nucleus that relays nerve impulses
from one tract to another within the central nervous sys-
tem. For example, the lateral geniculate nuclei receive
fibers from the optic tract and send fibers to the visual cor-
text. Relay nuclei are especially prominent in the thala-
mus.

Relearning method see savings method.

Release n. 1. The letting go of physical, mental, or emo-
tional tension or pent-up energy, tending toward relaxation
or arousal reduction. See also releaser. 2. Discharge of an
individual from any type of correctional or therapeu-
tic residential facility. Also called institutional release.

Release from proactive interference restoration of
the capacity to readily remember items of one type after
switching categories of materials to be recalled. For exam-
ple, successively trying to memorize dates leads to the
buildup of proactive interference, causing a decline in
immediate recall of dates; switching to remembering
names releases proactive interference, and retention im-
proves (i.e., names are remembered more easily than dates
were).

Release inhibitor a substance that prevents or inter-
feres with the release of hormones or other agents from
glands or tissue cells. For example, somatostatin is a re-
lease-inhibiting hormone (or factor) that inhibits the nor-
mal rate of release of growth hormone from the pituitary
gland.

Release phenomenon unrestricted activity of a lower

brain center when a higher center with inhibitory control
is incapacitated, damaged, or excised.

Releaser n. In ethology, a stimulus that, when presented
under the proper conditions, initiates a fixed action pat-
tern (see also modal action pattern). For example, a red
belly on a male stickleback fish elicits aggressive behavior
from other male sticklebacks but is attractive to gravid fe-
male sticklebacks. Also called sign stimulus. See also in-
nate releasing mechanism; vacuum activity.

Release theory of humor the theory that people
laugh out of a need to release pent-up psychic energy. In
Sigmund Freud’s version of this theory, humor permits the
expression of normally taboo impulses, and the energy it
releases is that normally used in keeping such impulses out
of consciousness. See also incongruity theory of humor.

Release therapy 1. Any therapy whose ultimate value is
in the release of deep-seated, forgotten, or inhibited emo-
tional and psychic pain through open expression and direct
experience of anger, sorrow, or hostility in the therapy con-
text. The technique is used, for example, in play therapy
and in psychodrama. 2. A form of therapy in which young
children reenact anxieties, frightening experiences, and
traumatic events with such materials as figurines, stuffed
animals, and water guns. [Developed in the 1930s by U.S.
psychiatrist David M. Levy (1892–1977)]

Release zone the region of a presynaptic axon terminal
where synaptic vesicles discharge neurotransmitter mole-
cules into the synaptic cleft. See synapse.

Releasing hormone any of a class of hypothalamic hor-
mones that travel via the hypothalamic–pituitary portal
system to control the release of hormones by the anterior
pituitary gland. Examples are corticotropin-releasing fac-
tor and gonadotropin-releasing hormone.

Relevancy-sensitivity tradeoff in research, the bal-
ance struck between measuring dependent variables ac-
curately and specifically and obtaining results with appli-
cability to contexts beyond the original study. The rele-
ance-sensitivity tradeoff should be considered by a
researcher when designing a study.

Relevant-irrelevant test a question format used in
polygraph testing in which physiological responses ac-
companying questions relevant to a crime (e.g., “Did you
steal from the office?”) are compared with responses ac-
companying questions irrelevant to the crime (e.g., “Are
you 24 years old?”). In criminal investigations, it has been
increasingly replaced by the control question test. See
also guilty knowledge test.

Reliability n. The trustworthiness or consistency of a
measure; that is, the degree to which a test or other mea-
urement instrument is free of random error, yielding the
same results across multiple applications to the same sam-
ples. See alternate-forms reliability; internal consis-
tency; reliability coefficient; test-retest reliability.

Reliability coefficient (symbol: rxx) an index describ-
ing the consistency of scores across contexts (e.g., differ-
ent times, items, or raters). Its value, ranging from 0 to 1, pro-
vides an estimate of the amount of obtained score variance
that is due to true variance rather than error. The larger
this coefficient, the more confident a researcher may be
that scores obtained at different times under similar
conditions with the same participants will be alike. Typi-
cally, reliability coefficients are considered to be acceptable
and then use that information to determine the test’s overall reliability of the larger test. For example, a repetition sets is determined and then used to estimate the all reliability.

reliability index see RELIABILITY COEFFICIENT.

reliability of components the average RELIABILITY of scores obtained from the component subsets that make up a test. Components are identified by grouping a large set of items into clusters with similar content through rational or intuitive approaches or through the use of an empirical method (e.g., FACTOR ANALYSIS, PRINCIPAL COMPONENTS ANALYSIS). The internal consistency of each of the component sets is determined and then used to estimate the overall reliability of the larger test. For example, a researcher might factor analyze a 20-item social support questionnaire, identify three content subscales, calculate the internal consistency of scores for those three subscales, and then use that information to determine the test’s overall reliability.

reliability of composites see COMPOSITE RELIABILITY.

reliability sampling a form of ACCEPTANCE SAMPLING in which samples of, for example, a consumer product are inspected to determine their acceptability against quality specifications at some future date. This is often a test of the product’s future life.

reliability theory any of various conceptualizations about why scores on a test or performance task are consistent across contexts. Three prominent reliability theories are CLASSICAL TEST THEORY, GENERALIZABILITY THEORY, and ITEM RESPONSE THEORY. Each considers error differently and thus it is important for researchers to specify which conceptualization underlies their research.

relief n. a POSITIVE EMOTION that occurs as a response to a threat that has abated, disappeared, or failed to materialize.

religion n. a system of spiritual beliefs, practices, or both, typically organized around the worship of an all-powerful deity (or deities) and involving behaviors such as prayer, meditation, and participation in collective rituals. Other common features of organized religions are the belief that certain moral teachings have divine authority and the recognition of how human beings create myths to make themselves feel more comfortable or to find meaning in life. It has also been argued that the religious instinct may have a biological origin and serve an evolutionary purpose.

religious mania a state of acute hyperactivity, agitation, and restlessness accompanied by hallucinations of a religious nature.

religiousness n. the tendency to adhere to religious beliefs and to engage in religious practices.

religious obsessive-compulsive disorder see SCRU-PULOSITY.

religious therapy therapeutic intervention through such approaches as PASTORAL COUNSELING, scriptural study, and church-sponsored community activities.

REM abbreviation for RAPID EYE MOVEMENT.

remand vb. 1. to send back a case from an appellate court to the lower court from which the appeal came, together with instructions on how to proceed. 2. to send an accused person back into custody or remit him or her to bail, pending further legal proceedings.

REM behavior disorder (RBD) a SLEEP DISORDER involving motor activity during REM SLEEP, which typically includes a physical enactment of dream sequences. Because the dreams that are acted out are generally unpleasant or combative, this behavior is usually disruptive and can result in violence.

remedial education a learning process that occurs after the initial, primary instruction of a subject or skill. Remedial education is intended to improve skills that appear deficient in a particular subject or area. For example, remedial reading is specialized instruction for individuals whose READING QUOTIENT is significantly below average or who have faulty reading patterns.

remedial therapy an intervention aimed at assisting a person to achieve a normal or increased level of functioning when performance is below expectations in a particular area (e.g., reading). Also called remedial training.

remember cue see DIRECTED FORGETTING.

remembering n. the process of consciously reviving or bringing to awareness previous events, experiences, or information. Remembering also involves the process of retaining such material, which is essential to learning, since without it one would not profit from training, practice, or past experience. According to Endel Tulving, remembering is distinct from knowing (see REMEMBER–KNOW PROCEDURE). Methods of assessing remembering include the RECALL METHOD, RECOGNITION METHOD, and SAVINGS METHOD.

remember–know procedure a procedure in which
remembrance

various memory tasks (e.g., CUED RECALL, FREE RECALL) are used to measure and assess two different ways of accessing events from one’s past—EPISODIC MEMORY and SEMANTIC MEMORY. Remembering (episodic memory) is the conscious and vivid recollection of a prior event such that a person can mentally travel to the specific time and place of the original event and retrieve the details; he or she is able to bring to mind a particular association, image, or sensory impression from the time of the event. Knowing (semantic memory) refers to the experience in which a person is certain that an event occurred but fails to recall anything about its actual occurrence or what was experienced at the time of its occurrence; the retrieval of the event is not accompanied by specific recollections about the time, place, or details. [introduced in 1985 by Endel Tulving]

**remembrance n.** 1. the act of remembering or the state of being remembered. 2. a late stage in the GROUP SOCIALIZATION process during which ex-members review their experiences in the group and continuing members discuss the contributions and activities of former members.

**Remeron n.** a trade name for MIRTAZAPINE.

**remifentanil n.** see FENTANYL.

**reminder n.** a cue that helps to reinstate or initiate a memory, behavior, habit, or goal.

**reminiscence n.** 1. the recalling of previous experiences, especially those of a pleasant nature. Events that occurred in adolescence and early adulthood (often called the **reminiscence bump**) are most often remembered. Unlike RECOLLECTION, reminiscence does not necessarily involve vivid and detailed memory. See also AUTOBIOGRAPHICAL MEMORY; EPISODIC MEMORY; LIFE REVIEW. 2. in a test, the retrieval of an individual piece of information (e.g., word, picture) that was not retrieved on a previous test. Reminiscence often occurs when information is repeatedly tested in close succession. The longer the delay between tests, however, the more likely a given piece of information will be forgotten. See HYPERMNESIA.

**reminiscence theory of knowledge** the theory of Greek philosopher PLATO that knowledge originates prior to birth in a hypothetical existence during which humans are exposed to the true forms or essences of things. After birth, this knowledge is retrieved through reminiscence. According to Plato, this is the only possible explanation for human knowledge of certain ideal concepts, such as perfect equality, that cannot be derived from experience. See PLATONIC IDEALISM; THEORY OF FORMS.

**reminiscence therapy** the use of LIFE HISTORIES—written, oral, or both—to improve psychological well-being. The therapy is often used with older people.

**remission n.** a reduction or significant abatement in symptoms of a disease or disorder, or the period during which this occurs. Remission of symptoms does not necessarily indicate that a disease or disorder is cured. See also INTERMISSION; SPONTANEOUS REMISSION.

**remitting-disorder study** an empirical investigation of patients whose condition is in remission. Because the trajectories of certain pathologies (e.g., schizophrenia, bipolar disorder, chronic pain, cancer) include periods of relapse and abatement, researchers seek to identify the conditions under which each occurs so as to predict these transitions more accurately and develop better treatments.

**REM latency** the time between onset of sleep and the first occurrence of REM SLEEP.

remorse n. a strong sense of guilt and regret for a past action.

**remote association** an association between one item in a list or series and another item that does not adjoin it. Hermann Ebbinghaus first reported that associations are formed not only between adjacent items but also between items further apart in a list or series.

**remote-association test** a creativity test in which the participant is asked to suggest a fourth word that links three apparently unrelated words, such as rat–blue–cottage (answer: cheese).

**remote cause** a cause that is removed from its effect in time or space but is nevertheless the ultimate or overriding cause. In a CAUSAL CHAIN, it may be considered to be the precipitating event without which the chain would not have begun (the original cause). For example, the PROXIMATE CAUSE of Smith’s aggression may be a trivial snub, but the remote cause may be Smith’s early childhood experiences. See also CAUSAL LATENCY; DELAYED EFFECT.

**remote grandparent** the type of grandparent who interacts with his or her grandchildren infrequently, due to physical distance or emotional detachment. Compare COMPASSIONATE GRANDPARENT; INVOLVED GRANDPARENT.

**remote masking** the masking of a signal by a masker that is much higher in frequency than the signal. See AUDITORY MASKING.

**remote memory** recall or recognition of experiences or information dating from the distant past. See LONG-TERM MEMORY.

**remote perception** 1. in parapsychology, the perception of a scene or event at which one is not present. In the usual research protocol, one person is present at a target location, while the remote perceiver is situated at some distance from the scene, with no prior knowledge of it, and attempts to perceive aspects of its ambience and detail. Both participants record their impressions on identical checklists, and the observations are later correlated for level of agreement. 2. the perception of an object using means other than the senses normally used to perceive it. For example, rocks on Mars may be perceived using a video camera mounted on a robot. See TELEPRESENCE.

**remote viewing** see CLAIRVOYANCE.

**remotivation** n. intervention aimed at increasing the likelihood that a person will cooperate with and benefit from treatment. It includes efforts directed toward stimulating withdrawn patients in psychiatric hospitals, such as by involving them in poetry-reading groups or conversation groups in which a bridge to reality is established by discussing current topics.

**removing harmful consequences** an ethical principle requiring researchers to ensure that participants in DECEPTION RESEARCH or other potentially detrimental practices leave a study in the same emotional state as when they arrived. Investigators thus are obligated to alleviate any feelings of alienation, resentment, negativity, and so forth by minimizing study risks before the study begins and providing an in-depth DEBRIEFING after the study is complete. For example, at the conclusion of a study in which participants were induced into negative moods, the experimenters would need to take steps to induce a positive mood in participants and explain the reasons for the methods used in the study. See also FREEDOM FROM HARM.
REM rebound the increased occurrence of REM sleep following REM-sleep deprivation. It is an example of a REM-BOUND PHENOMENON.

REM sleep rapid-eye-movement sleep: the stage of sleep, formerly called desynchronized sleep, in which most dreaming tends to occur and during which electroencephalograms show activity that resembles wakefulness (hence, it is also known as paradoxical sleep) except for inhibition of most skeletal and cranial muscles. This stage has two phases—tonic and phasic—and it is largely during the phasic period that muscle twitches and bursts of rapid eye movements occur. REM sleep accounts for one quarter to one fifth of total sleep time. Compare NREM SLEEP.

REM-sleep deprivation an experimental SLEEP DEPRIVATION technique designed to study the effects of reduced REM sleep on activities that occur during this stage of sleep (e.g., REM dreaming; see DREAM DEPRIVATION) or on processes that are believed to be affected during this stage (e.g., NEUROGENESIS, memory consolidation).

REM storm a burst of rapid eye movement (REM) during sleep.

renal adj. referring to the kidney or kidneys.

renal system the kidneys and related structures—including the ureters, bladder, urethra, renal blood supply, and renal nerve supply—that are involved with the excretion of waste materials from the body.

Renard Diagnostic Interview a structured interview designed to elicit information relating to established criteria (i.e., the FEIGNER CRITERIA) for the diagnosis of 15 psychiatric disorders. See RESEARCH DIAGNOSTIC CRITERIA.

Renfield Diagnostic Interview a structured interview designed to elicit information relating to established criteria (i.e., the FEIGNER CRITERIA) for the diagnosis of 15 psychiatric disorders. See RESEARCH DIAGNOSTIC CRITERIA. [developed in 1977 at the Renard Hospital, Washington University, St. Louis]

renewal following extinction the return of a response to an extinguished conditioned stimulus following movement away from the context in which extinction occurred.

Renfield’s syndrome see VAMPIRISM. [named in 1992 by U.S. clinical psychologist Richard Noll (1959– ) after a character in Bram Stoker’s novel, Dracula (1897)]

renifleur n. a person with a morbid interest in body odors, especially as a means of sexual excitement. See OPIPHIROLAGNIA.

renin n. an enzyme that is released by the kidneys when blood pressure falls. It cleaves the plasma globulin protein angiotensinogen to form ANGIOTENSIN.

renin–angiotensin system a system of the liver and kidneys that regulates the production of ALDOSTERONE from the adrenal cortex and is therefore involved in the control of blood pressure. See ANGIOTENSIN; RENIN.

Renpenning syndrome a condition that is inherited as an X-linked trait (see SEX-LINKED) and almost exclusively affects males. It is characterized by eye defects, MICROCEPHALY, psychomotor retardation, short stature, small testes, and intellectual disability. [Hans Renpenning (1929–2006), Canadian physician]

Renshaw cell a neuron that inhibits motor neurons near the spinal cord. Renshaw cells are a part of the NEGATIVE FEEDBACK system that prevents rapid, repeated firing of motor neurons. See also RECURRENT COLLATERAL INHIBITION. [Birseyd Renshaw (1911–1948), U.S. neurophysiologist]

renunciation n. 1. in general, the act of giving something up or denying oneself. 2. in classical psychoanalytic theory, a refusal of the ego to follow impulses of the id, or a sublimation of those urges. —renounce vb.

reorganization principle the principle deriving from GESTALT PSYCHOLOGY that new learning or perception disrupts old cognitive structures, requiring a reorganized structure. This is in opposition to the associationist principle that new learning is essentially added on to existing structures (see ASSOCIATIONISM).

reorientation therapy see CONVERSION THERAPY.

repair n. in language, a revision made spontaneously in conversation to correct miscommunication. Also called CONVERSATIONAL REPAIR.

reparameterization n. the process of redefining the parameters necessary for the complete specification of a model, usually for the purpose of removing technical difficulties in an analytic solution that stem from the original parameterization. For example, in STRUCTURAL EQUATION MODELING a researcher may decide to add another pathway between a Manifest VARIABLE and a Latent VARIABLE because of a new insight gained from theory or an empirical result.

reparation n. 1. amelioration of or expiation for harm previously done. See also RESTITUTION. 2. in the OBJECT RELATIONS THEORY of Melanie Klein, acts that are performed during the DEPRESSIVE POSITION to repair the relationship with the GOOD OBJECT. Klein viewed all creative and positive acts in adulthood as examples of reparation.

reparative therapy see CONVERSION THERAPY.

reparenting n. 1. a controversial therapeutic procedure used to provide a client with missed childhood experiences. The client, who typically has severe problems, is treated as a child or infant; for example, he or she may be fed with a spoon or bottle, hugged, sung to, and provided with other forms of nurturance. Reparenting has been unethically used to justify recreation of the birth process by wrapping a client in a blanket and having him or her struggle to get out. 2. in self-help and some forms of counseling, a therapeutic technique in which individuals are urged to provide for themselves the kind of parenting attitudes or actions that their own parents did not provide.

repeatability n. the degree to which specific research studies obtain similar results when they are conducted again. Study and measurement conditions (e.g., instructions, assessments, setting) must be identical on all occasions. See REPLIATION; REPRODUCIBILITY.

repeated contrast a procedure in which sequences of responses are learned but the sequence changes from observation period to observation period. For example, a person might be asked to press a sequence of keys in the presence of seven different stimuli presented in sequence. Having learned to do so, the person would then be required to learn a different sequence of key presses in response to the same seven stimuli in the next test period.

repeated contrast in a WITHIN-SUBJECTS ANALYSIS OF VARIANCE, a comparison of means conducted across different levels of the INDEPENDENT VARIABLE. For example, assume a researcher is interested in how commitment to therapy changes over the course of the process. He or she could assess participant commitment at the start of therapy (Month 1) and at the beginning of each of the four
repeated factor

months thereafter, and then evaluate how the mean commitment scores at Months 2, 3, 4, and 5 differ from the mean baseline commitment score obtained at Month 1. There are several types of repeated contrasts available, such as SIMPLE COMPARISONS and POLYNOMIAL CONTRASTS.

repeated factor an INDEPENDENT VARIABLE for which multiple scores are recorded for an individual research participant. For example, in a study examining political attitudes a researcher may collect approval ratings for a candidate at four time points before the election. Thus, the variable of candidate approval would be a repeated factor having four levels corresponding to the four different points at which ratings were obtained. See also WITHIN-SUBJECTS DESIGN.

repeated measures analysis of variance see WITHIN-SUBJECTS ANALYSIS OF VARIANCE.

repeated measures design see WITHIN-SUBJECTS DESIGN.

repeated measures t test see DEPENDENT-SAMPLES T TEST.

repeated reproduction a method for studying memory in which participants repeatedly retrieve the same memory over time. The method often shows that repeated retrieval leads to changes in memory, supporting the theory that memory should be viewed as constructive and reconstructive (see CONSTRUCTIVE MEMORY; RECONSTRUCTIVE MEMORY), rather than simply reproductive. In the original 1932 study, British college students attempted to recall a particular Native American folk tale. Successive reproduction of the tale demonstrated that the students’ own cultural knowledge and expectations intruded into the recall, rationalizing and eliminating unusual elements and structuring unrelated items of the tale into a more coherent and familiar framework. Also called Bartlett technique: Bartlett tradition: successive reproduction. See also EFFORT AFTER MEANING; SERIAL REPRODUCTION. [developed in 1932 by Frederic C. Bartlett]

repeat offender see RECIDIVISM.

repertoire n. the sum total of potential behavior or responses that a person or nonhuman animal is capable of performing. It usually refers to behavior that has been learned and is generally quantified through the study of past behavior. Also called behavioral repertoire.

repertory grid a technique used to analyze an individual’s PERSONAL CONSTRUCTS. A number of significant concepts are selected, each of which is rated by the participant on a number of dimensions using a numerical scale. The findings are displayed in matrix form and can be subjected to statistical analysis to reveal correlations. The repertory grid was developed principally as a means of analyzing personal relationships but has also been used to determine the complexity of a person’s thinking (COGNITIVE COMPLEXITY) and in various other applications. [introduced by George A. Kelly]

repetition n. repeated presentation of material to be learned or remembered. Repetition forms the basis of DRILL and ROTE LEARNING methods. See also REPETITION EFFECT.

repetition blindness in RAPID SEQUENTIAL VISUAL PRESENTATION, the tendency for individuals to fail to notice a target stimulus when it is repeated. For example, when presented with the sequence of letters hobd, they are less likely to notice the second b than to notice c, e, or d. See also CHANGE BLINDNESS; INATTENTIONAL BLINDNESS.

repetition compulsion in psychoanalytic theory, an unconscious need to reenact early traumas in the attempt to overcome or master them. Such traumas are repeated in a new situation symbolic of the repressed prototype. Repetition compulsion acts as a RESISTANCE to therapeutic change since the goal of therapy is not to repeat but to remember the trauma and to see its relation to present behavior. Also called compulsion to repeat.

repetition effect the fact that repeated presentation of information or items typically leads to better memory for the material. The repetition effect is a general principle of learning, although there are exceptions and modifiers. For instance, spaced repetitions are usually more effective than massed repetitions. See DISTRIBUTED PRACTICE; LAW OF FREQUENCY; MASSED PRACTICE.

repetition priming cuing a response to a stimulus through prior exposure to the same or a related stimulus. The effects of repetition priming (e.g., changed speed of response, number of response errors) can occur without explicit memory of the first stimulus.

repetitive strain injury (RSI) a group of musculoskeletal disorders involving chronic inflammation of the muscles, tendons, or nerves and caused by overuse or misuse of a specific body part. RSI most commonly affects the hands, wrists, elbows, arms, shoulders, back, and neck and results in pain and fatigue of the affected areas. Examples include CARPAL TUNNEL SYNDROME and TENDINITIS (inflammation, irritation, and swelling of a tendon). Repetitive strain injuries are often associated with work, and their prevention is an important issue in ERGONOMICS and HUMAN FACTORS. Also called cumulative trauma disorder (CTD); repetitive motion disorder or injury (RMI); repetitive stress injury.

repetitive transcranial magnetic stimulation (rTMS) see TRANSCRANIAL MAGNETIC STIMULATION.

replacement memory see SCREEN MEMORY.

replacement sampling see SAMPLING WITH REPLACEMENT.

replacement therapy 1. treatment in which a natural or synthetic substance is substituted for one that is deficient or lacking in an individual. See HORMONE REPLACEMENT THERAPY. 2. the process of replacing abnormal thoughts or behaviors with healthier ones through the use of therapy focused on constructive activities and interests.

replication n. the repetition of an original experiment or research study to verify or bolster confidence in its results. In exact replication (or literal replication), a researcher uses procedures that are identical to the original experiment or duplicated as closely as possible. In modified replication, a researcher incorporates alternative procedures and additional conditions. In conceptual replication, a researcher introduces different techniques and manipulations to gain theoretical information.

reportability n. the quality of psychological events that allows them to be described (e.g., in VERBAL REPORTS) by the person experiencing them. It is the most widely used behavioral index of conscious experience in psychophysics, perception, memory, and applied settings such as medicine.

representation n. that which stands for or signifies something else. For example, in cognitive psychology the term denotes a MENTAL REPRESENTATION, whereas in psychoanalytic theory it refers to an INTROJECT (see INTROJECTION) of a significant figure or to a symbol for a repressed
impulse. —represent vb. —representational adj. —representative adj.

representational change a young child’s false memory of an initial belief, as demonstrated by performance in a FALSE-BELIEF TASK. For example, children shown a box marked as containing pencils and asked what it contains are likely to reply that it contains pencils; the box is then opened to reveal that it actually contains pennies. When later asked what they originally thought was in the box, most children ages 3 years and younger say pennies, whereas older children remember their original belief.

representational constraints the limitations imposed by the brain on the form and content of mental constructions, as reflected in the innateness of some types of knowledge (e.g., simple concepts of addition and subtraction). See also ARCHITECTURAL CONSTRAINTS; CHRONOTOPIC CONSTRAINTS.

representational insight the knowledge that an entity (e.g., a word, photograph) can stand for something other than itself.

representationalism n. the view that in perception the mind is not directly aware of the perceived object but of a mental representation of it. See PHENOMENALISM. —representationalist adj.

representational redescription the mental processes by which a child produces a new description of his or her existing representations. This recoding of information enables the child to think more flexibly and use knowledge in a more sophisticated way. [proposed by British psychologist Annette Karmiloff-Smith]

representational skills cognitive skills involved in understanding people, objects, and events in terms of mental representation, including the use of images and words.

representational stage in PIAGETIAN THEORY, another name for the PREOPERATIONAL STAGE.

representational thought cognition based on use of symbols, including, but not limited to, language and images.

representational validity the extent to which a SIMULATION accurately replicates the real-world situation that it is intended to represent (external representational validity) and functions in the intended manner (internal representational validity).

representative democracy see DEMOCRACY.

representative design an experimental design that includes processes and variables that might be found outside the laboratory setting. In representative designs, the participants, situations, constructs, and assessments are sampled in a way that permits generalization beyond the specific research setting, and background variables are intentionally not controlled so that research results will apply more realistically to the real world. See ECOLOGICAL VALIDITY.

representative factors in some studies of higher, nonhuman primates, hypothetical mental functions that permit the animals to continue or renew a response after the original stimulus is discontinued. Such functions are presumed to involve some form of MENTAL REPRESENTATION of stimuli.

representativeness n. the extent of the correspondence between a sample and the larger population from which it is drawn. A sample that accurately reflects its population, reproducing the essential characteristics and constitution in correct proportions, allows for GENERALIZABILITY.

representativeness heuristic a strategy for making categorical judgments about a given person or target based on how closely the exemplar matches the typical or average member of the category. For example, given a choice of the two categories poet and accountant, people are likely to assign a person in unconventional clothes reading a poetry book to the former category, however, the much greater frequency of accountants in the population means that such a person is more likely to be an accountant. The representativeness heuristic is thus a form of the BASE-RATE FALLACY. Compare AVAILABILITY HEURISTIC.

representative sampling the selection of study units (e.g., participants, homes, schools) from a larger group (population) in an unbiased way, such that the sample obtained accurately reflects the total population. For example, a researcher conducting a study of university admissions would need to ensure he or she used a representative random sample of schools—in other words, each school would have an equal probability of being chosen for inclusion, and the group as a whole would provide an appropriate mix of different school characteristics (e.g., private or public, student body size, cost, proportion of students admitted, geographic location).

repressed memory see RECOVERED MEMORY.

repression n. 1. in classical psychoanalytic theory and other forms of DEPTH PSYCHOLOGY, the basic DEFENSE MECHANISM that excludes painful experiences and unacceptable impulses from consciousness. Repression operates on an unconscious level as a protection against anxiety produced by objectionable sexual wishes, feelings of hostility, and ego-threatening experiences and memories of all kinds. It also comes into play in many other forms of defense, as in denial, in which individuals avoid unpleasant realities by first trying to repress them and then negating them when repression fails. See PRIMARY REPRESSION; REPRESSION PROPER. 2. the oppression or exclusion of individuals or groups through limitations on their personal rights and liberties. 3. more generally, the process of restricting, restraining, or subduing something or someone. Compare SUPPRESSION. —repress vb.

repression proper in psychoanalytic theory, a form of REPRESSION that acts on conscious experiences and wishes in order to make them unconscious. This is in contrast to PRIMARY REPRESSION, which operates on material that has never been conscious. Also called secondary repression.

repression resistance n. in psychoanalysis, the RESISTANCE deployed by a patient in order to maintain REPRESSION of unacceptable impulses. This may manifest in the patient’s forgetting of events, in an impeded flow of FREE ASSOCIATIONS, or in the patient’s application of interpretations offered by the analyst to others but not to himself or herself. Also called superego resistance. Compare ID RESISTANCE; SUPEREGO RESISTANCE.

repression–sensitization defense mechanisms involving approach and avoidance responses to threatening stimuli. The sensitizing process involves intellectualization in approaching or controlling the stimulus, whereas repression involves unconscious denial in avoiding the stimulus.

repressive coping style a pattern of dealing with life
characterized by downplaying problems or misfortunes and maintaining an artificially positive view. Repressive coping is indicated by a combination of high scores on social desirability bias and low scores on reported anxiety. See also positive illusion.

**reproducibility** n. the extent to which a study produces the same findings when it is conducted by a different independent researcher. A given research finding is thought to be stronger when it can be both repeated and reproduced. See repeatability; replication.

**reproduction** n. 1. in biology, the production of new individuals from parent organisms, which perpetuates the species. Sexual reproduction involves the fusion of male and female gametes in the process of fertilization; asexual reproduction does not. 2. the process of replicating information from memory. It potentially is subject to numerous errors or changes, as demonstrated via repeated reproduction and other techniques.

**reproduction theory** a theory suggesting that educational systems reproduce the social and economic structures and divisions of the societies in which they exist. [originated by French sociologist of education Pierre-Felix Bourdieu (1930–2002)]

**reproductive behavior** the range of activity, both biological and behavioral, that leads to propagation of individuals. The mechanisms range from simple cell division in unicellular organisms or budding of new offspring in simple multicellular organisms to a merger of chromosomes contributed by the male and female parents in sexual reproduction, often followed by supervision of the offspring until they can survive independently. Courtship, mate selection, copulation, and parental behavior are components of reproductive behavior.

**reproductive failure** failure to conceive or to bear offspring that grow to maturity.

**reproductive function** the total process of creating a new organism, or a specific act in the process, such as sexual intercourse.

**reproductive image** in piagetian theory, a mental image that is limited to evoking previously experienced sights and involves relatively static representations of objects. Compare anticipatory image.

**reproductive imagination** imagination used to reproduce images or objects with which one has become familiar in the past.

**reproductive memory** retrieval that is hypothesized to be an accurate recall of information. However, this type of memory is subject to errors of constructive memory or reconstructive memory. See repeated reproduction.

**reproductive success** the degree to which an individual is successful in producing progeny that in turn are able to produce progeny of their own. Individuals vary in their success in finding mates and reproducing successfully. Natural selection is based on this differential reproductive success. The genetic and behavioral traits that lead to greatest reproductive success survive in a population over generations, whereas traits producing low reproductive success eventually become extinct. See also inclusive fitness.

**reproductive suppression** the inability of one or several individuals within a group to reproduce, despite having reached reproductive maturity. In many cooperative-breeding species, dominant, breeding individuals suppress reproduction in subordinates. Both behavioral and physiological cues can be involved. Reproductive suppression can be temporary, as in wolves, marmosets, or meerkats, in which an individual can quickly become a breeder in the absence of cues from the dominant animal, or it can be permanent, as in social insects.

**reproductive type** a constitutional type characterized by a dominance of the reproductive system over other body systems (see roston types). See also reproductive behavior.

**resampling** n. an analytic method in which a researcher repeatedly chooses subgroups of observations from a larger overall data set in order to estimate various characteristics of that larger set. The smaller subsets of observations may be drawn through random sampling with replacement or without replacement, with both strategies having implications for the different analytic approaches that may be used.

**res cogitans** the Latin term (literally: “thinking thing”) used by Rene DESCARTES to refer to the mental realm as distinct from the realm of physical matter (res extensa). See cartesian dualism.

**Rescorla–Wagner theory** an influential theory of classical conditioning that posits that conditioning proceeds from pairing to pairing as a fixed proportion of the maximum amount of conditioning that can be achieved with the unconditioned stimulus (US). For example, if food (the US) produces 100 ml of salivation (the unconditioned response [UR]), and after one pairing of a tone with food, the tone elicits a conditioned response (CR) of 40 ml of salivation (i.e., 0.4 of the maximum amount achievable), a second trial will increase the magnitude of the CR by 24 ml (i.e., 0.4 × [100 – 40]), so that the response will be 64 ml. After a third trial, the magnitude will be 78.4 ml—that is, 40 + 24 + (0.4 × [100 – 64])—and so on until the CR is 100 ml (the maximum achievable). Also called Rescorla–Wagner model. [proposed in 1972 by Robert Rescorla (1940– ) and Allan Wagner (1934– ), U.S. experimental psychologists]

**research** n. the systematic effort to discover or confirm facts, to investigate a new problem or topic, or to describe events and understand relationships among variables, most often by scientific methods of observation and experimentation. Research is essential to science in contributing to the accumulation of generalizable knowledge.

**research design** a strategic plan of the procedures to be followed during a study in order to reach valid conclusions, with particular consideration given to participant selection and assignment to conditions, data collection, and data analysis. Research designs may take a variety of forms, including not only experiments but also quasi-experiments (see quasi-experimental research), observational studies, longitudinal designs, surveys, focus groups, and other nonexperimental methods. See also experimental design.

**Research Diagnostic Criteria (RDC)** a modification of the feighner criteria for diagnosis of psychiatric disorders, expanding the number of disorders from the original 15 to 25. It focused on present or past episodes of illness and provided inclusion and exclusion criteria for diagnosis of the different disorders. Developed to increase diagnostic reliability, the RDC became an important basis for the development of the third edition of the diagnostic and statistical manual of mental disorders (DSM–III; 1980), which was...
a major departure from prior editions’ largely psychoanalytic approach to mental disorder. [published in 1978 by U.S. psychiatrists Robert L. Spitzer (1932–) and Eli Robins (1921–1995) and U.S. clinical psychologist Jean Endicott (1936–)]

**research diary** an investigator’s documentation of the activities undertaken during a study, including the study’s overall design and conceptualization, sampling and measurement procedures, data collection and analysis, and reporting of findings as well as reflections, notes, and observations of a more personal nature. Research diaries may be reviewed to understand the nuances of a project and often provide ideas that form the basis of future studies.

**researcher bias** any unintended errors in the research process or the interpretation of its results that are attributable to an investigator’s expectancies or preconceived beliefs. The term essentially is synonymous with EXPERIMENTER BIAS, but it applies to all types of investigative projects rather than to experimental designs only.

**research ethics** the values, principles, and standards that guide the conduct of individual researchers in several areas, including the design and implementation of studies and the reporting of findings. For example, research ethics stipulate that studies involving data collection from human participants must be evaluated by INSTITUTIONAL REVIEW BOARDS.

**research hypothesis** a statement describing the investigator’s expectation about the pattern of data that may result from a given study. By stating specific expectations before the data are collected, the investigator makes a commitment about the direction (e.g., Method A will yield higher final exam scores than Method B) and magnitude (e.g., participants’ income will increase with more education) of potential relationships based on the study’s theoretical framework and related prior studies. See also ALTERNATIVE HYPOTHESIS; NULL HYPOTHESIS.

**research method** a procedure for the formulation and evaluation of hypotheses that is intended to reveal relationships between variables and provide an understanding of the phenomenon under investigation. In psychology, this generally involves empirical testing and takes the form of the SCIENTIFIC METHOD. See also QUALITATIVE RESEARCH; QUANTITATIVE RESEARCH.

**research protocol** the complete description of one’s outline or plan for conducting a study. It should be as detailed as possible, including elements such as the RESEARCH HYPOTHESIS to be addressed and the rationale for doing so; the materials and resources that will be required; the timeline or duration; the precise sampling, measurement, and analysis procedures that will be used; a discussion of any ethical considerations; and a description of strengths and limitations.

**research register** a database of research studies, in progress or completed, about a specific topic, or funded by the same organization, or sharing a common design.

**research risk** the potential costs to participants or to society at large associated with a particular study, which must be clearly specified to an INSTITUTIONAL REVIEW BOARD by an investigator prior to conducting the research. Examples of potential risk to participants include embarrassment at being involved in DECEPTION RESEARCH, side effects from a treatment, time and resource commitments, and emotional upset (e.g., from exposure to unpleasant or painful memories). An investigator must discuss how the costs will be minimized to the fullest extent possible and how the study benefits outweigh the costs.

**research sport psychology** the nonclinical psychology of human movement as it relates to sport, with a primary focus on the development of theory and the study of the efficacy of application strategies.

**research synthesis** the systematic use of established data-gathering methods and statistical approaches to evaluate a body of empirical literature on a topic. An investigator should include both published and unpublished studies, document the methods that each study uses, provide detail about the findings and EFFECT SIZES, and summarize commonalities and account for differences across studies. See META-ANALYSIS.

**resentment** n. a feeling of bitterness, animosity, or hostility elicited by something or someone perceived as insulting or injurious.

**reserpine** n. see RAUWOLFIA DERIVATIVE.

**reserve capacity** the difference between performance on a psychological task and an individual’s maximum capability to perform that task. Training, intervention, and practice can be used to minimize reserve capacity on a given task.

**reserved adj.** emotionally restrained, particularly in social interactions.

**res extensa** the Latin term (literally: “extended thing”) used by René DESCARTES to refer to the physical realm of matter. By “extended” Descartes meant that material objects have the property of occupying space, in contrast to the mind, which has no spatial dimensions. Compare RES COGITANS. See CARTESIAN DUALISM.

**residence rate** the ratio of the number of people residing in institutions of a given type on a given date to the total population of the city, county, state, or other area.

**residential care** long-term care that provides housing and meals as well as medical, nursing, and social services for individuals with chronic illness (e.g., dementia, Parkinson’s disease) who are unable to function independently or for individuals undergoing rehabilitation. See also DOMICILARY CARE.

**residential habilitation** a HOME AND COMMUNITY-BASED SERVICE provided for a person with intellectual or developmental disability. This service is similar to DAY HABILITATION but is delivered in a supervised or supportive residential setting or in a family home.

**residential maze** an arrangement of intersecting pathways and blind alleys used to study learning and memory, in which a nonhuman animal is kept 24 hours a day rather than only for the test period. One of the simplest residential mazes has a nest box at the center of a plus-sign structure with four arms, each of which provides a different item (e.g., water, food) to the resident animal.

**residential school** a special educational facility that provides live-in services for children with intellectual or developmental disability. Although historically significant, the use of such facilities greatly diminished during the latter part of the 20th century, and children with these conditions now receive public education in their home communities.
residential treatment
treatment that takes place in a hospital, special center, or other facility that offers a treatment program and residential accommodation. Some programs require residence for a specific time (e.g., 1 month for treatment of an addiction), and some allow patients to learn or work in the community during the day.

residual 1. n. in REGRESSION ANALYSIS, the difference between the value of an empirical observation and the value predicted by a model. Analysis of residuals allows a researcher to judge the fit or appropriateness of the model for the data. 2. adj. denoting a condition in which acute symptoms have subsided but chronic or less severe symptoms remain. 3. adj. denoting remaining ability (e.g., residual hearing) or a remaining disability (e.g., residual loss of vision) after a trauma or surgery.

residual analysis a diagnostic review of discrepancies between specific observations and the values predicted by a model (see RESIDUAL). Summarizing these discrepancies in several different ways can help a researcher identify problems in the application of a model to a particular data set. For example, a residual analysis might show large discrepancies for one group but not another, suggesting that the model is not appropriate for the first group. See REGRESSION DIAGNOSTICS.

residual error see ERROR VARIANCE.

residual mean square see MEAN SQUARE ERROR.

residual schizophrenia in DSM–IV–TR, a subtype of schizophrenia diagnosed when there has been at least one schizophrenic episode but positive symptoms (e.g., delusions, hallucinations, disorganized speech or behavior) are no longer present, and only negative symptoms (e.g., flat affect, poverty of speech, avolition) or mild behavioral and cognitive disturbances (e.g., eccentricities, odd beliefs) remain. This subtype has been eliminated from DSM–5.

residual score see ERROR SCORE.

residual sum of squares see ERROR SUM OF SQUARES.

residual term see ERROR TERM.

residual variance see ERROR VARIANCE.

residual vision 1. usable vision in an individual with congenital or acquired VISUAL IMPAIRMENT. For example, an individual with impaired vision in the peripheral visual field due to glaucoma may still have residual vision in the central visual field. See also LOW VISION. 2. unconscious visual processes that are spared when damage to the STRIATE CORTEX (primary visual cortex) produces loss of vision. See BLINDSIGHT.

residue method see METHOD OF RESIDUES.

residue pitch see VIRTUAL PITCH.

resignation n. an attitude of surrender to one’s situation or symptoms.

resilience n. the process and outcome of successfully adapting to difficult or challenging life experiences, especially through mental, emotional, and behavioral flexibility and adjustment to external and internal demands. A number of factors contribute to how well people adapt to adversities, predominant among them (a) the ways in which individuals view and engage with the world, (b) the availability and quality of social resources, and (c) specific COPING STRATEGIES. Psychological research demonstrates that the resources and skills associated with more positive adaptation (i.e., greater resilience) can be cultivated and practiced. Also called psychological resilience. See also COPEING BEHAVIOR; COPEING-SKILLS TRAINING. —resilient adj.

resinous adj. denoting one of the primary odor qualities in HENNING’S ODOR PRISM.

resistance n. 1. generally, any action in opposition to, defying, or withholding something or someone. 2. in psychotherapy and analysis, obstruction, through the client’s words or behavior, of the therapist’s or analyst’s methods of eliciting or interpreting psychic material brought forth in therapy. Psychoanalytic theory classically interprets resistance as a defense and distinguishes three types in particular: CONSCIOUS RESISTANCE, ID RESISTANCE, and REPRESION RESISTANCE. 3. the degree to which an organism can defend itself against disease-causing microorganisms. See IMMUNITY. 4. the degree to which disease-causing microorganisms withstand the action of drugs. —resist vb. —resistant adj.

resistance of an attitude the extent to which an attitude remains unchanged in the face of attack or challenge.

resistance stage see GENERAL ADAPTATION SYNDROME.

resistance to change the measure of BEHAVIORAL MOMENTUM. Ongoing behavior is challenged by operations intended to disrupt it. The greater the degree to which the behavior persists unperturbed, the greater its resistance to change and, by inference, the greater its behavioral momentum.

resistance to extinction the endurance or persistence of a conditioned response in the absence of reinforcement.

resistance to interference the ability to ignore irrelevant information so that it does not impede task performance. Inability to ignore such information is called interference sensitivity.

resistant attachment see AMBIVALENT ATTACHMENT.

resistant estimator an estimator for an unknown characteristic in a population that is less likely to be influenced by the presence of OUTLIERS (extreme scores) in the sample on which it is based. See also ROBUST ESTIMATOR.

resocialization n. the process of enabling individuals with mental disorders to resume appropriate interpersonal activities and behaviors and, generally, to participate in community life through more adaptive attitudes and skills.

resolution n. a measure of the ability of the eye or an optical device or system to detect two distinct objects when these are close together. A system with high resolution can distinguish targets very close to one another as individual entities; a system with low resolution can only distinguish targets that are further apart. Also called resolving power.

resolution phase see SEXUAL–RESPONSE CYCLE.

resolving power see RESOLUTION.

resonance frequency see ACOUSTIC RESONANCE.

resource allocation the distribution of a program’s effort across different participants, components, or segments of the program.

resource competition mutual interference between cognitive resources involved in simultaneous effortful tasks. See DUAL-TASK COMPETITION.

resource defense polygyny a form of POLYGyny in nonhuman animals that can occur when some males defend areas containing sufficient resources to allow a num-
ber of females to breed successfully. A male defending sufficient resources is able to benefit from polygyny not by being more attractive or having better genes but because the resources he controls can feed multiple females and their offspring.

**resource teacher** a specialist who teaches children with special needs, gifted children, and other exceptional children and who is available to act as a consultant to other teachers.

**resource theory** a theory of interpersonal relationships holding that the amount of resources (e.g., information, love, status, money, goods, services) possessed by each of the participants greatly affects the nature of their relationship. Individuals with more resources than they require for themselves can distribute their excess to the other party and thus have power over the other to the extent that the other needs the resources. It is proposed that withholding needed resources can heighten conflict, whereas the relationship is harmonious when each party is equally powerful and cooperative in the exchange of resources. [proposed in 1974 by U.S. psychologists Edna B. Foa (1937– ) and Uriel G. Foa (1916–1990)]

**respect** n. an attitude of, or behavior demonstrating, esteem, honor, regard, concern, and other such positive qualities toward an individual or entity. Respect can serve an important purpose in interpersonal and intergroup relations by aiding in communication, for example. According to many theorists and practitioners, it is considered to play a crucial role as a bidirectional process in psychotherapy.

**respiration** n. 1. the series of chemical reactions that enables organisms to convert the chemical energy stored in food into energy that can be used by cells. Also called cellular respiration; internal respiration. 2. the process by which an animal takes up oxygen from its environment and discharges carbon dioxide. Also called external respiration.

**respiratory depression** slow and shallow breathing that can be induced by opioids and other sedatives. These drugs raise the threshold level of respiratory centers in the medulla oblongata of the brain that normally would react to increased carbon dioxide in the tissues by increasing the rate and depth of breathing. Respiratory depression is a primary hazard of the use of morphine and other sedatives. These are induced by opioids and other sedatives. These conditions can occur if the stimulus is presented. Also called elicited behavior. See also reflex. Compare emitted behavior.

**respiratory distress syndrome** a disorder in some newborn babies in which the lungs fail to expand due to deficiency of a natural surfactant that prevents the alveoli (air sacs) from collapsing. The alveoli are lined with a membrane of hyaline material. The condition, which is most common in premature infants, may worsen progressively before the lungs begin producing surfactant. Also called hyaline membrane disease.

**respiratory sinus arrhythmia** (RSA) the normal tendency for the heart rate to increase and decrease in synchrony but slightly out of phase with inhalation and exhalation. When observed, respiratory sinus arrhythmia can be taken as a sign of vagal function (see VAGAL TONE). It is sometimes used as a physiological index of temperamental disposition: According to Jerome Kagan, lack of RSA is associated with inhibited temperamental disposition.

**respiratory type** a constitutional type characterized by a dominance of the circulatory and respiratory systems over other body systems. See rostan types.

**respite care** assistance, supervision, and recreational or social activities provided for a limited period to a child, older adult, or person with a disability or chronic illness in order to temporarily relieve family members from caregiving responsibilities. These services may be provided on a scheduled or unscheduled basis, either regularly or occasionally, after school hours, during weekends, or overnight. Also called in-home respite.

**respondent** n. 1. an organism that responds to a stimulus. 2. a study participant who is interviewed as part of a research design or who completes a survey or questionnaire. 3. in conditioning, any reflex that can be conditioned by CLASSICAL CONDITIONING procedures. Compare OPERANT.

**respondent behavior** behavior that is evoked by a specific stimulus and that will consistently and predictably occur if the stimulus is presented. Also called elicited behavior. See also reflex. Compare emitted behavior.

**respondent conditioning** see CLASSICAL CONDITIONING.

**respondent validation** see MEMBER CHECK.

**response** n. any glandular, muscular, neural, or other reaction to a stimulus. A response is a clearly defined, measurable unit of behavior discussed in terms of its result (e.g., pressing a lever, indicating yes vs. no on a survey item) or its physical characteristics (e.g., raising an arm).

**response acquiescence** see YEA-SAYING.

**response bias** 1. the tendency for a study participant to give one answer or type of answer more than others, regardless of the stimulus condition. There are several different types of response bias, including the halo effect, nay-saying, and yea-saying. See also RESPONSE SET; RESPONSE STYLE. 2. in signal detection theory more specifically, the overall willingness to say yes (signal present) or no (signal not present), regardless of the actual presence or absence of the signal.

**response-by-analogy principle** the generalization that an organism in an unfamiliar situation will react in a manner similar to its reaction in a similar but familiar situation.

**response chain** following an initial stimulus, a series of responses that each trigger the next stimulus in the sequence: That is, Stimulus 1 (S1) leads to Response 1 (R1), which leads to S2, which leads to R2, which leads to S3, and so on. Also called stimulus-response chain.

**response circuit** the neural pathway from a receptor to an effector.

**response class** a category of behaviors with the same or similar external outcomes.

**response conflict** in choice reaction tasks, the interference of an irrelevant stimulus or stimulus feature such that CHOICE REACTION TIME to produce the correct response is slowed. For example, in the STROOP COLOR-WORD INTER-
response cost

REFERENCE TEST, in which participants are asked to name the color of letters that spell the name of another color. Reaction time is slowed because response activation from the irrelevant information (what the letters spell) conflicts with that from the relevant information (the color of the letters). Also called response competition.

response cost a procedure in operant conditioning in which certain responses result in loss of a valued commodity. The intent of such procedures is to produce punishment. See NEGATIVE PUNISHMENT.

response deprivation in operant conditioning, an approach to identifying reinforcers before their effectiveness has been demonstrated. It holds that if the opportunity to engage in some activity is restricted below its normal level, then opportunity to engage in that activity can serve as reinforcement for some other behavior.

response differentiation see DIFFERENTIATION.

response effect the influence of some attribute of the measurement scale or administration context on a participant’s answers to survey or interview items. For example, the order in which response options are presented may affect how a participant will answer, as might the inclusion of a middle or neutral point on an agreement scale or the means by which a survey is conducted (e.g., in person, via the Internet, by telephone).

response-focused emotion regulation in the process model of emotion regulation, a form of emotion control in which, following an event that has triggered an emotional response, one countermands this response and suppresses the urge to react emotionally to the event (called expressive suppression). For example, one might try to look composed while feeling devastated or to look calm while feeling angry or resentful. Since this type of emotion regulation occurs relatively late in the emotion process, potentially alter affective experience has already been generated, long-term reliance on its strategy of expressive suppression may have deleterious effects on psychological and physiological well-being. Compare ANTecedent-FOCused EMOTION REGULATION. [proposed in 1998 by U.S. clinical psychologist James J. Gross]

response frequency see RESPONSE RATE.

response generalization see INDUCTION.

response hierarchy the arrangement of a group of responses or response sequences in the order in which they are likely to be evoked by a specific stimulus (RESPONDent BEhavior) or to occur in a particular stimulus situation (OPerant BEhavior). Also called hierarchy of response.

response integration the process of combining reflexes and simple movements into more complex responses.

response latency see REACTION TIME.

response learning learning to perform a specific series of movements or responses. Edward C. Tolman contrasted response learning in mazes, in which the participant learns a sequence of left–right responses, with PLACE LEARNING, in which the participant develops a cognitive map of the maze. Also called movement learning.

response magnitude the amplitude, duration, or intensity of a response.

response-operating characteristic curve see RECEIVER-OPERATING CHARACTERISTIC CURVE.

response prevention see EXPOSURE AND RESPONSE PREVENTION.

response probability the likelihood that a response will occur in a particular circumstance. It is often inferred from the RELATIVE FREQUENCY or the RESPONSE RATE.

response proposition the content of an imagined response to an imagined situation stimulus. Response propositions are part of the BIOINFORMATIONAL THEORY of how and why imagery works in performance enhancement. See also STIMULUS PROPOSITION.

response rate 1. the number of responses that occur within a specified time interval. Also called response frequency. 2. the number of individuals who complete an interview, answer a survey, or join a research study compared to the number who were invited to participate, often expressed as a percentage. Compare REFUSAL RATE.

response–reinforcement contingency see REINFORCEMENT CONTINGENCY.

response scale any of various types of instruments provided to a respondent to express an answer to an item. Examples of different response scales include FIXED-ALTERNATIVE QUESTIONS, LIKERT SCALES, VISUAL ANALOGUE SCALES, and SEMANTIC DIFFERENTIALS.

response scenario any of a series of alternative behavior patterns that could occur when an individual is confronted with a specific stimulus. In sport, for example, a response scenario might consist of alternative offensive plays that could be run against a specific defensive formation.

response selection an intermediate stage of human information processing in which a response to an identified stimulus is chosen. Response selection is typically studied by varying relationships between the stimuli and their assigned responses.

response set 1. a tendency to answer questions in a systematic manner that is unrelated to their content. An example is the SOCIAL DESIRABILITY response set. See also RESPONSE BIAS; RESPONSE STYLE. [first extensively discussed and studied by Lee J. Cronbach] 2. in sport, the tendency for an athlete to exhibit the same pattern of play in specific situations (e.g., always faking to the right before driving for the basket).

response–shock interval (R–S interval) in a SIDMAN AVOIDANCE SCHEDULE, the time by which each response postpones the aversive stimulus (which is usually a shock). For example, with a response–shock interval of 20 seconds, each response restarts a 20-second timer that controls the time to the next shock. Therefore, if 20 seconds elapse without a response, a shock occurs.

response strength a hypothetical entity that summarizes the likelihood of occurrence, magnitude, and resistance to disruption of a class of responses, often measured by RESPONSE RATE or REACTION TIME.

response suppression a decrease in the rate or probability of a response due to some experimental operation.
For example, punishment often results in response suppression.

**response threshold** see threshold.

**response time** see reaction time.

**response topography** the physical characteristics of a response, including its duration, force, extent, and location. Also called topology of response.

**response variable** see dependent variable.

**responsible stage** see Schaie’s stages of cognitive development.

**responsiveness n.** a process in which interaction partners attend to and respond supportively to each other’s needs, wishes, and circumstances, thereby promoting each other’s well-being. Responsiveness originates in partners’ perceptions of each other’s needs and desires, as well as their goals in an interaction, and is most directly revealed in their reactions to each other. It is expressed in both words and nonverbal behavior (e.g., a warm smile). Extensive research has shown that responsiveness is a key feature of successful close relationships and is directly related to liking, intimacy, trust, and commitment. In developmental research, parental responsiveness, defined in terms of behavior that is sensitive to the child’s needs, is thought to be central to the child’s development of a sense of security and positive self-concept.

**REST** acronym for restricted environmental stimulation technique.

**restatement n.** in psychotherapy and counseling, the verbatim repetition or paraphrasing by the therapist or counselor of a client’s statement. The purpose is not only to confirm that the client’s remarks have been understood but also to provide a “mirror” in which the client can perceive his or her feelings and ideas more clearly (see mirroring). Compare clarification; interpretation; reframing.

**rest cure** a treatment approach developed in the 19th century for individuals—chiefly women—with nervous disorders attributed to the hectic pace of life in the “railroad age.” The regimen consisted of extended, enforced rest together with change of environment, physical therapy, massage, electrotherapy, and a regulated diet. [developed by U.S. physician Silas Weir Mitchell (1829–1914)]

**rest home** a facility for convalescent care or for older adults who do not need continuous medical or nursing care. See adult home; assisted living.

**resting potential** the electric potential across the plasma membrane of a neuron when it is in the nonexcited, or resting, state. It is usually in the range of −50 to −100 mV for vertebrate neurons, representing an excess of negatively charged ions on the inside of the membrane. See also action potential.

**resting tremor** a trembling that occurs when the affected body part is at rest. It is a characteristic symptom of Parkinson’s disease, in which case it sometimes is referred to as a parkinsonian tremor. The term parkinsonian tremor, however, more properly denotes any tremor associated with Parkinson’s disease, whether a resting tremor or an action tremor.

**restitution n.** the act of restoring or compensating for something lost through prior damaging actions or events. Acts of restitution exist on a behavioral spectrum: They may be a healthy, even necessary, part of acknowledging and dealing with harm committed intentionally or unintentionally, but they may also, more pathologically, take such forms as a compulsive drive to “do for others” or a persistent pattern of martyrdom.

**restitutionary damages** a sum of money a defendant is ordered to pay the plaintiff in a civil lawsuit to negate a benefit the defendant obtained by acting improperly. For example, consider a person who exploits for personal profit land that he or she does not own. This person may be considered to have unjustly benefited at the landowner’s expense and thus may be ordered to pay restitutionary damages.

**restless-legs syndrome** see ekbom’s syndrome.

**restlessness n.** a form of activity that appears purposeless and limited in time or intensity. A human being may constantly move, become distractible, or pace the floor; a nonhuman animal may move about its environment or change positions frequently. —restless adj.

**restoration effect** a phenomenon in which the mind nonconsciously restores information missing from a stimulus. The best known example is the so-called phonemic restoration effect, in which the perceiver fails to notice that certain phonemes have been masked out in speech recordings. The restoration effect is considered evidence of top-down processing.

**restoration therapy** 1. treatment that is directed toward the reestablishment of structure and function in a body part or system following disease or injury. For example, vision restoration therapy following postgeniculate visual system lesions is intended to enlarge the size of the visual field and facilitate recovery of more complex visual function. 2. a form of complementary and alternative medicine that uses techniques and concepts from massage, chiropractic, osteopathy, shiatsu, acupressure, and herbalism to treat specific ailments and enhance overall health by balancing the body’s life-force energy (see chi) and breaking down soft tissues, which then rebuild themselves. [created by Japanese professor Henry S. Okazaki (1890–1951)]

**restorative environment** an environment—often a natural setting—that rejuvenates a person and can help restore depleted attention resources or reduce emotional and psychophysiological stress. Characteristic features of restorative environments include legibility and elements that give rise to contemplation and provide a break from one’s normal routine. There is growing interest in the incorporation of restorative elements into health care settings because of evidence that they speed recovery.

**restorative justice** an approach to criminal justice in which emphasis is placed on rehabilitation of offenders and repairing the harm done to victims rather than on punishment.

**Restorff phenomenon** see distinctiveness effect.

**Restoril n.** a trade name for temazepam.

**rest period** a brief pause in work or any other taxing activity taken on either a regular or a discretionary basis for the purpose of rest, recreation, refreshment, entertainment, or avoidance of overfatigue or boredom.

**restraint n.** 1. the ability to control or prevent actions or behaviors that are harmful or otherwise undesirable. See self-control. 2. the use of control measures to prevent violent patients from injuring themselves or others.

**restricted affect** emotional expression that is reduced...
restricted code

in range and intensity. It is common in depression, inhibited personalities, and schizophrenia. See FLAT AFFECT.

restricted code see ELABORATED CODE.

restricted environmental stimulation technique (REST) reduction in the level of ambient information (i.e., external stimuli) to which an organism or individual is exposed, used both as an experimental technique to study the effects of reduced sensory stimulation and as a clinical therapy for stress management, treatment of stress-related pain, and several other purposes. REST utilizes different approaches, including flotation-REST in which an individual is immersed in a flotation tank where all incoming stimuli are reduced; the effects from brief immersion include a state of relaxation. The term restricted environmental stimulation technique was coined in the late 1970s by Canadian psychologist Peter Suedfeld (1935— ) and U.S. psychologist Roderick A. Borrie as an alternative for SENSORY DEPRIVATION, but the latter remains the more commonly used term in experimental contexts. Also called restricted environmental stimulation therapy.

restricted recovery see SPLIT RECOVERY.

restriction of range the limitation—via sampling, measurement procedures, or other aspects of experimental design—of the full range of total possible scores that may be obtained to only a narrow portion of that total. For example, in a study of the grade point averages of university students, restriction of range occurs if only students from the dean’s list are included. Range restriction on a particular variable may lead to such negative effects as failing to observe or improperly characterizing a relationship between the variables of interest.

results-only work environment (ROWE) a management practice that evaluates employees on what they produce regardless of the number of hours they work. Under this system, employees are given high levels of autonomy and flexibility and are permitted to choose when, where, and how long they work to meet performance objectives. [created by U.S. corporate executives Jody Thompson and Cali Ressler]

resurgence n. in conditioning, the reappearance of previously reinforced and then extinguished responses during a period of extinction for a subsequently learned response. For example, a rat might be presented with two levers. First, presses on Lever A are reinforced; next, presses on Lever A are subjected to extinction and presses on Lever B are reinforced. Pressing on A will cease, and pressing on B will occur. Finally, extinction is arranged for presses on B, so that no reinforcement is available in the situation. As responding on B declines, pressing on A will increase temporarily.

RET abbreviation for rational emotive therapy. See RATIONAL EMOTIVE BEHAVIOR THERAPY.

retardation n. 1. a slowing down or delay of an activity or process, as in PSYCHOMOTOR RETARDATION or MENTAL RETARDATION. 2. in conditioning, a delay in the appearance of a learned or acquired response due to prior experience. For example, presentation of a tone to be used later as a conditioned stimulus slows the development of conditioning.

retarded depression an obsolescent name for a MAJOR DEPRESSIVE EPISODE that includes PSYCHOMOTOR RETARDATION and appetite loss.

retarded ejaculation see MALE ORGASMIC DISORDER.

rete mirabile a network of blood vessels that is derived from a nearby artery or vein, such as the web of small arterial vessels in the kidney glomeruli or of small veins in the liver. A cranial rete mirabile is found in the brains of certain domestic animals but does not occur normally in humans.

retention n. 1. persistence of learned behavior or experience during a period when it is not being performed or practiced, as indicated by the ability to recall, recognize, reproduce, or relearn it. 2. the storage and maintenance of a memory. Retention is the second stage of memory, after ENCODING and before RETRIEVAL. 3. the inability or refusal of an individual to defecate or urinate.—retentive adj.

retention curve a graphic representation of a person’s remembrance of material over a period of time. Also called memory curve. See FORGETTING CURVE.

retention interval the period between a participant’s exposure to information and being tested for retention of that information. During the retention interval, the participant may be exposed to a DISTRACTOR or other information.

retention measure any method used to assess memory for information following its initial presentation or acquisition. Several broad categories of such measures exist, including FREE RECALL, SERIAL RECALL, RECOGNITION METHOD, and SAVINGS METHOD. Retention measures may be immediate (given right after the learning session) or delayed (given some hours, days, weeks, or other time period after the learning session), and they may be for IMPLICIT MEMORY as well as EXPLICIT MEMORY.

retest reliability a measure of the consistency of results on a test or other assessment instrument over time, given as the correlation of scores between the first and second administrations. It provides an estimate of the stability of the construct being evaluated. Also called test–retest reliability.

reticular activating system (RAS) a part of the RETICULAR FORMATION thought to be particularly involved in the regulation of arousal, alertness, and sleep–wake cycles.

reticular formation an extensive network of nerve cell bodies and fibers within the brainstem, extending from the medulla oblongata to the upper part of the midbrain, that is widely connected to the spinal cord, cerebellum, thalamus, and cerebral cortex. It is most prominently involved in arousal, alertness, and sleep–wake cycles but also controls some aspects of action and posture. Also called brainstem reticular formation. See also RETICULAR ACTIVATING SYSTEM.

reticular membrane in the ear, a stiff membrane in the ORGAN OF CORTI that forms a division between ENDOLYMPH and PERICYLMPH, which differ in their ionic composition. Some of the HAIR CELLS of the stereocilia make contact with the reticular membrane. Also called reticular lamina.

reticuloventricular tract see VENTRIMEDIAL PATHWAY.

retifism n. see FOOT FETISHISM.

retina n. the light-sensitive inner surface of the eye. A layer of neurons lines the inner surface of the back of the eye and provides the sensory signals required for vision. The retina contains the photoreceptors—that is, the RETINAL RODS and RETINAL CONES—as well as additional neu-
rons that process the signals of the photoreceptors and convey an output signal to the brain by way of the optic nerve. This inner layer of the retina is sometimes called the neural retina, to distinguish it from the retinal pigment epithelium, which abuts the tips of the photoreceptors. See also amacrine cell; retinal bipolar cell; retinal horizontal cell; retinal ganglion cell.

Retinal 1. adj. of or relating to the retina. 2. n. an aldehyde of vitamin A that is a component of the photopigment rhodopsin. Also called retinene.

Retinal bipolar cell any of various neurons in the inner nuclear layer of the retina that receive input from the photoreceptors (retinal rods and retinal cones) and transmit signals to retinal ganglion cells and amacrine cells. Rods and cones are served by different populations of retinal bipolar cells, called rod bipolars and cone bipolars, respectively.

Retinal cone any of various photoreceptors in the retina that require moderate to bright light for activation, as opposed to retinal rods, which require very little light for activation. In primates, retinal cones are concentrated in the fovea centralis of the retina, where their high spatial density and the pattern of connections within their pathways are critical for high-acuity vision. The cone pathways also provide information about the color of stimuli. This is achieved by the presence of three different populations of cones, each having their maximum sensitivity to light in the short, middle, or long wavelengths of the spectrum, respectively. Other animals have additional populations of cones; for example, some fish have cones that are sensitive to ultraviolet wavelengths. See also photopic vision; photopic pigment.

Retinal densitometry a method of measuring the absorption characteristics of retinal photopigments. A light that is shone into the eye travels through the retina, is reflected back out of the eye by tissues behind the retina, and is measured. The light that emerges is compared to the original light to determine how much was absorbed.

Retinal detachment see detached retina.

Retinal disparity see binocular disparity.

Retinal field an array of photoreceptors stimulated by a visual target. This is different from the retinal receptive field (see visual receptive field).

Retinal ganglion cell the only type of neuron in the retina that sends signals to the brain resulting from visual stimulation. Retinal ganglion cells receive input from retinal bipolar cells and amacrine cells. The axons of retinal ganglion cells form the optic nerve.

Retinal horizontal cell any of various neurons in the retina that make lateral connections between photoreceptors, retinal bipolar cells, and one another. Their cell bodies are located in the inner nuclear layer of the retina.

Retinal image the inverted picture of an external object formed on the retina of the eye. The resolution of the image varies with the diameter of the pupil, the focus becoming sharper as illumination of the object increases and the aperture of the pupil decreases.

Retinal light a sensation of light experienced in the absence of any type of visual stimulation, which is thought to result from neural activity within the visual system. Also called dark light.

Retinal oscillations the alternating sensations or a series of sensations that persist after a brief visual stimulation. Examples include charpenter’s bands and flight of colors.

Retinal pigment epithelium (RPE) see pigment epithelium.

Retinal receptive field see visual receptive field.

Retinal rod any of various photoreceptors in the retina that respond to low light levels, as opposed to retinal cones, which require moderate to bright light for activation. In primates, which have both rods and cones, the rods are excluded from the center of the retina, the fovea centralis. All rods contain the same photopigment, rhodopsin; therefore, the rod pathways do not provide color information. The connections of the rod pathways enhance retinal sensitivity to light, but acuity is relatively poor. See also scotopic vision.

Retinal size the dimensions of the retinal image. Retinal size diminishes in proportion to an object’s distance from the eye. The perception of size is a scaled estimate of object distance and retinal size.

Retinene n. see retinal.

Retinex theory a theory based on the idea that color registration is carried out in the brain. Demonstrations such as the Land effect suggest that wavelengths register on the color-sensitive components of the retina as color-separated “photos.” The visual mechanisms in the brain then compare the average of the long-wave photos with the average of the shorter-wave photos, assigning different colors according to the ratios between them. Also called Land theory of color vision.

Retinitis n. inflammation of the retina.

Retinitis pigmentosa a disorder of the retina marked by progressive atrophy of the photoreceptors (affecting rods more than cones) and disturbances in the retinal pigment epithelium. Retinitis pigmentosa causes night blindness and visual field loss (see tunnel vision). Although most commonly a hereditary condition, it has been associated with the use of phenothiazine antipsychotics, such as chlorpromazine and especially thioridazine.

Retinol n. see vitamin A.

Retinopathy of prematurity (ROP) an eye disorder in which irregular development of blood vessels in the retina, as well as growth of fibrous (scar) tissue due to vessel leakage, may lead to retinal detachment (see detached retina) and, in severe cases, profound vision loss. ROP most often affects preterm infants with a birth weight of less than 1,250 g (2.75 lbs) and a gestational age at birth of under 31 weeks. Other risk factors include apnea, sepsis, prolonged parenteral nutrition (intravenous feeding), blood transfusions, and excessive oxygen administration. Formerly called retrolental fibroplasia.

Retinoscope n. a device used to assess the refractive state of the eye. It projects a beam of light into the eye; by determining the direction in which the light moves when the retinoscope is moved, the clinician can detect myopia, hyperopia, and astigmatism. Lenses of various powers can be placed between the retinoscope and the eye to determine the correction that provides the best refraction for the patient. Compare ophthalmoscope.

Retinotopic map the point-by-point representation of the retinal surface in another structure in the visual sys-
retinotopy

tem, such as the STRIATE CORTEX. VISUOTOPIC MAP is sometimes used synonymously but more properly refers to the representation of the visual field in any neural structure.

retinotopy n. in the visual cortex, the spatial organization of neuronal responses to stimuli and their orderly topographic arrangement, or RETINOTOPIC MAP, in the visual field.

retirement counseling individual or group counseling of employees to help them prepare for retirement. Discussions usually include topics such as norms for this transition, mental and physical health, recreational activities, part-time or consultant work, finances, insurance, government programs, and issues related to change of residence.

retreat from reality see FLIGHT FROM REALITY.

retrieval n. 1. the process of recovering or locating information stored in memory. Retrieval is the final stage of memory, after ENCODING and RETENTION. 2. in information science, the recovery of information from a computer or other storage device.

retrieval block a brief inability to recall a specific piece of information, accompanied by the feeling that there is an impediment or block to its recollection. The well-known TIP-OF-THE-TONGUE PHENOMENON is an example.

retrieval cue a prompt or stimulus used to guide memory recall. See CUE-DEPENDENT FORGETTING; ECPhory; ENCODING SPECIFICITY.

retrieving behavior a component of parental behavior among some nonhuman animals that is characterized by picking up and carrying to the nest young offspring that have wandered away or have been born outside the nest.

retroactive interference INTERFERENCE that occurs when new learning or exposure to new information impairs the ability to remember material or carry out activities previously learned, especially if the two sets of material are similar. For instance, studying French in college may retroactively interfere with what is remembered of Spanish learned in high school. Retroactive interference is one of the processes that account for forgetting. Also called retroactive inhibition. Compare PROACTIVE INTERFERENCE.

retrobulbar adj. behind the eyeball.

retrochiasmatic visual deficit see POSTCHIASMATIC VISUAL DEFICIT.

retrocochlear hearing loss any auditory disorder related to the neural pathways of the eighth cranial nerve (see AUDITORY NERVE) and the higher centers of the central nervous system (i.e., beyond the cochlea).

retrocognition n. in parapsychology, the experiencing of a past event as if it were occurring in the present, or knowledge of a past event that includes details that could not be learned, inferred, or verified through normal means. In a test of retrocognition, the participant might be asked to guess the outcome of an earlier set of trials involving ZENER CARDS or similar stimulus materials. Also called postcognition. See also BACKWARD DISPLACEMENT. Compare PRECognition. [coined by English poet and philologist Frederic William Henry Myers (1843–1901)]

retrograde amnesia see AMNESIA.

retrograde degeneration a pattern of neuron destruction following axonal injury that spreads backward along the axon, toward and then into the nerve cell body. Compare ANTEROGRADE DEGENERATION.

retrograde ejaculation the ejaculation of semen in a reverse direction, into the urinary bladder, from which it is excreted later. This may be a result of surgery of the prostate gland, and it also occurs when the penis is squeezed just before ejaculation—a misguided attempt at preventing impregnation. Retrograde ejaculation is occasionally associated with the use of antidepressants, including the TRICYCLIC ANTIDEPRESSANTS and SSRIs, as well as conventional antipsychotic agents (particularly chlorpromazine). There are also reports of retrograde ejaculation with ATYPICAL ANTIPSYCHOTICS (e.g., risperidone).

retrograde memory the ability to recall events that occurred or information that was acquired prior to a particular point in time, often the onset of illness or physical damage such as brain injury. For example, an individual with deficits of retrograde memory (i.e., retrograde amnesia) might not remember the name of a close childhood friend but would remember the name of a person just introduced to him or her. Compare ANTEROGRADE MEMORY.

retrograde transport see AXONAL TRANSPORT.

retrogression n. the return to a previous inappropriate behavior or to a behavior appropriate to an earlier stage of maturation when more adult approaches fail to solve a conflict. It is approximately equivalent to REGRESSION but without the full psychoanalytic connotations.

retrogressive formation see BACK-FORMATION.

retroental fibroplasia see RETINOPATHY OF PREMATURITY.

retronasal olfaction sensations of smell arising via the nasopharynx from an odorant in the mouth (compare ORTHONASAL OLFACTON). Retronasal olfaction is easily confused with gustatory (taste) sensations.

retropulsion n. walking or running backward with short steps, observed in some patients with parkinsonism.

—retropulsive adj.

retrospection n. the process of reviewing or reflecting on an experience from the past, either directed (as in learning and memory research) or spontaneous (as in evaluating one’s behavior in a given situation).

retrospective audit in health administration, a method of determining medical necessity or appropriate billing practices for services that have already been rendered.

retrospective cohort study research that compares outcomes for groups of individuals who differ on a single identified characteristic that occurred in the past. For example, a researcher studying exposure to secondhand tobacco smoke might use existing survey data to divide a sample into groups or cohorts based on reported exposure in their childhood homes (no smoking, one person smoked, more than one person smoked) before examining current health problems. Because the research relies on reports of past occurrences, inaccuracies may arise due to poor recall. See also RETROSPECTIVE RESEARCH.

retrospective confidence judgment an individual’s assessment of how well he or she did on a test, typically one involving recall of learned information. Such judgments tend to be only weakly correlated with a participant’s actual performance on the test. Compare EASE-OF-LEARNING JUDGMENT.
reverse causality 1. the alteration of a story each time it is told in order to emphasize its favorable points or make it more interesting. It may be deliberate or unintentional. [defined by British psychologist Donovan Hilton Rawcliffe in his 1952 book, The Psychology of the Occult] 2. the addition of false details to memories of past experiences.

reverse medical audit see MEDICAL AUDIT.

reverse memory see PROSPECTIVE MEMORY.

reverse research observational, nonexperimental research that tries to explain the present in terms of past events; that is, research that starts with the present and follows participants backward in time. For example, an investigator may select a group of individuals who exhibit a particular problematic symptom and then study them to determine if they had been exposed to a risk factor of interest. Also called retrospective study. Compare PROSPECTIVE RESEARCH.

reverse sampling a technique in which participants or cases from the general population are selected for inclusion in experiments or other research based on their previous exposure to a risk factor or the completion of some particular process. Participants are then examined in the present to see if a particular condition or state exists, often in comparison to others who were not exposed to the risk or did not complete the particular process. Compare PROSPECTIVE SAMPLING.

reverse validity the extent to which an instrument that purports to measure a particular behavior can be shown to correlate with past occurrences that demonstrate this behavior. For example, a researcher evaluating a new measure of accident proneness might administer it to a sample of respondents and then check their archived medical records to determine if higher test scores on the measure correlate with the number of actual treated injuries in the past. It is one of several types of CRITERION VALIDITY. Also called postdictive validity. See also CONCURRENT VALIDITY; PREDICTIVE VALIDITY.

Rett syndrome a genetic disorder that occurs almost exclusively in female children who develop normally in early infancy but then, between 6 and 18 months of age, undergo rapid regression in motor, cognitive, and social skills; these skills subsequently stabilize at a level that leaves the child with intellectual disability. Symptoms generally include loss of language skills, hand motion abnormalities (e.g., hand wringing, other repetitive, purposeless movements), learning difficulties, gait disturbances, breathing problems, seizures, and pronounced deceleration of head growth. See AUTISM SPECTRUM DISORDER. [first described in 1966 by Andreas Rett (1924–1997), Austrian pediatrician]

reuptake n. the process by which neurotransmitter molecules that have been released at a SYNAPSE are reabsorbed by the presynaptic neuron that released them. Reuptake is performed by TRANSPORTER proteins in the presynaptic membrane.

reuptake inhibitor a substance that interferes with the reabsorption of neurotransmitters by the presynaptic neurons that released them. For example, selective serotonin reuptake inhibitors (see SSRIs) are thought to block the reabsorption of serotonin, thereby increasing the amount of serotonin available to bind to postsynaptic receptors.

revealed-differences technique a method of studying the behavior of members of a dyad or family in a laboratory setting by having them first independently complete a questionnaire, often on somewhat controversial topics. Once the questionnaires are completed and the answers compared, the experimenter presents to the reassembled group of participants one or more of the questionnaire items on which the participants disagreed, asks them to discuss their differing answers, and observes the ways in which the participants reconcile their differences.

reverberating circuit a neural circuit in which nerve impulses that were initially activated in response to stimuli are more or less continuously reactivated so that retrieval of information on demand is possible. A theory of reverberating circuits has been proposed to explain learning and memory processes. Although reverberating circuits have been demonstrated only in the autonomic nervous system, they are also believed to exist in the central nervous system. Also called reverberatory circuit.

reverie n. a pleasant state of daydreaming or musing.

reversal design an experimental design, generally used when only a single group is being studied, that attempts to counteract the confounding effects (see CONFOUND) of sequence and treatment by alternating baseline conditions with treatment conditions. Examples include the A-B-A DESIGN and other similar combinations. See also ALTERNATING TREATMENTS DESIGN.

reversal error a mistake in which a word or letter is read or written backward (e.g., tip for pit, b as d). When reversal errors are marked and developmentally inappropriate, they are indicative of DYSEXIA. See also STREPHOSYMBOLIA.

reversal learning in DISCRIMINATIONS involving two alternatives, the effect of reversing the contingencies associated with the two alternatives. For example, a monkey could be trained under conditions in which lever presses when a red light is on result in food presentation and lever presses when a green light is on are without effect. The contingencies are then reversed, so that presses when the red light is on are ineffective and presses when the green light is on result in food presentation. If the monkey’s behavior adapts to the new contingencies (i.e., it presses the lever only when the green light is on), reversal learning has occurred.

reversal of affect in psychoanalytic theory, a change in the AIM OF THE INSTINCT into its opposite, as when a masochistic impulse to hurt the self is transformed into a sadistic impulse to hurt others, or vice versa. Also called affect inversion: inversion of affect.

reversal shift in DISCRIMINATIONS involving two alternatives, a reversal of contingencies. For example, in initial training, a white stimulus might be designated as correct and black as incorrect. A reversal shift would mean that, in a later phase of the training, black becomes correct and white incorrect. Compare NONREVERSAL SHIFT.

reversal theory a theory of motivation, emotion, and personality that attempts to explain the relationship between arousal and performance. It suggests that the way an individual interprets the arousal, rather than the amount of arousal, affects performance and that the individual can reverse the positive-negative interpretation from moment to moment.

reverse anorexia see MUSCLE DYSMORPHIA.

reverse causality the common error of mistaking...
reverse counterbalancing

cause for effect and vice versa. Asking whether an event or condition considered to be the cause of a phenomenon might in reality be its effect can be a useful check against preconceptions and generate fresh, challenging ideas. For example, the poverty of Mr. X may be seen as an effect of his financial irresponsibility, but what if this presumed irresponsibility is in fact an effect of his poverty? Considering a reversed causality is also a useful strategy for dealing with correlational data. See also FALSE CAUSE: HISTORICAL FALLACY.

reverse counterbalancing a specific procedure for ordering stimulus materials in a research study that involves administering one order (A-B-C) for one half of the participants and the opposite order (C-B-A) for the other half. Reverse counterbalancing is used to minimize any potential influence of presentation on results.

reversed dependency trap a situation in which the personal self-worth of a parent or parents becomes dependent on their child’s performance in school, sport, or some other social context.

reverse discrimination a term sometimes used to denote advantageous or preferential treatment of a historically disfavored or minority group over a generally favored or majority group, as when twice as many women as men are promoted to management positions. The concept of reverse discrimination is controversial, especially in the context of AFFIRMATIVE ACTION and similar policies. Also called positive discrimination. See EQUAL OPPORTUNITY. See also DISCRIMINATION.

reverse tolerance an effect of certain drugs, usually psychoactive substances (particularly CNS stimulants), in which repeated use alters the body’s sensitivity so that repeated administration of the drug will enhance its effects. Also called sensitization. Compare TOLERANCE.

reversibility n. in PIAGETIAN THEORY, a mental operation that reverses a sequence of events or restores a changed state of affairs to the original condition. It is exemplified by the ability to realize that a glass of milk poured into a bottle can be poured back into the glass and remain unchanged. Reversibility can be expressed in terms of negation or COMPENSATION. See also CONSERVATION.

reversible dementia deterioration or impairment of cognitive function in older adults that is caused by noneu- rological conditions such as depression, drug or alcohol abuse, normal-pressure hydrocephalus, metabolic diseases such as hypothyroidism and Addison’s disease, and vitamin B₁₂ deficiency. Treatment of the underlying condition may bring only partial improvement to cognitive functioning, although improvement to full functioning may occur with early diagnosis and intervention. Sometimes it is also called pseudosenility.

reversible figure an AMBIGUOUS FIGURE in which the perspective easily shifts, so that at certain times specific elements appear to make up a distinct figure while at others those same elements appear as an indistinct background (see FIGURE–GROUND). Examples include the NECKER CUBE and Rubin’s FIGURE.

reversible inhibitor of monoamine oxidase-A (RIMA) see MONOAmine OXIDASE INHIBITOR.

reversion n. in genetics, the expression of a hereditary trait that was not manifested in either parent. The offspring may resemble a remote ancestor more closely than a member of the immediate family.
rotransmitter dopamine and neural structures such as the NUCLEUS ACCUMBENS and ORBITOFRONTAL CORTEX.

**rewrite rule** see PHRASE-STRUCTURE GRAMMAR.

Rey Auditory Verbal Learning Test (RAVLT) a memory test requiring the participant to learn verbal material, generally lists of unrelated nouns, over several spoken presentations. In the standard format, the examiner reads aloud a list of 15 words and asks the participant to repeat all the words he or she can remember, in any order. After writing down the words recalled by the participant, the examiner rereads the list four more times, and each time the participant recalls as many words as possible. Next, the examiner presents a second list of 15 different words, allowing the participant only one attempt at recall. Immediately thereafter, the participant is asked to remember as many words as possible from the first list. Finally, after a 20- to 40-minute delay, the examiner again asks the participant to recall all the words he or she can remember, in any order.

Rey Complex Figure Test (RCFT) see COMPLEX FIGURE TEST. [André Rey]

Rey–Osterrieth Complex Figure Test (ROCFT) see COMPLEX FIGURE TEST. [André Rey; Paul-Alexandre Osterrieth]

R factor analysis see R-TECHNIQUE FACTOR ANALYSIS.

**Rh factor** any of at least eight different antigens, each determined genetically, that may be attached to the surface of an individual’s red blood cells (the name derives from the rhesus monkey used in early studies of the factor). A person whose blood cells carry an Rh factor is said to be Rh-positive. One whose blood cells lack an Rh factor is Rh-negative. Some 99% of African Americans, Native Americans, and Asian Americans and 85% of European Americans are Rh-positive. See also RH BLOOD-GROUP INCOMPATIBILITY.

rhinal fissure a fissure or groove on the anterior medial surface of each temporal lobe in the brain. Also called rhinal sulcus.

Rhine cards see ZENER CARDS. [Joseph B. Rhine]

rhinencephalon n. the portion of the brain that includes the limbic system: olfactory nerves, bulbs, and tracts and related structures. The term literally means “smell brain,” because early anatomists assumed it was an olfactory organ itself.

rhino- (rhin-) combining form nose or sense of smell.

rhinolalia n. a speech quality characterized by unusual nasal resonance, sometimes due to abnormalities or obstruction within the nasal cavity.

rhizomelic adj. relating to or affecting the hip, shoulder, or both. For example, an affected individual may have one leg that is shorter than the other or contractures of the hip and shoulder joints.

rhizotomy n. a surgical procedure in which a spinal nerve root is severed within the spinal canal. A rhizotomy may be performed for the relief of pain or to control muscle spasms. The different types of rhizotomy include anterior rhizotomy, in which an anterior (motor) spinal nerve is cut; posterior rhizotomy, in which a posterior (sensory) spinal nerve is cut; and trigeminal rhizotomy, in which the sensory root fibers of the trigeminal nerve are transected.

rhor correlation (symbol: r) 1. see POPULATION CORRELATION COEFFICIENT. 2. see SPEARMAN CORRELATION COEFFICIENT.

rhodopsin n. a visual pigment associated mainly with function of the retinal rod cells. Rhodopsin consists of the vitamin A aldehyde 11-cis retinal bound to the protein ops in. When activated by light (photons), 11-cis retinal is transformed into all-trans retinal, which detaches from the opsin. This initiates a cascade of events that results in VISUAL TRANSDUCTION. Also called visual purple. See SCOTOPSIN; VISUAL CYCLE.

rhombencephalon n. see HINDBRAIN.

**Rh reaction** see RH BLOOD-GROUP INCOMPATIBILITY.

rhyming delirium compulsive speaking or responding in rhymes, occasionally associated with a MANIC EPISODE.

rhythm n. 1. a regular pattern of changes, fluctuations, or occurrences, such as a BIOLOGICAL RHYTHM. 2. the frequency of BRAIN WAVES, identified as alpha waves, beta waves, gamma waves, delta waves, and theta waves. 3. the cadence or long-term temporal structure of similar sounds.

rhythmic or rhythmic adj.
rhythmic stereotypy

rhythmic stereotypy a gross motor movement, such as body rocking or foot kicking, that has no apparent function. It is a form of locomotor play that occurs in the 1st year of life.

rhythmic stimulation use of repetitive auditory or visual input to produce synchronized brain activity, as observed via electroencephalography. Studies in which participants are exposed to flickering lights or repetitive sounds have recorded positive effects on pain management, attention, and mood. Some bright-light rhythms may trigger epileptic seizures in susceptible individuals. See also photic driving.

rhythm method a technique of contraception in which a woman abstains from coitus during the days of her menstrual cycle that she is most likely to become pregnant, from just before until just after ovulation. The rhythm method is not very effective because of the difficulty in predicting the precise time of ovulation. Predictions are made by charting rectal or vaginal temperature changes daily or by testing changes in the sugar content of the cervical mucus.

RI abbreviation for random interval. See random-interval schedule.

RIA abbreviation for radiomunoassay.

ribonucleic acid see RNA.

ribosome n. an organelle, consisting of RNA and proteins, found in large numbers in all cells and responsible for the translation of genetic information (in the form of messenger RNA) and the assembly of proteins. Ribosomes can occur free in the cytoplasm or be attached to the endoplasmic reticulum. —ribosomal adj.

Ribot’s law 1. the principle that the most recently acquired memories are the most vulnerable to disruption from brain damage. As a result, a temporal gradient is observed in retrograde amnesia. 2. a generalization stating that when a multilingual person recovers from aphasia caused by a stroke or cerebral injury, the language recovered first will be the person’s native language. Compare pittres’ rule. [Theodule Ribot]

Ricco’s law the principle that visual threshold is a function of the intensity of a visual image and its area on the fovea. Compare piper’s law. [Annibale Ricco (1844–1919), Italian astrophysicist]

rich interpretation an approach to analyzing the language of young children that goes beyond the literal sense of the word or words used and takes into account the surrounding verbal and nonverbal contexts to infer the full meaning of the utterance and draw conclusions about the child’s linguistic competence. See holophrase.

rich medium see media richness.

rickets n. see calcium-deficiency disorders.

Riddoch’s phenomenon the ability of patients with injury to the visual system beyond the optic chiasm to see moving, but not stationary, light stimuli (statokinet ic disso- ciation). Riddoch’s phenomenon can also be associated with damage to the optic nerve. See also cerebral ambylo- pia. [first described in 1917 by George Riddoch (1888–1947), British neurologist]

ridge regression a variant on ordinary least squares regression designed to remedy problems that arise from multicollinearity. It involves modifying the main diagonal of the correlation matrix before calculating the coefficients, thus eliminating the associations among the independent variables. A researcher can use the information obtained from this analysis to determine whether certain independent variables should be removed from the final model. Also called damped regression.

right-and-wrong-cases method see method of constant stimuli.

right-and-wrong test see M’naughten rule.

right brain the right cerebral hemisphere of the brain. The term is sometimes used to designate functions or cognitive style supposedly mediated by the right (rather than by the left) hemisphere, such as creative thinking. Compare left brain. See also hemispheric lateralization.

right censoring inability of a researcher to document the results of a study when all participants have reached a target event (e.g., achieving a specific milestone) at the conclusion of the study period. This may occur for one of three reasons: A participant may never experience the target event or may experience it after the observation period has ended; a participant may experience a competing event that prevents him or her from experiencing the target event; or a participant may be lost to attrition. Compare left censoring.

right-handedness n. the preferential use of the right hand for major activities, such as eating, writing, and throwing. It is a component of dextrality and applies to about 90% of the population. See also laterality. Compare left-handedness.

right hemisphere the right half of the cerebrum, the part of the brain concerned with sensation and perception, motor control, and higher level cognitive processes. The two cerebral hemispheres differ somewhat in function; for example, in most people, the right hemisphere has greater responsibility for spatial attention. See hemispheric encoding–retrieval asymmetry; hemispheric lateralization. Compare left hemisphere.

right-hemisphere consciousness the hypothesis that the right cerebral hemisphere of the brain is a conscious system in its own right, even though it typically has a minor role in spoken communication (compare left-hemisphere consciousness). The right hemisphere is pos- tulated to function in a holistic, nonlinear manner, specialized for spatial and suprasegmental (prosodic) perception. The hypothesis arose from Roger Sperry’s work with split-brain patients in the 1960s and was widely popularized. Modern research is generally much more cautious in assigning specific independent functions to either side of the intact brain.

righting reflex the automatic tendency of an organism to return to an upright position when it has been thrown off balance or placed in a supine position. Also called righting reaction.

right–left disorientation a disorder characterized by general difficulty in distinguishing between the right and left sides or right and left directions. It has been linked to aphasia and other disorders of comprehension but also occurs in their absence. Although thought to be related to disorders of the left parietal lobe of the cerebral cortex, right–left disorientation also occurs to a mild degree in oth- erwise healthy adults.
right–left orientation test any test that measures the ability to discriminate between right and left directions.

right-or-wrong test see M’NAGHTEN RULE.

rights of patients see PATIENTS’ RIGHTS.

rights of people with mental disabilities rights enshrined in the United Nations Standard Rules on the Equalization of Opportunities for Persons With Disabilities (1993), including people with intellectual and developmental disabilities. These include (a) the right to receive proper medical care, physical therapy, education, training, rehabilitation, assistive technology, and guidance; (b) the right to economic security and to work; (c) the right to live with their families or with foster parents or, if this is not feasible, to live in a residential setting under circumstances as close as possible to family life; and (d) the right to protection from abuse and exploitation. See also UNITED NATIONS DECLARATION ON THE RIGHTS OF MENTALLY RETARDED PERSONS.

right to die the right to suicide or physician-assisted suicide that some consider should be available for terminally ill patients (see ASSISTED DEATH). Right-to-die laws have been passed in a few states and countries. This is distinguished from the RIGHT TO REFUSE TREATMENT in cases in which the patient is on life support.

right to refuse treatment 1. the right of patients to refuse treatment that may be potentially hazardous or intrusive, particularly when such treatment may not be in the best interests of the patient. In the United States, various state laws and court rulings support the right of patients to receive or reject certain treatments, but there is a lack of uniformity in such regulations. See also FORCED TREATMENT. 2. the right of terminally ill patients (e.g., those on life-support systems) to refuse treatment intended to prolong their lives. See also RIGHT TO DIE.

right to treatment 1. a statutory right, established at varying governmental levels, stipulating that people with disabilities or disorders, usually persistent or chronic in nature, have the right to receive care and treatment suited to their needs. Such statutory rights may apply nationally or to certain state or provincial areas, and they may be limited to certain conditions and disabilities. 2. the principle that a facility that has assumed the responsibility of treating a patient is legally obligated to provide treatment that is adequate and appropriate.

right-wing authoritarianism (RWA) a theoretical refinement of the theory of the AUTHORITARIAN PERSONALITY that identifies political conservatism, authoritarian submission, authoritarian aggression, and conventionalism as key predictors of prejudice, racism, and right-wing extremism. [first proposed in 1981 by Canadian social psychologist Robert A. Altemeyer]

rigid family a family structure in which rules are never questioned and have no exceptions. Such a structure can cause emotional and behavioral problems for the children of the family.

rigidity n. 1. stiffness or inflexibility, particularly MUSCULAR RIGIDITY. 2. a personality trait characterized by strong resistance to changing one’s behavior, opinions, or attitudes or by the inability to do this. 3. the tendency, after brain injury, to be inflexible and complete a task in only one manner, despite more effective available alternatives. Compare PLASTICITY. See also DECEREBRATE RIGIDITY. —rigid adj.

rigid rotation see ORTHOGONAL ROTATION.

RIMA abbreviation for reversible inhibitor of monoamine oxidase-A. See MONOAmine OXIDASE INHIBITOR.

ring chromosome 18 a congenital chromosomal disorder characterized by MICROCEPHALY, ear and eye abnormalities, and mild to severe cognitive impairment. The condition is not hereditary but due to breakage of the arms of chromosome 18, which fuse to form one or more rings of varying sizes.

Ringelmann effect the tendency for groups to become less productive in terms of output per member as they increase in size. The effect is named for Max Ringelmann (1861–1931), a French agricultural engineer who studied the productivity of horses, oxen, men, and machines in various agricultural applications. He found that groups often outperform individuals but that the addition of each new member to a group yields less of a gain in productivity. Subsequent studies suggest that this loss of productivity is caused by the reduction of motivation experienced in groups (SOCIAL LOAFING) and the inefficiency of larger groups.

ring-finger dermatitis a skin disease involving an area of a finger where a ring usually is worn. The condition may be marked by itching, dryness, redness, or erosion of small blisters. If the condition is not caused by irritation from or an allergic reaction to metals or agents in the ring or in detergents trapped beneath the ring (the most common cause), ring-finger dermatitis may be a PSYCHRONOMIC DISORDER.

Rinne test a tuning-fork test used to aid in differentiating between conductive and sensorineural hearing loss. The sensation produced by the tuning fork when presented via air conduction is compared to that produced by placing the tuning fork against the MASTOID process of the temporal bone. [Friedrich Heinrich A. Rinne (1819–1868), German otologist]

riot n. violent disorder involving a large, hostile, and typically disorganized mob. A number of different conditions can lead a crowd to riot, including panic over a limited resource, contagion of affect and violence in provocative situations, confrontation with another group, and oppressive social conditions. Although the concept of GROUP MIND traditionally has been associated with riots, EMERGENT-NORM THEORY suggests that rioting individuals are conforming to emergent-situation norms, and SOCIAL IDENTITY THEORY suggests that riots are instances of intergroup conflict. See also COLLECTIVE BEHAVIOR.

rise n. the distance along the y-axis between two points. Compare RUN.

risk n. 1. the probability or likelihood that a negative event will occur, such as the risk that a disease or disorder will develop. 2. the probability of experiencing loss or harm that is associated with an action or behavior. See also AT RISK; MORBIDITY RISK; RISK FACTOR. —risky adj.

risk-as-feelings theory a model stating that decision making in situations involving a degree of risk is often driven by emotional reactions, such as worry, fear, or anxiety, rather than by a rational assessment of the desirability and the likelihood of the various possible outcomes (see SUBJECTIVE EXPECTED UTILITY).
risk assessment

risk assessment the process of determining the danger an individual would be likely to pose if released from confinement due to mental illness or criminal acts. See ACTUARIAL RISK ASSESSMENT; CLINICAL RISK ASSESSMENT.

risk-assessment matrix a table used to prioritize hazards on the basis of risk, which is defined by the intersection between the probability of the hazards and the severity of their consequences. Also called hazard-assessment matrix.

risk aversion the tendency, when choosing between alternatives, to avoid options that entail a risk of loss, even if that risk is relatively small. Compare RISK PRONENESS.

risk factor a clearly defined behavior or constitutional (e.g., genetic), psychological, environmental, or other characteristic that is associated with an increased possibility or likelihood that a disease or disorder will subsequently develop in an individual. Compare PROTECTIVE FACTOR.

risk level the probability of making a TYPE I ERROR that one is willing to accept in null hypothesis SIGNIFICANCE TESTING.

risk metrics numbers, formulas, graphs, or other means of presenting or describing the probability or likelihood of developing a disease or disorder.

risk perception an individual’s subjective assessment of the level of risk associated with a particular hazard (e.g., health threat). Risk perceptions vary according to factors such as past experiences, age, gender, and culture. For example, women tend to overestimate their risk of developing breast cancer. These exaggerated perceptions of risk may motivate people to seek genetic services, genetic testing, or prophylactic surgery. Also called perceived risk.

risk proneness the propensity to be attracted to, or the willingness to tolerate, options that entail a potentially high risk of loss. Compare RISK AVERSION.

risk ratio the comparison of one group’s probability of experiencing an event (e.g., being diagnosed with lung cancer) to a second group’s probability of experiencing that event. It is often used to describe health status following exposure to some stimulus or risk factor (e.g., lead in water) or clinical intervention. A value greater than 1 indicates the group under study has a higher probability than the control group of experiencing the event; a value less than 1 indicates the group under study has a lower probability of experiencing the event; and a value of exactly 1 indicates the two groups are equally likely to experience the event. Also called relative risk.

risk-recreation model see ADVENTURE-RECREATION MODEL.

risk–rescue rating a formula comparing the inherent risk of a method of attempted suicide with the likelihood of discovery and rescue.

risk sensitivity the ability of an organism to choose an environment where the availability of resources over time is stable. Individuals that do not show risk sensitivity choose environments with high variances in the stability of resources. If resources are poor, these individuals and their offspring thrive; if resources are poor, they fare less well than risk-sensitive individuals.

risk taking 1. a pattern of unnecessarily engaging in activities or behaviors that are dangerous or highly subject to chance. This pattern of behavior is often associated with substance abuse, gambling, high-risk sexual behaviors, and extreme sports (e.g., mountain climbing). 2. accepting a challenging task that simultaneously involves potential for failure as well as for accomplishment or personal benefit. It is often associated with creativity and taking calculated risks in the workplace or in educational settings.

risk tolerance 1. the level of risk to which an individual is willing to be exposed while performing an action or pursuing a goal. Tolerance of risk is usually based on an assumption (justified or not) that the risk is slight, the consequences are minor, and both are outweighed by immediate benefits. 2. the degree of economic loss that a person, company, or other organization is willing to risk in pursuit of a possible gain.

risky prediction a prediction made on the basis of a scientific hypothesis that has a real possibility of proving that hypothesis wrong. According to Austrian-born British philosopher Karl Popper (1902–1994), certain ostensibly scientific theories and hypotheses, including many in psychology, can be stretched in order to explain a range of possible experimental results. To the extent that this can occur, the theory or hypothesis is not genuinely falsifiable and thus not genuinely scientific. Popper held that scientific theories must be tested by means of risky predictions. See FALSEFIABILITY; FALSEIFICATIONISM.

risky shift a tendency for the decisions of individuals to be more risky following group discussion. Research has revealed that group discussion does not make decisions more risky per se but simply serves to polarization group members in the direction of their initial views. Compare CAUTIOUS SHIFT.

risperidone n. an ATYPICAL ANTIPSYCHOTIC of the benzisoxazole class. It was the second atypical antipsychotic introduced into the U.S. market (CLOzapine was the first). It has a less frequent incidence of extrapyramidal symptoms than do conventional antipsychotics when used at a lower dose range, and it acts as a potent inhibitor of both D2 dopamine and 5-HT2 serotonin receptors. It is also approved for bipolar disorder–related acute manic or mixed episodes and for irritability in autism. U.S. trade name: Risperdal.

Ritalin n. a trade name for METHYLPHENIDATE.

rite n. a culture-bound ceremony or ritual, often spiritual in nature.

rite of passage a ritual that marks a specific life transition, such as birth, menarche, marriage, or death, or a milestone such as a bar mitzvah, graduation, or admission to a new profession or association. In many prescientific societies, such rites are considered essential if the individual is to make a successful transition from one status to another. The persistence of rites of passage in modern secular societies where there is no such belief suggests that they can fulfill an important psychosocial function for both the individual and the social group. See BIRTH RITE; DEATH RITE; PUBERTY RITE.

ritual n. 1. a form of compulsion involving a rigid or stereotyped act that is carried out repeatedly and is based on idiosyncratic rules that do not have a rational basis (e.g., having to perform a task in a certain way). Rituals may be performed to reduce distress and anxiety caused by an OBSESSION. 2. a ceremonial act or rite, usually involving a fixed order of actions or gestures and the saying of certain prescribed words. Anthropologists distinguish between several major categories of ritual, although these can often overlap in practice: magic rituals, which involve an attempt to manipulate natural forces through symbolic, often imi-
tative, actions (e.g., pouring water on the ground to make ruin); calendrical rituals, which mark the changing of the seasons and the passing of time; liturgical rituals, which involve the reenactment of a sacred story or myth, as in the Christian eucharist and many other religious rituals; RITES OF PASSAGE and formal procedures that have the effect of emphasizing both the importance and the imper- sonal quality of certain social behaviors, as in a court of law. More generally, any habit or custom that is performed routinely and with little or no thought. —ritual- ism n. —ritualistic adj.

ritual abuse organized, repetitive, and highly sadistic abuse of a physical, sexual, or emotional nature, perpetrated principally on children. The abuse is reported as using rituals and symbols from religion (e.g., upside-down crosses), the occult, or secret societies. It may also include the creation of pornography or the selling of sexual access to children. Victims may be forced to engage in heinous acts, such as the killing of animals, as a means of coerking their participation and silence. The prevalence and even existence of ritual abuse have been the subject of much controversy. See also SATANISM.

ritualization n. the process by which a normal behavioral action becomes a communication signal representing the behavior or its physiological consequence. For example, among nonhuman animals, threat displays may be the ritualization of the conflict between attack and escape, incorporating aspects of both, or a ritualization solely of impending attack, as when dogs pull back their lips in a snarl in response to a threat. This lip-pulling began as a way for dogs to avoid biting themselves in an attack, but as other animals recognized this behavior as a precursor to biting, it became ritualized into a warning communication. Animals learn that ritualized behavior can be an effective form of avoiding a fight.

rivalry n. competition between individuals or groups for a specific goal or for status and prestige within a particular field. See SIBLING RIVALRY.

rivastigmine n. a CARBAMATE that is a reversible acetylcholinesterase inhibitor, used for the treatment of mild to moderate dementia associated with Alzheimer’s disease (see COGNITIVE ENHANCER). Because it can cause nausea and loss of appetite, low starting doses with a slow upward titration are recommended. U.S. trade name: EXelon.

RJP abbreviation for realistic job preview. See JOB PREVIEW.

RL abbreviation for REE LIMEN.

RMD abbreviation for repetitive motion disorder. See REPE- TITIVE STRAIN INJURY.

R methodology a collection of methods used to evaluate individuals’ scores on a set of objective measures, such as intelligence tests. Examples include FACTOR ANALYSIS and PRINCIPAL COMPONENTS ANALYSIS. Compare Q METHODOLOGY.

RMI abbreviation for repetitive motion injury. See REPET- TITIVE STRAIN INJURY.

RMS abbreviation for ROOT MEAN SQUARE.

RMT abbreviation for RECOGNITION MEMORY TEST.

RN abbreviation for REGISTERED NURSE.

RNA ribonucleic acid; a nucleic acid that directs the synthesis of protein molecules in living cells. There are three main types of RNA. MESSENGER RNA carries the GENETIC CODE from the cell nucleus to the cytoplasm. RIBOSOMAL RNA is found in ribosomes, small particles where proteins are assembled from amino acids. TRANSFER RNA carries specific amino acids for protein synthesis. Each of the 20 amino acids has a corresponding transfer RNA molecule to place the amino acid in the proper sequence in protein assembly. RNA is similar to DNA in structure except that it consists of a single strand of nucleotides (compared with the double strands of DNA), the base uracil (U) occurs in- stead of thymine (T), and the sugar unit is ribose, rather than deoxyribose.

RNG abbreviation for RANDOM NUMBER GENERATOR.

road rage aggressive or confrontational behavior while driving, typically triggered by an actual or imagined transgression by another driver. Often associated with traffic congestion, road rage varies in severity and can involve hostile verbal expression, hazardous driving, and interper- sonal violence. It is not a recognized mental disorder, how- ever.

Robaxin n. a trade name for METHOCARBAMOL.

Robbers Cave experiment a field study of the causes and consequences of conflict between groups. In the experiment, two groups of 11-year-old boys from similar backgrounds, none of whom previously knew one another, were sent camping in the same area of wilderness. During the first stage, the two groups were allowed to develop their own rules, structures, and collective identities in complete independence of one another. During the second stage, they were made aware of each other’s presence and encouraged to develop a sense of rivalry through a series of competitive exercises; the result was deepening hostility leading to open violence. In the third stage, staff deliberately created various urgent problems, such as a fault in the water supply, that could be solved only by the two groups working together; the result was a complete reconcili- ation. See also SUPERORDINATE GOAL [performed in 1954 by Muzzeler SHERIF and colleagues; the study derives its name from the state park in Oklahoma that served as the site for the research]

Roberts syndrome an autosomal recessive disorder in which a child is born with abnormally short arms and legs as well as a cleft lip and palate. Other features include Mi- crocephaly and genital hypertrophy (enlargement). Few affected individuals survive early infancy, and those who do are likely to have severe intellectual disabilities. Also called Appelt–Gerken–Lenz syndrome. [described in 1919 by John Bingham Roberts (1852–1924), U.S. physi- cian, and in 1966 by Hans Appelt (1919–1988), Hartmut Gerken (1934– ), and Widukind Lenz (1919–1995), German physicians]

Robitussin n. see DEXTROMETHORPHAN.

robot n. 1. a machine that performs functions similar to those of a human (e.g., a spot-welding robot). 2. a human being whose rigid, insensitive, or detached behavior resembles that of a machine. —robotic adj.

robotics n. the science of designing and constructing machines (AUTOMATONS) capable of performing functions similar to those of humans. For example, personal assistance robots are under development for individuals with disabilities. See CYBERNETICS.

robust estimator an ESTIMATOR for an unknown character- istic in a population that is less likely than others to be influenced by VIOLATIONS OF ASSUMPTIONS about the sam-
ple data on which it is based. For example, rather than using a mean to describe CENTRAL TENDENCY in a distribution with OUTLIERS, a researcher might choose a MEDIAN, a TRIMMED MEAN, or a WINZORIZED MEAN. Each option reflects a different way of handling the outliers, such as downweighting them, replacing them with a new value, or ignoring them. See also RESISTANT ESTIMATOR.

robustness n. the ability of a statistical procedure to produce valid estimated values for a population characteristic (PARAMETER) despite violations of the ASSUMPTIONS on which the procedure is based.

ROC curve abbreviation for RECEIVER-OPERATING CHARACTERISTIC CURVE.

ROCFIT abbreviation for Rey-Osterrieth COMPLEX FIGURE TEST.

rocking n. a stereotyped motor behavior in which the body rocks to and fro, often observed in children or adults with severe or profound intellectual disability, autism, or stereotypic movement disorder. Also called BODY ROCKING.

Rock v. Arkansas a case resulting in a 1987 ruling by the U.S. Supreme Court that it is a violation of DUE PROCESS rights to prohibit a defendant from presenting evidence discovered after undergoing hypnosis.

rod n. see RETINAL ROD.

Rod-and-Frame Test (RFT) a test used to study the role of visual and gravitational cues in judging the visual vertical. It is the most widely used measure of visual FIELD DEPENDENCE and FIELD INDEPENDENCE. The test consists of a movable rod inside a frame; the participant must adjust the rod to a true vertical position as the position of the frame is changed. Degree of error (i.e., the number of degrees away from 90°) is the measure used to score the test. The higher the score, the more field dependent the participant is; the lower the score, the more field independent he or she is. [developed in 1948 by U.S. psychologists Herman A. Witkin (1916–1979) and Solomon Asch]

rod–cone break the shift in visual sensitivity that occurs during DARK ADAPTATION when the sensitivity of the RETINAL RODS first exceeds that of the RETINAL CONES. When visual sensitivity is measured in the dark following a very bright flash of light, the cones reach maximum sensitivity after about 7 minutes. However, overall visual sensitivity continues to improve for about 20 more minutes as RHODOPSIN regenerates and the rods reach their maximum sensitivity.

rods of Corti the two rows of stiff pilliarlike structures that form an arch (the arch of Corti) in the ORGAN OF CORTI.

rod vision vision that depends solely on the RETINAL RODS, which are active in dim light. See also SCOTOTIC VI-

Roelofs effect a distortion of space perception in which the subjective location of “straight ahead” is shifted by the presence of a large rectangle or frame whose center is located to one side of the true straight-ahead position. The subjective location of straight ahead moves in the same direction as the frame or rectangle. [C. Otto Roelofs, 20th-century Dutch physician]

Roentgenogram n. a photographic record produced by X-RAY exposure. See RADIOGRAPHY. [Wilhelm Konrad Roentgen (1845–1923), German physicist]

roentgen ray see X-RAY. [Wilhelm Roentgen]
from leadership positions for no valid reason. See STATUS INCONGRUENCE.

role differentiation in groups and other social systems, the gradual increase in the number of roles and the decrease in their scope that tends to occur over time as each role becomes more specialized. For example, in many cases the LEADERSHIP role divides, over time, into two: the task leader role and the relationship leader role. See ROLE LEADERSHIP.

role diffusion a state of confusion about one’s social role that typically occurs during adolescence. See IDENTITY VERSUS IDENTITY CONFUSION. [described by Erik Erikson]

role enactment see ASSUMED ROLE.

role-enactment theory an explanation of hypnotism as a social phenomenon, claiming that the hypnotized individual nonconsciously takes on the socially constructed role of a hypnotic subject and behaves accordingly. Belonging to the category of NONSTATE THEORY OF HYPNOSIS, it was conceived in the 1950s by Theodore R. Sarbin, who developed the idea from his more general theory of role enactment in social behavior. See ASSUMED ROLE.

role expectations the traits, attitudes, and behaviors considered appropriate for an occupant of a particular position within a group or social setting. For example, being an elementary school teacher may be associated with expectations of warmth and patience, the desire to motivate students and help them achieve, and the ability to develop useful curricula and provide appropriate instruction. These expectations may be communicated to the occupant by other people in the occupant’s role set or may be held by the occupant himself or herself. See also PVMALON EFFECT; UPWARD PVMALON EFFECT.

role model a person or group serving as an exemplar for the goals, attitudes, or behavior of an individual, who identifies with and seeks to imitate the role model.

role overload a situation resulting from the assumption of a role or of multiple roles in which one is asked to do more than one is capable of doing in a specific period of time (quantitative overload) or in which one is taxed beyond one’s knowledge, skills, and abilities (qualitative overload).

role play a technique used in HUMAN RELATIONS TRAINING and psychotherapy in which participants act out various social roles in dramatic situations. Originally developed in PSYCHODRAMA, role play is now widely used in industrial, educational, and clinical settings for purposes such as teaching employees to handle sales problems, helping change attitudes and relationships among couples or family members, and rehearsing different ways of coping with stresses and conflicts.

role-playing research a study design in which participants are asked to assume the behavior of a specific character in a defined situation. It is a type of SIMULATION, often used in therapeutic and organizational contexts, that enables researchers to assess how individuals think, feel, and act under certain circumstances.

role reversal a technique used for therapeutic and educational purposes in which an individual exchanges roles with another individual to experience alternative cognitive styles (e.g., in problem solving), feelings, and behavioral approaches. In PSYCHODRAMA, the PROTAGONIST exchanges roles with an AUXILIARY EGO in acting out a significant interpersonal situation. Role reversal is also used in manage-
Ionate love; in others, it is seen as involving elements of both. See also limerence; love scale; triangular theory of love.

Romazicon n. a trade name for flumazenil.

Romberg’s sign a diagnostic sign of certain neurological disorders, including locomotor ataxia, that consists of a swaying motion and unsteadiness when the individual stands with eyes closed, feet together, and arms out-stretched. [Moritz Romberg (1795–1873), German physician]

Romeo and Juliet effect the tendency of relationship partners, usually adolescents, to feel greater affection for their partners when they perceive others (e.g., parents) to be interfering with the relationship. The Romeo and Juliet effect is an example of reactance, or the tendency to find something more desirable when outside forces threaten to restrict one’s access to it. See reactance theory.

Rooming-in n. a practice in some hospitals in which a mother and her newborn child share the same room so that the mother can feed, care for, and establish a close relationship with the baby as soon after birth as is feasible.

Root cause analysis a method that identifies the underlying cause or causes of a recurring problem (e.g., in the workplace) by using progressively more specific strategies to uncover the source.

Rooted graph see graph.

Rootedness n. in the psychoanalytic theory of Erich Fromm, the need to establish bonds or ties with others that provide emotional security and serve to reduce the isolation and insignificance that Fromm believed were at the heart of human existence. It is manifested positively in brotherliness and negatively in incestuous ties. Compare identity need.

Rooted tree see tree.

Rooting reflex an automatic, unlearned response of a newborn to a gentle stimulus (e.g., the touch of a finger) applied to the corner of the mouth or to the cheek, in which the infant turns his or her head and makes sucking motions.

Root mean square (RMS) the square root of the sum of the squares of a set of values divided by the number of values. For a set of values \(x_1, x_2, \ldots, x_n\), the root mean square value is

\[
\sqrt{\frac{1}{n}(x_1^2 + x_2^2 + \ldots + x_n^2)}
\]

and describes the average size of the values in the set. In the physical sciences, the term is used as a synonym for standard deviation under certain circumstances.

Rootogram n. a histogram modified to show the response or outcome variable on the horizontal x-axis and the square root of the response frequencies (or counts) on the vertical y-axis. Alternatively, the square root of relative frequencies, cumulative frequencies, or cumulative relative frequencies may be plotted along the y-axis. See also hanging rootogram.

Rootwork n. a cultural or folk health belief system, common in the southern United States and the Caribbean, that attributes illness to witchcraft, hexing, voodoo, or spells (i.e., “roots”). The individual displays intense fear, symptoms of anxiety, and related somatic complaints and typically remains in this state until a traditional healer, called a root doctor, ostensibly removes the root. Also called brujeria: mal puesto.

ROP abbreviation for retinopathy of prematurity.

R-O relationship see R-S relationship.

Rorschach Inkblot Test a projective technique in which the participant is presented with 10 unstructured inkblots (half in black and gray and half including color) and is asked “What might this be?” The examiner classifies the responses according to such structural and thematic (content) factors as color (C), movement (M), detail (D), whole (W), popular or common (P), animal (A), form (F), and human (H). Various scoring systems, either qualitative or quantitative, are used. The object is to interpret the participant’s personality structure in terms of factors such as emotionality, cognitive style, creativity, impulse control, and various defensive patterns. Perhaps the best known—and certainly one of the most controversial—assessment instruments in all of psychology, the Rorschach is widely used and has been extensively researched, with results ranging from those that claim strong support for its clinical utility (e.g., for selecting treatment modalities or monitoring patient change or improvement over time) to those that demonstrate little evidence of validity. [Developed in the early 1920s by Hermann Rorschach]

Rosenthal effect the situation in which an investigator’s expectations about the outcome of a given study unwittingly affect the actual study outcome. A researcher may use blinds to prevent the Rosenthal effect from occurring and biasing study results. This term is often used synonymously with experimenter expectancy effect and self-fulfilling prophecy. See also demand characteristics. [Robert Rosenthal (1933– ), U.S. psychologist]

Rostan types a system of body types based on aspects of the inner structure of the body. See cerebral type; digestive type; muscular type; reproductive type; respiratory type. [described by Léon Louis Rostan (1790–1866), French physician]

Rostral adj. 1. pertaining to a rostrum. 2. situated or occurring toward the nose or beak of an organism, or toward the front or anterior portion of an organ. Compare caudal. —rostrally adv.

Rostrum n. (pl. rostra) a beak-shaped or prowlike structure, such as the rostrum of the corpus callosum at its anterior bend where it curves backward under the frontal lobe.

Rotarod n. a horizontally oriented rotating cylinder, about 3 cm in diameter, that is used to measure motor coordination and balance in rodents. A rat or mouse is placed on top of the rotarod, and the time taken for the rodent to fall off is measured.

Rotary pursuit test any test that requires the participant to follow a revolving or irregularly moving target with a pointer or other indicator.

Rotation n. in statistics, movement around the origin in a multidimensional space. Rotation is commonly used in factor analysis to enhance interpretability of a factor solution. For example, it may be used to maximize loadings on certain factors while minimizing these loadings on other factors, thereby showing simple structure. See oblique rotation; orthogonal rotation; quartimax rotation; varimax rotation. —rotational adj.
rotational aftereffect (RAE) a motion aftereffect produced by fixation of a rotating stimulus. When the motion of the stimulus is stopped, the stimulus appears to move in the opposite direction. See also PLATEAU’S SPIRAL.

rotational error a drawing or construction mistake that involves rotating the figure from the position of the copied stimulus.

rotational nystagmus see VESTIBULAR NYSTAGMUS.

rotation sampling a technique used when conducting surveys in which some proportion of respondents or cases is replaced with new units after specified time periods. Rotation sampling helps to reduce the burden on respondents and allows for better prediction from past samples.

rotation system a technique of GROUP THERAPY in which the therapist works with each individual in sequence in the presence of other group members.

rote learning memorization by repetition without any elaboration of other deep processing of the material. For example, a person may remember a list of errands to perform by mentally repeating it while driving from place to place in the car, or a student may prepare to recite a poem before the class by rehearsing it many times in front of a mirror. Rote learning uses strict memorization without comprehension, which tends to result in poorer retention than occurs with strategies that rely on higher level cognitive mechanisms (e.g., conceptualization, generalization, interpretation); it is factual recall without understanding the reasoning or relationships involved in the material. Also called rote memory.

rote recall precise recollection of information that has been stored in its entirety (e.g., an address, chemical formula, color pattern, piece of music). See also VERBATIM RECALL.

rote rehearsal see MAINTENANCE REHEARSAL.

Rotter Internal–External Locus of Control Scale a scale that is used to provide information regarding an individual’s feelings about causality of events. Individuals who measure high on internal locus of control assume causality is primarily under their control; those who measure high on external locus of control assume causality is primarily outside of their control. Those with high internal measures tend to take more responsibility for and control of their learning, resulting in better performance (e.g., on academic tasks). In contrast, those with high external measures have been shown to take less responsibility, resulting in poorer performance on tasks. [JULIAN ROTTER]

rough-and-tumble play (R & T play) play that involves vigorous contact with others, such as wrestling and mock fighting. R & T play is a form of LOCOMOTOR PLAY and is necessarily social as it involves another person, usually a peer. Observed in animals and children, R & T play tends to be more frequent in males than females.

roughness n. 1. the tactile quality of an object that is coarse, as in sandpaper. See also TOUCH BLiENDS. 2. a subjective quality used as part of a continuum to describe the percepts produced by amplitude-modulated sounds (see MODULATION). Slow, regular amplitude fluctuations that can be perceived as loudness changes are described as BEATS. Higher fluctuation rates, above approximately 15 Hz, are described as flutter, whereas those above approximately 40 Hz are described as being rough.

roughness discrimination test a test of somesthetic sensitivity in which participants are asked to determine by touch which of a choice of surfaces (e.g., grades of sandpaper) has a greater roughness. The ability is sometimes impaired following a lesion in a brain area related to the sense of touch.

round dance see BEE COMMUNICATION.

round window a membrane-covered opening in the cochlea where it borders the middle ear (see SCALA TYPANi). Pressure changes in the cochlea produced by vibration of the oval window are ultimately transmitted to the round window. This permits displacement of the BASILAR MEMBRANES and stimulation of the sensory receptors.

route learning learning to navigate within a spatial environment by acquiring information about specific directions, distances, and landmarks. Route knowledge is represented as a series of directions to get from one place to another (compare SURVEY KNOWLEDGE). Also called way finding.

routes of administration see ADMINISTRATION.

routinized behavior a behavior that has been so well learned and frequently repeated that it no longer takes conscious control to execute (e.g., walking). ELITE ATHLETES, for example, routinize the execution of basic skills so that they have greater capacity to attend to other aspects of their sport. Also called automatic performance.

routinized thoughts see AUTOMATIC THOUGHTS.

ROWE acronym for RESULTS-ONLY WORK ENVIRONMENT.

Royer’s syndrome see PRADER–WILLI SYNDROME.

RP abbreviation for READINESS POTENTIAL.

r ph symbol for POINT BISERIAL CORRELATION COEFFICIENT.

r phi, symbol for POINT BISERIAL CORRELATION COEFFICIENT.

RPE abbreviation for retinal PIGMENT EPITHELIUM.

RPE scale see BORG SCALE.

RR abbreviation for random ratio. See RANDOM-RATIO SCHEDULE.

-rrhagia suffix excessive flow or discharge (e.g., MENORRHAGIA).

-rrhea suffix flow or discharge (e.g., LOGORRHEA).

r-RST abbreviation for revised REINFORCEMENT SENSITIVITY THEORY.

RRT abbreviation for RANDOMIZED-RESPONSE TECHNIQUE.

r symbol for SPEARMAN CORRELATION COEFFICIENT.

RSA abbreviation for RESPIRATORY SINUS ARRHYTHMIA.

RSI syndrome see SMITH–LEMI–OPITZ SYNDROME.

RSI abbreviation for REPETITIVE STRAIN INJURY.

R-S interval abbreviation for RESPONSE–SHOCK INTERVAL.

R → S relationship the relationship between response and stimulus, as in trials where a given response by an organism produces a particular change in the environment, such as reinforcement or escape from aversive stimuli. This is also called an R → O relationship, where O stands for outcome.

RSS abbreviation for REINFORCEMENT SURVEY SCHEDULE.

RST abbreviation for REINFORCEMENT SENSITIVITY THEORY.
r-strategy n. a reproductive strategy that involves a high rate of reproduction (r value, or r) with low parental investment. It implies that frequently producing a relatively large number of offspring is more likely to lead to reproductive success than producing few offspring that require high levels of parental investment (see k-strategy).

R-technique factor analysis a type of factor analysis performed on a correlation matrix; it examines associations between variable measurements in order to understand how the variables themselves group together and are related. Also called R factor analysis. Compare p-technique factor analysis; q-technique factor analysis.

r to z transformation see Fisher’s r to z transformation.

RT abbreviation for reaction time.

RTS abbreviation for Rubinstein-Taybi syndrome.

rubber n. 1. slang for a condom. 2. see frotteurism.

rubella n. see German measles.

Rubin’s causal model a model used to estimate the magnitude of an intervention’s effect relative to a comparison condition. Used primarily in economics, medicine, and public health research, the model unrealistically assumes that participants experience multiple conditions simultaneously (e.g., the same participant was in a treatment and control condition at the same time) in order to envision all possible potential outcomes of the intervention. [Donald B. Rubin (1943– ), U.S. statistician]

Rubin’s figure an ambiguous figure that may be perceived either as one goblet or as two facing profiles. Also called goblet figure. [Edgar Rubin (1886–1951), Danish philosopher]

Rubinstein-Taybi syndrome (RSTS; RTS) a familial disorder caused by several different genetic factors and marked by facial abnormalities, microcephaly, hyperelorism, broad thumbs and toes, and intellectual disability. Hyponatonia (lack of muscles) and a stiff gait are common. Also called Rubinstein syndrome. [Jack H. Rubinstein (1925–2006) and Hooshang Taybi (1919–2006), U.S. pediatricians]

rubrospinal tract a motor pathway that arises from the red nucleus in the brainstem and descends laterally in the spinal cord, where it stimulates flexor motor neurons and inhibits extensor motor neurons.

Ruffini’s corpuscle a type of sensory-nerve ending in the subcutaneous tissues of human fingers. Ruffini’s corpuscles are believed to mediate sensations of skin stretch, motion detection, and hand and finger position. Also called Ruffini’s ending. [Angelo Ruffini (1864–1929), Italian anatomist]

rule n. 1. a guideline or standard that is used to guide responses or behavior or that communicates situational norms. 2. in linguistics, a formal mechanism used to account for the patterns of relationship between grammatical elements in a language. Formal linguistics draws distinctions between rules that are obligatory, optional, categorical, and variable.

rule-based system a computer program in which human knowledge is stored and used as a sequence of if-then relationships. See expert system; production system.

rule-governed behavior any behavior that is influenced by verbal antecedents, such as following instructions (as when children clean their rooms because they are told to do so) or reacting to one’s own private thinking (as when an adult begins an exercise program after thinking “I need to lose weight”). The term does not refer to behavior that can be described by a rule. For example, rats’ behavior that adopts a win-stay, lose-shift strategy cannot be described as rule governed. Also called verbally governed behavior. Compare contingency-governed behavior.

rule learning in psychology experiments, the process in which a participant gradually acquires knowledge about a fixed but unstated standard that defines, for example, the acceptability of a response or membership in a category.

rule of abstinence in classical psychoanalysis, the rule that the patient should abstain from all gratifications that might distract from the analytic process or drain off instinctual energy, anxiety, and frustration that could be used as a driving force in the therapy. Examples of such gratifications are smoking, engaging in idle conversation, or acting out during the sessions, as well as unlimited sexual activity, absorbing interests, and other pleasures pursued outside the sessions. This rule is no longer followed. Also called abstinence rule.

rule of double effect see principle of double effect.

rule of thumb a generally useful but by no means infallible strategy for approaching a problem or decision. See heuristic.

rules of inference rules for the construction of logical arguments stating what kinds of conclusions are valid from what kinds of premises. See deduction; deductive reasoning.

rumination n. 1. obsessional thinking involving excessive, repetitive thoughts or themes that interfere with other forms of mental activity. It is a common feature of obsessive-compulsive disorder and generalized anxiety disorder. 2. the voluntary regurgitation in the absence of gastrointestinal distress (e.g., nausea, acid reflux) of food from the stomach to the mouth, where it is masticated and tasted a second time or ejected. It generally occurs during infancy (age 3–12 months); however, it may also be observed in individuals of any age, particularly those with severe intellectual disability. If it lasts for a period of at least 1 month following a period of normal feeding, it is diagnosed as rumination disorder. Individuals may develop potentially fatal weight loss and malnutrition. Also called merycism.

—ruminate vb.

rumor n. a story or piece of information of unknown reliability that is passed from person to person. See also gossip.

rumor intensity formula a model that attempts to explain why some rumors persist and intensify whereas others peter out. In short, the strength of a rumor is the arithmetical product of the significance of the subject matter and the level of uncertainty about available informa-
tion. [proposed by Gordon W. Allport and Russian-born U.S. experimental psychologist Leo Postman (1918–2004)]

**run** n. 1. a single presentation of a series of stimuli or tasks as part of an experiment. 2. the distance along the x-axis between two points. Compare **rise**.

**runaway selection** a theory of female mate selection proposing that certain male traits with little or no survival advantage are nonetheless so sexually attractive to females that they choose mates with these traits and thereby ensure male offspring with the same attractive traits. The theory attempts to explain the rapid (runaway) evolution of disadvantageous male traits in some species (e.g., the long, colorful, but cumbersome tails of peacocks). Compare **good genes hypothesis**. [proposed by Ronald Aylmer Fisher]

**run-in period** in an experiment or simulation, an initial period of time that is included to allow the phenomenon of interest to stabilize before any treatment or manipulation is administered. A run-in period helps a researcher identify problems with the protocol or treatment.

**runner’s high** a euphoric sensation achieved while running, characterized by an elevated sense of awareness, a suppression of pain and discomfort, and ease of effort. See also **endorphin**.

**running wheel** see **activity wheel**.

**runs test** see **wald–wolfowitz test**.

**runway** n. in animal experimentation, the pathway that leads from a starting box to a goal box or to the main part of a maze.

**rural environment** an environment characterized by open land, sparse settlement, some distance from cities and towns, and an economy that is usually agriculturally based but that may be based on other types of economic activity, such as logging, mining, oil and gas exploration, or tourism. In environmental psychology, the rural environment is often used as a basis for comparison with the urban (city) environment with respect to air-pollution levels, crowding, crime, and other physical and social stressors. See also **urban behavior**.

**rural health clinic (RHC)** a clinic, physician practice, or health department that—in compliance with the Rural Health Clinic Services Act—is located in a medically underserved area and uses a physician, **physician assistant**, **nurse practitioner**, or some combination of these to deliver primary outpatient health care. See also **national association of rural health clinics**.

**rush** n. a colloquial term for the effect of an intravenous injection of amphetamine, cocaine, or methamphetamine. The sensation has been described as a dramatic awakening accompanied by sudden euphoria.

**RVS** abbreviation for **rokeach value survey**.

**RWA** abbreviation for **right-wing authoritarianism**.

**RxP** abbreviation for **prescriptive authority**.

**Ryan’s method** see **regwq test**.
s symbol for SPECIFIC FACTOR.
s^2 symbol for SAMPLE VARIANCE.
S abbreviation for spatial intelligence. See PRIMARY ABILITY.
S1 abbreviation for PRIMARY SOMATOSENSORY AREA.
S2 abbreviation for SECONDARY SOMATOSENSORY AREA.
S— symbol for NEGATIVE DISCRIMINATIVE STIMULUS.
S+ symbol for POSITIVE DISCRIMINATIVE STIMULUS.
SA symbol for NEGATIVE DISCRIMINATIVE STIMULUS.
SA abbreviation for SOCIAL AGE.
SAB abbreviation for STANDARD APPLICATION BLANK.
saccade n. a rapid eye movement that allows visual fixation to jump from one location to another in the visual field. Once initiated, a saccade cannot change course. See also MICROSCACCADES. Compare SMOOTH-PURSUIT EYE MOVEMENT. —saccadic adj.
saccadic dysmetria see OCULAR DYSMETRIA.
saccadic speed the speed of the rapid, ballistic eye movement known as a SACCAD. Human saccades reach speeds of 700° of VISUAL ANGLE per second.
saccadic time the duration of a SACCAD. Saccades last 15 ms to 100 ms, and approximately 150 ms must elapse before the next saccade can be initiated.
saccule n. the smaller of the two VESTIBULAR SACS of the inner ear, the other being the UTRICLE. Like the utricle, it contains a sensory structure called a MACULA. Movements of the head relative to gravity exert a momentum pressure on hair cells within the macula, which then fire impulses indicating a change in body position. —saccular adj.
sacral division the nerves of the PARASYMPATHETIC NERVOUS SYSTEM that arise from the spinal cord in the sacral (lower back) region. Compare CRANIAL DIVISION.
sacral nerve see SPINAL NERVE.
sacred disease a name for epilepsy used by the ancient Greeks based on the belief that seizures were evidence of divine visitation. Hippocrates, however, rejected this view, saying “Surely it, too, has its nature and causes whence it originates, just like other diseases, and is curable by means comparable to their cure.”
SAD acronym for SEASONAL AFFECTIVE DISORDER.
S-adenosylmethionine (SAM) n. a nonprotein chemical compound that mediates numerous metabolic reactions, including those involving certain proteins, phospholipids, neurotransmitters, and nucleic acids. It is commonly used as a dietary supplement in the treatment of depression because it may increase levels of serotonin in the brain. It also has been implicated in Alzheimer’s disease: Low S-adenosylmethionine levels often are observed in those with the disease, which may be a sign of altered SAM metabolism.
sadism n. the derivation of pleasure through cruelty and inflicting pain, humiliation, and other forms of suffering on individuals. The term generally denotes SEXUAL SADISM. In the classical psychoanalytic theory of Sigmund FREUD, sadism is attributed to the working of the DEATH INSTINCT and is manifested in innate aggressive tendencies expressed from the earliest stages of development. For example, during the ORAL-BITING PHASE, the infant expresses sadism by taking pleasure in biting. See also ANAL SADISM; ORAL SADISM. [Donatien Alphonse François, Comte (Marquis) de Sade (1740–1814), French soldier and writer] —sadist n. —sadistic adj.
sadness n. an emotional state of unhappiness, ranging in intensity from mild to extreme and usually aroused by the loss of something that is highly valued (e.g., by the rupture of a relationship). Persistent sadness is one of the two defining symptoms of a MAJOR DEPRESSIVE EPISODE, the other being ANEHOIDIA. —sad adj.
sadomasochism n. 1. sexual activity between consenting partners in which one partner enjoys inflicting pain (see SEXUAL SADISM) and the other enjoys experiencing pain (see SEXUAL MASOCHISM). 2. a PARAPHILIA in which a person is both sadistic and masochistic, deriving sexual arousal from both giving and receiving pain. —sadomasochist n. —sadomasochistic adj.
sadomasochistic personality formerly, in psychoanalysis, the characterization of people who enjoy both exhibiting and being the recipient of aggressive behavior.
SADS abbreviation for SCHEDULE FOR AFFECTIVE DISORDERS AND SCHIZOPHRENIA.
Saethre–Chotzen syndrome see CHOTZEN’S SYNDROME.
safe compartment in a two-compartment CONDITIONING APPARATUS, the compartment that is not associated with an AVERSIVE STIMULUS.
safe sex sexual activity in which the exchange of bodily fluids is inhibited as much as possible to help reduce the risk of unwanted pregnancy or of contracting sexually transmitted diseases. Precautions may include avoidance of high-risk sexual behaviors, careful selection of one’s partners, and the use of preventive barriers (e.g., condoms, dental dams). The practice is also called safer sex in recognition that 100% safety is not possible with, for example, condoms.
safety and health education instruction regarding health-related matters, including the causes and prevention of malnutrition, alcoholism, drug addiction, and sexually transmitted diseases, as well as safety on the roads, in the workshop, at home, and on the playing field. See also ACCIDENT PREVENTION.
safety behavior a behavior performed by an anxious individual in an attempt to minimize or prevent a feared catastrophe. For example, a person with PANIC DISORDER might only go out when accompanied, and a person with SOCIAL PHOBIA might wear sunglasses indoors to avoid eye contact. Safety behaviors may also include internal mental processes: A person with social phobia might memorize
what he or she plans to say at a social gathering. Safety behavior contributes to the maintenance of anxiety disorders when people believe that the behavior, rather than the lack of actual danger, is what prevents the feared catastrophe. Also called safety cues, safety-seeking behavior, safety signals. [first defined in 1991 by British psychologist Paul M. Salkovskis]

**safety device** in the therapeutic approach of Karen D. HORNEY, any psychic means used by an individual to protect himself or herself from threats, particularly the hostile elements of the environment. As such, the concept is similar to the classical psychoanalytic concept of the defense mechanism. See also basic anxiety.

**safety engineering** a discipline in which multiple approaches are applied to the design and evaluation of work systems and processes with the aim of eliminating or reducing hazards. See also hazard control.

**safety need** a desire for freedom from illness or danger and for a secure, familiar, and predictable environment. Safety needs comprise the second level of MASLOW’S MOTIVATIONAL HIERARCHY, after basic physiological needs.

**safety psychology** a subdiscipline of applied psychology involving the study of behavioral aspects of hazardous situations in human–environment systems, particularly within occupational contexts. Safe and unsafe behavior of employees is studied systematically to derive guidelines that can be translated into practical actions to ensure safety.

**safety signal** a stimulus that indicates to an organism that an aversive event will not occur.

**sagittal adj.** describing or relating to a plane that divides the body or an organ into left and right portions. A **mid-sagittal** (or **medial sagittal** plane) divides the body centrally into halves, whereas a **parasagittal plane** lies parallel but to one side of the center. —**sagittally adj.**

**sagittal fissure** see longitudinal fissure.

**Saint Dymphna’s disease** an early name for mental illness, deriving from the name of the patron saint of those with nervous disorders or mental illness. According to legend, Dymphna, a medieval Irish princess, fled to Belgium to escape the incestuous advances of her mad father, who later put her to death near Gheel. See GHEEL COLONY.

**Saint Vitus’s dance** an archaic name for Sydenham’s CHOREA.

**salary compression** see wage compression.

**salicylate** n. any of a group of drugs that are based on salicin, a compound obtained from the bark of willow trees (Salix), and that include salicylic acid and its derivatives. The latter are used as analgesics, antipyretics, and anti-inflammatory agents. They act on both the peripheral and central nervous systems, particularly the thalamus, but also mimic some aspects of the adrenal hormones. The best known member is aspirin (acetylsalicylic acid), introduced in 1899. Other salicylates include salicylamide and compounds used in topical formulations for the relief of muscle and joint pain.

**salicylism** n. poisoning with salicylates, the most common form of which is due to overdosage of aspirin. Symptoms of mild salicylism include tinnitus, confusion, headache, nausea, and vomiting. More severe forms of salicylism are characterized by severe acidosis, hemorrhage, and changes in mental status that may lead to convulsions, coma, and death.

**salience hypothesis** a theory of perception according to which motivationally significant stimuli (objects, people, meanings, etc.) are perceived more readily than are stimuli with little motivational importance. It has relevance in social perception, advertising, and linguistics.

**salient adj.** distinctive or prominent. A salient stimulus in a multielement array will tend to be easily detected and identified. The noun form, salience (or saliency), denotes a parameter of a stimulus that indexes its effectiveness. See conspicuity; pop-out; stimulus salience.

**saline adj.** consisting of salt or having a salty taste.

**saliromania** n. sexual interest and arousal associated with objects that are filthy, disgusting, or deformed.

**salivary gland** any of several glands located in the wall of the mouth that secrete a fluid (saliva) containing the enzyme gamma-amylase (ptyalin). The major salivary glands are the paired parotid, submaxillary, and sublingual glands; smaller glands are scattered over the cheeks and tongue. See also salivation.

**salivary reflex** a change in the secretion of the salivary glands caused by unconditioned or conditioned stimulation of their effector nerves. See conditioned response; unconditioned response.

**salivation** n. the secretion of saliva by the salivary glands, typically as a reflex response to stimuli associated with food.

**Salpêtrière** n. an institution founded in Paris in 1656 as an asylum for the infirm, aged, and insane. At one time, it contained nearly 10,000 people, and treatment was proverbially brutal. The Salpêtrière was transformed during the regime of Philippe Pinel (1745–1826), who became its director in 1794 and introduced many pioneering reforms in the treatment of people with mental illnesses. From the 1860s, the hospital became the center for the psychopathological investigations of Jean-Martin CHARCOT, which involved the use of hypnotic: in 1885, one of Charcot’s students was the young Sigmund FREUD.

**salpingectomy** n. the surgical removal of one or both fallopian tubes. A salpingectomy may be performed as a sterilization measure or because of an infection or malignant growth in the reproductive tract. Also called tubectomy. See also tubal ligation.

**saltation** n. 1. a dancing or leaping motion, specifically one seen as a result of chorea. 2. the mode of conduction of nerve impulses along myelinated nerve fibers. See saltatory conduction. 3. the phenomenon in which a sensation is felt at a site other than that where it was evoked. For example, auditory saltation is an illusion in which a train of clicks, the first half of which is presented at one location and the other half of which is presented at a second location, is perceived as originating not only from the anchor points but also from locations between them. 4. a sudden evolutionary variation or modification of a species due to large-scale genetic mutation. 5. an abrupt transition or sudden development in the course of an illness. [from Latin saltatio, “dance”]

**saltatory conduction** a type of conduction of nerve impulses that occurs in myelinated fibers, in which the impulses skip from one node of Ranvier to the next. This
permits much faster conduction velocities compared with those of unmyelinated fibers.

**salty adj.** denoting the TASTE elicited by sodium chloride or lithium chloride, by other sodium and lithium salts, and by the amino acid arginine. Sodium is the primary ion for generating osmotic forces in an organism and is an essential carrier of electrical potentials; it cannot be produced in the body and therefore must be ingested. —**saltiness n.**

**Salvia n.** a genus of plants in the mint family. The species *Salvia miltiorrhiza* is RED SAGE. The species *Salvia divinorum* is a kappa OPIOID AGONIST hallucinogen used as a recreational drug known as diviner’s sage or by its genus name, Salvia. Users chew, smoke, or place it under the tongue and may experience visions, uncontrollable laughter, loss of speech and coordination, anxiety, and nausea, although these effects are short-lived. It is illegal in many U.S. states.

**SAM 1.** abbreviation for S-ADENOSYLMETHIONINE. 2. abbreviation for SEARCH FOR ASSOCIATIVE MEMORY. 3. abbreviation for SYMPATHETIC–ADRENAL–MEDULLARY AXIS.

**same-sex marriage** a long-term, intimate, stable, and in some jurisdictions legally recognized relationship between two people of the same sex. It is less frequently called homosexual marriage. Also called gay marriage. See also DOMESTIC PARTNERSHIP.

**SAMHSA** abbreviation for SUBSTANCE ABUSE AND MENTAL HEALTH SERVICES ADMINISTRATION.

**sample n.** a subset of a POPULATION of interest that is selected for study with the aim of making inferences to the population. It is important to ensure that a sample is representative of the larger population. Characteristics that describe observations in this subset, such as the mean, median, or STANDARD DEVIATION, are called STATISTICS.

**sample correlation coefficient** (symbol: $r$) an index of the degree of association between two variables based on the data in a studied subset (sample) of cases from a larger group of interest. It is a variant of the PRODUCT–MOMENT CORRELATION COEFFICIENT, and the same symbol is used for both statistics. See also POPULATION CORRELATION COEFFICIENT.

**sample distribution** the distribution of scores in a particular subset (sample) drawn from a larger population. Of interest is the general shape of the distribution, reflecting the frequency of particular scores (his KURTOSIS, SKEWNESS, etc.). Compared to the theoretical POPULATION DISTRIBUTION, the distribution of scores in a sample is often jagged and not smooth.

**sample mean** (symbol: $X \bar{}$) the arithmetic average ($M$) of a set of scores from cases or observations in a subset drawn from a larger population. Because each score contributes equally to this index of CENTRAL TENDENCY, it can be affected greatly by OUTLIERS. Many widely used STATISTICAL TESTS are based on the comparison of sample means.

**sample reliability** the degree to which a subset of items (sample) is representative of the POPULATION from which it is drawn. It is typically indexed by the STANDARD ERROR OF THE MEAN.

**sample size** the number of observations (cases, individuals, units) included in a selection of items to be studied. This is usually denoted N (for the study as a whole) or n (for subgroups from the study).

**sample space** the collection of all possible outcomes of an experiment of chance. For example, for a toss of a single coin, the sample space is heads and tails, whereas for a toss of two coins, the sample space is heads–heads, heads–tails, tails–tails, and tails–heads.

**sample standard deviation** (symbol: $s$) see STANDARD DEVIATION.

**sample variance** (symbol: $s^2$) the dispersion of scores within a group selected for study, as opposed to the POPULATION VARIANCE. It is calculated by determining each score’s difference from the average for the set, squaring and summing these differences, and then dividing by the total number of scores minus one.

**sampling n.** the process of selecting for study a limited number of units from a larger set. The term most often refers to the selection of respondents, observations, or cases for inclusion in experiments, surveys, interviews, or other research. However, sampling can also involve selecting theoretical constructs to study, selecting measurement instruments from a broad set of potential options, or selecting time points at which to observe individuals or cases. There are various different selection methods, including SIMPLE RANDOM SAMPLING, STRATIFIED SAMPLING, CONVENIENCE SAMPLING, and QUOTA SAMPLING. Each approach has a different potential of obtaining a sample appropriately representative of the POPULATION under study.

**sampling bias** a systematic and directional error involved in the choice of units, cases, or participants from a larger group for study. Sampling bias can threaten the INTERNAL VALIDITY of a study if there is a possibility that preexisting differences arising from the sampling process may interact with the variable of interest. Similarly, if the procedure used to choose participants tends to favor specially motivated individuals or people from a certain segment of society, there would be a threat to the study’s EXTERNAL VALIDITY (i.e., inferences to a larger population would not be viable). Sampling bias is associated with a lack of RANDOM SAMPLING and with nonrandom assignment to conditions. Also called recruitment bias; selection bias. See also SELF-SELECTION BIAS.

**sampling design** the specific approach, method, or strategy that a researcher decides to use for selecting a sample from the larger population. Formulating a design involves determining the nature of the target population, a suitable SAMPLING FRAME for drawing the cases, the desired sample size, whether random or nonrandom selection will be used, and whether there are any important variables on which to stratify selection. Also called sampling plan.

**sampling distribution** the distribution of a statistic, such as the mean, obtained with repeated samples drawn from a population. SIMULATION studies allow researchers to specify known population information, conduct a very large number of repeated draws on the population, and build an empirical distribution of the statistic based on these draws (e.g., t, F, or $\chi^2$ distributions). For example, the means calculated from samples of 100 observations, repeatedly and randomly drawn from the population, yield a sampling distribution for the mean. Knowledge about the distribution of a statistic allows researchers to say when a finding from a sample is unusual (e.g., statistically significant) and when it would be expected from the statistic’s known behavior, thus enabling the sampling distribution of a statistic to be used in testing hypotheses about variables and their relationships. See also INFERENTIAL TEST.

**sampling error** the predictable MARGIN OF ERROR that
occurs in studies of samples of cases or observations from a larger population: It indicates the possible variance between the true value of a parameter in the population and the estimate of that value made from the sample data. For example, a sampling error of 3% in a large national survey finding that 65% of citizens prefer a particular policy means that the true figure could be anywhere between 62% and 68%.

**sampling frame** the specific source used in drawing a subset of cases or individuals from a larger population. In many cases, the sampling frame will be a complete list of all of the elements in a population (e.g., the electoral register). In other cases, this will be impossible or the issue may be less straightforward than it appears. The key point is that any sampling frame should be representative of the target population as a whole. In a study of college students' aspirations for life after graduation, for example, the researchers might decide to use a listing of students obtained from the institution's office of evaluation and assessment as their sampling frame and randomly select from this list every fifth student.

**sampling theory** the body of principles underlying the drawing of samples that accurately represent the population from which they are taken and to which inferences will be made. This conceptualization of the sampling process provides guidance to researchers about which sampling design to choose in the particular circumstances and how best to account for subsets of cases that are not well represented (or are overrepresented) in the population (e.g., by using weights).

**sampling unit** any of the elements selected from a population to make up a sample. For instance, if classrooms are selected at random from the population, then the classroom—not the individual student—is the sampling unit. See **UNIT OF ANALYSIS**.

**sampling variability** the extent to which the value of a statistic differs across a series of samples, such that there is some degree of uncertainty involved in making inferences to the larger population. See **SAMPLING ERROR**.

**sampling without replacement** a sampling technique that involves selecting an item from the larger set and removing it from the general pool; thus, this particular case cannot be redrawn.

**sampling with replacement** a sampling technique in which each item selected from the larger set is returned to the general pool. This means that a particular case may be drawn more than once for a given sample.

**samsara** n. see **METEMPSYCHOSIS**.

**sanatorium** n. formerly, an institution for the treatment and convalescence of individuals with chronic diseases, such as rheumatism, tuberculosis, neurological disorders, or mental disorders. Also called **sanitarium**.

**sanction** n. 1. authoritative approval or permission for an action. 2. a punishment or other coercive measure, usually administered by a recognized authority, that is used to penalize and deter inappropriate or unauthorized actions. See also **SOCIAL SANCTION**.

**Sandimmune** n. a trade name for **CYCLOSPORINE**.

**S and M** abbreviation for sadism and masochism. See **SADOMASOCHISM**.

**sandwich generation** midlife adults who simultaneously care for dependent children and ailing parents or other older relatives. Being a multigenerational caregiver has been shown to negatively affect health and behavior by decreasing one's level of exercise, increasing one's frequency of cigarette smoking, and increasing one's risk of depression. See also **CAREGIVER BURDEN**.

**Sanfilippo syndrome** an autosomal recessive, lysosomal storage disease caused by an inability of the body to break down heparan sulphate, a complex carbohydrate (see **MUCOPOLYSACCHARIDOSIS**). Affected individuals can have severe neurological symptoms, including progressive dementia, aggressive behavior, hyperactivity, seizures, deafness, loss of vision, and an inability to sleep for more than a few hours at a time. Sanfilippo syndrome is divided into four subtypes: A, B, C, and D. The different types have similar signs and symptoms, but Type A is the most severe. Also called **mucopolysaccharidosis Type III; Sanfilippo (A, B, C, D)**. [described in 1963 by Sylvester Sanfilippo (1926–2013), U.S. pediatrician]

**sangue dormido** a CULTURE-BOUND SYNDROME found among inhabitants (indigenous and immigrant) of Cape Verde. Symptoms include pain, numbness, tremor, paralysis, convulsions, stroke, blindness, heart attack, infection, and miscarriage. [Portuguese, literally: “sleeping blood”]

**sanguine type** one of the four temperamental types established by Galen, who believed that the ruddy complexion and cheerful outlook displayed by such individuals was due to the predominance of blood over other body fluids. See **HUMORAL THEORY**.

**sanitarium** n. see **SANATORIUM**.

**sanity** n. 1. in law, the state of not suffering from a mental disorder or neurological defect that impairs one’s ability to understand or appreciate one’s acts or to conform to the requirements of the law. Thus, it is the opposite of **INSANITY**. 2. more generally, soundness of mind or judgment.

—**sane** adj.

**Sansert** n. a trade name for **FLUOXETINE**.

**Saphris** n. a trade name for **ASENAPINE**.

**sapid stimulus** see **GUSTATORY STIMULUS**.

**Sapir–Whorf hypothesis** see **LINGUISTIC DETERMINISM**. [Edward Sapir (1884–1939) and Benjamin Lee Whorf (1897–1941). U.S. linguists]

**Saphphism** n. see **LESBIANISM**.

**Sarafem** n. a trade name for **FLUOXETINE**.

**sarcoma** n. see **CANCER**.

**SAR workshop** abbreviation for **SEXUAL ATTITUDE REASSESSMENT WORKSHOP**.

**SAS** abbreviation for **SUPERVISORY ATTENTIONAL SYSTEM**.

**SAT** acronym for **SCHOLASTIC ASSESSMENT TEST**.

**Satanism** n. a religion based on the worship of Satan, the supreme personification of evil in Christian tradition, whether as a deity or a concept. Satanist cults vary from neopagan groups that revere Satan as a benevolent force of energy in nature to those that pay some kind of allegiance to Satan as an evil principle. In the latter case, worship takes the form of magical rituals that may involve an element of deliberate transgression (e.g., by parodies of Christian ceremonies or taboo sexual practices). **Satanic ritual abuse (SRA)** is the alleged psychological, sexual, or physical abuse of humans or animals committed as part of a reli-
sativus.

satisfaction n. 1. the satisfaction of a desire or need, such as hunger or thirst; another name for SATIETY. 2. the temporary loss of effectiveness of a REINFORCER due to its repeated presentation. —satisfy vb.

satiation n. the state of being fully satisfied to or beyond capacity, as, for instance, when hunger or thirst have been fully assuaged, which inhibits any desire to eat or drink more. Ingested food, for example, provides two signals of inhibition, one reflecting the bulk of a consumed meal and associated with gastric distension and the other reflecting the chemical content of the meal and associated with numerous peptides, hormones, and CYTOKINES in the intestines and liver (notably including CHOLECYSTOKININ, GHRELIN, and LEPTIN). Satiety signals from the gastrointestinal tract travel via different branches of the VAGUS NERVE to act through the ARCULATE NUCLEUS of the hypothalamus and the SOLITARY NUCLEUS of the brainstem, where neuronal networks mediating food intake and eating behavior are activated.

satiation center see VENTROMEDIAL NUCLEUS.

satiation mechanism any of the bodily processes or systems involved in regulating food and fluid intake. See also APPETITIVE BEHAVIOR.

satisfaction of instincts in classical psychoanalytic theory, the gratification of basic needs, such as hunger, thirst, sex, and aggression, which discharges tension, eliminates UNPLEASURE, and restores the organism to a balanced state. Satisfaction may occur on a conscious, preconscious, or unconscious level. Also called gratification of instincts. See also LIBIDO.

Satisfaction With Life Scale (SWLS) a five-item self-report measure developed to assess subjective well-being. It consists of global statements (e.g., “In most ways my life is close to my ideal”) rated on a 7-point scale ranging from 1 (strongly disagree) to 7 (strongly agree). The range of possible scores is 5 to 35, with higher scores signifying greater life satisfaction. [developed in 1985 by U.S. psychologist Edward F. Diener (1946–) and colleagues]

satisfice vb. to choose an option that meets the requirements of a particular situation but that may not be the optimal choice when considered in the abstract. In economics, the hypothesis of satisficing behavior proposes that, given the constraints of BOUNDED RATIONALITY, economic agents seek a level of profit or utility that they find satisfactory rather than one that is optimal. [coined by Herbert A. SIMON as a blend of satisfy and suffice]

satisfier n. a type of consumer who is happy with a good-enough choice. For example, a satisficer on a shopping trip in a grocery store is likely to buy the first box of reasonably priced cereal he or she sees. Compare MAXIMIZER. [defined in 2002 by U.S. psychologist Barry Schwartz (1946–)]

satori n. in ZEN BUDDHISM, the state or moment of spiritual awakening (Japanese,“awakening”) or enlightenment in which reality is perceived.

saturated model a model that fits the data perfectly because it has as many estimated parameters as there are values to be fitted. In STRUCTURAL EQUATION MODELING, this type of model poses a problem because a researcher cannot evaluate fit. Relatedly, the unsaturated model has more parameters than can be estimated from the available data. In FACTOR ANALYSIS, the problem of saturation occurs when the number of factors that will be estimated is the same as the number of variables in the data set.

saturation n. the purity of a color and the degree to which it departs from white. Colors with high saturation are intense and brilliant (e.g., fuchsia), whereas colors of low saturation are diluted and dull (e.g., pastel pink).

saturation scale an index of the purity of a color, ranging from gray to the pure color. It is used in psychophysics to relate the perceived purity of a color to the percentage of light of a given wavelength that is present.

satyriasis n. excessive or insatiable desire in a male for sexual gratification. Sexual activity with one person is found to be inadequate, and many other sexual partners are sought. See also DON JUAN.

sauce béarnaise effect a colloquial term referring to a CONDITIONED TASTE AVERSION. If a person happens to become ill after tasting a new food, such as sauce béarnaise, he or she may subsequently dislike and avoid that food. Regardless of the actual cause of the illness, the sauce will be identified with it. See also PREPAREDNESS.

savant n. a person with an intellectual disability or an AUTISM SPECTRUM DISORDER (autistic savant) who demonstrates exceptional, usually isolated, cognitive abilities, such as rapid calculation, identifying the day of the week for any given date, or musical talent. The term idiot savant initially was used to denote such a person but has been discarded as pejorative.

savings method a way of measuring quantitatively, without relying on an individual’s conscious memory, how much learned material is retained. In an initial learning session, the number of trials or the amount of time until the individual can achieve a goal, such as one perfect recitation of a list of nonsense syllables, is recorded. At a later time, he or she is retaught the same material. The difference in number of trials or time taken to achieve the goal is compared between the first and second sessions; this is the savings value (or savings score). Even if the individual has no conscious recollection of the original learning experience (e.g., because of a large time delay between the two sessions), the measurement can still be obtained. Also called relearning method. [introduced by Hermann EBBINGHAUS]

sawtooth waves a series of pointed electrical waveforms recorded on an electroencephalogram just before the onset of rapid eye movements in phasic REM SLEEP. Sawtooth waves occur in bursts, with a frequency range of 1.5 Hz to 5 Hz, and last an average of 7 seconds.

saxitoxin (STX) n. an animal toxin that blocks the passage of sodium ions across a cell’s plasma membrane when applied to the outer surface of the cell.
SB abbreviation for STANFORD–BINET INTELLIGENCE SCALE.
SBS abbreviation for SHAKEN BABY SYNDROME.
scaffolding n. in education, a teaching style that supports and facilitates the student as he or she learns a new skill or concept, with the ultimate goal of the student becoming self-reliant. Derived from Lev Vygotsky’s theories, in practice it involves teaching material just beyond the level at which the student could learn alone. Technologies (e.g., computer software) that may be used to assist in this process are known as scaffolded tools.
scalability n. the usefulness of an item on a test or scale in eliciting responses that represent identifiable positions on an ordered progression of scores or values describing an underlying construct, such as an ability or attitude. See GUTTMAN SCALE.
scale media one of the three canals that run the length of the COCHLEA in the inner ear. Located between the scala vestibuli and scala tympani, it is filled with fluid (ENDOLYMPH) and is delimited by REISSNER’S MEMBRANE, the highly vascular STRIA VASCULARIS, and the BASILAR MEMBRANE, which supports the ORGAN OF CORTI. Also called cochlear duct.
scalar 1. n. a quantity having only magnitude and not direction. Compare VECTOR. 2. n. in MATRIX ALGEBRA, a quantity that can multiply a vector in a vector space to produce another vector. 3. adj. describing a variable that can be represented by positions on a scale. 4. adj. describing a matrix in which the entries along the MAIN DIAGONAL are equal and all other entries are zero.
scale tympani one of the three canals within the COCHLEA in the inner ear. It is located below the scala media, from which it is separated by the BASILAR MEMBRANE, and contains PERILYMHPH. At its basal end is the ROUND WINDOW.
scale vestibuli one of the three canals within the COCHLEA in the inner ear. It is located above the scala media, from which it is separated by REISSNER’S MEMBRANE, and contains PERILYMHPH. At its basal end is the OVAL WINDOW.
scale n. 1. a system for ordering test responses in a progressive series, so as to measure a trait, ability, attitude, or the like. For example, an agreement scale used on an attitude survey might have seven response options ranging from strongly disagree (1) to strongly agree (7), with neither disagree nor agree (4) as the middle point. See LIKERT SCALE; RATING SCALE. 2. a sequence of ordered values used as a reference in measuring a physical property (e.g., height, weight, temperature). See INTERVAL SCALE; RATIO SCALE. See also MEASUREMENT LEVEL. 3. more generally, any test or other assessment instrument as a whole.
scale attenuation the situation in which the response format on a measure includes too few options to reflect a respondent’s actual behavior, opinion, or belief. For example, if an item pertains to average time spent watching television each day and a scale ranging from none (1) to 1 hour or more (5) is used, the upper end of the scale is likely to be selected by the great majority of sampled respondents, some of whom watch many hours per day; this results in little ability to differentiate the sample in terms of how many hours are actually watched. See CEILING EFFECT; FLOOR EFFECT.
scale development the process of creating a new INSTRUMENT for measuring an unobserved or latent construct, such as depression, sociability, or fourth-grade mathematics ability. The process includes defining the content and test specifications, generating items and RESPONSE SCALES, piloting the items in a large sample, conducting analyses to fine-tune the measure, and then re-administering the refined measure to develop NORMS (if applicable) and to assess aspects of RELIABILITY and VALIDITY.
scale error a child’s attempt to perform an action on a miniature object that is impossible because of the size discrepancy between the child and the object (e.g., the child tries to get into a toy car).
Scale of Prodromal Symptoms (SOPS) an instrument used to identify and assess the PRODROMAL SYNDROME of schizophrenia and other psychotic disorders. It includes behaviorally defined diagnostic criteria and provides a 6-point scale to quantitatively rate the severity of five ATTENUATED POSITIVE SYMPTOMS, four disorganization symptoms, and four general symptoms. [developed in 2001 by U.S. psychiatrist Thomas H. McGlashan (1942–) and colleagues]
scale parameter see DISPERSION PARAMETER.
scaling n. the process of constructing an instrument to measure, assess, and order some quantity or characteristic (e.g., height, weight, happiness, empathy). A researcher must evaluate how a given construct of interest should be measured and how optimally to obtain scores for individuals on these measures. See SCALE DEVELOPMENT.
scaleogram n. see GUTTMAN SCALE.
Scanlon plan a type of GAINSHARING program in which employees are motivated to improve productivity by monetary bonuses and participation in solving production problems. A production committee made up of supervisors and employees is formed within each unit in an organization; this committee screens suggestions from employees for reducing costs and improving productivity. Gains, such as cost savings or the value of improved production, are shared with the whole group, not just the individuals making the suggestions. See also INDUSTRIAL DEMOCRACY: PARTICIPATIVE DECISION MAKING; QUALITY CIRCLE. [Joseph Scanlon (1899–1956), U.S. union leader]
scanning n. in medicine, the process of using radiological, magnetic, or other means to visualize and examine the body or a portion of it to diagnose a disease or disorder.
scanning hypothesis the speculative notion that rapid eye movements during REM SLEEP may correspond to subjective gaze shifts of the sleeper looking at a dream scene. Such eye movement are, however, generally very repetitive, unlike normal eye movements in an awake individual who is visually fixating on a specific object or scene.
scanning speech speech that is slow with variable intonation and involuntary interruptions between syllables. It results from cerebellar lesions or other neuromuscular damage.
scapegoating n. blaming: the process of directing one’s anger, frustration, and aggression onto others and targeting them as the source of one’s problems and misfortunes. See also DISPLACEMENT. —scapegoat n., vb.
scapegoat theory 1. an analysis of violence and aggression in which individuals undergoing negative experiences (such as failure or abuse by others) are assumed to blame an innocent individual or group for causing the experience. Subsequent mistreatment of this scapegoat then serves as an outlet for individuals’ frustrations and hostilities (see DISPLACED AGGRESSION). It has also been suggested...
scapular reflex

that when scapengagts have been targets for aggression over the years they may thus acquire the quality of a stimulus for aggression. 2. an analysis of prejudice in which intergroup conflict is assumed to be caused, in part, by the tendency of individuals to blame their negative experiences on other groups. The theory is supported by studies suggesting that racial prejudice increases during periods of economic downturn and high unemployment. See REALISTIC GROUP CONFLICT THEORY. See also FRUSTRATION–AGGRESSION HYPOTHESIS.

scapular reflex  an involuntary contraction of the scapular muscle when the skin over the scapula (shoulder blade) is irritated.

SCAT  acronym for SCHOOL AND COLLEGE ABILITY TEST.

scat-o- (scat-) combining form feces or filth.

scatology n. preoccupation with obscenities, lewdness, and filth, mainly of an excremental nature. The term is derived from the Greek word for dung. In psychoanalytic theory, scatology is usually associated with ANAL EROTICISM. Also called scatology, scatological.

scatophilia n. sexual interest and arousal derived from talking about excrement and using obscene language.

scatter n. 1. the tendency of data points to diverge from each other. An example is the variation in scores across a set of tests on the same individual; another is the variation among test takers on a particular test. See also DISPERSION; VARIANCE. 2. in PROFILE ANALYSIS, the tendency for a set of scores for an individual to vary from the average of scores.

scattering n. a type of thinking characterized by tangential or irrelevant associations that may be expressed in incomprehensible speech. It is observed in individuals with schizophrenia.

scatterplot n. a graphical representation of the relationship between two continuously measured variables in which one variable is arrayed on each axis and a dot or other symbol is placed at each point where the values of the variables intersect. The overall pattern of dots provides an indication of the extent to which there is a LINEAR RELATIONSHIP between variables. A round mass of points shows no linear relation, an elliptical cloud of points with a positive slope shows a positive relation, and an elliptical cloud with a negative slope shows a negative relation. OUTLIER points are also clearly visible. Also called dot plot; scattergram. See also REGRESSION LINE.

scavenging n. the behavior of feeding on dead organic matter, such as carrion or scraps left by other animals. Scavenging behavior is found in many species, including lions, vultures, hyenas, jackals, and chimpanzees.

scedasticity n. the distribution of ERROR TERMS in a set of random variables. The pattern of errors may be due to chance and have constant VARIANCE (homoscedasticity), or there may be some pattern, such as a clustering of greater error with certain points on the independent variable (heteroscedasticity). REGRESSION ANALYSIS generally assumes homoscedasticity.

scenario analysis  a process in which managers conceptualize a range of plausible, logically consistent situations (scenarios) that may arise in the future and attempt to identify the implications of these for their organization and its activities. The purpose is not so much to predict the future—some of the scenarios considered may be highly unlikely—as to promote better decision making, better personnel use, and critical scrutiny of existing systems and processes, especially in terms of their ability to respond flexibly to unexpected negative events. Scenario analysis has important applications in such fields as politics, military strategy, business, ergonomics, and accident prevention.

scenario-based design  in ergonomics, a design practice in which different potential uses for a product or system are envisioned and then analyzed to help designers identify and correct potential problems or flaws.

scent marking  the act by a nonhuman animal of depositing ODORANTS on a substrate. Often from specialized SCENT GLANDS that produce them. Scent glands are commonly found in the anogenital region, in the uxxilla, in the suprapubic region, and around the mouth. Scent marking provides cues about species, sex, reproductive status, and dominance status that can remain on or diffuse slowly from a substrate after the marking individual has left.

Schachter–Singer theory  the theory that experiencing and identifying emotional states are functions of both physiological arousal and cognitive interpretations of the physical state. Also called attribution of emotion; cognitive arousal theory of emotion: Schachter theory; two-factor theory of emotion. See also JAMES–LANE THEORY. [Stanley Schachter and Jerome E. Singer (1924–2010), U.S. psychologists]

schadenfreude n. the gaining of pleasure or satisfaction from the misfortune of others. [from German, “harm,” and Freude, “joy”]

Schaffer collateral  an axon branch from a neuron in area CA3 of the HIPPOCAMPUS that projects to area CA1.

Schaie’s stages of cognitive development  a stage theory in which human cognitive processes are posited to develop within up to live periods during the lifespan. In the first, the acquisitive stage, an individual’s primary cognitive task is to acquire knowledge and intellectual skills. Corresponding to developmental approaches such as that of Jean Piaget, this stage occurs from infancy through adolescence. The achieving stage occurs next, in young adulthood, during which an individual’s primary cognitive task is to achieve personal goals (e.g., starting a family, establishing a career) by applying the intellectual skills learned during the acquisitive stage. The individual then uses those skills in middle adulthood, during the responsible stage, to manage increasingly complex situations arising from family, community, and career responsibilities. This stage may be followed by the executive stage, during which some middle-aged adults may achieve a high level of intellectual functioning characterized by a broadened focus on societal rather than on exclusively personal concerns and by an ability to set priorities as well as to assimilate conflicting information. Finally, in the reintegrative stage, individuals in late adulthood apply their intellectual skills to reexamine their life experiences and priorities and to focus their attention on tasks of great personal meaning. Memory storage and retrieval and the speed of other cognitive functions may decline, but general cognitive ability continues to develop during this stage. Also called Schaie’s stages of adult cognitive development. See also SEATTLE LONGITUDINAL STUDY. [proposed in the 1970s by K. Warner Schaie (1928– ), U.S. psychologist]

scheduled awakening  a form of behavior therapy for elimination of persistent nightmares (see NIGHTMARE DISORDER; SLEEP TERROR DISORDER). The procedure includes
the regular waking of the sleeper at intervals related to REM sleep.

scheduled drug any of various drugs whose prescription or use has been restricted by the U.S. Drug Enforcement Administration in accordance with the Controlled Substances Act of 1970. Schedule I drugs are those for which all nonresearch use is illegal (e.g., LSD, heroin). Schedule II drugs include most opiates, stimulants (e.g., cocaine, amphetamines, methylphenidate), barbiturates, and prescribed forms of tetrahydrocannabinol (dronabinol). For Schedule II drugs, no refills or telephone prescriptions are permitted. Schedule III drugs include some opioids, barbiturates, and stimulants subject to abuse; prescriptions must be rewritten after 6 months, with a maximum of five refills. Schedule IV drugs include certain opioids, some stimulants, and most of the benzodiazepines. Refills are limited to five, and prescriptions must be rewritten after 6 months. Schedule V drugs include several opiates with low abuse potential (low doses of codeine and others). The Schedule of Controlled Substances, originally designed to restrict the prescription of commonly abused drugs, is periodically updated as the popularity of new agents—generally drugs of abuse—reaches the attention of authorities.

Schedule for Affective Disorders and Schizophrenia (SADS) a STRUCTURED INTERVIEW used to identify and describe in detail a range of psychopathological symptoms so as to make standardized and reliable diagnoses in adults. The SADS includes a progression of questions and criteria and provides for the rating of symptom severity, both for lifetime occurrence and most recent or current occurrence, using a 0 to 4, 0 to 6, or 0 to 7 scale. A version of the SADS for use with children and adolescents, the Kiddie Schedule for Affective Disorders and Schizophrenia (KSADS), is also available. [originally developed in 1978 by U.S. psychiatrist Robert L. Spitzer (1932– ) and U.S. clinical psychologist Jean Endicott (1936– )]

scheduling polydipsia see ADJUNCTIVE BEHAVIOR; POLYDIPSIA.

schedule of reinforcement in conditioning, a rule that determines which instances of a response will be reinforced. There are numerous types of schedules of reinforcement, entries for which are provided elsewhere in the dictionary. Also called reinforemet schedule.

Scheffé test a post HOC TEST used after a researcher obtains a significant F RATIO in an ANALYSIS OF VARIANCE that has more than two levels (i.e., more than two conditions of an independent variable that are being examined for differences among their mean values). It allows for the testing of all possible contrasts (weighted comparisons of any number of means) while controlling the probability of a TYPE I ERROR for the set of contrasts at a prespecified level. The Scheffé test is considered to be one of the most stringent MULTIPLE COMPARISON TESTS because it is conservative in its identification of statistically significant mean differences between groups. [Henry Scheffé (1907–1977), U.S. mathematician]

schema n. (pl. schemata) 1. a collection of basic knowledge about a concept or entity that serves as a guide to perception, interpretation, imagination, or problem solving. For example, the schema “dorm room” suggests that a bed and a desk are probably part of the scene, that a microwave oven might or might not be, and that expensive Persian rugs probably will not be. Also called cognitive schema. See also FRAME; PERCEPTUAL SCHEMA. 2. a cognitive structure representing a person’s knowledge about some entity or situation, including its qualities and the relationships between these. Schemas are usually ABSTRACTIONS that simplify a person’s world. In 1932, Frederic C. Bartlett showed that past experiences are stored in memory as schemas; impressions of other people are also thought to be organized in this way. 3. an outlook or assumption that an individual has of the self, others, or the world that endures despite objective reality. For example, “I am a damaged person” and “Anyone I trust will eventually hurt me” are negative schemas that may result from negative experiences in early childhood. A goal of treatment, particularly stressed in COGNITIVE THERAPY, is to help the client to develop more realistic, present-oriented schemas to replace those developed during childhood or through traumatic experiences. See also SELF-IMAGE; SELF-SCHEMA. —schematic adj.

schema therapy a therapeutic approach that integrates the techniques of COGNITIVE BEHAVIOR THERAPY with the depth-oriented and emotion-focused strategies of other approaches to bring about schema change—that is, to alter patterns of belief that individuals have derived about themselves, other individuals and social groups, and various situations from early experiences and that now interfere with their cognitive, emotional, and behavioral functioning. Schema therapy is used to treat individuals with chronic psychological conditions, such as personality disorders, eating disorders, and intractable couples problems. It has also been used for relapse prevention of depression, anxiety, and substance abuse. [developed in the 1990s by U.S. clinical psychologist Jeffrey E. Young (1950– )]

schematic classification see COMPLEMENTARY CLASSIFICATION.

schematic image a mental picture or representation of an object composed of that object’s most conspicuous features. Once formed, the schematic image is the model against which similar perceptual configurations are judged.

schematic representation the characterization of individuals, objects, events, or processes in terms of their real or potential interactions with each other.

scheme n. a cognitive structure that contains an organized plan for an activity, thus representing generalized knowledge about an entity and serving to guide behavior. For example, there is a simple sucking scheme of infancy, applied first to a nipple and later to a thumb, soft toy, and so forth. This term is often used as a synonym of SCHEMA.

schizencephalic adj. denoting or relating to abnormal clefs or divisions in brain tissue. The deformities may result from maldevelopment during fetal life or early infancy or be produced by destructive lesions of the brain. —schizencephaly n.

schizo- (schiz-) combining form split or fissure.

schizoaffective disorder in DSM–IV–TR, an uninterrupted illness featuring at some time a MAJOR DEPRESSIVE EPISODE, MANIC EPISODE, OR MIXED EPISODE concurrently with characteristic symptoms of schizophrenia (e.g., delusions, hallucinations, disorganized speech, catatonic behavior) and, in the same period, delusions or hallucinations for at least 2 weeks in the absence of prominent mood symptoms. DSM–5 identifies the mood episodes only as either major depressive or manic and emphasizes that mood disturbances must be present for a majority of the time.
**schizoid**

Also called schizoaffective psychosis: schizoaffective schizophrenia.

**schizoid adj.** denoting characteristics resembling schizophrenia but in a milder form, involving lack of affect, social passivity, and minimal introspection.

**schizoidism n.** a complex of behavioral traits that include exclusiveness, quietness, and general introversion, indicating a separation by the person from his or her surroundings, the confining of psychic interests to the self, and in many cases a tendency toward schizophrenia. Also called **schizoidia**. [defined by Eugen BLEULER]

**schizoid–manic state** a psychotic state combining features of both manic and schizoid excitement. Also called **schizomania**. [identified by Adolf MEYER, Austrian-born U.S. psychiatrist Abraham Brill (1874–1948), and Eugen BLEULER]

**schizoid personality disorder** a personality disorder characterized by long-term emotional coldness, absence of tender feelings for others, lack of desire for and enjoyment of close relationships, and indifference to praise or criticism and to the feelings of others. The eccentricities of speech, behavior, or thought that are characteristic of Schizotypal Personality Disorder are absent in those with schizoid personality disorder. It is included in both DSM–IV–TR and DSM–5.

**schizoid phenomena** in Object Relations Theory, an individual’s withdrawal into fantasy and avoidance of contact with others, due to fears of being abandoned or engulfed, while at the same time yearning for social relationships. [introduced in 1968 by British psychoanalyst Harry Guntrip (1901–1975)]

**schizomania n.** see SCHIZOID–MANIC STATE.

**schizophrenia** n. a psychotic disorder characterized by disturbances in thinking (cognition), emotional responsiveness, and behavior, with an age of onset typically between the late teens and mid-30s. Schizophrenia was first formally described in the late 19th century by Emil KRAEPELIN, who named it DEMENTIA PRAECOX; in 1908, Eugen BLEULER renamed the disorder schizophrenia (Greek, “splitting of the mind”) to characterize the disintegration of mental functions associated with what he regarded as its FUNDAMENTAL SYMPTOMS of abnormal thinking and affect. According to DSM–IV–TR, the characteristic disturbances must last for at least 6 months and include at least 1 month of active-phase symptoms comprising two or more of the following: delusions, hallucinations, disorganized speech, grossly disorganized or catatonic behavior, or NEGATIVE SYMPTOMS (e.g., lack of emotional responsiveness, extreme apathy). These signs and symptoms are associated with marked social or occupational dysfunction. Some have argued (beginning with BLEULER) that disorganized thinking (see Formal Thought Disorder; Schizophrenic Thinking) is the single most important feature of schizophrenia, but DSM–IV–TR and its predecessors have not emphasized this feature, at least in their formal criteria. DSM–5 retains essentially the same criteria but emphasizes that delusions, hallucinations, or disorganized speech must be among the symptoms required for diagnosis. It also eliminates the five distinct subtypes of schizophrenia previously described in DSM–IV–TR: CATATONIC SCHizophrenia, DISOrganized SCHizophrenia, PARANOID SCHizophrenia, RESidual SCHizophrenia, and UNDIFFerentiated SCHizophrenia. —**schizophrenic adj.**

**Schizophrenia Patient Outcomes Research Team (PORT)** a group of researchers established in 1992 by the Agency for Health Care Policy and Research and the National Institute of Mental Health. The team conducted a 3-year study to assess the treatment and management of schizophrenia (including pharmacotherapies, psychological and family interventions, vocational rehabilitation, and assertive community treatment) and subsequently developed 15 recommendations for improving patient outcomes. The researchers reviewed the literature on schizophrenia treatment outcomes and also surveyed a random sample of 719 individuals diagnosed with schizophrenia in two U.S. states to determine how the scientific evidence compared with actual clinical practice in outpatient and inpatient settings in both urban and rural areas. It was found that the overall rates at which patients’ treatment conformed to the study recommendations were generally below 50%, indicating the need for greater efforts to ensure that treatment research results are translated into practice, and that the key to improving patient outcomes is adoption of a comprehensive and individualized strategy that includes not only proper doses of appropriate medications but also patient and family education and support.

**schizophrenic episode** a period during which an individual exhibits prominent symptoms of schizophrenia, such as hallucinations, delusions, disordered thinking, and disturbances in emotional responsiveness and behavior. See also ACUTE SCHIZOPHRENIC EPISODE.

**schizophrenic reaction** a former diagnosis for the symptoms of schizophrenia. Coined around 1911 by Adolf MEYER, the term signified a cluster of maladaptive disturbances that he believed developed in reaction to psychosocial stressors. His views were an argument against the concept, originally advanced under the name of DEMENTIA PRAECOX by Emil KRAEPELIN, that characterized schizophrenia as a disease entity with purely biological causes. Schizophrenic reaction was one of several REACTION TYPES in Meyer’s nomenclature of mental illness.

**schizophrenic thinking** pervasive, marked impairment of thinking in terms of LOOSENING OF ASSOCIATIONS and slowness of associations, representing POSITIVE SYMPTOMS and NEGATIVE SYMPTOMS, respectively, of schizophrenia. Because thinking must be inferred rather than observed, and because no single definition or test or technique of inference has been universally accepted, evaluation is usually limited to examining samples of speech or writing that the individual is inclined to express. On certain psychological tests (e.g., Rorschach, MMPI), schizophrenic thinking is identified by deviant verbalizations, which are unusual, exaggerated, or otherwise abnormal responses to items presented during the test, such as inventing a word (see NEOLOGISM) to describe a Rorschach inkblot. On the Whitaker Index of Schizophrenic Thinking (WIST; 1980), schizophrenic impairment of thinking is defined as simultaneously illogical, impaired, and without apparent awareness, all to a marked degree.

**schizophreniform disorder** in DSM–IV–TR and DSM–5, a disorder whose essential features are identical to those of schizophrenia except that the total duration is between 1 and 6 months (i.e., intermediate between BRIEF PSYCHOTIC DISORDER and schizophrenia) and social or occupational functioning need not be impaired. The diagnosis applies without qualification to an episode of between 1 and 6 months’ duration from which the individual has already recovered. The diagnosis is provisional when there is
no certainty of recovery within the 6-month period. If the disturbance persists beyond 6 months, the diagnosis would be changed to schizophrenia.

**schizophreniform psychosis** a type of psychosis in which symptoms typical of **nuclear schizophrenia** are present but there is good **premorbid adjustment**, sudden onset in response to a clear precipitating event, and a good prognosis and high probability of return to normal levels of functioning. Also called **schizophreniform state**. [proposed in the late 1930s by Norwegian psychiatrist Gabriel Langfeldt (1895–1983)]

**schizophrenogenic adj.** denoting a factor or influence viewed as causing or contributing to the onset or development of schizophrenia.

**schizophrenogenic mother** the stereotypical mother of an individual with schizophrenia. She is held to be emotionally disturbed, cold, rejecting, dominating, perfectionistic, and insensitive. At the same time, however, she is overprotective, fosters dependence, and is both seductive and rigidly moralistic. Historically, this type of mother was considered to play a causal role in the development of schizophrenia, but this view is no longer held. [first defined in 1948 by Frieda Fromm-Reichmann]

**schizotaxia n.** a genetic predisposition to schizophrenia, deemed necessary for the disorder to manifest and held to be activated by severe environmental stresses. [presented as a concept in 1962 by Paul Everett Meehl]

**schizotypal personality disorder** a personality disorder characterized by various oddities of thought, perception, speech, and behavior that are not severe enough to warrant a diagnosis of schizophrenia. Symptoms may include perceptual distortions, magical thinking, social isolation, vague speech without incoherence, and inadequate rapport with others due to aloofness or lack of feeling. It is included in both DSM–IV–TR and DSM–5.

**schizotypy** n. in research contexts, a type of personality organization defined by milder forms of **positive symptoms** of schizophrenia, such as **cognitive slippage**, and **negative symptoms**, such as inability to experience pleasure (see anhedonia). Schizotypy is studied in individuals and family members as a predictor of or liability for the later occurrence of schizophrenia.

**Schmid-Fraccaro syndrome** see CAT’S-EYE SYNDROME.

**Schnauzkrampf n.** see LIP PURSING.

**scholastic acceleration** see **EDUCATIONAL ACCELERATION**.

**scholastic achievement test** any test that measures a student’s knowledge and ability in a specific area of academic study, such as chemistry, history, mathematics, Spanish, or literature.

**Scholastic Assessment Test** (SAT) a test used in selecting candidates for college admission, formerly called the **Scholastic Aptitude Test**. It measures critical reading abilities, mathematical reasoning abilities, and writing abilities developed over time through work done in school and alone. The critical reading section (formerly called the verbal section) tests the ability to understand and analyze what is read and to recognize relationships between parts of a sentence. The mathematics section tests the ability to solve problems involving arithmetic, algebra, and geometry. The writing section tests the ability to organize thoughts, develop and express ideas, use language, and adhere to grammatical rules. The SAT is accepted by most public and private colleges in the United States as a standardized evaluation test for the purpose of competitive admission discrimination.

**Scholasticism n.** the system of logic, philosophy, and theology taught by university scholars in medieval Europe. It was based on **ARISTOTELIAN** logic, the writings of the early Christian fathers, and the authority of tradition and dogma. Major preoccupations included the attempt to reconcile faith with reason and the dispute between **nominalism** and **realism**. Prominent Scholastics included Thomas Aquinas, French philosopher Jean Buridan (c. 1295–1358), Scottish theologian John Duns Scotus (c. 1226–1308), and English Franciscan monk and philosopher William of Occam (c. 1285–1347).—**Scholastic** adj., n.

**school n.** 1. a place or institution where people receive instruction. 2. a major division of a university consisting of specialized, related subdivisions devoted to teaching, research, and scholarship. 3. the adherents, collectively, of an approach to some field of subject matter having a developed theoretical framework and an associated literature. Examples of schools of psychology are behaviorism, functionalism, Gestalt psychology, structuralism, and psychoanalysis.

**school-ability test** an assessment designed to evaluate a student’s educational achievements in order to obtain information that will subsequently enhance his or her learning. The assessment can include a variety of widely accepted tests and measurement techniques as the bases for judgment. Under the direction of trained and competent staff, the assessment will meet appropriate federal and state laws, Board of Education policy, and the criteria for ethical and professional teaching.

**school-activity record** 1. a record of an individual’s participation in the sports, clubs, and interscholastic and intramural activities of a school or institution. 2. a listing of all such activities that are offered by a school or institution.

**School-Age Cognitive Battery** see **DIFFERENTIAL ABILITY SCALES**.

**School and College Ability Test** (SCAT) an academic aptitude test in three levels, administered from Grade 2 through Grade 12 to children performing above grade level. The test yields a verbal score, based on a verbal-analogies segment; a quantitative score, based on comparisons involving fundamental number operations; and a total score. It is often used to identify candidates for **TALENTED AND GIFTED** programs. [originally developed by the EDUCATIONAL TESTING SERVICE and now owned by The Johns Hopkins University Center for Talented Youth]

**school avoidance** see SCHOOL REFUSAL.

**school-based intervention** any strategy implemented in a classroom setting to improve the health and well-being of students, often by reducing or preventing pathology and problem behaviors (e.g., depression, social anxiety, cigarette smoking, drug or alcohol use, bullying and aggression). Requiring interdisciplinary coordination among school psychologists, counselors, social workers, teachers, and administrative staff, programs may be targeted at subgroups of high-risk individuals or implemented across the general school population of children and adolescents. Interventions may incorporate such activities as specially designed lectures, guided online lessons, group discussions,
school counseling

role play, and special homework assignments to be completed with parents.

school counseling guidance—offered at school or elsewhere to students, parents, and other caregivers—that focuses on students’ academic, personal, social, and career adjustment, development, and achievement. Counseling is offered by certified and licensed professionals at all educational levels, from elementary through college and professional school.

school grade 1. a letter or number representing the quality of academic work. 2. a group of students who are taught together at the same level, usually grouped by age, or the children who belong to such a grouping.

schooling n. 1. in animal behavior, the formation of large aggregations of fish. Schooling is thought to minimize predation through confusion effects and dilution effects or to improve hydrodynamic properties so that individual fish can move more efficiently through water. 2. the process of educating students in a formal setting or the provision of education.

school integration 1. the process of bringing all parts of a classroom or community environment together into a whole, using such means as computers, communication with local-government officials, and applied workplace learning. 2. the reduction or elimination of racial segregation in public schools. This has been attempted by artificially reconfiguring the racial balance within all district schools to reflect the proportionate racial balance in the community as a whole.

school neuropsychology an emerging specialty that seeks to provide teachers, educational administrators, and others with a better understanding of their students’ cognitive processing strengths and weaknesses, with the ultimate goal of informing their development of educational practices that will most benefit each individual learner.

School neuropsychologists observe student behavior; administer and interpret neuropsychological tests and other standardized assessment instruments; and use student profiling systems, curriculum-based measures, and progress monitoring. Although school neuropsychology often concentrates on children, particularly those with learning and other disabilities, it serves adolescents and adults as well. See also pediatric neuropsychology.

school phobia see school refusal.

school psychology a field of psychology concerned with the psychosocial educational problems and other issues arising in primary and secondary schools. The responsibilities of the school psychologist include involvement in overall curriculum planning, individualized curriculum assessment and planning, administration of psychoeducational tests, interviews with parents concerning their child’s progress and problems, pupil behavior problems, counseling of teachers and students, and research on systematic educational questions and issues. See behavioral consultation.

school readiness 1. the developmental level at which a child is prepared to adjust to school. 2. any of a variety of programs designed to prepare children of below kindergarten age for attending formal school by helping them acquire certain skills, such as being able to pay attention to adult-directed tasks for short periods of time, to speak in five- to six-word sentences, and to identify letters of the alphabet. These programs are often referred to as prekindergarten or nursery school. 3. efforts to help communities provide the best environments for children, especially in the areas of health, early education, and school entry. The emphasis is on reducing factors that could detract from children’s readiness to attend school.

school refusal persistent reluctance to go to school, which usually occurs during the primary school years and is often a symptom of an educational, social, or emotional problem. School refusal may be a feature of separation anxiety disorder. It may be triggered by a stressor (e.g., loss of a pet or loved one, a change of school, loss of a friend due to a move), or it may occur after a summer vacation when the child has spent more time with the primary caregiver. School refusal is often associated with complaints of physical symptoms (e.g., upset stomach, nausea, dizziness, headache) and anxiety at the start of the day. Also called school avoidance: school phobia.

school truancy see truancy.

Schroder staircase an ambiguous figure of a staircase, which can be perceived as seen either from above or from underneath the stairs, depending on the perspective of the observer. It is often confused with the Staircase illusion. [Heinrich Schröder (1810–1885), German bacteriologist and educator]

Schultze’s acroparesthesia see acroparesthesia. [Friedrich Schultze (1848–1934), German neurologist]

schwa n. a nondistinct neutral vowel represented in the International Phonetic Alphabet by the symbol a. In English, it is very common in unstressed syllables, such as the first syllable of alone.

Schwann cell a type of nonneuronal peripheral nervous system cell (Glia) that forms the myelin sheath around axons. Extensions of a single Schwann cell wind tightly and many times around several neighboring axons, so that the myelin sheath consists of multiple layers of the Schwann-cell plasma membrane. [Theodor Schwann (1810–1882), German physiologist]

schwannoma n. a type of tumor that develops from SCHWANN CELLS. Although typically benign, schwannomas tend to displace and compress surrounding neurons as they grow. A schwannoma is very similar to a neurofibroma but is distinguished by its capsule.

schwannomatosis n. see neurofibromatosis.

sciatic nerve a large peripheral nerve that connects the receptor and effector cells in the leg to the spinal cord. Pain in the leg, which may extend over the entire length of this nerve, from the buttocks to the foot, is called sciatica. The cause is most commonly a slipped disk pressing on the nerve root emerging from the spinal cord.

science n. the systematic study of structure and behavior in the physical, natural, and social worlds, involving the generation, investigation, and testing of hypotheses, the accumulation of data, and the formulation of general laws and theories. There are several major branches, including the natural sciences (e.g., biology, physics) and the social sciences. The subdisciplines of psychology are themselves divided among the different branches. For example, neuroscience and the study of the biological bases for behavior can be classed with the natural sciences, whereas social psychology and many aspects of clinical psychology can be seen as belonging to the social sciences. See scientific explanation; scientific method.
scientific explanation an account of an event, behavior, or thought that is couched in terms of an established set of scientific principles, facts, and assumptions. Typical forms of explanation may be reductionistic, analyzing a phenomenon into components and describing how they combine to produce the phenomenon; ontogenetic, relating the phenomenon to a universal set of developmental stages; empiricist, describing a phenomenon in terms of the conditions that have been observed to produce it; or metaphorical or categorical, identifying a phenomenon as similar in some important respects to other phenomena already understood. Such an explanation stated systematically is generally known as a theory.

scientific jury selection the use of the methods of social science to identify prospective jurors who may be favorably predisposed to one’s side in a legal dispute.

scientific management generally, the application of scientific methods to achieve improved worker efficiency and work conditions. More specifically, the term refers to the approach introduced by U.S. engineer Frederick W. Taylor (1856–1915) in the late 19th century and publicized in a 1911 book. This approach, also known as Taylorism, involves (a) studying the work to determine the most efficient way of performing tasks (see time and motion study) and (b) paying workers piece-rate incentives to adopt these methods (see piecework).

scientific method a set of procedures, guidelines, assumptions, and attitudes required for the organized and systematic collection, interpretation, and verification of data and the discovery of reproducible evidence, enabling laws and principles to be stated or modified. See also science; scientific explanation.

scientific psychology the body of psychological facts, theories, and techniques that have been developed and validated through the use of the scientific method. They thus depend on objective measurement and the replication of results under controlled or known conditions. See experimental psychology.

scientific rationality the qualities of reason and logic that characterize, or ought to characterize, scientific inquiry. For many, science is the epitome of rationality because of its adherence to the rules of logic and evidence, its rejection of supernatural explanations, its devotion to objectivity, and its careful public testing of hypotheses. A commitment to standards and procedures of this kind is usually taken to be the criterion by which a discipline, such as psychology, may be judged to be a science. More narrowly, scientific rationality is sometimes equated with positivism.

scientific reasoning a type of reasoning that involves the generation of hypotheses and the systematic testing of those hypotheses.

scientific revolution a major change in the theoretical framework of a field of science, as identified by U.S. philosopher of science Thomas Kuhn (1922–1996). Research carried out within the framework of a normal science—that is, one with an active paradigm that defines the subject matter and methods of the science—will over time yield anomalies that are inconsistent with predicted results. When a sufficient number of anomalies occur, a crisis stage may emerge, which motivates scientists and theorists to rethink the fundamental assumptions and methods of the science, and a complete reformulation may take place. This drastically changes both the activities and perspective of the scientists involved and the nature and subject matter of the science, at which time a new normal science may emerge. See also paradigm clash; paradigm shift.

scientism n. an uncritical commitment to a particular view of science and scientific methods that leads its adherents to dismiss all other approaches as intellectually invalid. The term is mainly used by those who criticize the assumptions of Western science as arrogant or flawed, who maintain that scientific methods are inappropriate in certain fields or incapable of apprehending certain kinds of truth, or who reject the implication that all philosophical questions will one day reduce to scientific questions. —scientistic adj.

scientist-practitioner model the concept underlying university training of doctoral clinical (or other applied) psychologists in the United States that is intended to prepare individuals both to provide services and to conduct research on mental health problems, essentially integrating these two functions in their professional work by making a laboratory of their applied settings and studying scientifically both the phenomena that are the focus of their services and the results of those services. The purpose of the model is to ensure that practitioners contribute to the scientific development of their field. The training emphasizes research techniques applicable to therapeutic settings. The model emerged from a conference held in Boulder, Colorado, in 1949, which was sponsored by the U.S. Veterans Administration and the National Institute of Mental Health. Also called Boulder model.

Scientology n. a movement and belief system, first incorporated as a religion in 1953, that emphasizes the harmful effects of engrams (memory traces) of past traumatic experiences. Adherents practice a technique known as dianetics, in which interactions with an auditor and the use of a device called an e-meter (essentially a gauge of the electrophysiological response; see galvanic skin response) can lead eventually to a postulated liberated state known as being clear. Scientology also has its own elaborate cosmology, in which humans are believed to be reincarnated “thetans,” immaterial, divine beings who have become trapped in the material world. [founded by U.S. science-fiction writer L(afayette) Ron(ald) Hubbard (1911–1986)] —Scientologist n.

sclerophobia n. a visual anomaly in which objects appear to be in a shadow. It can have emotional or psychological causes, in which case it is identified as scieneuropia.

SCII abbreviation for Strong-Campbell Interest Inventory. See strong interest inventory.

scintillating scotoma see scotoma.

sciosophy n. any system of thought, such as astrology, that claims knowledge of natural or supernatural phenomena but that is not supported by scientific methods. See pseudoscience. [coined by U.S. biologist and ichthyologist David Starr Jordan (1851–1931)]

scissors gait a type of gait observed, for example, in some patients with cerebral palsy who cross their legs in scissors fashion when walking.

sclera n. the tough, white outer coat of the eyeball, which is continuous with the cornea at the front and the sheath of the optic nerve at the back of the eyeball.

sclero- (scler-) combining form hardness.
sclerosis

sclerosis n. hardening of tissues, usually as a consequence of disease or aging. It particularly affects the nervous system (see AMYOTROPIC LATERAL SCLEROSIS; MULTIPLE SCLEROSIS) and the circulatory system (see ARTERIOSCLEROSIS; ATHEROSCLEROSIS). —sclerotic adj.

SCL-90-R abbreviation for SYMPTOM CHECKLIST-90-REVISED.

SCN abbreviation for SUPRACHIASMATIC NUCLEUS.

scoliosis n. a lateral (sideways) curvature of the spine. See also KYPHOSIS; LORDOSIS.

-scope suffix instrument for observing (e.g., OSCILLOSCOPE).

scope of attention 1. the extent to which an individual is able to attend to and process a range of different items at the same time. A distinction is sometimes made between perceptual scope of attention, which is the capacity to process a range of sensory stimuli (see APPREHENSION SPAN), and conceptual scope of attention, which is the ability to deal simultaneously with a number of ideas or concepts. 2. the range of stimuli that an individual is actively focusing his or her attention upon at any particular time. The scope of attention will be more or less narrow depending on the demands of the task at hand and a range of subjective factors. See ATTENTIONAL NARROWING; FOCAL ATTENTION; SELECTIVE ATTENTION.

scopo- (scop-) combining form observation or watching.

scopolamine n. an ANTICHOLINERGIC DRUG found as an alkaloid in HENbane and related plants. Its most common therapeutic use is for the prevention of motion sickness; in the past, it was sometimes used in labor to produce twilight sleep (a conscious but drowsy state with lack of sensitivity to pain) and amnesia for the event. Small doses can have a sedative effect, but large doses may cause restlessness, agitation, or delirium. Also called hyoscin. U.S. trade names: Scopace; Transderm-Scop.

scopophilia n. sexual pleasure derived from watching others in a state of nudity, undressing, or engaging in sexual activity. If scopophilia is persistent, the condition is essentially VOYEURISM. Also called scotophilia.

score 1. n. a quantitative value assigned to test results or other measurable responses. 2. vb. to assign scores to responses using some predetermined criteria.

score band see BANDING.

score equating the process of ensuring that results from one version or administration of a test have the same distribution as those obtained from another version or administration, so that the interpretation of the results can be as fair as possible to all test takers. Also called observed-score equating.

scorer reliability see INTERRATER RELIABILITY.

scoring n. the application of an answer key to a test or survey for the purpose of obtaining a value (SCORE) that reflects an individual’s position on an underlying construct. The answer key would typically indicate individual scores for the different responses on each item (e.g., from 1 to 7), such that the values per item can then be summed or averaged to obtain a composite score. Some instruments may have multiple subscales yielding separate values.

scoterythrous vision a type of color blindness in which reds appear darkened because of a deficiency in perceiving the red end of the spectrum.

scot(o-) (scot-) combining form 1. darkness (e.g., SCOTOPIC). 2. blindness (e.g., SCOTOMA).

scotoma n. an area of partial or complete loss of vision in the visual field. Vision may be depressed (relative scotoma), altered (scintillating scotoma), or completely lost (absolute scotoma). Scotomas can occur either in the central visual field (see CENTRAL SCOTOMA) or in the periphery (see PARCENTRAL SCOTOMA). See also VISUAL FIELD DEFECT.

scotomization n. in psychoanalytic theory, the tendency to ignore or be blind to impulses or memories that would threaten the individual’s ego. Scotomization is a defensive process and may also be a form of RESISTANCE. Also called scotomatization. See also BLIND SPOT.

scotophilia n. see NYCTOPHILIA.

scopotic adj. pertaining to low light levels and consequently being reliant on the RETINAL ROD system.

scotopic stimulation visual stimulation with dim targets, usually under conditions that specifically activate the RETINAL ROD system. Compare PHOTOPIC STIMULATION.

scotopic vision vision that occurs in dim light by means of the RETINAL ROD system. Because scotopic vision does not permit color discrimination, the visual scene appears in gray scale. However, the closer the illumination of a target is to 510 nm in wavelength, the brighter it will appear relative to other targets with the same energy, since this is the peak wavelength sensitivity for the rod system. Also called twilight vision. Compare PHOTOPIC VISION.

scotopsin n. the specific form of OPsin found in RETINAL RODS. Scotopsin combines with 11-cis retinal to form RHODOPSIN, which is the functional photopigment with sensitivity to photons in the rods.

scramble competition in animal behavior, the mating rivalry that ensues when females are broadly dispersed or synchronous in their breeding, so that males do not benefit from holding territories or defending resources. Instead, males range widely and mate with any female they encounter, with little or no courtship behavior or MATE SELECTION. The males that are able to mate first with a female generally have the most REPRODUCTIVE SUCCESS.

screen defense in psychoanalytic theory, a DEFENSE MECHANISM in which a memory, fantasy, or dream image is unconsciously employed to conceal the real but disturbing object of one’s feelings.

screen equating the process of ensuring that results from one version or administration of a test have the same distribution as those obtained from another version or administration, so that the interpretation of the results can be as fair as possible to all test takers. Also called observed-score equating.

screener reliability see INTERRATER RELIABILITY.

screening n. 1. a procedure or program to detect early signs of a disease in an individual or population. Individuals at increased hereditary risk of developing a disease are advised to follow regular screening plans. See also SCREENING TEST. 2. the initial evaluation of a patient to determine his or her suitability for psychological or medical treatment generally, a specific treatment approach, or referral to a treatment facility. This evaluation is made on the basis of medical or psychological history, MENTAL STATUS EXAMINATION, diagnostic formulation, or some combination of these. 3. the process of selecting items for a psychological test. 4. the process of determining, through a preliminary test, whether an individual is suitable for some purpose or task. See also SELECTION TEST.

screening audiometry rapid group measurement of audibility using a tone or tones of fixed level.

screening experiment a preliminary study in which a large number of factors are examined with the aim of filtering out those that show little association with the stud-
ied outcome. This allows researchers to narrow the field of potentially important factors before devoting resources to further study. See PILOT STUDY.

**screening sample** in survey methodology, a large group of individuals who are asked a preliminary set of questions in order to identify a much narrower subset of the population with an attribute of interest. For example, a nationwide survey of businesses might allow researchers to identify and then study in greater depth those companies that were started by business owners over 60 years old.

**screening test** any testing procedure designed to separate out people or items with a given characteristic or property. Screening tests are typically used to distinguish people who have a disease, disorder, or premorbid condition from those who do not; they may be used, for example, in primary health care settings at intake to identify people who are depressed and need further clinical attention. Screening tests are designed to be broadly sensitive, and subsequent highly specific or focused testing is often required to confirm the results. They are also often designed to be brief to facilitate broad classifications.

**screening tests for young children** checklists or assessment protocols that have been developed to detect risk factors associated with certain conditions during infancy and early childhood through the primary school years. Such tests do not provide diagnostic information but instead are used with large numbers of children to identify those who may require further assessment for emotional disturbances, intellectual disabilities, neurological conditions, or other disorders.

**screen magnifier** an adaptation for individuals with visual impairment that enlarges both text and graphical information displayed on a personal computer screen. Screen magnifiers may be built into the operating system provided by the computer manufacturer or purchased as separate products.

**screen memory** in psychoanalytic theory, a memory of a childhood experience, usually trivial in nature, that unconsciously serves the purpose of concealing or screening out, or is a conglomeration of, an associated experience of a more significant and perhaps traumatic nature. Also called **cover memory: replacement memory**.

**screen reader** a software program for individuals with visual impairment that converts both text and graphical information on a personal computer screen to a form that can be spoken through a **speech synthesizer** or shown on a refreshable **Braille display**.

**screen touch matching** in parapsychology experiments using ZENER CARDS, a technique in which the participant indicates his or her guess concerning the symbol on the top card in an inverted deck by pointing to one of five positions corresponding to each of the possible symbols. The card is then placed in this position, still face down, for later checking. Because the person handling the cards never sees them face up, the technique is used in tests of clairvoyance as opposed to telepathy. Also called **screened touch matching**. See also **BASIC TECHNIQUE**.

**scree plot** in **EXPLORATORY FACTOR ANALYSIS**, a graphic that shows (in descending order) the **eigenvalues** of the **communality-adjusted correlation matrix**. Researchers examine the plot to identify a “break” in the curve between strong, dominant factors at the top and smaller factors at the bottom. In this way, they can determine which factors to retain in the analysis. The plot was named by Raymond B. Cattell, in analogy to the sloping heaps of differently sized rocks (scree) that form at the foot of a mountain.

**script** n. 1. a cognitive schematic structure—a mental road map—containing the basic actions (and their temporal and causal relations) that comprise a complex action. Also called **script schema**, 2. a structured representation consisting of a sequence of **CONCEPTUAL DEPENDENCIES** grouped together to capture the semantic relationships implicit in everyday human situations. It was designed for the purpose of computer-based story understanding. [created in 1966 by U.S. cognitive and computer scientist Roger C. Schank (1946– ) and U.S. psychologist Robert P. Abelson (1928–2005)] 3. see **SCRIPT ANALYSIS**.

**script analysis** in **TRANSACTIONAL ANALYSIS**, the examination of the client’s unconscious life plan, or **script**, which is based on fantasies, attitudes, and games or ploys derived from the individual’s early experiences. [developed by Canadian-born U.S. psychiatrist Eric Berne (1910–1970)]

**script theory** 1. the proposition that discrete affects, such as joy and fear, are prime motivators of behavior and that personality structure and function can be understood in terms of self-defining affective scenes and scripts. [proposed by Silvan S. Tomkins] 2. in **TRANSACTIONAL ANALYSIS**, the theory that an individual’s approach to social situations follows a sequence that was learned and established early in life.

**scrivener’s palsy** an archaic name for **WRITER’S CRAMP**.

**scrupulosity** n. overconscientiousness with respect to matters of right and wrong, often manifested as an obsession with moral or religious issues (e.g., preoccupation that one may commit a sin and go to hell) that results in compulsive moral or religious observance and that is highly distressing. Although it is often also called **religious obsessive-compulsive disorder**, it is more typically associated with **OBSESSIVE-COMPULSIVE PERSONALITY DISORDER**.

**scrying** n. a DIVINATION practice in which a person attempts to see visions of or gain insights about the past, present, or future by staring into fire, smoke, or (more commonly) a shiny, opaque, or reflective medium, such as water, crystals or a crystal ball, glass, or mirrors. See also **CRYSTAL GAZING**.

**SCU** abbreviation for **SPECIAL CARE UNIT**.

**sculpting** n. see **FAMILY SCULPTING**.

**SE** symbol for **STANDARD ERROR**.

**SD** symbol for **STANDARD DEVIATION**.

**SDAT** abbreviation for **SENILE DEMENTIA OF THE ALZHEIMER’S TYPE**.

**SDS** 1. abbreviation for **SYMPTOMS OF DEMENTIA SCREENER**. 2. abbreviation for **ZUNG SELF-RATING DEPRESSION SCALE**.

**SDT** 1. abbreviation for **SIGNAL DETECTION THEORY**. 2. abbreviation for **SOCIAL DOMINANCE THEORY**.

**seamstress’s cramp** a type of **OCUPATIONAL CRAMP** affecting the hands and manifested by the inability to perform such manual operations as threading a needle and...
using scissors to cut cloth. See also REPETITIVE STRAIN INJURY.

**search** n. 1. a mental process in which a set of memories or other MENTAL REPRESENTATIONS is checked for the presence or absence of a particular target item. For example, one might search one's memory for the name of a former teacher. 2. a task in which a person is asked to check an array of presented stimuli, or a previously memorized list of stimuli, to determine whether any of a set of target stimuli is in the array or list. See VISUAL SEARCH. See also CONSISTENT MAPPING; VARYING MAPPING. 3. in problem solving, the process by which the solver attempts to find the correct answer or best solution from among a range of alternatives. See BACKWARD SEARCH; BEST-FIRST SEARCH; EXHAUSTIVE SEARCH; HEURISTIC SEARCH; SELF-TERMINATING SEARCH. 4. in artificial intelligence, the systematic investigation of states of a problem or game as part of finding a solution. There are multiple approaches to the search, including BACKTRACK SEARCH, DEPTH-FIRST SEARCH, BREADTH-FIRST SEARCH, and *A* SEARCH, and many techniques are available for investigating the relevance of these approaches for different applications.

**search asymmetry** in studies of VISUAL SEARCH, the situation in which a search for the presence of a feature produces one pattern of results but a search for the absence of that feature produces another. For example, searching for a *Q* in a field of *O*s (i.e., searching for the “tail” segment in the *Q*) is relatively easy, but searching for an *O* in a field of *Q*s (i.e., searching for the absence of this segment) is difficult.

**search image** a predator’s visual or odor-based sense of a prey animal. Predators develop a search image for particular prey through repeated encounters with it, after which they may temporarily specialize in that animal even in the presence of other suitable prey. They may, however, develop new search images after repeated encounters with other prey.

**search of associative memory** (SAM) a GLOBAL MEMORY MODEL used to explain recall and recognition memory in laboratory studies. Information may reside in SHORT-TERM MEMORY, from which it may be stored in LONG-TERM MEMORY or used to search long-term memory. Associations can be formed among items in memory and between items and the context in which they occur. See also DUAL-STORE MODEL OF MEMORY. [described in 1981 by U.S. cognitive psychologist Richard M. Shiffrin (1942– ) and Dutch psychologist Jeroen G. W. Raaijmakers]

**Seashore audiometer** an instrument used to measure threshold sound intensity. [Carl Emil SEASHORE]

**Seashore Measures of Musical Talent** a series of recorded subtests of the components of musical aptitude, including tonal memory, time awareness, rhythm awareness, pitch discrimination, timbre awareness, and loudness discrimination. In these six subtests, various pairs of tones, tonal sequences, or rhythmic patterns are presented and the participant must distinguish each along the particular dimension of interest. For example, in the time awareness subtest, the participant must indicate for each of 50 tone pairs whether the second tone is longer or shorter than the first. Also called **Seashore Measures of Musical Ability.** [originally developed in 1919 and subsequently revised in 1939 by Carl Emil SEASHORE]

**Seashore Rhythm Test** a neuropsychological test in which the participant listens to a recording of pairs of rhythmic patterns and indicates whether they are the same or different. The test is used by neuropsychologists to measure generalized cerebral function, although it was developed as a subtest of the **Seashore Measures of Musical Talent** to predict musical talent and knowledge. [Carl Emil SEASHORE]

**seasickness** n. MOTION SICKNESS occasioned by sea travel.

**seasonal affective disorder** (SAD) a mood disorder in which there is a predictable occurrence of MAJOR DEPRESSIVE EPISODES, MANIC EPISODES, or both at particular times of the year. The typical pattern is the occurrence of major depressive episodes during the fall or winter months. Also called **seasonal mood disorder.**

**seasonality effect** the observation that individuals with schizophrénias are most likely to have been born during the months of January to April. The hypothesized significance of the season of birth is uncertain. See also VIRAL HYPOTHESIS. [advanced by U.S. psychiatrist E. Fuller Torrey (1937– )]

**seasonal mood disorder** see **SEASONAL AFFECTIVE DISORDER.**

**seasonal variation** behavioral, psychological, or physiological changes that vary over seasons or that occur in response to seasonal changes. In nonhuman animals and plants, seasonal variation is often controlled by PHOTOPERIODISM. Examples include the increased rate of food intake and body weight gain in hibernating animals in late summer, seasonal migrations, and seasonal changes in gonad size and hormone production in temperate-zone species leading to reproduction at optimal times.

**seat of mind** the proposed place or organ in the body that serves as the physical location of the mind (or, in CARTESIAN DUALISM, the location in the body where mind and body interact; see CONARIUM). In current thinking, the brain is the seat of the mind; historically, other organs have been proposed, such as the heart. Some theories suggest that the mind (or the spirit) is diffused throughout the body.

**Seattle Longitudinal Study** a comprehensive ongoing study of intelligence and cognitive functioning from young adulthood to old age. Using a sequential design (a combination of cross-sectional and longitudinal data-collection methods), the study began in 1956, with testing done in 7-year intervals up to the present. Original testing was based on the Primary Mental Abilities Test (see PRIMARY ABILITY); in subsequent intervals of the study, other tests were added to investigate various influences (e.g., cognitive style, personality, health, lifestyle, family environment, brain changes) on cognitive functioning during the aging process. Approximately 6,000 individuals, ranging from age 22 to 103, have participated in the study since its inception. [conducted by U.S. psychologists K. Warner Schaie (1928– ) and, since 1983, Sherry L. Willis]

**Seckel syndrome** a familial disorder, now linked to a defect on chromosome 3 (locus 3q22.1–24), marked by MICROCEPHALY, a beaklike nose, prominent eyes, a narrow face, short stature, and intellectual disability. It was originally called **bird-headed dwarfism.** Now also called **Seckel nanism; Virchow–Seckel syndrome.** [reported in 1960 by Helmut P. G. Seckel (1900–1960), German physician; the term **bird-headed dwarfism** was introduced by Rudolf Virchow (1821–1902), German pathologist]
seclusiveness n. the tendency to isolate oneself from social contacts or human relationships. See also PRIVACY.
—seclusive adj.

secondary aging changes due to biological aging but accelerated by disabilities resulting from disease or produced by extrinsic factors, such as stress, trauma, lifestyle, and the environment. Secondary aging is often distinguished from PRIMARY AGING, which is governed by inborn and age-related processes, but the distinction is not a precise one.

secondary amenorrhea see AMENORRHEA.

secondary appraisal in the COGNITIVE APPRAISAL THEORY of emotion, one’s evaluation of his or her ability to cope with the consequences of an interaction with the environment, which follows a PRIMARY APPRAISAL. See also COPING POTENTIAL; CORE RELATIONAL THEMES. [proposed by Richard S. Lazarus]

secondary attention active attention that requires control of the environment. In classical psychology, the term is used to denote a higher kind of attention, developed in humans after PRIMARY ATTENTION. Also called active attention. See also VOLUNTARY ATTENTION.

secondary auditory cortex (A2) see AUDITORY CORTEX.

secondary care health care services provided by medical specialists (e.g., cardiologists, urologists, dermatologists) to whom, typically, patients are referred by a PRIMARY CARE PROVIDER. Compare PRIMARY CARE; TERTIARY CARE.

secondary cause a factor that contributes to the onset of symptoms of a disorder but that in itself would not be sufficient to cause the disorder.

secondary circular reaction in PIAGETIAN THEORY, a repetitive action emerging around 4 to 5 months of age that signifies the infant’s aim of making things happen. This forward step occurs during the SENSORIMOTOR STAGE. The infant repeats actions, such as rattling the crib, that have yielded results in the past but is not able to coordinate them so as to meet the requirements of a new situation. Usually near the end of the child’s 1st year, that coordination ability emerges: In what is called coordination of secondary circular reactions (or of secondary schemes), the child becomes increasingly adept at the purposeful combination of secondary circular reactions to achieve a desired aim, such as picking up a pillow to get a toy placed under it, and is able to choose and coordinate previously developed SCHEMES that are logically related to the requirements of new situations. See PRIMARY CIRCULAR REACTION; TERTIARY CIRCULAR REACTION.

secondary control behavior that, though not directly controlling, is aimed at producing a sense of control by altering oneself (e.g., one’s values, priorities, behavior) so as to be more in line with the environment. Compare PRIMARY CONTROL. See LOCUS OF CONTROL.

secondary coping a stress-management strategy in which a person seeks to adjust his or her hopes, expectations, attributions, and other aspects of the self to achieve a better fit with current events and prevailing conditions. This adaptation of oneself to the environment represents a more internally focused COPING STRATEGY that generally is applied when stressors cannot easily be counteracted directly. It includes such mental actions as distraction, positive thinking, COGNITIVE RestructURING, and rethinking about the stressor or problem in such a way as to facilitate acceptance. Also called secondary control coping. Compare PRIMARY COPING. [identified in 1982 by Fred M. Rothbaum (1949–2011) and John R. Weisz (1945—). U.S. clinical and developmental psychologists, and Samuel S. Snyder, U.S. developmental psychologist]

secondary data information cited in a study that was not gathered directly by the current investigator but rather was obtained from an earlier study or source. The data may be archived or may be accessed through contact with the original researcher. When consulting or analyzing this information, the investigator should be sensitive to the original research questions and the conditions under which the observations were gathered. Compare PRIMARY DATA.

secondary defense symptoms a set of defensive measures used by obsessive individuals when their primary defenses against repressed memories no longer offer protection. The secondary defenses usually include obsessive thinking, including DOUBTING OBSESSION, and speculations, which may be expressed as phobias, ceremonial, superstitions, or pedantry. [defined by Sigmund Freud]

secondary deviance see PRIMARY DEVIANCE.

secondary disposition see PERSONAL DISPOSITION.

secondary drive a learned drive: that is, a drive that is developed through association with or generalization from a PRIMARY DRIVE. For example, in an AVOIDANCE CONDITIONING experiment in which a rat must go from one compartment into another to escape an electric shock, the secondary drive is fear of the shock and the primary drive with which it is associated is avoidance of pain. Also called acquired drive.

secondary elaboration in psychoanalysis, the process of altering the memory and description of a dream to make it more coherent and less fragmentary or distorted. See also DREAM-WORK.

secondary emotion an emotion that is not recognized or manifested universally across cultures or that requires social experience for its construction. For some theorists, PRIDE represents a secondary emotion, stemming from the conjunction of a PRIMARY EMOTION (JOY) and a favorable public reaction. Other secondary emotions include ENVY, FRUSTRATION, and JEALOUSY.

secondary environment an environment that is incidental or marginally important in a person’s life and in which interactions with others are comparatively brief and impersonal. An example is a bank or a shop. Compare PRIMARY ENVIRONMENT.

secondary gain in psychoanalytic theory, the advantage derived from a NEUROSES in addition to the PRIMARY GAIN of relief from anxiety or internal conflict. Advantages may include extra attention, sympathy, avoidance of work, and domination of others. Such gains are secondary in that they are derived from others’ reactions to the neurosis instead of from causal factors. They often prolong the neurosis and create resistance to therapy. Also called advantage by illness.

secondary group compared to a PRIMARY GROUP, a larger, less intimate, and more goal-focused group typical of more complex societies. Such social groups influence members’ attitudes, beliefs, and actions but as a supplement to the influence of small, more interpersonally intensive primary groups. Whereas primary groups, such as families and children’s play groups, are the initial socializ-
secondary gustatory cortex

ing agents, secondary groups, such as work groups, clubs, congregations, associations, and so on, become increasingly influential during adolescence and adulthood.

**secondary gustatory cortex** see TASTE CORTEX.

**secondary hypertension** see HYPERTENSION.

**secondary identification** identification with admired figures other than parents.

**secondary memory (SM)** memory that retains a large number of items relatively permanently, in contrast to PRIMARY MEMORY. The term was used in DUAL-STORE MODELS OF MEMORY before being replaced by LONG-TERM MEMORY. [introduced by William James]

**secondary mood disorder** a prolonged, pervasive emotional disturbance that occurs in the context of another disorder and whose symptoms may be caused by that other disorder.

**secondary motivation** motivation that is created by personal or social incentives (e.g., the urge to learn classical music or become a movie star) rather than by primary, physiological needs (e.g., for food). Compare PRIMARY MOTIVATION.

**secondary motor cortex** see MOTOR CORTEX.

**secondary narcissism** in psychoanalytic theory, self-love that develops later in life, after the original infantile PRIMARY NARCISSISM, and occurs when the LIBIDO is withdrawn from OBJECTS and centered on the self.

**secondary need** a need developed through association with or generalization from a PRIMARY NEED. Also called derived need.

**secondary oocyte** see OOGENESIS.

**secondary personality** a second discrete identity that repeatedly controls behavior in individuals with dissociative identity disorder. This personality is in sharp contrast to the original, PRIMARY PERSONALITY and generally has a different name as well as dramatically different attitudes, behavior, manner of speaking, and style of dress.

**secondary position** any location of binocular fixation other than the PRIMARY POSITION.

**secondary prevention** intervention for individuals or groups that demonstrate early psychological or physical symptoms, difficulties, or conditions (i.e., subclinical problems), which is intended to prevent the development of more serious dysfunction or illness. Compare PRIMARY PREVENTION; TERTIARY PREVENTION.

**secondary process** in psychoanalytic theory, conscious, rational mental activities under the control of the ego and the REALITY PRINCIPLE. This mental process, which includes problem solving, judgment, planning, and systematic thinking, enables individuals to meet both the external demands of the environment and the internal demands of their instincts in rational, effective ways. Also called secondary process thinking. Compare PRIMARY PROCESS.

**secondary quality** in the philosophy of John Locke, a sensible quality of an object that does not exist in the object itself but rather in the experience of the perciever. Color, for example, is a secondary quality, since the sensation of a particular color can only be produced by an object under certain conditions of light. Compare PRIMARY QUALITY.

**secondary reinforcement** 1. in OPERANT CONDITIONING, the process in which a neutral stimulus acquires the ability to influence the future probability of a particular response by virtue of being paired with another stimulus that naturally enhances such probability. That is, the initially neutral stimulus or circumstance functions as effective REINFORCEMENT only after special experience or training. For example, a person teaching a dog to understand the command "sit" might provide a treat and a simultaneous popping noise from a clicker tool each time the dog successfully performs the behavior. Eventually, the clicker noise itself (the conditioned or secondary reinforcer) can be used alone to maintain the desired behavior, with no treat reward being necessary. 2. the contingent occurrence of such a stimulus or circumstance after a response. Also called conditioned reinforcement. Compare PRIMARY REINFORCEMENT.

**secondary reinforcer** see NATURAL REINFORCER; SECONDARY REINFORCEMENT.

**secondary repression** see REPRESS P R ESSION.

**secondary reward** a reward with a learned value that facilitates the retrieval of a PRIMARY REWARD.

**secondary sensory area** any of the regions of the cerebral cortex that receive direct projections from the PRIMARY SENSORY AREA for any sense modality. An example is the SECONDARY SOMATOSENSORY AREA. Also called nonprimary sensory area.

**secondary sensory ending** see FLOWER-SPRAY ENDING.

**secondary sex characteristic** see SEX CHARACTERISTIC.

**secondary somatosensory area** (S2) an area of the cerebral cortex, located in the parietal lobe on the upper bank of the LATERAL SULCUS, that receives direct projections from the PRIMARY SOMATOSENSORY AREA and other regions of the anterior parietal cortex. It has outputs to other parts of the lateral parietal cortex and to motor and premotor areas. See also SOMATOSENSORY AREA.

**secondary spermatocyte** see SPERMATOGENESIS.

**secondary stuttering** dysfluency in speech characterized by uncomfortable awareness of and attempts to modify the dysfluency. Effort, fear, and anxiety are typically conveyed through abnormal or unusual movements of the face, head, or body (e.g., tics, blinking, lip tremor, head jerks, fist clenching). Compare PRIMARY STUTTERING.

**secondary suggestibility** a form of suggestibility that responds to indirect or hidden influence, as contrasted with direct or PRIMARY SUGGESTIBILITY. Some test results have indicated that these forms of suggestibility are only weakly correlated. Also called indirect suggestibility. See also TERTIARY SUGGESTIBILITY. [proposed by Hans Eysenck]

**secondary symptoms** 1. symptoms that are not a direct result of a disorder but are associated with or incidental to those that are (e.g., social avoidance accompanying obsessive-compulsive disorder). 2. symptoms that appear in the second stage of a disorder or that are derived from an earlier traumatic event, disease process, or disordered condition. 3. according to Eugen Bleuler, those symptoms of schizophrenia, such as delusions and hallucinations, that are shared with other disorders and therefore not specifically diagnostic of schizophrenia. Bleuler theorized that these symptoms do not stem directly from the disease
but rather begin to operate when the person reacts to some internal or external process. Also called accessory symptoms. Compare FUNDAMENTAL SYMPTOMS; PRIMARY SYMPTOMS.

**secondary task** in ergonomics, a task that is peripheral to a central or PRIMARY TASK in a situation requiring MULTIPLE-TASK PERFORMANCE. The operator is expected to allocate sufficient cognitive resources to processing the primary task before allocating remaining resources to processing the secondary task.

**secondary task methodology** an experimental design used in the study of attention in which participants perform a primary task as well as possible and a secondary task to the extent possible while maintaining performance on the primary task. Performance on the secondary task provides a profile of the attention required by the primary task at various phases. See also DUAL-TASK PERFORMANCE.

**secondary taste cortex** see TASTE CORTEX.

**secondary territory 1.** a space routinely used by a person or group who does not control or use it exclusively (e.g., the local tennis court). Habitual use may harbor feelings of possession, but they will acknowledge others’ claims. Compare PRIMARY TERRITORY; PUBLIC TERRITORY. See also PROXEMICS. 2. in animal behavior, see HOME RANGE.

**secondary traumatization 1.** see INTERGENERATIONAL TRAUMA. [term introduced in 1985 by U.S. psychiatrist Robert A. Rosenheck and Indian-born U.S. psychiatrist Pramila M. Nathan] 2. see VICARIOUS TRAUMATIZATION.

**secondary visual cortex** (V2) the area immediately surrounding the primary visual cortex (see STRIATE CORTEX) in the OCCIPITAL LOBES, receiving signals from it secondarily for analysis and further discrimination of visual input in terms of motion, shape (particularly complex shapes), and position. See also PRESTRIATE CORTEX; V2.

**secondary visual system** the visual pathway that lies outside of, and is phylogenetically older than, the PRIMARY VISUAL SYSTEM. Retinal input travels directly to the SUPERRIOR COLICULUS and then to visual nuclei in the thalamus other than the lateral geniculate nucleus (i.e., the PULVINAR AND LATERAL POSTERIOR NUCLEUS) before terminating in the PRESTRIATE CORTEX. The vision supported by the secondary visual system is relatively poor for the detection of form but allows localization and detection of movement. It functions relatively well in the newborn. See also BLIND-SIGHT.

**second cranial nerve** see OPTIC NERVE.

**second-degree relative** a grandparent, aunt, uncle, or cousin. The closeness of a relative with a particular hereditary disease has implications in assessing the risk for a particular person. Compare FIRST-DEGREE RELATIVE.

**second-generation antipsychotic** see ANTIPSYCHOTIC; ATYPICAL ANTIPSYCHOTIC.

**second messenger** an ion or molecule inside a cell whose concentration increases or decreases in response to stimulation of a cell RECEPTOR by an agonist (e.g., a neurotransmitter, hormone, or drug). The second messenger acts to relay and amplify the signal from the agonist (the first messenger) by triggering a range of cellular activities. For example, receptors for the catecholamine neurotransmitters epinephrine and norepinephrine are coupled to G PROTEINS, whose activation in post synaptic neurons affects levels of second messengers that act to open or close certain ION CHANNELS. Second messengers include CYCLIC AMP, CYCLIC GMP, IP₃ (see INOSITOL PHOSPHATES), and calcium ions.

**second moment** see MOMENT.

**second-order conditioning** in CLASSICAL CONDITIONING, the establishment of a conditioned response as a result of pairing a neutral stimulus with a conditioned stimulus that gained its effectiveness by being paired with an unconditioned stimulus. See HIGHER ORDER CONDITIONING.

**second-order factor** a latent construct that emerges from a further FACTOR ANALYSIS (i.e., a second-order factor analysis) of the primary dimensions derived from correlations among a set of items or variables. The higher order dimensions so derived are held to generate the FIRST-ORDER FACTORS that in turn generate observed responses at the level of the individual item or scale.

**second-order interaction** in ANALYSIS OF VARIANCE or REGRESSION ANALYSIS, an effect in which three independent variables combine to have a nonadditive influence on a dependent variable. See HIGHER ORDER INTERACTION.

**second-order language** see METALANGUAGE.

**second-order neuron** the second neuron in any neural pathway. In the somatosensory system, for example, a second-order neuron receives input from a FIRST-ORDER NEURON in the spinal cord and transmits it to the thalamus.

**second-order schedule** a SCHEDULE OF REINFORCEMENT in which the units counted are not single responses but completions of a particular reinforcement schedule (the unit schedule). For example, in a second-order fixed-ratio 5 of fixed-interval 30-second schedule [FR 5 (FI 30 seconds)], reinforcement is delivered only after five successive FI 30-second schedules have been completed. Often, a brief stimulus of some sort is presented on completion of each unit schedule.

**second-person perspective** the point of view of one person aware of another’s subjectivity, as in an I–THOU relationship. Compare FIRST-PERSON PERSPECTIVE; THIRD-PERSON PERSPECTIVE.

**second quartile** see QUARTILE.

**second-rank symptoms** common manifestations of schizophrenia that may be seen in other disorders as well. They include RESTRICTED AFFECT, confusion or bewilderment, and the sudden onset of paranoid, persecutory, and other types of delusions. Although not specifically indicative of schizophrenia, second-rank symptoms nonetheless may be useful for differential diagnosis in certain situations. They are the complement of FIRST-RANK SYMPTOMS, [part of a diagnostic classification system for schizophrenia proposed in 1938 by German psychiatrist Kurt Schneider (1887–1967)].

**second sight** an alleged paranormal faculty that enables some individuals to see events that are remote in time or space. See CLAIRVOYANCE; PRECognition.

**second sleep** see SEGMENTED SLEEP.

**secretin** n. a hormone produced by the upper small intestine in response to the arrival of hydrochloric acid from the stomach. Secretin stimulates secretion of pancreatic juice by the pancreas and of bile by the liver. Its function was discovered in 1902 by British physiologists William Maddock Bayliss (1860–1924) and Ernest Starling (1866–1912).
secretion

1927), and it was the first substance demonstrated to be a hormone.

**secretion** n. 1. the synthesis and discharge of specific substances from cells (which may be organized in glands) into other parts of the body. The substance produced may be released directly into the blood (an endocrine secretion) or through a duct (see exocrine gland). 2. the substance discharged by this process. —secretory adj.

**SECs** abbreviation for STIMULUS EVALUATION CHECKS.

**sect** n. a group whose members adhere to a distinctive set of doctrines, beliefs, and rituals. The term is often applied to a dissenting faction that breaks away from a larger religious, political, or other social organization. —sectarian adj.

**section** n. 1. a thin slice of tissue (e.g., brain tissue) that can be examined microscopically. See CROSS SECTION. 2. an image of a body part in any plane obtained by such techniques as COMPUTERIZED TOMOGRAPHY or MAGNETIC RESONANCE IMAGING.

**sectioning** n. the educational strategy of offering the same course, typically taught by the same teacher, several times during the day. This enables many students to take the same course but keeps the teacher–pupil ratio low.

**Section 504 plan** written documentation of the accommodations needed for any student with disabilities so that his or her individual educational needs are met as adequately as the needs of students without disabilities, in compliance with U.S. legislation Section 504 of the Rehabilitation Act of 1973. Students are in a general education setting, and accommodations include educational interventions, aids, and services. See also INDIVIDUALIZED EDUCATION PROGRAM.

**secular** adj. civil, temporal, and free from religious influence or affiliation. A secular society, for example, is one in which various religions may exist but in which the laws and governing institutions have no basis in religious doctrine. —secularism n. —secularist n. —secularize vb.

**secular humanism** a broad perspective, increasingly influential in Western countries since the mid-20th century, that can be characterized by some or all of the following: (a) a belief in seeking solutions to human problems through science and rational thought rather than through religious or traditional forms of morality; (b) a focus on this world rather than on a putative afterlife; (c) an emphasis on an intrinsic human potential for growth rather than on human limitation or sinfulness; (d) a search for new truth and a belief in free thought, free speech, and free inquiry as the means to find it; (e) an acceptance of cultural and human diversity, including sexual diversity; and (f) an acceptance of some degree of RELATIVISM in ethics, usually accompanied by some type of UTILITARIANISM in practice.

**secure attachment** 1. in the STRANGE SITUATION, the positive parent–child relationship, in which the child displays confidence when the parent is present, shows mild distress when the parent leaves, and quickly reestablishes trust and a sense of safety, confidence, and freedom when the parent is present, shows mild positive parent–child relationship, in which the child dis-}

**secure base** a place of safety, represented by an attachment figure (e.g., a parent), that an infant uses as a base from which to explore a novel environment. The infant often returns or looks back to the parent before continuing to explore. Also called secure base phenomenon.

**secure treatment setting** a locked residential setting providing safety and treatment services for adolescent or adult offenders, usually felons, with intellectual or developmental disabilities.

**security** n. a sense of safety, confidence, and freedom from apprehension. In psychology, security is believed to be engendered by such factors as warm, accepting parents and friends; development of age-appropriate skills and abilities; and experiences that build a stable sense of self. The development of security in the psychotherapeutic context (most often referred to as TRUST) is seen as a mediating goal that encourages open exploration of emotional and behavioral issues and is considered to be part of a strong and healthy THERAPIST–PATIENT RELATIONSHIP.

**security blanket** see TRANSITIONAL OBJECT.

**security operations** in the approach of Harry Stack SULLIVAN, a variety of interpersonal defensive measures, such as arrogance, boredom, or anger, that are used as a protection against anxiety or loss of self-esteem.

**security theory** the proposition that infants and young children need to develop a secure dependence on their parents before they can explore unfamiliar situations. Lack of this secure base hampers a child from exploration and therefore from acquiring new skills. Mary D. Saltz AINSWORTH used this theory as the initial framework for her studies on infant attachment. [proposed by William Ernest BLATZ]

**SED** abbreviation for serious EMOTIONAL DISTURBANCE.

**sedative** 1. n. a drug that has a calming effect and therefore relieves anxiety, agitation, or behavioral excitement by depressing the central nervous system. The degree of sedation depends on the agent, the size of the dose, the method of administration, and the condition of the patient. A drug that sedates in small doses may induce sleep in larger doses and may be used as a HYPNOTIC; such drugs are commonly known as sedative–hypnotics. BENZODIAZEPINES are commonly used as sedatives. 2. adj. producing sedation.

**sedative, hypnotic, and anxiolytic drug** any of a group of CNS DEPRESSANTS that have been developed for therapeutic use because of their calming effect (i.e., sedative) and ability to induce sleep (i.e., hypnotic) and reduce anxiety (i.e., anxiolytic). They include the BARBITURATES, MEPHRAMATE, and the BENZODIAZEPINES. At low doses, these drugs are prescribed for daytime use to reduce anxiety; at higher doses, many of the same drugs are prescribed as sleeping pills. Although efficacious when used sparingly, over the long term all induce marked tolerance, and cessation of use can precipitate potentially life-threatening withdrawal phenomena. Acute abuse can yield dangerous intoxication effects, and chronic abuse can cause a range of serious, irreversible conditions.

**sedative, hypnotic, or anxiolytic abuse** in DSM–IV–TR, a pattern of use of sedative, hypnotic, or anxiolytic drugs marked by recurrent significant adverse consequences related to the repeated ingestion of these substances. This diagnosis is preempted by the diagnosis of SEDATIVE, HYPNOTIC, OR ANXIOLYTIC DEPENDENCE. If the criteria for abuse and dependence are both met, only the lat-
ter diagnosis is given. Both have now been subsumed in DSM–5 under sedative, hypnotic, or anxiolytic use disorder and are no longer considered distinct diagnoses.

sedative, hypnotic, or anxiolytic dependence in DSM–IV–TR, a pattern of repeated or compulsive use of sedative, hypnotic, or anxiolytic drugs despite significant behavioral, physiological, and psychosocial problems associated with their use and possible tolerance and withdrawal symptoms if use is suspended (see SEDATIVE, HYPNOTIC, OR ANXIOLYTIC WITHDRAWAL). The separate diagnoses for dependence on and abuse of these substances have been subsumed in DSM–5 under sedative, hypnotic, or anxiolytic use disorder and are no longer considered distinct entities.

sedative-, hypnotic-, or anxiolytic-induced persisting amnestic disorder a disturbance in memory due to the persisting effects of sedative, hypnotic, or anxiolytic drugs. The ability to learn new information or to recall previously learned information is impaired enough to interfere markedly with social or occupational functioning and to represent a significant decline from a previous level of functioning. Unlike those diagnosed with ALCOHOL-INDUCED PERSISTING AMNESTIC DISORDER, people diagnosed with this disorder can recover memory functioning.

sedative, hypnotic, or anxiolytic intoxication in DSM–IV–TR and DSM–5, a reversible syndrome specific to the recent ingestion of sedative, hypnotic, or anxiolytic drugs. It includes clinically significant behavioral or psychological changes (e.g., inappropriate sexual or aggressive behavior, mood lability, impaired judgment, impaired social or occupational functioning), as well as one or more signs of physiological involvement (e.g., slurred speech, an unsteady gait, involuntary eye movements, memory or attentional problems, incoordination, stupor or coma).

sedative, hypnotic, or anxiolytic withdrawal in DSM–IV–TR and DSM–5, a characteristic withdrawal syndrome, potentially life threatening, that develops after cessation of sedative, hypnotic, or anxiolytic drugs. Symptoms may include autonomic hyperactivity; increased hand tremor; insomnia; nausea or vomiting; transient visual, tactile, or auditory hallucinations or illusions; psychomotor agitation; anxiety; either a transient worsening (rebound) of the condition that prompted treatment or a recurrence of that condition; and tonic–clonic seizures. Risks of physiological dependence and withdrawal are present with long-term use of all benzodiazepines and similarly acting anxiolytics. Short-acting benzodiazepines pose particular withdrawal risks, and patients taking high doses of short-acting agents must be carefully withdrawn over an extended period to avoid adverse outcomes. See also SUBSTANCE WITHDRAWAL.

sedative, hypnotic, or anxiolytic withdrawal delirium in DSM–IV–TR and DSM–5, a reversible syndrome that develops over a short period of time (usually hours to days) following cessation of prolonged, heavy consumption of sedative, hypnotic, or anxiolytic drugs. It involves a disturbance of consciousness (e.g., reduced ability to focus, sustain, or shift attention) accompanied by changes in cognition (e.g., memory deficit, disorientation, language disturbance) in excess of those usually associated with withdrawal from these substances.

sedative occupation an activity or task, such as knitting, that has a soothing or sedating effect because of its repetitious nature. Compare STIMULATING OCCUPATION.

seduction n. 1. the inducement of a person to participate in sexual intercourse, without the use of force. 2. more generally, the act or process of attracting or alluring.—seduce vb.

SEE symbol for STANDARD ERROR OF ESTIMATE.

SEEKING system collectively, those parts of the brain (e.g., nucleus accumbens, amygdala) within or connected to the MESOLIMBIC SYSTEM and MESOCORTICAL SYSTEM that are associated with goal-directed behaviors and are strongly influenced by DOPAMINE. [coined by Estonian-born U.S. physiological psychologist Jaak Panksepp (1943– )]

segment n. in linguistics, a consonantal or vowel PHONEME occurring as part of a consecutive sequence of these. See SUPRASEGMENTAL.—segmental adj.

segmental reflex see SPINAL REFLEX.

segmentation n. 1. division of a whole into parts. 2. in linguistics, the process through which a hearer separates speech into a sequence of identifiable words and phonemes. 3. the division of an animal’s body into a number of similar compartments (segments or metameres). Metameric segmentation is most apparent in annelid worms, in which the arrangement of muscles, blood vessels, nerves, and so on recur in each segment. 4. see CLAYWAGE.

segmented regression see PIECEWISE REGRESSION.

segmented sleep a pattern in which two periods of nighttime sleep are separated by an extended period of wakefulness. It has been suggested that this pattern, called first sleep and second sleep and often involving a third period of light sleep during the day, may have been the norm for human beings before industrialization and the advent of electric lighting. See POLYPHASIC SLEEP. [described by U.S. historian A. Roger Ekirch in 2001]

segregated model in evaluation research, an administrative relationship, used in FORMATIVE EVALUATION, between the program director, the production unit, and the evaluation unit as three distinct entities. In this model, the production unit and the evaluation unit have equal importance and share improved access to the program director. Compare INTEGRATED MODEL.

segregation n. 1. the separation or isolation of people (e.g., ethnic groups) or other entities (e.g., mental processes) so that there is a minimum of interaction between them. 2. in genetics, the separation of the paired ALLELES of any particular gene during cell division (see MEIOSIS), leading to sex-cell formation. 3. in genetics, separation of the SISTER CHROMATIDS of each chromosome during normal cell division (MITOSIS).

segregation analysis a statistical method to determine if particular traits show MENDELIAN INHERITANCE.

seismic communication the use of the ground or other substrate by some animals to transmit signals between individuals. Rabbles, some frogs, and kangaroo rats thump on the ground with their feet in distinctive patterns that provide cues for individual recognition and may serve to attract mates or repel intruders. Ongoing research by U.S. biologist Caitlin O’Connell-Rodwell (1965– ) has established that elephants use seismic methods for long-distance communication, including estrus calls.

seizure n. a discrete episode of uncontrolled, excessive electrical discharge of neurons in the brain. The resulting clinical symptoms vary based on the type and location of the seizure. See EPILEPSY.
seizure disorder

**seizure disorder** see EPILEPSY.

**selected group** a sample explicitly chosen with respect to specific criteria related to the purpose of a research study. For example, in a study of attitudes of older adults, a researcher might choose a sample of citizens ages 65 and over from four geographic regions in the United States. Also called **selected sample**.

**selection** *n.* 1. the differential survival of some individuals and their offspring compared with others, causing certain physical or behavioral traits to be favored in subsequent generations. The general process is known as **natural selection**, with components of **individual selection** and **kin selection**. 2. the process of choosing an item (e.g., an individual, an object, a measurement) from a larger universe of units for a purpose, such as study, testing, classifying, or working (hiring employees).

**selection bias** see **SAMPLING BIAS**.

**selection invariance** in choosing among applicants for employment, admission to college, or other purposes, the property of a selection procedure such that it is equally efficient (i.e., has a similar numbers of errors) for all subgroups of applicants (e.g., ethnic or income groups). Selection invariance is the empirically testable assumption that there is equal **sensitivity** and equal **specificity** across all groups. Compare **MEASUREMENT INVARiance**.

**selectionist brain theory** see **NEURAL DARWINISM**.

**selection model** a two-stage **REGRESSION ANALYSIS** used to estimate **PARAMETERS** and **STANDARD ERRORS** in an unbiased way when scores for one aspect of the sample may be affected by a nonrandom selection process. An example of data that could be appropriate for this method is women’s salaries: Some aspects of the data could be modeled using standard regression methods, but the preponderance of zero salaries (reflecting a decision by some women not to work) would also need to be incorporated into the analysis. See also **TRUNCATED DISTRIBUTION**.

**selection pressure** a measure of the influence that **natural selection** has on the survival of some genotypes over others and thus the degree to which it alters the genetic composition of a population over successive generations.

**selection ratio** the proportion of those eligible to be selected for a purpose (e.g., inclusion in research) that actually are selected. In **PERSONNEL SELECTION**, for example, it is the number of applicants who are hired to perform a job in an organization divided by the total number of applicants. The lower the selection ratio, the more competitive the hiring situation will be and the more useful (all other factors being held constant) any given **PREDICTOR VARIABLE** will be in making selection decisions.

**selection research** the use of empirical investigation to determine the reliability, validity, utility, and fairness of procedures used in **PERSONNEL SELECTION** and to maximize the effectiveness of these procedures.

**selection test** any physical or mental test to assess an individual’s suitability for a task. Such tests are usually used to screen and select people for occupational and educational placement. See also **EMPLOYMENT TEST**.

**selective action** an action whereby a reinforcer may have a greater effect on some responses than on others (i.e., its effects are selective).

**selective adaptation** the observation that perceptual adaptation can occur in response to certain stimulus qualities while being unaffected by others. For example, color adaptation can take place independently of motion adaptation.

**selective agent** a factor in the environment that exerts **SELECTION PRESSURE** and brings about **NATURAL SELECTION**.

**selective amnesia** the forgetting of particular issues, people, or events that is too extensive to be explained by normal forgetfulness and that is posited to be organized according to emotional, rather than temporal, parameters. The selectivity appears to be of benefit to or convenient for the person who cannot remember. See also **DISSOCIATIVE AMNESIA**.

**selective attention** concentration on certain stimuli in the environment and not on others, enabling important stimuli to be distinguished from peripheral or incidental ones. Selective attention is typically measured by instructing participants to attend to some sources of information but to ignore others at the same time and then determining their effectiveness in doing this. Also called **controlled attention**: directed attention; **executive attention**. See also **FOCAL ATTENTION**.

**selective breeding** the breeding of nonhuman animals with known genetic characteristics to produce a particular kind of animal or to produce uniform animals with identical genetic characteristics.

**selective cell death** an early developmental process in which neurons that are not activated by sensory and motor experience die.

**selective dropout** the nonrandom loss of participants from a study that occurs when an identified feature of the study design (e.g., topic studied, number of tasks) interacts with respondent characteristics (e.g., depression, education level). See **ATTENTION**.

**selective estrogen receptor modulator** (**SERM**) see **ANTHISTORY**.

**selective inattention** 1. unmindful absence or failure of attention to particular physical or emotional stimuli. 2. a perceptual defense in which anxiety-provoking or threatening experiences are ignored or forgotten. [defined by Harry Stack SULLIVAN]

**selective information processing** the processing of attitude-relevant information in a biased manner. Although a number of potential biases are possible, it has traditionally been assumed that when this type of processing occurs, the bias will be toward confirming the attitude. Bias can occur at one or more of the following stages of processing: exposure, attention, encoding, perception, and retrieval. See also **BIASED ELABORATION**; **BIASING FACTOR**; **DEFENSIVE PROCESSING**.

**selective learning** learning to make only one of several possible responses or learning about one stimulus when several stimuli are available. A particular response or stimulus could have a selective advantage due to biological **PREPAREDNESS**, previous experience, or salience in a given situation. See also **KAMIN EFFECT**; **OVERSHADOWING**.

**selective listening** attending to only one stream of auditory stimuli when two or more streams are presented.

**selective mutism** in **DSM–IV–TR** and **DSM–5**, a rare disorder, most commonly but not exclusively found in young children, characterized by a persistent failure to speak in certain social situations (e.g., at school) despite
the ability to speak and to understand spoken language. Age of onset is usually before 5 years, and the failure to speak lasts at least 1 month (not counting the first month at school, when many children are shy about talking). Generally, these individuals function normally in other ways, although some may have additional disabilities. Most learn age-appropriate skills and academic subjects. Currently, selective mutism is thought to be related to severe anxiety and social phobia, and it is classified as an anxiety disorder in DSM-5, but the exact cause is unknown. It was formerly called elective mutism.

**selective optimization with compensation** a process used in SUCCESSFUL AGING to adapt to biological and psychological deficits associated with aging. The process involves emphasizing and enhancing those capacities affected only minimally by aging (selective optimization) and developing new means of maintaining functioning in those areas that are significantly affected (compensation). [described by German psychologists Paul B. Baltes and Margret M. Baltes (1939–1999)]

**selective perception** the process in which people choose to attend to one or a few stimuli from the myriad array of stimuli presented to the senses at any one time. See also MOTIVATIONAL SELECTIVITY; PERCEPTUAL SET.

**selective permeability** the property of a membrane that allows some substances to pass through but not others.

**selective placement** see JOB PLACEMENT.

**selective potentiation** the enhancement of the sensitivity or activity of certain NEURAL CIRCUITS.

**selective rearing** an experimental paradigm in which a nonhuman animal is raised from birth or from the time of eye opening under conditions that restrict its visual experience. This induces long-term changes in the structure and function of its visual system. For example, MONOCULAR REARING reduces the number of neurons in the STRATE Cortex that are sensitive to binocular stimulation and alters the structure of the OCULAR DOMINANCE COLUMNS; rearing with prism goggles that restrict the orientations that are visible can alter the orientation selectivity of neurons and the ORIENTATION COLUMNS in the striate cortex.

**selective reminding test** any memory test in which the participant is given the answer when it cannot be remembered so that he or she is more likely to answer correctly on subsequent trials. For instance, if the word pencil is presented on a list-learning task and the participant is unable to recall it, the word would then be presented along with other words not recalled. The best known of the clinical selective reminding tests is the Buschke–Fuld Selective Reminding Test.

**selective response** a response that has been differentiated from a group of possible alternative responses.

**selective retention** variation between individuals in the capacity to remember with respect to the vividness, accuracy, quantity, and specific contents of memory. This selectivity is usually determined by such factors as interest, experience, motivation, and emotional arousal.

**selective serotonin reuptake inhibitor** see SSRI.

**selective silence** in psychotherapy, a prolonged silence imposed by the therapist to generate tension that may encourage the client to speak. Thus beginning or resuming communication in a session.

**selective value** the relative importance of any factor in determining the evolution of organs, traits, or species through NATURAL SELECTION. See also SELECTIVE AGENT.

**selective physiology** see selective optimization with compensation.

**self** n. the totality of the individual, consisting of all characteristic attributes, conscious and unconscious, mental and physical. Apart from its basic reference to personal IDENTITY, being, and experience, the term’s use in psychology is wide-ranging. According to William James, self can refer either to the person as the target of appraisal (i.e., one introspectively evaluates how one is doing) or to the person as the source of AGENCY (i.e., one attributes the source of regulation of perception, thought, and behavior to one’s body or mind). Carl Jung maintained that the self gradually develops by a process of INDIVIDUATION, which is not complete until late maturity is reached. Alfred Adler identified the self with the individual’s LIFESTYLE; the manner in which he or she seeks fulfillment. Karen D. Horney held that one’s REAL SELF, as opposed to one’s idealized self-image, consists of one’s unique capacities for growth and development. Gordon W. Allport substituted the word PROPRIUM for self and conceived of it as the essence of the individual, consisting of a gradually developing body sense, identity, self-estimate, and set of personal values, attitudes, and intentions. Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981) used the term to denote the sense of a coherent, stable (yet dynamic) experience of one’s individuality, continuity in time and space, autonomy, efficacy, motivation, values, and desires; he believed that this sense emerges through healthy narcissistic development empathically supported by the significant figures in one’s early life and that, conversely, narcissistic developmental failure leads to a fragile or incoherent sense of self. See SELF PSYCHOLOGY. See also FALSE SELF; MULTIPLE SELVES; PHENOMENAL SELF; SENSE OF SELF; TRUE SELF.

**self-abasement** n. 1. the act of degrading or demeaning oneself. 2. extreme submission to the will of another person. Also called self-debasement.

**self-abuse** n. a euphemism for MASTURBATION. The term apparently evolved from an attempt by certain 18th-century religious and medical writers to identify masturbation as “the sin of Onan” (see ONANISM) and to substantiate unscientific claims that a number of disorders (e.g., blindness, intellectual disability) were produced by masturbation.

**self-acceptance** n. a relatively objective sense or recognition of one’s abilities and achievements, together with acknowledgment and acceptance of one’s limitations. Self-acceptance is often viewed as a major component of mental health.
self-activity

**self-activity n.** the performance of actions that have been determined by oneself, with or without dependence on outside activators.

**self-actualization n.** the complete realization of that of which one is capable, involving maximum development of abilities and full involvement in and appreciation for life, particularly as manifest in PEAK EXPERIENCES. The term is associated especially with Abraham Maslow, who viewed the process of striving toward full potential as fundamental yet obtainable only after the basic needs of physical survival, safety, love and belongingness, and esteem are fulfilled. Also called self-realization.

**self-administration n.** 1. among humans, the taking of a medication (e.g., injecting insulin) or an abused substance (e.g., injecting heroin, inhaling cannabis) by the individual himself or herself. 2. in nonhuman animal research, a procedure used to study the rewarding effects of drugs. Animals (usually primates or rodents) are required to perform an OPERANT RESPONSE (e.g., lever pressing) to receive a drug infusion, which is delivered via an intravenous catheter or through a CANNULA implanted in the brain. Also called drug self-administration.

**self-advocacy n.** the process by which people make their own choices and exercise their rights in a self-determined manner. For people with developmental and other disabilities, for example, self-advocacy might entail making informed decisions about what services to accept, reject, or insist be altered.

**self-affirmation n.** 1. any behavior that confirms the moral and adaptive adequacy of the self. See SELF-AFFIRMATION THEORY. 2. in psychotherapy, a positive statement or set of such statements about the self that a person is required to repeat on a regular basis, often as part of a treatment for depression, negative thinking, or low self-esteem. 3. in performance or competitive situations, any thought about oneself that is believable and vivid and that reinforces positive characteristics, abilities, or skills.

**self-affirmation theory** the concept that people are motivated to maintain views of themselves as well adapted, moral, competent, stable, and able to control important outcomes. When some aspect of this self-view is challenged, people experience psychological discomfort. They may attempt to reduce this discomfort by directly resolving the inconsistency between the new information and the self, by affirming some other aspect of the self, or both. Self-affirmation theory has been used as an alternative to COGNITIVE DISSONANCE THEORY for explaining some phenomena. See also DISSONANCE REDUCTION; SELF-CONSISTENCY PERSPECTIVE. [originally proposed by U.S. psychologist Claude M. Steele (1946– )]

**self-alienation n.** estrangement from oneself, typically accompanied by significant emotional distancing. The self-alienated individual is frequently unaware of or largely unable to describe his or her own intrapsychic processes.

**self-analysis n.** 1. generally, the investigation or exploration of the self for the purpose of better understanding personal thoughts, emotions, and behavior. Self-analysis occurs consciously and nonconsciously in many contexts of daily life, and with assistance from the therapist, it is a crucial process within most forms of psychotherapy. 2. an attempt to apply the principles of PSYCHOANALYSIS to a study of one’s own drives, feelings, and behavior. Early in his career, Sigmund Freud proposed self-analysis as part of the preparation of an analyst, and much of his early psychoanalytic theory was based on his own self-analysis as described in The Interpretation of Dreams (1900). He later dropped the idea in favor of a TRAINING ANALYSIS. Nonetheless, most psychoanalysts conduct an ongoing self-analysis to monitor for COUNTERTRANSFERENCE and blind spots as they work with patients. —self-analytic adj.

**self-appraisal n.** see SELF-CONCEPT.

**self as agent n.** 1. the self that has goals, plans, and control over voluntary actions. Gordon W. Allport and others considered this term to be similar in meaning to the “I” in the thought of William James (see NOMINATIVE SELF). See also SELF AS OBSERVER. 2. the aspect of the self that has agency and plays a role in a psychic process. In this sense, the term is closer to James’s “me” (see EMPIRICAL SELF).

**self as known n.** the self that is known through reflection (see EMPIRICAL SELF). In the thought of William James, it contrasts with the self AS KNOWN and is synonymous with the “I” (see NOMINATIVE SELF). See also SELF AS AGENT.

**self-assertion n.** the act of putting forward one’s opinions or of taking actions that express one’s needs, rights, or wishes. Self-assertion is often seen as a goal of treatment and in some cases is specifically targeted by structured group treatments. —self-assertive adj.

**self-assessment n.** see SELF-CONCEPT.

**self-assessment motive** the desire to gain accurate information about the self. It leads people to seek highly diagnostic feedback (see DIAGNOSTICITY) and to reject flattery or other bias. Also called accuracy motive: appraisal motive. Compare CONSISTENCY MOTIVE; SELF-ENHANCEMENT MOTIVE. See also SELF-VERIFICATION MOTIVE.

**self-awareness n.** self-focused attention or knowledge. There has been a continuing controversy over whether nonhuman animals have self-awareness. Evidence of this in animals most often is determined by whether an individual can use a mirror to groom an otherwise unseen spot on its own forehead. A few chimpanzees, gorillas, and orangutans have passed this test. See also SELF-FOCUS.

**self-awareness theory** any theory of the consequences of focusing attention on the self. Distinctions are sometimes made between subjective self-awareness, arising directly from the observation and experience of oneself as the source of perception and behavior, and objective self-awareness, arising from comparison between the self and (a) the behaviors, attitudes, and traits of others or (b) some perceived standard for social correctness in any one of these areas.

**self-care n.** activities required for personal care, such as eating, dressing, or grooming, that can be managed by an individual without the assistance of others.

**self-care children** see LATCHKEY CHILDREN.

**self-categorization theory** an explanation of the cognitive processes that align people’s self-conceptions with the groups to which they belong. According to the theory, perceivers not only classify others into SOCIAL CATEGORIES but also recognize their own membership in such categories and apply STEREOTYPES pertaining to those categories to themselves. See also AUTOSTEREO Typing. [developed by
self-control therapy

British psychologist [John C. Turner (1947–2011) and his colleagues]

self-censure n. an individual’s conscious self-blame, condemnation, or guilt in judging his or her own behavior to be inconsistent with personal values or standards of moral conduct.

self-clarity n. a certainty of identity and a confidence that one possesses certain traits and attributes. Individuals with low self-esteem are more likely to lack self-clarity than are individuals with high self-esteem.

self-compassion n. a construct derived from Buddhist thought and entailing a noncritical stance toward one’s inadequacies and failures. It has been suggested that if self-criticism can lead to negative emotions, self-compassion may promote well-being by protecting one from the negative emotional implications of one’s perceived failings.

self-completion theory the theory that many behaviors are performed to claim desired identities, so that by behaving in a certain way one is symbolically proving oneself to be a certain kind of person. Insecurity about being the sort of person one wants to be is often the reason for engaging in such self-completing acts. For example, a person who takes pride in being very fit and active may respond to the first signs of illness or exhaustion by increasing, rather than reducing, his or her activities.

self-complexity n. the number of separate, unrelated aspects of the self-concept. For instance, a woman might think of herself in terms of her various social roles (lawyer, friend, mother), her relationships (colleague, competitor, nurturer), her activities (running, playing tennis, writing), her superordinate traits (hard working, creative), her goals (career success), and so forth. People low in self-complexity have few distinct facets of the self-concept, so they react more extremely to positive and negative events relevant to one of those aspects. People high in self-complexity have multiple distinct self-aspects, so they react less extremely to such events.

self-concept n. one’s description and evaluation of oneself, including psychological and physical characteristics, qualities, skills, roles, and so forth. Self-concepts contribute to the individual’s sense of identity over time. The conscious representation of self-concept is dependent in part on nonconscious schematization of the self (see schema). Although self-concepts are usually available to some degree to the consciousness, they may be inhibited from representation yet still influence judgment, mood, and behavioral patterns. Also called self-appraisal: self-assessment: self-evaluation: self-rating. See self-image: self-perception.

self-concept test a type of personality assessment designed to determine how participants view their own attitudes, values, goals, body concept, personal worth, and abilities. The Tennessee self-concept scale is an example.

self-confidence n. 1. self-assurance: trust in one’s abilities, capacities, and judgment. Because it is typically viewed as a positive attitude, the bolstering of self-confidence is often a medium or end goal in psychotherapy. 2. a belief that one is capable of successfully meeting the demands of a task. —self-confident adj.

self-confrontation n. the examination of one’s attitudes, behaviors, and shortcomings to provide an impetus to change and to gain insight into how one is perceived by others.

self-conscious emotion an emotion generated when events reflect on the worth or value of the self in one’s own or others’ eyes. Self-conscious emotions include shame, pride, guilt, and embarrassment. Also called self-evaluative emotion.

self-consciousness n. 1. a personality trait associated with the tendency to reflect on or think about oneself. Psychological use of the term (e.g., in personality measures) refers to individual differences in self-reflection, not to embarrassment or awkwardness (see sense 3). Some researchers have distinguished between two varieties of self-consciousness: (a) private self-consciousness, or the degree to which people think about private, internal aspects of themselves (e.g., their thoughts, motives, and feelings) that are not directly open to observation by others; and (b) public self-consciousness, or the degree to which people think about public, external aspects of themselves (e.g., their physical appearance, mannerisms, and overt behavior) that can be observed by others. 2. see REFLECTIVE CONSCIOUSNESS. 3. extreme sensitivity about one’s behavior, appearance, or other attributes and excessive concern about the impression one makes on others, which may lead to embarrassment or awkwardness in the presence of others. —self-conscious adj.

self-consistency n. 1. behavior or traits that have a high degree of internal harmony and stability. 2. the compatibility of all aspects of a theory or system.

self-construal n. any specific belief about the self. The term is used particularly in connection with the distinction between independent self-construals and interdependent self-construals.

self-contradiction n. 1. in logic, a fundamental inconsistency between two or more premises of a single argument, such that they cannot both be true. 2. more generally, a deep inconsistency between two or more beliefs, intentions, desires, or behaviors of an individual or of a group. —self-contradictory adj.

self-control n. the ability to be in command of one’s behavior (overt, covert, emotional, or physical) and to restrain or inhibit one’s impulses. In circumstances in which short-term gain is pitted against long-term greater gain, self-control is the ability to opt for the long-term outcome. Choice of the short-term outcome is called impulsiveness. See also self-discipline: self-regulation. —self-controlled adj.

self-control technique a method used in behavior therapy in which clients are trained to evaluate their own behavior and reinforce desired behavior with appropriate material or social rewards.

self-control therapy a form of behavior therapy that involves self-monitoring (e.g., keeping diaries of behavior), self-evaluation, goal setting, behavior contracts,
self-correction

self-management therapy. [developed by Austrian-born U.S. clinical psychologist Frederick H. Kanfer (1925–2002)]

self-correction n. any situation in which an individual makes an error but fixes it spontaneously, with no external instructions or cues.

desensitization n. the evaluation of one’s own behavior and attributes, with recognition of one’s weaknesses, errors, and shortcomings. Although self-criticism can have a positive effect in fostering personal growth, a tendency toward harsh self-criticism is thought by some to be a risk factor for depression. —self-critical adj.

self-debasement n. see SELF-ABASEMENT.

self-deception n. the process or result of convincing oneself of the truth of something that is false or invalid, particularly the overestimation of one’s abilities and concurrent failure to recognize one’s limitations.

self-defeating behavior repetitive actions by an individual that invite failure or misfortune and thus prevent him or her from attaining goals or fulfilling desires.

self-defeating personality disorder in DSM–III–R (but not in later DSM editions), a personality disorder characterized by a reluctance to seek pleasurable activities, an encouragement of others to exploit or take advantage of oneself, a focus on one’s very worst personal features, and a tendency to sabotage one’s good fortunes. See also MASOCHISTIC PERSONALITY DISORDER.

self-definition n. 1. a self-view, self-concept, or other belief about the self. 2. personal independence. See AUTONOMY.

self-demand schedule in animal or child-rearing studies, a feeding schedule regulated by the individual’s needs and desires, in contrast to a fixed or rigid schedule. Also called demand feeding.

self-denial n. the act of suppressing desires and forgoing satisfactions.

self-derecogitation n. the tendency to disparage oneself, often unrealistically. It frequently is associated with a MAJOR DEPRESSIVE EPISODE.

self-desensitization n. a procedure used in BEHAVIOR THERAPY in which the individual, when confronted with objects or situations that arouse anxiety, engages in coping strategies designed to reduce anxiety, such as repeating positive self-statements, mentally rehearsing a potential confrontation, or employing muscle relaxation. See also DESENSITIZATION; SYSTEMATIC DESENSITIZATION.

self-destructiveness n. actions by an individual that are damaging and not in his or her best interests. The individual may not be aware of the damaging influence of the actions or may on some level wish for the resulting damage. The behavior may be repetitive and resistant to treatment, sometimes leading to suicide attempts. —self-destructive adj.

self-determination n. the process or result of engaging in behaviors without interference or undue influence from other people or external demands. Self-determination refers particularly to behaviors that improve one’s circumstances, including effective decision making, problem solving, self-management, self-instruction, and self-advocacy.

self-determination theory the concept that regulation of behavior varies along a continuum from externally controlled (e.g., to obtain rewards or avoid punishments) to autonomous or intrinsically motivated (e.g., to have fun or explore interests). The theory emphasizes the importance of INTRINSIC MOTIVATION for producing healthy adjustment and asserts that negative outcomes ensue when people feel that they are driven mainly by external forces and extrinsic rewards.

self-detoxification n. see DETOXIFICATION.

self-development n. the growth or improvement of one’s qualities and abilities.

self-differentiation n. the tendency to seek recognition for one’s individuality and uniqueness, particularly in contrast to the other members of one’s social group. See OPTIMAL DISTINCTIVENESS THEORY.

self-directedness n. see CLONINGER’S PSYCHOLOGICAL MODEL OF PERSONALITY; TEMPERAMENT AND CHARACTER INVENTORY.

self-discipline n. 1. the control of one’s impulses and desires, forging immediate satisfaction in favor of long-term goals. 2. resolve adherence to a regimen or course of action in order to achieve one’s goals. See also DELAY OF GRATIFICATION; SELF-CONTROL; SELF-REGULATION. —self-disciplined adj.

self-disclosure n. the act of revealing personal or private information about one’s self to other people. In relationships research, self-disclosure has been shown to foster feelings of closeness and intimacy. In psychotherapy, the revelation and expression by the client of personal, innermost feelings, fantasies, experiences, and aspirations is believed by many to be a requisite for therapeutic change and personal growth. Additionally, pertinent revelation by the therapist of his or her personal details to the client can—if used with discretion—be a valuable tool to increase rapport and earn the trust of the client.

self-discovery n. the process of searching for and finding one’s unique self or identity.

self-discrepancy n. an incongruity between different aspects of one’s self-concept, particularly between one’s ACTUAL SELF and either the IDEAL SELF or the OUGHT SELF. [derived from the theory of U.S. psychologist E. Tory Higgins (1946– )]

self-dynamism n. the pattern of motivations or drives that comprise one’s SELF-SYSTEM, including especially the pursuit of biological satisfaction, security, and freedom from anxiety. [proposed by Harry Stack SULLIVAN]

self-effacement n. 1. acting in such a way as to avoid drawing attention to oneself or making oneself noticeable. 2. in the approach of Karen D. HORNLEY, a neurotic idealization of compliance, dependency, and selfless love as a reaction to identification with the hated self. See also COMPLIANT CHARACTER; NEUROTIC TENDENCY. —self-effacing adj.

self-efficacy n. an individual’s subjective perception of his or her capability to perform in a given setting or to attain desired results, proposed by Albert BANDURA as a primary determinant of emotional and motivational states and behavioral change. Also called PERCEIVED SELF-EFFICACY.

self-enhancement n. any strategic behavior designed to increase either SELF-ESTEEM or the esteem of others. Self-enhancement can take the form of pursuing success or merely distorting events to make them seem to reflect bet-
self-enhancement motive the desire to think well of oneself and to be well regarded by others. This motive causes people to prefer favorable, flattering feedback rather than accurate but possibly unfavorable information about themselves. Compare self-assessment motive; self-verification motive.

self-enucleation n. see autoneucleation.

self-esteem n. the degree to which the qualities and characteristics contained in one’s self-concept are perceived to be positive. It reflects a person’s physical self-image, view of himself or her accomplishments and capabilities, and values and perceived success in living up to them, as well as the ways in which others view and respond to that person. The more positive the cumulative perception of these qualities and characteristics, the higher one’s self-esteem. A reasonably high degree of self-esteem is considered an important ingredient of mental health, whereas low self-esteem and feelings of worthlessness are common depressive symptoms.

self-esteem stability the magnitude of short-term fluctuations around a typical or baseline degree of self-esteem. It is distinguished from self-esteem level (i.e., high or low), which is more global and relatively enduring over time. In contrast, stability-related fluctuations may be in response to external, environmentally based events (e.g., receiving positive or negative feedback on a task) or internally based events (e.g., reflecting on one’s progress, or lack thereof, toward a goal). Individuals with unstable self-esteem tend to be particularly susceptible to perceiving threats to self-worth in the environment and are at higher risk for experiencing depressive symptoms.

self-evaluation n. see self-concept.

self-evaluation maintenance model a conceptual analysis, related to social comparison theory, in which an individual is assumed to maintain a positive self-evaluation by (a) associating with high-achieving individuals who excel in areas with low relevance to his or her sense of self-worth and (b) avoiding association with high-achieving individuals who excel in areas that are personally important to him or her. [developed by U.S. social psychologists Abraham Tesser (1941– ), Jennifer D. Campbell (1944– ), and their colleagues]

self-evaluative emotion see self-conscious emotion.

self-evident adj. perceived immediately by the mind to be true without need of supporting argument or empirical evidence. In deductive reasoning, it is customary to begin an argument from a proposition that is considered self-evident (an axiom). Philosophers have also held various types of innate idea to be self-evident.

self-examination n. see self-reflection.

self-exiting circuit a neural circuit or neural pathway in which part of the output is fed back to the original cell, thus maintaining activity. See positive feedback; recurrent circuit.

self-expression n. free expression of one’s feelings, thoughts, talents, attitudes, or impulses through such means as verbal communication; the visual, decorative, literary, and performing arts; and other commonplace activities (e.g., gardening, sports).

self-extension n. according to Gordon W. Allport, an early stage in the development of the proprium or self, beginning roughly at age 4 and marked by the child’s emerging ability to incorporate people, objects, and abstractions into the self-concept. Self-extension is the investment of ego in those entities outside of the self with which the individual feels affinity or identification.

self-extinction n. in psychoanalytic theory, a form of neurotic behavior in which the patient lacks experience of himself or herself as an entity and identifies vicariously with the experiences and lives of others. [introduced by Karen D. Horney]

self-feeding n. the act of feeding oneself without the direct assistance of others. Some individuals with disabilities may not be capable of self-feeding, whereas others may be able to feed themselves with the help of certain assistive technology devices.

self-focus n. 1. the direction of conscious attention on oneself and one’s thoughts, needs, desires, and emotions. Trait self-focus refers to a chronic habit or pattern of self-consciousness, whereas state self-focus refers to objective self-awareness. An excess of trait self-focus has been associated with the development of, or with heightened vulnerability to, several mental health disorders, such as alcohol abuse, depression, and anxiety disorders. Also called self-focused attention. 2. the capacity of an individual to analyze and evaluate his or her mental and emotional states. 3. excessive concern for the self and its needs: selfishness. —self-focused adj.

self-focused coping in situations considered stressful, the combination of behavioral tendencies to blame oneself (i.e., believe the situation results entirely from one’s actions) and to keep to oneself (i.e., avoid interacting with others).

self-fulfilling prophecy a belief or expectation that helps to bring about its own fulfillment, as, for example, when a person expects nervousness to impair his or her performance in a job interview or when a teacher’s preconceptions about a student’s ability influence the child’s achievement for better or worse. See pygmalion effect; upward pygmalion effect. See also behavioral confirmation; demand characteristics; expectancy effect.

self-gratification n. the satisfaction of the needs of the self.

self-guide n. a specific image or standard for the self that can be used to direct self-regulation. In particular, self-guides include mental representations of valued or preferred attributes: that is, ideals and notions of how one ought to be. These may be chosen by the self or may come from others.

self-handicapping v. a strategy of creating obstacles to one’s performance, so that future anticipated failure can be blamed on the obstacle rather than on one’s lack of ability. If one succeeds despite the handicap, it brings extra credit or glory to the self. The concept originally was proposed to explain alcohol and drug abuse among seemingly successful individuals. —self-handicap vb.

self-help n. a focus on self-guided, in contrast to professionally guided, efforts to cope with life problems. Self-help can involve self-reliance, in which one addresses such problems on one’s own (e.g., by reading self-help books), or it can involve joining with others to address shared concerns together, as in self-help groups.

self-help clearinghouse an organization that serves
self-help group

as an information and referral source about self-help groups in a given locality or region, providing up-to-date directories of all groups in that jurisdiction, as well as national self-help group resources. It is an important resource for citizens, groups, and professionals. Some clearing-houses also provide consultation to groups and group leaders and attempt to educate the public and professionals about the nature, value, and availability of groups.

self-help group a group composed of individuals who meet on a regular basis to help one another cope with a life problem. Unlike therapy groups, self-help groups are not led by professionals, do not charge a fee for service, and do not place a limit on the number of members. They provide many benefits that professionals cannot provide, including friendship, mutual support, EXPERIENTIAL KNOWLEDGE, identity, a sense of belonging, and other by-products of a positive group process. Each group also develops its own ideology or set of beliefs about the cause of and best means to address the problem that brings members together; the ideology is unique to that group and serves as an aid or “antidote” to its particular type of problem. For instance, the ideology of ALCOHOLICS ANONYMOUS (AA) includes the belief that alcoholism is a lifelong problem and that the first step in addressing it (see TWELVE-STEP PROGRAM) is for group members to admit that they do not have control over their drinking. Of the various types of self-help groups, AA represents only one: it falls into a broader category of groups whose focal problem is addiction or compulsive behavior (e.g., GAMBLERS ANONYMOUS). Other types of self-help groups include those focused on a life stress or transition (e.g., COMPASSIONATE FRIENDS), those focused on mental health concerns (e.g., NATIONAL ALLIANCE ON MENTAL ILLNESS), and those focused on a particular physical disease or disorder (e.g., the National Multiple Sclerosis Society). See also MUTUAL SUPPORT GROUP; SUPPORT GROUP.

self-hypnorelaxation n. a form of SELF-HYPNOSIS in which clients are trained to respond to their own relaxation suggestions.

self-hypnosis n. the process of putting oneself into a trance or trancelike state, typically through AUTOSTIGMATION. Also called autohypnosis. Compare HETEROHYPNOSIS.

self-ideal n. see EGO-IDEAL.

self-ideal Q sort a technique used to measure the discrepancy between an individual’s existing and ideal SELF-CONCEPTS. Participants are required to sort descriptions of characteristics twice, first with regard to how they see themselves and then in terms of how they would like to be.

self-identification n. the act of construing one’s identity in particular terms, usually as a member of a particular group or category (e.g., “I am Hispanic,” “I am a lesbian,” “I am a father”) or as a person with particular traits or attributes (e.g., “I am intelligent,” “I am unlucky,” “I am fat”).

self-identity n. see IDENTITY.

self-image n. one’s view or concept of oneself. Self-image is a crucial aspect of an individual’s personality that can determine the success of relationships and a sense of general well-being. A negative self-image is often a cause of dysfunctions and of self-abusive, self-defeating, or self-destructive behavior.

self-image bias the tendency of people to judge others according to criteria on which they themselves score highly. The more favorably a person rates himself or herself on some trait, the more central and important that trait is likely to be in how the person perceives others. The self-image bias is one subtle way in which the SELF-CONCEPT influences how the person perceives others.

self-inflicted wound see DELIBERATE SELF-HARM.

self-injurious behavior see DELIBERATE SELF-HARM.

self-insight n. understanding oneself in some depth. It is a mediate goal or the desired outcome of many types of psychotherapy.

self-instructional imagery imagery that is used in the learning or perfection of a skill. It may be the image of a past performance used to detect errors for correction, or it may be the image of an unperformed alteration of a skill. See MENTAL PRACTICE.

self-instructional training a form of COGNITIVE BEHAVIOR THERAPY used to modify maladaptive beliefs and cognitions and develop new skills in an individual. The therapist identifies the client’s maladaptive thoughts (e.g., “Everybody hates me”) and models appropriate behavior while giving spoken constructive self-instructions (or self-statements). The client then copies the behavior while repeating these instructions aloud. See also SELF-STATEMENT TRAINING. [developed by U.S. psychologist Donald Meichenbaum (1945–)]

self-interest n. one’s personal advantage or benefit. Self-interested behavior includes both the pursuit of rewards and benefits and the avoidance of costs, dangers, and harm.

self-inventory n. a questionnaire or series of statements on which participants check characteristics or traits that they perceive to apply to themselves.

selfish gene hypothesis the postulate that the sole purpose of genes is to replicate themselves and that genes are the overriding units of selection (i.e., the entities upon which NATURAL SELECTION operates). Hence, any mutation enhancing gene replication (and transmission) would be selected for. Many contemporary evolutionary biologists argue that this view oversimplifies the relationship between genes and organisms and is extreme in its notion that genes consistently override selection on the organism or population level. They accept, however, the principal notion of gene replication as consistent with a number of processes in evolution. [proposed by British biologist Richard Dawkins (1941–) in his 1976 book The Selfish Gene]

selfish herd in animal behavior, a gathering of highly selfish individuals each jostling to keep other individuals between them and a source of danger. Individuals end up clustered in groups not for mutual defense or cooperation but simply because each individual is looking after its own interests by using the others as a shield.

selfishness n. the tendency to act excessively or solely in a manner that benefits oneself, even if others are disadvantaged. —selfish adj.

self-love n. 1. regard for and interest in one’s own being or contentment. 2. excessive self-regard, or a narcissistic attitude toward one’s body, abilities, or personality. See EGOTISM; NARCISSISM.

self-managed reinforcement see SELF-REINFORCEMENT.

self-management n. 1. an individual’s control of his or
her behavior, particularly regarding the pursuit of a specific objective (e.g., weight loss). Self-management is usually considered a desirable aspect for the individual personally and socially, but some forms of self-management may be detrimental to mental and physical health. Psychotherapists and counselors often seek to provide clients with methods of identifying the latter and modifying them into the former. 2. A BEHAVIOR THERAPY program in which clients are trained to apply techniques that will help them modify an undesirable behavior, such as smoking, excessive eating, or aggressive outbursts. Clients learn to pinpoint the problem, set realistic goals for changing it, use various CONTINGENCIES to establish and maintain a desired behavior, and monitor progress.

**self-management** see SELF-CONTROL THERAPY.

**self-monitoring** n. 1. a method used in behavioral management in which individuals keep a record of their behavior (e.g., time spent, form and place of occurrence, feelings during performance), especially in connection with efforts to change or control the self. For example, a therapist may assign a client self-monitoring as homework to encourage better self-regulation by that person. 2. a personality trait reflecting an ability to modify one’s behavior in response to situational pressures, opportunities, and norms. High self-monitors are typically more apt to conform their behavior to the demands of the situation, whereas low self-monitors tend to behave in accord with their internal feelings.

**self-monitoring observation** self-tracking of one’s behaviors, attitudes, or emotions over time. In research studies and clinical interventions focused on weight loss, for example, participants are encouraged to keep track of their eating patterns, their feelings related to their eating, and triggers for not maintaining their diet. This enables a clinician or researcher to review periods when the participant is outside the clinical setting or laboratory. Compare ANALOGUE OBSERVATION; NATURALISTIC OBSERVATION.

**self-mutilation** n. the act of disfiguring oneself through DELIBERATE SELF-HARM.

**self-object (self-object)** n. in SELF PSYCHOLOGY, one’s experience of another person (object) as part of, rather than as separate and independent from, one’s self, particularly when the object’s actions affirm one’s narcissistic well-being. The need for self-objects can be an aspect of psychopathology, as when an individual’s self-esteem requires support or attachment from another. (first described by Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981))

**self-objectification** n. the achievement of objective knowledge about the self or self-understanding. It is one of Gordon W. Allport’s set of seven adaptive characteristics for psychological maturity.

**self-object transference (self-object transference)** see NARCISSISTIC TRANSFERENCE.

**self-organizing system** any system whose elements spontaneously interact in such a way as to create a higher level structure as a result of their intrinsic properties. Many biological molecules show spontaneous self-organization, but purely physical systems do so as well, as in phase changes in water at different temperatures.

**self-perception** n. a person’s view of his or her self or of any of the mental or physical attributes that constitute the self. Such a view may involve genuine self-knowledge or varying degrees of distortion. Also called self-percept. See also PERCEIVED SELF; SELF-CONCEPT.

**self-perception theory** the hypothesis that people often have only limited access to their attitudes, beliefs, traits, or psychological states. In such cases, they must attempt to infer the nature of these internal cues in a manner similar to the inference processes they use when making judgments about other people. For example, a person may infer what his or her attitude is by considering past behaviors related to the ATTITUDE OBJECT. Approach behaviors imply a positive attitude; avoidance behaviors imply a negative attitude. Self-perception theory has been offered as an alternative explanation for some phenomena traditionally interpreted in terms of COGNITIVE DISSONANCE THEORY. The theory has also been used to explain the success of the FOOT-IN-THE-DOOR TECHNIQUE. (originally proposed by U.S. psychologist Daryl J. Bem (1938–))

**self-presentation** n. any behaviors intended to convey a particular image of, or particular information about, the self to other people. Self-presentational motives explain why an individual’s behavior often changes as soon as another person (e.g., a person whom one else is thought to be present or watching). Canadian-born U.S. sociologist Erving Goffman (1922–1982) likened self-presentation to a theatrical (dramaturgical) performance in which individuals strive to create an image of themselves through their verbal and nonverbal displays in order to influence the impressions formed by those around them. Some common strategies of self-presentation include EXEMPLIFICATION, SELF-PROMOTION, and SUPPLICATION. See also IMPRESSION MANAGEMENT; —self-presentational adj.

**self-preservation instinct** the fundamental tendency of humans and nonhuman animals to behave so as to avoid injury and maximize chances of survival (e.g., by fleeing from dangerous situations or predators). In his early formulations of classic psychoanalytic theory, Sigmund Freud proposed that self-preservation was one of two instincts that motivated human behavior, the other being the sexual instinct. In his later formulations, he combined both instincts into the concept of EROS, or the LIFE INSTINCT, and opposed them to THANATOS, the DEATH INSTINCT. Also called self-preservative instinct; survival instinct.

**self-promotion** n. in SELF-PRESENTATION theory, a strategy of making oneself look good to others by highlighting or exaggerating one’s competence and abilities.

**self-protection** n. any strategic behavior designed to avoid losing either SELF-ESTEEM or the esteem of others. Self-protection fosters a risk-avoidant orientation and is often contrasted with SELF-ENHANCEMENT.

**self psychology** 1. any system of psychology focused on the self. 2. a school of psychoanalytic theory that stresses the importance, in healthy self-development, of an individual’s relationships with others and locates the source of many psychological problems in caregivers’ lack of responsiveness to the child’s emotional needs. In self- psychological therapy, the therapist attempts to build an empathetic relationship with the patient, rather than keep an emotional distance as in classic psychoanalytic practice. (pioneered by Austrian-born U.S. psychoanalyst Heinz Kohut (1913–1981))

**self-punishment** n. the act of inflicting physical or psychological harm on oneself for one’s perceived misdeeds. Self-punishment ranges from blaming oneself unjustifiably
for negative occurrences to attempting suicide, and it commonly occurs in severe cases of major depressive disorder.

**self-rating** n. 1. see self-concept. 2. in psychological measurement, the act of reporting on or describing characteristics of oneself.

**self-rating scale** any questionnaire, inventory, survey, or other instrument in which participants are asked to assess their own characteristics (e.g., attitudes, interests, abilities, performance). See also self-report; self-report inventory.

**self-realization** n. see self-actualization.

**self-reference** n. a tendency to relate events or information to the self, such as by directing discussions toward one’s personal concerns and perceptions. —self-refer vb. —self-referential adj.

**self-reference effect** the widespread tendency for individuals to have a superior or enhanced memory for stimuli that relate to the self or self-concept.

**self-referral** n. the act of consulting a health care practitioner without being directed to by a medically qualified professional or similar person or without being forced to seek such help by an employer, a spouse, or the courts. Self-referred individuals are often viewed as more motivated for treatment and more likely to admit to problems.

**self-reflection** n. 1. examination, contemplation, and analysis of one’s thoughts, feelings, and actions. The condition of or capacity for this is called self-reflexivity. 2. see reflective consciousness.

**self-regulated learning** the process of continuously monitoring and controlling one’s learning. For example, students studying for a test might periodically test themselves to determine what they have learned, and then they might devote additional studying to the material that is not as well learned. Self-regulated learning involves metacognition, cognitive control, motivation, and strategic use of learning behaviors.

**self-regulation** n. the control of one’s behavior through the use of self-monitoring (keeping a record of behavior), self-evaluation (assessing the information obtained during self-monitoring), and self-reinforcement (rewarding oneself for appropriate behavior or for attaining a goal). Self-regulatory processes are stressed in behavior therapy. See also self-control; self-management.

**self-regulatory resources theory** a model stating that self-regulation depends on a global, but finite, pool of resources that can be temporarily depleted by situational demands. See ego depletion; volition.

**self-reinforcement** n. the rewarding of oneself for appropriate behavior or the achievement of a desired goal. The self-reward may be, for example, buying a treat for oneself after studying for an exam. Also called self-managed reinforcement.

**self-relevance** n. see ego involvement.

**self-report** n. a statement or series of answers to questions that an individual provides about his or her state, feelings, thoughts, beliefs, past behaviors, and so forth. Self-report methods rely on the honesty and self-awareness of the participant (see self-report bias) and are used especially to measure behaviors or traits that cannot easily be directly observed by others.

**self-report bias** a methodological problem that arises when researchers rely on asking people to describe their thoughts, feelings, or behaviors rather than measuring these directly and objectively. People may not give answers that are fully correct, either because they do not know the full answer or because they seek to make a good impression (see social desirability). The self-report bias is often cited as a reason to use direct observation whenever practicable.

**self-report inventory** a questionnaire on which participants indicate the degree to which the descriptors listed apply to them. Also called self-report scale.

**self-repudiation** n. denial of one’s pleasure or rights, usually out of a sense of guilt or low self-esteem.

**self-respect** n. a feeling of self-worth and self-esteem, especially a proper regard for one’s values, character, and dignity.

**self-reward** n. see self-reinforcement.

**self-righting** n. the ability to right oneself, that is, to rebound from adversity by taking effective actions to adapt to it and by seeking a functional accommodation within the constraints imposed by the environment. See also coping behavior; resilience.

**self-schema** n. a cognitive framework comprising organized information and beliefs about the self that guides a person’s perception of the world, influencing what information draws the individual’s attention as well as how that information is evaluated and retained. Compare social schema.

**self-selected groups design** an experimental design in which participants choose their own group or the condition to which they will be exposed. Because the assignment of participants to research conditions is nonrandom, causal inference from data gleaned in such experiments is questionable. See quasi-experimental design.

**self-selection bias** a type of bias that can arise when study participants choose their own treatment conditions, rather than being randomly assigned. In such cases, it is impossible to state unambiguously that a study result is due to the treatment condition and not to the preexisting characteristics of those individuals who chose to be in this condition. Also called self-selection effect. See also sampling bias.

**self-serving bias** the tendency to interpret events in a way that assigns credit for success to oneself but denies one’s responsibility for failure, which is blamed on external factors. The self-serving bias is regarded as a form of self-deception designed to maintain high self-esteem. Compare group-serving bias.

**self-statement modification** a technique designed to change maladaptive ideas about the self that are uncov-
ered in COGNITIVE BEHAVIOR THERAPY. See also SELF-INSTRUCTIONAL TRAINING.

**self-statement training (SST)** a type of COGNITIVE REHEARSAL that involves periodically thinking or saying something positive about oneself, such as “I am a capable individual who is worthy of respect.” It is used in SELF-INSTRUCTIONAL TRAINING. See also INNER DIALOGUE: SELF-AFFIRMATION.

**self-stereotyping** n. see AUTOSTEREOTYPING.

**self-stimulation** n. 1. the act or process of inducing or increasing the level of arousal in oneself. It can be observed in various situations; for example, infants who are under-stimulated may explore their surroundings or babble to themselves. 2. see INTRACRANIAL STIMULATION; PLEASURE CENTER. 3. see MASTURBATION.

**self-suggestion** n. see AUTOSUGGESTION.

**self-synchrony** n. see SYNCHRONY.

**self-system** n. the relatively fixed personality of the individual resulting from relationships with his or her parents and other significant adults, in which approved attitudes and behavior patterns tend to be retained and disapproved actions and attitudes tend to be blocked out. [first described by Harry Stack SULLIVAN]

**self-talk** n. an internal dialogue in which an individual utters phrases or sentences to himself or herself. Negative self-talk often confirms and reinforces negative beliefs and attitudes, such as fears and false aspirations, which have a correspondingly negative effect on the individual’s feelings (e.g., a sense of worthlessness) and reactions (e.g., DEMOTIVATION). In certain types of psychotherapy, one of the tasks of the therapist is to encourage the client to replace self-defeating, negative self-talk with more constructive, positive self-talk. In sport, athletes are trained to use positive self-talk to cue the body to act in particular ways, to cue attentional focus, to motivate, to reinforce self-efficacy, and to facilitate the creation of an IDEAL PERFORMANCE STATE. See also INTERNALIZED SPEECH; RATIONAL EMOTIVE BEHAVIOR THERAPY. [described by Albert ELLIS]

**self-terminating search** any SEARCH process in which the search is ended as soon as a given target is detected. This may be a search for target items in memory, a VISUAL SEARCH, or any problem-solving exercise that involves finding the correct solution among a number of alternatives. Compare EXHAUSTIVE SEARCH.

**self-test** n. a test that can be administered without the help of a trained professional.

**self-transcendence** n. 1. the state in which an individual is able to look beyond himself or herself and adopt a larger perspective that includes concern for others. Some psychologists maintain that self-transcendence is a central feature of the healthy individual, promoting personal growth and development. [first described by Viktor E. FRANKL] 2. see CLONINGER’S PSYCHOBIOLOGICAL MODEL OF PERSONALITY; TEMPERAMENT AND CHARACTER INVENTORY.

**self-understanding** n. the attainment of knowledge about and insight into one’s characteristics, including attitudes, motives, behavioral tendencies, strengths, and weaknesses. The achievement of self-understanding is one of the major goals of certain forms of psychotherapy.

**self-validation factor** a variable that serves to affect confidence in the validity of cognitive responses generated during ELABORATION of attitude-relevant information. See also ELABORATION-LIKELIHOOD MODEL: MULTIPLE ROLES IN PERSUASION.

**self-verbalization** n. 1. self-directed private speech or thinking aloud. Self-verbalization can be a cognitive strategy that fosters internal self-regulation by verbally controlling behavior. Often used as a learning tool, it can be used to teach new skills, enhance problem-solving abilities, or alter previously held beliefs. Varying perspectives on this type of speech include the work of Lev VYGOTSKY, Jean PIAGET, and Alexander LURIA. 2. see SELF-TALK.

**self-verification motive** the desire to seek information about oneself that confirms one’s chronic self-views, regardless of whether this information is good or bad. This desire is often stronger than the SELF-ENHANCEMENT MOTIVE, wherein people seek favorable information about themselves, or the SELF-ASSESSMENT MOTIVE, wherein people seek accurate information about themselves. People seek self-verification (a) by gravitating toward situations and relationship partners in which they will receive self-confirmation, (b) by striving to elicit self-verifying feedback through their behavior, and (c) by selectively attending to, recalling, and interpreting evaluations in ways that tend to maintain their own views of themselves. [first proposed in 1983 by U.S. social psychologist William B. Swann (1952– )]

**self-view** n. an umbrella term for various forms of self-definition, including global SELF-ESTEEM and specific beliefs about oneself (SELF-CONCEPTS).

**self-worth** n. an individual’s evaluation of himself or herself as a valuable, capable human being deserving of respect and consideration. Positive feelings of self-worth tend to be associated with a high degree of SELF-ACCEPTANCE and SELF-ESTEEM.

**SEM** abbreviation for STRUCTURAL EQUATION MODELING.

**SEM** 1. symbol for STANDARD ERROR OF MEASUREMENT. 2. symbol for STANDARD ERROR OF THE MEAN.

**sem-** combining form signs or meanings.

**semantic** adj. of or pertaining to meaning, particularly that of words and other symbols. For example, *semantic analysis* is a computational process for examining in detail the language used within a text so as to extract and analyze its stated and often implied meanings; the method utilizes statistical manipulations of word usage frequencies to clarify relationships among elements or identify thematic patterns.

**semantic anoma** loss or impairment of the ability to understand the correct meaning of words or to situate them into their conceptual categories (e.g., the word dress in the category of clothing). Recent research suggests that semantic anoma is due to degradation of semantic knowledge caused by damage to the temporal lobe.

**semantic aphasia** a form of APHASIA characterized by loss or impairment of the ability to find the proper words to convey meaning appropriately when speaking. See also LOGOCGRAMMATICAL DISORDER.

**semantic code** the means by which the conceptual or abstract components of an object, idea, or impression are stored in memory. For example, the item *typewriter* could be remembered in terms of its functional meaning or properties. Compare IMAGERY CODE.

**semantic counseling** a type of COUNSELING in which
**semantic dementia**

Emphasis is placed on interpretations of meanings, particularly those related to adjustment and maladjustment.

**semantic dementia** a type of FRONTOTEMPORAL DEMENTIA resulting from focal degeneration of the polar and inferofrontal regions of the temporal lobes. It is characterized by a selective, progressive impairment in SEMANTIC MEMORY, leading to difficulties in object naming, comprehension of words and their appropriate use in conversation, and appreciation and use of objects. Nonsemantic aspects of language, as well as perceptual and spatial skills, are preserved.

**semantic differential** a type of scale that researchers use to assess a respondent’s views on a certain topic (e.g., a stimulus such as a word or photograph, the quality of some experience). Participants are asked to rate the topic on a scale that has pairs of opposites, such as bad–good, unpleasant–pleasant, or competitive–cooperative, as ANCHORS or reference points. For example, the bipolar opposites bad and good may be scaled along 7 points and the respondent asked to position himself or herself along the 7-point continuum for a given topic. Generally, the anchors are focused on three dimensions—evaluation, activity, and potency. Responses to word pairs assessing the evaluative dimension are scaled in some way (e.g., according to the potency). Responses to word pairs assessing the evaluative dimension are scaled in some way (e.g., according to the potency).

**semantic dissociation** a distortion between words and their culturally accepted meanings that is characteristic of the THOUGHT DISORDER of individuals with schizophrenia. It includes semantic dissolusion, marked by a complete loss of meaning and the ability to communicate; semantic dispersion, in which meaning and the correct use of syntax are lost or reduced; semantic distortion, in which meaning may be transferred to neologisms; and semantic halo, marked by coherent but vague and ambiguous language.

**semantic encoding** cognitive encoding of new information that focuses on its meaningful aspects as opposed to its perceptual characteristics. This will usually involve some form of ELABORATION. See also DEEP PROCESSING.

**semantic fluency** the ability to generate words in different categories (e.g., types of dogs). It is often assessed within a 1 minute time frame. Also called category fluency.

**semantic generalization** a result of CLASSICAL CONDITIONING in which a word, phrase, or sentence functions as a conditioned stimulus because it shares the same (or highly similar) meaning with a word, phrase, or sentence that has already been established, via direct pairing with an unconditioned stimulus, as a conditioned stimulus. For example, the word delicious, when paired with actual food, will eventually elicit the response of salivation. After delicious is established as a conditioned stimulus, related words or phrases (e.g., tasty) may elicit the same or similar responses. See STIMULUS EQUIVALENCE.

**semanticity** n. 1. the property of language that allows it to represent events, ideas, actions, and objects symbolically, thereby endowing it with the capacity to communicate meaning. According to Roger BROWN, it is one of the formal properties of language. See PRODUCTIVITY. 2. in nonhuman animal communication, the meaning conveyed through vocalizations (e.g., alarm calls).

**semantic jargon** a symptom of fluent APHASIAS (e.g., WERNICKE’S APHASIA) in which individuals utter real words and sentences but in combinations that have little meaning. For example, an individual asked about his or her poor vision might reply, “My wires don’t hire right.” See also JARGON APHASIA.

**semantic knowledge** general information that one has acquired; that is, knowledge that is not tied to any specific object, event, domain, or application. It includes word knowledge (as in a dictionary) and general factual information about the world (as in an encyclopedia) and oneself. Also called generic knowledge.

**semantic memory** memory for general factual knowledge and concepts, of the kind that endows information with meaning and ultimately allows people to engage in such complex cognitive processes as recognizing objects and using language. Impairments of semantic memory may be seen following brain injury as well as in certain neurological disorders, particularly dementia. For instance, people with Alzheimer’s disease often find it increasingly difficult to categorize and name items (i.e., to refer to an apple as an apple) as their memory deficits worsen. Semantic memory is considered by many theorists to be one of the two forms of DECLARATIVE MEMORY, the other being EPISODIC MEMORY. [defined in 1972 by Endel TULVING]

**semantic network** a GRAPH used to capture conceptual relationships. Created by the artificial intelligence research community, it was originally used in programs designed to understand natural (human) language. Nodes in the network represented entities and their properties in a domain. The arc link reflected the semantic nature of the property. This system has been used to model human information storage (particularly the means by which words are connected to meanings and associations in long-term memory), with latencies in retrieval times supposedly reflecting the length of the path of the network searched for the required response.

**semantic paradox** see PARADOX.

**semantic paraphasia** a form of PARAPHASIA in which conversational speech is fairly fluent but objects are misnamed, although some associative connection may exist. For example, a pipe may be called a “smoker” and glasses a “telescope.”

**semantic priming** an effect in which the processing of a stimulus is more efficient after the earlier processing of a meaningfully related stimulus, as opposed to an unrelated or perceptually related stimulus. For example, responses to the word nurse would be faster following presentation of the word doctor than of the word parse.

**semantic primitive** one of the fundamental building blocks thought to be involved in the construction of meaning in language. Many refer to a basic physical property or simple sensation; for example, the concept car could be reduced to the semantic primitives moves, fast, noisy, shiny, and so on. Semantic primitives are thought to play an important role in language development in young children.

**semantics** n. 1. in linguistics, the study of meaning in
language, as opposed to the study of formal relationships (GRAMMAR) or sound systems (PHONOLOGY). 2. aspects of language that have to do with meaning, as distinguished from SYNTACTICS. 3. in logic and philosophy, the study of the relationships between words or phrases and the things or concepts to which they refer. Compare SEMIOTICS.

semiotic satiation the effect in which a word seems to lose its meaning after it has been repeated many times in rapid succession. The reasons for this effect remain poorly understood.

semantic therapy a form of psychotherapy in which clients are trained to examine undesired word habits and distorted ideas so that they can think more clearly and critically about their aims, values, and relationships. This approach is based on an active search for the formation of clear abstractions, as well as on uncovering hidden assumptions and increasing awareness of the emotional tone behind the words the client has been using. Polish-born U.S. philosopher and scientist Alfred Korzybski (1879–1950) and U.S. psychologist Wendell A. L. Johnson (1906–1965) were major early exponents of this approach. See also GENERAL SEMIOTICS.

semasiology n. the study of development and change in the meanings of words. See also SEMIOTICS.

semiosis (semeiosis) n. the process by which objects, words, gestures, and other entities become associated with particular meanings and function as SIGNS within a particular sign system. See SEMIOTICS.

semiotic function see SYMBOLIC FUNCTION.

semiotic movement a trend toward formalisation of systems of visual communication by the use of signs or symbols that are not a part of the standard alphabet. The semiotic movement, which has been particularly popular in the United States, promotes the acceptance of “rules of grammar” for symbolic logic, mathematical formulas, or other symbolic systems that may be analogous to language.

semiotics n. the study of verbal and nonverbal SIGNS and of the ways in which they communicate meaning within particular sign systems. Unlike SEMANTICS, which restricts itself to the meanings expressed in language, semiotics is concerned with human symbolic activity generally. As an academic discipline, semiotics developed within the general framework of 20th-century STRUCTURALISM, taking as its premise the view that signs can only generate meanings within a pattern of relationships to other signs. Also called SEMIOLGY. [introduced by Charles S. PEIRCE]

semipermeable membrane a membrane that allows some but not all molecules to pass through. See also PERMEABILITY.

semistructured interview see PATTERNED INTERVIEW.

semivowel n. 1. a vowel-like speech sound that functions as a consonant in that it forms a syllable when combined with a true VOWEL. Examples are [w] as in well and [y] as in yellow. Compare SONANT. 2. a LIQUID SONANT speech sound.

sender n. in TELEPATHY experiments, the participant who attempts to transmit information to the RECEIVER. See also AGENT.

senescent adj.

senescence n. 1. the biological process of growing old or the period during which this process occurs. 2. the state or condition of being old. —senescent adj.

senile dementia see DEMENTIA.
senile dementia of the Alzheimer's type

senile dementia of the Alzheimer's type (SDAT) an older name for DEMENTIA of the Alzheimer's type with onset after age 65.

senile miosis a reduction in the size of the pupil that occurs in old age and that is caused by atrophy of the muscles controlling dilation of the pupil, which restricts the amount of light that enters the eye.

senile plaque see AMYLOID PLAQUE.

senility n. an obsolescent term for dementia associated with advanced age.

senior citizen an older adult, especially one who is retired or has reached the age of retirement (generally 65 years or older).

senium n. an older, less commonly used term for the period of old age.

sensate focus an approach in which people with sexual dysfunction are trained to focus attention on their own natural sensual cues and gradually achieve the freedom to enjoy sensual stimuli. Therapy is conducted by teams of male and female professionals in joint interviews with the partners. The procedures use prescribed body-massage exercises designed to give and receive pleasure, initially involving body parts other than the breasts and genitals and then moving to these areas. This approach eliminates performance anxiety and allows the partners to relax and enjoy the sensual experience of body caressing without the need to achieve erection or orgasm. Sensate focus therapy is one component of the program developed by U.S. sex researchers William H. Masters (1915–2001) and Virginia E. Johnson (1925–2013).

sensation n. 1. the process or experience of perceiving through the senses. See SENSORY SYSTEM. 2. an irreducible unit of experience produced by stimulation of a sensory RECEPTOR and the resultant activation of a specific brain center, producing basic awareness of a sound, odor, color, shape, or taste or of temperature, pressure, pain, muscular tension, position of the body, or change in the internal organs associated with such processes as hunger, thirst, nausea, and sexual excitement. Also called sense datum; sense impression; sensum. 3. in the STRUCTURALISM of Edward Bradford Titchener, one of the three structural elements of mental experience, the other two being images and feelings. 4. in general usage, a thrilling or exciting experience. See SENSATION SEEKING. —sensational adj.

sensationalism n. in philosophy, the position that all knowledge originates in sensations and that even complex abstract ideas can be traced to elementary sense impressions. See ASSOCIATIONISM; EMPIRICISM. —sensationalist adj.

sensation level the perceived intensity of a particular sensation. An example is the intensity of an auditory stimulus as experienced by a given listener (auditory sensation level).

sensation seeking the tendency to search out and engage in thrilling activities as a method of increasing stimulation and arousal. It typically takes the form of engaging in highly stimulating activities that have an element of danger, such as skydiving or race-car driving. See also NOVELTY SEEKING.

Sensation-Seeking Scale (SSS) a 40-item, forced-choice questionnaire designed to quantitatively measure individual differences among late adolescents and adults in optimal levels of stimulation and arousal. Items pertain to preferences for intensities of sensation (temperatures, sounds, tastes, colors), familiarity as opposed to novelty, routine as opposed to irregularity, and security as opposed to adventure. Each item relates to one of four subfactor scales: Thrill and Adventure Seeking, representing a desire to engage in unusual or risky physical activities; Experience Seeking, representing a need for a variety of inner experiences; Disinhibition, representing impulsiveness, extravagance, and a hedonistic lifestyle; and Boredom Susceptibility, representing a dislike of repetition, predictability, and monotony. The SSS total score for all 40 items is used as an overall measure of sensation seeking, with higher totals indicating people with a strong need for stimulation who tend to seek relatively high levels of sensory input. Many variations of the SSS exist, including brief forms and forms designed for children, and the instrument also has been translated from English into several other languages. Also called Zuckerman Sensation-Seeking Scale. [originally developed in 1964 by clinical psychologist Marvin Zuckerman and colleagues]

sensation threshold see ABSOLUTE THRESHOLD.

sensation type in the ANALYTIC PSYCHOLOGY of Carl Jung, a FUNCTIONAL TYPE dominated by sensory perception, such that the individual experiences the world primarily through his or her senses. It is one of Jung’s two IRATIONAL TYPES, the other being the INTUITIVE TYPE. See also FEELING TYPE; THINKING TYPE.

sensation unit a discriminable sensory experience. See DIFFERENCE THRESHOLD.

sense 1. n. any of the media through which one gathers information about the external environment or about the state of one’s body in relation to the environment. They include the five primary senses—vision, hearing, taste, touch, and smell—as well as the senses of pressure, pain, temperature, kinesthesia, and equilibrium. Each sense has its own receptors, responds to characteristic stimuli, and has its own pathways to a specific part of the brain. Also called sense modality; sensory modality. 2. n. a particular awareness of a physical dimension or property (e.g., time, space) or of an abstract quality, usually one that is desirable (e.g., humor, justice). 3. n. good judgment or intelligence manifested by, or absent from, a person. 4. n. the gist or general meaning of something, such as an argument, play, or event. 5. vb. to perceive something using the senses. 6. vb. to make an emotional or cognitive judgment about something, such as another person’s mood.

sense datum see SENSATION.

sense distance an interval between two distinct sensations along a given dimension, such as the distance between the notes C and G on the musical scale.

sense experience awareness produced by stimulation of a sensory RECEPTOR.

sense impression see SENSATION.

sense modality see SENSE.

sense of coherence 1. a perception of having clarity or intelligibility, that is, of being capable of thinking and expressing oneself in a clear and consistent manner. 2. the ability to present a narrative of oneself in a way that is understandable and easy to follow. Sense of coherence is considered a PROTECTIVE FACTOR against the deleterious effects of stress on physical and mental health. [proposed by U.S.-born Israeli medical sociologist Aaron Antonovsky (1923–1994)]
sense of equilibrium the sense that enables the maintenance of balance while sitting, standing, walking, or otherwise maneuvering the body. A subset of proprioception, it is in part controlled by the vestibular system in the inner ear, which contains vestibular receptors that detect motions of the head. Also called equilibrium sense; labyrinthine sense; static sense; vestibular sense.

sense of presence 1. the sense of being in a particular place or time period. 2. awareness of one's current existence. 3. an intimate sense of the nearness of invisible entities, such as God, spirits, and so on. 4. in virtual reality technology, the user's sense of being inside the simulated environment.

sense of self an individual's feeling of identity, uniqueness, and self-direction. See also self-concept; self-image.

sense organ a body part, such as the eye or ear, that contains or comprises receptor cells, which are sensitive to particular stimuli, together with associated structures specialized to receive this sensory input. Also called sensory organ; sensory receptor organ.

sense-ratios method a system of scaling sensory magnitudes by adjusting pairs of stimuli until they are perceived to have the same ratio of intensity as a pair of reference stimuli.

sensibilities pl. n. things that are capable of being sensed.

sensibility n. 1. a capacity to respond to an emotional situation with refined or intense feeling. 2. the capacity to receive sensory input.

sensible adj. 1. showing reason and sound judgment. 2. capable of receiving sensory input (e.g., feeling pain). 3. receptive to external influences. 4. felt or perceived as real or material.

sensitive 1. adj. responsive to stimuli, changes in the environment, feelings, or other phenomena; that is, having sensibility. 2. adj. having well-developed or intense affective sensibility. 3. n. in spiritualism and parapsychology, a person who is supposedly capable of receiving knowledge by paranormal means, as in clairvoyance and telepathy; or of perceiving auras and similar alleged phenomena beyond the range of normal perception. See also medium; psychic.

sensitive dependence the tendency for complex, dynamic systems to be highly sensitive to initial conditions, so that two such systems with starting points that are almost identical may become extremely divergent over time. In other words, the future states of complex systems are very dependent on small differences in their initial states. The best known example of sensitive dependence is the so-called butterfly effect. One possible explanation for this phenomenon is that measurements in chaotic systems are imprecise, so that prediction becomes extremely difficult. See chaos theory.

sensitive period a stage in development when an organism can most rapidly acquire a particular skill or characteristic. For example, in humans, the 1st year of life is considered significant for the development of a secure attachment bond. Lack of appropriate growth-dependent experiences during a sensitive period does not permanently and irreversibly affect development, as it would during a critical period, but rather makes the acquisition process outside the period more difficult.

sensitive soul in the thought of aristotle, the type of soul possessed by nonhuman animals. The sensitive soul has the capacity to receive and react to sensory impressions but does not have a capacity for rational thought. Compare rational soul; vegetative soul.

sensitive zone any point on the body that is highly responsive to a particular type of stimulus, such as touch or pain.

sensitization n. 1. a form of nonassociative learning in which an organism becomes more responsive to most stimuli after being exposed to unusually strong or painful stimulation. 2. the increased effectiveness of an eliciting stimulus as a function of its repeated presentation. Water torture, in which water is dripped incessantly onto a person's forehead, is a good example. 3. see reverse tolerance.

sensor n. 1. a receptor cell or organ. 2. a device that responds to the presence of something (e.g., a smoke detector).

sensorimotor adj. 1. describing activity, behavior, or brain processes that involve both sensory (afferent) and motor (efferent) functions. 2. describing a mixed nerve that contains both afferent and efferent fibers.

sensorimotor aphasia a combination of sensory or receptive aphasia and motor or expressive aphasia, in which there is impairment or loss of the ability to perceive and understand language as well as to use it. See also global aphasia.

sensorimotor arc a reflex arc consisting of an afferent sensory branch and an efferent motor branch.

sensorimotor cortex areas of the cerebral cortex that
sensorimotor intelligence

are concerned with somatosensory and motor functions. The primary motor cortex lies just in front of the central sulcus, whereas the primary somatosensory area is just behind it.

sensorimotor intelligence in PIAGETIAN THEORY, knowledge that is obtained from sensory perception and motor actions involving objects in the environment. This form of cognition characterizes children in the SENSORIMOTOR STAGE.

sensorimotor memory 1. a recollection, commonly of a traumatic experience, that is encoded in terms of sensations and actions rather than verbally. Frequently, it is a memory of an event that occurred during the period of CHILDHOOD AMNESIA, which commonly lasts up to the age of 3 years. See also BODY MEMORY. 2. see PROCEDURAL MEMORY.

sensorimotor rhythm (SMR) a rhythmic electrical impulse of 1.2 Hz to 1.4 Hz recorded over the ROLANDIC CORTEX in the brain. It is used in NEUROFEEDBACK studies and procedures. See BRAIN WAVES.

sensorimotor stage in PIAGETIAN THEORY, the first major stage of cognitive development, extending from birth through 2 years of age. Evolving over several subphases of increasingly complex behavior—from BIAS REFLEX to various degrees of CIRCULAR REACTION TO MENTAL COMBINATION—the sensorimotor stage is characterized by the development of sensory and motor processes and by the infant’s first knowledge of the world acquired by interacting with the environment. Some rudimentary awareness of the reality of time, space, and cause and effect is present. See also CONCRETE OPERATIONAL STAGE; FORMAL OPERATIONAL STAGE; PREOPERATIONAL STAGE.

sensorineural deafness the loss or absence of hearing function due to pathology in the inner ear or along the nerve pathway from the inner ear to the brainstem. Also called nerve deafness; sensorineural impairment. Compare CENTRAL DEAFNESS; CONDUCTION DEAFNESS.

sensorineural lesion any damage to structures of the auditory system along the nerve pathway from the inner ear to the associated brain centers. Childhood sensorineural lesions may be congenital and due to a failure of such structures to develop normally in the fetal stage, or they may result from postnatal infection (e.g., measles, mumps, scarlet fever), whereas adult sensorineural lesions are due to injury or disease, such as tumors.

sensorium n. 1. the human sensory apparatus and related mental faculties considered as a whole. The state of the sensorium is tested through the traditional MENTAL STATUS EXAMINATION; the sensorium may be clear (i.e., functioning normally) or clouded (lacking ability to concentrate and think clearly). 2. see SENSORIUM COMMUNE.

ewn sensorium commune a hypothetical location in the brain formerly held to be the seat of sensation in humans and nonhuman animals and the site for the operations of the sensorial areas. Also called sensorium.

sensorial adj. relating to the SENSES, to SENSATION, or to a part or all of the neural apparatus and its supporting structures that are involved in any of these. See SENSORY SYSTEM.

sensorial acuity the extent to which one is able to detect stimuli of minimal size, intensity, or duration.

sensorial adaptation see ADAPTATION.

sensorial amimia see AMIMIA.

sensory amnesia see AMNESIA.

sensory aphasia see WERNICKE’S APHASIA.

sensory aprosodia an inability to understand the emotional inflections of language, that is, the rhythm, pitch, and “melody” of speech. Compare MOTOR APROSODIA.

sensory area any area of the cerebral cortex that receives input from sensory neurons, usually via the thalamus. There are specific areas for the different senses, and they are functionally differentiated into PRIMARY SENSORY AREAS and SECONDARY SENSORY AREAS. Also called sensory cortex; sensory projection area.

sensory ataxia lack of muscular coordination (see ATAXIA) due to the loss of the sense of limb movements (see PROPRIOCEPTION).

sensory awareness training 1. the methods used in SENSATE FOCUS and similar therapies to help an individual become more aware of his or her own feelings and sensations and learn new ways of experiencing them. 2. in sport, training an athlete to become aware of the kinesthetic sensations experienced while performing and of the sensations related to arousal level.

sensory bias the display of sensory preferences that may not relate to species-typical signals. Female tungara frogs prefer a low-pitched chuck note that males add to courtship calls, and females of a closely related species also prefer low-pitched chuck notes, even though males of their species do not produce these notes. The preference for low-pitched chuck notes is a sensory bias that can be exploited by any males able to add such a note to their mating calls. See SENSORY EXPLOITATION.

sensory circle an area of the skin that gives rise to nervous activity when stimulated, analogous to a SENSORY PROJECTION AREA. Examples of sensory conversion symptoms include loss of touch or pain sensation, double vision, blindness, deafness, tinnitus, and hallucinations.

sensory cortex see SENSORY AREA.

sensory cue a visual, tactonal, olfactory, gustatory, or auditory stimulus that evokes a response or a behavior pattern.

sensory deficit a loss, absence, or marked impairment of vision, hearing, taste, touch, or smell.

sensory deprivation the reduction of sensory stimulation to a minimum in the absence of normal contact with the environment. Sensory deprivation may be induced (e.g., via the use of a FLotation TANK) for experimental or clinical purposes, or it may occur in a real-life situation (e.g., in deep-sea diving). Although short periods of sensory deprivation can be beneficial, extended periods have detrimental effects, causing (among other things) hallucinations, delusions, hypersuggestibility, or panic. See also RESTRICTED ENVIRONMENTAL Stimulation technique.
sensory discrimination the perceptual differentiation of stimuli, particularly closely related sensory stimuli (e.g., very similar shades of blue).

sensory disorder any disturbance in the optimum transmission of information from a sense organ to its appropriate reception point in the brain or spinal cord, particularly when related to an anatomical or physiological abnormality. An auditory disorder, for example, may be due to damage to the cochlear structures from injury or disease.

sensory drive see SENSORY EXPLOITATION.

sensory engineering see KANSEI ENGINEERING.

sensory epilepsy a type of epilepsy marked by seizures involving abnormal skin sensations (see PARESTHESIA), such as tingling, numbness, or burning. Such seizures may occur without loss of consciousness.

sensory evoked potential a type of EVOKE POTENTIAL recorded from electrodes placed on the scalp, overlying the cerebral cortex, in response to sensory stimulation. The stimuli may be visual, auditory, somatosensory, gustatory, or olfactory, and the mapping of sensory evoked potentials in the cortex helps to locate the different SENSORY AREAS. See also AUDITORY EVOKED POTENTIAL; VISUAL EVOKED POTENTIAL. Compare MOTOR EVOKED POTENTIAL.

sensory exploitation in animal behavior, the use of a SENSORY BIAS to gain increased REPRODUCTIVE SUCCESS by changing some feature of ornamentation or calling behavior to be more attractive to mates. For example, if low-frequency call notes are attractive to mates, then the first individuals to use these notes will achieve the greatest reproductive success. Also called sensory drive.

sensory extinction the total loss of the stimuli that impinge on a receptor or an individual at a given time.

sensory gating see GATING.

sensory homunculus a figurative representation, in distorted human form, of the relative sizes of the sensory areas in the brain that correspond to particular sensory parts of the body. The homunculus is arranged upside down with the largest proportional areas representing the face and hands. Compare MOTOR HOMUNCULUS.

sensory inattention see PERCEPTUAL EXTINCTION.

sensory field the totality of the stimuli that impinge on a receptor or an individual at a given time.

sensory gating see GATING.

sensory homunculus a figurative representation, in distorted human form, of the relative sizes of the sensory areas in the brain that correspond to particular sensory parts of the body. The homunculus is arranged upside down with the largest proportional areas representing the face and hands. Compare MOTOR HOMUNCULUS.

sensory information store (SIS) see SENSORY MEMORY.

sensory input the stimulation of a sense organ, causing a nerve impulse to travel to its appropriate destination in the brain or spinal cord.

sensory integration the neural processes involved in perceiving, organizing, and evaluating sensory information across modalities, such as vision and hearing, and producing an adaptive response via impulses transmitted through the motor nerves. Development or enhancement of SENSORY-INTEGRATIVE FUNCTIONING is an important goal of OCCUPATIONAL THERAPY.

sensory integration dysfunction a condition characterized by difficulties in organizing, processing, and analyzing sensory input (touch, movement, body awareness, sight, sound, smell, and taste). Also called sensory processing disorder. [first described by U.S. occupational therapist and psychologist A. Jean Ayres (1920–1989)]

sensory intensity the perceived strength or magnitude of a physical stimulus, predictably related to its actual magnitude by psychophysical laws. See STIMULUS-INTENSITY DYNAMISM.

sensory interaction the integration of sensory processes when performing a task, as in maintaining balance using sensory input from both vision and PROPRIORCEPTION. See also CROSS-MODAL ASSOCIATION; INTERSENSORY PERCEPTION; PERCEPTUAL SYNTHESIS.

sensory leakage in experiments on EXTRASENSORY PERCEPTION, the conveying of information about the TARGET to the SUBJECT through ordinary sensory channels, often by inadvertent cues from the tester. See also DEMAND CHARACTERISTICS; EXPERIMENTER BIAS.

sensory memory brief storage of information from each of the senses, in a relatively unprocessed form beyond the duration of a stimulus, for recoding into another memory (such as SHORT-TERM MEMORY) or for comprehension. For instance, sensory memory for visual stimuli, called ICONIC MEMORY, holds a visual image for less than a second, whereas that for auditory stimuli, called ECHOCR MEMORY, retains sounds for a little longer. Also called sensory-information store (SIS); sensory register.

sensory modality see SENSE.

Sensory Modality Assessment and Rehabilitation Technique (SMART) see VEGETATIVE STATE.

sensory modulation dysfunction a condition characterized by difficulties in responding appropriately to sensory input (touch, movement, body awareness, sight, sound, smell, and taste). A person may be overresponsive or underresponsive to sensations or alternate rapidly between both response patterns.

sensory neglect an inability to attend to sensory information, usually from the left side of the body, as a result of brain injury, most often to the right hemisphere. Also called perceptual neglect. See MOTOR NEGLIG; UNILATERAL NEGLIG; VISUAL NEGLIG.

sensory nerve any nerve that conveys impulses from a sense organ to the central nervous system.

sensory neuron a neuron that receives information from the environment, via specialized RECEPTOR cells, and transmits this information—in the form of nerve impulses—through SYNAPSES with other neurons to the central nervous system.

sensory organ see SENSE ORGAN.

sensory organization the neural process of structuring and integrating impulses from sensory receptors so as to enable meaningful perception.

sensory overload a state in which one’s senses are overwhelmed with stimuli, to the point that one is unable to process or respond to all of them. See also COGNITIVE OVERLOAD; COMMUNICATION OVERLOAD; INFORMATION OVERLOAD; STIMULUS OVERLOAD.

sensory paralysis a condition in which sensory function is impaired but movement is not necessarily lost.

sensory pathway any of the routes followed by nerve impulses traveling from sense organs toward sensory areas of the brain. See AFFERENT PATHWAY; NEURAL PATHWAY.

Sensory Perceptual Examination see REITAN–KLØVE SENSORY PERCEPTUAL EXAMINATION.
sensory preconditioning a form of CLASSICAL CONDITIONING established by initially pairing two neutral stimuli—A and B—and subsequently pairing A with an unconditioned stimulus. If B comes to elicit a response, then sensory preconditioning has occurred. Also called sensory conditioning.

sensory processing disorder see SENSORY INTEGRATION DYSFUNCTION.

sensory projection area see SENSORY AREA.

sensory psychophysiology the study of the relation between psychological and physiological functioning as it pertains to the senses and perception.

sensory receptor organ see SENSE ORGAN.

sensory register see SENSORY MEMORY.

sensory root see DORSAL ROOT.

sensory spot a skin spot or location of high sensitivity to tactile, thermal, or pain stimuli.

sensory stimulation the elicitation of a response in a sensory receptor by a stimulus.

sensory substitution the perception of a stimulus normally analyzed by one sense through the activity of another sense. Tactile sensations can substitute for visual input, for example, when the visual world is transcribed into tactile sensations for an individual who is blind. Sensory substitution requires an active translation of stimulation between sensory systems, in contrast to SYNESTHESIA, which is an involuntary association of one sense with another or one sensory attribute with another.

sensory summation the combining and integrating of sensory inputs at different levels of the nervous system. For example, sensory input will increase when multiple stimuli are summed over time (see TEMPORAL SUMMATION) or across space (see SPATIAL SUMMATION).

sensory suppression the phenomenon occurring in any sensory modality when an individual is given two sensory inputs simultaneously (such as a touch on the hand and face) but perceives only one of the stimuli.

sensory system the total structure involved in SENSATION, including the sense organs and their RECEPTORS, afferent sensory neurons, and SENSORY AREAS in the cerebral cortex at which these tracts terminate. There are separate systems for each of the senses. See AUDITORY SYSTEM; GUSTATORY SYSTEM; OLFACTORY SYSTEM; SOMATOSENSORY SYSTEM; VISUAL SYSTEM; VESTIBULAR SYSTEM.

sensory test a test designed to measure any of various sensory abilities, such as visual acuity, depth perception, color discrimination, or auditory acuity.

sensory transduction see TRANSDUCTION.

sensual adj. 1. referring to the senses, particularly gratification or appeal to the senses. 2. referring to physical or erotic sensation.

sensum n. (pl. sensa) see SENSATION.

sensuous adj. describing the sensory aspect of an experience or something that is capable of arousing the senses.

sensus communis in the thought of ARISTOTLE, the mental faculty that takes data provided by the five senses and integrates them into unified perceptions. The operations of the sensus communis (Latin, "common sense") were thought to occur in the SENSORIUM COMMUNE.

sentence-completion test a test in which the participant must complete an unfinished sentence by filling in the specific missing word or phrase. The test is typically used to evaluate personality. The participant is presented with an introductory phrase to which he or she may respond in any way. An example might be “Today I am in a __ mood.” As a projective test, the sentence-completion test is an extension of the WORD-ASSOCIATION TEST in that responses are free and believed to contain psychologically meaningful material. Also called incomplete-sentence test.

sentence-repetition test a test in which the participant is required to repeat sentences of increasing difficulty and complexity directly after the examiner reads them. It is used primarily to measure memory skills.

sentence-verification task a procedure in which participants are briefly presented with simple sentences and asked to make quick judgments about them. For example, a person might have 5 seconds to read the sentence The sky is blue and respond whether it is true or false. Numerous variations of this basic task exist, including ones in which the focus is on different sentence characteristics or types of responses, ones in which sentences are matched with pictures, and ones in which individuals simultaneously perform other tasks (e.g., imagining a particular visual pattern). The sentence-verification task most commonly is used in cognitive research on SEMANTIC MEMORY and verbal comprehension.

sentence n. 1. the simplest or most primitive form of cognition, consisting of a conscious awareness of stimuli without association or interpretation. 2. the state of being SENTIENT.

tentent adj. capable of sensing and recognizing stimuli.

sentimentality n. the quality of being excessively or affectingly swayed by emotional situations, especially those of a romantic or maudlin nature. See also EMOTIONALITY. —sentimental adj.

sentinel behavior a form of animal behavior in which one member of a group watches for potential predators while others in the group forage, rest, or engage in social interactions. Sentinel behavior is often seen in COOPERATIVE-BREEDING species, with different individuals taking turns as sentinels with those carrying young or feeding.

sentinel event in health administration, an unexpected occurrence or variation in service delivery involving death or serious physical or psychological injury. The event is called “sentinel” because it sends a signal or sounds a warning that requires immediate attention.

SEP abbreviation for SOMATOSENSORY EVOKED POTENTIAL.

separated display in ergonomics, a machine display that separates critical information from more secondary information. The design is based upon the need to highlight important pieces of information so they stand out from other information on the display. Compare INTEGRATED DISPLAY.

separation anxiety the normal apprehension experienced by a young child when away (or facing the prospect of being away) from the person or people to whom he or she is attached (particularly parents). Separation anxiety is most active between 6 and 10 months of age. Separation from loved ones in later years may elicit similar anxiety. See SEPARATION DISTRESS.

separation anxiety disorder in DSM–IV–TR, an anx-
seriation disorder occurring in childhood or adolescence that is characterized by developmentally inappropriate, persistent, and excessive anxiety about separation from the home or from major attachment figures. Other features may include marked anticipatory anxiety over upcoming separation and persistent and excessive worry about harm coming to attachment figures or about major events that might lead to separation from them (e.g., getting lost). There may also be school refusal, fear of being alone or going to sleep without major attachment figures present, separation-related nightmares, and repeated complaints of physical symptoms (e.g., vomiting, nausea, headaches, stomachaches) associated with anticipated separation. These symptoms cause clinically significant distress or impairment in functioning. In DSM-5, the criteria have been adjusted to recognize the existence of this disorder in adults; symptoms must be present for at least 6 months in adults versus 4 weeks in children.

separation distress discomfort and anxiety felt by an individual upon losing contact with an attachment figure, such as by a child after losing contact with a caregiver or by an adult in reaction to the traumatic loss of a spouse or partner. See separation anxiety.

separation-individuation n. a developmental phase in which the infant gradually differentiates himself or herself from the mother, develops awareness of his or her separate identity, and attains relatively autonomous status. [defined by Hungarian-born U.S. child psychoanalyst Margaret Schönberger Mahler (1897–1985)]

separation strategy see acculturation strategies.

sepsis n. the condition of tissues contaminated by the presence of pus-forming bacteria or other microorganisms or by the toxic substances produced by such microorganisms. When spread throughout the bloodstream, the condition is called septicemia. —septic adj.

sept n. a subdivision of a CLAN or other large social unit, especially one based on (supposed) common ancestry. In Scotland and Ireland, a clan is often composed of several septs, which may be affiliated through a common loyalty or interest rather than a common ancestor. See also DESCENT GROUP.

septal area a region of the forebrain that contains the septal nuclei and the septum pellucidum, which separates the lateral ventricles. The septal nuclei, which include the NUCLEUS ACCUMBENS, form an integral part of the limbic system; they contribute fibers to the medial forebrain bundle and have interconnections with the amygdala, hippocampus, and regions of the hypothalamus. Functionality of this area includes pleasure generation and anger suppression.

septicemia n. a severe (usually bacterial) infection of the bloodstream, typically as a result of microorganisms invading from an infection site elsewhere in the body. Septicemia may be characterized by fever, chills, and skin eruptions. A particularly hazardous complication is spread of the infection to tissues of the nervous system. Also called bacteremia; blood poisoning. See also SEPSIS.

septum n. (pl. septa) a thin partition or dividing wall, such as the nasal septum (see NASAL CAVITY) or the septum pellucidum. —septal adj.

septum pellucidum a triangular, two-layered translucent membrane separating the anterior horns of the two lateral ventricles of the brain. It touches the corpus callosum and the body of the fornix and is part of the septal area.

sequela n. (pl. sequelae) a residual effect of a disease, injury, or mental condition, often (but not necessarily) in the form of persistent or permanent impairment. Examples include paralysis, which may be the sequela of poliomyelitis, and flashbacks, which may be the sequelae of traumatic stress.

sequence effect in within-subjects designs, a difference in scores that emerges because of a particular arrangement of treatments—that is, the presentation of one level of the independent variable has an effect on responses to another level of that variable. A researcher can test for a sequence effect by administering the treatments in various different arrangements (e.g., the arrangement ABC vs. ACB, vs. BCA, and so forth). The sequence effect is not to be confused with the ORDER EFFECT.

sequential analysis a class of statistical procedures in which decisions about sample size and the type of data to be collected are made or modified as the study proceeds, based on the cumulative findings. This approach contrasts with one in which the sample size is determined in advance and data are not analyzed until the entire sample is collected. A common form of sequential analysis is one in which data are collected until a desired outcome or level of precision is reached. Also, some clinical trials require an approach that allows researchers to stop data collection if the treatment is clearly not working or if participants are being harmed in some way.

sequential design 1. a research design that allows for termination of the study at various points of data collection if the results do not conform to a desired pattern or if there is danger or cost to participants. See sequential analysis. 2. see cohort-sequential design.

sequential effect in choice-reaction tasks, the influence of an immediately preceding trial (or trials) on performance in the current trial. As with priming effects, sequential effects have both automatic and strategic components.

sequential processing see serial processing.

sequential regression see hierarchical regression.

sequential sampling a method of nonprobability sampling in which the researcher draws a group of units from the larger population, conducts a study within a specified time frame, analyzes the data, and then determines whether another sample is needed. The process can be repeated several times. The sequential approach enables a researcher to determine when enough data have been collected and to fine-tune his or her methodology over repeated studies.

Serax n. a trade name for oxazepam.

serendipity n. the knack of making fortunate discoveries by accident. Serendipity is often considered a characteristic of the creative scientist. The word was coined in 1754 by British writer Horace Walpole (1717–1797) from the title of his story “The Three Princes of Serendip.” Serendip was an old Arabic name for Sri Lanka, whose princes were said to have had this ability.

Serentil n. a trade name for mesoridazine.

serial anticipation method a technique that involves learning to associate a stimulus (e.g., an item in a list or series) with a stimulus or response that follows (e.g., the next
item in the list or series, so that when subsequently given
the stimulus, one can produce the response or recall the
next item in the series. This method is frequently used in
PAIRED-ASSOCIATES LEARNING and SERIAL RECALL. Also
called **anticipation method**: anticipation learning
method.

**serial behavior** an integrated sequence of responses that
elicit each other in fixed order (e.g., playing music). The
individual responses that comprise, and occupy specific
positions within, the sequence are referred to as **serial
responses**.

**serial correlation** see **AUTOCORRELATION**.

**serial exhaustive search** a hypothesized process of
searching for a particular target item in **SHORT-TERM MEMORY**
that involves inspecting each item in turn for a match.

**serial-exploration method** see **METHOD OF JUST
NOTICEABLE DIFFERENCES**.

**serial interpretation** a psychoanalytic technique in
which the analyst studies a series of consecutive dreams
that, when taken as a group, provide clues that would be
overlooked in interpretation of a single, isolated dream. See
also **RECURRENT DREAM**.

**serial killer** an individual who repeatedly commits murder,
typically with a distinct pattern in the selection of victims,
location, and method.

**serial learning** the learning of a sequence of items or
responses in a precise order. For example, actors must learn
their lines in sequence. Also called **serial-order learning**.

**serial memory** remembering a list of items in sequence.
See SERIAL POSITION EFFECT; SERIAL RECALL.

**serial-memory search** a retrieval process in which
each item in **SHORT-TERM MEMORY** is examined in the order
in which it was entered into memory.

**serial monogamy** see **MONOGAMY**.

**serial position curve** a graphic representation of the
number of items that can be remembered as a function of
the order in which they were presented in a list. Items at
the beginning and end of the list are usually remembered
best, thus producing a U-shaped memory curve.

**serial position effect** the effect of an item’s position in
a list of items to be learned on how well it is remembered.
The classic serial position effect shows best recall of the
first items from a list (see **PRIMACY EFFECT**) and good recall
of the last items (see **RECENCY EFFECT**), while the middle
items are less well recalled.

**serial processing** **INFORMATION PROCESSING** in which
only one sequence of processing operations is carried out at
a time. Those who hold that the human information-processing
system operates in this way argue that the mind’s
apparent ability to carry on different cognitive functions si-
multaneously is explained by rapid shifts between different
information sources. Also called **INTERMITTENT PROCESSING**: sequential processing. Compare **PARALLEL PROCESSING**. See also **SINGLE-CHANNEL MODEL**.

**serial recall** recalling items in the order in which they
were presented. For instance, to remember a telephone
number, the digits must be correctly sequenced. See also
**SERIAL MEMORY**.

**serial reproduction** a method for studying memory in
which one person reads a set of information before repro-
ducing it for another person, who then reproduces it for a
third person, who does the same for a fourth, and so on. Se-
rial reproduction is widely regarded as a model for the so-
cial communication of retained information, and as such it
is an important experimental tool in the analysis of rumor
and gossip transmission, stereotype formation, and similar
phenomena. The processes at work in changes that occur
in serial reproductions by different individuals—that is,
leveling (simplification), sharpening (emphasis on selected
details), and ASSIMILATION—have been of great theoretical
importance both in social psychology and in theories of
personality. See also **CHAIN REPRODUCTION**; **REPEATED
REPRODUCTION**. [developed in 1912 by Frederic C. BARTLETT]

**serious emotional disturbance (SED)** see **EMOTIONAL DISTURBANCE**.

**SERM** abbreviation for selective estrogen receptor modula-
tor. See **ANTIESTROGEN**.

**Sernyl n.** a trade name for a brand of phencyclidine
hydrochloride, an animal anesthetic with hallucinogenic
properties sometimes taken as a drug of abuse (see **PCP**).

**Seroquel n.** a trade name for **QUETIAPINE**.

**serotonergic adj.** responding to, releasing, or otherwise
involving serotonin. For example, a **serotonergic neuron** is
one that employs serotonin as a neurotransmitter. In the
brain, most **serotonergic pathways** originate in the **RAPHE
NUCLEUS** and project diffusely to other sites in the brain and
to the spinal cord.

**serotonin** n. a common monoamine neurotransmitter in
the brain, particularly the **RAPHE NUCLEUS**, and in other
parts of the central nervous system; it also is found in the
gastrointestinal tract, in smooth muscles of the cardiovas-
cular and bronchial systems, and in blood platelets. It is
synthesized from the dietary amino acid **L-TRYPTOPHAN** (see
**TRYPTOPHAN HYDROXYLASE**), and in the pineal gland it is
converted to **MELATONIN**. It is primarily degraded by mono-
amine oxidase, which yields its principal metabolic prod-
uct, 5-HYDROXYINDOLEACETIC ACID (5-HIAA). Serotonin has
roles in emotional processing, mood, appetite, sexual desire
and performance, sleep, pain processing, hallucinations,
and reflex regulation. For example, levels of serotonin cor-
relate negatively with aggression, and release of serotonin
may promote sleep. It is implicated in many psychological
conditions, including depressive disorders, anxiety disor-
ders, sleep disorders, aggression, and psychosis; many
common psychotropic drugs affect neurotransmission medi-
ated by serotonin. Also called **5-HYDROXYTRYPTAMINE (5-
HT)**.

**serotonin agonist** any agent that increases the affinity for,
or availability of, serotonin at various serotonin recip-
tors in the brain or peripheral tissues. Commonly used IN-
DIRECT AGONISTS are the SSRIs (e.g., fluoxetine, citalopram),
which work by blocking the presynaptic reuptake of sero-
tonin, thereby increasing the availability of serotonin at
postsynaptic receptor sites. Other serotonin agonists exert
their effects directly at the receptor site; for example, the 
TRIPTANS are direct agonists at receptor subtypes 5-HT_{1A} and 5-HT_{1D}. The anxiolytic agent BUSPIRON is a PARTIAL AGONIST at the postsynaptic 5-HT_{1A} receptor, whereas the serotonin-like hallucinogens (e.g., LSD) act as partial agonists at 5-HT_{1A} receptors.

serotonin and norepinephrine reuptake inhibitor see SNRI.

serotonin antagonist any agent that opposes the ac-
tion of serotonin. Such drugs include CYPROMETHADINE and METHYLERGIDE, which are used for the prevention of mi-
graine attacks, and the antiemetic ONDANSETRON.

serotonin receptor any of various receptors that bind and respond to serotonin (5-hydroxytryptamine; 5-HT). They occur in the brain and in peripheral areas and have different sensitivities that can be measured by susceptibility to ligands or blockers. At least 15 classes of serotonin receptors, affecting a variety of physiological and psychological processes, have been identified. They are designated by subscript numbers and letters (e.g., 5-HT_{1A}, 5-HT_{1B}, 5-HT_{2A}, 5-HT_{2C}, 5-HT_{3A}).

serotonin reuptake inhibitor (SRI) see SSRI.

serotonin reuptake transporter see SEROTONIN TRANSPORTER.

serotonin syndrome a collection of symptoms, includ-
ing fever, agitation, confusion, delirium, and increased heart rate, due to excess activity of the neurotransmitter serotonin. It may result from drug interactions that in-
crease amounts of available serotonin to toxic levels.

serotonin transporter (SERT) a protein that regu-
lates the signaling and availability of serotonin in the cen-
tral nervous system via REUPTAKE. It is believed to have major roles in depression, obsessive-compulsive disorder, and social phobia and is a target of SSRI treatment. A vari-
ant, with repeated amino acids, of the gene that codes for SERT but that may cause reduced serotonin reuptake is called the serotonin transporter-linked polymorphism re-
gion (5-HTTLPR). This polymorphism has been associated with several mental disorders, including schizophrenia, mood disorders, and autism. Also called serotonin reup-
take transporter.

serous otitis media see OTITIS MEDIA.

SERT abbreviation for SEROTONIN TRANSPORTER.

Sertoli cell any of the elongated cells lining the SEMINIF-
EROUS TUBULES that protect and nourish developing sperm. As the sperm approach maturity, they become oriented in the seminiferous tubules so that they are partly embedded in the Sertoli cells. [Enrico Sertoli (1842–1910), Italian histologist]

sertraline n. an SSRI that is used for the treatment of major depression, panic disorder, posttraumatic stress dis-
order, and obsessive-compulsive disorder. It has also been indicated for the treatment of premenstrual dysphoric disorder. U.S. trade name: Zoloft.

service delivery system a complex, interrelated set of organizational (i.e., people and providers) and technologi-
ical inputs and processes, resulting in the provision of such services as mental health interventions, public health pro-
grams, social welfare, and education.

servomechanism n. a device that automatically acti-
vates changes or corrections in the performance of certain

functions according to a predetermined SET POINT. For ex-
ample, the cruise control of an automobile automatically adjusts engine output to maintain a constant speed. Also called serv. See also COMPARATOR.

SES abbreviation for SOCIOECONOMIC STATUS.

sessile adj. 1. describing an organism that is permanently attached to its SUBSTRATE, such as a sea anemone. 2. at-
tached broadly by a base, rather than by a stalklike struc-
ture, as in a sessile lesion.

set n. 1. a temporary readiness to respond in a certain way to a specific situation or stimulus. For example, a sprinter gets set to run once the starting gun fires (a MOTOR SET); a parent is set to hear his or her baby cry from the next room (a PERCEPTUAL SET); and a poker player is set to use a tactic that has been successful in other games (a MENTAL SET). See also PREPARATORY SET. 2. a collection of psychological fac-
tors (expectations, beliefs, mood, etc.) that can influence an individual’s response to a drug. 3. in mathematics and logic, a collection of entities that is itself regarded as an en-
tity. A set that is defined by a condition, such that its mem-
ers must possess a particular attribute or attributes, is

known as a CLASS.

SET acronym for STUDENTS’ EVALUATION OF TEACHING.

set-level compatibility effect see STIMULUS–RE-
SPONSE COMPATIBILITY.

set point the desired value in a SERVOMECHANISM, such as the level at which a thermostat is set to maintain a reason-
ably constant temperature. By extension to physiological and behavioral systems, set point refers to the preferred level of functioning of an organism or of a system within an organism. When a set point is exceeded (i.e., when phys-
iological responses become higher than the set point), com-
pensatory events take place to reduce functioning; when a set point is not reached, compensatory processes take place to help the organism or system reach the set point. Accord-
ing to the set-point theory of happiness, individuals each have a particular set point, or baseline, of SUBJECTIVE WELL-
BEING that is generally stable throughout life and that they are likely to return to despite life-changing events, whether positive (e.g., winning the lottery) or negative (e.g., sustain-
ing a spinal cord injury). As applied to ATTACHMENT THER-
apy, set point refers to the physical proximity to a primary caregiver in conditions of threat; that is, threat leads the
child to seek physical closeness to an attachment figure. This proximity becomes a set point for intimacy later in life and is sometimes used to explain why people vary in their levels of subjective well-being. See also HIDONIC TREADMILL.

set/reset model the theory that people’s default (set) tendency when making judgments about a target is to as-
similate contextual elements into those judgments but that, with CONTRAST EFFECTS occurring under relatively de-
liberative conditions, people actively attempt to partial out (reset) the contextual influence and instead inadvertently partial out elements of the target itself. Because resetting requires substantial cognitive effort, contrast effects are considered unlikely to occur under nondeliberative condi-
tions. See also ASSIMILATION; FLEXIBLE CORRECTION MODEL; INCLUSION/EXCLUSION MODEL. [proposed by U.S. psycholo-
gist Leonard L. Martin and his colleagues]

set theory the branch of mathematics and logic that is concerned with the properties of SETS (i.e., collections of entities that are themselves treated as entities). See also CLASS THEORY.
setwise regression see ALL-POSSIBLE-SUBSETS REGRESSION.

set zone the range of values for a variable that a FEEDBACK SYSTEM is to maintain. See also CRITICAL RANGE.

SEU abbreviation for SUBJECTIVE EXPECTED UTILITY.

seven plus or minus two the number of items that can be held in SHORT-TERM MEMORY at any given time and therefore accurately perceived and recalled after a brief exposure (see CHUNKING). The phrase originated in the title of an article (1956) by George Armitage MILLER, “The Magical Number Seven, Plus or Minus Two: Some Limits on Our Capacity for Processing Information.”

seventh cranial nerve see FACIAL NERVE.

severe mental retardation an older diagnostic category applying to those with IQs of 20 to 34, comprising about 7% of people with MENTAL RETARDATION. Although able to manage basic self-care activities such as dressing and eating, these individuals typically do not acquire much more than rudimentary communication, social, educational, and vocational skills and generally require significant assistance and supervision. Additionally, sensory and motor deficits are common.

severity error a type of rating error in which the ratings are consistently overly negative, particularly with regard to the performance or ability of the participants. It is caused by the rater’s tendency to be too strict or negative and thus to give undeservedly low scores. Also called severity bias. Compare LENIENCY ERROR.

sex n. 1. the traits that distinguish between males and females. Sex refers especially to physical and biological traits, whereas GENDER refers especially to social or cultural traits, although the distinction between the two terms is not regularly observed. 2. the physiological and psychological processes related to procreation and erotic pleasure.

sex change see SEX REASSIGNMENT.

sex characteristic any of the traits associated with sex identity. Primary sex characteristics (e.g., testes in males, ovaries in females) are directly involved in reproduction of the species. Secondary sex characteristics are features not directly concerned with reproduction, such as voice quality, facial hair, and breast size. Also called sexual characteristic.

sex chromatin a condensed mass of CHROMATIN that is observed in the nucleus of nondividing SOMATIC cells of males. It is not observed in the somatic cells of normal males. The substance represents material within the X chromosome that is not involved in somatic-cell metabolism. The presence of sex chromatin in somatic cells is generally regarded as proof of the sexual identity of females. Also called Barr body. See also CHROMATIN NEGATIVE CHROMATIN POSITIVE.

sex-chromosomal aberration any disorder of structure, function, or both that is associated with the complete or partial absence of a sex chromosome or with the presence of extra sex chromosomes. Examples of such disorders are KLINEFELTER’S SYNDROME, XXY SYNDROME, and TURNER SYNDROME.

sex chromosome a chromosome that determines whether an individual is female or male. Humans and other mammals have two sex chromosomes: the X CHROMOSOME, which carries genes for certain sexual traits and occurs in both females and males; and the smaller Y CHROMOSOME, which is normally found only in males. An individual usually is considered to be a female if the body cells contain the XX combination of chromosomes and male if the cells contain the XY combination, regardless of physical traits or signs of hermaphroditism. Diseases coded by genes that are carried only on a sex chromosome (usually the X chromosome) are called SEX-LINKED conditions.

sex counseling guidance provided by therapists to sex partners in such matters as birth control, infertility, and problems with sexual performance or response.

sex determination the genetic mechanism that determines the sex of offspring. In humans, a fertilized egg with two X CHROMOSOMES becomes a female, and a fertilized egg with one X and one Y CHROMOSOME becomes a male. See SEX DIFFERENTIATION.

sex differences 1. the differences in physical features between males and females. These include differences in brain structures as well as differences in primary and secondary SEX CHARACTERISTICS. 2. the differences between males and females in the way they behave and think, with such differences often viewed as driven by actual biological disparity (nature) rather than by differing environmental factors (nurture). See also GENDER DIFFERENCES. Compare SEX ROLE.

sex differentiation the process of acquiring distinctive sexual features during the course of development. Human sexual differentiation is determined genetically at the time of fertilization, primarily by the presence or absence of a Y CHROMOSOME. Fertilized eggs containing a Y chromosome develop as male embryos, whereas ones lacking a Y chromosome develop as male embryos, whereas ones lacking a Y chromosome develop as females. This is due to the presence on the Y chromosome of a particular gene, called SRY (sex reversal on Y). It encodes a testis-determining factor that, via a cascade of signals, triggers the development of testes and other male reproductive organs. In the absence of this gene, the embryo develops along the default pathway, with ovaries and other female organs.

sex discrimination differential treatment of individuals on the basis of their biological distinction as male or female. Although such treatment may sometimes favor women relative to men, in contemporary society, most sex discrimination favors men over women; common manifestations include unfair hiring and promotion practices, lower wages paid to women doing the same type of work as men, and a tendency to undervalue characteristics and interests associated with women. Changing attitudes toward marriage, improved availability of day care facilities, increased educational opportunities, role changes in the home, and workforce shortages in some industries have led to a heightened awareness of the erroneous nature of certain SEX-ROLE STEREOTYPES and altered conceptions of what men and women can do. In addition, in many societies, legislation prohibits sex discrimination. Nevertheless, sex discrimination persists and contributes to a number of social problems, including inadequate support for working women, lower standards of health care for women, and violence against women. Also called sexual discrimination. See also GLASS CEILING; PREJUDICE; SEXISM.

sex distribution see SEX RATIO.

sex drive an arousal state precipitating the desire for sexual gratification and, usually, for sexual reproduction. Although it is not necessary for an individual’s survival, it is considered a PRIMARY DRIVE because it is essential for species survival. In many animals, sexual activity is cyclical
sex role

(e.g., seasonal or dependent on cyclical hormone release), although a variety of factors (e.g., external stimulation) may arouse the drive. Also called sexual drive. See LIBIDO.

sex education a formal course of instruction in reproductive processes that is presented in a classroom setting. Sex education ideally provides young adolescents with authoritative and objective information about both the psychological and physical aspects of sexual behavior.

sex feeling see SEXUAL FEELING.

sex hormone any of the hormones that stimulate various reproductive functions. Primary sources of sex hormones are the male and female gonads (i.e., testis and ovary), which are stimulated to produce sex hormones by the FOLLICLE-STIMULATING HORMONE and LUTEINIZING HORMONE secreted by the pituitary gland. The principal male sex hormones (ANDROGENS) include testosterone; female sex hormones include the ESTROGENS, PROGESTERONE, and PROLACTIN.

sex hygiene the health-maintenance procedures related to sexual activity, such as the prevention or control of sexually transmitted infections. Also called sexual hygiene.

sex identification see SEXUAL IDENTIFICATION.

sex identity the purely biologically determined sexual status of an individual as male or female. See also GENDER IDENTITY.

sex-influenced character an inherited trait that is dominant in one sex but recessive in the other. For example, male-pattern baldness is controlled by an allele that is dominant in one sex but recessive in the other. For example, male-pattern baldness is controlled by an allele that is dominant in one sex but recessive in the other. Hence, its full effects rarely appear in women.

sex instinct see SEXUAL INSTINCT.

sexism n. discriminatory and prejudicial beliefs and practices directed against one of the two sexes, usually women. Sexism is associated with acceptance of SEX-ROLE STEREOTYPES and can occur at multiple levels: individual, organizational, institutional, and cultural. It may be overt, involving the open endorsement of sexist beliefs or attitudes; covert, involving the tendency to hide sexist beliefs or attitudes and reveal them only when it is believed that one will not suffer publicly for them; or subtle, involving unequal treatment that may not be noticed because it is part of everyday behavior or perceived to be unimportant. See also PREJUDICE; SEX DISCRIMINATION. —sexist adj.

sex-limited adj. describing a trait or anomaly that is expressed only in one sex, despite being determined by genes carried on the AUTOSOMES rather than the sex chromosomes. For example, the genes governing the development of ovaries and breasts are expressed only in females, whereas genes determining sperm production are expressed only in males.

sex-linked adj. describing either a gene that is located on one of the sex chromosomes, typically the X chromosome (X-LINKED), or a trait determined by such a gene. The process whereby a sex-linked gene or trait is passed on from parent to offspring is called sex-linked inheritance. Sex-linked inherited diseases from a defective gene on the X chromosome include hemophilia, itself called X-LINKED RECESSIVE because the defective gene is usually a recessive allele. It is carried by females and expressed mostly in their male offspring. In their daughters, who have two X chromosomes, the defective gene is usually masked by the normal, dominant allele on the other X chromosome, whereas in their sons, who have an X and a Y chromosome and in whom the Y chromosome lacks many of the alleles of the X chromosome, masking cannot occur. Disorders that are X-LINKED DOMINANT, in which only one copy of an allele of a defective gene on the X chromosome is sufficient to cause inherited disorder, may occur in either male or female offspring depending on which parent is affected. A form of sex-linked inheritance in which a recessive trait is inherited from father to son by way of a single gene on the Y chromosome (Y-LINKED) affects only male offspring. Diseases or disorders passed on through Y-linked inheritance are rare.

sex-negativity n. a negative attitude or stance toward any sexual behavior other than procreative marital coitus. Compare SEX-POSITIVITY.

sex object see SEXUAL OBJECT.

sex offense a sex act that is prohibited by law. An individual who has committed such an offense is called a sex offender. Some crimes are acts of violence involving sex, and others are violations of social taboos; there is much variation, by culture and jurisdiction, concerning which behaviors are considered crimes and how they may be punished. Some jurisdictions consider certain consensual sex acts to be illegal. Common examples of sex offenses include forcible and statutory rape, child molestation, incest, prostitution and pimping, bestiality, sodomy, sex murder, and forcible sexual assault without penetration. Also called sexual offense. See also MOLESTATION.

sexological examination the study of an individual’s sexual behavior in terms of physiological, psychological, sociological, and specific genetic and environmental influences.

sexology n. the study of sexuality, particularly among human beings, including the anatomy, physiology, and psychology of sexual activity and reproduction. —sexological adj. —sexologist n.

sex-positivity n. a positive attitude or stance toward sexual activity between consenting individuals when this is seen as promoting healthy relationships and forms of self-expression. Sex is seen as neither good nor bad, per se, and the purpose of sexual relations is not deemed to be confined exclusively to procreation through marital coitus. Compare SEX-NEGATIVITY.

sex preselection predetermination through reproductive technology of whether offspring will be male or female.

sex ratio the proportion of males to females in a given population at a given life stage, primarily at conception (see CONCEPTION RATIO) or birth (see BIRTH RATIO) but also at any stage between birth and death. Also called sex distribution.

sex reassignment a process, involving hormone treatment and surgery, in which a person’s sex characteristics are changed to conform to that person’s sense of GENDER IDENTITY, particularly in cases of TRANSGENDERISM. Also called gender reassignment; sex change; sexual reassignment. See also GENDER DYSPHORIA; GENDER IDENTITY DISORDER.

sex reversal on Y (SRY) see SEX DIFFERENTIATION.

sex role the behavior and attitudinal patterns characteristically associated with being male or female as defined in a given society. Sex roles thus reflect the interaction between biological heritage and the pressures of socializa-
sex-role reversal

tion, and individuals differ greatly in the extent to which they manifest typical sex-role behavior.

sex-role reversal a form of animal behavior in which each sex behaves in a manner generally considered typical of the other sex. For example, in some insects and fish, males take full responsibility for care of the offspring, and in some polyandrous birds, females are aggressive and defend territories.

sex-role stereotype a fixed, overly simplified concept of the social roles that are believed to be appropriate to males and to females. See also GENDER STEREOTYPE.

sex steroid any of the steroid hormones secreted by the gonads. See SEX HORMONE.

sex therapy a multimodal therapeutic approach designed to improve sexual functioning, based on the assumption that sexual performance problems are caused by a combination of lack of knowledge, misinformation, and faulty learning. Several different techniques commonly are used in sex therapy (e.g., SENSATE FOCUS, COGNITIVE RESTRUCTURING, COUPLES THERAPY), but they share the goal of providing education, reducing performance anxiety, improving communication, and teaching skills to improve sexual pleasuring for both partners. Sex therapy incorporates homework assignments, ideally carried out with a partner.

sex trafficking see TRAFFICKING.

sex typing the process by which particular activities are identified within particular cultures as appropriate expressions of maleness and femaleness. Usually, the preferred term for this process is GENDER TYPING.

sexual abuse violation or exploitation by sexual means. Although the term typically is used with reference to any sexual contact between adults and children, sexual abuse can also occur in any relationship of trust.

sexual addiction a problematic sexual behavior, such as PARAPHILIA or HYPERSEXUALITY, regarded as a form of addiction similar to drug addiction. The defining features of a sexual addiction include sexual behavior that is out of control, that has severely negative consequences, and that the person is unable to stop despite a wish to do so. Other features include persistence in high-risk, self-destructive behavior; spending large amounts of time in sexual activity or fantasy; neglect of social, occupational, or other activities; and mood changes associated with sexual activity.

sexual adjustment the process of establishing a satisfactory relationship with one or more sexual partners. Sexual adjustment may depend on psychological as well as physical factors.

sexual aggression aggression directed by one sex toward the other, often in the context of MATING BEHAVIOR. In species whose males are much larger than females, it is thought that a male may use sexual aggression to achieve FORCED COPULATION.

sexual and gender identity disorders in DSM–IV–TR, a category of disorders involving sexual or gender identity problems not attributable to another mental disorder. It includes SEXUAL DYSFUNCTIONS, PARAPHILIAS, and GENDER IDENTITY DISORDERS. It has been replaced in DSM–5 with discrete categories for sexual dysfunctions, GENDER DYSPHORIA, and paraphilic disorders. Formerly called psychosexual disorders.

sexual anesthesis an absence of normal sensation during sexual activity, including coitus. Sexual anesthesia is usually psychogenic. Although some patients report that they obtain sexual pleasure in masturbation but not in sexual activity with a partner, many derive no pleasure from any form of sexual behavior. See also ERECTILE DYSFUNCTION; FEMALE SEXUAL AROUSAL DISORDER.

sexual anomaly a congenital or developmental abnormality of the reproductive system, such as the presence of both male and female gonads in an infant.

sexual apathy lack of interest in sexual activity. See HYPOACTIVE SEXUAL DESIRE DISORDER.

sexual arousal a state of PHYSIOLOGICAL AROUSAL elicited by sexual contact or by other erotic stimulation (e.g., fantasies, dreams, odors, objects), resulting in impulses being transmitted through the central nervous system to the sacral region of the spinal cord. The impulses also trigger the release of sex hormones (conversion of the androgens supplying the genital areas, and inhibition of vasoconstrictor centers of the lumbar nerves. The effects of sexual arousal are mediated through the hypothalamus. See SEXUAL-RESPONSE CYCLE.

sexual arousal disorder a class of sexual disorders characterized by the inability to attain or maintain an adequate physiological response in the excitement (arousal) phase of the SEXUAL-RESPONSE CYCLE. See FEMALE SEXUAL AROUSAL DISORDER; MALE ERECTILE DISORDER.

sexual assault violent sexual penetration of an individual. It includes forced vaginal, oral, and anal penetration. See also RAPE.

sexual attitude reassessment workshop (SAR workshop) a group educational experience in which participants view films on such issues as same-sex sexual orientation, sex in aging, sexual values, and sexual myths. The workshop also involves group discussion and personal reflection on these issues.

sexual attitudes values and beliefs about sexuality. Manifested in a person’s individual sexual behavior, these attitudes are based on family and cultural views about sexuality, on sex education (both formal and informal), and on prior sexual experiences.

sexual attraction the first step in the MATING BEHAVIOR of many animals, in which they emit stimuli intended to attract a mate.

sexual aversion disorder in DSM–IV–TR, negative emotional reactions (e.g., anxiety, fear, disgust) to sexual activity, leading to active avoidance of it and causing distress in the individual or his or her partner. This can be lifelong or acquired, and although it usually applies to all sexual activity (generalized type), it may be specific to some activities or some partners (situational type). This aversion is not caused by a medical condition, a medication, or a drug side effect. DSM–5 has eliminated this diagnosis with the explanation that it is rarely used and not supported by research.

sexual behavior most narrowly, all reproductive activities between nonhuman animals, beginning with COURTSHIP, leading to MATE SELECTION, and culminating in COPULATION. In some species, sexual behavior may occur only during certain seasons or at specific stages of the ES'TROUS CYCLE. When applied to humans, however, the term has a much broader meaning that encompasses not only physical practices but also attitudes, experiences, desires, preferences, and a variety of related psychological and so-
cial phenomena, including any actions related not only to reproduction but also to pleasurable satisfaction without conception (i.e., sexual arousal). Such actions are shaped by culture and to a further extent by individual experience and observation, and they may be performed with a partner (as in foreplay and role play) or alone (as in fantasizing and masturbatıng). Additionally, some nonconceptive sexual behavior, such as phone sex or viewing an erotic movie, does not necessarily involve direct stimulation of the body at all. Certain avian and nonhuman mammalian species, particularly primates, also display nonconceptive sexual behavior, which may serve to maintain social relationships or pair bonds or to confuse mates about certainty of paternity.

sexual burnout loss of sexual function or interest due to a period of excessively frequent or demanding sexual activity. Sexual burnout also sometimes refers to the effects of advancing age on sexual activity.

sexual characteristic see sex characteristic.

sexual conditioning the learning of cues that predict opportunities for mating; these learned cues subsequently control sexual behavior. In both fish and birds, sexual conditioning increases the reproductive success of conditioned males. See also sexual imprinting.

sexual contact any person-to-person touching or connection with genital or erogenous skin or membrane surfaces, as in fondling, kissing, biting, or coitus.

sexual curiosity interest in sex and sexuality.

sexual desire disorder a class of sexual disorders, including hyperactive sexual desire disorder and sexual aversion disorder, characterized by a person's chronic lack of interest in or negative reactions to sexual activity and by associated distress or interpersonal difficulty.

sexual development the progression toward sexual maturity, in attitudes and behavior as well as in physical characteristics, from infancy through puberty. See also psychosexual development.

sexual deviance any sexual behavior, such as a paraphilia, that is regarded as significantly different from the standards established by a culture or subculture. Deviant forms of sexual behavior may include voyeurism, fetishism, bestiality, necrophilia, transvestism, sadism, and exhibitionism. Also called sexual deviation. See also sexual perversion.

sexual differentiation see sex differentiation.

sexual dimorphism the existence of males and females within a species that differ distinctly from each other in form. Compare monomorphism. See sex characteristic; sex differences.

sexual discrimination see sex discrimination.

sexual disorder any impairment of sexual function or behavior. Sexual disorders include sexual dysfunction and paraphilic disorders (see paraphilia).

sexual drive see sex drive.

sexual dysfunction any sexual disorder characterized by problems in one or more phases of the sexual-response cycle. The particular dysfunction may be primary, in which failure in sexual functioning has always been present in the person and happens in all sexual situations; or secondary, denoting any disturbance in sexual functioning that is not lifelong or that occurs only with some partners or in some situations. Examples of sexual dysfunction include sexual desire disorders; sexual arousal disorders such as erectile dysfunction; orgasmic disorders (e.g., female orgasmic disorder, male orgasmic disorder, premature ejaculation); and sexual pain disorders (e.g., dyspareunia). Formerly called psychosexual dysfunction.

sexual erethism abnormal irritability or unpleasant sensitivity to stimulation of the sexual organs.

sexual fantasy mental images or stories of sexual activity, not constrained by such real-world issues as partner availability or setting and situation.

sexual feeling the pleasurable feeling associated with coitus or other sexual contact. Also called sex feeling.

sexual functioning the performance of sexual intercourse or other sexual activities or the capability of performing them.

sexual harassment conduct of a sexual nature that is unwelcome or considered offensive, particularly in the workplace. According to the U.S.Equal Employment Opportunity Commission, there are two forms of sexual harassment: quid pro quo and behavior that makes for a hostile work environment. In the United States, under Title VII of the 1964 Civil Rights Act, an employee subjected to sexual harassment is entitled to sue employers. See also Harris v. Forklift Systems Inc.; Meritor Savings Bank v. Vinson.

sexual hygiene see sex hygiene.

sexual identification the perception, starting during the first 3 or 4 years of life, of physical sex differences between males and females, followed somewhat later by an awareness of psychological differences between the sexes and of socially determined gender roles. Also called sex identification. Compare gender identification.

sexual identity 1. an individual's sexual orientation. 2. an occasional synonym for sex identity.

sexual imprinting the development of a preference for a sexual partner that occurs during a sensitive or critical period. For example, if zebra finches are cross-fostered to Bengalese finch parents for the first 40 days of life, they will prefer to mate with Bengalese finches as adults. In addition, birds often prefer to socialize with other birds that resemble those they were exposed to in the first month of life.

sexual inhibition suppression of the sexual impulse or the inability to feel sexual desire, to perform sexually, or to experience sexual gratification. See hypoactive sexual desire disorder; female orgasmic disorder; male orgasmic disorder.

sexual instinct 1. the basic drive or urge to preserve the species through mating and the activities that precede it, by extension, simply to express the self and the self's psychological and psychological needs through sexual activity. 2. in classical psychoanalytic theory, the instinct comprising all the erotic drives and sublimations of such drives. It includes not only genital sex but also anal and oral manifestations and the channeling of erotic energy into artistic, scientific, and other pursuits. In his later formulations, Sigmund Freud saw the sexual instinct as part of a wider life instinct that also included the self-preservation impulses of hunger, thirst, and elimination. Also called sex instinct. See also eros; libido; self-preservation instinct.
sexual intercourse

**sexual intercourse** see COITUS; COPULATION.

**sexual interest** a readiness to engage or participate in discussions, viewing, or other activities related to or leading to sexual contact.

**sexual inversion** see INVERSION.

**sexuality** n. 1. the capacity to derive pleasure from various forms of sexual activity and behavior, particularly from sexual intercourse. 2. all aspects of sexual behavior, including gender identity, orientation, attitudes, and activity. 3. in classical psychoanalytic theory, the "organ pleasure" derived from all ERGONOMIC ZONES and processes of the body, including the mouth, anus, urethra, breasts, skin, muscles, and genital organs, as well as such functions as sucking, biting, eating, defecating, urinating, masturbating, and having intercourse.

**Sexuality Information and Education Council of the United States (SIECUS)** a nonprofit organization founded in 1964 that develops, collects, and disseminates information about sexuality; promotes sex education; and advocates the right of individuals to make sexual choices.

**sexualization** n. see EROTIZATION.

**sexual liberation** 1. the state of being free from sexual mores or obligations that are considered restrictive. See FREE LOVE. 2. any social trend or process toward increased sexual freedoms.

**sexual lifestyle** an individual pattern of sexual behavior in terms of orientation, number of partners, and types of sexual activity engaged in. Sexual lifestyle reflects such influences as early childhood observations of the family of origin, experiences with male and female contacts in childhood and adolescence, and cultural or religious values.

**sexually dimorphic nucleus** a NUCLEUS of the central nervous system that differs in size between males and females. In humans, for example, a nucleus in the MEDIAL PREPRODUCTIC AREA of the hypothalamus that synthesizes GONADOTROPIN-RELEASING HORMONE tends to be larger and more active in males than in females because gonadotropin release is continuous (it is cyclical in females). In songbirds whose males sing more than females, several brain nuclei associated with both song learning and song production are larger in males than in females.

**sexually transmitted disease (STD)** an infection transmitted by sexual activity. More than 20 STDs have been identified, including those caused by viruses (e.g., hepatitis B, herpes, HIV) and those caused by bacteria (e.g., chlamydia, gonorrhea, syphilis). STDs are also known as VENEREAL DISEASES, the term used traditionally for syphilis and gonorrhea. Also called SEXUALLY TRANSMITTED INFECTION (STI).

**sexual masochism** a PARAPHILIA in which sexual interest and arousal is repeatedly or exclusively achieved through being humiliated, bound, beaten, or otherwise made to suffer physical harm or threat to life.

**sexual maturation** the stage of development of the reproductive system at which coitus and reproduction can be achieved.

**sexual metamorphosis** a rare delusion in which the individual believes that his or her biological sex has been changed into the other sex.

**sexual object** 1. in general language, a person regarded only in terms of his or her sexual attractiveness. 2. in psychoanalytic theory, a person, animal, or inanimate object toward whom or which the sexual energy of an individual is directed. Also called SEX OBJECT.

**sexual offense** see SEX OFFENSE.

**sexual orientation** one’s enduring sexual attraction to male partners, female partners, or both. Sexual orientation may be heterosexual, same sex (gay or lesbian), or bisexual. See also OBJECT CHOICE.

**sexual orientation change efforts (SOCE)** see CONVERSION THERAPY.

**sexual orientation grid** a method of classifying SEXUAL ORIENTATION on the basis of seven factors: sexual fantasy, sexual attraction, sexual behavior, emotional attraction, social attraction, social behavior, and self-identity. Each of these factors is evaluated in three time periods: past, present, and ideal future. Thus, a person’s sexual orientation is described in terms of positions in a $3 \times 7$ grid. [developed by U.S. psychiatrist Fritz Klein (1932–2006), who considered the KINSEY SCALE of sexual orientation to be simplistic]

**sexual pain disorder** a class of sexual disorders, including DYSPARAUNIA and VAGINISMUS, characterized by persistent or recurrent pain during sexual activity.

**sexual perversion** any sexual practice that is regarded by a community or culture as an abnormal means of achieving orgasm or sexual arousal. Sexual perversion is an older term that is little used nowadays, largely having been replaced by SEXUAL DEVIANCY or, in a psychiatric context, PARAPHILIA.

**sexual preference** 1. any particular sexual interest and arousal pattern, which may range from the relatively common (e.g., particular patterns of foreplay, particular positions) to those associated with a PARAPHILIA. 2. loosely a synonym for SEXUAL ORIENTATION, although its use as such is considered offensive by some who believe it characterizes one’s deep-rooted sexual attractions as a matter of simple choice.

**sexual reassignment** see SEX REASSIGNMENT.

**sexual receptivity** see RECEPITIVITY.

**sexual reflex** 1. penile erection produced by stimulation of the male genitalia. 2. vaginal secretion and lubrication and swelling of the clitoris produced by stimulation of the female genitalia. 3. the reflex activity involved in ORGASM. 4. components of sexual behavior, such as the CRIMINAL REFLEX, that are not under direct control of the higher brain levels and may be stimulated through spinal or bulbular neural connections.

**sexual response** a reaction to sexual stimulation. The most noticeable sexual response in the male is erection of the penis. See SEXUAL AROUSAL.

**sexual-response cycle** a conceptualization of a four-stage cycle of sexual response exhibited by both men and women, differing only in aspects determined by male or female anatomy. The stages include the AROUSAL (or EXCITEMENT) PHASE, which lasts several minutes to hours; the PLATEAU PHASE, lasting 15 seconds to 3 minutes, marked by penile erection in men and vaginal lubrication in women; the ORGASMIC PHASE, lasting 15 seconds and marked by EJACULATION in men and ORGASM in women; and the RESOLUTION PHASE, lasting 15 minutes to 1 day; (see REFRACTORY PHASE). This conceptualization was
introduced by U.S. sex researchers William H. Masters (1915–2001) and Virginia E. Johnson (1925–2013) in 1966, but it has subsequently been criticized, particularly in the way that it equates the male and female pattern.

sexual revolution either of two periods in U.S. (and, to some extent, European) history marked by a significant change in sexual values and behavior. The first sexual revolution occurred in the early part of the 20th century after the end of the Victorian era, and it involved efforts to increase sexual knowledge, legitimize women’s enjoyment of sex, and eliminate prostitution. The second sexual revolution, during the 1960s, was stimulated by such events as the development of oral contraception and the publication of Alfred Kinsey’s books on the sexual behavior of men and women (the “Kinsey reports”). This led to more openness of sexual expression in literature and the media, an increase in sexual activity, more tolerance of what were previously considered “deviant” activities, and greater acceptance of female sexuality.

sexual sadism a PARAPHILIA in which sexual excitement is achieved by intentional infliction of physical or psychological suffering on another person. The harm may be inflicted on a consenting partner, typically involving mildly injurious bodily suffering combined with humiliation. When practiced with nonconsenting partners, sexual sadism may involve Inflicting extensive, permanent, or possibly fatal bodily injury. This activity is likely to be repeated, with the severity of the sadistic acts increasing over time. See also SADISM, SADOMASOCHISM.

sexual selection a theoretical mechanism for the evolution of anatomical and behavioral differences between males and females, based on mate selection. [proposed in 1871 by Charles Darwin]

sexual sensation the effect of stimulation of the genitalia and other erogenous zones.

sexual socialization the process by which children and adolescents absorb their culture’s beliefs, values, and attitudes toward sexuality.

sexual stimulation touching, kissing, licking, or other manipulation of the genitals, breasts, or other areas of the body that leads to sexual arousal. See also GENITAL STIMULATION.

sexual tension a condition of anxiety and restlessness associated with the sex drive and a normal desire for release of sexual energy. Sexual tension may be complicated by fear of inadequate performance, fear of an unwanted pregnancy, fear of discovery, or other concerns.

sexual trauma any disturbing experience associated with sexual activity, such as rape, incest, and other sexual offenses. It is a common cause of POSTTRAUMATIC DISORDERS and DISSOCIATIVE DISORDERS.

sexual value system a person’s beliefs about what is and is not normal, moral, and acceptable sexual behavior and activity.

S factor abbreviation for SPECIFIC FACTOR.

SGA abbreviation for SMALL FOR GESTATIONAL AGE.

shade n. any colored or uncolored stimulus defined by the amount of black it contains.

shading n. gradations of darkness on the surface of a real object or on a depiction of an object, providing a DEPTH CUE.

shadow n. in the ANALYTIC PSYCHOLOGY of Carl Jung, an ARCHETYPE that represents the “darker side” of the human psyche, which may comprise anything (e.g., a trait, desire, or emotion, whether positive or negative) that is unacceptable to an individual’s conscious ego and as such remains unexpressed and hidden in the unconscious.

shadowing n. in cognitive testing, a task in which a participant repeats aloud a message word for word at the same time that the message is being presented, often while other stimuli are presented in the background. It is mainly used in studies of ATTENTION.

shadow jury a group of people hired by a TRIAL CONSULTANT to watch trials and report their impressions of the evidence presented. Attorneys use this feedback in the development of their trial strategies.

shaken baby syndrome (SBS) the neurological consequences of a form of child abuse in which a small child or infant is repeatedly shaken. The shaking causes diffuse, widespread damage to the brain; in severe cases, it may cause death.

shallow affect significant reduction in appropriate emotional responses to situations and events. See also FLAT AFFECT.

shallow processing cognitive processing of a stimulus that focuses on its superficial, perceptual characteristics rather than its meaning. It is considered that processing at this shallow level produces weaker, shorter-lasting memories than deep processing. See LEVELS-OF-PROCESSING MODEL OF MEMORY. See also BOTTOM-UP PROCESSING. [proposed in 1972 by Canadian psychologists Fergus I. M. Craik (1935–) and Robert S. Lockhart]

shaman n. in various indigenous cultures, especially those that include nature and ancestor worship, a male or female spiritual leader who uses allegedly supernatural or magical powers for divination (particularly diagnosis) and to heal mental or physical illness. The status of shamans is not conferred by recognized organizations but is held to arise from a significant personal physical or mental crisis or to be hereditary. Shamanism includes a wide spectrum of traditional beliefs and practices, many of which involve communication with the spirit and animal worlds in pursuit of physical or mental healing. —shamanic adj. —shamanistic adj.

shamanic trance an ALTERED STATE OF CONSCIOUSNESS as experienced by SHAMANS in certain indigenous societies. It may be induced by hallucinogens; rhythmic dance, drumming, and music; suggestion; or similar means.

sham disorder a colloquial name for FACTITIOUS DISORDER.

shame n. a highly unpleasant SELF-CONSCIOUS EMOTION arising from the sense of there being something dishonorable, improper, or indecent in one’s own conduct or circumstances. It is typically characterized by withdrawal from social intercourse—for example, by hiding or distracting the attention of another from one’s shameful action—which can have a profound effect on psychological adjustment and interpersonal relationships. Shame may motivate not only avoidant behavior but also defensive, retaliative anger. Psychological research consistently reports a relationship between proneness to shame and a host of psychological symptoms, including depression, anxiety, eating disorders, subclinical sociopathy, and low self-esteem. Shame is also theorized to play a more positive
shame culture

adaptive function by regulating experiences of excessive and inappropriate interest and excitement and by diffusing potentially threatening social behavior. Compare guilt. —shameful adj.

shame culture a trend or organizing principle in a society characterized by a strong desire to preserve honor and avoid shame. Compare guilt culture.

shamelessness n. behavior marked by an apparent absence of feelings of shame. This may arise as the result of psychological problems or reflect a loss of judgment after brain injury. —shameless adj.

sham feeding in research, a procedure in which a nonhuman animal chews and swallows food that is then extracted through a tube surgically implanted in the esophagus so that it does not reach the stomach.

sham rage sudden aggressive behavior and motor activity occurring disproportionately in response to a weak or relatively innocuous stimulus. Sham rage initially was observed by researchers in the 1920s: Following surgical DECRITATION, cats responded to the touch of a hand by growling, spitting, lashing the tail, arching the back, protracting the claws, erecting the hairs, jerking the limbs, rapidly moving the head from side to side, and attempting to bite. It subsequently has been demonstrated to occur with direct electrical stimulation of the LIMBIC SYSTEM as well. Additionally, sham rage has been seen in some pathological human conditions involving similar damage to the cerebral cortex that removes its inhibitory influence over the activities of the HYPOTHALAMUS and other deeper, more primitive structures.

sham surgery in clinical research on the value or usefulness of experimental surgical interventions, the controversial practice of performing surgery that functions as a CONTROL because it mimics the features of the experimental surgery but does not result in the alteration or removal of any bodily structures; that is, it does not have the systemic effects of the experimental procedure. Also called sham operation.

shape n. the spatial form of an object as it stands out from its background.

shape coding in ergonomics, coding a control or display by shape so that it can be readily distinguished from other controls or displays. See control discriminability.

shape constancy a type of PERCEPTUAL CONSTANCY in which an object is perceived as having the same shape when viewed at different angles. For example, a plate is still perceived as circular despite appearing as an oval when viewed from the side.

shaping n. the production of new forms of OPERANT BEHAVIOR by reinforcement of successive approximations to the behavior (see METHOD OF SUCCESSIVE APPROXIMATIONS). Also called approximation conditioning: behavior shaping.

Shapiro–Wilk test an INFERENTIAL TEST to determine whether a random sample comes from a population with a NORMAL DISTRIBUTION. If the test statistic, W, is significant, then the NULL HYPOTHESES that the distribution is normal should be rejected. Because so many of the most common statistical tests are designed for normally distributed data, Shapiro–Wilk is a useful test to identify those data sets that require a different approach. [Samuel S. Shapiro (1930–1992), U.S. statistician; Martin B. Wilk (1922–2013), Canadian-born U.S. statistician]

shared attention see joint attention.

shared environment in behavior genetic analyses, those aspects of an environment that individuals living together (e.g., biologically related individuals in a family household) share and that therefore cause them to become more similar to each other than would be expected on the basis of genetic influences alone. Examples of shared environmental factors include parental child-rearing style, divorce, or family income and related variables. Compare nonshared environment.

shared medical appointment model an approach to health care in which a group of patients with a similar medical condition meet with a physician for an extended period of time, usually more than an hour, to discuss aspects of their common condition, including its medical management (e.g., prescriptions), and potentially to address any mental health considerations that it might present. Typically, a behaviorist (e.g., a psychologist or social worker), a nurse or physician’s assistant, a scheduler, and a documentation specialist also are in attendance. This model tends to be used for follow-up care rather than for new patient intakes.

shared mental model in ergonomics, a MENTAL MODEL of a work system that is held in common by the members of a team. Ideally, team members should have a shared mental picture of the system and its attributes, a shared knowledge of all relevant tasks, and a shared understanding of the team’s progress toward its goal. Coordination, efficiency, and accuracy will increase as team members converge on a common mental model that is accurate and complete yet flexible. Also called team mental model.

shared psychotic disorder in DSM–IV–TR, a disorder in which the essential feature is an identical or similar delusion that develops in an individual who is involved with another individual (sometimes called the “inducer” or the “primary case”) who already has a psychotic disorder with prominent delusions. Shared psychotic disorder can involve many people (e.g., an entire family) but is most commonly seen in relationships of only two, in which case it is known as FOLIE À DEUX. In DSM–5, the disorder is not recognized or included as a distinct diagnostic entity separate from DELUSIONAL DISORDER. Formerly called induced psychotic disorder.

sharpening n. a phenomenon in which some details of a memory become more sharply defined and accentuated—and possibly exaggerated—over time in comparison to the original experience.

Sheehan’s syndrome see hyponophysial cachexia. [Harold Leeming Sheehan (1900–1988), British pathologist]

sheep–goat effect in parapsychology experiments using ZENER CARDS or similar targets, a supposed difference in outcomes found between trials involving participants who believe that they may succeed in the given task (sheep) and trials involving those who assume that this is impossible (goats). See also decline effect; differential effect; focusing effect; position effect; preferential effect. [coined by U.S. parapsychologist Gertrude Schmeidler (1912–2009)]

Sheldon’s constitutional theory of personality the theory that everyone possesses almost all degree of three primary temperamental components that relate to three basic body builds (somatotypes), measured on a
7-point scale. The three body types—ectomorph, endomorph, and mesomorph—are correlated with the three components of temperament: cerebrotonia, viscerotonia, and somatotonia. Constitution provides a substructure, but nutrition and early experiences also influence the physique and temperament, respectively. [William H. Sheldon (1899–1970), U.S. psychologist]

**shell shock** the name used during World War I for combat stress reaction. At the time, the disorder was attributed solely to minor brain hemorrhages or brain concussion due to exploding shells and bombs, without involving psychological factors.

**shelter care** the provision of a facility without physical restrictions for the temporary care of children who have been taken into custody pending investigation and placement. Shelter care is a form of foster care.

**sheltered workshop** a rehabilitation facility that provides a controlled, noncompetitive, supportive working environment and individually designed work settings for people with disabilities. Work experience and related services are provided to assist individuals in achieving specific vocational goals. Sheltered workshops differ from supported employment in that the latter occurs in a competitive, noncontrolled working environment.

**shenjing shuairuo** see shinkeishitsu. shin-byung n. a culture-bound syndrome found in Korea, characterized by anxiety and physical complaints such as general weakness, dizziness, loss of appetite, insomnia, and gastrointestinal problems, followed by dissociation and alleged possession by ancestral spirits (see Dissociative Trance Disorder). It is considered by those affected to be a “divine illness,” in which the individual experiences hallucinations of becoming a shaman and a cure occurs when this conversion takes place.

shinkeishitsu n. a culture-bound syndrome prevalent in Japan, with symptoms that include obsessions, perfectionism, ambivalence, social withdrawal, physical and mental fatigue, hypersensitivity, and hypochondriasis. Japanese psychiatrist Shoma Morita (1874–1938), a pioneer in the study of shinkeishitsu, postulated that there is a shinkeishitsu-prone innate temperament, which he called "hypochondriacal temperament." According to Morita, people born with this temperament are overly sensitive, self-reflective, and notice even minimal changes in their mental and physical states. This disorder is also prevalent in China, where it is known as shenjing shuairuo. See also Morita Therapy.

**Shipley Institute of Living Scale** (SILS) a short assessment of general cognitive functioning consisting of two subtests: vocabulary, in which participants must choose which of a group of words is most similar in meaning to a target word; and abstraction, in which participants must provide the final element in a sequence of numbers, letters, or words. The scale was originally developed in 1940 for use in psychiatric settings to identify and evaluate the intellectual decline associated with certain mental disorders. A revised and restandardized version, Shipley-2, now includes a block-patterns scale as a nonverbal alternative to the abstraction subtest. Also called Shipley–Hartford Institute of Living Scale. [Walter C. Shipley (1903–1966), U.S. psychologist]

**shock** n. 1. the application of electric current. See electroconvulsive therapy. 2. a condition of lowered excitability of neural centers following the cutting of their connections with other neural centers. For example, spinal shock occurs when connections between the spinal cord and the brain are severed. 3. acute reduction of blood flow in the body due to failure of circulatory control or loss of blood or other bodily fluids, marked by hypotension, coldness of skin, usually tachycardia, and sometimes anxiety. 4. a sudden disturbance of equilibrium.

**shock phase** see General Adaptation Syndrome.

**shock probation** a criminal sentence in which an offender is incarcerated for a brief period and then released into the community under the supervision of a parole or probation officer. This approach is typically used with juveniles or with first-time offenders who have committed less serious offenses, the theory being that such offenders may be capable of successful rehabilitation into society after they have experienced the initial shock of incarceration. Also called shock sentencing.

**shock–shock interval** (SS interval) in a Sidman Avoidance Schedule, the time between successive presentations of the aversive stimulus (often an electric shock) in the absence of the specified response.

**shock therapy** the treatment of severe mental disorders by administering a drug or an electric current that shocks the central nervous system to induce loss of consciousness or convulsions. Also called shock treatment. See electroconvulsive therapy, insulin-shock therapy.

**shoe anesthesia** see Stocking Anesthesia.

**shoe fetishism** see Foot Fetishism.

**shook yong** see Stocking Anesthesia.

**shortcut key** in ergonomics, a key or combination of keys on a control panel that can be used to activate frequently used functions in a single step, thus reducing reliance on more complex selection methods. A familiar example is the function keys on a computer keyboard, which enable the user to select a function without going through a series of menus.

**short Grit Scale** (Grit–S) see Grit Scale.

**Short Portable Mental Status Questionnaire (SPMSQ)** a brief questionnaire typically used to screen older adults for dementia and other neurologically based cognitive deficits and to determine the severity of impairment. It consists of 10 simple questions relating to orientation (e.g., “What is the date today?”), knowledge of current events, short-
short-term memory

long-term memory, and calculation. [developed in 1975 by
U.S. geriatric psychiatrist Eric A. Pfeiffer]

short-term memory (STM) the reproduction, recogni-
tion, or recall of a limited amount of material after a period
of about 10 to 30 seconds. STM is often theorized to be sep-
arate from LONG-TERM MEMORY, and the two are the compo-
nents of the DUAL-STORE MODEL OF MEMORY. STM is
frequently tested in intelligence or neuropsychological ex-
aminations. See also IMMEDIATE MEMORY; MODAL MODEL
OF MEMORY; MULTISTORE MODEL OF MEMORY; PRIMARY
MEMORY; WORKING MEMORY.

short-term psychodynamic psychotherapy see
BRIEF PSYCHODYNAMIC PSYCHOTHERAPY.

short-term psychotherapy see BRIEF PSYCHOTHER-
APY.

short-wavelength pigment the PHOTOPIGMENT
present in one of the three populations of RETINAL CONES that
has maximum sensitivity to a wavelength of 419 nm. The
absence of the gene for the short-wavelength pigment
causes TRITANOPIA, a form of color blindness in which blue
and green are confused with one another. See also
LONG-WAVELENGTH PIGMENT; MEDIUM-WAVELENGTH
PIGMENT.

showup n. a witness identification procedure similar to a
LINEUP, except that only one suspect is presented.

shrink n. slang for a psychologist, psychiatrist, or other
mental health professional who conducts psychotherapy. It
is short for headshrinker, an allusion to the practice of
HEADSHRINKING.

shrinkage n. the situation in which the strength of a
CORRELATION COEFFICIENT or REGRESSION EQUA-
tion decreases when it is applied to a new data set. Such shrinkage
occurs when the initial estimate of the correlation reflects
unique characteristics of the initial sample that are not
replicated in subsequent samples.

SHRM abbreviation for STRATEGIC HUMAN RESOURCE
MANAGEMENT.

shrunken R² see ADJUSTED R².

shuk yang see KORO.

shunning n. systematic OSTRACISM of an individual by
a group, usually taking the form of minimal physical or
social contact with the outcast. —shun vb.

shunt n. a congenitally occurring or surgically created
passage diverting the flow of bodily fluids such as blood or
cerebrospinal fluid from one part of an organ or body to
another. For example, a VENTRICULOARTERIAL SHUNT is an artifi-
cially formed passage for draining cerebrospinal fluid from
the ventricles of the brain to the external jugular vein to
relieve symptoms of HYDROCEPHALUS. The shunt carries the
fluid through a catheter to the venous system that
empties into the right atrium of the heart.

shuttle box a two-compartment box used for avoidance-
conditioning research with animals. An electric shock to
the feet is scheduled to be delivered if the animal remains
in the same compartment for more than a specified period
of time (e.g., 30 seconds). The subject can avoid electric
shocks by regularly moving from one compartment to the
other (i.e., shuttling between them). There is sometimes a
small barrier that the animal must jump over or push to
get from one compartment to the other.

shy bladder syndrome see PARURESIS.

shy–bold continuum the tendency of some individu-
als within a group to be fearful or cautious of new stimuli
and of others to explore novel stimuli. The more fearful indi-
viduals are less likely to be preyed on but also less able to
use new resources. A shy–bold continuum has been dem-
onstrated in many species, from fish through human be-
ings, and may be a universal dimension of behavioral
variation.

shyness n. anxiety and inhibition in social situations,
typically involving three components: (a) global feelings
of emotional arousal and specific physiological experiences
(e.g., pounding heart, sweating, blushing); (b) acute public
self-consciousness, self-deprecation, and worries about
being evaluated negatively by others; and (c) observable
behavior such as quietness, gaze aversion, and social with-
drawal. Extremely shy individuals are at an increased risk
of developing anxiety disorders such as SOCIAL PHOBIA.
Shyness also is seen in nonhuman animals, manifest as an
avoidance of novel stimuli and a lack of exploration in un-
familiar environments. Also called TUMIDITY. Compare
BOLDNESS. —shy adj.

sialorrhea n. see PTALISM.

Siamese twins see CONJOINED TWINS.

sib n. 1. short for SIBLING. 2. in anthropology, a person’s
kindred collectively. See KINSHIP; KINSHIP NETWORK.

sibilant 1. adj. denoting a FRICTIONAL produced by forcing
the air through an opening between the tongue and the
roof of the mouth and creating a hissing sound, for exam-
ple, [s], [z], or [sh]. 2. n. a sibilant speech sound.

siblicide n. the killing of one’s siblings. In ASYNCHRON-
OUS BROODS, the first-hatched bird often attacks and kills
those that hatch later. This is an extreme form of SIBLING
RIVALRY.

sibling n. one of two or more children born of the same
two parents (i.e., a sister or brother). Also called sib.

sibling rivalry competition among siblings for the at-
tention, approval, or affection of one or both parents or for
other recognition or rewards, such as in sports or academ-
ics. See also PARENT–OFFSPRING CONFLICT.

sib-pair method a technique used in genetics—particu-
larly in attempts to discover the extent of inherited psychi-
atric factors—in which the incidence of a disorder among
blood relatives is compared with the distribution of the dis-
order in the general population. Sib-pair method studies
have found a higher incidence of schizophrenia in twins
and close family members than in the general population.

sibutramine n. an APPETITE SUPPRESSANT used for the
management of obesity. Sibutramine acts on the central
nervous system to inhibit the reuptake of the neurotrans-
mitter epinephrine and, to a lesser extent, serotonin and
dopamine. Sibutramine may raise blood pressure, and be-
cause of its ability to release monoamines, it should not be
used in conjunction with MONOAMINE OXIDASE INHIBITORS.
Like other appetite suppressants, it is effective only in con-
junction with dietary restriction. Due to concerns about se-
rious adverse effects, it has been removed from the market
in many countries, including the United States. Former U.S.
trade name: Meridia.

sick headache see MIGRAINE HEADACHE.

sick role the behavior expected of a person who is physi-
cally ill, mentally ill, or injured. Such expectations can be
the individual’s own or those of the family, the community.
or society in general. They influence both how the person behaves and how others react to him or her. In his pioneering discussion of the subject, U.S. sociologist Talcott Parsons (1902–1979) noted in 1951 that people in a sick role are expected to cooperate with caregivers and to want to get well but are also provided with an exemption from normal obligations. See also factitious disorder.

Šidák test see Dunn–Šidák procedure.

side effect any reaction secondary to the intended therapeutic effect that may occur following administration of a drug or other treatment. Often these are undesirable but tolerable (e.g., headache or fatigue), although more serious effects (e.g., liver failure, seizures) may also occur. Occasionally, harmful side effects are unexpected, in which case they more properly are termed adverse drug reactions.

Sidman avoidance schedule a procedure in which brief, inescapable aversive stimuli are presented at fixed intervals (Shock–Shock Intervals) in the absence of a specified response. If the response is made, the aversive stimulus is postponed by a fixed amount of time (the Response–Shock Interval) from that response. Also called avoidance without warning signal: continuous avoidance: free-operant avoidance. [Murray Sidman (1923– ), U.S. psychologist]

SIDS acronym for sudden infant death syndrome.

SIECUS abbreviation for SEXUALITY INFORMATION AND EDUCATION COUNCIL OF THE UNITED STATES.

Siegel–Tukey test a nonparametric test that evaluates any difference in variance across two independent samples to determine whether they represent two different populations. Data values for the two groups are first ordered in a single list from lowest to highest and then ranked in terms of alternate extremes, so that, for example, the highest and lowest values are both ranked 1, the next highest and next lowest 2, and so on. Finally, the ranked values in each group are summed. If final sums per group do not differ, there is no evidence that the dispersion differs across groups. The test has relatively low statistical power when data have a normal distribution.

sighting line a visual axis that extends along a line from a point of fixation to the point of clearest vision on the retina.

sight method see whole-word method.

sight words in reading, words that are recognized instantly without additional analysis. Also called sight vocabulary.

sigma n. 1. (symbol:  Σ) the sum of a list of values. 2. (symbol:  σ) see population standard deviation.

sigma receptor (symbol:  σ) a receptor that currently is not well understood but is thought to affect neurotransmitter release and function (particularly of dopamine and serotonin) as well as the immune and endocrine systems. Once identified as an opioid receptor in part because synthetic opioids such as dextromethorphan bind to it, it is now considered to be a separate class of receptor with two subtypes: sigma-1 (σ1) and sigma-2 (σ2). Sigma-1, the more fully investigated of these subtypes, is activated by some drugs of abuse (e.g., cocaine, methamphetamine), and it has been implicated in several disorders (e.g., depression, Alzheimer’s disease), with a possible role in their treatment.

sigmatism n. 1. a kind of LISP specifically involving incorrect production of the [s] and [z] sounds. 2. an obsolescent name for lisping.

sigmoid curve an S-shaped curve that describes many processes in psychology, including learning and responding to test items. The curve starts low, has a period of acceleration, and then approaches an asymptote. Often, the curve is characterized by the logistic function.

sign 1. n. an objective, observable indication of a disorder or disease. See also soft sign. 2. n. in linguistics and semantics, anything that conveys meaning; a sign may be either verbal (e.g., a spoken or written word) or nonverbal (e.g., a hairstyle). The term is now mainly associated with approaches deriving from the theory of Swiss linguist Ferdinand de Saussure (1857–1913), who emphasized the arbitrary nature of linguistic signs (i.e., the lack of any necessary relationship between the material signifier and the idea signified). The application of this idea to nonlinguistic sign systems provided the basic method of structuralism in the social sciences. 3. vb. to communicate using sign language.

signal amplification bias see interpersonal gap.

signal anxiety in psychoanalytic theory, anxiety that arises in response to internal conflict or an emerging impulse and functions as a sign to the ego of impending threat, resulting in the preemptive use of a defense mechanism. Compare primary anxiety.

signal detection task a task in which the observer is required to discriminate between trials in which a target stimulus (the signal) is present and trials in which it is not (the noise). Signal detection tasks provide objective measures of perceptual sensitivity. Also called detection task.

signal detection theory (SDT) a body of concepts and techniques from communication theory, electrical engineering, and decision theory that were applied during World War II to the detection of radar signals in noise. These concepts were applied to auditory and visual psychophysics in the late 1950s and are now widely used in many areas of psychology. An important methodological contribution of SDT has been the refinement of psychophysical techniques to permit the separation of sensitivity from criterial, decision-making factors. SDT has also provided a valuable theoretical framework for describing perceptual and other aspects of cognition and for quantitatively relating psychophysical phenomena to findings from sensory physiology. A key notion of SDT is that human performance in many tasks is limited by variability in the internal representation of stimuli due to internal or external noise. Many of the theoretical notions of SDT were anticipated by Louis L. Thurstone. Also called detection theory. See D prime: receiver-operating characteristic curve.

signaled avoidance see discriminated avoidance.

signal-to-noise ratio (S/N) the ratio of signal power (intensity) to noise power, usually expressed in decibels. When the signal is speech, it is called the speech-to-noise ratio.

signal word in ergonomics, a word used in risk communications (e.g., on a warning sign) to indicate the level of
risk associated with a hazardous situation. Examples of signal words include danger, warning, caution, and notice.

**signal word panel** in ergonomics and risk communication, a warning sign that contains a specific SIGNAL WORD (e.g., danger). The size, color, and font of the lettering, as well as the design of the panel itself, are selected for maximum clarity and impact. The signal word panel may also contain an alerting symbol, such as a skull and crossbones.

**signature** n. an identifiable unique object, message, or symbol left by a criminal at the scene of a crime. It plays no part in the criminal act but represents a coded clue to the offender’s identity, which can be of use in CRIMINAL PROFILING. Usually, a criminal leaves the same signature at the scene of all his or her crimes. Also called calling card.

**signed-ranks test** see WILCOXON SIGNED-RANKS TEST.

**sign effect** see BEHAVIORAL ECONOMICS.

**significance** n. the extent to which something is meaningful or of consequence. In statistics and related fields, the term usually denotes STATISTICAL SIGNIFICANCE. See also CLINICAL SIGNIFICANCE; PRACTICAL SIGNIFICANCE; PSYCHOLOGICAL SIGNIFICANCE.

**significance level** (symbol: α) in SIGNIFICANCE TESTING, a fixed probability of rejecting the NULL HYPOTHESIS of no effect when it is in fact true. It is set at some value, usually .05, .01, or .001, depending on the consequences associated with making a TYPE I ERROR. When a particular effect is obtained experimentally, the PROBABILITY LEVEL (p) associated with this effect is compared to the significance level. If the p value is less than the α level, the null hypothesis is rejected. Small p values suggest that obtaining a statistic as extreme as the one obtained is rare and thus the null hypothesis is unlikely to be true. The smaller the α level, the more convincing is the rejection of the null hypothesis. Also called alpha level.

**significance testing** in HYPOTHESIS TESTING, a set of procedures used to determine whether the differences between two groups or models are statistically significant (i.e., unlikely to arise solely from chance). In its most common form, significance testing is used to decide whether the NULL HYPOTHESIS of no effect should be rejected. A comparison of the probability statistic obtained from the test to the chosen SIGNIFICANCE LEVEL determines whether an observed effect may be due to chance variance and hence whether the null hypothesis is or is not likely to be correct. This approach may also be used to differentiate between two models that differ in terms of the number of parameters specified in them (as in MULTIPLE REGRESSION analysis).

**significant difference** the situation in which a SIGNIFICANCE TESTING procedure indicates the statistical differences observed between two groups (e.g., a treatment group and a control group) are unlikely to reflect chance variation.

**significant other** any individual who has a profound influence on another person, particularly on his or her self-image and SOCIALIZATION. Although the term most often denotes a spouse or other person with whom one has a committed romantic relationship, it is also used in psychology and sociology to refer to parents, peers, and others.

**signifier** n. 1. in linguistics and SEMIOTICS, the material form of a SIGN as opposed to the idea or concept indicated (the signified). In language, therefore, the signifier is the spoken or written word or component of a word. The distinction between signifier and signified is of central importance in STRUCTURALISM and POSTSTRUCTURALISM. See also REFERENT. [introduced by Swiss linguist Ferdinand de Saus-sure (1857–1913)] 2. in the theory of French psychoanalyst Jacques Lacan (1901–1981), a symbol, such as a word or symptom, that stands for some aspect of the patient’s unconscious. Lacan’s use of the term reflects his central belief that the unconscious is structured as a language.

**sign language** any system of communication in which signs formed by hand configuration and movement are used instead of spoken language. The term refers particularly to the system used by people who are deaf or have severe hearing loss, which has its own syntax and methods of conveying nuances of feeling and emotion and is now accepted by most linguists as exhibiting the full set of defining characteristics of human oral–aural language. The particular system of hand signs and movements used primarily in the United States and Canada is called American Sign Language (ASL). Forms of sign language are sometimes used also to communicate with children with certain neurological disorders and with nonhuman primates, but these systems are far less sophisticated than those used by people with hearing impairment. Also called signing. See FINGERSPELLING.

**sign stimulus** see RELEASE.

**sign test** a simple NONPARAMETRIC procedure used to determine whether a sample has the same MEDIAN value as another sample or a reference population. Consider a farmer who wants to know whether he or she can grow a particular crop that requires soil with a median acidity level (pH) of 8. The farmer measures the soil in several different areas on his or her property and then compares the pH value of each measurement to the required median value. Each acidity reading above 8 is marked positive using a + sign and each below 8 is marked negative with a — sign. If the proportion of positive signs for the group of measurements is significantly different from the proportion of negative signs, then the farmer’s sample soil data have a different median than the one required and the desired crop cannot be planted. Unlike the WILCOXON SIGNED-RANKS TEST, the sign test does not take into account the magnitude of the observed differences from the median.

**sign tracking** in conditioning, elicited behavior directed toward a stimulus that is reliably paired with a primary reinforcer.

SII abbreviation for STRONG INTEREST INVENTORY.

**Silenor** n. a trade name for DOXEPIN.

**silok** n. a CULTURE-BOUND SYNDROME found in the Philippines that has symptoms similar to those of LATAH.

**SILS** abbreviation for SHIPLEY INSTITUTE OF LIVING SCALE.

**Silver–Russell syndrome** a congenital disorder characterized by short stature, hypertrophy of one side of the body, and elevated urinary gonadotropin hormones without precocious sexual maturity. Motor development is often delayed because of muscle weakness. Physical features include pseudohydrocephalus, a condition of normal head circumference but a small face, giving the appearance of an enlarged head. Various studies have found a higher than average incidence of intellectual disability among people with this disorder. Also called Silver’s syndrome. [Henry K. Silver (1918–1991), U.S. pediatrician; Alexander Russell (1914–2003), British pathologist]

**Simenon’s syndrome** a delusional condition charac-
terized by the false perception or belief that one is loved by or has had a sexual affair with a public figure or other individual. See EROTIC DELUSION; EROTIC PARANOIA. See also CLÉRAMBault’S SYNDROME. [named for Georges Joseph Christian Simenon (1903–1989), Belgian-born French novelist, possibly because the condition was featured in one of his stories].

**similarities test** a test in which the participant must either state the likenesses between items or arrange items in categories according to their similarities. Some neuropsychological batteries include these assessments.

**similarity** n. one of the GESTALT PRINCIPLES OF ORGANIZATION. It states that people tend to organize objects with similar qualities into a perceptual group and interpret them as a whole. Also called factor of similarity. law of similarity: principle of similarity.

**similarity classification** see CONCEPTUAL CLASSIFICATION.

**similarity coefficient** any index that allows a researcher to assess the similarity of two or more samples. In EXPLORATORY FACTOR ANALYSIS, for example, such an index is used to compare factor structures across studies. Compare DISSIMILARITY COEFFICIENT.

**simile** n. see METAPHOR.

**Simmonds’ disease** a disorder of the pituitary gland caused by necrosis and failure of the anterior lobe of the gland, which may be partial or complete. This results in secondary failure of the gonads, adrenal cortex, and thyroid gland, which depend on the hormonal stimulation of the pituitary. Symptoms include anorexia, atrophy of sexual features, absence of libido, hypotension, bradycardia, and hypoglycemia. [Morris Simmons (1855–1925), German physician]

**Simon effect** in a two-choice task, the finding that the response to a stimulus is facilitated if the location of the stimulus corresponds to the location of the response, even though stimulus location is irrelevant to the task. For example, if a left (rather than a right) keypress is the required response to a blue stimulus, reaction time will be quicker if this stimulus is presented on the left-hand side than if it is presented on the right (and vice versa). [discovered in 1969 by U.S. psychologist J. Richard Simon (1929– )]

**simple causation** an instance of causation in which a single event is caused by a single identifiable antecedent, without multiple causes or other intervening processes. Compare MULTIPLE CAUSATION.

**simple cell** a neuron, most commonly found in the STRIATE CORTEX, that has a receptive field consisting of an elongated center region and two elongated flanking regions. The response of a simple cell to stimulation in the center of the receptive field is the opposite of its response to stimulation in the flanking zones. This means that a simple cell responds best to an edge or a bar of a particular width and with a particular direction and location in the visual field. Also called simple cortical cell. Compare COMPLEX CELL.

**simple comparison** a contrast between two means, usually in the context of multilevel analyses of data from a FACTORIAL DESIGN. For example, consider a researcher examining the influence of three different amounts of caffeine (0 mg, 50 mg, and 100 mg) on student test performance. His or her evaluation of the differences between 0 mg and 50 mg would represent one possible simple comparison. Compare COMPLEX COMPARISON.

**simple correlation** the linear association of one variable with one other variable, as quantified by a CORRELATION COEFFICIENT.

**simple effect** in an experimental design involving multiple independent variables, the consistent total effect on a dependent variable of a particular level (quantity, magnitude, or category) of one independent variable at a particular level of another independent variable.

**simple-effects analysis** when an ANALYSIS OF VARIANCE or MULTIPLE REGRESSION analysis has identified an INTERACTION EFFECT among two independent variables, an examination of the effect of one variable at one level of the other variable. For example, if there were two levels of a factor, $a_1$ and $a_2$, and two levels of a second factor, $b_1$ and $b_2$, the comparison of $a_1$ versus $a_2$ at $b_1$ would represent one simple-effects analysis; another would be a comparison of $a_1$ versus $a_2$ at $b_2$. In this way, a series of simple-effects analyses can be used to break down an interaction into its component parts.

**simple emotion** see COMPLEX EMOTION.

**simple eye** the type of eye found in vertebrates and some invertebrates. It consists of a single focusing element, which may be a thickening of the exoskeleton (in an arthropod), a pinhole in the surface of the eye (in a mollusk), or a crystalline lens (in a vertebrate), plus one or more photosensitive cells. Compare COMPOUND EYE.

**simple factorial design** an experimental design in which the two or more levels of each INDEPENDENT VARIABLE or factor are observed in combination with the two or more levels of every other factor. See also FACTORIAL DESIGN.

**simple hypothesis** a hypothesis that specifies all the parameters of a population distribution. For example, consider a researcher who wants to examine the hypothesis that graduates from a particular institution have higher than average overall grade-point averages if they have studied abroad. If the researcher specified the population mean and standard deviation of grades in the full population of students at that institution, this would be a simple hypothesis. Compare COMPOSITE HYPOTHESIS.

**simple ideas** in ASSOCIATIONISM, the simple, unorganized sensations, derived from the various senses, that form the basis of all knowledge. Through the rational process of reflection, simple ideas can be transformed into more abstract COMPLEX IDEAS. [defined by John Locke]

**simple partial seizure** see PARTIAL SEIZURE.

**simple phobia** see SPECIFIC PHOBIA.

**simple random sampling** the most basic approach to drawing a RANDOM SAMPLE of cases, observations, or individuals from a population, in which the cases are selected individually using a fair process, such as the toss of a coin or a table of random digits. Also called INDEPENDENT RANDOM SAMPLING.

**simple reaction time (SRT)** the total time that elapses between the presentation of a stimulus and the occurrence of a response in a task that requires a participant to perform an elementary behavior (e.g., pressing a key) whenever a stimulus (such as a light or tone) is presented. The individual makes just a single response whenever the only possible stimulus is presented. Compare CHOICE REACTION TIME. See also DISCRIMINATION REACTION TIME.

**simple regression** a type of REGRESSION ANALYSIS that
simple schizophrenia

has only one predictor or independent variable and one outcome or dependent variable. See also MULTIPLE REGRESSION.

simple schizophrenia one of the four major types of schizophrenia described by Emil Kraepelin and Eugen Bleuler, characterized primarily by gradual withdrawal from social contact, a lack of initiative, and emotional apathy.

simple sentence see COMPLEX SENTENCE.

simple stepfamily a STEP FAMILY in which only one of the parents brings a child or children from a previous union to the new family unit.

simple structure in EXPLORATORY FACTOR ANALYSIS, a set of criteria for determining the adequacy of a FACTOR ROTATION solution. These criteria require that each factor show a pattern of high FACTOR LOADINGS on certain variables and near-zero loadings on others and that each variable load on only one factor. This minimizes the complexity of the factor solution, allows each variable to be most strongly identified with a specific factor, and increases interpretability.

simple tone see PURE TONE.

simple universal see PSYCHOLOGICAL UNIVERSAL.

simplicity principle see LIKELIHOOD PRINCIPLE.

Simpson’s paradox a phenomenon that can occur when data from two or more studies are merged, giving results that differ from those of either study individually. For example, two studies, each showing a correlation of .00 between two variables, x and y, may show a strong positive correlation between variables x and y when the data are merged. This paradoxical effect could occur if the mean values of each variable in one study are both substantially lower (e.g., lower) than their mean values in the second study. [Edward H. Simpson (1922-), British statistician]

simulated family a technique used in training and therapy in which hypothetical family situations are enacted. In training, the enactment is by clinicians or other professionals. In FAMILY THERAPY, one or more members of the family may participate with others, who play the roles of other family members. See also ROLE PLAY.

simulation n. 1. an experimental method used to investigate the behavior and psychological processes and functioning of individuals in social and other environments—often those which investigators cannot easily access—by reproducing those environments in a realistic way. For example, simulations are often used in personnel selection. Where various exercises have been developed to tap job-related dimensions or behaviors. 2. the artificial creation of experimental data through the use of a mathematical or computer model. The purpose is usually to test the behavior of a statistic or model under controlled conditions. 3. resemblance or imitation, particularly the mimicking of symptoms of one disorder by another or the faking of an illness.

simulation training a technique in which trainees learn a complex or hazardous task by practicing with a replica of the task. This may involve the use of computer simulations, mechanical training aids, or plausible but fictitious scenarios (e.g., BUSINESS GAMES or CASE METHODS). For example, a medical student may practice inserting an intravenous line on a mannequin before doing so on a live patient, and factory workers may use virtual reality to practice operating a new piece of heavy machinery prior to using the actual equipment.

simulator n. a training device that simulates the conditions or environment of the actual operating situation or that resembles the actual equipment to be used, such as a flight simulator for pilots. The training allows for a safe, lower-cost experience with the conditions under study but may lack realism.

simulator sickness a form of MOTION SICKNESS experienced without actual motion, as when playing a video game or using a flight simulator.

simultanagnosia n. see VISUAL AGNOSIA.

simultanaprapxia n. a type of APRAXIA that involves the inability to perform two simultaneous motor acts (e.g., closing the eyes and protruding the tongue). It is a subset of MOTOR IMPERSONANCE.

simultaneous conditioning a CLASSICAL CONDITIONING technique in which the conditioned stimulus and the unconditioned stimulus are presented at the same time. Compare DELAY CONDITIONING.

simultaneous contrast see COLOR CONTRAST; CONTRAST.

simultaneous discrimination in conditioning, DISCRIMINATION between two concurrently available stimuli.

simultaneous lightness contrast see BRIGHTNESS CONTRAST.

simultaneous masking see MASKING.

simultaneous processing see PARALLEL PROCESSING.

simultaneous regression a type of REGRESSION ANALYSIS in which all predictors or INDEPENDENT VARIABLES are entered into the equation at the same time. Each independent variable’s coefficient or WEIGHT is interpreted in the context of all of the other independent variables in the model at that time, some of which may be correlated. Also called SIMULTANEOUS MULTIPLE REGRESSION. Compare HIERARCHICAL REGRESSION; STEPWISE REGRESSION.

Sinemet n. a U.S. trade name for a drug combination of LEVODOPA and carbidopa used in the treatment of Parkinson’s disease, the symptoms of which are due to lack of striatal dopamine. Carbidopa inhibits the action of the enzyme DOPA DECARBOXYLASE in peripheral tissues, thereby enabling levodopa to be administered in lower doses to achieve an effective concentration in the brain, where it is converted by striatal enzymes into dopamine.

Sinquan n. a trade name for DOXEPIN.

sine qua non an indispensable element (Latin, literally: “without which not”). In law, for example, a guilty mind (see MENS REA) is the sine qua non of CRIMINAL RESPONSIBILITY.

sine wave a mathematical expression involving the trigonometric functions sine or cosine. In much of physics, a sine wave is a function of time. For example, in acoustics a pure tone is a variation in sound pressure that is a sinusoidal function of time. The parameters of a sine wave are its frequency, amplitude, and phase. A sine wave, unlike a complex wave, has only one frequency component.

single alternation in experimental research, a pattern in which one kind of event alternates with another. For example, in an OPERANT CONDITIONING experiment, a reinforced trial (R) may alternate with a nonreinforced trial...
(N), yielding the pattern RNRNRN . . . See also DOUBLE ALTERNATION.

**single blind** see BLIND.

**single-capacity model** see UNITARY-RESOURCE MODEL.

**single-case design** an approach to the empirical study of a process that tracks a single unit (e.g., person, family, class, school, company) in depth over time. Specific types include the ALTERNATING TREATMENTS DESIGN, the MULTIPLE BASELINE DESIGN, the REVERSAL DESIGN, and the WITHDRAWAL DESIGN. In other words, it is a WITHIN-SUBJECTS DESIGN with just one UNIT OF ANALYSIS. For example, a researcher may use a single-case design for a small group of patients with a tic. After observing the patients and establishing the number of tics per hour, the researcher would then conduct an intervention and watch what happens over time, thus revealing the richness of any change. Such studies are useful for generating ideas for broader studies and for focusing on the microlevel concerns associated with a particular unit. However, data from these studies need to be evaluated carefully given the many potential threats to INTERNAL VALIDITY: there are also issues relating to the sampling of both the one unit and the process it undergoes. Also called N-of-1 design. N=1 design: single-participant design: single-subject (case) design.

**single-case method and evaluation** a type of PSYCHOTHERAPY RESEARCH based on systematic study of one client before, during, and after intervention.

**single-channel recording** see MICROELECTRODE.

**single-channel model** a model of human INFORMATION PROCESSING in which only SERIAL PROCESSING is possible. Cognition is held to consist of a series of discrete sequenced steps involving one information source and one processing channel at a time.

**single-episode depression** a MAJOR DEPRESSIVE EPISODE in an individual who does not have a history of such episodes. It is thought that the effects of treatment in people having single episodes may be different from those in individuals with recurrent depression.

**single-event learning** the formation of associations between elements or occurrences after only one exposure to them. The term is discussed most commonly with reference to CONDITIONED TASTE AVERSION and conditioned fears. For example, a person who becomes sick after one meal at a restaurant and subsequently refuses to dine there has formed a negative association between the illness and that one meal. Similarly, a dog with no previous aversion to nail trimming may suddenly become fearful of the procedure after having its nails cut painfully short. The precise neural mechanisms by which such rapid and often long-lasting associations are formed have yet to be determined.

**single-factor design** see ONE-WAY DESIGN.

**single-gene disorder** a disease or condition that is due to the presence of a single mutated gene. Generally, the single mutation causes a failure to synthesize a normally functioning enzyme that is required for a specific step in building body tissue or for a vital stage in the metabolism of a food component. Single-gene disorders are relatively rare (Huntington’s disease and sickle-cell disease are examples); instead, many diseases exhibit MULTIFACTORIAL INHERITANCE and are also influenced by environmental factors.

**single-group validity** the notion that some measures may be valid for certain groups (e.g., Caucasians) but not others (e.g., minority ethnic groups). See also DIFFERENTIAL VALIDITY.

**single mothers by choice** women typically in their 30s and 40s who opt to raise a child without a partner. It is estimated that more than 40% of single mothers have never been married and that the largest number of unmarried women now choosing single motherhood are college educated, usually with stable economic resources. They may become pregnant by accident and then decide to bear and raise the child alone; they may plan the pregnancy and conceive with a male or through ARTIFICIAL INSEMINATION, intending to enter single motherhood; or they may adopt and raise a child on their own.

**single-nucleotide polymorphism** (SNP) a common, tiny variation in human DNA, occurring roughly every 1,000 bases along the molecule and affecting single NUCLEOTIDES. Such variations can be used as GENETIC MARKERS to track the inheritance of particular defective genes in families.

**single parent** a person who rears a child without the assistance of a partner.

**single-participant design** see SINGLE-CASE DESIGN.

**single photon emission computed tomography** (SPECT) a functional imaging technique that uses gamma radiation from a radioactive tracer to create a picture of blood flow in the body. In the brain it can be used to measure cerebral blood flow, which is an indirect measure of cerebral metabolism and activity.

**single-sample test** any of various statistical procedures used to analyze data collected from one sample and determine whether the distribution of values differs significantly from a known or theoretical distribution for the larger POPULATION from which the sample is believed to be derived. Also called one-sample test. Compare TWO-SAMPLE TEST.

**single-sample t test** a statistical procedure used to determine whether there is a significant difference between the observed mean of a SAMPLE and the known or hypothetical mean of the larger POPULATION from which the sample has been randomly drawn. In the single-sample t test, one calculates a t value using (a) the mean of the sample (observed average); (b) the mean of the population (known or theoretically expected average); (c) the STANDARD DEVIATION of the sample; and (d) the total number of sample observations taken. The t value obtained is then compared to a standard table of values, arranged by sample size, to determine whether it exceeds the threshold of STATISTICAL SIGNIFICANCE. Also called one-sample t test.

**single-session therapy** (SST) therapy that ends after one session, usually by choice of the client but also as indicated by the type of treatment (e.g., TRUCKSONIAN PSYCHOTHERAPY, SOLUTION-FOCUSED BRIEF THERAPY). Some clients claim enough success with one hour of therapy to stop treatment, although some therapists believe that this claim represents a FAITH INTO HEALTH or temporary relief from symptoms. Preparation for the session (e.g., by telephone) increases the likelihood of the single-therapy session being successful.

**singles test** in parapsychology experiments on PSYCHOKINESIS, a technique in which the participant attempts to influence the throw of a single die.

**single-subject case design** see SINGLE-CASE DESIGN.
**single-subject design** see SINGLE-CASE DESIGN.

**singleton** *n.* 1. a fetus that develops alone or an offspring born singly. 2. sometimes, in popular usage, the only child of two parents.

**sinistral** *adj.* left-handed.

**sinistrality** *n.* a tendency to use the left hand, arm, or leg in motor activities. See also LEFT-HANDEDNESS. Compare DEXTRALITY.

**sinistro-** *(sinistr-)* combining form on or toward the left.

**sinusoid** *n.* 1. generally, any SINE wave form. 2. in addition, see PURE TONE. —sinusoidal *adj.*

**SIP** 1. abbreviation for Sociedad Interamericana de Psicología. See INTERAMERICAN SOCIETY OF PSYCHOLOGY. 2. abbreviation for SOCIETY OF INDIAN PSYCHOLOGISTS.

**SIPPA** abbreviation for Students of the International Positive Psychology Association. See INTERNATIONAL POSITIVE PSYCHOLOGY ASSOCIATION.

**SIQ** abbreviation for SPORT IMAGERY QUESTIONNAIRE.

**SIS** 1. abbreviation for sensory-information store. See SENSORY MEMORY. 2. abbreviation for STIGMA IMPACT SCALE.

**sissy behavior** slang for effeminate behavior in boys, which is often a source of ridicule by others. See ROLE CONFUSION; TOMBOYISM.

**SIT** 1. acronym for SLOSSON INTELLIGENCE TEST. 2. acronym for SMALL IDENTIFICATION TEST. 3. acronym for STRESS-INDOCULATION TRAINING.

**situated cognition** cognition seen as inextricable from the context in which it is applied. From this, it follows that intelligence also cannot be separated from its context of application (situated intelligence). See also STREET INTELLIGENCE.

**situated identity theory** the theory that individuals take on different roles in different social and cultural settings, so that a person’s behavior pattern may shift radically according to the situation and the others with whom he or she is interacting. [proposed in 1981 by U.S. sociologists C. Norman Alexander Jr. (1939–1989) and Mary Glenn Wiley]

**situated intelligence** see SITUATED COGNITION.

**situated knowledge** knowledge that is embedded in, and thus affected by, the concrete historical, cultural, linguistic, and value context of the knowing person. The term is used most frequently in perspectives arising from social constructionism, radical feminism, and postmodernism to emphasize their view that absolute, universal knowledge is impossible. It sometimes carries the further implication that social, cultural, and historical factors will constrain the process of knowledge construction itself. To the extent that knowledge is situated, it is difficult to avoid some kind of epistemological relativism.

**situated learning** learning that occurs in specific physical and social contexts (e.g., in a classroom). Knowledge learning may be facilitated when people interact within the setting or if they interact with the physical setting (e.g., when map learning occurs in the actual physical space being studied). However, situated learning may be less meaningful than other types of learning if it does not transcend the particular situation in which it was acquired (see CONTEXT-SPECIFIC LEARNING).

**situation** *n.* one or more circumstances, conditions, states, or entities in the environment that have the potential to exert causal influences on an individual’s behavior. To social psychologists, the term commonly refers to the real or imagined presence of other persons, but it can also refer to the physical environment or to more abstract qualities (e.g., deadlines imposed by a supervisor or different motivational orientations). A central belief among social psychologists is that situations affect behavior, often powerfully and so often without the person’s awareness of such influence. Attention to the situation as a cause of behavior is commonly linked to Kurt Lewin’s famous dictum B = f(E, P), postulating that all behavior is a function of the person and the environment, although the strict separability of these two factors into independent causal forces is questionable.

**situational approach** see CONTINGENCY MODEL.

**situational attribution** the ascription of one’s own or another’s behavior, an event, or an outcome to causes outside the person concerned, such as luck, pressure from other people, or external circumstances. Also called ENVIRONMENTAL ATTRACTION; EXTERNAL ATTRACTION. Compare DISPOSITIONAL ATTRACTION.

**situational conditions** all the relevant external variables within a setting that influence individual behavior. Situational conditions in a classroom setting, for example, include the variables affecting student learning and achievement: physical environment, teaching methods, time factors, goals, organization of material, methods of testing, consequences of performance, type of reinforcement, and social relationships.

**situational determinant** an environmental condition that exists before and alter an organism’s response and influences the elicitation of this behavior. It is one of the four variables considered in behavioral analysis. See SORC.

**situational differences** any distinction arising from environmental characteristics, as opposed to INDIVIDUAL DIFFERENCES. For example, in a study of men and women in social settings versus business settings, the amount of positive emotion displayed by the participants may be explained not only by gender (e.g., females tending to exhibit more positive emotion) but also by the situation (more positive emotions in a social setting regardless of whether the participant is male or female).

**situational homosexuality** same-sex sexual behavior that develops in a situation or environment in which the opportunity for heterosexual activity is missing and close contact with individuals of the same sex occurs, such as a prison, school, or military setting where individuals are living together, segregated according to their sex. Once away from this setting, the person typically returns to heterosexual activity.

**situational interview** an EMPLOYMENT INTERVIEW in which applicants for a job are presented with scenarios and asked what they would do in those situations. Their potential to perform the job is then evaluated using BEHAVIORALLY ANCHORED RATING SCALES.

**situationalism** *n.* see SITUATIONISM.

**situational judgment test (SJT)** a type of EMPLOYMENT TEST that presents respondents with realistic work-related situations and asks them how to handle those scenarios. Several potentially plausible response options are provided for each scenario, reflecting behaviors that may...
be effective or ineffective. The respondent must exercise his or her judgment and choose what he or she believes is the appropriate response. SJTs may be administered orally or via paper, video, or computer.

**situational leadership theory** a CONTINGENCY THEORY OF LEADERSHIP suggesting that successful leaders use varying amounts of directive (TASK-MOTIVATED) and supportive (RELATIONSHIP-MOTIVATED) leadership, depending on the job maturity (e.g., experience, ability, knowledge) and psychological maturity (e.g., level of motivation, willingness to accept responsibility) of followers. [proposed by U.S. management theorists Paul Hersey (1931–2012) and Kenneth H. Blanchard (1939–)]

**situationally bound panic attack** see CUED PANIC ATTACK.

**situationally predisposed panic attack** a PANIC ATTACK that occurs in response to a specific situational trigger but is not invariably induced by it. Compare CUED PANIC ATTACK: UNCUED PANIC ATTACK.

**situational psychosis** a severe but temporary reaction to a traumatic event or situation (such as imprisonment) involving symptoms such as delusions and hallucinations. Also called reactive psychosis: traumagenic psychosis.

**situational restraint** the use of environmental features (e.g., screens on windows, immovable furniture), as opposed to physical restraint of an individual, to minimize the risk of dangerous or destructive acts by patients with mental or emotional problems.

**situational semantics** a branch of SEMANTICS holding that the meaning of utterances, particularly their truth value, must be understood by considering not only the correspondence of the utterance to what is actually the case in the world but also the situation in which the utterance is made. A major implication of this notion is that truth is situational and that language expresses primarily situations rather than transsituational facts. This view is related to SOCIAL CONSTRUCTIONISM, POSTMODERNISM, and some species of FEMINISM.

**situational test** see SITUATION TEST.

**situation awareness** conscious knowledge of the immediate environment and the events that are occurring in it. Situation awareness involves perception of the elements in the environment, comprehension of what they mean and how they relate to one another, and projection of their future states. In ergonomics, for example, it refers to the operator’s awareness of the current status and the anticipated future status of a system. Situation awareness is influenced by a number of factors, including stress; it may be impaired by COGNITIVE TUNNELING or SOCIAL TUNNELING. Compare AMBIENT AWARENESS: VIGILANCE.

**situation ethics** the view that the morality or immorality of an action must be evaluated within the context of a given situation as interpreted according to some ethical norms. Compare MORAL ABSOLUTISM: MORAL RELATIVISM.

**situationism** n. the view that an organism’s interaction with the environment and situational factors, rather than personal characteristics and other internal factors, are the primary determinants of behavior. Also called situationalism. [proposed by Kurt LEWIN]

**situation sampling** the observation of individuals in several real-life situations—as opposed to experimental situations—as part of the study of their behavior.

**situation test** a test that places an individual in a natural setting, or in an experimental setting that approximates a natural one, to assess either the individual’s ability to solve a problem that requires adaptive behavior under stressful conditions or the individual’s reactions to what is believed to be a stressful experience. For example, a course of DESENSITIZATION therapy aimed at reducing phobic reactions might begin with a situation test in which the individual encounters the phobic object. The individual’s reactions are then assessed and considered in relation to his or her needs or a specific therapy program. Also called situational test.

**SITUTS** acronym for stimulus-independent and task-unrelated thoughts. See MIND WANDERING.

**Sixteen Personality Factor Questionnaire (16PF)** the fifth edition (1993) of a comprehensive self-report PERSONALITY INVENTORY. The instrument assesses personality on 16 key scales: warmth, vigilance, reasoning, abstractedness, emotional stability, privateness, dominance, apprehension, liveliness, openness to change, rule-consciousness, self-reliance, social boldness, perfectionism, sensitivity, and tension. The 16 factors (called SOURCE TRAITS) are grouped into 5 “global factors”: extraversion, independence, tough-mindedness, anxiety, and self-control, [developed by Raymond B. CATTELL and his associates]

**sixth cranial nerve** see ABUDUCENS NERVE.

**sixth sense** 1. in general language, an intuition or instinct that enables a person to make a correct judgment or decision without conscious use of the five senses or normal cognitive processes. 2. in parapsychology, the ostensible sensory modality responsible for mediating the phenomena of extrasensory perception (ESP). Some consider the term to be a synonym for ESP. See PSI.

**size constancy** the ability to perceive an object as being the same size despite the fact that the size of its retinal image changes depending on its distance from the observer. It is a type of PERCEPTUAL CONSTANCY.

**size cue** any of a variety of means used by the visual system to interpret the APPARENT SIZE of a stimulus. These include the size of the retinal image, the relationship of the object to others in the VISUAL FIELD, DEPTH CUES, and SIZECONSTANCY.

**size discrimination** the ability to distinguish differences in the sizes of objects.

**size–distance paradox** an illusion that an object is bigger or smaller than it actually is, caused by a false perception of its distance from the viewer. For example, in the so-called MOON ILLUSION, the moon appears to be larger on the horizon, where DEPTH CUES (e.g., ocean, trees) make it appear to be farther away, than at its zenith, where there are no depth cues. Also called distance paradox.

**size-invariant neuron** see LOCATION-INVARIANT NEURON.

**size principle** the principle that the order of RECRUITMENT of motor neurons serving a particular muscle is related to their size: To produce muscle responses of increasing strength, small, low-threshold neurons are recruited first, and large, high-threshold neurons are recruited last.

**size–weight illusion** the tendency to judge density when trying to judge weight: a person may be influenced by the size of an object and thus perceive a large object as part of size–weight illusion
Sjögren–Larsson syndrome

an autosomal recessive disorder characterized by scaly skin, spasticity, and intellectual disability, caused by several different genetic factors. Sweat glands are sparse or deficient. The scaliness varies in specific cases among populations from different regions of the world. [reported in 1957 by Torsten Sjögren (1896–1974), Swedish physician, and Tage Konrad Leopold Larson (1905–1998), Swedish scientist]

Sjögren's syndrome see XEROPTHALMIA. [Henrik S. C. Sjögren (1899–1986), Swedish ophthalmologist]

SJT abbreviation for SITUATIONAL JUDGMENT TEST.

skeletal age a measure of the degree to which a skeleton has matured. Skeletal age can be the same as, more than, or less than CHRONOLOGICAL AGE.

skeletal muscle a muscle that provides the force to move a part of the skeleton. Skeletal muscles are attached to the bones by tendons and usually span a joint, so that one end of the muscle is attached via a tendon to one bone and the other end is attached to another bone. Skeletal muscles work in reciprocal pairs (see ANTAGONISTIC MUSCLES) so that a bone can be moved in opposite directions. Skeletal muscle is composed of numerous slender, tapering MUSCLE FIBERS, each of which is bounded by a membrane (sarcolemma) and contains cytoplasm (sarcoplasm). Within the sarcoplasm are the longitudinal contractile fibrils (myofibrils), organized into arrays (sarcomeres) that give a striped appearance when viewed microscopically. Contraction of skeletal muscle is typically under voluntary control of the central nervous system. Each muscle fiber is stimulated to contract by nerve impulses conducted along a MOTOR NEURON and transmitted to the fiber via a NEUROMUSCULAR JUNCTION. A single neuron may activate from several up to hundreds of muscle fibers. Also called striated muscle; voluntary muscle. Compare CARDIAC MUSCLE; SMOOTH MUSCLE.

skelic index the ratio between length of the legs and length of the trunk. This index is used in ANTHROPOMETRY.

skeptical postmodernism a perspective within POSTMODERNISM that is particularly reluctant to grant any foundations for meaning or morality. From such a perspective it is difficult to see why any political system or ideology should be thought preferable to any other, or how the idea of social progress can have any meaning. Skeptical postmodernism is often contrasted with AFFIRMATIVE POSTMODERNISM.

skepticism n. 1. an attitude of questioning, disbelief, or doubt. In philosophy, the position that certainty in knowledge can never be achieved. David Hume made skepticism a cornerstone of his system and provoked much later discussion when he taught that sensory experience provides no sure basis for knowledge of the external world and that nothing can be proved by observation. CAUSATION, for example, is only an inference that relates two observed events, and one has no knowledge that this relationship will apply in similar cases; it is a generalization that could be proved wrong by a different result. In modern philosophy, POSTMODERNISM, POSTSTRUCTURALISM, and DECONSTRUCTION are essentially systems of skepticism. —skeptic n. —skeptical adj.

skewness n. the degree to which a set of scores, measurements, or other numbers are asymmetrically distributed around a central point. A normal FREQUENCY DISTRIBUTION of data is shaped like a bell, with equal values for each of its three indices of CENTRAL TENDENCY—the MEAN, the MEDIAN, and the MODE. Approximately 68% of the scores lie within 1 STANDARD DEVIATION of the mean and approximately 95% of the scores lie within 2 standard deviations of the mean. When a distribution has a few extreme scores toward the high end relative to the low end (e.g., when a test is difficult and few test takers do well), it has a positive skew (or is positively skewed), such that the mean is greater than the mode. When a distribution has a few extreme scores toward the low end relative to the high end (e.g., when a test is easy and most test takers do well), it has a negative skew (or is negatively skewed).

skill n. an ability or proficiency acquired through training and practice. Motor skills are characterized by the ability to perform a complex movement or SERIAL BEHAVIOR quickly, smoothly, and precisely. Skills in other learned tasks include BASIC SKILLS; COMMUNICATION SKILLS; and SOCIAL SKILLS.

skilled nursing facility (SNF) a licensed or approved facility; whether freestanding or affiliated with a hospital, that provides continuous rehabilitation and medical care of a lesser intensity than that provided in an acute-care hospital setting. Also called convalescent center. See also CONTINUING CARE UNIT.

skill learning learning to perform a task with proficiency, as defined by ease, speed, and accuracy of performance, acquired through extensive practice. Skills may be motor, perceptual, cognitive, or a combination of these (as in reading and playing music). See also THREE-STAGE THEORY.

skill theory the proposition that cognitive development is the result of a dynamic interaction between the individual and the environment. According to this theory, a skill (or dynamic skill) is the capacity to act in an organized way in a specific context, and in order for a skill to be developed to its OPTIMAL LEVEL, it must be exercised in the most supportive of environments. Also called dynamic skill theory. [proposed by U.S. psychologist Kurt W. Fischer (1943– )]

skimming n. a rapid, somewhat superficial, reading of material to get the general idea of the content. —skim vb.

skin n. the external covering of the body, consisting of an outer layer (epidermis) and a deeper layer (dermis) resting on a layer of fatty subcutaneous tissue. The skin is well supplied with nerves and blood vessels and forms an effective yet sensitive barrier that prevents the entry of foreign substances and pathogens into the body. It defends against injury to underlying tissues, reduces water loss from the body, and forms part of the body’s temperature-regulation mechanism through the evaporation of sweat secreted from sweat glands. Human skin typically has only a sparse covering of hair, except on the head and genital regions, and the hair has minimal value as insulation, although it is often highly significant in social terms. In humans, insulation is provided mainly by the subcutaneous ADIPOSE TISSUE. The root of each hair arises from a HAIR FOLLICLE, into which the ducts of sebaceous glands discharge sebum, an oily secretion that lubricates and waterproofs the skin surface. Various types of sensory nerve endings provide the skin with touch and pressure sensitivity, as well as sensations of pain and temperature (see CUTANEOUS RECEPTOR).

skin conductance the degree to which the skin trans-
mits a small electric current between two electrodes, changes in which are typically used to measure a person’s level of arousal or energy mobilization (see GALVANIC SKIN RESPONSE). In contrast to other autonometrically mediated indices, skin conductance rarely shows relations to specific emotional states, such as fear or anger, responding instead to level of arousal. The mechanism of skin conductance is not fully known: It seems to be related to the electrical activity of sweat glands but not to sweating itself. Compare SKIN RESISTANCE.

**skin graft** a piece of skin, either of full thickness or split (i.e., partial) thickness, surgically applied to wounds to facilitate healing. Skin grafts can conform to irregular wounds and concavities.

**Skinner box** see OPERANT CONDITIONING CHAMBER, [initially developed by B. F. SKINNER]

**skin-picking disorder** see EXCORIATION (SKIN-PICKING) DISORDER.

**skin popping** slang for the injection of a substance containing an opioid—usually HEROIN—under the skin, as opposed to mainlining (i.e., injecting into a vein).

**skin receptor** see CUTANEOUS RECEPTOR.

**skin resistance** the opposition of the skin to the passage of an electric current. This electrodermal property is measured by applying a small external charge (e.g., 1.0 V) across two electrodes placed at different points on the palm, hand, or other area and recording how much of the current passes between the electrodes; the measurement is then converted into micro-ohms (or microamperes) to provide the degree to which the skin resists the flow of electricity. The baseline or minimum level of electrical skin resistance in an individual in a resting state is called basal skin resistance. Sometimes used in research as a physiological marker of arousal, and more controversially in POLYGRAPH examinations as a manifestation of deception and various emotional states, skin resistance is the reciprocal of SKIN CONDUCTANCE. See also GALVANIC SKIN RESPONSE.

**skin sense** see CUTANEOUS SENSE.

**skin stimulation** a cutaneous sensation experienced as pain, pressure, coldness, warmth, tickling, or itching through nerve receptors in the skin.

**sl** abbreviation for sublingual.

**SLD** abbreviation for SPECIFIC LEARNING DISABILITY.

**SLE** abbreviation for systemic LUPUS ERYTHEMATOSUS.

**sleep** n. a circadian state characterized by partial or total suspension of consciousness, voluntary muscle inhibition, and relative insensitivity to stimulation. Other characteristics include unique sleep-related electroencephalogram and brain-imaging patterns (see SLEEP STAGES). These characteristics help distinguish normal sleep from a loss of consciousness due to brain injury, disease, or drugs. See also NREM SLEEP; REM SLEEP.

**sleep apnea** the temporary cessation of breathing while asleep, which occurs when the upper airway briefly becomes blocked (obstructive sleep apnea) or when the respiratory centers in the brain fail to stimulate respiration (central sleep apnea). It can cause severe daytime sleepiness, and evidence is building that untreated severe sleep apnea may be associated with high blood pressure and risk for stroke and heart attack. See also BREATHING-RELATED SLEEP DISORDER.

**sleep attack** see NARCOLEPSY.

**sleep center** an obsolete name for an area in the hypothalamus formerly thought to control sleep. It has now been shown that no single area of the brain governs the SLEEP–WAKE CYCLE; rather, multiple areas, including the hypothalamus and RETICULAR ACTIVATING SYSTEM, have been implicated in its regulation. See also WAKING CENTER.

**sleep cycle** a recurring pattern of SLEEP STAGES in which a period of SLOW-WAVE SLEEP is followed by a period of REM SLEEP. In humans, a sleep cycle lasts approximately 90 minutes.

**sleep deprivation** the condition of getting insufficient sleep. This may occur as a result of illness, shift work, or lifestyle considerations (e.g., having a newborn, staying up late to study). It may also be induced for experimental or interrogation purposes. Studies show that the loss of one night’s sleep has a substantial effect on physical or mental functioning; participants score significantly lower on tests of judgment and SIMPLE REACTION TIME and show impairments in daytime alertness and memory. Sleep loss also may be detrimental to the immune and endocrine systems. See also REM–SLEEP DEPRIVATION.

**sleep disorder** a persistent disturbance of typical sleep patterns (including the amount, quality, and timing of sleep) or the chronic occurrence of abnormal events or behavior during sleep. In DSM–IV–TR, sleep disorders are broadly classified according to apparent cause, which may be endogenous or conditioning factors (primary sleep disorders), another mental disorder, a medical condition, or substance use. Primary sleep disorders are subdivided into DYSSOMNIAS and PARASOMNIAS. DSM–5, which encompasses sleep disturbances under the rubric SLEEP–WAKE DISORDERS, eliminates sleep disorders related to another mental disorder and to a general medical condition as distinct entities in order to avoid making causal assumptions about comorbid disorders. A classification system introduced in 1979 by the Association of Sleep Disorders Centers groups sleep disorders according to individuals’ presenting symptoms: DISORDERS OF INITIATING AND MAINTAINING SLEEP; DISORDERS OF EXCESSIVE SOMNOLENCE; DISORDERS OF THE SLEEP–WAKE CYCLE SCHEDULE; and DYSFUNCTIONS ASSOCIATED WITH SLEEP, SLEEP STAGES, OR PARTIAL AROUSALS.

**sleep disorientation** see CONFUSIONAL AROUSAL.

**sleep drive** the basic physiological urge to sleep, which varies throughout the day but typically is strongest (for adults) between 2 a.m. and 4 a.m. and between 1 p.m. and 3 p.m. It appears to be governed in part by the hypothalamus and the reticular activating system.

**sleep drunkenness** see CONFUSIONAL AROUSAL.

**sleep efficiency** 1. the ratio of total time asleep to total time in bed, which is therefore a measure of INSOMNIA. 2. more generally, the amount of restorative sleep one gets, as indexed by one’s cognitive functioning on the following day.

**sleep enuresis** see BED-WETTING.

**sleep epilepsy** 1. a type of epilepsy in which seizures occur exclusively or predominantly during sleep. 2. a former name for NARCOLEPSY.

**sleepier effect** the finding that the impact of a persuasive message increases over time. This effect is most likely to occur when a person carefully scrutinizes a message with relatively strong arguments and then subsequently re-
sleep hygiene

teaches a discounting cue (i.e., some piece of information suggesting that the message should be disregarded). The discounting cue weakens the initial impact of the message, but if the cue and the arguments in the message are not well integrated in memory, the cue may gradually be forgotten. If this occurs, the impact of the arguments will be greater at a later point in time than they were at the time of their initial presentation.

sleep hygiene techniques for the behavioral treatment of insomnia that involve instructions given to the client to follow certain routines aimed at improving sleep patterns. Typical recommendations include using the bed only for sleeping and sex (e.g., the client is instructed not to read in bed), not napping during the day, decreasing caffeine intake or eliminating it after a certain point in the day, going to bed regularly at a set time, and keeping a sleep diary.

sleep latency the amount of time it takes for an individual to fall asleep once the attempt to do so is made. Sleep latency is measured in the diagnosis of SLEEP DISORDERS. Sleeping pills (e.g., benzodiazepines) are designed to decrease sleep latency so that the individual can fall asleep more quickly.
