Editors

David A. Snow is a Distinguished Professor of Sociology at the University of California, Irvine, where he also serves as the Co-Director of the Center for Citizen’s Peacebuilding. He has authored numerous articles and chapters on aspects of social movements and collective action, particularly on framing processes, as well as a number of books on social movements, including: *Shakubuku: A Study of the Nichiren Shoshu Buddhist Movement in America, 1960–1975* (1993), *The Wiley-Blackwell Companion to Social Movements* (with Sarah Soule and Hanspeter Kriesi, 2004), *Social Movements: Readings on Their Emergence, Mobilization, and Dynamics* (with Doug McAdam, 1997, 2010), and *A Primer on Social Movements* (with Sarah Soule, 2010). Professor Snow was the 2008 recipient of the Society for the Study of Social Problems’ Lee Founders Award for career contributions to the study of social problems.

Donatella della Porta lectures at the European University Institute, Florence, and directs the ERC project “Mobilizing for democracy: Democratization processes and the mobilization of civil society.” She is the co-author of *Social Movements: An Introduction* (with Mario Diani, 2006), *Europeanization and Social Movements* (with Manuela Caiani, 2009), and *Mobilizing on the Extreme Right: Germany, Italy, and the United States* (with Manuela Caiani and Claudius Wagemann, 2012), and editor of *Democracy in Social Movements* (2009) and *Another Europe* (2009). In 2011, Professor della Porta was awarded the Mattei Dogan Prize for political sociology.

Bert Klandermans is Professor in Applied Social Psychology at the VU University of Amsterdam. He is Director of the research program Social Conflict and Change. He is the editor and co-author of *Methods of Social Movement Research* (with Suzanne Staggenborg, 2002) and *Extreme Right Activists in Europe* (with Nonna Mayer, 2006). He also co-edited the *Handbook of Social Movements across Disciplines* (with Conny Roggeband, 2007). In 2011/2012 he was President of the International Society of Political Psychology. In 2009 he received a Royal Award for his efforts to link science and society.

Doug McAdam is Professor of Sociology and Director of the Program on Urban Studies at Stanford University. He is widely credited as one of the pioneers of the political process model in social movement analysis. His publications include *Political Process and the Development of Black Insurgency, 1930–1970* (1982), *Freedom Summer* (1988), *Dynamics of Contention* (with Sid Tarrow and Charles Tilly, 2001), and *Putting Social Movements in their Place: Explaining Opposition to Energy Projects in the United States, 2000–2005* (with Hilary Boudet, 2012).

Introduction

This encyclopedia is based, in part, on the premise that an understanding of many of the most significant social and political developments and changes throughout much of human history – such as the ascendance of Christianity and Islam, the Reformation, and the American, French, Russian and Chinese revolutions, for example – is partly dependent on an understanding of the workings and influence of social movements. If anything, this observation seems even more relevant in the past two to three centuries, as well as in the last few years. Looking back at the various social and cultural landscapes across the world over the past 200 years, it is reasonable to wonder how very different things might be in the absence of the international antislavery movement, which led to the abolishment of slavery, the suffrage movement, which sought to enfranchise women, the labor movement, which sought to reduce the exploitation of workers of all ages, and the various civil and human rights movements, which sought, and continue to seek, to guarantee for all citizens of all countries the range of human rights that too many citizens have been and still are denied. All of these movements played an important role in the establishment and deepening of democracy and citizenship rights in some countries, and are still operative in other countries that have yet to guarantee such rights. Needless to say, the importance of social movements and protest is strikingly evident in the contemporary world, with the welling up of the politically consequential Tea Party movement in 2009 in the United States, the protest movements and attempted revolutions rolling across the Arab world in 2011 and 2012, the anti-austerity protests in Greece and other European countries in 2011, widespread protest over contested elections in a host of countries – including Iran in 2009 and Russia in 2011, and the Occupy Wall Street movement surfacing in New York City in 2011, and spreading rapidly across US and European cities.

The importance of these and other movements is recognized not just by social movement scholars within the academy but also by other chroniclers of the flow of history. *Time* magazine’s final issue of the twentieth century, for example, included among its three major candidates for the person of the century the inspirational leader of one of the more consequential movements of the past century, Mohandas Gandhi. Why Gandhi? Because, in *Time*’s words,

> He stamped his ideas on history, igniting three of the century’s great revolutions – against colonialism, racism, and violence. His concept of nonviolent resistance liberated one nation and sped the end of colonial empires around the world. His marches and fasts fired the imagination of oppressed people everywhere. (*Time*, Dec. 31, 1999: 123)

As Time added “his strategy of nonviolence … spawned generations of spiritual heirs around the world,” including Martin Luther King Jr, César Chávez, Lech Walesa, Benigno Aquino Jr, and Nelson Mandela – all prominent leaders of major, consequential social movements in their respective homelands of the United States,
Poland, the Philippines, and South Africa. And more recently, *Time* named as its 2011 Person of the Year “The PROTESTOR from the Arab Spring to Athens, From Occupy Wall Street to Moscow” (Dec. 26, 2011).

The aforementioned movements and names highlight the fact that some of the major events and figures of the past century, as well as before, are bound up with social movements and protest. Thus, the study of social movements is not only warranted in its own right, but it can also lead to a better and deeper understanding of the social worlds in which they emerge and operate; hence, the core rationale for this encyclopedia on social and political movements.

Even though social movements have been an important actor in the flow of human history, it would have been well-nigh impossible to compile an encyclopedia of this magnitude 50 years ago, say in the early 1960s. The reasons are twofold. First, it is arguable that social movements, as one of the principle forms through which collectivities give voice to their shared grievances and claims by engaging in various kinds of collection action or behavior, such as protesting in the streets, have escalated with the spread of democracy and the corresponding growth of civil society (see entry titled “Social movements” for conceptual elaboration). Indeed, it is arguable, to enlarge upon a claim of one set of scholars, that the societies in which a significant proportion of the world’s population live are, among other things, movement societies. It is also the case that social and political movements tend to cluster across time in “waves” or “cycles,” and that the events associated with the Arab Spring and the Occupy protests spreading across US and European cities at the time of this writing suggest that we may well be in the midst of such a cycle.

Yet, a cycle of social movement protest was clearly evident in the 1960s, perhaps even more so then than now, so why not an encyclopedia like this back in the 1960s? The answer to this question takes us to the second reason for the compilation of an encyclopedia on social and political movements now rather than in the 1960s or the 1970s or even the 1980s. Aside from the fact that the publication of various academic, discipline-based encyclopedias has been in fashion within the publishing industry over the past decade or so, the scholarly literature on social movements that existed in the 1950s and 1960s was relatively scant and limited conceptually and theoretically. Moreover, most scholarship was of the armchair variety, with little attention given to the collection of systematic empirical evidence regarding movement dynamics. What the social movements and protests of the 1960s did, among other things, was to jumpstart a more focused, empirical study of various aspects and dimensions of social movements, which has continued to the present. One of the consequences has been the proliferation of conceptual and theoretical advances, which is reflected in the number and range of conceptual and theoretical entries within this encyclopedia. Further illustration of the almost meteoric growth of the scholarly, empirical study of social movements within the social sciences, and particularly sociology, is provided by its recent development into one of the largest and most intellectually vibrant subfields in sociology, as well as by the recent publication of two international journals of
research and theory about social movements and protest (Mobilization published in the US, and Social Movement Studies published in the UK). Social movement studies have also been very pluralistic methodologically, thereby leading to a broadened and better understanding of citizen mobilization. Thus, there is far more conceptual and systematic empirical work on which to base an encyclopedia now than there was 50, 40, 30, or even 20 years ago.

Our objective in compiling this encyclopedia has been to provide a comprehensive, authoritative, interdisciplinary, up-to-date work on social and political movements that will be an invaluable reference volume for students and scholars of social movements worldwide. Thus, the coverage is broad-based such that major social and political movements and related collective phenomena throughout segments of history and across the globe are represented among the entries. Obviously, selectivity was involved, since there is no assembled worldwide population of social movements from which to sample. But the movements and related events included were not selected haphazardly. Rather, we selected some of our advisory editors with an eye to ensuring that there was regional representation of movements across the globe. In other words, we selected a number of advisory editors who have specialized knowledge of social movements and related activities in different regions of the world – for example, Africa, Eastern Asia (China, Japan, Korea, Taiwan), Europe, and Latin America. Additionally, we also wanted to include major theoretical perspectives, concepts and processes, and relevant research methodologies and procedures; so we also selected advisory editors who could ensure coverage of the major perspectives and concepts and different types of movements.

Consistent with the aim to produce a broad-based, comprehensive encyclopedia that will have interdisciplinary and international appeal, the team of 13 advisory editors we assembled is nationally and substantively diverse (see the list of advisory editors). When the four of us (the co-editors) are coupled with the 13 advisory editors, there is representation from ten countries (China, France, Germany, Italy, Japan, Mexico, Netherlands, Switzerland, United Kingdom, and United States), four disciplines (history, political science, social psychology, and sociology), as well as broad coverage of theoretical perspectives, substantive research topics, different methods of study and a broad range of social movements studied. In short, we tried to assemble a team of advisory editors that, in combination with us, ensured sufficient national diversity and scholarly research breadth to produce a top-flight encyclopedia that would meet our articulated objectives and aims.

We think we have been reasonably successful in realizing these objectives. However, we do have some misgivings about the finished product. The major one has to do with the daunting task of finding informed authors for all of the entries and then the difficult challenge of patiently pestering the would-be authors to write the promised entry. While the patient pestering paid off in most cases, a number of entries were never written, and this was particularly the case with entries on specific movements in some parts of the world. Thus, for example, we received fewer entries on social movements
in Africa than we had hoped. But such challenges notwithstanding, we still secured 434 entries on specific social movements, revolutions, and related events worldwide, and on a very broad range of theoretical perspectives, concepts, processes, and methods fundamental to the study and understanding of social and political movements. We are therefore hopeful that readers and scholars alike will find the encyclopedia helpful in extending their knowledge and understanding of social movements as well as inspiring further study of social movements of all kinds and their dynamics.
Timeline

This timeline provides a listing of some of the most influential events, figures, and publications in the history and study of social movements beginning in the eighteenth century, which has been referred to as the “Age of Reason and Change.” Understandably, the listing is not comprehensive; many important social movements and scholarly works from around the world during this period are missing. However, in indicating many of the major events, movements, and influential scholarly publications across this period, the timeline underscores the centrality and salience of social movements and related phenomena in the flow of history over the past 300+ years.

In order to facilitate identification of the three different clusters of listings, they are keyed accordingly: events and movements are in bold; selected figures/leaders are underlined; and publications are in regular font style and italics. Not all of the listings of events and figures have associated entries in the encyclopedia, but many do.

https://vk.com/readinglecture

1715 & 1745 Jacobite rebellions in Great Britain and Ireland
1773 Peasant uprisings in Russia
1773 Boston Tea Party
1775 American Revolution begins
1780 Gordon Riots in London
1780–1782 Tupac Amaru indigenous uprising against Spanish colonial rule in Peruvian and Bolivian highlands (culminating a century of indigenous rebellions in the Andes against colonial rule in the region)
1789 French Revolution begins
1791–1804 Haitian Revolution (defining moment in the history of Africans in the New World)
1792 Reign of Terror in France (ends in 1794)
1794 The Whiskey Rebellion tax revolt challenges federal authority in the fledgling United States
1818–1883 Marx, Karl
1820–1895 Engels, Frederick
1848 Marx and Engels inspire the masses and call for revolution with the Communist Manifesto
1848 First Women’s Rights Convention at Seneca Falls, NY
1848 Revolutions break out across Europe
1850–1864 Taiping Rebellion of China
1861 Fourteen Southern states secede from the United States, marking the onset of the Civil War

Abeyance

Abeyance depicts a holding pattern in which a social movement manages to sustain itself and mount a challenge to authorities in a hostile political and cultural environment, thereby providing continuity from one stage of mobilization to another. Abeyance carries with it the connotation of movement decline, failure, and demobilization relative to peaks of mobilization. When a movement declines, it does not necessarily disappear. Rather, pockets of movement activity may continue to exist and can serve as starting points of a new cycle of the same or a new movement at a later point in time. During periods of abeyance, movements sustain themselves but develop distinct repertoires of contention that are different from the mobilizing structures and tactical repertoires of movements in a stage of mass mobilization. A social movement in abeyance may provide linkages to new rounds of mobilization through activist networks, an established repertoire of goals and tactics, and by constructing a collective identity that can serve as a symbolic resource for subsequent mobilization.

Verta Taylor (1989) introduced the abeyance formulation to understand the persistence of the American women’s movement. The concept of abeyance questioned the orthodoxy that the US women’s movement mobilized through two intense waves of protest and died in the interim, calling into question the prevailing view that movements have “births” and “deaths.” Factors that contribute to abeyance are both structural and cultural, as well as external and internal to a movement. Shifting political, cultural, and institutionalized environments lead social movement organizations and activist networks to change their repertoires of contention when a movement is in abeyance. Internal factors that promote movement abeyance are longevity of attachment to movement organizations, intense levels of individual commitment to movement goals and tactics, exclusiveness in terms of membership, centralization that ensures organizational stability and sustained action among a small cadre of highly committed activists, and a rich political culture that promotes solidarity, oppositional consciousness, and continued involvement in the movement. Externally, a lack of status opportunities for integrating intensely committed activists into the mainstream once a movement recedes creates conditions for abeyance. Abeyance structures, in turn, promote movement continuity by sustaining organizational remnants or “holdovers” of a protest wave that provide a resource infrastructure from which a new protest wave may emerge in a different political environment.

Rupp and Taylor’s initial work on abeyance focused on a scaled-down period of women’s movement activity in the United States in the 1950s and the 1960s when feminist organizations and activists retreated from protest and political engagement. Taylor and her collaborators (Taylor & Whittier 1992; Taylor & Rupp 1993; Taylor & Whittier 1997) subsequently examined the abeyance structures that sustained the women’s movement since the 1980s, arguing that the movement had become more decentralized, polycentric, and reticulate than ever before in order to survive a decline in recruitment and a political environment unresponsive to feminist claims. Sawyers and Meyer (1999) contend that abeyance brought about the absence of the women’s movement from policy domains, the polarization of its institutionalized and radical branches, and a shift toward cultural activities and alternative institutions away from political activities. Others argue that the culture of a social movement, including its collective emotions, beliefs, and rituals sustains organizational membership and enhances the abeyance function (Staggenborg & Taylor 2005).
The abeyance formulation has been used to examine the state of women’s movements in a wide range of developed democracies, including Australia, Canada, Japan, New Zealand, the United Kingdom, South Korea, and the United States (Bagguley 2002; Grey & Sawyer 2008). In most countries, women’s movements peaked in two cycles of protest but have persisted in a different form since the second wave of feminist protest ended in the 1970s. Cross-national and comparative research has led to a more developed model of abeyance by illuminating the variety of abeyance structures in addition to formal organizations through which movements sustain themselves during periods of quiescence.

The concept of abeyance has been influential in reorienting scholars away from a preoccupation with the emergence of movements to an understanding of movements as developing in cycles or waves of mobilization. Abeyance has been used to examine the survival and continuity of a wide variety of movements (Kendrick 2000; Holland & Cable 2002; Isaac & Christiansen 2002; Almeida 2003; Rojas 2007). The abeyance formulation challenges social movement scholars not only to consider the organizational, network, and ideological bridges that connect different phases of mobilization, but also to expand analyses of social movement outcomes beyond a narrow focus on short-term gains.

Activism is, in many ways, the most important activity undertaken by social and political movements. In short, activism is the action that movements undertake in order to challenge some existing element of the social or political system and so help fulfill movements’ aims. Thus, activism includes a wide range of different actions, from participating in a forum to sabotaging property. Not only does activism vary according to the type of action chosen, but also depending upon the target or targets, which could be local citizens, corporations, local or national governments, international financial institutions, the capitalist system, and so on.

In general, scholars have distinguished between two main types of activism: the conventional and the unconventional. Conventional activism is related to party politics, and so involves standing for, working with, or belonging to a political party, or contacting a party official. Unconventional activism includes all other forms of political activity in which movements engage, including petitions, boycotts, marches, and even sabotage. However, this simple distinction between conventional and unconventional activism is now rather worn for a number of reasons. Firstly, the distinction has, historically at least, implied that unconventional forms of protest were irrational and disrespectful of the political order. For example, some early movement theorizing (such as Gurr 1970 and Kornhauser 1965) branded it as irrational spontaneous outbreaks fueled by frustration and aggression, contrasting with the respectable and rational realm of party politics. We have now seen a shift toward (at least some forms of) unconventional activism being regarded as rational and useful contributors to democracy and citizenship (e.g., Stoker et al. 2010).

Secondly, Norris (2007) argues that many forms of activism traditionally considered to have been unconventional, such as demonstrations and boycotts, have now become so common that it is wrong to label them “unconventional.” She illustrates this argument with data from the World Values Survey (WVS), which shows that in Western democracies, around 40 percent of the population have, at some point in their lives, participated in activism. However, the WVS tends to overestimate the popularity of activism by asking respondents whether they have ever engaged in it. The European Social Survey, which asks whether respondents have participated in a legal demonstration in the last 12 months, reveals a more accurate picture and reports much lower levels of activism. In 2005, only 2 percent of UK respondents claimed to have participated in a legal demonstration.

Despite this small glitch in Norris’s argument, it is certainly the case that there is a distinction to be made between the conventional-unconventional, such as legally approved and relatively contained protest marches, and the unconventional-unconventional, such as attacks on property or illegal international economic summit disruption. There are so many different types of nonconventional activism that it does not make sense to lump them all together in one category. Further distinction is also required not least because the category of conventional activism incorporates a much smaller range of activities than does unconventional activism. In a cross-European study of environmental activism, Rootes and colleagues (2003) resolved the conventional/nonconventional dichotomy by distinguishing between five different types of activism: conventional, demonstrative, confrontational, property damage, and violence. Demonstrative activism included rallies and marches, confrontational activism included blockades and sit-ins, property damage covered acts of...
ecotage (sabotage to protect the environment), and violence involved violence toward another human being.

A different, but equally compelling, distinction between types of activism comes from McAdam (1986) who distinguishes between high risk and cost and low risk and cost activism. High risk activism has anticipated dangers, perhaps arrest or personal injury (such as illegally blockading a nuclear weapons base) and high cost activism involves commitment of time, energy, and resources (such as running as a candidate in government elections). In contrast, low risk activism has few dangers and low cost activism takes little time or resources. The signing of a petition or voting for a political party would be good examples of low risk and cost activism.

More recently published literature on activism has begun to discuss forms of activism not explicitly covered by either the Rootes and colleagues or McAdam schemas. These include transnational activism (Tarrow 2005), “cyber-activism” (Pickerell 2003), and prefigurative activism (Epstein 1993). Transnational activism involves organizations and activists working together across different countries to tackle a range of issues. It has come to the fore of academic attention since the “Battle of Seattle” demonstrations against the World Trade Organisation Ministerial in 1999. Cyber-activism ranges from the sending of online postcards to coordinating netstrikes (coordinated visits to servers with the aim of causing them to crash), and prefigurative activism involves taking the political personally—either by engaging in lifestyle changes and hoping they will spread, or trying to create ideal organizational practices within one’s own activist group.

Activism, then, is at the heart of everything that social and political movements do. There is such a diverse array of types of activism that the simple dichotomy between conventional and nonconventional activism is no longer very helpful in giving academics a handle on activism’s processes and forms.

Advocacy networks
EMANUELA BOZZINI

Advocacy networks consist of individuals and organizations “who are bound together by shared values, a common discourse and dense exchange of information and services” to defend the causes of others and/or advance a cause in the public interest (Keck & Sikkink 1998a). They organize around campaigns on issues related to a common good, or the defense of rights, and they are thus characterized by a centrality of principled beliefs, normative ideas, and values.

The emergence of advocacy networks has been understood in the context of structural changes in communication technologies, a rapid increase in contentious activities that has expanded the range of constituencies represented, and a shift toward the professionalization of activism. The concept is relevant to the analysis of local, national, and transnational contentious politics, although it has been most frequently employed by scholars working on transnational mobilization to signal the diffusion of ideas and activism beyond national borders. From an empirical point of view, research mainly focuses on transnational advocacy networks working on environmental issues (Dalton & Rohrschneider 2002), ethnic minorities, human rights, and women’s rights (Keck & Sikkink 1998b).

By stressing the centrality of principles, ideas, and discourses in mobilization and politics, the concept of advocacy networks is relevant to theories of social movements on the diffusion of frames, to the argumentative turn in public policy analysis (Fisher & Forrester 1993), and to the debate on the role of principles and norms in international relations. More specifically the concept of advocacy networks partially overlaps with epistemic communities – “networks of professionals with recognised expertise and competence in a particular domain and an authoritative claim to policy-relevant knowledge within that domain or issue area” (Haas 1992: 3) – in its emphasis on information politics. In the context of the literature on policy processes, advocacy network overlaps with the concept of advocacy coalitions, which comprise experts, activists, journalists, and concerned policymakers who share core policy beliefs, interests, and specific preferences on policy instruments (Sabatier & Jenkins 1993; Sabatier 1998). It is of note that actors in advocacy networks and coalitions may include policymakers, governmental agencies, and state actors, alongside nongovernmental organizations, local social movements, foundations and charities, and the media. This suggests that advocacy networks may be distinct from social movements, since they are ad hoc, contingent alliances among social and institutional actors and are not expected to develop forms of long-term collective identity (Diani & Bison 2004).

In terms of actions, advocacy networks employ a wide repertoire, from petitions to lobbying to mass demonstrations; research shows that conventional forms of claims-making predominate. Advocacy networks rely mainly on their ability to gather relevant information and knowledge and to use this strategically in different political venues. Scholars refer to concepts developed in the social movements literature to highlight how advocacy networks seek influence through the construction, alignment, and bridging of cognitive frames. They put issues on the public agenda by providing policymakers and the general public with timely information and by collecting nonexpert, local, and traditional forms of knowledge, as well as testimonies and stories that help draw popular attention to, and make sense of, complex issues. In so doing transnational advocacy networks empower domestic social movements organizations,
enhance their visibility and leverage in the global arena, and put external pressure on national governments. A similar dynamic has been observed at the EU level, where advocates target EU institutions with the aim of influencing national decision-making processes (Wessels 2004). Finally, in the context of the debate on new forms of democratic governance, networks of activists and experts are expected to promote social accountability by monitoring institutional performance and making relevant information accessible to citizens (Bovens 2007).

Age and social movements
OLIVIER FILLIEULE

FROM LIFE CYCLE TO LIFE-COURSE THEORIES

The notion of life cycle was first used in the social sciences in the 1930s and remained prominent until the end of the sixties in political behavior studies, despite its lack of empirical consistency. The basic idea is that stage-specific needs result in the adoption of particular political attitudes. Based largely on Freudian psychodynamic theory, the life cycle approach has mainly been interested in explaining adolescent rebellion (and, more rarely, the conservatism of the elderly) and attempted to attribute social protest in the sixties to young people’s life-cycle characteristics and needs, and to deep-seated emotional conflicts between youth and adults (Erikson 1968; Feuer 1969).

In a more structuro-functionalist perspective, life-cycle theory has given birth to a cohort-generational perspective, in which youth unrest is viewed as a product of a rapidly changing social order and unique growing-up experiences that exacerbate age-group relations, and may generate organized protest behaviors. However, contemporary research has found no clear diminution with age in the number of left-oriented attitudes nor any rush to conservatism more generally, as life cycle theories would suggest. Here, the main result is that social unrest is not causally linked to chronological age and that people do not seem to become more conservative with age (Glenn 1980; Binstock & Quadagno 2001).

If such an approach of the political effects of age still survives in some contemporary research, especially in psycho-sociology, it has now been superseded by the more powerful notion of life-course. The life-course refers to a sequence of age-graded events and social roles that are embedded in social structure and historical change. Political attitudes and preferences, interest and involvement in politics change over the adult life-span depending on one’s life experiences: primary socialization and reference groups, affective life, occupation, and the time in which the person lives. Such a perspective is directly in line with the lifelong openness model and the impressionable years models of socialization, which suggest that political behavior and attitudes have an approximately uniform potential for change at all ages, even if, because of the pile-up of role transitions, specific discontinuities occur most often in late adolescence and early adulthood (Sigel 1989; Visser & Krosnick 1998).

FROM CHRONOLOGICAL AGE TO SOCIAL AGE

In a life-course model, chronological age is a very imperfect indicator of the social roles individuals assume and the transitions they experience. As a matter of fact, not everybody does perform the same roles at the same age, because of their different structural location in terms of social class, status, and sex. Nor can we state that major events have the same effect on everyone who is of the same chronological age. For example, the military draft in France during the Algerian War of Independence affected young working class males very differently than it did university students or dropouts. As a result it is next to impossible to attribute political behavior and attitude changes exclusively to chronological age.

The focus here is on the sequence of roles associated with adult maturation and aging and the effects of the transition from one role to another. Hence the importance of taking into account, on one hand, the diversity of roles concerned in different “sub worlds” (Strauss 1959) and, on the other hand, the context...
in which these roles are differentially valued (Fillieule 2010). For example, disengagement and withdrawal from social involvement of the elders is certainly less a function of biological aging than of a loss of social responsibilities and meaningful roles, particularly in western societies where the most praised values are often youth-oriented.

However, in contemporary societies numerical age largely contributes to defining status and social roles (e.g., schooling, entry into and exit out of work, military service), even if in recent decades the boundaries between ages have blurred and new age categories have appeared such as the “young-old” or the “Third Age.” This is why it is not surprising that forms and intensity of political participation are correlated with (and not caused by) age variation. That is why conventional political participation follows a curvilinear path, with young adults the least involved and the middle-aged the most, older people tending to disengage progressively from civic life. So called nonconventional political participation follows a slightly different pattern with young adults being more prone to protest politics than the middle-aged and the aged being strongly disengaged. To take into account these different changes due to role transition at each age, one usually distinguishes three periods: young adulthood (usually 15 to 25), middle age, and old age (60 or 65 and over).

Young adulthood has been particularly singled out for attention. The unrest of the 1960s generation, and more generally the strength of youth movements, spawned interest in the politics of the 15–25 year olds. Questions were asked concerning their alleged idealism (Flacks 1971), their lack of commitment or their alienation (Keniston 1971), their general attachment to the political system and their post-materialism. Literature offers sociological explanations for the higher readiness of young adults to participate in social movements, such as the notion of “biographical availability” (McAdam 1989). However, a closer look reveals that direct political participation during periods of social unrest concerned primarily certain campuses and specific communities, without striking a responsive chord among young people in general, even being opposed by some youths. As a whole, it seems that the most common picture remains one of low involvement and a lack of trust in SMOs, as recent studies on the No Global movement tend to show (Sommer, Fillieule, & Agrikoliansky 2010; Teune 2010).

Old age, for obvious demographic reasons, has become the subject of many studies. Two main questions are addressed: First, the idea that as people age they hold more tenaciously to their views and are more resistant to change (Alwin 2002); and second, that older people’s attitudes are more stable than those of younger people (Krosnick & Alwin 1989). However, serious doubts have been cast on the notion that with old age comes political disengagement or growing conservatism on political issues. Moreover, one should note the emergence and development of interest groups for the aged, like the Townsend movement or the American Association of Retired People with its 24 million members, which automatically contribute to increasing occasions for mobilization and activism (Amenta 2008). Finally, recent work on age differences in learning and training, and on responses to major life transitions, provides evidence of the adaptability of older people to changes in social circumstances (Wang & Chen 2006).

Middle age certainly remains the least studied stage in terms of its link to politics. Are there specific age-related experiences unique to the various phases of middle age that might also give rise to political restructuring? For the most part, scholars have had little to say about political transformations during middle age. Exceptions include some research in the field of terrorism studies (Horgan 2009) and the feminist literature which has sought to reflect on the political implications of various stages in a woman’s life and relate macro structural changes to role changes (e.g., the lower fertility and higher longevity rates that make for a much prolonged empty-nest stage, which could have played a role in the growth of the women’s liberation movement in the last three decades).
CHALLENGES AND NEW DIRECTIONS

Literature on life-course and social movements is still a rather virgin territory. As such, more work needs to be done to build stronger theorizations and single out fundamental mechanisms. One can briefly point out three domains in which research should be developed in the future.

First, the task of linking early and later experiences in the life-course remains a challenge. Studies have traced the persistent effect of early events and experiences to subsequent outcomes, such as the effect of a teenage birth or military service, but the chain of linking mechanisms is largely understudied.

Second, interlocking trajectories, such as activism and work or family, or activism in one domain and activism in other domains, represent a basic distinction of life-course theory, but only recently have scholars attempted to fully articulate different life-spheres in a process model. This has occurred most commonly by using in-depth interviews and more rarely by having recourse to an increasing number of statistical techniques enabling researchers to assess this dynamic (Fillieule & Blanchard 2011).

Third, it seems that research has not been sensitive enough to national variations and subgroup variations (in terms of class, gender, and race), and how they may transform the relationship between chronological age and political outlook. In this respect, the development of intersectional perspectives in the field of social movement research pave the way for more fine-grained research.

Agents provocateurs
GARY T. MARX

When authorities or elites are challenged by a social movement, they may ignore it or respond with a variety of tools from cooptation to redirection to repression with many points in between. One extreme form of the latter is provocation. The idea of the agent provocateur entered popular consciousness in the nineteenth century as Europe experienced dislocation and conflicts associated with industrialization and urbanization. The concept initially referred to an activist secretly working with authorities who might provide information, sow suspicion and internal dissension, and/or provoke violent actions that would turn public opinion against a social movement and offer legal and moral grounds for its repression. The term has entered popular culture as the name of a lingerie brand and British electronica band.

There are many historical examples. Some of the most dramatic occurred in Russia where, lacking basic democratic rights, clandestine groups sought to overthrow the tsar. Police responded by infiltrating existing groups and, in a strategy that could backfire, creating their own. Roman Malinovsky, a highly paid agent of the Russian secret police (Okhrana), was an important Bolshevik leader. The English Cato Street conspiracy offers a classic case. Joseph Conrad’s novel The Secret Agent provides a fictional account. Social movements in the United States in the 1960s saw many examples of provocation, some in conformity with the FBI’s COINTELL program (Counter Intelligence) (Donner 1990; Cunningham 2005). A New York detective helped open and headed the Bronx chapter of the Black Panthers, and Malcolm X’s bodyguard, who tried to resuscitate him when he was shot, was an undercover police officer.

The phenomenon illustrates the often intricate interdependence between a social movement and its environment. While history and broad social structural variables create contexts of constraint and possibility, the daily events of a social movement and its career path are very much dependent on the contingencies of interaction within movements and between movements and authorities.

The topic fits within a number of areas of inquiry: social movement studies with an emphasis on the repression and facilitation of protest and the environmental engineering of behavior to preclude or direct behavior; the broader field of social control; criminal justice with an emphasis on undercover policing and legal restrictions; human rights protections and violations; and mass communication, censorship, surveillance, and public opinion.

Claims about agents provocateurs must be carefully assessed given the deception and secrecy surrounding the topic, and the vested interests of the parties involved (control agents do not wish to reveal operational tactics or behavior that might create bad public relations or harm a prosecution and activists generally have an interest in painting agents in a negative light). Yet, much is known about agents provocateurs as a result of government hearings and court records, first-person accounts from agents who publicly disavow their actions, leaks, Freedom of Information Act requests, archives, police training materials, and investigative journalists.

The classical image of the nineteenth-century European political or US labor union provocateur is today statistically atypical. In contemporary democratic societies, laws, policies, and the mass media are constraining and the more sophisticated control agents are aware of the challenges of controlling secret agents and the ever-present risks of backfire and blowback. Control in many ways has become more technical, mechanical, softer, diffuse, and less visible.

Yet specious activists have not disappeared. Following 9/11, national enforcement priorities
gave greater attention to terrorism than to traditional crime. Emphasis was placed on anticipatory control in which the goal is preventive rather than reactive after the fact. This requires information and budgets for more informants, and the number increased significantly. With this came a concomitant increase in opportunities and incentives for specious activism.

Social movements have much greater awareness of infiltration efforts and may take protective actions such as screening new members and even, as with the Black Panthers at one point, simply stop recruiting new members. It has even been suggested that movements use face-recognition technology to identify police, since police use this in crowd settings. The movement may engage in counterintelligence activities directed toward social control agents.

The reciprocal efforts of social movements to control those who wish to control them have rarely been studied. Rather than passive recipients, movements are better viewed as actors in a dynamic process. The playing fields are not level but new means of surveillance and communication such as the computer, cell phone, and video camera may help activists in defensive and offensive responses to social control efforts.

Contemporary movements, with a decentralized cell-like structure, and those based on tribal and religious affiliation (as is particularly the case in Africa and Asia), are more difficult to infiltrate than open mass movements with a more heterogeneous social base and universalistic ideology. Ironically the openness of democratic movements and their interest in broad communication with the public makes them vulnerable to infiltration and overt surveillance.

The provocateur is better seen as one extreme type of the much larger category of the faux activist. Such hidden-agenda activists are other than what they appear to be. They may engage in a wide variety of actions – from seeking to damage a social movement to helping it or redirecting it away from illegal actions (agents conformistes). At the level of abstract analysis a distinction must be made between the active participant (whether in legal and/or illegal behavior) and the more passive, observing bystander merely relaying information. However, given the need to establish their legitimacy and to learn anything in depth, it is difficult for a faux activist to simply remain an observer.

Faux activists may work for national or local police or the military, domestic or foreign governments, private interest groups, or rival social movements (whether those on the same side or those with opposing goals). They may work as freelancers such as investigative journalists, social scientists, and as individuals on an ideological mission or hoping to peddle what they discover. In recent years there appears to have been a significant increase in the use of faux activists by private corporations responding to challenges from globalization, environmental, antinuclear, and animal rights movements (Lubbers 2012). There are also new hybrid forms blurring the line between state and private control organizations.

However large the number of activists formally in specious roles, a far greater number of persons on the fringes or in the immediate environment of the movement (such as a bartender at a tavern favored by activists) serve as unofficial informants in the hip pockets of authorities passing on information.

Among other differentiating factors are whether the agent is a sworn police or military agent or a civilian (the most common form), whether they infiltrated a group or were recruited after being a member and then were pressured or came forward voluntarily, and type of motivation. Determining motives can be challenging – they are varied, may change over time, and the same behavior, such as encouraging militant action, can result from different motives.

Among the most common individual motivations for the police is that being an informant is sometimes simply a part of a police officer’s job. For non-police a distinction can be made between involuntary and voluntary participation. Common motivations for the former include coercive pressure, such as to avoid
prosecution or to gain a reduced sentence or help a family member, and for the latter, financial or other rewards, a counter ideology, or at least belief that a group poses a dangerous threat, disenchantment and/or personal reasons on the part of those who began as activists, and seeking strategic advantage for a competing or opposing movement or interest group. Less frequently, a committed activist may nonetheless cooperate with authorities as a form of self-protection, or in an effort to affect the knowledge and behavior of control agents.

Motivations and allegiances can be exquisitely complex and fluid, as the case of double and triple agents suggests. Consider the case of the legendary Russian Yevno Azef. He was a police agent for 15 years, five of which were spent as head of the most notorious terrorist organization in the pre-Soviet period. He betrayed many of his colleagues, but also arranged numerous assassinations, including the minister of the interior (his employer) and an attempt on the life of the tsar.

When activists are arrested for serious violations and a specious activist is identified, the defense may claim that those charged were entrapped – with the idea and resources for the action coming from the government agent. The prosecution will counter claim that the agent was passive, simply going along with the intentions of those arrested. New surveillance tools that generate a record, such as video and audio-taping and web and cell phone use, may be used to bolster authorities’ cases. However, such data can be ambiguous and require interpretation. However clear the image and sound, they will not reveal interaction that was not recorded, which might change the meaning of what was documented (e.g., the possibility that an activist was initially resistant to, or ambivalent about, an illegal action or threat made to the activist if he or she does not go along with a plan).

The secrecy of the setting can make it difficult to manage agents and to know if they are being truthful. They may have organizational, career, or ideological incentives to exaggerate the threat posed by a movement and to play a provocative role, and infrequently they make take on the role of the double agent. Whether intended or unintended, they may create what they were charged with controlling.

In democratic settings with basic civil liberties, the need to sustain the veneer of legality and legitimacy among citizens can be conducive to reliance on hidden trickery and strategic disruption of an organization’s ability to function. This can involve manipulating activists (particularly leaders) into illegal actions so they can be arrested – requiring that resources go to defensive needs and away from the pursuit of the broader goals; disrupting the flow of resources such as money and spaces to organize; creating paranoia and suspiciousness and harming morale and solidarity by creating the myth of surveillance which implies that watching is omnipresent (with respect to the student movement, a 1970 FBI memo, for example, encouraged creating the impression that “there is an FBI agent behind every mailbox”); spreading disinformation; encouraging internal schisms and external conflicts with other organizations; and inhibiting or sabotaging planned actions and communication. In settings where there are no protections for freedom of speech and association and with few limits on the state’s ability to search, detain, and use violence, activists may simply disappear or be locked away, without resort to the elaborate trickery and subterfuge seen in more democratic settings where law creates formal limits, particularly when cases come before the court.

There has sometimes been a curious overlap in the goals of authorities and activists with respect to daring acts, the former viewing provocation as a means of repression and the latter as a way of raising public consciousness. In a risky strategy some social movements have welcomed repression in the hope that it would raise public awareness and sympathy, create martyrs, and reveal the brutal face of the regime. There is little systematic research on the impact of such agents. Given the vast differences in historical periods and contexts, little can be concluded other than to note
a range of possible impacts and the ways in which they may vary depending on the time period. In establishing credibility and seeking to rise within an organization, agents can offer needed energy and resources. Trotsky was not much worried about agents, believing that they helped much more than they hurt. However, in conjunction with a broader array of control means, as Starr, Fernandez, and Scholl (2011) show for the antiglobalization organizations, movements in democratic societies may also be seriously impaired by such actions.

Alienation and social movements
LAUREN LANGMAN and DEVORAH KALEKIN-FISHMAN

Domination, inequality, injustice, and tyranny have existed since the dawn of recorded history. But with capitalism, based on wage labor, alienation became an inherent aspect of society. And while on the one hand, workers were rendered powerless, at the same time, forces were set in motion to overcome alienation in that modern capitalism might foster revolutionary worker’s movements. History has given little support to Marx’s theory of revolutionary movements. Working-class revolutions generally failed, even the Paris Commune was short lived. The “successful” socialist revolutions were peasant revolutions such as in Russia or China, or anticolonial, peasant movements framed in Marxist rhetoric such those in as Cuba, Angola, or Vietnam. Nor did that theory specify the actual process by which grievances or strains foster recruitment into movements, leaders emerged, how issues become framed, what led to the “success” of movements, and the means by which mobilizations foster change.

Notwithstanding the actual history of Marxist revolutions, considerations of alienation provide us with important insights about social movements and mobilizations. Thus as we shall argue, following Castells (2000), while there may no longer be a Winter Palace to storm, the concept of alienation can help us understand some contemporary social movements and clarify issues such as recruitment into social movements, the motivations of the actors, and the dynamics of social movements, especially framing, articulating visions, and mobilizing action.

The concept of alienation harkens back to Roman commercial law, early psychiatry, and the Hegelian philosophy that influenced Marx. For Marx (1959), alienation was rooted in the structural conditions of capitalist society in which capitalists owned the means of production and goods produced for markets depended on the wage labor paid to workers. Workers neither owned nor controlled their tools and the products of their work. That in turn fostered alienation, objectification, and estrangement. The worker became powerless, she was controlled by external forces. She became an object in which her humanity was not recognized – she was more like a pack animal than a human being. She became more isolated, estranged from her community; at the same time she became estranged from her “natural” human potential, her “species being,” her life was devoid of any meaning beyond survival. Marx’s writings on alienation did not appear until the 1920s. They would have a major impact on the Frankfurt School which saw alienation as disposing fascist mobilizations. After World War II, the alienation of capitalist society was seen in mass society, consumerism, and “one dimensional thought” (Marcuse 1964). Some sociologists explored the role of alienation and work organizations (Blau 1964).

A number of sociologists attempted to operationalize alienation as a social psychological cluster of powerlessness, meaninglessness, normlessness, isolation, and self-estrangement (Srole 1956; Seeman 1959; Dean 1961); aspects of the social structure were conceptualized as individual attitudes. Alienation was measured by scale items purporting to feelings and attitudes that were then correlated with job satisfaction, sexual satisfaction, political apathy or activism, and/or drug addiction. Many critics, however, have argued that alienation
is the condition of the worker, or perhaps consumer, in capitalist society and not a matter of her personal feelings. Whether or not these individual differences could be related to the larger social structure was hotly debated. Meanwhile, various Marxist and neo-Marxist writings on alienation of the 1960s and 1970s tended largely to be philosophical critiques of the concept. While such writings were useful, the works of Mészáros (1970), Israel (1971), or Ollman (1976) said very little about social movements per se.

Since that time, most of the theory and research on alienation has taken three directions. First, there has been less interest in overall social/philosophical critiques of capitalism or the human condition and more concern with specific instances and manifestations. Second, the foci of alienation has shifted from factory labor to various other sites, ranging from malls and the domination of mass media, consumerism, the body, the ambiguous situations of immigrant populations, and everyday life. And third, there has been more concern with the various means by which people seek to overcome alienation and/or seek realms and spaces apart from alienated conditions (Langman & Kalekin-Fishman 2006).

Just as society changes, so too do different social movements emerge or wane, and so too do the attempts to theorize these movements. By the late 1960s and early 1970s, with the winding down of the cold war and the eventual fall of the Soviet Union, with the ascent of postmodern/post-structural theories, sociological interests moved away from functionalisms, Marxisms, and neo-Marxist critiques. Frankfurt School theory then focused on crisis theory, civil society (the public sphere), and communication. For postmodern and post-structural theorists the primary concerns were semiotics, simulations, local knowledge, texts, discourses, and identities that might be fluid or inscribed by a gaze. At the same time, various social movements such as civil rights, anti-Vietnam mobilizations, feminism, gay rights ecology, and “identity politics” had moved from interests (labor, suffrage) to issues and identities. As college students and/or progressive activists organized and mobilized over civil rights, resource mobilization/political opportunity theories stressed the self-interested, rational behavior of actors, rather than their emotions, the importance of social movement entrepreneurs rather than structural strains, and finally the extent to which social or political movements might be encouraged, tolerated, or were violently repressed (McCarthy & Zald 1977; Tilly 1978; Tarrow 1998).

More specifically, in the United States, while the civil rights and/or student movements were seen through the lens of resource mobilization theories, the European social movements, such as opposition to Russian domination in communist countries, the Paris Spring, and even some separatist movements, gave rise to new social movement theories pioneered by Touraine (1981), Melucci (1989), and Castells (2000). The NSM theories placed greater emphasis on emotions, culture (meanings), and identities. It is not surprising that these theories could be traced to the Frankfurt School, especially its Freudo-Marxist analysis of the rise of fascism in which it was argued that alienated, authoritarian characters typical of the lower middle classes, facing social or economic crisis, were disposed to “escaping freedom” through self-subordination to charismatic leaders who articulated their anger, embodied toughness, and promised retribution to those responsible. More specifically, NSM theories suggested that the newer social movements were indeed responses to the nature of society in which certain actors, typically members of submerged social networks, felt alienated from their contemporaries and/or the nature of contemporary society, and sought to create and negotiate new forms of identity to transform society and its culture to foster a better kind of world

OVERCOMING ALIENATION: FOUR EXAMPLES OF MOBILIZATION

Given these observations, it can be argued that alienation, considered structurally, is present in
many other realms of modern society besides factory work. As Hochschild (1983) has shown, the emotional labor of service work, subjected to “feeling rules” established by corporations, can be just as alienating as the physical labor of production. The various kinds of dead-end jobs can be quite alienating. As Marcuse (1964) suggested, the one-dimensional thought fostered by consumerism and advanced by the mass media might lead to the same kinds of alienation that truncated the self, and rendered the person isolated and devoid of meaning. Moreover, while alienation may very well be a structural condition, its consequences may elicit various emotions ranging from loneliness to fear and anxiety, and even to anger and disgust. But the important point here, actually quite controversial, is that people may very well be alienated, but may not necessarily feel it and/or express discontent. Indeed many social critics have noted how mass consumption and/or mass media have fostered various types of “cheerful robots” (a.k.a. couch potatoes).

How do people cope with alienation? We suggest that people in diverse social locations, not necessarily class positions, may or may not have emotional reactions to various social conditions. In general, people seek amelioration and often seek support by repressing the recognition of adversity and/or seeking gratifications. They may seek various kinds of information, from media and/or social networks, proximate or virtual, that provide information and interpretations; such experiences may be shared. Various groups, with or without specific leaders, may then attempt to develop frames which explain adversity and suggest courses of action informed by a vision of what might be possible. Some suggestive illustrations follow.

**From punk to heavy metal**

In the late 1960s and early 1970s, as the initial effects of deindustrialization were becoming evident in the manufacturing centers of the United States and the United Kingdom, there was a decided shift in popular culture, especially the transformation of the counterculture. While rock 'n roll extolled love, peace, and of course drugs and sex, increasing numbers of young working-class men were no longer able to find well-paid factory jobs, there was more and more unemployment and/or underemployment and, in turn, alienation and anger at the prospects of downward mobility. This was articulated in the anger and self-destructive nihilism of punk music, as for example in the Sex Pistols, Clash, or Iggy Pop and the Stooges. But these cultural movements were not simply responses to economic factors, but to cultural issues as well, and signaled the quest for recognition of identities and frameworks of meaning. As many working-class men faced more dismal economic futures, punk began to morph into heavy metal with its loud chords and black leather that extolled a compensatory hyper-masculinity, which, at least at the level of fantasy, partly assuaged the realities of economic stagnation and alienation.

**The Tea Party**

Right-wing populism (and often fascism) has long been the political expression of an alienated petit bourgeoisie, resentful, if not fearful of economic changes that threaten their livelihoods and in turn their social position. In many cases, their fears also rest on cultural changes, which they see as moral threats that challenge their conservative religious beliefs and values (pro-choice, gay rights, and sexuality in general typically elicit anger, disgust, and “moral panics” – intense fears and anxieties that the moral order is being undermined). These economic and/or cultural stresses often foster anger that is typically directed at government and/or economic elites, who are perhaps seen as traitors, as well as the “dangerous classes” below. For many rural or suburban church-going, white, Christian Americans, the economic, social, and cultural changes of the last several decades have undermined their social position within American society. They have seen threats to their wallets, while banks and automakers are bailed out. They witness assaults upon their conservative values.
and identities as feminism, hedonism, sexuality, and even pornography have entered the mainstream culture. The growing numbers of immigrants and the rising status of African-Americans have fostered “status anxiety” and a sense of alienation and anger. Finally, for many such people, the election of Obama, the first African-American president – itself a legacy of the civil rights movements of the 1960s – was seen as “unnatural,” a violation of the “natural order,” and thus constituted a threat to white privilege that had been an essential ingredient of the identity of many conservative whites. These alienating conditions for some Americans, it has been argued, gave rise to various Tea Party mobilizations that played a major role in the Republican victories in the 2010 elections.

Democratic mobilizations

For many of the enlightenment philosophers, and indeed the early founders of sociology, history was seen in terms of a series of social changes. With the rise of modernity that extolled freedom, democracy, equality, and brotherhood, a variety of social movements emerged that have attempted to realize these goals. Ever since the English Civil War, or perhaps the American and French revolutions, we have seen a number of contentious social movements in which large numbers of people have attempted to overthrow despotic governments and establish democratic governments with popularly elected leaders. Such governments would support the equality of all citizens, guarantee social, political, and human rights. Such movements and political struggles have not always been successful. But one of the common denominators of such movements has been the mounting alienation of heretofore powerless publics that attempt to overcome those conditions and determine their own political agendas and select their own representatives. Such movements toward democratization that would overcome the alienation of political powerlessness continue to this very day. In the last few decades (1990–2011), there have been major political shifts throughout Latin America, Asia, and even more recent struggles in Iran, Tunisia, Yemen, and Egypt, followed by Israeli Summer and the Occupy Wall Street mobilizations, each in their own way being attempts to overcome political, economic, and/or cultural alienation.

Global justice mobilizations

Perhaps the most important movements of today, little noted in mainstream American media, have been the various progressive social justice movements growing in number and power; some may be local, others are national, and indeed many are global. Throughout the contemporary world, often more visible given the Internet, there are vast populations of alienated, marginal people who face domination, oppression, often genocide, poverty, hunger, and disease. While many long-standing NGOs from the Red Cross to UN agencies have provided aid to such groups, more recently, more and more people in privileged positions have become aware of the injustices associated with sweat shops, sex trafficking, paramilitary death squads, and the like. Given the rise and spread of the Internet, and the emergence of “virtual public spheres,” we are also witnessing the emergence of “internetworked social movements” such as transnational feminist movements, antiwar movements, and environmentalists. Such movements may draw from widely dispersed populations in which small numbers may periodically meet, but are nevertheless electronically connected with groups across the globe. The World Social Forum brings 150 000 social justice activists, NGOs, and SMOs together to share ideas, strategies, and visions. One common theme is that the move from alienation and victimhood to empowerment gives rise to the collective hope that “a better world is possible.”

CONCLUSION

The place of alienation in sociology has ebbed and flowed since Marx first used the term to critique wage labor and its alienating
consequences. On the one hand, alienation has often been dismissed as “political,” while similar concepts such as dehumanization/de-mystification (Weber) or anomie (Durkheim) were seen as more “objective” – that is, less likely to imply that capitalism must be overthrown. The concept of alienation informed the Frankfurt School scholars who were as critical of economistic/authoritarian socialism as they were of capitalism. Following World War II and the explosion of consumerism and mass media, especially television, the concept was used by many scholars to critique “mass society” with its conformity, its celebration of kitsch, and mass production of “cheerful” robots. But the consumerist moment of late capitalism created spaces for postmodern theories that rejected “grand narratives” like Marxism, located the self within a matrix of signification, and the notion of alienation receded from sociological theory and research. But as this was happening, the initial signs of globalization, namely import substitution, de-industrialization, and rusted factories, and in turn growing expressions of discontent, led to the demise of postmodern theories – at least in sociology. Given the impacts of globalization, wage stagnation or decline, growing inequality, environmental despoliation, and migrations, there has been renewed interest in alienation.

We suggest that as society has changed since the rise of industrial capitalism, so too has the concept of alienation been debated and its meanings revised. While wage labor remains an essential part of global production, so too do we suspect to find alienated labor in many of the services now typical of global capitalism. Moreover, many of the same adversities can be seen in consumerism, in nationalisms (especially their reactionary forms), and in various realms of culture and identity. In addition, we have attempted to argue that alienation, and/or the overcoming of alienation, plays a central role in contemporary social movements. More specifically, while we see alienation as a consequence of social arrangements or conditions, it itself has consequences that may cultivate various grievances and emotions that in turn foster susceptibility to certain kinds of leadership, predispositions to certain kinds of explanations, and either participation in various social movements, or apathy and withdrawal.

We are not suggesting a theory of social mobilization. Indeed various perspectives on resource mobilization, the framing of reality and visions of amelioration, and political opportunities have provided valuable insights. But we also find that the concerns of NSMs with culture, meaning, and identity, emotions and submerged social networks, and most of all, moral visions, are essential for understanding the who, how, why, and fate of social movements. The concept of alienation may not only illuminate various kinds of social movements, but it may also be a bridging concept that provides linkages and syntheses of different theories of social mobilization.

Altruism and social movements
FLORENCE PASSY

What is altruism? Since the 1990s scholars have agreed to define altruism as acts that seek to increase another’s welfare. Those acts are performed voluntarily without external constraints or coercion, with the intention of helping someone else, and without expecting any rewards (Simmons 1991). These are the four components of altruistic acts.

Until recently, altruism was highly challenged. The utilitarian paradigm could hardly make sense of altruistic behavior. Relying on its universalist and monist understanding of human motives, conceiving that any action is driven by self-interest, it dismissed altruism. Altruism was explained either by hidden private psychological benefits or by deferred benefits. In other words, altruism could not exist. However, research in biology (e.g., Boyd & Richerson 2005), psychology (e.g., Baston 1991), and sociology (e.g., Oliner & Oliner 1988; Monroe 1996) stressed that acts of altruism, without rewards, with the intention of increasing others’ welfare, do exist. interestingly, rational choice scholars in economics and psychology have recently conducted numerous experiments that also clearly emphasize that altruistic behavior exists, and is definitely not composed of marginal actions (e.g., Ostrom 2000). After many experiments, Frey and Meier affirmed that: “the canonical model of the self-interested payoff maximization actor is systematically violated” (2004: 11). All these studies concluded that altruism is about as frequent as selfishness. Thus altruism, this highly contested concept, should finally not be disregarded.

Doing good unto others and contributing to the provision of common goods are not synonymous concepts but they show similarities in two respects. Firstly, both types of action are public-spirited, society-oriented, pro-social acts. Altruism enhances others’ welfare. Acting to promote common goods – such as public education, health care for all, environmental protection – increases the supply of collective goods for the whole of society. Secondly, individuals contributing either to increasing others’ welfare or the welfare of a whole society could easily free ride. Actors engaged in altruistic acts do not receive any direct benefit from their action. They could let other individuals contribute to improving others’ welfare. In contrast, actors committed to the provision of common goods directly benefit from their public-spirited action since no individual is excluded from common goods. But here again, those actors could leave it to others to pay the costs of their action. The difficulty of acting on behalf of others as well as contributing to the common good was made famous by Olson’s paradox of collective action (1965) and Hardin’s tragedy of the commons (1968). Both concepts are of interest for scholars studying political and social movements.

DOES ALTRUISM RELATE TO SOCIAL MOVEMENTS AND CONTENTIOUS POLITICS?

Social movements and contentious politics bring to the fore (at least) two issues directly related to the concept of altruism. First, activists often mobilize on behalf of others. Mobilization in the antislavery movements in the nineteenth century, organizations defending migrants’ rights, associations promoting development aid, or human rights protests are good examples. Those contentions, labeled “distant issues movements” (Rucht 2000) or “political altruism” (Passy 2001), are not marginal protests. In addition, many protests

mobilize “conscience constituents” (McCarthy & Zald 1977), such as white students in the civil rights’ movement, or men in the women’s liberation movements. All these activists are not the direct beneficiaries of their political struggle.

Second, many protests are about the provision of common goods. Many collective actors and activists devote their political efforts to improving individual (or group) rights and welfare or to providing common goods to certain groups or the whole of society. Political struggles include protests for environmental protection or peace, against racism, or the emancipation of excluded minorities. As Mansbridge states: “How can human beings be induced to give their lives – even one minute of their lives – for their group?” (2001: 1). Following Mansbridge’s statement, we can add: “how can people mobilize to promote common goods for the whole of society?” Those people, weakly or strongly involved, could free ride and not collaborate in the provision of common goods.

Protest politics – of course not on all occasions, but not only occasionally, either – is about pro-social action. But what do we know about that behavior in the literature of social movements? Actually, very little. Altruism has been largely under-studied in our field. Scholars studying protests on behalf of others have not directly handled the question of altruism. Their studies focused on specific social mechanisms in order to better explain contention processes (e.g., diffusion, cultural factors), but they disregarded the others-directed-goals of the protests they analyzed. Other scholars raised the question of altruism but mainly to assess whether specific processes were at stake. Processes for joining altruistic contention do not differ from those for non-altruistic protest (Passy 2003). Similarly, Rucht (2000) finds structural resemblances between distant issues movements and other forms of protest. However, both studies leave aside the puzzling question of altruism: why do people protest on behalf of others? The wide range of studies examining contentious performances that enforce common goods do not raise the question of pro-social behavior, either. The question of why do some people mobilize for the provision of common goods remains unexplored.

ALTRUISM WILL DEEPEN OUR KNOWLEDGE OF SOCIAL MOVEMENTS AND CONTENTIOUS POLITICS

Dealing with questions of both altruism and the provision of common goods will enrich our knowledge, specifically by responding to the question of what motivates actors to act politically on behalf of others, and to produce common goods. This question induces us to open up the black box of activists’ motives. It invites scholars to go back to the question of “why” that has been disregarded in the literature of social movements. Why are some human beings prone to joining movements, to giving their lives for their group, or to providing common goods for the whole society? It also invites scholars to study more carefully what we have achieved until now on the subjective aspects that form part of the explanation of contentious politics. It is time to go inside the subjective world of protestors, to investigate activists’ points of view, their cognitive map, the lenses through which they see the world, and their adherence to certain political and moral convictions.

Studies on incentives actually stressed two interesting findings. First, they emphasized the plurality of motives leading actors to take part in contentious politics (e.g., Knoke 1988). This paralleled theoretical insights concerning individuals’ plurality (Sorber & Wilson 1998) and self’s plurality (Elser 2007). Second, and even more interesting for our purpose, those studies revealed that purposive incentives – that is incentives linked to a political issue – are the main motives for action (Knoke 1988). It is time now to investigate this black box of public-goods concerns.

For example, preliminary results on activists’ motives in mobilizing to defend migrants’
right reveal two interesting findings (Passy & Monsch 2009). First, those protestors do not set cognitive barriers between themselves and others. They have an extending self that links them to others, and which clearly distinguishes them from the rest of the population. This finding supports Monroe’s cognitive-perceptual theory that actors’ perception of self in relation to others defines actors’ capacity to act for others (Monroe 1996). Second, the study emphasizes that those activists have a clear consciousness of what are common goods and how to live in interconnection with others. Self-extension and a clear sense of common goods explain, in part, “why” some individuals are involved in social movements defending migrants’ rights.

To open up the black box of activists’ motives by examining why they are doing good unto others and why protestors are engaged in promoting common goods will also encourage us to examine how activists’ motives are constructed over time. We must analyze how people develop a concern for others and for common goods, and trace social mechanisms that favor pro-social concerns. Individual processes are at stake. Socialization, actors’ embeddedness in particular social networks favoring communicative processes, and daily life experiences are certainly factors that lead individuals to construct cognitions that favor pro-social commitment. But external factors also contribute to pro-social concerns. Organizational aspects develop and strengthen pro-social inclinations as Healy (2004) stressed in his study of the procurement of organs. Structural and cultural aspects also offer opportunities to sustain or increase pro-social inclinations (Koopmans et al. 2005).

We need more research on activists’ motives, and on how pro-social motives emerge and develop in order to deepen our understanding of contentious politics. We specifically need to grasp the social mechanisms at stake that favor altruism and a concern for common goods. After all, is it not those concerns that are at the core of social movements and contentious politics?

REFERENCES AND SUGGESTED READINGS

Anarchism refers to a tradition of social and political thought that in the 1860s emerged as an organized political force. Since then, anarchism has inspired protests, organizations, and movements, mainly in Europe, Russia, and the Americas, but also in other parts of the world. While it may be difficult to talk of “one” anarchist movement, a distinct anarchist current within the history of the labor movement can be identified as well as anarchist tendencies and groups within other social movements. The term “anarchy” comes from the Greek *an-arkhos*, meaning “without a leader or ruler.” It was first used in a positive sense, being identified as the ideal form of government, in Pierre-Joseph Proudhon’s (1809–1865) *What Is Property?* (1840). Proudhon, Mikhail Bakunin (1814–1876), and Pyotr Kropotkin (1842–1921) pioneered a broad tradition which has developed in a variety of forms. These range from varying interpretations of how to organize society in economic terms to the more basic distinction between social anarchism and currents farther removed from collective action (e.g., philosophical, individualist, and spiritual anarchism), as well as more specific variations around forms of organization, of action, and the use of violence. In spite of this rich variety, anarchism can be identified by its strong commitment to individual freedom and sovereignty; the opposition to any form of oppression, domination, and authority; the promotion of voluntary, decentralized, and non-hierarchical associations; and the use of forms of direct action that prefigure a freer society with more solidarity and respect for individual self-government.

**PROBLEMS, TARGETS, AND GOALS**

Historically, anarchists have seen the state as the origin of social problems, a form of centralized, hierarchical social organization which monopolizes violence to exploit workers for the benefit of the bureaucracy and the ruling elite. The state maintains a cruel prison system and requires individuals to fight each other in wars that serve only “the protection or aggrandizement of the state itself” (Miller 1984: 7). The state is seen as a solution worse than the problem of violence that it supposedly wants to eliminate, regardless of the form it may adopt, whether liberal or socialist. It produces authoritarian and self-preserving dynamics regardless of who runs it. Anarchists also challenge other institutional forms of authority and domination such as organized religion and the education system. Moreover, anarchists have attacked the state-regulated capitalism which prevails in the West as an oppressive and criminal economic system.

The responsibility for this corrupt state of affairs is seen as lying mainly with the representatives of the state and big capitalists but also with bureaucrats, the armed forces, police, and priests. Faced with a distinctive but heterogeneous body of enemies, anarchism has not focused on a single revolutionary subject, but rather on an equally heterogeneous social base consisting of industrial workers, peasants, professionals, disillusioned intellectuals, members of what Marx disparagingly called the *Lumpenproletariat* (city drop-outs, vagabonds, unemployed, and so on), and more recently by representatives of the middle class, students, and casual workers.

Anarchism does not stop, however, at identifying problems and their origins but also sets targets for collective efforts articulated in social and political terms. And yet, it is possible
to discern a tension between the defense of individual autonomy and the effectiveness of political action (Arvon 1979). The recognition of a human nature—a common element of modern political thought—led the major anarchist theorists of the nineteenth century to develop alternative economic models to satisfy the needs of humanity. These are the mutualism of Proudhon, Bakunin's collectivism, and the anarcho-communism of Kropotkin. Their influence can be seen well into the twentieth century. Nevertheless, criticisms of their essentialism and historical linearity, especially after 1945, led many anarchists to address specific policy problems by replacing the longing for total revolution with a more concrete “problem-solving” approach (White 2007).

**FORMS OF ORGANIZATION**

Anarchists deploy decentralization, transversal communication, committed but voluntary participation, and deliberative democracy as organizing principles. They search for consensus solutions instead of relying on the “majority rule” system and replace representatives with delegates or spokespersons. Anarchism’s heterogeneous social base has prevented them from using Marxist-style class-based organizations. Instead, anarchism has found its basic unit of organization in the affinity group; a voluntary group, usually consisting of five to ten members connected by personal relationships and a strong commitment to the same ideological principles. The group’s small size allows easy coordination for specific actions, even in the context of state repression. Although radically autonomous, the groups may act in collaboration with one another.

Gordon (2008) places the affinity groups at the micro level of anarchist organization along with “collectives” (a more permanent group with a small membership that may exist for an ongoing task). The meso level is formed by local networks, typically in one city, coordinating non-confrontational activities and contacts with other actors while serving as platforms from which affinity groups and collectives may emerge. Finally, at the macro level we find broader anarchist networks (regional, national, continental, and global) for communication and coordination but without formal membership or fixed boundaries. It must be remembered that this macro level describes contemporary anarchist organization practices, rather than those of the past, when affinity groups were coordinated by national federations, often territorially organizing themselves into local and sub-national federations. Nor should we forget the role of the anarchists in the trade unions. For many, the union represents a small, defined space for grassroots activism (as opposed to the vast structure of the state). Anarchism’s influence on revolutionary trade union activity has been far from insignificant, and anarcho-syndicalism is the name given to the branch of anarchism arising from it.

**FORMS OF ACTION**

The antistate attitude of anarchists has led them to reject participation in its institutions, whether through democratic parliamentarism or a Marxist strategy of conquest of the state. In fact, tactics based on program are thoroughly disapproved of as they involve the submission of the individual to some degree. Instead, anarchists use direct action; a specific intervention often carried out by individuals but sometimes by groups, aimed at changing reality in a desired direction without reference to the authorities. Historically, it has been used as a trade union tactic as it involves the absence of intermediaries in dealing with employers. Sabotage, boycott, and the strike produced immediate pressure, but were also intended to pave the way for a revolutionary general strike that would overcome the state and capitalism. Probably better known is another version of direct action which first appeared in the late 1870s; “propaganda by the deed,” defined as dramatic interventions in the form of violent attacks on property and persons in order to make a major impact on public opinion and denounce a situation of misery and exploitation. Although
only sporadically employed, it has contributed
to a negative image of anarchists as “bomb-
throwers,” down to the present day.

In any case, it is important to stress that the
use of violence is a minority trend within anar-
chism, strongly rejected by many activists who
have chosen instead to participate in construct-
ive projects, such as land-based agricultural
communes, decentralized “free schools” and
independent platforms for information and
communication. In terms of theory, violence
also contradicts the tactical principle of con-
sistency between means and ends. A second
such principle concerns spontaneity. Both date
back to Bakunin and his followers, who saw
the Workers International as the embryo of
a future society, and appealed to the sponta-
neous forces of life against the abstractions of
scientific socialism. Spontaneity and “prefigu-
rativeness” are not obsolete as they have
been renewed with the revival of direct action,
initially in protests in the late 1960s and, more
recently, in the mobilizations against neoliberal
globalization. Even though there is no shortage
of affinity groups describing themselves as van-
guard movements, it would be fairer to say that
anarchist action has arisen mostly from below,
through spontaneous initiatives that seek to
raise awareness of the existing and problematic
state of affairs and the need for change.

HISTORICAL FORMS AND RECENT
DEVELOPMENTS

Numerous ideas and experiences have fueled
 anarchism, the form it takes varies widely
from country to country, and its historical
development is rather discontinuous. Its ori-
gin can be located in the aftermath of the
French Revolution, when the principal mod-
eran ideologies took shape and crystallized, but
it did not become a distinctive social force
until the late 1860s with the rise of a Bakunin-
ist position in conflict with that of Marx and
his followers within the First International,
a largely anarchist-inspired body founded in
London in 1864 under the name of the Inter-
national Workingmen’s Association (IWA),
whose statutes were drawn up on the basis
of an initiative by Proudhon’s mutualists.

However, the victory of Marxist positions
led to the final expulsion of the anarchists from
the IWA in 1872. They again tried to influ-
ence the Second International (Paris, 1889) and
were expelled once more in 1896. Between the
First and Second International anarchists went
through a period of ostracism, accompanied
by unsuccessful attempts to organize a purely
anarchist international. The second expulsion
coincided with the rise of revolutionary trade
unionism and the massive influx of anarchists
into unions, especially in France. This was a
period of visibility marked by the influence of
trade unions independent of political parties
(Charter of Amiens, 1906) and an antimili-
tarist position (Congress of Amsterdam, 1907)
(Woodcock 1986).

The end of World War I and the triumph of
the Revolution of 1917 marked the beginning of
a new period of a certain visibility, in this case
dominated by the anarcho-syndicalists, who
re-founded the IWA (Berlin, 1922). Among
the original member organizations, the most
important were those from Italy, Argentina,
Portugal, and Germany, soon joined by the
Spanish National Labor Confederation (CNT).
The latter became the beacon of international
 anarchism in the 1930s. During the early stages
of the Spanish Civil War (1936–1939), its
membership reached almost two million and
it engaged in the organization of a social
revolution in the form of industrial and agrar-
ian collectivization; the only experience of
a revolutionary anarchist society except the
ephemeral federated commune system built
in Ukraine in 1921. Both were dismantled by
state troops, by the Red Army in the case of
Ukraine and the Republican Army in Spain in
1937.

After 1945, anarchism failed to regain its
influence within the labor movement, but cer-
tainly did not disappear. In postwar Europe
and America, transnational networks opposed
the division of the world into two imperialist
blocs. Some intellectuals (e.g., Herbert Read,
Paul Goodman, Albert Camus, Daniel Guérin)
contributed to new ideas through dialogue and confrontation with socialism and liberalism. New protest movements (the Dutch Provos, Situationists, and the New Left) linked to the anarchist tradition while exploring opportunities for emancipation outside the world of work. Following the 1968 protests, anarchist tendencies developed within new social movements. For example, a new wave of anarcho-feminists linked their radical critique of everyday life to past historical activists and organizations, such as Emma Goldman (1869–1940) and the Spanish Mujeres Libres (created in 1937). Also, new anarchist theory influenced the development of new social movements, for example, Murray Bookchin’s (1921–2006) philosophy of “social ecology” in the environmental movement. More recently, anarchism has come to the fore with the Global Justice Movement, in part thanks to the popularity of a supposedly anarchist “black block” that uses confrontational and sometimes violent direct action in counter-summits. In any case, and despite the fact that many antiglobalization activists do not self-identify as anarchist, or do so as part of a multiple identity, their interest in nonviolent direct action, transversal forms of organization and communication, respect for internal diversity, and deliberative and participatory democracy has opened new opportunities for the renewal of anarchism in the twenty-first century.

Artistic currents and milieus and social movements
LILIAN MATHIEU and JUSTYNE BALASINSKI

ART AND PROTEST: SIMILAR BUT DIFFERENT FIELDS

Artistic currents and social protest have long been intertwined. One of the most paradigmatic examples of similarities and proximities between those fields is surrealism. It appeared in the early 1920s as a movement, as it gathered on a collective basis various artists (poets, painters, filmmakers, carvers, photographers, etc.) who shared the same aesthetic principles. Those principles were expressed in manifestos that had been written by a charismatic leader, André Breton, whose authoritative methods led to repeated internal challenges, exclusions, and secessions. Like protesters who seek change to the social or political structure, the surrealists sought for a regeneration of the aesthetic norms of their time. Posing as an artistic vanguard, they violently challenged the dominant artistic forms of academism using provocation, scandal, and disruption. But the surrealists did not restrict their criticism to the world of aesthetics; they also set out to challenge the political order by joining the communist movement and by participating in various mobilizations, for example, against colonial wars. Other artistic movements – such as Cobra or Situationism – have adopted the same form of a collective vanguard that intends to challenge both the aesthetic values and the political order.

Similarities between artistic and social movements have seldom been explored by analysts. This is all the more intriguing since studies of contentious politics often use artistic metaphors. Charles Tilly’s well-known concept of the repertoire of collective action refers to Commedia dell’arte and to jazz in order to stress that there is always some improvisation in the way challengers mobilize established ways of protesting, and he defined it in his last works as performances – a word that also designates happenings (often with a disruptive dimension) that are widely used in modern arts. These references to artistic production in describing contentious action have also been used in Jasper’s book, The Art of Moral Protest (1997), in which he insists on creativity and culture in contention.

Although they have much in common, art and protest are not the same thing. Reed refers to Bourdieu’s theory of the power and cultural fields to stress that the “logic of politics and the logic of aesthetic objects seldom, if ever, perfectly coincide,” and that “the field of power never exhausts the meaning of the work of art, and political meanings are always also in excess of aesthetic ones on their own terms” (2005: 303). Recognizing that the art world and the social movement sector form two different fields helps us understand the complex relations between art and contention (Balasinski & Mathieu 2006). These include artists’ commitment to movements, mobilization of arts in protest, and the way social movements produce cultural change.

ARTISTS’ COMMITMENT TO MOVEMENTS

The mobilizations of artists take a particular form when social movements appear within the art worlds. As any other worker and professional, an artist may join social movement organizations and unions in order to protect his or her professional interests, and sometimes mobilize in order to obtain better wages or working conditions; this was the case when thousands of US film, television, and radio writers joined in the 2007 strike, forcing some TV shows and series to stop. Artists also have
to mobilize in order to protect their creative freedom when the circulation of their works is threatened by censorship. This is the case in authoritative regimes around the world, and was especially so in Eastern and Central Europe under the Soviet regime (Glenn 1999; Balasinski & Mathieu 2006: ch. 4). Artists also mobilize when political elites attempt to control and define the arts, or when moral crusade entrepreneurs use judicial or disruptive means to preclude the circulation of aesthetic works they consider as outrageous and offending.

But the main figure is the committed artist, who is a traditional companion of social movements. Good examples are Bob Dylan and Joan Baez, who participated in the US civil rights movement, and more recently Sean Penn who showed his commitment against the US-lead war in Iraq. Artists can support movements by creating songs, poems, movies, or paintings that express the movements’ grievances in an aesthetic form, by providing them financial resources, by conferring on them the legitimacy and visibility of their fame, or by becoming public spokespersons for the cause. As such, a well-known artist’s support can be an important material and/or symbolic resource for a movement.

But an artist’s participation in social movements does not always happen without tensions and mutual misunderstandings. It may, at times, create more costs than benefits for the cause. Meyer and Gamson (1995) have listed some of the difficulties movements face when artists (or more commonly celebrities) join a cause. A well-known artist’s participation can help attract media attention, but it also carries the risk of overshadowing a movement, causing it to lose control of its self-definition and of its framing of the issue. In this view, an artist’s support can produce a “softening effect” on a movement. For example, in order to avoid disapprobation from an audience that does not share his or her political interests, an artist may choose to support consensual claims rather than more disruptive strategies. An artist’s commitment can also be viewed as superficial and insincere, designed to maintain personal fame and celebrity at the movement’s expense. If an artist has to be careful about the legitimacy of the cause, a movement’s credibility will also depend on how famous (or obscure or tacky) the artist is who accepts to support them. From a sociological point of view, understanding why and how an artist joins a movement requires knowing his or her position within the cultural field, because an artist’s professional identity will structure his or her political commitments just as much as occupational logics will shape the available forms of action (Roussel 2007).

ART AS A RESOURCE FOR PROTEST

Art itself is one of the various resources social movements use to mobilize: many movements use arts, and some even produce works of art themselves, as a strategy in its own right. Movements such as these often use art in order to gather material resources. The selling of art works that artists have produced specifically for the cause is a typical way to raise funds. “Band Aid” and “We are the World” concerts and records (Reed 2005), that gathered many pop stars in the mid-1980s in a mobilization against famine in Africa, are good examples of such popular fundraising operations. But money is not their sole raison d’être, as they also aim at raising consciousness amongst their public, and at recruiting new adherents and sympathizers. Following Olson, these artistic works can be seen as aesthetic selective incentives designed to sensitize and mobilize people. Often those who were at first attracted by the pleasure to listen to their favorite pop stars became supportive of the cause.

Taking this view, the nature and the content of an art work are closely related to its mobilizing potential. Art is a powerful vehicle for movement framing. It expresses grievances and appeals for mobilization in a symbolic and emotional language that may be more sensitizing and convincing than pure activist rhetoric. More widely, as stressed by Adams, “it is not just at a cognitive, intellectual level
that art mobilizes protest . . . Song and other art forms help to recruit individuals into a specific movement because they provide reassuring emotional messages . . . tap into the spirituality of potential recruits and activists . . . reinforce the value structure of individuals who are active supporters of social movements . . . and provide a renewed feeling that social and political change is possible” (Adams 2002: 27).

Adam’s own study of Chilean *arpilleras*—pictures in cloth depicting repression during the Pinochet regime that were sold in support to shantytown women who made them—stresses that movements produce art even if they do not count professional artists within their ranks. In some cases, the activist becomes an artist, and protest action becomes art work or performance. ACT UP, initiated by playwright Larry Kramer, dramatizes public actions that rely extensively on theatrical staging in order to express anger. ACT UP activists use sophisticated clothing, chants, and slogans to produce the group’s particular public image that enable it to draw media attention (Reed 2005). ACT UP benefited from the commitment of professional artists within its ranks (like the graphic collective Gran Fury that created its pink triangle image), but most social movements rely on their members’ amateur artistic skills to stage their public actions. Ordinary demonstrations often include poetic slogans, parody songs, painted banners, and disguise by which activists can express their own aesthetic.

**PROTEST, ART, AND CULTURAL CHANGE**

Art is not only a way for movements to communicate information toward a public they want to sensitize to their cause. Artistic expression within a movement can strengthen identity and cohesion, especially as a way to nurture movement ideology. It can help sustain personal commitment and reinforce mobilization potential within its constituency. Artistic events such as feminist music festivals (Staggenborg, Eder, & Sudderth 1993–1994) or punk concerts (Moore & Roberts 2009) gather movement activists and sympathizers for a short time, during which they can share experience and from which they leave with a greater sense of validation and internal power. Even if political mobilization is not their first motivation, they “create social networks and strengthen communities, which can be drawn upon as the organizational basis for movement action” (Staggenborg, Eder, & Sudderth 1993–1994: 44). Taking this view, art must not be seen as an alternative to politics, since both are so closely intertwined.

The idea that social movements produce not only political but also cultural change has been further developed by Eyerman and Jamison (1998). They argue for an enlarged perspective on social movements, and do not restrict their analysis to ideologies, strategies, and organizations. On the contrary, they consider social movements as clusters for cultural renewal. They cite as their main example the US civil rights movement, which provided a space for musical expression and creativity. In particular, it rejuvenated traditional slaves’ and workers’ songs into protest anthems sung by popular folksingers. Indeed, its music is what remained after the movement faded away as a political force. Movements can rework cultural resources, give new meanings to older artistic works and challenge aesthetic conventions. They create their own cultural tradition that can itself have a major impact on larger popular culture and inspire further mobilizations.

Whether it is lowbrow or highbrow, art is a major component of protest: it provides material and symbolic resources, contributes to movement framing, mobilizes constituencies, sensitizes the broader public, and produces social change by renewing cultural traditions. By bringing back culture into the analysis, the study of the role of art in social movements contributes to enrich the knowledge of collective protest.

The accumulation of objects as an act or tactic of political protest makes its debut in history during the “Day of the Barricades” (Journée des barricades) of May 12, 1588. Cordonswere set up to protect Paris from social unrest and people barricaded themselves in, notably with hogheads (barriques). The same phenomenon plays itself out again on another “Day of Barricades” – August, 27 1648 – the first “Fronde” (insurrection) against the young Louis XIV (Descimon 1990). Subsequently, the practice of erecting barricades is not reported in France until the end of the French Revolution, during the days of Prairial year III (May 1795), when the French revolutionaries, who had exclusively used offensive tactics since 1789, deployed barricades as a defensive action.

It is during the nineteenth century that the barricade becomes, materially and symbolically, the representational staple of a Parisian revolutionary “journée.” From the first barricades of November 1827 to those of 1830, 1831, 1832, 1834, 1839 (very rapidly dismantled), and 1851 (shaky), to the very last fortified barricades of the Paris Commune, nineteenth-century street fighting was based upon a specific praxis and vision of social protest. The high point of this practice took place in 1848 when, from Palermo to Paris (February and June), to Berlin or Prague, the insurrection, although undergoing several reincarnations, presented shared traits uncontained by political environments and borders.

If it is easy today to sense the difference between a barricade, a highway blockade, a crossing gate, a checkpoint, an Israeli roadblock, or any other means used to impede or check circulation (by the official police or by rioters), but in the nineteenth century it proved difficult to define what a real barricade was.

The ideal description given by Blanqui in his Instructions pour une prise d’armes (Instruction for an insurrection) is both a criticism of past usages of the barricade and a manifestation of the obsessive character of the Blanquist way of thinking and preparing the revolution. Victor Hugo’s description, in Les Misérables, portrays a barricade that is improbably allegorized (Bouchet in Corbin & Mayeur 1997), while at the same time harking back to the actuality of its construction as an heteroclite accumulation of objects by which the people transform their misery into a barricade (Charles in Corbin & Mayeur 1997): “It was the collaboration of cobble-stones and rubble-stones, beams and iron bars, cloth, broken glass, burst chairs, cabbage cores, rags, tatters, malediction.”

According to Ross (1988), the barricade becomes the metaphor of Rimbaud’s poetic work. This new poetic is constructed, in the very literal sense of the term, like a handyman’s work, a barricade in which disparate objects are assembled. The barricade also becomes an object of pictorial art, notably in Delacroix’s “Liberty Leading the People” where, as in a well-thought-out allegory, the various characters of the popular insurrection are assembled.

In the nineteenth century, the barricade constitutes a known element of the repertory of riot (Traugott 1995). Habit, recourse to the familiar, practical, and symbolically possible, and apprehension of the show of force, all of these preferred forms of mobilization can be traced back to the barricade. The recourse to the familiar might also constitute, if not a desire to succeed, at least a type of suicidal behavior that, beyond postures and dramatizations, presents dying for one’s convictions or in the name of misery as a possibility or even as an ideal (Boudon in Corbin & Mayeur 1997) that is not a simple motto: just as was the case with the Canuts’ “to live working or to die fighting” of 1831 Lyons.

Barricade solidarity is first and foremost local. One stays in one place, even at the risk of ignoring what is happening in the immediate vicinity – “let’s each defend our position and we will be alright”; resources are found in situ – they are both material (notably cobble-stones, narrow streets, knowledge of the environment and of the line of fire) and human (interrelationships, solidarities), allowing for the deep-rootedness of the mobilization. This explains the extraordinary number of barricades erected during the major Parisian uprisings (a reported 4054 in July and 1512 in February 1848); their cartography corresponds to the militant workers’ quartiers (neighborhoods).

The mobilization fluctuates during the insurrection and, by persuasion or by force, the barricaders obtain the participation of the locals. Nonetheless, as proven by in-depth sociogeographic studies of nineteenth-century Parisians (Traugott 1995), the solidarity between the communities of each quartier is not the only mode of mobilization; during the whole century, workers frequently move within Paris to follow the large construction sites opened as an urbanistic response to the narrow-street fighting.

In 1898, echoing Victor Hugo, the front page of the newspaper Le Temps read: “Universal Suffrage Killed the Barricades.” Passions, recriminations, and interests were all focused on voting. The “Grand soir” had been a long-standing reachable objective for its partisans, who were now reformists “digested” by universal suffrage or who might have conceded that the revolution would not be proclaimed and that the disproportion between the two parties’ military resources had become too great; the National Guard, that militia at times numerous and popular, was disbanded after the Commune.

The Russian and the German insurgents of 1917–1918, the Spanish Civil War fighters, and the Parisian students rioting in May 1968 also erected barricades; so did the Mohawks in 1990, the Serbs and the Bosnians in 1992, and the Uzbeks and the Thais in 2010. But in those cases, the same word tells very different stories.

REFERENCES AND SUGGESTED READINGS
In the context of social activism, biographical availability refers to the “absence of personal constraints that may increase the costs and risks of movement participation, such as full-time employment, marriage, and family responsibilities” (McAdam 1986: 70). Individuals who have spouses, children, or less time-flexible occupations are expected to be less willing and likely to participate in collective action because familial and occupational commitments can reduce the amount of time and energy available for activism and increase the risks associated with it. Theoretically, biographical availability should be more significant in cases of costly or risky social activism, with costs referring to the time, money, and energy requirements of participation and risk referring to the anticipated dangers of participation, such as physical harm or social, financial, and legal repercussions (McAdam 1986). For example, while signing petitions does not involve significant time away from work or children, participating in protest events does, and because this activity could result in arrest, there is potentially an additional risk for those who are employed or who are primary caregivers of children.

Empirical studies have observed that age, marriage, parenthood, and employment—common proxies for biographical availability—have inconsistent effects on social activism. McAdam (1986) showed that while applicants to Mississippi Freedom Summer had much lower marriage and employment rates than the general population, participants were more likely to be older, married, or employed full-time than nonparticipants. In another case of high-cost/risk activism—the Sanctuary movement—Wiltfang and McAdam (1991) reported that age was negatively associated with costly activism, having children living at home was positively associated with risky activism, and marital status had no significant effects. Nepstad and Smith (1999) found that for applicants to volunteer in coffee harvest brigades in Nicaragua during the US Central America peace movement, those who eventually participated had the most demanding, least time-flexible occupations. Based on a nationally representative sample of US adults, Schussman and Soule (2005) found no significant effects for marriage or full-time employment on the probability of protest participation. However, they did observe that younger people were more likely to participate in protest and that, when accounting for other factors, parenthood decreased the probability of protest participation.

Across these studies, factors used to measure biographical availability increase participation in some cases, but have no effect or actually decrease participation in others. One possible explanation for the lack of consensus for biographical availability’s effects is that the impact of marital status, employment, children, and age on activism likely depends on broader factors. For instance, in societies where domestic work falls disproportionately on women, the time and energy constraints associated with marriage and children are expected to be greater for women than for men. In the United States, Beyerlein and Hipp (2006) demonstrated that while marriage significantly reduced protest willingness for women, this effect was not observed for men. Additionally, rather than being a barrier to participation, there are situations in which having children could be an asset. In the 2006 immigrant rights rallies, for example, teenagers used their English language skills and access to political information through schools and online media to inform and mobilize their parents (Bloemraad & Trost 2008). Lastly, while being employed might reduce the amount of time available to participate in collective action, these costs could
be offset by the skills and resources conducive to activism that workplaces often provide (Verba, Schlozman, & Brady 1995; Nepstad & Smith 1999).

Another way to clarify the role that biographical availability plays in social activism is to assess its effects at different stages of participation. For example, those who are married are less likely to be willing to protest than those who are single, as are those who are working relative to individuals in school, which removes the married and employed from the pool of potential protest participants (Beyerlein & Hipp 2006). Biographical availability can also influence activist recruitment; for example, younger adults are more likely to be asked to participate in protest (Schussman & Soule 2005), and people without countervailing social ties are more likely to accept recruiters’ invitations to get involved (Snow, Zurcher, & Ekland-Olson 1980).

In sum, the mixed empirical findings for the impact of biographical availability on activism suggests that it shapes the participation and mobilization process in complex ways. Further, biographical unavailability may not uniformly decrease participation, as apparent constraints may actually foster participation in some cases. To advance our understanding of the relationship between biographical availability and activism, it is important to identify and incorporate more of the contextual factors that affect this relationship. Moreover, because biographical availability has mainly been operationalized indirectly by age, marital status, employment, and parenthood, a fruitful direction for future research would be to develop and to test direct measures of this concept, such as free time, discretionary income, physical stamina, and the likelihood of job loss or disapproval from loved ones if social activism were pursued.

Biographical consequences of activism
MARCO GIUGNI

DEFINITIONAL ISSUES

Social and political movements have a wide range of effects. The biographical consequences of social movements are one of them. They can be defined as effects on the life-course of individuals who have participated in movement activities, effects that are at least in part due to involvement in those activities (see McAdam 1989; Goldstone & McAdam 2001; Giugni 2004 for reviews). Other types of effects include political and cultural outcomes. Political consequences are those effects of movement activities that alter in some way the movements’ political environment. Policy outcomes, a special category of political outcomes consisting of changes in legislation or other policy measures induced by social movements, are among the most often studied. Cultural outcomes are those effects of movement activities that alter in some way the movements’ cultural environment. They are perhaps the most difficult to study empirically as they are not easily identified, they depend on a wide range of other actors and events, and often they make themselves felt only in the long run. In addition, one can also imagine the existence of that which some have called spillover effects, that is, effects of movements on each other.

The study of the biographical consequences of activism crosses two major fields of investigation: (1) studies of life-course and the life-cycle and (2) work on processes of political socialization and participation. Focusing more specifically on scholarly work on the demographic and personal dimensions of contentious politics, Goldstone and McAdam (2001) have mapped the literature on demography, life-course, and contention, allowing us to better define our subject matter. They distinguish between four bodies of literature in this field depending on whether they thematically focus on movement emergence/development or decline/outcomes and whether they analytically focus on the macro or micro levels of analysis (see Table 1): (1) studies looking at the origin of contention from a macrosociological point of view; (2) studies looking at the biographical availability or other life-course factors that facilitate or prevent movement activism following a microsociological perspective; (3) studies analyzing contention as a force for aggregate change in life-course patterns at the macro level of analysis; and (4) studies focusing on the biographical consequences of individual activism at the micro level of analysis. Concerning our subject matter, this typology tells us that we should pay attention to two main types of consequences of activism: (1) the biographical consequences of individual activism and (2) the aggregate-level change in life-course patterns (see further McAdam 1999). While the former concerns the micro-level effects of sustained participation in social movements, the latter deals with the broader, macro-level consequences of activism.

THE STATE OF RESEARCH

Works on the biographical consequences of individual activism are much less numerous than the now quite substantial body of studies of the political and, more specifically, policy outcomes of social movements. In addition, a great deal of these studies have dealt with former activists of movements of the New Left in the United States, including participants in the civil rights movement (see Table 2). Works on Europe and on other movements are relatively scarce.

In general, these follow-up studies of New Left activists quite consistently point to a strong and durable impact on the political
and personal lives of activists. Specifically, on the one hand, they show that former activists had continued to espouse leftist political attitudes (e.g., Demerath, Marwell, & Aiken 1971; Fendrich & Tarleau 1973; Whalen & Flacks 1980; Marwell, Aiken, & Demerath 1987; McAdam 1989), had continued to define themselves as “liberal” or “radical” in political orientation (e.g., Fendrich & Tarleau 1973), and had remained active in contemporary movements or other forms of political activity (e.g., Fendrich & Krauss 1978; Jennings & Niemi 1981; Fendrich & Lovoy 1988; McAdam 1989). On the other hand, they show that former activists had been concentrated in teaching or other “helping” professions (e.g., Fendrich 1974; McAdam 1989), had lower incomes than their age peers, were more likely than their age peers to have divorced, married later, or remained single (e.g., McAdam 1988, 1989), and were more likely than their age peers to have experienced an episodic or nontraditional work history (e.g., McAdam 1988, 1989).

The biographical consequences of involvement in movements other than those of the New Left wave of the late 1960s and early 1970s are less numerous. Furthermore, they do not form such a consistent and easily recognizable body of literature. Yet they have not been completely ignored. For example, just to mention a few, Klatch (1999) has studied the longstanding biographical consequences of both leftist and rightist movement participants; Taylor and Raeburn (1995) have looked at the career consequences of high-risk activism by lesbian, gay, and bisexual sociologists; Whittier (1995) has shown in her study of the radical women’s movement in Colombus, Ohio, that social movements may alter their social context, leading successive generations of participants to develop new perspectives; and Nagel (1995), in her study of the American Indian movement, has argued that Indian activism in the 1960s and 1970s led to an increased tendency of Indians to self-identify as such.

Still, most if not all of these studies are zoomed in on strongly committed movement participants (i.e., activists) or at least those who strongly identify with a movement and its cause or objectives. Some scholars, however, have inquired into the individual-level effects of involvement in social movements by not-so-committed participants. For example, Sherkat and Blocker (1997) have used panel survey data to show that ordinary involvement in antiwar and student protests of the late 1960s had both a short-term and a long-term impact on the lives of participants. Specifically, demonstrators held more liberal political orientations and were more aligned with liberal parties and actions, they selected occupations in the “new class,” were more educated, held less traditional religious orientations and were less attached to religious organizations, married later, and were less likely to have children than nonparticipants. In a similar fashion, McAdam and collaborators (Wilhelm 1998; McAdam 1999; Van Dyke, McAdam, & Wilhelm 2000) have inquired into the biographical consequences of participation in social movements by means of a randomized national survey of US residents born between 1943 and 1964. What they found is largely consistent with the

Source: Adapted from McAdam (1989:747)

\(^a\)This table was originally adapted from DeMartini (1983: 198).

\(^b\)Fendrich’s 1977 article is based on comparative data on 28 white and 72 black activists.

\(^c\)Fendrich’s 1993 book summarizes the overall thrust of his work on this topic.

results of the follow-up studies of New Left activism mentioned earlier. Specifically, they found movement participants to be more likely to have been divorced, to have been married later, to have cohabited outside of marriage, and to have experienced an extended period of unemployment since completing their education, and conversely, less likely to have had children and to have ever married (see further Goldstone & McAdam 2001). Thus, they observed a strong biographical impact of movement participation. More broadly, they concluded that there is a close relationship between people’s political experiences and orientations during the 1960s and 1970s and their subsequent life-course choices.

These studies have shifted the focus of the analysis from a small group of strongly committed activists to the biographical consequences of more “routine,” low-risk forms of participation, making it possible to generalize the findings beyond the quite peculiar groups of activists included in the follow-up studies of New Left activists and also showing that people who have been involved in social movements in less committed forms carry the consequences of that involvement throughout their lives. In addition, they allow us to examine the broader implications of participation in social movements for the population at large and the aggregate patterns of life-course events, therefore providing more insights into the processes of political, cultural, and social change.

This is, for example, the thrust of the research by McAdam and collaborators (Wilhelm 1998; McAdam 1999; Van Dyke, McAdam, & Wilhelm 2000). They have looked at the aggregate-level change in life-course patterns due to involvement in social movements. Specifically, this research argues that participation in the movements of the 1960s is partly responsible for the broader cultural shift associated with people born during the period of the so-called “baby boom” after the end of World War II. McAdam (1999; see further Goldstone & McAdam 2001) suggests a three-stage process to explain the link between the movements of the 1960s and 1970s and the changes in life-course patterns associated with the baby boom cohorts. In the first stage, activists in the political and countercultural movements of the period rejected normal life-course trajectories in favor of newer alternatives (e.g., cohabitation, childlessness, and an episodic work track). In the second stage, these alternatives to traditional patterns became embedded in a number of geographic and subcultural locations (most notably college campuses and self-consciously countercultural neighborhoods) that were the principal centers of the “1960s experience” and of New Left activism, thus leading upper-middle-class suburbs to embody the new alternatives through socialization processes. Finally, in the third stage, these alternative life-course patterns spread to increasingly heterogeneous strata of young Americans through processes of diffusion and adaptation, and were largely stripped of their original political or countercultural content to be experienced simply as new life-course norms. Thus, in this perspective, the involvement of the few in social movements has much broader consequences on society at large.

METHODOLOGICAL ISSUES

From a methodological point of view, students of social movements and political activism have employed a variety of approaches to account for the biographical consequences of activism. At the most general level, however, it is worth recalling the suggestion made some years ago by Charles Tilly to deal with the explanatory problems inherent in the study of all kinds of movement effects. According to him, only one repose will work:

1. to formulate clear theories of the causal process by which social movements produce their effects;
2. to limit the investigation to the effects made plausible by those theories;
3. to work upstream by identifying instances of the effects, then seeing whether the hypothesized causal chain was actually operating;
4. to work downstream by identifying instances of the causal chain in operation, then seeing whether and how
its hypothesized effects occurred; (5) to work mid-stream by examining whether the internal links of the causal chain operated as the theory requires; and (6) to rule out, to the extent possible, competing explanations of the effects. (Tilly 1999: 170)

The latter aspect has often been the Achilles’ tendon of research on the biographical consequences of activism. More specifically, as already pointed out by McAdam (1989, 1999) in reviewing work in this field (see further Giugni 2004), in particular the early follow-up studies of New Left activists have suffered from one or more of a number of methodological problems. Some of them pertain to timing and the cause–effect nexus. Firstly and most importantly, most of the studies reviewed above lack so-called “before/after” data on activists (but see the studies by Demerath, Marwell, & Aiken 1971; Jennings & Niemi 1981; Marwell, Aiken, & Demerath 1987; McAdam 1988). The latter refer to information retrieved before people get involved in social movement activities as well as after such an involvement. In the absence of a research design that allows for obtaining data both before and after involvement, one needs to rely on retrospective data and make inferences based on individual recollections, which is obviously problematic from a methodological point of view. Secondly, most of the studies focus on the 1960s cycle of contention, that is, a particular period characterized by strong social movement mobilization. Such a specific focus makes it difficult to disentangle individual effects of participation in social movements from the characteristics of the period examined and prevents empirical generalizations. Thirdly, studies on New Left activists have often suffered from too short a time span separating activism from its consequences (but see the studies by Marwell, Aiken, & Demerath 1987; Fendrich & Lovoy 1988; McAdam 1999). If such a time span is not long enough, one cannot determine whether activism has had a durable influence on the activists’ life-course. Fourthly, a related weakness consists in having measured prior activism at a single point in time instead of repeated measures. The absence of such repeated observations weakens the explanation as one does not know whether activism had lasted for a fairly long period or was short-lived and the subjects were defined as activists only at the time the research was conducted. A panel design would be an important, although costly, improvement in this regard.

Further methodological shortcomings of work on New Left activists, in part related to the ones just mentioned, concern sampling and the generalization of empirical findings. Firstly and most importantly, most of these studies suffer from a lack of representativeness of the sample as subjects were often drawn from non-representative samples of the population. Not only do they deal only with people belonging to the New Left, but most works have focused on activists who are most strongly involved. In both cases, of course, generalizations are, to say the least, difficult, if not impossible. The use of survey data avoids this problem. Secondly, researchers often did not include a control group made up of people who did not participate in movement activities (but see the studies by Fendrich 1974, 1977; Jennings & Niemi 1981; Fendrich & Lovoy 1988; and McAdam 1988, 1989). This is an important shortcoming. A control group of nonactivists provide the research with a baseline against which one can assess the impact of activism. Without such a baseline, any conclusion about the biographical consequences of activism would be difficult to make and potentially spurious. Thirdly, most works have studied only a small number of subjects (but see the study by McAdam 1999). While not a problem in itself, this prevents the researcher from being able to generalize the findings beyond the subjects examined. Again, survey data can be of much help here. Fourthly, often subjects were drawn from narrow geographical areas, sometimes from a single city. Generalizations become obviously difficult in this case. Selecting the subjects from wider areas or from more than one area would certainly improve the generalizability of results.

Bloc recruitment

MARIO DIANI

Bloc recruitment refers to “the way in which social movement organizers often recruit members and participants among groups of individuals already organized for some other purpose” (Oberschall 1993: 24; see also Oberschall 1973). This is basically a reformulation of the classic argument about the role of networks in facilitating mobilization (Diani & McAdam 2003). The additional advantage offered by bloc recruitment is that the recruitment effort is considerably lower, inasmuch as it builds upon the trust relations, mutual obligations, and consolidated routines that exist between the members of an already established and operative group.

Although we lack a systematic empirical as well as conceptual exploration of patterns of bloc recruitment, it is possible to identify at least three basic types. The first consists of political organizations redirecting their issue focus and transforming their own identity to the point of turning eventually into another organization. One example comes from the relationship between left-wing organizations and the developing environmental movement in Italy between the 1970s and the 1980s. At times, groups of the disbanding “extra-parliamentary” left converted themselves into antinuclear organizations and eventually into political ecology groups. At other times it was branches of a fairly institutional organization like ARCI, close to the socialist and communist parties, that turned into environmental organizations (Diani 1995).

A second pattern sees nonpolitical organizations becoming political or at least playing an explicitly political role. A popular example of this model are the black churches in the developing civil rights movement in the United States between the 1950s and the 1960s (McAdam 1982). However, one of their major opponents adopted a very similar approach. In the early decades of the twentieth century, the Ku Klux Klan revamped its structure by targeting for bloc recruitment various organizations, in particular fraternal lodges and Protestant churches. Protestant ministers were, for example, offered free membership and powerful Chaplain status within the organization (McVeigh 2009).

Still another pattern consists of recruitment attempts targeting a bloc of people, tightly bound to each other not by membership in another organization but by their strong involvement in some time of communal activity. For example, Ohlemacher (1996) showed how such ties accounted for the success or failure of local mobilizations against low-flying military jets; Hirsch (1986) described how a combination of this and the previous model enabled an association, operating at neighborhood level in Chicago’s West Side, to effectively mobilize clubs of residents organized at the block level.

While the possibility of recruiting cohesive sets of activists from already existing organizations is certainly an opportunity for developing movements, the same note of caution applies as the one brought against network accounts of mobilization; namely, that the really crucial process for mobilization, the transmission of cognitive cultural messages, often happens through channels other than networks such as, for example, the media (Jasper & Poulsen 1995). More generally, it is not always easy to transfer existing loyalties and identities to new goals and new collective actors. A complex work of adaptation and reframing of one group’s original profile is required, and not always achieved (Hirsch 1986: 383–384).

The recognition that bloc recruitment is not always possible has not prompted to date a systematic exploration of the conditions that may facilitate or discourage its development, comparable to what has been done in reference
to individual recruitment (Diani & McAdam 2003: pt. I). A deeper knowledge of the mechanisms through which groups may shift from one cause to another may actually improve our understanding of waves of protest. It has long been pointed out that phases of intense collective action do not imply only changes in the behavior of individuals but also in the size and profile of organizational populations, with rates of emergence of new organizations being particularly high at crucial times (Minkoff 1997). Taking into account the possibility of bloc recruitment processes on a significant scale should enable us to better evaluate the distinctiveness of specific phases of contention and also their connection to earlier campaigns and movements. To what extent are “new” organizations simply the outcome of the conversion of already existing actors? And to what extent are we instead witnessing the development of organizational actors that somehow cut across major movement families, suggesting some degree of realignment of previous organizational and ideological allegiances? The bulk of work around these issues remains to be done.

Boycotts
FRANCESCA FORNO

In a boycott, one or more parties attempt to achieve certain goals by urging individuals to refrain from purchasing certain goods or using certain public services. Unlike other forms of action utilized by social movements, such as demonstrations and other unconventional activities, boycotts aim to activate the political agency embedded in consumption practices, by stimulating individuals to use marketplace means to achieve what may or may not be marketplace ends.

Although often used to serve the economic objectives of consumers, such as lower prices or higher quality goods, boycotts have also been widely employed to achieve political goals by social movements of different types. Boycotts have been launched by a wide variety of sponsoring groups, including consumer organizations, labor unions, organizations representing ethnic and racial minorities, religious groups, women’s rights groups, antiwar groups, and environmental groups.

Some highly publicized examples of historically significant boycotts are that of British goods in Boston, New York, and Philadelphia following the Stamp Act in 1765 during the American Revolution; the anti-Nazi boycott of German goods invoked by the American Jewish community in the 1930s and early 1940s; the Montgomery, Alabama, bus boycott during the US civil rights movement intended to oppose the city’s policy of racial segregation on its public transit system; and the United Farm Worker boycotts of grapes and lettuce in the late 1960s (see Friedman 1999 for a more detailed list).

The number of boycotts organized worldwide has been increasing over the last two decades. Today’s rise in boycotts is often explained by the shift taken by civic groups toward the global market as their political arena (Micheletti 2003). By targeting directly economic enterprises, boycotts appear to adapt to a situation in which national and supranational institutions are often recognized as unable, or unwilling, to regulate and solve the serious environmental and human rights issues associated with corporate globalization.

In the late 1990s more and more activists turned to nonstate actors in the search for new strategic pressure points. Boycotts became very popular within the Global Justice Movement (della Porta 2006). The underlying logic of many movement campaigns of this period was “naming and shaming.” These campaigns, especially when conducted against multinationals, aimed at spreading detailed information to make public opinion aware of particularly glaring cases of negligence of human rights, and called on people to punish the companies involved by boycotting their products.

Changes in technology have substantially reduced the costs of mobilizing support for these actions. A number of successful boycotts during these years were initiated via e-mail and the Internet. Some boycotts that were initiated at the turn of the new century were the one against Shell, criticized for polluting the North Sea and the Niger River; Nike, accused of subcontracting production to small enterprises in Indonesia and Vietnam that use child labor; Novartis, condemned for denying millions of poor people the life-saving treatments they so desperately needed; and McDonald’s, blamed for supposedly using the meat of animals raised extensively on antibiotics.

Through boycotts, transnational activists have publicized grievances and built new transnational awareness across borders to step up pressure on corporations. While globalization has stretched the distance between workers and consumers, boycotts have helped to build a broader sense of community by stimulating individuals to consider the
conditions under which goods are produced in an increasingly global market (Collins 2003; Micheletti, Follesdal, & Stolle 2006).

In response to boycotts, some major corporations have made real efforts to improve working conditions or their environmental standards, either because they feared that transnational campaigns might blemish their image and damage their sales, or because they recognized the validity of activists’ concerns (Spar & La Mure 2003). By the end of the 1990s, in part because of the rise of anti-sweatshop activism, business leaders were much more likely to accept some level of social responsibility in the communities where they did business. Firms such as Nike, Reebok, and Novartis have since developed codes of conduct and social auditing systems for their supply chains.

Although boycotts have managed to persuade some companies to acknowledge responsibility for the conditions in which their products are made, the impact of this tactic remains a long way from the activists’ real goals of changing global market mechanisms to protect labor and improve environmental standards (Seidman 2007). In general, boycotts tend to be more effective when applied to well-known logos, easily identifiable products, or goods produced in specific countries. Moreover, especially when successful, these efforts may run the risk of generating unwanted side effects by indirectly damaging third parties, such as the workers of boycotted firms or, in the cases of boycotts launched against a specific country, the economy of the local community.

Partly for these reasons, some movement activists see a much more promising alternative to boycotts in “buycotts” – campaigns aimed at exhorting people to buy, instead of not to buy, products or services produced respecting certain environmental standards and working conditions. Perhaps the most common example of buycotts is the effort made on the part of many civic groups to encourage individuals to buy goods with a fair trade or eco label. More recently, several movement organizations, such as Slow Food, have launched campaigns to encourage the consumption of local produce in an attempt to reduce food miles and stimulate new local economic activity.

Brokerage
MARIO DIANI

In its most basic terms, brokerage refers to the mechanism whereby an actor acts as an intermediary between two other actors that are not directly linked, thus creating a new line of communication and exchange. This premise has been shared widely across the social sciences, yet with different twists and emphases. On the one hand, some views of brokerage stress in particular the profits incurring to those occupying intermediate positions from their specific structural location. Filling “structural holes” (Burt 1992) enables some actors to secure privileged access to scarce resources (e.g., information or advice), as well as to affect other actors’ behavior through network-based mechanisms of dependence. One well-known instance of this dynamic is given by the so-called role of the tertium gaudens (Caplow 1968, in turn inspired by Simmel), who secures gains precisely by virtue of his/her capacity to play one of the other partners in the relation against the other. Another view of brokerage underlines first and foremost brokers’ ability to bridge different social milieus and different cultures (e.g., Marsden 1983; Gould & Fernandez 1989). Although the presence of personal interest aside other motives can never be ruled out, here the main emphasis is on the collective, rather than the individual, consequences of brokerage: for example, brokers are perceived as crucial to the emergence of new collective actors. This is the notion of brokerage that most social movement analysts primarily refer to, without necessarily pitching them explicitly one against the other (McAdam, Tarrow, & Tilly 2001; Diani 2003).

The role of intermediaries and brokers is crucial because the very existence of social movements, and not just their success and influence, depends on movement actors’ capacity to forge broad coalitions. However, while coalitions may find it easier than individual organizations to launch campaigns with a broad scope, and to target higher-level political institutions, the creation and maintenance of inter-organizational alliances is often problematic. This depends in part on the scarcity of organizational resources, but also – and probably mostly – on the fact that social movement actors are often heterogeneous in their specific agendas and/or ideological orientations. Framing such diverse points of view into broader and more encompassing narratives, enabling a multiplicity of subjects to identify with a certain cause and a certain collective actor, is far from obvious. Moreover, social movement actors’ reliance on normative and/or ideological incentives to mobilize makes them particularly sensitive to needs for personal and group coherence and integrity. This may in turn facilitate schisms, factionalism, and mutual distrust, thus creating further obstacles to alliance building. Differences in specific goals, strategic and tactical options, and broader attitudes may often discourage communication and cooperation between SMOs. Accordingly, networks of “restricted access” (Marsden 1983: 690) may develop within social movement sectors.

Under these conditions, the capacity to develop linkages between organizations or individual activists that are not directly communicating constitutes an important asset. In particular, when pronounced differences linked to ideology, tactical and/or strategic options, the social background of activists, and so on, exist within a movement, actors placed in intermediary structural positions may be expected to be particularly influential, possibly more so than actors with the same or perhaps a higher number of ties, but which are, however, concentrated within specific movement factions. In other words, actors with brokerage skills, capable of spanning different social and political milieus, may be expected to be crucial in any mobilization process (McAdam, Tarrow, & Tilly 2001).
Brokerage roles may be played by organizations, in particular those that act as providers of services for movement sectors and their constituents, and/or are not easy to associate with any specific movement faction given their profile (think, e.g., of a media-focused organization such as Indymedia in the Global Justice Movement). They may also be played by individuals, whether activists who enjoy wide respect from different sectors of a movement, or persons in touch with a movement by virtue of their role/profession (e.g., academics, politicians, public servants, clergy, media operators, etc.). It should be noted that being a social movement broker does not necessarily imply the assumption of explicit leadership roles. In the case of social movements that are very much ridden by ideological disagreement if not explicit conflict, playing a public leadership role may actually lead to being strongly associated with one specific faction, and therefore hamper one’s chances to act as a mediator between the different components of a specific movement field. Leaders and brokers may instead be expected to overlap more substantially, when the overall levels of ideological strife are relatively low (Diani 2003).

Applications of the concept of broker to the investigation of specific social movement processes have stressed different aspects. Some studies have focused on the integration of movement organizational fields and on the brokerage roles played by movement actors themselves. Diani (2003) has in particular looked at the capacity of brokers to bridge political ecology and conservation sectors of Italian environmentalism (e.g., Diani 2003). In their global overhaul of social movement approaches, McAdam, Tarrow, and Tilly (2001) have assigned brokerage a crucial role among the social mechanisms that account for the emergence of collective actors and mobilization dynamics. They have also stressed how brokerage roles may be taken up by actors with quite different levels of proximity to the core of social movement fields.

Bureaucratization and social movements
SUZANNE STAGGENBORG

Bureaucratization in social movements generally refers to the formalization of social movement organizations in terms of record keeping, decision-making procedures, and division of labor. Although movement organizations never become as complex in their structures as bureaucracies such as corporations or government agencies, movements often develop organizations that meet minimal standards of bureaucratic organization. In The Strategy of Social Protest (1990: 91), William Gamson defines a bureaucratic challenging group as having at least three elements: some type of written document that describes its purpose and operating procedures; a list of members; and three or more levels of internal divisions such as officers, committees, and rank and file members. Although centralization of power is often seen as a feature of bureaucracy, Gamson distinguishes the two as characteristics of challenging groups, noting that bureaucratic organizations may lack a single center of power.

Studies of the organizational evolution of social movements find that formalized organizations are increasingly important to modern social movements, although multiple forms of organizations coexist in modern social movements (Clemens 1993; Minkoff 1994, 1999). This research suggests that there are important advantages to formalized organizations in terms of survival, but does not suggest that bureaucratization is inevitable in movement organizations. Movement organizations may take bureaucratic, collectivist, or hybrid form (Rothschild-Whitt 1979; Bordt 1997). A number of studies examine the impacts of these different types of structures, assessing the merits of various forms of bureaucracies and other organizational arrangements in social movements.

Much of the debate regarding the effects of bureaucracy and centralization takes off from the provocative argument of Robert Michels in his classic work Political Parties (1962). Based on his analysis of the German Social Democratic Party, Michels came to the conclusion that democracy and large-scale organization are incompatible; mass organizations tend to become oligarchical, ruled by a small minority. While large oligarchies are not necessarily bureaucratic, Michels, following Max Weber’s work on bureaucracy, regarded technological division of labor as necessary in mass organizations. While recognizing the benefits of bureaucracy, including efficiency, Michels argued that leaders of large, bureaucratic organizations become separated from the rank-and-file and, because they seek to preserve their own positions, they become more concerned with maintenance of the organization than with the original goals of the movement. The growth and bureaucratization of political organizations results in the displacement of radical social change goals by more conservative goals because the leadership becomes more pragmatic, trying to accommodate the goals of the organization to the dominant society.

In Poor People’s Movements, Frances Fox Piven and Richard Cloward 1977 employ Michels’s logic to analyze the consequences of creating large bureaucratic organizations. Piven and Cloward argue that movements of people who are “poor” relative to the standard of living of American society, such as welfare recipients, the working class, and blacks, can only succeed through mass insurgency. That is, only by engaging in disruptive tactics such as large protest marches and sit-ins can poor people compel political and economic elites to make concessions. According to Piven and Cloward, mass insurgency is only possible under extraordinary circumstances, and the
gains that can be achieved by poor people's movements in such times are limited, but they are real. Efforts to build mass organizations are counterproductive because they drain energy away from mass insurgency and do not help to win new advantages. Instead, organizations come to rely on elites for resources and become co-opted as elites reward less radical organizations. Moreover, many poor people's organizations dissolve with the decline of mass militancy, so they do not serve the purpose of keeping the movement alive during less extraordinary times.

Critics of Michels and his followers have argued that the process of internal transformation that he described is not inevitable – large and bureaucratic movement organizations do not always become more conservative, undemocratic, and concerned with organizational maintenance. Zald and Ash (1966) note that a variety of transformations in organizations may occur, including coalition formation among movement organizations, organizational decline, factional splits, and increased rather than decreased radicalism. They argue that external environmental factors, as well as internal organizational processes, influence organizational transformation and they urge attention to a variety of organizational structures. Numerous theorists have since taken up the challenge of analyzing how bureaucratization and other features of organizations influence organizational maintenance, strategies and tactics, goals and outcomes of protest.

In his study of 53 challenging groups, Gamson (1990) finds, in contrast to Piven and Cloward, that bureaucratic structure helps to keep challenging organizations “combat ready.” By distinguishing centralization and bureaucratization as two separate organizational characteristics, Gamson shows that each provide different advantages to challenging groups. Bureaucracy aids organizational maintenance, as the division of labor within bureaucratic structure helps to ensure that “certain necessary tasks will be routinely performed” (1990: 91). Centralization of power decreases internal division and factionalism. The combination of bureaucratization and centralization of power, Gamson finds, offers significant advantages to challenging groups.

Other studies support Gamson’s finding that bureaucratization aids organizational maintenance. Research on the American pro-choice movement shows that movement organizations became increasingly bureaucratic or formalized after the legalization of abortion in 1973 (Staggenborg 1988). Formally structured organizations, often staffed by professional leaders, helped keep the movement alive at a time when grassroots interest in abortion declined because the battle had seemingly been won. Later, when events such as the 1980 election of antiabortion president Ronald Reagan threatened movement gains, formalized organizations, including the National Abortion Rights Action League, were available to assist grassroots mobilization by providing local affiliates with resources such as leadership training. Thus, contrary to Michels, bureaucracy can be helpful to the maintenance of grassroots activism as well as large-scale organizations.

But does bureaucracy lead to more conservative strategies and goals or to co-optation by the state? In the case of the pro-choice movement, there did appear to be a tendency for more formalized organizations to engage in more institutionalized tactics such as legislative lobbying (Staggenborg 1988). And in the civil rights movement, the more bureaucratic NAACP was more likely to engage in institutional actions such as litigation and less able to participate in direct-action tactics than more informally organized groups such as SNCC, which could make decisions quickly and take advantage of opportunities for direct action (Morris 1984). Yet institutionalized tactics do not necessarily imply conservative goals, and formalized organizations often engage in institutionalized tactics at the same time that more informal groups employ direct-action tactics, sometimes with support from formalized organizations. While individual organizations may be limited by their structures, movements such
as the pro-choice and civil rights movements typically consist of multiple organizations and structures, capable of a range of strategies and tactics.

A number of studies suggest that even leaders with oligarchic control can take organizations in either a radical or conservative direction (Zald & Ash 1966; Jenkins 1977; Schwartz, Rosenthal, & Schwartz 1981; Barnes 1987; Voss & Sherman 2000). Moreover, bureaucratic organizations are not necessarily less democratic ones. In a comparison of the NAACP and CORE, Rudwick and Meier (1970) found that CORE endorsed black power as the leadership changed, whereas the NAACP’s bureaucratic structure prevented any leaders from altering the organization’s goals without going through organizational procedures. In other words, a more bureaucratic organization might require procedures such as membership votes, whereas a more informal organization might be taken over by leaders who are motivated to change organizational goals. Some movement organizations combine bureaucracy and professionalization with “regular competitive elections with organized factions and open communication” in a “polyarchy” (Jenkins 2006: 318). Nyden 1985 found in the case of local caucuses of the United Steelworkers of America that mechanisms such as elections, open decision-making processes, and communications with grassroots members helped to overcome oligarchic tendencies and create organizational democracy. Similarly, the National Organization for Women has democratically elected leaders and encourages much grassroots activism within a formalized organizational structure with a developed division of labor (Barakso 2004).

Most studies suggest that there are advantages and disadvantages to bureaucracy and other organizational structures. Jo Freeman (1977: 44) argues that bureaucratic structure aids organizational maintenance and helps channel energies into needed tasks, but that “too much structure can discourage participation and inhibit eagerness.” Yet movement organizations may also become exclusive, Freeman argues, if they require too much participation, such as attendance at endless meetings. Seemingly “structureless” groups can end up with unaccountable leaders and informal structures that exclude many participants (Freeman 1972). In a comparison of the more informally organized and decentralized Chicago Women’s Liberation Union (CWLU) with the more formalized and centralized Chicago NOW chapter, Staggenborg (1989) finds that the NOW chapter was better at organizational maintenance, while the CWLU was more innovative in its strategies and tactics. In a study of the New Left, Breines (1980) argues that activists in decentralized, grassroots organizations such as Students for a Democratic Society were deliberately eschewing bureaucratic organization in order to create a participatory democratic political movement; to appreciate the contribution of the New Left, we need to understand its “prefigurative politics.” Thus, different forms of organization serve different political ends. Beyond considering the effects of bureaucratization, social movement scholars continue to investigate the advantages and disadvantages of a wide range of organizational structures that affect participation, strategies, and outcomes in social movements (e.g., Ganz 2000).

Bystander publics
NICK COULDRY

Bystander publics lack the longstanding political motivation of the engaged publics of political parties or social movements, and so are important for different reasons, depending on one’s direction of analysis. For those interested in expanded political agency, bystander publics are the standing reserve of political action, available for recruitment to parties and movements. For those concerned with apathy, bystander publics signal entropy in political systems: the temporarily mobilized lose interest and revert to the “bystander frame” which simply wants an end to conflict. These two contrasting scenarios make this difficult-to-define group of rich interest (Gamson 2004).

Some democratic theory assumes the naturalness of the bystander position, generating assumptions about the limited information people want about politics (Lupia & McCubbins 1998: 36–37) or a political culture’s balance between activity and passivity (Almond & Verba 1963: 474). The less powerful’s distinterest in politics was classically explained in terms of their isolation from processes of decision-making or the presumed ignorance of the private citizen who “lives in a world which he cannot see, does not understand and is unable to direct” (Lippman 1925: 13–14). But this image of the “naturally” passive bystander has been fiercely challenged by critics of liberal models of democracy. Whatever one’s model of democracy, the underlying distribution of education and other opportunities may make lack of involvement seem a natural response to inequality. As one analyst wrote of America, “the forces discouraging a sense of [political] agency among working people are overwhelming” (Gamson 1992: 59, cf. Croteau 1995). More equal societies arguably encourage greater political participation (Milner 2002). “Bystander publics” cannot then be detached from wider assessments of societies’ opportunity structures.

However we evaluate the figure of the “bystander,” media narratives and media’s “master arena” for portraying political action (Gamson 2004: 243) are vital in shaping bystander publics. First, it can be argued that in the United States and the United Kingdom mainstream media encourage people into bystander status by generally portraying ordinary citizens not as political actors but as passive reactors to government action (Lewis, Inthorn, & Wahl-Jorgensen 2005). Second, social movements and political parties through their communication strategies target bystanders as recruits. Such mobilization strategies draw on bystanders’ collective identities and latent loyalties. This requires attention to the “cultural resonances” (Gamson 2004: 255) of political actions and discourse, and their framing possibilities both positive (encouraging recruitment) and negative (leading to disfavor or, worse, support by bystanders for opponents). The multiple levels of media’s political coverage hugely complicate such strategies (Bennett & Edelman 1985), especially if media and political constituencies cross national borders.

Analyzing the bystander – Lippman’s distracted spectator in the back row – and his or her potential for action (or inaction) has always been difficult, but various recent factors complicate it still further. In the “third age of political communication” the range of political information sources has increased hugely even in the decade since Blumler and Kavanagh (1999) invented that term; the informational starting-point of the average bystander is harder to pin down now when prime-time news and a daily newspaper cannot be assumed as everyone’s basic reference-point and increasing numbers may choose to insulate themselves from all political news (Prior 2008).
The dynamics of political agency are also hugely disputed: do we live in an “uncivic culture” (Bennett 1998) where the individualization of lifestyles and uneven opportunities to talk politics (Eliasoph 1998) leave bystanders increasingly cut off from political action? Or are new forms of political agency flourishing outside mainstream politics (Dalton 1999)? Meanwhile bystanders’ potential for action has increased as individual political actors can become visible to each other and then mobilize (though Twitter, YouTube, and so on) at unprecedented new speeds and scales.

In the age of political communication via social networking, the bystander is the site of contradictory claims: an optimistic argument that the possibilities for political mobilization are expanding quite radically; or the cautious argument that exponentially expanding information flows make it all the more difficult to grasp the conditions under which temporary political mobilization can be sustained into wider processes of democratization.

Catnets
MARIO DIANI

The expression “catnet” merges two distinct concepts, “categories” and “networks.” It was forged by Harrison White in the context of his attempt to develop an approach to the study of social structure that departed from the Parsonsian view of attitudes and values as the driving forces behind patterns in human behavior. Alternatively, and also distancing himself from purely interactionist views of structure, White proposed that the building blocks of social structure be collectivities constituted by the intersection of specific patterns of interaction and categorical traits, on which boundary definition could be founded (White 2008).

While the concept was not conceived with problems of collective action primarily in mind, it became popular in that particular field through Charles Tilly’s *From Mobilization to Revolution* (1978). There, Tilly argued extensively, in explicit criticism of deterministic, macro-structural accounts of collective action, that the presence of specific social traits within a population, associated with specific types of inequality and discrimination, is not sufficient cause of collective action. To the contrary, this depends on the presence of dense flows of interaction between actors sharing specific categorical traits. Although this basic idea actually inspired a large part of Tilly’s work, it re-emerged most forcefully in the last phase of his life, when Tilly (2005) devoted considerable attention to the social mechanisms lying behind categorization processes. Whether articulated in relation to class, trade, gender, nationality, religion, and so on, the emergence of social boundaries is reflected in both social relations and social representations (the two mutually constituting each other). Social boundaries define specific patterns of relations between sites located on one or the other side of them. They also define a distinctive type of relation between the two categories defined by them, and they also correspond to distinctive social representations of the sites located on either side of the boundary: what connects them and what separates them. Social identities are defined basically by the same elements: on the one hand we have shared stories through which people collectively represent themselves and their targets of loyalty and enmity; on the other hand, we have the relational patterns that people are involved in. Again, the two mutually constitute each other.

Forty years after its elaboration, one could not claim that the concept of catnet ranks among the most popular ones in the study of collective action. Yet, its indirect intellectual influence should not be underestimated. The concept of catnet has indeed enabled analysts to better formulate questions linked to the conversion of structural potential for collective action into real action, in many senses paving the way to the development of a network approach to these issues (Diani & McAdam 2003). How is it that certain categorical traits become salient whereas others do not? Does this depend on the uneven presence of entrepreneurs with the appropriate resources, or on the opportunities offered by the system, for example, through institutional arrangements that encourage inter-organizational collaborations? These and related questions have been at the core of “the classic agenda” in social movement theory in the last decades.

It is also possible, however, to go one step further and acknowledge the contribution of less orthodox perspectives, in particular, that of a broader line of theoretical reflection devoted to the cultural dimension associated with social networks. This had developed in direct dialogue with Harrison White’s work, viewing social ties primarily as the reflection of ongoing processes of meaning construction (Emirbayer & Goodwin 1994; Mische 2003). This perspective
not only went beyond the notion that ideas have an independent explanatory role, but also challenged the assumption that ties somehow determine culture, whether at the collective or the individual level. To the contrary, ties are constituted through culture and culture shapes interactions as much as being shaped by them. Accordingly, the formation of ties upon which collectivities are based is inextricably linked to processes of social construction. It follows that, in order to understand the emergence of collectivities, we need to explore how social relations are forged. Drawing explicitly upon communication theory and conversation analysis, Mische (2003, 2008) has identified a number of mechanisms of relation formation in conversational settings. They enable us to show how the formal and apparently static configuration of structural relation is actually the result of innumerable, local interactions, each of which is in principle subject to multiple interpretations by the actors involved.

Case studies and social movements
DAVID A. SNOW

A case study is one research strategy for studying social movements and movement-related processes. Other research strategies include ethnography, participant or organizational surveys, experimentation, life histories, and protest event research via newspaper and other media sources. This entry distinguishes the case study from these and other research strategies by sketching its defining characteristics, and then discussing the ways in which case studies can vary, with illustrations drawn from case studies of social movements.

DEFINING FEATURES OF THE CASE STUDY

There are three defining or distinguishing features of a case study. The first is that it is an investigation and analysis of an instance or variant of some bounded social phenomenon. All studies of social movements, as well as other social phenomena, are bounded in time and place, thus making the results of any study temporally and spatially contingent. But case studies are bounded in another way: the social phenomenon investigated is a “member of a larger set of broadly defined objects” (Sjoberg et al. 1991; Ragin 1992: 2). What is studied, in other words, is a subset or species of some encompassing genre. So, for example, the object of study may be a particular analytic type or representative of a genre of movements, such as reform, religious, or revolutionary movements. This is important to know, because a study of a religious movement, such as the Hare Krishna movement in the US (Rochford 1985), may not speak so directly to a study of a political movement, and thus the implications may not be extended to movements that don’t fall within the genre of religious movements or some subset thereof. That is, of course, a matter for ongoing empirical investigation. However, the object of case studies among social movement scholars is not always a particular type of movement. Oftentimes, the focal topic of study is a social movement process or mechanism, such as recruitment, framing, tactical innovation, diffusion, emergence, or institutionalization. Examples include Lofland’s (1977) study of recruitment, conversion, and commitment to an early 1960s cult that was the forerunner of the Reverend Sung Yung Moon movement in the US, and McAdam’s study (1988) of the precipitants and consequences of participation in the 1964 Freedom Summer campaign. In each of these studies, the focal instance or variant of inquiry is of some theoretical process or concept, which is probably the focus of most movement case studies. Additionally, the focus of inquiry for other case studies may be “an intrinsically interesting historical or cultural entity in its own right” (Ragin 1992: 2; see also Sjoberg et al. 1991: 54–55), as illustrated by Klinenberg’s (2002) study of the 1995 Chicago heat wave. Whatever the substantive or theoretical focus of a case study, be it a social object, process, or event, such foci alone do not constitute a case study, as there are two other defining criteria.

The second defining feature of a case study is the generation of a richly detailed, “thick” elaboration of the phenomenon and the context in which it is embedded. This typically involves the elaboration of a system of action constituted by sets of interrelated activities and routines engaged in by one or more networks of actors within a social context bounded in time and space.

While the system of action may vary in scope and organization, as between an exclusive, communal movement or cult (e.g., Hare Krishna) and an inclusive, broad-based...
national movement (e.g., civil rights movement), and in other ways as well, the unit of analysis for the case study is typically some system of action rather than a cross-section of individuals, as in a survey, or a media-based sample of protest events examined in media-based protest event analysis. Auyero’s (2007) study of Argentina’s “gray zone” of politics and contentious violent action nicely illustrates the case study’s detailed elaboration of a system of action, in this case the furtive and collaborative connections between political agents and the perpetrators of collective violence – namely looting and property destruction – that occurred in Argentina in December 2001.

The third defining feature of the case study is the use and triangulation of multiple data sources and data-gathering procedures. Although survey data and quantitative procedures are sometimes used in case studies, there is typically greater reliance on qualitative data and procedures that may include ethnography and participant observation, various forms of qualitative interviewing ranging from semi-structure interviewing to unstructured, conversational interviewing, and the use of various documents and archives, particularly those that are indigenously generated, such as social movement fliers, pamphlets, and newsletters or -papers. The utility of such qualitative data and procedures for the case study is that they are grounded in real-life situations and settings, and are therefore more likely to generate the kinds of data that allow for the development of a richly detailed and contextual understanding of the phenomenon of interest.

Auyero’s study of the mentioned “gray zone” nicely illustrates this triangulation of data and procedures, as he culled data from national and local newspapers, journalists’ reports, video archives, and in-depth and informal conversational interviews with residents of two poor barrios. “The strategy,” he writes, “was to pile up evidence regarding the looting dynamics and the existence of the workings of the gray zone, triangulating as much as possible the available different sources of information with each other” (Auyero 2007: 25).

Inasmuch as data and procedural triangulation is a defining feature of the case study, it follows that a case study is not a method per se, as are ethnography and survey research, but rather a research strategy associated with a number of data-gathering methods or procedures.

WAYS IN WHICH CASE STUDIES VARY

In addition to variation in focus on a movement, process, or event, case studies can vary in two other ways. One form of variation is in the kinds of cases examined. Sjoberg et al. (1991) and Yin (2009) have suggested that cases are generally one of four kinds: they may be relatively typical or normal and thus constitute a representative case; they may be a critical case in that they constitute an ideal opportunity for observing a patterned or theorized principle; they may be a deviant or negative case in that they constitute an exception to the expected pattern; or they may be an extreme or unique case in the sense of not being fully comparable to other seemingly similar cases.

Case studies can also vary as to whether the study is based on detailed examination of a single case or a comparison of multiple cases within the same set or genre of phenomena. Analyses of single cases are exhibited in studies of single movements, and typically take one of two forms. The first is characterized by studies that provide a primarily descriptive overview of a single, usually national-level movement. The case is the movement as a whole, and the objective is to situate it in time and place, and to say something about its beliefs and ideology, its appeal and diffusion, and its spread. The second form of a single case study makes the analysis of major movement processes and issues the centerpiece of inquiry. A highly contextualized, descriptive understanding of the movement is still provided, but it is secondary to elaborating empirically how these focal processes operated within the context of the movement studied and how these more specific findings extend or refine the relevant theoretical or conceptual understandings.
within the field. Illustrative of this type of case analysis is Lofland’s (1977) mentioned study of a small religious movement, with an emphasis on the processes of proselytization and conversion, and Goodwin’s (1997) study of the Huk rebellion in the Philippines, with its emphasis on affective ties and their implications for understanding the solidarity and discipline of the participants.

Case study analysis of multiple cases embedded within a larger, encompassing case also appear to take two forms in the study of social movements. In one form, the cases, typically social movement organizations (SMOs) or events, are taken to be “normal cases” that are representative of the broader movement. Staggenborg’s (1991) use of thirteen SMOs (six national and seven local organizations in Chicago and Illinois) as the basis for understanding the pro-choice movement in America is illustrative of this use of multiple cases. In the second form of multiple case analysis, the cases are examined in a comparative framework that allows for nuanced assessment of variation among the cases with respect to the broader movement and processes or conceptual issues examined. Cress and Snow’s (1996, 2000) qualitative segment of their study of homeless social movement mobilization is illustrative. Based on data gathered for each of fifteen homeless SMOs in eight US cities, and using the analytic techniques of qualitative comparative analysis, they found noteworthy differences in resource mobilization, benefactors, organizational viability, and outcomes that contributed not only to understanding the homeless movement in general, but to detailed understanding of local variations and to the factors that accounted for these variations.

**SUMMARY**
A case study is a research strategy, based on the triangulation of various data sources and data-gathering procedures, that seeks to generate rich, detailed, contextualized accounts of social phenomena that are interesting in their own right, as with the civil rights movement, the women’s movement, and the homeless movement, or that unpacks and elaborates various case-relevant social processes or events, such as recruitment, conversion, and resource mobilization. Attending to and fulfilling these objectives makes the case for conducting case studies. But there is another contribution that is generally unrecognized or glossed over: the capacity of case studies to engage in theoretical generalization. The relationship between any research procedure or method and generalizability is contingent on the kind of generalization in question. If the only form of generalization is statistical or enumerative, then clearly case studies fall short. But statistical generalization is not the only form of generalization. There is also analytic, or theoretical, generalization, which is the kind of generalization case studies are well-suited to pursue. As noted by a number of students of cases studies, one of their goals “is to expand and generalize theories (analytic generalization) and not to enumerate frequencies (statistical generalization)” (Snow & Trom 2002; Yin 2009), which the movement case studies cited herein have done.

Cause lawyering
ERIC AGRIKOLIANSKY

All social movements have, at one point or another in their development, been confronted with the question of legality. This may come about either because the movement aims to change the law, or because it is itself facing legal repression. In addition, this could reflect that “the state usually acts through law, the state can be constrained by law” (Abel 1998: 69). However, the use of law, and the legal system, as tools of protest is not an easy task, and there are indeed a number of limits to legal strategies of protest. The field of critical legal studies has emphasized that the legal system has an underlying tendency to treat disadvantaged groups less fairly and, above all, that legal decisions are insufficient on their own to bring about changes in the economic and social order (see, for example, Rosenberg 1991). However, this position has been challenged in recent years by a number of pieces of work which have reconsidered the importance of contentious uses of law.

In this context, the analysis of “legal mobilizations” (McCann 1994, 2006) has shown that the most important aspect of court decisions may not be their direct effect but rather their indirect effect. This is first of all because having recourse to courts may have a significant dissuasive tactical effect. McCann (1994) shows how the threat of legal proceedings encouraged employers to prefer bargaining to confrontation in the context of the American equal pay movement. In addition, litigation strategies may constitute a resource for the development of social movements themselves. Courts can, in the first instance, act as public and political tribunals allowing public opinion to be questioned, demands to be disseminated, and support to be mobilized (Barkan 1980). Moreover, one of the main obstacles to collective action is that unequal treatment might be considered to be natural and inevitable by those who suffer from it. In this context, reclaiming one’s rights can change the perception of what is just and unjust and bring about a cognitive liberation making collective action feasible (McAdam 1982). The fight for the legalization of same-sex marriage entered into by gay movements in the USA in the 1970s illustrates this judicial empowerment effect which contributed to the challenge to the dominant heterosexual norms and to the later development of the gay movement (Barclay & Fischer 2006).

For social movements to be able to have recourse to these litigation strategies they nonetheless require access to the judicial system and need to benefit from the support of lawyers. Work on cause lawyering (Sarat & Scheingold 1998, 2006) has suggested that this is more likely to develop in countries with liberal democratic systems, in which citizens enjoy substantial political and legal rights. The emergence of international legal bodies may, however, provide additional opportunities for action against authoritarian regimes outside of the national legal space, although these bodies are most often used to punish crimes rather than to prevent them. The receptiveness of the judicial system to the demands of social movements varies considerably between democracies: in the USA in the 1950s and 1960s the development of a “rights-based constitutionalism” amongst judges and those in the legal administration who had begun to pay attention to claims in terms of equality helped minorities gain access to the court system. However, the 1980s were characterized by a change in the attitude of judges, who became less open to these kinds of demands, and a reduction in the legal opportunities of contention (McCann & Dudas 2006).

The support of lawyers is another key factor in understanding legal mobilizations. The professional structures are important. “Public-interest firms” or “legal services offices” in
the USA allow lawyers to work full time with groups suffering from discrimination who typically do not have access to the law. In France, on the contrary, cause lawyers practice mostly in small private law firms. They have to reconcile social justice or political lawyering with other kinds of litigations and rarely specialize in cause lawyering. The commitment and motivations of lawyers in social movements also reflects their own personal histories, as in the case of the lawyers in Philadelphia considered by Porter (1998), who were characterized by their own experience of discrimination and were constrained by their position in the local legal market to specialize in black working-class clients.

The participation of lawyers in social movements has sometimes been seen as dangerous, as the former may monopolize the leadership of the latter and engage them in costly legal strategies with uncertain outcomes (as, for example, in the case of the consumer movement: see Meili 2006). There are, however, numerous examples which contradict this position: lawyers paradoxically do not systematically favor litigation strategies, nor do they subordinate the political objectives of the movement to them (McCann & Silverstein 1998). Cause lawyering therefore neither implies the blind adhesion of social movements to the myth of rights, nor the abandon of confrontational strategies.

REFERENCES AND SUGGESTED READINGS

Charisma was introduced as a social scientific concept by Max Weber, who used the term to identify one of three types of legitimate authority. In Weber’s framework, bureaucratic (or legal-rational) authority is based on respecting rational rules, traditional (or patriarchal) authority is based on following traditional ways, and charismatic authority is based on challenging existing rules and traditions. The first two, he wrote, are conservative in that they underpin existing institutions, while charismatic authority is revolutionary in that it challenges the legitimacy of existing institutions. Weber used social movements as examples of the power of charismatic authority and following his logic all social movements that challenge some aspect of the status quo must rely on charismatic authority.

Because Weber was concerned with sources of authority, he was particularly interested in movement leaders. Unlike bureaucratic and traditional authority, he reasoned, charismatic authority cannot rely on existing institutions, so it depends to a far greater extent on the personal traits of a leader. In order to be convinced to violate laws and traditions, movement participants have to believe their leaders have extraordinary knowledge and abilities. Moreover, Weber wrote, because charismatic movements pursue a mission that transcends existing institutions, they are averse to routine activities, especially rational, rule-bound economic pursuits, which distract from the charismatic mission. He did not, however, exclude material interests as a motivating concern: Among the examples he cites of charismatic leaders are pirate chieftains and radical populists who promise to redistribute wealth (Weber 1978).

Following Weber’s lead, many scholars have used the concept of charismatic authority to analyze movement leadership. Studies in this tradition have focused on the characteristics of charismatic leaders and their role in creating new belief systems, winning adherents, and developing emotional bonds with followers (Downton 1966; Willner 1984). Other scholars, dissatisfied with Weber’s focus on leaders, have shifted their attention to the social contexts that give rise to charismatic movements and the role of participants in selecting, shaping, and rejecting movement leaders. Successful charismatic movements, they stress, arise at moments of crisis, when large segments of the populace have come to question the legitimacy of existing institutions. At these moments, many would-be leaders contend for followers and they often articulate grievances and visions that are widely held in a broad insurgent milieu, even if they each elaborate their own particular version (Friedland 1964; Tucker 1968). Charismatic movements, then, are usually broader than the following of a single leader and allegiance to particular leaders is often fluid. Sometimes a single leader emerges at the head of a movement, but many movements are less centralized and some scholars have argued that decentralized charismatic movements are particularly resilient (Gerlach & Hine 1970).

Charismatic authority, Weber emphasized, is inherently transitory: As movements establish stable organizations and institutions, charismatic authority gradually becomes “routinized” in a traditional or a bureaucratic direction. Thus, his concept of authority is cyclical, with charismatic movements toppling traditional and bureaucratic institutions, only to establish new institutions, which are once again based on bureaucratic or traditional principles. With this cycle in mind, Weber drew attention to conflicts within political parties between founding leaders, who gather a following based on charismatic inspiration, and party officials, who increasingly depend on bureaucratic methods. Subsequent scholars have built on Weber’s themes to analyze the internal
workings and trajectories of social movement organizations. Some have distinguished between charismatic and bureaucratic organizational forms and mobilizing strategies in order to assess their consequences (Panebianco 1988; Andreas 2007). Many have highlighted the inherent tensions within modern social movements (and the regimes they create) between charismatic and bureaucratic authority, often embodied in the persons of visionary leaders and practically oriented movement cadres. Some have stressed the effectiveness of such a division of labor, while others have emphasized the conflicts engendered (Gerth 1940; Gonzalez 1974; Hiniker 1978). Weber’s cycle, involving the eruption and routinization of charisma, has been employed to explain the conservative trajectories of radical social movement organizations and the vulnerability of conservative organizations to charismatic upheavals (Zald & Ash 1966; Andreas 2007).

The concept of charisma played an important role in strain theories of collective behavior, which enjoyed great influence in the United States from the 1940s through the 1970s. In these theories, social movements were precipitated by structural strain that produced anxiety in individuals, with charisma providing the link between individual anxiety and collective action. A central concern of these theories was that the breakdown of traditional institutions was uprooting individuals, making them particularly susceptible to charismatic appeals. Talcott Parsons outlined this thesis when he introduced the concept of charisma to English-speaking readers in his translation of a compilation of Weber’s essays (Parsons 1947), and subsequent efforts to elaborate strain theories of collective action included charisma as an essential element (Kornhauser 1959; Smelser 1962). This tradition has generated a large number of books and articles on the topic of charismatic movements, as well as on particular movements and leaders (Madsen & Snow 1991; Rinehart 1997).

In contrast, charisma played little role in the theories that came to dominate the social movements field in the 1970s. These theories, populated with rational actors pursuing their interests, did not find much use for the concept of charisma, which Weber had defined as irrational because of its aversion to rules, and which previous theories of collective behavior had associated with psychological distress, emotional attachment, and fanatical belief. In recent decades, however, social movement theorists have again come to recognize the importance of identity formation, the crafting of collective action frames, and other cultural, cognitive, and psychological processes. As scholars have sought to explain how movement leaders reframe the world in ways that make the status quo seem unjust and how movement participants become convinced that hopeless causes are not only possible but necessary, there has been a renewed interest in charisma (Melucci 1996; Morris & Staggenborg 2004).

Civil disobedience
SARA TESCIONE

Civil disobedience refers to a public, nonviolent, contentious yet political act contrary to law, usually done with the aim of bringing about a change in the law or policies of a government.

The origins of the modern notion and practice of CD are to be found in the 1848 essay “Resistance to Civil Government” (also known as “Civil Disobedience”) by the American naturalist Henry David Thoreau, which represents one of the first modern attempts to reflect on the existence of anything such as a legitimate duty to disobey state laws. In fact, in 1842 Thoreau refused to pay his poll taxes in objection to the ongoing Mexican–American War and the federal government’s support of slavery in the southern states, experiencing arrests and imprisonment as a consequence for his law-breaking behavior. Eminent theorists and practitioners of CD such as Leo Tolstoy, Mohandas Gandhi, and Martin Luther King Jr all drew from Thoreau’s ideas.

Although there is some dispute among philosophers and social scientists on both the exact definition of CD and the conditions under which the act of disobedience is to be considered justified, John Rawls’ account of CD within the framework of liberal democracy remains the most widely accepted to date. From his perspective, CD is defined as a political act not only in the sense that it is addressed to those who hold the political power, but also because it is guided and justified by the principles of justice underlying the political order. Publicity is a second distinctive feature of CD: an act of CD can be considered such insofar as it is not covert or secretive, but rather done in public, with fair notice. The publicity of the act, together with its nonviolent nature, is intended to prove that CD is the expression of profound political convictions and the ultimate trust of the rule of law. As a consequence of CD, in fact, laws are broken but trust in the law is nonetheless expressed by the willingness to accept the legal consequences of the unlawful conduct. The ultimate goal of CD is to stigmatize and change unfair laws or policies by making an appeal to consciences – both those of the authorities and of the general public (Rawls 1999). Therefore, CD falls between legal protests, and conscientious refusal, revolutionary action, and organized forcible resistance.

CD can be defined “direct” when the law deliberately broken is itself the object of the protest; all the cases in which the violated law does not coincide with the political objective of the protest, but is somehow related to it, are examples of “indirect” CD.

There remain disputes over the very notion of CD, especially with regards to nonviolence. While many agree that CD is nonviolent by definition, there is no agreement on what constitutes violence, and some scholars do not exclude from the notion of CD minor acts of coercion (Morreall 1991; Smart 1991).

A further problem with Rawls’ notion is that it is designed only for the case of a “nearly just society,” raising questions over the criteria that would define and justify the use of CD as a mechanism for social and political change in an unjust and nondemocratic society.

FROM INDIVIDUAL TO COLLECTIVE ACTION

If in Thoreau the main focus of CD remains the protection and safeguard of the moral autonomy of the individual, Gandhi’s approach, within the framework of his philosophy and practice of nonviolent resistance (satyagraha), marked the passage from individual to collective action, thus transforming the theory and practice of CD into a mass phenomenon.
Applied for the first time in 1906 in South Africa, during the years of Gandhi’s involvement with the struggle of Indian immigrant workers against Pretoria’s regime, in the 1930s mass CD became a successful tool in the struggle for Indian Independence from British colonial rule. The famous salt march in 1930 opened the way to a nationwide campaign of mass CD, which encompassed a rich repertoire of noncooperation methods and resulted in the arrest of an estimated 60,000 people.

The influence of Gandhian CD eventually crossed India’s borders, reaching religious pacifists and civil rights activists in the United States, who began to study and experiment forms of nonviolent resistance in the early 1940s. It is with the Montgomery Bus Boycott of 1955 that CD became a distinctive feature of the African-American civil rights movement against racial segregation, under the charismatic leadership of Martin Luther King Jr. A decade of campaigns, from the 1960 Greensboro sit-ins to the 1961 Freedom Rides to the 1963 Birmingham campaign, to the 1966 Chicago Freedom Movement was in fact fundamental in publicly denouncing the unconstitutionality of local segregationist laws, contributing to the passage of the Civil Rights Acts in 1964 and 1968.

War and nuclear armament became targets of campaigns of indirect CD in the United States as well as in Western Europe. In the United Kingdom, the Campaign for Nuclear Disarmament (CND) and the Committee of 100 animated large sit-in demonstrations at military bases to push the country toward unilateral nuclear disarmament. Despite some initial objections to unlawful methods within the CND, by the 1980s CD became a constitutive component of the British antinuclear movement.

In the late 1960s and early 1970s, both in Europe and the United States, the right to draft refusal was often acquired thanks to direct actions of CD. In Italy, activists of the Radical Party were imprisoned for months as they affirmed the right to conscientious objection to military service; the resulting law was passed in 1972.

Over time, organized CD has been employed to target a great variety of laws or policies. Nor has this instrument of collective action been confined to political and social movements in Western democracies. From the 1986 people power revolution in the Philippines, to the 1989 “velvet” revolutions in Eastern Europe, to the most recent wave of “colored revolutions” against the corrupt regimes of the post-Soviet area, mass CD initiatives have recurred in the repertoire of numerous pro-democracy popular movements, together with the revival of nonviolent resistance theories.

REFERENCES AND SUGGESTED READINGS
Civil society
MARIO DIANI

Until the late 1980s, the term “civil society” was largely absent from the political and social lexicon (Edwards 2004). The restart of interest in this idea has been spurred by a number of quite heterogeneous, if parallel, developments. In the crumbling socialist regimes of Eastern Europe in the 1980s, “civil society” was hailed, in a classic Lockean sense, as the locus of citizens’ autonomy and resistance to an authoritarian, invasive state (Seligman 1995). In Western neoliberal democracies, civil society has been seen as one possible alternative to the financial crisis of the welfare state, and as the embodiment of the virtues associated with cooperation and generalized trust and solidarity (Deakin 2001). The European Commission has repeatedly stressed the possible contribution of civil society to reducing its (real or perceived) “democratic deficit.” Its 2001 EU White Paper on Governance paid a lot of attention to the role of citizens and associations, although it remains an open issue whether significant increases in rates of active participation from the citizenry would actually be sustainable for the policy process.

The idea of civil society has also loomed large in explorations of the opportunities offered by globalization for the emergence of a genuinely transnational public sphere. The development since the 1990s of mobilizations grouped under the “Global Justice movements” heading has probably represented the most prominent case in which the renewed attention for citizens’ activism and for civil society have met in a distinctive intellectual and political agenda (Anheier, Glasius, & Kaldor 2001). At the same time, attention to civil society organizations in reference to both political advocacy and service delivery has steadily grown in both Western and non-Western democracies, with special attention to the realm of local politics (Deakin 2001).

Unsurprisingly, the variety of empirical processes which the term has been used to explore matches the heterogeneity in the meanings attributed to the concept. We can identify at least three dominant conceptions of “civil society” (Edwards 2004: ch. 1). One has a strong normative component, and associates civil society to the notion of the “good society.” In this perspective, civil society is equated in the first place to principles of civility, tolerance, generalized trust, and cooperation, and to the behaviors that they inspire. The second version equates “civil society” to “public sphere.” It views civil society as a discursive arena where competing views on moral and ethical issues as well as on the running of public affairs may be brought up and submitted to public scrutiny. The third version of civil society focuses instead on the role of organizations as conducive to the development of political capacity and cooperative behaviors, essential for social cohesion and/or the quality of democratic life. Although some influential social thinkers are strongly associated with one of these versions (e.g., Habermas (1989) with the second, Putnam (1993) or Arato & Cohen (1992) with the third), each major instance of civil society theorizing attempts some integration of these three dimensions. For example, Alexander (2006) regards the civil sphere as the locus in which civil values are reinforced and common grounds between citizens holding diverging views are identified, but does not consider all types of voluntary associations as part of the civil sphere. “Non-civil” associations are those that do not attempt to identify general criteria of civility but instead limit themselves to the pursuit of special interests and agendas.

Although social movement and civil society research show limited amounts of communication and cross-fertilization (della Porta & Diani 2011; see, however, Edwards, Foley, & Diani 2001), the two fields share a few questions and empirical objects of analysis.
These include the mechanisms that facilitate or discourage citizens’ involvement in collective action, and the organizational dynamics taking place within “social movement organizations” (the term favored by movement analysts), “voluntary associations” and “public interest groups” (the terms favored by civil society analysts). There is indeed much common ground in considering how individuals overcome tendencies to free ride (Kitts 2000), how organizational forms combine a quest for efficacy with a commitment to decentralized, participatory structures, and how they coordinate resources (Kriesi 1996; Jordan & Maloney 1997).

At the same time, it is also important to recognize where these two fields of inquiry diverge. First, an emphasis on conflict is not so strong in reference to civil society research as it is to social movements. Social movement studies have for a long time stressed conflict as the key dynamic element of societies. In contrast, analysts of civil society often focus on non- or less-contentious forms of collective action that give priority to largely consensual issues and agendas (Alexander 2006). For example, campaigns promoting collective responses to pressing public issues that most people recognize as important (such as environmental degradation or the persistence of inequality between industrialized and developing countries) are surely akin to coalitions if not to full-fledged social movements, since they involve multiple organizations and may also generate long-term solidarities. Yet conflict is not necessarily central to them, since civil society often acts in pursuit of goals defined broadly enough to make them acceptable – if not top priority – to large sectors of public opinion. In an effort to bridge these two sectors of social life, social movement analysts have sometimes talked of “consensus movements” to identify instances of collective action in which conflict was either absent or peripheral.

Similar considerations apply to social movement practices, which are often defined as confrontational and/or unusual forms of political behavior. Many scholars pinpoint the fundamental distinction between movements and other political actors in the use by the former of protest as a form of exerting political pressure. While protest repertoires (at least in Western democracies) have probably spread to more diversified constituencies than it was the case in the 1960s or 1970s, analysts of civil society tend to emphasize its non-confrontational elements, and its non-confrontational repertoires (in particular the recourse to service delivery in place of protest as a major way to achieving public goals). The implied link here between reducing conflict and increasing social cohesion has been criticized by those who argue that the articulation and explicit management of social conflict is essential for the survival of democracy (Mouffe 2005).

Claims-making
LASSE LINDEKILDE

Claims-making refers to the process of performing or articulating claims that bear on someone else’s interests. In its simplest form an instance of claims-making includes two actors—a subject (claimant) and an object (addressee)—and a verbal or physical action (demanding, protesting, criticizing, blaming etc.). In the context of social movement studies and contentious politics, claims-making has most often referred to the conscious articulation of political demands in the public sphere, thus leaving aside more private or hidden forms of political claims-making such as voting and lobbying.

CLAIMS-MAKING AS PERFORMANCE

Political claims-making has been conceived of as performances that air certain claims to an audience, involving governments as targets, initiators of claims, or third parties (Tarrow & Tilly 2006: 4; Tilly 2008: 5). Understood in this way, political claims-making entails both the formulation of a political demand with a specific content (the claim), and the public staging of this demand (claims-making), giving the term a degree of semantic overlap with social movement core concepts such as framing, collective action, and action repertoires.

Political claims-making can take on many forms and be performed in many different arenas. It can be argued that the concept of claims-making has its origin in the legal system, where it refers to the assertion of a right or claim to money, property, freedoms, and so on, which is enforceable in court. Although social movements have often made use of court rooms as arenas of political claims-making, they have traditionally been characterized, or even defined, by the use of transgressive or extra-procedural claims-making targeting governments and public opinion through performances in the streets and/or the media. Mediatized claims-making—either mass media coverage of performances like demonstrations or media-dependent performances like interviews, press releases, text messaging campaigns, and so on—is increasingly essential for social movements in making their cause visible (Gamson & Wolfsfeld 1993).

EXPLAINING POLITICAL CLAIMS-MAKING

Explaining variance in political claims-making in terms of the “semantic triplet” (Franzosi 2004) of subject (who), object (whom), and action verb (what), across countries, political systems, issue fields, and time is in many respects at the core of social movement studies. Hence, political claims-making has often been treated as the dependent variable in comparative research designs (e.g., Kriesi et al. 1995). The list of independent variables suggested as explaining variance in claims-making is long, including variance and/or development in political opportunity structures, political culture, state formation, and transnationalization (e.g., Tilly 1995). There have also been attempts to go beyond the semantic triplet of claims-making and focus on the more discursive content. Linking claims-making to concepts of “framing” and “discursive opportunity structures,” some research argues how issues, proposed solutions, and justifications of raised claims regarding, for example, immigration depend on national differences in conceptualizing cultural diversity and societal integration (Koopmans et al. 2005).
POLITICAL CLAIMS ANALYSIS

The concept of claims-making has in particular been applied to analyze and compare media debates on contested issues, including immigration/integration (Koopmans & Statham 2001; Lindekilde 2008) and Europeanization (della Porta & Caiani 2009).

Protest event analysis, where instances of (physical) claims-making reported in print media are coded systematically, has been the most common way to study variance in political claims-making empirically (see Rucht & Ohlemacher 1992). Building on this, Koopmans and Statham (1999) have developed political claims analysis, an approach that takes the strategy of event analysis further. First, they propose integrating elements of discourse analysis making the verbal aspect of a claim – its argumentative structure and discursive content – a part of the coding schema. This move entails paying attention to conventional speech acts (e.g., the articulation of blame, dissent, propositions, critique, affirmation, and viewpoints) as performances of political claims, when articulated in the media regarding a contested issue field. Second, political claims analysis extends the scope of relevant claimants from movement actors to other kinds of civil society actors as well as institutional actors and thus studies claims-making as an exchange of views in a “multi-organizational field” (Koopmans & Statham 1999: 3). In this perspective, the analysis of claims-making becomes relational, focusing on the public exchange of views, linking the approach to certain forms of network analysis (see Wada 2003). As a consequence, political claims analysis offers an opportunity to study the dynamics of contentious episodes (the sequentially ordered appearance of claims and counter-claims) as they unfold in the media.

Class consciousness: the Marxist conception

NICK CROSSLEY

Within the Marxist tradition “class consciousness” refers to the awareness of itself as a class which the dominated class within capitalism, the proletariat, is predicted to arrive at, historically. When the proletariat become aware of themselves as a class and of their collective strength, Marx claims, they will rise up in revolution and overthrow their bourgeois masters.

Writing in and about early industrial societies, Marx identifies two main social classes: the bourgeoisie and the proletariat. Each is defined by their relation to the other and to the means of production; that is, to the material infrastructure of the dominant form of economic activity of their society, in this case factories and mines. The bourgeoisie own and control the means of production. They are factory and mine owners. The proletariat own only their own labor, which they must sell to the bourgeoisie in return for a subsistence wage.

These two classes are interdependent and mutually constitutive. Neither can exist in the absence of the other. The bourgeoisie need workers to work in their factories and mines. They cannot exist, as a capitalist class, independently of a workforce. The proletariat, as a class who sell their labor, can only exist in relation to a bourgeois class whose members buy it. Interdependence and co-constitution do not equate to harmony, however. The bourgeoisie and the proletariat have juxtaposed interests, according to Marx. It is in the interests of the former to pay a little for a lot and of the latter to earn a lot for a little. Moreover, Marx argues that the relationship of the two is fundamentally exploitative of the proletariat, whose (subsistence) wages represent only a fraction of the value that they create by means of their labor. The bourgeoisie extract this “surplus value” in the form of profits.

The proletariat are not, in the first instance, aware of their position, however. Drawing upon a Hegelian distinction, Marx believes that classes exist, firstly, in themselves, which is to say objectively, as a matter of fact, and only later for themselves, which is to say (inter)subjectively, within the awareness and consciousness of their own members. Classes are class conscious when they exist for themselves. As noted, however, the significance of class consciousness, for Marxists, is that this awareness triggers and belongs to a revolutionary project. The class consciousness of the proletariat exists not only in their awareness of themselves as a class but also in their determination to bring about a revolutionary transformation of society which will improve their position, reconfiguring social relations and effectively thereby dissolving them as a class.

Marx is notoriously vague about the processes that bring about this awakening of class consciousness. The hints that he makes, however, all seem to point back to what he identifies as the crisis tendencies of capitalism. On one hand, he argues, there is a tendency for profit to decline within capitalism, as a consequence of competition between individual capitalists and the need for constant reinvestment in technology which this necessitates. Capitalists can only respond to this, he believed, by forcing down wages. In addition, because capitalist markets are essentially unregulated (Marx says anarchic) and rely upon the chance coincidence of levels of supply and demand, respectively, they are prone to periodic “overproduction” or “under consumption” crises; that is, capitalists produce more goods than they are able to sell. In the worst cases and particularly in relation to smaller firms, which cannot withstand losses, this leads to firms going bankrupt, making workers redundant, which can further reduce demand, leading to further overproduction,
and so on. The net effect of this is that big firms tend to buy out smaller firms, which go bust, generating a general tendency toward the concentration of capital in fewer hands.

These crisis tendencies, or at least their effect, might help to engender class consciousness in three ways. Firstly, they tend to polarize classes through the depression of wages and concentration of capital into fewer hands. The rich get richer, the poor get poorer, and the middle ground disappears.

Secondly, as workers are increasingly employed by the same limited and narrowing pool of employers it is easier for them to recognize their common position and interests. This is partly a subjective matter. It is easier for workers to see their common position when they all work for a small pool of capitalists. And this is greatly enhanced insofar as the concentration of capital and growth in the wealth of a few results in larger factories and industrial centers where large concentrations of workers rub shoulders and form solidaristic bonds. The process is also partly objective, however, in the respect that workers who work for the same employer do arguably have more similar interests than those who work for different employers. Workers in competing firms have at least some interest, at an individual level, in their firm doing better than the other. As they work for fewer and fewer bigger employers this conflict diminishes and their interests converge.

Finally, notwithstanding the considerable body of work on social movements which problematizes the idea that economic downturns necessarily have a radicalizing effect, Marx implies that the worsening of living conditions brought about by overproduction crises and wage depression will radicalize workers and make them more aware of both their interdependence with one another and their shared interdependence and antagonism with members of the capitalist class.

In *What is to be Done?* Lenin (1973) famously challenges Marx’s assumption that workers will arrive at a revolutionary consciousness under their own steam. Left to their own devices, he maintains, workers will only ever develop a “trade union consciousness”; that is, they will form groups (unions) to defend their interests but on a piecemeal basis and within the structure of capitalism. Workers will only become truly revolutionary, he maintains, through the mediation of a revolutionary party. This is one of several key disputes which have attached to the concept of class consciousness. Others center more squarely upon the issue of why revolutionary class consciousness has never developed in advanced capitalist societies, at least on any significant scale, and whether, in contemporary societies, subjective awareness of class is declining in both prevalence and significance.

Coalitions
NELLA VAN DYKE

Virtually all social movements involve organizations which sometimes work together on a common task, in what can be called a coalition. Coalitions take many forms; sometimes they are formal and endure for years, at other times they involve only temporary alliances that disband at the conclusion of an event. No matter what their form, coalitions are critically important for collective action, and a complete understanding of social movement dynamics is impossible without knowledge of organizational alliances and the factors that inspire or inhibit their formation.

Some of the largest protests in the world have been coordinated by organizational coalitions. In early 2003, as the United States prepared to go to war against Afghanistan, protests involving millions of people were staged by activists around the world on coordinated dates. Advances in communication and transportation technology facilitated these events, by allowing activists to form connections with one another at World Social Forums and elsewhere and continue interacting via the Internet. The common threat of a political administration’s planned war inspired their coordinated action. As this example illustrates, pre-existing social ties and a shared threat facilitated these massive global protests, and similar factors have influenced coalition formation around a variety of issues at different times. This entry will explore the social conditions that facilitate coalition formation, as well as the internal organizational factors that can inspire or inhibit collaboration.

Many factors influence an organization’s decision to participate in a coalition. Organizations may weigh the costs and benefits to collaboration, and if participating will bring needed resources, personnel, or mobilizing skills, they may decide to work in alliance. At other times collaboration may emerge less consciously, as groups with connections to one another decide to work together without much thought. However, cost–benefit analyses or ideological perspectives may inhibit coalition work. The decision to participate in a coalition is not without risks for a movement organization. Collaboration may drain critical resources from an organization, making organizational maintenance and survival difficult, if not impossible. Working with another organization may dilute a group’s collective identity, weakening the commitment of participants. An organization’s desired goals, tactics, and rhetorical frames may be changed as they attempt to find common ground with coalition partners. Thus, while the benefits to coalition work may seem obvious, the costs may also be great and inhibiting. Research on social movement coalitions is increasingly providing evidence on a number of factors that facilitate coalition formation, including social ties between organizational leaders, congruent ideologies and identities, and the presence of political opportunities or threats in the social environment. The literature on each of these topics is reviewed below.

SOCIAL TIES IN TIME AND SPACE

The research on individual protest participation has conclusively demonstrated that having ties to other activists or activist organizations is one of the strongest predictors of protest participation. Social networks provide people with information and often are an important source of social support. At the most fundamental level, individuals must know that a protest event is happening in order to attend it. Although this fact is often taken for granted, it is actually one of the strongest predictors of protest participation (Schussman & Soule 2005). Likewise, organizations must know of other organizations or else they are unlikely to ever connect with one
another for coalition work. Recent research (Obach 2010) demonstrates that social structures shape the organizational environment in profound ways, such that some organizations may never come into contact with others. Obach (2010) shows how the US government’s policy structure, wherein environmental issues are in a separate policy domain from labor issues, inhibits labor and environmental organizations from ever collaborating. Because of the structure of the organizational field, groups may never come into contact with each other, and may also come to frame the issues differently as they interact with policymakers and organizations focused on different issues. Thus, contact or at least knowledge of one another is probably the most fundamental facilitating condition for organizational collaboration.

Past contact and often collaboration between individual activists is an important facilitator of subsequent organizational coalitions. Corrigall-Brown and Meyer (2010) demonstrate that the organizers of the Win Without War coalition, opposing the recent American wars in the Gulf, had extensive ties to one another forged through their previous activist activities. The five founders of Win Without War had worked with one another previously on disarmament campaigns, and these five were in turn connected to another 24 of the organizations that ended up joining the coalition. Fully 71 percent of the organizations involved in the coalition were connected via these five individuals.

INTERNAL DYNAMICS

Organizations must share at least some common goals, consistent identities, and ideology in order to collaborate. We would never expect to see a pro-abortion organization working with one opposed to abortion rights. However, while a shared ideology may be critical to collaboration, many organizations share common goals and beliefs yet never come to work together. Research is only beginning to explore the ideological characteristics that facilitate coalition work. Assuming organizations share one basic goal, we can consider what elements of their ideology make them more likely coalition partners.

One ideological characteristic that makes an organization more likely to engage in coalition work is ideological breadth. Organizations with a broad, or multi-issue, focus are more likely to collaborate with others (Van Dyke 2003). Thus, the Students for a Democratic Society were a frequent collaborator on college campuses in the 1960s because of the organization’s broad focus and commitment to working on multiple issues, including the Vietnam War, civil rights, economic inequality, and so on.

However, even two chapters of the same organization, which thereby employ a very similar ideology and have consistent goals, may choose not to work with one another if group identities are incompatible. Thus, Reger (2002) shows how Cleveland-area NOW chapters had a history of not working together because class differences inhibited collaboration. Thus, status differences, whether they be based on gender, race or ethnicity, or some other social dimension, can get in the way of collaboration even in the face of almost exact issue foci and ideological orientations.

Roth (2010) shows how a failure to collaborate based on identity differences may be based on mobilizing philosophy rather than actual conflict or bias. In her examination of second-wave feminist organizing, she shows how women’s groups in the late 1960s and early 1970s failed to work together because they all shared an ideology of “organizing one’s own.” Black, white, and Chicana organizations chose not to pursue coalitions with women’s organizations from other racial and ethnic groups because each believed that women should organize on their own behalf, and that it was almost paternalistic for women to try to speak or take action on behalf of others. Lichterman (1995) similarly shows that an organizing philosophy that avoids outreach is unlikely to lead to cross-ethnic or racial collaboration. Thus, mobilizing philosophy is a critical ideological element that shapes coalition participation.
EXTERNAL FACILITATING FACTORS

While internal organizational characteristics, including ideology, identity, and the social ties of leadership, play a critical role in coalition formation, conditions in the external social environment also influence organizational collaboration. Both political opportunities and threats can play a critical role in coalition formation.

The literature on social movement emergence demonstrates that progressive movements are more likely to emerge when they enjoy political opportunities. When a group comes to enjoy a favorable political environment, including political allies or a decrease in repression, they are more likely to mobilize. At the same time, a growing body of literature demonstrates that political threats also inspire mobilization. For example, the threat of a new policy that is in opposition to a group’s goals may inspire mobilization, as can the threat or presence of a new antagonist or the actions of a countermovement. Just as the broader movements literature illustrates the mobilizing effect of political opportunities and threats, so too does the literature on coalition formation.

Staggenborg (1986), in her pioneering work on the abortion rights movement, shows that pro-choice groups sometimes formed coalitions when they felt that doing so would allow them to take advantage of a political opportunity. At other times, groups within the same movement would collaborate in order to gain strength in numbers to oppose some threatened antiabortion legislation.

McCammon and Campbell (2002), in their study of coalitions between suffragists and temperance activists, argue that threats may be especially mobilizing: “When movement actors are frustrated in attempts to achieve their goals . . . they will be more willing to seek out new strategies, including the strategy of collaboration with another movement.” Van Dyke (2003) similarly found that on American college campuses, student groups were more likely to work in coalition when faced with political threats than when faced with opportunities. Specifically, left-oriented student groups formed broad, cross-movement coalitions when facing a Republican in the White House, and within-movement coalitions formed in response to more local threats, including a hostile college administration or the activity of counterdemonstrators.

Almeida (2008) suggests that sometimes political opportunities and threats may combine to inspire coalition work. In his study of antiausterity mobilization in Latin America, he finds that the opening of political opportunities afforded by democratization combined with the threat of new economic austerity policies to inspire new alliances. He illustrates the power of coalitions by demonstrating that in Costa Rica, where movements formed coalitions with groups outside the public sector, the movements were better able to defeat the proposed austerity policy than in El Salvador, where movements failed to create broad coalitions. Thus, both political opportunities and threats can facilitate organizational collaboration, and sometimes it is a combination of both that inspires coalitions.

CONCLUSION

The modern era has seen some of the largest protests in world history, and these could not have occurred without the work of organizational coalitions. The research literature on social movement coalitions demonstrates that the coalitions that staged these events likely decided to work together through some combination of social ties, shared goals and facilitating ideologies, political opportunities to mobilize, and threatening political developments. We know well that organization is critical to mobilization, and that organizations provide one of the surest routes to participation. There is little question that organizational coalitions, therefore, play an important role in social mobilization. While the research literature has made great progress in illuminating the factors that give rise to coalitions, we need to further study how coalitions shape mobilization and the
outcomes of that mobilization. Contemporary events and coalitions will provide plenty of material to study.

Cognitive liberation
DOUG MCADAM

The concept of cognitive liberation was introduced by McAdam (1982) as one of the three central causal factors in his formulation of "political process theory." The term refers to the process by which members of some aggrieved group fashion the specific combination of shared understandings that are thought to undergird emergent collective action. In particular, McAdam (1982:51) argues that "before collective [action] . . . can get under way, people must collectively define their situations as unjust and subject to change through group action" (emphasis added). Thus it is the combination of perceived injustice and collective efficacy that is held to be the subjective linchpin of movement activity. Indeed, McAdam suggests that, notwithstanding the importance of the two more structural components of the model (e.g., political opportunities and established organizations), it is these shared understandings that are the key to movement emergence. As he writes: "while important, expanding political opportunities and indigenous organizations do not, in any simple sense, produce a social movement . . . Together they only offer insurgents a certain objective 'structural potential' for collective political action. Mediating between opportunity and action are people and the subjective meanings they attach to their situations" (1982: 48). So while the political process model has been roundly criticized for its "structural bias" (see, for example, Goodwin & Jasper 1999), in its original formulation, McAdam assigned central causal importance to processes of social construction and collective attribution. On the other hand, in using the term "cognitive liberation" to describe these processes, McAdam was clearly ignoring the emotional dimensions of collective action.

How does cognitive liberation compare to the more familiar concept of "collective action framing" (Snow et al. 1986; Snow & Benford 1988, 1992)? In general, scholars have equated framing with the conscious strategic efforts of activists to fashion shared interpretive frameworks that legitimate and motivate collective action. In other words, framing has been seen as an activity engaged in by groups that already define themselves as involved in struggle. One part of that struggle involves the group in conscious efforts to "frame" their activities in ways that resonate with various audiences (e.g., potential recruits, the media, policymakers, etc.) whom the group hopes to influence. The point is, for all their importance, these later framing efforts depend on earlier and far more contingent interpretive processes. Strategic framing implies adherence to a non-routine and conflictual definition of the situation. But this definition is itself a product of the logically prior processes of cognitive liberation described by McAdam.

Rather than the work on framing, the process of cognitive liberation is thus much closer in spirit and conception to work by scholars such as Gamson, Fireman, and Rytina (1982), and Walsh and Worland (1983). In their ingenious study, Gamson, Fireman, and Rytina recruited groups of people to take part in what they were told were focus groups designed to establish "local standards of moral behavior" to be used in a fictitious suit brought by an oil company attempting to end their franchise agreement with a gas station owner accused of violating the morals clause of the agreement. In fact, the people in the groups were really subjects in a natural experiment designed to see whether, when confronted with a clearly unfair process, they would "revolt" against the "unjust authorities" responsible for the injustice. Instead of being objective in their efforts to determine "local standards," those running the "focus groups" sought to manipulate and badger the subjects into accepting a definition of standards clearly in the interest of the oil company.
Despite the transparent abuse of the process, only a minority of the groups managed to mobilize around an emergent definition of the situation as “unjust.” In effect, the researchers were studying the conditions under which some groups managed to achieve “cognitive liberation.”

In their work Walsh and Warland (1983) document a dramatic upsurge in antinuclear activism in the wake of the 1979 accident at the Three Mile Island nuclear reactor near Harrisburg, Pennsylvania. They attribute the increase to what they term the “suddenly imposed grievances” generated by the near melt down of the reactor. But regardless of the term, their emphasis on the transformation of consciousness as a necessary prerequisite for movement activity bears a strong “family resemblance” to the process of cognitive liberation.

Examples of other transformations of consciousness linked to emergent collective action abound in the literature on social movements. In her account of the emergence of the women’s liberation movement, Evans (1979) documents an emerging sense of injustice on the part of women activists, shaped by their shared experience of discrimination in the male-dominated movements of the New Left. Historians of the embryonic women’s rights movement of the 1830s document a very similar process, in which female abolitionists, barred from full participation in movement activities, gradually came to see themselves as akin to slaves as a result of their second-class citizenship within the movement. This emergent consciousness fueled the rise of first wave feminism (Flexner 1959; Lerner 1971).

Collective action (collective behavior)
PAMELA OLIVER

Collective action is a fundamental to social movements. People in social movements do things that promote or resist social change, and the things they do are collective action. Social movements are made up of multiple collective actions. When we focus on collective action, we focus on how each individual march or rally or riot happened, and on the general principles about how they happened.

At its core, the concept of collective action means just what the words imply: anything people do in groups or with other people. Within this, some theoretical perspectives have emphasized a collective orientation or purpose of action, while others have emphasized its collective form (i.e., multiple people doing something together). Forms of collective action within social movements include spontaneous protests, lynchings, panics, riots, violent uprisings, public meetings, organized peaceful marches and demonstrations, vigils, fundraising campaigns, letter-writing campaigns, lobbying, charitable works such as providing meals at a soup kitchen or providing rides to women at night, spreading protest messages via Facebook or Twitter, holding meetings, giving press conferences, or twisting arms at city council meetings. Collective action can be done by spontaneous crowds and temporary gatherings, reform campaigns, charitable and voluntary organizations, institutionalized groups like labor unions or political parties, broad social change movements like civil rights, nationalist movements, ethnic conflict, religious groups ranging from institutionalized churches to small sects, and informal friendship groups or families. Actions with collective orientation or purpose can be individualized in form. Although some forms of collective action are more typically associated with social movements than others, there is no sharp disjuncture between the forms of collective action that occur within social movements and those that occur in other contexts.

To study collective action is to study the nuts and bolts of how people come to act together or for common purposes. This is the core stuff of the study of social movements. In a sense, all the other entries in this encyclopedia can be understood as speaking about collective action from different perspectives. This entry will focus on a few key issues that are most closely associated with the use of the term collective action. They are developed in this entry roughly in the order in which they developed in the sociological study of social movements:

• Collective action versus collective behavior
• Collective action as collective goods provision
• The key questions about collective action

COLLECTIVE ACTION VERSUS COLLECTIVE BEHAVIOR

Although they are now understood as synonyms, the terms “collective behavior” and “collective action” were associated with different theoretical traditions and sometimes understood as referring to different empirical phenomena, especially from 1939 to the early 1970s. “Collective behavior” was associated with theories that stressed the emergence of behavior in spontaneous crowds, especially violent crowds, and was viewed as a topic within social psychology, while “collective action” was associated with theories emphasizing purposive or goal-oriented behavior in protests and social movements and was used in economics, political science, and political sociology.
In a full text keyword search of sociology articles in JSTOR published before 1930, the two terms were used interchangeably in theoretical discussions of the formation of a social order and concerted action. For example, Robert Park’s 1927 article “Human Nature and Collective Behavior” used only “collective action” within the text. “Collective action” was also in descriptions of unions, strikes, and protests and to refer to social solutions to problems like unemployment; “collective behavior” was not used in such contexts.

The special meaning of “collective behavior” as denoting emergent, nonroutine or non-normative action and as referring specifically to empirical phenomena such as panics, fads, riots, and collective violence dates from Blumer’s influential textbook chapter titled Collective Behavior (1939) which was widely circulated in reprint through the 1970s. Blumer elaborated on Robert Park’s distinctions between crowd and public which, in turn, were based on works of Le Bon and Tarde and contrasted the unthinking and reactive behavior characteristic of crowds with the reasoned discourse and rational decision-making characteristic of the public (McPhail 1989). Park emphasized “circular reaction” as the central dynamic of crowd behavior, but it was Blumer’s influence that led a generation of sociologists to treat “collective behavior” as a distinct empirical phenomenon. Even Blumer’s 1939 article referred to collective behavior as the basis of all social life. But Blumer also distinguished the “elementary collective behavior” in crowds as being fundamentally different from the collective behavior of routine social life, and the term “collective behavior” came to be defined as referring to the kind of behavior that happens in crowds or other spontaneous face-to-face gatherings which, in turn, was defined as being nonroutine, nonnormative, and emergent. Subsequent scholars working in this tradition often critiqued or modified Blumer’s arguments and varied greatly among themselves in their central definitions and theoretical accounts of core processes (Turner & Killian 1957; Smelser 1962; Turner & Killian 1972), but shared a core assumption that the object of study was behavior that was spontaneous, emergent, disconnected from “ordinary” routines and life, and characterized more by emotion or simplistic thinking than by reasoned discussion. Collective behavior was recognized as a distinct subfield of sociological social psychology in textbooks and curricula.

Meanwhile, the term “collective action” continued to be used in economics, political science, and political sociology to refer to specific actions like strikes or protests, to labor unions generally, and to the general matter of social versus individual solutions to social problems. Especially after the 1965 publication of Mancur Olson’s The Logic of Collective Action, which had a major impact on the thinking of political scientists and political sociologists, the term “collective action” often came to be understood as referring specifically to actions that led to the provision of public or collective goods, that is, goods that are inherently shared and cannot be restricted only to those who paid for them.

These two traditions came into conflict in the wake of the civil rights and antiwar movements of the 1960s. A new generation of scholars identified positively with the 1960s movements and saw them as fundamentally rational attempts to pursue clear-cut policy goals and objected to portrayals of protests and even riots as “irrational” collective behavior, arguing that protesters and rioters were no less rational than the people studying them (Couch 1968; Currie & Skolnick 1970; McPhail 1989; McPhail 1991). In the 1970s, the new generation of resource mobilization scholars drew boundaries and distanced themselves from the term collective behavior and all it signified (McCarthy & Zald 1973; McCarthy & Zald 1977).

As the 1980s brought a new wave of scholars who criticized resource mobilization theory for its excessive emphasis on rational action and failure to engage issues of social construction and identity (e.g., Gamson 1992), the signification of contrasting collective behavior and collective action faded. It became well recognized
that there are important social construction processes involved in defining interests and goals as well as in defining collective identities and group boundaries. It became more acknowledged that not all collective actions are well-organized and orchestrated demonstrations, that there are processes of emergence in many collective actions, and that there were many insights into these processes in older works that deserved to be revisited by a newer generation of scholars. The terms once again were seen as synonyms but, consistent with older usage, with collective action being the dominant term for describing protest and collective behavior being used more by social psychologists and to describe apolitical behaviors like rumors and fads rather than protest.

COLLECTIVE ACTION AS THE PROVISION OF COLLECTIVE GOODS

As noted above, the term “collective action” has long been used in discussions of social policies and a tradition deriving from economics uses the term to refer specifically to the provision of a public or collective good. Mancur Olson’s *The Logic of Collective Action* (1965) brought this tradition to sociology and political science with great impact on the study of social movements. Olson specifically called attention to the “free rider problem,” wherein individuals interested in a collective good are motivated to let others pay the price to provide it, and argued that all group action for any common goal inherently invokes the free rider problem. Olson argued that this problem could only be solved with selective incentives, private goods that could reward contributors or punish noncontributors. Although subsequent scholars criticized Olson’s specific analysis of the free rider problem, and Olson himself only addressed the issue of the disjuncture between individual and group interests, not the problems and costs of coordinating action, Olson’s arguments had the crucial impact of problematizing the matter of collective action itself. Prior to Olson, social scientists tended to assume that an awareness of group or common interests would lead relatively automatically to collective action around those interests. After Olson, social scientists paid attention to the gap between interest and action, to the process of motivating and coordinating the action itself. Olson’s discussion of selective incentives inspired theoretical consideration of the kinds of side benefits that could motivate participation in collective action.

Some use the term “collective action theory” to refer to formal theories following in this tradition. Focusing on the problem of individual contributions to a collective good led to further considerations and elaborations. Instead of the narrow but easily-answered question of whether people will voluntarily make individual contributions to collective goods—sometimes they will and sometimes they won’t, it depends on them and the conditions—sociological theorists have sought to answer increasingly complex questions about what conditions foster collective action. The line of work called critical mass theory focused attention on the dimensions of differences in collective action problems and the importance of organizers, role differentiation, and the complexities of multi-step mobilizations in which some people organize themselves to create a system that motivates other people to provide a collective good. Other lines of collective action theory incorporated more complex models of human decision-making, including models of adaptive learning and normative influence. Increasing attention was devoted to the structural, distributional, and network properties of groups to assess how they fostered or hindered collective action.

Although most of this work has been abstract and theoretical, there has been relevant empirical work. Experiments have tested the conditions under which experimental subjects will make individual contributions to collective goods, generating findings that suggest that most people operate under decision rules that will promote collective action when there is
some normative basis for expecting cooperation by others (de Rooij, Green, & Gerber 2009). Survey researchers have asked people specific questions about their perceptions of individual and collective costs and benefits, generally finding that people’s assessments of the value of the collective good and the efficacy of action for providing it are more important than their individualized cost/benefit calculations (e.g., Muller & Opp 1986; Opp 1988). A particularly important line of empirical and theoretical work focuses on the conditions that permit communities to effectively manage common resources and avoid environmental degradation (Ostrom 1999). Beyond these explicit traditions, there is a much broader body of research that takes for granted that collective action occurs in goal-oriented contexts and pays attention to the ways the goals motivate action or the ways action does or does not accomplish the goals. Sometimes consciously and sometimes implicitly, this tradition of thinking was essentially rationalist, in that it assumed the purpose of collective action was the achievement of some policy or social change goal, or the provision of some collective good.

COLLECTIVE ACTION AS A FOCUS OF RESEARCH

Collective action research seeks to identify the general principles or patterns of collective action. That is, it is focused on how a single collective action happens in general, the conditions that promote or hinder it, and the ways in which one collective action influences future actions. Within social movements research, this is often called the problem of mobilization: how do the people and the resources get together and coordinate their actions. This “how does it happen?” is the same question that animated collective behavior research between 1940 and 1970. Understanding collective action entails a number of key questions:

1. What actually happens in collective action? What do people do? What is the variability among people in what they do?

2. Why do people act? What motives or interests undergird collective action? What is the relation between individual interests and collective interests? What motives matter besides interests? Do people bring their motives and interests to collective action or are motives and interests created within the creation of the collective action?

3. What kinds of human collectivities or groups do collective action and how is collective action shaped by the type of group doing it? The different kinds of collectivities or groups include formal organizations and coalitions or networks of organizations, informal groups, diffuse networks of individual people, temporary gatherings, and virtual groups created through remote communication technologies.

4. Does collective action require that people have a group or collective identity, a sense of themselves as all being part of some collective entity? How does collective action build on collective identities? How are collective identities created and changed in the process of collective action?

5. How do people get connected with other people so they can act collectively? How do organizations, social networks, communication processes, and communication technologies undergird and shape collective action?

6. What is the role and significance of organizers, the people who focus their efforts on organizing and coordinating other people into collective action?

7. What are the important types or dimensions of difference among collective actions? One dimension of difference is the level of coordination required and the complexity of the action, for example, parallel actions like writing letters versus complex events requiring role differentiation and sequencing like a major demonstration. Another is the type of individual action or resource required, for example, giving money versus marching in a demonstration versus cooking food for the homeless versus going to meetings. Another is
the type of group that does the action, for example, formal organizations versus temporary gatherings. Another is the extent to which the actions are consistent with carrying on an ordinary life versus requiring a choice between ordinary life and the collective action.

These broad questions permeate the study of collective action in social movements and are addressed by many other entries in this encyclopedia. An introduction to them can be found in texts and resource books such as Snow, Soule, and Kriesi (2004) and della Porta and Diani (2006). Different theories of collective action have focused on different parts of the problem, different forms of collective action, or different core assumptions about which aspects of collective action are problematic or unproblematic.

Collective efficacy
BERT KLANDERMANS

Although it would be hard to deny that people who take part in protest activities are aggrieved, grievances do not provide a sufficient reason to participate in collective action. Resource mobilization theorists argue that grievances abound, whereas collective action does not. Therefore, they reason, the key question that needs to be addressed is not whether people are aggrieved, but why some aggrieved people become mobilized, while others do not. Resource mobilization and political process theorists have suggested respectively that the availability of resources and the presence of opportunities play a key role. Groups that have more resources and more opportunities are more likely to succeed in mobilizing collective action. Furthermore, Klandermans (1997) has shown that people are more likely to participate in movement activities when they believe that this will help to redress their grievances at affordable costs. Simon and colleagues (1998) have labeled this the instrumental pathway to movement participation. For the instrumental pathway the key component is collective efficacy – an individual’s expectation that collective action participation can make a difference and bring about the desired changes. The more effective an individual believes collective action participation to be, the more likely s/he is to participate.

In his classic 1984 American Sociological Review article Klandermans breaks collective efficacy down into three different expectations: expectations about the behavior of others; the expectation that the action goal will be reached if many others participate; and, the expectation that one’s own participation will increase the likelihood of success. Such expectations are formed in interactions within social networks and micro-mobilization structures. A spectacular example of how success expectations are formed is reported by Zhao (1998) in his description of the mobilization for a student demonstration in Beijing. On campus, looking from their dorm windows down into the streets, students could literally see the demonstration building up. In their 2008 American Sociological Review article Klandermans et al. demonstrated the crucial role of social embeddedness in the formation of success expectations. In a way, this is nothing new. As early as 1965, Almond and Verba observed a positive correlation between active engagement in voluntary associations and subjective political competence. They argued that by engaging in voluntary associations people learn about the working of political institutions. This became known as social capital, defined by Lin (1999:35) as “resources embedded in a social structure which are accessed and/or mobilized in purposive actions.” McClurg (2003) showed that the effect of interaction in social networks on the propensity to participate in politics is contingent on the amount of political discussion that occurs in social networks and the information that people are able to gather about politics as a result. This provides support for Almond and Verba’s initial observation that people learn about politics from participation in voluntary associations. The question of whether the influence of participation in civil society also holds for unconventional political participation (demonstrating, boycotting, protesting) remained to be answered. Paxton (2002) explored this question at an aggregate level. She argued that associational life accumulates social capital, which “provides space for the creation and dissemination of discourse critical of the present government, and it provides a way for active opposition to the regime to grow” (257). In other words, civil society provides the resources necessary for opposition movements and collective action. This argument was supported by results from two studies of associational life, conducted among
different samples from countries around the world. This leads to the conclusion that embeddedness in social networks fosters conventional and unconventional political participation.

What Paxton demonstrated at an aggregate level, Klandermans et al. (2008) showed at the individual level. In a study among immigrants, social embeddedness and efficacy appeared to maintain a tight reciprocal relationship, such that immigrants who felt more efficacious were also more embedded in social networks, and vice versa. At the same time, the link between efficacy and participation was moderated by social embeddedness: efficacy translated into participation only among immigrants who were involved in civil society. In addition, the authors reported findings supporting McClurg’s assumption that discussions about politics make people more aware of the working of political processes and therefore made people feel efficacious. This is the more interesting because feelings of efficacy seem to control whether grievances generate fear or anger. Immigrants who felt discriminated against because of their ethnic background displayed anger if they felt politically efficacious, and displayed fear if they did not feel efficacious. This is in line with prior research showing that efficacy was associated with anger but not fear, while lack of efficacy is associated with fear but not anger. Hence, anger and efficacy appear to mutually reinforce the relationship with collective action participation. All this suggests that whether grievances translate into collective action depends on the extent to which people feel efficacious. Depending on such feelings grievances generate fear or anger. Grievances are discussed in people’s social networks and the feelings of efficacy of the people who take part in the discussion influence what emotions they display. The more efficacious they feel, the angrier they will be – both efficacy and anger will strengthen people’s motivation to take part in collective action.

Collective identity
JACQUELIEN VAN STEKELENBURG

From the 1980s onward movement scholars have increasingly emphasized the significance of collective identity as a factor stimulating protest participation. Sociologists were among the first to emphasize the importance of collective identity in protest participation. They argued that the generation of a collective identity is crucial for a movement to emerge (Taylor & Whittier 1992). Similarly, social psychological studies report consistently that the more people identify with a group the more they are inclined to protest on behalf of that group (e.g., Reicher 1996; Simon et al. 1998). Apparently, identification with a group is an important reason why people participate in protest on behalf of that group. In order to understand why, we must elaborate the identity concept.

Identity is our understanding of who we are and who other people are, and, reciprocally other people’s understanding of themselves and others. As for “understanding who we are” Klandermans and de Weerd (2000) distinguish an individual personal level and a collective group level. For the individual level they rely on the distinction made by Tajfel and Turner (1979), who argue that a person has one personal and several social identities whereby a personal identity refers to self-definition in terms of personal attributes, and social identity refers to self-definition in terms of social category memberships. Collective identity at the collective group level concerns “the shared definition of a group that derives from members’ common interests, experiences, and solidarity” (Taylor & Whittier 1992). According to Klandermans and de Weerd, group identification forms the link between collective and social identity, and thus forms the bridge between the individual and collective level of identity. Different levels of identity require different levels of analyses. A group’s collective identity can be studied by examining such phenomena as the group’s symbols, rituals, beliefs, and the values its members share. An individual’s identification with a group can be studied in its own right as well as by examining the individual’s beliefs, sentiments, commitment to the group, use of symbols, participation in rituals, and so on.

The literature on collective identity and social movements is extensive; this contribution therefore only touches upon a few movement dynamics in which identity may operate (for overviews see Stryker et al. 2000; and more recently Snow 2013; Taylor 2013). The first section focuses on the identity–protest link, followed by the influence of the sociopolitical context on the politicization of identities, and finally a section on “identities of the future,” that is, how more “liquid” identities in contrast to the traditionally more “solid” identities “work” and affect social change.

IDENTITY AND PROTEST

Social movements are built on identities and they are populated by people who identify with the collectivity and the movement. Identity is thus simultaneously a characteristic of collectivities and people. There exists a division of labor between movement scholars of identities. Sociologists tend to study identity at the collective level on the supply side of contentious politics, while social psychologists typically focus on the individual level of social identity and group identification at the demand side of politics. This division of labor affects the study of this phenomenon conceptually and empirically (see the entry on Politicized identity for a similar argument regarding politicized identity).

Collective identity. Collective identity is conceived as an emergent group phenomenon. Melucci (1989: 793) refers to the process of collective identity: “Collective identity is an interactive, shared definition of the field of
opportunities and constraints offered to collective action produced by several individuals that must be conceived as a process because it is constructed and negotiated by repeated activation of the relationships that link individuals to groups." Hence, identity is not a given fact; identity is a practical accomplishment, a process. Identifying ourselves or others is a matter of meaning, and meaning always involves interaction: agreement and disagreement, convention and innovation, communication and negotiation (Jenkins 2004). Taylor and Whittier (1992) show how strong bonds existing in social networks contribute to the formation and politicization of collective identities. Within these networks individuals come to see themselves as part of a group when some shared characteristic becomes salient and is defined as important. As a result, boundaries are drawn between “a challenging and a dominant group” (175). These boundaries are not clear-cut, stable, and objectively given, but exist in the shared meaning attributed to group membership by group members. The second component is consciousness. Consciousness consists of both raising awareness of group membership and the realization of the group’s position within society, in comparison to other groups. This position must be perceived as illegitimate or unjust to make group membership politically relevant. The third component is negotiation. Within their networks, people negotiate in order to change symbolic meanings of daily life’s thinking and acting “the politicization of daily life.” The politicization of identities unfolds as a sequence of politicizing events that gradually transform the group’s relationship to its social environment. Hence, collective action can be an important instrument to change collective identities. As the Elaborated Social Identity Model (Reicher 1996) holds: “identities should be understood not simply as a set of cognitions but as practical projects.” In this account, identities and practice are in reciprocal interaction, each mutually enabling and constraining the other. In other words, collective identities are constantly “under construction” and collective action is one of the factors that shape collective identity. Taylor (2013) therefore conceives of social movements as discursive communities held together not only by common action and bonds of solidarity, but by identities, symbols, shared identity discourse, and practices of everyday life that attribute participants’ experiences to particular forms of social injustice. In movements that frame injustice in terms of identity politics, identity strategies provide a crucial link between individual and collective identity (Taylor 2013). Identity strategies include “individual or group disclosure of identity with the aim of producing change in how individuals understand and feel about their identity, in how the group is defined in the larger culture, or in the politics of state and other institutions” (Whittier 2011: 4, in Taylor 2013).

Social identity. In the late seventies, a social psychological identity perspective on protest emerged in the form of social identity theory (SIT) (Tajfel & Turner 1979). Social identity is seen as a cognitive entity; if social identity becomes more salient than personal identity, then people see themselves less as unique individuals and more as the prototypical representatives of their in-group. When social identity becomes more salient than personal identity, people think, feel, and act as members of their group. Hence, the notion of identity involves two criteria of comparison between people: “sameness” and “distinctiveness.” Tajfel and Turner (1979) showed that social categorization according to some trivial criterion such as the “blue” or the “red” group suffices to make people feel, think, and act as a group member. SIT proposes that people generally strive for and benefit from positive social identities associated with their groups. The only way for participants in minimal group studies to obtain a positive social identity is by identifying with the groups into which they are categorized, and then ensuring that their group comes off best in the only available comparison between the groups (i.e., giving more rewards to the in-group than the out-group). Compared to this “minimal group paradigm,” real-world intergroup conflicts with histories
and the high emotional intensity attached to them, and sociopolitical consequences can be seen as “maximal group paradigms” that bring group membership powerfully to mind. Why would people identify with groups that reflect negatively on them (e.g., disadvantaged or low-status groups)? SIT’s answer is that three social structural characteristics affect how people manage their identity threats. The first characteristic is permeability of the group boundaries. Permeable group boundaries allow disadvantaged group members to leave their group for a higher status group, whereas impermeable boundaries offer no such “exit.” When people do not perceive possibilities to join a higher status group, they might feel commitment to the lower status group. The second characteristic is stability. People who conceive status positions as variable see protest as a possible method to heighten group status, especially when the low group status is perceived as illegitimate. Members of a low-status group who perceive the dominant group’s position as illegitimate and unstable can use a variety of strategies to obtain a more positive social identity. They may, for instance, redefine characteristics of their own group previously seen as negative (Black is beautiful!), or they may engage in social competition of which protest is the clearest expression.

Group identification. Group identification links social identity to collective identity and is the social psychological answer to the question of what drives people to participate in protest. Because it bridges individual and collective identity processes, the stronger the group identification, the more shared beliefs and fate are incorporated in the individual’s social identity and the more people are prepared to take action on behalf of the group. However, individuals do not incorporate the complete picture but rather a selection of what a collective identity encompasses. These idiosyncratic remakes of collective beliefs at the individual level create variety in the content of the social identity. Indeed, not all Muslims have identical social identities, yet they do feel like Muslims. The same holds for Hispanics, workers, and women, for example. Huddy (2003) argues that it is not group identification per se but the strength of such identification that influences group members’ readiness to view themselves and act in terms of their group membership. She criticizes social identity literature for neglecting the fact that real-world identities vary in strength; identifying more or less strongly with a group, she argues, may make a real difference, especially in political contexts. Related to this point is the fact that identity strength is related to identity choice. Huddy distinguishes between ascribed and acquired group membership, ascribed identities are “quite difficult to change, and acquired identities are adopted by choice” (2003: 536). Group identification tends to increase in strength when it is voluntary. Membership in a social movement organization can be seen as a prototypical example of a voluntarily acquired, hence strong, identity. Social movement participation may help people to change their stigmatized or “spoiled” imposed identities into strong and empowered social movement identities.

Dual and multiple identities. Work on multiple identities moves beyond attention to singular identities and emphasizes that people can hold many different identities at the same time, which may come into conflict or may push in the same direction. The intersectional approach emphasizes the conflictual side of multiple identities at the group level. This approach argues that when activists work to create solidarity among diverse constituencies and struggle to represent themselves as similar to or different from those they oppose or seek to influence, there is always the potential for disagreement and conflict, and the construction of collective identity becomes challenging. Cross-pressure means identity conflict at the individual level; when two of the groups people identify with end up on opposite sides of a controversy (for example, union members who are faced with the decision to strike against their company), people might find themselves under cross-pressure. Indeed, workers who go on strike or movement activists who challenge their government are often accused of being
disloyal to the company or the country. Advocates of multiple identities, on the other hand, have high hopes for the social and political relevance of dual identities (González & Brown 2003). They hold that a “dual identity” is the desirable configuration as it implies sufficient identification with one’s own group to experience some basic security and sufficient identification with the overarching identity to preclude divisiveness. Multiple identities are thus – in the words of González and Brown – potentially highly conducive to democratic politics. There is evidence that immigrants who display a dual identity are more inclined to take to the streets on behalf of their group. Immigrants who display a dual identification tend to be more satisfied with their situation than those who do not display such identity, but if they are dissatisfied they will be more likely to participate in protest (Klandermans et al. 2008).

COLLECTIVE IDENTITIES AND CLEAVAGES

The fact that people have many collective identities raises the question of why some collective identities become central to mobilization while others do not. People have many identities that remain latent most of the time. Social identity theory (Tajfel & Turner 1979) hypothesizes that, depending on contextual circumstances, the transition from an “I” to a “we” as locus of self-definition occurs, and thus a social identity becomes salient. A particular identity is said to be salient if it is “functioning psychologically to increase the influence of one’s membership in that group on perception and behavior” (Turner et al. 1987: 118). What makes a dormant identity salient and spurs action on behalf of that identity? Besides contextual factors and direct reminders, the presence of other in-group members can be a potent reminder of someone’s social identity, the more so if the members are aiming at a common goal. The presence of an out-group will also remind people of their in-group identity. Another effective prompt is being treated as a member of a minority. Although all these reminders can make a social identity salient, probably the most powerful factor that brings group membership to mind is conflict or rivalry between groups. Sociopolitical conflicts don’t emerge randomly, but in the context of ongoing, unequal power relations rooted in structural and cultural cleavages in society. These cleavages operate as fault lines along which opposing identities emerge and organizational fields break up, and thus create a demand and supply for politics. Why do sociopolitical conflicts emerge in the context of social cleavages? This can be explained in terms of salience, embeddedness and shared fate, and movement–countermovement dynamics.

Salience. The more salient a cleavage the denser the multi-organizational field linked to that cleavage, and the more “ready” its mobilization potential is to act in response to that cleavage. In fact, the salience of a cleavage reflects a strongly elaborated supply and a well-defined demand of protest. Hence, identities rooted in cleavages are often organized identities and organized identities are more likely to mobilize than unorganized identities. According to Klandermans and de Weerd (2000), this makes sense because being organized implies communication networks, access to resources, interpersonal control, information about opportunities when, where, and how to act, and all those other things that make it more likely that intentions materialize, facilitated by a collective memory on who “we” are, what “we” are prepared to fight for, and, perhaps most important, how “we” usually take arms. That is why anarchists fight the police during summit protests while unionists strike in the face of factory closings and mass redundancies (Taylor 2013).

Embeddedness and shared fate. Simon and colleagues (1998) describe identity as a place in society. A place is a metaphorical expression and concerns people’s social embeddedness, that is the networks, organizations, associations, groups, and categories of which they are members. People are not randomly embedded in society; cleavages affect the formal and
informal networks in which people are embedded (cf. Klandermans, van der Toorn, & Van Stekelenburg 2008), and nowadays this process is complemented by embeddedness in virtual networks (Van Stekelenburg & Boekkooi 2013) which reflect traditional and new cleavages of the physical world. Social cleavages may give rise to shared fate, because cleavages determine people’s place in society; a place shared with others, which leads to shared experiences and grievances. People share interests and identify and associate almost exclusively with other members of “their” group. Hence, cleavages create “communities of shared fate” and “sameness” within cleavages and “distinctiveness” between cleavages, and as such create identities and opposing identities. The more salient a cleavage, the more organizations will attempt to politicize the shared fate of people embedded in that cleavage. Organizers play a crucial role in this transformation of “readiness” into action. In order to mobilize potential constituencies, organizers must develop master frames that link a conflict to “their” cleavage. Hence, organizers may frame the same conflict in different terms. Inequality, for instance, can be framed in terms of “class” or “ethnicity.” The more salient a cleavage and the better organizers align the conflict to “their” cleavage – the more their frames “resonate” – the more successful their mobilization attempts. Traditionally, mobilization emerged around social divisions between class, religion, and region; separate collective identities emerged and divided sections of political and social organizations developed. But Western societies have undergone far-reaching social and cultural transformations. In contemporary Western societies, traditional cleavages are replaced, complemented or cut across by new cleavages such as post-materialism versus materialism and the “winners” versus the “losers” of modernity. In addition to the “old” cleavages, new identities and grievances evolved around these new cleavages and politicized into new social movements.

Movement–countermovement dynamics. There is substantial evidence that cleavages alter conflict behavior via increased ease of mobilization. The argument is typically given as follows. If conflicts flare up, the locus of self-definition shifts from “I” to “we” (Tajfel & Turner 1979). The opposing groups develop their ideas and actions in reaction to each other and the perceived opposition. Both groups assert that what “we” stand for is threatened by “them,” tribute is been paid to in-group symbols and values, and the out-group is derogated. In such conflicts group members define themselves in (an opposing) relation to other conflicting groups. Take for instance the pro-life and the pro-choice movement and how they have “kept each other alive.” Movement–countermovement dynamics can shape a movement’s collective identity (Einwohner 2002). First of all, the presence of powerful opponents makes identities more salient for activists. Second, polarization induces a strategic reformulation of “who we are.” Einwohner (2002), for instance, shows how animal rights activists responded to opponents’ claims that they were overly emotional by presenting alternate identity characteristics to the public, while in private they often embraced the “emotional” characterization. Thus, the more salient a cleavage the more polarized the multiple organizational fields and the more strongly politicized its related collective identities.

IDENTITIES OF THE FUTURE

The foregoing has demonstrated the role of identity in spurring social movement participation. Indeed, collective action is contingent upon seeing the self as part of a group, while acting collectively requires some collective identity or consciousness (Klandermans & de Weerd 2000). The role of identification in movement participation is not simply a matter of on/off. Indeed, the influence of identity strength, identity salience, multiple identities, and sociopolitical context reveal that the role of identity on collective action participation is dynamic and multifaceted.

However, the pace and global character of social change force us to be more reflexive
about processes of action and identity. In late modern societies people are becoming increasingly connected as *individuals* rather than as members of a community or group, they operate their own personal – physical and virtual – networks. Traditional “greedy” institutions such as political parties, trade unions, and churches which made significant demands on members’ time, loyalty, and energy are replaced by “light” groups and associations that are less demanding, easy to join, and easy to leave. It is thus arguable that society is becoming increasingly organized around networked individuals rather than groups or local solidarities, and connections are more flexible than fixed. Despite this process of individualization, people in late modern societies are still committed to collective causes. Underlying this, is what Lichterman (1996) calls “personalism”: people feel a personal sense of political responsibility rather than feeling restricted or obliged to a community or group. Personalism affects the “greediness” of organizations or groups, because the individual rather than an organization or network determines the level of “greediness.” Hence, concepts such as “traditional” vs. “new”, and “formal” vs. “informal” do not automatically align with being either less demanding or greedy. In fact, some informal groups such as anarchist subcultures can be greedy, while membership of some formal traditional groups such as “checkbook membership” of political parties can be less demanding. So, what matters is the strength of the identity rather than whether a group is traditional or “new,” or formal or informal (Van Stekelenburg & Boekkooi 2013). Although our understanding of the traditional collective identity–protest link is rather elaborated, it is unclear whether researchers should revise their understanding of collective identity to meet these challenges. Indeed, how contemporary fluid identities “work” and affect social change and to what extent our traditional “collective identity models” are able to capture these identity processes is a question yet to be answered.

Collective memory and social movements
LORENZO ZAMPONI

The widespread interest in the processes of construction of collective identities, typical of the most recent scholarship on social movements (Polletta & Jasper 2001), focusing on the symbolic dimension of collective action, has been the bridge across which collective memory entered the study of social movements.

In this context, memory studies, and in particular the sociology of memory based on the seminal work of Maurice Halbwachs, have become a fundamental tool for the development of research on social movements. This relationship also works the other way around: scholarship on contentious politics has been a model for the study of contention in the memory field (Jansen 2007).

The definition of collective memory as the set of symbols and practices referring to the past which are shared by a community of people, commonly used by most scholars (Kansteiner 2002; Aguilar 2008), has required researchers to face the problem of pluralism: different communities refer to different sets of symbols and practices, and the same individual can belong to more than one group, developing a multi-level identity based on different mnemonic practices. This line of work has challenged the common-sense idea of a unique shared memory linked to national identity, and has put together a set of definitions able to account for the intrinsic pluralism of memory. Thus, collective memory is now defined as the memory shared by a community or a group, social memory as the memory spread across the entire society, and public memory as that part of the latter which refers to the public sphere (Jedlowski 2007).

The study of collective memory has been characterized by two main approaches: the individualistic perspective, based on psychology, that considers collective memory to be an “aggregation of socially framed individual memories” and focuses on “neurological and cognitive factors,” and the collectivistic perspective, rooted in the Durkheimian sociological tradition, that “refers to collective phenomena sui generis” and emphasizes “the social and cultural patterns of public and personal memory” (Olick 1999: 333).

This distinction between collected and collective memory is based on “two radically different concepts of culture”: “one that sees culture as a subjective category of meanings contained in people’s minds versus one that sees culture as patterns of publicly available symbols objectified in society” (Olick 1999: 336).

The contemporary sociology of memory is, for the most part, rooted in the Durkheimian perspective started by Halbwachs, focusing on “public discourses about the past as wholes” and on “narratives and images of the past that speak in the name of collectivities,” in order to resist the temptation of methodological individualism and “sociobiological reductionism” and to defend the relevance of the historical context (Olick 1999: 345). Nevertheless, there is an increasing interest in the effort to combine the two approaches in the construction of a new “historical sociology of mnemonic practices” (Olick & Robbins 1998: 105), able to take into account both public and private contexts and factors.

This debate, situated in the so-called “new political culture” perspective, which calls for a new interest in the role of culture in politics and in particular in the “symbolic structuring of political discourse” (Olick 1999: 337), echoes the topics of the cultural turn in social movement studies, and the interest in the symbolic construction of conflict. Some scholars, for example, have recently pointed out the role of external cultural factors in structuring the symbolic environment in which the collective
identity-building process takes place. Among these factors, collective memories (Polletta 2004: 100–101) and protest traditions (Morris 2004: 243–245) are particularly relevant. As Polletta pointed out, explaining the cultural dimension of structural opportunities, “these traditions, principles, codes and arrangements cannot easily be ‘thought away’ by insurgents. They are supra-individual and constrain individual action” (Polletta 2004: 101). This last point is often underestimated: memory can help collective action by drawing on symbolic material from the past, but at the same time can constrain people’s ability to mobilize, imposing proscriptions (taboos and prohibitions) and prescriptions (duties and requirements) (Olick & Levy 1997).

The contentious nature of memory and the dynamic definition of identity are now recognized by most of the scholarship. Memory, as identity, is a pluralistic field, continually reproduced in a social process involving a plurality of actors, none of which, usually, can completely control the results of the process, and each of which must deal with the “existing cultural material” (Tonello 2003: 118).

The field of public memory is structured by the conflict between different narratives of the past, each one struggling for a group’s position inside the public sphere. If memory is strategic for setting the criteria of plausibility and relevance, then the narrative which succeeds in imposing itself can grant legitimacy and symbolic power in the public sphere to the group to which it belongs. From this point of view, the common notion of “distortion” does not make any sense: “Memory is distortion since memory is invariably and inevitably selective. . . . memory is a process of encoding information, storing information, and strategically retrieving information, and there are social, psychological, and historical influences at each point” (Schudson 1995: 348).

The goal of the social researcher, therefore, is to analyze the processes of distortion that constitute memory, in order to identify recurrent mechanisms and agents involved in them. This distortion is sometimes part of a specific cultural and political project, that may or may not succeed, but often is the result of a complex casual interaction between different factors, involving diverse agents carrying their own interests and goals. Collective memory is “as much a result of conscious manipulation as unconscious absorption and it is always mediated” (Kansteiner 2002: 180).

Social movements provide a good example for pointing out what is missing in collective memory studies: while there exists a strong and developed literature on official state-controlled memory and on resisting popular memory, there is little on what happens in the middle of these two extremes. How does the process of memory building work? Which actors are likely to be successful in the attempt to impose their narrative? Which mechanisms determine their outcomes, and why, or, at least, under which conditions? And how does this process influence the identity-building process of contemporary actors in the same field? At the same time, social movements act in a symbolically constructed world, of which public memory forms an important part. They are, therefore, a somewhat peculiar social actor, whose relationship with memory can be examined in both directions: social movements can be analyzed as mnemonic agents in the arena of public memory and collective memories can be studied as a strategic feature in the building of a group’s identity.

The media, and in particular the discursive material that it produces, is relevant to the analysis of public memory for similar reasons to those that make it relevant to social movement studies. The role of the media, in fact, is fundamental in framing and shaping the identity of a movement (Gamson 2004), often using a narrative format, that is considered the most natural format of contemporary media (Bird & Dardenne 1988). Therefore, the capacity to adapt to a narrative format is a central resource for success in the field of public memory for a mnemonic project as well as for accessing the audience of a social movement. This format is not arbitrarily created by the media, but
comes from a tradition of narrative conventions. In turn, “such media-shaped perceptions may then become part of the common cultural framework, to be drawn on again by journalists in a continuing dialectical process” (Bird & Dardenne 1988: 82). Thus, the practices of remembrance need to be placed in a mediatized public space, in which the media, as “a master arena” of public discourse (Gamson 2004: 243) is the main repertoire of social representations of the past which people draw on when they need to (Zelizer 2008).

The use of the past in order to contextualize present events by the media has been acknowledged by many scholars (Edy 2006; Zelizer 2008), while more work needs to be done in order to more fully understand how the mnemonic repertoires to which the media refers are constructed, how the media reshapes the memory it uses, and how these processes influence and constrain the public action of present social actors. Scholars have acknowledged memory among the factors involved in social contention (Harris 2006; Meyer 2006; Polletta 2006), but more work needs to be done, in particular with regard to the influence of the representation of past social movements in the collective identities developed by contemporary movements.

This process involves movements with both a passive and an active role: the past, in particular the memory of past social movements, is the lens used by the media to analyze and represent every movement (Edy 2006), and the movements participate in the construction of this lens, choosing strategically the representation of the past more useful to their goals.

Memory is at the same time an outcome of protest and a tool in constructing new mobilizations, and in the last few years the active role of social movements in the processes that lead to the construction of public memory as a symbolic environment has been acknowledged: an event, to become relevant in the field of public memory, needs “social appropriation” (Harris 2006: 19). Collective memory is not an automatic outcome of protest, but the result of a specific “memory work” (Jansen 2007: 953), depending on different factors: Armstrong and Crage (2006: 726–727) identified, among these factors, the “commemorability” of an event, the “mnemonic capacity” of a movement, the “resonance” in the audience produced by the chosen “commemorative form” and the potential for “institutionalization” of this form (Armstrong & Crage 2006: 726–727), providing the bases for an analytical model aiming to explain why and how a specific event has success in being socially remembered.

Movements can challenge the hegemonic representation of their antecedents, as reported by the media, or distance themselves from them. A movement can adopt old symbols, traditionally far from its identity, and charge them with new meanings (Fantasia & Hirsch 1995). Likewise, an episode from the past can become part of a new narrative (Jansens 2007). The contemporary debate in the field is focused, among other topics, on the limits of this memory work. How manipulable is the past? Recent studies have challenged the most radically constructionist assumptions, underlining the path-dependency of memory work and the limited malleability of the historical material (Spillman 1998), while calling for a strategic approach, able to take into account the “limited set of symbolic conditions that both constrain and enable particular options for memory work” (Jansen 2007: 993). An analysis of these mechanisms could be very useful for understanding how the relationship between social movements and collective memory works, showing the results of the movements’ work as mnemonic agents and the consequence of this process on the symbolic construction of contemporary conflict.

Commitment
SHARON ERICKSON NEPSTAD

Once individuals have been recruited into a social movement, their ongoing engagement is dependent on a number of factors, including the strength of their commitment. Movement commitment is shaped by individual-level factors as well as movement practices.

COMPONENTS OF COMMITMENT

Drawing upon research from organizational psychology, Bert Klandermans (1997) has argued that there are three elements of social movement commitment. First, there is an affective component, referring to the degree of emotional attachment to the movement. Affective commitment forms when people receive material or cultural rewards from participation. It can also develop through close friendship ties to other activists (Taylor 1989; Nepstad 2004a) and to movement leaders (Barkan, Cohn, & Whitaker 1993). Second, there is a continuance component that reflects the potential costs incurred by leaving a movement; these costs may persuade individuals to remain engaged. Continuance commitment can develop when people take extraordinary measures to further movement goals—such as serving prison terms, giving up careers or valued personal possessions, or jeopardizing their own physical safety (Kanter 1968; della Porta 1992). This strengthens commitment since activists do not want their sacrifices to be in vain should the movement fail. Third, there is a normative component that refers to the moral obligation to continue fighting for a movement’s cause. Normative commitment develops by framing ongoing movement participation as consistent with ideological or religious imperatives.

FACTORS THAT UNDERMINE COMMITMENT

Even when all three components of commitment are robust, certain circumstances can weaken recruits’ engagement. These circumstances include increasing life responsibilities, such as full-time employment and family obligations, which may limit the amount of time that people can devote to activism (Downton & Wehr 1997). Additionally, some recruits drop out if their significant others oppose their activism (Aho 1994) or if they lose a sense of efficacy, no longer believing that the movement can achieve its goals (Zald & Ash 1966). Commitment can also dissipate as activists experience burn out, which occurs when movement participation generates high levels of psychological tension or incurs significant costs (Klandermans 1997). Still others may shift their engagement to different causes due to competition from new movements and voluntary associations (Cress, McPherson, & Rotolo 1997).

FACTORS ASSOCIATED WITH PERSISTENT MOVEMENT PARTICIPATION

There are several individual-level factors associated with persistent movement commitment, even in the face of countervailing forces such as those described above. Several studies indicate that participants will likely remain engaged if they consider the movement to be effective and if they perceive movement leadership as legitimate and trustworthy (Zald & Ash 1966; Hirsch 1990; Barkan, Cohn, & Whitaker 1993). Additionally, those who maintain long-term movement commitments often arrange their lives to accommodate their activism (Lichterman 1996; Downton & Wehr 1997). For example, many persistent activists choose jobs with flexible schedules that allow time for movement
activities while others seek employment in social movement organizations so they can earn a livelihood through activist work.

Movement organizations can also strengthen recruits’ commitment. They can incorporate cultural practices – such as rituals, narratives, and consciousness-raising discussions – that reinforce normative beliefs and commitment (Hirsch 1990; Nepstad 2004a, 2004b). They can build local chapters and regularly hold retreats or celebrations that increase relational ties to other activists, thereby strengthening affective commitment (Nepstad 2004a). In fact, in a study of the American women’s rights movement from 1945 to the 1960s, Verta Taylor found that strong cultural practices, combined with close friendship ties, enabled a small cadre of activists to remain deeply committed despite the virtual disappearance of the feminist movement during this period. Finally, social movement organizations can implement democratic group decision-making practices that give participants a greater sense of investment in the movement and thus a greater willingness to stay engaged (Polletta 2004). While none of these practices will guarantee ongoing commitment to the cause, they can decrease the chances that recruits will drop out.

Comparative research
DONATELLA DELLA PORTA

COMPARATIVE RESEARCH AND COMPARATIVE POLITICS

While all research is to a certain extent comparative, the concept of comparative research usually refers to studies that compare more than one unit of analysis or, in less inclusive definitions, more than one country. Even though comparative sociology starts to spread, it is especially in political science – with its focus on political institutions – that comparative research became at the same time a broadly used method and also gave the name to a established discipline.

The field of comparative politics, as the branch of political science concerned with comparing nations (Verba 1991), has developed particularly since the 1960s on the bases of broader concerns with an accelerated interdependence among countries, that made knowledge of various regimes all the more necessary. In this period, development theory dominated the field, proposing specific interpretations of democracy (and its preconditions).

During and after the Vietnam War, not only the pretence to apply developmental theory’s assumptions through (more or less belligerent) plans to export democracy, but also the attempt to impose Western models of modernization as the only game in town, came under heavy criticism within the discipline, as well as in public opinion. The attempt at building all-encompassing theories also lost ground, with more attention given to area studies (that focused on specific geographical areas such as Latin America or Southern Europe), based upon a small number of cases, and aiming at middle-range explanations that focused on specific political systems (Mair 1996).

This evolution had the positive effect of increasing awareness of the risks of imposing cultural-specific categories to historically different realities, and sensitizing to the importance of contextual analysis (Tilly & Goodwin 2006). It, however, had the short-coming of favoring a separation between a large majority of political scientists working on democracies and “area” specialists who addressed the analysis of nondemocratic countries. Not only have there been few interactions between the two groups, but also their methodological perspectives developed along separate lines, with comparatists more interested in building models, and area study specialists concerned instead with thick descriptions (Dutton 2005).

Especially since the 1990s, the revival of a neopositivist epistemology in search of invariant causes, as well as the availability of some data bases (even if of debated quality) brought attention back to comparison based on a large number of countries, with attempts at increasing the potential for generalizing the results by including different geographical areas and political regimes. At the same time, attention to comparative research as cross-national comparison also spread in other disciplines such as sociology (e.g., through the debates on the welfare states, or the varieties of capitalism) and even history.

COMPARATIVE RESEARCH IN SOCIAL MOVEMENT STUDIES

A similar evolution can be traced in social movement studies. Especially in the sixties, within the so-called breakdown approach, comparisons of large number of cases aimed at a general explanation of phenomena such as political violence. A most influential example is Ted Gurr’s (1970) analysis of 114 polities between 1961 and 1965 that explained the intensity of civil strife as deriving from high
levels of relative deprivation (defined as the perceived discrepancy between a person’s value expectations and her value capability), and consequent aggressive reactions. With what critics consider as a typical illustration of an ecological fallacy, the empirical research collected data on both the dependent variables (strife) and the independent ones (socioeconomic indicators) at the country level, but the explanation was offered at the individual level. Moreover, frustration was just assumed, but not proved, to be a consequence of deprivation and, therefore, discontent.

Also in social movement studies, an effect of the criticism of developmental theories, and of relative deprivation as a specific variance, was a decline in comparative analysis, and a focus on case studies. Instead, especially since the 1980s, when the fields of social movement studies spread to enclose not only sociologists, but also political scientists, a revival of comparative research can be observed. As in the broader field of political science, research projects covered mainly a small number of cases (typically, two to four), comparing similar types of political systems (democracy) and aiming at middle-range theories, with a limited aspiration at generalization. The first series of cross-national comparisons of this kind developed on the antinuclear movement, including Nelkin and Pollack’s (1981) research on France and Germany, Herbert Kitschelt’s (1986) seminal work on Germany, France, Sweden, and the United States, Christian Joppke’s (1993) on Germany and the United States, as well as the project directed by Helena Flam (1994) on Austria, Great Britain, the Netherlands, France, Sweden, Norway, and Italy. In the same years, Tom Rochon (1988) compared the peace movement in France, Great Britain, Germany, and the Netherlands; Dieter Rucht (1994) the environmental movement in Germany, France, and the United States; Hanspeter Kriesi and his collaborators (1995) the new social movements on Germany, France, Switzerland, and the Netherlands; and Donatella della Porta (1995) the development of left-wing political violence in Italy and Germany.

Most of these studies addressed the environmental constraints and resources for social movements, looking in particular at the political systems. Particularly, but not only, European scholars built on widespread interpretations in their discipline, focusing attention on the different mix of opportunities and constraints for protest offered by the majoritarian versus consensual models of democracy or inclusive versus exclusive political cultures, as well as on the legacy of the different historical paths to democracy (for a review see Kriesi 2004). In line with their relevance in European politics and political science, political parties have been considered as particularly important allies for social movements, all the more so where political opportunities are more closed (for instance, on the women’s movement in Southern Europe, della Porta, Valiente, & Kousis forthcoming; on the labor movement, Marks 1989). Attention to citizenship regimes and welfare state comparison was also reflected in social movement studies. In an attempt to link specific institutional opportunities to specific movements, differences in the characteristics of national citizenship regimes have been considered as related with the forms and intensity of conflicts around immigration politics (Koopmans & Statham 1999), and national welfare regimes in the contentious politics of unemployment (Berclaz, Fueglister, and Giugni 2004).

RECENT TRENDS IN COMPARATIVE RESEARCH

The most widespread use of comparative research in the field has been based upon a case-oriented logic of comparison, taking into account complex historical units, rather than variable-oriented (della Porta 2008). As Dieter Rucht wrote (1994), justifying the selection of countries for his cross-national comparison, “theory building in the social sciences is historical. It remains linked to the spatial and temporal boundaries of its object of study.” In several cases, research designs included
not only cross-country, but also longitudinal, comparison, addressing the evolution of movements and/or protest in the long term. Charles Tilly’s influence in the field, as well as European political science’s sensitivity to history converge in explaining this choice.

While comparison of a small number of cases remained dominant in research on social movements, also in this field large, statistical cross-national comparisons have reemerged in recent years especially in research on political violence. Using the existing data base or constructing new ones, scholars have in particular looked at the onset as well as forms and end of civil wars (see Sambanis 2002 for a review).

In social movement studies as elsewhere, comparative research had the merit of contributing to conceptualization as well as the elaboration and testing of hypotheses about the impact of macro, environmental conditions (such as the type of democracy or political culture) on the development of social movements. Comparative research also helped to bridge the gap between European scholars, who conceptualized and theorized (new) social movements as an historical development from the labor movement, and US scholars, who tended to see social movements as specific forms of voluntary association.

A main limit of the way in which comparative research developed in social movement studies has been, however, a focus on the global North, as well as on specific (left-libertarian) movements. Comparative research in social movements privileged in fact a “most similar” research design, according to which broadly similar cases are selected in order to explain different outcomes (e.g., forms of action or policy impact) on the bases of some specific contextual differences. Additionally, in a more and more global world, the focus on cross-national comparison has tended to hypostatize the nation-state as independent unit of analysis (della Porta 2002).

Some recent trends started addressing these limits. First, comparative studies developed beyond Europe and the United States, including research on the impact of nondemocratic contexts on protest (e.g., Tilly 2006; Boudreau 2004 on Southeast Asia; Wiktorowicz 2004 on the Middle East). This research has the merit not only of shedding light on little-known cases, but also of helping to reflect on the specific adaptation of the hypotheses built upon democratic contexts for nondemocratic ones, where potential opportunities for the opponents tend to be more informal and forms of protest happen in different spheres. Additionally, the “dynamic of contention” project (McAdam, Tarrow, & Tilly 2001) not only broadens attention from social movements, active mainly in democracies, to other phenomena of contentious politics (such as democratization or revolutions), but also experiments with paired comparison, based upon “most different research design.” This means that very different cases are compared in order to single out similar causal mechanisms, with the objective of avoiding mistaking specific features of democratic contexts for general features of contention. Second, research on the Global Justice movements developed more complex explanations of the interactions between transnational influences on national opportunities and constraints. A comparative analysis of France, Italy, and Spain on the one hand, and Germany, Switzerland, and the United Kingdom on the other has also pointed at the presence of different social movement constellations, through which similar transnational impacts are filtered (della Porta 2007).

Competition theory of ethnic/racial conflict and protest

SUSAN OLZAK

Competition theory of race and ethnic conflict specifies three mechanisms under which racial/ethnic conflict and protest occurs. The first reflects a familiar “racial threat” argument, suggesting that the magnitude of response by dominant groups depends on the timing and size of the incoming group and on the clarity of ethnic distinctions made between newcomers and residents (Blalock 1967). Thus, particularly large and concentrated waves of newcomers perceived as ethnically or racially distinct are especially likely to receive a hostile response. Furthermore, as migration and immigration of distinct ethnic and racial populations surge, the potential for protest or violence directed against ethnically distinct newcomers becomes more likely (Koopmans & Olzak 2004).

The literature has also identified other strategies for containing ethnic/racial competition. For example, Lieberson (1982) and Massey and Denton (1994) analyze residential and occupational segregation as alternative strategies for constraining competition and maintaining racial dominance (see also Bonacich 1972). In this view, the magnitude of response – in the form of violence, repression, or residential discrimination directed toward a racial minority – depends upon the pace of change and the relative size of the populations characterizing these demographic shifts.

The second dimension of competition theory emphasizes forces of economic competition among ethnic and racial populations. Scholars who emphasize the economic aspects of competition theory of ethnic/racial conflict express these ideas in terms of the interplay between two types of boundaries: ethnic boundaries and productive niches (Barth 1969). As ethnic and racial groups enter a population, competition for limited resources ought to increase (all else being equal). Economic contraction further intensifies competition over increasingly scarce resources, raising the potential that dominant groups will restrain or exclude less powerful competitors (Olzak 1992). This argument also implies that marketplace competition will raise perceptions that unfair competition is occurring (Bobo & Hutchings 1996), increasing the chances that tensions will spill over into violence.

Specification of economic competition processes that spark ethnic conflict depend upon the distribution of members of different ethnic and racial groups into productive niches (Hannan 1979). Economic competition rises to the extent that niche overlap occurs. This happens when new groups invade another’s niche, which can be fueled by in-migration, economic contraction, or upward mobility of a disadvantaged group. Conflict arises when members resist the entry of members of an ethnically distinct group into their niche.

A third mechanism by which competition processes spark protest and conflict concerns the political/power domain. This line of argument from competition theory emphasizes that mobilization arises when newcomers pose threats to the power balance and political control by dominant groups. In this view, powerful ethnic groups mobilize collective action in response to a potential loss in political control (Olzak 1992; Tolnay & Beck 1995). Such power-threats may be instigated by a recent arrival of a racially or ethnically distinct population (to a city, state, or country) that threatens the political balance, or by a sudden shift in political opportunities afforded by new or expanded voting rights. In this view, politically threatened groups will mobilize against such changes in an effort to restore the status quo. Using this perspective, lynching and ethnic violence, anti-immigration protest,
disenfranchisement, racial gaps in arrests and incarceration can all be understood as a response to real or perceived threats activated by a minority population’s increased political leverage.

While distinguishing the demographic, economic, and political features of competition is analytically useful, in practice they often occur together and are mutually reinforcing. Thus, the economic and power-threat dimensions of ethnic competition are likely to escalate when the surges of immigrants or migrants are large in proportion to the size of the native-born population. Furthermore, it appears that even small changes in levels of neighborhood homogeneity have substantial impacts on perceptions of racial threat. Residential desegregation also ignites racial violence, especially in situations where racial homogeneity was initially high (Olzak, Shanahan, & West 1994).

Of course, the impact of competition on protest and conflict is also shaped by human capital factors, such as training, skills, and education that newcomers bring with them. And the nature of citizenship status and voting rights of a population will greatly influence perceptions of political threats to a dominant ethnic population, creating a heightened sense of political competition where political challenges are more credible (Koopmans & Statham 2000). Finally, there are likely to be threshold effects of increasing the size of the minority population, above which additions to a minority population are no longer perceived as threatening (Keen & Jacobs 2009).

Forces of racial/ethnic competition have the capacity to expand and contract group boundaries that can effectively redefine race/ethnic identities. For example, Olzak and Shanahan (2003) find that the rate of attacks on African-Americans around the turn of the nineteenth century in US cities systematically rose when major court decisions increasingly rested upon the court’s ability to draw distinctions between white versus black identities. Gullickson (2010) has also documented how occupational differences (and racial threats from declining differences) help to explain variation in the salience of the mulatto–black boundary lines during this same period. Others have explored how the dynamics of pan-ethnic boundaries may be related to competition processes (e.g., Kim & White 2010).

Competition theories have also explored the conditions under which ethnic and racial protest occurs. For example, competition theory has been used to analyze anti-busing protests (Olzak, Shanahan, & West 1994) and race riots (Olzak, Shanahan, & McEneaney 1996), which have often been characterized as protest. These studies draw on resource mobilization arguments to suggest that disadvantaged ethnic or racial populations will mobilize when their access to resources rises substantially. Competition theory also provides an explanation for backlash movements that arise in the wake of social movements for expanded civil rights. In this view, dominant groups whose power is threatened will mobilize against disadvantaged groups. If successful, such practices maintain existing apartheid conditions, which heighten the salience of ethnic boundaries and further aggravate ethnic tension.

Forces embedded in globalization have also been linked to ethnic competition and conflict. As a result of the uneven exposure to globalization (including increase trade flows, foreign direct investment, exposure to the Internet and other information and social technologies), competition among ethnic groups rises, as does the salience of ethnic boundaries. Existing violations in the form of ethnic exclusion from educational or political opportunities likely encourages ethnic protest challenging state authorities (Olzak 2006; Wimmer, Cederman, & Min 2009; Olzak 2011). Whether real or perceived, ethnic inequalities in exposure to globalization ought to generate ethnic discontent, which in turn increases the likelihood that violent insurgent movements will become organized along ethnic lines.

Community organizing (United States)
HEIDI SWARTS

Community organizing is the process of mobilizing people in the same geographic area to advocate for themselves in enduring organizations. While social movements are usually issue-based, community organizing (CO) is geographic constituency-based. It typically addresses multiple issues such as housing, jobs, public safety, healthcare, and community reinvestment. While affluent communities organize also, the term generally refers to organizing residents of poor and working-class communities into lasting organizations to gain power. Tactics vary from unruly disruption to more conventional methods of rewarding and punishing elected officials through mobilizing voters. While most social movements have geographically organized mobilization, “community organizing” has a more specific meaning. Likewise, while organizing disempowered individuals in communities has occurred worldwide, this review focuses on the United States, where “community organizing” refers to specific traditions with US roots.

COMMUNITY ORGANIZING IN HISTORICAL CONTEXT

Fisher (1997) has traced modern CO to multiple roots. Since 1886, Progressive-era settlement houses and social workers provided services such as classes for immigrants and health clinics. Ward organizations of political machines were another model for those who sought tightly organized working-class groups who built power not for a political boss, but for themselves and their neighborhoods. The Depression gave rise to energetic Communist Party organizing but also to radical reformist Saul Alinsky, who rejected Marxism but insisted on “rubbing raw the sores of discontent” (1971) in order to mobilize a passive, disempowered majority. Alinsky popularized CO more than any other American organizer. He worked with labor leader John L. Lewis organizing the Chicago stockyards, and began his first community organization in the workers’ neighborhood (Back of the Yards) in 1939. The labor movement and CO continued as sources of mutual influence. In the South, the Highlander Center, founded by Miles Horton, was a training center for civil rights organizers such as Rosa Parks, who helped organize the movement initially through geographically specific local campaigns. In the 1960s generations of community organizers began their careers in successive waves of organizations within the civil rights movement, and also the United Farmworkers Union.

SAUL ALINSKY AND THE INDUSTRIAL AREAS FOUNDATION

Alinsky supported his work and trained organizers through his Industrial Areas Foundation (IAF). The sixties social movement cycle regenerated Alinsky’s organizing, which included predominantly black organizations that were invigorated by and contributed to the civil rights movement in the North. In response to black insurgency, President Johnson’s War on Poverty funded inner city organizing; however, many organizing leaders then and now eschew government funding because of the risk of cooptation. Sixties’ movements were conflictual and confrontational, so Alinsky and his conflict-based organizing had a resurgent popularity. However, as the political climate shifted, Alinsky had a visionary fear that a disillusioned middle class would be susceptible to right-wing appeals. Indeed, blaming crime on blacks and attacking student activists...
and “big-government liberals” became a staple of Republican strategy beginning with Nixon, and fueled a resurgent conservative movement. This, along with a more tenuous economy, ushered in a decline of resources and opportunity for liberals and the Left.

Community organizers responded in several ways. Rather than continuing to form contentious pressure groups, some entrepreneurs turned to community development corporations (CDCs). In keeping with both the conservative ideology of private sector self-help and traditional CO self-empowerment, CDCs provided economic development, jobs, housing, and other neighborhood revitalization themselves rather than challenge the public sector to do it. They were funded by private foundations such as Ford, and federal sources as well. In the 1980s, federal support was drastically cut, and these funding arms were dismantled under Reagan.

NATIONAL PEOPLE’S ACTION

Led by Shel Trapp, this national network of local groups was perhaps the first to organize nationally. It used Alinsky-style direct action tactics to confront elites. NPA won national legislation mandating that all banks disclose lending data. The group used this data to document “redlining,” the redistribution of urban bank deposits to suburban mortgages. This led to a national CO effort to win the Community Reinvestment Act of 1977, which gave citizen groups leverage to force banks to invest in distressed neighborhoods. As of 2010, the NPA continued to work on similar issues such as preventing foreclosures during the “Great Recession” following 2008.

FAITH-BASED COMMUNITY ORGANIZING

After Saul Alinsky’s death in 1972, Ed Chambers became director of what he called the “modern IAF.” In 1973, IAF organizer Ernesto Cortes began to develop the current faith-based method in San Antonio, Texas. COPS (Communities Organized for Public Service) won more than a billion dollars in improvements, brought together middle-class whites and poor Hispanics, helped win city council elections by district, and significantly shifted the balance of power in San Antonio (Warren 2001).

By the mid-1980s, despite declining resources, thousands of neighborhood organizations had sprung up in response to urban blight. The IAF’s strategy developed in Texas capitalized on one of the few remaining institutions in poor urban neighborhoods: churches. Faith-based community organizing (FBCO), known also as “congregation-based,” “broad-based,” and “institution-based,” provided respected community leaders (pastors), organized members, resources, legitimacy, and a shared language and culture of fundamental values that neighborhood organizations lacked. Technically, their members are organizations (congregations), which pay institutional dues – enough to fund only a percentage of the annual budget, but they demonstrate local commitment which in turn helps win foundation grants.

Unlike CDCs, these organizations aim to build powerful organizations and launch redistributive campaigns. Most local FBCOs are interfaith independent nonprofit federations of 20–80 congregations that contract with a national organizing “network” of affiliates for membership training and supervised, experienced organizers. Some also include labor unions, schools, and neighborhood associations.

This approach views organizing as a highly disciplined craft, and organizers as career professionals. However, it also emphasizes in-depth member “ownership” of the group, democratic decision-making, and constant cultivation of new grassroots leaders. Congregations have local organizing teams that elect a city federation board of directors, which usually hires the chief organizer. Organizers are dually accountable to this board and the
national network that trains them. FBCO tactics are usually more decorous than other COs: typically civil, formal meetings with officials in which they exert power through mass numbers in attendance and through control of all aspects of the meeting, where members make demands on the officials. US FBCO networks have steadily expanded, and are organizing in Great Britain, Germany, Rwanda, Latin America, and South Africa.

ACORN

Another major organizing model was ACORN (Association of Community Organizations for Reform Now), active from 1970 to 2009. ACORN was founded by former National Welfare Rights Organization staffers, notably Wade Rathke (“Chief Organizer” for ACORN’s entire 39 years), who believed winning gains for the poor would require a broader base than welfare recipients – “low- to moderate-income” Americans. ACORN began in Arkansas, spread quickly, had periods of decline, but always experimented with new methods and issues and grew. Unlike FBCOs, ACORN organizers knocked on doors to recruit people to form neighborhood groups, which together made up city organizations. Also, its membership (by family) was predominantly low-income, African-American, and Latino. It was known for dramatic direct action protests, which helped compensate for smaller numbers and won extensive media coverage. From 2000 to 2009, ACORN had 70–80 city affiliates and some effective state-level organizations. Besides its mass base, its greatest resource was senior organizers, often Ivy League graduates (or dropouts), who excelled at innovative tactics to extract resources from corporate targets, foundations, and even government bureaucracies, and win major victories and national campaigns. ACORN’s strategic innovation allowed it to run regular and successful national-level campaigns. This success was made possible by its centralized structure as one national organization with a unified national strategy; a long-term strategy that included electoral politics and an alliance with labor; and constant tactical and organizational experimentation.

ACORN’s centralized structure and willingness to experiment helped it survive the conservative resurgence and even thrive. However, it collapsed due both to its success and failures – internal flaws such as secrecy and excessive control by top staff, which caused internal conflict. More critically, since Barack Obama was a former community organizer, in 2008 CO became a target of the McCain presidential campaign, the Republican Party, and Fox News network. ACORN’s national electoral work made it both visible and vulnerable. The New Organizing Institute reported in 2009 that ACORN’s affiliate Project Vote registered and mobilized the largest number of new minority and low-income voters in 2008 (432, 440, or 43 percent of similar campaigns combined); added to 2004’s total, the number was 746,000 new likely Democratic voters in tightly contested 2008 campaigns. ACORN was subject to constant media attacks that exploited and distorted their flaws (Dreier & Martin 2010). Congress cut off funding (a small proportion of their budget), but this signaled private foundations to do the same, resulting in ACORN’s bankruptcy. Some of ACORN’s large state-level organizations reorganized under different names.

SCHOLARSHIP ON COMMUNITY ORGANIZING

Because it was traditionally locally dispersed, social movement scholars largely ignored CO. However, both FBCOs and ACORN achieved a scale sufficient to gain scholars’ attention in the 1990s. Research on organizing is predominantly single or comparative case studies. The neo-Tocquevillian turn in the 1990s helped faith-based organizing capture the imagination of scholars concerned with civic engagement, participation, and democracy. They noted its effectiveness in uniting Americans across lines
of race, class, and religion. Scholars studied links between democratic practice in FBCOs, their roots in communities, shared values, and major policy reforms won for poor and working Americans. Warren’s study of the IAF’s Texas Interfaith (2001) examines this process closely. Shirley (2002) examines education reform campaigns. Hart (2001), Wood (2002), and others analyzed how effective principles of organizing combine with deeply held values (here, religious). Some scholars came to the topic from urban politics, as they discovered some organizations’ role in urban power structures (Orr 2007).

As US economic inequality steadily increased, progressives questioned how a strategy historically rooted in localism could adequately respond. By 2000, FBCO and ACORN had achieved the scale to undertake national campaigns, but needed to overcome traditional sectarianism among different approaches. Joint efforts increased between ACORN and faith-based networks, ironically at ACORN’s peak but just before attacks destroyed it. The PICO Network began organizing nationally in about 2000; its first major campaigns mobilized locals to support national health care reform. In 2009 the IAF began a flexible, international “anti-usury” campaign in the United States, the United Kingdom, and Germany. These efforts are fruitful subjects for scholars interested in barriers and facilitators to coalitions. As they increasingly organize nationally, the need to form alliances with staff-led public interest groups challenges COs that have a mass base and culture of broad, democratic decision-making.

Confessional protest

MICHAEL P. YOUNG

The social movement term “confessional protest” originates in Michael P. Young’s work on the rise of national social movements in the United States in the 1830s (Young 2002; Young & Cherry 2005; Young 2007). Young argues that the first sustained and interregional social movements in US history were shaped by a particular form of protest that called Americans to bear witness against particular sins such as slavery and intemperance. He terms this form of religious and political dissent confessional protest, and argues that religious forces, not political institutions, were decisive in the emergence of the national social movement in the United States. Arguing against Tilly’s state-centered explanation of the rise of the national social movement, Young presents a cultural explanation that hinges on the combination of the intensive and extensive evangelical schemas of public confession and special sins (Tilly 1986, 1995; Young 2002). In Bearing Witness Against Sin, Young demonstrates how temperance, antislavery, and the beginning of the women’s rights movements emerged as evangelicals joined together in this particular form of religious dissent fusing intensive projects of personal redemption with extensive projects of particular national reform. This interlacing of intimate responsibility and far-flung social problems fueled the first national wave of social movements in the United States. These confessional protests emerged as two religious movements driving the Second Great Awakening started to interact: the “new measure” religious revivals associated most closely with Charles Grandison Finney and an emerging network of national benevolent societies including the American Tract Society and the American Home Missionary Society. Evangelicals closely associated with new measure revivals and the increasingly rationalized work of organized benevolence spearheaded the wave of protest. In the late 1820s and early 1830s, the popular religious revivals of the upstart or populist sects and those influenced by them came into contact with the agencies of benevolent societies centered in the northeastern cities (Hatch 1989). The combination proved radical. As public confessions, the dramatic centerpiece of the populist revival, became central to the specialized campaigns of organized benevolence, a wave of social movements independent of ecclesiastical order broke across the United States. This unprecedented national wave of social movements emerged as hundreds of thousands of Americans joined together bear witness against special sins. Although religious in origin, these movements quickly became secular forces pushing for political reform (Young & Cherry 2005).

The antebellum reformer’s connection of the intimate and the far-flung, her fusion of personal reform and social change, stemmed from an evangelical sense of the dynamic of sin, repentance, and reformation. This evangelical sensibility projected personal sins onto national problems and introjected national evils into personal affairs. It made sense of national struggles by making them axial to personal reform. In these confessional protests, antebellum moral reformers anticipated the “life politics” of contemporary protest (Giddens 1991). This fusion of inward-looking struggles of personal change and movements to transform society not only shaped the wave of movements emerging in the United States in the 1830s but a surprisingly wide range of social movements in modern history. A strikingly similar form of religious dissent is described by Walzer in The Revolution of the Saints as shaping the radical politics of the English Civil War and by Rossinow in Politics of Authenticity as shaping the rise of prairie
radicals in the New Left. A number of radically secular forms of protest also share a clear family resemblance with confessional protest. “Coming out” in the gay liberation movement and “consciousness raising” in the women’s liberation movement both share with confessional protest the powerful interlacing of individual and social change, fusing the personal and the political in moral protest. Secular or religious, confessional protest remains a powerful form of dissent because of its intensive and extensive power.

Consensus and action mobilization
BERT KLANDERMANS

Much social movement research concerns processes of mobilization. Understandably, because mobilization is the mechanism that brings demand and supply of protest together. Without mobilization there will be no action even in circumstances of high demand. The study of mobilization concerns such matters as the effectiveness of persuasive communication, the mobilization channels, the influence of social networks, and the perceived costs and benefits of participation. As for the effectiveness of communication, organizers must solve a crucial problem, namely, which are the people in demand of protest and how can they be reached. Sometimes this problem is easy to solve, if for example, it regards the inhabitants of a neighborhood or the workers in a company, but most of the time there are no such easy solutions to the problem. Under stark repression mobilization is extremely difficult and indeed dangerous. Censorship makes newspapers, radio and television unusable, while organizers and movement activists run the risk of being imprisoned or worse. Oppressive societies offer examples of people high on demand but low on supply of protest and failing mobilization. Once protest movements come in the open and mobilization can no longer be oppressed, the system quickly collapses.

Social networks are part of the solution to the problem of how to reach and mobilize potential participants. People are involved in all kinds of organizations and social networks: labor unions, neighborhood organizations, but also churches, sports clubs, and so on. In addition to such formal organizations they are embedded in interpersonal networks: friendship networks, networks of relatives, family, and so on. Such networks are of crucial significance in mobilization campaigns. They serve as a communication network and fuel the motivators of participation by controlling some of the costs and benefits of participation. Participation in collective action can be costly but also rewarding and obviously, the balance of costs and benefits influence people’s motivation to participate.

Consensus mobilization versus action mobilization. Mobilization can be distinguished into the processes of convincing and activating. A movement’s attempts to convince people I call consensus mobilization (Klandermans 1988). These attempts embrace grievance interpretation, causal attribution, possible measures to be taken, protest activities to be staged, and so on. Consensus mobilization is a long-term enterprise. It takes time – sometimes years – to convince people of the plausibility of a movement’s points of view. However, the possible success in activating people is limited by the degree of success of consensus mobilization. Action mobilization concerns the transformation of consensus into action. Indeed, activating sympathizers is difficult enough let alone turning people into sympathizers. Therefore, action mobilization campaigns tend to concentrate on transforming sympathizers into participants.

Steps toward participation. Action mobilization is a process that evolves in various steps that each has its own explanation (see figure). As action mobilization concerns the transformation of sympathizers into participants, the process as it is conceived of in the figure starts with that part of the population that sympathizes with the movement’s cause; in social movement literature often depicted as the mobilization potential of a social movement. As mentioned, the size of the mobilization potential reflects the success or failure of the consensus mobilization efforts. The first problem to solve is targeting the sympathizers. This step seems obvious but its significance is often overlooked, both by organizers and researchers. Formal
and informal networks, strong and weak ties to movement organizations, and all kinds of communication channels are important vehicles of mobilization at this stage.

The next step involves motivating people to participate (see the entries on Motivation and Political psychology and movements for further elaboration of the motivational dynamics of participation). For here it suffices to reiterate that the fact that someone sympathizes with the cause of a movement does not guarantee that he or she is prepared to participate. Moreover, being motivated for the one activity – let’s say signing a petition – does not necessary mean being motivated for another activity – for instance, joining a site occupation. Motivation is to say the motivation to take part in the specific activity that is mobilized for. In the final step those who are motivated to participate must actually be persuaded to take part. This is still a significant step to take. For example, in a study we conducted of the mobilization campaign for a demonstration 60 percent of those who said that they were prepared to take part in the demonstration the next day eventually did not go (Klandermans & Oegema 1987). Indeed, this is a complicated step for organizers. What is an organizer to do? People have been targeted, their motivation has been aroused, what more can an organizer do to make sure that someone participates? At this final stage the strength of the motivation, the height of remaining barriers, and the influence of friends are making the difference. It is your friends who make you live up to your promises. This is understandable. If two friends decide to take part in an event, each of them will make sure that the other will not defect.

Consensual decision-making
FRANCESCA POLLETTA

Consensual decision-making requires that all participants agree on an option before it is adopted. Consensual decision-making can be contrasted with nonparticipatory forms of decision-making (i.e., by representatives or experts) and with majority voting. In a typical consensus process, an issue is introduced and discussed and a proposal is formulated; then the facilitator or a participant calls for consensus. Participants may signal their agreement with the proposal, may “stand aside” if they do not agree but do not want to block the proposal’s adoption, or may voice objections to the proposal. Participants discuss dissenters’ concerns and may amend the proposal before calling for consensus once again. The process may continue until participants reach consensus or decide to table the issue. In some processes, a single veto may prevent the adoption of a proposal; in others, near but not complete unanimity is required.

Organizations relying on consensus have been a prominent feature of pre- and post-World War II pacifism, the American civil rights movement, antiwar, antinuclear, and environmental movements, gay and lesbian activism, and the Global Justice Movement. Organizations using consensus tend to be more radical, less mainstream, and often smaller than those that do not, and they tend to espouse broader commitments to radical democracy, nonviolence, and direct action (although none of these is always true).

Organizations vary, however, not only in how they practice consensus, but also in why they do so. Although Quakers, who have been active in a number of movements, understand consensual decision-making as an expression of their religious faith, many activists see it rather as a prefigurative commitment to enacting a radically egalitarian society in the here and now. For still other activists, the instrumental purposes of consensual decision-making have been more salient. For example, proponents of civil disobedience have relied on consensus to increase each participant’s commitment to follow through on the course of action they decided on. The Southern black student sit-inners who formed the Student Nonviolent Coordinating Committee (SNCC) in 1960 insisted that their organization operate by consensus as a way to discourage Northern students from using parliamentary maneuvers to gain control of the organization. Later, when the SNCC moved into political organizing in the Deep South, it used consensual decision-making as a way to train local black residents to evaluate political strategies collectively. This pedagogical rationale for consensus continues today in faith-based community organizing, where citizens’ assemblies make decisions about program and leadership by consensus. In contrast with late-1960s conceptions of consensus, this version of consensual decision-making is not at odds with the existence of leaders. To the contrary, it is intended to develop leaders, as well as to develop the habits of dialogue that will keep leaders accountable.

Differences in purposes thus account for some of the variation in activists’ practice of consensual decision-making. In addition, broad processes of organizational learning have transformed the practice. Activists today are indisputably more comfortable with rules than they were in the 1960s. Many have taken to heart feminist Jo Freeman’s (1973) charge that consensus processes could easily produce a “tyranny of structurelessness” in which informal cliques made decisions in spite of their egalitarian ethos. Roles of vibes-watcher, facilitator, spokescouncils, and affinity groups have formalized the consensus process in a way
that minimizes unacknowledged disparities in influence.

Activists have responded to another frequent criticism of consensual decision-making, that it is inherently inefficient, by showing that it can work even in situations such as mass demonstrations, where there are large numbers of people, multiple organizations, and little time for deliberation. At the same time, organizations that have been pressed to adopt more conventional organizational structures, in particular by federal funding agencies, have found that they could effectively combine consensual decision-making with other ways of making decisions without sacrificing their democratic commitments. For example, feminist organizations have sometimes reserved consensual decision-making for issues deemed critical rather than routine or have combined majority voting with the informal consultation of all members. These arrangements have preserved consensual decision-making’s capacity to elicit a range of ideas and to ensure that decisions, once made, are implemented.

Creating mechanisms to switch from consensus to majority or supermajority vote responds to a third frequent criticism of consensual decision-making: that it depends on a commonality of interests that is rare in most groups. In this view, consensus processes provide no means for adjudicating fundamental conflicts of interests. The alternative, which many organizations have adopted, is to shift to majority or supermajority voting when decisions cannot be made by consensus nor can they be postponed.

A quite different response to the foregoing criticism has been to resist consensus altogether. Some global justice activists today believe that bids to achieve consensus invariably require a coercive unity. Accordingly, participants in the World Social Forum are barred from adopting unified positions. Instead, the Forum provides activists with an opportunity to share experiences, analyses, and strategies; and to undertake collaborative projects among themselves. Although critics charge that Forum organizers have thereby surrendered opportunities to craft an organized challenge to neoliberalism, organizers insist that respecting difference is more important than forging an inevitably constrained consensus.

These trends suggest that consensual decision-making will continue to be associated with progressive movements, even as the forms it takes continue to change.

Contagion theory
DAVID A. SNOW

Scholars of collective gatherings or crowds, such as riots, protest events, and collective celebrations, have long been interested in accounting for the coordination that makes collective behavior truly collective rather than the aggregation of parallel individual behaviors. For about 75 years, from at least the time of Gustave Le Bon’s The Crowd (1897) until the 1970s, one of the dominant explanations was provided by what Ralph Turner and Lewis Killian (1972) called “contagion theory” (see also the entries on Convergence/dispositional theory and Emergent norm theory). The idea of contagion conjures up the imagery of some behavioral, emotional, or ideational phenomenon spreading rapidly, uncritically, and uniformly within a collectivity, from one participant to another. People in collective gatherings or crowds, many of which are sponsored by social movements, are portrayed as behaving uniformly, intensely, and often in a fashion at odds with their usual normative behavioral patterns.

Proponents of contagion theory have posited various social psychological mechanisms thought to account for the presumed rapid dissemination of a common impulse, sentiment, or behavior among participants. For example, Le Bon (1960) emphasized the heightened “suggestibility” of crowd participants, contending that participants adhere to the mood and temper of the crowd and/or follow the exhortations of leaders; Tarde (1903) accented “imitation,” portraying the collective gathering as an undifferentiated collection of persons imitating each other or a leader; Allport (1924) highlighted “social facilitation” – the observation of others doing what one wanted to do – as the trigger that activated learned dispositions; Freud (1959) proposed “identification” as the mechanism accounting for behavioral uniformity, arguing that it developed out of affection for a leader wherein the participant renounces her own superego and relegates it to the leader; and Blumer (1972) introduced “circular reaction” as a type of interstimulation wherein the response of one individual reproduces the behavior or sentiment communicated by another individual and is reflected back to this individual, reinforcing and intensifying the original behavior and/or sentiment. These various mechanisms are theorized as being activated in situations of social unrest, ambiguity, and uncertainty which function to reduce the individual’s critical faculty by short-circuiting the usual interpretive process between stimulus and response. This reduction of critical faculty, coupled with the supposed anonymity provided by the crowd is hypothesized to neutralize ordinary behavioral inclinations and renders the individual susceptible to uncritical acceptance of the emotions, ideas, and behaviors being communicated or called forth. Clark McPhail (1991) calls this the “transformation hypothesis” because of the presumed diminished ability of participants to control their behavior.

In time, more careful theorizing and empirically grounded assessments of the behaviors within collective gatherings, particularly within riots, protest events, and celebrations, indicated that the classical contagion thesis was seriously misguided. Among the various flaws now associated with the theory, cataloged primarily by Turner and Killian (1972) and McPhail (1991), the following are foremost: the assumption of a degree of uniformity in collective gatherings that is often the exception rather than the rule; the failure to specify both the limits of contagion and its socio-spatial boundaries; it provides little understanding of the kinds of shifts which occur in course of collective gatherings, from, for example, active, assertive behavior to more subdued behaviors, and vice versa; the emphasis on emotional
arousal and spiraling excitement makes it less applicable to quiet and more subdued moments or gatherings; it offers little understanding of the social organization of collective gatherings, such as the common differentiation of roles among the participants; it overemphasizes the significance of anonymity, especially since many participants are accompanied by friends or relatives; it perpetuates the image of crowds as highly irrational, emotional, and inclined toward violent or objectionable behavior, thereby implying everyday behavior is quite the contrary—rational and controlled.

The upshot of these critical observations and the increasingly sophisticated examination of diffusion processes in relation to social movements and protest (see Soule 2004) is that the long-standing contagion perspective has been pushed aside, as the contagion concept is now seldom used by students of collective behavior and social movements. Instead, the term diffusion has become the operative, umbrella concept for considering the spread or flow of social behaviors, moods, or sentiments, and various cognitions or cognitive clusters or perspectives among individuals, organizations, and even nations and nationalities.

Contentious politics
SIDNEY TARROW

“Contentious politics” means episodic, public, collective interaction among makers of claims and their objects when: (a) at least one government is a claimant, an object of claims, or a party to the claims, and (b) the claims would, if realized, affect the interests of at least one of the claimants or objects of claims. Roughly translated, the definition refers to collective political struggle. Contentious politics, in the sense of this entry, includes social movements, but it also includes less sustained forms of contention – like riots and strike waves – and more extensive ones – like civil wars, revolutions, and episodes of democratization – and it intersects with routine political processes – like elections and interest group politics.

Of course, each term in the definition cries out for further stipulations. The term “episodic,” for example, excludes regularly scheduled events such as votes, parliamentary elections, and associational meetings. The term “public” excludes claim making that occurs entirely within well-bounded organizations, including churches and firms. Contention of course occurs both inside and outside of public politics, but political contention involves government, however peripherally, and thereby increases the likelihood of intervention of coercive agents such as police and, on the average, increases the stakes of the outcome.

Are not all forms of politics “contentious?” Not really. Much of politics consists of ceremony, consultation, bureaucratic process, collection of information, registration of events, educational activities, and the like; these actions usually involve little if any collective contention. This does not imply that all forms of contention conform to a single general model. This becomes clear when we think of the differences among three major forms of contention:

1. social movements: sustained challenges to power holders in the name of a population living under the jurisdiction of those power holders by means of public displays of that population’s worthiness, unity, numbers, and commitment;
2. civil wars: sustained large-scale reciprocal armed conflict between two or more social actors in a population, however defined, over control of a state or over the demand of one of the actors to establish its own state;
3. revolutions: attempted transfers of power over a state in the course of which at least two distinct blocs of contenders make incompatible claims to control the state, and some significant portion of the population is mobilized on behalf of the claims of each bloc.

These sustained forms of contention have different dynamics, involve different combinations of performances, and produce different levels of violence. Although they can overlap empirically and easily shift from one to another, we will only begin to understand them if we begin from what they have in common: contentious interaction between makers of claims and others, claims that are recognized by those others as bearing on their interests and bring in governments as mediators, targets, or claimants.

Underlying this broad approach is the claim that different forms of contentious politics involve similar causal processes. Think of mobilization, a central process in civil wars, revolutions, and social movements as well as in electoral campaigns, strikes, and warfare. Mobilization involves interaction between challenging actors and their targets, based on combinations of well-known and innovative forms of contention, around claims that are framed in ways that both attract support and communicate messages to both targets and significant others. As long as the same...
mechanisms and processes can be identified in different forms of contention, they can be studied together irrespective of the boundaries that scholars have established between these forms.

Social movements and lethal conflicts. This is not to claim that there are no empirical differences between social movements, which are mostly peaceful, and civil wars and revolutions, which generally involve large-scale violence. Two features in particular make a difference. First, killing, wounding, and damaging affect the survival of participants well after the immediate struggle has ended. Second, creating and maintaining armed force requires extensive resources. Large-scale lethal conflicts include interstate wars, civil wars, revolutions, and genocides as well as a significant subset of struggles across religious, ethnic, linguistic, and regional boundaries. All of them involve high stakes and disciplined military organizations.

Even so, there are significant commonalities between lethal conflicts and social movements. As in more pacific conflicts, existing political opportunity structure interacts with established repertoires of contention to shape what sorts and degrees of large-scale violence occur within a given regime. When we compare large-scale lethal contention with social movements, we also see similar mechanisms and processes: environmental mechanisms, like resource extraction or depletion; dispositional mechanisms, like the hardening of boundaries between ethnic groups that formerly lived together; relational mechanisms like the brokerage of new connections between previously unconnected or weakly connected sites.

In contrast with social movements, which concentrate in high capacity democratic or democratizing states, lethal conflicts concentrate in low capacity authoritarian states. High capacity states reduce the threat from challengers both by offering routine opportunities for making low-level claims and by making it difficult for anyone to create rival concentrations of coercive means within their territories. Low capacity states fear that making concessions to low-level claims will trigger broader ones. They also more often face the threat that some rival actor will build up a major concentration of coercive means and use it to topple existing rulers.

Considering these different forms of contention within the same framework helps to understand three important properties of contentious politics: first, the rapid formation and transformation of different forms of contention (i.e., the “repertoire of contention”); second, the interactions between actors that form across institutional boundaries; and, third, transitions between different forms of contention and between contentious and conventional forms of interaction.

Repertoires of contention. Considering different forms of contention in the same framework helps to understand how the sets of performances that people habitually use in mounting contention both emerge and develop. Repertoires represent not only how people make claims but what they know about making claims and the reception by targets of their claims. Performances can be either linked to specific sites of contention – as the grain seizure is linked to famine and to little else – but they can also be “modular” – transferable from one axis of contention to another – like the strike, which was invented on the docks of London when seamen “struck” the sails of their ships but was adapted to the factory, the office, or the airplane.

Repertoires can be rigid or flexible, weak or strong. Historical studies of long periods of contentious politics reveal that strong repertoires are those that whose performances are strong enough to evolve without losing their essential properties. Such a performances is the demonstration, which evolved out of the religious procession to a patterned march and assembly in a public place, ending in speeches and sometimes in the presentation of petitions to officials. In general, since repertoires depend on structures of public order control and on cultural acceptance, they evolve slowly, but repertoire change is hastened in major episodes of contention, like the cycles of protest that marked the 1960s.
Movements and institutional boundaries. How does contentious politics relate to institutions? An earlier research tradition saw all political contention aimed against institutions. But properly seen, contention in the sense defined above can occur outside of, within, and on the boundaries of institutions. Boundaries between institutionalized and non-institutionalized politics are hard to draw with precision. More important, the two sorts of politics involve similar causal processes. For example, the study of coalitions has almost always been operationalized within legislative institutions, but coalitions occur widely in the disruptions of rebellions, strikes, and social movements. As long as the same mechanisms and processes can be identified in institutional and non-institutional politics, they can be studied together irrespective of institutional boundaries.

Of course, institutions both constrain and enable contentious politics and that means that different kinds of regimes produce different configurations of contention. These connections among contention, political power, and institutions appear in both turbulent periods and in the more routine politics of both authoritarian regimes and settled democracies. But it is in weak authoritarian regimes and “anocracies” (so termed by James D. Fearon and David D. Laitin in a 2003 article), that the more violent forms of contention are most likely to develop.

Within the liberal states of the West and increasingly in the global South, contentious routines intersect with elections. The anti-authoritarian movements of the first decade of the twenty-first century in Slovakia, Serbia, Ukraine, and Georgia were all touched off by charges of electoral corruption. Conversely, the anti-Iraq war movement in the United States contributed to the Democratic party’s takeover of Congress in 2006 and to the election of Barack Obama in 2008. More violently, the charges of electoral fraud in Kenya in 2007 led to bloody clashes between different ethnic groups and the destabilization of that country’s fragile democracy.

Contentious transitions. Changes in repertoires accompany changes in the overall forms of contention and, to some extent, help to explain them. Although many of the same routines are found in different forms of contention, transitions between these forms can be traced through changes in the combination and the intensity of different performances. Thus, the strike can touch off a revolution, set off ethnic violence, or end in institutionalized collective bargaining. Social movements can transform into institutionalized interest groups or produce a revolution, as the Islamist movement led by Ayatollah Khomeini led to the Iranian Revolution. The contentious transition we know as “democratization” frequently combines elite pacts at the summit with the pressure of strikes and social movements at the base of society.

Open questions. As in any evolving field, a number of contested issues score the surface of the study of contentious politics. Space limitations make it possible to provide only a brief sketch of the most important of these:

1. What about social movements that do not target the state? Do they fall outside the range of “contentious politics?”
2. What are the major outcomes of contentious politics: are they limited to the policy terrain or do they also involve cultural change and biographical impacts?
3. Do new forms of collective action – particularly Internet-based campaigns – challenge existing approaches to contentious politics, or will they eventually be absorbed into the repertoire of contention, much as the newspaper and television were?
4. What of globalization? Does it shift the targets of contention from national states to something beyond the state, or does it simply add the possibility of “forum shopping” to the strategies of claims-makers?

Convergence/dispositional theory

DAVID A. SNOW and DEANA ROHLINGER

Convergence, or dispositional, approaches to crowds and social movements focus on various psychological traits and states that hypothetically render individuals more or less susceptible to participation. The underlying assumption is that specifiable personality characteristics and/or cognitive or emotional states are likely to make the appeal of some movements especially attractive, thereby predisposing some individuals to participation. Rather than focusing on the material basis or socially constructed character of grievances, attention is focused on the psychological manifestation of or responses to grievances. Thus, crowd and social movement participants are seen as a relatively undifferentiated and unrepresentative grouping of individuals because of the dispositional or tendencies they share. Hence the idea of convergence: the assemblage of “like-minded” or similarly disposed individuals, as represented in Eric Hoffer’s *The True Believer*. Especially prominent among the psychological and personality factors thought to account for this dispositional vulnerability to movement appeals are heightened frustration, a sense of relative deprivation, alienation, spoiled or stigmatized identities, and authoritarianism.

Convergence/dispositional accounts for the appeal and growth of social movements and mass gatherings were particularly popular during the 1940s and 1950s, in large part as an attempt to account for the appeal and growth of fascist and/or extremist movements such as Nazism and McCarthyism. However, these explanations were largely abandoned in the 1970s because of a number of intersecting critical observations (most of which are cataloged in McPhail 1991, and Turner & Killian 1987). First, there was a lack of compelling empirical support for the hypothesized causal link between individual predispositions and participation in riots and other mass gatherings. Second, convergence/dispositional arguments leave unexplained how it is that similarly disposed individuals manage to coalesce in the first place. In other words, they do not account for physical/spatial convergence. Third, the convergence thesis presumes a uniformity and continuity of participant behavior in crowds and social movements that is contradicted by the range and complexity in behavior revealed by more systematic observation. Fourth, the presumption of generalized dispositions, like intense frustration and/or relative deprivation, contradicts the observation that participation in crowds and social movements is often prompted by a variety of motives. Fifth, beginning in the 1970s there was a paradigmatic shift in theorizing about social movements that rendered the convergence/dispositional thesis even more suspect. Not only were participants increasingly regarded as being much more rational than previously thought, but social movement scholars became more sensitive to the interactive characteristics of mobilization and participation, which shifted attention to the socially embedded character of social movements and how social and political structures shaped and channeled mobilization and participation. Sixth, the growing recognition of the socially embedded character of social movement mobilization also made meaning-making processes and emotion more central to understanding mobilization and participation. Whereas the convergence/dispositional approach circumvented the need for meaning-making and conflated irrationality and emotion, social movement scholars increasingly became aware of the importance of both to understanding the dynamics of social movements (Goodwin, Jasper, & Polletta 2004; Snow 2004). Additionally, these meaning-making processes
and affective dimensions were found to be of importance to understanding the generation of grievances, mobilization, and participation. These critical observations and paradigm shifts notwithstanding, concern with some psychological predispositions and personality characteristics is not without some merit. If individuals get involved in social movements and related collective gatherings that express their interests and sentiments, then social psychological and personality factors that affect the level and type of participation may be important.

Conversion and new religious movements

JAMES T. RICHARDSON

Conversion, as the concept is used in the social sciences, is usually applied to joining a religious group, although the concept has considerable overlap with issues concerning recruitment and participation in other types of social movements. Recent conversion research in the area of sociology of religion has focused mainly on the question of how and why thousands of young people joined New Religious Movements (NRMs), even if temporarily. (Contrary to popular belief, defection or disaffiliation rates have always been quite high for NRMs, and most NRMs are small as a result.)

From the late 1960s through the 1980s seemingly large (in absolute terms) numbers of young people were choosing to participate in NRMs. Mass media focused on this phenomenon, which was in sharp contrast to participation in antiwar and other political movements of the time. Journalists posed the question of why this was happening with members of the most affluent and well-educated generation in American history. Scholars also became interested and began researching this intriguing question concerning NRMs, as well as other interesting issues concerning the new movements.

The early conversion research on NRMs usually was informed by traditional models of conversion that were quite individualistic, psychological, and deterministic in orientation. Such approaches assumed that something was wrong with a person if they converted to a religious group, and the approach also ignored historical and sociological considerations, as well as any notion of active agency and volition on the part of the individual choosing to participate in a religious group. Those applying these deprivation or psychopathological models quickly found them wanting, however, just as occurred with research on participation in political movements of the same time period.

An important way out of this conundrum was furnished by John Lofland, a doctoral student at UC Berkeley working under Rodney Stark. Lofland did ground-breaking research on the early beginnings of the Unification Church for his doctoral dissertation, and he published one of the first monographs about one of the controversial NRMs, Doomsday Cult. He and Stark also published a seminal article in the American Sociological Review in 1965 (“Becoming a World-Saver”) that has become the most-cited conversion/recruitment model in all of the social sciences. Included in the model are elements that are combined in a “value-added” manner, but not strictly chronologically. The first three elements are “predisposing characteristics,” while the last four are designated “situational factors.”

1. Long-term felt tension or strain by the individual
2. Possession of a “religious” rhetoric and problem-solving perspective by the individual
3. Self-definition by the person as a religious seeker
4. “Turning point” reached
5. Development of affective bonds between preconvert and group members
6. Weakened affective bonds with those outside the group
7. Intensive (usually communal) interaction with group members, making the convert a “deployable agent”

The model combined a psychological/individualistic perspective (first three elements) with a social psychological one (last three elements) that also is cognizant of sociological or structural considerations. The model integrates deterministic assumptions (elements 1 and 2).
concerning human beings with more agency-oriented ones as well (elements 3 and 4). Therefore, the model was attractive to researchers from several different persuasions and who adopted different philosophical approaches to the phenomenon of study.

The model was applied, most often in a post-hoc fashion, to many studies of conversion and recruitment, with mixed results. Several of the elements of the model that were more deterministic did not gain support with follow-up research, while the ones that did were more agency-oriented and social psychological in approach. Indeed, the importance of interaction with group members to conversion has stood the test of time, while most other elements of the model have lost favor. More sociological concepts such as pre-existing social networks also have come to the fore in conversion research.

It is noteworthy that Lofland himself changed his perspective considerably over the years, and began to direct his students, such as Roger Straus, to study “how individuals go about changing themselves” using NRMs as vehicles of change. Straus and others, including this author, have attempted to develop more full explanations of the conversion process that assumes the convert is an individual with volition who has decided to experiment with a new belief system and ethic, even if only for a short period of time, as they develop a “conversion career.”

This “conversion career” perspective has raised an issue of why so many contemporary young people have difficulty making longer term commitments to any set of beliefs or practices, and has led some scholars to question popular assumptions that NRM leaders have some powerful psychological techniques that overcome free will and force people to convert. Some scholars have referred to this latter view as the “myth of the omniscient leader,” a view that, while quite popular with the general public, has little support in the vast NRM research literature.

One major issue that arose in conjunction with this myth about why people join NRMs concerned the pseudo-scientific concept of “brainwashing.” Those opposed to the development and spread of NRMs included parents of some participants, representatives of some religious traditions who feared the loss of youth to the NRMs, and a few representatives of scholarly disciplines, particularly clinical psychology and psychiatry, some of whom (but not all) believed that participation in NRMs was a mental health problem that should be addressed by public policy changes and by the helping professions.

Those opposed to the NRMs coalesced into what came to be called the Anti-Cult Movement (ACM). This amorphous movement promoted the concept of “brainwashing” as a counter to the developing volition and social psychological perspective on why and how young people choose to participate in NRMs. This “Manchurian Candidate”-like concept was derived from a narrow and ideologically based interpretation of some early research on the resocialization techniques used by the communists in China in the 1940s and 1950s, and by the Chinese operating prison camps in Korea during the Korean War. The brainwashing concept as applied to NRM recruitment achieved near hegemonic status within the United States general public and even with political leaders, leading to efforts to pass laws against NRM conversion and legal cases against the movements because of the alleged damage caused by such groups. The concept also has diffused around the world, and undergirds public perceptions and public policy concerning recruitment to NRMs in a number of other nations.

Another issue that arose, in part because the “brainwashing” perspective became dominant in public discourse about conversion to NRMs, concerns what happens to the alleged convert in terms of personality. Popular perceptions that rely on the brainwashing motif as an explanation also often assume that some thoroughgoing personality change takes place when a leader or recruiter engages with a potential recruit and convinces them to join the group. However, considerable research has revealed that
there is no basic personality change associated with joining an NRM, but that there can be profound changes of belief and behavior associated with such actions. Further, some scholars have noted that such changes can be viewed as quite positive in terms of deterring more destructive lifestyles and promoting activities that improve one’s mental state and life situation. Indeed, one psychiatrist (Marc Galanter) has even written about the “relief effect” brought about by participation in NRMs.

The scholarly conversion literature has advanced greatly over the past few decades, but not without controversy, given that the bulk of research and scholarship associated with conversion to NRMs has evolved to a more agency-oriented view of this phenomenon, whereas much public opinion has been quite negative about what leads many young people to join new religious groups or cults. And it is worth noting that this more agency-oriented and social psychological/sociological perspective also has infused studies of conversion to more traditional religious groups as well.

Co-optation
PATRICK G. COY

As social and political movements gain enough strength to seriously challenge the more powerful forces that legitimate and protect status quo arrangements in a country, a society, an institution, an agency, an organization, or other social system, those in authority who are being challenged may reach out to and attempt to bring the challengers into the system as participants. This formalized inclusion of challengers into the authority system that they are challenging is the essence of co-optation. An early and influential work on understanding co-optation is Philip Selznik’s (1949) study of how the Tennessee Valley Authority targeted and eventually absorbed local elites and community activists into its administrative structure in order to transform local opposition to TVA policies into support for those policies. Gamson’s (1990) analysis of 53 challenging groups, in which he defined co-optation as challengers gaining access to the public policy process but without achieving actual policy changes, is also important.

Those in authority may extend participation to challengers simply in order to turn back, channel, or at least moderate the threat faced by the authority system. Conversely, or even at the same time, they may genuinely wish to share power, create better practices and policies, and improve decision making within the authority system. In any case, the legitimacy of the challenger’s demands is recognized and some challengers are formally included at the germane decision-making tables. Co-optation includes institutionalizing and channeling communications between the authority system and its challengers in ways that tend to be conducive to the preservation of the authority system and its existing and preferred future policies. Inclusion does not necessarily result in power sharing. For example, in the TVA case Selznik showed that the co-opted leaders of local opposition groups often had to share the burdens associated with TVA administrative power without their having bona fide access to the agency’s power.

Co-optation also serves to blunt the radical demands and far-reaching changes advocated by challenging groups. It may have diluting, demobilizing, depoliticizing, and disempowering effects on the movement, its organizations, and on its leadership and key activists. For example, once a group gains access and a seat at the decision-making table, ongoing participation may become a primary goal of the formerly outsider challenging group, usurping its other goals. Equally important is the fact that inclusion and genuine participation in a decision-making or policy process often results in identification and ownership of its results for the participants, including the challengers. Thus co-optation of challenging groups contributes to the hegemony of the existing system and intensifies existing practices of social control.

Coy and Hedeen (2005) developed a four-stage model of social movement co-optation in their analysis of both the degrees and the dimensions of co-optation of the community mediation movement in the United States by the court system and the broader legal establishment. Each stage includes multiple steps and various manifestations of the co-optive process, including: the appropriation and harnessing of challenger discourse and techniques without their underlying values; the redefinition of movement terms and their application to antithetical practices; salience control; legitimation of challengers; assimilation of challenging group leadership; transformation of movement goals; establishing regulations that impact and control challengers in the future; and various resistant responses by the challenging group to these and other co-optation pressures. This model was later used as an interpretive framework in a study of the co-optation...
of family mediation in Israel by legal professionals. Finally, the co-optation pressures experienced by contemporary movements advocating for an international fair trade system, for organic foods and labeling, and for community health standards have each received significant scholarly attention in recent years.

Co-operative movement

FRANCESCA FORNO

The co-operative movement first emerged in Europe during the nineteenth century. Although scholarly research remains in disagreement about exactly where the movement began, many trace its origins back to a number of cooperative experiences that developed in Britain and France in the eighteenth century, especially in the farming industry and consumer organizations (Holyoake 1908).

During the years of the industrial revolution, co-ops spread across all Western countries as a reaction to the negative side-effects of industrialization. At that time, cooperatives became a means of economic organization for workers. Regardless of their type, size, geographical location, or purpose, cooperatives provided a tool by which to achieve one or more economic goals, such as improving bargaining power when dealing with other businesses, bulk purchasing to guarantee lower prices, obtaining products or services otherwise unavailable, gaining market access or broadening market opportunities, improving product or service quality, securing credit from financial institutions, and increasing income.

Although the first cooperatives appeared in the eighteenth century, it was from the Equitable Pioneers of Rochdale Society that the steadily spreading co-operative movement first began to gain ground. The Rochdale Society, generally recognized as the founding father of the modern cooperative movement, was established by a group of 28 weavers and other craftsmen in Rochdale, England, who decided in 1844 to band together to open their own store selling food items they could not otherwise afford (Digby 1948). The idea behind the Rochdale Pioneers – who between 1850 and 1855 also established a flourmill, a shoe factory, and a textile plant – was to reorganize industry from the consumption end, on the basis of production for use instead of production for exchange (Webb & Webb 1921).

This successful example was quickly emulated throughout Britain and elsewhere. By 1863, more than 400 British cooperative associations, modeled on the Rochdale Society, were in operation (Seth & Randal 1999). Thereafter, the number of societies and their members grew steadily and the British co-operative movement became the model for similar movements worldwide. Notable among the European countries in which workers’ cooperatives were soon to gain grassroots support were France, Germany, Belgium, Austria, Italy, Denmark, Finland, Norway, and Sweden.

In the United States, the cooperative movement became widespread later than in Europe. The first co-ops were formed by farmers, either to help them buy necessities at lower cost or to help them market their produce more efficiently and at higher prices. Although a few large associations existed before World War I – such as the California Fruit Growers’ Exchange and the Eastern Shore of Virginia Produce Exchange – US cooperative societies remained mainly local and independent from one another for many decades (Hibbard 1929). It was in fact not until the early 1900s that the co-op societies began to increase in number and coordination, both as associations of producers and of consumers.

In 1895, the International Cooperative Alliance (ICA), a nongovernmental organization, was established as an umbrella organization designed to promote amicable economic relations between cooperative organizations of all kinds, both nationally and internationally. The major objective of the ICA was to promote and strengthen “the autonomous association of persons united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly-owned and democratically controlled enterprise” throughout the world (ICA 2011).
By the 1930s, the ICA had become an extensive organization claiming to represent the interests of 100 million cooperators in Europe, the Americas, Asia, and beyond (Hilson 2011).

Although the nature of ownership rules may vary greatly between individual cooperative societies, the general idea behind these kinds of association is that members should share the economic burden of producing or buying goods, and divide any financial surplus amongst them at the end of the year. As well as in farming and retailing, cooperative societies are also present in almost every sector, including banking, insurance, housing, transport, and so on.

While earlier interpretations of the cooperative movement tended to describe it as devoid of ideological aspiration, more recent works have underlined how its role went well beyond the provision of groceries and other necessities (Hilson 2009, 2011). Through their educational work, social life (expressed through activities ranging from dance and billiard halls, libraries, and women’s and men’s guilds, to children’s summer camps) and internationalism, cooperative societies were fundamental for the spread of a culture of cooperation and the formation of social ties among their members, which in several cases led to collective actions undertaken by specific social groups (Gurney 1996). In this respect, the role of cooperation in mobilizing consumer interest among working-class housewives, especially during World War I, is of particular interest. The Women’s Cooperative Guild, for example, has been acknowledged as one of the most radical and influential working-class women’s organizations in early twentieth-century Britain (Scott 1998).

The history of the cooperative movement has been a cyclical one. The number of cooperative societies tends to grow in times of economic crisis. After the emergence of the movement during the nineteenth century, a surge in the number of co-ops coincided with the Great War. High inflation, war profiteering, and food shortages contributed to the shift toward alternative solutions.

The Great Depression triggered another wave of co-ops. In all Western countries, cooperatives organized in cities and rural areas produced a variety of goods for trade and self-use, and organized exchanges between laborers and farmers in which people would work for a share of the produce. During these years, the movement gained support from many national governments, which in some cases provided major assistance to rural and farmer cooperatives. This was the case for example of Roosevelt’s New Deal programs in the 1930s (Conkin 1959).

In the late 1960s and 1970s, a new generation rediscovered cooperation, collectivity, and communalism and a “new wave” of co-ops emerged out of sixties counterculture to promote economic participation. Throughout the 1960s and 1970s, cooperative ideologies and organizations gained many new supporters and promoters in civil society, including antiapartheid campaigners, pro-development NGOs, and alternative trading organizations aiming to help producers in developing countries.

However, despite considerable pressure from their members, most established cooperative societies – such as the British CWS (Co-operative Wholesale Society) – failed to connect with the new initiatives demanding greater social justice and fairer trade. Throughout the 1970s and 1980s, the major cooperatives’ priorities remained those of securing a consistent supply of produce and maintaining a relevant market share. Increasing competition from supermarkets and multinational corporations during these years led to most ethical concerns being dropped from the agenda of major cooperative organizations (Anderson 2009).

Things started to change once more in the mid-1990s. On one hand, the increasing desires among Western citizens for eco-friendly and ethical products pushed many cooperative societies to rethink their trade policies, adopting a more clearly ethical stance. On the other hand, faced with increasing environmental and financial challenges, new forms
of cooperation between consumer–producer groups – such as community-supported agri-
culture and other forms of alternative trade networks – also started to regain momentum
in Europe and North America, to some extent reappraising the nineteenth-century Rochdale
Pioneers’ original ideas on the need to reorganize economic life on the basis of human and
social needs, not just accumulation (e.g., the degrowth discourse, Latouche 2010).

Countercultures
ROSS HAENFLER

The term counterculture describes a variety of social subgroups possessing distinctive norms and values in opposition to the widely accepted beliefs and practices of the dominant culture. Countercultures espouse primarily a cultural, rather than explicitly political, challenge commonly enacted through alternative lifestyles rather than direct challenges to institutional authority structures such as governments or corporations. While the term is widely used in both scholarly and pop culture contexts, its usage is imprecise. In the context of social movement studies, countercultures may be considered as a type of social movement (e.g., forms of gay, lesbian, bisexual, and transgender movements), part of a social movement (e.g., cultural feminism), separate from but overlapping with social movements (e.g., hippies and the New Left), or more distinct from movements and conceptually closer to subcultures (e.g., punk). Contemporary definitions of social movements are broad enough to include the sorts of collective behavior typically labeled countercultural, sometimes called countercultural movements. Specifically, countercultures are extra-institutional challenges to cultural (rather than institutional) authority structures, generally informally organized yet having some degree of continuity (see Snow, Soule, & Kriesi 2004).

THEORETICAL BACKGROUND AND THE COUNTERCULTURE

The contemporary concept of counterculture emerged from J. Milton Yinger’s (1960) notion of “contracultures.” Yinger distinguishes central/countercultures from subcultures; the former emerge from conflict with and within the larger society, while the latter constitute any variety of groups distinguished by their own norms, whether or not in opposition to dominant norms. Importantly, then, countercultures must be understood in relation to the larger culture.

Theodore Roszak (1995) popularized the concept “counter culture,” describing the variety of 1960s youth cultural rebellions of Europe and the United States that came to be known as the Counterculture. Descended from the “Beats” but most associated with the hippies, the Counterculture encompassed a broad cultural resistance primarily of alienated youth against a “technocratic society” that privileges “experts,” rational planning, and scientific thinking at the expense of creativity and human fulfillment. More than a system of power relations and inequalities, technocracy “is the expression of a grand cultural imperative, a veritable mystique that is deeply endorsed by the populace” (Roszak 1995: xiv).

Such broad criticism or rejection of cultural imperatives – conformity, consumerism, sexual mores, gender roles, religious doctrine – are common to contemporary countercultures as well, whether progressive or conservative. For example, the “slow food” and “locovore” countercultures resist nearly every aspect of the modern “McDonaldized” food system by avoiding chain restaurants, cooking meals with fresh ingredients, shopping at farmers’ markets, making mealtime sacred, and gardening or engaging in community-supported agriculture.

CONCEPTUAL LOCATION:
COUNTERCULTURES, SUBCULTURES,
AND SOCIAL MOVEMENTS

While the Counterculture initially embraced a broad, generalized rejection of major sociocultural norms – gender, racial, sexual, economic, religious, and so on – it later splintered
into a variety of identity-based movements with segments engaged in: political confrontation (e.g., Black Power, nuclear freeze, peace movements); creating cultural refuges (e.g., gay communities, communes, New Age religions and other new religious movements); or both (e.g., feminist consciousness raising circles, “green” movements, anarchist punks). While the Counterculture included political activists, the “flower children” were in some ways empirically distinct from the New Left’s civil rights and antiwar activists. The former focused on creating and living alternatives to hegemonic culture, separate, to a lesser or greater degree, from dominant institutions, while the latter confronted those institutions directly. While overemphasizing the conceptual boundaries between countercultures, subcultures, and social movements is unproductive, the focus and emphasis of each form of collective behavior is worth noting.

Countercultures share characteristics of both subcultures and social movements. Like participants in social movements, counterculturists construct grievances and profess a desire for change. They foster collective identities as well as encouraging personal “identity work.” Similar to subcultures, countercultures often involve intentional lifestyle choices, pursuit of esoteric interests, and alternative daily routines rather than protest activity and conflict with the state (see Haenfler 2006). Yet countercultures are typically less organized than movements and more change-oriented than subcultures. Subcultures, while certainly critical of the “parent” culture, tend to be more narrowly focused on style, leisure, and youth, while countercultures often formulate a more coherent and actionable opposition. Thus while goth, rave, heavy metal, and other youth groupings certainly have political elements, they primarily serve as leisure spaces where youth can (often temporarily) experiment with deviant identities and fashions. Countercultures “often challenge and seek to challenge and change existing cultural understandings that function in an authoritative manner” (Snow, Soule, & Kriesi 2004: 8), and their structure consists more of diffuse networks bonded via shared cultural materials and events (e.g., music festivals, periodic seminars, zines, blogs, and websites) than social movement organizations.

RELEVANCE TO SM STUDIES

The concept of counterculture is relevant to social movement studies in several ways. First, countercultures may be examined as a form of prefigurative politics, sowing the seeds of change and facilitating movement emergence and mobilization. Likewise, social movements inspire countercultures, as the civil rights movement did for the sixties Counterculture by encouraging “egalitarian contact between black civil rights activists and the white student left” (McAdam 2000: 266). Countercultures often share members with a variety of movements and are ripe for recruitment to contentious politics. They may also be considered free spaces and abeyance structures, serving as staging grounds for consciousness raising, collective identity formation, or movement strategizing, and sustaining commitment between protest cycles. Countercultures may be part of movement “legacies”; the American Jewish havurah (fellowship groups) carried on after the Jewish student movement’s 1968–1972 peak, providing space for both spiritual exploration and continued political criticism (Friedman 1993).

Second, countercultures have much in common with new social movements (NSMs), the variety of identity-based, post-labor movements focused on postmaterialist values such as human rights, peace, and environmental sustainability. Kriesi (1996) places “countercultural movements” as one of three types of new social movements. Instrumental NSMs, such as peace movements, are goal-oriented and not overly concerned with fostering collective identity; subcultural NSMs, such as gay and lesbian movements, “aim at the (re)production of a collective identity that is primarily constituted in within-group interaction, but which depends on authority-oriented action as well”;

2 COUNTERCULTURES
and countercultural NSMs, while also identity-oriented, create, and enact identities primarily in conflict with authorities (Kriesi 1996: 158). Countercultures, then, are less institutionalized, less instrumental, and more expressive than the collective behavior most commonly understood as social movements (“new” or not). Counterculturists’ efforts toward social change entail both collective and individual elements, but similar to new social movements, most action occurs at the individual level: “many contemporary movements are ‘acted out’ in individual actions rather than through or among mobilized groups” (Johnston, Larana, & Gusfield 1994: 7). Despite constituting communities of like-minded people, countercultures place a premium on individuality – of thought, style, and expression (Goffman & Joy 2004). As an example, anarchist punks may eschew careers, squat in vacant buildings, and adopt “anti-fashion” styles to resist capitalist culture, but tend to frame their involvement as an expression of individualism in conflict with what they view as conformist culture.

Third, countercultures highlight the growing scholarly interest in expanding theories of movement strategy and participation beyond the political process paradigm. The image of strategic, mobilized activists belonging to social movement organizations engaged in collective, public protest targeted toward the state or other institutional authority structures does not, as others have pointed out, capture all avenues of social change action. Countercultures, like NSMs, utilize strategies of both social and personal transformation and participation is as much individual as it is collective. For example, the voluntary simplicity movement encourages adherents to reject consumerism, workaholism, and disposability in order to advance an ethic of environmental sustainability by reducing consumption and waste, but also to lead more fulfilling, intentional personal lives, spend more time with friends and family, or pursue spiritual goals. Such a movement’s participation requires changes in personal behavior in the (relatively) private sphere versus collective action in the public domain. Yet voluntary simplifiers share a collective identity, a sense of community (however diffuse), and a belief that their individual choices add up to a collective cultural challenge.

FUTURE DIRECTIONS FOR RESEARCH

The concept of countercultures is underutilized in contemporary research, perhaps because the theorizing of new social movements and the critique of political process and organizational models has widened movement definitions to include collective behavior that may have once been labeled countercultural. Still, there are several questions worthy of study.

First, how do countercultures and protest cycles overlap? For example, how does the growth of the “green living” counterculture coincide with contemporary environmental activism? Does a shift to “everyday activism” blunt, spark, or supplement political protest? Are countercultures (like subcultures) more vulnerable to co-optation and commodification than are social movements? Or are they better able to persist because they are less tied to the political opportunities of the moment?

Second, and related, what are the connections between contentious politics, countercultures, and electoral politics? Conservative Christian countercultures, for example, cultivate homogenous, value-based communities in defiance of perceived moral decline. As part of that counterculture, virginity pledge groups focus primarily on personal abstinence framed as resistance to a pornographic culture (rather than pushing for abstinence-only public policies), creating cultural spaces within which to reject dominant sexual practices. Yet clearly conservative Christian movements have also engaged in contentious and electoral politics. What are the connections? What role do countercultures play in the larger social movement sector?

Finally, studying countercultures in relation to movements may shed new light on many of the same theoretical topics related to the study
of contentious politics – movement emergence, framing, emotion, decline, and so on. Examining the differences – in structure, focus, goals, tactics, and participation – between countercultures and social movements, might give new insights into how, for example, framing and grievance mobilization occur in diffuse, lifestyle-centered groups.

Critical mass theory
PAMELA OLIVER

“Critical mass theory” in social movements refers loosely to any formal theory about how interdependent decisions accumulate into collective action or more narrowly to work in the tradition of Marwell and Oliver (1993). The term “critical mass” originates in nuclear physics, as the smallest amount of fissile material needed to sustain a nuclear chain reaction. As analogy or metaphor the term has diffused into popular culture and social science and is widely used to refer to any context in which things change after a certain number of people get together or enter a setting. The term has been especially important in research and court cases about racial/ethnic or gender diversity in college admissions or employment (Addis 2007). Social movement activists and scholars often use “critical mass” in a loose metaphorical way to refer to an initial group of protesters or actors that is big enough to accomplish social change. Critical Mass Bulletin was the name given to the 1970s newsletter for scholars of collective behavior and social movements. An article written in the early 1970s bemoaned the lack of critical mass of scholars studying collective behavior (Quarantelili & Weller 1974).

SIMPLE CRITICAL MASS MODELS

In Granovetter’s (1978) influential paper on threshold models of collective behavior, individuals are assumed to attend to the number of others who act in a certain way and vary in the threshold number of others whose actions change their own choice. Whether a cascade of action occurs or not is highly sensitive to the presence of gaps in a distribution and the degree of group heterogeneity which, as Oliver (1993) shows, affects the proportion of a group who are self-starters (i.e., have thresholds of zero). Granovetter and Soong (1983) provide further elaborations. Macy (1991) reworks Granovetter’s models in stochastic learning terms, finding similar results. The image in these models is that collective action happens not from coordination and planning, but spontaneously through local interactional influence.

CRITICAL MASS THEORY

In social movements, the critical mass is often understood not just as a spontaneous consequence of individual decisions, but as self-conscious cadres of actors who are intentionally trying to “make something happen” in pursuit of a social change goal. In a series of articles titled “a theory of the critical mass,” later collected into a book (Marwell & Oliver 1993), Oliver and Marwell developed a variety of models for the provision of collective goods which emphasized the different roles of a relatively small group of intentional actors in promoting social change. “Critical mass theory” will be used in this section to refer to this specific line of theory. In it the desired social change is conceptualized as the rational choice concept of a collective good. Following Olson (1965), collective goods have two dimensions: nonexcludability (the extent to which a good provided to one group member cannot be withheld from other group members) and jointness of supply (the extent to which a good can be provided to more people without increasing its cost). Group heterogeneity and interdependent action are taken as givens. A central concept in the theory is the production function, that is, a mathematical expression of the form \( y = f(x) \) that gives the relation between outputs of the collective good (\( y \)) and inputs of participation or contribution (\( x \)). Unlike other approaches, critical mass theory treats the form of the production function itself as a factor that defines different types of collective action situations.
with different dynamics. A central claim of critical mass theory is that “there is no unitary phenomenon of ‘collective action’ that can be described by a simple set of theoretical propositions” and that it is futile to pose “general questions such as ‘Is collective action rational?’ or ‘Do people free-ride?’” (Marwell & Oliver 1993: 3). Instead, the goal is to use theoretical concepts to define specific sub-types of collective action and explore how their dynamics vary as parameters describing them vary.

In their foundational paper (Oliver, Marwell, & Teixeira 1985), Oliver and Marwell distinguish between decelerating and accelerating production functions for goods that are both fully nonexcludable and have perfect jointness of supply. In both the accelerating and decelerating cases, a relatively small group of highly interested and resourceful actors play a critical role in collective action, but the character of their role varies. In the accelerating case, the marginal increase in $y$ is greater for later contributions of $x$ and collective actions exhibit threshold effects and the “exploding” dynamics typically envisioned in the critical mass metaphor. In the accelerating case, the central problem of collective action is efficacy: can a large-enough group of potential contributors be mobilized to pass the critical mass threshold? By contrast, in the decelerating case where the marginal increase in $y$ is smaller for later contributions of $x$, earlier contributors provide enough of the collective good for everyone that other potential contributors are satisfied and thus motivated to “free ride” on the efforts of others. In the decelerating case, strategic gaming and free riding are potential issues, and original contributors are motivated to try to persuade less-interested people to help share the costs of collective action. Theoretical results are complex and often incorrectly oversimplified in citations. Their simplest paper on the “group size” effect (Oliver & Marwell 1988; also Marwell & Oliver 1993: ch. 3) argues that heterogeneity and group size interact to produce a smaller critical mass (number of people whose contributions add up to enough to provide a jointly supplied collective good) when the mean level of interest or resources would be too low to make people willing to contribute to a jointly supplied collective good.

Work has moved in different directions from their initial insights. Marwell and Oliver themselves primarily focused on the effects of group heterogeneity and networks in the second-order mobilization problem, in which a relatively small group of initial activists or organizers expend resources to recruit others to participate. In this work, the “critical mass” refers to organizers. In one analysis (Marwell, Oliver, & Prahl 1988; also Marwell & Oliver 1993: ch. 5), they model an organizer-centered mobilization of an all-or-none contract in an accelerating case, finding a simple negative effect of organizing costs, a simple positive effect of network density, and a complex effect in which more centralized networks are more beneficial in highly heterogeneous groups. In another (Marwell & Oliver 1993: ch. 6) they model a situation in which both mobilization and information-gathering involve costs and organizers choose between mobilizing more people unselectively or paying the information cost to target mobilization on fewer larger contributors, finding that information is worth more as group heterogeneity increases. In a third (Prahl, Marwell, & Oliver 1991; also Marwell & Oliver 1993: ch. 7) they use a different model for the trade-offs between reach and selectivity in organizer-centered recruitment campaigns with accelerating production functions, finding that all factors exhibit multidimensional thresholds that must be exceeded before collective action can occur and then approach asymptotes.

THEORETICAL EXTENSIONS AND ELABORATIONS

Macy (1990) reformulated the original Oliver–Marwell (Oliver, Marwell, & Teixeira 1985) “critical mass” model using backward-looking adaptive learning instead of forward-looking rational decisions and replacing the production function with an
S-shaped logistic function that combines an early accelerating phase and a later decelerating phase. In a rational-action model like that of Oliver and Marwell, actors only act if they expect benefits to exceed costs. In an adaptive learning model, actors respond to their absolute level of satisfaction or dissatisfaction: actors in an unhappy situation will randomly experiment with alternate behavior. If enough happen to experiment at the same time, in Macy’s models, the critical mass can be exceeded and the action cascade proceeds to the second cooperative equilibrium, where the production function becomes decelerating. Macy also argues that solidarity and cooperative action can be a consequence of crisis (i.e., a bad initial situation).

Gould (1993) builds on both the Granovetter and Oliver–Marwell work to consider situations in which people are most influenced by the contribution levels of those near them. Gould assumes this works through a fairness norm in which most people want to make contributions similar to those adjacent to them, although there is a subset of unconditional contributors. In this work, the location of unconditional contributors in a network makes a substantial difference in the impact of network density and size. As in earlier work, results are often nonlinear and exhibit thresholds and interactions among independent variables, once again finding that different mobilization contexts yield different dynamics.

Heckathorn (1996) synthesizes critical mass theory with several other strands of work to define a composite game in which actors make choices at three levels: (1) in the first-order game, they can contribute or not to a collective good; (2) in the second-order game (Oliver 1980), they can contribute to a selective incentive system to promote contribution to the collective good, incur costs to oppose the incentive system, or do nothing in the second-order game; (3) in a third-order game, they either incur an information cost to make their actions conditioned upon others’ actions, or they can make theirs unconditional. Using a representation of the production function that distinguishes between accelerating and decelerating functions, Heckathorn shows that the shape of the production function and the ratio of the value of the collective good to the cost of using an incentive jointly define a space in which different regions have different strategic dilemmas. In a subsequent article, Heckathorn (1998) argues that five distinct ideologies for reconciling potential conflicts between individual and collective interests can be identified, each corresponding to a distinct form of social dilemma.

RELEVANCE FOR UNDERSTANDING REAL SOCIAL MOVEMENTS

Critical mass theory and other formal models are not directly relevant to the complexities of real social movements, but do provide insights into the dynamics and dilemmas that underlie movements. As several authors stress, (e.g., Marwell & Oliver 1993; Heckathorn 1996), activists often make conscious strategic choices that are essentially choices between different production functions or games. For example, activists might choose an informational lobbying campaign with a decelerating production function or they might adopt a second-order recruitment and incentive strategy to persuade people to join together in a mass campaign with an accelerating production function. Formal critical mass analysis offers tools for understanding these choices.

Cults
ROBERT W. BALCH

A cult is a religious movement whose beliefs and/or practices are regarded as highly unconventional. Beyond that, scholars disagree about the meaning of the term and the significance of the phenomenon.

Until the 1970s, sociologists generally regarded the cult as an inconsequential, ephemeral form of religious organization. Most often it was described as a small, loosely knit group with unorthodox beliefs and usually a charismatic leader, but which lacked a coherent doctrine and required little or nothing from its members. Cults were distinguished from sects, which were seen as highly cohesive communities that require strict adherence to doctrine, make great demands on their members, and often live separately from society. Wallis (1974) attributed the organizational differences between cults and sects to differences in their epistemological foundations. He argued that the sect is “epistemologically authoritarian,” meaning it claims a single Truth, whereas the cult is “epistemologically individualistic,” leaving matters of Truth and salvation up to each individual.

However, even as Wallis was writing in the 1970s, the cult–sect dichotomy was being challenged by the unexpected proliferation of radical religious movements in Western societies, particularly the United States. The most visible groups (e.g., the Unification Church and Children of God) had features of both cults and sects. They had highly unorthodox beliefs and charismatic leaders, but they were also closed, tightly knit, doctrinaire communities. Because they were epistemologically authoritarian, Wallis referred to them as sects, but other scholars defined them cults because of their deviant beliefs and practices. More significantly, they were labeled as cults in the mass media and by an emerging anticult movement (ACM).

During the 1970s, media depictions of cults became overwhelmingly negative and relied heavily on expert opinions provided by the ACM, which claimed that cults were psychologically harmful and potentially dangerous. ACM experts saw cults as high-demand organizations distinguished by charismatic leadership, rigid group boundaries, strict control over daily life, and the use of powerful influence processes, popularly known as “brainwashing.”

The anticult perspective was quickly challenged by social scientists who were studying these movements. Labeled “cult apologists” by the ACM, these scholars rejected the brainwashing hypothesis, claiming that converts are willing participants in their own conversions, and that, in any event, brainwashing does not work very well, as demonstrated by high rates of defection from even the most notorious cults. The ACM lost momentum in the 1990s, but the role of social influence in conversion remains a contentious issue.

The apologists also accused the ACM of stereotyping cults based on a few sensational but atypical cases (e.g., the Peoples Temple mass suicide). In fact, the movements branded as cults by the ACM varied so widely that they had almost nothing in common except that their beliefs and practices were perceived as deviant. By the end of the 1970s, the matter of what constitutes a cult was more confused than ever.

Stark and Bainbridge (1985) tried to clear up the ambiguity by defining both cults and sects in terms of their relationship to the dominant religious culture, represented by mainstream religious organizations known as churches. Although both cults and sects deviate from religious norms, sects are schismatic movements (usually fundamentalist) that attempt to revitalize an existing faith, whereas cults are genuinely new in that they inject novel ideas into a society’s religious culture. Some cults represent religions transplanted from other societies (e.g.,...
Buddhism), while others are true cultural innovations (e.g., Mormonism and Scientology).

Stark and Bainbridge further classified cults by their degree of organization. “Audience cults” are least organized and require no commitment beyond reading a web page or attending occasional lectures. Somewhat more organized are “client cults” that provide spiritual services in exchange for money. Audience and client cults appear equivalent to the ephemeral cults described by Wallis. Most organized, but least common, are “cult movements,” which are true religions that provide a total way of life and demand major commitments, including severing all ties to other religious organizations. Cult movements would be sects under Wallis’s rubric, and would include most of the high-profile new religions of the 1970s. In contrast to most scholars, Stark and Bainbridge gave cults a leading role in the drama of religious change. Cults introduce new ideas, inspire social action, start new traditions, and, in rare cases (most recently, the Mormon Church) evolve into world religions.

Nevertheless, by the end of the twentieth century, the term “cult” was used in such diverse ways and had acquired so many negative connotations that most social scientists had abandoned it in favor of “new religious movement” (NRM). Yet “NRM” has proved equally problematic. Sects, for example, are also new, but the term NRM is customarily reserved for movements that used to be called cults. Newness itself is ambiguous, sometimes referring to recency of origin and other times to cultural distinctiveness.

Despite continued terminological confusion, cult scholars have amassed a vast amount of data on topics directly related to social movement studies, for example: movement origins, charisma, recruitment, conversion, commitment, defection, and factors related to movement growth and decline. Though studies of North American NRMs dominated during the twentieth century, the emphasis has shifted to religious movements in other societies, enabling cross-cultural tests of Western-based theories. Yet the NRM literature has been virtually ignored by social movement scholars, and cult researchers have responded in kind. Both fields could benefit from cross-fertilization.

Decolonization and social movements
VINCE BOUDREAU

In their influence on state and social structures, colonial processes established some of the basic parameters for the social movements that contested imperial rule, and for those that rose to confront the independent governments of the newly postcolonial world. For decades, the study of decolonization was mainly the purview of area specialists, who approached these events with the interdisciplinary inclinations of men and women wanting deeply to understand the specific dynamics of particular places. For theorists of social movements, decolonization and contention posed analytic puzzles, because such processes seldom followed the patterns inscribed by political reform movements on which most of the early literature was rooted. More recently, analysts have made more concerted efforts to think theoretically about contention in the colonial and postcolonial worlds, even as new theoretical developments, such as the Dynamics of Contention program, have provided new ways to approach these struggles (McAdam, Tarrow, & Tilly 2001).

In assessing decolonization and contention, the analyst must often adjust key conceptual tools to capture new ranges of variation. What shaped the range of opportunities and alliances available to movement activists? How did different colonial arrangements – some of which imposed draconian restrictions of assembly or organization – influence mobilization patterns? What forms of resistance, including armed insurgency, confronted colonial regimes, and what legacies did these struggles leave? To answer, we are drawn to consider concepts that have been generally central to the analysis of social movements – political opportunity structures, repertoires of contention, mobilizing structures, and collective action frames – in a new light. In colonial and decolonizing contexts, these concepts often unfold in relationship to distinct empirical realities: political opportunity may have less to do with an election or a policy cycle, and more with a military coup or demonetization. The repertoire of contention may range from millenarian risings to the appropriation of the legal arena. Mobilizing structures may need to contain elites with degrees from some of Europe’s finest universities and village residents whose traditions remain rooted in local ideas of authority, justice, and citizenship. Moreover, histories of colonial domination, nationalist emergence and struggle, and postcolonial state- and regime-building form a path-dependent chain, with the legacies of earlier forms of struggle and domination setting the tone for much of what follows – because rather more than in settled political regimes, decolonization struggles often play out over years and decades, and participants in those struggles often remain in the political field, as authorities and challengers, for years after independence.

As Young (1994) reminds us, while colonial regimes had the framework and technology for modern state-building and domination, they were often limited in the resources they commanded. Most imperial projects set out to secure what was imagined to be vast economic opportunities in national resources and trade – and even the later Berlin-conference-era rush for African colonies was conceived as a relative advance, if only in terms of blocking rivals’ access to territory. In virtually all cases, however, lacking the capacities to directly administer the state apparatus, colonial states enlisted and trained local forces to collaborate on the project. While the power structure in these arrangements varied to reflect the interaction of colonial plans and existing local arrangements, in all cases, colonial administrations
strongly influenced where rivalry, resentment, and resistance to colonialism would most likely emerge, and so provide the crucible in which many modes of contention were first forged.

Four elements of the colonial context are most important in establishing the contours of contention: First, how directly did the colonial apparatus attempt to govern colonial society? Second, what was the geographic scope of colonial rule? Third, what spaces did the colonial system open up, even via its repressive apparatus, for members of colonial society to develop bonds of solidarity with one another? And, finally, how did international influences, including anticolonial norms or factors that may weaken the imperial power, influence patterns of anticolonial struggle?

THE DIRECTNESS OF COLONIAL RULE

The colonial administrator and writer, John Furnival, aptly divided colonial domination projects into regimes that are directly ruled and those that worked more indirectly, through local leaders (Furnival 1948). Directly ruled administrations tended to unseat local authority structures, and in their place, create and train a cadre of officials specially designed to carry forth the colonial mission. The singular institution of the directly ruled colony was the colonial school, in which young and promising men learned the rules of governmental administration. Armies and colonial militia were often also created from the whole community, and frequently recruited from among the ranks of populations ethnically distinct and physically distant from lowland centers of traditional and colonial power. In these different respects, colonial forces created their own social and administrative foundations, often calling forth significant tension with whatever older elites existed. Indirectly ruled administrations, in contrast, drew existing elites and more traditional authorities into the colonial administration, overlaying established functions and powers with new tasks. Outside the administrative context, among the ranks of traders, writers, and nongovernmental schools, nationalism often emerges at least in part as contestation with “collaborating” elites.

In either case, relationships between power, capacity, and status deserve close examination, because they signal where and how nationalism will emerge and the kinds of mobilization it will likely inspire. Hence, if and when the colonial administration has (in the minds of administrators) recruited sufficient local talent, the administrative schools will begin to graduate young men (always young men!) who were less and less likely to find gainful employment with the colonial regime. Across the colonial world, the existence of educated local people living outside the colony has virtually always presented a habitat for the emergence of nationalist resistance. In other places, the new status of populations traditionally marginal to local power arrangements — one thinks of the various hill tribes that formed the backbone of many colonial levies — will engender or enflame ethnic rivalries, as has the common colonial practice of recording and ossifying what had been fluid or less salient ethnic differences. Because it depends on a structure of internal boundaries demarcating different rights and privileges among races, colonial status structures inevitably set up moments in which educated and skilled colonial subjects are subordinate to less skilled, less educated colonists. The fact that nationalist movements often do not emerge among the most repressed, but rather among those who have been the most involved in colonial administrations or schools, demonstrates the tremendous power of the juxtaposition of talent and limited opportunities in generating nationalist movements.

THE SCOPE OF COLONIALISM

Second, apart from the directness of colonial rule, colonialism’s geographic scope also matters, both in relationship to nationalist movements and more generally. Some colonial powers sink down deep roots in cosmopolitan colonial centers, and project a far
weaker presence into the countryside. Others, typically associated more with plantation or other extractive economic activities, elaborate a pattern of rule and penetration across broader geographic expanses. The sheer magnitude of the administrative tasks associated with this more expansive colonial domination suggests that colonists in them will often govern indirectly, via local functionaries. But the matter is worth independent investigation, because particularly in the postcolonial era, contention will in some large measure reflect how differently patterned states, at least initially inherited from the colonial era, interact with newly national societies. The scope of colonial rule helps establish both the contours of anticolonial resistance and the character of struggles that will likely follow. Colonialism elaborated across vast territory may be expected to call forth patterns of geographically broad resistance as well, and may influence how integrated the idea of the emergent political community may be. Where colonialism settles into central enclaves, even successful movements of independence may set up subsequent struggles in which central states must work to incorporate potentially resistant national peripheries – often sparking new rounds of struggle and contention.

SOLIDARITY AND CONNECTION UNDER COLONIAL RULE

A third consequential element of the colonial setting is the ways in which interactions between colonial rule and local society produce contexts that could support solidarity and rivalry among what had been more separated peoples. In some cases, new solidarities emerged in colonial-era schools, or in the military, or as a result of the efforts of local people to construct shadow martial or educational institutions because they are barred from those the state had established. Elsewhere, state efforts to check subversion – and especially the construction of penal colonies – created institutions in which nationalist leaders met and learned from one another. Hence, the “prison as school” is an important and widespread idiom in nationalist movements. Travel between the colonies and the metropolitan power, sometimes for education and sometimes for business, often provided emerging nationalists with opportunities to meet one another and to make contact with cosmopolitan political currents. Perhaps most important of all, travel to Europe, the United States, Japan, and China often provided perspectives that exploded the racial and political myths on which colonialism depended. But while colonialism established and strengthened some solidarities, it also initiated or sharpened rivalries. Mamdani (1996) describes colonial practice in Africa as depending on a kind of apartheid across the continent that established permanent differences between urban and rural society. Elsewhere, colonial policies established borders that cross-cut pre-existing ethnic divisions, or took fluid identity categories and, by dint of administrative practice, made them more permanent, in the process setting the stage for future contention.

INTERNATIONAL FACTORS AND ANTICOLONIAL RESISTANCE

Finally, international factors also influence contention under colonialism in several ways. In important measure, colonial practice evolved over time, and different administrations reflect the spirit of their age, and often the politics of metropolitan societies. Early colonialism, driven by the powerful Dutch and British merchant companies, sparked resistance among merchants and traders – one thinks of the Sepoy mutiny in India or the leading role that Muslim traders played in Indonesian nationalism. Sharply different conflict emerged under settlement colonialism, which sought to eliminate indigenous populations, or incorporate them as servants and laborers in what was imagined as a fully articulated European or American society and governing system (largely realized in places like the United States and Australia; less so in places
like Kenya, Zimbabwe, and South Africa). The aristocratic character of Latin American nationalist movements, and the regimes they produced, reflects international influences as well: war-weakened Spain surrendered its colonial possessions a full century ahead of transitions in Asia or Africa – at a time before working classes were incorporated or modern states had developed the technology to incorporate their peripheries. Without access to either liberal or Marxist idioms to guide politics, local elites replaced colonial elites, but established a pattern of rule that embraced and indigenized the aristocratic entitlements of colonial practice.

Near the turn of the twentieth century, questions of citizenship and rights provided a new locus of contention, partly reflecting imperialism’s newly prominent nation-building concerns. This rights-based discourse sprang in part from colonists’ need to reconcile their practice with political trends at home, particularly as liberalizing currents swept Europe. America’s later external colonialism (as distinct from the bloody domestic manifestations of its destiny) emerged entirely within that current and was more liberal in both its rhetoric and the prospects it opened for local political participation (something that shouldn’t eclipse the decimation of the Philippine population during the American conquest). The more prominently questions of rights loomed in the colonies, the more contention clustered around demands for participation and voice in the colonial edifice – although, often, such settings also raised sharp conflict over whether to engage or overthrow the colonial order. Outside that liberal orbit, the distinctive character of Japanese colonialism also had much to do with world time, reflecting both the sharp economic needs of a late-developing modernizer and a missionary devotion to modernity itself; no wonder that this more closed approach to colonial subjects produced some of the sharpest and most enduring nationalist resistance, particularly in places like Korea.

International warfare involving imperial powers also strongly influenced the opportunities available on the ground in colonial settings, sometimes by merely weakening colonial authority, but sometimes by providing a chance for local leaders – even nationalist leaders – to bargain for independence. On the ground, great power alliances provided a context within which nationalist movements sided with or against their colonial rulers. To understand these politics, it is important to recall that by the middle of the twentieth century, two kinds of international networks had been inspired by colonialism – one among colonial powers themselves, connecting colony and metropole but increasingly also linking colonists from different countries in a transnational community that shared information about best practices. The second network emerged in opposition to colonialism, and reflected the efforts of Comintern agents (among others) to establish a network of anticolonial forces that would defend socialism and the Soviet Revolution by resisting the expansion of capitalism and Western power. When Japan expanded across what it called the East Asia Co-Prosperity Sphere, it triggered some sharp tactical dilemmas among forces resisting colonialism. Where Comintern-allied nationalists were comparatively strong (one thinks of the Viet Minh) those defending socialism argued for a tactical alliance with colonists and their allies. Hence, American paratroopers received important logistical information for use against the Japanese by the man later known as Ho Chi Minh. Where Comintern forces were weaker, nationalists often sided with the Japanese to throw off a newly weakened colonial administration – as happened in Indonesia, the Philippines, and Burma. In other places, European powers made deals with nationalists that exchanged support against Axis or Allied powers for eventual independence – and the independence that followed in places like India reflected those deals.
ANTICOLONIAL CONTENTION

These four considerations inform answers to some of the key questions one asks about political contention. They influence, for instance, patterns of political opportunity in colonial settings: how isolated and vulnerable was the colonial regime? (Patterns of rule could either unite colonial society against the state, or produce significant and powerful local collaboration that divided and weakened anti-colonial mobilization.) Local power brokers who were incorporated into the colonial apparatus could pre-empt or undercut political contention, but alienated traditional authorities or elites were often powerful anti-colonial leaders. Colonial regimes needed to appear invincible to local society, but their power depended on factors that included standing in the international arena and support from the metropole. Alliances and solidarities — the mobilizing structures and micro-mobilization contexts of struggle — also reflect colonial practice: who went to school, to jail, to Europe, into exile, or into Comintern organizations all influenced the contours of struggle. They also influenced the ideas and tactics that activists would use; the more one reads the memoirs and letters of anticolonial activists, the more clear it becomes that ideas about independence and techniques of resistance played important roles in colonial-era contention. Assessing these factors helps analysts to understand contention under colonialism — when it arose, who its participants were, and what adversaries or tactics it was likely to meet.

But the character of nationalist mobilization is consequent in another way: new and independent regimes build on the legacies of these struggles, both in terms of the governing apparatus they set up, and the kinds of social challenges they will, in turn, confront (Boudreau 2004). For instance, did independence, in the end, require a massive mobilization and revolution? If so, that struggle in all likelihood also triggered processes of social mobilization, and perhaps the creation of a security force that either controls the new administration, or sits restively on the sidelines, nursing resentment about the inefficiencies of civilian rule. A mass-mobilizing struggle may also ossify and politicize ethnic, regional, or other divisions in a country — particularly when colonial policy recruited local participants in their militia from specific ethnic groups. Finally, some of the most resilient and successful Marxist insurgencies in the 1960s and 1970s established themselves by playing key roles in a national democratic coalition. Conversely, negotiated transitions to independence tended to tamp down the need for mass mobilization. Particularly resilient elite class and caste structures may emerge precisely because the new leaders of the independent nation had no real need of mass participation in a nationalism movement, or were able to take the final steps toward independence through negotiation with colonists. Needing less, they often promise less, and were less compelled to accommodate mass society in the new arrangement. For subsequent politics, this may mean that social movements may initially lack an organizational structure, or a tradition of orienting claims toward the new structures of government. It may also mean that the ramparts of power are higher and more protective of elite privilege, and that contention will be more explosive when it rises.

Like all path-dependent approaches to complex social phenomena, the links between particular patterns of colonial domination and patterns of social movement are complex, and reflect both the stable structural influences discussed, and the legacies of specific cycles of protest and struggle. Communist parties acquire standing in a postcolonial regime, or are eliminated in sectarian fighting. Interstate warfare can help lodge a nationalist movement closer to real power, affect a transition to independence, or help root colonialism more firmly in any given setting. In all cases, however, the analysis of any particular episode of contention must reflect patterns of power and the lessons that citizens learn about how to struggle, who their natural allies might be, and
how power should operate in a postcolonial setting.

Demand and supply of protest

BERT KLANDERMANS

The demand and supply of protest concerns the mobilizing context of participation. The “demand and supply” metaphor is borrowed from economics. Demand refers to the potential in a society for protest; supply refers to the opportunities staged by organizers to protest. Mobilization brings a demand for political protest that exists in a society together with a supply of opportunities to take part in such protest. The demand side of participation requires studies of such phenomena as socialization, grievance formation, causal attribution, and the formation of collective identity. The study of the supply side of participation concerns such matters as action repertoires, the effectiveness of social movements, the frames and ideologies movements stand for, and the constituents of identification they offer. Mobilization is the process that brings demand and supply together. Mobilization is the marketing mechanism of the social movement domain, and thus, the study of mobilization concerns such matters as the effectiveness of (persuasive) communication, the influence of social networks, and the perceived costs and benefits of participation.

The demand side of protest refers to the proportion of the population in a society that sympathizes with the cause. The supply side of protest refers to the opportunities for protest offered to people. If there is no supply of protest, the demand might be high but nothing will happen. If, on the other hand, there is no demand there is no point in offering opportunities to protest. Mobilization is the mechanism that brings demand and supply together. It must be communicated to people who want to protest that there will be opportunities to protest. Without mobilization a high demand and a strong supply would get nowhere.

The demand side of protest concerns the characteristics of a social movement’s mobilization potential. A movement’s mobilization potential can be characterized in terms of its demographic composition (gender, age, social class, level of education, ethnicity, etc.) and its political composition (left-right, liberal-conservative); in terms of collective identities, shared grievances, and shared emotions; in terms of its internal organization; and in terms of its embeddedness in society at large. Internal organizational structures and embeddedness relate to the social capital accumulated in a movement’s mobilization potential. The dynamics of demand refer to the formation of mobilization potential: grievances and identities must politicize and emotions must be aroused.

Social movement organizations are more or less successful in satisfying demands for collective political participation and we may assume that movements that are successfully supplying what potential participants demand gain more support than movements that fail to do so. Movements and movement organizations can be compared in terms of their effectiveness in this regard.

The supply side of participation concerns characteristics of the social movement sector in society. How contentious is the social movement sector and how dense? It regards such matters as the composition of a movement’s multiorganizational field, its allies, and its opponents. Are traditional organizations such as churches, parties, or unions involved in the movement, or any other societal organization? The supply side also concerns action repertoires, the effectiveness of social movements, the ideologies movements stand for, and the constituents of identification they offer. How well is the opposition in a society organized? What kinds of activities are they staging and are those activities effective one way
or the other? What is the ideological position of these organizations? Do organizations have charismatic leaders people can identify with? Movement organizations are not isolated structures. On the contrary, they engage in coalition formation – negotiations with other movement organizations in order to stage collective action.

Studies of participation tend to concentrate on mobilization and to neglect the development of demand and supply factors. Yet, there is no reason to take either for granted. To be sure, grievances abound in a society, but that does not mean that there is no reason to explain how grievances develop and how they are transformed into a demand for protest. Nor does the presence of social movement organizations in a society mean that there is no need to understand their formation and to investigate how they stage opportunities to protest and how these opportunities are seized by aggrieved people.

Scholarly attention to the dynamics of demand has been limited. Similarly, little is known about the formation of the social movement sector and how its make-up impacts on social movement activity.

Perhaps social movement scholars do not bother too much about how mobilization potential and the social movement sector is formed, as they tend to study contention when it takes place and mobilization potential and social movements are formed and mobilized already. Hence, little is known about the formation of mobilization potential and the movement sector in the ebb and flow of contentious politics. Basic questions remain unanswered, questions such as how consensus is formed, how individuals come to feel, think, and act in concert; why and how some grievances turn into claims, while others don’t; why and how some identities politicize, while others don’t. Similarly, we lack fundamental insight into how movement organizations come into being; how are they formed, how does their leadership work; are they competing with other organizations; and so on.

Demobilization
OLIVIER FILLIEULE

We know little about the mechanisms governing the decline of social movements and the varied forms of individual or collective demobilization that prompt this decline or end it. Indeed, as Verta Taylor emphasizes, “scholars generally are more interested in movements undergoing cycles of mass mobilization and have done little research on movements in decline or equilibrium” (1989: 772; see also McAdam 2005: 67). Yet, the logical counterpart of the initial recruitment and mobilization processes is clearly collective demobilization and individual disengagement.

The notion of demobilization brings us back to a plurality of phenomena ranging from individual disengagement (Fillieule 2005) to the political demobilization of an entire society, the sum of individual behavior producing macrosocial cycles of involvement or, conversely, withdrawal to the private sphere (Hirschman 1983). More precisely, beyond cycles of political attention, analysis reveals four other distinct types of situations. First, there is the demobilization phenomenon in a multiorganizational field, that is, of an entire social movement industry, with its formal organizations, its support networks and those involved along the way. The brutal ending of the 1956 protest movement in Poland due to harsh repression (Osa 2003), the generalized decline of leftist movements in developed countries in the aftermath of the May 68 crisis (e.g., Whalen & Flacks 1989), and the movement of de-unionization and disintegration of workers’ struggles in Europe (Klandermans 1997) are several such examples. Second, demobilization may relate less to a specific sector than to the slow collapse of a mobilization campaign, as a result of its success or, conversely, its failure. The history of antinuclear struggles in the 1970s and 1980s provides an illustration of this. At the mesosociological level, demobilization may affect a specific social movement organization, whether due to its voluntarily disbanding, rare though it is (Gottraux 1997), or a general decline in a cause, or even the effect of repression (e.g., the banning or removal of the leadership), as seen with numerous clandestine or semi-clandestine extreme leftist groups at the end of the 1970s in Japan and the United States (Zwerman & Steinhoff 2005), as well as in Europe (della Porta 1995). Finally, at the microsociological level, individual disengagement may figure in all these cases but may also stem from idiosyncratic trajectories. From this perspective, individual demobilization is not always voluntary. It may also result from a collective decision to dissolve an organization; from the decline of an ideology, as Taylor illustrates (1989) with regards to American postwar feminism; from exclusion; from deprogramming; or from being sidelined due to forced exile or a prison sentence.

The cost of the individual departure is related first to the way in which organizations impose various constraints on defections. The psychological or material cost of the defection and, therefore, its probability, are traceable to many factors. These include the extent of the sacrifices accepted to join the group (initiation rites, tests, hierarchization and the compartmentalization of groups); the degree of socialization within the group, which reinforces emotional attachment, related to the extent of renunciation of social relations outside of the group (networks of families and friends); and, finally, the rules governing defection, sometimes made impossible by material dependence or the threat of being hunted down as a traitor (Bennani-Chraibi & Fillieule 2003). To these barriers, we must also add the existence of opportunities to reconvert acquired resources, the possibility of reconnecting with alternative sociability networks and, finally, the social legitimacy of...
defection. This is linked to the social acceptance of departure, as well as to society’s readiness to grant those who leave an alternative social identity. Similarly, the modalities of individual defection vary. It may be isolated or collective, on the occasion, for example, of an organizational split, or when groups with a certain affinity leave together. Introvigne distinguishes defectors, who leave in a negotiated manner, apostates, who become professional enemies of their organization, and ordinary leavers, who disappear without their withdrawal representing a significant cost, for either themselves or the organization (1999). This is a typology which needs to be completed by adding all forms of passive defection, but also all the cases in which withdrawal is followed, and sometimes provoked, by joining another organization.

A certain number of recent studies have focused on the processes leading to withdrawal (Björgo & Horgan 2009; Fillieule 2010; Maalki 2010), rather than on its determinants or what happens to those who withdraw. From this perspective, withdrawal is seen as resulting from three interdependent factors: exhaustion of the rewards of involvement, the loss of ideological meaning, and the transformation of relations of sociability.

Attention to the variability of rewards involves examining the reasons for which, at a particular stage of the life-course, involvement in protest activity becomes problematic, and determining under which conditions the benefits experienced from involvement are maintained or exhausted. This leads to identification, in different life spheres, of the “succession[s] of phases, of changes in individual behavior and perspectives” (Becker 1966). These critical moments prompt a fresh assessment of the rewards, knowing that their value in a given sphere is correlated to the value they are accorded in all other spheres. Examples abound of occasions when involvement in a cause, or withdrawal from it, corresponds almost exactly to the collapse or rise of new perspectives in the professional or affective sphere.

The impetus for individuals to re-evaluate the associated rewards must be examined. In addition to immediate reasons, such as the loss of a job or the end of a relationship, joining the workforce or entering a new serious relationship, we must also add a whole array of factors not directly related to the individual. Indeed, the price accorded to the rewards in a given universe is indexed to the value that other beneficiaries and the entire society accord it. In a context of political turmoil, for example in the 1960s, the rewards of involvement were very likely to be greater than those offered at a time of a loss of interest in politics.

Finally, we must attempt to understand how individuals seek to weigh the exhaustion experienced and the rewards, through turning back, distancing themselves from the role, and trying to transform the role or defect from it. It is at this point that the degree of dependence on the role and the existence of lateral possibilities, determined notably by the extent of compartmentalization of various spheres of life, constitute a universe of constraints making defection more or less difficult. It is as much the socializing power of the role that one is leaving as the manner in which one departs that explains the changing trajectory, once the individual has left and sometimes much later.

Withdrawal may also be observed in the erosion of acquired beliefs within groups, which may lessen the sacrifices one is willing to make for the cause. Here, we may discern two levels of possible determination. On one hand, the strength of beliefs may vary, depending on a change in political climate, whether from the perspective of a theory of social cycles (Hirschman 1983), the historical exhaustion of a commitment model (e.g., Fuchs-Ebaugh 1988), or even a backlash and return to order. This is what Whalen and Flacks (1989), for example, show in their work on what became of American students opposed to the Vietnam War. According to them, the primary cause of the decline of the 1960s was related to a change in the zeitgeist. The Vietnam War was coming to an end while the repression of leftist
movements was intensifying. Such a context led to a re-evaluation of the revolution’s chances for success, as well as of the cost of involvement. Specifically, it became more and more difficult for young activists to sacrifice their professional future to the increasingly remote possibility of reforming society. The question of the personal versus the political carried the day. In the same way, the success, rather than the decline, of a movement may erode convictions. Indeed, the satisfaction of demands, along with the eventual institutionalization of movements as they are integrated into the state’s decision-making processes, may lead to a rethinking of priorities and demobilization. Examples are the demobilization of gay movements at the end of the 1970s and the emergence of state feminism.

On the other hand, the loss of ideological conviction may also stem from a rupture of the consensus within the movement, the appearance of factions or splinter groups. Social psychology, notably based on the study of small groups, shows under what conditions loyalty to the group can be maintained. For example, Kanter (1972) proposes a typology of elements likely to encourage attachment, constructed around the two mechanisms of sacrifice and investment: the more sacrifices required to enter a group and remain, the higher the cost of defection. Here, Kanter is inspired by the concept of cognitive dissonance to stress the psychological dimension of the cost: the more intense the efforts, the more difficult it is to acknowledge the futility of these efforts. The notion of disinvestment, for its part, is linked to the existence of alternatives. The more individuals are caught in a system which is the only one distributing rewards and costs, the more they remain involved.

Finally, disengagement may be interpreted in terms of the transformation of relations of sociability within groupings. Indeed, the manner in which groups support these relations both inside and outside the groups reveals an array of significant factors affecting withdrawal. For example, McPherson and his colleagues produced interesting results on networks of sociability, their role in maintaining commitment and the importance of intragroup relations in the decision to defect (McPherson, Popielarz, & Drobnic 1992; Cress, McPherson, & Rotolo 1997). In particular, they show that when individuals are part of multiple networks, they are more likely to leave the organizations (niche overlap hypothesis). They also show that voluntary associations lose atypical members faster than more typical volunteers (niche edge hypothesis). This finding is consistent with Kanter’s observations that, when groups are underrepresented in an organization, they experience tensions and are generally excluded from informal friendship networks created in the course of their activism. So, overall, individual withdrawal is often inseparable from tensions observable amongst generations of activists.

While research has certainly made progress in understanding the mechanisms of individual demobilization, a certain number of avenues remain insufficiently explored. Thus, for example, at the meso-sociological level, we still lack a reliable typology of the diversity of routes chosen by social movement organizations that are undergoing a process of demobilization. Certain cases are clearly identifiable, starting with those of bureaucratization, institutionalization, and assimilation by the state or, on the contrary, of radicalization, to which we add the periods of abeyance, highlighted by Taylor (1989) and perfectly illustrated by Osa (2003). Yet this is still insufficient.

In addition, research could more systematically study the way in which some macrosocial contexts discourage or encourage certain paths to demobilization. The existence or availability (most often via the state) of possibilities of reconversion is an example of this. From this point of view, the literature on so-called terrorist movements or on leaving armed conflicts, especially around the issue of rehabilitation programs, as well as that dealing with public policies to end crises and to encourage disarmament of armed groups, constitutes a valuable tool. This helps in understanding what impedes and what accelerates the phenomena of demobilization at both the meso-
and microsociological level (Björgo & Horgan 2009). Finally, the consequences of phenomena of political demobilization over the short and long term also raise a series of fascinating questions which the literature has largely ignored, except with respect to the biographical consequences of involvement. Thus, for example, and to conclude, while there is considerable questioning on the spread of social movements from a positive perspective, it would also be interesting to explore the effects across time and space of the failure of a movement, a campaign, or an organization on other movements or campaigns, whether in an alliance network or a conflict network. Thus, to give only three examples, we would gain a more thorough understanding of the consequences of the crushing of the Paris Commune in 1871, the revolutions of 1848, or even the Tiananmen student movement in 1989.

Democracy and social movements
DONATELLA DELLA PORTA

Democracy is usually defined as a specific method of decision making, in which elected representatives are accountable to the citizens through regular elections. Social movements have always been concerned with democracy, keeping governors accountable, but also in many cases advocating and practicing alternative conceptions of democracy than the dominant, representative ones.

Several studies have indicated that the increasing challenges to representative democracy are accompanied by the (re)emergence of other conceptions and practices of democracy. Empirical research on political participation has stressed that, while some more conventional forms of participation (such as voting or party-linked activities) are declining, protest is increasingly used. While some traditional types of associations are decreasing in popularity, social movement organizations are growing in resources, legitimacy, and members.

What is more, historical and normative research has pointed at the presence of different conceptions of democracy, which pose different emphases on different democratic qualities. According to Pierre Rosanvallon’s influential volume on Counterdemocracy (2006), while the dominant conception of democracy focuses on a set of rules oriented to implement electoral accountability, in the historical evolution of democratic regimes, a circuit of surveillance, anchored outside of state institutions, has developed side by side with representative institutions. Citizens’ attentive vigilance upon powerholders is thus defined as a specific, political modality of action, a “particular form of political intervention,” different from decision making, but still a fundamental aspect of the democratic process (Rosanvallon 2006: 40).

Actors such as independent authorities and judges, but also mass media, experts, and social movements, have traditionally exercised this function of surveillance. Control from below is all the more important given the crisis of representative, electoral democracy.

In another influential theorization, Bernard Manin observed that the “democracy of the moderns” – that is, contemporary democracy as a system that governs territories of large dimensions – is fundamentally representative democracy: decisions are made by representatives, through standardized procedures, that are supposed to guarantee equality among citizen-voters and (electoral) accountability of those who represent them. Participation beyond elections is, however, essential also for modern democracies that gain legitimacy not only through the principle of majority decision-making, but also through their ability to submit decisions to the “test of the discussion” (Manin 1995). The main actors that perform this function of control change in time: while in party democracy, participation happened mainly within and throughout political parties (Manin 1995), in a contemporary democracy of the public, social movements acquire increasing relevance as actors of democratic participation.

Empirical research has indicated that social movement organizations take the democratic function of control seriously, mobilizing to put pressure on decision-makers, as well as developing counterknowledge and open public spaces. If electoral accountability has long been privileged over the power of control in the historical evolution of representative democracy, social movements contribute to stress the importance of extra-electoral forms of accountability. While stressing the need for more public and less private, more state and less market, they define themselves especially as autonomous from institutions and as performing democratic control of the
governors. By creating public spaces, they contribute to the development of ideas and practices of democracy (della Porta 2009a).

Democratic control acquires a special meaning given the perceived challenge of adapting democratic conceptions and practices to the increasing shift of competence toward the transnational level. In this respect, social movement organizations contribute to the debate on global democracy, not only by criticizing the lack of democratic accountability and even transparency of many existing at local, national, and transnational level, but also by asking for a globalization of democracy and actually constructing a global public sphere that could hold IGOs accountability (Marchetti 2008; della Porta 2009b).

Social movements, however, do not only ask to increase transparency; they also ask for more participation. Normative theorists of democracy (especially, Pateman 1970) have suggested that if institutional decision making is mainly controlled by a restricted class of professional politicians, the healthy functioning of democracy is linked to the presence of multiple arenas that allow for the participation of citizen. While theories of representative democracy have focused on electoral arenas, theories of participatory democracy have stressed the importance of involving citizens beyond elections. In this vision, citizens should be provided with as many opportunities to participate as there are spheres of decision making. In these conceptions, the actors of participatory democracy are mainly outside the public institutions.

Research on social movements has in fact stressed that, as highly reflexive actors, far from limiting themselves to presenting demands to decision-makers, they in fact address a meta-political critique to representative democracy (Offe 1985). The alternative they propose has usually been conceptualized in terms of participatory democracy, referring to an “ancient element of democratic theory that calls for an organisation of collective decision making referred to in varying ways as classical, populist, communitarian, strong, grass-roots, or direct democracy against a democratic practice in contemporary democracies labelled as realist, liberal, elite, republican, or representative democracy” (Kitschelt 1993: 15). At least since the 1960s, new social movements have in fact criticized delegation as well as oligarchic and centralized power, and instead supported forms of direct participation and grassroots, horizontal, egalitarian organizational models.

Recent studies observed that participation acquires different meanings in different social movements (Polletta 2002; Reiter 2009). In the Old Left, participation and delegation are seen as highly compatible, and the stress on participation appears as a recovery of the original values of democratic centralism. For the New Left, the emphasis is on direct democracy and self-organization, while the solidarity groups and new social movement organizations stress the prefigurative role of participation as a “school of democracy.” Similarly, searching for coherence between their criticism of existing democratic institutions and their internal practices, the organizations emerging with the Global Justice Movement elaborate counter-models that combine concrete proposals of reform with a utopian orientation to build alternative, free spaces. At the same time, social movement organizations interact with public institutions at various territorial levels. In many cases, especially but not only at the local level, they collaborate with public institutions, both on specific problems and in broader campaigns.

Participation is a value also in conceptions of deliberative democracy that acquired support in contemporary social movements. Although representative procedural democracy is mainly based on principles of delegation and majority votes, conceptions of democracy have always balanced such principles with respect for high-quality debate oriented toward the public good. With some different emphasis, in normative political theory, deliberative democracy refers to decisional processes in which, under conditions of equality, inclusiveness, and transparency, a communicative process based on reason (the strength of a good argument) is able to transform individual preferences, leading to decisions oriented to the public good.
In the conception of deliberative democracy, particular attention is given to the discursive quality of democracy with an emphasis on four elements: the transformation of preferences, the orientation to the public good, the use of arguments, and the development of consensus.

While representative democracy is based upon the aggregation (through vote or negotiation) of exogenously generated preferences, deliberative democracy is defined as oriented to preference (trans)formation. In deliberative processes, initial preferences are transformed during the confrontation with the points of view of others in order to reach a common understanding of the public good (Young 1996). This requires the deliberative process to take place under conditions of plurality of values, where people have different perspectives but face common problems. This should be achieved through rational argumentation, based on the exchange of reasons: people should be convinced not by the use of hard power, but by the force of the better argument (Elster 1998). In particular, deliberation should be facilitated by horizontal flows of communication, multiple contributors to discussion, wide opportunities for interactivity, confrontation on the basis of rational argumentation, and attitude to reciprocal listening (Habermas 1996). Recognition of others’ reasons allows for the building of consensus, so that decisions can be reached by convincing others of one’s own argument. They are therefore legitimate in as far as they are approvable by all participants – in contrast with majority-rule democracy, where decisions are legitimated by votes.

Also in this perspective, democracy develops (also or mainly) outside of public institutions in voluntary groups and social movement organizations, presented as enclaves, free from institutional power (Mansbridge 1996). Sometimes explicitly but more often not, many social movement organizations have adopted deliberative norms (della Porta 2009a, 2009b). First of all, they stress that, given a complex reality, no easy solution is at hand or can be derived from big ideologies. Many conflicts must therefore be approached by reliance on the potential for mutual understanding that might develop in an open, high-quality debate. The notion of a “common good” is often recalled (for example, water as a common good), but also democracy should be constructed through communication, exchanges of ideas, and knowledge sharing. The value of discussion among “free and equal” citizens is mirrored in the positive emphasis on diversity and inclusion, but also in the attention paid to the development of structured arenas for the exchange of ideas, with the experimentation with some rules that should allow for horizontal flows of communication and reciprocal listening. In particular, consensus is increasingly mentioned as a general value as well as an organizational principle in internal decision making (della Porta 2009a). In fact, even though social movements have stressed conflict as a dynamic element in society, they tend increasingly to balance it with a commitment to values such as respect for diversity, dialogue, and mutual understanding. Consensus is presented as an alternative to majoritarian decision making, which is accused of repressing and/or alienating the minorities. Through consensual decision making, instead, not only would legitimacy increase with participants’ contributions to decisions, but the awareness of different points of view would also help in “working on what unites,” constructing a shared vision while respecting diversity.

In particular in the Global Justice Movement, consensus spread transnationally, thanks to the symbolic impact and concrete networks built around the Zapatistas’ experience, and the successive adoption of consensual principles and practices in the Social Forum process (Smith et al. 2007; della Porta 2009b). Dedicated publications, workshops, and training courses helped the diffusion of consensual practices. Here as well, multiple meanings attached to consensus. In particular, when coupled with an assemblary, horizontal tradition, consensual decision making is perceived as a way to reach a collective agreement that reflects
a strong communitarian identity. This vision, particularly widespread among small and often local groups within the autonomous tradition, resonates with an anti-authoritarian emphasis and an egalitarian view. Group life assumes here mainly a prefigurative value. An alternative, more pragmatic view is spread in the emerging networks. Here, consensual decision making is accompanied especially by an emphasis on diversity and the need to respect it, but also to improve mutual understanding through good communication.

Democratization and democratic transition
DONATELLA DELLA PORTA and FEDERICO M. ROSSI

Social movements are increasingly considered as relevant actors in theorizations about democracy. Recently, an empirical linkage between movements and democratization processes has also been established. On the one hand, many of the processes that cause democratization generally promote social movements and “democratization as such further encourages people to form social movements” (Tilly 2004: 131). On the other, “under some conditions and in a more limited way, social movements themselves promote democratization” (Tilly 2004: 131). When looking at the impact of movements on democracy, the evidence is however mixed. First, some social movements support democracy, but some do not. Second, their relevance in democratization processes is discussed: while a “populist” approach to democracy emphasizes participation from below, with movements as important actors in the creation of democratic public spheres, the “elitist” approach considers democratization as mainly a top-down process.

Social movements support democracy and contribute to democratization only under certain conditions. Mobilization has frequently contributed to a destabilization of authoritarian regimes, but it has also led to an intensification of repression or the collapse of weak democratic regimes, particularly when movements do not stick to democratic conceptions. Labor, student, and nationalist movements brought about a crisis in the Franco regime in Spain in the 1960s and 1970s, but the worker and peasant movements and the fascist countermovements contributed to the failure of the process of democratization in Italy in the 1920s and 1930s (Tarrow 1995). Beyond a movement’s propensity to support democracy, democratization processes might follow different paths, being more or less influenced by social movements. As the relationship between social movements and democratization is not simple, two main questions for research are: When, how, and why do movements promote democratization? And, what are the consequences of their participation in the different stages of democratization processes?

These questions could be addressed by bridging social movement studies and democratization studies. Notwithstanding the practical and theoretical relevance of the topic, the interactions between movements and democratization have rarely been addressed in a systematic way. Additionally, even though social movements are increasingly recognized, in political and scientific debates, as important actors in democracies, interactions between the two fields have been rare. On the one hand, movements have been far from prominent in the literature on democratization, which has mainly focused on either socioeconomic pre-conditions or elite behavior. On the other hand, social movement scholars, until recently, have paid little attention to democratization processes, mostly concentrating their interest on democratic countries (especially on the Western European and North American experiences), where conditions for mobilization are more favorable.

THE ROLE OF MOVEMENTS FOR DEMOCRATIZATION STUDIES

Studies on democratization have traditionally assigned a limited role to social movements and protest. Democratization studies developed within a structuralist approach. Within modernization theory, Lipset (1959) associated the chances for the emergence of a democratic
regime with economic development. Although powerful in explaining the survival of established democracies, modernization theory tended to ignore the role of social actors and movements in *crafting* democracy, leaving the timing and tempo of democratization processes unexplained. When they did examine the role of organized and mobilized actors in society, they tended—as in Huntington (1991)—to consider mobilization, in particular of the working class, as a risk more than an asset.

A different vision dominated some of the main works in *historical sociology*, which linked democratization to class relations. Among others, Bendix (1964) and Marshall (1992) recognized the impact of class struggles in early democratization. More recently, Rueschemeyer, Stephens, and Stephens (1992) have pointed to the role of the working class in promoting democratization in the last two waves of democratization in Southern Europe, South America, and the Caribbean; and Collier (1999) confirmed their important impact in recent waves of democratization in Southern Europe and South America. Although recognizing a path of democratization from below, these studies still tended to explain these mainly on the basis of structural conditions.

The “structuralist bias” is criticized by the *transitologist approach*, which stresses agency, as well as a dynamic and processual vision of democratization, focusing on elite strategies and behavior (O’Donnell & Schmitter 1986). While protests and movements are supposed to play an important role at the beginning of the transition process, this so-called “resurrection of civil society” is seen as a short disruptive moment when movements, unions, and society in general push for the initial liberalization of a nondemocratic regime into a transition toward democracy. Although this is a moment of great expectations, “regardless of its intensity and of the background from which it emerges, this popular upsurge is always ephemeral” (O’Donnell & Schmitter 1986: 55–56). As in this wave of reflection the “*reforma/ruptura pactada*” in Spain was considered (explicitly or implicitly) as the model for successful democratization, the ephemeral life of a mobilized society tended to be perceived as not only inevitable, given the re-channeling of participation through political parties and the electoral system, but also desirable, in order to avoid frightening authoritarian soft-liners into abandoning the negotiation process with pro-democracy moderates. Several studies, however, have demonstrated the crucial role played by mobilized actors in the Spanish transition (cf. Maravall 1982; Tarrow 1995; McAdam, Tarrow, & Tilly 2001).

Within transitology, more systematic attention to civil society in democratization processes can be found in Linz and Stepan’s (1996) model of extended transition, which addresses South American, and Southern and Eastern European cases. Contrasting it with a “political society” composed of elites and institutionalized actors, “A robust civil society, with the capacity to generate political alternatives and to monitor government and state can help transitions get started, help resist reversals, help push transitions to their completion, help consolidate, and help deepen democracy. At all stages of the democratization process, therefore, a lively and independent civil society is invaluable” (Linz & Stepan 1996: 9). Although they recognize its role in theory, these authors do not give much empirical space to civil society.

Linz and Stepan (1996), though, hypothesize that the type of nondemocratic regime influences the potential for the emergence of movements and protests that precede liberalization, and accompany democratization. *Totalitarian* regimes are those that, by eliminating any pluralism, jeopardize the development of autonomous organizations and networks that could then be the promoters of democracy. *Sultanistic* regimes, due to the high personalization of power, include the manipulative use of mobilization for ceremonial purposes and through para-state groups, discourage and repress any kind of autonomous organization that could sustain resistance networks. *Authoritarian* regimes, that were mainly installed in countries with previous (semi-)
democratization and democratic transition

democratic experience, are those which generally experience the most massive mobilizations, and the best organized underground resistance based on several networks that either pre-dated the regime or were formed later thanks to higher degrees of pluralism. Adding to this argument, within authoritarian regimes, we may expect mobilization opportunities to be different for bureaucratic-authoritarianism, where a technocratic civic–military elite commands the depoliticization of a mobilized society for capital accumulation (O’Donnell 1973), and populist-authoritarianism, where the elites mobilize the society from above for the legitimation of the regime while incorporating the lower classes (cf. Hinnebusch 2007). Mobilization during democratic consolidation also seems to be more difficult the longer the life of the authoritarian regime (cf. Ulfelder 2005).

Different transition paths can also offer different opportunities to social movements. Linz and Stepan (1996) singled out the specific challenges of multiple simultaneous transitions, where regime changes are accompanied by changes in the economic system and/or in the nation-state arrangement. It is important not only whether the previous regime was authoritarian or totalitarian, but also whether it was a capitalist or a communist one. In particular, when there is a triple transition, the problem of nation-state building is reflected in the emergence of nationalist movements mobilizing in the name of contending visions of what the demos of the future democracy should be (Beissinger 2002). The moderation versus radicalization of claims for autonomy/independence has been mentioned as favoring or jeopardizing the transition to democracy.

Even though the dynamic, agency-focused approach of transitology allowed for some interest in the role played by movements in democratization to develop, transitology tends to consider movements as manipulated by elites. Transitology stresses the contingent and dynamic nature of the democratization process, but tends to reduce it to bargaining among political elites in a context of uncertainty. In addition to their “elitist bias,” transitologists have been criticized for emphasizing the role of individuals over collective actors, thereby reducing the process to strategic instrumental thinking, for ignoring class-defined actors such as unions and labor/left-wing parties, and for being state-centric, subordinating social actors to state actors (Collier 1999).

THE ROLE OF MOVEMENTS FOR SOCIAL MOVEMENTS STUDIES

Within the social movement approach, attempts to look at social movements in democratization phases have been very rare (Rossi & della Porta 2009). Especially in Latin America, the new social movement approach, which addressed the emergence of a new actor in post-industrial society, was widely applied in the 1980s and 1990s to single out the cultural and social democratization produced by movements (Escobar & Álvarez 1992). The political process approach – that highlights the interrelationship between governmental actors, parties, movements, and protest – was instead sometimes applied to explain regime transformation in Eastern Europe and the former Soviet Union (Beissinger 2002). Yet this approach has also been criticized as overly structuralist.

Even if the systematic analysis of processes of transition from below is scarce, there has been some fresh research on movements and democratization. The emergence of the Global Justice Movement pushed some social movement scholars to pay more attention to issues of democracy, as well as to movements in the Global South. Some pioneering research aimed at applying social movement studies to authoritarian regimes, from the Middle East (Wiktorowicz 2004) to Asia (Boudreau 2004). More generally, recognizing the structuralist bias of the political process approach, a more dynamic vision of protest has been promoted, with attention paid to the social mechanisms that intervene between macro-causes and macro-effects.
(McAdam, Tarrow, & Tilly 2001). Recently, some scholars within this approach proposed the reformulation of the transitology perspective, taking into account the role played by contentious politics (McAdam, Tarrow, & Tilly 2001; Tilly 2004; Schock 2005). Similarly to the transitology approach, they have stressed agency as well as the importance of looking at democratization as a dynamic process.

Some reflections have pointed to the democratizing role of civil society – theoretically located between the state and the market – with diminishing confidence in the role played by political parties as carriers of democratization. The global civil society perspective emphasizes the democratizing role played by a worldwide organized civil society in democratization on a supra-national scale. In some of these interpretations, civil society is conceptualized as almost synonymous with social movements.

MOVEMENTS IN DEMOCRATIZATION PROCESSES

Case studies have indicated that democratization is often linked to two contentious dynamics, which could affect different steps of the democratization process: (a) a pro-democratic cycle of protest, and (b) an increasingly massive and nonsyndical wave of strikes (cf. Foweraker & Landman 1997; Collier 1999; McAdam, Tarrow, & Tilly 2001). In Spain, Brazil, and Peru, for instance, strike waves were very important during the whole or part of the democratization process (Collier 1999). While Peru’s democratization is very much associated with a strike wave (1977–1980) against a highly unpopular authoritarian regime (Collier 1999), Brazil experienced a strike wave (1974–1979), followed by a cycle of protest (1978–1982) mainly mobilized by urban movements. Sometimes cycles of protest and strike waves converge. On many other occasions strike waves are stronger in the first resistance stages, decline later, and then reemerge during liberalization and transition in coordination with the upsurge of a cycle of protest originating from underground resistance networks. An attempt to identify a sequence of stages where movements play different roles in democratization processes can be carried out following the literature on movements (Rossi & della Porta 2009).

First, underground networks of resistance often undermine the legitimacy and the (national and international) support for authoritarian regimes. Human rights movements, unions, and churches promote the delegitimation of the authoritarian regime in international forums such as the United Nations, and in clandestine or open resistance to the authoritarian regime at the national level. The resilience of resistance networks under the impact of repression can lead to splits in the ruling authoritarian elites (Schock 2005). Among those organizations that have played a pro-democratic role are church-related actors (Osa 2003), and human rights networks, sometimes in transnational alliances (Keck & Sikkink 1998), as well as, very often, the labor movement (Collier 1999). Social networks of various types have emerged as fundamental, especially for some paths of mobilization under authoritarian regimes (Osa 2003).

Second, the increased open mobilization for a regime change during liberalization pushes the process to a transition notwithstanding some elites’ resistance. Protests or strikes often constitute precipitating events that start liberalization, spreading the perception among the authoritarian elites that there is no choice other than opening the regime if they want to avoid an imminent or potential civil war or violent takeover of power by democratic and/or revolutionary actors (e.g., Bermeo 1997; Wood 2000). During liberalization, social and political organizations publicly (re)emerge in a much more visible fashion (O’Donnell & Schmitter 1986): unions, labor/left-wing parties, and urban movements, mainly in shantytowns and industrial districts, have often pushed for democracy (Collier 1999), sometimes in alliance with transnational actors (Keck & Sikkink 1998). During the transition
to democracy, old (labor, ethnic) movements and new (women’s, urban) movements have often participated in large coalitions asking for democratic rights as well as social justice (Tarrow 1995).

Third, the consolidation of a procedural democracy is related to the struggle among sectors pushing for an authoritarian return and the (re)mobilization of social and political organizations for sustaining and expanding democracy. In transition literature, consolidation is generally linked to the end of the democratization process as signaled by the first free and open elections, the end of the uncertainty period, and/or the implementation of a minimum quality of substantive democracy (Linz & Stepan 1996). In some cases, this is accompanied by a demobilization of some organizations as energies are channeled into party politics; in others, however, demobilization does not occur (e.g., on Argentina, Bolivia, and the Andean region). In fact, social movement organizations (SMOs) mobilized during liberalization and transition rarely totally disband. On the contrary, democratization often facilitates the development of SMOs (e.g., the women’s movement in Southern Europe). The presence of a tradition of mobilization, as well as movements that are supported by parties, unions, and/or religious institutions, can facilitate the maintenance of a high level of protest, as in the Communist Party’s promotion of shantytown dwellers’ protests in Chile, the Partido dos Trabalhadores (PT) and part of the Roman Catholic Church working with rural workers’ movements and unions in Brazil, or the environmental movements in Eastern Europe (Flam 2001). In this stage, movements might claim the rights of those who are excluded by “low intensity democracies” and ask for a more inclusive democracy (i.e., land reform, employment, indigenous and women’s movements) and the end of authoritarian legacies (Eckstein 2001). Movements’ alternative practices and values help to sustain and expand democracy. Furthermore, movements’ networks play an important role in mobilizing against persistent exclusionary patterns and authoritarian legacies. Keeping elites under continuous popular pressure after transition can facilitate a successful consolidation.

Finally, there are major transnational influences that play out during the whole process of democratization and which are linked to the evolving interstate rules that define the global normative context for action by states as well as linking states and social organizations against human rights violations. All of these aspects have an indirect or direct impact on movements’ participation in democratization processes (cf. Keck & Sikkink 1998), with particular tensions between the conceptions of democracy expressed by local SMOs and the Western conceptions promoted by transnational actors.

Democracy inside social movements
DONATELLA DELLA PORTA

THE IMPORTANCE OF INTERNAL DEMOCRACY FOR SOCIAL MOVEMENTS

Although social movements have been said to propose alternative visions of democracy, social movement studies have only rarely addressed the issue of democracy in movements, from either the empirical or the normative point of view.

Internal democratic procedures have been analyzed mainly in research on social movement organizations, that have been however conceptualized in different ways. Attention to the instrumental relevance of social movement organizations has been at the core of the resource mobilization approach. However, social movement organizations have been seen also as sources of identity for their constituencies. In the first approach, decision making inside the organization tends to be analyzed in terms of efficient allocation of resources under environmental constraints. In the second, social movement organizations are considered as arenas for political conversations, characterized by specific etiquettes (Eliasoph 1998: 21): internal democracy is here linked with the normative positions within them.

For a long time, the mainly empirical orientation of social movement studies has deflected attention from normative reflections on democracy, and the focus on the behavior (protest, lobbying, etc.) of social movement organizations vis-à-vis institutional politics has discouraged research on their prefigurative politics (Leach & Haunss 2009). As Clemens and Minkoff (2004: 156) have recently noted, with the development of the resource mobilization perspective, “Attention to organization appeared antithetical to analysis of culture and interaction. As organizations were understood instrumentally, the cultural content of organizing and the meanings signaled by organizational forms were marginalized as topic for inquiry.”

Attention to democracy inside movements increased, however, with the “cultural turn” in social movement studies that pushed toward a recognition of the symbolic and emotional dimension of social movement politics. This did not imply a denial of the instrumental role social movements play in normal politics, or the importance of concerns for efficiency in their choice of internal forms of organization as well as external strategies of protest. However, it opened the way to considering the “passionate” and normative dimension of social movement politics. At the same time, especially in normative theory, the debate on deliberative forms of democracy offered conceptual instruments for a fresh look at the visions of democracy inside and outside social movements.

More and more, internal democracy is recognized as particularly important for social movement organizations. First, as they have few material incentives to distribute, they must gain and keep the commitment of their members on the basis of shared beliefs. Second, the rules for making collective decisions are especially challenging for a base of activists that appear as very demanding. Social movements are in fact self-reflexive actors that tend to debate the issue of democracy as it applies to their internal lives (Melucci 1989; della Porta 2005). Past experiences are reflected upon, showing learning processes. Although no satisfactory solution has yet emerged to address the main organizational dilemmas – between, among others, participation versus efficacy, equality versus specialization, and so on – experiments develop, innovating on the old, and unsatisfactory, models.
DEMOCRACY IN MOVEMENTS: WHICH MODELS?

With particular attention to left-wing social movements, research has stressed their role in promoting alternatives to representative democracy. Not only do they express criticism of real, existing democracies, but they also experiment with different democratic practices within their own organizational life. In different historical moments, social movements have contributed to the debate on democracy.

Developing during the phases of first democratization, the labor movement criticized the then dominant conception of democracy as based upon (limited) electoral representation, developing alternative visions and practices. While struggling for universal enfranchisement, labor movement organizations also contested the representative model, asking for direct forms of democracy and limits upon the delegation of power. As historians such as E.P. Thompson (1991) and William Sewell (1980) have observed, the ideas of direct democracy remained alive in the labor movement in Europe, with frequent contestation of the increasing bureaucratization of left-wing political parties and trade unions.

Direct democracy remained central in the visions and practices of the new social movements that emerged in the late 1960s and early 1970s, criticizing, among others, the institutionalization of the Old Left and proposing more participatory democratic practices. The student movement, the women’s movement, and the environmental movements expressed not only specific claims, but also a fundamental critique of conventional politics, thus shifting their endeavors from politics itself to metapolitics (Offe 1985). These movements have been said to represent important innovations vis-à-vis the conceptions then dominant in the labor movement: among them are decentralized and participatory organizational structures; defense of interpersonal solidarity against state and corporate bureaucracies; and the reclamation of autonomous spaces (Offe 1985).

In contemporary social movements, in particular in the Global Justice movements, the values of deliberative (or discursive) democracy, with particular emphasis on consensus building, have been linked with participatory ones (della Porta 2009b). As Francesca Polletta has observed, in grassroots social movement organizations activists “expected each other to provide legitimate reasons for preferring one option to another. They strove to recognize the merits of each other’s reasons for favouring a particular option . . . the goal was not unanimity, so much as discourse. But it was a particular kind of discourse, governed by norms of openness and mutual respect” (Polletta 2002: 7). Resonating with the novel debates in political theory, these values and related practices are seen as partial solutions to the limits of participatory (especially direct) democracy, such as the “tyranny of the majority,” the closedness of small groups to newcomers, and the risks of a “hidden” leadership (among others, Freeman 1974; Breines 1989).

INTERNAL DEMOCRACY IN GLOBAL NETWORKS

Recently, attention to internal democracy has developed around contemporary social movements that are said to have undergone relevant transformations, among which are the development of intense and innovating forms of networking; the related emergence of tolerant identities, with acknowledgment of diversity and subjectivity as positive elements; the presence of multiple repertoires, with a pragmatic acceptance of both protest and lobbying, but also a focus on the experimentation of “possible utopias” (della Porta 2009a, 2009b).

Research on democracy inside the Global Justice Movement pointed at the growing attention to values related with communication in an open space, networking, respect for diversity, equal participation, and inclusiveness. The importance of conceiving social movement organizations as spaces for networking, with a positive emphasis on diversity, is present in
particular in the World Social Forum, as well as in the macro-regional and local social forums. In their normative self-conception as an inclusive public sphere, the main organizational challenge is seen in the capacity to address the tension between the need for coordination and the respect for the autonomy of the various organizations and activists that participate in various networks, forums, and coalitions.

Networking involves in fact different and diverse actors, particularly at the transnational level. In contemporary social movements, this has been nurtured under the conception of an “open space method” of internal democracy, that should produce strength from diversity. Common to the Global Justice Movement is a positive understanding of diversity, including its own internal diversity, based on recognition of the history of the different organizations that converge in it.

The networking logic reflects, and at the same time contributes to, the spreading of embedded sets of values oriented toward the building of horizontal ties and decentralized coordination of autonomous units (Juris 2004). Horizontality, or lack of vertical power, is in fact a founding value of several recent movement organizations.

The degree to which these norms are implemented in practice is however debated in the movements themselves, as diversity is itself a source of tensions (Pleysers 2005: 512). Transnational social movement organizations emerged in fact as plural and contested spaces, in which “ideological differences were largely coded as disagreement over organizational process and form” (Juris 2004: 257). The broadest convergence spaces, including the social forums, involve a complex amalgam of diverse organizational forms.” Research on the European Social Forums has observed the presence of different democratic forms of internal decision making, with various equilibria between participation versus delegation of power and deliberation versus majority voting in internal decision making (della Porta 2009a, 2009b). Crossing these two dimensions, four democratic models have been singled out: an associational model, with a high degree of delegation and majority votes; deliberative representation, with delegation coupled with decision-making based on a consensual basis; assembleary model, when decisions are taken by majority in open assemblies; and deliberative participation, when decisions are made in open assembly on the basis of consensual decision-making. The associational model emerged as quite widespread when looking at the formal structure of social movement organizations, as emerged in their own written documents; the representatives of the organizations stressed, in interviews, the presence of consensual decision making; participatory models (both assembleary and of deliberative participation) emerged as still preferred by the rank-and-file members. At the organizational level, the organizational age, the size of membership, and the availability of material resources explain the spread of the associational model, but normative positions played an even more
important role, with new social movement organizations more oriented toward participation, and those founded within the Global Justice Movement stressing deliberative values (della Porta 2009a). Consistent results emerged at the individual level from a survey with the participants in the Fourth European Social Forum (della Porta 2009b), indicating a predominant importance of past and present experiences of political socialization. Members of parties and large NGOs tended to have lower levels of participation; those of informal social movement organizations defended more participatory and consensual vision of democracy. However, conceptions of consensus and participation emerged as widespread among all organizational types and ideologies.

Demography and social movements and revolutions
RALPH I. HOSOKI

Originating with the strain and breakdown theories of the classical collective behavior tradition that dominated in the 1960s, the analytical repertoires for understanding contentious politics expanded to include structuralist (political opportunity) and post-Marxist approaches as well as resource mobilization theories in the 1970s and 1980s, and constructivist and cultural approaches in the 1980s and 1990s (McAdam, Tarrow, & Tilly 2009). This progression entailed a general shift from deterministic collective behavior paradigms that focused on external causal explanations of movement emergence to more agency-oriented resource mobilization paradigms that emphasized the importance of internal movement dynamics and rational, agentic, and interest-based decisions of movement actors and collectives (Buechler 2004). Furthermore, collective action—originally understood by strain and breakdown theorists as irrational, disruptive, and spontaneous behavior stemming from social breakdown—was gradually cast in a more positive light with the emergence of empirical studies in the 1970s that pointed to organizational solidarity and not social malintegration as the necessary condition for collective action (Useem 1998; Buechler 2004). Somewhat lost in this transition, however, was the emphasis placed on what Goldstone and McAdam (2001) term, the *macro determinants of contention*. With the demise of strain and breakdown theories, the emphases placed on opportunities (over threats), and the conceptualization of contentious actors as rational entities, contemporary studies on social movements and revolutions have largely undervalued systematic efforts to understand how social and demographic factors might affect the emergence and development of political contention.

A multidisciplinary survey of the literature on contentious politics, however, reveals that specific attention to demographic factors—often through the lenses of variants of strain and breakdown approaches—has persisted in various forms through the works of scholars who argue that macro demographic factors can provide more nuanced understandings of the processes and contexts in which contentions arise. For instance, Goldstone (1991) presents a demographic/structural model of state breakdown and argues that state breakdown—and in many cases, ensuing revolutions—in early modern societies between the sixteenth and mid-nineteenth centuries can be explained by a single basic process that is rooted in population growth. Through population growth and pressures on resources, a chain of interrelated destabilizing events precipitated in societies with inflexible social and political structures. According to this model, (1) state fiscal distress, (2) the polarization of social wealth and rising intra-elite factionalization, (3) the heightening of popular mobilization potential through popular unrest caused by urban migration, unemployment, land competition, and increases in a population’s youthfulness, and (4) the increased salience of folk and elite ideologies of rectification and transformation have often been the critical results of population growth that combined to ultimately unfold in state breakdown.

Although an argument aimed at understanding the emergence of revolutionary crises, Goldstone’s model resonates with Snow et al.’s (1998) reconceptualization of the classical breakdown argument in social movement literature. In an attempt to reassess the conceptual utility of strain and breakdown theories through a demonstration of the complementarity of the seemingly

*Note: The listed dates are conventional markers that refer to the year in which revolutionaries initially overthrew extant political authorities. Revolutions, however, are best conceptualized not as events, but as processes that typically span many years.

Some recent empirical studies have addressed – from multiple disciplinary angles – how structural social and demographic change may spark contentious action. For example, in their study on patriot and militia organizing in the United States, Van Dyke and Soule (2002) found that at the county level (but not on the state level), an increase in the ethnic minority population was significantly associated with a higher number of patriot and militia groups, thereby indicating that reactive social movements may mobilize in response to perceived threats by actors outside of the institutional political arena. Additionally, Goldstone and McAdam (2001) argue that the rise of the New Left in the 1960s and early 1970s was, in part, made possible by important economic, social organizational, and social psychological processes that were triggered by the advent of the highly educated and optimistic postwar “baby boomer” generation.

In terms of violent conflict, Urdal’s (2008) study on the effects of population pressure and resource scarcity on political unrest in India revealed that youth bulges within subnational regions were associated with armed conflicts, political violent events, and riots. Ostby et al. (2011) also found that population pressure and horizontal intergroup material inequalities had an interactive effect on routine political violence in Indonesian provinces. Furthermore, with regard to mobile populations, Weiner and Teitelbaum (2001) have raised multiple ways in which immigration, demographic change, social order, and state security are interlinked. Finally, Ware’s (2005) study on the Pacific Island countries illustrates how continuous emigration can serve as a safety valve to help prevent population pressures and communal tensions from precipitating into high levels of unemployment and civil unrest.

With the paucity of interdisciplinary dialogue and the inherent complexity of the relationship between structural social and demographic change and the emergence of various forms of contentious action, much of the extant literature remains fragmented with tentative or mixed results emerging from antithetical breakdown and solidarity models, Snow et al. present the concept of *quotidian disruption*. Their argument posits that it is the dislocations that disrupt or threaten to disrupt the taken-for-granted routines of everyday life that are most likely to precipitate into collective action. More specifically, the quotidian is disrupted when, with all other things being equal, claimant demands increase while resources remain constant, claimant demands remain constant while resources decrease, and claimant demands increase as resources decrease. Goldstone’s model resonates with the first condition in which the quotidian is disrupted as population increases while resources remain relatively constant. Such theorization on the demographic roots of popular unrest therefore underscores Goldstone and Tilly’s (2001) assertion that the mere existence of opportunities does not always suffice to explain why collective action materializes, and that threats – whether ecological or internal to movements – *interact* with opportunities to produce variation in patterns of protest and contention.
variations in levels of analysis and the selection criteria of intervening variables. However, fragmented as they are, the aforementioned studies, inter alia, suggest that there may still be much to gain from further attempts to revisit the utility of theorization on the demographic determinants of contentious action.

Demonstrations

STEFAAN WALGRAVE

Demonstrations are legal or illegal gatherings of people in the public domain (squares or streets) voicing economic, social, or political claims. When these people move from point A to B in the public space we call this a demonstration; when they are static we instead call them “rallies.”

When people think about movements they think about protest. And when they think about protest they think about demonstrations. Indeed, in many countries, demonstrations are the most visible face of social movements. They form the key ingredient of many social movements’ action repertoire (Tilly 1996). In some countries, such as France and Belgium, more than a third of the population claims to have participated at least once in a demonstration, in other countries participation is much lower (e.g., United Kingdom, United States), but everywhere demonstration participation appears to be on the rise (Norris, Walgrave, & Van Aelst 2005). In many Western capitals, demonstrations are daily and routinized events. Demonstration participation, at least participation in its legal variant, has normalized. What used to be a radical and out of the ordinary type of political behavior has become a mainstream and normal instrument to gain political leverage in which people from all walks of life take part (Van Aelst & Walgrave 2001).

Demonstrations may have major consequences, mark the end of regimes, and lead to democratic or other regime transitions (e.g., Ukraine 2004–2005, Egypt 2011). Demonstrations also reflect the birth, or death, of specific social movements (e.g., the so-called “Battle of Seattle” in 1999, marking the coming-of-age of the global social justice movement). The largest demonstration wave on record was the worldwide protest against the imminent war on Iraq on February 15, 2003. An estimated six to ten million people took to the streets in 60 different countries (Walgrave & Rucht 2010). The demonstration in Rome (Italy) that day, with three million participants, is one of the largest demonstrations ever recorded.

According to Charles Tilly, demonstrations (just like many other types of protest) are what he calls “WUNC-displays.” WUNC is an acronym which stands for Worthiness, Unity, Numbers, and Commitment. The more “WUNC” a protest, the larger its impact (Tilly 2006). Demonstrators need to be worthy, which means that they should show that they are a respectable crowd deserving the claimed resources or change. They should display their unity and show that they share the same claim and are not internally divided. They need to be comprised of many participants to be able to threaten the power holders with sanctions (electoral or economic). And, they need to be committed, which means that they really care about the issue and are prepared to go to great lengths to get what they want. Whether the “WUNCness” of protest really matters for the power of present-day demonstrations has never been established empirically.

Extant social movement work on demonstrations has mainly focused on four topics and employed different research strategies. The incidence and properties of demonstrations, first, have been systematically dealt with based on so-called protest event analyses. Drawing on police archives or content analysis of media coverage, scholars create databases of protest events that enable analysis of protest waves, the mobilization dynamics of social movements, and the reaction of power holders (see, e.g., Kriesi et al. 1995). Next, there has been considerable corresponding investigation, based on archive research but also on field observations, of the way the police deal with street protest in general and demonstrations in particular (della Porta & Reiter 1998). Third, media coverage of demonstrations has also been of interest to
movement scholars, leading to the conclusion that there are several biases in the coverage of demonstrations, among which “selection bias” and “description bias” are most prominent (Smith et al. 2001). Finally, more recent research has tackled the question of who the people are who participate in demonstrations, why they do so, and how they were mobilized. These scholars draw on the protest survey methodology to draw samples of participants and use postal or face-to-face interviews to gauge participants’ sociodemographics, motives, and behavior (Walgrave & Verhulst 2011).

Direct democracy

NICOLE DOERR

Direct democracy describes a theory of democracy and a form of collective decision-making in which sovereignty is directly exercised by the people. Democracy is direct if it is characterized by citizens making all decisions together with a maximum of equal participation. Direct democracy can be distinguished from representative democracy, which is indirect and centralized, and in which citizens elect representatives for executive offices and parliament.

Early historical examples of direct democracies are the Athenian democracy (461 BC), and the Swiss Confederation (1291 AD). The Athenian democracy was a city polity the inhabitants of which made all decisions in an assembly of 500 male citizens rotating annually and selected by lot. Women, slaves, and the foreign born were excluded (Polletta 2002: vii). During the nineteenth and twentieth centuries, social and political movements were important in the trend toward more direct democratic access to decision making within modern nation-states. Such states today function as representative democratic systems with instruments of limited direct democracy such as referenda, initiatives, and recalls. Referenda allow citizens to either accept or reject a law, a recall of an elected representative, or a new constitution. Initiatives grant the opportunity to collect signatures in order to propose new laws or amendments without the consent of the elected government. Recalls provide a strong direct democratic instrument by allowing for the removal from office of incumbent representatives.

In response to the alleged crisis of representative democracy in past decades (Manin 1995), many countries have introduced more direct democratic instruments, including consultative referenda, participatory budgeting, citizen juries, and wisdom councils. These instruments vary widely in their impact and place-specific implementation. Arguing that top-down reforms have not been sufficient, social movements in the past and present have pushed for more radical forms of direct, participatory, and consensus-based democracy as opposed to decision making in institutions defined as representative, elitist, hierarchical, republican, and distant from the people (Kitschelt 1993: 15). In different periods of the twentieth century, pacifists and civil rights movements, New Left groups, students’ and women’s movements, community organizers, and direct action groups in the United States have thus experimented with new forms of radical democracy (Polletta 2002).

In theoretical terms, a first argument for why policymakers should adopt direct democracy procedures is the claim that they will enhance direct governance by the people, increasing the transparency of decisions and making political office holders accountable to their constituents. Thus, direct democracy holds the potential to prevent apathy and raise voter turnout, key symptoms of the modern crisis of representative democracy (Kriesi 2005: 112). A pragmatic argument against direct democratic processes is their time-consuming character. They also make unpopular but necessary decisions hard to implement. Enthusiasts of direct democracy, conversely, argue that cases such as Switzerland provide an example of time-effective decision making. They also draw attention to efficient methods of electronic democracy via the Internet (Trechsel & Mendez 2005).

Enthusiasts of direct democracy, conversely, argue that cases such as Switzerland provide an example of time-effective decision making. They also draw attention to efficient methods of electronic democracy via the Internet (Trechsel & Mendez 2005).

A theoretical perspective that tries to combine representative and direct democratic elements is the deliberative approach to democracy (Gutman & Thompson 2004). The claim is that direct, deliberative processes of public debate will produce informed decision making and make elected decision-makers more accountable to their constituents. An initial deliberative process will broaden consensus for

The Wiley-Blackwell Encyclopedia of Social and Political Movements,

eventual representative decision making, build civic reason, and increase trust in the legitimacy of institutions through a joint debate among all concerned citizens. However, critiques suggest that the deliberative process may increase existing cultural, social and gender-based inequalities and be open to manipulation by influential groups. Another problem is that consensus-oriented deliberation restricts opposition, depoliticizes decision making, and leads to deadlock in settings of lasting differences of interest (Mansbridge 1983).

In terms of civic education, the deliberative process within direct democracy aims ideally to transform self-interested individuals into responsible, informed, and consensus-oriented citizens. In the practice of policymaking, however, innovative forms of participatory public policymaking adopted from new social movements remain limited in their capacity to enhance deliberation and democratize decision-making structures (Sintomer & De Maillard 2007: 55). Empirical evidence suggests that citizens’ direct democratic participation is lower than enthusiasts of participatory democracy would like and de facto excludes socially disadvantaged groups and linguistic minorities despite the willingness of these groups to participate actively (Kriesi 2005: 134). A key condition for enhancing participation in the deliberative process, then, is public campaigns by social movements, which can create awareness for issues neglected by political elites (Kriesi 2005).

Yet, the public character of direct democracy itself touches upon another theoretical concern: namely that direct democratic decisions following public debate may impose the rights of majorities against minorities. More generally put, the fear of representative democratic theorists is that citizen deliberation will not lead to more informed political decisions. Right-wing political parties in the Weimar Republic, anti-immigrant organizations, religious groups, and nationalist parties today have all made use of referenda to campaign against social, political, ethnic, or religious minorities. However, democratically elected representatives also use polemic media debates to agitate majorities against minorities. This shows the need to further compare the institutional settings and power relationships within direct democratic forms, where referenda campaigns are also used by economic interest groups to impede political reforms. Another open question regards the conditions that make direct democratic debates in social movements reach out to broader public arenas to challenge and change political decision-making effectively.

Social movements’ aim of putting on the agenda unpopular issues ignored by policymakers has led to the increasing politicization of decision making in international institutions. Due to new communication technologies activists within current social movements have extended their demands for democracy to the transnational level. Feeling ignored by international and EU policymakers, activists in the recent waves of protest in the Global Justice Movement have also united physically in global democracy experiments such as the World Social Forum. First held in Porto Alegre, Brazil, in 2001, the World Social Forum brings together groups that seek global justice while contesting the closed nature of decision making by states representative in the World Economic Forum, the G8 summits, or the meetings of the International Monetary Fund. The Porto Alegre experiment of consensus-based democracy in an “open space” is built on experiences of radical democracy in different parts of the world, notably, in countries of the Global South (Smith et al. 2007). Porto Alegre’s local participatory budgeting model, in turn, has spread to city councils and local policymakers around the world.

The global diffusion of direct democratic political forms has strengthened activists’ call to promote a transnational citizenship in supranational polities such as the European Union (EU). The large public debate on the question of a European Constitution shows how the Europeanization of social movements contributes to democratization of EU politics through engagement for transnational citizenship and social rights (della Porta & Caiani 2009). Responding
to criticism of its “democratic deficit,” the European Union introduced the opportunity for citizens from different EU countries to participate in local democratic elections (see also Trechsel & Mendez 2005). Excluded from these reforms are immigrants from third-world countries, resident immigrant workers, and refugees. Some EU member states also introduced the opportunity for citizens to participate in national referenda on a future European Constitution, while other member states deny such opportunities, fearing populist campaigns by anti-European and antidemocratic movements.

Another important question regards the role of linguistic difference in the context of global social movements and the rapid diffusion of direct democracy instruments involving geographically distant or ethnically diverse populations in polities such as the European Union. Most democratic theorists still conceive of linguistic barriers as obstacles to communication between policymakers and citizens. Some evidence on democracy in the World Social Forum process, however, highlights a new model of multilingual face-to-face translation that includes traditionally disadvantaged groups in direct democracy (Doerr 2008). However, we know relatively little about the mobilization of linguistic barriers as a trigger for new cultural cleavages in direct democratic procedures relying on referenda or voting. By comparing the interactions between protest for new direct democratic forms, on the one hand, and institutional responses and their effects on the other, we should be able to understand how and when movement groups effectively promote democratic change.

Discourse analysis and social movements
HANK JOHNSTON

The discourse of a social group or community is the whole of its verbal and textual production. It represents its communicative repertoire and the symbolic space and structure of that repertoire. Regarding social movements, it is common that oppositional discourse draws upon the conflicts, struggles, and divisions of the broader social, political, and cultural environment, and articulates these elements to make the ideas it expresses both challenging to opponents and familiar to potential supporters. Analysts sometimes use the plural form, discourses, to emphasize that what is being discussed and acted upon is never unanimous, but often challenged and negated by opposing groups. These researchers sometimes stress the emergent and agentic character of textual production, variably called the rhetorical approach (Billig 1995), the rhetorical turn (Simon 1990), or the dialogic perspective (Steinberg 2001). These approaches treat meaning as context-specific, multifaceted, ever evolving, and contested, which is widely recognized to be true. The operative question, however, is if these qualities make traditional social-science analysis that focuses on the measurement of causal variables and relationships suspect.

Discourse analysis originated in the field of linguistics in response to what was perceived as an overemphasis on grammatical analysis at the level of the sentence. Harris (1952) was among the first to recognize that a great deal of meaning was conveyed by textual materials located beyond the single sentence, making it necessary to consider those occurring nearby in order to make full and accurate interpretations. Beyond proximate sentences, consideration of entire speech or textual episodes may be necessary, where themes and ideas are fully developed and brought to closure. This represents the basic discursive principle that the holistic text is the proper unit of analysis, a view that has been embraced by historians, literary theorists, and social and political scientists of the “discursive turn” (or narrative turn, Somers 1992). Some strands of cultural analysis extend the field of analysis to contextual factors residing in the social conditions and the broader culture. This brand of macro-level discourse analysis concentrates on the global meaning of texts, on their interpretation, and deconstruction according to social factors such as status, politics, economic interests, and cultural trends.

In the study of social movements, data sources for discourse analysis can include pamphlets, manifestos, minutes or recollections of meetings and strategy sessions, slogans, speeches, media coverage, public statements of leaders, or actions of political demonstrators. In other words, discourse analysis looks at the textual production of a movement. Some cultural scholars propose that behavioral repertoires can be read as text, but this is a focus that shifts from concrete spoken or written texts and relies more on interpretation, and has not been widely applied in the analysis of social movements. In practice, organizational documents, newsletters, newspaper articles, and interviews with social movement participants and leaders which are audio-recorded and transcribed, are the most common data sources. Examining a movement’s discourse and sounding its members’ narratives are important research strategies to examine its culture.

LEVELS OF DISCOURSE

Applied to social movements, there are different levels of discourse. The broadest are world-historical discourses (or mentalités) of the Reformation, Enlightenment, Islamism,
neoliberalism, that span national and transnational levels. These are expansive cultural trends and ideologies that are particularly important when considering influences of change-oriented movements, and are often related to more movement-specific discourses, such as gay rights, liberation theology, or ecology. A common strategy to analyze these discourses is to focus on texts that are representative, such as documents that are widely recognized as seminal or definitive of a movement – the Port Huron statement, for example, as a text for the US student movement, or Luther’s Invocavit sermon of 1522 for the Reformation (Wuthnow 1989).

At a more specific level is the discourse of a social movement organization (SMO). When a movement is structured according to different SMOs, their textual production forms part of the polyphonic voice of a movement’s discourse. The producers of organizational discourse are its activists, committeees, and functionaries at various levels of the SMO. It is common that the discourse produced by intellectuals and movement leaders is taken as representative of organizational discourse. Rochon (1998) points out that this level often reflects discursive elements that resonate among the larger populace, akin to processes of frame alignment and frame bridging. Demonstrating this nesting phenomenon, that subordinate levels draw upon and reflect the essential elements of broader discourses, is a common research goal in discourse studies.

At the most micro level, the researcher analyzes the individual production of text and speech by participants and activists. This micro focus is in line with traditional linguistic discourse analysis or narrative analysis (Johnston 2005). It seeks to explain what is said by expanding the analysis to broader textual units such as the speech episode for spoken language and the complete text or story for written language. Both are defined by the development and resolution of themes, and by their own internal structures. This level of analysis is important because there is a relationship between it and more general levels because individuals – not organizations or movements – produce texts. Even when a group of activists take part in crafting a statement or manifesto, the individual contributions may be crucial for interpretation. Key texts are partly shaped by writers’ biographies, the roles occupied within the organization, and individual goals that may vary from organizational goals. Accurate interpretation of macro-level organizational or world-historical texts may require micro-level data about the writer/speaker.

APPROACHES TO DISCOURSE ANALYSIS

The concepts of discursive opportunities (e.g., Koopmans & Statham 1999) and discursive fields (Steinberg 1999) refer broadly to the cultural climate of a movement’s messages, mobilizing frames, or aspects of them, and whether there is support in culture’s prevailing schemas of what is good, appropriate, and desirable. These ideas refer to favorable cultural environments and trends – intellectual, legal, or popular – which movements may draw upon and link with to enhance their support. Presumably, these cultural patterns are represented in texts as well, but some studies that explore discursive opportunity structures rely on “interpretative readings” of movement texts and larger cultural trends, rather than the textual empiricism of discursive analysis. Narratives and stories are ways of approaching elements of discourse. Narratives are recapitulations of past experiences and events that are organized according to temporal order (Ricoeur 1981), in which a change of conditions occurs (Barthes 1977). These elements give narratives a conflictive or dilemmatic quality. Sequencing occurs according to certain principles of “story grammar” that provide a global schematic form (Abbot 1995). Events are presented teleologically in that a narrative’s ending clarifies its sequencing and selection of events. Up until that point, understanding is tentative without the story’s culmination (White 1981). Successful narratives presume a degree of identification between the teller and the audience,
and one often finds assumptions of shared normative orientations (Klimova 2009). Also, they build upon presuppositions held by the audience that allow the teller to lead them to intended conclusions. These structural and functional elements of narratives help the social movement analysis determine what makes a compelling story, which is part of the task of mobilizing participants.

There is an established body of research that explains language production and understanding through “story grammars,” schematic forms by which stories, tales, accounts, and histories are organized and remembered (Rumelhart 1975; Thorndyke 1977). According to Thorndyke (1977), simple stories have deep structures, beginning with the setting (characters, location, and time period), then the central theme (one or several events are described, and the goals of the characters are specified), then plot – with substructures consisting of several episodes, and episodes being ordered according to subgoals, attempts, and outcomes. The result is a hierarchically organized story grammar that describes the action, who is doing it, and to whom.

Discourse analysis brings culture and language to the study of social movements. It focuses on the complexity of textual data, which is often taken for granted in the research process. Because discourse analysis is based on interpretation, theoretical concepts should be linked with empirical observation in a clear and convincing way if they are to make sense to the broader community of scholars who may be less persuaded about the utility of cultural analysis. Discourse analysis must not journey too far from the original texts on which interpretations are based. Also, the criteria for selection of texts, either written or spoken, should be specified. These criteria include an understanding of how the texts are produced, either by the movement or by movement participants, and how these texts are related to the movement development and participation. Full disclosure of sampling procedures at all levels imparts greater confidence about the accuracy and generality of the findings.

discourse analysis and social movements

Discursive fields
DAVID A. SNOW

The concept of “discursive fields” is used to conceptualize an aspect of the context in which discourse and meaning-making processes, such as framing and narration, are generally embedded. Discursive fields, like the kindred concepts of multiorganizational fields and identity fields, are constitutive of the genre of concepts in the social sciences that can be thought of as “embedding” concepts in that they reference broader enveloping contexts in which discussions, decisions, and actions take place. Discursive fields evolve during the course of discussion and debate, sometimes but not always contested, about relevant events and issues, and encompass cultural materials (e.g., beliefs, values, ideologies, myths) of potential relevance and various sets of actors (e.g., targeted authorities, social control agents, countermovements, media) whose interests are aligned, albeit differently, with the issues or events in question, and who thus have a stake in how those events and issues are framed and/or narrated.

The concept of discursive fields gained a measure of currency in the social sciences with the “cultural turn” of the 1990s and has been formulated and used in overlapping ways to advance understanding of various phenomena relevant to the study of culture and social movements. For example, in Communities of Discourse (1989), Wuthnow examines the ways in which the Protestant Reformation, the Enlightenment, and the ascent of Marxist socialism were influenced by the contexts in which they arose, the ways in which they became institutionalized, and the ways in which their associated “ideologies were shaped by and yet succeeded in transcending their specific environments of origin” (1989: 5). For Wuthnow, discursive fields constitute not only “a space ... within which discourse can be framed” (1989: 555), but also provide “the foundational categories in which thinking can take place” and “establishes the limits of discussion and defines the range of problems that can be addressed” (1989: 13). Also writing within the sociology of culture, and tussling with the structure/culture connection, Spillman (1995) proffers the discursive field as the mediating link between the two – that is, “between structure and meaningful action” (139). Like Wuthnow, Spillman regards discursive fields as the site or locale of “creative cultural work” but also extends Wuthnow’s analysis by bringing social structure into her conceptualization by contending that “discursive fields express structured constellations of social relations” (142) that are “presupposed in interaction” and thus limit or constrain meaning making or cultural work (143–144).

Overlapping with these treatments of discursive fields is Steinberg’s examination of repertoires of discourse among nineteenth-century English cotton spinners. Steinberg draws on Spillman’s treatment by conceptualizing discursive fields as “dynamic terrain in which meaning contests occur” (1999: 748), and agreeing that fields both constrain and enable in the sense of limiting meaning construction as well as providing the tools for meaning work. But Steinberg parts company a bit with Wuthnow in terms of the clarity of field boundaries, arguing “that the boundaries of a discursive field are never entirely fixed or clear” (749).

Taken together, these three treatments suggest that discursive fields are the contexts in which meaning-making activities, like framing, are embedded; that the ideational stuff that gets discussed and the rules or grammar for the discourse are contained within the field; that the field is also constituted by a set of patterned relations imported from the outside; and field boundaries, while not fully transparent or fixed, are skewed in the direction of fixity and clarity.

To get a handle on the way in which discursive fields are structured, and thus the
participants engaged in the discursive dialogue, Snow (2008) draws on the concept of organizational fields, as originally propounded by DiMaggio and Powell (1983), and suggests that the degree of field organization or the system of relations among the actors can vary on a continuum from unstable or unsettled to stable or settled. Unstable fields exist when the actors or participants and the system of relations among them are emergent or just evolving, or when the system of relations is dissolving due to a shift in attention to a more recent, noteworthy event or to contestation among the actors. Stable, or highly structured fields, on the other hand, exist when there is an ordered and legitimated system of relations among the various actors, such that there is an understanding of the decision-making process and the relative influence of the different actors in that process.

Incorporating these observations into an expanded understanding of discursive fields suggests a conceptualization that includes not only relevant cultural materials that constrain and facilitate argumentation, but also the range of actors participating in the discussion and the system of relations among them, whether it be emergent and unstable or highly ordered and structured. This suggests, then, that discursive fields can vary on a continuum ranging from emergent and relatively unstructured and unstable at one end to highly structured and stable at the other end.

Since discursive fields are constituted when two or more individual or collective actors discuss some relevant event or issue, and since there can be considerable variation in the extent of agreement or disagreement regarding the focal event or issue, it is also clear that discursive fields can vary on a continuum ranging from consensus to heated contestation.

The cross-classification of the emergent/structured and consensual/contested continua yields a four-fold typology of discursive fields, which is schematically summarized in the figure. Cell 1 contains emergent discursive fields in which there is considerable agreement or near consensus about framing the event either diagnostically or prognostically. The discursive field that emerged in response to the December 26, 2004, earthquake-triggered Indian Ocean and Southeast Asian tsunamis is illustrative. Not only was there immediate, near diagnostic consensus about the causes of the disaster—a 9.1 to 9.3 magnitude earthquake—but it prompted, as well, a huge worldwide effort to help victims of the tragedy, with billions of dollars being raised for disaster relief. In time, prognostic debates began to percolate as to the timeliness and sufficiency of the response, and the disaster response field became more structured as well. But these observations bring into play temporal considerations, which contribute to the dynamic character of discursive fields.

Cell 2 includes emergent fields in which there is heated contestation among the actors. Examples include the contested and unstable fields that emerged in response to the 2005 hurricane Katrina disaster and the Paris riots that began on October 27 and ended on November 17, 2005 (see Snow, Vliegenhart, & Corrigall-Brown 2007).

Equally contested, but somewhat more structured, was the discursive field that emerged in response to the documentary, *The March of the Penguins*. It was emergent in the sense of being unanticipated because the contested interpretation of the documentary’s deep meaning caught people off-guard, but the field was initially more structured than the Katrina or Paris riots fields because the contested framings were in accord with the fields that were already organized around the creationist and intelligent design movement and the antigay marriage countermovement.

Cell 3 encompasses discursive fields in which there is considerable consensus among actors who are situated in relation to each other in a structured and relatively stable fashion. An illustration is provided by the July 7, 2005, suicide bombings of London’s public transport system during the morning rush-hour. Three bombs exploded within less than a minute of each other on three underground trains and in a bus about an hour later. All told, 56 were killed and around 700 injured. Since
it was an unanticipated event, the discursive field that emerged with it as an object of discussion is positioned almost in the middle of the continuum, but skewed slightly toward the structured end because the discussion was highly orchestrated and strongly consensual, suggesting rapid frame crystallization (convergence around or toward a proffered framing).

Cell 4 is the last type or category of discursive fields schematized in the figure. It includes discursive fields that are structured in varying degrees but in which various issues, events, or practices are not merely debated but hotly contested. Examples include the fractionated but structured discursive fields associated with the build-up to sectarian splits, whether resulting in large-scale ones such as the Protestant Reformation (Wuthnow 1989) or smaller scale ones such as the factionalism and defection that occurred within the Hare Krishna movement in the late 1980s (Rochford 1989), with the Iraq War, and with the ongoing creationist/intelligent design and evolution debate. In each of these cases, and others like them, the discursive field consists of the various actors on different sides of the issue, practice, or event in question and is thus fragmented into what social movement scholars have theorized as conflict and alliance systems (Klandermans 1992; Rucht 2004). But the system of relations among these fragmented or contentious actors is still structured inasmuch as it is organizationally or institutionally embedded, and patterned or relatively stable, as is typically the case with divergent political parties.

This typology indicates that discursive fields are not all of the same cloth or form but can vary along at least two dimensions that, when cross-classified, yield four types into which real-life discursive fields can be categorized. But actual discursive fields, like organizational fields, are not static or fixed entities, but dynamic terrain. However, not all fields are equally dynamic, thus raising questions for future inquiry: What other factors or variables, other than the consensual/contested and emergent/structured dimensions, affect the extent of dynamism or turbulence or stability of a

![Figure 1](image-url)
discursive field? In other words, what additional factors account for variation in discursive fields and associated framing and narrative activity?

Discursive opportunity structure
HOLLY MCCAMMON

In 1999, Koopmans and Statham introduced the term “discursive opportunity structure” (DOS) to identify ideas in the broader political culture believed to be “sensible,” “realistic,” and “legitimate” and whose presence would thus facilitate reception of specific forms of collective action framing—forms, that is, that would align well with these pre-existing ideational elements (1999: 228). The notion of DOS, therefore, provides social movement scholars with a conceptual tool to understand which social movement frames are likely to have the greatest capacity to mobilize existing and new recruits, to convince the public of a movement’s demands, and to persuade authorities to alter policy and practices in line with the movement’s agenda. The conceptualization of discursive opportunities synthesizes theories of social movement framing and political opportunity structure. Framing theory by itself is limited in its ability to explain why some collective action frames are more successful than others. Political opportunity theory, while drawing our attention to political-institutional opportunities for successful movement mobilization, tends to neglect cultural dynamics that also play a pivotal role in movement outcomes. Discursive opportunity structures reveal that cultural elements in the broader environment facilitate and constrain successful social movement framing.

While the term, “discursive opportunity structure,” was introduced in the late 1990s, the idea behind it has been around for some time. Snow and Benford (1988) describe various circumstances that influence whether a frame will resonate with target audiences, such as the centrality of the frame’s values or beliefs for its recipients or the fit of a frame to its audience’s real-world experiences. Similarly, McAdam (1994) discusses “expanding cultural opportunities” that can elicit specific types of framing efforts among activists. Noonan (1995), in a study of Chilean women’s mobilization, shows that activists seized a cultural opportunity, relying successfully on a maternalist frame that mirrored the dominant discourse of the authoritarian Pinochet regime. Gamson and Meyer (1996) remind us that opportunity structures have a cultural side, and Steinberg’s (1999) “discursive fields” draws our attention to the privileged role of hegemonic beliefs and values in the broader context.

Researchers continue to refine our understanding of DOSs. Ferree and colleagues (2002) delineate both the cultural and institutional components of DOS. While activists must consider the alignment of their framing efforts with widespread beliefs and core values in the broader population (the cultural component), they must also navigate the structured terrain of key institutions that help define discourse in the public arena, an arena which most activists must access in order to add their claims to the public discourse. Koopmans and Olzak (2004) point to the pivotal role of the mass media and the gatekeeping functions of editors and journalists. Gamson (2004: 249) conjures a vivid image of the DOS of the media by saying that it “is not the flat, orderly and well-marked field in a soccer stadium but one full of hills and valleys, sinkholes, promontories, and impenetrable jungles.” Ferree (2003) highlights another aspect of the DOS by pointing to the importance of public debates over law and legal rights and the ways in which movement actors must often invoke legal constructs and negotiate legal institutions in their collective discursive work. McCammon and her collaborators (2007) alert us to both stability and volatility in discursive opportunities, as well as the fact that challengers must often contend with...
Multiple dominant public discourses, which sometimes carry conflicting and competing messages about how activists might frame their claims for social change. Bröer and Duyvendak (2009) point out that some discourses are prominently used by activists because they tap into powerful emotional undercurrents. Thus, the DOS, at least in part, is configured by emotional themes as well.

Increasingly, scholars examine the empirical effects of DOSs, particularly their impact on framing strategies, tactical choices, and movement political and economic gains. A number of studies demonstrate that DOSs shape movement framing (e.g., Guigni et al. 2005). King and Husting (2003), in a study of the French antiabortion movement, find that not only did cultural openings influence activist claims making, but the discursive environment also affected the movement’s willingness to utilize “rescue” strategies. Wahlstrom and Peterson (2006) investigate the animal rights movement to explore the combined circumstance of an “open” discursive environment, one in which broad receptivity for the activists’ demands existed, but a “closed” economic opportunity structure, where corporations vigorously resisted the movement’s demands. In addition, Holzer’s (2008) study of a critical ruling in the European Court of Justice shows that women’s activism in Europe has succeeded in institutionalizing a women’s rights frame in the legal system, thereby significantly altering the discursive opportunity structure for future women’s activism.

Disengagement in social movements
CATHERINE CORRIGALL-BROWN

Social movement participation is widespread in most modern industrial democracies. To illustrate, the World Values Survey finds that 37.5 percent of the French, 30.8 percent of Germans, 26.3 percent of Canadians, and 15.1 percent of Americans report having participated in a protest (2010). While this is a large proportion of these countries’ populations, what happens to these individuals after they have been initially mobilized? While some remain active and involved over time, not all activism is sustained. In this entry, I propose that there are multiple trajectories that participation can follow once an individual engages with a social movement; persistent participation, transfer, individual abeyance, or disengagement. Below, I outline these trajectories and explore the factors which lead to disengagement from movements over time.

How do we understand the participation of individuals in social movements over time? We can begin with Bert Klandermans’ theoretical model of movement participation outlined in The Social Psychology of Protest (1997). In this book, Klandermans delineates three stages of engagement – initial engagement, sustained participation, and disengagement. These three stages of participation are intended to illuminate the process whereby an individual joins and then leaves a specific social movement organization (SMO). Yet, many participants engage in this process several times over the course of their lives, joining and leaving many different groups or campaigns. Understanding social movement participation as following one of a variety of trajectories, of which disengagement is only one option, enables us to examine participation over the life-course as individuals move in and out of not only organizations but activism more generally.

I propose four prototypical trajectories that individual participants can follow after their initial engagement in social movements. First, individuals can persist by remaining in their initial SMO or continue participating in protest activities over time. Second, individuals can transfer by disengaging from their organization or protest activities, but becoming active in another SMO or cause. These individuals disengage from the original movement organization, but not from contentious political participation. Third, activists can follow a pattern of individual abeyance by disengaging from their SMO or protest activities, but returning to participation later in life. Finally, individuals can disengage from their organization and from participation permanently.

Persistence and transfer are similar to the processes described by McAdam in his influential study of the Freedom Summer campaign. In this campaign, elite white college students traveled from the Northern American states to Mississippi to register African-Americans to vote during the summer of 1964. This was a transformative experience, inspiring many of the volunteers to remain politically active over their life-course (1988).

While the term persistence refers to the process of staying in the same social movement organization over time, the transfer trajectory describes shifting from one social movement organization to another. There are many reasons why an individual might do this. These reasons fall into three categories: the group may change, the individual and their interests may change, or the context may change. First, a group may disband or begin focusing on different issues. Second, an individual may move to a new city or town or, due to changing circumstances or maturation, develop interests in new groups or activities. Finally, the political and social context may change, making certain...
issues and groups more or less salient. (For a discussion of activists who moved from one peace organization to another, see Downton & Wehr 1997.)

The concept of social movement “spillover” is partly based on the observation that individuals often transfer their participation from group to group as shared personnel move from one group to another or cooperate across groups (Meyer & Whittier 1994). One of the results of these shifting involvements and cooperative coalitions is that a range of movement characteristics, including frames, collective identities, tactics, and elements of movement culture, can spill over from one group or campaign to another (Meyer & Whittier 1994). This process can also facilitate the movement of individual activists from one organization to another over time.

To these possibilities I add the concept of individual abeyance, which is intended to capture the often intermittent and undulating nature of contentious political participation over time. Taylor (1989) offers the concept of movement abeyance structures in order to highlight the continuity in SMOs and movements as a whole. When examining the feminist movement, for example, it appears there were distinct movements for suffrage, jury rights, and equal pay. However, Taylor argues that these were not discrete or isolated movements; rather, they were tied together by overlapping networks of individuals, ideologies, goals, and tactics known as abeyance structures. These structures work to sustain movements under circumstances that are unfavorable to mass mobilization and provide continuity from one stage of mobilization to another (Taylor 1989; see also Melucci, Keane, & Mier 1989).

In a similar way, episodes of participation for individuals are not always discrete or isolated; they are often tied together by individual abeyance structures over the life-course. These structures consist of networks of friends, repertoires of tactics, and ideological commitments. At a general level, examining participation over the life-course can help to illuminate the ways that individuals disengage from a particular social movement organization, but perhaps not from participation as a whole, and how one episode of participation is related to later episodes.

Individuals can also disengage permanently from a SMO or contentious political activity. At its core, disengagement arises because of a loss of commitment on the part of individuals to a movement or its goals. There are three types of commitment: affective, continuance, and normative. Affective commitment is based on how gratifying the relationship is between a movement and a participant and is based on interactions with the organization. Continuance commitment is the investment that someone has in a movement and the attractiveness of alternatives. And, normative commitment is the congruence between a person’s values and the ideals of the movement (Klandermans 1997).

Individuals join movements assuming that the benefits will outweigh the costs. If these expectations are met and interactions with the group are satisfying, commitment to the group develops. On the other hand, disappointing participatory experiences can weaken commitment and this weaker commitment can lead to less active participation. This can create a self-perpetuating cycle, as less active participation can further reduce commitment and can precipitate disengagement.

Downton and Wehr (1991) argue that social bonds are the key to maintaining an individual’s commitment to a movement over time. These bonds can be fostered in five main ways: through leadership, ideology, organization, rituals, and/or social relations. The most effective bonding comes when organizations use a combination of these five key elements. Sandell’s (1999) work on the Swedish temperance movement also highlights the significance of social ties in protecting against dropout from movements and finds that individuals tend to leave movements when their close friends do, creating what he calls a negative bandwagon effect.

Empirical studies also emphasize the role of identity in supporting activism over time.
Passy and Giugni (2000) examine the process of disengagement and argue that one of the critical factors accounting for continued participation is the connectedness of an individual’s “life-spheres.” Specifically Passy and Giugni argue that the more connected the central life-spheres of an activist to her sphere of political engagement, the more stable her commitment to a movement over time. Conversely, an isolated political sphere is likely to lead to diminished activism or disengagement. This work indicates that activism must be a salient part of an individual’s identity for participation to be sustained over time.

Our understanding of the processes of disengagement from social movements and contentious politics can be enriched by examining it through a more general lens of role exiting. All roles are sets of social expectations attached to particular statuses or social positions. Individuals simultaneously perform a variety of roles and move in and out of roles over time. Being a participant in social movements and contentious political activity can be seen as one role an individual can perform and this lens can give us some leverage on the process of engaging and disengaging in contentious politics.

Leaving jobs or career changes can be seen as processes of role exit. In fact, it is in the study of occupations that Albert O. Hirschman (1970) posited his model of exit and voice which can be very useful for understanding general processes of disengagement. Hirschman hypothesized that the consequences of commitment can produce four types of responses which can be either active or passive. First, individuals can exit or actively destroy the relationship or the link with an organization. Second, they can neglect their commitment by passively allowing their relationship or the link with the organization to deteriorate. Third, individuals can exercise voice by actively and constructively attempting to improve conditions. Finally, Hirschman posits that individuals can display loyalty by passively but optimistically waiting for conditions to improve. High levels of commitment produce constructive responses (voice or loyalty) whereas low levels of commitment produce destructive responses (exit or neglect). This way of thinking about role exit has been influential in studies of labor unions which find that exit behavior is more likely when commitment is low (Van Der Veen & Klandermans 1989).

In her influential work, Becoming an Ex (1988), Helen Rose Fuchs Ebaugh discusses the concept of role exit, which she describes as the process of disengaging from a role that is central to one’s self-identity and reestablishing a new identity in a new role. She posits that the processes whereby individuals leave roles are similar in certain ways, regardless of the substance of the role being left. For Erving Goffman, disengagement is a mutual process between the individual and other group members with whom he interacted as part of his previous role (1952). As the person begins to remove themselves from the social expectations of a previous role, he in turn begins to withdraw from other individuals in the group both emotionally and physically. Like the work of Sandell on social movement engagement, Goffman focuses on the importance of social ties in the role exiting process.

In my examination of a nationally representative panel study that followed 1669 Americans from 1965 until 1997, I find that about 40 percent of individuals who had ever participated in a social movement disengaged after a period of participation (Corrigall-Brown 2010). This type of turnover is difficult for organizations. When members leave groups, new members need to be found to replace them—a costly activity for the organization both in terms of time and energy. In addition, new recruits have to be socialized into the group. At some point, if too many members leave or too few new members join, organizations may cease to exist. Organizers can, however, adapt to facilitate the continued engagement of members over time. By helping members create social ties within the group and fostering identities supportive of continued engagement, organizations can maintain the commitment and, as a result, the participation of their members over time.

Dramaturgy and social movements
ROBERT D. BENFORD

Social movements are replete with drama. Indeed, some observers have suggested that social movements are dramas. Benford and Hunt (1992) define social movements as dramas in which protagonists and antagonists clash as they seek to affect audiences’ interpretations of power relations in various institutional domains (e.g., religion, politics, economy, etc.). Drawing on Goffman’s (1959) dramaturgical perspective in which the theater provides a metaphor for analyzing everyday life, social movement scholars have examined how movement activists construct and communicate grievances in a fashion that maximizes their potential impact on social change. Often that entails deploying dramatic tactics that capture the attention of media, targets of change, bystander publics, and potential recruits. The US civil rights movement, for example, consistently employed a variety of nonviolent direct action tactics including lunch-counter sit-ins, boycotts, freedom rides, marches, and other forms of civil disobedience in defiant protest of racial segregation. As the civil rights leaders intended, many of these tactics elicited a violent response from their opponents (McAdam 1996). The movement’s disruptive actions and the repressive actions of local authorities yielded dramatic news coverage and hence increased popular and political support for their cause.

Social movement dramas are dynamic and emergent. Yet there are patterns associated with the dramatic techniques movement activists employ. Benford and Hunt (1992) identified four broad techniques: scripting, staging, performing, and interpreting. Scripting refers to the creation of a set of directions that define the scene, identify the actors involved, and outline participants’ expected actions. It entails various framing activities including developing diagnoses, prognoses, and compelling rationales for change as well as outlining strategic and tactical direction. Scripting also involves developing dramatis personae, the cast of movement characters. Activists help construct identities and roles for protagonists, antagonists, victims, supporting cast members, and audiences. Finally, scripting provides direction for appropriate performances such as the orchestration of emotions at a protest.

Staging refers to the tasks of appropriating, managing, and directing materials, audiences, and performing regions. These activities involve mobilizing the necessary resources needed to put on a movement performance. Beyond such obvious but essential logistical matters, staging also entails developing and manipulating symbols or props (e.g., a peace sign, a clenched fist, a burning flag, a mock coffin, etc.) for media and other audience members’ consumption. Social movement staging tasks further include the various promotional and publicity activities associated with rounding up an audience for an event. Finally, consistent with one of Goffman’s (1959) primary focal concerns, those staging a movement drama must attend to the interrelated issues of audience segregation and backstage control.

Performing refers to social movement actors’ collective actions that seek to persuade others to support their cause, to encourage those who hold the keys to change to act in accordance with the movement’s script, and to elicit a scripted response from, or counter and demobilize, their antagonists. Engaging in a movement action can be empowering in itself and frequently enhances the development of esprit de corps and thus collective identity. Movement performers seek to maintain dramaturgical loyalty, by remaining true to the movement’s scripts and emergent norms. Those who lack the dramaturgical discipline to sustain the
movement’s party line or the dramaturgical circumspection to adjust their actions in reaction to unforeseen contingencies, run the risk of undermining the movement’s performance and are thus subject to internal sanctions by their fellow movement actors.

Interpreting is the ongoing social activity that makes movement scripting, staging, and performing possible. For each dramatic technique, movement actors seek to develop a line of action consonant with their collectively negotiated interpretations of reality, their idealistic visions for the future, and their readings of the audiences’ interpretations of the movement’s performances. This interpretive work entails a continuous collective framing and reframing of their understandings of others’ interpretations and appropriate adjustments to subsequent scripting, staging, and performing activities.

Despite the close affinity between theater and collective action, dramaturgical approaches to studying social movements have been fairly rare. Rather than extending the metaphor or theater lens widely, social movement scholars have tended to focus on specific dramaturgical dimensions of mobilization such as protagonist and antagonist identity attributions, movement public spectacles, and “carnivalized politics” (St John 2008), and the generation of deeply felt emotions (Cadena-Roa 2002; Juris 2008). While these studies contribute to extant understanding of the dramaturgy of social movements, a more holistic approach is needed – one that identifies and analyzes the dynamic relationships among various dramaturgic processes encompassing the plethora of unfolding dramas across time and space that constitute a social movement.

Dual identity

BERT KLANDERMANS

The concept of dual identity originates in the identity family of theories. Identity, more specifically collective identity, became an important concept in the social movement literature during the last decade of the previous century. Cohen (1985) and Melucci (1985) were among the first to emphasize the significance of collective identity formation in social movements, and the concept gained importance in the years after (see Stryker, Owens, & White 2000 for an overview). Coming from a social psychological perspective, Simon and his colleagues (1998) proposed the existence of an identity pathway to collective action in addition to the instrumental pathway. These authors reasoned that people do not participate in social movements for instrumental reasons only, but also for fulfilling identity needs. Meanwhile, social psychologists had begun to explore the role of group identification in movement participation (Simon & Klandermans 2001 for an overview) and concluded that the more one identifies with the group that is involved in a protest activity, the more likely one is to take part in that activity. Applied in the context of identity theories of social movement participation the concept of dual identity introduces a dynamic element in that it recognizes that individuals hold multiple identities at the same time that do not necessarily work in the same direction.

Recent work on multiple identities (cf. Kurtz 2002) shows that people simultaneously hold several identities, which may come into conflict and guide behavior in different directions. People might find themselves under cross-pressure when two of the groups they identify with find themselves on opposite sides of a controversy (for example, union members who are faced with the decision to strike against their own company). Indeed, workers who go on strike or movement activists who challenge their government are often accused of being disloyal to the company or the country. This problem is especially relevant in the case of protest participation by minority groups or immigrants, specifically Muslim immigrants, which is easily (mis)interpreted as disloyalty to the country of residence. González and Brown (2003) coined the term “dual identity” to point to the concurrent workings of identities. These authors argued that identification with a subordinate entity (e.g., ethnic identity) does not necessarily exclude identification with a supraordinate entity (e.g., national identity). In fact, they claimed that a so-called “dual identity” is the desirable configuration, as it implies having sufficient identification with one’s subgroup to experience basic security and sufficient identification with the overarching group to preclude intergroup conflict. In the context of cultural adaptation by immigrants González and Brown’s concept of dual identity is akin to what Berry (1984) defines as integration. Berry distinguishes between four types of cultural adaptation, depending on the degree of identification with the culture of the country of origin and the culture of the country of immigration. The possible resulting forms of adaptation are integration (identification with both cultures), assimilation (sole identification with the culture of the country of immigration), separation (sole identification with the culture of the country of origin), and marginalization (identification with neither culture). There is evidence suggesting that integration, that is, holding a dual identity, comes with more satisfaction with one’s situation than the other forms of cultural adaptation (González & Brown 2003; Sam & Berry 2006). Furthermore, studies among Spanish and Dutch farmers and among South African citizens (Klandermans, Roefs, & Olivier 2001; Klandermans, Sabucedo, & Rodriguez 2004) suggest that integration or holding a dual identity, rather than
separation, assimilation, or marginalization, stimulates subgroup mobilization, suggesting that some degree of identification with the nation is needed in order to mobilize for political action. This makes us expect that, overall, citizens who report holding a dual identity will be more satisfied with their social and political situation than those who do not hold a dual identity. However, if they are dissatisfied, we expect that citizens holding a dual identity are more likely to participate in collective action.

This is indeed, what Klandermans, van der Toorn, and van Stekelenburg (2008) found – perceived unfairness particularly influences political participation among immigrants who display a dual identity. The authors suggest two possible explanations for this finding. Immigrants who display a dual identity may expect to be treated in a fair and respectful manner, due to having a stronger identification with the host nation. If, then, they are disappointed in government they react in a stronger fashion. Moreover, because of their national identification they may be more inclined to believe that collective action makes a difference.

This reasoning regarding dual identity also concurs with Hirschman’s (1970) classical analysis of exit, voice, and loyalty in firms, organizations, and states. Hirschman stresses that loyalty to the firm, organization, or state is an important psychological prerequisite for any attempt on the part of dissatisfied customers, members, or citizens to change (voice option) rather than escape (exit option), the objectionable state of affairs in the firm, organization, or state.

Simon (2009) suggests a connection between politicized collective identities and dual identities. He proposes that a dual identity has a pacifying effect on politicization and associated collective action in that it prioritizes normative claims and actions (i.e., claims and actions that stay within the limits of normative acceptance in the larger polity). In contrast, collective identities lacking this pacifying effect, such as separatist identities based on more exclusive cultural, ethnic, or religious allegiances, should be more prone to non-normative escalation and radicalization.

Ecological conditions/determinants

DINGXIN ZHAO

Human activities are always undertaken in certain places. The natures and the spatial configurations of those places, either as built or natural environments, will shape the ways in which the places are used and understood. More specifically, they shape the spatial activities of the people who live in or use the place, pattern the ways in which information is transmitted and people are encountered, and affect the feeling and understanding of people toward the places. We may call the patterns of interaction between humans and the physical (built or natural) environment, as well as the patterns of interactions among humans under a certain physical environment, ecological determinants.

The ways in which the natures and spatial configurations of a place have shaped humans’ spatial activities, social networks, and place-based identity have been a research topic in many scholarly fields, including but not limited to small group ecology, human geography, and environmental psychology. For those who have studied riots, social movements, and revolutions, ecological determinants have also been commonplace knowledge from very early on. For instance, Feagin and Hahn (1973) and Fogelson (1971) have demonstrated how the large-scale black riots in Southern US cities were facilitated by the densely populated black ghettos and by the fact that the residents of those ghettos spent a great deal of time on the street. Heirich (1971: 59–65) has described quite convincingly how the change of Berkeley’s built environment in the 1950s made Berkeley students more available for political mobilization during the stormy 1960s. Chow (1967) has noticed how the congested living conditions on early twentieth-century Beijing campuses facilitated the student mobilization during the May Fourth Movement. Tilly and Schweitzer (1982) have analyzed how the redistribution of economic activities, administrative activities, and residential patterns in pre-Victorian London shaped people’s spatial routines and consequently the geographic locations of contentious collective actions.

Research on the roles of ecological determinants in social movements did not see major developments in the United States before the 1990s. In the 1970s and 1980s, most social movement scholars in the United States were studying those home-grown social movements which had emerged in the 1960s. Most of these social movements were well organized and had clearly defined goals. These features of American social movements led scholars of that generation to identify the resources, interests/strategic choices, and organizations/networks as the only keys to explaining the dynamics of social movement. Starting in the 1990s, ecological determinants in social movements began to receive more attention, in part because more and more scholars became interested in social movements that had happened in the past and in non-Western countries. In his studies of the contentious mobilization in nineteenth-century Paris, Gould (1995) finds that while working class consciousness had played a significant role in the 1848 Parisian uprising, the base of mobilization for the 1871 Paris Commune was not class consciousness but neighborhood solidarity. Gould attributes this difference to the change in the built environment of Paris in the mid-nineteenth century as a result of the Haussmann projects, and argues that the new residential patterns had not only shaped how the Parisians were mobilized but also the solidarities and fighting capacities of the battalions during the insurrection. Stillerman (2003) shows how the characteristics of the built environment and everyday spatial routines of the metal workers and coal miners...
in Chile influenced the tactical repertoires and mobilizing structures of strikers. Sewell (2001) compares the roles of what he calls "concrete space" in both the 1989 Tiananmen student movement and the French Revolution, and argues for the general significance of ecological determinants in movement mobilization. It is, however, Zhao’s (1998) study of student mobilization during the 1989 Tiananmen student movement that pushed the study of ecological determinants to a new level of detail.

Zhao finds that the university students were living in a built environment that can be briefly summarized as follows. At the time Beijing had 67 universities that hosted a total of 162,576 boarding students. By far the majority of these universities were located in the Haidian district in close proximity to each other, and each of these universities was separated from the outside world by a brick wall. The students at these universities lived in dormitories; with six to eight undergraduates in each room, each dormitory building accommodated up to several hundred students. In most universities, these dormitory buildings were also clustered to form a student living quarter as opposed to the administrative quarter, teaching quarter, recreational quarter, commercial quarter, and so on. Zhao finds that the campus ecology affected student mobilization during the 1989 movement in at least the following ways: (1) It facilitated the spread of dissident ideas before the movement started and the transmission of news and rumors during the movement; (2) it nurtured many dormitory-based student networks. These networks were the basis of mutual influence, even coercion among the students and, therefore, sustained a rate of student participation that went as high as 90 percent on certain occasions; (3) it compelled the students to frequently bump into, or hear noises of, various protesting events and other movement activities, thereby attracting some of them into the movement; (4) it patterned students’ spatial routine on the campus, and created a few places that most students had to pass or frequent on a daily basis. These places became centers of student mobilization; (5) the concentration of many universities in one district encouraged mutual imitation and interuniversity competition for activism among students of different universities; (6) it also patterned students’ mobilization strategies as well as the routes of student demonstrations in ways that facilitated mobilization and nullified the control strategies of the police forces and the government.

The nature of the built or natural environment can also shape people’s understanding of a place, which will also have a significant impact on social movement mobilization. What made Tiananmen Square such a politically sensitive place, for example, is not just that it is a large space ideal for staging a protest, but more importantly because it embodies numerous political symbols that have been associated with it in twentieth-century China. China’s first modern student movement, that is, the May Fourth Movement, started in the square, as did many other major student movements of the twentieth century. Most of these student movements were then reinterpreted to the benefit of the communist rule and sanctified in China. The communist government also added the Monument to the People’s Heroes and a few other symbolic architectures in the square after it took power. Finally, since the communist takeover, but particularly during Mao’s era, Tiananmen Square has been used by the Chinese government to stage all sorts of political events with loaded meanings. The preceding characteristics of Tiananmen Square have made it China’s most sacred place for the government to showcase its power and legitimacy and for the aggrieved to usurp it and challenge the government. Nevertheless, while the impact of people’s memory and understanding of a place on movement mobilization is a commonsense to most scholars, few rich and systematic studies have been done on the topic, which could be a possible direction for future research (Tilly 2000: 152–153).

Ecological condition is an important factor affecting social movement mobilization, but it is not a mechanism in the sense that the
The role of an ecological condition in social movement mobilization is likely to change when it is associated with different structural conditions. The campus ecology, for example, greatly facilitated the student mobilization during the 1989 Beijing protests. Yet, the same campus ecology had made it impossible for the development of antigovernment student protest during Mao's era. This was because most Beijing students during the Mao era believed in the communist propaganda and were likely to act voluntarily as government agents and report the other students' "wrongdoings" to the university authorities (Zhao 1997). In studying the structure of student mobilization during the 1999 anti-US student protests triggered by the US bombing of the Chinese embassy in Belgrade, Zhao (2008) also finds that the level of student activists' reliance on the campus built environment in the mobilization was highly correlated with the involvement of organizations in the student mobilization. The campus built environment was crucial only when the mobilization process was more spontaneously initiated in ways similar to the student mobilization during the 1989 Tiananmen student movement. In other words, the impact of the same ecological condition on social movement mobilization can differ under different structural conditions.

Elections and social movements
MICHEL T. HEANEY

Social movements are organized efforts to bring about change in public policies and/or society. Elections are a mechanism whereby citizens decide collectively who occupies positions of responsibility in government. These two phenomena are reciprocally interrelated with one another (McAdam & Tarrow 2010). By affecting who wins elections, social movements may be able to influence changes in public policies and/or society. The outcomes of elections may affect the motivations of individuals to devote their time and energy to social movements. The interactions between electoral actors and movement activists are sometimes cooperative, and at other times conflictual, depending on the strategies employed by these actors (Schwartz 2010).

MOVEMENTS AFFECT ELECTIONS

 Movements have the potential to affect elections in a variety of ways. First, social movements may play a vital role in pressuring non-democratic governments to allow democratic elections. Indeed, movements to legitimize democratic participation in government have been among history’s most successful movements. For example, during Mexico’s transition from an authoritarian political system to a more fully democratic system in the 1980s and 1990s, social movement organizations (such as pro-Zapatista organizations in Chiapas) helped to support minority parties that would eventually challenge the ruling Partido Revolucionario Institucional (PRI) successfully (Cadena-Roa 2003). Such movements generally do not settle all questions of legitimate participation, but they do promise to amplify citizens’ voices within the halls of government.

Second, social movement strategies may make a difference in extending voting rights to previously disenfranchised groups. Social movements have long fought to incorporate women, ethnic minorities, indigenous peoples, and other excluded groups into the electoral process. Banaszak (1996) demonstrates that the actions of movement groups help to explain why the United States granted universal voting rights to women in 1920, while Switzerland delayed extending the franchise to all women until 1990. In particular, the confrontational tactics employed by women’s groups in the United States promoted movement success, while Swiss women’s groups were relatively stymied by their unwillingness to resort to confrontational tactics. What social movements do or fail to do makes a difference in accessing the franchise.

Third, over time, social movements may grow into political parties that become challengers in elections. Goldstone (2003) points out that the Republican Party in the United States, the Nazi Party in Germany, and the Democratic Russian Party were all outgrowths of social movements that eventually became governing parties. Electoral systems are more likely to accommodate a role for movements as parties if they allow relatively proportional representation in the legislature than if they have majoritarian rules for selecting representatives (Kriesi et al. 1995). For example, Germany’s proportional electoral rules accommodated the environmental movement’s participation in the federal government through the Green Party more easily than did the United States, where majoritarian electoral rules were a major factor preventing the Green Party from electing its members to federal offices.

Fourth, social movements may affect the outcomes of elections by influencing the balance of support received by different electoral coalitions. Movements may have these effects because they influence the salience of issues,
encourage changes in parties’ platforms, or cultivate a readily mobilizable constituency that can influence the outcome. For example, the coordinated worldwide protests against the invasion of Iraq on February 15, 2003, affected the distribution of support among electoral coalitions in nations where the Iraq War was a highly salient issue (Rudig 2010). This effect was felt most strongly in Spain, where the Socialist Party’s 2004 electoral victory was facilitated by its alignment with the antiwar movement, the realignment of issues around the Iraq War, and the 2004 Madrid train bombings. Even if movements are not decisive in determining the victor of an election, they may matter for the distribution of vote shares among parties.

Fifth, social movements may shape the personal identities of activists and their orientations toward the political system, thus altering the terrain in which elections take place. In her study of Brazilian youth movements, Mische (2008) documents how movements educated activists about political parties and partisanship, which encouraged their participation in demonstrations for direct elections, the impeachment drive against President Collor, and election campaigns. If movements are able to mold the ways in which activists think of their place in the political world, then movements’ impacts may be felt for years after collective action dissipates.

Finally, movements may introduce new forms of collective action, which may be used by candidates in elections. In the United States, Democratic Party candidates for President (most notably, Howard Dean and Barack Obama) adopted social movement styles of campaigning in the 2004 and 2008 Democratic primaries. In the 2000 presidential election in the United States, online activists created trading schemes to allow voters to exchange votes for Al Gore and Ralph Nader across states. Internet technology was used to match voters, who would make mutual commitments to one another, so that Nader supporters could see that votes were cast for their preferred candidate without increasing the likelihood that the conservative candidate, George W. Bush, would prevail. By helping to transform how election campaigns work, movements may redirect what they do.

ELECTIONS AFFECT MOVEMENTS

On the other side of the reciprocal relationship, elections have the potential to affect movements in several ways. First, the timing of elections alters the opportunity structure of movements. In an ethnographic study of social movement groups in Pittsburgh before and after the 2004 presidential election in the United States, Blee and Currier (2006) found that most groups had little interest in participating in elections at the beginning of the study. However, as the date of the election neared, the groups were presented with opportunities to use the election as a platform for their issues. Thus, the groups and their members sometimes jumped into the electoral process. Elections generate events, shape issues, and direct citizens’ attention in ways that social movements may not be able to ignore.

Second, the decision to participate or not in electoral activities may cause conflict within social movements. In the context of the antiwar movement in the United States of the 2000s, Heaney and Rojas (2007) point to substantial divisions between partisans – who wanted the antiwar movement to engage in electoral politics – and nonpartisans – who wanted the antiwar movement to avoid electoral politics. Partisans argued that participation in elections is the only way to have any real influence on the outcomes that social movements care about. However, nonpartisans argued that participation in elections forces movements to make unacceptable compromises on their core values. These divisions complicate the abilities of social movement actors to reach decisions on the structure of coalitions, the framing of issues, the endorsement of events, and other strategic choices.

Third, participation in the electoral process may cause movements to moderate their positions. Since social movements rarely comprise
a majority in a democratic society, obtaining the numerical support needed to win elections requires that movements attract other interested groups to their cause, which requires them to broaden their positions. In a study of electoral socialism in Belgium, Denmark, Finland, Germany, Norway, and Sweden, Przeworski and Sprague (1986) found that the inability to gain majorities through the votes of working-class citizens alone forced socialist parties to reach out to broader segments of their electorates, thus changing the issue focus and principles of the socialist movement. Movements may no longer be what they once were after engaging with elections.

Fourth, the outcomes of elections may affect the motivations of citizens to participate in social movements. In a study of 17 democracies around the world, Anderson and Mendes (2005) demonstrate that groups that are in the minority after an election are more likely to be mobilized to protest than are groups that are in the majority, with minorities in emerging democracies more likely to protest than minorities in established democracies. Heaney and Rojas (2007) show how the antiwar movement in the United States demobilized after the election of President Barack Obama, despite the fact that President Obama continued many of the war policies of his predecessor, President George W. Bush. Conversely, the election of Obama prompted the mobilization of a conservative countermovement, known as the Tea Party, which took a strong stand against excessive government spending and debt, despite the fact that its participants had ignored spending and debt during the administration of President Bush (Williamson, Skocpol, & Coggin 2011). These results are consistent with the proposition that losers turn to protest as a way to regain their political voice when their opponents win elections.

Finally, elections may shape the identities of citizens, which may open opportunities and erect barriers to social movements’ efforts to mobilize constituencies. Aminzade’s (1993) analysis of the French presidential election of 1848 showed how the Republican Party helped to construct working-class solidarities by forging bonds among workers. These party-based identities would provide a foundation for the French socialist movement for years to come. By defining the conflicts that help to forge identities, elections may set the parameters within which social movements must navigate.

**FUTURE DIRECTIONS FOR RESEARCH**

A substantial body of research has accumulated on the relationship between elections and social movements. The emphasis of this research has been on one direction or the other of this relationship, rather than on its reciprocal nature (but see McAdam & Tarrow 2010; Schwartz 2010). Greater attention could be devoted to analyzing feedback effects between these phenomena. One avenue for evaluating this dynamic would be to investigate the biographies of activists who move back and forth between movements and elections over the course of their political careers. Another avenue would be to trace the diffusion of innovations between movements and elections. Examining the emergence of social networking technologies, and other interactive Internet technologies, may be an especially fruitful way to observe the co-evolution between elections and movements.

4 ELECTIONS AND SOCIAL MOVEMENTS

Electronic protest

VICTORIA CARTY

Over the past decade there has been an explosion of user-friendly, high-speed, and low cost opportunities for electronic protest via new technologies. E-mail, web sites, chat rooms, blogs, and bulletin boards enable efficient new forms of communication, organization, and mobilization, and low operating costs enable people to support causes they may not be willing or able to do offline (Bimber 1998; Earl & Kimport 2008). Electronic activism, sometimes referred to as cyberactivism or e-activism, assists in the mobilization of social movement actors to either sustain efforts of ongoing groups or to create new groups and/or campaigns. In some cases the purpose is to promote activism exclusively online (e-movements), in others it is to encourage locally based disruptive tactics on the ground, and in others to enhance social movement organizations (SMOs) with an online presence through consciousness raising and advocacy (Veigh 2003).

Often SMOs adapt existing modes of contention to an online environment. These include online petitions, boycotts, letter writing campaigns, fundraising, and designing and maintaining web pages (instead of flyers) to disseminate information about protest activities (Rheingold 2002; Earl 2006). To facilitate many of these tactics there are a number of web sites that host or link online actions, such as PetitionOnline.com which offers a free service through which visitors can create and maintain online petitions for any cause (Earl & Kimport 2008). Other sites feature action centers that allow citizens to choose from a menu consisting of a variety of actions such as boycotts, signing an online petition, or sending an e-mail or fax about a cause of concern (Earl 2010). There are also easily and quickly assembled self-organizing online groups that operate in horizontal forums such as “meet ups” and viral e-mail lists that quickly and organically coordinate protest activities (Bimber & Davis 2005; Garrett 2006). The software tool Meetup allows activists to find each other in cyberspace and then organize to meet in their own local communities to organize offline events.

One of the best-known online organizations and among the first born in cyberspace (through an online petition) is MoveOn.org, which combines e-activism with meaningful offline engagement. Online tactics include e-mail petitions, fundraising for progressive candidates and causes (it has set records for raising money in short periods of time through small donations), and readymade letters to editors or congressional representatives. It also strongly encourages offline contentions and electoral politics including participation in protests, vigils, voting, lobbying, canvassing, and house parties. In February of 2003 it held one of its most prominent acts of online civil disobedience in a virtual march to protest the imminent invasion of Iraq – 200,000 individuals signed up and made more than 400,000 phone calls and sent 100,000 faxes to every senate office in the United States. Every member of the US Senate also received a stream of e-mails clogging up virtual mailboxes in Washington. Some refer to this as “flash activism” because it is quick and involves massive participation for a short duration of time, and then subsides (Earl 2010). MoveOn’s pioneering efforts have been replicated by other SMOs and set a model for other exclusively virtual progressive groups such as GetUp.org., ColorofChange.org, and ProgressNow.org.

Hacktivism is another form of online activism and distinct from other types because those who participate tend to hide their identities due to the illegal nature of many of the practices. These can include electronic forms of civil disobedience such as virtual...
sit-ins, whereby occupation/blockading takes place in the virtual sphere rather than a particular building or public space (Wray 1999). By repeatedly reloading a web site at the same time activists generate a vast amount of traffic and cause technical problems for the server and can ultimately crash a target’s web site. Unlike traditional forms of civil disobedience, anyone can partake in virtual blockades from wherever they have access to a computer, and the target may be located anywhere. FloodNet is an engine that uses software that automates the repeated simultaneous multiple keystrokes, effectively blocking a web site. This was first used during the 1994 Zapatista struggle when the indigenous Mayan population of Chiapas, Mexico declared war on the government on the eve of the signing of the North American Free Trade Agreement (Wray 1999). Various web sites of the Mexican government as well as the US Pentagon were swarmed for days. FloodNet was also successfully used during the Battle of Seattle demonstrations in 1999 (which also effectively shut down the meetings in the streets) when activists coordinated efforts on a global scale to oppose the World Trade Organization meetings (Jordan & Taylor 2004).

Other more aggressive forms of hacktivism include e-mail spamming and virtual attacks on computer networks. Spam refers to the illegal use of electronic messaging systems to send unsolicited bulk messages. These are often sent through zombie networks – meaning the networks are infected with a virus that originated with a particular computer and can spread rapidly (Veigh 2003). E-mail bombing is another tactic which refers to sending e-mails with large file attachments to the target’s e-mail address to flood the server (Chamberlain 2004). Hacktivists also create fake web sites (or web site parodies) which often consist of copies of a certain site which graphically replicates the original but alters the content. In other instances hacktivists create URLs to cause confusion among people legitimately trying to access the initial site.

Cyberterrorism (the most destructive form of hacktivism) consists of illegal attacks and/or threats of sabotage against computers, networks and data stored to intimidate or coerce a government, business, or individual to further a political or social objective. Under the guise of cyberterrorism hacktivists break into computer systems, steal personal data, vandalize and/or alter web sites through defacement, disrupt, deny, or re-direct service, sabotage data and systems, launch computer viruses, worms, and Trojan horses, and conduct fraudulent transactions. This is facilitated through user-friendly software tools that are readily available for free from thousands of web sites.

OPPOSITIONAL MEDIA AND ELECTRONIC ACTIVISM

Social movements rarely succeed without media coverage and web sites allow activists and SMOs to control their own image and relay information to viewers without the filter of mainstream media (Rogerson 2009). In addition to web sites, alternative forms of media used by activists include culture jamming, alternative computing, mediated mobilization, and Indymedia. Indymedia refers to an umbrella structure through which the IMC (Independent Media Center) operates. This is a worldwide network of Internet activist sites that serves as both news media and a forum for grassroots mobilization (Kidd 2003). It enables the rapid dissemination of text images, video, audio, and regular updates about situations related to contentious politics as they unravel in real time, and is designed so that anyone can post information directly online without moderation or limitation. This has set the model for a many-to-many use of the media that is frequently used among activists. There are now over 130 Indymedia web sites that are constantly activated for local and global protests.

Culture jamming is another oppositional form of media that increasingly relies on virtual disruptive activities. In the traditional sense,
Jammers engaged in media hoaxes, information warfare, and guerilla semiotics mainly in the form of billboard alterations and fake ads. In the new media and communication landscape this has shifted toward the creation of fake websites, the hijacking of URLs, and virtual media hoaxes. The main agenda is to disrupt the language of control, subverting images and ideas of mainstream media through co-opting, hacking, and re-contextualizing meanings while using irony, humor, and subversion for political ends.

One of the most widely renowned instances of culture jamming involved an e-mail exchange between MIT graduate student Jonah Peretti and Nike Corporation (Carty 2001). Responding to the service offered on Nike's web site for consumers to personalize their shoes, Peretti requested the word “sweatshop” be stitched onto his shoes. At the time Nike was besieged by accusations of using sweatshop labor among activist groups. An awkward exchange of e-mails ensued as Nike offered a number of invalid reasons (such as the word “sweatshop” being slang) for its refusal to grant the request. In the end the corporation conceded that it would not fulfill the proposal because it was damaging to the company's image. Peretti e-mailed the thread to a few friends, and in a couple of weeks it reached millions of people on all seven continents. The news filtered up from the micromedia to mainstream press as it was covered in Time Magazine, the Los Angeles Times, the Wall Street Journal, Business Week, and the news show NBC Today. This demonstrates that forms of electronic protest, even on an individual level, can have an exponential effect in terms of information exposure.

While there is a lot of enthusiasm about cyberactivism, its potential to enhance democracy and inspire political participation has come into question. The difficulty of establishing strong ties and sustained commitment, in addition to the consequences of opt-in opt-out dynamic of Internet activism may in fact inhibit participation in civic life. There is also the issue of elite control of cyberspace, surveillance, and repression to stifle information and conversation, as well as the digital divide, which may in fact exacerbate inequality. The effect of “cyberbalkanization,” as put forth by Putnam (2000), can also lead to polarization among Internet users.

THE FUTURE OF ELECTRONIC PROTEST

New media technologies are developing rapidly among social networking sites such as Facebook, MySpace, Twitter, and YouTube among dozens of others. Similar to Internet technology, they include blogs, chat rooms, and new social software sites. These support not only networked interpersonal interaction but also have sites that allow for the arrangement of informal “live meetings” which are similar to tools like Meetup that have been used extensively by groups like MoveOn. Also, social networking sites are making e-activist tools increasingly available, and given the popularity of this technology among youth, this may serve as a good recruitment tool. How these new media platforms are being used and to what ends, as well as the implications that they may have for social movements, offers an emerging field of inquiry that needs further exploration.

Emotion work

DUNYA M.M. VAN TROOST

Emotion work has been defined as “the act of trying to change in degree or quality an emotion or a feeling” (Hochschild 1979). The concept, first coined by sociologist Arlie Hochschild, describes the efforts people make in their private lives to manage and control their emotions in agreement with the social situation in which they are expressed. Hochschild’s theory of feeling rules and emotion work puts forward the notion that social rules apply to the experience of emotion. These feeling rules are “guidelines for the assessment of fits and misfits between feeling and situation” (Hochschild 1979), meaning that cultural and social aspects influence the appropriateness of emotions we feel. In Hochschild’s words: “Emotion work can be done by the self upon the self, by the self upon others, and by others upon oneself” (Hochschild 1979). Important to note is that emotion work refers to the effort of trying to change an emotion or feeling, not whether this effort was successful and the emotion actually changed (Hochschild 1979).

Within social movement research, emotion work is mentioned as a process between members, through interpersonal contact, and as a top-down process, for instance through framing efforts. Examples of emotion work between members can be found in research on discussion groups for women dealing with postpartum depression. Women are encouraged to express emotions they experience but which do not line up with the “script for American motherhood” of self-sacrificing love (Taylor 1996). This builds on work done by the feminist movement to create a free space for women to express emotions such as anger, and to transform feelings of hopelessness and frustration when confronted with gender inequality (Reger 2004). Both Taylor and Reger mention that women struggle with cultural norms dictating that anger is predominantly a masculine emotion. Other examples of social movements where emotion work is geared at changing and transforming the emotions of individuals, via support groups and interpersonal contact, can be found in research on transgender movements and movements against child sexual abuse (Goodwin, Jasper, & Polletta 2001).

Emotion work is also described as a top-down process taking place to inspire action and by transforming feeling rules for society at large. Emotions can motivate people into action or stall mobilization due to the type of motivation associated with emotions. Social movements will benefit if their members experience emotions such as pride and anger that invoke approach motivation. Feelings such as shame or fear, however, trigger avoidance motivation, leading to inactive and passive adherents (Britt & Heise 2000). The civil rights movement in the United States and East Germany therefore tried to manage the fears of the high risks involved with movement participation. Intimate networks and mass gatherings were used to help adherents overcome their fears (Goodwin, Jasper, & Polletta 2001).

Social movements work to change social and cultural norms both unintentionally and strategically (Goodwin, Jasper, & Polletta 2001). Strategic formation of alternative feeling rules will often coincide with the use of extrinsic emotion work. Movement leaders have been found to try to change cultural rules through the use of emotional framing, attempting to mobilize hope, shame or anger to recruit members, pride or guilt to maintain commitments, and sympathy or empathy to attract bystander publics (Aminzade & McAdam 2001). Other forms of strategically used emotion work can be found among the animal rights movement, where activists favor a “rational” approach to dealing with animal cruelty. The movement’s claims were at risk of
being classified as emotional, which might be interpreted as irrational. Activists recognized that feeling rules are gender related. “Men are praised for being both emotional and rational. But women are criticized if they are not rational all of the time” (Goodwin, Jasper, & Polletta 2001: 226). Therefore they strategically enlisted men to advocate their cause even though most of the activists were women (Jasper 1999; Goodwin, Jasper, & Polletta 2001).

The creation of alternative feeling rules is part of the strategy social movements use to change public discourse, influence politics, and change policies. The ideology of an organization provides the basis for these alternative feeling rules. Hochschild poses that we can “think of ideology as an interpretive framework consisting of framing rules and feeling rules” (Hochschild 1979). In order to change society movements may offer feeling rules that are aligned with the ideology of the movement but disaligned with dominant feeling rules in society. Movement leaders thereby attempt to create room for adherents and bystanders alike to alter their affective disposition toward a social problem. Dominant cultural norms in the United States about homosexuality (think for instance of the word “faggot” used to indicate a flaky vacuous person) triggered feelings of shame and immobilized the gay movement in their fight against AIDS in the early 1980s. AIDS activists started realizing that in order to be successful in this battle they had to create countercultural rules on what it meant to be gay. Emotions such as fear and shame had to give way; grief needed to be transformed into anger. Gay men and lesbian women needed to have a sense of pride instilled in them to spur them into action (Britt & Heise 2000; Gould 2009).

Remember that emotion work refers to the effort of trying to change an emotion. A factor that influences whether social movements are successful in this attempt is emotional resonance; that is, does the invoked emotion line up with the emotional lives of adherents (Robnett 2004). Overall we can conclude that emotions and the meaning of emotion work for social movements have become an established aspect of the study of social movements and contentious politics. For social movements emotion work consists of a twist of highly personal feelings, political aims, and the mobilization of emotions. Emotion work is a “necessary and exceedingly important component of any significant instance of collective action” (Aminzade & McAdam 2001).

REFERENCES AND SUGGESTED READINGS

Entrepreneurs, movement
SUZANNE STAGGENBORG

The notion of a social movement entrepreneur was introduced by John McCarthy and Mayer Zald (1973, 1977) in their seminal essays on resource mobilization theory. McCarthy and Zald’s treatment of the movement entrepreneur was part of their analysis of the rise of “professional social movements.” In contrast to the “classical model” of movements, which focused on common grievances that give rise to social movements and emergent leaders, McCarthy and Zald argued that modern social movements are increasingly professionalized, characterized by full-time leadership, a largely paper membership, and a reliance on conscience constituents who “do not stand to benefit directly from its success in goal accomplishment” (1977: 1222). While grievances play a role in movements, they receive second billing to entrepreneurial leaders who take the initiative to organize movements. In extreme cases, “grievances and discontent may be defined, created, and manipulated by issue entrepreneurs and organizations” (1977: 1215).

This perspective on the importance of entrepreneurial activity is reminiscent of the earlier focus on moral entrepreneurs in the labeling theory of deviance (Becker 1963). Howard Becker argued that moral rules, and our views about what is deviant or acceptable behavior, do not follow automatically from the nature of the behavior, but are the result of labeling activities by moral entrepreneurs. Moral entrepreneurs, in Becker’s view, might be motivated by deep-seated ideological beliefs and genuine outrage, or they might be self-interested actors. In the social constructionist approach to social problems that builds on labeling theory, social problems are not objective conditions, but are produced by the entrepreneurial activities of claims-makers (Spector & Kitsuse 1977). Issue entrepreneurs, including movement leaders, politicians, and journalists among others, define issues for various audiences and bring them to public attention; if successful, they increase the pool of people concerned about an issue who can potentially be recruited to a social movement (McCarthy & Zald 2002: 536).

The ways in which movement entrepreneurs and social problems claims-makers package or frame issues are critical to both the mobilization of movements and the social construction of social problems. There is now an extensive literature on collective action framing, which examines the ways in which grievances and issues are defined in order to motivate collective action (Benford & Snow 2000). Although the framing perspective was not yet developed when McCarthy and Zald wrote their early essays on resource mobilization theory (McCarthy & Zald 2002: 536 fn) – or when Spector and Kitsuse first wrote about social problems claims-making – framing activities are clearly central to the work of movement entrepreneurs and other claims-makers. Movement leaders need to frame issues in ways that attract followers and, to form coalitions across organizations and movements, they must bridge the concerns of multiple audiences (Gerhards & Rucht 1992).

Some analysts have attended to the processes by which movement and moral entrepreneurs are created and the means by which they develop effective frames. Importantly, issue entrepreneurs often operate within organizations and institutions, and they employ and alter preexisting frames associated with those organizations and institutions. In the civil rights movement, the community institution of the black church provided the “freedom and justice” frame that ministers and other leaders adapted for the purposes of the movement (Morris & Staggenborg 2004: 184–186).
The interests of preexisting organizations may also shape the rise of entrepreneurship. For instance, Robert Chauncey (1980) analyzes how “new careers for moral entrepreneurs” were created within the National Institute of Alcoholism and Alcohol Abuse, an agency with an interest in promoting the problem of teenage alcoholism. Jerome Himmelstein (1983: 11–12) notes that organizations, such as the Federal Bureau of Narcotics, may engage in moral entrepreneurship on particular concerns during one period of time, but not another, and a variety of issue entrepreneurs with different amounts of power may compete with one another. Thus, analysts of entrepreneurship need to examine how political and cultural environments and organizational dynamics, as well as motivations such as moral outrage or economic interest, affect the emergence and actions of movement entrepreneurs.

Although McCarthy and Zald associate movement entrepreneurs with movement professionals, the two types of leaders may be distinct, and the nature of leadership in social movement organizations may change over time. In the abortion rights movement, entrepreneurs played a critical role in initiating movement organizations, but professional leaders took over as SMOs became institutionalized (Staggenborg 1988). Entrepreneurial leaders may be attracted to less formalized structures, which give them more room for initiative; as organizations become more bureaucratic or formal, they may turn to leaders who are more accustomed to working within such structures. When organizational structures are informal and decentralized, movement entrepreneurs are likely to be essential. In the case of online organizations, Earl and Schussman (2003) find that movement entrepreneurs substituted for social movement organizations in organizing the strategic voting movement.

In addition to their role in mobilizing movements and collective action, movement entrepreneurs influence the structures, strategies, and goals of movement organizations. Informal and decentralized organizations led by movement entrepreneurs are more likely to choose direct-action tactics than are formalized organizations led by professionals (Staggenborg 1988). In the “e-movements” led by entrepreneurs, “membership” declines in importance and decision-making becomes more discretionary (Earl & Schussman 2003). In institutional settings, entrepreneurs are often “ideological activists” who change institutions by exploiting political opportunities to engage in successful framing activities (Rao & Giorgi 2006). As these examples indicate, scholars are examining the impacts of movement entrepreneurs in a wide range of movements and organizational contexts.

Ethnography and social movements
PAUL LICHTERMAN

Ethnography is a powerful research method for understanding how people turn grievances into public claims, organize collective action, and sustain collective action over time. During the past quarter-century, scholars of social movements have called repeatedly for research on the social and symbolic processes that ethnography is particularly well-suited to investigate. It is a promising and curiously under-employed method in this field.

Ethnography here refers to research in which the researcher observes and to some degree participates in action as the action is happening. In sociology, “participant-observation” names this mode of research more precisely. Given the sometimes loose uses of the terminology, it is important to clarify that ethnography (participant-observation) and the sometimes closely associated interview research method are different methods that produce different kinds of evidence useful for addressing different though occasionally intersecting questions. Ethnographic research, unlike other research methods, investigates action in the setting of the actor, in the time of the actor. Much of what is distinctive as well as intellectually and logistically challenging about the method derives from these two features.

To carry out ethnographic research, the investigator takes extensive descriptive notes on the people, places, actions, and interactions under study. The ethnographer codes those notes systematically, develops new hypotheses or refines initial ones, chooses new settings or people for further observation, and continues the process, following one or more logics of ethnographic inquiry, all of which differ from the conventional hypothesis-testing logic of social science (Glaser & Strauss 1967; Burawoy 1998). Followed in a disciplined, self-reflexive way, this coding-and-observing process produces a well-supported, social-scientific argument. Ethnographic research may synthesize new observations with pre-existing or emergent academic concepts in different ways; there is more than one logic of inquiry for sociological ethnography. These conceptual issues in ethnographic research have been discussed extensively (see, e.g., Lichterman 2002; Snow & Trom 2002). The discussion here will limit itself to ethnography’s role in advancing our understanding of social movements.

Some now-classic ethnographic studies of collective action appeared when social, religious, and other kinds of “movements” were considered kindred forms of “collective behavior” and a lot of the current terminology of social movements scholarship was only beginning to appear. John Lofland’s study (1966) of the Unification Church in the United States, and John Hall’s later work (1978) on utopian communes are good examples. In different ways these studies represent a kind of sociology that interprets nonmainstream social worlds, recuperating their shared meanings, worldviews, or moral order. Similar curiosities about subcultures of collective action turned other researchers to ethnographic research on abortion protestors (Ginsburg 1989). Still others used ethnography to observe local, pivotal moments, as when Fantasia (1988) followed the moment-by-moment decisions that add up to collective labor action.

New conceptual developments further widened social movement scholars’ appreciation of ethnography. By the end of the 1980s, many researchers were no longer content with determining social movements in terms of underlying social-structural conditions, and more interested in understanding how vague private grievances become strident public claims and collective identities. In that spirit, contemporary social movement researchers...
are more likely to address social structure by investigating the social networks that religious congregations, college campuses, or other organizations potentially make available to social movements, instead of inquiring into the social class or other social-structural bases of grievances (Diani & McAdam 2003). Ethnographic research helps us see how activist leaders rally people around dissenting claims and identities with innovative rhetoric and networking savvy. Ethnography also reveals that social ties mean different things in different settings, and the differences affect collective action. In the United States, Green movement activists had a difficult time allying with activists from the more accessible and much more widely publicized antitoxics movement in the 1980s and 1990s because these two environmental movements built social ties on the basis of different meanings of membership and political obligation. Greens, like antinuclear activists, radical women, and other grassroots movements directly preceding them thought that serious activists should practice personalized politics and create deeply individualized, life-changing ties to a movement, while antitoxics activists in community-organizing projects assumed that serious members participate in a tightly bound collective and fight for “the community” (Lichterman 1995). In Brazil, youth activists during the tumultuous transition to democracy bracketed some of their social connections and conveyed different social identities in different settings, depending on who they were collaborating or arguing with (Mische 2008).

The cultural turn in American social movement research since the 1990s similarly encourages, as well as benefits, the ethnographic ear and eye. Quite often ethnographic findings can challenge received understandings of how meanings work in social movements. Ethnographic research often has been associated with the study of emergent meanings and new kinds of group action, partly because of the symbolic interactionist orientation of some of the most accomplished practitioners. Ethnographic research apprehends collective meanings too fleeting, slippery, or unconventional to reflect easily in opinion surveys or solidify into historical documents. Participant-observation shows better than other methods, for instance, how protest suddenly flares up, how a critical sensibility sometimes sneaks into mundane routines of work and play, or how institutionalized social settings suddenly become informal public spheres of lively political debate. Ethnography shows how activists create new kinds of social movement, as when alternative globalization activists innovate new forms of participation and new kinds of collective communication in the course of organizing their conferences (Juris 2008).

Ethnographic research also may investigate the ways that activists recycle or refine long-standing cultural forms, and with what consequences. It shows us how and why grassroots environmentalist, feminist, and peace activists at the end of the twentieth century drew heavily on a kind of personal growth-centered individualism with long roots in nineteenth-century American Romanticism (Lichterman 1996). Doing so, they appealed to highly schooled, affluent, and youthful publics more than others despite their explicit wishes to represent a more diverse constituency. Participant-observation shows how and when biblical language of social justice helps religious congregation-based community organizers energize collective action against local governments and corporations on behalf of more public services and better schools. This research shows that religious activists have built more effective local movements than have activists who use a rhetoric of racial minority struggle toward similar ends, but are more effective with Catholic than conservative Protestant congregations (Wood 2002).

Probing the symbolic dimensions of movements, many scholars have used a concept of “framing” to investigate activists’ public claims-making. Originally used by Erving Goffman to denote the implicit assumptions about the meaning of action in a particular setting, the concept now often refers to ideological theme or worldview, the picture of the
world that activists try to agree upon and then strategize to make appealing to new activists and broader publics (Snow et al. 1986). The initial statement of this framing perspective drew on ethnographic studies of religious and social movements. Ethnographic work shows, too, that framing varies by setting: Antitoxics activists articulate themselves with more conventional frames in front of the mass media than in other settings (Eliasoph 1998). Other activists eschew strategic framing even at the risk of scaring off people who might otherwise join the collective effort. In the 1990s, liberal church activists in a midwestern US city argued that federal welfare policy reform benefited big business interests who wanted to lower their tax burden, and not the poor. Their strident style of communicating social criticism alienated potential supporters who actually agreed with their critique (Lichterman 2005).

As this example implies, ethnography invites us to view the everyday negotiations of meaning, the ongoing reality tests that can put concepts such as frame or collective identity in motion. We see how activists communicate and coordinate action around their dissenting beliefs. These ways of communicating and coordinating often follow patterns and are not simply random or always emergent: Like other public entities, social movement organizations draw boundaries with other groups in a wider field, sustain distinctive bonds between members, and observe speech norms that privilege some kinds of communication over others. These three elements of organizational style are often enduring and shape the way a social movement organization publicizes claims and organizes action (Eliasoph & Lichterman 2003).

Finally, by helping us view social movements in terms of communication processes and styles of action, ethnography also helps scholars investigate the shifting, sometimes ambiguous boundaries between social movements, governing agencies, and commercial enterprises. Social movement action often is nested inside of larger civic organizations that address public problems without necessarily challenging governments or using nonroutine means (Sampson et al. 2005). Affordable housing developers, for instance, hire community organizers who need to decide when to act as social movement activists on behalf of low-income housing, when to work as partners with municipal agencies, and when to avoid activism in order to remain on good terms with builders (Lichterman, Eliasoph, & Cefai forthcoming). By taking everyday communication and action into account, ethnographic research may avoid hypostatizing the category of “social movement” itself.

Europeanization and social movements
DONATELLA DELLA PORTA

THE EUROPEANIZATION OF SOCIAL MOVEMENTS: DEFINITIONS

Europeanization indicates not only the construction of the institutions of the European Union (EU), but also the changes in the politics and policies of the member states. Studies of Europeanization look at the impact of the European Union on the national systems of the member states, addressing processes of resistance, transformation, and adaptation to EU policies and norms in member states, shifting attention from the supranational level to multilevel governance. Linked to this is the notion that public policies are produced in a complex system where several norms and implementing agencies interact.

Notwithstanding the increasing relevance of European institutions, research into the effects of the construction of European institutions on social movements is still underdeveloped. As in other areas of Europeanization studies, the empirically observed objects have often influenced the emerging images. Thus, research on protest events reported in the (national) press has supported the vision of the European Union as an intergovernmental organization, with the nation-state in a still-dominant role and remaining the target of most protest. Research on the activities of public interest groups in the European institutions has pointed, instead, at the emergence of a new polity.

A prevailing image of low Europeanization of social movements fits well with some widespread hypotheses in social movement studies. According to the political process approach, social movements should be discouraged by some characteristics of the European Union. First of all, the European governance is more open to conventional lobbying than to contentious and disruptive actions (Marks & McAdam 1999: 103–104). Additionally, the types of opportunities available at the EU level allow for a selective access of the collective actors better endowed with some type of material and symbolic resources. The high transaction cost of transnational organizing also privileges richer organizations and in fact a lack of material resources has been seen as responsible for the weakness of public interest groups and social movement organizations at the EU level (Chabanet 2002; Giugni & Passy 2002; Rootes 2002).

If these considerations lead scholars to expect low levels of transnational social movement activities, others instead point at more EU-level protest. First, there is the need for social movements to address the territorial levels where decisions are taken. If the construction of the nation-state produced the building of national social movements, we might expect that the growing relevance of European institutions is reflected in the growing focusing of conflicts around Europe. Additionally, computer-mediated communication, as well as low-cost flights, have certainly reduced the transaction costs for organizing transnationally (della Porta & Tarrow 2005). We might expect that as social movements frame the European union as a relevant level of decision-making, protest will more often target the European level. Cultural traditions also play an important role in facilitating or jeopardizing the development of transnational strategies. From this point of view, social movement organizations seem more motivated to develop transnational organizational networks and frames than are, for instance, political parties (della Porta & Kriesi 1999; Imig & Tarrow 2001a, 2001b) or trade unions, which are traditionally more deeply rooted in the nation-states (Marks & McAdam 1999).

While at the beginning research on the Europeanization of social movements seemed to
assume that protest at the European level had to reproduce the national pattern, with European challengers targeting a European polity, more recently it has started to take into account the structure of multilevel governance. If Europeanization produces more layers of decision making, social movements may adapt themselves following different paths.

DOMESTICATION

A first path, which had already emerged in the first research on social movements and Europeanization, is *domestication*: social movements might target EU decisions by putting pressure upon national governments in order to push them to negotiate better arrangements at supranational levels.

Protest event analysis has repeatedly concluded that concerns about EU decisions have been mainly expressed at the national level, where elected political institutions are considered more accountable to the citizen-electors. Relying upon Reuters World News Service and the Reuters Textline, Doug Imig and Sidney Tarrow (2001b) found a very limited number of such protests. In protest event analysis based on national newspapers, Dieter Rucht (2002) observed in Germany a low (and declining) proportion of protests targeting international organizations, Giugni and Passy (2002) noted that only rarely did protests on migrant rights target the EU, and the same emerged on environmental protest in several European countries (Rootes 2002). Since protest grows when institutions are accountable to the electorate, the relative inaccessibility of the supranational level to protest and the weakness of the European public sphere has been mentioned in these studies to explain why the target of social movements continues to be predominantly national governments.

However, research indicated that, exploiting the complexity of EU governance, social movements do challenge EU policies through multiple, crossed pressures. In their analysis of protest in Europe, Doug Imig and Sidney Tarrow (2001b) observed indeed that most of the EU-related events they coded were cases of domestication. In particular, domestication is used by social movements that want to put pressure on the European Union in favor of national interests, especially if in direct competition with other national interests represented in other member states, as is in particular in the case of several protest campaigns by European farmers.

EXTERNALIZATION

The European Union has also been seen as an additional arena for the mobilization of resources that may then be used at the national level. A path of *externalization* (Chabanet 2002) characterizes the mobilization of national actors targeting the European Union in attempts to put pressure on their own governments. Social movements that feel weak at home attempt at mobilizing allies at the supranational level, addressing the EU institutions in order to push them to intervene upon domestic governments. This strategy has been used above all by movements that perceive the challenges as supranational, and have in fact appealed to the kinds of discourse and identity legitimized at the European level, as is the case for environmental movement (Rootes 2002).

Several previous studies have indicated the difficulties that civil society organizations encounter when they want to act at EU level (for most recent accounts, Schmidt 2006; Kohler-Koch & Rittberger 2007). Channels of access at the EU level are in fact constrained by institutional characteristics such as their limited (even though increasing) electoral accountability, the selective tradition of consultation of representatives of different interests, as well as the emphasis on expertise (Ruzza 2004; Kohler-Koch & Rittenberg 2007; Balme & Chabanet 2008). In fact, research on representation at EU level confirmed that, for social movement organizations, access is limited. First, business found it much easier...
than civil society organizations “to go European,” while social movement organizations active at the EU level – such as Platform of the European Social NGOs, European Anti-Poverty Network, Human Rights Contact Group, European Migrant Forum, United (against racism), and the European Network of Women – are usually loose and poorly staffed networks. Inclusion has also been selective: only the organizations that adapt to the rules of the game obtain routine access, though usually of an informal nature, to EU institutions (Marks & McAdam 1999). In fact only a few, larger, moderate and well-structured civil society organizations have obtained some routine access, usually of an informal nature, to supranational organizations (among others, see Balme & Chabanet 2002; Ruzza 2004; della Porta 2007).

These difficulties notwithstanding, some characteristics and changes in the European institutions seem to have facilitated access by social movement organizations. Even though selectively, as mentioned, (some) social movement organizations have recently been granted increasing participation in return for expertise and legitimacy. If the building of the European Community, and then of the European Union, as oriented to the creation of a common market has been mentioned to explain the dominance of producers’ interests, with the progression of market-making legislation (from the Commission, the Council, but also the Court), there was also an increase in organized demands for market-correcting policies (with mobilizations of consumers, environmentalists, etc.). Research indicates in fact a growth in the number of citizens’ interest groups, which accounted for 20 percent of all interest actors active in Brussels in 2000. Since the 1990s, EU institutions have in fact made attempts at expanding consultation with representatives of organized interests of civil society, also enhanced via online consultations (Kohler-Koch 2007: 259–260). Research based on interviews with social movement organizations indicated that they tend to share the criticism of the EU institutions as formally closed, selective, and unaccountable. At the same time, however, they use the available channels of access to the European public sphere as well as promoting new ones (della Porta & Caiani 2009).

THE BUILDING OF EUROPEAN SOCIAL MOVEMENTS

Paths of domestication and externalization seem to have facilitated Europeanization in the form of the development of European social movements that target different levels of governance at the same time, involving loose networks of national (often local) and transnational groups. The objectives of their protests tend to be more and more general, with the participation of national and supranational collective actors that turn simultaneously to various governmental levels. Their mobilization involves loosely structured networks of European activists that address different polities.

Even when they mainly target their national governments, social movements that contest EU decisions tend to adapt their frames and organization. Domestication, which has been seen as proof of the persistent relevance of the nation-state as the target for protest and of the related permanent weakness of EU institutions, has the side effect of producing European identities and structures; the effects of national protests do not stop however at national borders. In fact, recent research singled out, in the course of “domesticated” protest, innovations both in the organizational structure and in the frames of the protest, with the development of European networks and European identities. Domestication pushes national social movements to build transnational coalitions, that tend to stabilize into transnational organizations. At the same time, targeting EU institutions has the cognitive effect of pushing to frame claims in a European perspective (della Porta 2007).

Also externalization tends to produce a development of supranational organizational structures and identities. The European arenas offer
to social movement organizations from different EU countries the opportunity to meet each other, build organizational networks, coordinate activity, and construct supranational discourses. Growing interaction facilitates the development of common, more or less European, identity. While research on SMOs active in EU policies had stressed their preference for lobbying, a centralized structure, and focus on single issues, more and more often protest campaigns targeting the EU have mixed conventional and unconventional means, build informal networks linking local, national, and transnational groups, and use more and more political and cross-issue frames (della Porta & Caiani 2009).

Especially during the nineties, a series of steps in European integration (including the treaties signed in Maastricht, Amsterdam, Nice, and Lisbon) have been the targets of supranational protest campaigns, during which national SMOs and NGOs started to network at the European level. By governing, the EU institutions attracted conflicts and contestation – as the nation-state institutions had done. As a by-product, they also helped in forming supranational nets and norms. The formation of European identities seems indeed to develop not on the bases of abstract norms, but through the continuous and contentious interactions of various political and social actors around EU institutions (Imig & Tarrow 2001a: 23). European mobilization helps, then, in a process of transnational diffusion and networking that goes beyond merely instrumental aims. Additionally, the development of the Global Justice Movement increased the occasions for encounters and collaboration by various and different movements.

As with other international institutions (Tarrow 2005), the European Union has worked as a sort of “coral reef” favoring the construction of supranational organizations by offering in some cases material and symbolic (legitimacy) resources, in others a target for common mobilizations. From a neo-functionalist perspective, social movements’ Europeanization could be defined as a spillover effect of European integration. Advocating power and competences at the supranational level, EU institutions are less and less able to call for a “legitimation through output,” based upon trust in an efficient and apolitical governance. As EU decisions increasingly do affect the lives of citizens on the most delicate (and political) policy fields such as the welfare state, pensions, migration, or education, the paths of political contestation in Europe seem in fact to become more and more multilevel.

Event history analysis

J. TOBIN GRANT

Event history analysis examines whether and when phenomena occur. Also known as survival, duration, or failure-time analysis, event history analysis has proven useful in a wide range of disciplines because it allows researchers to make inferences about when an event happens and the duration until the event occurs (Raferty 2001; Box-Steffensmeier & Jones 2004). Some view event history analysis as time series analysis for dichotomous dependent variables; others approach it as an extension of limited dependent variable analysis for panel data. Regardless, event history analysis provides a method of inference for longitudinal data common in social movement research.

There are three key concepts in event history analysis. Because event history analysis has its roots in medicine and engineering, it uses a variety of terms, some of whose meanings may be apparent in social science applications.

1. **“Event” or “Failure.”** The occurrence of a phenomenon. This is an indicator variable. In engineering and medical applications, this is referred to as a “failure” because the phenomenon is often the breakdown of a machine, disease relapse, or death.

2. **“Duration,” “Survival,” or “Spell.”** The length of time until an event occurs. The duration has a well-defined beginning, which may or may not be the same as the start of the observation period. As with “failure,” “survival” is a term carried over from early applications where the duration was measuring the time until a breakdown or death.

3. **“Hazard Rate” or “Risk.”** The probability that an event will occur conditional on the event not occurring already. For example, the hazard rate for death is the probability of someone dying at age \( t \) given that the person has already lived \( t - 1 \). Growing older does not change the probability of a person dying (the probability of death is, unfortunately, always equal to 1.0), but growing older does increase the risk or hazard rate of death. Hazard rates are inherently linked with durations. Events with higher hazard rates have shorter durations; those with lower hazard rates have longer durations.

There are two broad classes of event history models: duration models and hazard models. The former are parametric models that estimate the effect of explanatory variables on the time until an event occurs. Because early applications were in bio-statistics, these models are sometimes referred to as “survival models” because they model how long until death. These models are similar to ordinary least squares regression, but duration models usually assume a distribution such as the Weibull distribution (Kiefer 1988; Zorn 2000). In addition, event history data is often censored and truncated. On the “left side” durations cannot be negative. Durations are also censored or truncated on the “right side.” Researchers may end observation before all of the events occur. Event history analysis assumes that the data is left-truncated and allows researchers to indicate if the durations are right-censored or not.

Soule’s (1997) study of antiapartheid protests on US college campuses in the late 1980s provides an illustration of this type data. The event in Soule’s study was the shantytown. This new type of protest began at Columbia University, where students literally camped out on campus in order to protest the university’s investments in South Africa. Soule measured whether or not other colleges and universities had shantytown protests on their campuses. Those that did not were coded as
right-censored. Soule found that shantytown protests were more likely to spread amongst colleges that were similar to each other; students took their cues from colleges with similar wealth, mission, and academic prestige. Shantytown events were more likely (had a higher risk of occurring) on elite liberal arts campuses with few African-Americans.

Hazard models (or alternatively proportional hazard models) estimate the effect of explanatory variables on the hazard rate. Unlike duration models, hazard models have a dependent variable indicating whether an event has occurred or not. The data for any case is divided into temporal units. For example, Andrews and Biggs (2006) looked at sit-in protests in the American south during the spring of 1960. They examined 334 urban areas from February 1 through April 14, 1960. The event was the occurrence of a city’s first sit-in. The data was organized as date-city observations. For each date-city observation, the dependent variable would indicate whether a sit-in occurred or not. There would be additional data, some that would also vary each day (e.g., the number of other cities with sit-ins in the previous week) and some that do not vary over time (e.g., the percentage of the population that was black). The hazard model would estimate the relative probability of a sit-in occurring conditional on the time since the observation began.

The most commonly used approach to estimate a hazard model is the Cox proportional hazard model (Cox 1972). This is a nonparametric modeling approach that estimates the effect of covariates on hazard rate. The Cox model is very flexible. It can incorporate durations that are left-censored because they begin before the observation period, discontinuous risk intervals, and repeated events (Box-Steffensmeier & Jones 2004). These and other event history models can be estimated using commonly used software including Stata, SAS, and S-Plus.

Everyday activism

JANE MANSBRIDGE

Everyday activism is talk and action in everyday life that is not consciously coordinated with the actions of others but is (1) to some degree caused (inspired, encouraged) by a social movement and (2) consciously intended to change others’ ideas or behavior in directions advocated by the movement.

A woman refuses to get her husband’s plate at a big family dinner and says later that she “ended up liberating the other women in the family,” who stopped serving their husbands too. Her word “liberating” in a focus group of African-Americans who all identify as feminists suggests that the feminist movement affected her action, although she had no other connections to the movement. She also intended to effect change in a direction advocated by the movement.

Organized activists and other individuals committed to coordinated collective action almost always engage in everyday activism along with their consciously coordinated activities. In addition, individuals whose opportunities and identification with the movement are insufficient to lead them to engage in coordinated collective action can still function as everyday activists when they pick up ideas from the movement and, as micro change agents, use them to change another person’s behavior, perhaps taking small risks in the process.

In everyday activism, the often spontaneous actions of many individuals become the interactive base for the parts of social movements that form “emergent” phenomena in the sense of complex adaptive systems (CAS) theory (e.g., Holland 1998; Sawyer 2005). In an emergent phenomenon, unplanned, dynamic, feedback-driven micro-level interactions among proximate individuals create, without central coordination, macro-level outcomes far beyond their additive effects. A flock of birds and a school of fish are good examples among nonhuman animals, as are market prices among humans or a hurricane in the physical world. In the CAS understanding of emergence, “it is simultaneously true to say that the actions of the parts cause the overall behavior and that the overall behavior guides the action of the parts” (Clark 1997). This technical meaning adds specificity and the reflexive action of the whole upon the parts to the meaning, in early symbolic interactionism, of emergence as the unplanned appearance of novel behavior (e.g., Turner 1964).

Because everyday activism is not consciously coordinated and because each action is small enough to require only a small motivation often supplied by the emotion of the moment, the resulting emergent phenomena largely avoid the free-rider problems of collective action (Olson 1965).

Local actors engaging in everyday activism do not simply diffuse (Soule 2004) the concepts devised by the “critical communities” (Rochon 1998) or enclaves of the movement; they are themselves active agents of change. In a process of enclave variation and everyday selection (Campbell 1965; Mansbridge & Flaster 2007), they select from enclave-generated ideas and frames those that they can apply in their own situations, where they are relatively vulnerable to retaliation. They may also adapt innovatively, producing emergent local frames. Unlike “emergent norms,” these frames, conceptually based in CAS theory, do not stress a precipitating crisis, pressures for conformity, crowds, or relatively short periods of interaction.

Although everyday activism could be considered a form of overt resistance (Hollander & Einwohner 2004), it differs from standard “everyday acts of resistance” such as foot-dragging, pilfering, sabotage, dissimulation, and gossip (e.g., Hall & Jefferson 1975/2006; Scott 1985) in being often visible and even confrontational rather than concealed, silent,
avoidant, diversionary, secret, hidden, or underground. Everyday activism is also cumulative and forward-looking, as part of its implication in a social movement, in contrast to Foucault’s (1982) avoidance of any “positive” understanding of resistance.

Experimental methods
PAMELA OLIVER

Although “experiments” are popularly understood as research done in a laboratory, for social scientists the key element of an experiment is at least one manipulated independent variable. A variable is manipulated if the researcher can determine who experiences each category (or treatment) of the variable. A “true” experiment is one in which the researcher randomly assigns subjects to different categories (treatments) of the independent variable. This random assignment (randomization) can yield high internal validity in assessing the causal effect of the independent variable on the dependent (outcome) variable. There have been important randomized field experiments in policy areas such as education, welfare provision, population control, or medical treatments. Market researchers may use randomized field experiments to test the impact of different advertising campaigns and some professionalized social movement organizations have used this kind of field experiment to test the impact of various ways of “marketing” their issues. Smaller voluntary groups might also find it valuable to use rigorous experimental methods to test their persuasive tactics, although they rarely do.

Randomized field experiments are rare in academic studies of social movements because researchers cannot manipulate the independent variables of interest. One exception is in studies of collective action and social dilemmas, where researchers create artificial situations in which people must choose between doing something that benefits themselves only or doing something that benefits others. These experiments typically involve relatively small groups. The independent variables include such things as the balance between the individual payoff and the group payoff, whether and how people can communicate, or whether and how people can reward or punish each other for their behavior. Such experiments have demonstrated that many people do contribute to collective goods and that their contributions are strongly affected by the social features of the situation.

There have been some academic field experiments of individual contributions to collective goods. Marwell and Ames (1979, 1980) invited randomly selected high school students to participate in an exchange where they were given tokens that could be “spent” on an individual benefit or contribute to a group exchange where the points were worth more but had to be shared with others and total payoffs to everyone would be higher if everyone contributed to the group exchange. Independent variables included whether the students shared equally or unequally in the group exchange and the size of the group they thought they were dealing with. Alfano and Marwell (1980) conducted a similar experiment with incoming freshman college students who would be on the same floor of a dorm to test the effect of whether the “group good” was divisible (each individual got his or her share of the contributions to the group exchange) or indivisible (the “group exchange” money could only be spent by the dorm floor as a whole on something that would benefit all of them).

In perhaps the most unusual field experiment conducted by scholars of social movements, Gamson, Fireman, and Rytina (1982) rented motel rooms and created a situation in which a group of ordinary citizens faced an ambiguous case of possible injustice. The dependent variable was whether the participants refused to cooperate with the injustice. The crucial independent variable turned out to be whether someone labeled the situation as unjust and urged others to act.

REFERENCES AND SUGGESTED READINGS
Extremism
MANUELA CAIANI

Extremism has become a very common term nowadays, both in social science and outside the academic sphere. However, its usage is rather awkward: nobody has arrived at a satisfactorily comprehensive definition. The concept refers to individuals or groups who advocate or resort to measures that lie beyond the moral and political center of society (Eatwell & Goodwin 2010: 8). It can be associated with ideologies (values systems) or behaviors. Historically, it has been also used to indicate totalitarian regimes such as communism and fascism. When applied to politics, extremism is commonly defined by the elements anti-constitutionalism and antidemocracy; it is the rejection of the fundamental values, procedures, and institutions of the democratic state (Carter 2005). In this sense some scholars, taking into account an action-based and a values-based form of extremism, also distinguish it as consisting of three components: extraordinary, excessive, and intolerant political opinion, belief, or activity; violent political activity; and activity aimed against the democratic constitutional state (Downs, Manning, & Engstrom 2009).

One of the difficulties regarding the definition of extremism is that the real meaning of the concept is ultimately attributed by others to a group rather than by a group labeling itself. Indeed, it is not a value-neutral term, but it is adopted in a pejorative way, as “a term of damnation” (Eatwell & Goodwin 2010: 7). Some go even further, stressing that extremism can be also used “to criminalise protest, discredit any form of ‘radical thinking’ and label political dissent as potentially dangerous” (Neumann 2008: 3). Furthermore, approaching the notion of extremism, one is confronted with several different synonyms such as fanaticism, zealotry, bigotry, immoderation, terrorism, and revolution; some of them, as for example radicalism, are often used interchangeably with extremism. However, a differentiation between these two terms (although still debated in literature, e.g., Mudde 2000) is necessary. Radicalism involves the advocacy of, and commitment to, far-reaching changes in social and political institutions, which might constitute a challenge to the legitimacy of established norms and policies but does not necessarily, in itself, lead to violence (European Commission’s Expert Group 2008: 5). On the contrary, extremism involves the active subversion of democratic values and the rule of law and implies the implicit or overt acceptance of violence as legitimate (Eatwell & Goodwin 2010: 9). This distinction is clear for example in the German Constitution that differentiates between “radicals” (who oppose some of the principles of the liberal democratic system) and “extremists” (who are hostile to the constitution) and persecutes legally only the latter.

Extremism can take several forms which vary across countries and groups and can be divided into at least four types: left wing, right wing, nationalist, or religious. Left-wing extremism includes a range of Marxist–Leninist, environmental, animal rights, anarchical, and antiglobalization groups. Right-wing extremism includes racist and fascist groups. Right-wing extremism is said to be against human equality, whereas left-wing extremism is said to be against individual freedom. Nationalist extremism includes groups inspired by a desire for independence, territorial control, or autonomy because of ethnic or other affiliations. Religious extremists act to comply with a religious mandate or to force others to follow that mandate (Jones & Libicki 2008). These different analytical categories are not necessarily mutually exclusive and can be
found in combination in the empirical reality. However, one common feature of extremism is interpreting the world through “black or white” or “all-or-none” categories (Mandel 2002). Extremists divide the world between friends (those who support their cause) and enemies (those who oppose it), without seeking a common ground among contending parties, nor does extremism seek common perspectives, as liberalism does (Downs, Manning, & Engstrom 2009: 153). The “in-group” is usually seen as treated unfairly, humiliated, or deprived of what they otherwise deserve, whereas the “out-group” is considered to be benefiting directly by this injustice (Mandel 2002). Therefore, feelings of anger and revenge, as well as the dehumanization of the enemy are considered the main mechanisms which prompt extremists to use violence.

Nevertheless, there is still an open debate in academic literature concerning the most important causes favoring extremism (for an overview, Borum 2004). There are those explanations underlining, at an individual level, the psychological characteristics of extremists and their values and motivations (e.g., psycho-pathologies and mental illness research until the mid-1980s, feeling of humiliation, Richardson 2004; history of injustice and abuse, Juergensmeyer 2000; identity and belonging, Horgan 2005); those, at a context level, that focus on the social and political conditions that lead to extremism (e.g., relative deprivation, Gurr 1970; social, ethnic, or political fragmentation within a state, oppressive regimes, Pape 2005; repressive police, della Porta 1995; social support, Paz 2004); and finally, those, insisting on ideologies, organizations, and leaders as crucial determinants (e.g., organizational processes, Goodwin 2006; leadership and network dynamics, Sageman 2006; recruitment, socialization, and training, Gupta 2005). These factors have long been studied in isolation, however there is now a common agreement among scholars that there is not a single explanation of extremism and that in order to shed light on the phenomenon, it is necessary to consider the context of both structural and group dynamics as well as the psychological conditions of extremism (e.g., della Porta 1995).

Factions/factionalism
KELSY KRETSCHEMER

A faction is a subgroup within a larger organization that is in conflict with other members of that organization. Factions occur when a subset of organizational members begin to develop a distinct collective identity that is at least partially at odds with other members. Factionalism refers to this conflict between an organizational faction and other members, or between competing organizational factions. Strictly speaking, factionalism refers to this intra-organizational conflict. However, many social movement scholars have used the concept of factionalism to understand inter-organizational conflict within a broader social movement. In other words, we can use the language of factions to understand a wider range of phenomena, including how different branches of a social movement form and interact. Scholars have paid attention to the ways factions originate, to how they disperse or strengthen over time, to the different outcomes of factionalism, and the consequences of factionalism for social movements generally.

There are varying perspectives on why factions develop. Many of the social movement studies on factionalism found that it is the result of poor organizational leadership and management, and that it signals the impeding death of the organization (Zald & Ash 1966; Gamson 1975; Balser 1997). In this vein of research, social movement scholars have paid attention to how the structure of some organizations encourages factionalism and affects its intensity. While all organizations are vulnerable to factionalism, some types may be better able to withstand factionalism and some are more vulnerable. For example, Zald and Ash (1966) argue that exclusive organizations – those with stricter membership requirements – are more likely to suffer from factionalism and schism than are inclusive organizations. In this view, inclusive organizations offer greater flexibility in dealing with internal conflict, meaning the organization can withstand greater internal conflict (see also King 2008). Others have found that there is no great difference between inclusive and exclusive organizations in terms of factionalism (Gamson 1975).

In a different vein, social psychologists and small-group sociologists have paid attention to the process through which factions emerge and evolve. These studies have found that factions do not randomly form, but are shaped in ways that reflect social divisions in the broader world. Social psychologists studying this phenomenon refer to the preexisting social “fault lines” within organizations (Stark & Bainbridge 1985; Lau & Murnighan 1998; Hart & Van Vugt 2006). Social fault lines refer to meaningful diversity within the organization, including race, gender, and class differences among members. These fault lines may not be initially important to the members of the organization, but the fault lines can be triggered by an event or crisis that makes them relevant. For example, changes in affirmative action policy can cause factions to form along race and gender lines within an organization.

By examining factions after their initial emergence, other scholars have focused on the subsequent stages of factionalism and on how the boundaries around factions change over time. The specific stages vary across the literature, but they often include a preliminary stage, where there is not yet any conflict; the formation of subgroups, where members begin to align themselves more with some co-members than with others; an escalation of conflict, when the sub-groups begin to compete with other members; and then a final exit stage, where one faction chooses to leave the organization (Pondy 1967; Worchel, Coutant-Sassic, & Grossman 1992; Worchel
Factionalism does not have to escalate however, and under certain conditions it can be ratcheted up or down by the members involved. Lau and Murninghan (1998) found that the level of factionalism is intensified when factions meet independently of other organizational members, institute organizational changes based on the subgroup’s views, compete with members not associated with the faction, and when the faction has a more cohesive collective identity than members of the broader organization have. Factionalism can be dampened under certain circumstances, including the appearance of an external threat to the broader organization and when there is opportunity and pressure to work with members outside of the faction. Dyck and Starke (1999) echo these findings, stating that in the cases where episodes of factionalism were successfully resolved, the organization experienced a “harmonizing event,” where all members came together and declared their commitment to maintaining a unified organization.

While most factionalism theory and research emphasizes how the internal composition and structure of organizations leads to conflict, a new promising direction in the field focuses on the effect of an organization’s environment in producing factionalism. Deborah Balser (1997), for example, argues that a variety of external challenges can create or exacerbate friction between members of an organization. These challenges include changes in the political opportunity structure, increased social control by authorities, increasing resources, and changing relationships with other organizations in the social movement. Each of these challenges forces members to renegotiate established ways of managing the organization, and can lead to factionalism. These findings were echoed by Shriver and Messer (2009) in their study of the Czech environmental movement. They found that as the political opportunities shrank, the largest environmental organization in the country, the Rainbow Movement, experienced intense factionalism. Members struggled over how to best respond; some became militant anarchists while others wanted the organization to professionalize in order to attract more funding. As a result, the organization experienced a schism when a core group of members left to form a new organization, Neschnuti.

Along with the debates over what causes factionalism (internal versus external factors), there is also debate over the consequences of factions for social movements. Factionalism is often painted as a destructive force for social movements and social movement organizations. Miller (1983) for example, argues that factionalism is harmful to social movements because it channels resources and energy away from the movement’s target and instead focuses it on the internal conflict. This pattern was found by Cable and Shriver (2010) in their study of the Gulf War illness movement. They argue that the activists’ arguments over the government’s responsibility diverted pressure from authorities to respond to the veterans’ claims. Cable and Shriver argue that the movement should have had a far bigger impact than it actually achieved, and that the factionalism is to be blamed for this disappointing outcome.

On the other side of the debate, scholars argue that factionalism and conflict can have important benefits for social movements. Through factionalism, new ideas and perspectives are brought to the forefront in social movement organizations. It can shed light on organizational inequalities that might otherwise go unnoticed. One infamous example of this kind of factionalism occurred within the Student Nonviolent Coordinating Committee (SNCC), when female members of the organization produced the Waveland Memo. In this memo, the women argued that despite their importance in SNCC’s operations, they were blocked from leadership positions and compelled to serve in traditional female roles (Breines 2006). In cases like this, factionalism works to ameliorate organizational problems like the systematic inequality of some members.
Factionalism and schism can also have a positive outcome when they expand the boundaries around a social movement and give more people room to participate. When factionalism causes the exit of some organizational members who then create new organizations, these new organizations offer additional venues for new potential activists to join. For example, the National Organization for Women (NOW) experienced intense factionalism early in its history, and these factions often left NOW to create organizations that provided new definitions of feminism and activism. This includes both organizations that were more politically conservative than NOW and organizations that were more radical than NOW. All of these factions broadened the reach and power of the feminist movement (Davis 1999).

Factions and factionalism remain fertile topics in social movement studies. Because much of the work on factionalism is done with a single case study or small number of cases, it remains unclear how the broader political and economic environment affects factionalism across the population of social movement organizations. Specifically, is factionalism more likely in prosperous economic times because there are more resources to fight over? Or is factionalism more likely in difficult economic times because there are fewer resources to meet members’ needs? Research also points in conflicting directions about the role of political repression and factionalism. Small-group research indicates that the presence of an external threat decreases factionalism as all members band together. Balser’s (1997) case studies indicate that political repression can increase factionalism. Understanding which environmental conditions exacerbate factionalism and which conditions dampen internal organization conflict can provide us with a better understanding of how social movement fields evolve over time.

REFERENCES AND SUGGESTED READINGS

Feminist movements, in the broadest sense, are collective efforts to improve the situation of women, and they have emerged in most parts of the world, beginning in the mid-nineteenth century and continuing into the present. Feminism has also influenced other social movements, such as the peace, environmental, global justice, reproductive rights, and gay/lesbian movements, through its ideologies, collective identities, tactics, and organizational forms. Scholarship on feminist movements has focused on their origins; different waves or cycles; feminist ideologies, collective identities, tactics, and organizational forms across time and place; and the impact of feminism on other social movements.

Scholars do not all agree about what movements qualify as feminist or even as women’s movements, a broader term. The word “feminism” originated in France at the end of the nineteenth century and then spread to other languages and parts of the world, leading sometimes to the association of feminism with Western importation. Originally feminism referred to the move to emancipate women from restrictions on their legal rights. In the transnational women’s movement in the years before World War I, the term had come to connote, quite specifically, support for identical laws for women and men, particularly opposition to special—what was known as “protective”—labor legislation for women. For some scholars, a feminist movement must specifically embrace that label, so that only modern movements qualify as feminist. Freedman, taking a historical and global view of feminism, defines it as a belief that women and men are “inherently of equal worth” and that “social movements are necessary to achieve equality … with the understanding that gender always intersects with other social hierarchies” (2002: 7).

ORIGINS OF FEMINIST MOVEMENTS

From a social movement perspective, women have always had sufficient grievances to serve as a basis for feminist activity, but only in certain circumstances have they mobilized in their own interests. Historically, collective action on the part of women directed toward improving their situation has flourished primarily in periods of generalized social upheaval. The first feminist movements emerged in the mid-nineteenth century—particularly around the European revolutions of 1848—in connection with socialism, liberalism, and, in the United States, the movement to abolish slavery.

Structural conditions, in addition, underlie the emergence of feminist protest. In the Western world, changes in patterns of female labor-force participation, increased access to education, and shifts in fertility rates and reproductive roles have been associated with the emergence of feminist movements. Outside the West feminist movements tended to emerge from nationalist and anti-imperialist impulses rather than processes of economic development.

Although the early feminist movements in Europe and the United States have influenced movements elsewhere that developed later, there are also indigenous roots of feminist movements around the globe. Women in most regions of the world have, in modern times, organized collectively against the injustice and oppression in their communities. Gender oppression for many third-world feminists cannot be divorced from issues and histories of colonization, immigration, racism, and imperialism, so that feminist activism is often organized around a constellation of oppressions rather than exclusively around gender.
The political contexts of different countries have been critical in shaping feminist movements and facilitating or constraining success in achieving feminist goals. In Western Europe and the United States, feminist movements have had the greatest success in policymaking where the political left has been either very strong, as in Sweden, or very weak, as in the United States.

Since the 1970s, regional, interregional, and transnational networking among feminist groups has grown enormously, although the origins of transnational organizing date back to the end of the nineteenth century. The United Nations’ International Women’s Year in 1975 and Decade for Women (1975–1985), originating with the Soviet-bloc-sponsored Women’s International Democratic Federation, fostered global feminist dialogues and stimulated the growth of feminist activism around the globe. Four official UN world conferences of governmental representatives devoted to women’s issues, with associated unofficial forums of women’s groups, have focused global attention on feminist questions and fostered connections among feminist activists. Although the official conferences and the affiliated forums have proven extremely contentious, grappling with questions of politics, religion, sexuality, and social custom, they have also sometimes bridged global North–South differences.

WAVES OR CYCLES OF PROTEST

Traditionally, scholarship on feminist movements, based on the US and European experience, has depicted their emergence in two waves: the first in the mid-nineteenth century to the early twentieth century, culminating in the struggle to win the right to vote, and the second since the late 1960s. Late-twentieth-century and twenty-first-century developments, particularly among young women, have come to be considered a third wave.

After a lull, at least in the countries where the right to vote was won by the early twentieth century, feminist movements burst forth with renewed vigor in connection with the social movements of the long 1960s: civil rights in the United States, student and left-wing movements throughout the Western world, and national liberation movements in the third world. In the United States and Western Europe, women came together in consciousness-raising groups and took to the streets with all kinds of protests designed to challenge public assumptions, alter institutions, and create political change. Often divided on questions of ideology, strategy, goals, and membership, these late-twentieth-century movements mobilized around a broad range of issues, from reproductive rights to sexual and economic exploitation to violence against women. These feminist movements conceptualized women as sharing common experiences of oppression, asserting that “sisterhood is global,” but increasingly, in response to critiques from women of color and women in the third world, came to emphasize differences among women on the basis of class, race/ethnicity, sexuality, and nation.

This “second wave” of feminism encountered criticism as prudish, dogmatic, and lacking in diversity from a younger generation in the 1990s. Third-wave feminism in the United States mobilized around such issues as sexuality, body image, gender identity, the environment, globalization, and popular media. Especially important is an emphasis on the intersections of class, race/ethnicity, and sexuality. Yet scholars have increasingly challenged the notion that the resurgence of feminism in the 1960s was entirely a white and middle-class phenomenon, pointing to organizing among African-American and Chicana women and in labor unions and the welfare rights movement.

Recent scholarship makes clear that there is more continuity than the wave model suggests. Movements grew outside the Euro-American arena precisely when feminism went into decline there after World War I and, in addition, feminist movements did not die out between the early twentieth century and the resurgence of feminism in the last
quarter of the twentieth century or in the 1980s, when media reports of the death of feminism became commonplace. Instead, in periods of less visible and dramatic protest, the feminist movement has gone into what Taylor (1989) calls abeyance. Feminist organizations have continued to form and grow across the globe, while feminists have also moved into traditional institutions, including government bureaucracies, giving rise to the term “femocrats.” Research on US feminism within labor unions, the military, the Catholic Church, and liberal organizations and foundations shows its perseverance even when dramatic protest died down. As a result, scholars increasingly critique the wave metaphor in favor of recognizing continuity, albeit with changing forms over time.

**FEMINIST IDEOLOGIES, COLLECTIVE IDENTITIES, AND TACTICAL REPERTOIRES**

Feminist movements are by no means monolithic, encompassing as they do numerous ideological strands that differ in the scope of change sought, the extent to which gender inequality is linked to other systems of domination, and the significance attributed to gender differences. Offen (1988) distinguishes historically between individualist feminism, which emphasizes human rights and personal autonomy, and relational feminism, which advocates equity for women in their traditional roles as wives and mothers. At bottom, the basic divide in these categories is between those who emphasize the sameness of women and men and those who focus on difference. This ideological distinction has its counterpart in the goals of movements, some of which work to win identical treatment for women and men and some of which advocate different treatment as the proper route to equality in outcome.

With the resurgence of feminism in the late 1960s, scholars distinguished among liberal feminism, socialist feminism, and radical feminism. Liberal feminism, most characteristic of the mainstream US women’s movement, seeks equality for women within the existing social structure, working for equal opportunity in male-dominated economic and political arenas. Socialist feminism, with a strong tradition in European movements, sees class and gender as mutually responsible for creating inequality and calls for a transformation of both capitalism and patriarchy. Radical feminism considers women a “sex class” and seeks a fundamental transformation of society based on “female values” of nurturing, egalitarianism, pacifism, and cooperation. Categories of feminism have proliferated to include black feminism, lesbian feminism, Islamic feminism, and ecofeminism, to name just a few. Increasingly the plural, “feminisms,” captures the diversity of feminist ideologies.

Scholars increasingly view feminism as a socially constructed collective identity that emerges out of the interactions and accomplishments of participants in networks and organizations engaged in efforts to improve women’s status and opportunities. A collective-identity approach to feminism shows how feminist culture and the maintenance of a feminist collective identity contribute to the continued vitality of women’s movements.

Feminist movements have employed a variety of tactical repertoires in different times and places, sometimes dramatic public protests such as marches, demonstrations, and rallies, and sometimes consciousness-raising, self-help, or cultural and discursive forms of resistance oriented to cultural and social change. Not all tactical repertoires are aimed at the state. On the global level, feminists are organizing around such issues as health, housing, education, population, human rights, genetic engineering, trafficking, migration, militarism, and debt, developing new tactical repertoires to meet the challenges of an increasingly globalized world.

**FEMINISM WITHIN OTHER SOCIAL MOVEMENTS**

Feminist movements have roots in leftist, racial/ethnic, and nationalist movements, and
feminists have continued to participate in a range of other movements, including peace, global justice, environmental, reproductive rights, and gay and lesbian movements. Feminists have also been heavily involved in the Global Justice Movement, which brings together activists from labor, environmental, peace, and consumer movements as well as the women’s movement. Feminists have contributed numerous tactics to such public protest events, as well as to less visible cultural venues, helping to perpetuate the women’s movement and shape movement outcomes.

Fields of contention
NICK CROSSLEY

Contentious politics, in Tilly’s sense, involves multiple relays of interaction (Tilly & Tarrow 2008). Activists interact amongst themselves, both within and between “social movement organizations” (SMOs); they interact with opponents and elites; with police and other security forces; and often also with journalists and even academics. The outcome of contentious politics is generated by these interactions and the concept of “fields of contention,” as coined by Crossley (2003, 2006), is intended to capture the network which they form.

Any field of contention comprises multiple sets of actors party to a given conflict (or set of connected conflicts), sets of various relations and interactions between those actors, and a culture of contention that emerges within and by way of these interactions. Fields are always in-process, changing “shape” as an effect of the dynamics of continuous contentious interaction which both drives and constitutes them.

The intellectual sources of the concept are various. In part it builds upon Zald and McCarthy’s (2003) modeling of the interaction between SMOs within movement industries and the wider movement sector. Zald and McCarthy suggest that SMOs emerge to service demands for change in society, effectively exchanging their efforts for the material and symbolic rewards they can demand in return. However, they add that several SMOs might emerge in relation to the same demand, fueling competition. This competition is often further amplified on account of the many diverse issues that prompt movement activity. SMOs compete within movement industries but industries also compete within a movement sector. And the movement sector itself must compete with private, public, and voluntary sector activities which all make demands upon and seek to lure the wider public.

The economic, resource mobilization aspect of Zald and McCarthy’s account is very useful and appropriate but also somewhat limited. Although it gestures toward the symbolic and cultural dimension of social movement sectors and industries it does no more than gesture, failing to illuminate the cultural elements that are both generated by and embed contentious politics. Furthermore, it tends to conceive of actors (both activists and SMOs) in an overly materialistic-utilitarian fashion, failing to consider the significance of symbolic and moral goals, identity, habit and expressive action, and of the rather looser forms of association (than formal organization) that are common in many forms of contentious politics. Other more recent contributions to the study of social movements and contentious politics have made this point and sought to fill the gap but in doing so they have tended to lose sight of both the economic dimension and the sense of a structured field of interaction that we find in Zald and McCarthy. “Fields of contention” is an attempt to draw these elements together by way of a substantial reworking of Zald and McCarthy’s model which incorporates many of the more recent insights.

Although the significance of networks is raised in the resource mobilization literature, this isn’t picked up in Zald and McCarthy’s model. As in much of the economic literature that they draw from, Zald and McCarthy tend to suggest a rather atomized picture of political contention, with actors making decisions and acting largely independently of one another. Again “fields of contention” is intended to correct this. A second source for the concept is the growing body of literature focused upon social networks in contentious politics and on the techniques of formal social network analysis (Diani & McAdam 2003; Crossley 2008). If contentious politics consists of multiple relays
of interaction then these relays collectively form a network of both interactions and the more durable relationships that emerge by way of it. These networks are important because they generate both opportunities and constraints for those involved in them. Moreover, social network analysis affords us a variety of techniques for mapping these networks and identifying their most salient properties. Fields of contention are networks, therefore, both of individual human actors and of the various corporate actors, including SMOs and other organizations, that become involved in struggle.

Formal social network analysis (SNA) allows for an empirically sophisticated approach to fields of contention which is able to draw out salient aspects of their structure, and increasingly network analysis is attuned to the dynamics of network evolution. Fields of contention are not just networks, however. As noted above, they equally entail cultures of contention and distributions of resources. Furthermore, they incorporate antagonistic interactions and relations as well as the more cooperative ties more usually focused upon when SNA is applied to contentious politics.

The final intellectual source of inspiration behind “fields of contention” is Bourdieu’s conception of “fields” (Bourdieu & Wacquant 1992). Bourdieu is most often associated with the analysis of “reproduction” rather than the transformation which contentious political actors seek to bring about. Much that he says can be applied to emerging fields of contention, however (Crossley 2003). More importantly, his work alerts us to the various ways in which contention might be shaped, culturally, by its past, taking on conventional forms, and by both domination and the unequal distribution of resources (including cultural resources) within it. Furthermore, Bourdieu’s use of the techniques of multiple correspondence analysis, to map fields, suggests a further (to SNA) way of operationalizing the notion of fields, empirically, and analyzing them.

Bourdieu was the key inspiration behind the early development of “fields of contention.” More recently, however, the author has become more aware of the limits of his version of “fields” and, indeed, of his wider framework. In particular Bourdieu pitches his analysis at a level of abstraction which ignores empirical social interactions and networks, and he suggests that such phenomena are secondary, if relevant at all, to a modeling of fields. His model of fields is focused rather upon the distribution of different social capitals (Crossley 2010). This is problematic in general terms and a fortiori in relation to contentious politics, which, as noted, consists in networked interactions. For these reasons, whilst Bourdieu remains important, we must be careful to distinguish “fields of contention” from Bourdieu’s “fields.” The former must be analyzed in more concrete terms, focusing upon empirical interactions, relations, and networks.

The concept of fields of contention can be widely applied. It is not formulated with any single example of contentious politics in mind and it does not require that potential empirical foci meet strict criteria. It is, as much as anything else, a tool for thinking through the parties to any given struggle and their various relations and interactions, albeit a tool informed theoretically by the belief that such relations and interactions are the very “stuff” of contentious politics and should be central to any analysis of it. One area in particular where the concept has been picked up, however, is the area of health-related struggles. It has been argued, in this context, that the concept is of particular use because it provides a framework for analyzing the structural and cultural context of struggles that are not centered specifically upon government (Taylor & Zald 2010). This reflects the above-mentioned openness of the concept. It is not prescriptive in relation to the agents involved in a struggle but rather asks of the researcher that they address this as a question.

Frame disputes
ROBERT D. BENFORD

Frame disputes refer to differences of opinion or preference regarding claims associated with framing activities that social movement actors fashion. Frame disputes are a pervasive dynamic within social movements, one of several contested discursive processes within the movement arena (Benford & Snow 2000). The concept derives from Erving Goffman’s observations in *Frame Analysis* that interpretations of what’s going on in a particular circumstance are subject to disagreement. On such occasions “reality” must be negotiated. In the context of social movements, frame disputes erupt within a movement organization (intraorganizational dispute) and/or between representatives of two or more SMOs within a social movement (interorganizational dispute). Frame disputes in the wider political arena, such as those that often arise between social movements and their opponents (e.g., countermovements, targets of change, media, etc.), have been referred to as “framing contests” (Ryan 1991). The focus of this entry is on interpretive and discursive disagreements that occur within a social movement.

FORMS OF FRAME DISPUTES

Social movement actors spend considerable time constructing particular versions of reality, developing and proffering alternative visions of that reality, seeking to affect various audiences’ understandings of the movement and its claims, and managing the impressions people form about their cause (Benford 1993: 678). All of these interpretive matters are subject to dispute. Social movement frame disputes tend to take three forms. Most fundamental are those disputes that pertain to *diagnostic framing*, what’s wrong and who or what’s to blame for the problem. Because these disputes are over “reality” (what actually happened), they most closely resemble Goffman’s (1974) notion of frame disputes. A second form of disputes entails disagreements regarding *prognoses* – what is to be done to correct the current injustice or social problem that the movement seeks to address. Finally, social movement participants frequently disagree about how the movement should portray the movement’s grievances and solutions. This form of frame dispute concerns which frame alignment strategies are most likely to resonate among specific audiences and thus yield successful mobilization. Hence, researchers refer to these disputes as “frame resonance disputes” or framing disputes (Benford 1993).

CAUSES AND EFFECTS OF FRAME DISPUTES

Recent research has sought to specify the conditions most likely to yield frame disputes. Haines’ (2006) comparison of internal disputes resulting from Amnesty International’s expansion of its human rights agenda to include the death penalty and the American Civil Liberties Union’s endorsement of drug legalization are attributable to contrasting organizational cultures, framing vocabularies, and membership profiles in the two SMOs. In a study of disputes pertaining to pro-life pharmacists who refuse to fill birth control prescriptions, Chiarello (2006) found that frame disputes are caused by divided loyalties, definitional differences, and misinterpretation of frames. More often than not frame disputes erupt between ideologically diverse wings of a movement. At one extreme are those moderates who prefer to build bridges and establish allies with the targets of change. At the other extreme are those who prefer to dethrone the current elites and to build an entirely new system. In such cases, rhetorical differences tend to reflect ideological differences.
While numerous social movement scholars have analyzed the causes and subjects of frame disputes within various contemporary social movements, only a few have sought to determine the effects of such intramural conflicts. A study of the nuclear disarmament movement of the 1980s suggested both positive and negative effects resulting from frame disputes including mobilization and demobilization, resource depletion and resource concentration, factionalism and cohesiveness, and chasms and a division of interpretive labor (Benford 1993). Jessup’s (1997) study of the Ku Klux Klan indicates that frame disputes tend to increase a movement’s efficiency as long as the disputes do not reach such a rancorous level so as to delegitimate the movement. In those instances where the movement loses legitimacy, frame disputes tend to yield identity divergence and factionalism. A study of a transnational movement’s framing rifts notes that frame disputes can be strategically beneficial by allowing an issue to resonate among multiple audiences (Resnick 2009). Successful movements learn from these disputes and adapt to changes in their discursive opportunity structure (McCammon et al. 2008). Additional research needs to illuminate the conditions under which frame disputes tend to be facilitative of or detrimental to the achievement of SMO and social movement goals as well as to the longevity of SMOs and social movements.

Free rider problem
PAMELA OLIVER

A free rider is someone who gains the benefit of a collective or public good without contributing to the cost of its provision. The term was introduced to social scientists by Mancur Olson’s *The Logic of Collective Action,* which argued that the problem of motivating collective action is equivalent to the problem of motivating private contributions to a public or shared good. Olson’s use of the term is structural: a person is a free rider if they benefit from a public good without contributing to it, regardless of their awareness of the possibility of contributing. A more restricted meaning refers to conscious free-riding, in which a person prefers to benefit from the actions of others.

Although the term “free riding” is sometimes used for any failure of collective action, a more accurate usage distinguishes the free riding problem from the feasibility or startup problem. The free riding problem is strategic gaming between people who would be willing and able to contribute to the collective good but can hope to obtain its benefits without contributing. The group has the resources needed to provide the good but needs to solve the coordination problem of who will pay. Because individuals find it individually rational to contribute to the good if they know others will not contribute, true “free riding” dilemmas are often resolved by the most interested people paying for the good. Free riding dilemmas can also be resolved by side payments or cost sharing. By contrast, the feasibility or startup problem arises when no single individual can make a large enough difference in the collective good to make their individual contribution rational, even though concerted action by many people at once would be a net benefit to everyone. The most interested actors in groups facing feasibility or startup problems cannot provide the good themselves and can only solve the problem through investing in organizing others to simultaneous action (Oliver, Marwell, & Teixeira 1985; Marwell & Oliver 1993).

There has been a debate about the impact of group size on free riding. Free riding is generally a larger problem in larger groups where it is more difficult to coordinate action and bring social pressure to bear on each other. But the problem of free riding is not restricted to large groups, as anyone who has ever shared a residence and argued over housework can attest. The small group problems of free riding are sometimes of central importance in the dynamics of real social movement organizations. Of particular importance is the dynamic Olson called “the exploitation of the great by the small,” more accurately called “the exploitation of the more interested by the less interested.” In many groups, the most enthusiastic and interested members of a group do most of the work and find it difficult and frustrating to pull in smaller contributions from other group members.

Free riding is an instance of a more general concept of a social dilemma or mixed-motive situation, in which individuals have both individual and common interests. Experimental research on conscious free riding finds that it is common but not universal, and that the average or typical person faced the choice between benefiting only herself and benefiting the group will try to split the difference and make some contributions to the group along with some contributions to individual benefit. There are many strategies that can produce cooperative outcomes if people are allowed to communicate or are in ongoing interaction with each other.

Similarly, empirical research in social movements finds that both structural free riding and participation that cannot be accounted for by individual payoffs are common. Many structural free riders are not conscious free riders. In Walsh and Warland’s (1983) study of
community residents in the Three Mile Island area after the nuclear reactor accident, only 5 percent of the people who were “objective” free riders reported conscious free-riding (i.e., letting other people make the effort on their behalf). The most common reason given for not participating despite supporting the issue was not having heard of the groups working on the issue (26%); the second most common was family or personal preoccupations (18%). Other common reasons were opposition to joining any groups (9%), never invited to join (8%), economic or job pressures (7%), and criticism of the group’s policies or actions (6%).

Free spaces
FRANCESCA POLLETTA and KELSY KRETSCHMER

Free spaces are small-scale settings within a community or movement that are removed from the direct control of dominant groups, are voluntarily participated in, and generate the cultural challenge that precedes or accompanies political mobilization. Since the term became popular in studies of movements in the 1980s, scholars have sought to better identify the features of particular institutional sites that equip them to spur political challenges. They have also probed the role of free spaces in authoritarian regimes, in right-wing movements, and in relation to new digital technologies.

Historians Sara Evans and Harry Boyte used the term “free spaces” in their 1986 book of that title (both Evans and Boyte had separately used the term in earlier work): “Free spaces are settings between private lives and large scale institutions where ordinary citizens can act with dignity, independence and vision” (1986: 17). In the dense interactive networks of community-based institutions like churches, fraternal organizations, and cultural groups, people envision alternative futures and plot strategies for realizing them. Free spaces supply the activist networks, skills, and solidarity that assist in launching a movement. They also provide the conceptual space in which dominated groups are able to penetrate the prevailing common sense that keeps most people passive in the face of injustice. In that sense, they are crucial to the very formation of the identities and interests that precede mobilization. Thus the Southern black church, removed from white control and central to the life of black communities, provided the emerging civil rights movement meeting places to develop strategy and commitment, a network of charismatic movement leaders, and an idiom that persuasively joined constitutional ideals with Christian ones.

For Evans and Boyte and many authors who followed them, the free-space concept reflected the insight that the oppressed are not without resources to combat their oppression. Undermining the well-worn opposition between tradition and radical change, it showed that normally conservative or nonpolitical institutions such as churches, literary circles, families, and working-class bars could become seedbeds of political challenge. Undermining another familiar opposition, that between structure and culture, the concept also pointed to the specifically cultural dimensions of mobilizing networks.

The list of free spaces (and analogous sites such as “havens,” “spatial preserves,” “free social spaces,” “sequestered social sites,” “spheres of cultural autonomy,” and “protected spaces”) that have played key roles in spurring counterhegemonic challenge is now long, and includes such varied sites as literary circles for Eastern European nationalist movements, progressive churches for the Central American Solidarity movement, and music festivals for the White Power movement. Beginning with Evans and Boyte, scholars have also seen free spaces as operating within movements: for example, the “autonomous zones” of European new social movements, the “women’s only spaces” of 1970s radical feminism, the block clubs created by tenant organizers to mobilize an urban constituency, the alternative food coops, health clinics, credit unions, and schools that flourished in the late 1960s and 1970s. By giving people the freedom and warrant to enact relationships that differ from those characterizing mainstream society, such spaces are intended to prefigure alternative societies.

The early appeal of the free-space concept, however, obscured inconsistencies in its use. Free spaces created by movements clearly played different roles in mobilization than did the free spaces that preceded mobilization, yet
the differences were not well specified. While many scholars treated free spaces as physical sites, others maintained that free spaces could exist in print, practice, or the Internet. While some saw freedom from the surveillance of authorities as a crucial feature of a free space, others pointed out that federal prison served as a free space for the development of post-World War II radical pacifism. Scholars were undecided, too, about whether all societies possessed free spaces, as well as whether free spaces only became the seedbeds for revolt in contexts of economic and political instability or whether they could help to create that instability.

Behind the dissensus over free spaces’ referents and their role in mobilization, Polletta (1999) argued, was a tendency to elide free spaces’ structural distance from sites of power with their supposed freedom from hegemonic ideas. Free spaces were treated as, in a sense, empty, and as mobilizing for that reason alone. That view begged the question of just why some institutional settings were able to preserve or produce challenging ideas. It also minimized the extent to which all social settings are characterized by complex dynamics of deference and challenge.

Scholarship in recent years has tackled these issues. One clear finding in the diverse empirical studies is that although people do need some freedom from government surveillance in order to formulate, plan, and organize opposition, they are usually able to find it. Protest has been organized in prisons, in public parks and markets in authoritarian regimes, in the midst of official commemorations and festivals. All regimes and societies have free spaces. But different settings facilitate distinct mobilization tasks and play different roles in more and less repressive regimes. In Eastern European Leninist regimes, the ubiquity of secret police, spies, and informers sometimes restricted the expression of dissent to intimate discussions among friends (Johnston & Mueller 2001). In contemporary China, by contrast, a regime that is both liberalizing and overburdened has failed to stop evangelical Christians from recruiting in public places like busy streets and public Christmas performances (Vala & O’Brien 2007).

A second clear finding in recent scholarship is that what makes some settings generative of protest is not that they are empty of hegemonic ideas but that they are full of counter-hegemonic or potentially counter-hegemonic ones. Churches, schools, art and theater groups, and intellectual institutions have preserved or nurtured traditions of dissent in part because they have enjoyed some autonomy from the state. They are often permitted to operate without direct surveillance; they control certain aspects of daily life; and they may have moral authority on issues that are within the purview of the state.

Such institutions’ autonomy is never complete, of course, and degrees of freedom are won and lost through hard-fought political battles. Challenges to the state must usually be made obliquely, moreover, in an idiom that is not directly political. But the fact that such institutions possess a nonpolitical idiom for formulating challenge is as important a resource as is their political independence. Cultural institutions often provide moral schemas that can be transposed to political issues. For example, Poles drew on a moral idiom from Catholicism to challenge the communist regime. Estonian choral groups preserved a nationalist impulse in a repertoire of folk songs and Czech theater groups voiced dissent in a language that was understandable to all but government censors (Johnston & Mueller 2001). Free spaces in this sense provide not so much a space as an idiom for formulating opposition.

Scholars have long linked free spaces to the creation of collective identities that can later command much wider mobilization. While past research emphasized the importance of forging tight bonds in intimate settings, more recent scholarship has focused on the fact that groups must become visible to themselves as a collective actor. Converging with work on subaltern publics, this perspective looks to settings in which people become both performers of and audience for a new collective identity. The Internet has become important, in this sense, by
lowering the costs of co-presence in a way that makes it easier to form collective identities. Not only do Internet sites allow people to communicate across geographical distance. People also see that there are others like themselves, who are similarly invested in, and potentially willing to act on behalf of a cause. This is probably especially important where people face stigma in their daily lives: an Internet-based free space allows people to “out” themselves with fewer fears of sanction. Internet-based free spaces may also foster ties among more diverse people and allow them to experiment with new forms of association and relationship (della Porta & Mosca 2005).

Finally, if researchers have shown that public, dispersed, and virtual spaces can nurture dissent, they have also emphasized the limitations of the densely networked and physically bounded settings that we often associate with the concept of free spaces. Most obviously, for opposition to become full-scale mobilization, people within a free space must connect with people outside it. But external links may be important even earlier. Outsiders or relative outsiders may counter pressures to accommodation that come with an institution’s relative autonomy. Links to more explicitly political groups may help to identify the shifts in political alignments that signal opportunities for mobilization. Interestingly, contact with opponents may also be necessary. For example, when imprisoned IRA activists were reclassified as ordinary criminals rather than political prisoners, they were forced into daily confrontations with prison authorities, confrontations that strengthened their commitment both to group and to cause. At the same time, the information they smuggled out to supporters about their plight made them a focal point for a much broader collective identity (O’Hearn 2009).

Understanding the links between free spaces and broader publics and between cultures of resistance and full-scale mobilization remain pressing tasks. Do such links consist primarily of people, institutions, or events? When do they come into play? In addition, we know little about the free spaces that are created by movements. Collectivist organizations, cultural festivals, and cooperative institutions are intended to prefigure alternative ways of acting and interacting. Do they? What effects do free spaces have on behaviors and institutions outside the free space? Answering questions like these will advance our understanding of the cultural preconditions for and effects of social movements.

REFERENCES AND SUGGESTED READINGS

Frustration-aggression theory is one of the classic grievance theories in social psychology. It was first formulated by a group of researchers at Yale University. In 1939 Dollard, Doob, Miller, Mowrer, and Sears published their book *Frustration and Aggression*. In the 70 years that have passed since then, the frustration-aggression hypothesis has been the subject of much debate. Through the years, the original sweeping statements have been replaced by more modest claims (Berkowitz 1989).

**ORIGINAL FORMULATION**

In its original formulation the theory advanced a few basic propositions to explain the origin and consequences of all human aggression. Dollard et al. built their theory on one core assumption: “Aggression is always a consequence of frustration” (1). In other words, aggressive behavior always presupposes frustration and frustration always leads to some sort of aggression. The one exception the authors made concerned situations where open aggression may bring punishment.

Part of the debate on the frustration-aggression hypothesis concerns the definition of frustration itself. Some refer to it as an external instigating condition and some as the organism’s reaction to this event. Dollard et al. speak about frustration only in the former sense. For them frustration is an obstacle blocking the attainment of an expected gratification. Aggression they define straightforwardly as an action having one definite objective: the infliction of injury on the source of the frustration.

**REVISED FORMULATION**

The revised formulation of the frustration-aggression hypothesis is very much associated with the work of Leonard Berkowitz. In 1989 he wrote a review article and formulated a revision of the original frustration-aggression hypothesis. Berkowitz argued that frustrations give rise to aggression because they are aversive. They produce an instigation to aggression only to the extent that they are unpleasant to those affected. Berkowitz suggested that the thwarting-generated instigation to aggression can be thought of as anger. He subscribed to the core proposition of Dollard et al. but also offered a fundamental modification. Frustrations are aversive events and generate aggressive inclinations only to the extent that they produce negative effect. An unanticipated failure to obtain an attractive goal is more unpleasant than an expected failure, and it is the greater displeasure in the former case that gives rise to stronger instigation to aggression. Similarly, the thwarted persons’ appraisals and attributions presumably determine how bad they feel at not getting what they had wanted so that they are most aggressively inclined when they experience strong negative effect. Attributional interpretations of aggression- or anger-provoking situations are what make the difference between situations that do and do not provoke anger. People become angry and aggressive on being kept from reaching a desired goal to the extent that they think that someone has intentionally and unfairly produced this interference and wrongly tried to hurt them.

**FRUSTRATION-AGGRESSION AND THE DEMAND SIDE OF PROTEST**

The frustration-aggression hypothesis clearly features at the demand-side of protest.
It specifies people’s reaction to blocked aspirations. Berkowitz’s formulation of the frustration-aggression hypothesis differentiates between deliberate blockades and unintended interferences. Obviously, the former generates more aggression than the latter. The emotion literature reveals a similar mechanism where it alludes to the causes of anger. Indeed, anger is the affective reaction to frustration that leads people to aggressive reactions. In its turn anger is known in the literature on social movements and emotions as the emotion that spurs collective action participation. Note that the frustration-aggression hypothesis refers to individual feelings and behavior. Indeed, under specific circumstances frustrations turn into aggressive action, but remember that this is an individual response not yet collective action. We still need mobilization processes that bring such demand for retaliation together with a persuasive supply of collective action.

FRUSTRATION-AGGRESSION AND PROTEST DYNAMICS

There is yet another setting in which the frustration-aggression hypothesis is relevant for movement dynamics. People in the act of protesting who are blocked on their way to their protest targets tend to react with anger and aggression against the police, who are usually the source of frustration. Particularly when the thwarting is deemed illegitimate and arbitrary, people react in an aggressive manner. Sophisticated crowd management can prevent this from turning into violent confrontations, but all-too-easily so-called police riots are the result.

Geography and social movements
PAUL ROUTLEDGE

During the 1970s, and drawing from Marxism and feminism, the discipline of geography inquired into socio-spatially constituted inequalities and injustices. However, it was not until the early 1990s that a direct and sustained engagement with the geographies of social movements began (e.g., Routledge 1993; Miller 2000; Nicholls 2007). Although engaging with the theoretical traditions of resource mobilization and political process (e.g., Miller 2000; Nicholls 2007), and new social movements (e.g., Routledge 2000), geographers have been concerned with the lack of engagement with geography in social movement studies, arguing that geographical (spatial) understandings of social movement practice are crucial to the interpretation of contentious action. Movements act from space, politically mobilizing from the material conditions of their (local) spaces; movements act on space appropriating it with a group identity; movements act in space, such as taking to the streets for protests, or occupying land; and movements make space: creating conditions to expand public political involvement, for example through the creation of solidaristic alliances (Dikeç 2001). As I will discuss below, social movements negotiate multiple spatialities in their prosecution of conflict. These include the politics of place and socio-spatial positionality, spatial inequalities, the politics of scale and networking (Nicholls 2007; Leitner, Sheppard, & Sziarto 2008).

SOCIO-SPATIAL POSITIONALITY AND THE POLITICS OF PLACE

Differently positioned subjects have distinct identities, experiences, and perspectives that shape their understanding of, and engagement with, the world. These emerge relationally through connections and interactions with differently positioned subjects, and are shot through with unequal power relations. Through people’s geographically situated practices and imaginaries, power relations are contested, frequently through social movements (Leitner, Sheppard, & Sziarto 2008).

This is because different social groups endow space with an amalgam of different meanings and values. Hence, particular places frequently become sites of conflict where the social structures and relations of power, domination, and resistance intersect. This is most evident in instances where different ethnic or nationalist groups contest the same political space (e.g., Israel/Palestine). Collective action is often focused upon cultural codes which are themselves spatially specific, since culture and ethnicity influence a community’s sense of place, that is, the subjective orientation that can be engendered by living in a place. This plays a distinct role in shaping both the political claims of actors and the perception of political opportunities (Martin 2003). The ideology that emanates from this articulates a process of positive assertion (of local values, beliefs, and lifestyles) and resistance to intervening values of domination.

Sensitivity to such processes when considering particular practices of contentious action acknowledges the subjective nature of people’s perceptions, imaginations, and experiences when they are involved in political action. It locates such action in dynamic spatial contexts, as it sheds light upon how geographic spaces are transformed into places redolent with cultural meaning, memory, and identity under conditions of conflict. For example, the Zapatista insurgency was informed by the place-specific political and cultural economy of indigenous people in the Mexican state of Chiapas. Place has a central role in shaping the
claims, identities, and capacities of mobilized political agents, helping to explain why social movements occur where they do, how the particularities of specific places influence the character and emergence of various forms of contentious action, and the context within which movement agency interpolates the social structure. Such a context-based analysis of social movements seeks to understand how the geographically uneven modes of exercising state and economic power intersect with people’s everyday lives, combining to generate particular “terrains of resistance” (Routledge 1993).

Spatial proximity enables strong social and cultural ties to be established (e.g., through trust and kinship networks, ethnic and religious affiliations, common history, shared language and traditions, etc.) which can then be drawn on to enable collective action (Miller 2000; Tarrow & McAdam 2005; Nicholls 2007). Moreover, social movements frequently draw upon local knowledges, cultural practices, and vernacular languages to articulate their resistances. Songs, poems, stories, myths, metaphors, and symbols are used to inform and inspire collective action evoking a sense of place, history, and community. Such cultural expressions of contentious action frequently form a place-specific discourse of dissent which motivates and informs social movement agency, and articulates a movement’s resistance identity. The poetics that emerges from such place-based resistance – that is, the geopoetics – are deployed in order to mobilize, to educate, to propagandize, to teach tactics and explain strategies (Routledge 2000).

Spatial imaginaries – that is, individual and collective cognitive frameworks constituted through the lived experiences, perceptions, and conceptions of space – mediate how actors evaluate the potential risks and opportunities of joining social movements. For example, in the context of agricultural restructuring, political openings, and religious mobilization in southern Brazil, landless farmers used and reformulated their spatial imaginaries to embrace land occupation through Movimento dos Trabalhadores Rurais Sem Terra (MST), or Landless Workers’ Movement; while in the northeast, unemployed rural workers overcame the spatial imaginaries put in place by the local sugarcane economy to join the movement (Wolford 2004).

Finally, places are internally multiple with pluralistic exchanges between actors within these areas and the possibility for relational interactions across different sites: places are connected to extensive economic, political, and cultural networks with varying geographical reach (Massey 2004; Nicholls 2007). Therefore, movement interests and identities are formed through relational exchanges between multiple actors within and between different sites (Featherstone 2008). As a result, movements must negotiate constructing alliances between folk with diverse socio-spatial identities, interests, and imaginaries – both in their own particular struggles, and when participating with other movements in broader networks (Leitner, Sheppard, & Zsiarto 2008).

However, while social movements may be increasingly made up of extensive and pluralistic relational flows, a number of factors continue to require their territorialization. Research on transnational social movements has shown how they must negotiate political power primarily institutionalized through discrete territorial boundaries despite increased interdependencies and relational exchanges across state spaces. Hence territorially intensive and geographically extensive relations contribute distinct yet complementary resources to social movements (Beaumont & Nicholls 2007).

SPATIAL INEQUALITIES

Economic and political processes are articulated in geographically uneven ways that produce variations in the grievances and development trajectories of social movements (Miller 2000). The uneven nature of capitalism both differentiates grievance structures across space, and concentrates and disperses the resources
needed to make social movements possible (Nicholls 2007). For example, the urbanization process within the southern states of the United States resulted in the concentration of organizational resources of black Americans (e.g., churches, people, money, social networks) in a handful of urban centers (McAdam 1982). Conversely, the increased mobility of people and resources can diffuse the resource base available to movements, weaken important social networks between potential collaborators (hence limiting the usefulness of networks for procuring key resources), and place movements into territorial competition with one another (Nicholls 2007).

The uneven character of economic cycles creates differential conditions of social movement mobilization (Miller 2000). Rapid economic growth in one location may create conditions of environmental degradation, gentrification, or urban redevelopment, while economic decline in another location may generate conditions of unemployment, factory closures, or inner city decline. Hence, the uneven articulation of economic and state power – at the macro-level – geographically differentiates the grievance structures of social movements and presents different sets of political opportunities for actors in different locations (Nicholls 2007).

Between states and within them, geographical variations in the relationship between states and civil society actors are important in understanding the context from which social movements emerge. For example, trade unions are still accepted as legitimate “social partners” in much of Western Europe, though they have been under attack in North America, the United Kingdom, and Australia and are heavily censored or often state-dominated in parts of Asia, Eastern Europe, and the former Soviet Union. Social movements are confronted by a range of more or less democratic political systems, and hence must operate within political spaces that are more, or less, coercive which may increase the barriers to cooperation. In addition, the degree of political opportunities available to movements differs profoundly across political regimes (Nicholls 2007). The coercive powers of the state are deployed differentially across space, which creates an uneven pattern of regulatory and repressive controls to contain those places where social and political contention is articulated (Nelson 2006). At the sub-national level, variations are also evident in the relations between local state actors and civil society. For example, in the United States, the American Federation of Labor (AFL-CIO) has faced a more favorable organizing environment in northern states than unions in the southern states (Herod 1998).

**THE POLITICS OF SCALE**

Social movements mostly operate at the intersection of a series of overlapping scales – from more local municipalities, through regions, to the nation-state and, increasingly international forums. These different politics of scale provide movements with a range of opportunities and constraints (Nicholls 2007). For example, subsuming national labor regulations to international conventions reduces the opportunities for social movements to use electoral threats to pressure national political leaders. Also, devolving welfare policies to local government diffuses resistance because social movements must make claims in countless local bodies rather than a single national one (Nicholls 2007).

Movements that are local or national in character derive their principal strength from acting at these scales rather than at the global level. For example, transnational corporations such as Nestlé, McDonalds, and Nike have usually been disrupted primarily due to the efficacy of local campaigns (Klein 2000). Where international campaigns are organized, local and national scales of action can be as important as international ones. For example, the Liverpool dock workers international campaign was grassroots-instigated and coordinated (by Liverpool dock workers) and operationalized by dock workers beyond the United Kingdom working within established union frameworks (Castree 2000). However, Kathryn Sikkink (2005) has argued that political opportunities
for transnational social movements differ markedly between national and international scales depending on the political character of countries, international institutions, and the nature of the political issues at stake. Movements often utilize political opportunities at one scale to create opportunities at other scales.

The persecution of multi-scalar strategies is also an interactive and relational process that requires the development and reorganization of social networks across geographical and social boundaries (Nicholls 2007). In their work on the American civil rights movement, Tarrow and McAdam (2005) term this process “scale shift” achieved through “relational diffusion,” that is, the spatial extension of a movement through pre-existing relational ties containing trust and shared identities; and “brokerage,” that is, the spread of social movement mobilization (through various brokers) resulting from linking two or more social movement actors who were previously unconnected.

NETWORKS

When place-based struggles develop, or become part of, geographically flexible networks, they become embedded in different places at a variety of spatial scales. These different geographic scales (local, national, regional, global) are mutually constitutive parts, becoming links of various lengths in the network. Networks of agents act across various distances and through diverse intermediaries (Dicken et al. 2001).

Networks can create cultural and spatial configurations that connect places with each other (Escobar 2001). Moreover, particular places can also be important within the workings of those networks. For example, the Madres de Plaza de Mayo in Argentina, protested in different places across space (e.g., the public meetings of madres in plazas across Argentina) that enabled the sustainability of different movement communities and movement identities. By reinforcing moral commitments and group solidarity, activist identities were maintained both within particular groups and between movements and activists in wider solidarity networks (Bosco 2001).

The identification with particular places can be of strategic importance for the mobilization strategies of movements. Activists may deploy symbolic images of places to match the interests and collective identities of other groups and thereby mobilize others along common cause or grounds. Hence the ties to particular places can be mobile, appealing to, and mobilizing, different groups in different localities (Bosco 2001). However, international alliances have to negotiate between action that is deeply embedded in place, that is, local experiences, social relations, and power conditions, and action that facilitates more transnational coalitions. For example, People’s Global Action Asia, a network of Asian peasant movements, had to negotiate the different power (e.g., caste, class, and gender) relationships within Indian, Nepali, and Bangladeshi movements while attempting to forge an effective alliance against the processes of neoliberal globalization (Routledge 2003).

Geographically, social movement networks can be conceived as “convergence spaces” (Routledge 2003; Routledge & Cumbers 2009) defined by the following characteristics. First, they comprise place-based, but not place-restricted movements. Second, they articulate certain “collective visions” (e.g., unifying values and organizational principles) that generate common ground between participants. Third, they involve a practical relational politics of solidarity, bound up in five forms of interaction and facilitation: communication, information sharing, solidarity actions, network coordination, and resource mobilization. Fourth, they facilitate spatially extensive political action by participant movements. Fifth, they require “networking vectors,” activists that intervene in the work of translation by which networks are formed and developed, conducting ideational work and acting across space to further the process of communication, information sharing, and interaction within and between a network’s participant movements and the
communities in which they operate. Sixth, they are characterized by a range of different operational logics, spanning from more horizontal (decentered, nonhierarchical) to more vertical (hierarchical, centralized) operational logics. Finally, they are sites of contested social and power relations, because the diversity of groups that comprise them articulate a variety of potentially conflicting goals (concerning the forms of social change), ideologies (e.g., concerning gender, class, and ethnicity), and strategies (e.g., institutional (legal) and extra-institutional (illegal) forms of protest).

Generational and cohort analysis

Nancy Whittier

The study of generations and cohorts in social movements examines waves of protest that originate from particular age-groups and differences between participants of different ages or movement eras. These studies assume that individuals' experiences are shaped by their historical context, producing distinctive perspectives on society and social movements. Mannheim (1952) first identified the problem of political generations, arguing that, when age groups enter social life in youth, they form distinct perspectives shaped by the social and political events of their era. In Mannheim's view, age groups contain multiple “generation units,” which interpret events in different ways, forming distinct ideological or cultural movements. In the Mannheimian view, these generational perspectives endure over the life-course, and members of different political generations thus have different perspectives. Modifying this approach, some scholars of social movements define political generations not by common age, but by common time of entry into a social movement. In this view, it is the historical and social movement context when individuals begin activism that defines lasting political understandings, which may be shared by non-agemates who enter the social movement at the same time. Studies show that political views formed in youth or initial participation in activism persist over the life-course, but that individuals practice their politics differently as they age, shaping work choices and family relationships (McAdam 1988). Scholars have studied a variety of cohort sizes within social movements, from “micro-cohorts,” which may consist of those who enter a movement within as short as a one-year timeframe, to multi-year or even decade-long cohorts (Whittier 1997).

Generational effects are important in understanding social movement origins, change over time, and decline or demise.

Origins. Social movements can arise out of distinctive generational experiences. For example, the sixties wave of protest in the United States and Western Europe emerged in part as a consequence of the large number of young people whose experiences differed from their predecessors. In the United States, the civil rights movement of the 1950s and early 1960s shaped the political perspectives of young activists who peopled the civil rights, antiwar, feminist, and lesbian/gay movements. The political perspectives these activists formed during their peak movement involvement persisted over time, creating a political generation that has ongoing impact on social and political life. In keeping with Mannheim's notion of generation units, Baby Boomers on the Right also shaped a distinct conservative perspective (Klatch 1988).

Change over time. Cohort differences produce multiple perspectives within long-lasting social movements, contributing to internal conflict and change over time (Whittier 1997). The concept of “waves” of social movements refers not only to varying levels of mobilization, but also to generational differences in goals, frames, collective identities, and strategy. These differences are a product of the changing political and cultural contexts that shape the issues activists see as important and their outlook on the world. When multiple cohorts are active in the same movement, their differences can produce internal conflict over movement priorities, tactics, or even presentation of self. Conversely, cohort differences can be an engine of change, as incoming cohorts bring new priorities and strategies to a longstanding movement. The way that cohort differences are managed depends on both movements' internal characteristics and their political and cultural opportunities.

The Wiley-Blackwell Encyclopedia of Social and Political Movements,

DOI: 10.1002/9781405198431.wbespm098
Decline. Generational effects can also contribute to movement decline. An issue or strategy that originates in a particular context may lose appeal over time; even as longtime activists remain committed, new entrants are scarce, leading to movement decline. The women’s movement after suffrage exemplifies this.

A number of methodological and theoretical issues remain to be addressed. Longitudinal studies of political generations are relatively scarce, and there are few studies of multiple cohorts within the same movement. Further, the bulk of the scholarship on political generations focuses on the sixties generation. Less is known about how this cohort is distinct and how its characteristics may have shaped scholarship on the topic.

Globalization and movements
ERIC AGRIKOLIANSKY

Has globalization revolutionized contentious politics? Starting in the 1990s, a number of researchers announced that the growing internationalization of economic, cultural, and political exchanges, combined with nations’ growing loss of control over these flows, had led, or would lead in the near future, to profound changes in social movements. The emergence of “transnational advocacy networks” (Keck & Sikkink 1998) and “transnational social movement organizations” (Smith, Chatfield, & Pagnucco 1997) foreshadowed the rise of the “global public sphere” (Guidry, Kennedy, & Zald 2000) and the “transnational civil society” (Florini 2000). These global social movements had seemingly moreover invented a third repertoire of actions (Cohen & Rai 2000), defined by its transnational character and solidarity. In the same way as the growth of market capitalism and liberal ideology, and the rise of the nation-state, had reconfigured national protest movements in the nineteenth century (Tilly 1986), economic globalization and the free-enterprise culture that accompanied it, together with the forecast decline of nation-states, had apparently produced another substantial transformation in contentious politics at a global level.

Ten years later, and with the benefit of hindsight, we can take stock. Were these transformations as violent and coherent as first intuition had suggested? Changes in social movements have certainly taken place: globalization has introduced both constraints and opportunities. However, these changes, which reflect the combination of different mechanisms at both the local and global scale, rather than one single trend, should be analyzed not so much in terms of a revolution as a change of scale.

GLOBALIZATION AS A CONSTRAINT AND AN OPPORTUNITY

The different processes that make up what we call globalization have affected social movements in a variety of ways. This is firstly because globalization has facilitated the global diffusion of common themes of protest and the subjects of dispute. Globalization reflects structural affinities in different countries which reveal themselves by the convergence of both social and cultural cleavages and public policies, and by the institutional environments in which these protests occur (Meyer 2000; Giugni 2002). Confronted by increasingly similar threats and public policies, social movements thus share increasingly similar objectives and stakes. In addition, the development of fast and cheap forms of communication and transport has encouraged new forms of network organization which transcend national boundaries (Bennet 2005) and allow the coordination of international protest movements (countersummits, and simultaneous demonstrations as in the case of the antiwar demonstrations of February 2003).

The capacity to act collectively on the international scene also reflects the transformation of international politics in the 1990s, and in particular what della Porta and Tarrow (2005) call the “complex internationalism” in which state authorities have lost their monopoly over international politics and have had to come to terms with both supra-national powers and nongovernmental organizations. This, which sometimes goes by the loose name of “multilevel governance,” has contributed to what Keck and Sikkink (1998) call the “boomerang effect,” in which activists build up international alliances to put pressure on their own
governments (notably by invoking the norms and values put forward by United Nations agencies or international NGOs). The growing activity of IGOs (international governmental organizations) has also contributed to the development of “coral reefs” (Tarrow 2005: 27) around which protest activities have developed (Smith, Chatfield, & Pagnucco 1997). For example, the global conferences organized by the United Nations have led to increasing cooperation between activists who did not know each other beforehand, the identification of common enemies, and the framing of local demands in transnational terms.

The effects of globalization on social movements thus constitute both a constraint and an opportunity. It is the former because globalization brings about new threats and modifies the environments in which protest movements are in the habit of operating. It is also an opportunity as it opens new possibilities of expression for these social movements. The development of the antiglobalization movement at the end of the 1990s is an excellent example. This movement emerged to fight against the effects of free-market globalization but at the same time profited from the opportunities that this globalization produced. IGOs (such as the IMF or the WTO) have also served as targets, giving structure to protests which first started within large international conferences, and then during countersummits (the meeting of the WTO at Seattle in 1999 was notably one of the defining moments in this sense). The theme of global justice has also allowed a diverse set of protests to be framed in transnational language and brought NGO-centered issues together around criticisms of capitalism, the free market, and the decline in the power of nation-states.

THE HISTORY, RESOURCES, AND STRATEGIES OF INTERNATIONALIZATION

The analysis of the effects of globalization cannot however be restricted to the identification of structural opportunities which would lead directly to a radically new and uniform movement of transnational collective action.

Globalization is neither a homogenous movement, nor a unique causal determinant (Yashar 2002; Siméant 2005). What is called internationalization actually refers to a set of heterogeneous tactics and actions, of which the degree of internationalization is itself variable: the international circulation of ideas and tactics, the internalization of international goals in national debates, with the detour via the international arena aiming to influence national governments on its return, and last the transnational coordination of protests relative to international stakes (della Porta & Tarrow 2005). These processes are not as new as they are sometimes made out to be. Both diffusion and internalization can be found throughout the twentieth century. Transnationalization is not exclusively contemporary either, as the example of the international workers’ movements at the end of the nineteenth century shows, and continues to play an important, but sometimes neglected, role in the structuration of anticapitalist movements today. From the International Brigades during the Spanish Civil War to the role of Cuban refugees in American postwar foreign policy, the history of contentious politics in the twentieth century is punctuated by moments in which national and international politics coincide. In this way, the effects of globalization cannot be understood as a radical shift from the national to the transnational level, but should rather be considered as a series of “scale shifts” (McAdam, Tarrow, & Tilly 2001) affecting the issues, collective action frames, and subjects of contention. While the end of the twentieth century was certainly a key moment, it did not reflect one sole phenomenon (globalization). These changes of scale are rather the product of multiple processes which echo the continuing importance of the national context and the resources to which protest movements have access.

One of the paradoxes of globalization is exactly that the propensity to transnationalization depends on the internal logic of nation-states. Domestic structures always
mediate global protests. First, because the access of NGOs to the international space depends on the attitude of the individual countries: the support (in particular logistic and financial) provided for participation in international summits constitutes for example a considerable asset for European and North American NGOs. In addition, as the example of the anticapitalist movement in Europe shows (Sommier, Fillieule, & Agrikoliansky 2008), internationalization is not a synonym for uniformity: there is no “one” movement protesting against globalization, but rather a mosaic of protests which still remain very largely structured by national processes, in their goals, tactics, and ideological references. Last, the perception of globalization as threat or opportunity still depends to a great extent on state–society relations (Yashar 2007). Transnationalization strategies in particular reflect different logics of competition which are specific to militant groups within each country. International action is thus often perceived as an opportunity by outsiders who seek to outdistance powerful rivals in a new space. This is, for example, the case of the European unions of workers or peasants (such as the well-known Confédération Paysanne of José Bové) who have only limited influence nationally, but who have found new openings in contesting globalization.

Second, we need to take into consideration the resources which are necessary to profit from the opportunities for transnational action. Transnationalization is not free: on the contrary, it is expensive (in terms of travel, coordination, and so on) and demands scarce resources, not only financial but also in terms of translation and mastery of different languages, inclusion in international networks, and the understanding of international institutions and the stakes which are at play in this context. The use of communication technologies such as the Internet changes rather than reduces the costs of internationalization (in terms of access to the technology, notably), in particular for activists from southern countries. The sociological analysis of anticapitalist militants in Europe (Agrikoliansky & Sommier 2005) has shown that these movements tend to recruit in national elites that are educated and with considerable experience of national politics. There is a certain similarity here to the “rooted cosmopolitans” (Tarrow 2005), who mix strongly rooted nationalism, and the resources which result from it, with a capacity to travel, both physically and cognitively, beyond the limits of their national space.

In summary, the relationship between the different processes associated with globalization and contentious politics is complex. Transnational politics represents a new constraint for protest movements, but at the same time a new opportunity from which some of them will be able to profit. While transnational relations are becoming increasingly important, state–society relations remain the framework which shapes the resources and the perceptions of activists and organizations. Last, the causal relationship is also ambiguous: while we imagine that the economic and political developments linked to globalization influence contentious politics, the reverse relationship is also possible. By setting up international networks, pushing for universal standards, and questioning IGOs, social movements themselves help to shape what we call globalization.

Grievances, individual and mobilizing
DAVID A. SNOW

When individuals collectively challenge authorities via social movements, they typically do so over matters about which they are deeply troubled, have considerable concern, and feel passionately. These troublesome matters or conditions, and the feelings associated with them – such as dissatisfaction, fear, indignation, resentment, and moral shock – can be thought of as grievances. They provide the primary motivational impetus for organizing social movement campaigns and for engaging in social movement activities. Although there are various sets of conditions that contribute to the emergence and operation of social movements – such as some degree of perceived political opportunity, organization, and resource acquisition, none of these factors is more important than the generation of mobilizing grievances. After all, it is difficult to imagine most individuals engaging in social movement activity without feeling deeply aggrieved about some condition that is regarded as contrary to the interests, rights, moral principles, or well-being of themselves or others. Consider the adherents of the pro-choice and pro-life movements, and of those advocating for and against same-sex marriages in the United States or immigration and tighter border control throughout much of the developed world. Not only are the adherents of one movement deeply aggrieved by the prospect of the other movement achieving its goals, but their passions about their movement are often palpable and thus worn, metaphorically, on their sleeves. Certainly other motivational factors – such as curiosity, the desire for approval, and peer pressure – may come into play when considering why people align themselves with a particular movement, but these usually are secondary and largely irrelevant in the absence of deeply felt grievances.

In thinking about the importance of grievances to movement emergence, it is analytically useful to distinguish between individual and mobilizing grievances because the latter are associated with the emergence and operation of social movements. So what is the difference? Individual grievances are experienced individually rather than collectively. They typically encompass the kinds of discontents and aggravations experienced on a regular basis by most people, such as dissatisfaction with a raise, office procedures, or one’s boss, or having to wait too long for a scheduled physician’s appointment or in lines at the bank, the grocery store, the gas station, or on the freeway. These kinds of aggravations are commonplace, and perhaps even ubiquitous, in the modern world. But for most people they are typically regarded as unpleasant aspects of everyday life about which little can be done, or for which the payoffs of doing something are generally thought to be minuscule. Additionally, they rarely congeal into collectively shared grievances that spur collective intervention. Mobilizing grievances, on the other hand, are grievances that are shared among some number of actors, be they individuals or organizations, and that are felt to be sufficiently serious to warrant not only collective complaint but also some kind of corrective, collective action. Thus, it is mobilizing grievances, rather than individual grievances, that provide the primary motivational impetus for organizing social movement campaigns and for engaging in social movement activities. But unlike individual grievances, mobilizing grievances are not everyday phenomena that materialize on a regular basis. Put metaphorically, mobilizing grievances are more like mushrooms after a spring rainfall than weeds; they don’t flourish
continuously and everywhere, but only under specifiable conditions (Snow & Soule 2010).

So what are those conditions and/or processes that account for the generation of mobilizing grievances? A review of the relevant theorizing and empirical research suggests the following interlocking observations: (1) Structural or material conditions – such as social arrangements that stratify aggregations of individuals unequally, immiserating life circumstances, or quotidian disruptions – may be necessary for the generation of mobilizing grievances, but they alone are not sufficient conditions. In other words, such conditions fertilize the ground for mobilizing grievances, but they do not generate them (Snow et al. 1998; Snow & Soule 2010). (2) Certain social psychological processes – particularly comparison processes, assessments of procedural justice, and weighing the prospect of loss – contribute importantly to the generation of mobilizing grievances because they constitute the intervening mechanisms that may ignite the fertilized conditions (Klandermans, Roefs, & Oliver 2001). (3) The formation of mobilizing grievances, including the character of the intervening psychological processes, is highly contingent on the manner in which grievances are interpreted and the generation and diffusion of those interpretations. The key, in other words, is not merely the presence or absence of grievances, but the process of grievance interpretation, which has been theorized and analyzed empirically in terms of framing processes (Snow et al. 1986; Snow & Soule 2010).

Taken together, these observations suggest that the generation of mobilizing grievances can be best understood as a function of the confluence and interaction of structural or material conditions, social psychological factors, and interpretive or framing processes, rather than in terms of a single perspective or line of argument.

High and low risk/cost activism
DOUG MCADAM

Lost in the generic concept “social movement” is the extraordinary diversity of types of movements (e.g., revolution, terrorism, religious revivals, peasant insurrections, cults, etc.). Similarly movement activism comes in a dizzying variety of forms. While the term “movement activist” tends to conjure up images of marchers in the street or maybe even suicide bombers, the concept applies equally well to someone who signs an online petition in support of a movement initiative or makes a $10 donation to the Sierra Club.

How are we to think about this variation? McAdam (1986) used two broad distinctions – high and low risk and cost – to begin to map this variation. For the author, cost referred to “the expenditures of time, money and energy that are required of a person engaged in any particular form of activism,” while risk had to do with “the anticipated dangers – whether legal, social, physical, financial . . . of engaging in a particular type of activity” (67). Combining the two dimensions yields the following four-fold typology of distinct categories of activism: low risk, low cost; low risk, high cost; high risk, low cost; and high risk, high cost. So signing an online petition is virtually costless and generally risk free. At the other extreme – high cost, high risk – is participation in a hunger strike. Then there are the two “mixed” cases. Participating in a one-hour vigil on the same day each week for several years is low risk, but quite costly in terms of time expended. And during the Vietnam War era in the United States turning in one’s draft card entailed serious legal risks, but little or no cost.

So what? Is this simple typology of types of activism only useful as a descriptive heuristic? McAdam thought otherwise, arguing that it made no sense to assume that the dynamics of movement recruitment were the same for all forms of activism. As he asked rhetorically, “would anyone really want to argue that the same mix of factors that explain riot participation accounts for the signing of a nuclear freeze petition?” (67). Analytically then McAdam uses these distinctions to formulate separate theories of recruitment to high and low risk/cost activism. He argues that low risk/cost activism requires little more than “receptive political attitudes” and facilitative contact with someone in the movement. High risk/cost activism, on the other hand, is generally reserved for those who are both “biographically available” and whose initial forays into low risk/cost activism help to set in motion a cyclical process by which increasing integration into the activist community leads to both a greater identification with the aims and collective identity of the movement and ever riskier and/or costlier forms of activism. In short, one is rarely if ever recruited directly into high risk/cost activism; it is instead the byproduct of a gradual process of integration and resocialization through which the individual becomes an activist in the same way he or she learns and internalizes any new role.

Consistent with this account, McAdam found that relative to the “no shows,” those who took part in the decidedly high risk/cost 1964 Freedom Summer project, had (a) much higher levels of prior civil rights activity, (b) were affiliated with more social movement organizations, and (c) had stronger and more extensive ties to others involved in the project. All of these differences suggest that, in the aggregate, the volunteers were already well integrated into the movement community and indeed, already thought of themselves as civil rights activists.

Unfortunately, few subsequent studies have built on the initial conceptual and empirical work done on the topic by McAdam. Three which did are Wiltfang and McAdam (1991),
Nepstad and Smith (1999), and Tindall (2002). Using survey data on 141 participants in the Tucson-based Sanctuary movement, Wiltfang and McAdam sought to extend work on the topic in two ways. First, they tried to empirically differentiate the behavioral correlates of cost and risk. Second, they, in turn, sought to relate these behavioral differences to various theories of individual activism. Their central finding was that “biographical availability” (e.g., being relatively free of other major life responsibilities) predicted high-cost sanctuary activism (operationalized as devoting a large number of hours to the movement) while deep value commitments and longstanding integration into the movement predicted high-risk activism (defined as having direct responsibility for transporting and safeguarding Central American refugees).

In an important 1999 article, Nepstad and Smith reported the results of their research on participation in a high risk/cost campaign mobilized by Nicaragua Exchange in the 1980s as part of the broader US–Central America peace movement. Consistent with earlier work, the authors once again found that strong prior ties to others in the movement predicted participation in the campaign. Participation, on the other hand, did not seem to bear the imprint of “biographical ability.” That is, a good many of those involved in the campaign were “burdened” by the kind of life-course constraints thought to discourage participation in high risk/cost activism (i.e., full-time employment, parental responsibilities). Based on their findings, the authors concluded that “constraint management skills’ may be more important than biographical availability in high risk/cost campaigns” (1999: 39).

Finally, concerned that all previous work on the topic had focused on high risk/cost activism, Tindall focused his 2002 study of participation on low–medium risk/cost activism among participants in British Columbia’s “wilderness preservation movement.” His central contribution was to show that while all prior studies had consistently stressed a link between high risk/cost activism and strong ties to other activists, low–medium risk/cost activism appeared to depend more on weak ties to other activists and, in general, did not require anything like the intensive integration into a movement community that we normally see with high risk/cost activists.

Historical research and social movements
MATHIEU DEFLEM and APRIL LEE DOVE

The use of historical research methods in modern sociology has been largely conditioned by the relative popularity of the specialty area of (comparative-)historical sociology, despite the relative autonomy of methodological orientation and substantive research themes. Any discussion of historical research, whether in the specialty area of social movements’ research or in sociology more generally, must therefore proceed from the place of history in sociology and embark on an always difficult quest, for intellectual and institutional reasons alike, to delineate the boundaries between the scholarly tradition of history, on the one hand, and sociology, on the other (Burke 1980; Tilly 1981).

HISTORY AND SOCIOLOGY

The science of sociology has historically emanated from the European traditions of social philosophy that, during the classical period built on the ideals of the Enlightenment, relied upon history to move away from speculative thought toward substantiate normative prescriptions on the basis of historical accounts of the evolution of social life. Until the late nineteenth century, these historically based social philosophies were typically framed in terms of an evolutionary framework denoting increasing complexity, linked up to the growth of industry, individualism, and related manifestations of modernization. Evolutionism in social philosophy found its sharpest expression in the historical materialism of Karl Marx.

In classical sociology, evolutionary models stretched the spectrum of thought from Ferdinand Tönnies to Emile Durkheim and Max Weber. Tönnies (1940) suggested a societal development from small-scale agricultural communities (Gemeinschaft) to the complex industrial societies of his days (Gesellschaft). Durkheim (1984) transformed the Marxian sketch of an increasing division of labor from a narrow economic focus to a more encompassing social development that was primarily shaped by cultural changes concerning the relation between individual and society. And Weber (1978) characterized the modern age in terms of an increasing reliance on purposive-rational models of thought that were preoccupied with considerations of efficiency.

Despite the centrality of history in classical sociology, modern sociology was initially not receptive to the use of historical research. Among the reasons, sociology was understood to be a science of the present, while history was the study of the past. Sociologists themselves, more importantly, understood some of the European building blocks of sociology as implying a static view. The work of Durkheim was misunderstood on the basis of its orientation toward functional analysis (Tilly 1981), rather than its more comprehensive attention toward function as well as cause (Durkheim 1982).

Whereas the classics argued implicitly or explicitly that all sociology is by necessity of a (comparative-)historical nature, it was not until the growing popularity of Marxist sociology, especially by the generation of sociologists that came of age during the 1960s, that a (re)turn toward historical sociology became possible (Adams, Clemens, & Orloff 2005). Rejecting the evolutionism of old, this second wave of historical sociology focused on the contradictions of the modern political economy and the centrality of the state. Ironically, this development overlooked the historical fact that virtually all of the important classic scholars worked in an essential (comparative-)historical framework. Yet, whatever its roots, the development of historical research in sociology has
Since been subject to developments not uncharacteristic of other movements.

HISTORICAL METHODS IN SOCIOLOGY

From a methodological viewpoint, the rigid separation of history as idiographic (particularizing) and sociology as nomothetic (generalizing) disciplines has serious consequences that can be, and have been, overcome by premising that all topics of inquiry, whether historical or sociological, can only be presented within analytically relevant models that posit those topics as relatively unique or, conversely, representative of broader patterns. The very conception of history as the descriptive analysis of concrete events is antithetical to sociology as a theoretically driven social science. The most central insight remains that historical sociology is not a mere study of the past but an intrinsic part of a sociology of the present: in order to explain the structures of contemporary societies, one must investigate their historical origins and development.

Arguably as a result of the march of survey research and the advance of techniques of statistical data analysis, the antimodernization and antiquantification tendencies of modern (and contemporary) historical sociology have been methodologically attacked because of their reliance on the study of a limited number of cases (small-N research) and the logical limitations associated with comparisons of variables associated with real-life events. Nevertheless, the methodology of historical sociology can be systematized in terms of both its strategies and data collection techniques.

Various strategies can be used in historical research to link theory and research questions with an appropriate methodology (Skocpol & Somers 1980). In the parallel investigation of a particular sociological theory, propositions can be examined in various historical contexts in order to demonstrate or falsify that various cases are to be conceived as different modalities of a more general process. By interpreting contrasting events, alternatively, it is endeavored to analyze specific historical events in terms of their unique composition and meaning, such as is associated with the sociological perspective in the Weberian tradition of Verstehen (understanding). By analyzing causalities at the macro level, the Millean method of difference and of agreement can be relied upon, not as an explanatory model, but to systematically present cases subject to further exploration.

The methods of data collection and investigation in historical research involve the empirical examination of the traces the past has left behind in the present, including material artifacts, written and/or otherwise recorded sources (both primary and secondary), and oral history. In a most ideal and systematic case, the procedure of historical inquiry involves at least four stages. First, relevant sources have to be identified, found, and selected. Special problems are thereby posed in terms of availability, when materials are lost, and access, when available sources cannot be accessed because of physical or social obstacles (e.g., classified government documents). Second, on the basis of formal and substantive criteria related to research needs, sources are registered and classified in preparation of further analysis. Third, the collected sources are subjected to critique and confrontation to determine their authenticity and accuracy in portraying social events. Fourth, as indicated by the variety of strategies that exists in historical sociology, analysis can proceed in multiple directions, involving qualitative or quantitative methods, interpretive or explanatory perspectives, in a structured or unstructured framework with deductive (theory-testing) or inductive (theory-construction) objectives.

HISTORICAL RESEARCH ON SOCIAL MOVEMENTS

The very term “movement” presumes the relevance of history, involving change and/or continuity. It would therefore alone seem indispensable for sociologists of social movements to engage in historical research. Yet, as one manifestation of the relative specialization of
historical sociology, the modern sociology of social movements is also subject to the trends that have shaped the discipline in general, leading to much research on what movements are and do, rather than where they come from and what they have done. Nonetheless, it is also true that historical research has been put to good use in the study of social movements (Marx & McAdam 1994; Clemens & Hughes 2002).

A useful distinction can be made between the internal and the external history of social movements. An examination of the internal history of a social movement concerns the development over time of the movement itself. At least two components are thereby important to consider. First, with respect to movement institutionalization and planning, social movements can be distinguished from more informal manifestations of collective behavior by a variety of formal characters such as the formulation of membership criteria and the routinization of activities. With respect to movement emergence, a focus on internal history includes questions concerning members, activities, and outcomes. Second, as distinct from more ephemeral episodes of collective behavior, social movements are also more structured to enable a more prolonged, ideally permanent existence as an established and recognized entity. Relevant questions pertain to movement maturation, transformation, and possible dissolution. Attention can go to both relatively short intervals of time (e.g., weekend versus working days) and longer periods of historical time (e.g., before, during, and after a period of war).

The external history of social movements refers to the surrounding societal conditions in which they formed and transformed. In this respect, minimal attention should go to the economic, political, cultural, and normative contexts in which social movements emerged and have evolved. It can be safely assumed that those contexts are important in accounting for questions of movement formation and transformation, although it should also be addressed if and how movements in turn have affected their surrounding environments. It is also important to recognize that aspects of a movement’s internal and external history may be mutually influential.

The data sources to be investigated to answer relevant questions of movement history can be derived from organizations as well as individuals. Organizations can provide useful data because social movements exhibit at least some degree of institutionalization and invoke responses from other organizations, such as countermovements, media, and government agencies. Individual-level data can come from members of a movement and its various proponents and opponents.

SUMMARY

The main limitation of historical research, most obviously, is that the past can be revealed only inasmuch as, and in the manner in which, it is still present today, thus posing important problems of validity. Sociologists interested primarily in the testing of their theories, rather than in the analysis of important social events, will therefore favor other methodologies whereby data can be generated. Alternatively, the unobtrusive nature of historical research may be seen as the main advantage of the methodology, as the research enterprise itself cannot affect its subject matter.

However, apart from questions of methodological rigor, the relevance of historical research to our knowledge of social events is easily demonstrated. Suppose that at a given moment in time a particular social community exhibits a particular level of commitment from its members in the cause advocated by a social movement. What can be known about such a commitment without knowledge of its development over time is severely limited, as its level may have decreased sharply or, on the contrary, increased dramatically from before, with all kinds of variations in between. Only historical research can unravel such sociological questions that ponder on the conditions of society as emanating from a historical process of change and continuity.

Identity fields
ROBERT D. BENFORD

The term identity fields merges two influential social movement concepts: movement framing processes and collective identities. A fundamental and ubiquitous aspect of social movement framing processes involves the avowal and imputation of characteristics relevant to at least three generic sets of actors within the *multiorganizational field* that comprises a particular social movement arena: protagonists, antagonists, and audiences. Hunt, Benford, and Snow (1994) refer to the clustering of these socially constructed movement actor categories as *identity fields*. Identity fields are constructed throughout the life-course of a social movement as its participants identify a problem and attribute blame or causality (Snow & Benford 1988), as they seek to mobilize support for their cause by employing various frame alignment strategies (Snow et al. 1986), as they respond to criticisms and other attacks from countermovements, the media, and targets of change (Benford & Hunt 2003), and as they talk with one another to reflect on and redefine movement successes and failures (Hunt & Benford 1994).

**Protagonist identity fields** are constellations of identity attributions about individuals and groups constructed as those capable of overcoming injustice or solving the problem the movement has identified. They include collective identity claims about the movement and its allies and typically involve identity attributions such as “heroes” and “heroines,” “innocent victims,” “aggrieved populations,” and “future generations.” Protagonists include not only the ardent activists and charismatic leaders; they also include the rank-and-file followers and ordinary peasants.

**Antagonist identity fields** are constellations of identity attributions about individuals and groups constructed to be the movement’s opponents or “enemies.” Antagonists are either blamed for causing the problem(s) the movement seeks to overcome or for standing in the way of the changes the movement seeks. Movement protagonists often vilify their opponents, referring to them by caustic labels such as “baby killers,” “fascists,” “warmongers,” “capitalist pigs,” “gun grabbers,” and the like (Benford & Hunt 1992). Such attacks on the collective character of an opponent serve to demarcate boundaries between “us” and “them,” good and evil, and right and wrong, as well as seeking to discredit a movement’s opponents. Social movement actors employ various framing processes in making identity claims about antagonists, most notably by representing antagonist identities as conflicting with protagonists’ identities, values, and character traits.

**Audience identity fields** are constellations of identity attributions about individuals and groups assumed to be neutral or uncommitted observers who are in a position to react to, report, and even eventually support the movement’s activities. Audiences include allied and potential allied SMOs, the media, powerful elites, marginal supporters, sympathizers, and bystander publics. Audiences are assumed to be capable of and interested in receiving and assessing protagonist messages in a favorable light and thus being persuaded to support, perhaps even contribute significant resources to the movement. A great deal of social movement framing activities are directed at such audiences. This makes the protagonists’ framing of their own identities and those of their opponents all the more critical. By the same token, movement protagonists take care in how they frame the targeted audience’s identity, frequently casting them in the role of those who are fair, just, and humane and whose values, beliefs, and interests are aligned with those of the protagonists (Snow et al. 1986).

Scholars employing the identity fields concept have tended to focus attention on the
boundary marking activities of protagonists and antagonists. While this is conceived as a somewhat dynamic process, it might be more fluid than was originally assumed. Recent research suggests that protagonists and antagonists constantly adjust their framings in response to their opponents’ counterframings (Benford & Hunt 2003), which in turn yields reconstructions in the movement’s and their opponents’ collective identities (Chowdhury 2006). Further research on the relationships between and among various social movement framing and identity construction processes should be fruitful.

Identity politics
MARY BERNSTEIN and VERTA TAYLOR

The term “identity politics” refers to activism engaged in by status-based social movements organized around such categories as gender, race/ethnicity, and sexuality, in contrast to class-based movements. The term also applies to any mobilization related to politics, culture, and identity. It is sometimes used in a derogatory manner to criticize movements as exclusionary and focused on individual rather than societal change. Debates about the validity of identity politics reveal competing theoretical ways to understand the relationships among experience, culture, identity, politics, and power.

COMPETING PERSPECTIVES ON
IDENTITY POLITICS

There is substantial disagreement in the scholarly literature about the nature of identity politics. Neo-Marxist approaches view class inequality as the only real source of oppression and activists working to challenge the class structure as the major agents of social change. As a result, activists engaged in claim making in other arenas are viewed as doing cultural or psychological, not political, work. Because such accounts do not see class as an identity with cultural and psychological components, or identities based on social status as having economic implications, identity politics is set apart from real political activism. Any focus on self-transformation, from a neo-Marxist perspective, is self-indulgent and nonpolitical. Furthermore, critics of identity politics view a focus on cultural difference as both essentialist and divisive, undermining the possibility of a broad-based social justice movement.

Neo-Marxist analyses of identity politics have been challenged on a number of grounds. Rather than identity-based movements destroying the New Left, some scholars argue, the Left’s inability to address gender, race, and sexual inequality led to its demise and the rise of identity-based movements. Others point out that the separation of culture from class and the political economy ignores the ways that cultural dimensions and meanings are linked to concrete structural and material locations.

European new social movement theorists, in contrast to neo-Marxist theory, attend to the range of nonclass movements that emerged in the 1960s and 1970s, although they also differentiate identity-based from class-based movements. New social movement theory views movements organized around values and ideology as different from traditional labor and socialist movements of the past, a response to modernity and the rise of a post-industrial society. Most importantly, new social movement theory pioneered in seeking to understand the role of identity in social movements, provoking resource mobilization and political process theorists to pay attention to identity and culture. According to Melucci (1996), new social movements challenge dominant cultural codes and raise the question of how societies deal with difference. As a result, identity politics is not viewed as merely cultural, symbolic, or psychological. Critics of new social movement theory question the claim that postindustrial society gave rise to the new movements, pointing to the similarities in the origins and dynamics of status-based movements and older labor and socialist movements.

Social constructionist, postmodernist, and poststructuralist approaches to identity politics are based on an entirely different view of power than neo-Marxist or new social movement approaches. The status categories around which identity politics is organized are, in this view, a form of regulation, so movements based on identity contribute to the hardening
Identity politics is often seen as essentialist, narrow, and state-centered, in contrast to the neo-Marxist view, which sees them as too political and not cultural enough because they lack a broad view of the cultural basis of power. This perspective emerged out of both queer theory and queer politics, particularly the emergence of Queer Nation, which eschewed identity politics as privileging white middle-class gay men. Queer became an anti-identity. From this perspective, what looks like purely expressive action from neo-Marxist and new social movement approaches is understood as a fundamental challenge to power. Social constructionist, postmodernist, and poststructuralist perspectives criticize the essentializing of identity and point to the failure of identity politics to challenge the social construction of status categories, to attend to the intersection of identities, and to come to grips with diversity within groups. These criticisms have evoked the response that claims of essentialism may be strategic, that eliminating social categories as a political strategy is extremely difficult, and that identity politics has not been shown to be responsible for the negative outcomes, such as fragmentation of movements, to which it is linked.

INTEGRATIVE APPROACHES

The challenges to neo-Marxist, new social movement, and postmodern approaches to identity politics make clear that identity plays a role in all movements. Bernstein (1997) argues that the concept of identity in social movements has at least three distinct analytical levels. First, a collective identity is necessary for the mobilization of any social movement, including the classic labor and socialist movements. Second, expressions of identity can be deployed at the collective level as a political strategy, which can be aimed at what are traditionally thought of as cultural and/or political goals. Third, identity can be a goal of social movement activism, either gaining acceptance for a stigmatized identity or deconstructing categories of identities.

Taylor and Whittier (1992) argue that all social movements develop and maintain a collective identity characterized by boundaries between group members and nonmembers, a shared consciousness that defines and analyzes interests, and negotiation of symbols and actions as strategies of personalized resistance. Movements organized on the basis of a lesbian/gay identity, a concern for the environment, or a class identity all share a similar process for constructing and maintaining identities.

In some movements, identities are invoked or felt as if they were essentialist. The mobilization of essentialized identities is related to the political context and the devaluation of certain identities by the dominant discourse. In addition, some identities are both internally defined and externally imposed, as in the case of lesbian and gay identities. The feminist literature on standpoint theory conceptualizes identity politics as a way to produce knowledge that derives from the material conditions, lived experience, and social location of participants. Naples (2003) argues that people do not translate personal experience into political action in an unreflective, essentialist manner, but instead arrive at political analyses through collective interpretation. In this view, self-definition and the creation of knowledge through the development of a standpoint is a form of political activism and does not rely on false universal understandings of categories such as race, gender, sexuality, or class. Thus organizing around an identity represented as essential can be strategic.

Social movements also engage in identity politics with the goal of altering the self-conceptions of participants and challenging negative representations of the group. Identity politics can be a form of emotion work, translating isolation, fear, and shame into anger, solidarity, pride, and action (Taylor & Leitz 2010). The concept of identity deployment (Bernstein 1997) captures the strategic processes that explain how activists deploy their identities for political change. Activists alternately emphasize similarities to or differences
from the norm because of the interactions among social movement organizations, state actors, and opposing movements. Identities can be deployed strategically as a form of collective action to change institutions, to transform mainstream culture, to change participants, or to educate lawmakers or the public.

When the identity around which a movement is organized is also the basis for grievances movements face a strategic dilemma. Movements that seek to erase boundaries must first recognize them, which ultimately results in confirming them. Movements that deconstruct social categories run the risk of undermining their own existence. Gamson (1995) calls this the "queer dilemma." However Bernstein and De La Cruz (2009) find that the multiracial Hapa movement deconstructs traditional understandings of (mono)racial identities while simultaneously claiming recognition for a new multiracial identity, thus overcoming the queer dilemma.

IDENTITY POLITICS AND INSTITUTIONALIZED POWER

Identity politics does not necessarily represent a retreat into culture that does not engage with institutionalized structures of power. Cultural expressions and events can support conventional political activities and constitute strategic collective action. Demands for recognition are intertwined with material concerns and can alter social relations that are institutionally based. Social movement scholarship increasingly contests the separation of the political economy from the realms of culture and identity, challenging the separation of movements into expressive, cultural, and identity-based, on the one hand, and political, instrumental, and strategic, on the other (Armstrong & Bernstein 2008).

CONCLUSION

Identity politics is not a theory of social movements in the same sense as resource mobilization or political process theories because it does not attempt to explain the emergence and development of social movements. Because of the divergent notions of power derived from competing theoretical traditions in the field of social movements, analyses of identity politics often carry normative political evaluations about what constitutes worthwhile collective action for social change.

Scholarship on identity politics has led to the collective identity approach to social movements that examines the role of identity in all movements in terms of mobilization, strategies, and goals. Movements can strategically deploy identities that are both internally embraced and externally imposed. Such identities can be translated into political action, yet movements face strategic dilemmas when the identity on which they are based is also the basis for oppression. When movements appear to rest on essentialist identities, essentialism may be strategic, influenced by social, political, and cultural factors. Finally, identities can be deployed to challenge institutionalized relations of power, challenging the division between what is cultural and what is political. By taking seriously how conceptions of power inform collective action, social movement scholars can show how activist concerns with representation and recognition are related to both institutional structures and the political economy.

Identity work processes
RACHEL L. EINWOHNER

The study of identity and social movements has been heavily influenced by the symbolic interactionist perspective, which stresses the active construction of meaning in human interaction. Thus, scholars recognize that the identities that are relevant to social movements are not simply pre-existing sets of characteristics that individuals bring with them to the mass march or meeting hall; instead, these identities are actively created, debated, and sometimes even unmade and established anew in the course of collective action. Of course, all of this activity takes work. The concept of identity work in social movements therefore refers to all the work involved in creating, displaying, and managing the identities that are relevant to collective action. The term is borrowed from Snow and Anderson’s (1987) discussion of identity work among the homeless, which demonstrates the ways in which homeless people construct and maintain positive personal identities that are distinct from the negative labels assigned to them by the public. It is also related to Hochschild’s (1979, 1983) concept of “emotion work,” which references the management of emotion in accordance with social norms about the situationally appropriate display of feelings.

Identity work is directed both internally and externally. Internally, activists must construct and maintain a coherent collective identity that helps sustain individuals’ participation in the movement; externally, the task is to present the movement to opponents and third parties in a particular light in order to gain support and achieve goals. Perhaps the most developed, and therefore best understood, identity work processes are internal in nature and focus on collective identity construction and identity convergence. The former term refers to the dynamics involved in the creation of a shared sense of “we,” such as boundaries, consciousness, and negotiation (Taylor & Whittier 1992), while the latter describes the process by which individual identities become congruent with a movement’s collective identity (Snow & McAdam 2000).

A more recent focus addresses the challenges associated with identity work. Many of these challenges result from diversity within movements (Reger, Myers, & Einwohner 2008). There can be different ways to present a group strategically (Bernstein 1997), which can lead to disagreements about who “we” are. In such situations, some activists may feel only a partial convergence between their individual identity and the movement’s collective identity, and may therefore need to engage in identity justification work in order to maintain their participation (Robnett 2005). Further, the construction and maintenance of a group’s identity can be complicated by differences among activists, such as those based on race, class, or generation (Whittier 1995; Reger 2002). Other challenges stem from the broader context in which identity work takes place, which shapes both the types of identity work in which activists engage and the difficulties involved. For instance, in repressive contexts the dangers associated with activism may force activists to pass, thereby hiding rather than celebrating a valued identity (Einwohner 2006). Despite the difficulties involved, however, identity work is thought to be important, and possibly necessary, for sustained activism: if not done successfully, movements can splinter or die out entirely (Glass 2009).

As well explored as this topic is, there are still areas that deserve further inquiry. One topic that is potentially rich for continued theoretical development is transnational activism. As Hertel (2006) and others have shown, activists working across borders to solve a problem in a particular country or region can face difficulties stemming from differences in the way issues are
framed and groups are understood, differences that can be exacerbated by global inequalities and assumptions of privilege. Global identity work, then, may face distinct challenges, and may therefore follow different processes than those that have been identified by the extant literature, perhaps because of the relative lack of face-to-face interaction among all activists. Relatedly, another area that is ripe for future work is the role of technology in identity work, such as the use of social networking sites in bridging divides across different groups and potentially minimizing the costs of identity work. Thus, further work on a variety of cases, in different settings and at all points along the political spectrum, should prove to be useful.

Ideology
COLIN J. BECK

Ideology is an important aspect of social and political movements. The most basic and commonly held view of ideology is that it is a system of multiple beliefs, ideas, values, principles, ethic, morals, goals, and so on, that overlap, shape, and reinforce one another. In Swidler’s (1986: 279) influential terms, ideology is “a highly articulated, self-conscious belief and ritual system, aspiring to offer a unified answer to problems of social action.”

Ideology is often an implicit and assumed feature of movements. Without an ideology that articulates and identifies a mobilization’s beliefs and goals, it would be difficult to speak of this as a movement at all. Rather, collective action without ideology would appear disorganized and temporary. In contrast, movements are generally held to be relatively organized and relatively sustained over a period of time. Ideology can be one such feature of organization and a marker of sustained collective action.

There is little consensus of how ideology can be best conceptualized or empirically researched. This may be due to the implicit, but understudied, assumption of ideology as a feature of movements or perhaps the legacy, particularly in Marxist thought, of the pejorative use of the term (see Oliver & Johnston 2000). Yet, since the broad “cultural turn” of the latter twentieth century, particularly through the framing and new social movements approaches, ideology has re-entered the study of collective action. This has yielded common recognition of ideology’s import for understanding movements, numerous conceptualizations, and prominent debates (e.g., Sewell 1985 and Skocpol 1985; Oliver & Johnston 2000 and Snow & Benford 2000; Zald 2000, Diani 2000, and Klandermans 2000). Four primary perspectives on ideology are outlined below: cognition and social psychology; emergence and interaction; action and strategy; and social order and structure.

IDEOLOGY AS COGNITION AND SOCIAL PSYCHOLOGY

One of the most prominent approaches to ideology has been to stress it as a cognitive or social psychological process. Since ideology is held to provide a systematization and articulation of underlying beliefs, it can be said that ideology is one method that actors use to make sense of the social world. Thus, ideology differs from culture in that it is a “tool kit” (Swidler 1986) of hermeneutic, interpretative, and sense-making strategies. Rather than being mere ideas, ideology is distinguished by its active use and its import for shaping and creating certain types of action. This process is theorized to occur most crucially when pre-existing cognitive strategies and normative routines are stressed by new realities. From this view, ideology may have its most important role during unsettled times, akin to theories of social strain that featured so prominently in collective behavior approaches to movements.

Beyond the level of individual cognition, ideology also exists in social psychological approaches to movements. Ideology is not just a rational sense-making strategy for an individual. Rather, ideology is distinguished by its social feature – its systematization is usually shared by multiple actors and is thus a feature of groups more so than individuals. In fact, commonly held systems of beliefs and values, that is, ideologies, provide meaning and identity for movement participants as stressed by new social movement theorists. Many identity statements are actually statements of ideological affiliation, for example, Marxists who follow Marxism, environmentalists who subscribe to environmentalism, feminists who identify with feminism, and so on. Thus, ideology can be seen as more than
just a cognitive tool that suggests actions or beliefs for an individual; it is also a shared social psychological process that can create group affiliations and help stitch together a movement of like-minded actors. In short, ideology plays a role in both individual and group understandings, actions, and formation.

IDEOLOGY AS EMERGENCE AND INTERACTION

If ideology is the cognitive and social psychological scaffold on which shared beliefs, actions, and identities are built, then another approach is to consider how this scaffold is constructed. Rather than being inherited in a complete and stable form by actors, ideology is used and, in being used, created and recreated. In other words, ideology can be emergent during periods of mobilization and shaped by the interactions of movements’ leaderships and participants, and even movement exogenous actors. Thus, the assumption of a coherent and stable nature of ideology can be problematized (Snow 2004).

In early stages of mobilization, movements are often riven by ideological debates as movement goals and strategies are crafted. In later stages of a movement’s life, ideological debates are again often prominent as successes and failures challenge prior settlements of tactics and objectives. Thus, one strategy has been to analyze how ideologies emerge and the role of leaderships and intellectuals in crafting ideologies. For example, Wuthnow (1985) examines the role of “discursive communities” in shaping sixteenth-century Protestant theology, eighteenth-century Enlightenment principles, and nineteenth-century socialism, all of which became important ideological bases for social and political movements.

Ideology is also often held to be created by the interactions of movement actors, publics, countermovements, and authorities. A primary emphasis in this perspective is on the discursive side of ideology, seeing it as heavily shaped, and even created by, ongoing and iterative ideological appeals and repartees. Emphasis on the emergent and interactional side of ideology is most prominent in studies of revolutionary movements (e.g., Goldstone 1991; Moaddel 1992), perhaps because revolutions seem to be times of confusion where prior actions and beliefs are challenged and new ways of doing and understandings are formed (Sewell 1985; Kurzman 2004).

IDEOLOGY AS ACTION AND STRATEGY

As ideology has interactional dynamics and can be a form of activated culture, a third perspective has emphasized how ideologies inform collective action’s tactics and goals, link supporters to movements, and are strategically employed in mobilization. The primary example of this approach is found in the framing literature on movements (see Benford & Snow 2000). Framing focuses on the construction of meaning by actors and how through the rhetorical use of particular meanings, “frames,” movements mobilize and transform society. From the perspective of ideology, frames are crucial to the extent that they resonate with actors (as suggested by a social psychological approach) and articulate, amplify, and transform existing beliefs and values (as suggested by an interactional approach) in a strategic manner that furthers a movement’s goals. An important part of this process is the existence of “master frames” that are broad enough value and belief systems that multiple meanings and instantiations can thrive under their aegis. For example, discourse and belief in civil rights has extended beyond a race-based notion to encompass the rights of numerous other marginalized groups. Ideology thus may suggest particular frames, but a unidirectional link should not be assumed (Snow 2004).

The framing perspective on movements has been criticized for only describing intentional and strategic use of ideology, rather than being a distinct process (Oliver & Johnston 2000; Westby 2002). Framing may also be dynamic as well as strategic, transformed through discursual (see Steinberg 1998). In particular, master
frames may be considered as systems of beliefs and values, that is to say ideology, present outside of a movement’s use of them. Thus, another ideology as action perspective has been to emphasize how ideological forces enable and constrain all collective action, even outside of the strategic and constructivist process of framing. Zald (2000), in particular, proposes that consideration of “ideologically structured action” is a broad and fruitful area for research on movements. In this view, the historic and stable nature of ideology is stressed. Rather than being primarily emergent and interactional, belief systems are held to be more permanent properties of society.

IDEOLOGY AS SOCIAL ORDER AND STRUCTURE

If ideology is a more stable and permanent feature of society, then it logically follows that social structures and institutions can have ideological features. Thus, a fourth perspective is to examine how ideology is institutionalized within society and how these legitimate belief systems shape collective action of any sort. This, in fact, is the classic approach to ideology in Marxist thought, for example, the hegemony of Gramsci (1971) or the ideological state apparatuses of Althusser (1971). The Marxist view stresses how ideology is a tool of social control whereby widely shared beliefs and values are created and/or maintained by elites to legitimate their authority and undercut opposition.

It is possible, however, to recognize the institutionalization of belief systems in society without necessarily seeing all ideology as a facet of state cooptation and repression: “ideology needs to be recognized as a constitutive feature of social order itself” (Wuthnow 1985: 815; see also Rudé 1980). Social structures are embedded in cultural and ideological constructions that make sense of them and articulate their role in society. One view in the structure–agency debate holds that social structures are dual, comprised of both resources that can be used and rules that govern the action of using them. Thus, all institutions and orders have an element of ideology in the schemas that are used to interpret resources (Sewell 1992). In short, “Ideology, then, should be conceived in structural terms” (Sewell 1985: 60).

In the context of movements, a focus is on how the ideological properties of existing structures and institutions inform collective action. These beliefs, principles, values, and so on, may inform the repertoires of movements – particular forms of action and strategy are deemed more or less legitimate at different times. Further, the goals and discursive appeals of movements are likely shaped by the ideological orientation of the society in which they occur. And the cognitive and social psychological resonance and utility of particular systematized beliefs are heavily dependent on prior cognitions and psychology shaped by the context of the social system. Thus, a social order or social structural view of ideology may provide a perspective that unifies the dissensus among the other approaches.

IMPLICATIONS FOR EMPIRICAL STUDY

Each of the four perspectives on the nature of ideology suggests particular conceptual tools and methods of empirical analysis. For example, a cognitive and social psychological approach calls attention to the role of individual beliefs and group processes in collective action. Interactional and emergent approaches suggest that ideology can be studied through discursive dynamics in times of mobilization, while action and strategy perspectives lend themselves to examining the tactics of movements. And a social order or social structural view requires a broader examination of the context, both current and historical, in which collective action takes place. In this manner, the study of ideology in movements may benefit from consideration of discussion in other subfields; be it on cognition and culture (e.g., Vaisey 2009), the dynamics of intellectual movements (e.g., Frickel & Gross...
2005), or the traditional political orientations literature (see Walder 2009).

Rather than only consider ideological effects at the individual, group, movement, or social level, systematic research could examine the interactions and overlaps of the four perspectives, for example, the stages at which one is more important than the others or how changes in one cascade into changes in the other. Clearly, existing social orders do change, novel strategies and repertoires are innovated, new ideologies do emerge, and beliefs and values evolve. It is possible to consider these as “contentless” social processes that have common features no matter the ideology in question. However, there is likely a role for the particular beliefs and values at hand in shaping the dynamics of these processes. Thus, the implicit understanding of social movement research – that all movements have an ideology – could be harnessed explicitly to advance knowledge of ideational processes.

Immigration, protest, and social movements

Simon Weffer

As pointed out in her 2010 piece on the state of the discipline vis-à-vis the immigration literature, Menjivar argues that the links between immigration and protest (or social movements more broadly) have been few and far between. In fact, she states that link “...has remained underdeveloped and thus could stand to benefit from a more active dialog” (18). She further argues that the immigration protests of 2006 in the United States served as a jumpstart to the study of the relationship between immigration and protest. While it is true that the study of this connection between immigration and protest has been sparse, there are four specific venues in which we can see this relationship engaged and examined: (1) immigration as an explanatory variable in protest research; (2) specific immigration-related movements; (3) the aforementioned 2006 protests; and (4) the study of immigration and protest in a non-US contexts.

The first example of the relation between immigration and protest are those studies that focus on immigration not as a principal explanatory variable, or even the dependent variable (e.g., immigration protests), but where it is just one of many independent variables in a statistical model explaining rates, timing, or counts of protest. It should be noted this is not meant to be a pejorative critique of the work. It is meant to say both empirically and theoretically immigration isn’t the primary focus. Here we can look at studies such as that by Olzak and Shannah (Shannah & Olzak 1999; Olzak & Shannah 2002) where immigration is used primarily in the context of testing competition theory. Here immigration is used to explain the hardening of the boundaries between groups and increasing ethnic violence.

The second broad category of research on the intersection of immigration and protest entails immigration-focused, specific movements. Some of the best examples of this work include Lippert (2005), Cunningham (1999), Wiltfang and Cochran (1994), Coutin (1993), and Wiltfang and McAdam (1991), with much attention focused on the Sanctuary Movement. This movement originated in Arizona, and was initially designed to take in Central American refugees created by the political turmoil of the 1980s. It soon spread to several hundred congregations nationwide, including sanctuaries in Chicago, Philadelphia, and Los Angeles. In the United States, the Sanctuary Movement lasted from 1982 to 1993, but continued in Canada into the early years of the twenty-first century, eventually taking on international dimensions with sanctuary cities and congregations in Germany, France, Belgium, the Netherlands, Norway, Switzerland, and Australia. Thus, while the literature has examined Sanctuary Movement mobilization, systematic analysis of disruptive, public protest in support of immigrants’ rights movement has been emphasized less.

The third category of investigation focuses on the immigration protests of 2006 in the United States. These protests arose in reaction to H.R. 4437 – The Border Protection, Anti-Terrorism, and Illegal Immigration Control Act of 2005, otherwise known as the Sensenbrenner bill, after its sponsor, Wisconsin congressman Jim Sensenbrenner. The bill was not your average immigration bill; rather opponents saw it as a draconian measure that, along with “strengthening the border” (and adding more fence in various locations), increased penalties not just on employers of undocumented immigrants, but also made it a felony for anyone to provide assistance to any undocumented individual – regardless whether the individual might be a doctor or even a priest. The bill was seen as a clear threat to the undocumented and their allies, and thus greatly
immigration, protest, and social movements facilitated mobilization, resulting in the largest protests (at least to that point) around immigration in major US cities, including Los Angeles, Chicago, and New York, as well as in much smaller locales.

From these events have come studies with major contributions, both empirical and theoretical, to our understanding of immigration protests. The first set of important results emerged in a special issue of *American Behavioral Scientist* in December 2008, and the second in a coedited volume by Irene Bloemraad and Kim Voss entitled *Rallying for Immigrant Rights: The Fight for Inclusion in 21st Century America* (Voss & Bloemraad 2011). We should think of these two works as companion pieces, as many of the same authors in the special issue are present in the edited volume. The introductory pieces in each serve as bookends to the 2006 immigration marches. Pantoja, Menjivar, and Magaña (2008) contextualize the 2006 marches given their relative proximity to the events, while Bloemraad and Voss and Lee set the stage for the 2011 edited volume by providing a broader overview of immigrant protest and how it fits into topics such as immigrant incorporation, while the Wang and Winn chapter speaks more generally about how to use protest mobilization as a springboard to large issues of empowerment and incorporation of immigrant mobilizers’ communities (a set of ideas that often movement/protest scholars ignore).

Many of the authors who are in both the *American Behavioral Scientist* and the Bloemraad and Voss edited volume use the new book as a chance to build on their previous work from the special issue. For example, Ramirez expands on his work on the use of ethnic media and protest from the special issue to more closely examine how Spanish-language radio, especially widely syndicated and distributed shows such as *El Piolín* aided in the development of a Latino political identity rooted in mobilization. In more closely examining the edited volume, we can look at two clear themes that emerge: institutional engagement and place-based analysis. In the first case, that of institutional engagement by protesters, the most obvious institution targeted is the political realm – specifically looking at the relation between civic engagement (broadly defined) and immigration reform, which clearly encompasses all three branches of government (legislative, executive, and judicial), as well as how the marches impacted Latino perceptions and opinions of the US political process and institutions.

But more than just the social institution of politics were impacted by the marches. Religion, as well as the media, in the role it plays on identity formation is examined. As we now exist in a 24/7/365 news cycle, critical analyses of the role of the fourth estate in mobilization, particularly on “hot-button” topics such as immigration, will only increase in importance. Finally, the most personal (and micro focused) of social institutions, the family, is examined in Pallares and Flores-González (2011) work on family mobilization in Chicago, as well as on Bloemraad and Trost’s expanded work on intergenerational mobilization.

The fourth and final broad category examining the intersection of immigration and protest is the work that has occurred outside of the United States. One possible critique of Menjivar’s 2010 piece is that the focus was on the case of the United States in the analysis of the intersection of immigration and protest. As point of fact, looking internationally, there have been more empirical studies, using a variety of methodologies, to examine immigration and the resulting protest and/or social movements. Specifically the work of Ruud Koopmans and his colleagues (Koopmans et al. 2005; Koopmans & Statham 2000 in particular) has examined immigration protest comparatively across multiple countries, as well as the effects of immigration and protest in various social structures. Interestingly, in the study of European immigration protest, it has typically been framed as part and parcel of the contentious political tradition, in contrast to the United States, which has often seen immigration and contentious politics as separate and distinct spheres. Koopmans and his colleagues explain that this is due to the European political elites,
as well as the constituencies, having resisted the notion of European counties being “countries of immigrants.” This point is made in the very introductory paragraph of Koopmans et al.‘s 2005 work, where they state that “as late as 1998 it was still the official position of the German government that Germany is not a country of immigration.” This open hostility clearly explains why immigration is automatically pushed into the realm of contentious politics. It is therefore no surprise that studies on immigration and protest include European Far Right parties, organizations, and opinions, as often as they do supporters of immigration rights (see Koopmans & Olzak 2004; Koopmans et al. 2005). On some level, protest in Europe seems to have always included multiple sides of the immigration debate at protests. In fact, as Koopmans et al. (2005) point out, immigration protests often include three groups – migrants themselves, those working on behalf of migrants, and those against migration. In the United States, there has been a tendency to treat immigration protests either strictly on behalf of or including immigrants (such as the 2006 march in Los Angeles) or against immigration (Minuteman Militia events).

As noted, the work on Europe takes on a comparative nature, not just across nations, but across other categories. For example, Koopmans et al. (2005) examine not only how grievances/claims are handled, but also the legitimacy (or lack thereof) of the different actors (antiracists, racists, pro-immigrant, the state), the access of different groups to institutional channels, and the differences in tactics (e.g., protest action vs. confrontational action vs. public statements), the relative openness/closedness of institutional structures, and the access to the political structure. For example Giugni, Koopmans, Passy, and Statham (2005) examine the opportunities (both institutional and discursive) for the Far Right in five countries.

One final contrast to the United States in terms of immigration mobilization is that in Europe, immigration and related protests are not confined to issues of foreign nationals, but also concern religion – specifically protest for and against Muslims. For example, one can examine the work of Astor (forthcoming) on conflict surrounding the building of mosques in Madrid and Barcelona. Koopmans et al. (2005), in their examination of this intersection of immigration and protest, find that there is not much faith-based mobilization for non-Muslim groups. This is not surprising; when we look at the threats (which encouraged mobilization) against various religions from 1992–1998 (the time period where events were collected) clearly the bulk of the threats were vis-à-vis legislation targeting Muslims. The most well documented of these threats was the French legislation to ban headscarves. This ties into another finding derived from examination of group-based demands: that “. . . European public controversies about claims for group demands are not about migrants’ cultural differences per se, but arise from a specific contradiction of Islam in the liberal nation-state” (Koopmans et al. 2005: 174). This then leads us to the conclusion for Koopmans et al. that if the political institutions fail to recognize and include Islam/Muslims, this will lead to an increase in mobilization both for and against Muslim immigrants. The question, as they pose it, is whether Europe will adopt a model of incorporation similar to the United States in the nineteenth century where the Irish, Italians, and Polish Catholics, or those of Jewish descent from Eastern Europe, were incorporated into US society. Or, instead, will Muslims be increasingly socially isolated, which then may lead to increased radicalized protest and mobilization by an increasingly marginalized group.

Indymedia (the Independent Media Center)

STEFANIA MILAN

Indymedia, short for Independent Media Center (IMC), is a global network of independent media organizations offering grassroots anticorporate news coverage. Its website, indymedia.org, operates as an “open publishing” platform, enabling anyone with Internet access to upload text and digital files.

The first IMC appeared in late November 1999 in Seattle, Washington, on the occasion of the mass demonstrations against the World Trade Organization, when a coalition of media and grassroots tech activists created a media center in downtown Seattle and launched a web site to enable activists to report directly from the protests. The Seattle IMC operated for over a week, providing up-to-date reports, videos, photos, and audio clips, broadcasted via a local low-power radio station. It produced its own newspaper, “The Blind Spot,” and launched a documentary project about the protests. Its reports were picked up by a number of mainstream media, which relied on the firsthand accounts provided by about 150 IMC activists. For the first time in history, a web site provided unfiltered access to the web: no registration was required, and content was not filtered. During the week of protests, indymedia.org received over a million and a half hits, outstripping mainstream media coverage (Kidd 2003).

What started as a localized response to the distortions of mainstream media reporting spread quickly across the world. In early 2000, an IMC was formed in Washington to cover the protests against the World Bank and the International Monetary Fund. Soon other local groups became interested in forming their own IMC and asked to connect to the main web site. In 2002, three years after its foundation, there were already 89 IMCs in six continents. The growth of the network began to slow down only in 2005, following the decrease in number and prominence of antiglobalization protests. Currently, there are 150 local IMCs, from Kenya to Canada, from Indonesia to the Basque Country, operating under the motto “Don’t hate the media, be the media.” According to its mission statement, Indymedia is a “democratic media outlet for the creation of radical, accurate, and passionate tellings of truth.” The web site is its main interface, and provides coverage in eight languages. Local IMCs occasionally also operate offline, particularly in situations where Internet access is limited. In Mexico, for example, IMC activists rely consistently on audiotapes and radio.

In early 2000 “open publishing” was a novelty, and Indymedia can rightly be considered the “mother of all blogs” (Milan 2010: 89). Currently, the web site closely resembles the original 1999 platform, and provides news from a variety of social justice movements. It is divided in three main columns. The left column provides access to local IMCs, the various mailing lists, and information about how to get involved and form an IMC. It also links to the video and audio spin-off projects, such as the monthly production Indymedia Newsreal, airing on online video channel FreeSpeech TV. The right column is devoted to the news posted by activists: thanks to the open publishing policy, anyone can post his or her article, video, or photo. The content is unfiltered; however, occasionally content may be “hidden,” if a post breaks the Indymedia editorial guidelines, which may vary across the IMCs but share the rejection of hateful, racist, and sexist content. Hidden content, however, remains accessible through the web site. The newswire, or central column, features the main news stories, as agreed by the editorial collective. Occasionally, stories may be promoted to the newswire from
the left column. “Gatekeeping” is kept to a minimum.

IMC nodes are autonomous groups with their own mission statement, finances, and decision-making procedures. However, IMCs share some basic values, summarized in ten “Principles of Unity.” According to such principles the network is rooted on equality, decentralization, self-organization and local autonomy, diversity and nondiscrimination, and trust. IMCs are committed to develop nonhierarchical and antiauthoritarian relationships, both at the interpersonal and group levels, as well as to promote participation and consensus-based decision-making. All IMCs are not-for-profit. Open exchange of and access to information are seen as “a prerequisite to the building of a more free and just society.” Whenever possible, digital infrastructure of the network should be based on open-source software. The principles, however, are not written in stone, and are considered to be in permanent revision.

Decisions are taken in open mailing lists and chat rooms. The Indymedia global group and the various collectives in charge of specific sections of the network are formed by self-appointed, highly committed individuals. Indymedia can be seen as an example of prefigurative politics, as “the way these networks were created, run and developed, mirrored, as much as possible, the direct, participatory, collective and autonomous nature of the emerging social movement(s)” (Milan 2010: 88–89). However rooted in equality and nondiscrimination principles, Indymedia consensus-based decision-making processes, online discussion and offline meeting dynamics, and open-publishing policy have been object of criticism within the network. For example, decision-making processes are potentially distorted by the male dominance of technical work within the network, and the consensus process might hinder diversity, as minorities are sacrificed in favor of the dominant vision (Brookten & Hadl 2009).

Indymedia has frequently been targeted by national security agencies in the United States, Canada, Italy, and Spain, to name a few. In July 2001, during the protests against the meeting of the world’s eight richest countries (G8) in Genoa, Italy, the IMC media center was brutally raided by the Italian riot police. In October 2004, the global Indymedia network suffered a major breakdown, as the US Federal Bureau of Investigation (FBI) seized the disks of two Internet servers located in London which hosted about 20 local Indymedia web sites. The seizure triggered strong reactions from many civil society groups around the world, including the International Federation of Journalists.

Despite not being the mouthpiece of the movements, Indymedia is frequently associated with the Global Justice Movement. More recently, however, with the explosion of blogs, video-sharing platforms such as YouTube, and social network sites like Facebook, grassroots movements seem to rely increasingly on commercial platforms rather than Indymedia. In response to these concerns, some local IMCs, including the London group, are working on developing their web site to respond to the organizational needs of contemporary activists, including for example the possibility of texting news directly from the streets with a mobile phone.

Initiator and spin-off movements

DOUG MCADAM

Most theories of movement emergence treat movements as independent of one another. The popular convention of naming individual movements reflects this view as well. So we refer to movements – for example, the women’s movement, the civil rights movement, the environmental movement – as separate and discrete phenomena. This conventional view, however, does not accord with the “facts.” The facts are that a good many movements:

• cluster in time and space;
• are developmentally dependent on the broader, ideologically coherent “movement families” (della Porta & Rucht 1995) in which they are embedded;
• and bear the clear tactical, organizational, and ideological imprint of prior movements within the same “family.”

That movements cluster in time and space is clear from even a cursory survey of recent history. So we note the popular uprisings in major European capitals in 1848–1849, or the wave of independence movements that swept through South America between 1810 and 1820, or the “velvet revolutions” that toppled the Soviet system in the late 1980s, or the American New Left of the 1960s/early 1970s, or Samuel Huntington’s (1991) “third wave” of democratization, or the nationalist revolts that emerged in many Southeast Asian countries in 1948–1949. We could add many more examples to this list, but the point has been made. The most consequential movements or other forms of “contentious politics” tend to come in waves.

First introduced by McAdam in a 1995 book chapter, the concept of “initiator” and “spin-off” movement is but one of a number of attempts by scholars to align social movement theory more closely with the wave-like structure of popular contention. Initiator movements refer to those rare, but exceedingly important, struggles that set in motion an identifiable “protest cycle” or wave of ideologically linked movements. “The second . . . category of movements includes those spin-off movements that, in varying degrees, draw their impetus and inspiration from the original initiator movement” (McAdam 1995: 219; emphasis in original). Examples of the former would include the American civil rights movement, which birthed the cluster of struggles – the anti-Vietnam War movement, women’s liberation, the American Indian movement, gay liberation, and so on – that came to be known as the New Left, and the movement that deposed Slobodan Milošević in Serbia in 2000, that set in motion the wave of “color revolutions” that shook post-Soviet Eurasia in the first decade of the twenty-first century.

McAdam’s discussion of the link between initiator and spin-off movements is but one of many scholarly attempts to theorize the interdependence of movements. Meyer and Whittier (1994) have written perceptively on the processes of “movement spillover” by which later struggles adopt/adapt the tactics, organizational forms, and strategic action frames of earlier movements. A number of scholars including John Markoff (1996) and Samuel Huntington (1991) have authored books on the dynamics of democratizing “waves.” Mark Katz (1997) and Colin Beck (2011) have sought to do the same for “revolutionary” waves. In his work on both the collapse of the Soviet Union (2002) and the emergence and spread of the “color revolutions” (2007), Mark Beissinger has begun to fashion a theory of the diffusion of what he calls “modular” forms of contention. Ruud Koopmans (2004) has also offered a general account of “the evolution of waves of contention.”
If a good many scholars have acknowledged and sought to theorize the temporal and spatial connections between movements, close empirical studies of such links would appear to be somewhat rarer. But there are certainly exceptions to this rule. Although it is typically described as a follow-up study of movement activists, McAdam’s (1988) research on the 1964 Mississippi Freedom Summer project (see separate entry in this volume) is also a detailed account of how participation in the project and the Southern civil rights movement in general helped to catalyze three later struggles: the Free Speech movement at Berkeley, women’s liberation, and the anti-Vietnam War movement.

In collaboration with Dieter Rucht, McAdam also authored a detailed empirical account of how fortuitous ties between American and German student activists helped, they claim, to spread the student New Left from the United States to West Germany in 1964–1965 (1994). In his aforementioned work (2007), Beissinger offers both a general explanatory perspective on the cross-national diffusion of contention and a specific account of the spread of the so-called “color revolutions” from Serbia to Georgia to Ukraine to Kyrgyzstan. For Beissinger, the key to the latter process was the critical role played by the dissident student group Otpor (“Resistance” in English) in first fashioning the very distinctive modular form of nonviolent electoral challenge used to such good effect in Serbia and then aggressively spreading the Otpor “template” through brokered connections to like-minded student groups in other Russian republics. Indeed, a number of Otpor activists remain active today in the dissemination of this template.

In her 1979 book, *Personal Politics*, Sara Evans offers a final and particularly rich example of the generative ties between an initiator and spin-off movement. The initiator, is once again, the civil rights struggle and the spin-off movement is the radical wing of the women’s movement. Evans recounts how the women’s liberation movement was born of the contradiction between the egalitarian ideology of the civil rights struggle and the forms of discrimination experienced by female civil rights workers. Outraged by the contradictions, yet inspired by the movement’s ideals, the female workers sought to create a movement of their own. In an eerie parallel, the women’s rights movement of the 1830s developed within the similarly inspiring, constraining context of the antislavery movement. Empowered by abolitionist ideals, yet treated as second class citizens within the movement, first generation feminists – like their sixties counterparts – broke away to forge their own struggle.

The last two examples underscore an important point. While movements clearly do cluster in time and space, the specific social processes that account for the spread of contention are by no means uniform. In the case of the color revolutions, brokerage and intentional emulation mediated the diffusion process, while the rise of both first- and third-generation feminism owed more to a gradual process of radicalization and rejection of older struggles in favor of entirely new movements.

Injustice frames
WILLIAM A. GAMSON

Students of social movements with different orientations share an emphasis on the importance of a strong injustice component in the political consciousness that supports collective action (Moore 1978: 88; McAdam 1982: 51; Turner & Killian 1987: 202). The main challenge on this point comes from those who accept that a sense of grievance is necessary but argue that it is so ubiquitous that it lacks any explanatory value (Oberschall 1973: 133–134; McCarthy & Zald 1977: 1215). But the view that grievances have little explanatory value, since it is so easy for leaders or organizations to link more elaborate world views with the sufferings of the “lower orders,” has not prevailed (Gamson 1992).

Most contemporary analysts treat it as no simple matter to explain how the indignities of daily life are sometimes transformed into a shared grievance with a focused target of collective action. Different emotions can be stimulated by perceived inequities – cynicism, bemused irony (for example, “Who says life is fair?”), or resignation. But injustice focuses on the righteous anger that puts fire in the belly and iron in the soul.

A sense of injustice is not merely an abstract intellectual judgment about what is fair but is what psychologists call a “hot cognition” (Zajonc 1980). The heat is intimately related to beliefs about what acts or conditions have caused people to suffer undeserved hardship. The critical dimension is the abstractness of the target. Vague, abstract sources of unfairness diffuse indignation and make it seem foolish. We may think it dreadfully unfair when it rains on our parade but nature is a poor target for an injustice frame. When we see impersonal, abstract forces as responsible for our suffering, we are taught to accept what cannot be changed and make the best of it.

At the other extreme, if one attributes undeserved suffering to malicious or selfish acts by clearly identifiable persons or groups, the emotional component of an injustice frame will almost certainly be there. Concreteness in the target, even when it is misdirected, is a necessary condition for an injustice frame. Hence, competition over defining targets is a crucial battleground in the development or containment of injustice frames (Alinsky 1972: 130–131).

More specifically, an injustice frame requires that motivated human actors carry some of the onus for bringing about harm and suffering. These actors may be corporations, government agencies, or specifiable groups rather than individuals. They may be presented as malicious, but selfishness, greed, negligence, and indifference may be sufficient to produce indignation.

The antidote to excessive abstraction has its own problems. In concretizing the targets of an injustice frame, there is a danger that people will miss the underlying structural conditions that produce hardship and inequality. They may exaggerate the role of human actors, failing to understand broader structural constraints, and misdirect their anger at easy and inappropriate targets or scapegoats.

To sustain collective action, the targets identified by the frame must successfully bridge abstract and concrete. By connecting broader sociocultural forces with human agents who are appropriate targets of collective action, one can get the heat into the cognition. By making sure that the concrete targets are, in fact, linked to and can affect broader forces and policies, one can make sure that the heat isn’t misdirected in ways that will leave the underlying source of injustice untouched (Gamson 1992: 33).
INJUSTICE FRAMES AS A COMPONENT OF COLLECTIVE ACTION FRAMES

Collective action frames “are relatively coherent sets of action-oriented beliefs and meanings that legitimate and inspire social movement campaigns and activities” (quote taken from Framing and social movements entry, this volume). Movements may have internal battles over which particular frame will prevail or may even offer several frames for different constituencies but their frames have in common the implication that those who share the frame can and should take action.

Injustice is only one of three crucial components in such frames but it can be viewed as the core that holds the three components together (Gamson 1992). In addition to injustice, there is an agency component that refers to the consciousness that it is possible to alter conditions or policies through collective action. Collective action frames imply some sense of collective efficacy and deny the immutability of some undesirable situation. They empower people by defining them as potential agents of their own history. They suggest not merely that something can be done but that “we” can do something.

The identity component refers to the process of defining this “we,” typically in opposition to some “they” who have different interests or values. Without an adversarial component, as noted above, the potential target of collective action is likely to remain an abstraction, greatly complicating the development of the injustice component.

The injustice component of collective action frames facilitates the adoption of other elements. It increases awareness of social movements among bystanders and encourages sympathy toward their efforts at collective action even when people are not ready to join. It promotes personal identification with whatever collectivity is being wronged and spurs the search for agents who are responsible for the undeserved hardship that members of the recipient group suffer. Hence, it is the key to integrating the three elements into a single collective action frame.

Interviewing activists

KATHLEEN BLEE

Personal interviews with activists are a common strategy for gathering data on current social movements. They allow scholars access to a broader segment of social movement participants than are represented in documents and propaganda produced by movement leaders. Interviews also provide different kinds of data than can observational methods. Through interviews, researchers can probe the biographies and motivations of activists as well as the meanings they give to their actions (Blee & Taylor 2002; Munson 2009). Indeed, activist interviews are a key source of information on many critical issues in social movement studies, including how individual and collective identities are constructed, how movements attract followers, and how members’ commitments fluctuate over time.

TYPES OF INTERVIEWS

Social movement scholars use structured, unstructured, and semi-structured interviews to collect information from respondents. In structured interviews, each participant is asked a similar or identical set of questions. These produce data that are comparable across activists, but since they generally are based on pre-determined categories and questions, researchers cannot follow up when new issues or concepts are raised in the interview (Eliasoph 1998). Unstructured interviews are non-directive, open-ended, and often very lengthy. These are used to understand the perspective and experiences of a few activists.

Semi-structured interviews are used to capture the emotional and affective dimensions of movements, reveal the nuances of many activists’ perceptions, and illuminate how subcultures develop and shape movement goals and outcomes. The most common forms of semi-structured interviews are oral histories, life histories, key informants, and focus groups.

Oral histories generate historical information by interviewing people with firsthand knowledge of past events or time periods. They are particularly important for studying aspects of social movements that are not represented in documentary sources or official records, such as how domestic life impacts movement participation or the activism of poor or disenfranchised people (della Porta 1992).

Life histories are similar, but focus more on the activist’s narration of their life story. They are valuable for uncovering the fluctuations in activist commitment over a lifetime and how activists evaluate and make sense of their experiences in social movements (della Porta 1992; Blee 2002; Auyero 2003; Team Members 2006). Activists have an interest in presenting themselves and the movement in a certain light, making them unreliable narrators of the history of movements in which they have been involved. However, the point of life histories is to capture activists’ meaning and emphasis rather than record the facts of history. As Luisa Passerini (1989: 197) argues, “all autobiographical memory is true; it is up to the interpreter to discover in what sense, where, for what purpose.”

In key informant interviewing, scholars select interviewees for a particular purpose. They may choose those who can provide information on particular aspects of a social movement, such as its tactics or strategies, modes of recruitment, internal dynamics, membership composition, or future plans and goals. Or a scholar may interview those likely to know about a movement’s history or relationships with other movements. Interviewees also may be chosen because they can convey a certain perspective on the movement, like that of a leader or rank-and-file member. Many key informants are movement insiders who have
extensive knowledge of its operations over a long period of time or who are active in many of its operations.

Focus groups can be used to interview small groups of activists at the same time. In a focus group, activists are asked to talk with each other about a set of questions provided by the interviewer. These are useful for capturing topics that unify and divide movement participants.

Interviews of all types can be conducted on the telephone or face-to-face if activists are in close proximity to each other and to the researcher. Increasingly, both structured and semi-structured interviews also rely on virtual media such as e-mail, Internet web sites, and other forms of communication technologies. Phone and virtual interviewing allow access to activists across the globe and provide the possibility for anonymity that generally is lacking in face-to-face interviews.

SAMPLING

Scholars use varying sampling methods to select interviewees. How they do depends on the type of movement and the purpose of the study. Formal social movement organizations may have a membership list that can serve as a sampling frame from which current or former activists can be chosen randomly or purposively. For less institutionalized social movements or those whose memberships are not well documented, scholars often rely on snowball sampling, asking initial interviewees to suggest or contact others to be interviewed. Snowball sampling is particularly effective for finding activists who are hidden, difficult to locate, or hard to identify, such as those associated with violent or stigmatized movements or movements that are not currently operating, and for identifying former or marginal members or supporters of current social movements (Team Members 2006; Morrison 2009). Social movement scholars also sample by approaching activists at events such as protests or rallies and either conducting interviews on-site or arranging interviews for a later time.

DYNAMICS OF INTERVIEWING ACTIVISTS

Researchers need to be flexible to the changing dynamics of the relationship between interviewer and activist as these can affect what questions are asked and how the interview proceeds. The dynamics of rapport can be particularly complicated. When researchers remain distant and emotionally guarded, activists may be reluctant to provide rich information about themselves and their movements. Yet, researchers who become too closely identified with interviewees may find it difficult to evaluate the taken-for-granted assumptions by which activists operate. There are a number of strategies for keeping a healthy balance of closeness and distance during an interview. Some scholars keep their opinions and personal lives to themselves to maintain a neutral interviewing situation; this is also a strategy used by scholars to protect themselves from potentially violent activists and to maintain rapport with activists from various factions of a movement or on different sides of a conflict (Blee 1998; Stein 2001). Other scholars position themselves as “distant but not neutral” researchers by revealing beliefs and experiences that differ substantially from those of the activists they interview (Blee 1998: 385).

Not all researchers strive to maintain a distance from the movements or activists they study. Indeed, some reveal their support, or are themselves involved in the movements they study. Such personal and political involvement with activists can get scholars an entrée to important or nuanced information about movement participants and operations that are generally only available to insiders (Blee & Taylor 2002: 97). Verta Taylor (1998) built rapport with activists involved in issues of postpartum depression by being both an advocate for the movement and a confidante who talked openly about her own bouts of depression. However, scholars who develop a close relationship with activists may worry that in writing the analysis, they will misrepresent, misinterpret, or
interviewing activists

Javier Auyero (2003: 194) related how Lara, an activist and friend, summarized her feelings about his work: “I offer you trust; if you do something that betrays it, you are the one who’s going to be a bad person, not me. I am positive I did the right thing.” The emotional dynamics of the interview also can be an important source of data. Activists may display emotions of anger, grief, or excitement that suggest how deeply they are attached to a movement or issue, the emotional dynamics of the movement itself, or how activists relate to those outside the movement (Blee 1998; Whittier 2001).

Scholars have opinions about the value, morality, efficacy, or direction of the political work in which the activists they interview are involved. Such political or moral judgments are unavoidable, but they need to be considered in the process of interviewing and analyzing interview data. For example, scholars may need to decide whether or not they want to publicize a movement through their research. To avoid giving publicity to a movement they dislike, scholars may use pseudonyms in place of actual group names. In contrast, scholars may use identifying information for movements they want to publicize as long as they are confident that the research will not expose these movements to legal or other harm (Blee & Taylor 2002; Blee & Vining 2010). Also, scholars’ assessment of the movement or activist may influence the direction of activist interviews. Interviews with activists from particularly disagreeable movements like far-right racist or antigay groups might focus less on the movement’s goals and more on how activists became involved in such movements (Blee 1998; Stein 2001).

CODING

In order to analyze information gathered in interviews, scholars transcribe interviews in whole or part into written text, develop a coding schema, and code statements, lines, or words from interviews into a set of analytic categories. Coding is the exercise of naming interesting items and “applying the name consistently, wherever you find that item in your notes” (Lichterman 2002: 130). In structured interviewing, responses by interviewees may be entered directly into a computerized word processing program and, since the categories of analysis are established in advance, codes are developed directly from the questionnaire. In semi-structured and unstructured interviewing, the process of coding is more elaborate. Typically, scholars use a combination of open, closed, and focused coding. In inductive studies, scholars rely heavily on open coding to create analytic categories based on meanings and interpretations in the interviews that may not be documented in prior research. Open coding requires scholars to carefully read interview transcripts so as to “identify and formulate any and all ideas, themes, or issues they suggest, no matter how varied and disparate” (Emerson, Fretz, & Shaw 1995: 143). Scholars find that working with concepts throughout data collection can help them decide what codes are most significant and what codes ought to be dropped (Lichterman 2002: 130). Creating codes during the first stages of research can also help scholars form new questions for subsequent interviews. Closed coding, done after or instead of open coding, is more deductive; codes are created from categories derived from issues, questions, and findings in prior research. In focused coding, which takes place after both open and closed coding, scholars connect analytically significant themes and develop “subthemes and sub-topics that distinguish differences and variations within the broader topic” (Emerson, Fretz, & Shaw 1995: 160).

ETHICAL ISSUES

Activist interviewing raises a number of ethical issues. There are ethical concerns about the legal, emotional, financial, and social vulnerabilities to which activists may be exposed by being interviewed about their involvement in social movements, especially
those that are under official scrutiny (Blee & Vining 2010). Scholars who interview activists also may face thorny ethical issues about the interpretation of these interviews (Borland 1998; also see Chodorow 1989). Activists and scholars may struggle over who controls the story that is conveyed in an interview, especially when scholars are critical of movements or categorize them with labels, like “feminist,” “racist,” or “political,” that activists and movements do not use for themselves (Borland 1998; Mahmood 2005). Researchers must be responsible in their relationships with activists without necessarily adopting their definitions of reality (Eliasoph 1998; Auyero 2003).

REFERENCES AND SUGGESTED READINGS

Institutionalization of social movements
SUZANNE STAGGENBORG

Social movement theorists have viewed various phenomena as aspects of the “institutionalization” of social movements. One meaning of institutionalization is that movements become established interest groups that are formalized in structure and headed by professional leaders. Along with formalization and professionalization, movements may also become institutionalized in the sense that their goals become conservative or mainstream. Another meaning of institutionalization is that movement ideas are incorporated into mainstream organizations or practices. And movements can be institutionalized in the sense that they operate within social institutions and organizations. All of these ideas are important to theories of the origins, development, and outcomes of social movements.

Ideas about institutionalization as the final stage in the movement “career” can be found in early analyses of collective behavior. Other analyses have looked at the process whereby movement organizations become formalized and professionalized, making them difficult to distinguish from established interest groups. In the tradition of Robert Michels (1962), some analysts associate the adoption of formalized or bureaucratic structures with oligarchy and a move toward conservative views and strategies; as organizations grow, leaders spend more time on organizational maintenance and adopt mainstream positions that allow them to survive. Piven and Cloward (1977) argue that the creation of large bureaucratic organizations in poor people’s movements is counterproductive because such movements can only succeed through disruption, and institutionalization leads to the decline of mass protest.

Work on other types of movements suggests, however, that formalized structures aid organizational maintenance and that such groups can assist grassroots efforts (Staggenborg 1988; Gamson 1990). Institutionalization in this view is not necessarily the end stage in the life cycle of a social movement, but a process that allows movements to survive and re-mobilize when environmental events create the impetus for new campaigns. Institutionalized actors may play a role in the origins and maintenance of social movements, and in some instances they help to spur countermovements. In the US women’s movement and in various minority rights movements, insiders in government agencies helped the movements get off the ground (Skrentny 2002; Banaszak 2010). When movement strategies show signs of success, interest groups might find it useful to take on the forms and tactics of the less established social movement, thereby creating or supporting a countermovement. Established interest groups sometimes join outside activists, or, in the absence of genuine grassroots activity, they may mimic the organizational structures and tactics of movements in what critics have derided as “astroturf” campaigns. Useem and Zald (1982) found that a pronuclear power movement, comprised of both a nuclear power industry-supported wing and a local community wing, emerged as a result of the successes of the antinuclear power movement in the 1970s and early 1980s. In this case, an established pressure group provided substantial resources to a movement to promote nuclear power. Thus, both institutionalization and de-institutionalization can occur in political struggles.

When movements become institutionalized in the sense that their frames, rhetoric, and goals are taken up by mainstream organizations, this is sometimes seen as a kind of co-optation of the movement. Yet, such changes might also be counted as a sign of movement
success in dissemination of its ideas to mainstream institutions. Often, movements operate within organizations and institutions, targeting government, corporate, and other authorities (Zald & Berger 1978; Katzenstein 1998; Raeburn 2004; Snow 2004; Soule 2009). By gaining footholds within institutions, movements such as the women’s movement can use institutional resources (e.g., women’s studies programs at universities) to help maintain themselves over time (Staggenborg 1996). When organizations and institutions change their policies in line with movement goals, it is often because the movement creates pressure for change, sometimes from within. For example, Raeburn (2004) shows how gay rights activists within corporations pressured many Fortune 500 companies to adopt gay-friendly policies. Movements often create institutional changes either through outside protests, such as boycotts, or insider tactics, such as shareholder resolutions (Schneiberg & Lounsbury 2008; Soule 2009). Yet not all movement efforts at institutionalization succeed; the characteristics of both movements and institutions affect institutional willingness to adopt practices in line with movement goals (Davis & Anderson 2008).

Instrumental versus expressive action
BERT KLANDERMANS

Instrumental action refers to action as an attempt to influence the social and political environment; expressive action refers to action as an expression of people’s views.

Instrumental action presumes that participants take part because they believe that they can change their social and political environment at affordable costs. Therefore, movement organizations try to make participation attractive by increasing the benefits and reducing the costs of participation. Authorities or opponents for their part may try to make participation less attractive by imposing costs upon participants. Instrumental action presupposes an effective movement that is able to enforce some wanted changes or at least to mobilize substantial support. Making an objective assessment of a movement’s impact is not an easy task, but movement organizations will try to convey the image of an effective political force. They can do so by pointing to the impact they have had in the past, or to the powerful allies they have. They may lack all this, but then, they might be able to show other signs of movement strength. A movement may command a large constituency as witnessed by turnout at demonstrations, or by membership figures, or large donations. It may comprise strong organizations with strong charismatic leaders who have gained respect, and so on. From an instrumental perspective a solution must be found to the dilemma of collective action. Olson (1968) argued that a rational actor will choose to take a free ride, unless selective incentives (costs or benefits that are made contingent upon participation in the production of the collective good) prevent him from doing so. Therefore, instrumentality also implies the provision of selective incentives. Movements may vary considerably in the selective incentives for participation they provide. This is, obviously, also a matter of the resources a movement commands. Surprisingly little comparative information is available on the resources movements have at their disposal. In a similar vein, systematic documentation is lacking on the way in which the larger political system and the alliances and opponents of movement organizations influence movement participation. Tilly coined the now classic terms “repression” and “facilitation” to distinguish between political systems that increase or decrease the costs of participation. Indeed, repressive political environments may increase the costs of participation considerably: people may lose friends, they may risk their jobs or otherwise jeopardize their sources of income, they may be jailed, and they may even lose their lives.

Expressive action presumes that people take part in collective action because they want to express their views. In classic studies of social movements the distinction was made between instrumental and expressive movements or protest. In those days, instrumental movements were seen as movements that aimed at some external goal, for example, the implementation of citizenship rights. Expressive movements, on the other hand, were movements that had no external goals. Participation was a goal in itself, for example, the expression of anger in response to experienced injustice. Movement scholars felt increasingly uncomfortable with the distinction, as it was thought that most movements had both instrumental and expressive aspects and that the emphasis on the two could change over time. Therefore, the distinction lost its use. Recently, however, the idea that people might participate in movements to express their views has received renewed attention. Attention arises this time from movement scholars who were unhappy with the overly structural approach of resource mobilization and political process theory. These scholars...
began to put an emphasis on the creative, cultural, and emotional aspects of social movements, such as music, symbols, rituals, narratives, and moral indignation. People are angry, develop feelings of moral indignation about some state of affairs or some government decision, and wish to make that known. They participate in a social movement not necessarily to enforce political change, but to gain dignity in their lives through struggle and moral expression.

Acting on one’s view is one of the fundamental motives of action participation and necessarily charged with emotion. Appraisal and action are socially constructed, that is to say, are formed in interpersonal interaction, especially in the case of politically relevant emotions. Cultural and historical factors play an important role in the interpretation of the state of affairs by which politically relevant emotions are generated. Obviously, appraisals can be manipulated. Activists work hard to create moral outrage and anger and to provide a target against which these can be vented. They must weave together a moral, cognitive, and emotional package. But also in the ongoing activities of the movements emotions play an important role. In the literature, two kinds of collective emotions are distinguished – reciprocal emotions and shared emotions – that reinforce each other. Shared outrage against an injustice reinforces the reciprocal emotion of fondness for others because they feel the same way. Conversely, mutual affection is a context in which shared emotions easily arise.

Social movements play a significant role in the diffusion of ideas and values. Rochon (1998) makes the important distinction between “critical communities” where new ideas and values are developed and “social movements” that are interested in winning social and political acceptance for those ideas and values. “In the hands of movement leaders, the ideas of critical communities become ideological frames” (31), states Rochon, who continues to argue that social movements are not simply extensions of critical communities. After all, not all ideas developed in critical communities are equally suited to motivate collective action. Social movement organizations, then, are carriers of meaning. Through processes such as consensus mobilization or framing they seek to propagate their definition of the situation to the public at large. Social movements do not invent ideas from scratch, they borrow from the history of ideas. They build on an ideological heritage as they relate their claims to broader themes and values in society. In so doing they relate to societal debates that have a history of their own and that history is usually much longer than that of the movement itself.

Interest groups and social movements
ONDŘEJ ČÍSAR

This entry elaborates the conceptual similarities and differences between interest groups, social movements, and social movement organizations (SMOs). First, two views of their relationship are presented, followed by an abbreviated description of the main contributions to their conceptualization. Although, according to an important part of the available scholarship, contemporary SMOs and interest groups share many common features, the entry concludes by summarizing differences between the two concepts.

TWO APPROACHES

There are two basic ways to capture the conceptual relationship between interest groups and social movements. While still indebted to collective behavior theories, the first perspective conceptualizes interest groups as institutionalized and formalized collective actors included in the policymaking process. In this understanding, interest groups are political insiders. They are governed by formal rules, positioned close to power centers, mostly utilizing formal channels of political communication, and engaging in conventional strategies such as lobbying. The image of dressed-up lobbyists captures this understanding particularly well.

The same perspective views social movements as these lobbyists’ unruly siblings. Although they share the goal of expressing political demands and influencing politics – except perhaps for identity-oriented movements active in the sphere of civil society – they are much less institutionalized, often informal and, since they are excluded from routine politics, they rely on collective mobilization and protest instead of conventional action. As a result, the first perspective views interest groups and social movements as two “different kinds of collectivities” (see Snow, Soule, & Kriesi 2004: 7–8).

The second approach, drawing on classical pluralist and, to some extent, resource mobilization theories of collective action, regards the concept of social movement organization as something akin to the overlap of interest groups and social movements. From this perspective, in both their organizational structure and action repertoire, contemporary SMOs do not differ from interest groups (see also below). Consequently, Paul Burstein (1999: 19) claims that there is “no theoretical justification for distinguishing between social movement organizations and interest groups.” According to this approach, the difference is purely nominal: while sociologists prefer the term SMO, political scientists subscribe to interest groups. In their effort to bridge the two disciplines, Andrews and Edwards (2004) offer a synthetic definition of the advocacy organization, including not only (public) interest groups and SMOs, but also nonprofit organizations. Influential as it may be, their definition excludes one particularly powerful category of interest groups, namely business and economic groups.

Although they are embedded in different disciplines, the concepts of SMOs and interest groups share many common characteristics. According to the standard definition, an SMO is “a complex, or formal, organization which identifies its goals with the preferences of a social movement . . .” (McCarthy & Zald 1977: 1217–1218). At the same time, SMOs do not seek to run candidates for public office. Similarly, according to contemporary definitions, interest groups are organizations advocating for some degree of political or social change or continuity and not competing in elections (Beyers, Eising, & Maloney 2008: 1106).
INTEREST GROUP AND SOCIAL MOVEMENT STUDIES

Originating in the pluralism of Bentley’s *The Process of Government* (for a summary, LaVaque-Manty 2006), and fully expressed in David Truman’s *The Governmental Process* (1951), interest group studies viewed organizations as a vehicle, in a democratic society, that were more or less available to every population segment, through which citizens aggregate and articulate their preferences and interests. Interest groups serve citizens as a means of collective coordination and as a conduit for letting their voices be heard in the decision-making process. Similarly, resource mobilization theories underscore the role SMOs play in the coordination of collective action and sustaining that action over time. From this point of view, there are not as many differences between SMOs and interest groups as the first perspective would claim. Except for those interest groups that are completely devoid of individual members, such as some entrepreneurs’ associations, interest groups and SMOs are essentially the same in nature, providing individuals with organizational means to overcome a collective action problem.

In contrast to interest group studies indebted to the pluralist perspective, social movement scholars underscore the inequality in access to organizational resources existing across citizens and their groups (for a summary, Edwards & McCarthy 2004). Unlike pluralism, social movement studies demonstrate that the generally better resourced segments of society are also better organized, making it easier for them to collectively coordinate, mobilize, and influence political outputs. Nonetheless, there are also traditions within interest group studies, such as neopluralism, which acknowledge this inequality. Neocorporatism, in particular, made this argument one of its most important “trade marks” (Balme & Chabanet 2008).

While neocorporatism, like social movement theory, acknowledges the privileged access to politics enjoyed by some interest groups, it parts company with social movement studies by making these privileged groups – trade unions and employers’ associations – the sole focus of scholarship. According to the main idea of corporatism, the incorporation of trade unions and employers together with the state in coordinated tripartite institutions made the economic management of modern societies more effective and the distribution of national product more just (for a summary, Molina & Rhodes 2002).

Neocorporatism has developed as a distinctive paradigm in interest group studies and in complete isolation from the social movement field, partly because while neocorporatism was clearly European-centric in its focus, the empirical studies of social movements originally developed in the United States. The very different trajectories of Europe and the United States after World War II account for the separate development of these two fields of study. By including employers and trade unions in policymaking, European societies started to experiment with and build corporatist institutions to coordinate their postwar economic boom; in contrast, starting in the 1950s, the United States experienced consequential social movements, most notably the civil rights struggle and the various successors it inspired.

For some time, a division of labor existed: interest group studies were primarily defined by their focus on institutional insiders, while social movement scholars concentrated on outsiders instead. While essentially capturing the same type of phenomenon, namely the interest organization, the former researched those organizations integrated in policy process, and the latter called attention to institutional challengers (Burstein 1999). At the same time, both understood organizations as important preconditions of collective action, be it channeled intra- or extra-institutionally.

As stated by Meyer and Tarrow (1998), this distinction largely evaporated during the last decades of the twentieth century: with the exception of radical SMOs, which opt out of the established system of interest representation, in
contemporary Western “social movement societies,” it is easily possible to distinguish between interest groups and mainstream SMOs neither on the basis of their position vis-à-vis the political system nor the strategic repertoire used. First, some radical social movements of the 1960s and 1970s have become institutionalized and incorporated in routine democratic politics. In developed democracies, (new) social movements, such as environmentalism and feminism, may be as close to the decision-making process as (traditional) interest groups, such as trade unions. Second, important portions of the protest repertoire, traditionally associated with social movements, have spread across democratic polities and become institutionalized; protest is utilized as a more or less conventional way of claim-making nowadays. In many countries around the world, not disruptive social movements, but institutionalized trade unions are able to sponsor the biggest protest events. All in all, based on the level of incorporation and action repertoire, the distinction between the large part of SMOs and interest groups is no longer as pronounced as once argued. However, three important differences remain.

THREE DIFFERENCES

First, while interest groups may or may not be embedded in interpersonal networks and thus may or may not have a constituency on the level of individual citizens, SMOs at least need to claim that they are embedded in social networks and represent a particular constituency. Although this does not necessarily mean that all SMOs have to mobilize individuals – in fact, the opposite is sometimes true in contemporary democracies (Minkoff, Aisenbrey, & Agnone 2008; Fagan & Carmin 2011) – it nonetheless means that they engage in some type of either direct or indirect communication with them. A group formed by the representatives of the most important national corporations may still be a powerful interest organization, but at the same time lack any real ties to the public.

Second, unlike an interest group, an SMO is typically embedded in a broader interorganizational network defined by various types of mutual transactions. These can concern interorganizational cooperation, information exchange, resource borrowing, and most importantly an overlapping interest. While there can be a “free-standing” interest group, there is rarely a complete “SMO isolate.” Although an SMO may lack immediate organizational ties to other parts of the network, it often shares in the identity and/or interest of its constituent parts. In other words, SMOs form the nodes of broader networks, namely social movements constituted by “formally independent actors, who all identify nonetheless – if with variable intensity – with a common cause” (Diani 2011: 226). Unlike interest groups there are no social movement organizations without social movements, from which the SMOs derive their identity in the first place.

Third, interest groups may overlap only with a certain portion of SMOs. Unlike interest groups, there are radical social movements and SMOs that by their definition do not strive to be included in the conventional political process as legitimate partners. Instead of advocating a particular interest, they normally present both a comprehensive critique of the present order and its preferred alternative. Radicals deliberately refuse to develop a stable organizational structure, mobilize substantial financial resources, and be included in the political process: “to gain acceptance [for their claims] from a system they critique would be anathema” (Fitzgerald & Rodgers 2000: 587). Therefore, these radical SMOs consciously opt for disruptive strategies challenging the established system with its repressive apparatus to question its very legitimacy and existence.

Internet and social movements

VICTORIA CARTY

The emergence of new information communication technologies (ICTs) such as the Internet and the digital media boom in general, have strongly affected scholarship on social movements. The Internet has fuelled a new source of political energy that posits a new relationship between ICTs, political struggle, and public life. Electronic social movement organizations (SMOs) and online activists are redefining political struggle across the dimensions of contentious politics in terms of recruitment, mobilizing, strategizing, fundraising, and protest activities. The explosion of e-movements, e-protest, and e-activism highlights the importance of the Internet as an organizational tool to the dissemination of information and wired activism, and shows it has become a significant, if not essential, repertoire for social movement actors (Carty 2010). Many scholars therefore argue that the novel intricacies of the ICT-driven “network society” require a fundamental re-conceptualization of social mobilization that was originally formulated for face-to-face contact.

Historically, communication and information have been fundamental sources of power and counter-power of domination and social change. This is particularly true in contemporary society given the increasing numbers and variety of producers, distributors, and consumers of information through the World Wide Web and other digital forms of media using little time, effort, or money. New online technologies allow for more varieties of group formation and support among individuals, even among some of the most marginalized sectors of society who care about similar issues, as like-minded people are easier to find in cyberspace. Activists can use electronic communication to engage in direct civic communication outside of traditional broadcast media and national elites through the quick and cheap dissemination of information via e-mails, listservs, and bulletin boards that allow for discussion and debate. This has proven significant in the mobilization of political struggle and is of particular relevance for transnational social movements.

The potential of ICTs to organize social movements across borders was first illustrated in 1994 by the Zapatistas in Chiapas, Mexico, who declared war on the Mexican government to coincide with the signing of the North American Free Trade Agreement (NAFTA). They used the Internet, e-mail, listservs, and various web sites to reach an international audience who mobilized to pressure the Mexican government to adhere to a ceasefire (Garrido & Halavais 2003). Having accomplished this, the Zapatistas and their supporters helped form the Peoples Global Action Movement (and later the Global Justice Movement) during the 1996 global summit held by the Zapatistas that encouraged dozens of international grassroots social movements to work collectively to combat other neoliberal policies. Out of this summit also came collective organizational strategies to mobilize against the World Trade Organization when it convened in Seattle 2001 as days of action were repeatedly advertised over the Internet.

A few years later, the 2001 “Battle of Seattle,” which successfully shut down the World Trade Organization meetings, served as one of the first major examples of the significance of the Internet in terms of the intersection between online organization and offline mobilizing/protest. The Internet facilitated and coordinated not only the various networks of global protesters, but also permitted an international division of labor prior to and during the protests. Leading up to the three-day protest, in which over 500 000 activists from all over the world
participated, actions were electronically organized and mobilized via e-mail, bulletin boards, chat rooms, and alternative media outlets. The Web also facilitated global and simultaneous protests to coincide with the Seattle disruptive actions. Demonstrations were held in over 80 locations in dozens of countries (Rheingold 2003). These were organized through the web site (www.seattlewto.org/N30), which put out action alerts and calls for action in ten different languages to provide information regarding how potential participants could contact local directors all over the world to get involved. These protests set a pattern that was followed by demonstrations mainly organized by the Global Justice Movement at nearly every major summit over the next few years that targeted powerful economic/political entities, proposed treaties, regulatory agencies, and trading blocks. Targets included the International Monetary Fund, the World Trade Organization, the World Bank, the Free Trade Treaty of the Americas, EU meetings, and the G8 summits among others.

ICTs also proved critical in facilitating the largest global protest ever when, on February 15, 2003, 15 million citizens across 75 countries participated in a coordinated day of action, organized by the British-based Stop the War coalition, against the US invasion of Iraq in March of that year. More recently, protests against alleged electoral fraud following the 2009 Iranian presidential election demonstrated the power of not just the Web but also of social networking sites. The catalyst for the uprising was when Neda Agha-Soltan, a young female Iranian, was shot and killed by police during a protest. Amateur videos of the episode and her death spread virally across the Internet after being posted to Facebook and YouTube, and were eventually picked up by mainstream media coverage. This sparked solidarity among Iranians abroad in the United States, Britain, and Canada who protested outside of Iranian embassies in Washington, DC, London, and Toronto in solidarity (Bawaba 2009).

CONTRASTING THEORETICAL PERSPECTIVES OF THE INTERNET ON SOCIAL MOVEMENTS

The above examples support the more celebratory theoretical affirmations of the power of the Internet and claims among scholars that it can help build a new form of civil society based on what Castells (2001) calls the “electronic grass-rooting” of democracy. The power of horizontal networks of interactive communication via a many-to-many flow of communication, and the increased visibility of opinions and opportunities to network in the virtual sphere are viewed among many researchers as advantageous to political struggle. ICTs such as the Internet are in many ways resistant to state regulation and control over information and communication, and the flexibility and efficiency among online groups allows them to embrace a new type of civic engagement at the grassroots level and form “virtual public spheres” (Bennett & Iyengar 2008) and “post subcultures” (Kahn & Kellner 2004). Online networks also flatten bureaucratic structures and make boundaries more permeable and can lead to more collaborative decision-making and strengthen a sense of collective identity and community. Additionally, they result in a shift toward more fluid, issue-based group politics which can promote permanent campaigns and broad networks despite relatively weak ties.

These scholars also credit the Internet’s ability to create a “spillover” effect whereby online organizing, recruitment strategies, and information sharing lead to offline engagement in local and concrete settings.

Critical theoretical perspectives of the Internet, however, contend that social relations in cyberspace are not a substitute for traditional and face-to-face forms of community, protest, and collective identity, and these may in fact weaken forms of political engagement (Bimber 2003). Many discussion groups and listservs tend to be composed of like-minded people, and citizens self-select issues relevant to them. Other critiques highlight elite domination over cyberspace and control over listservs
by gatekeepers, as well as the digital divide regarding access to computers. Others note the phenomenon of “Cyberbalkanization” or the “echo chamber” effect (Putnam 2000). This means that online discussions can lead to fragmentation and polarization as viewers choose sites and discussion boards in search of like-minded people.

Additionally, state authorities can use sophisticated monitoring software to facilitate surveillance and repression via social media especially when material is deemed political or critical of the government. This was the case in Iran following the 2009 protests against the reelection of president Ahmadinejad whereby the government effectively shut down certain pro-opposition web sites and access to social networking sites (Bawaba 2009). Another example is Google’s announcement in January 2010 that it may pull out of China after hackers tried to access Gmail accounts of human rights activists.

AREAS FOR FUTURE RESEARCH

ICTs are certainly not monopolized by progressive social movement actors, and the Internet has both democratic and antidemocratic potentials. In addition to state control and regulation, conservative and extremist grassroots groups use the Internet, as well as other digital media such as MySpace, YouTube, Facebook, and Twitter in similar ways that marginalized groups do. The demonstrations against healthcare reform and the Tea Parties across the United States in general, as well as the use of the Internet to increase recruitment for jihad groups or the Ku Klux Klan, are some relevant examples. The dialogue within the social movement literature thus far, however, is limited regarding the undemocratic nature of the Internet. This serves as a fruitful area for more rigorous investigation. Also, more longitudinal and comparative studies, rather than just case studies, can help further the field of social movement research.

REFERENCES AND SUGGESTED READINGS

Resource mobilization, a dominant theoretical approach to the study of social movements for many decades, points to social movement organizations (SMOs) as a focal point for efforts to understand the variations in both the impact and fate of social movements. SMOs, like other types of political organizations, are expected to represent members' common preferences for some specified social change, acting to bring about such change by influencing formal political decisions, or the values and behaviors of the members of a polity, or both. In this context, the classic analysis offered by Robert Michels (1962) of typical evolutionary processes in the governance of political organizations, and the impact of such processes on organizations’ goals, is very relevant to scholars of social movements. Early studies of social movements often drew heavily on Michels’ work (e.g., Messinger 1955; Sills 1957; Zald & Denton 1963; Zald & Ash 1966), documenting and fleshing out the nature of the evolutionary processes he posited, and the transformational consequences for social movements. Concern with movement transformation has been less dominant in contemporary work, despite a lack of evidence that such processes are any less operative in current movement organizations. Below, the key processes involved in what Michels’ referred to as the “iron law of oligarchy” are sketched, followed by a brief discussion of some of the implications of this analysis for social movement researchers.

Drawing on his own disillusioning experiences as a member and supporter of a socially liberal political party in early twentieth-century Germany, Michels described a number of conditions and processes that inevitably impel (in his view) even the most democratically committed organizations to become divided into a set of elites, or oligarchs, with their own set of distinctive interests in the organization, and the rest of the membership, whose labor and resources are exploited by the elites. The first condition precipitating the drift to such an oligarchical system is, ironically, success in recruiting new members to the organization’s cause. As organizations grow, the ability of members to participate equally in organizational decisions becomes progressively more difficult, both because it is hard to find a place and time for all members to assemble and because decision making is significantly slowed – not infrequently to a standstill – as the number of decision-makers increases. The usual response to such problems is delegation of responsibility to a relatively small subset of members for formulating and recommending lines of action. Although members may attempt to maintain democratic control by demanding extensive explanations for leaders’ proposals and maintaining ultimate voting rights on these, a number of forces militate against such control.

First, as a very large body of research on organizations has documented, increases in organizational size lead to increases in complexity – the creation of separate, specialized positions and units to carry out different tasks – as well as to increases in rules and formal processes. Thus, effective administration requires both hard-to-gain, specialized knowledge of these aspects of the organization (Michels referred to these as “administrative secrets”), and what are often scarce organizing talents, such as the ability to manage interpersonal relations and to conduct logistical planning. This limits the ability of rank-and-file members to challenge leaders’ recommendations or decisions, and to replace them; thus, power increasingly inheres in the leadership.

Moreover, once ensconced, leaders are likely to acquire vested interests in maintaining their positions in the organization. As with complexity and formalization, increasing
organizational size also typically leads to the creation of full-time administrative positions; thus, office-holding becomes a means through which incumbents make their livelihood. Michels argued that this, in turn, makes it likely that the leaders will ultimately recognize their common interests in maintaining their positions within the organization, and develop a sense of solidarity with one another (becoming, in Marxian terminology, like a classe fur sich). As such, they are inclined to act cohesively in fending off criticisms and warding off displacement efforts by the membership. If serious challenges are not readily suppressed, the leaders may resort to co-optation of individual rank-and-file members, thus effectively hobbling lower-level resistance. Because their continued position also depends on the survival of the organizations, Michels also suggested that leaders of once-radical protest organizations are likely to guide them in an increasingly conservative direction, to minimize chances of state or general social sanctioning, and the ultimate disbanding of the organization. Given these commonplace evolutionary developments in organizations, Michels was led to the famous, pessimistic conclusion (1962: 365), “He who says organization, says oligarchy.”

As noted at the outset, Michels’ analysis has provided the basis for a number of classic studies documenting the evolution and transformation of social movements; it has also generated efforts to define conditions that may mitigate the postulated evolutionary processes (see Lipset, Trow, & Coleman 1956; Rothschild-Whitt 1979). In a classic analysis, Zald and Ash (1966) identified a number of conditions that affect the probabilities of oligarchical transformation, including the consonance between an SMO’s goals and values commonly held in society, the nature of the incentives provided to members and their involvement in an SMO, and the occurrence of turnover in founding members. It has been revisited, although somewhat less directly, in research and debates on the advantages and disadvantages of the use of professional employees by social movement organizations (e.g., Jenkins 1977; McAdam 1983; Staggenborg 1988). A key implication of Michels’ work for social movement researchers, however, has been given only limited attention: the need to understand sources of variations in governance arrangements, and their impact on SMO decision-making processes and outcomes. Some progress has begun to be made on this front (e.g., Carmin & Balser 2002; Jasper 2004; Osterman 2006; see also Tolbert & Hiatt 2009, for an extension to business organizations), and recent studies have explicitly called for more work (Minkoff & McCarthy 2005), but it remains an important, largely unexplored legacy of Michels.

Journalism and social movements
ALICE MATTONI

When looking at journalism from a social movement perspective, there are two possible viewpoints. On the one side, the journalistic field, its rules and values, routines and practices, is external to the social movement milieu. On the other side, the very notion of journalism has always intertwined with grassroots communities of activists that rethink and reshape journalistic practices from a bottom-up perspective. In the first case, scholars investigate the interactions between social movements and journalism at large, where journalism denotes mainstream journalistic practices. In the second case, conversely, scholars research the development of so-called alternative and grassroots journalistic practices within activist communities and networks.

Interactions between social movements and journalism situated into mainstream and for-profit media corporations usually rest on an asymmetric distribution of symbolic power in naming realities and give visibility to oppositional claims and demands. Both journalists and activists work at the symbolic level in that they participate in the elaboration of public and political discourses. Social movements, however, need journalists to reach wide audiences, but journalists do not need social movements in order to have news published in the press (Rucht 2004). Several studies underline the difficulties for social movements in achieving unbiased representation within the press. Due to the presence of strong news values, such as proximity and violence, usually both a selection and description bias characterizes journalistic accounts of demonstrations, rallies, and strikes (McCarthy, McPhail, & Smith 1996; Smith et al. 2001). This means that fewer mobilizations than those which actually occur receive journalistic coverage and, frequently, mobilizations able to gain journalistic accounts and reports suffer from misrepresentation and misrecognition. A factor influencing the limited access to mainstream news is the strong competition for news coverage amongst political and nonpolitical actors that surround contentious issues: political parties, interest groups, governments, and activist groups compete in the same arena to voice their own definitions and interpretations of a given contested topic (Ferree et al. 2002). In this competition, activist groups are usually the weaker ones in terms of material resources. Other political and nonpolitical actors than social movements, furthermore, often have a central role in the political and economic fields, which in turn have a strong influence on the journalistic field. Finally, journalists usually seek reliable and stable news sources, while social movements are changing and fluid subjects that refuse some of the dynamics on which the press relies. In the case of the Global Justice Movement, for instance, the movement often refuses to have an official spokesperson, while journalists prefer to have easily identifiable activists from whom they can elicit information about mobilizations.

The difficult interaction between journalism and social movements creates a dilemma for activists. Social movements, indeed, seek recognition in societies and they do so in an attempt to gain journalistic coverage. At the same time, however, they develop knowledge about journalistic routines and news values, through past experience and as active audiences, so that they frequently develop a negative image of journalism. The result is a continuous tension between the need to gain coverage and the awareness of the negative role that journalism may have for social movements in reporting mobilizations. For this reason, social movements often engage in several types of interactions within and at the borders of the journalistic field.
They accept and adapt to journalistic news values. They refuse and subvert journalistic routines. But they can also create alternative models of journalism that challenge the dominant one (Rucht 2004). The second viewpoint on social movements and journalism highlights the existence of bottom-up approaches to journalistic practices that is revisited through the involvement of activists and citizens that create and diffuse reports outside mainstream media corporations and within alternative, radical, autonomous, and independent media. Activists producing accounts of their own mobilizations and discourses act as grassroots and alternative journalists who put into question news values and organizational patterns at work in mainstream journalism. They, indeed, engage in a form of “native journalism,” according to which the boundaries between the news source and the person writing the news dissolve (Atton & Hamilton 2008).

Difficult interactions between social movements and mainstream journalism as well as the engagement with alternative journalism within the social movement milieu existed in the past and will continue to exist in the future. What changes, however, is the mediated space where this twofold interaction between journalism and activism takes place. The emergence of information and communication technologies contributes to a blurring of the boundaries between mainstream and alternative journalism in the online and offline environment. Portable communication devices like cell phones, for instance, render virtually everyone capable of reporting on demonstrations and struggles in the streets. Nonprofessional journalists produce video and audio accounts that are then uploaded into the online mainstream press. This enlarges the opportunities for social movements to gain visibility, but opens up new questions related to the role of mainstream journalism and alternative journalism in the construction of the public and political debates.

Law and social movements
STEVEN A. BUTCHER and JAMES E. STOBAUGH

Legal institutions, elites, and norms played an important role in the development of social movements over the latter half of the twentieth century, yet social movement scholars have only recently begun to take notice. The subfield of law and social movements has developed in two separate but increasingly integrated fields – legal scholarship and social movement scholarship – and has developed around two broad sets of research questions. First, is litigation an effective strategy for social movements? Second, what role does law play in shaping the trajectories of social movements? Early research tended to focus on the question of effectiveness, but more recent scholarship has expanded to include analyses focusing on the dynamic role that law plays in shaping movement trajectories. Here we focus on how legal institutions and strategies have been incorporated into existing social movement theories.

TRADITIONAL APPROACHES TO LAW AND SOCIAL MOVEMENTS

Traditional scholarship on law and social movements has been skeptical of the effectiveness of litigation as a viable tactic for social change. Sociolegal scholars have analyzed the many ways that law, as a formal institution, is biased toward the status quo and reinforces social hierarchies (Galanter 1974; Kairys 1998). To the extent that outsiders rely on law and rights-based strategies, these scholars have painted a pessimistic picture for successful social change. Early movement studies were very critical about litigation as a strategy for achieving broad-based social change. Indeed, the classic works of both Stuart Scheingold (2004) and Joel Handler (1978) were highly skeptical about the effectiveness of litigation. These scholars argued that litigation was a conservative strategy dominated by elites and that it saps the energy from more political and broad-based grassroots organizing (see also Meyer & Boucher 2007).

The lure of litigation, spurred in part by the successes of the National Association for the Advancement of Colored People’s (NAACP) campaign to end desegregation, has led subsequent social movements to take faith in a “myth of rights” – a view that directly links rights, litigation, and social change together in a unilateral process (Scheingold 2004: 5). Scheingold argues, however, that relying on the courts alone removes movement struggles away from being political struggles and that activists are more effective when they focus on the “politics of rights” – the infusion of rights strategies into a broader political strategy that includes multiple modes of activism. As Scheingold (2004: 8) notes, “litigation is more useful in fomenting change when used as an agent of political mobilization than when it is employed in the more conventional manner – that is, for asserting and realizing rights.” Echoing many of these arguments, Gerald Rosenberg (1991) argues that litigation strategies reflect a “hollow hope” for substantive policy reform. Drawing upon an impressive array of data across a variety of movement campaigns, Rosenberg concludes that litigation almost never leads to significant social change, and to the extent that it might, it is due to the unusual circumstances leading to the overcoming of judicial constraints, including elite and public support, low levels of opposition, and compliance incentives. Indeed, as Rosenberg illustrates, the NAACP’s desegregation campaign, which culminated in Brown v. Board of Education, spurred local opposition to enforcement and the mobilization of a strong countermovement – resulting in political failure, even though the litigation campaign was a success.

THE CONSTITUTIVE APPROACH TO LAW AND SOCIAL MOVEMENTS

Although early scholarship was skeptical about the role of litigation for social change, recent scholarship has focused on the more subtle, nuanced, and dynamic ways that law affects social movement processes. Moreover, whereas early scholars focused on a top-down, formalistic relationship between legal institutions and social movements, recent scholarship decenters law from a narrow focus on the courts and shifts the analysis to the social movement – focusing on the constitutive role that law plays in movement dynamics. As Michael McCann states, “law provides both normative principles and strategic resources for the conduct of social struggle . . . the primary project of legal mobilization analysis is aimed at the constitutive role of legal rights both as a strategic resource and as a constraint, as a source of empowerment and disempowerment, for struggles to transform, or to reconstitute, the terms of social relations and power” (McCann 2006: 22). Consequently, scholarship has focused on how law structures the very terrain that activists navigate in their struggles to reconstitute social relations. Indeed, in line with this perspective, the research agenda has been directed toward the indirect effects of law and litigation, focusing on how activists have used litigation to leverage power from targeted groups, build organizational resources, and mobilize constituents. This line of research also questions the assumption that lawyers necessarily co-opt and channel movement strategies – demonstrating that legal strategies are often incorporated in conjunction with other political strategies (McCann 1994; Cummings & Eagly 2001).

Studying law and social movements as a bottom-up, constitutive process aligns socio-legal scholarship with the long tradition of social movement scholarship that focuses on resources, political opportunities and threats, and framing. However, social movement scholars have been slow to include law in their models of movement processes. Nonetheless, there is a burgeoning line of research, which builds from a constitutive perspective.

SOCIAL MOVEMENT THEORIES AND THE LAW

Resource mobilization

Resource mobilization theory explains social movement mobilization, outcomes, and longevity from the standpoint of the resources available to movements (McCarthy & Zald 1977). Litigation can provide important resources to a movement to sustain its challenges. Historically, the view of law as a resource has focused on the availability of lawyers to represent the movement’s interest in the court (Handler, Hollingsworth, & Erlanger 1978). Lawyers bring important resources, including professional skills, knowledge, and legitimacy, to a movement, which are vital to navigate the complexities of the legal system. However, recent research has also shown that legal advocacy organizations can be also constrained because they privilege certain types of claims over others (Levitsky 2006). Other research has shown that the threat of litigation is often a valuable resource in balancing the power inequalities between challengers and their targets. For example, McCann (1994) illustrated that the threat of litigation by pay equity reformers was often enough to leverage management into bargaining with workers. Furthermore, others have found that litigation can provide indirect resources outside of the courts, including raising money from supporters and raising awareness of the issue in the media (Handler 1978; McCann 1994).

Political opportunity

Recent scholarship has incorporated the legal arena as a component of a movement’s overall political opportunity structure – representing both the “stable” and “volatile” dimensions of the theory (Pedriana 2004; see also Gamson & Meyer 1996). For example, legal systems (e.g., federalism in the United States) represent
a stable context that shapes social movement strategies whereas court decisions are examples of the volatile forms of political opportunity (Pedriana 2004: 184).

Focusing on court decisions as an element of political opportunity, sociolegal scholars have demonstrated that positive decisions can facilitate subsequent movement activity. For example, in his study of pay equity reform, McCann (1994) has shown how a positive victory expanded the space for activism—facilitating a "rights-consciousness" among female workers and spurring them into action. Similarly, in their studies of the civil rights movement, both McAdam (1982) and Morris (1984) illustrated that the victory in *Brown v. Board of Education* facilitated increased mobilization.

In her study of the lesbian, gay, bisexual, and transgender (LGBT) movement, Andersen (2005) developed a "legal opportunity structure" framework, which focuses on the importance of the institutional character of the courts. Courts can be more or less open to opponents at different points in time, which structures the types of strategies and cases that activists bring forward. Furthermore, recent scholarship has demonstrated how the expansion of legal opportunities for one group has affected subsequent movements. For example, Meyer and Boutcher (2007) argue that *Brown v. Board of Education* not only helped shape the expectations of the civil rights movement—by creating an opening in the legal and political system that the civil rights movement seized—but that the perception of a progressive court affected the legal strategies of other rights-based movements on both sides of the political spectrum.

**Framing**

Finally, there is a growing interest in the relationship between social movement framing and legal frames. Social movement frames are interpretive schemes that activists use to highlight problems, propose solutions, and mobilize constituents (Snow et al. 1986). It is through these frames that activists impart meaning to the environment, institutions, and their interactions with others. Recent scholarship has shown that framing toward the court matters for how a movement constructs its identity and for outcomes (Bernstein et al. 2009; Pedriana 2006). For example, Pedriana’s (2006) research on legal frames examined the contest that occurred internally within the National Organization for Women about which legal frames the movement should pursue. Similarly, in her study of Lambda Legal Defense and Education Fund, Andersen (2005) shows that the organization changed its strategy to pursue different legal frames at different times. Specifically, the issue of sodomy repeal was initially pursued using the legal frame of "privacy" but shifted to an "equal protection" frame in a later court challenge. Legal framing strategies are often contested and both examples highlight the consequences of legal frame selection, which can include both legal and symbolic cultural victories (Pedriana 2006: 1753). Beyond framing to the court, framing also matters in the legislative formation of laws. McCammon and her colleagues have shown the importance of strategic framing in influencing the adoption of laws allowing women to serve on juries (McCammon et al. 2008; McCammon 2012).

The choice of legal frames is constrained by several factors. Courts legitimize certain legal arguments over others, which affects the framing decisions of activists (Stobaugh & Snow 2010). Furthermore, opposing movements also influence the legal frames that activists choose (Andersen 2005). Because the American legal system is inherently adversarial, legal frames must counter the frames of the opposition within the acceptable institutional context. For example, the shift in legal frames utilized by creationists in advocating for intelligent design is a case where a social movement had to reframe itself in an institutionally acceptable manner but in so doing it also attempted to neutralize its rival’s framing strategy (Stobaugh & Snow 2010).
CONCLUSION

The intersection of law and social movements is a growing area of inquiry; however, mainstream scholarship remains slow to incorporate law as a central institution shaping social movement processes. Law is not only a target for activism, but is also a source of cultural meaning that shapes the terrain that activists navigate in their ongoing struggles for social change. Recent research has expanded upon these insights and we hope that scholars continue to incorporate law and legal institutions into existing social movement theories.

Leadership
BELINDA ROBNETT

Surprisingly little is known about leadership in social movements (Morris & Staggenborg 2004). It is not that there are no studies on leaders or leadership. Indeed, nearly all studies of social movements include some acknowledgment or discussion of the role of leadership in relation to, for example, recruitment, mobilization, or the achievement of goals. Rather, the area suffers from weak theoretical development, and a general failure to place leaders and leadership at the center of the analysis. Leadership is often tangential to analyses of social movement development, goals, tactics, and outcomes. Until recently, leadership has been treated as a structurally or socially constituted dependent variable, thus we know little about its independent effect on social movements.

THEORETICAL UNDERPINNINGS

Max Weber and Robert Michels have shaped our approaches to the study of leaders and leadership in social movements. Weber posited that there are three types of legitimate authority, legal, traditional, and charismatic (Weber 1947). Individuals will follow leaders only inasmuch as they fulfill the requirements of one of the three types. Just as Weber asserts the inevitability of the routinization of authority accompanied by bureaucratic structure, so too Michels argues that leaders of social movements eventually come to serve their own interests rather than that of the group they purportedly represent. The bureaucratization of the movement through party formation leads to the “iron law of oligarchy” (Michels 1962). The party leaders become isolated from their followers, and defend their own particular interests. Michels believed that “one dominant class inevitably succeeds to another” and that the principle of oligarchy is a “preordained form of the common life” (1962: 354). Both Weber and Michels view leadership as largely a product of structural forces (see Barker 2001). Legal authority and traditional authority as well as the “iron law of oligarchy” emerge from the nature of the structures inhabited by the leader. Charismatic authority is an exception, but it is temporary and cannot be sustained before succumbing to organizational imperatives.

PROBLEM APPROACHES TO LEADERSHIP ANALYSIS

Early sociological trends

Aminzade and colleagues provide an excellent critique of the theoretical treatment of leadership in social movements, arguing that structuralists, culturalists, and rationalists neglect the independent effect of leaders on social movement outcomes. Early sociological research on social movement leadership focused on structural imperatives, rendering leadership as either a dependent variable or an indirect variable (Aminzade, Goldstone, & Perry 2001). Adhering to the work of Weber and Michels, the research emphasized the impact of organizational shifts from the peak of activism to routinized bureaucracy on leadership change. In moving away from overly deterministic perspectives, scholars of social movements adopted Talcott Parsons’ general theory of action, which views leadership as a product of group processes with a focus on its relative influence in the decision-making process. Although extensively criticized for its failure to take power relations into account, the shift to a conceptualization of leadership as a product of group interactions broadened our understanding of the multiple contexts in which movement leaders operate.

Subsequently, scholars employed an organizational and institutional analysis in the study

The Wiley-Blackwell Encyclopedia of Social and Political Movements, Edited by David A. Snow, Donatella della Porta, Bert Klandermans, and Doug McAdam. © 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd. DOI: 10.1002/9781405198431.wbespm121
of social movements. Organizations form clusters because of incentives and their pursuit of specific goals. As a result of internal struggles and external pressures, particular types of organizations emerge, each requiring a specific type of leader. Leadership status, then, is conferred upon those individuals who can fulfill the organization’s needs.

Another area of earlier research on movement leadership applied a rational theory approach to examine why individuals choose to serve as leaders, and emphasized the costs and benefits of leadership. The costs include the expenditure of time and energy, and the benefits may include status, monetary benefits, and deference goods or psychological gratification. Ultimately, this explanation also rests on structural imperatives. Leaders lead because the costs do not outweigh the benefits. Research shows deference incentives or psychological gratification is not enough to overcome the costs (Oberschall 1973), thus structural incentives provide the basis for continued leadership. The structuralist and rational choice approaches treat leadership as a dependent variable that is determined by the organizational or movement needs and resources.

The contemporary treatment of social movement leadership

Much of the contemporary treatment of leadership in both the political process models and framing traditions views leaders as intermediaries or tacticians, between the movement and the state, or between culturally held beliefs and followers. Theoretically, leaders emerge from organizational structures and because of political opportunities. As Morris and Staggenborg (2004) have pointed out, not all leaders take advantage of political opportunities (Oberschall 1973), but they maintain that leadership emerges from preexisting structures.

Morris and Braine (2001) provide a significant contribution to our understanding of the relationship between leadership emergence and the type of a social movement. In liberation movements such as the US civil rights movement, leaders emerge from preexisting institutions such as the Black church; in special issue movements such as the abortion rights movement, they emerge from preexisting, related movements such as the women’s movement; and in social responsibility movements, leaders may emerge suddenly, as in the Mothers Against Drunk Drivers Movement (MADD). Cultural tradition and political contexts are central to their analysis, but these are mediated through structures. In the case of the civil rights movement, tradition dictated that Black ministers lead the movement, and Candy Lightner spearheaded MADD because she framed the culturally resonant message of the “killer drunk” that supported the “personal responsibility” ideology promoted by 1980s conservatives during the Ronald Reagan era (Morris & Braine 2001). As scholars have pointed out, not all leaders emerged from the church. At the time, the church tradition and culture did not support women as formal leaders, yet their leadership emerged less from structures than from the cultural context of their communities and spontaneous events (Robnett 1997). Thus, while structural analyses help us to understand the emergence of some leaders, it only provides a partial understanding of who becomes a movement leader and how.

Although critical to our understanding of social movement processes, the framing approach provides another example of the limits of structural and cultural analyses as they have been generally applied. Leaders serve as protest persuaders, emphasize success in the face of defeat, transform cultural understandings, and market and package issues. Movements are movements because leaders successfully frame a core set of beliefs to which followers align their understandings. This approach neglects the multiple variations in the success of frame alignment.

Leaders must choose among a large array of resonant long-standing beliefs, amplifying some, altering others, and choosing to downplay those that will undermine the movement’s
ability to recruit or sustain followers. The framing perspective provides agency to leaders, but often neglects the negotiation processes (Payerhin & Zirakzadeh 2006) or the ways in which such processes determine movement outcomes. As Payerhin and Zirakzadeh acknowledge, some framing analysts discuss internal disagreements and factions, but nonetheless focus on consensus.

A relational perspective views movements as segmented contentious entities (Melucci 1996). Leaders must expend considerable energy building some semblance of temporary cohesion. That frames are critical to this process is undisputed. What we do not know are the circumstances under which leaders are best able to achieve consensus. What types of leaders are most able to unify meanings and contending movement groups? What types of leadership structures, both within the movement as a whole and within specific movement organizations, are most amenable to frame alignment? In order to answer these questions, researchers must examine the direct effects of leadership on social movement outcomes.

RELATIONAL APPROACHES TO LEADERSHIP

The relational approach to leadership challenges the notions that rational choices and/or organizational needs determine who becomes a leader and leadership styles. It illuminates the processes through which actors acquire and maintain authority. Organizational structures both within and outside of the movement remain important, but within a relational context. Conceptually, leadership may consist of an individual authority or levels of individuals with authority within a movement (Ganz 2000). Authority, however, stems not just from the internal dynamics of a movement but also from the acknowledgment of opponents, the media, and other supporters. Leaders operate in a field in which they must simultaneously focus on external and internal interactions.

Charismatic, traditional, and legal–rational authority are products of the processes of authority legitimization. The interaction patterns between each of three types of leaders – charismatic, ideological, and pragmatic – and social movement followers is the central focus of the relational approach. This processional model gives agency to leaders as, for example, the charismatic leader must initiate her/his role, by articulating for and acting on behalf of the community.

Although this approach represents a significant conceptual and theoretical leap, several gaps remain. Our understandings of the relational processes through which leaders gain leadership status, inspire commitment, and influence movement outcomes require further development. The focus of much of this research remains on leaders’ capacities to manipulate movement strategies and tactics in response to political opportunities or repression. We still know little about the nature of the relationship between organizational structure and leadership capacity, the social psychological aspects of the interactions between leaders and followers, or the relative influence of different levels of leadership on organizational capacity.

THEORETICAL AND CONCEPTUAL GAPS

Organizational structure and leadership capacity

There is little attention paid to the nature of the relationship between organizational structure and leadership capacity. “To progress beyond Weber, scholars need to construct empirically based typologies that can tap the kinds of leadership within SMOs over time and can also relate organizational characteristics to expected bases of authority” (Baker 1982: 335). Ganz’s (2000) richly detailed comparative analysis of the United Farm Workers (UFW) and Agricultural Workers Organizing Committee (AWOC), for example, provides the basis upon which further research may be built.
Ganz’s focus on what he terms the strategic capacities of organizations and leadership includes three key areas. Both organizations and leaders are more likely to effectuate successful movement outcomes if they have access to salient knowledge about the local or global environment, cultivate heuristic processes that are deliberative and inclusive of multiple repertoires and ideas, and are personally, as opposed to professionally, motivated and committed because of intrinsic rewards. Conceptually, Ganz’s work expands our knowledge of the factors that enhance successful strategic organization and leadership capacities. However, in his formulation, organizational structure and leadership capacity operate as separate entities, each with a set of strategic capacities. Unlike the UFW, AWOC failed to organize support because of its hierarchical organization and the professional rather than personal style of its leadership. What is unclear is the extent to which the organizations reflect the leadership types, or the leadership types reflect the organizational structures. Moreover, there is some suggestion that the outcomes may have been influenced, in part, by the race-ethnicity of the leaders.

Identity

Recent scholarship finds that race-ethnicity influences organizational life and can enable or constrain leadership. Nepstad’s and Bob’s (2006) research shows that ascribed characteristics impact the success of movement strategies. They posit that successful leadership capital is comprised of cultural capital, social capital, and symbolic capital. Leaders must possess localized cultural capital or an understanding of a community’s grievances, universalistic cultural capital, or knowledge of the broader society’s “values, sympathies, cultural principles, and political trends,” and transcultural skills or the ability to connect to groups in other movements. Social capital is essential in the form of strong ties to members but, in larger groups, the primary leader must have strong ties to secondary leaders. In comparing two anti-Vietnam direct action Plowshares movements, the authors find that, with similar cultural and social capital, the US Plowshares movement was successfully mobilized in contrast to the movement waged in Sweden. The former was led by priests who framed the message around biblical texts. In more secular Sweden, male leaders attempted to frame the movement ideology with a popular feminist discourse. Their attempts failed largely because they were men (Nepstad & Bob 2006). Thus, symbolic capital derived from status or ascribed qualities matters. Specific leader qualities can determine the acceptance or rejection of a resonant frame.

Still, many unanswered questions remain. First, given that symbolic capital is dependent upon perceptions, which perceptions count? Who is designated “the leader” of a movement variously requires the acknowledgement of followers, the larger public, state actors, and supporters. How does this relational process work? Second, recent scholarship has failed to systematically analyze the ways in which such constructions may influence leadership styles, movement structures, and strategic choices. Feminist organizations have been characterized as collectives that require consensus in decision making and nurture an ethic of care. It is clear that the style of leadership and decision-making processes may be influenced by the identity of the leader. Third, there is evidence that identity constructs influence strategic choices. Baker’s (1982) research on a lesbian-feminist group shows that the leaders’ commitment to radical egalitarianism led them to consciously sacrifice organizational maintenance. In keeping with Weber’s and Michels’ predictions, the organization moved from a less structured organization to a bureaucratic hierarchical model, but the leaders’ personal commitment to anti-masculine models of egalitarianism led them to dismantle it (Baker 1982). Comparative analyses of different types of movements over time are needed to determine if, when, and how identity influences social movements.
MULTIPLE LEVELS OF LEADERSHIP

Levels of leadership are also associated with ascribed characteristics and the social meanings attached to them. Both gender and race served to constrain and enhance the leadership capacities of participants in the civil rights movement. For example, black women’s leadership contrasted with that of black men and white women. While black men occupied formal leadership positions, black women largely served as bridge leaders, who through face-to-face interactions fostered ties between the social movement and local communities. White women’s leadership was significantly more constrained. Traveling throughout the South with black male activists often provoked violence, so their leadership skills were generally focused on connecting white mainstream institutions to the movement. All three types of leadership, however, were crucial to the success of the civil rights movement (Robnett 1997). Most studies of leadership in social movements focus exclusively on a single leader or a small core of primary leaders. Leadership, however, is often comprised of multiple levels, as organizations may include grassroots branches or other tiers of leadership. Leadership teams are found to reduce or prevent burnout, to sustain long-term leaders that in turn support the longevity of a movement (Reger & Staggenborg 2006), and to facilitate strategies that cultivate both a general membership and a loyal cadre (Robnett & Alabi forthcoming). Analyses of the multiple roles and levels of leaders may tell us a great deal about leadership capacity, about the ability of movements to create a movement culture or collective identity, and about the ability of movements to frame cognitive understandings and respond to emotional needs.

CONCLUSION

The relational approach to the study of leadership in social movements is promising, but we must guard against the tendency to reduce the role of leaders to that of strategists or tacticians who simply fulfill the needs of movements. Leaders are much more than intermediaries, and analyses of leadership in social movements should examine their independent effect. To be sure, leaders must develop strategies, respond to crises, interact with state or institutional officials, persuade followers and potential adherents, and frame movement outcomes. However, leaders and leadership structures are more than the sum of these parts. Leader characteristics such as gender or ethnicity matter inasmuch as such qualities may inspire or dissuade others to act, impede or enhance democratic processes, and connote status or power. Leaders do not emerge in a vacuum, but derive acceptance and acknowledgement from others, determined largely by socially constructed and culturally embedded understandings of who should lead. As scholars of social movements, we must be as concerned about who becomes a leader as by who does not.

One way to avoid slippage into a structurally deterministic analysis of leadership is to examine relations of power. This necessarily entails a comprehensive understanding of the relationships between multiple levels of leaders, between leaders across the movement sector, between leaders and state actors, between leaders and followers, and between leaders and opponents. Analyses of frames, strategies, tactics, and organizational structure do not always tell us about the relational dynamics of power that produced them.

Leadership

Life history research and social movements

Catherine Corrigall-Brown and Mabel Ho

Life history research is a useful technique in qualitative methodology. This technique is suited for researchers interested in generating rich and textured detail about social processes, understanding the intersection between personal narratives and social structures, and focusing on individual agency and social context. Life history research captures the participants’ subjectivities while being aware of potential pitfalls such as generalizations and memory recall problems. Life history research can deepen our understanding of social processes, including social movements. Here we examine what life history research is and when it is used. Through an examination of two social movement studies that employ these techniques, we assess the utility of these methods. We conclude by discussing potential problems associated with this methodology and how to deal with these issues.

WHAT IS LIFE HISTORY RESEARCH?

Life history research explores how the individual, group, or organization experiences and interprets their particular circumstances (Denzin 1989). In practice, methods that employ life history research are varied, including life history interviewing, biography, case history, ethnography, and oral history. The focus for the life history researcher is to situate the participants’ lived experiences in the broader economic, social, historical, cultural, and political context (Cole & Knowles 2001). As a qualitative methodology, life history research is interested in the subjective experience of participants. Because of this, research in this tradition directs attention to the participants’ perception of what issues are central. As a result, life history research has a potential to be filled with rich and nuanced descriptions when exploring a particular phenomenon.

Life histories in social movement research are oriented toward understanding the experiences of individual activists over time and exploring the interaction between macro events such as protests and social movements with individual actions and identities. In life history interviewing, the informant herself or himself is often the subject of study, in addition to serving as an observer and narrator of the past. Scholars using life histories pay close attention to how individuals tell stories about their past and to how their accounts of social movement participation fit with other events in their lives (Blee & Taylor 2002).

WHEN IS LIFE HISTORY RESEARCH USED?

While there are a number of different ways that life history research can be used, we focus on the role of life history techniques within interviewing. Interviewing has a number of benefits as a methodology. Through interviewing methods, scholars can gain access to the motivations and perspectives of a broader and more diverse group of social movement participants than would be represented in most documentary sources and brings the role of agency to center stage. In addition, interviewing allows researchers to scrutinize the semantic context and meanings of statements by social movement participants and leaders. Interviews can provide a longitudinal window on social movement activism and allow social movement scholars access to such nuanced understandings of social movement outcomes as the construction of collective and individual identities (Blee & Taylor 2002).

Blee (2003) describes four important contributions life history interviews bring to social movement studies. First, as life history
research is participant centered, researchers are able to draw connections between identity and ideology as understood by the participants. This personal narrative construction allows the researcher to pinpoint tipping points in an individual’s life. Second, the life-story technique provides political and discursive context of the social movement. Third, life history traces the cause and effect in participants’ lives and how the individual’s life trajectory intersects with broader societal changes. In other words, this technique allows for conceptual dimensions of time, agency, and context to be explored critically and to assess their interactions in an individual’s life. Fourth, the life history approach can capture the patterns of participation in social movements. For example, issues surrounding strategies involved in mobilizing social action and the dynamics within a social organization can be explored. Life histories provide rich depth and a thorough examination of individual subjectivities. The goal of the researcher is to locate and identify the interaction between individual narratives and the context that surrounds it.

LIFE HISTORY RESEARCH AND SOCIAL MOVEMENTS

There is a wealth of research within social movements that uses life history methods. We focus on two examples of such studies: Blee (2003) and Corrigall-Brown (2011). These studies illustrate how life history interviews can be used to answer fundamental research questions in the area of social movements.

Blee’s (2003) study of women members of the contemporary US racist movement used life history interviewing to explore how women, often from secure, stable, and politically moderate backgrounds, come to be committed to the violent and extremist agenda of organized racism. Blee’s decision to use life history interviewing was shaped by her theoretically informed interest in understanding racist activism as a constructed identity whose meaning changes with the increased exposure to a racist group. Through life history interviews with her participants, Blee challenges conventional preconceptions of the women who participate in hate groups and disentangles the cause and effect of why women join the racist movement. This analysis also illuminates the critical involvement women play in the hate movement in their roles in families, as social facilitators, and as recruiters. Thus, the life history approach is useful for exploring the internal dynamics within this social movement as well as providing rich insight to how organized racism perpetuates in contemporary times.

Corrigall-Brown’s (2011) study of individual trajectories of participation in social movements is also, in part, based on life history interviews. While quantitative data is used to assess the general demographic, biographical, and resource factors that predict participation in social movements, this type of quantitative data is less well suited for assessing the role of important factors like social ties and identity in predicting the trajectory of an individual’s participation over their lives. Because of this, Corrigall-Brown employed life history interviews with 60 activists in four movements in order to trace their engagement in social movements from their initial engagement until the present day. These interviews allow for an assessment of, for example, how individuals understand their identities as supportive of, or not connected to, their activism and how these identities change over time.

Both these studies illustrate how life history interviews can give a researcher insight into the ways that individuals make sense of their engagement in social movements and why they continue to participate in these groups over time. In addition, the element of time is explored in both studies, which enables the researcher to illustrate how the experiences of individuals evolve and change instead of being static and stationary. These life histories add to our understanding of larger social movement processes.
ISSUES AND PROBLEMS IN LIFE HISTORY

Biographical reconstruction and memory failure are always a problem in life history interviewing. Although revealing how social movement participants make sense of their lives, life histories need to be used with caution since they can be highly unreliable indicators of autobiographical change. For example, virtually all of Blee’s racist informants spoke of their decision to participate in an organized racist group as the result of a “conversion” (2003). Yet it was clear from their responses to a structured questionnaire that few became converted to racism before joining a racist group. Most joined through a personal connection to a current member and only then learned intensely racist ways of thinking. Mills’ (1940) insight that vocabularies of motive are often furnished “after the act” is a useful reminder that it is problematic to take at face value a respondent’s articulated reasons for joining a social movement. For this reason, social movement researchers need to weigh life history accounts against data from other sources.

There are a number of ways of dealing with this issue of biographical reconstruction. One technique used by Polletta (2002) to respond to these problems was by discussing particular decisions, sometimes showing interviewees portions of meeting minutes. In addition, she conducted a number of group interviews with two to six people, all with histories in the same organizations. From diminishing interviewees’ candor, the group setting allowed people to jog each other’s memories and to push each other to give unvarnished accounts of the internal dynamics of their organizations.

It is also useful to structure questions around past events rather than past attitudes because memories of events are more reliable (Markus 1986). In addition, research shows that more salient, less repetitive events are remembered with particular accuracy (Scott & Alwin 1998: 114). To this end, it is possible to ask respondents about memorable life events, such as the birth of a child or marriage, and then ask if this event had occurred before or after pivotal participation events. This makes it possible to assess more clearly the temporal order of events and cue respondents to the context in which they made particular decisions or experienced certain events.

CONCLUSION

Life history techniques can be used with a variety of qualitative research methods, such as ethnography and case studies. They provide rich descriptions of social processes, focus on the intersection between individual experience and social context, and allow for an examination of temporality. While there are potential problems with life history approaches, such as issues of recall and biographical reconstruction, these issues can be moderated through the use of techniques that help respondents more accurately recall information and situate that information in larger context. When used effectively, life history research can provide important insights into the dynamics and processes of social movements and illuminate key issues such as individual recruitment and participation in social movements, identity changes in movements over time, and the role of the individuals in larger social movement campaigns.

Marxism and social movements

COLIN BARKER

One distinctive feature of Marxist thought is that it yokes together three ideas: class struggle, social movements, and social revolution. For Marx and Engels, struggle between classes was both a characteristic of exploitative modes of social production, but also the means by which class society could be abolished. Marxism thus generates a central theoretical and practical question. How can humanity emancipate itself from the toils of existing capitalist society and begin creating a new and different form of society?

There is a second question. How does the language of “class struggle” mesh with an understanding of “social movements” (or, simply, “movements”)? Marx, Engels, and their successors regularly used the term “movement” (and less regularly “social movement”), but none seems ever to have fully defined their usage. An account of Marxism’s approach to social movements must therefore involve a degree of selection and reconstruction, and must hold in mind that Marxism is itself both a contested and a developing tradition.

The main theme of Marxist thinking and practice is the struggle against capitalism as a system. Capitalism is one of a set of “modes of production,” a term delineating the dominant form in which human social cooperation is organized across a whole historical epoch. What distinguishes such modes of production, Marx suggested, is the particular form in which “unpaid surplus labor” is pumped out the class of immediate producers: “the direct relationship of the owners of the conditions of production to the immediate producers” provides “the innermost secret, the hidden basis of the entire social edifice, and hence also the political form of the relationship of sovereignty and servitude, in short, the specific form of state in each case” (Marx 1981: 927).

The form taken by exploitation also shapes the ways that class struggle develops. Under capitalism, surplus labor is pumped out of the direct producers in the money form, as surplus value, accumulated by the bearers of capital. This mode of cooperation is marked by a number of core contradictions and oppositions.

The inherent opposition of “economic interests” between capital and labor is interwoven with a contradiction between opposed legal–political principles. Value and surplus value rest on commodity production and exchange. That, Marx stresses, does indeed presuppose a form of freedom and equality between participants. The principles of market exchange, celebrated by liberalism, are indeed what he terms “Liberty, Equality, Property and Bentham” (Marx 1976: 280). Capitalism – unlike slave or feudal modes – can function with direct producers who are legally free and equal before the law, and who possess “rights.” Liberalism cannot, however, adequately explain how enormous surpluses are accumulated in a few hands alongside material poverty and propertylessness for the many. Behind the surface freedoms and formal equality of exchange Marx uncovers a netherworld of production where these relations are reversed. Here seeming equals are transformed into master and servant, capitalist and worker; here the freedom to make contracts becomes a world of “despotism,” where the propertyless labor under the command of and to enrich their rulers.

Capitalism’s inner movements are dominated not only by exploitation but also by competition – both between the bearers of capital and the bearers of labor power. Competition compels capitalists into endless innovation, giving this system its dynamic expansionism. Capitalism has, on one hand, generated vast increases in human productivity, and forcibly drawn the entire globe into a
single interacting world market, while, on the other hand, it is also a system beyond anyone’s power of control. It has produced untold riches alongside grinding poverty, ferocious expansions and convulsive collapses, immense growth in both human creativity and human destructiveness.

The “pumping” of surplus value, driven by competition, sets up systematic conflicts across the whole face of society. Class struggle, an inherent property of this system of social relations, is a two-sided affair: labor must find ways to evade or limit capital’s depredations just as capital must struggle to contain and overcome labor’s resistance. Even considered at its most abstract level, however, class struggle is interwoven with competitive impulses. Those who play the part of capital form a working fraternity vis-à-vis labor, while they are also (especially in periods of crisis) a band of “enemy brothers” (Marx 1981); and while labor may share common interests vis-à-vis capital, it too is divided by competition in labor markets into potentially “hostile brothers and sisters.”

In this system, the translation of “class interests” into political action is always liable to be a complex and difficult process, since the key social forces identified are also riven by inner rivalries and mutual conflicts. Just to add to the problems, Marx identifies two other reasons why the proletariat might find its gravedigging work difficult. First, “the dull compulsion of economic relations” means that the worker “by education, tradition, habit, looks upon the conditions of that mode of production as self-evident laws of Nature” (Marx 1976: 899). Second, there is the impact of ideas supportive of the dominant social order: “The ruling ideas of every age have ever been the ideas of its ruling class” (Marx and Engels 1973: 85).

Historically, capitalism has expanded not only by “economic” means. Its history has included the colonial subjugation of whole peoples, slavery and other kinds of forced labor, wholesale depopulation and the forcible breaking up of older systems of social reproduction, immensely destructive wars, along with the promotion of racist, sexual, and religious oppression. The combination of capitalism’s development and resistance against it has always entailed more than a simple economic opposition between capital and labor.

For capitalism’s Marxist antagonists, these complexities set up both theoretical and practical–strategic problems, reflecting the need to understand and oppose capitalism at a number of different levels which are themselves interrelated. Marx’s own methodological reflections are very explicit about the need to distinguish between different levels of abstraction and concreteness (Marx 1904, 1973; Ilyenkov 1982; Ollman 2003). In *Capital*, Marx mostly explores the inner workings of the capitalist mode of production at a high level of abstraction. Its landscape is populated by “bearers of economic relations” – the capitalist, the laborer, the financier, the landowner – who appear as “cartoon” characters lacking all but the most general history, who speak no definite language and draw on no particular cultural traditions. This abstraction is necessary in order to define the capitalist systems underlying processes, relationships, and tendencies of development.

In these terms, “class struggle” too is a concept involving a high level of abstraction, generalizing from a multitude of forms of both domination and resistance across whole historical epochs. Much greater historical concreteness is required, however, to explore how people, as Marx puts it, “fight it out.” *Classes* are not themselves coherent political actors, capable of acting as single entities: they are inwardly divided by particular interests and perspectives, subject to conflicting impulses and pressures. Political actors are compelled to confront “class issues,” in the sense of problems arising from the nature of capitalism’s underlying character, but their action is always “mediated” by a host of concrete particulars.

Marxism is sometimes mistakenly described as a “structuralist” theory – which would imply it has no room for social movements, or indeed for human agency. Rather, Marx construes agency and structure as dialectical poles of an
ongoing and developing unity. Human beings are active creators of their own history, though not under conditions of their own choosing. On one hand, they necessarily enter into social relations that are the product of previous activity and independent of their will (Marx 1904). These social relations have their own “emergent properties” independent of the individuals who compose them: for example, divisions of labor, rules, patterns of rights, and responsibilities. They coexist at a whole number of levels, all the way from epochal “modes of production” to the immediate and local relations of family, neighborhood, and workplace. On the other hand, the people who, as self-developing, active, reflective beings, compose these various systems of activity also actively remake them as they “live” them. They regularly run up against features of these systems that impede them in the pursuit of their self-developing needs and goals. As they seek to resolve the problems thus engendered, they act in ways that are liable to disrupt existing patterns, generating conflicts that potentially reconfigure both their social relations and themselves as actors. Such a general conception underlies a Marxist approach to social movements.

Only at a more immediate level than that explored in Marx’s Capital can we locate definite people, speaking in particular tongues and with their own histories and traditions, struggling to understand and achieve control of their material and social conditions. It is at this more immediate level that “social movements” emerge, as specific forms of social and political activity.

From a Marxist standpoint, social movements – the predominant form in which the class struggle is fought – are collective achievements, transcending individual and atomized responses to the problems posed by capitalism. For Marxism, collective organization and activity is significant, for it contains within itself the immanent possibility of alternative ways of organizing social life.

Movement organizational forms vary in permanence, from temporary “crowds” to semipermanent institutional networks. Like repertoires of activity, these forms are not fixed, but shift according to how participants respond to immediate situations. The inherent changeability of form and of activity provokes an ongoing Marxist concern with how movements transform themselves and their potentials.

A movement does not possess a unified “identity,” “ideology,” “cognitive praxis,” or “strategy.” Rather, movements are fields of argument. What is a movement’s purpose? What is it trying to maintain or change? How are its boundaries defined? Who are its opponents, and why and how are they organized? What strategies, tactics, and repertoires of collective activity should it deploy? How should it respond to specific events and crises? All these and other matters are open to ongoing contestation and debate among a movement’s varied adherents – and not only among them. For nothing prevents a movement’s opponents from also seeking to influence the way it interprets the world and seeks to alter it. The means of such influence vary according to the opponents’ nature, but they include the deployment of law and state force, control of mass media, co-optation and neutralization of movement “leaders,” and so on. Movements, precisely because they engage in social conflict, induce responses from opponents that shape the ways they develop. The “class struggle” is conducted not only between movements and their antagonists, but also within them: their ideas, forms of organization, and repertoires of contention are all within their opponents “strategic sights” (Shandro 1995). Marxist theory is reflexively concerned with its own active involvements and interventions in class struggle, as movements conduct it and argue about it.

In one respect, Marx and Engels, along with other nineteenth-century thinkers, employed the language of “social movement” in a way different from much contemporary usage. They wrote not of “social movements” as a multiplicity, but of “the social movement” as a single entity, describing the upsurge in popular organization that marked the turbulent politics of Europe and beyond in their period. For
them, the term encompassed revolutions, trade unionism, suffrage movements, nascent feminism, the emergence of socialist and utopian ideas, demands for national independence and unification, peasant pressure for land, and more—and the ways that these were challenging and sometimes transforming states’ legal and political systems. All these, taken together, constituted a single reality: “the social movement,” a notion with a loose class reference, indexing political and social organization by “the poor,” “the plebs,” the working classes’—all those contesting “the social question” but also the “national” and “colonial” questions. In this usage, “social movement” denoted a whole field of emerging political and social struggles, seen as mutually interacting, sometimes underground and sometimes overt, sometimes mutually reinforcing but sometimes contradicting forward movement, and variably capable of embodying a challenge to class privilege and domination.

This usage was connected to their overall concern with social revolution. Rather than following today’s academic tendency to consider movements as relatively distinct entities, each conceptually isolated from each other—for example, the “peace,” “labor,” “feminist,” “gay and lesbian,” “black,” “migrant,” “ecology” movements—they considered the pattern of organization of resistance as a whole in relation to the totality of capitalism. That involved a continually critical probing of the limits of existing forms of movement activity, organization and ideas, matched by an ongoing concern with the kinds of interventions that they and their co-thinkers might make with respect to existing movement practice and ideology.

Some accounts assume that “class struggle” refers only to immediate struggles between capitalists and workers over matters like wages, hours, working conditions, and the like, and that such struggles enjoy some kind of “primacy” over all other questions. This was not Marx’s own view.

There is no question that Marx and Engels, and their successors, paid great attention to the “labor movement” aspect of the social movement. They treated labor movements—trade unions, socialist parties, cooperatives—as embodying a combination of struggle against the rule of capital with submission to its dictates. Marxism, from its beginnings, involved a critical stance toward working-class practices and institutions. Marx did not—unlike many nineteenth-century socialists—reject unions and strikers, but rather urged that their demands (e.g., “a fair day’s work for a fair day’s pay”) and their forms of organization were insufficient. Trade unionism limited itself to “guerrilla war against the effects of the existing system” instead of using its organized power to bring the wages system itself to an end. The workers’ movement needed to go beyond economic struggles to a political movement, “a movement of the class, with the object of enforcing its interests in a general form, in a form possessing general, socially coercive force” (Marx 1965b: 271). However, Marx also celebrated the victories of the Ten Hours campaigns, and of the cooperative workshops, not so much for their immediate achievement as for outlining the beginnings of a “political economy of labour” (Marx 1974: 79–80). The argument is characteristic of Marx’s revolutionary theory: he looks within existing movement practice for intimations of future possibilities, for what is potentially immanent within it, and draws its significance to the movement’s attention.

Trade union struggles certainly have a particular significance for Marxism, for at least three reasons. First, in most capitalist countries, trade unionism remains the largest “part” of the social movement in terms of simple, continuous membership. Second, workers engaging in strikes, the most characteristic form of union action, do—even if in limited measure—challenge capital’s power. Third, collective action itself changes the participants, partly transforming their view of themselves, of their own potentials, and of their relations with fellow workers. It was in that sense that Lenin described strikes as “schools of socialism.” That said, the limitations and contradictions of trade unionism remain significant. As the
“labor movement” has emerged as a recognized and licensed agency of working-class representation, it has also commonly narrowed its ideological agenda. Trade unions appear as agencies of both struggle for and containment of workers’ demands. To maintain any influence over employers, they need to threaten and occasionally deploy the strike weapon, which requires that they maintain some semblance of membership involvement and democracy; at the same time they offer finished examples of “labor bureaucracy.” As Gramsci commented, trade unions “are in a sense an integral part of capitalist society, and have a function that is inherent in a regime of private property . . . The trade union has an essentially competitive, not communist, character. It cannot be the instrument for a radical renovation of society” (Gramsci 1977b: 99). That said, “trade unionism” is not a fixed quality (Cliff & Gluckstein 1986). As with all movement questions, trade union forms and activities are highly contestable, and their history is one of great variation. “Unofficial” and “wildcat” strikes have been quite as numerous as “official” strikes; in the US, for example, the Knights of Labor and the Industrial Workers of the World were very different from the American Federation of Labor, while the rise of the Congress of Industrial Organizations in the 1930s added more diversity to the mix. Distinct forms – occasional one-day protest strikes summoned by union officials as against semi-insurrectionary mass occupations and strikes – contain very different developmental potentials. One involves bargaining over the price of labor within capitalism, the other contains revolutionary possibilities.

For Marxism, moreover, “labor movements” must be judged not simply by how they engage with employers, but how they relate to other forms of oppression and exploitation within capitalism. Marx strongly supported Irish independence from the British Empire. He and Engels explored the way that anti-Irish prejudice divided and held back the English workers’ movement, just as American racism held back the workers’ movement there. In 1869, Marx wrote to Engels that he had changed his mind about how this problem might be solved:

…it is in the direct and absolute interest of the English working class to get rid of their present connection with Ireland . . . For a long time I believed that it would be possible to overthrow the Irish regime by English working class ascendency. I always expressed this point of view in the New York Tribune. Deeper study has now convinced me of the opposite. The English working class will never accomplish anything before it has got rid of Ireland. The lever must be applied in Ireland. That is why the Irish question is so important for the social movement in general. (Marx 1965a: 232)

Here, Marx takes the “social movement in general” as his standpoint of judgment. He is in no sense inclined to idealize the English workers’ movement – indeed, his correspondence with Engels is full of rueful remarks about its general backwardness after the 1848 defeat of Chartism. His opponents, like Proudhon and Bakunin, were prone to reduce the struggle for a dictatorship of the proletariat to a simplistic struggle of “class against class,” resisting his support for both Polish and Irish emancipation (Anderson 2010: 146–147). Marx, rather, treats the struggle against national oppression, in still agrarian nations, as a condition for advance by “the social movement in general.” Marx likewise supported the nascent anticolonial movement in India. On slavery, he was very explicit about the interconnection between antislavery and the workers’ movement: “In the United States of North America, every independent movement of the workers was paralyzed so long as slavery disfigured a part of the Republic. Labor cannot emancipate itself in the white skin where in the black it is branded” (Marx 1976: 414). The centrality of “class struggle” does not mean “economic” questions are somehow “more important.” Struggles against oppression – whether based on nationality, ethnicity, religion, gender, skill, or sexuality – are not distinct from or opposed to class struggle, but are mutually interdependent parts of the social movement against capitalism as a totality.
The shaking up of social movement life by something “from without” is a recurring theme in its history. Raymond Williams recorded that all the innovative movements in Britain in the previous 30 years had originated outside the institutions of the official “labor movement”: “all have this character, that they sprang from needs and perceptions which the interest-based organizations had no room or time for, or which they had simply failed to notice” (Williams 1983: 172–173). The same can be said about movement development in the postwar US. Developing capitalism enlarges and empowers new layers, especially within the working class, providing resources to pose new demands and thus to enrich the social movement with new perspectives and new layers of activists. Successive waves of colonized and enslaved peoples, migrants, working women, white-collar employees, and college and school students have all, in different ways and times, fought their way into “the social movement in general.” In the process, they have both reshaped the imagery of “class” and enriched Marxism’s content.

In practice, a recurring test for Marxists has been to respond adequately to new issues and struggles as “newcomers” have forced their concerns onto the social movement agenda. If they ignored or denied them, their own formations were liable to collapse, as did the Italian Left groups who couldn’t come to terms with feminist resurgence in the 1970s. More often, the Left embraced new issues and sought to carry them into the “labor movement,” a more open environment, for all its inner contradictions, than the institutions of capital or states. Consciously or not, they followed Lenin, who urged – against the “economists” who focused only on workers’ immediate struggles against employers – that revolutionaries should be “tribunes of the people,” opposing all forms of oppression and drawing workers into the struggle against them (Lenin 1961a).

The ongoing development of capitalism and its states system has posed new problems for the Marxist tradition. Even as the working class has massively expanded and changed its inner composition, social movements have – in the very process of making partial gains – increased their inner complexity. Unevenly, sometimes only after periods of severe repression, more and more states have conceded universal adult suffrage, expanded state “welfare,” licensed a range of forms of popular contestation like strikes, street demonstrations, public rallies and meetings, loosened censorship, and in other ways promoted the conditions for social movement expansion. One effect has been to promote the development, within social movement formations, of a variety of “career paths” for officials and representatives in unions, parties, nongovernment organizations, and other licensed formal institutions. Mediating between movements and their opponents, their presence sets up new political and organizational dilemmas and sources of ideological division, providing an extended basis for “reformist” as against revolutionary tendencies within movements.

Marxism since Marx has had to grapple with these questions, and to consider how struggles within capitalism might be transformed into a potential struggle against it. The problems are practical as well as theoretical.

Much of the time, the key issues concern how day-to-day struggles should be conducted. Marx and Engels themselves devoted less attention to immediate questions about strategy and tactics than did their successors, some of whose accounts amount to virtual cookbooks of militancy (Dobbs 1972). Among the matters stressed are cases for mass mobilization, maintaining and developing rank-and-file democracy, developing solidarity, connecting initially distinct struggles, restricting the influence of conservative officialdom, and making socialist propaganda. Movement activity always creates space for practical and theoretical debate, since movements change in the course of conflicts, involve smaller or larger crises of development, and experience advances and retreats. Every concrete situation offers more than one potential way forward, and the literature of Marxism is in part a repository of practical historical lessons to be offered.
With one eye always on the idea of social revolution, Marxism is always alert to new possibilities, new forms of organization and activity, new potentials for movement breakouts and breakthroughs. Marxism has, naturally, a particular interest in the phenomena of “waves” in movement development. Periods of relative calm, when stability and social reproduction appear to be the watchwords of development, are punctuated by crises both of capitalism’s everyday functioning but also – though not in parallel – by what Shanin terms “axial moments” and Tarrow calls “cycles of protest” (Shanin 1986; Tarrow 1994).

It is in such periods of crisis that the development of social movements in the direction of revolution appears most realistically possible. The first significant analysis of the inner development of movements in such conditions was Luxemburg’s account of mass strikes in the period of the 1905 revolution (Luxemburg 1986). She stressed several matters: the breakdown of the everyday distinction between “economic” and “political” struggles, the ways that different parts of a mass movement interacted with each other to extend its mobilizing reach, the rapid growth of new organizational attachments, and especially the “cultural and spiritual growth” experienced by participants. Similar arguments were made about potentially revolutionary movements by such writers as Lenin, Trotsky, and Gramsci (Lenin 1961b; Trotsky 1965; Gramsci 1977a). In a whole series of large-scale movements in the century since 1905 similar phenomena to those Luxemburg identified have been recorded and analyzed by Marxists writers – in, for example, Germany 1918–1923, Spain and France 1936, Hungary 1956, France 1968, Chile 1972–1973, Portugal 1974–1975, Iran 1978–1979, Poland 1980–1981, Argentina 2001–2002. (For exploration of some of these, see Barker 1987.) It is especially when such movements begin to develop new kinds of democratic institutions from below that they can pose anew the possibility of working-class self-emancipation.

However, such possibilities must still be realized. There was a fatal weakness in Luxemburg’s account. She recognized the conservative potential in existing social democratic parties and unions, but argued that “if once the ball is set rolling then social democracy, whether it wills it or not, can never again bring it to a standstill” (Luxemburg 1986: 77). That prophecy proved sadly amiss, as her own experience would demonstrate when mutinies and mass strikes erupted on a much larger scale in the course of the German revolution from November 1918 (Harman 1982; Gluckstein 1985; Broué 2006).

Despite a huge upsurge of militancy, German Social Democracy was able to ally with right-wing armed forces to contain and defeat revolutionary impulses. This combination murdered Luxemburg herself in January 1919. The “spontaneity” of mass mobilization, while it brought down the Kaiser’s regime, proved insufficient to generate successful social revolution—a recurring pattern in a whole series of potentially revolutionary situations over the next century.

These problems were most directly addressed by that tradition in Marxism represented by Lenin, Trotsky, Gramsci, and their successors. Even in revolutionary situations, “spontaneity” both rests on previous experiences and organizational forms and involves a mixture of radical and conservative aspects (Lenin 1961a: 373–397; Trotsky 1965: 510–511; Gramsci 1971: 196–199). Rather than popular consciousness representing a finished and coherent set of positions, it is inherently a contradictory mixture of radical and conservative elements, containing quite different potentials for development (Gramsci 1971: 333). Movements remain, as suggested, field of argument and discovery, in which different tendencies struggle for leadership (Gramsci’s “hegemony”). However large, mass movements do not travel from initialisation to mobilization to potential revolution along a single, smooth path, but undergo crises and turning points in their development, as they draw in new forces, engage in unexpected kinds of struggles with their opponents, formulate innovative understandings, and find out new qualities in their own capacities and
aspirations. The beginnings of potential popular revolutions are commonly marked by a sense of harmonious unity: the moment of the “springtime of peoples,” the moment of “the beautiful revolution.”

But that moment opens new possibilities and dangers. Now, questions can be posed about the very structures of society which could hardly be named before, let alone addressed with any hope of solution. One weight of oppression has been removed, but the new question is, “What next?” “Class struggle” soon intrudes in new forms. The “people” redissolve into their opposed parts, to contest the future. Arguments about strategy come to the fore.

Under such conditions, questions about what any kind of “Left” is capable of saying and doing become immensely significant, for good or ill. In the midst of a popular upsurge, a host of variegated voices can always be found, urging a movement not to “go too far.” Indeed those who first come to the leadership in an initially successful movement may well be moderate figures, as Trotsky suggests happened in Russia in February 1917 (Trotsky 1965). For a movement to continue forward, the Left must struggle for its leadership: its own capacity to organize itself coherently, and to draw wider sections of the movement toward itself, becomes a vital issue. Hence the enormous attention that Lenin, Trotsky, and Gramsci paid to questions concerning Marxist party organization, strategy, and tactics. Whether or not social movements, in the fire of major struggles, do indeed become agencies of revolutionary development depends, ultimately, on the outcome of political argument within them.

What, then, of the Marxist emphasis on the working class? In the Marxist revolutionary perspective, what matters is not simply the working class “blocking power” – still celebrated by radical theory – but ultimately its “replacement power.” In numbers of great social movements over the past century working people have created the outline of new institutions of the kind Marx celebrated in the Paris Commune of 1871: highly democratic bodies with the capacity to found a new society. The Commune’s modern heirs – under names like soviet, workers’ council, cordón, shora, interfactory strike committee, popular assembly – have sought, as yet without triumphing, to unite popular political power with the extension of democratic control over economic life. The direct products of “the social movement,” potentially uniting struggles against exploitation and oppression in a common project of social revolution, they embody the Marxist vision of social movements.

Capitalism in the new millennium continues to demonstrate its crisis tendencies and its immense destructiveness. These will provoke new “axial moments” and “cycles of protest,” and new potential challenges to capital’s domination of the world. It’s unlikely that we have heard the last of Marxism.

Marches

STEFAAN WALGRAVE

Marches are part of the classic action repertoire of social movements. They are a form of protest closely connected to rallies and demonstrations. In the case of rallies, marches are the relatively organized means through which an aggregation of individuals gets from point A to point B, coming to assemble in a common space for the purpose of a protest or celebratory rally. Although the terms “marches” and “demonstrations” are often used interchangeably, demonstrations typically encompass a broader set of collective actions, including not only the march but also assemblage and the rally in which economic, political, and social or cultural concerns and demands are voiced.

One of the best-known marches in modern social movement history was the Great March on Washington staged by the civil rights movement in the US in 1963. The march consisted of more than 200,000 participants marching to the Lincoln Memorial where Martin Luther King delivered his famous “I Have a Dream” speech.

Some protest organizers often call their regular demonstrations or rallies “marches” in order to avoid radical and political connotations. In many countries, marches are held to protest against random violence or to make other nonpolitical, or at least not explicitly political, claims. For example, after the killings of several young girls in 1996 in Belgium, some 300,000 Belgians took the streets in the White March to protest against the felling of the judiciary and the police to capture the convicted killer, who had mistakenly been released earlier. Another example is the Million Mom March, a massive rally in Washington, DC, in 2000, claiming stricter gun laws in the US.

However, sometimes marches are specific types of demonstrations with typical properties. In contrast to demonstrations, a march often refers to a long-distance walk, sometimes spanning several days connecting two symbolic places, or to a long walk toward a symbolic target place (e.g., the capital, the headquarters of the target organization or decision-maker, the sea). Once under way, other activists join in, often with the march becoming larger as the destination nears. For example, one of the earliest examples of the study of individual protest participants is Parkin’s Middle Class Radicalism. Parkin drew on a survey of the participants of the three-day Easter Peace March organized by the British Campaign for Nuclear Disarmament in 1965 (Parkin 1968). The most famous multi-day march is probably Mahatma Gandhi’s 390 km March to Dandi in 1930. The march was part of the Indian independence movement and involved civil disobedience against the British salt monopoly and salt tax. In general, multi-day march formats have often been employed by the peace movement from the 1950s onward.

The term “master frame” was originally conceptualized in order to account for the empirical observation that cycles of protest occasionally emerge in the absence of a favorable political opportunity structure (POS). Given that POS had been theorized as the engine driving cycles of protest, an alternative explanation was sought from the social movement framing perspective to account for those instances when a number of movements clustered together during a period even though the structural conditions did not appear conducive for widespread mobilization. Under such conditions a cycle of protest could be attributed in part to the development of a resonant master frame. A master frame refers to a generic type of collective action frame that is wider in scope and influence than run-of-the-mill social movement frames (Snow & Benford 1992). Whereas most collective action frames are context specific (e.g., drunk driver frame, cold war frame, exploited worker frame, environmental justice frame, etc.), a master frame’s articulations and attributions are sufficiently elastic, flexible, and inclusive enough so that any number of other social movements can successfully adopt and deploy it in their campaigns. Typically, once a social movement fashions and espouses a highly resonant frame that is broad in interpretive scope, other social movements within a cycle of protest will modify that frame and apply it to their own cause. For example, once the US civil rights movement of the 1950s and 1960s experienced a number of successes based on an equal rights and opportunities frame, several other movements, including the American Indian, women’s, gay and lesbian, Chicano/a, and Gray Panthers, adopted and proffered a similar frame to their specific movement campaigns.

In addition to the equal rights and opportunities master frame, researchers have suggested the following as master frames: injustice, justice, oppositional, hegemonic, imperial, anti-imperial, and market choice. There are no doubt others. Since its original formulation the concept of master frames has been used to explain more than cycles of protest (Snow 2004). Mooney and Hunt (1996), for example, extended their analysis of agrarian mobilization beyond a single cycle of protest to show how movements can create a repertoire of interpretations across periods of mobilization and abeyance to produce ideological continuity in a movement. Carroll and Ratner (1996a, 1996b) have used the master frame idea to explain and understand cross-movement networking and unity among several Canadian social movements. Other scholars have shown that inclusive and elaborated master frames are essential for broad-based mobilization campaigns, especially when the targeted audiences are diverse (Gerhards & Rucht 1992; Noonan 1995). In an analysis of the Irish Sinn Féin movement, Swart (1995) concludes that social movement actors rhetorically transform the various master frames within a cycle of protest so as to bring them into alignment with the social movement’s specific cultural and historical context thereby affecting “master frame alignment.”

Despite the concept’s popularity, social movement scholars still do not know much about the conditions under which a particular collective action frame will evolve into a master frame and thus spawn a cycle of protest. Nor do researchers know much about the transportability of particular master frames from one culture to another. A recent study of nationalist movements in Uzbekistan and Tajikistan suggests that a successful master frame in one place can lead to mobilization failures elsewhere when local differences or shifts in the political environments are ignored (Markowitz 2009). Finally, in their initial conceptualization of master frames Snow and

Benford (1992) set forth ten propositions regarding the relationship between master frames and the emergence of cycles of protest, specific movements within a cycle, tactical repertoires within a cycle, the shape of cycles, and the decline of cycles of protest. To date, none of those propositions have been examined empirically.

Mechanisms
SIDNEY TARROW

A intellectual movement has been growing in the social sciences around the adoption of mechanism-based explanations, as complements to, or even substitutes for, variable-based explanations (Bunge 1997). In sociology, Arthur Stinchcombe recently emphasized studying causal mechanisms as part of a larger repertoire of methods of sociological research (2005). Peter Hedström and Richard Swedberg, working in the rationalist tradition, moved in the same direction (1998). John Campbell has identified a number of common mechanisms in social movement and organizational research (2005).

Political scientists’ discussions have also begun to turn more to mechanism-based approaches (Mahoney 2001, 2002, 2008; Mayntz 2004; Zuckerman et al. 2007). In his well-known Alchemies of the Mind, Jan Elster took a decidedly mechanistic line, albeit one that rejected the methodological individualism that has dominated this approach in rationalist quarters (Elster 1999).

All episodes of politics and social exchange result from mechanisms: delimited changes that alter relations among specified sets of elements in identical or closely similar ways over a variety of situations. What is new is the attempt to specify them as having influence upon outcomes independent of structural, organizational, or attitudinal preconditions, attempting to measure them with some degree of reliability and identifying mechanisms that are common to different circumstances or processes, like democratization, revolutions, or nationalist episodes.

Scholars of contentious politics and social movements have long been interested in the dynamics of change – particularly in the emergence, escalation, diffusion, and demobilization of social movements. But they have generally sought to get at them by measuring the relationships among static structural variables rather than specifying the mechanisms that link independent and dependent variables. For example, it has long been observed that communities characterized by dense network ties are more likely to experience collective action than those with sparser ties. And they have demonstrated that recruits into activism tend to have more ties to those already in the movement than non-activists (McAdam & Paulson 1993). But these relationships tell us nothing about the mechanisms on which such network-based recruitment turns. Is it due to social control, mutual trust, and confidence, or the power in numbers? We need to be able to specify and empirically investigate the mechanisms that connect network preconditions to behavioral outcomes.

As is always the case when new movements arise, competing definitions and practical proposals for the study of mechanisms have proliferated (Mahoney 2001; Norkus 2005). The proliferation of research using mechanisms has led to criticisms of conceptual vagueness, proliferation of mechanisms, and lack of methodological rigor in the production of mechanism-based analyses. Particularly in the field of contentious politics, where structuralists and culturalists have been contesting over turf for decades (Goodwin & Jasper 2004), mechanism-based approaches which attempt to connect structure and agency have met with less than universal approval (Mobilization 2003).

Although the specification and measurement of mechanisms has become more insistently in the last decade, mechanisms are nothing new in the study of contentious politics. Mechanisms like mobilization and demobilization, escalation and defection, identity shift and boundary delimitation have long been important for the dynamics of contention. For example, an entire class of mechanisms has been specified in the
research that has grown up around the concept of “framing”, originating in the theoretical work of David Snow and his collaborators (Snow & Benford 1988). In her sensitive analysis of educational controversies, Amy Binder has also made excellent use of a mechanism-based approach (2002). And in her rigorous work on the antiapartheid movement, Sarah Soule has effectively traced the mechanism of diffusion (1997).

Citing such different styles of work as those of Snow and Benford, Binder, and Soule side-by-side leads to a major methodological premise: that a range of methodological strategies are compatible with a mechanism-based approach to the study of contention. We can divide methodological approaches into four quadrants according to whether measurement is direct or indirect, systematic or ethnographic:

- Mechanisms of contention can be measured directly by using systematic events data to identify and track the mechanisms that produce episodes of contention, as Charles Tilly did in studying the general process of scale shift, illustrating it through the specific form of parliamentarization during a long period of contentious politics in Britain (Tilly 1995);
- Mechanisms can also be measured directly through the use of field-ethnographic methods. Focusing on the process of coalition formation, we Ann Mische (2008) studied networking among a wide array of Brazilian student groups;
- Much of social science is based on indirect statistical measurement. Such measures are usually associated with correlational techniques, but Elisabeth Wood also used it to indicate the presence or absence of elite defection in El Salvador and South Africa (2000, 2003);
- Finally, indirect field-ethnographic methods can be used to indicate the presence or absence of mechanisms. Von Bülow (2010) studied the mechanism of brokerage in the construction of trade-policy coalitions in Brazil and Chile.

Four main problems arise in inserting mechanisms deliberately in the study of causal processes: First is the difficulty of measuring mechanisms directly. Mahoney is correct that mechanisms cannot easily be entered into a correlational analysis as “an empirical state to be measured across cases for its covariation with some outcome” (Mahoney 2001: 581). But correlation is not the only route to effective measurement, and scholars of mechanisms have identified a variety of ways of studying mechanisms.

A second problem is the relationship between mechanisms and variables. In his Logic of Social Research, Stinchcombe lucidly summarized the logic of variable-based explanations: it is to show that distances among different observations in one dimension (conceived of as a dependent variable) correspond to distances among different observations in at least one other dimension (conceived of as an independent variable) (Stinchcombe 2005: 11–12, 89–91). Analysts ordinarily tell causal stories about relationships between dependent and independent variables, but mechanistic explanations need to specify what sort of event produces the correspondence between the presumed cause and the presumed effect.

Mechanistic purists like the later Tilly insist that studying mechanisms is an alternative to the more familiar correlational mode of social analysis. “How is why!” he proclaimed, in response to criticisms that mechanistic analysis elides causation. But most other analysts of mechanisms see them as the connective tissue between independent and dependent variables. The dilemma is that mechanism-based analyses often use a different metric than variable-based analysis and thus are frequently tacked on as “as-if” statements to “explain” otherwise underspecified correlations.

A third problem is specifying the relationship between mechanisms and contexts. Tulia Falleti and Julia Lynch have argued that “credible, causal social scientific explanation can occur if and only if researchers are attentive to the interaction between causal mechanisms and the context in which they operate” – no matter
whether the methods they employ are small-N, formal, statistical, or interpretive in nature” (2009, emphasis in original). As an example, they focus on temporality, pointing out that how we specify time is essential for what we can observe and what we can infer about an episode of change. Similarly, Büthe (2002) argues for more careful attention to the placement of starting and ending points in research using historical narratives, an injunction that applies to time-series event histories as well.

Fourth, mechanisms are often used as synonyms for processes, which are larger-scale causal events that contain sequences or combinations of mechanisms. For example, the best studied process in contentious politics is mobilization. But mobilization contains, at a minimum, the mechanisms of attribution of an opportunity, the assessment of cost or risk, the framing of the issue involved, and the adoption of a form or forms of collective action (McAdam 1999). Distinguishing mechanisms from processes is essential if we are to understand whether broad processes like democratization are invariably made up of the same mechanisms and how similar mechanisms combine with others to produce different processes.

Once we have agreed on the dignity and measurability of mechanisms, how can mechanisms of contention be ordered? Stinchcombe distinguished five classes of mechanisms: structural holes, individual actions, rational choices, situations, and patterns. McAdam and colleagues distinguish environmental, cognitive, and relational mechanisms (McAdam, Tarrow, & Tilly 2001: 25–26; Stinchcombe 2005: 170–176). It is the combinations of mechanisms that explain differences in causal outcomes. For example, successful revolutions invariably appear to contain elite defection; failed revolutions almost never do.

This discussion brings us back to the limits of the dominant structural perspective on social movements/contention. By starting from the accomplished fact of contentious action, and then working back in time to note that movements tend to arise in established social settings, structural analysts exaggerated the link between organization and action. And by selecting on the dependent variable – in this case, successful collective action – analysts inevitably focus on the exceptional cases in which existing groups produce movements, and elide the more numerous examples in which groups constrain action. In searching for causal mechanisms that produce collective action, we should be as interested in cases where nothing much happens as in those in which widespread action ensues. In order to do so, it makes sense to examine fields of decision making – (rather than social movements) that may produce emergent collective action, but need not do so. Unpacking episodes of contention into their constituent mechanisms and designing ways of measuring them will improve our ability to understand contentious politics and social movements.

Media and social movements
DEANA ROHLINGER and CHRISTIAN VACCARO

Mass media refer to any medium used to diffuse mass communication. Generally speaking, mass media include eight mediums: radio, television, newspapers, magazines, books, recordings, movies, and the Internet. Mass media are relevant to the study of social movements because they carry movement ideas to a broad audience and give activists leverage in institutional and political processes. More specifically, mass media are important to social movements because they legitimate movement issues, provide social movements an opportunity to shape public understandings of political problems, and mobilize a broader public to action. Mass media coverage legitimates movement issues and claims. News media, for instance, set the public agenda by, first, choosing what events and social problems are relevant to the citizenry and, then, focusing public attention on these events and problems. Media coverage of social movement ideas and organizations is legitimizing because it indicates to the broader public that a movement represents credible claims. A publication of a book can have a similar affect. Ralph Nader’s book, *Unsafe at Any Speed*, exposed the reluctance of car manufacturers to spend money on safety features (such as seat belts) and supported Nader’s efforts to mobilize a consumer rights movement. Mass media offer frameworks for understanding the causes of and solutions to political problems (Gamson 1992; Benford & Snow 2000). Social movements, then, that garner media attention have an opportunity to shape public perceptions of political problems and affect broader debate. Mass media can also mobilize a broader population to action. Social movement frameworks disseminated via mass media identify motivations for and targets of collective action.

For example, radio played an important role in strike campaigns of textile workers between 1929 and 1934. Music broadcast throughout the South articulated the concerns of textile workers (such as low wages and family subsistence) and identified the root causes of these problems (i.e., exploitative owners and domineering managers). This music and Franklin Roosevelt’s “Fireside Chats,” which indicated support for industrial workers and improved working conditions, helped mobilize workers (Roscigno & Danaher 2001).

GENERAL APPROACHES TO STUDYING THE MEDIA–MOVEMENT RELATIONSHIP

Mass media constitute an institutional arena that is governed by rules, norms, and relationships, and subject to economic pressures; both affect media content. With this in mind, research on mass media and social movements generally takes one of two approaches. The first approach focuses on the institutional logics guiding mass media operations and examines how these logics influence the diffusion of movement messages. Much of this research analyzes how journalistic norms and practices bias when and how social movement protest events are covered in news media outlets. Researchers have identified two biases that influence protest event coverage: selection bias and description bias. Selection bias is a result of “gatekeeping” in the newsroom, whereby journalists and editors make choices about what events to cover and ignore (McCombs & Shaw 1972). This means that while there are a large number of protest events in a given city only a very small number are covered by news outlets. More importantly, the protest events that get media attention share a number of characteristics. For instance, protests that are large, involve a visible opposition, and address issues
that are currently on the political or public agenda are more likely to be covered than events that lack one or more of these characteristics (McCarthy, McPhail, & Smith 1996; Oliver & Maney 2000). Description bias refers to how a selected protest event is portrayed in media coverage. Journalists are less concerned with movement messages than they are with how to present movement ideas and events in ways that will attract their target audience and generate profits. As such, journalists often cover the most dramatic events and extreme groups in a social movement. Such coverage can undermine a social movement because journalists marginalize activist groups in news stories which cast the entire movement in a negative light and reinforce a political status quo (Gitlin 1980; Smith et al. 2001).

Researchers also examine how the institutional logics of the entertainment industry affect the diffusion of movement ideas, although this literature is very limited. Eyer- man and Barretta (1996), for example, examine the conditions under which the profit-driven music industry provided an opportunity for folksingers to promote political ideas and symbols in the 1950s and 1960s. They find that these opportunities are historically contingent and, therefore, limited. Specifically, the promotion of political music by the mainstream recording industry was a result of demographic change in the US, and the emergence of a huge youth market in particular, which left record labels scrambling to find acts that would appeal to this population.

The second approach to understanding the media–movement relationship examines the ways in which social movement groups contend with the challenges inherent to mass media and try to use mass media for their own purposes. Social movement organizations make choices regarding how mass media can best be used to accomplish their goals and employ strategies that will further their efforts. Research highlights the strategies that social movement organizations use in the media arena and the utility of these choices. For instance, social movement organizations that want to affect public and political debate will build standing, or credibility, with mainstream news organizations. It is necessary for activist groups to build standing because journalists, who consistently deal with scarce resources, tight deadlines, and limited space for their stories, rely heavily on known and legitimate sources of information. This creates an overreliance on institutional sources such as politicians, government officials, and academics, which shape how the broader public understands issues. Social movement organizations that want to influence public debate mimic institutional sources in order to build their credibility with journalists and affect how issues are presented to the broader public (Gamson & Wolfsfeld 1993). In contrast, activist groups that are primarily interested in using mass media to alert the broader public about a problem and to mobilize this public to action use extreme rhetoric and dramatic tactics to do so. The pro-life, direct action group Operation Rescue, for example, saw mainstream media as critical for mobilizing Evangelicals and staged dramatic “rescues” intended to stop the killing of unborn babies outside of abortion clinics. The rescues resulted in mass arrests and a great deal of mainstream media coverage.

Not all strategies involve getting media coverage or even mainstream venues. For instance, activist organizations sometimes try and get like-minded experts, rather than themselves, in media coverage because it will buttress movement claims and generate additional support for their issue. Likewise, social movement groups may remain publicly silent on issues that they believe undermine public support for their cause (Rohlinger 2006). Similarly, social movement organizations sometimes decide to bypass mainstream media outlets altogether and, instead, target media venues that are sympathetic to movement issues and, therefore, more likely to give groups a platform for promoting their ideas and campaigns (Rohlinger 2007).

An emerging area of research examines how social movement organizations strategically use the Internet to forward their goals. The Internet
Media and Social Movements

provides a means through which movement groups can communicate with an audience directly. Social movement organizations can use websites as both a “brochure” to advertise their issues and campaigns and as an information clearinghouse (Earl & Kimport 2008). The latter is particularly important for activist groups that want to legitimate their claims and build credibility with mainstream media outlets because it enables activists to share research and documentary evidence on movement issues. Additionally, activist groups can use the Internet to mobilize international support and, in some instances, constrain how a government responds to a social movement. For example, the relative success of the Zapatista National Liberation Army, which includes a lack of violent repression by the Mexican government, is attributed to Subcommander Marcos’ use of the Internet. Marcos, the leader of the army, employed the new technology to bring the plight of indigenous people in Chiapas to a broader audience, including journalists who brought international attention to the small Mexican state (Schulz 1998).

UNRESOLVED ISSUES

Although the movement–media relationship has generated substantial empirical research, there are at least three issues that have not been adequately addressed. First, the proliferation of online venues, including virtual newspapers, magazines, radio broadcasts, and blogs, has altered the media–movement relationship and the strategies of social movement organizations. Much of the existing literature is based on the premise that the media–movement relationship is unequal and that activist organizations must find ways to deal with its many disadvantages. While this unequal relationship likely still exists, the proliferation of online outlets has shifted the dynamics of the relationship. Social movement organizations have more choices regarding how they can diffuse their ideas than ever before. Additionally, a strategy that does not initially include mainstream media does not mean movement ideas will not make it on the evening news. Mainstream outlets increasingly cover news that breaks online, which gives social movement organizations an opportunity to move their ideas from the Internet to the mainstream. Second, and related, it is not clear what biases resulting from journalistic norms and practices exist in nonmainstream outlets. As a result, scholars do not know what challenges social movement groups face when they try use these alternative venues for their own purposes (Rohlinger 2007). Finally, scholars need to pay much more attention to the role of entertainment media and celebrity in social movements. In an age where celebrity reigns, there are incentives for social movement organizations to collaborate with commercially recognized artists (Meyer & Gamson 1995). However, the forms that these collaborations might take as well as the potential risks associated with a celebrity’s fall from grace are unclear. Likewise, the extent to which social movement organizations create their own entertainment products, such as online games, and exploit online networks, like Facebook, and the benefits derived from these endeavors are completely unexplored.

Micro-meso mobilization
MARIJE BOEKKOOI and BERT KLANDERMANS

Social movement events do not spontaneously occur; they need to be organized and mobilized. This involves two steps of mobilization: mesomobilization followed by micromobilization. Mesomobilization refers to the efforts of an initiator(s) of a campaign, trying to mobilize other organizers to jointly set up and organize the event (Gerhards & Rucht 1992), while micromobilization refers to the joint effort of the organizers to mobilize participants for the event (McAdam 1988). The mobilization process thus involves two steps: the mobilization of other organizers by the initiators and the mobilization of participants by the organizers.

Mesomobilization involves building mobilizing structures, in which organizers cooperate and negotiate to set up a strategy to jointly mobilize participants for the event. Mobilizing structures are those “collective vehicles, informal as well as formal, through which people mobilize and engage in collective action” (McAdam, McCarthy, & Zald 1996: 3). At any time, all kinds of groups, organizations, and networks that exist in society can become part of the mobilizing structure. However, none can be assumed to automatically become part of it. Networks need to be adapted, appropriated, assembled, and activated by organizers in order to function as mobilizing structures. Even networks whose primary goal is movement mobilization (e.g., social movement organizations) might need hard work to be activated to participate in a particular campaign. Social movement organizations often decline to participate in a campaign, and thus do not become part of the mobilizing structure. On the other hand, networks with very different goals such as a network of colleagues, friends, neighbors, or the parent-teacher association, might become involved in the campaign and thereby become part of the mobilizing structure. Some of these informal networks are especially helpful in building a mobilizing structure, because they consist of activists in “abeyance.” Although invisible, networks of activists may continue to exist. They are “submerged” in everyday life, but can reemerge and become active when a specific issue arises. Between upheavals these groups are in “abeyance”; they no longer stage large-scale activities, but keep a network and a minimum of organization going (Taylor 1989), which can be reactivated when a new campaign starts.

The assembling of mobilizing structures is becoming increasingly important as civil society is changing. Solid societal patterns are eroding and we are moving toward a more liquid society (Bauman 2000) or a network society (Castells 1996), in which bonds between people are becoming looser and more flexible. Individuals in late modern societies prefer less binding and more flexible relationships with organizations over traditional rigid and hierarchical ones. Underlying this is what Lichterman (1996) calls “personalism”: people feel a personal sense of political responsibility, but they do not want to feel restricted or obliged to a community or group. Thus, “light” groups and associations that are loose, easy to join, and easy to leave are replacing the more “greedy” ones (Duyvendak & Hurenkamp 2005). Society is thus becoming organized around networked individuals rather than groups or local solidarities, and connections are loose and flexible rather than fixed. Assembling a mobilizing structure is important as it helps in the process of micromobilization. Mobilizing structures are the connecting tissue between organizers and participants. Many studies have shown that networks are important in explaining differential recruitment and mobilization (e.g., Snow, Zurcher, & Eckland-Olson 1980; Klandermans & Oegema 1987). Which organizations join the mobilizing coalition is an important predictor of who will participate in the protest
Most studies are based on organizational affiliations, showing that organizations predominantly mobilize their own members. Some scholars have also looked at membership in civil society organizations (Baldassarri & Diani 2007) or embeddedness in a community (Gould 2003). Other studies have shown that not only organizations mobilize their members, but members themselves are important agents who activate new people since they often ask people in their environment to join as well (Boekkooi 2010).

After assembling the mobilizing structure, organizers need to cooperate, negotiate, and make decisions to set up a campaign. The development of these negotiations impacts on the formation and consolidation of the coalition (e.g., if they develop badly some people and groups will likely leave the coalition and/or not want to cooperate again in the future). Furthermore, in these negotiations choices regarding the campaign itself are made, such as what kind of action to organize, which slogans to use, and how to attract people. This process is often problematic; it can cause quarrels and even splits within movements. Several social movement scholars have noted that cooperation between different organizational forms and styles can cause problems (Clemens & Minkoff 2004). Social psychologists have studied negotiations and the problems that may occur extensively. They define negotiation as the “joint decision making between interdependent individuals with divergent interests” (van Kleef, de Dreu, & Manstead 2004: 510). This may involve two people or a large group. In the case of negotiations among social movement organizers, these are typically “multiparty” negotiations. Multiparty negotiations are characterized by interdependent decision-making, the presence of multiple issues, heterogeneity in members’ motivations toward social interaction, the absence of natural coalitions, and a mixed-motive nature of the problem (Kern, Brett, & Weingart 2005). That is, they usually involve a large group of negotiators—often representatives of an organization or group—who need to talk about and make decisions on several different issues. They might already know each other and have opinions about the others, but not necessarily, and it is not predetermined who will agree with whom. Furthermore, because of the mixed-motive nature of their “problems,” the organizers need to cooperate to maximize “the size of the pie,” but compete with each other to gain as much as they can for themselves. Outcomes better than compromises can be achieved by making trade-offs across issues of differential importance to the parties (Schei & Rognes 2005). As may be clear from this description, negotiations between social movement organizers are usually complicated. In such complex negotiations cooperative behavior is necessary to find a solution (Kern, Brett, & Weingart 2005). Many activists too, see this approach to negotiations as the ideal form of negotiation.

Cooperative behavior is not a given, though; people may have either a cooperative or a competitive negotiation style. In a cooperative approach, effective communication, friendliness, and nonobstructiveness are central. Cooperative negotiators define conflicting interests as a mutual problem to be solved by collaborative effort. On the other hand, when negotiators use a competitive style communication is impaired. Within this style obstructiveness is central, and the conflict becomes a power struggle or a matter of moral principle. Several factors impact on whether or not organizers behave cooperatively. One important factor is cultural background. Cooperation is more likely in groups with a more horizontal culture than in groups with a more vertical or hierarchical culture (Chen & Li 2005). Cooperation is also more likely when organizers discuss practical issues as opposed to ideological issues, as they are unwilling to trade off their principles (Harinck & de Dreu 2004) and, unsurprisingly, cooperation is more likely when organizers have positive relationships with each other rather than negative ones (van Kleef, de Dreu, & Manstead 2004).
Despite these hurdles, organizers need to set up their campaign and decide on a mobilization strategy. Then micromobilization—the execution of the mobilization strategy—can start. Micromobilization entails the further expansion of the mobilizing structure, because if organizers want to mobilize widely they will need to appropriate additional bonds and turn those networks into a mobilizing structure for themselves. When organizers use mass media to spread their message, these media have become part of the mobilizing structure, and the same goes for other channels. These channels through which one tries to reach out to potential participants are as an important part of the mobilizing structure as is the network of organizers. Both the shape of the network of organizers and the mobilizing strategy that they choose, therefore, determine who can be reached and mobilized.

In order to mobilize participants organizers can use strong and weak bonds, and open and closed channels. Strength and weakness of bonds refer to how much is invested in them, the strength of identification, and the influence the bond can exert (Granovetter 1973). Open and closed refers to who can be reached by the channel (Walgrave & Klandermans 2010). Closed channels target only the own group, examples are organizational meetings or newsletters. Open channels on the other hand target potentially everyone; the mass media is the clearest example. We would like to add to this semi-open (or semi-closed) channels, that target beyond the own group; for example, the Internet. Websites of organizations, forums, blogs, and mailing lists, are not exclusively for members of one specific group, but they usually only attract those people who are already interested in the topic and likely to agree. They thus have a wider reach than closed—organizational—channels, but not as wide as the mass media. The distinctions between open and closed and strong and weak are related. Granovetter (1973) noted that strong bonds exist mainly within a group, while it is the weaker bonds that form a bridge between various groups. Thus, closed channels tend to target the people with whom organizers have strong bonds. They are expected to be efficient mobilizers. Open channels on the other hand, create weak bonds, which will usually not change people’s opinions, but when consensus has formed in society, such channels can mobilize people by letting them know an event will be staged.

It is thus easiest for organizers to mobilize their strong bonds, that is to say, the members of their group, organization, or network. These strong bonds do not have a wide reach, but the more successful the mobilization of organizers has been (i.e., the more all-embracing the mobilizing structure), the more people can be reached through strong bonds. It is thus important to build an encompassing mobilizing structure; by involving a central member of a group the entire group can be mobilized (Oberschall 1973) and coalition formation becomes a shortcut to mass mobilization. In addition, those mobilized by the organizers can in their turn start mobilizing the people with whom they have strong bonds, such as their friends, family, or colleagues. Extra-movement interpersonal bonds of members are an important asset for mobilization as has often been shown (McAdam & Paulsen 1993).

Organizers will usually want to reach beyond those to whom they are directly or indirectly related. In the case of mass demonstrations it is not enough to reach a critical mass; organizers need to reach as many people as possible. To reach beyond the circles of people with whom they are directly or indirectly connected, the organizers need to use open channels and weak bonds. Weak bonds and open channels are the only way to inform people who do not belong to the organizers’ own and indirect networks. However, to get media attention is often not easy for social movements, it is either expensive to employ, or it is hard to control the coverage. Nonetheless, weak bonds diffuse information most effectively, because they connect people from different groups, and consequently enable individuals to spread and receive new information (Granovetter 1973). The most common example of weak bonds
is the mass media. Although weak bonds are not sufficient to change opinions or spur motivation, such an impact might not always be necessary. Some groups in society may already agree with the message and be convinced that action should be taken, so that they need to only hear about an imminent demonstration (Walgrave & Manssens 2000).

Modular protest forms
CLARK MCPHAIL

Tarrow’s (1993) concept of “modular protest” is an improvisation on Tilly’s (1977, 1979) concept of protest repertoire. Tilly frequently compared his concept to the repertoires of jazz musicians and street theater troupes whose players improvise on familiar tunes or stories to produce pleasing sounds or humorous scenarios. Of protest repertoires Tilly argued (1979: 131) “The main point is elementary: within any particular time and place, the array of collective actions that people employ is well defined and quite limited in comparison to the range of actions that are theoretically available to them. In that sense, particular times, places, and populations have their own repertoires of collective action.” Modularity was not yet in Tilly’s own published theoretical repertoire.

Tarrow (1993: 77) wrote:

By the modular character of the modern repertoires I mean: first, that its forms were relatively few and were very flexible; second, that they were distinct from the identity of those who used them and those they were aimed at, and third, that they could be adopted by different groups in a variety of settings and serve as a common denominator for different groups acting together or in series. All of this made it possible for even scattered groups of people with minimum organization, perhaps unknown to one another, to unite in national social movements.

Hence the title of Tarrow’s influential article in the spring of 1993: “Modular Collective Action and the Rise of the Social Movement” (cf. Tilly 1979).

Tarrow (1993) cites a coauthored conference paper (Soule & Tarrow 1991) as influential in the development of his own treatment (1994) of “modular forms of protest” and Tilly (1993) cites the same paper. Soule and Tarrow cite as their source of inspiration Anderson’s (1991) treatment of “modularity” as a model or exemplar that is emulated in the diffusion of phenomena across time and space (cf. Soule 1997). Tilly’s first published reference to “modular” protest appears in his (1993) analysis of changes in Great Britain’s repertoires of collective action. He characterized the British eighteenth-century repertoires as “parochial, particular and bifurcated . . . particular because forms of contention varied significantly from one place, actor, or situation to another” (1993: 271). In contrast, he characterized nineteenth-century British repertoires as “national, modular, and autonomous . . . modular in that the same forms served many different localities, actors, and issues” (272). The relationship between repertoire, modularity, and the birth of social movements was, of course, at the center of Tilly’s (1995) magnum opus on the birth of social movements. Tilly’s treatment of modularity was less on models to be emulated than on components of a repertoire that could be employed by different actors in the solution of their particular problems in space and time, for example, “Modular means that the performances in the repertoires transferred easily from place to place, issue to issue, group to group” (2006: 42).

Protest forms will be treated here as the modules of protest repertoires. Social movement campaigns comprise linked repetitions of various combinations and permutations of forms. Most forms reviewed here involve what Tilly calls “contentious gatherings.” Gatherings refer to multiple persons occupying a common location in time and space; they are contentious when those persons collectively assert grievances, claims, and demands by employing one or more forms. Some large public gatherings involving sport (Snow, Zurcher, & Peters 1981), civic (McAdam et al. 2005), or religious concerns (McPhail 2006) are not primarily contentious but warrant attention for comparative analyses. All these gatherings are
comprised of alternating and varied individual and collective actions and interactions. Just as there are repertoires of protest forms, there are also repertoires of elementary forms of collective action (McPhail 1991). The three methodologies used to study protest forms are discussed below, followed by brief comments on their advantages and disadvantages and on some recent innovations.

SURVEYED FORMS

Crozat (1998) analyzed 1974 and 1990 attitude surveys in Great Britain, Germany, Italy, the Netherlands, and the US that asked respondents if they “accepted” five different forms of protest: the petition, the demonstration, the boycott, the “wild-cat” strike, or the sit-in occupation of a building. His measure of “acceptance” was any respondent’s statement that they had participated, or they would participate, or they might participate. The percentage of “participation acceptance” was highest for the petition in all five countries and declined stepwise through the remaining four forms in the 1990 survey. In the 1974 survey, Italy had a lower rate of acceptance for boycotts and strikes, and a higher level for sit-ins. Crozat concludes that people in all five countries are more likely to participate in noncontentious than contentious forms of protest.

ARCHIVED FORMS

Most students of protest have mapped a country’s repertoire by scrutinizing newspaper archives for journalists’ reports of protest events. Tracking reports over time provides a quantitative record of the fluctuating incidence of protests that, in turn, is taken as an index of protest incident dynamics. Studies of mid to late twentieth-century protest in three countries are notable for the overlapping spans of time they cover, and for the similarities and differences in those countries’ repertoires of protest forms. Rucht (2004) examined forms in Germany from 1950 through 1997. Tarrow (1989) cataloged forms in Italy from 1966 through 1973. McAdam et al. (2009) examined forms in the US from 1960 through 1995. Rallies, marches, and civil disobedience were in the top five most frequent forms, and strikes and petitions among the top ten forms, in all three countries. Lawsuits were in the top five in the US, the top ten in Germany, and near the bottom in Italy. Each study had several slightly different categories of violence targeting person or property. When both target categories are combined within country (but see Martin, McCarthy, & McPhail 2009), violence tops the list of most frequent protest forms in Italy; it moves into the top five forms in the US and into the top ten forms in Germany. This yields a crude overall portrait of the prevailing repertoires of protest forms in three countries. For a longer and more diverse list of protest forms, see Wikipedia (Protest 2011).

The accessible data set of McAdam and colleagues’ (2009) Dynamics of Collective Action project enables plotting a dynamic portrait of the year-by-year proportions of 18 protest forms in the US repertoire from 1960 through 1995. Limited space dictates a snapshot here. Rallies were in double-digit percentages in 35 of 35 years, followed by lawsuits in 26 of 35, civil disobedience in 21 of 35, petitions in 12 of 35, marches in 9 of 35, pickets in 8 of 35, and rioting in but 2 of 35 years. Four forms – attacks, press conferences, strikes, and vigils – each occurred in double-digits in only one of 35 years; dramaturgies, boycotts, and clashes occurred even less frequently. This project has produced a very useful portrait of the repertoire of protest forms in the US over a 35-year period.

OBSERVED FORMS

A few investigators (Wright 1978; Snow, Zurcher, & Peters 1981; Lofland & Fink 1982; McPhail & Wohlstein 1986; Steinhoff 2008) have observed and reported what participants actually do in protest gatherings. McPhail (1991) and colleagues (Schweingruber & McPhail 1999) have observed and
analyzed collective actions in several hundred political, sport, civic, and religious gatherings in an attempt to catalog the phenomena to be explained (Tilly 2002). Their catalog is comprised of four dozen elementary forms of collective action (EFCA) divided into collective facing, voicing, manipulating, and locomoting. All consist of what two or more adjacent persons are doing with or in relation to one another.

1. Facing EFCA includes: the common direction two or more persons are orienting toward some actor, activity or object; or the convergent directions two or more persons are orienting toward one another. (McPhail 2008)

   Voicing EFCA includes: the similar vocal sounds of two or more persons cheering, booing, laughing, or whistling; or their verbal sounds of conversing, chanting, singing, or praying. (McPhail 2006)

   Manipulating EFCA includes: the similar ways the hands of two or more persons are engaged in: gesturing; embracing; grasping leaflets or petitions (Steinhoff 2008) that assert grievances, claims, and demands; grasping candles or clubs; throwing bottles or rocks; clenching hands in applause or in 'high-fives'; clenching fists in gestures of solidarity or in preparation to strike another person.

   Locomoting EFCA includes; two or more persons whose lower limbs are engaged in: the similar postures of standing, sitting, kneeling, or lying; or the similar locomotions of marching, walking, running, crawling, dancing, or kicking. (McPhail & Wohlstein 1986)

   These are modular forms of collective action; almost any two or more persons can engage in them; most occur repeatedly in political, sport, religious, civic, and convivial gatherings; and most are likely to occur in multiple cultures. Systematic one-minute observation records at ten-minute intervals of the proportion of rally members engaging in one or more of these EFCA provide quantitative measures of the dynamic variation in participation over time (McPhail 2006). These data illustrate the “illusion of unanimity” with evidence that mutual inclusive collective action is extremely rare and short lived when it does occur. Combinations and permutations of two or more forms in the same observation minute yield a measure of the dynamic complexity of collective action over time (McPhail, Schweingruber, & Ceobanu 2012). These data illustrate the claim that most gatherings, including protest gatherings, are kaleidoscopes of alternating and varied individual and collective actions and interactions rather than a blanket of uniformity. This also suggests a useful conceptual continuum in which individual and collective actions and interactions comprise gatherings: two or more gatherings (e.g., a rally followed by a march) comprise events; multiple gatherings and events comprise campaigns; and multiple gatherings, events, and campaigns comprise waves or surges.

ADVANTAGES AND LIMITATIONS

Surveys are the most practiced of all social science data collection methods. Some, like those Crozat (1998) examined, tell us more about attitudes than about participation. Surveys have also been used to ascertain who participated in protests (and who did not) and how participants came to do so. Few have inquired about participants’ actions during the events. Surveyors now interview participants as they are assembling or dispersing. Assemblers have been asked if they are alone or with others (and how many); dispersers have been asked the same questions, as well as if they remained with their companions throughout the event. Dispersers could be asked if they had participated, or not, in a checklist of activities (e.g., cheering, singing, chanting, gesturing, applauding, booing, cursing, throwing, striking, etc.)? Did their companions participate? Did most, some, or none of the other persons immediately surrounding the respondent-and-companions also participate in those activities?
Answers to these survey questions cannot tell us about variation in participation across time and place but would tell us far more than merely that respondents were present during a protest.

Newspaper archival research has its limitations (Earl et al. 2004) but also has no equal for constructing longitudinal records of the incidence of protest events. Fluctuations in incidents correlate with a host of other important variables of social science interest (see the publications list in McAdam et al. 2009). The journalists who provide the raw data from which newspaper stories are written and subsequently archived are trained to report who does what, when, and where. Large protest gatherings are a challenge for journalists because the latter are too few in number, cannot be everywhere at once, and have not been trained to look for and report collective actions, or variations across time and place. Ideally they could be trained to beware the twin illusions of unanimity and continuity and to observe and report whatever alternating and varied individual and collective actions occur. Conceivably this could improve the quality of archived accounts of protest events for subsequent generations of archival researchers.

Systematic observations in situ can provide rich records of the alternating and varied individual and collective forms of action that comprise contentious gatherings. There are no immaculate perceptions; observers must know what to look for. They have to be trained to recognize and record collective actions when they see or hear them (Schweingruber & McPhail 1999); that training can be accomplished in a day or two. To date, it has been costly to train and deploy multiple observers, to compile and analyze the records they produce. Cell phones, digital cameras, and other digital recording devices lend themselves to prudent sampling and recording of the actions comprising protest events. Digital film records are lending themselves to the development of new and efficient means of coding and analyzing digitized data. Digital recording devices are now ubiquitous in protest and celebratory gatherings; consequently, similarly equipped social scientists may be less obtrusive to others around them while producing systematic observation records.

INNOVATIONS AND DERIVATIVES

The Internet, cell phones, and digital videocams have revolutionized the way in which three traditional forms of protest – vigils, blockades, and rallies – are mobilized and recorded. After Cindy Sheehan’s son was killed in the Iraq War, she stood vigil outside the US president’s summer home protesting the war; the media covered her vigil. At a press conference she called for nationwide sympathy vigils on August 17, 2005; that call was repeated on several antiwar movement websites. One site asked local organizers to report when and where their vigil occurred (McCarthy & McPhail 2006). The reported total of 1627 different vigils throughout the US on that single day was four times larger than the number of vigils reported in the 35-year period covered by the Collective Action Dynamics project. Neither of those data sources tell us whether two or more vigilers at any of the sites were collectively stationary or rotating, silent or intermittently chanting, singing or praying, carrying lighted candles or placards, distributing leaflets or depending on placards to inform onlookers and passersby of their grievances, claims, and demands; nor do we know the duration of their vigils. Social scientists have reported observations of all of these combinations and permutations of EFCA in numerous vigils over the past half-century.

The Internet has also been used to mobilize participants throughout the US to send faxes and/or emails to congressional offices in Washington, DC in protest of the Iraq War. The resulting tens of thousands of electronic messages effectively obstructed those offices by shutting down their fax machines and computer systems, thereby blockading business-as-usual. Both the Internet and cell phones
are now routinely used to mobilize participation in forthcoming rallies and marches as well as impromptu protests and celebrations. Cell phones are used on site to contact others located elsewhere informing them of the impromptu gathering in progress and inviting them to assemble. Inquisitive social scientists can use these same recording and reporting tools to generate systematic data on the individual and collective actions comprising protest and other temporary gatherings.

6 MODULAR PROTEST FORMS

Moral incentives
JACQUELIEN VAN STEKELENBURG

One of the most fascinating and puzzling features of collective action is the fact that people undertake potentially high-risk protests with little likelihood of reward. Take the widespread protests of early October 1989 in East Germany with high chances of repression and low chances of success. Why are people time and again prepared to participate in protests?

This question refers to the so-called collective action problem. Collective action problems arise in relation to public goods because they attract free riders who consume but do not contribute to the production of public goods. Why were the thousands of East Germans prepared to overcome this free rider dilemma? The literature identifies two main answers (Olson 1965). The first explains participation in terms of collective incentives, a combination of individual demands for public goods and perceptions of individual and group efficacy. The second explains participation in terms of selective incentives, benefits that participants – participants only – derive from the activity itself, irrespective of whether they manage to provide the public good or not.

Selective incentives are classified according to the different ways in which they affect people’s motives and actions (e.g., Marwell & Oliver 1993; Opp, Voss, & Gern 1995). Material incentives are payments or incentives for participating or coercion for not participating. Social incentives are benefits or costs of participating (or not) arising from relationships with other people, either their respect and honor, or the communal pleasures of doing things together. Moral incentives arise from the internal feeling of doing the right thing. A person acting on moral incentives can expect a sense of self-esteem, and approval or even admiration. People take a free ride on the collective good unless selective incentives propel them to protest participation. Olson (1965) emphasized material incentives as the logics of action, whereas scholars such as Chong (1991) and Opp, Voss, and Gern (1995) emphasized social and moral incentives. Note that Olson did not argue that people participate in social movements out of rational self-interest. He acknowledged that moral attitudes could mobilize to the extent they provide selective incentives, but, he argued, it is not possible to get empirical proof of the motivations behind these “soft” incentives (1965: 61, n.17). Nowadays, moral incentives and motivations can be and are measured (e.g., Gross 1995; Opp, Voss, & Gern 1995; Verba, Schlozman, & Brady 1995; Muhlberger 2000; Van Stekelenburg, Klandermans, & Van Dijk 2009). They appear to be of utmost importance in explaining protest participation.

People participate in protest because they see it as an opportunity to change a state of affairs they are unhappy with at affordable costs (instrumental route), or because they identify with the others involved (identification route), or because they want to express their values and their anger with a target that violates their values (ideology route, cf. Klandermans 2004). The literature suggests efficacy and selective incentives (Olson 1965; Klandermans 1984) as the logics of action in the instrumental route. The feeling of being able to make a difference combined with selective incentives helps to lower the costs and increase the benefits of participation. Social incentives: commitment, respect and honor, and communal pleasures of doing things together, are the logic of action in the instrumental route. Moral incentives function as the logic of action in the ideological route. Violated (sacred) values generate moral outrage propelling people into action to express their views (Jasper 1997). The more a political or social “wrong” is against people’s principles and values, the more they feel obliged to defend their subjective moral
boundaries (Van Stekelenburg, Klandermans, & Van Dijk 2009).

In taking the instrumental route people have to overcome the free rider dilemma, but the identification and ideological route generate an inner obligation that helps to overcome this dilemma – even though the two routes create an inner obligation for different reasons. Maintaining one’s moral integrity may incite an inner moral obligation to oneself, versus the inner social obligation to other group members incited by group identification (Stürmer et al. 2003). These obligations release an energizing force if and only if one participates, and therefore make free riding less likely. Hence, one might take a free ride on the production of a collective good, but one cannot take a free ride on one’s own inner obligation.

With these insights in mind, let me conclude by returning to the East German protesters of early October 1989. Opp, Voss, and Gern (1995) demonstrate that social and moral incentives especially helped them to overcome the fear of repression and negligible success probability. Successful collective action requires an ever-changing mix of material, social, and moral incentives that work together to overcome collective action problems, and hence, dependent on the sociopolitical context, a different mix of incentives may motivate people to protest.

Motivation and types of motives (instrumental; identity, ideological motives)
BERT KLANDERMANS

The social psychology of movement participation distinguishes three fundamental reasons why people participate in social movements: people may want to change their circumstances, they may want to act as members of their group, or they may want to express their views. Together these three motives account for most of the reasons why people take part in collective political action. Social movements may supply the opportunity to fulfill these motives and the better they do the more movement participation turns into a satisfying experience. In brief, the literature refers to these three motives as instrumentality, identity, and ideology. Instrumentality refers to movement participation as an attempt to influence the social and political environment; identity refers to movement participation as an expression of identification with a group; and ideology refers to movement participation as an expression of one’s views. Different theories are associated with these three angles (Klandermans 1997; Tarrow 1998). Instrumentality is related to resource mobilization and political process theories of social movements and at the psychological level to rational choice theory and expectancy-value theories; identity is related to sociological approaches that emphasize the collective identity component of social movement participation and with the social psychological social identity theory; and ideology is related to approaches in social movement literature that focus on culture, meaning, narratives, moral reasoning, and emotion and in psychology to theories of social cognition and emotions.

These are not mutually exclusive motives, or competing views on social movement participation, although some parties in the debates in the literature seem to take that position. However, approaches that neglect any of these three motives are fundamentally flawed. This is not to say that each motive should necessarily be active, or that they should be equally strong. For some people a specific motive can be more important than another and the same holds for some movements. One might imagine that in the case of the labor movement instrumentality, that is, aiming for a better agreement, is more important. Identity motives, on the other hand, might be more important for the gay and lesbian movement, while ideological motives might have been more important for participants in the anti-Iraq War demonstrations.

Perceived costs and benefits. The instrumental motive to participate in collective action conceives of action participation as controlled by the perceived costs and benefits of participation. Klandermans presented his classic expectancy-value model in the American Sociological Review in 1984. The model holds willingness to participate dependent on collective benefits and selective incentives. The selective incentives are the expected outcomes of participation multiplied by the value of those outcomes. Between values and expectancies a multiplicative relationship exists which implies that each factor must be higher than zero. If an expected outcome is not valued it does not make a difference; if a valued outcome is not expected, it does not make any difference either. Some outcomes are called selective incentives because they are contingent upon participation. Others are characterized by jointness of supply, that is to say that once they materialize everybody benefits, including those who did not take part in their realization. Therefore, they are called collective benefits. This makes collective action vulnerable to the free-rider problem, that is, nonparticipation under the...
assumption that one will reap the collective benefits anyway. The key factor of this part of the model is expectations: expectations about the behavior of others, expectations that the goal will be reached, and expectations about the contribution of one’s own behavior.

Inner social obligation. The drive originating from identification with other participants is the felt inner social obligation to act on behalf of the collective. Stürmer and his collaborators demonstrate that the motivating force behind collective identity is such a felt inner obligation (Stürmer et al. 2003). Sociopsychologically, and in terms of motivation, a felt inner obligation to participate is important because it is impossible to take a free ride on such an obligation. An inner obligation to participate can only be met by acting upon it, that is to say by participating.

Inner moral obligation. Ideology as a motivating force results in an inner obligation as well, but this time a felt moral obligation (Van Stekelenburg and Klandermans 2007). Norms and values are violated, for instance, equality or protecting the weak, and in order to maintain their moral integrity people choose to participate in collective action. And again, one cannot take a free ride on a felt inner obligation.

An additive model. Instrumental, identity, and ideological motives presumably combine in an additive manner. That is to say that each motive adds to the other two in explaining why people participate in collective action, although the relative contribution need not be equal on all occasions. This also implies that the three motives can compensate for one another. Indeed, someone can participate in a protest event although she is not convinced that it will have much impact on politics, but she identifies with the other participants and that is what makes her participate. Alternatively, someone can feel so upset about the violation of some core value, for example animal rights, that he wants to express his indignation irrespective of the expected political outcomes. Van Stekelenburg (2006) was the first to demonstrate that, depending on the organizer or the issue, the relative weight of the motives vary. She proposed and tested that movements might have different action orientations that appeal differentially to the three key motives. Borrowing Turner and Killian’s distinction between power-oriented, participation-oriented, and value-oriented movements she argued that power-oriented movements appeal more to instrumental motives, and value-oriented movements more to ideological motives (Turner and Killian 1987). This turned out to be true.

Movement/counter-movement dynamics
MARIA K. DILLARD

Movement/counter-movement dynamics refers to the patterns of interaction between the originating social movement and the responding countermovement. A recognition of the importance of this dynamic came about with the concept of countermovements, which arose when scholars recognized that opposition to the movements of the 1960s bore a striking resemblance to social movements in both form and function. Scholars have since identified the interaction of social movement and countermovement as an important aspect of the political context and of democratization. Movement/counter-movement dynamics span a range from direct influence of the opposing side to indirect changes to the political context in which the other side operates (Meyer & Staggenborg 1996). Countermovements (CM) and social movements (SM) have been distinguished from one another on several key dimensions, including goals, ideology, tactics, membership, and location in the social structure. SMs and CMs engage with each other on each dimension. Movement/counter-movement dynamics include the ways in which SMs contribute to CM emergence, relationships of SM, CM, and the state, and patterns of interaction.

EMERGENCE

The first interaction of the SM and CM can be traced to the emergence of the CM. A variety of factors have been tied to countermovement emergence, including progress and success of the originating SM, threatened interests for some population as a result of the SM, the CM ideology, availability of political allies and other resources to support the CM, and the political opportunity structure. SMs create the grievances and political opportunities for the emergence of CMs through actions that advocate for change, threaten established interests, mobilize constituents, and that demonstrate the use of collective action as a means to effect or resist social change (Zald & Useem 1987). Therefore, SMs are active in creating the conditions for the mobilization of their own opposition. Upon emergence of the countermovement, SM/CM interaction begins. Zald and Useem (1987: 247) famously describe the movement/counter-movement dynamic as a “loosely coupled tango of mobilization and demobilization.”

RELATIONS TO STATE

The state or some other authority (e.g., political authorities and social institutions) often mediates the interaction of a SM and CM. The relationship of the SM, CM, and the state varies, as does the direction and nature of the conflict. Models of possible SM–CM-authority relationships take into account the issues and goals of the SM and CM, as well as the type of governing structure in place at the time of emergence. In addition, the relationships vary as the SM evolves and gain complexity when interacting with multilevel governing structures.

DYNAMICS

Though the state’s relationship to SMs and CMs is important, its involvement often obscures the sustained interaction of SM and CM. As a result, many theorists have called for analysis of these strategic interactions, particularly when the conflict persists over time (Zald & Useem 1987; Meyer & Staggenborg 1996). This interaction or conflict may take various forms, depending on how tightly coupled the movements are (Zald & Useem 1987). With sustained conflict
between SMs and CMs, the consequences may include unexpected outcomes for the original movement and society. For example, the emergence of new, all-white private schooling institutions in Mississippi has been tied to the interaction of SM and CM (Andrews 2002). SM/CM dynamics are among the determinants of selection of tactics and strategies, development of an ideology, and of success for both sides.

Zald and Useem (1987) identify a number of points at which the SM and CM connect (and confront) one another. They include direct, face-to-face encounters, attempts to gain support from the same third party, and efforts to undo the impacts of the other. The resulting conflicts can be indirect (e.g., efforts to persuade authorities and bystanders to return to original policies) or direct (e.g., legal battles, violent confrontation), but are ultimately focused on inhibiting the mobilization of one side while persuading the relevant authorities and bystanders to adopt the ideology of the other. The presence of conflict may lead to increased opportunities for SMs in some areas (e.g., gains in media attention as the media strives to maintain balance), and decreased or limited opportunities in others (e.g., resources are exhausted in actions aimed at reacting to the opponent).

Movement/countermovement strategies include the use of disruptive or damaging actions to harm the opponent, preemptive action directed at the opposition, and persuasion and recruitment of the opposition to join the movement (Zald & Useem 1987). Within each strategy, SMs and CMs utilize various tactics. In order to increase the costs of mobilization for the opposition, a movement might resort to gathering information on their opponent in order to expose negative aspects of the movement or its members, create fear, or simply dissuade mobilization. The mass media serves as a source of strategic information on the opposition’s views and behaviors, as well as on the public’s reaction to the strategies in play. Additional tactics include restricting the opposition’s access and use of resources and creating a negative public image of the opposition. Interactions between SMs and CMs make it difficult for either side to choose an exclusively institutional tactical repertoire; such tactics are too limiting in the presence of opposition. Instead, tactical innovation and adaptation, as well as escalation, are used in the SM/CM interaction as a means of counteracting the moves of the other (McAdam 1983).

The more tightly coupled the SM and CM, the more closely related the patterns of mobilization and the more influence they will have over the tactics and strategies employed by the other. For example, SMs and CMs are generally forced to act within the same venue, which narrows the tactical repertoires available to each (Meyer & Staggenborg 1996). Protracted oppositional interaction of SMs and CMs focused on the same targets and within the same venue leads to the development of similar structures, strategies, and tactics, despite other differences (Lo 1982; Meyer & Staggenborg 1996).

SM/CM dynamics extend to the production of each movement’s cultural resources. While SMs are able to create a new ideology, CMs have to “remember the answers” (Zald & Useem 1987: 270). CMs are forced to justify the way things already are and provide support for the lack of change. SMs must show that new times necessitate new ways. Alternately, CMs have the burden of discrediting the ideas and goals of the SM and of showing that the status quo is still relevant. The ideology of the movement impacts the mobilization efforts of both sides, particularly in framing one’s opposition.

Movements and countermovements also engage in framing contests, in which each side attempts to persuade authorities and bystanders that they are on the right side of the issue (Zald 1996). CMs sometimes publicly challenge the diagnostic and prognostic frames of the original SM (Benford & Snow 2000). The demands of the SM and the way in which those demands are framed are impacted by the CM. Framing contests between SM and CM are very important to public perception of
the movement, the definition of the problem, the assignment of blame, and for highlighting the solution or desired change, as well as for determining media coverage, resource allocation, and mobilization success. The process of framing is determined, in part, by SM/CM dynamics, as each side competes for the support of the bystander public.

Political opportunities and constraints impact both SMs and CMs, as well as their interaction. For example, critical events that dominate the sociopolitical landscape, open government structures, political instability, and threatened interests (e.g., political, economic, cultural, social) can facilitate and hinder mobilization efforts for both SMs and CMs. According to Meyer and Staggenborg (1996), because SMs and CMs influence political opportunities and public policies, they are part of the creation of the political structure within which they operate. The SM and CM shape and are shaped by their interaction. For this reason, Mottl (1980: 631) conceptualized this movement/countermovement dynamic as a “continuous dialectic of social change.”

THEORETICAL AND EMPIRICAL CONTRIBUTIONS

Several of the key theoretical examinations of the movement/countermovement dynamic came about in the 1980s, as the theoretical development of social movement research was gaining momentum. In the years that followed, the theoretical backdrop for explaining the interactions of SM and CM further developed. Theorists have applied resource mobilization theory, collective behavior theory, and the concept of political opportunity structure, taken from political process theory, to the exploration of SM/CM dynamics. Alongside the development of specific propositions about SM/CM dynamics, movement theorists outlined directions for future research related to movement/countermovement dynamics, including calls for macro-level research on countermovements, more longitudinal, multimovement studies, and analyses of the continuous pattern of mobilization of SMs and CMs.

Social movement scholars have since responded to these calls. In empirical analyses, countermovement variables have been utilized to explain such things as the selection of movement tactics and movement outcomes. Further examples include work on animal rights (Jasper & Poulsen 1993), climate change (McCright & Dunlap 2000), German politics (Koopmans 1997), nuclear weapons (Useem & Zald 1982), student divestment (Soule 1997), and abortion (Rohlinger 2002). The theoretical and empirical importance of countermovements and their interaction with originating movements is no longer unknown.

REFERENCES AND SUGGESTED READINGS

The phrase, “social movement society,” represents a theory to unify a series of observations about social protest in the contemporary era. Offered by David S. Meyer and Sidney Tarrow (1998) in their introduction to an edited collection on contemporary social movements, it makes a series of claims about how protest movements have changed, and raised a series of questions to provoke subsequent scholarship.

Some early work on social movements focused on the profiles of those who engage in protest, offering aggregated psychological explanations for mass behavior, but for the past 40 years, many researchers have emphasized the politics context, concerns, and outcomes of social movements. The explicit premise of this tradition of research was that social protest, or unconventional political participation more generally, was the province of groups poorly positioned to get what they want through conventional means. The disadvantaged could use disruption to bring attention to their cause, to engage latent support, and to mobilize countervailing resources (see Lipsky 1970). In relatively closed or repressive polities, this meant that anyone outside the ruling group might try to launch protest movements. In advanced industrialized democracies, however, people who were disadvantaged politically, economically, or socially were the ones who would use protest to try to make gains.

The focus of the social movement society theory was on those advanced industrialized democracies. The signal social movements of the 1960s, particularly in the US, supported the notion that people who could get what they wanted in other ways would avoid protest. The large movements of the time were animated by ethnic minorities seeking civil rights and inclusion, young people seeking to end the war and enhance their opportunities to participate in decisions about both political life and higher education, and women seeking meaningful inclusion in politics and economic opportunities.

But by the 1970s, social movements emerged representing constituencies that had more tenuous claims to being disadvantaged, often organizing and mobilizing on issues that might have little direct effect on their lives. By the 1980s, the repertoire of social movement actions, including demonstrations and even civil disobedience, had extended to people and causes that were not dramatically disadvantaged, and they were often making claims on behalf of others. The peace and environmental movements, for example, were led by educated and middle-class people who could engage in more conventional politics, including participating in electoral politics; indeed, they often did in addition to movement tactics.

Meyer and Tarrow (1998) observed an increase in the number of causes and constituencies represented by social movements and a diffusion of the social movement repertoire across the political and economic spectrum. Social movements, in effect, became a permanent presence in American life. Increased frequency of protests, they argued, was accompanied by other changes in politics and life that made the social movement less disruptive: (1) the general public became more tolerant to protest as a political tactic; (2) police and other state authorities developed negotiating strategies to manage protests to increase predictability for all concerned and minimize disruption; (3) social movement organizations formalized, bureaucratized, and established themselves as more or less constant presences in political life, (4) creating a professional identity for organizers (Everett 1992); and (5) activists employed a narrower range of social movement tactics, emphasizing less disruptive, threatening, or costly approaches to invite broader participation, for example,
staging a large and colorful demonstration on a weekend in a public location negotiated with authorities rather than staging ongoing civil disobedience campaigns.

Meyer and Tarrow (1998) questioned whether the social movement society represented an increased democratization of political life in advanced industrialized societies or the effective neutering of a tactic that had sometimes been useful to those without other access to political influence. They suggested that the more crowded social movement landscape made it harder for any new cause of constituency to break through the clutter of movements. When social movements become routinized, they asked, do they also become routinized so as to be less consequential?

Subsequent scholarship has made extensive use of the social movement society idea, and this has informed research on protest movements in advanced industrialized states. Soule and Earl (2005) used protest events data drawn from newspaper reports to test social movement society claims. They interpret their results as mostly consistent with the movement society theory, but different in important particulars that merit additional scrutiny. They found, for example, that the papers actually reported fewer, but much larger, protest events, employing more moderate tactics. They also found that the number of claims supported by protest events has increased, but there is a decline in the number of new claims, and that these claims may actually be narrower than the overarching ideas that animated movements in an earlier time.

Rather than employing direct tests, the social movement society has mostly been taken as a given, providing a backdrop for the analysis of a particular case or political behavior. For example, Earl and Kimport (2009) have examined fan engagement in computer networks, in effect recognizing nonobtrusive mobilization that is stripped of all political content. Interestingly, the movement society theory has extended much as its originators suggest the social movement form has extended, leaving larger questions about political, social, and economic inequality to be addressed.

Movements within institutions/organizations
CALVIN MORRILL and ELIZABETH CHIARELLO

Social movement scholars traditionally concern themselves with coordinated and sustained collective action apart from institutional channels that promote or constrain change. Organizational scholars, by contrast, traditionally focus on the strategies and structures embodied in bureaucracy. Zald and Berger (1978) were among the first to systematically articulate the idea that organizations are polities in which members can engage in collective action to change and/or resist official policies. Over the past three decades, scholars began blurring the boundaries of the conventional analytic foci of organizational and social movement research as they recognized that a great deal of social change occurs in organizations via social movements and movement-like dynamics. As Davis and colleagues (2005) illustrate, these developments led to multiple, interrelated shifts in social movement research, including: investigating the organizational bases of social and institutional change; expanding focal analytic concerns beyond state-centered authority to address collective challenges to institutionalized authority that operates separately from or in the shadows of state authority; examining collective action that involves both formally organized and tacitly coordinated efforts within and across organizations, markets, and fields.

Davis and Zald (2005) observe that organizational researchers likewise have increasingly drawn on social movement theory to explain structures and strategies in private corporations with nonbureaucratic, distributed production processes that resemble social movements; collective action in consumer and financial markets; and shifting organizational alliances across private, public, and nonprofit organizations. The combination of social movement and organization theory, rather than organization or economic theory alone, is more useful for explaining the dynamics of this new organizational world. Of particular importance has been collaboration and intellectual dialogue among social movement and neo-institutional organization theorists who explain organizational structures and strategies as expressions of taken-for-granted cultural-cognitive assumptions that constitute key institutions in society, including markets, law, work, the family, gender, and ethnoracial hierarchies. Much of the analysis in neo-institutionalism concerns “fields,” which are recognized domains of social life that bring together similar types of organizations, practices, normative regulation, and legitimized cultural-cognitive assumptions. As neo-institutionalists have increasingly focused on field emergence and change, as well as contradictions within and between different institutions, social movement theorists have recognized that broad collective attempts at change often target multiple institutions and fields at once. The American civil rights movement, for example, simultaneously targeted ethnoracial hierarchy, law, education, and other key institutions of contemporary society in the quest for social justice and racial equality. This intellectual cross-traffic among social movement and organizational researchers has prompted a multi-institutional conception of society in which the state is but one source of legitimate authority and power.

Armstrong and Bernstein (2008) argue that the multi-institutional conception of society calls attention to how social movements and other collectivities challenge and shape nonstate, institutionalized authority in many fields involving multiple social institutions. Scholars advocating a “new social movements” approach have similarly broadened understandings of power and authority to include multi-institutional targets. While new
social movement scholars typically address nonmaterialistic, cultural sources and changes, organizational scholars focus on movement dynamics and institutional change within and across organizational and field boundaries. Although not all social movement scholars recognize collective action in which the state is not directly involved as a social movement, many scholars argue that applying social movement theory outside state-centered politics can yield insights into organizational and institutional change that conventional theories in those domains cannot.

Attention to organizations and institutions as contexts and targets of social movements underscores the importance of reconceptualizing social movements as challenges to institutionalized authority (whether linked to governments or not), variation in the forms and strategies of political conflict in organizations and fields, and the dynamics of movement emergence and their consequences.

RECONCEPTUALIZING SOCIAL MOVEMENTS AS CHALLENGES TO INSTITUTIONALIZED AUTHORITY

McAdam, Tarrow, and Tilly (2001) argue that social movement theory traditionally falls under the umbrella of contentious politics, which locates social movement research in the realm of political sociology by focusing on how social movements target state agents, facilitate or disrupt political processes, and secure state-based outcomes. Organizational and social movement scholars increasingly identify social movement processes occurring in organizations and fields outside or loosely connected to the state.

Snow (2004: 11) calls for liberating social movements from the stronghold of state-centered contentious politics by redefining social movements as “collectivities acting with some degree of organization...and continuity...primarily outside of institutional or organizational channels for the purpose of challenging extant systems of authority, or resisting change in such systems, in the organization, society, culture or world order of which they are a part.” Systems of authority share two key characteristics: (1) behavioral elements – they are the locus of decision-making that influences some group of people, and (2) interpretive elements – they are supported by an interconnected set of beliefs and values that serve to justify their exercise of authority. Movements may challenge either or both of these elements in seeking organizational and institutional change.

A focus on challenges to institutionalized authority enables scholars to expand and refine social movement theory by evaluating whether the mechanisms and processes identified in state-oriented political arenas apply similarly to collective change efforts or resistance to change in other venues. Since different forms of institutional authority link to different constituents, norms, goals, and ideological bases for exercising authority, the applicability of social movement theory across various institutional arenas speaks to the robustness of those theories while the need for theoretical modification reveals how institutional targets influence the forms and processes of collective action. The expansion of social movement research to include all institutionalized systems of authority ties studies of social movements to research on authority and power more generally, thereby linking social movement studies integrally to key concerns across much of the social sciences.

Empirically, this approach expands the array of organizations to which social movement theory can apply and facilitates comparative research by enabling researchers to focus on a broad range of organizational forms and settings. This approach also facilitates scholars bringing under the rubric of social movements those forms of collective action that are not aimed at the state, such as religious, self-help/therapeutic, countercultural, and scientific/technological movements. Including these movements in the analytic purview of social movement research broadens an understanding of the sources and mechanisms of institutional change as it enables scholars
to understand different forms of collective action at various developmental stages. This expansion also provides a fresh look at entrepreneurial activity in fields and organizations that can account for new technologies and innovations in markets and, in scientific fields, new waves of ideas and discoveries.

Social movement research sometimes receives criticism for using the single case study as a primary method of analysis. State-centered studies lend themselves to single case studies as it is difficult to engage in cross-comparative research when examining a phenomenon unique to one country or governmental system. To rectify this, Amenta (1991) has argued for breaking cases into smaller units of analysis, such as examining governmental subunits (e.g., states, provinces) within federal governments. The study of social movements in and across organizations provides additional opportunities for comparative research by investigating collective action in multiple kinds of organizations and their environments.

FORMS OF COLLECTIVE ACTION IN ORGANIZATIONS AND FIELDS

The examination of collective challenges to institutionalized authority, broadly understood, draws attention to organizations and fields as political systems in which social power is reproduced and challenged. As Ewick and Silbey (2003) argue, power is not a fixed essence, but a relational process constituted at all levels of social life through ongoing social interactions. Social hierarchies in organizations and fields are linked to broader institutionalized arrangements, including hegemonic structures that organize economies and social relations of all kinds (e.g., social class, gender, race, and ethnicity). Because power is grounded in the relational dynamics of organizational systems, the same structures that reproduce power provide resources for resistance. This cycle of power and resistance occurs in organizations of all types and is constrained and facilitated by broader institutional arrangements and movements, including legal changes.

Political conflict in organizations and fields varies in terms of its visibility (overt to covert), structure (disaggregated to formally coordinated), and size (small group/network to mass mobilizations). Zald and Berger (1978) identify three categories of movement dynamics in organizations that illustrate some of these differences. Coups d’etat involve covert, informally coordinated small groups who target leaders for change. Bureaucratic insurgency typically begins covertly but can become more overt with large, formally coordinated networks of followers. Mass movements within and across organizations are highly visible, large-scale mobilizations typically requiring formal coordination. Likewise, collective efforts of change within and across fields can take on similar variation from small critical masses to mass mobilizations that captivate and/or create whole fields and markets.

Most studies of political conflict in organizations/institutions address overt, formally coordinated action, but recent work attends to covert tactics – collective dissent that occurs beneath the surface of normalized routines, but can facilitate or resist change. Because those who challenge or resist institutionalized authority often lack material or cultural resources, they opt to engage in their actions covertly to avoid repression from dominant and/or official groups. Morrill, Zald, and Rao (2003) argue that covert political conflict is marked by multiple attributes, including perceptions of collective injury (or the failure of orthodox practices), contestation of institutionalized power and authority, social occlusion, and officially forbidden forms of dissent that target material and/or symbolic elements of institutionalized authority. Although perceptions of collective injury and the failure of orthodox practices can precede the contestation of institutionalized authority, they need not do so and can emerge in the social interaction that constitutes covert action. Sabotage and theft exemplify covert challenges to the material aspects of institutionalized authority while symbolic challenges include “symbolic escape” in which aggrieved
parties psychologically or physically separate themselves from the sources of organizational injustice and abuse by taking long breaks or daydreaming, hidden transcripts, gossip, and insubordination paired with feigned ignorance of the rules. In all these dynamics, it may be difficult for both dominant groups and broader audiences to make accurate attributions of the identities and interests of covert challengers.

The collective dimensions of covert action that challenges institutionalized authority can also be conceptualized as a continuum from “disorganized co-action,” in which actors simultaneously subvert dominant norms without consciously coordinating their actions, to “tacit complicity,” where organizational members conceal the actions of others engaged in covert conflict, to informal coordination through networks and virtual groups, to clandestine formal coordination via unions and other organized groups that can result in overt mass mobilizations.

Official structures that permit or constrain dissatisfaction/voice influence the forms of political conflict in organizations. McFarland (2001) demonstrates how authority structures in high school classrooms that permit student participation create opportunities for mass mobilization against teachers while those that impede student participation limit disruption to those students with advantaged social networks. Professional, voluntary, and federated organizations with flatter organizational structures diminish covert conflict while those with more hierarchical organizational structures suppress overt voice and exacerbate covert conflict. Roscigno and Hodson (2004) demonstrate how other aspects of organizational structure, such as disorganization and union presence, yield both collective and individual political action. Institutional fields with dominant organizations may experience similar dynamics as challenges to institutionalized authority take more overt forms, while fields with more fragmented structures can lead to more overt and organized forms of collective challenges.

MOVEMENT EMERGENCE

For collective action to emerge in organizations and fields, the same conditions identified by social movement theorists as necessary in broader social settings must exist: political opportunities, mobilizing structures and resources, and resonant frames. At the same time, the experience of social movement dynamics in organizations and fields blurs the traditional dichotomy of social movement “outsiders” and targeted “insiders.” Categorizing individuals as insiders or outsiders glosses over the complexities of activism; scholars suggest this belongs along a continuum since many individuals operate simultaneously inside and outside organizations and fields. Scully and Segal (2002) demonstrate that activists within and across organizations and fields can play multiple roles depending upon their focal activities; organizational members engaged in activism within their own organization may have to devise strategies to reach out to constituents that prefer anonymity while at the same time sharing activist strategies across organizations and fields in more explicit ways. Meyerson (2003) analyzes “tempered radicals” who buy into the formal goals of the private corporations at which they work yet also look for opportunities to collectively fight for social justice within their workplaces.

Organizational members’ accountability to the organization and to outsiders helps explain the emergence and dynamics of their activism. They may depend on the organization or field to which they belong for financial resources, but depend on an outside movement for discursive resources (resonant frames). Katzenstein (1998) observes that divided accountability helps shape the forms activism takes. To fight for change from within, activists must first gain entrée to the organization or field. Broad societal and legal changes resulting in an influx of minorities into mainstream organizations has set the stage for this pathway to activism. Traditional movements developed outside institutional channels help pave the way for institutional activism by
movements within institutions/organizations

furnishing activists with discursive and tactical repertoires promoting movement goals. Movements that emerge inside organizations reach out to external movements to validate their claims and pressure the organization using tactics unavailable to insiders such as boycotts and petitions. Similarly, Binder (2002) argues that movements emerging outside organizations can reach out to sympathetic insiders to advance their claims from within.

MOVEMENT OUTCOMES

One of the most vexing questions in social movement research concerns linking collective action with particular outcomes. The most well-known conceptualization of social movement outcomes comes from Gamson’s (1975) early focus on the “acceptance” of movement goals by targets and the “new advantages” to which such acceptance can lead. In organizations, scholars have framed the outcomes of collective action in terms of micro-level changes to workplace routines, implementation of new policies and technologies at the organizational level, and alterations of existing and the construction of new organizational forms and fields. Aside from these types of outcomes, movement outcomes can also carry biographical and personal outcomes in terms of risks and opportunities to professional careers or emotional commitments to activism. Outcomes can also unfold in various kinds of settlements and quasi-formalized collaborations of groups with very different practices and orientations across organizational and field boundaries, which can lead to broader consequences involving new values, beliefs, identities, and cultural practices out of which new organizational forms and fields can form.

CONCLUSION

The study of social movements in organizations and institutional fields underscores the blurring of boundaries between the concerns of social movement and organizational research. Scholars operating on and/or across these boundaries have drawn from social movement theory to understand institutional change and new formations in organizations, fields, and markets. Scholarship on social movements in and across organizations has expanded both the types and targets of collective action, as well as the forms and consequences that such action produces. By taking seriously the idea that a great deal of social and institutional change occurs in and across organizations, social movement and organizational scholars can demonstrate how institutional change at multiple levels of analysis occurs.

Movies and movements
PETRA ANDITS

Film has been recognized for its potential social and political impact since its beginning (see, for example, the debate between Walter Benjamin and Theodor Adorno). Therefore, film, and in particular documentary film, can also be seen as an instrumental tool of social movements to bring about social and political change. Although generally ignored by social movement scholars, films can have a wide range of important impact on the public, social movement organizations and policymakers. Social movements continually attempt to create public space for debate of the issues they consider important, and films can become a crucial segment of that struggle as they create a forum in which the public can encounter issues (Whiteman 2003). Activist documentaries may provide a sense of shared identification around the issue at stake and this in turn can mobilize citizens, as was the case after the screenings of *Panama Deception*, a film about the 1989 US invasion of Panama. Activist films may also influence the activist communities themselves. The production process itself can stimulate greater communication among individuals and organizations and can strengthen organizational networks. For example, labor organizations have mobilized their members by educating them about the long history of labor activism in the southeastern US through *The Uprising of ’34* (film about the 1934 textile strike). In addition, documentary films have proven to be powerful tools in influencing public policy. For example the documentary *Yes, In My Backyard*, exploring the dependence of one American farming town on the prison industry, helped spark debates about policy and reframe the policy agenda (Whiteman 2003).

The first wave of activist documentary appeared during the early 1930s, influenced by the emerging radical ideas of the time. Probably the most notable filmmaker of this period was John Grierson, whose famous film *The Drifters*, about commercial fishing off the west coast of Scotland, attempted to shift the image of the proletariat away from the Victorian capitalist perspective.

During the 1960s and 1970s heightened political turbulence and the development of low-cost video technology facilitated the peak of film activism. Most prominent were the French and South American activist cinemas. They promoted the politicization of cinema, not only as a cultural apparatus but also as means of social and political transformation (Granjon 2011). Some of the key French collectives in the period were Unicité, Ciné-Lutte, Medvedkine, Arc, Iskra, and Cinéma Rouge. Activist cinema’s main emphasis laid on factory workers’ and farmers’ class struggle against capitalism, while other films focused on immigrants, prostitutes, gays, women, and new critical issues, such as antipsychiatry and ecology. Examples include the *Les prostituées de Lyon parlent; Coup pour coup; Travailleurs immigrés; Avoir vingt ans dans les Aurès; Malville, état de siège.*

At the same time, the New Latin American Cinema grew out of the Imperfect Cinema from Cuba, Third Cinema from Argentina, and Cinema Novo from Brazil. These collectives shared not only the regional sociohistorical conditions under which they emerged, but also an urge for radical political and social intervention (Del Sarto 2005). Fernando Solanas and Octavio Getino, the two notable Argentinean filmmakers of the Third Cinema, claimed that the “new historical situation” demands a new “revolutionary cinema”; a “militant cinema that contributes to the possibility of revolution” (cited in Del Sarto 2005: 81). The focus of their films was oppression, exploitation, marginality, and poverty.

A noteworthy example of the usage of films by social movements during this period is that...
of the women liberation movement. During the second wave of feminism a number of feminists used films as part of their liberation activities. Women’s use of film has been crucial in creating feminist political expression (Tomsic 2007). Activists involved in the movement made films to self-represent female experience and feminist demands and to address what they saw was missing from films already in circulation. Some feminist film examples are *Wanda, Maidens, Ladies Rooms, Film for Discussion, We Aim to Please, Separation, Vibration*.

The use of film by social movements to convey their messages has increased dramatically in the first decade of the twenty-first century. In the last ten years SMOs have successfully incorporated documentary film projects into their campaigns for social and political change. The third wave of activist documentary began to evolve with a number of labor documentaries and films documenting the mounting AIDS crisis (for example, *Voices from the Front and Fast Trip, Long Drop*). Social movements championing human rights are probably the most fruitful in producing and distributing films about the issues they fight for. Since the turn of the century a great many activist documentaries have recorded human rights abuses. For example, *Total Denial* (2006) exposes violations of the Burmese people’s rights; *The Greatest Silence* (2007) portrays rape and mutilation of women in Congo; *Taxi to the Dark Side* (2007) deals with torture in Abu Ghraib and Afghanistan. *Not in Our Town* shows the residents of Billings, Montana, who stood up for local minorities when they were targeted by white supremacists. Human rights film festivals are burgeoning worldwide. Examples include the Annual Human Rights Watch International Film Festival, the Annual International Human Rights Film Festival in Buenos Aires, and the Human Rights Arts & Film Festival in Melbourne. By screening thought-provoking films, festivals offer platforms to discuss issues, mobilize activists, and promote action to stop the abuses (Kaiser 2011).

Multiculturalism and social movements
FABIO ROJAS

Multiculturalism is a movement advocating the representation of multiple cultures in education, government, and other institutional settings. Multiculturalists are motivated by ethical and practical considerations. Ethically, multiculturalists believe that it is unjust that social institutions only recognize a single cultural group. States, for example, have an obligation to recognize all citizens and their traditions, not merely those that have traditionally controlled the state. Multiculturalists also believe that individuals and groups benefit when they are exposed to multiple cultures. Individuals may become more tolerant if they know about ethnic groups aside from their own. Groups that have been historically repressed may benefit from having their voices heard in schools or government, and thus decrease the stigma associated with being from a particular group. It is also argued that recognition of multiple cultures reduces conflict because nondominant groups are not forced to completely assimilate the dominant culture.

THE BEHAVIOR OF MULTICULTURAL MOVEMENTS

Multicultural movements operate at multiple levels. Some political movements institutionalize multiculturalism in the national government. A number of Southeast Asian nations have created policies that emphasize the representation of multiple groups. Following a period when Chinese ethnics dominated, the Malaysian government created a 1963 policy that formally recognized non-Chinese groups and gave them power. A very well-known example is Canada, which has formally recognized multiple cultures for decades. Not only are the French-speaking Quebecois recognized, but so are indigenous groups and various immigrant communities (Driedger 1996).

Multicultural movements also target civil institutions. In the 1980s, for example, multiculturalists targeted American schools (Binder 2002). The principal argument was that American schools had systematically ignored or minimized the history and culture of various ethnic groups, such as African-Americans, Native Americans, and Chicanos. The solution was to thoroughly revise school curricula, especially in history and languages. At the primary and secondary level, multiculturalists demanded that schools employ textbooks showing the accomplishments of non-European individuals (Binder 2002). At the post-secondary level, activists demanded that universities require students take courses exploring the experiences of different ethnic groups and that administrators create ethnic studies programs to conduct research on American ethnic groups (Bryson 2005; Rojas 2007).

THE IMPACT OF MULTICULTURAL MOVEMENTS

The success of multicultural movements depends on a number of factors, such as the tactics employed and the openness of the targeted institutions. In studies of educational politics, it has been found that moderate levels of protest are the most likely to lead to implementation multicultural college curricula. Protest that is violent, or that does not occur at all, has a negative impact on creating multicultural college curricula (Rojas 2006). The culture of the institution appears to matter a great deal as well. If activists can make their proposals consistent with the school’s stated goals, then they are more likely to have the proposals accepted. Radical demands that schools or colleges completely change are ignored. Similarly, multicultural movements
that find allies within institutions are also likely to experience success (Binder 2002).

The long-term impact of multicultural movements on individuals is unclear. For example, even though a number of universities have multicultural course requirements, there is almost no research on whether such courses significantly change students’ attitudes or academic experiences. One exception is Yamane’s (2002) discussion of multicultural university curricula. Yamane suggests that multicultural course requirements might be a policy that mitigates vocationalism in the university. Ethnic studies majors, unlike other liberal arts majors, have not decreased relative to business. Similarly, there is little research in political science asking if state-sanctioned multiculturalism decreases ethnic tensions within a country. However, it is clear that there are lasting organizational impacts. Multicultural policies regarding languages and ethnic rights remain in many countries and they are enforced. Despite criticisms, ethnic studies ideas are now found in many school curricula, whether it be in history books or in the novels assigned in reading classes. Governments often have ethnic caucuses, such as the Black Congressional caucus, that continue to have influence.

**OPPOSITION TO MULTICULTURALISM**

Like most movements, multiculturalism has spawned its own countermovements. In the United States, there are associations of university professors who oppose campus multiculturalism and espouse a return to classical teaching. Political parties have arisen to combat multiculturalism and associated group rights. These parties are often populist and traditionalist in orientation and target immigrant groups. The Dutch Party for Freedom (Partij voor de Vrijheid) is one such example. Founded in 2005, it opposes dual citizenship, a key feature of multiculturalism in the Netherlands, and continued immigration from Islamic nations.

Many intellectuals have opposed multiculturalism on practical and ethical grounds. Practically, critics claim that multiculturalism exacerbates ethnic tensions by celebrating group differences. Instead, people should be encouraged to adopt the dominant culture. On moral grounds, critics claim that multiculturalism is bad because it “ghettoizes” people and sorts them into low status groups, rather than treating them as autonomous individuals. Other critics note that multiculturalism relies on the assumption that all cultures equally deserve respect. Thus, multiculturalism is criticized by traditionalists and populists, who value the dominant culture, and individualists, who are highly suspicious of group differences.

Multiorganizational fields
BERT KLANDERMANS

Movement organizations are embedded in multiorganizational fields (Curtis & Zurcher 1973; Klandermans 1992). Multiorganizational fields can be defined as the total possible number of organizations with which the movement organization might establish specific links. A social movement organization’s multiorganizational field can be broken down into sectors that are supportive, antagonistic, or indifferent. The first is described as the movement organization’s alliance system, consisting of groups and organizations that support it; the second as the organization’s conflict system, consisting of groups and organizations that oppose it— including countermovement organizations. Alliance systems provide resources and create political opportunities; conflict systems drain resources and restrict opportunities. The boundaries between the two systems remain fluid and may change in the course of events. Organizations that try to keep aloof from the controversy may choose or be forced to take sides. Coalitions can fall apart and former allies can become opponents.

The composition of a movement’s organizational field is not random, but relates to existing cleavages in a society, be it class, religion, ethnicity, Left–Right affiliation, the environment, and the like. Long before a controversy develops into an open conflict, various groups and organizations exist within a society, each with its own position and opinion. Depending on the issue one can to some extent predict which groups and organizations will end up on which side of the controversy. Opinions about social issues develop within subcultures of groups and networks of individuals who already share many attitudes and agree on certain principles. The direction in which these opinions develop suggests the initial contours of the multiorganizational field of a would-be challenger. Individuals, organizations, and groups may be antipathetic, sympathetic, or indifferent toward the issues at hand. In this situation, persuasive communication by a challenger resonates first among individuals from those sectors who have some sympathy or affinity for the challenger’s viewpoint. Many a persuasive campaign never goes beyond these sectors. It should be emphasized that movement campaigns direct their messages not only to potential supporters but to opponents as well. Indeed, a large number of a challenger’s arguments emerge in interactions with its opponents. As a result, “us–them” dynamics tend to develop.

Different social movement organizations have different but overlapping conflict and alliance systems. The greatest overlap will exist among organizations from the same social movement industry (e.g., the women’s movement or the environmental movement), but organizations from different movement industries will also have overlapping conflict and alliance systems (e.g., groups from the women’s movement and the environmental movement may coalesce in antiwar protest). The specific makeup of the multiorganizational field will vary over time and with the particular movement and situation. The proportion of the field engaged in one of the two systems expands or contracts according to the cycles of protest. At the peak of a protest cycle, initially indifferent organizations may choose sides, while in a downturn organizations may drop off. Although other movement organizations constitute a major part of the alliance system of a social movement organization, almost any kind of organization can become engaged in it: youth organizations, student organizations, women’s organizations, organizations of conservationists, business people, consumers, community organizations, as well as political parties, unions, churches, social welfare, and neighborhood organizations. The principal components of a
social movement's conflict organization are its targets: governmental institutions, employer’s organizations, elites, political parties, countermovement organizations, and so on.

The concept of a multiorganizational field provides us with a new way of looking at the mobilization of individual citizens (Fernandez & McAdam 1989). Individuals are embedded in multiorganizational fields and, depending on their positions within these complex fields, they become a more or less likely target of mobilization attempts and thus involved in events. The social construction of protest takes place within the context of a community’s multiorganizational field – in the groups, networks, and organizations the multiorganizational field is composed of. It is there that grievances are interpreted, means and opportunities are defined, opponents appointed, strategies are chosen and justified, and outcomes are evaluated. Such interpretations and evaluations are as a rule controversial. As a social movement organization competes to influence public opinion or the opinion of its constituency, its multiorganizational field determines its relative significance as an individual actor. Because of the complex makeup of multiorganizational fields, individuals are objects of persuasive communication emanating not only from movement organization A but also from competing organization B, opponent C, countermovement organization D, and so on. The individual’s embeddedness determines what impact these different sources have.

Narratives
FRANCESCA POLLETTA

A narrative or story is an account of a sequence of events in the order in which they occurred to make a point. Formally, narratives are composed of (1) an orientation, which sets the scene; (2) a series of complicating actions (implicit "and then..." clauses) ending with one that serves as dénouement; and (3) an evaluation, which can appear at any point in the story, establishing the importance of the events related (Labov & Waletsky 1967). As a rhetorical form, stories are distinctive in their use of sequence to denote causality, their integration of explanation and moral evaluation, and their reliance on a structure (plot) that is familiar from prior stories.

Scholars of social movements have used narrative materials such as life histories and news stories to capture dynamics of protest, and scholars often present analyses in narrative form, as for example, in accounts of the rise and fall of particular movements. They have also treated narratives as objects of analysis, for several reasons. Methodologically, it is fairly easy to isolate narrative in a chunk of discourse. This makes it possible to compare narratives over time and across contexts, examining how changes in stories create new arenas for and stakes in contention. Second, there exists a large multidisciplinary body of scholarship on how narrative figures in processes such as cognition, identity transformation, and persuasion. Scholars have drawn sometimes counterintuitive hypotheses from that literature about culture’s role in mobilization. Third, the fact that stories are a familiar rhetorical form as well as a conceptual one makes it possible to identify how institutional rules and popular norms limit the ways in which one can use culture to challenge the status quo.

While many scholars of social movements have treated stories as a persuasive rhetorical tool, showing how stories can, among other things, mobilize participants, build solidarity, and secure third party support, other scholars have made a stronger argument. Stories are strategic and they set the terms of strategic action. Available stories and norms for telling stories shape the interests on behalf of which people mobilize, the kinds of action they see as effective, and the conditions in which they are able to achieve their goals.

Thus, with respect to why movements emerge when they do, scholars have drawn on narrative to account not only for why groups act on preexisting interests but also why those interests come to exist in the first place. Protest is likely, goes one argument, when the stories that govern action and interaction in a particular institutional arena lose their force. For example, Luker (1984) showed that physicians who routinely performed abortions developed a stake in abortion reform when medical advances rendered implausible the moral story that they were acting to save the life of the mother. Since stories integrate description, explanation, and evaluation, institutional stories, in this view, both describe institutional practices and legitimate them. When the description is no longer accurate, the moral warrant suffers too. Newly vulnerable to challenge, physicians mobilized to gain legal protection for abortion.

People may also develop a stake in protest when new stories come to animate an institutional arena. For example, Davis (2005) attributes the rise of a movement against child sexual abuse to the institutionalization of a new storyline derived from the anti-rape movement. Before the 1970s, child sexual abuse was seen through the lens of family systems and psychoanalytic therapies. Harm to the victim was not considered inevitable and was rarely thought to be long lasting. Family members, and even the victim, were often seen as collusive with the abuser in tolerating the
abuse. That account changed when antirape and child protection movements converged on the issue of child sexual abuse. The rape experience was transposed to the experience of sexually abused children. In the new storyline, abuse was widespread but unrecognized, even by victims themselves, victimization was clear cut, and harm was profound and long lasting. The appropriate response to such abuse was for victims to mobilize to speak out and gain rights. The adoption of a new story thus made it possible for people to interpret their experiences in new ways, and in ways, crucially, that gave them a stake in collective action.

Once movements are underway, activists use stories strategically to enlist support, make claims in diverse political contexts, and defuse opposition. Activists use other rhetorical forms, of course, such as arguments and logical explanations. But recent research in communication shows convincingly that stories are better able than other kinds of messages to change people’s opinions (Slater & Rouner 2002). This is especially true when audiences are not already invested in the issue in question, a situation that social movement activists confront routinely.

However, activists are not unconstrained in their efforts to use narrative to advance their cause. One constraint comes from the range of stories that are considered relevant and believable. Activists with access to widely known and oft-told stories of collective resistance undoubtedly have an advantage over those who have not. Yet the very familiarity of such stories also poses obstacles. Nicaraguan Sandinistas could claim the historical figure of Augusto Sandino as inspiration and guide because Sandino had largely dropped out of official memory; he was thus available for the taking. By contrast, since Emile Zapata remained prominent in Mexican national memory, Zapatistas had to struggle with the state to claim his legacy (Jansen 2007).

Often, activists’ claims, in whatever form they are made, are heard against the backdrop of stories that have taken on the character of common sense. For example, advocates for the poor in the 1980s fought cuts to welfare that were justified as curbing welfare “dependency.” The new idea that dependency was a psychological problem rather than a structural relation made sense in the context of stories that were circulating about (chiefly women’s) dependency on drugs, alcohol, and destructive relationships (Fraser & Gordon 1994).

A second kind of constraint on effective storytelling comes from institutional norms governing how and when stories should be told. For example, plaintiffs making claims of gender discrimination in employment have been pressed by judges to provide stories of individual episodes of discrimination, even when their claims have rested rather on patterns of disparate treatment (Schultz 1990). Adult survivors of child abuse who appeared in court seeking monetary damages were advised to emphasize the debilitating consequences of their past abuse, not to present themselves as survivors who were in control of their lives rather than controlled by their pasts (Whittier 2009). Media reporters’ tendency to tell stories about people and events may make it difficult for activists to communicate the structural causes of the injustices they fight (Smith et al. 2001).

Certainly, activists can challenge conventions of narrative performance. Plaintiffs could have refused to have women tell personal stories of discrimination, insisting that proving a single case of discrimination was not their point. But doing so would have been risky. Culture shapes strategy in the sense that abiding by the rules of cultural expression – here, institutional norms of storytelling – yields more calculable consequences than challenging them. Moreover, there is no reason to expect that activists themselves are immune to popular beliefs about storytelling. Animal rights activists discouraged women from serving in leadership positions because they believed that women were seen by the public as prone to emotional storytelling. That would cost the movement credibility. However, activists spent little time debating whether women were in fact prone to emotionalism or whether emotional stories rather than rational arguments were in fact bad for the
movement (Groves 2001). So their calculations were strategic but only in the context of a set of questionable assumptions about the relations between emotion, reason, stories, and gender. Like other cultural constraints, those imposed by the conventions of narrative’s use and evaluation are not insuperable but, like the distribution of financial resources or the structure of mainstream politics, they operate for the most part to support the status quo.

Finally, studying stories can shed light on how and when movements achieve the impacts they seek. This, however, is an area that merits much further study. Scholars have shown that movement groups possessing strong narrative traditions of overcoming are better able to withstand setbacks than those that do not possess such traditions (Voss 1998). Movements that have prominent spokespersons in politics, even after the movement is over, are better positioned to gain public acceptance for their preferred storyline than those without such spokespersons (Meyer 2006). We do not know, however, just what kinds of benefits flow from winning public acceptance of a movement’s preferred storyline. Congressional representatives now ritually tell the story of the civil rights movement – but in a way that casts further protest as unnecessary (Polletta 2006). And although we know that stories about past movements and their accomplishments or failures are contentious, we know little about just what is at stake in those debates and what is required to win them.

More generally, we do not know what kinds of stories prove the most politically effective: whether, for example, simple stories are more effective than complex ones, or just how accurate stories have to be to remain convincing, or whether it is possible to tell stories that depart from familiar ones. Better answers to questions like these should advance our understanding of how stories figure in much broader dynamics of political change and constraint.

New Left and social movements
RICHARD FLACKS

The term “New Left” came into use in the late 1950s, when it was adopted by British intellectuals who came together after the Khruschev revelations about Stalin and the Soviet invasion of Hungary and the British invasion of Suez. Politically, this group shared a rejection of both Stalinism and the rightward drift of social democracy and a determination to oppose the political framework defined by the cold war.

A similar US-based intellectual/political dynamic paralleled the British formation, and, though influenced by it, had its own indigenous roots. Restlessness among American socialists and other radicals with ideological and theoretical foundations originating in Europe was expressed early in the twentieth century by intellectuals such as Jane Addams, Walter Lippman, and Randolph Bourne, who shared a sense that cultural and educational transformation was fundamental to the fulfillment of visions of radical democracy. One can see in the thought and action of John Dewey a quest, over several decades, for a radical political formation that would be grounded in American experience and language. The organizational experiments of A.J. Muste to create a revolutionary framework rooted in Gandhian pacifism and Marxian anticapitalism resulted in formations, including the Congress on Racial Equality (CORE) and the Student Nonviolent Coordinating Committee (SNCC) that, in the 1950s and 1960s, transformed American protest strategies and tactics as well as the ideological premises of many American radicals. Muste was a mentor to key founders of the nonviolent civil rights movement, including Bayard Rustin, James Farmer, and James Lawson and his teaching was a strong influence on Martin Luther King in his formative years.

By the late 1950s, efforts to define a radical critique and to articulate alternative social possibilities were being advanced by several public intellectuals who commanded large audiences. The most explicit exponent of the need and possibility for an American New Left was sociologist C. Wright Mills. In the space of some seven years, Mills wrote a series of books and articles that contributed much to setting the agenda of what became the new left in the US. These included The Power Elite (an effort to rework radical analysis of power relations), a reader on Marxism with his own theoretical annotations, The Sociological Imagination (a scathing critique of academic sociology combined with a stirring program for its renovation), The Causes of World War III, and a “Letter to the New Left” enunciating a hope for new sources of radical political agency.

Alongside these fresh intellectual fusions and visions came, as the 1950s turned into the 1960s, an outburst of unexpected grassroots social movement.

Emerging civil rights and peace movements appealed strongly to significant fractions of the American student body. The first wave of youthful activism was the mass nonviolent actions – sit-ins, Freedom Rides, etc. – of mostly black students in the South, beginning in 1960. White and black students on a number of northern campuses engaged in sympathy protests in support of the southern sit-ins; these actions sparked a strong moral/political turn in the intellectual subcultures of university towns after years of self-conscious disaffiliation. A number of new journals suddenly came out of these towns (these included Studies on the Left in Madison, New University Thought in Chicago, and Root & Branch in Berkeley). They shared a theme: the new potential for a
A major breakthrough in the development of the New Left was the founding of a new national student organization: Students for a Democratic Society (SDS). The organization had its roots in the “Old Left” tradition: it grew out of the Student League for Industrial Democracy (SLID), which itself had begun as the Intercollegiate Socialist society in 1905. The League for Industrial Democracy was founded by a number of prominent intellectuals and labor leaders (John Dewey was an early president), and SLID had been an important campus organization in the activist 1930s. A small group of students, led by Al Haber, persuaded the LID board to turn the moribund SLID over to them in hopes of creating a new organizational format to provide organizational and ideological leadership for the emerging student activism of the early 1960s. With this ambition and a small budget, Haber was able to recruit a number of local leaders of campus activism to the project. Among these, Tom Hayden, editor of the University of Michigan Daily, was perhaps the most ambitious to create a new radical intellectual as well as organizational synthesis. Hayden, a voracious reader and stylish writer, strongly identified with the British New Left. In addition to reading their work, he, like other early 1960s activists, was affected by Camus’ critique of revolutionary strategies based on power and violence. Most importantly, he was impressed with Mills’ work, his social analysis and his presentational style. He could see in all of these, sources for crafting a morally grounded political manifesto for a new generation of the left. He brought a draft of the manifesto to the founding meeting of the new SDS at Port Huron, Michigan, in 1962; the several dozen assembled there spent some days debating its substance. Out of this deliberation came the Port Huron Statement (PHS), which is generally regarded as the seminal document of the American new left.

The central idea of the PHS was embodied in a phrase derived from the teaching of a young pragmatist philosopher at Michigan: Arnold Kaufman. He apparently coined the term “participatory democracy,” but it was the PHS that gave it currency. The phrase itself condenses much of what the New Left project was about: it was a neologism designed to displace “socialism” in defining Left vision and program; it tried to situate the Left squarely in the American democratic tradition; it was, however, a radicalization of that tradition because it extended democracy’s meaning beyond the conventionally political and electoral. “Participatory democracy” establishes a critical standard for evaluating all institutional arrangements: the family, the school, the church, the prison, the workplace – as well as the state (and by so doing connects to the culturally based social critiques identified with John Dewey, as well as with a multiplicity of anarchist thought streams). Indeed, the phrase quickly became identified with efforts to create new forms of internal organization within the new social movements of the 1960s, replacing “party” style structures with forms of direct democracy, consensus decision making and decentered leadership. It was a model that typified the new social movements of the 1960s and beyond.

There were a number of other “new” ideas expressed by the PHS. The manifesto explicitly rejects the cold war as a framework for thought and action, condemning the communism of the soviet bloc and the communist parties as profoundly antidemocratic, but also criticizing anticommunism as a major barrier to articulate social criticism and collective action. Its anticommunism greatly distressed most ‘adult’ leaders of the old ‘democratic Left’ (although it was prescient about how the Left in both Europe and the US would be reconstituted in the decade to follow).

Equally prescient was the statement’s argument that a New Left must have an important base in the university. The university, it declares, is now a crucial social institution; the knowledge it creates and distributes is critical for social change; its inhabitants, especially the students, may be ready for active mobilization. But academia as currently constituted needs reform: it must be a space where scholars and
students can connect both to the world of ideas and to the public sphere (especially the social movements).

Thus, in its formal beginning, the American New Left was an effort to: (1) define a post-Marxian radical democratic ideological foundation for radicalism; (2) foster new strategies, organizational forms, and tactics of grassroots collective action; (3) legitimate the role of the “public intellectual” within the university; (4) sustain ongoing internal critique of radical activism itself in terms of a radical, participatory democratic standard.

SDS, by 1965, had become a mass student organization, because of its early leadership of protest against the Vietnam War. SDS mobilized the first national protest against the war in April 1965 and pioneered antidraft protest in the months that followed. The organization’s membership ballooned, and dozens of its chapters spearheaded the waves of anti-war protest on American campuses in the second half of the 1960s. SDS, as a national organization, refrained from leading national mobilizations against the war, but its local activists helped trigger campus confrontations. These typically focused on local manifestations of the war effort (defense research, military recruiting, Reserve Officers Training Corps); demands for ending university “complicity” in that effort were advanced by mass occupations of administration buildings. In the many cases when such actions were met by harsh police responses, mass student strikes resulted. Some of these confrontations reverberated internationally (as for example the crises at Columbia University, University of Wisconsin, and Kent State).

Such antiwar confrontations were embedded in a diffuse national student movement that was widely seen as a potent cultural as well as political force in those years. SDS’ founding leadership had not imagined that such a student movement was possible in the US, envisioning their efforts as aimed at helping to create a national coalition of labor, civil rights and other reform movements. A successor leadership generation in SDS advocated a focus on “student power,” an extension of participatory democracy to the governance of the university itself. By the end of the decade, and particularly after the killings of students at Kent State and Jackson State, their hope for a mass student movement was realized, at least for a brief time.

The early New Left had sought ideological moorings apart from traditional Marxist and socialist perspectives. An amalgam of radical democratic, anarchist, pacifist, and pragmatic principles and values shaped action orientations of New Left organizers. As the war and repression of protest escalated many activists were attracted by revolutionist rhetoric and sentiment. SDS and other groups identified with the New Left increasingly reframed their goals in revolutionary terms, rejecting non-violence, embracing third world revolutionary models. New movement organizations, of which the Black Panther Party was the most visible and influential, embodied these new directions, affecting movement discourse and practice. The revolutionist moment was short lived, but the 1960s organizations that defined the New Left project (SDS and SNCC) did not survive it.

Although the specific New Left projects and organizations of the 1960s were not sustained, important elements of their perspectives continued to characterize post-1960s social movements:

1. Many of the “new” social movements – feminism, environmentalism, gay liberation – were led, in part, by veterans of the 1960s New Left. In crucial ways, these developments were fueled by reactions against established New Left practices. Late 1960s feminism was pioneered by SDS and SNCC activist women. Less well known were initiatives by previously closeted gay SDS leaders in foundational gay movement organizing.

2. These movements have continued and elaborated the New Left’s demand for forms of participatory democratic decision making. This can be seen in the
global emergence of community-based movements seeking local voice or control over development; in the spread of environmentalist consciousness, questioning market or technology-based planning; in mass street mobilizations challenging authoritarian regimes in many countries; in the World Social Forum and related manifestations challenging established global trade and economic structures.

3. These movements have elaborated the decentralized forms of social movement mobilization and decision making that originated in the 1960s.

4. New social movement emphasis on cultural and personal as well as “economistic” goals represent further elaboration of the New Left project.

5. Finally, the New Left project is embodied in continuing efforts to legitimize and promote “public” social science (as opposed to strictly “academic” or “policy” bases of legitimation). As the Port Huron Statement argued, the fulfillment of the New Left project depends on processes of interaction between the intellectual worlds of universities and of social movements in hope of generating knowledge of democratic use.

REFERENCES AND SUGGESTED READINGS

The New Left and the social movements that were born out of it changed for good the way in which movements were conceptualized in Europe. The New Left began in the US as the intellectual offspring of critical sociology, French existentialism, Beat literature, and participatory democracy principles deriving from the civil rights movement. The New Left in Europe shared some of these premises but, according to Carl Oglesby, mainly had to “overcome the memories, the certitudes, and the promises of the Old Left” (Oglesby 1970: 13). On one hand, the advent of a postindustrial age in post-World War II Europe put into question the centrality of the capital–labor conflict. On the other, the death of Joseph Stalin in 1953 exacerbated the disillusionment of certain left-wing circles with old style communism due to the harshness of repression of the 1956 revolts in Eastern Europe that took place in its aftermath.

In France, vanguard groups organized around the journal Socialisme ou Barbarie, which was focused, from the late 1940s, on the premise that both superpowers followed an imperialist path. In Britain, the New Left Review (1960) became one of the most important platforms for the promotion and popularization of New Left ideas. In Italy the ideas of interwar Communist leader Antonio Gramsci were rediscovered, especially his stress of the role of culture in social change. The ethos that the New Left promoted was putting an emphasis on more democratic decision-making, less bureaucratic centralization, and a more humanist understanding of politics.

But the New Left did not limit itself to the realm of ideas. In mobilizational terms it was very much influenced by the Campaign for Nuclear Disarmament in Britain and, in general, by the peace movement of the 1950s. But its climactic point was the 1968 student movements in France, West Germany, and Italy, in particular, which to a large extent bore the characteristics of a radical opposition to both blocs of the cold war and an identification with the national liberation struggles of the third world. The emergence of students as the revolutionary subjects par excellence proved correct the idea, advocated by intellectual figures such as Herbert Marcuse, that the proletariat was not the definite carrier of social change (Varon 2003). This fact once more underlined the divide between the two Lefts, since for the old Marxist guard a revolution without the workers that was instead spearheaded and led by inexperienced students was inconceivable. The tacit rejection of the 1968 movements by a number of Western European communist parties and the Soviet invasion of Czechoslovakia that crushed the Prague Spring consolidated the divide.

The year 1968 signaled the advent of the so-called “new social movements” (NSMs) that mobilized different resources and used new protest ideas and techniques. Young activists of the New Left felt that they no longer had to wait for a revolutionary situation to arrive; they could instead create this situation themselves by accepting their role as revolutionaries. Among the most important exponents of this tendency was the Italian “Autonomia” in the 1970s, promoting the idea of “self-management,” and the emergence of minority nationalism in Spain, with the advent of Basque and Catalan separatism being framed as identity politics. Follow-up movements, including peace movements, antinuclear energy protests, homosexual rights, second wave feminism, animal rights, and New Age and ecology movements (the West German Greens being the most prominent) capitalized on the organizing efforts of the previous years and had a distinctly local emphasis. In a few
cases, such as the Greek New Left, parts of the movement stepped back later on and (re)joined the “Old Left.”

What were the basic characteristics and what were the broad theoretical and practical concerns of these NSMs? First of all, they tended to transcend class differences as the movement participants came from diverse class backgrounds. Second, in terms of ideology, NSMs were not defined by a Marxist conception of social affairs like the working-class movements of the past. Third, they were characterized by the emergence of new identities – as identity issues were deemed to be more important than class or economic grievances. Fourth, in opposition to the rigid Marxist analysis of the Old Left and its social conservatism, the New Left proposed a radical transformation not only of the political but also of the personal sphere. Therefore, the boundaries between public and private in the NSMs were blurred, including intimate aspects of human life. Moreover, their action repertoire changed radically from the workers’ movements of the past. Nonviolence, civil disobedience, and street theater were among the tactics that were introduced by NSMs. Finally, in terms of organization, NSMs tended to be nonhierarchical, horizontal, and decentralized social networks – in contrast to the vertical way in which traditional parties were structured (Laraña, Johnston, & Gusfield 1994).

From very early on, the New Left and NSMs were criticized and attacked for not privileging categories such as class. They were linked from the very outset to “postmaterialism” and the changing values of postindustrial societies. The typical critique is summarized in the idea that their focus on issues of identity and culture bred a lifestyle phenomenon that was ultimately “postmodern” and nonpolitical. A recent tendency, however, is to challenge the differentiation between “new” and “old” social movements, arguing that their outlook did not differ as much as literature suggests.

In terms of current research, among the most interesting contributions of recent times is the emphasis on culture in general, but also the relationship between the local and the global in terms of “transnationalism.” A good oral history of the movements – with a focus on the changing subjectivities of collective actors over time – still needs to be written, as well as a comprehensive history of the New Left juxtaposed to the parallel evolution of the communist parties and the Eurocommunist phenomenon. Finally, it would be interesting to see the ways in which “old technologies” facilitated “cultural transfers” between the New Left and Eastern bloc activists.

Perry Anderson, the renowned editor of New Left Review, hinted in his first editorial of the year 2000 that the New Left’s political credentials were historically defeated. However, its impact was not commensurate with its political and economic successes or failures (in a Marxist type of analysis), but rather with its significant social and cultural impact.

New social movements and new social movement theory
STEVEN M. BUECHLER

New social movement theory (NSMT) emerged in the 1980s in Europe to analyze new social movements (NSMs) that appeared from the 1960s onward. These movements were seen as “new” in contrast to the “old” working-class movement identified by Marxist theory as the major challenger to capitalist society. By contrast, NSMs are organized around gender, race, ethnicity, youth, sexuality, spirituality, countercultures, environmentalism, animal rights, pacifism, human rights, and the like.

If the history of movement theory in the US can be crudely summarized as a transition from collective behavior to resource mobilization and political process approaches, European social movement theory underwent a parallel transition from classical Marxism to NSMT. Paradigms changed on both continents, but the gulf between the later orientations remained almost as great as that between the earlier ones (Crossley 2002: 10).

This is largely due to differences in theoretical style on opposite sides of the Atlantic. Theorizing in the US has largely followed a middle-range strategy that is analytical, empirical, and scientific, occasionally empiricist and positivist, and nominally neutral or objective. In sharp contrast, the “European trajectory has been more firmly framed by the Marxist/Hegelian tradition of the philosophy of history” (Crossley 2002: 10). European analyses of collective action have followed a “grand theory” strategy that is historical, philosophical, and speculative, occasionally metaphysical and teleological, and distinctly normative in blending ethical, political, and cultural concerns.

THEMES OF NSMT

NSMT is a distinct approach to the study of social movements, albeit with significant internal variations (Cohen 1985; Klandermans 1991; Johnston, Laraña, & Gusfield 1994). Indeed, the very term “new social movement theory” can be misleading if it implies unanimous agreement on core premises, just as the term “new social movement” can be misleading if it is seen as an ontological claim about an empirical object (Melucci 1996). It is more accurate to speak of a congeries of interrelated ideas and arguments that comprise new social movement theories (NSMTs) with many variations on a general approach to the topic (Buechler 1995). As a first approximation, however, it is possible to identify several themes that are prominent in most if not all versions of NSMTs.

First and foremost, these theories identify a distinct social formation that provides the context for the emergence of collective action. While theorists differ on specifics, the identification of a historically specific social formation as the structural backdrop for contemporary collective action is perhaps the most distinctive feature of NSMTs. As a corollary, transitions between social formations change the context and hence the types of movements that emerge over time.

Thus,

European debates have typically been as much about the constitutive structure and type of society in which modern movements emerge, the relation of those movements to that society and their ‘historical role’ therein, as they have been about the movements themselves. There has been an assumption that societies centre upon certain key conflicts or contradictions and that these conflicts generate particular movements, perhaps even a singular key movement, which seeks to address them. (Crossley 2002: 10)
Hence, a second theme is a causal claim that links NSMs to the contemporary social formation; they are direct responses to postindustrialism, late modernity, advanced capitalism or postmodernity. If contemporary society is defined by capitalist markets, bureaucratic states, scientized relationships, commodified culture, and instrumental rationality, then NSMs are historically specific responses to these conditions. These depictions often emphasize the extent to which large, anonymous, institutional forces have become especially intrusive and invasive; this “colonization” (Habermas 1987) has prompted new collective responses to new forms of social control in late modernity.

A third theme concerns the diffuse social base of NSMs. Some analysts see these movements as rooted in a fraction of the (new) middle classes (Kriesi 1989). Others have argued that these movements are no longer rooted in the class structure, but rather in other statuses such as race, ethnicity, gender, sexual orientation, age, or citizenship that are central in mobilizing new NSMs (Dalton, Kuechler, & Burklin 1990). Still others have argued that even these statuses are less important than ideological consensus over movement values and beliefs. For all these reasons, the social base of these movements is presumed to be more complex than in older, class-based activism.

This leads to a fourth theme concerning the centrality of collective identity in social protest (Johnston, Laraña, & Gusfield 1994; Melucci 1989, 1996). With the uncoupling of activism from the class structure as well as the fluidity and multiplicity of identities in late modernity, the ability of people to engage in collective action is increasingly tied to their ability to define an identity in the first place (Melucci 1989, 1996). This places a premium on the social construction of collective identity as an essential part of contemporary social activism, and it has led to a belated appreciation of how even “old” class-based movements were not structurally determined as much as they were socially constructed through mobilization itself.

A fifth theme involves the politicization of everyday life as the “relation between the individual and the collective is blurred” (Johnston, Laraña, & Gusfield 1994: 7) and formerly intimate and private aspects of social life become politicized. The equation of the personal and the political fosters not only identity politics but a lifestyle politics in which everyday life becomes a major arena of political action. Like many aspects of these movements, this characteristic cannot be understood apart from its social context. It is late modernity with its invasive technologies that has blurred the lines between the political and the personal. Movements are as much responses to the systemic politicization of life as initiators of it.

A sixth theme concerns the values advocated by NSMs. While some have argued that the sheer pluralism of values and ideas is their defining hallmark (Johnston, Laraña, & Gusfield 1994), others have focused on the centrality of postmaterialist values (Inglehart 1990; Dalton, Kuechler, & Burklin 1990) in such activism. Whereas materialist values involve redistributive struggles in the conventional political sphere, postmaterialist values emphasize the quality rather than the quantity of life (Habermas 1987). Rather than seeking power, control, or economic gain, postmaterialist movements are more inclined to seek autonomy and democratization. As a generalization about NSMs, the “postmaterialist” designation can be challenged. Where accurate, however, it means that such movements are resistant to conventional strategies of co-optation via material rewards.

A seventh theme involves cultural, symbolic forms of resistance alongside or in place of more conventional political strategies (Cohen 1985). For many movements, this signifies a philosophical or spiritual rejection of the instrumental rationality of advanced capitalist society and its systems of social control and co-optation. This cultural emphasis rejects conventional goals, tactics, and strategies in favor of the exploration of new identities, meanings, and symbols. While some have criticized this orientation as apolitical, such criticisms ignore
the importance of cultural forms of social power. If hegemony is an important form of such power, then the culturally oriented, anti-hegemonic politics of new movements is an important form of resistance. The very ability to envision and symbolically enact new and different ways of organizing social relationships can itself be a potent challenge to dominant social arrangements (Melucci 1989, 1996).

A final theme in NSM activism is a preference for organizational forms that are decentralized, egalitarian, participatory, prefigurative, and ad hoc (Melucci 1989). For these movements, organization is less a strategic tool than a symbolic expression of movement values and member identities. NSMs function less as standing armies than as cultural laboratories that vacillate between latency and visibility (Melucci 1989, 1996) as they episodically organize for specific battles and then revert to politicized subcultures that sustain movement visions and values for the next round of explicitly organized activism.

These themes distinguish NSMT from both classical Marxism and resource mobilization/political process theories with their emphases on political contention, material resources, formal organization, and instrumental success. They also suggest some common concerns between NSMT and collective behavior or social constructionist approaches with their emphases on symbolic meaning, grievance articulation, fluid processes, and malleable identities. Having described NSMT, it is also important to acknowledge some internal variations in this paradigm as it emerged in European sociology.

TWO IDEAL-TYPICAL VERSIONS

There are two ideal types of NSMTs that we can loosely label “political” and “cultural.” The political version draws upon neo-Marxist scholarship to describe the social formation of advanced capitalism and to trace links between this formation and the emergence of NSMs.

This version is macro-oriented in general and state-oriented in particular. It sees strategic questions and instrumental action as central to social activism while recognizing the importance of identity formation, grievance definition, and interest articulation. It recognizes new constituencies in social activism based on race, gender, nationality, or other characteristics, but it does not jettison the potential for class-based movements alongside these groups.

This version emphasizes the potential for progressive change if appropriate alliances between class-based and nonclass-based movements can be forged. The political version is wary of the “apolitical” nature of culturally oriented NSMs as limiting their potential for producing meaningful social change. And finally, this perspective identifies the social base of NSMs in class terms by analyzing the complexity of contemporary class structure and its contradictory locations as the backdrop for social activism.

The cultural version of NSMT is post-Marxist in presuming a more radical break between past and present societal types and movement forms. The cultural version identifies the dominant society in cultural or semiotic terms as an information society whose administrative codes conceal forms of domination. It emphasizes the decentralized nature of both power and resistance, so it is less macro oriented or state centered and more focused on everyday life, civil society, and the cultivation of “free spaces.”

The cultural version eschews strategic questions and instrumental action in favor of symbolic expressions that challenge the instrumental logic of systemic domination. This version not only recognizes new social constituencies but also argues that the old worker-based constituencies for social activism have been transcended along with industrial capitalism. The cultural version views activism as a defensive reaction to domination that can potentially challenge systemic imperatives, but it rejects the language of “progressive” movements as invoking an unwarranted metaphysics of history.

This approach also rejects the apolitical label often attached to culturalist movements by arguing that political movements can be
easily co-opted whereas cultural movements challenging symbolic codes can more effectively expose contemporary forms of power. This version is also more likely to identify the social base of NSMs in nonclass terms that identify other statuses or distinctive values as defining movement constituencies.

EXEMPLARS OF NSMT

Four founders of this perspective illustrate its scope and evolution. Their work also reveals a relative shift from the political to the cultural version of NSMT over time. Thus, in the early 1980s, the political version was prevalent and it was linked to other forms of neo-Marxist theorizing. By the mid 1990s, it had been largely eclipsed by the cultural version, reflecting the broader cultural turn in social theory.

For Manuel Castells (1983), capitalist development has transformed urban space into arenas of conflicting interests and values. Elites pursue capitalist commodification and bureaucratic domination while urban social movements demand noncommodified forms of collective consumption, defend community identity and local culture, and seek political self-management and autonomy. Pursuit of these goals requires state action prodded by effective movement strategies; movements must thus engage in instrumental action to shape state policies if they are to realize their goals. Finally, Castells retains a role for the conventional working class while also recognizing other newer constituencies for such movements across the urban landscape. Castells is thus a good exemplar of the more political or neo-Marxist version of NSMT.

For Alain Touraine (1981), postindustrial society provides knowledge and technology that enhances the conscious self-production of society. Control of this capacity is at the center of an ongoing struggle between a dominant class of managers and technocrats and a popular class of consumers and clients. As they clash over society’s self-management, they become NSMs. Touraine assumes every type of society has a central conflict; in postindustrial society, it centers around the state as the repository of this increasing capacity for societal self-production. This emphasis on the state and instrumental action links Touraine to the political version of NSMT. Touraine (1985) also expresses misgivings about contemporary activism that displaces protest from the political to the cultural realm because it promotes individualism and identity quests that can blunt the denunciation of power and undermine genuinely collective action.

Jurgen Habermas (1987) proposes the most elaborate theory of modern social structure by distinguishing between a politico-economic system governed by generalized media of power and money and a lifeworld organized through normative consensus. Whereas the system follows an instrumental logic that detaches money and power from any accountability, the lifeworld retains a communicative rationality requiring that norms be justified through rational discourse.

The problem is that, in modern society, system imperatives colonize the lifeworld, so that money and power regulate not only economic and political transactions but also identity formation, normative regulation, and symbolic reproduction. These intrusions undermine unquestioned traditions and politicize the lifeworld at the same time they consolidate decision-making power in administrative structures that deny participatory input into the arenas they have politicized (Crossley 2002: 161–162). Colonization thereby dramatizes the tension between the instrumental rationality of the system and the communicative rationality of the lifeworld.

Habermas locates NSMs at the seams between system and lifeworld. At a minimum, they defend the lifeworld against colonization and sustain a role for normative consensus and communicative rationality. More broadly, NSMs practice a new politics concerned with quality of life, self-realization, identity formation, moral autonomy and political participation. Since they largely avoid material, distributional struggles, they are more difficult
to co-opt than conventional movements. As incubators of new politics and communicative rationality, NSMs foreshadow the discursive contours of a more rational society.

For Alberto Melucci (1996) modern, complex societies are based on the production of signs and the processing of information in accordance with the instrumental logic of administrative systems. Hence, the search for meaning and the decoding of information is central to social life in general and to collective action in particular. Contemporary conflicts thus emerge at the intersection of information production, symbolic resources, and social control. Since power is increasingly embedded in control of information, movements that challenge prevailing cultural codes strike directly at this new form of power.

Contemporary society also fractures traditional bases of identity. The pace of change, plurality of memberships, and abundance of messages weaken traditions and identities rooted in religion, neighborhoods, parties, or classes. The result is a homelessness of personal identity that turns people into “nomads of the present” (Melucci 1989). The resulting intensification of personal needs paradoxically fuels participation in NSMs as people join movements based on an individualist logic. In late modernity, however, the linkage between the personal and the political is not just a slogan but a reality; fulfilling personal needs is increasingly and self-evidently contingent on addressing global problems of ecological preservation, resource sustainability, and conflict resolution.

Melucci thus argues that NSMs are largely about establishing and maintaining new collective identities connecting personal needs and movement participation. Such movements have heterogeneous, non-negotiable goals that bypass the political system and challenge boundaries between private and public. They survive as dispersed networks submerged in everyday life, and they thrive as cultural laboratories exploring alternative forms of social life in opposition to the technocratic, instrumental rationality of administrative systems. These movements thus have a self-referential quality; their organizational form deliberately prefigures a more egalitarian society.

The goal of symbolic challenges to dominant codes is “rendering power visible. The function of contemporary conflicts is to render visible the power that hides behind the rationality of administrative or organizational procedures” (Melucci 1989: 76). By making power visible, movements reveal it as a social construction subject to transformation rather than a natural force beyond human intervention. The promise of NSMs thus resides less in achieving a specific agenda than in promoting democratization in society and in everyday life.

CONCLUSION

NSMT has been criticized on various grounds. The most common criticism is that many features of supposedly “new” movements can also be found in “old” labor or working-class movements, including collective identity, movement cultures, or symbolic grievances. The most eloquent rejoinder to these criticisms is that NSMs are analytical constructs and not empirical objects and that NSMT was never intended to make an ontological claim. Thus, Melucci has bemoaned a misguided debate in which “both the critics of the ‘newness’ of the ‘new movements’ and the proponents of the ‘newness paradigm’ commit the same epistemological mistake: they consider contemporary collective phenomena to constitute unitary empirical objects . . . The controversy strikes one as futile” (1996: 5).

Although there have been claims of a synthesis of perspectives or a division of labor around distinct questions, the real fate of NSMT in US sociology has been selective co-optation. The grand theorizing behind European versions of NSMT was simply too foreign to take root in the pragmatic, middle-range, and frequently positivist soil of US sociology. Thus, as it entered US sociology, NSMT was stripped of its most sweeping and distinctive claims about the connections between social formations and types of
movements. Instead, the paradigm was reduced in elementarist fashion to new dimensions or factors that needed to be considered alongside more familiar ones. For these reasons, the story of NSMT remains entangled with larger differences in theoretical style between European and US sociology (Buechler 2000).

Having said that, there are at least two ways in which new social movement theory may leave an indelible mark on social movement theorizing in the foreseeable future. The first concerns the concept of collective identity, perhaps best articulated by Melucci (1996) and now widely recognized in many movement studies. For instance, collective identity is now routinely included as a “variable” alongside opportunity, mobilization, and framing in much mainstream research.

Perhaps more significantly, this concept has figured prominently in recent discussions of recognition struggles and identitarian movements in which the creation, defense, or recognition of particularistic differences or collective identity has been either a primary mobilizing focus or a major dimension of collective struggles across diverse historical and cultural contexts (Hobson 2003).

A second indicator of this perspective’s impact concerns the widespread adoption of NSMT’s distinctive claims about collective identity and cultural struggles among theorists and activists in lesser developed regions such as Latin America. This popularity is initially perplexing since these (national) societies do not closely resemble new social formations to which new social movements presumably respond.

This interpretation becomes more compelling if we shift the unit of analysis from nation-states to globalizing forces. To whatever extent globalization combines economic exploitation and political domination with ethnic homogenization and cultural standardization, the rise of new social movements in lesser developed regions as a response to these intensifying globalizing forces fits the original logic of NSMT quite nicely. If we understand the new social formation to which new social movements respond to be global rather national, then new social movement theory may yet have a very promising future as a means to understand collective struggles around the globe.

Nongovernmental organizations

JACKIE SMITH

Nongovernmental organizations (NGOs) are formal organizations that lie outside formal government structures. They include social movement organizations (SMOs) as well as other organizations that may be potential mobilization structures available to social movements. The term comes from the United Nations, where it is used to distinguish UN member governments from other actors. As it is commonly used in official circles, the term NGO thus can include both national and transnational groups and private, for-profit actors as well as not-for-profit associations of all kinds. Scholars have used the general term to refer to the collection of formal organizations of civil society groups pursuing any collective aims. Thus, social movements and other political advocacy groups are a subset of this larger category, which includes many other nonprofit, voluntary groups.

Article 71 of the United Nations Charter grants NGOs formal recognition within the United Nations according to three distinct consultative status categories. Currently the UN reports more than 3000 NGOs have consultative status with its Economic and Social Council (ECOSOC), and another 400 have official consultative relations with the more recently established Commission on Sustainable Development (CSD), which was formed following the UN Conference on Environment and Development (1992). Groups entitled to consultative status must show that their work addresses the broad issues of UN jurisdiction. The status is granted by a committee made up of government representatives, and groups must regularly renew their status (Willetts 1996a). NGOs with consultative status may make oral and written interventions in relevant UN meetings, have access to some official documents and to the UN buildings, and may be invited to attend open sessions of United Nations conferences and other meetings. Rules of accreditation were revised in 1996, following a dramatic increase in civil society participation in the United Nations system (Willets 1996b; Charnovitz 2007).

Because the United Nations and its agencies address issues of peace, human rights, environmental protection, and other matters of concern to social movement activists, some social movement organizations have participated in UN certification processes and conferences. This was particularly true in the 1990s, when the UN hosted a series of global conferences on key global problems to help the post-cold war international community respond to the openings and challenges of the changed international context. Typically such SMOs have involved transnational memberships, and they have helped to inform other civil society groups and individuals about relevant policy developments in UN and related international forums. But since the late 1990s, many social movements have become less optimistic about the prospects for achieving their aims through the United Nations process (Smith 2008).

While the generic term NGO refers to any nongovernmental association, many of the more critical and radical activists have come to view the term as derogatory, referring to an ideal type of the professional, staff-run organizations that are typically well funded and focused more on official agendas than the concerns of people in local settings. The term “NGO” is thus often contrasted to “grassroots organizations” – which are seen as less well resourced, membership-based, democratically run organizations that are more responsive to the concerns of people “on the ground.” This dichotomy emerges from the observation by some activists that groups that were deeply involved in United Nations politics during
the 1990s tended to become very focused on technical issues and on influencing language in international treaties, which were increasingly seen as irrelevant to influencing the actual problems social movements sought to address. Moreover, the process of “NGOization” generated organizational practices and routines that contradicted the participatory, democratic, and feminist values of some groups and heightened internal tensions within organizations and movements (Alvarez 1998). Other analysts have argued that some NGOs have become co-opted through their participation in intergovernmental arrangements, particularly those within the World Bank, contributing to what Ferguson calls the “neoliberalization of civil society” (2006).

Organizations, 
community-based
EDWARD T. WALKER

Community-based organizations (CBOs) are local organizations, active in low- or moderate-income communities, which mobilize individual community members in order to develop the civic and political power of local residents. They do so mainly through canvassing rather than building upon pre-existing community institutions. Although the term “community organizing” refers to a broad range of organizations (McCarthy & Walker 2004), the focus here is not on organizations that use congregations as recruitment blocs. CBOs have become an important part of our national civic and political discourse, especially as the 2008 election of Barack Obama brought community organizing into the national spotlight.

Modern community organizing can be traced to the War on Poverty’s Community Action Program starting in the 1960s, building toward the passage of the Community Reinvestment Act (CRA) in 1977. The 1970s were a crucial period in the history of CBO activity (Boyte 1980), despite being a period that scholars more often associate with the decline of the New Left and conservative turn against government. And yet it was in this period that a broad range of new CBOs were established in order to fight back against slumlords, bank redlining, manufacturing corporations that were closing their doors, and local officials who were seen as oblivious to the low quality of local schools, housing, and economic opportunities. The community activism of the 1970s toned down “the late sixties emphasis on ideology” and replaced it with a focus on “winning power and building organizations owned and directed by working class people” (Fisher 1994: 140).

The CBOs active in the 1970s “backyard revolution” (Boyte 1980), like CBOs today, were often very interested in building coalitions among diverse community stakeholders. These early struggles by groups like National People’s Action in Chicago helped to shape the passage of the CRA, which sought to reduce discrimination in the provision of credit and lending in low-income communities. Consistent with the expectations of scholars of American political development, new legislation did more to spur organizing than the opposite: The passage of the CRA encouraged the founding of many new organizations who would seek to exploit the potential of the Act. Walker and McCarthy’s (2009) sample of long-standing local community organizations, for example, shows that the 1980s was a period of considerable growth among CBOs.

The Association of Community Organizations for Reform Now (ACORN) was, until a concerted series of attacks by conservative groups, the Republican Party, and conservative media outlets in 2008 and 2009, the leading national individual membership CBO in the US. Founded in Arkansas in 1970 by welfare rights organizer Wade Rathke (1948–), ACORN had a presence in 27 states by 1989, ultimately expanding to include 85 local groups active in 37 states as of 2008 (Swarts 2008). ACORN was heavily active in the areas of community reinvestment, fair lending policies, increasing the minimum wage, voter registration, and, to a lesser extent, public safety and access to health care. As of this writing, local ACORN chapters are reforming as unaffiliated local groups, such as the Alliance of Californians for Community Empowerment (formerly California ACORN) and New York Communities for Change (New York ACORN) (Tarm 2010).

Like other types of community organizations, many individual-membership CBOs are affiliated with regional or national networks.
that provide staff support and technical assistance to local groups. These networks include the Center for Community Change (est. 1968), National People’s Action (est. 1972), National Training and Information Center (est. 1972), The Woodstock Institute (est. 1973), the Center for Third World Organizing (est. 1980), and the National Community Reinvestment Coalition (est. 1990). Networks like these assist local groups such as People United for a Better Oakland (Oakland, CA) and Oregon Action (Portland, OR) by providing staff support, assistance in locating funding sources and applying for grants, conducting policy research, and mobilizing the media. Thus, although these networks are themselves nonmembership organizations, they play a considerable role in building the infrastructure needed for effective grassroots advocacy (Minkoff, Ainsbrey, & Agnone 2008; Walker, McCarthy, & Baumgartner, 2011).

CBOs often have a smaller membership base than their congregation-based counterparts, but are more willing to take on contentious issues like workers’ rights or police brutality. In part because they lack the established congregational support of the faith-based organizations, they are much more likely to rely upon grassroots fundraising sources like bake sales, canvassing, and direct mail. Even though less stable than other sources of funding, grassroots fundraising builds local legitimacy and is a powerful predictor of long-term CBO survival (Walker & McCarthy 2010).

In the years since the 1970s “backyard revolution,” community organizing has waxed and waned, but, until the financial crisis of 2008, had remained relatively stable. Indeed, research on the survival of CBOs found that nearly 60 percent of organizations that were active in the early 1990s continued to be active as of 2004, which translates to an annual mortality rate of approximately 3.6 percent (Walker & McCarthy 2010); this is considerably better than what has been found for seemingly more stable organizational populations like peace and antidrunk driving groups. Although the current environment facing individual-membership CBOs is quite turbulent, the accomplishments of these organizations, won through the hard work of knocking on doors to mobilize low-income citizens, are considerable.

Organizations, congregation-based
EDWARD T. WALKER

Congregation-based community organizations (CBCOs) are local organizations active in low- or moderate-income communities that build upon the existing infrastructures of diverse religious congregations in order to develop the civic and political power of local residents. Typically, individuals may only participate in a CBCO by virtue of being a member of a participating congregation. Although such groups represent only one of the two dominant models for organizing local communities (McCarthy & Walker 2004), CBCOs are a major force in local (and, increasingly, state and national) civic and political discourse. Indeed, it is worth noting that current US president Barack Obama was trained as a South Side Chicago community organizer through the faith-based Gamaliel Foundation.

CBCOs can be identified through six key characteristics: (1) Their organizing is explicitly grounded in the diverse faith traditions that comprise the organization; (2) They are broad based and inclusive, and center their organizing around either ecumenical Christianity or interfaith dialogues, while also seeking to be inclusive across racial, gender, and class lines; (3) Their emphasis is mainly on local rather than state- or national-level organizing; (4) They are multi-issue in focus, and allow member congregations to determine which issues are worth pursuing in the first place; (5) They hire outside professional organizers to develop indigenous leadership, often through “relational organizing” strategies that enhance the social capital of the community; and (6) CBCOs are political but nonpartisan nonprofit organizations (Wood & Warren 2002: 15). The most recent estimates of the field suggest that there are over 130 CBCOs active, mostly concentrated in California, Texas, New York, and Florida. Groups have, on average, 26 member congregations and nearly 200 core leaders each (Wood & Warren 2002).

Although organizing in low-income communities has historical roots in the work of Jane Addams in the settlement house movement in late nineteenth-century Chicago, modern CBCO traces its origins to the work of famed organizer Saul Alinsky (1909–1972). Alinsky, a sociologist by training, helped to found the Back of the Yards Neighborhood Council (BYNC) in Chicago in 1939, which served as an “organization of organizations” that brought together representatives of a broad range of local institutions, including the Catholic Church, numerous labor unions, and local social clubs and small businesses. At the core of BYNC’s model, replicated by many CBCOs since, was the idea to link representatives of diverse community institutions in order to find their common interests and build power. Through groups like BYNC, Alinsky developed a template by which outside organizers would assist leaders of local institutions to create a unifying organization designed to improve community conditions by way of direct action and, often, confrontational negotiation with policymakers.

Alinsky then adapted this framework in organizing the Industrial Areas Foundation (IAF) in 1941, which continues to this day to serve as the central network of CBCOs across the US. Like BYNC, IAF-affiliated organizations followed Alinsky’s tradition of enrolling institutions such as churches, unions, schools, and community groups as members. This model continues in the IAF, although, after Alinsky’s death in 1972, former seminarian Ed Chambers took the helm and began to emphasize congregations as the central organizing bloc. Aside from IAF, three other major organizational networks support local congregation-based organizing, including the Gamaliel Foundation.
(established 1968), Direct Action and Research Training Center (DART, established 1982), and the Pacific Institute for Community Organizations (PICO National Network, established 1972). These regional and national networks help organizations to train and retain staff, identify issues of community concern, and develop strategies for building influence for their congregational members.

Importantly, as informed by Alinsky’s teachings, CBCOs are quite attuned to avoiding the concentration of power within their own ranks. The IAF network, for example, has always prescribed the role of its national office, as true power in the organization resides in its local affiliates, in groups like the well-known Communities Organized for Public Service (COPS) of San Antonio, TX. As Dreier (2009: 14) puts it, the national office “is primarily responsible for training staff members and leaders, but it does not seek to coordinate organizing campaigns, raise money, or conduct research for its affiliates, nor does it encourage chapter leaders to strongly identify with IAF as a national organization.” Osterman (2006) argues that this structure, which reflects the culture of CBCO, helps congregation-based groups resist tendencies toward oligarchy. Similarly, Staudt and Stone (2007) maintain that IAF organizations are “built through careful socialization and control,” and that such CBCOs adopt the forms associated with their congregational members while still taking a cautious approach to the issue of hierarchy in organization building.

Warren (2001) provides a compelling portrait of faith-based community organizing today. Based upon a rich, detailed ethnography of IAF organizers in Texas, Warren illustrates the many strengths of the “relational organizing” approach common in CBCOs. This organizing strategy attempts to activate preexisting community networks, find mechanisms to help those networks coalesce into broader interfaith coalitions, and then to determine which issues to pursue for advocacy from the bottom up. In so doing, the IAF affiliates he studied were able to effectively reform the public school system, secure the reallocation of millions of public dollars for services in low-income neighborhoods, and more generally to help disadvantaged citizens to have a civic voice and to work together across not only religious but also racial and ethnic boundaries. We know, however, that CBCO networks beyond the IAF are also having a significant influence on local communities. Affiliates of the PICO National Network, such as PACT in San Jose, CA, for instance, can boast of considerable successes in mobilizing communities and generating diverse and boundary-bridging coalitions (Swarts 2008: ch. 7).

The congregation-based model of community organizing offers a number of distinct advantages and challenges. One challenge is that recruiting congregational members may limit organizations’ ability to mobilize the poorest of the poor, who tend not to be members of congregations (Delgado 1994). Further, as Wood (2002) identifies, CBCOs may, at times, “buffer the sacred core” by prioritizing the religious activities of individual congregations over the community organizing activities of the collective. Also, compared to community organizations that are not congregation based (like local ACORN chapters), CBCOs tend to avoid divisive issues that might cause rifts between members (McCarthy & Walker 2004). The benefits of this organizing model, however, are many: (1) local organizations’ institution-based approach confers a degree of durability; (2) affiliate organizations are broad based and represent diverse community stakeholders; and (3) they address a wide range of community concerns, unlike the professionalized single-issue advocacy organizations that have become influential in Washington since the 1970s (Osterman 2002).

Outcomes, cultural
JENNIFER EARL

Whether and when social movements result in cultural, social, and/or political changes are important questions in social movement scholarship. However, as has been widely reported (e.g., Bosi & Uba 2009), scholars have made less progress on these topics than is desirable. Research that is able to establish a clear causal connection between social movement activity and cultural change has been in particularly short supply (although research showing that culture can affect mobilization, which is a distinct question, has been increasing). This entry examines why this may be the case and provides a brief summary of the literature that is available on the topic.

DEFINING CULTURAL OUTCOMES

Studying cultural aspects of social movements has become increasingly common, contributing to both social movements scholarship and the sociology of culture. However, the way in which culture is understood and conceptualized has varied widely, resulting in a fractured literature on cultural outcomes. Moreover, researchers interested in cultural outcomes face the same kinds of definitional quandaries that face other outcomes researchers (see Earl 2004 for a brief review of these), with the added challenge that culture is also divergently defined. For instance, while political outcomes researchers face a host of concerns about how to define outcomes, politics is a commonly understood referent whereas culture is not.

In the face of this basic divergence, mapping different and parallel lines of work on cultural outcomes is necessary. Hart (1996) breaks the conceptualization of culture within social movements scholarship into three visions of culture: culture as opinions and beliefs (i.e., culture as what is in people's heads), culture as sign and signified (i.e., cultural products and their meanings), and culture as community and worldview. In the first vision of culture, culture is fundamentally social psychological. In the second, culture is material (or behavioral, as when the culture product is a specific ritual or institution, such as a handshake). In the third, culture describes the underlying fabric of entire communities; this view is well represented by Geertz’s reflections on cock fights (1973). All three of these views of cultures correspond to different conceptualizations of cultural outcomes of social movements. Below I separately review the literatures on each broad category of cultural outcomes and comment on the specific research challenges or methodological difficulties that each sub-area faces.

Culture as beliefs: Cultural outcomes as belief change

A number of scholars have focused on changes in beliefs and opinions as social movement outcomes. Most recently, Krinsky (2008) argued for a cognitive model of how belief change results from contention, but research going back two decades also finds merit in describing opinion change as a cultural outcome (e.g., Gamson & Modigliani 1989). Rochon (1998) wrote one of the most extended treatments on cultural outcomes from this perspective, arguing that one could study cultural outcomes by focusing on changes in discrete values. Other notable work from this tradition examines value and opinion change surrounding slavery and abolition (e.g., d’Anjou 1996). This view of cultural outcomes also has an obvious affinity with scholarship on New Social Movements (NSMs), which has been interested in the rise of “lifestyle” politics and in broad changes in public opinion (e.g., Melucci 1989).

Methodologically, this area of cultural outcomes research benefits from survey research and a host of other methods that are well
outcomes, cultural

equipped to help researchers identify and track opinion change over time. Nonetheless, while identifying opinion change may be methodologically soluble, causally tying such changes to social movement activity is much more difficult. For instance, it is not enough to show that movements were active at the same time that opinions were changing at a macro level. Rather, researchers need to be able identify and measure mechanisms that would translate movement activity into opinion change. That is a much harder task than measuring opinion alone.

Culture as sign/signified: Cultural outcomes as products and practices

This view of cultural outcomes suggests that specific products or practices have been developed or altered because of social movement activity. In terms of material outcomes, scholars have traced the impact of social movements on children’s literature (Pescosolida, Grauerholz, & Milkie. 1997), magazines (Farrell 1995), and a specific novel subgenre (Isaac 2009). Music has been argued to both affect social movement mobilization and to be affected by social movements (e.g., Eyerman & Jamison 1998). Oldfield (1995) argues that the abolition movement also created specific visual images that were adopted into visual culture through various mediums (coins, prints, etc.). McAdam identifies impacts of civil rights activism on fashion (McAdam 1988).

Beyond discrete material artifacts, others have argued that fields of production have been affected by social movements. For instance, Gamson and Modigliani (1989) examine the impacts of social movements on media coverage and discourse more broadly. Katzenstein (1995) also identifies discourse effects of social movements. Academic disciplines have also been developed in reaction to social movement activity (e.g., Rojas 2007 on black power and black studies). Alternatively, other disciplines have been altered by their interactions with social movements (e.g., Moore 1999 on science and engineering). More broadly, one might think of myths that are told and retold as potential social movement outcomes (e.g., Armstrong & Crage 2006).

In terms of creating or modifying specific practices, research has shown that movements can affect language (McAdam 1988; Rochon 1998). Work showing that social movements affected existing academic disciplines also showed effects on practices within the discipline (e.g., Moore 1999).

Methodologically, this area of cultural outcomes research faces dual burdens of tracking the actual outcome of interest and also causally tying that change to social movement activity of some sort. For scholars interested in material cultural products, the challenge of measuring cultural change in the first place (without respect to causality) is often easier than the challenges facing scholars interested in changes in cultural practice or institutions. For instance, it is much easier to identify and count songs, trace the diffusion of images, or track the growing publication or circulation of print products than it is to trace (and count) the emergence and diffusion of cultural practices. Ingenious researchers have found ways to identify and measure these changes, but the level of difficulty is certainly high. Moreover, even after establishing a clear change in sign/signified, the daunting task of tying this to social movement activity remains, which is as difficult for this area of cultural outcomes research as it is for others.

Culture as worldviews: Cultural outcomes as collective identity and community

To other scholars, culture denotes larger worldviews, communities, and associated collective identities. There is a tradition of studying utopian communities (e.g., Hall 1988), counter-cultures, and countercultures (Yinger 1982); one could see these communities and subcultures as distinct social movement outcomes. More recently, Epstein (1991) examines the creation of a direct action movement that included distinct values, decision-making processes, and ideology.

Methodologically, these scholars are in a good position to both identify the emergence
of new communities and to trace the role of social movements in creating those communities since there are often fewer other potential causes. However, the creation of entirely new communities or subcultures is probably one of the more rare cultural outcomes.

Scholars have also focused on the collective identities associated with social movement communities as a potential cultural outcome. Social movements may explicitly view the creation of new identities as a goal or the (re)creation of collective identity may result directly from conflict and contention (e.g., Fantasia 1988). This type of outcome is particularly relevant to NSM research (e.g., Melucci 1989).

On a methodological front, scholars interested in tying changes in collective identity to social movement activity have been fairly successful. This may be because of the strength of existing collective identity research. Alternatively, it may be that research examining the dialogic co-construction of contestation and identities (e.g., Fantasia 1988) is able to uniquely show how social movement activity and co-identities co-evolve through micro interactions. Whatever the case, this has also been an area where methodological problems have been less constraining.

MECHANISMS THAT MIGHT PRODUCE CULTURAL OUTCOMES

Although other areas of social movements outcome research have produced coherent theoretical accounts of how outcomes are produced (e.g., political mediation), there are no dominant, coherent accounts about how culture is influenced by social movements. Instead each of the individual studies referenced thus far has generated its own specific account of changes that sometimes overlap with other existing accounts but are largely independent. The field awaits a more coherent approach derived from the sum of this work or generated in some other fashion.

The range of accounts that have been featured by prior work varies widely. The only two accounts that have been used to explain more than one broad type of outcome include the impact of movement framing and the impact of media coverage (which is itself a result of movement interaction with the media; see Gamson & Modigliani 1989). Both have been used to explain social psychological cultural outcomes and outcomes that view culture as sign/signified. For instance, to varying extents, Rochon (1998), d’Anjou (1996), and Gamson and Modigliani (1989) all focus on framing as a key mechanism of cultural change. Earl (2004) traces other idiosyncratic explanations to all three types of cultural outcomes reviewed here.

While enumerating the reasons for such a divergent set of explanations goes beyond this review, a few important possibilities are clear. First, many accounts of cultural outcomes focus more on establishing an outcome than on identifying or evidencing a clear causal pathway to the outcome (save notable exceptions such as d’Anjou 1996 and Rochon 1998). Precisely how social movements promote an outcome is often fairly opaque. Indeed, Earl (2004) infers the causal pathway for many of the studies she examined because the original work did not offer a specific tie between contention and a subsequent cultural change. That said, a few exemplary works have forwarded explicit and detailed explanations. Scholarship on cultural outcomes as belief change has been the strongest area in this regard. D’Anjou and Rochon both offer clear causal explanations of belief change. Krinsky (2008) introduces a cognitive model of belief change.

Second, the variety of outcomes that have been considered also make it difficult for the field to converge on causal explanations – having a common explanation for belief change is a tall order, let alone an explanation that might also account for changes in music, fashion, visual culture, the academy, and so on. Diani (1997) is one of the few authors who attempt a grand approach. He traces how social networks are integral to a wide variety of other social movement outcomes, including cultural outcomes. Network ties may influence belief change, ties may affect
cultural production, and social capital may contribute to the formation of new subcultures or communities.

Third, cultural outcomes may result from conjunctural historical processes that complicate theory building. For instance, Isaac’s (2009) study of the labor problem novel suggests that contention was only one of several factors that converged to shape the subgenre. However, other areas of outcomes research have forwarded conjunctural models (e.g., political mediation), so this is certainly not an insurmountable barrier.

CONCLUSION

Divergent definitions of culture combine with all of the conceptual and methodological dilemmas facing outcomes researchers generally to make this a very challenging area of inquiry. Nonetheless, advances in identifying and evidencing specific cultural outcomes have been made, ranging from research showing opinion changes related to social movement activity, to changes in material cultural products and everyday practices, to the emergence of new communities and/or identities. More general theories of cultural change and cultural outcomes are still on the research horizon; unifying causal approaches would offer major advances to the field. Lacking that, new researchers’ best course of action is to examine studies of cultural outcomes most similar to their outcome of interest in hopes of identifying or inferring potential causal pathways tied to the specific outcome of interest.

Pacifism
JAVIER ALCALDE

The term “pacifism” was first used in 1901, although the idea can be traced back to the beginning of recorded human history across all cultures. Anglo-American pacifism opposes war and other forms of violence by combining advocacy of personal nonparticipation in war with a commitment to use nonviolent means of resolving conflict. From the European perspective, pacifism would include the efforts to achieve international peace and mutual understanding. Whether pacifism is expressed through a political movement or as a specific ideology, it can be based on moral, religious, or pragmatic principles. From a strictly rational perspective, pacifists are aware of the costs of war and violence and therefore believe in other ways of resolving conflicts.

The main areas in which pacifists have exercised an independent influence include issues of war resistance and the rights of conscription objectors, as well as the practical application of nonviolent techniques by different social movements. Pacifists have also been influential on the theoretical side with regard to innovative concepts, such as human security or nonoffensive defense and in promoting civilian resistance ideas. On the practical side, many mediation and reconciliation projects develop from pacifist ideas.

In its origins, the efforts to promote peace were linked to the essence of the great religions. But this early almost solitary focus on peace came to be linked with other major challenges of the day, such as human rights, the danger of the nuclear threat, the relationship between peace and development, and the environment. Similarly, the understanding of peace has evolved from a merely negative idea (i.e., the absence of war) to a more positive conception, which includes the conditions of dignity and social justice for every human being.

Accordingly, most collective action events, campaigns, networks, and movements have focused on one or another of these issues now linked to peace.

Through history various movements have advocated personal nonparticipation in war and suggested alternative nonviolent means of conflict resolution or transformation. A pacifist tradition based on nonviolence and noncontention was developed in Eastern religions, which would be translated in the twentieth-century pacifism into an active, social, and political nonviolent attitude. In the West, the character of Jesus represents a turning point in the development of a pacifist ethic. With the early Christian communities believing in “turning the cheek” – that is, not reacting with violence to violence, the establishment of Christianity as the official religion of the Roman empire would mean the end of Christian antimilitarism and the substitution of the Christian martyr by the soldier of Christ as a symbol of faith (Brock 1972).

Most of the historic peace churches have roots in religious expressions inspired by Christian sects, such as Mennonite nonresistance, peace testimony by the Quakers, or the international Bible students (later known as Jehovah’s Witnesses). They advocate for unconditional acceptance of nonviolent pacifism on the basis of their work as conciliators in different parts of the world and for a more peaceful international order. On another front, a more institutional approach is represented by the peace societies, the oldest of which date back to the end of the Napoleonic Wars. These groups campaigned for causes such as antislavery or women’s rights through arbitration, the codification of international law, and disarmament. They were not connected to the emergent labor movement, which lacked a completely pacifist ideology, though many supported a socialist antimilitarism.

An important influence bridging historic pacifism and contemporary nonviolence is Lev Tolstoy. By rejecting all kinds of violence, he also rejected participation in military service and paying taxes for war. The Russian writer is thus a precursor of the movement for conscientious objection, religious but also political, to conscription. This is a stage in the history of the peace movement which has lasted until today. With different levels of success, national social movements have led the way towards the abolition of compulsory military service in countries such as Greece, Germany, France, and Spain, as well as in Eastern Europe and even in Israel.

Another influential figure who bridges pacifist and nonviolent philosophies is Mohandas Gandhi. Inspired by the principles of truth, noninjury, and readiness to suffer, and through the technique of civil disobedience, he and his followers practiced their campaign first in South Africa, against legal discrimination of the Indian minority on the grounds of race, and then in India, against British rule. Since then, nonviolent resistance in the face of aggression has been successfully used in different parts of the world, by African nationalist leaders against the British, but also by the civil rights movement in the US. Other recent examples include Kosovo and Serbia, Colombia, Myanmar, Sri Lanka, and Palestine.

During the cold war many pacifists played a role in the antinuclear movement, as in the Campaign for Nuclear Disarmament in Britain. They promoted traditional nonviolent direct actions, such as the refusal to pay taxes for war and the organization of international peace walks, but also more innovative protest events, such as trespassing within the areas set aside for atomic testing. Also in this period the Esperanto movement was relevant as a way of communication between civil societies of the East and the West. Created by L.L. Zamenhof at the end of the nineteenth century, the international language achieved its biggest recognition as a tool for peace and mutual understanding until the interwar dictatorships and the world wars. In the current century new technologies have facilitated the expansion of this movement.

In the last decades, pacifism has gained in complexity and sophistication both in theoretical and practical terms. With reference to the opposition to wars, this has included questioning military expenditures and the arms trade, and allowing activists to participate in the different phases of the military economic cycle. However, some protesters in antiwar demonstrations have aimed to resist a particular war rather than wars in general, such as the Vietnam War or the occupation of Iraq in 2003. Nevertheless, this stream of peace activism has been present in almost every recent war and continues to be a key aspect of peace movements.

Another important trend of the current peace community is the feeling that opposition to war and the advocacy of nonviolent methods of conflict resolution are linked to a series of related issues of political, social, gender, environmental, and economic justice. In this sense, pacifist influence has been visible in the transnational nuclear disarmament movement in Europe, which sprang out of nonviolent campaigns such as those against nuclear energy and nuclear testing. More recently, the Global Justice Movement and the Arab Spring revolts have adopted civil disobedience techniques and nonviolence as key principles of their struggles. At the same time, new authors have challenged the claims of the moral superiority of pacifism, arguing that violence can be an effective and even a just form of power in politics, thus promoting a brand of pacifism differentiated from absolute pacifism. This alternative conception recuperates a political ethic that encourages broadened thoughtfulness about suffering and taking responsibility for our actions (Howes 2009).

As opposed to previous decades, current peace movements do not only focus on elaborating abstract theoretical discourses against the use of violence or nuclear power and weapons. Instead, they focus most of their effort on contingent and concrete action. The loss of the nuclear and chemical weapons’ primacy on the international agenda has allowed the emergence of new issues related to the humanitarian consequences of the use of some types
of conventional weapons. This context has facilitated the creation of single-issue advocacy networks that have been partially successful at both the national and global level (Alcalde 2010). The repertoire of action of the recent disarmament and arms control transnational campaigns is less oriented towards big protest events (with remarkable exceptions, such as February 15, 2003, the global day of action against the war in Iraq), and more oriented towards lobbying and negotiating processes. These trends suggest that pacifists might now have a lower profile, but at the same time be more effective than in the past. The treaties banning landmines and cluster munitions, and the efforts to regulate the conventional arms trade, provide confirmatory illustrations.

Participation in social movements
CATHRINE CORRIGALL-BROWN

Social movements are one of the pre-eminent vehicles for social change in contemporary Western society. From the civil rights movement to those for women, gays and lesbians, and the environment, social movements have left an indelible mark on public policy and cultural values. While social movements are larger than the individuals who comprise them, their survival and success is based on the participation of individuals. In fact, the rise and fall of campaigns at the macro-level is largely the result of the shifting involvement of individuals in and out of movement organizations at the micro-level. The discussion that follows outlines the variety of ways in which individuals can participate in social movements and the major factors which predict differential recruitment to social movements.

DIMENSIONS OF VARIATION

While many individuals participate in social movements, the nature and extent of their participation is highly variable. While social movement participation can take the form of membership in social movement organizations (SMOs), some individuals are not affiliated with specific groups but participate in contentious political activities, such as rallies, demonstrations, marches, and protests. In addition, many individuals engage in everyday activities that could be seen more broadly as part of social movements and contentious politics. For example, recycling, carpooling, signing petitions, or making financial contributions to SMOs are all ways that individuals can support causes and campaigns.

The variety of ways in which individuals participate in social movements has been conceptualized along the two key dimensions of risk and cost. The risk of participation can vary depending on the issue, group, or tactics used. Engagement in mainstream activities like signing petitions and attending peaceful protests is not particularly risky for most participants. However, participation in sit-ins, road blockades, or other tactics that may involve arrest, violence, or stigma can be very risky, as such activities could result in a loss of personal freedom, employment, or friendships. Participation can also vary in terms of cost, which entails the time and energy required. For example, costs are incurred when individuals have to travel, take time off work, or find child care in order to engage in social movements.

Risk and cost vary independently. Some activities can be costly but not risky, such as quitting your job to volunteer for a SMO. Other activities can be risky but not especially costly, such as attending a protest against election results in Iran. However, cost and risk can also vary together; signing a petition is generally low on both dimensions and engaging in a prolonged campaign like Freedom Summer is high on both dimensions.

When individuals are prepared to persevere in costly and risky activities they are said to be committed to a movement or cause. For example, engaging in the United Farm Workers (UFW) in the 1970s and 1980s sometimes involved both high cost and high risk. These volunteers often moved to and lived at the union headquarters and worked 12 hours a day, six days a week on union business. They were also targets of violence on the picket lines. Despite these costs and risks, many activists remained involved in the UFW for long periods, showing their commitment to the cause. Engagement in other organizations or causes requires much less commitment. For example, involvement in large national groups like the Sierra Club is often low cost and risk if a
participant only sends a yearly donation or reads the group’s newsletter.

PREDICTING PARTICIPATION

What leads certain individuals to participate in social movements while others do not? Recent work in the area has recognized that participation is a two-step process. First, individuals need to become committed to the goals and tactics of a movement to be eligible to participate (Klandermans 1997). While becoming committed to the goals of a movement does not necessarily translate into activism, individuals who are not sympathetic to the movement’s cause will not participate. For this reason, ideological commitment is the first condition of participation, priming an individual to become active in social movements.

Ideology

Political ideology is an important predictor of social movement participation. Beliefs play a significant role in an individual’s decision to participate in protest activity and are shaped by participation. Traditionally, protest has been seen as a tool for liberals who want to change the political establishment and who feel a need to go beyond the traditional political arena to get their views heard. Research in the US supports this argument, showing that liberals are more likely than other people to report participating in protest (Dalton, van Sickle, & Weldon 2010). However, it should be noted that the rise of the religious right and conservative movements in the US has, to some extent, changed the social movement terrain and fostered the participation of conservatives.

Religiosity is another element of ideology that can predict a wide range of behaviors, including engagement in contentious political activity. Religiosity can foster activism because belonging to and participating in a religious institution is associated with social networks, political knowledge, and resources. As a result, individuals who are strongly connected to their communities through religious institutions are more likely to join social movements than are other individuals (McAdam 1986; Diani 2004). Also, religious institutions can serve as political training grounds (Verba, Schlozman, & Brady 1995), and provide an abundance of resources that are favorable to collective action, including formal membership, an organizational headquarters, meeting places, publications, and professional leadership.

In addition to having an ideology that is supportive of protest, individuals must feel that their participation in social movements and related contentious political activity will yield results. This sense of efficacy is the belief that one is capable of the specific behaviors required to produce a desired outcome in a given situation (Gecas 2000). A high level of efficacy indicates that individuals feel self-confident, are causal agents in their environment, and, consequently, are able to produce the changes in the world that they desire. Research suggests that there is a positive relationship between efficacy and participation in protest activity (Rosenstone & Hansen 1993).

Resources

While having certain ideologies can predispose individuals to participate in social movements, these beliefs are not sufficient on their own to cause participation; individuals must also have the resources which allow them to translate these beliefs into action. Past research consistently finds that participation in collective action is more likely for individuals who have certain kinds of resources. For example, money is a key resource that can facilitate an individual’s engagement in contentious politics. In addition, there are less tangible resources, such as education and knowledge, which are also associated with participation.

Socioeconomic status (SES) is a critical predictor of participation in both social movements and traditional political activity (Verba, Schlozman, & Brady 1995). High SES is significant because it is associated with resources such as time, money, and civic skills which enable individuals to participate in politics and
social movements. Because of this, it is found that individuals with higher SES are more likely than other people to engage in political activity and in groups of all kinds, including social movement organizations (see also Rosenstone & Hansen 1993).

In addition to monetary resources, education is an important predictor of engagement. Level of education has a positive relationship with protest (Wilkes 2004). And, beyond formal education, political knowledge is also related to engaging in traditional political activities and protest. At a minimum, individuals must know about social movement groups, events, and issues in order to participate in them. Putnam’s work on political participation and general group membership finds that political knowledge is a “critical precondition for active forms of participation” and those who know more about politics are more likely to engage in protest (2000: 35). The importance of SES, political knowledge, and education for predicting engagement can be taken as evidence that protest is at least partially a function of personal resources, and mirrors the accepted relationship between resources and conventional political participation.

Biographical availability

The concept of biographical availability has long been central to studies of differential recruitment. This work argues that it is only when individuals are biographically available to participate in social movements that they will be able to convert their beliefs and resources into action (Beyerlein & Hipp 2006). Individuals experience life-cycle changes that make them more or less available to participate in contentious politics. For example, some personal constraints, such as family responsibilities or full-time employment, might increase the costs and risks of movement participation (McAdam 1986: 70). In addition, when individuals are performing certain kinds of roles, such as the role of parent or spouse, the commitments associated with these roles might limit their ability to participate in social movements. This suggests that individuals with fewer of these types of responsibilities and constraints would be more likely to have the time, energy, and inclination to engage in contentious political activity.

There are a number of specific role and life-cycle changes that can affect an individual’s decisions or ability to engage in collective action. Marriage and childrearing, for example, imply commitments to one’s spouse and family that may supersede loyalties to a movement and may take time away from activism. In addition, the many new responsibilities and dependencies that generally accompany marriage and parenthood also reduce the willingness of people to engage in especially risky forms of participation, which could result in arrest or other punishments. Empirical findings, however, are mixed. Being married and having children is a negative predictor of engagement in some work (Wiltfang & McAdam 1991) but a positive (Corrigall-Brown et al. 2009) or neutral predictor of participation in other studies (Barkan, Cohn, & Whitaker 1995).

In addition to changes in family circumstances, individuals also experience transitions in employment status over the course of their lives which could affect their propensity to engage in activism. McCarthy and Zald (1973), for example, hypothesize that those free of employment pressures, such as students, individuals who do not work, or those with flexible jobs, are more likely to participate in social movements. However, empirical findings have mostly contradicted these expectations. McAdam (1986) and Nepstad and Smith (1999) find that those who are employed full time and in less flexible jobs were more, not less, likely to engage in protest. This can be partly explained by the resources with which employment is associated, which are clearly predictive of participation and which may offset the effect of a restricted schedule.

Finally, age is an important source of biographical availability. Younger people tend to be free of family and employment constraints that could hinder political activity (Wiltfang & McAdam 1991). In addition, older people are often biographically available as their children
participation in social movements have left home and they are more likely to be retired (Nepstad & Smith 1999). In this way, both younger and older people tend to have more free time and less constraint on their activism and past work on social movement participation has demonstrated this curvilinear relationship between age and activism (Beyerlein & Hipp 2009).

Social ties and identity

Social ties have long been recognized as important predictors of engagement in social movements. As social movement activities are usually embedded in dense relational settings (Diani 2004), the probability that an individual will join an organization depends upon the number and strength of social ties that connect group members to each other and to non-members. In this way, integration into social networks can draw individuals into social movements (McAdam 1986) and, because of this, individuals who are well integrated into a community are more likely to engage in these organizations.

Many empirical studies have demonstrated the importance of social ties for social movement mobilization. For example, Morris (1981) finds that the Southern sit-in movement of the 1960s developed out of pre-existing social networks formed inside churches, colleges, and protest organizations. These personal networks of friends provide individual incentives to participate in social movement. They also create a gateway for participation and lower the costs of engagement for individuals. In light of the foregoing, it is not surprising that past research repeatedly finds that the presence of a social tie to someone already engaged in a movement is one of the strongest predictors of individual participation (e.g., Nepstad & Smith 1999).

Social ties are, in part, significant because they help to foster identities that are supportive of social movement engagement. Identities are the names that people give to themselves and others in the course of social interaction (Snow 2001) and identity is central to social movement participation. Some sociologists claim that a collective identity, a sense of “we-ness” or “one-ness” that derives from perceived shared attributes or experiences among those who comprise a group (Melucci, Keane, & Mier 1989), is a prerequisite for collective action (Klandermans and de Weerd 2000). In addition, many scholars, such Taylor and Raeburn (1995), argue that engagement in social movements leads participants to fundamentally change their identities and the way they see themselves. To this end, identities can be both the precipitant of social movement engagement as well as the result of participation in movements.

Political context/critical events

In addition to individual and interpersonal predictors of engagement, the context of mobilization is important for facilitating mobilization to social movements; some locations are more conducive to social movement mobilization than others. Such facilitative locales have been termed “free spaces,” which Polletta (1999) defines as the small-scale settings within a community or movement that are removed from the direct control of dominant groups, are voluntary, and generate the cultural challenge that precedes or accompanies political mobilization. Movements need free spaces where occupants enjoy some protection from authorities and enemies. These spaces give activists protection from state surveillance or repression, and segregated or partially autonomous institutions can shield them from interference by authorities. Such spaces could include student lounges and hangouts, union halls, and tenant associations (Fantasia & Hirsch 1995), which allow for the growth of movements and for mobilizing participants.

Zhao’s (1999) research on the prodemocracy student movement in Beijing highlights the importance of free spaces to the rise of that movement. Specifically, he shows that the various universities in Beijing provided safe spaces and common areas that facilitated student aggregation and mobilization, largely because these areas were relatively protected and encompassed much of the students’ everyday routines. This empirical example clearly
illustrates how spatial context can matter in creating an environment that is conducive, or prohibitive, for movement recruitment and mobilization.

CONSEQUENCES OF PARTICIPATION

Scholars have repeatedly found that social movement participation has long-term transformative effects for individuals. Participation has been shown to be related to educational attainment, job choice, income, marriage age, divorce rate, and the number and timing of children (for a summary of this research, see Giugni 2004). Similarly, individuals who join social movements are likely to continue to engage in political organizations and remain consistent in their ideology over time (Downton & Wehr 1997).

Follow-up studies of new left activists of the 1960s illustrate the important consequences of social movement engagement on the later lives of activists (e.g., Whalen & Flacks 1989) and can shed light on the predictors of engagement over the life course. These studies follow individual participants over time periods varying from 4 to 20 years, and assess the biographical and personal consequences of participating in social movements. All of these studies point to the powerful and enduring impact of participation on the biographies of participants. Politically, these studies find that activists tend to continue to espouse leftist attitudes, continue to define themselves as liberal or radical in orientation, and remain active in contemporary movements and other forms of political activity. Personally, former activists are concentrated in the teaching and other helping professions; have lower incomes; are more likely to have divorced, married later, or remained single; and are more likely to have experienced an episodic or non-traditional work history.

While social movement participation is clearly significant for the lives of individual activists, it also has larger consequences for movements as a whole. Mass movements cannot be successful without individual activists. In addition, the participation of individuals in movements is a vital part of social movement success. This is, in part, because mass mobilization shows the strength of a social movement. In turn, this mobilization of support can help sway public opinion and shape government policy.

Participatory budgeting (PB) is a process that directly involves local people in the definition of priorities and/or spending for a defined public budget. PB represents an institutional form of civic engagement implemented by an official body, but possibly involving social movement organizations (SMOs) in different ways. At the end of the 1980s, PB was jointly invented by local SMOs and members of the newly elected Workers’ Party in the city of Porto Alegre, Brazil (1.4 million inhabitants). It is based on neighborhood assemblies and thematic meetings that take place throughout the year and involve volunteer citizens (principle of grassroots democracy). Allocation criteria are used in the discussions about local infrastructure in order to redistribute funds to those with the greatest needs (principle of social justice). Specific boards of citizen delegates, trained by independent nongovernmental organizations (NGOs), ensure that local priorities are taken up in the budget to the largest extent possible (principle of citizen control). In Porto Alegre, this process has led to huge changes: it involved large parts of the (poor) population – up to 33,600 people in 2002, reduced corruption, and rendered public administration more efficient and transparent (Abers 2000; Avritzer 2002; Baiocchi 2005). As a result it created great enthusiasm around the world and is recognized as good practice by international organizations. Although a government change in 2004, financial problems, and the newly established link between PB and ideas of “governance” have modified the original process, it has been widely diffused to Brazil, Latin America, and other continents. In 2010, between 795 and 1469 versions existed in the world: 511–920 in Latin America and the Caribbean, 174–296 in Europe, 2–10 in North America, 40–120 in Asia, 66–110 in Africa, and 2–10 in Oceania (Sintomer et al. 2010).

Through the adaptation of PB by different actors and to different contexts, a broad diversity of procedural forms exists. At least six models can be identified as ideal types (Sintomer, Herzberg, & Röck 2008):

1. Adaptation of Porto Alegre: key elements of the original process (e.g., transfer of decision-making powers to civil society, high degree of citizens’ autonomy) are adapted to a new context.
2. Proximity participation: PB implemented only in neighborhoods; there are no clear rules and little autonomy of civil society.
3. Consultation on public finance: Citizens are consulted on priorities of overall financial situation of a town or city; there are clear rules, but little autonomy of civil society.
4. Multistakeholder participation: Citizens and private enterprises take part and discuss concrete projects financed by public/private partnerships; there are clear rules, but little autonomy for civil society.
5. Community participatory budgeting: Mostly local communities participate and directly decide and implement concrete projects; there are clear rules and a high autonomy for civil society.
6. Participation of organized interests: Different organizations participate (trade unions, associations, enterprises) in discussions, which are centred on specific public policies and possibly on single projects; the degree of autonomy for civil society is variable.

Real cases often combine elements of the six different models. Due to the activities of (inter)national networks and the combination of PB with existing traditions of participation, some models have become dominant in single
countries. For example, the “community PB” is very widespread in Great Britain (and in the Anglo-Saxon world), the “proximity” model in France, Belgium, and Portugal, and the “adaptation of Porto Alegre” in Spain, Italy, Brazil, and Latin America. Overall, it seems that the direct influence of Porto Alegre is diminishing in favor of the development of “homegrown” models. Whereas initially mostly left-wing political or community activists brought the idea of PB to other Latin American countries, the Western European context and the US or Canada, it was introduced in other contexts through development cooperation and international organizations (Africa, Eastern Europe). Social scientists have also played an important role in the global dissemination of PB.

Due to the huge diversity of contexts and procedures, it is impossible to provide an overall evaluation of the impact of PB. Moreover, many processes are very young and little comparative statistical data is available. Finally, the goals differ greatly, reaching from the provision of information and transparency of budgetary issues to the empowerment of citizens, the improvement of services, and the democratization of local political structures. The existence of clear procedural rules, a high degree of autonomy of civil society participants, a direct impact on decisions (or an indirect influence on decisions linked to an official process of accountability), and the discussion about local and broader political questions are crucial factors for initiating a democratization process. In many European countries, PB has been shown to have positive impacts on the development of a more user-oriented administration, whereas its effects in terms of social justice remain limited compared to the Latin American continent (Sintomer, Herzberg, & Röcke 2008); allocation criteria or specific methods to engage with “hard-to-reach” groups are promising ways to create a greater social profile of PB in Europe. Overall, PB can trigger certain positive developments, but needs to be embedded in a broader reform process in order to pave the way for an encompassing democratization of political systems. Core challenges consist in involving local SMOs without reducing their critical potential, the integration of new themes like gender mainstreaming and sustainable development, and the creating of new institutional links between the sphere of representative democracy and the space of direct citizen participation.

REFERENCES AND SUGGESTED READINGS

Petitions
JEAN-GABRIEL CONTAMIN

Petitions are usually defined as “protest texts which are intended to be signed by a number of persons, at least one of whom has not the opportunity to amend it.” This element of the repertoires of collective action has rarely been studied in sociology because it seemed too obvious. But, because it might be less obvious than it appears, it might be a fruitful opening to questioning social movement theory.

AN OBVIOUS PRACTICE

A petition “is not likely to be noticed” because it “might not offend anyone” (Crozat 1998: 59). Crozat summarizes what appears to be the dominant representation of the object “petition” in the contemporary sociological literature. Petitioning is simply not a very effective means of protest, perhaps because it requires very little effort from participants. Therefore, for petitioning, the paradox of collective action – according to which it would be more rational to let others mobilize rather than bear the costs of collective mobilization in order to get a collective good that would benefit all (Olsonian model) – would not work. “Free riders” would become “easy riders.”

This explains the relative rarity of surveys that address this mode of action. Most often, the study of petitioning is used as a pretext to deal with other objects. For instance, some psychosociologists have made it an ideal ground for studying the phenomena of obedience and conformity. They tend to show that situational factors are more efficient than personal beliefs or personal factors to explain the signature of a petition (Klandermans & Oegema 1994).

Petitioning is also sometimes taken into account as a political activity among others in quantitative studies which aim at comparing different models of political participation in different countries (Crozat 1998) or different social groups (Chong & Rogers 2005), for instance comparing the level of petitioning practice in different countries in order to conclude that the German nation “tolerates the less contentious form of protest but will not tolerate the more contentious ones” (Crozat 1998: 67) and to relate this teaching to “national cultures,” to historical traditions, or to political opportunity structures specific to each country. Thus, petitioning remains a little studied subject, either because it is regarded as a mere survival in the epoch of broadcast media, or because it seems a practice whose persistence is explained in an obvious way: certainly, it is not effective, but it costs little to those who use it.

THE DUAL PARADOX OF PETITIONING

However, according to these studies, petitioning does not appear to be a mere survival tactic, but the only one of those so-called “unconventional” political activities which has been practiced by almost half the population regardless of country. Furthermore, this practice tends to spread, although it appears archaic in a time of television, polling, and individualized democracy.

Similarly, it might be questioned that petitioning is generally an inexpensive practice for individuals. Of course, signing a petition often costs neither time nor energy nor money. However, this practice is supposed, like a contract, to leave the written record of a commitment identified by a name, a signature, and often an address. It is then likely to expose signatories and, even more, petition initiators, to some legal, physical, and moral risks (Hayes, Scheufele, & Huge 2006: 262), notably with the spread of the Internet.

The study of this practice adds then an extra dimension to the traditional “paradox of
collective action.” The Olsonian model implicitly assumes that collective mobilizations contribute to the gaining of the claimed collective good. So, for petitioning, it is necessary to understand why the signatories and those who organize these petitions endure the inconveniences of collective action even though they believe that this activity will not be sufficient to get what they ask for. This may be called the “dual paradox of petitioning” (Contamin 2001: 53).

A FRUITFUL OPENING FOR QUESTIONING MOBILIZATION STUDIES

Petitioning seems to be a fruitful way to question social movement theory from within and from outside. From outside, because admitting that petitioning might be less effective than other forms of action, without being less expensive and less used, leads us to postulate that everything cannot be reduced to rationality.

But it also questions the cost-benefit model applied to mobilizations. The rationality of petitioning cannot be explained without abandoning the paradigm that tends to evaluate the success and the rationality of mobilizations in terms of their ability to achieve some explicit demands. To understand this practice, it is necessary to reason relationally. In connection with other available modes of action petitioning takes place in sequences of mobilization within repertoires of collective action that constitute structures, and also in connexion with what everyone expects from others, according to a “metarationality.” In connection, finally, with the way each actor appropriates the petition. The persistence of petitioning can be understood by focusing on the plural uses that might be made of a petition: to test the echo of a question in a population, to engage in conversation with potential signatories, to create files of supporters, to occupy activists. In this sense, a petition is not so much an intangible protest text that each signatory must endorse in its entirety, than a pivotal text with which some people, who have not taken part in its writing, accept for heterogeneous reasons to be linked, despite the deep differences they may have, and provided that, at least symbolically, they can express those differences (Contamin 2001). So the paradox of collective action can be solved.

Policing protest
DONATELLA DELLA PORTA and HERBERT REITER

THE POLICING OF PROTEST: WHAT IT IS AND WHY IS IT IMPORTANT

Relying mainly on protest as a means to put pressure upon decision-makers, social movements challenge the power of the state to impose a monopoly on the use of legitimate force. Taking to the streets, often forcing their presence beyond the legal limits in order to get their voices heard, they directly interact with the police, who are supposed to control public order. In their interventions, the police force therefore has to realize an uneasy balance between the defense of state power through the implementation of law and order and the recognition of demonstration rights.

The intervention of the police in the case of violations of law is additionally not automatic: in public order, many minor violations are tolerated in order to avoid major disorders. While sometimes the government gives specific orders (or at least sends signals) about the type of intervention required (or desired) at political demonstrations, the police enjoy broad margins of discretion, at different hierarchical levels, as most decisions are taken on the spot, and are determined by the assessment of the specific situation as well as by interactive dynamics.

For many years a neglected issue in the social science literature, the policing of protest started to attract attention in the 1990s. The collection *Policing Protest: The Control of Mass Demonstration in Western Democracies*, edited by Donatella della Porta and Herbert Reiter (1998a), introduced the concept of protest policing, defined as the police strategies and practices used in order to control protest.

In authoritarian regimes, the policing of protest is often characterized by brutality, with challenges to public order not infrequently ending in massacres (see, among others, Sheptycki 2005). In democratic regimes, however, encounters between demonstrators and the police can still be a very delicate issue. In modern democratic societies, protest policing requires a difficult balance between the protection of the legal order and the defence of individual freedom and of citizens’ rights to political participation, and thus the very essence of the democratic system. The public order strategies employed by the police are in fact reflected in citizens’ perceptions of the respect the state shows toward their rights and freedoms. In this sense, the way in which a police officer intervenes in order to control protest is perceived as an indicator of the quality of democracy in the political system (della Porta & Reiter 1998b).

Empirical research has indicated that the policing of protest also affects the evolution of protest. Increasing the costs of protesting, it may reduce the individual availability to participate (Davenport 2005; Francisco 2005). However, the sense of injustice as well as the creation of intense feelings of identification and solidarity can increase the motivation to participate (della Porta & Piazza 2008). Police control tends to impact on the repertoires of protest, through a reciprocal adaptation (or sometimes, escalation) of police and demonstrators’ tactics (della Porta 1995). It may also influence the organizational forms used by social movements, for instance by spreading a sense of mutual mistrust through the use of infiltration (e.g., Fernandez 2008; Starr et al. 2008). Different effects of repressive behavior have been related to the timing of police intervention as well as to the characteristics of the affected social and political groups.

Equally protest has an impact on police forces and strategies. The policing of protest is a key feature for the development and the self-definition of the police as an institution.
and as a profession. Its gradual affirmation as the main agency specializing in this task was of fundamental importance to the process of modernization and professionalization of the European police forces in the nineteenth and twentieth centuries. Moreover, waves of protest have had important effects both on police strategies and on the organization of the police (Morgan 1987). In contemporary democratic societies, the way in which the police address protest is a significant aspect of their self-image (Winter 1998).

THE HISTORICAL TRENDS

With the development of the nation-state, the policing of protest has been characterized by some trends towards a growing deprivatization, nationalization, and demilitarization. First of all, the tasks of policing are at the core of the definition of a Weberian state power that claims the monopoly of force. Second, processes of state building brought about the centralization of the control of public order. Even if the degree of centralization in police structures clearly varies, and local police bodies often keep specific profiles and styles (see e.g., Kriesi & Wisler 1998 on Switzerland and Winter 1998 on Germany), there has been a progressive orientation of protest and its policing towards the national level. Third, here also with cross-country differences, there has been a progressive transfer of public order control from the military to the police. In democratic regimes in particular, the military aspects of protest policing were further reduced and the democratic accountability of police forces strengthened.

The protest policing style dominant in Western democracies prior to the 1960s and 1970s has been defined as “escalated force” (McPhail, Schweingruber, & McCarthy 1998). Based on a presumption of irrational crowd behaviour (Schweingruber 2000), it was rooted in intolerance of direct forms of political participation. Highly suspicious of any gathering, its adherents gave low priority to demonstration rights and foresaw the massive use of force to suppress even small violations of laws and ordinances.

According to many studies, the “1968” protest cycle had a profound impact on protest policing. The need to adapt to new forms of protests as well as the increasing legitimacy of (once) unconventional forms of political participation led to an increasing tolerance of protest by the police. From the 1970s onwards, police forces started to implement new public order strategies, considering peacekeeping more important than law enforcement and avoiding coercive intervention as much as possible.

Especially since the 1980s, research on the policing of protest in European democracies and the United States has singled out the dominance of a “negotiated management” strategy in protest policing (McPhail, Schweingruber, & McCarthy 1998). A shift was noticed from hard to soft forms of power, based upon the recognition of the right to demonstrate, tolerance for (even disruptive) forms of protest, frequent communication between protestors and the police in order to insure a peaceful evolution of events, and limited use of coercion (della Porta & Reiter 1998a; della Porta & Fillieule 2004). Research, however, has stressed the selectivity of police intervention, with the survival of harsh modes of protest policing in the 1980s and 1990s (della Porta 1998; Fillieule & Jobard 1998).

THE RECENT TRENDS: POLICING IN THE NEW MILLENNIUM

Recent developments in the policing of protest seem to indicate some (more or less abrupt) inversions. If protest policing had never been exclusively under public control (see e.g., private policing on university campuses or in the factories, but also the use of organized crime to intimidate unionists and protestors), the privatization and semi-privatization of spaces such as shopping malls as well as the outsourcing of police functions to private companies (e.g., in airports) have recently increased and made
more visible the role of private police bodies in the control of protest. Additionally, the control of more transnational protests brought about a growing coordination of police units from different countries and the introduction of transnational aspects into protest policing. Third, in the last few decades, processes of militarization of public order have been noted even in countries, such as Great Britain, once considered the best examples of “citizens’ policing.” Finally, negotiated management was less consistently implemented, leading researchers to indicate the emergence of new protest policing styles, variously defined as “command and control” (Vitale 2005) or “selective incapacitation” (Noakes & Gilham 2006) and characterized by a particular emphasis on prevention, with a growing reliance on “intelligence-led” policing, and a return to coercion, also employed preemptively.

What had been considered by many as a generally accepted “post-1968 standard” proved particularly fragile when confronted by the mass demonstrations of an emerging transnational movement (della Porta, Peterson, & Reiter 2006). At protest events of what came to be known as the global justice movement, coercive strategies (based upon the use of force) returned as a prominent aspect of protest policing, apparently recalling the “escalated force” style, although with adaptations to new protest repertoires, police frames, and technologies. Transnational aspects of protest policing were particularly evident in intelligence gathering, the basis for preventive (or preemptive) intervention against protest. Signs of militarization included a massive and usually highly visible police presence, heavy anti-riot gear, the use of special units for (also preemptive) coercive intervention against “troublemakers,” and the deployment of army units. Various types of “less-lethal” arms were also used against demonstrators, from those traditionally deployed by police public order units, such as tear gas and/or water cannons, to newer developments like hand-held irritating sprays and rubber and plastic bullets, which leave the responsibility for their use largely to individual police officers.

These developments, visible also at national and local protest events, emerge as significant departures from the protest policing styles dominant in the 1980s and 1990s. However, it should be recalled that the advent of negotiated management did not signify the disappearance of coercive intervention. Antagonistic interventions with a “show of force” attitude and a massive, highly visible police presence were however generally reserved for small extremist groups – in this period of demobilization not connected with a broader movement – or for a universally stigmatized phenomenon like football hooliganism. In the case of transnational protest events organized by the global justice movement, these features have been observed in conjunction with mass demonstrations of tens of thousands, if not hundreds of thousands, of participants.

Deterrence of demonstrators and the closing of public spaces to activists were underlined as growing strategic elements in the policing of protest events (Fernandez 2008). During the prelude to transnational counter-summits and other major protest events, the police forces in various countries also employed coercive measures offensively, directed against movement activists and movement strategies, including preventive arrests, the confiscation of propaganda material, and searches of demonstrators’ headquarters, independent media centers, and legal assistance offices. Moreover, temporary ordinances, creative use of old laws, and legal permits became common ways to control protests (Fernandez 2008: 166).

As for negotiation, there has often been stronger emphasis on isolating political leaders and dignitaries from the risks of contact with demonstrators than on negotiating with organizers to define spaces and limits of protest. In some cases of counter-summits, serious negotiations started late and were more or less haphazard, while no particular care seems to have been taken to assure open communication lines during demonstrations, one of the cardinal points of negotiated management. Above
all, preparations for the “fortification” of summit sites and, in general, police measures aimed at its protection, constituted public messages difficult to reconcile with a negotiating strategy.

Coercion and deterrence strategies were linked to information strategies. The literature on transnational policing has underlined the significance of technical innovation and the influence of advanced surveillance, information processing, and communications technologies on the way policing is organized. New terms such as “strategic,” “pro-active,” and “intelligence-led” policing imply approaches for targeting suspect populations and individuals in a highly systematic way. The trend towards intelligence-led policing, first established in the US with the “war on drugs,” is highly evident in particular in transnational protest policing, both in North America and in Europe. Comparative research (della Porta, Peterson, & Reiter 2006; Fernandez 2008) indicates an attempt to extend control over a population of transnational activists through a broad collection of information (from open sources as well as infiltration), shared transnationally among the different police bodies. Untrue information is also often spread in order to picture the activists as violent (della Porta et al. 2006; Fernandez 2008). However, the various police forces’ capacity for monitoring the “suspect population” of the protesters is often not sufficient to allow them to efficiently intervene in a strategic and proactive way. The massive amount of information collected on single activists and groups and the political (and not criminal) character of the phenomenon of transnational protest seem to have overstretched their analytical capacities.

EXPLAINING PROTEST POLICING STYLES

Della Porta and Reiter (1998b; 2006) suggest explaining the policing of protest based on characteristics both internal and external to the police, with both types of characteristics filtered through police knowledge – that is, the cognitive appreciation by the police of their role in society as well as of external demands and challenges.

Concerning external characteristics, social movement scholars have stressed the role of political opportunities, as both stable institutions and contingent developments. As for the first, the more centralized the political power, the less accessible “from below” political institutions have been considered to be. Additionally, historically rooted cultural elements about the proper ways to deal with opponents tend to reproduce themselves determining different degrees of inclusiveness versus exclusiveness towards social movements. Less durable political contingencies that influence the availability and influence of political allies (electoral instability, divisions among the elites, etc.) have also been mentioned as relevant in opening windows of opportunities for protestors.

As far as the particular case of the policing of transnational protest is concerned, the low formal accountability of international governmental organizations as well as the convergence on neoliberal policies of right-wing and left-wing political parties have been read as closing down channels of access for political movements (della Porta, Peterson, & Reiter 2006). The reduced support by allies in the institutional sphere of politics seems to have pushed the police towards harsher strategies, adapted from those applied in preceding decades against weak (politically unprotected) groups and generally stigmatized phenomena like football hooliganism. In addition, while the targets and organization of the protest become transnational, protest rights remain anchored at the national level (Reiter & Fillieule 2006).

Internal characteristics of the police, like its organizational resources as well as its professional culture, are also important in explaining police behavior. The degree of militarization of the structure and the equipment, the legal competences and the degree of professionalization influence the strategic choices of the police. Recent trends towards a (re)militarization of public order control reflect a more general
augmentation of paramilitary units, used for instance in the intervention against drug dealers, as well as the growth of a military culture exemplified by police training, armament, uniforms, and more.

Ethnographic research and case studies have allowed an understanding of the motivations for the different styles the police use towards different social and political groups (e.g., D. Waddington 1992; P.A.J. Waddington 1994). Police have been said to be sensitive to the characteristics of the perceived threat but also to the expected demands from authorities and public opinion. Research on the police has stressed that the organizational imperative is keeping control over situations, rather than enforcing the law. Police officers indeed enjoy a high degree of discretion in their encounters with citizens. However, they must also maintain (to different degrees) the support of authorities and the public. Research on the policing of social movements has identified a tendency to use harsher styles of protest policing against social and political groups that are perceived as larger threats to political elites, as being more ideologically driven, or more radical in their aims (see Earl 2003; della Porta & Fillieule 2004; Davenport 2005). Additionally, police repression is more likely to be directed against groups that are poorer in material resources as well as in political connections (della Porta 1998; Earl, Soule, & McCarthy 2003).

Police tactics in the control of protest also followed some general conceptions of the role of the police. Noakes and Gillham (2006) underline the importance of shifts in the dominant visions of the causes of crime and in the corresponding conceptual principles underlying police intervention for protest policing, in particular the implications of the “new penology” with its emphasis on protection and risk management. Zero tolerance doctrines, as well as militaristic training and equipment, are imported into the field of protest policing from other forms of public order control addressing micro-criminality or football hooliganism.

The elaboration of a “penal law of the enemy” is another case in point. The strategy of space fortification reflects the relevance of a conception of prevention as isolation from the danger (and the dangerous ones), through a reduction of rights (of demonstration, movement, privacy) of those citizens that are considered as potential enemies. A situation defined as an emergency is faced through the strategies experimented with in the control of the different, the street enemies (migrants, petty criminals). If this emergency right deviates from the principles of universal rights, instituting a dichotomy between citizens and enemy, in the control of protest the political rights of the citizens are subordinated to the security of certain groups.

The expansion of police preventive powers (e.g., in the control of football stadiums or of organized crime) facilitated the rise of intelligence-led policing in the control of protest. In addition, new laws on terrorism passed after September 11, 2001, and the enhanced international police cooperation on security issues, have provided instruments and norms that allow for a consistent restriction of demonstration rights. Old and new antiterrorism legislation is more and more used for the surveillance and intimidation of activists, who risk very high penalties for minor violations (see e.g., Starr et al. 2008).

Finally, the policing of transnational events tends to involve international policing, characterized by a very low level of democratic accountability. The involvement of multiple law enforcement agencies, as well as secret services, further reduces internal coordination and external controls on police intervention. A supranational public sphere capable of keeping a critical eye on the defense of citizens’ rights is emerging (as, for instance, the wave of international protest against police brutality at the Genoa counter-summit indicates), but it is still weak and surfaces only occasionally. Finally, the merely intergovernmental character of police cooperation (even among EU member states) has notably increased the difficulty for citizens to single out the institutional level which is politically and juridically responsible for limitations of their rights and where to ask for redress.

Police autonomy
FABIEN JOBARD

The police usually enjoy a great amount of autonomy, of which two levels can be distinguished. The first level (micro level) is called police discretion, and is used by rank-and-file officers. Daily police matters call for quick if not split-second decisions by individual officers on the beat, like bringing someone to the police station, approaching an apparent source of disorder, or following or abandoning the task given by a superior in order to help someone in trouble. The second level (macro level) is the autonomy exercised by the police as an institution. This autonomy is conceptualized in relation toward the authorities (usually political or judicial authorities), which give the police their mandate.

With respect to these two levels of autonomy, crowd control operations are specific in that the first level of autonomy has been more and more reduced in the course of the militarization process that characterizes the maintenance of order in most contemporary democracies. Individual officers are expected not to act on their own initiative: today, almost no discretion is tolerated in the context of highly professionalized forms of protest policing, even in the case of self-defence.

Two different conceptions of police autonomy are at stake. In common law countries, the key notion is the police chief’s “independence” in all law enforcement operations, specifically in maintaining order. This was expressed by the Royal Commission on the Police in Britain in 1962, and reaffirmed in what Stenning (2007) calls the “most oft-quoted statement of the doctrine in Britain, Canada, Australia, New Zealand”: the “Blackburn doctrine,” which states that “[t]he responsibility for law enforcement lies on him [the chief constable]. He is answerable to the law and to the law alone.” An opposite conception can be found in “continental” countries, especially as far as protest policing is concerned. There, the police are seen as the long arm of government. For instance, in France, the central government handles the police operations during protests, riots, or collective violence through its local representatives, the préfet. The préfet give the orders and police commissioners receive and implement these orders on the field.

It is true that, in both protest policing regimes, the government’s intervention in protest policing operations can lead to large-scale political scandals. Nevertheless, the public response is different in each system. The Canadian prime minister’s interference with police operations during the APEC meetings held in Vancouver in 1997 led to the formation of a commission which deplored that the police had “succumbed to government influence and intrusion.” In France, events like the massacre of more than one hundred peaceful Algerian protestors in 1961, the massacre of communist protesters the year after, or, more recently, the debates over police provocation through overintervention or nonintervention, never generated any public discussion on police subordination to the government’s stakeholder (the préfet or the ministry of the interior), but only with regard to the intent or the final result of the political intervention. Policing protest in France is always a matter for the government. No parliamentary, independent, or judicial commission ever investigated such issues, which simply remained part of the political debate between the government, its opposition and the voters.

These two opposite notions of police autonomy actually rely more on different patterns of policing than on a strict division between continental law and common law systems. Countries like New Zealand or Northern Ireland have, like France, a centralized police force headed by the government, and the notion of...
“police independence” appears almost fictitious there.

One should, however, not overestimate the size of the differences between the two police systems. First, operational autonomy is not the only thing at stake. Resources, nominations, promotions, working conditions, transactions with police unions, as well as general police policies, are always defined by the government or the regional or local political authority, which therefore has indirect control capacities. Facing a political protest, police chiefs keep that in mind. From this point of view, recent changes in police policies tend to increase central controls, via fiscal constraints, audits, and new public management doctrine in the organization of the police. Moreover, the focus on police agencies by “law-and-order” governments favors the intermingling of government interests and police matters. The uniformity of management guidelines and the growing importance of police issues in contemporary democracies contribute to erasing the differences between the two police systems outlined above.

The second reason why the differences between the two systems are less clear cut hinges on the fact that national police organizations display their own (sub)cultures and collective identities. A universal aspect of police subculture seems to be that it favors more repressive orientation toward groups identified as specifically weak or threatening, like racial minorities, foreigners, students, urban youths, prostitutes, etc. This kind of police autonomy is the source of a police-centred approach introduced by many scholars of social movements, which examines institutional factors in how the police handle protest. From this perspective, the problem is no longer the dependence of police chiefs on government or politicians, but, on the contrary, the lack of adaptation of police organizations vis-à-vis political change. This can be illustrated by the difficult transition from escalation to negotiated management strategies. During some periods (at the end of the 1980s and again since the end of the 1990s), local government in Berlin, Germany, has tried to discipline the inclination of the local police force toward repressive tactics against left-wing and anarchist May 1st demonstrations, and finally succeeded. In contrast, police autonomy was so strong in France during the 1950s–1960s that the government’s only hope was damage control strategies in order to limit the police abuse of force in Paris. The police’s power extended so far that many local politicians in Paris and its surroundings, and many civil servants in charge of immigration and colonial issues, were former police chiefs from Algeria – which reverses the question of police independence and political influence.

Police riots

ABBY PETERSON

Researchers remind us that most political acts of protest do not result in violence. However, when violence does break out authorities, protesters, and the general public alike are eager to place the blame on some party to the events. But it is often difficult to determine who was “responsible” for the violence when it does occur, or who lay behind its escalation. Responsibility is most readily assigned to protesters. However, activists are not the sole actors in riots, however instrumental to its outbreak they may be. Violence arises out of an interaction between protesters and responding authorities. Research since the 1960s suggests that police authorities often bear a major part of the responsibility (e.g., Waddington 1991; Skolnick & Fyfe 1993; della Porta 1998).

Direct confrontations between activists and police bring to the surface highly emotionally charged moments – moments of “collective effervescence” – which inevitably lead to processes which in most cases will result in an escalation of violence. In Peterson (2001) these moments of “collective effervescence” were analysed as to their role in the construction of militant collective identities, as well as to how these “moments of collective effervescence,” enhanced by the explosive sociality of direct confrontations, led to a rationale of violence on the part of activists. Waddington (1991: 177–178) turns the logic of these arguments toward the police, arguing that the baton charge easily leads to an escalation of violence.

The reason why baton charges are difficult to control is known colloquially in the Metropolitan Police as “the red mist”. This refers to a potential cocktail of psychological conditions which diminishes any person’s self-control, and from which the police are not exempt. Baton charges require officers to act aggressively in conditions of relative anonymity… they may be wearing protective clothing with visors to obscure their facial features; and they will almost certainly be acting, not as individuals, but an equally anonymous collective.

Protest events often reveal two groups “high” on the potent “red mist” cocktail – the masked, anonymous activists and the masked, anonymous police. The protagonists enter a “spiral of violence,” during the actual events as well as in their aftermath (cf. Peterson 1997). Emsley and Bessel (2000: 4) refer to French sociologist François Dieu and his typology of the violent force employed by policemen. The typology includes: la violence instrumentale, which is the exercise of force justified by their legitimate authority; la violence dérivée, which is a by-product of the former when individual police officers are carried away by panic or accident and strike out indiscriminately at those who happen to get in the way; and la violence déviante, which are uncalled-for and indefensible exercises of force by individual police officers carried away by anger, frustration, and revenge. I argue that the latter two categories are both examples of the unprofessional exercises of coercive force, only the motives behind their exercise vary. Violence dérivée is violent acts in the heat of the moment, by-products of the legitimate exercise of police power, which has gotten out of control. Violence déviante is premeditated acts of revenge and anger, by-products of the situations where authorized force has been instrumentally employed.

Stark (1972) analyzed police riots in the USA and argued that police riots were unusual only in their relative infrequency. Stark argues that whatever ideas and practices officers bring to their more everyday police work, the “culture of policing” is simply exacerbated during riots. Excessive acts of violence against persons who “anger, offend, or frighten” police officers are commonplace. “What is abnormal about police riots,” according to Stark, “is the number of policemen and civilians involved in a single
incident during a relatively condensed time-span” (1972: 55).

Stark finds the preconditions for police riots in the cultural predispositions of individual police officers embedded within a police culture that tends to demonize adversaries. This explanation is woefully inadequate. A siege mentality accounts for arbitrary and excessive acts of violence among individual officers, but it does not explain their collective occurrence. The existence of a police culture, which is predisposed to perceive political activists as more or less criminal hooligans, can underlie police riots, but other factors must come into play. Research on the police riots in Gothenburg 2001 during the European Union summit suggests that other factors were equally decisive. Deficiency in preparedness due to inadequate or nonexistent crowd control and riot control training, the lack of an operational strategy and set of tactics which could control and contain unexpected situations arising in the field, the breakdown in the operative command and coordination structure which undermined the authority of senior officers in the field, as well as a police culture that readily demonized in an arbitrary manner the activists assembled in the city, contributed to the police riots on the streets of Gothenburg (Peterson 2006).

Political alignments and cleavages
MARIE-LOUISE DAMEN

In social sciences, cleavages are a way to describe the political landscape along the fault lines of society. Cleavages structure the organizational field and its constituency, creating a supply and demand for politics (Lipset & Rokkan 1967). Cleavage theory occupies a central place in literature on conventional political participation, but is remarkably absent in literature on unconventional political participation (but see Kriesi et al. 1995). In explanations of conventional political behavior, cleavages supposedly affect party politics and citizens’ political beliefs and attitudes (Bartolini & Mair 1990; Deegan-Krause 2006; Lipset & Rokkan 1967). Transposed to unconventional political behavior, cleavages shape mobilization potential, or the “demand-side” of protest, and mobilizing structures, or the “supply-side” of protest (Klandermans 2004; Klandermans & Van Stekelenburg 2010). Thus, cleavages can be found in both conventional and unconventional politics. In order to understand political conflicts, we have to study cleavages in both conventional and unconventional politics.

Lipset and Rokkan (1967) were the first to claim that political conflicts are related to a limited number of cleavages. They assumed that political alignments can be applied to a historical sequence of four cleavages: those between center and periphery, state and church, urban and rural, and finally between owners and workers. In the seminal introductory chapter of Party Systems and Voter Alignments, Lipset and Rokkan (1967) explained that national and industrial revolutions across Europe have led to long-term alignments between social groups and political parties. In the processes of nation-state building, alongside the Protestant Reformation and Catholic Counter-Reformation, the cleavages between center and periphery and between state and church were formed. The two other cleavages are products of the industrial revolution: the urban–rural cleavage of opposing agricultural and industrial interests, and finally the class-cleavage between workers and employers.

Based upon the legacy of Lipset and Rokkan, Bartolini and Mair proposed a definition of cleavage that stressed three crucial elements for a political division to be called a cleavage:

- an empirical element which identifies the empirical referent of the concept, and which we can define in social-structural terms; a normative element, that is the set of values and beliefs which provides a sense of identity and role to the empirical element, and which reflect the self-consciousness of the social group(s) involved; and an organizational/behavioral element, that is the set of individual interactions, institutions, and organizations, such as political parties, which develop as part of the cleavage. (Bartolini & Mair 1990: 215)

The empirical, normative, and organizational elements are central in the literature on stability of party systems and electoral volatility. Lipset and Rokkan (1967) argued that the existing conflicts “froze” into party systems when universal suffrage was introduced in Western Europe in the 1920s. Conflicts which developed on the basis of social stratification created the basis for collective group identities. These group identities reinforced political consciousness of the group members and enabled the construction of an organizational infrastructure. When groups are socially and culturally clearly segmented from each other and internally highly integrated, the degree of closure is considered to be high. The higher the degree of closure of social groups, the more likely people are to be politically aligned along these cleavages (Kriesi et al. 1995). The freezing hypothesis came under pressure from a changing...
political and social reality since the mid-1970s. Social mobility diminished the degree of closure of social groups. The individual link to the social group weakened and people became less inclined to participate on behalf of common group interests. A growing electoral volatility and more party competition pointed to a decline of traditional cleavages. In the tradition of Lipset and Rokkan, such large-scale historical societal transformations can be held responsible for the emergence of a new cleavage. Several authors pointed to a change of values in Western societies, due to processes of modernization (Inglehart & Wenzel 2005) and educational expansion (Kriesi et al. 2008). The process started with a left-libertarian turn in the 1970s and 1980s, followed by a right-populist turn since the 1990s. Interestingly, the left-libertarian turn was driven by the emergence of the so-called “new social movements” (Kriesi et al. 1995), whereas the right-populist turn developed in the electoral arena (Hutter 2011; Hutter & Kriesi 2012). The last turn is thought to form a new integration–demarcation cleavage in Europe, demarcating the “winners and losers” of globalization (Kriesi 2010). Along this new cleavage new identities and grievances developed and crystallized into organizational fields. The emergence of new social movements can point to changing cleavage structures. At the same time, changing cleavage structures can facilitate the emergence of new social movements (Kriesi et al. 1995). Protest can thus be seen as the precursor or the tip of larger underlying or emerging conflicts.

To fully understand how cleavages affect protest, conflicts must be analyzed at various levels. At the macro level, cleavages are represented in the national sociopolitical context. Cleavages are “frozen” into stable party systems and civil societies, which are found both at the supply side (party and movement politics) and the demand side (public opinion or electoral and protest behavior) of politics (Klandermans & Van Stekelenburg 2010). The more salient a cleavage is, the more strongly it applies on the supply and demand side of conventional and unconventional politics and the higher its issues figure on the political agenda. At the meso level, the salience of a cleavage is also reflected in the density of the multiorganizational field (i.e., social movement organizations) linked to that cleavage and the embeddedness of the citizens in the organizational field. At the micro level we find citizens and their “readiness” to act in response to that cleavage. Who they are, why they protest (or not), and by which organizations they are mobilized (or not), is related to the cleavage the conflict reflects.

At times when conventional political behavior is on the decline and unconventional political behavior is on the rise, insight into the various levels of sociopolitical conflict is increasingly important. Cleavage theory seems promising in order to improve our understanding of the dynamics of both electoral and protest politics, especially when analyzing the relationship between the two arenas (see Hutter 2011; Hutter & Kriesi 2012). In social movement research, its application is rather new and limited, with many important questions waiting to be answered.

Political economy and social movements

JASON STANLEY and JEFF GOODWIN

The analysis of the interplay of capitalism and politics – in other words, political economy – played an extremely important role in many of the seminal, English-language studies of social movements and revolutions written by social scientists during the 1970s and 1980s (e.g., Paige 1975; Schwartz 1976; Piven & Cloward 1977; McAdam 1999). These studies had the effect of radically reorienting the academic study of movements, revolutions, and political conflict generally. The field moved away from primarily psychological and social-psychological treatments of political protest – studies that often cast a very negative light on protest – to more sympathetic analyses that emphasized the importance of resources, power, solidarities, and opportunities for movements. But all this is now common wisdom among students of movements. What has been largely forgotten is that these same studies tended to emphasize the effects of capitalism on movements. The dynamics of capitalism figure prominently in these studies, sometimes constraining and sometimes inciting or enabling disruptive collective action. By capitalism, these authors generally mean a mode of production in which a class that owns the means of production (capitalists) employs a class that must sell its labor power in exchange for a wage or salary (workers), and in which market competition among capitalists leads them to reinvest part of the surplus (or profits) in the production process (i.e., capital accumulation). The dynamics of capitalism that these authors emphasize include processes directly linked to market competition and capital accumulation, especially the proletarianization (or commodification) of labor, the commodification of productive forces generally, the concentration and centralization of capital, and periodic crises.

In McAdam’s (1999) influential study of the US civil rights movement, for example, the disintegration of the Southern cotton sharecropping economy and the concomitant movement of African Americans into urban waged jobs are portrayed as necessary preconditions for the emergence of that movement. McAdam writes, “If one had to identify the factor most responsible for undermining the political conditions that, at the turn of the [twentieth] century, had relegated blacks to a position of political impotence, it would have to be the gradual collapse of cotton as the backbone of the southern economy” (1999: 73). The collapse of the South’s cotton economy, in McAdam’s account, facilitated the emergence of the civil rights movement indirectly, through its effects on elite political alignments and on the “indigenous organization” and beliefs of African Americans. Note that this economic process was crucially important for the very possibility of the civil rights movement even though this movement was not itself a class-based insurgency making primarily economic demands, but rather a cross-class coalition – linking working- and middle-class African Americans as well as sympathetic whites – whose primary demands (at least until the movement fractured in the late 1960s) were desegregation and voting rights.

Political economy offers a range of ideas that are helpful for understanding social movements. Here we point to seven such ideas. First, political economy asks that we pay attention to actors’ material interests, which derive from their structural location in economic and political institutions. For example, employers have an interest in reducing labor costs because higher costs impinge upon the profitability of their firms. By contrast, workers have an interest in increasing their wages and improving their working conditions (e.g., working fewer hours) because their health and well-being...
depend on these. As this example makes clear, interests can differ substantially depending on one’s structural position and antagonisms can exist between the interests of different groups. Interests are not the same thing as perceptions or actions, but they will likely play some role in how people think about and act in the world around them. For example, the range of ideas or ideologies that appeal to particular classes of people are likely to be limited by their material interests. At times, individuals with common interests may act collectively against those with other interests, as is the case when organized workers struggle against employers. At other times, movements are comprised of groups with conflicting interests, as was the case in the US women’s movement, where conflicts erupted between elite and working-class women over the goals of the movement.

Second, while many analysts agree on the centrality of material resources in shaping movement persistence and success, political economy is unique in its focus on the key mechanism of resource distribution in capitalist societies, namely, the market. Capitalist property relations guarantee that the owners of productive assets acquire on average much greater wealth and control greater resources than do their workers. The market mechanism also makes likely a stratified working class, where some earn much greater incomes than others – a doctor who is employed by a hospital will have a much larger salary than that of a janitor who works at the same hospital. Understanding how markets distribute resources among different classes and class segments can help us make sense of variations in the emergence, trajectories, and success or failure of different movements.

Third, in assessing the relative strength of a movement (and its opposition), political economists distinguish between power that derives from a movement’s size, on the one hand, and power that derives from the structural position of movement participants in economic and political processes, on the other. Organized truckers have significant “structural power” because they have the capacity to tie up traffic and commerce and thereby seriously disrupt social and economic life. So too do soldiers, whose widespread disobedience would make impossible any war effort. Unemployed workers, on the other hand, have great needs and are sometimes well organized, yet they have little structural power to force elites to bend to their demands because they play no role in the production process. Paying attention to this distinction will help us understand why movements of equivalent size may be more or less effective at achieving their goals.

Fourth, political economy pays close attention to the ways in which competition between firms influences social movements. Competition drives individual firms to adopt strategies aimed at outcompeting rivals. One such strategy is the introduction of new technology, which can displace or de-skill workers or change patterns of social life among workers. Firms also sometimes relocate production away from expensive or militant workers. In both cases, these strategies seriously impinge upon the strength and organization of workers’ struggles. Competition also generates antagonisms between groups of economic elites based upon their ownership of different kinds of firms. For example, export-oriented firms have an interest in a weaker domestic currency (because this makes exports cheaper abroad), while import-dependent firms have an interest in the opposite. These divergent interests can generate open conflict among factions of economic elites. We see this arise where different business associations ally with and contribute financially to different political parties, with each economic faction hoping their investment will pay off with increased access and preferential treatment in the future. This intra-elite conflict can also generate openings for political mobilization from below, as movements find ways to ally with one elite grouping to make inroads against another.

Fifth, political economists also examine the implications for movements of the aggregate dynamics that arise from competition as firms throughout the economy pursue the strategies mentioned above. One area where this is clear
is in the recurrence of recessions and economic crises. While the trend in recent decades in most industrialized economies has been slow growth, this process is filled with ebbs and flows deriving from the uncoordinated nature of capitalist competition among firms. Booms can stimulate political mobilization as expectations grow, optimism increases, and anxiety over risk-taking subsides. Busts too can stimulate action, as when crises eject millions of workers from their jobs, convulse communities, and generate serious fiscal challenges for governments. Those affected by crises sometimes mobilize along lines of shared interests, as when the unemployed organize to push for job creation programs. Crises can also spark antagonism between vulnerable groups struggling over scarce resources, as they do when working-class movements against immigration rise up in the face of disappearing jobs, declining living standards, and evaporating welfare state provisions. States sometimes turn to military spending and even war as a “solution” to economic crisis – massive public expenditures help pump the domestic economy, while intervention abroad can open markets for domestic firms. Of course, wars often incite antivar movements, both at home and abroad.

Sixth, political economy stresses the ways in which the states confronted by reform movements remain biased in favor of the shared interests of the capitalist class. This bias arises from two features of capitalist democracies. The state is dependent on tax revenue derived from private economic activity, so it will be extremely reluctant to implement reforms that bring about a slowdown in overall private investment, even when strong movements demand such policies – and even when the government in question appears to be allied with such movements. In cases in which a government actually implements such reforms, moreover, any slowdown in investment will likely result in rising unemployment, declining tax revenue, and hence greater difficulties in financing social programs, all of which are likely to increase the unpopularity of the government. This does not preclude reforms, but it does lead governments of all political stripes to pay close attention to the demands of employers and to shy away from reforms that would jeopardize economic growth.

Seventh, political economy can be helpful in understanding the rise of new collective identities, some of which instigate and shape collective action. With the rise of large-scale factories, many industrial workers came face to face for the first time with others who shared similar exploitative experiences, creating the conditions for the rise of working-class identities. The dynamics of capitalist development also influence collective identities that appear to have little connection to the economy. For example, today’s lesbian, gay, bisexual, and transgender movement has roots in the industrial revolution, the urbanization that accompanied it, and the wars that followed it, as men and women left farm and rural life in droves to take advantage of jobs in big cities or to fight overseas (D’Emilio 1983). These changes carried with them new forms of independence, as well as the possibility for men and women to socialize more regularly with others of a similar sexual orientation, all of which contributed to the rise of self-conscious gay and lesbian identities beginning in the early twentieth century and (especially) after World War II. Movements for and against gay marriage today have their roots in these developments decades ago.

Political economy helps us understand some of the key factors behind movements that many scholars treat as “given” or as independent variables. It helps to explain elite divisions, state fiscal crises, and other “political opportunities” for movements; it helps to explain how people are connected to one another (or not) at work and in “civil society” (i.e., the “indigenous organization” or “mobilizing structures” of movements); and it helps to explain why some ideas, frames, collective identities, narratives, tactics, and emotions are especially resonant for certain classes of movement participants (or potential participants) at certain times. The dynamics of capitalism often directly shape movements, but they also strongly influence the political, institutional,
and cultural processes that recent scholarship on movements has emphasized.

Political generation
RICHARD G. BRAUNGART

Conflict between the generations is as old as history, as young people periodically challenge and confront those in authority. For centuries, generational conflict was expressed by youthful outbursts of collective behavior (e.g., medieval town-and-gown riots, raucous youth festivals, destructive student protests against university officials). In the early nineteenth century, generational conflict took a new form when young people organized full-fledged political movements that surged throughout European states. The political generation was launched as a dramatic and significant force for societal innovation and disruption.

Simply defined, a political generation is an age-conscious group that mobilizes for social and political change. The concept may be used to designate a decisive age group that attempts to reform or revolutionize society (e.g., Young Russia, Nazi generation, Chinese Cultural Revolution), or refer to age groups or segments of age groups that experience extraordinary events that have lasting effects on their members’ lives (e.g., lost generation of 1914, World War II generation, Vietnam generation). While “political generation” has been applied loosely and sometimes haphazardly in the media and popular culture, the term has a rich tradition in sociology and political science.

Political generations are a product of modern history. Spurred by the Enlightenment, the Age of Nationalism, and the American and French Revolutions, a highly diverse political culture emerged in the West. The modern democratic state was forged, ushering in competing ideologies (from political left-to-right and moderate-to-extreme) and unleashing various segments of society struggling to direct or redirect the course of human history. In 1815, the first political generation burst forth, when German university students (Burschenschaften) protested the failures of their elders and the Congress of Vienna and demanded liberty and national unification. Youthful political generations then spread quickly to Italy, France, Ireland, Russia, and elsewhere in nineteenth-century Europe. Eruptive and episodic, political generations reject the status quo in favor of a new order and are especially threatening to authorities, often creating a spiral of confrontation and conflict that may last more than a decade. Increasing in number and intensity throughout the twentieth century, political generations became global in scope by the 1960s, bringing with them opportunities for greater democracy and social reform as well as repression, violence, and destruction. Although most political generations have been mobilized by young people, a political generation can coalesce around any age group. Not all youth movements qualify as political generations.

Generational theory provides a useful framework for understanding political generations (Heberle 1951; Mannheim 1952; Ortega y Gasset 1962; Rintala 1968; Braungart & Braungart 1989). According to the theory, age-group membership gains potency in the formation of a political generation largely through the dynamics of inter- and intragenerational conflict. Intergenerational conflict is rooted in the incompatible life-cycle differences between youth and adults (life-cycle effects) as well as the disparate growing-up experiences of each age cohort in rapidly changing societies (cohort effects). During routine eras, age-based differences in politics play themselves out through the uneventful evolutionary process of cohort replacement. However, during extraordinary eras of cultural and historical change (period effects), an age cohort may be transformed into a political generation. A cohort becomes a political generation when a generational consciousness develops among age-group members at odds with other age groups because of a particular constellation of
events and expectations. Most important, there is a shared consensus (collective mentality and morality) of the need to mobilize for political change. Political generations also involve intra-generational conflict. Representing a range and intensity of political views, separate generation units form within a political generation, with some units organized by youth themselves while others are adult-sponsored. Though oriented against the dominant generation in power, the various generation units compete and struggle over the direction and control of the larger political generational movement. Thus, political generations involve a dynamic convergence of life-cycle, cohort, and period effects during heightened eras of change, and they have significant political consequences (Braungart & Braungart 1987; Scappini 2006).

In assessing youthful political generations over the past 200 years, several patterns emerge. Political generations are likely to occur in clusters and waves, called historical generations. Five historical generations have been identified: the Young Europe generation (1815–1848, 1860–1890), post-Victorian generation (1890–1918), Great Depression generation (1930–1940), 1960s generation (1960–1970), and 1980s generation (1980–1990). Each eruptive era involved intergenerational conflict as youthful generations deauthorized the adult generations and authorized themselves to bring about or resist political change.

Intragenerational conflict among competing generation units arose as well. Political generations are essentially forged by the events that differentiate the age groups during unsettling times. Period effects – cultural innovations, institutional discontinuities, societal and economic breakdowns, demographic bulges, and mobilization opportunities – were critical to the formation of political generations. The issues over which political generations clashed most often concerned Enlightenment values of citizenship (freedom, equality, democracy, self-determination, human rights). The effects of political generations are lasting on societies and their participants (Esler 1971; Braungart & Braungart 1993). Aided in part by rapid communications and electronic technology, both the issues and recruitment of political and historical generations are becoming transnational and global (Edmunds & Turner 2005).

Research at both macro and micro levels demonstrates the wide applicability and utility of the political generation concept. First, at the societal level, political generations have been identified as significant forces for institutional change, reform, and revolution. Researchers note that while the US has experienced two eras of political generational activity (1930s and 1960s), countries such as Germany, Russia, and China have long histories of generation-based conflict. Political generations have been responsible for toppling governments, gaining national independence, and reorganizing societies (i.e., Turkey, India, Indonesia, Argentina, Cuba, Czechoslovakia, South Africa, among other countries). Second, a number of studies provide support for Mannheim’s contribution to understanding political generations. For example, late adolescence has been identified as a critical stage for crystallizing political values and orientations, which, as Mannheim argued, do not change substantially with age (Alwin & McCammon 2007). Research has confirmed that eras of political generational activity are characterized by competition and conflict among a range of left–right and moderate–extreme generation units (Braungart 1993; Klatch 1999). Third, longitudinal studies document intergenerational shifts in values and political orientations over time (Inglehart 2008) and the lasting effects of the intergenerational transmission of political attitudes in the family, especially if parents are caring and politically engaged (Jennings, Stoker, & Bowers 2009). Fourth, when applied to social movements, generational theory has proven useful, such as identifying changes in the feminist movement due to cohort replacement (Whittier 1997), assessing political generations in developing countries (Tessler, Konold, & Reif 2004), and tracking the lasting effects of generational activity on leaders as they
The concept of political generation provides a rich framework to explore age-based movements and political change. If treated broadly, the theory can incorporate sociological perspectives advocated in social movement theory (i.e., social movement organization, processes, and resource mobilization). However, there are several caveats to consider. To employ the concept political generation accurately, it is essential to document the existence of a shared generational consciousness and demand for change that distinguishes a generation from an age cohort and one generation from the next. Political generational analysis also requires researchers to be thoroughly familiar with a society’s history, culture, and trends in order to identify the cohort effects that forge generational attitudes and behavior and the period effects associated with the rise and fall of political generations and generation units. A host of topics and dimensions related to political generations remains to be explored more thoroughly. Particularly important is the formation of political consciousness and collective identity (mentalité collective) as a principal dynamic of social movement mobilization, and it is not yet well understood how the interplay between inter- and intragenerational conflict sustains political generational activity. Detailing the political ramifications of demographic and historical trends on individuals, cohorts, and society over time is at the heart of studying political generations. Thus far, most of the research has focused on youthful political generations; in the future, older, elite, and global political generations need to be identified and studied as well.

Political mediation model

EDWIN AMENATA

The political mediation model is a theory explaining the influence of movements in politics. This theory builds on a series of ideas scattered throughout sociology and political science about the forms of mobilization, strategies, and political conditions that might account for the various political impacts of movements. It goes beyond them in indicating that specific movement strategies, activities, and forms in combination with specific political contexts will lead to influence for social movements – that social movement collective action is politically mediated (Amenta, Caren, & Olasky 2005; Amenta 2006).

Theories about the political impact of social movements were slow to develop because most scholars focused on why movements appeared or declined and developed theories of that, but had not thought specifically about what caused them to be politically influential (cf. Gamson 1990). Scholars tended to apply the main determinants of mobilization, resource mobilization, framing, and political opportunities to explain the political consequences of movements – generally arguing that one factor was a kind of magic bullet that would make movements influential (Amenta et al. 2010). But various scholars made arguments about movement influence combining aspects of movements or their strategies and their political environment, notably Piven and Cloward (1977), Kitschelt (1986), and Skocpol (1992, 2003). Each of these scholars discussed the mobilization of challengers and their strategic actions in relation to political contexts. Amenta and colleagues (Amenta et al. 1992, Amenta, Caren, & Olasky 2005; Amenta 2006) extended and went beyond these ideas in arguing that some forms of mobilization and strategies would likely be productive in some contexts rather than others.
in public opinion, acting on stated beliefs and claims, or increasing the support for the missions of governmental bureaus.

Political mediation arguments can rely on “action/reaction” models of influence (Andrews 2004; e.g., Piven & Cloward 1977), but most political mediation arguments work through slower-moving processes. More generally, the political mediation argument holds that some strategies and forms work best in specific contexts. To be influential, challengers need to alter their strategies and forms to address specific political contexts, notably the level of democratization in the polity, the partisan regime in power, and the development of bureaucratic authority surrounding the issue at hand. However, the mediation model drops the standard distinction in the movement literature between “disruptive”/“non-institutional” and “assimilative”/“institutional” strategies in favor of addressing “assertiveness,” meaning the use of increasingly strong sanctions beyond protest. Indeed, most assertive strategies involve institutional collective action. If the political regime is supportive and the domestic bureaucrats are professionalized and supportive, limited or symbolic protest or other relatively unassertive action is likely to be sufficient to provide influence. By contrast, achieving collective benefits through public policy is likely to be more difficult without a supportive regime or an administrative authority, and more assertive collective action is required. The sanctions in assertive institutional collective action threaten to increase or decrease the likelihood of gaining or keeping something valuable to political actors – their political support or their reputations. The institutional collective action of challengers works largely by mobilizing high numbers of people behind a course of activity demonstrating that a large segment of the electorate cares strongly about an issue. These theoretical claims have the advantage of specifying political conditions and making links between systemic political contexts and more short-term ones.

The policy situation facing the challenger is also an important part of the political context. Mobilized challengers will have to do far less work to be influential if their issue is already on the political agenda. A challenger may need to do little more than mobilizing to keep the issue from leaving the agenda and can act to bid up the benefits in legislation at issue, as well as induce legislators to back the legislation. A social issue’s appearance on the political agenda is usually connected to political alignments. An antisocial policy political alignment will generally prevent augmentations in social policy from getting onto the political agenda. However, a pro-social spending alignment will not insure that the issue will come up. Similarly, a mobilized challenger has an easier time influencing the implementation of legislation that has been recently enacted, but may have a more difficult time influencing it once the program becomes institutionalized. Once an issue comes on the agenda, it is incumbent on a challenger to attempt to influence its content and support. Once a program has been passed, issues of implementation take precedence (see Amenta 2006).

It is easiest for challengers to influence policy in its earliest phases, before a program or policy becomes highly institutionalized. The best case is for movement actors to be installed in a bureaucracy implementing policy chosen by the challenger, affording it great leverage over current and future policy. Somewhat less advantageous, but more likely, are well-run domestic bureaucracies with firm missions, committed experts, and a strong esprit de corps. In such instances, the bureau will press for the mission, which will often run in the same direction as the interests of a constituency of a challenger, but not always. Worse for movements pushing change are when domestic bureaus’ missions are subverted by being captured by nonexpert political operatives, such as by opposing groups, or when patronage political parties fill bureaucratic positions with nonexpert appointees. Challengers hoping to influence policy often face a target that is both
moving and becoming better fortified against it (see Amenta 2006).

Political mediation arguments also hold that it requires many simultaneous circumstances, some movement related and some not, to effect extensive change (see also McAdam & Su 2002; Giugni 2007). In the US setting, where controlling the government through a party is rarely an option, a national challenger with far-reaching goals is likely to need to have a favorable partisan context, its issue already on the agenda, high challenger organization and mobilization, credible claims-making directed at elites and the general public, and plausible assertive action, such as electoral strategies that seek to punish policy opponents and aid friends (Amenta, Caren, & Olasky 2005; Amenta 2006). The same is likely to be true for bids to transform the structural position of groups, such as through voting or civil rights.

RESEARCH RESULTS AND FUTURE RESEARCH

The explanatory value of political mediation arguments is underlined by recent literature on social movements. Research findings that a diversity of tactics or organizational types at the movement level produce political gains are consistent with these claims; more generally, a study of articles published regarding the political consequences of social movements in 2001 through the first half of 2009, in four major general sociology journals and specialty journal Mobilization (see Amenta et al. 2010 for details) found the following. Of the 50 positive relationships found, 47, or 94 percent, found that the size of the effect of the movement activity or size indicator varied by other factors interacting with it. Of these other factors, the most frequently noted were the partisan political context, involving 18 movements; another 6 addressed the stage in the legislative process. Another set of interactions of note included 11 involving different sorts of tactics. These studies, however, tended to focus on the larger and more publicized movements and organizations.

There is also some evidence in favor of the arguments that a combination of very favorable political circumstances, high organization and mobilization, and a policy of assertive, focused action can bring major changes. Amenta, Caren, and Olasky (2005) found that the most likely route to get US senators to vote in favor of a transformation of old-age policy included their being from a democratic and open polity, having Democratic or radical third party affiliation, being in a state with a strongly mobilized pension movement, and one that had engaged in assertive, institutional electoral action. Similarly, Amenta (2006) found that the best circumstances at the national level for the old-age pension movement took place in 1941, during a moderately favorable regime with old-age policy on the political agenda, with a new old-age insurance policy only starting to come into effect, and after the Townsend Plan had engaged in a productive new recruitment drive and the old-age pension movement having engaged in assertive electoral action that resulted in new endorsed proponents in Congress.

To address the degree to which movements have mattered and to test complex arguments about the mediation of influence, however, will require research designs that compare across several movements and over long stretches of time. One way to do so is to compare a small number of historically similar movements with greatly different results in political influence. Recent work (Amenta et al. 2009) suggests that there have been about 34 major movements over the last century in the US, and these might be compared comprehensively for their influence in the manner of Gamson’s (1990) study of movement organizations. Comparative and historical studies that examine the population of movements over time in one country, or an entire movement across many countries, taking into account other potential influences on outcomes, would go far in answering the big questions about overall movement influence and in testing hypothesized interactions among movement form, strategies, and political contexts.

Political opportunity/political opportunity structure
DONATELLA DELLA PORTA

Social movements not only challenge political institutions, but also interact with them in diverse arenas. The characteristics of these interactions affect the form and intensity of the challenge as well as its probabilities of success. These are the main tenets of the so-called political process approach that pointed at the links between social movements and politics. Developed especially by political scientists, this approach allowed a correction of a vision of social movements as belonging to a civil society, separated from the political system.

Within the political process approach, the most widely used and discussed concept for defining the characteristics of the external environment relevant to social movements is the political opportunity structure. A significant idea, developed by Tilly (1978), is that the forms of protest are influenced by broad contextual changes, such as the formation of the nation-state. Later, cross-national analyses linked some specific features of political institutions to the strength and strategies of opponents (Kriesi et al. 1995). Also, contingent conditions – such as the availability of potential allies and the instability of opponents in power – have been considered as windows of opportunity for social movements to emerge (Tarrow 1989).

THE (MORE) STABLE INSTITUTIONAL STRUCTURES

Alexis de Tocqueville’s famous contrast between a “weak” American government and a “strong” French one is usually an implicit or explicit starting point for analyses linking institutional structures – or “regimes” in Tilly’s definition (1978) – with social movement development (Kries 2004: 71). De Tocqueville considered that a system in which the state was weak and civil society strong (the US) would face a constant but peaceful flux of protest from below. Where the state was strong and civil society weak (France), on the other hand, episodic and violent protests would result. The idea that states’ strength or weakness influences social movement strategies remains central to the literature on collective action in general, and on revolutions in particular. Operationalizing the dimension of the strength or weakness of the state, research has looked at several dimensions.

Mirroring the traditional comparison between consensual and majoritarian democracies, the territorial and functional distribution of institutional power has been considered as relevant for social movements’ developments (Kitschelt 1986; Rucht 1994; della Porta 1995; Kriesi et al. 1995). Referring especially to the power of the central executive, these studies conceptualize the openness of opportunities for challengers as linked to the dispersion of political decisions. The assumption is that the larger the number of actors who share in political power, the greater the chance for social movements to influence institutions. So, territorial decentralization, as well as functional distribution of power has been seen as facilitating movement access to decision making, and therefore increasing protest, but also moderating its forms.

In the same vein, the characteristics of the public bureaucracy as well as the autonomy and powers of the judiciary have been considered to influence social movements. An efficient bureaucracy is better capable of implementing decisions, and the greater the independence of the judiciary the greater the possibility of access for social movements.

Relevant also is the overall amount of power in the hands of the state as compared with other
actors such as pressure groups, political parties, the media, and ordinary citizens. Opportunities increase with the degree of participation by citizens, through for instance, referendums for the proposition or abrogation of particular measures or procedures for appealing against the decisions of the public administration.

Institutions are embedded in political culture, and contribute to reproduce it. Social movements have been compared cross-nationally with reference to the characteristics of national political cultures (Kitschelt 1985) – another dimension that resonates with attention to consociationalism, quite familiar to European political science. A main hypothesis here is that countries with a strategy of exclusion (that is, repression of conflict) will tend to experience polarization of conflict with opponents, whereas a strategy of inclusion (co-optation of emergent demands) would produce a moderation of conflict (Kriesi et al. 1995).

Again resonating with an interest in cross-national comparison in the development of democratic regimes in European political science, comparative research on social movements also addresses the influence of a country’s democratic history, remarking that past authoritarianism often reemerges in times of turmoil. Young democracies tend to fear political protest and to have police forces that remain steeped in the authoritarian values of the preceding regime (della Porta & Reiter 1998). National democratic history has also been seen to influence protest through its impact on protest policing (della Porta & Reiter 1998).

THE CHANGING CONFIGURATION OF POWER

Not only structural, but also more dynamic political dimensions – susceptible to change in the short term and the object of pressure from social movements – influence social movement evolution. Some of the first scholars in the political process approach looked especially at changes which could cause sudden openings in the system. Attention went to aspects such as electoral instability, elite divisions, or availability of allies (see, for example, Tarrow 1989), with particular attention to sudden changes in these conditions (see also Tilly & Tarrow 2006).

The main assumption is that social movements interact with allies and opponents within the public administration, the party system, interest groups’ structure, and the civil society. Institutional structures are mediated by an alliance structure, formed by the political actors who provide resources and opportunities for challengers, and an opposition structure that aims at reducing them (della Porta & Rucht 1995). This configuration of power – defined as the distribution of power among the various actors operating within the party or interest groups’ system – affects the forms and results of the conflict (Kriesi 1989).

When looking at left-wing social movements, which have constituted the main object of empirical investigation in social movement research, the trade unions have been noted as an important ally for emerging actors, particularly in Europe. Here, cross-national research has helped, developing hypotheses on the conditions under which trade unions and the labor movement are more likely to ally with other movements, such as the student movement or the women’s movement. A main hypothesis is that the more recognized the trade unions (within the neocorporatist system of industrial relations), the more limited their tendency to ally with other (“new”) social movements. Vice versa, the weaker the institutional recognition of workers’ representatives in the workplace and the decision-making process, the greater will be their propensity to assume a political role, allying themselves with social movements and taking part in public protest. However, well-structured, neocorporatist systems of industrial relations could also create a tendency to incorporate emerging groups within the structure of concerted policymaking.

Movements have also often developed special links with a political party or party family: labor movements rise from, or give birth
to, socialist parties, regionalist movements to regionalist parties, environmental organizations to Green parties. In fact, the configuration of power on the Left has been considered as a most important component of political opportunities (Kriesi 1989). The strategy adopted by the Left towards social movements has been changing over time and space: competition has sometimes prevailed, sometimes negotiation, and sometimes co-option. Dimensions that influence the choices made by the parties on the Left refer to the characteristics of the political cleavages as well as the existence of party divisions within the traditional Left. Some research has indicated that the lack of pacification of the Left–Right cleavage has delayed (in countries such as France or Italy) the development of new social movements; however, where the party Left has been divided, communist parties have often sided with social movements, even if with much internal tension. Electoral competition is also an important variable in explaining the reaction of potential allies towards social movements. The propensity to support protest has been connected with electoral instability, which renders the winning of new votes particularly important. The position of the Left towards social movements can also be influenced by whether or not they are in government, alliances being easier when the Left is in opposition. It should be added that the actions of left-wing parties in government often depend on their weight within the governing coalition. They are obviously freer to take decisions when governing alone. Beyond being in government or not, the attitudes of the parties of the left towards social movements are related to their openness to reform politics (della Porta & Diani 2006: ch. 8).

CRITICISMS AND ADAPTATION

The political process approach to social movement studies has the merit of firmly linking social movements to the normal political process. The studies cited above demonstrated the explanatory power of the concept of political opportunity, but also raised some problems. First, there is a lack of consensus on the political opportunities which are relevant (McAdam 1996), resulting in an exponential growth in the concept’s dimensions, up to the point of making it a sort of trash can for any contextual dimensions which could have an effect on social movements (della Porta & Diani 2006: ch. 8). While the first studies focused on a small number of variables, since the 1980s growing research has added new variables to the original set. This accumulation of heterogeneous variables reflecting different authors’ concerns and ideas has stretched its conceptualization, reducing its heuristic value. This is why recent studies have aimed at singling out specific contextual conditions for specific movements: such as the citizenship regime for movements on migrant rights or the welfare state for those on unemployment.

An additional problem is a lack of clarity concerning the explanandum. The political opportunity structure has been investigated in order to explain a large number of dependent variables, among them social movement mobilization, the emergence of the protest cycle, the relationship between allies’ attitudes and movement behavior, and the predominance of either confrontational or assimilative protest strategies. To address this problem, attempts have been made to discern which variables in the complex set of political opportunities explain which social movement characteristic. So, territorial decentralization have been said to influence the geographical level at which social movements decide to act, and the presence of allies in government to affect their chances of success (della Porta & Diani 2006).

The concept of political opportunities has been particularly criticized as bearing too structuralist and deterministic a vision of reality, without taking into account the importance of the social construction of opportunities. More specifically, changes in the political opportunity structure do not have any effect on a social movement unless they are perceived as being important by the movement itself; alternatively, closed opportunities might be perceived as open by the activists. Research has
been therefore driven to address the cognitive processes which intervene between structure and action (Gamson & Meyer 1996), analyzing the lenses through which activists view potential opportunities for their movements (McAdam, McCarthy, & Zald 1996).

With its focus on structures, the political process approach has been accused of the same kind of weakness of previous breakdown theories: not being able to single out the intervening mechanisms between broad (and distant) structures and action. Even former proponents of the concept of political opportunity structures have recently written, “Opportunities and threats are not objective categories, but depend on the kind of collective attribution that the classical agenda limited to framing of movement goals” (McAdam, Tarrow, & Tilly 2001: 45). Their program is in fact oriented to single out the relational mechanisms that explain how contextual dimensions matter for social movements.

The criticism, however, has gone beyond the role of perceptions, addressing instead the restrictive effect that focus on political opportunities has had on social movement studies (Goodwin & Jasper 2004). The political opportunity approach is in fact accused of not recognizing that “cultural and strategic processes define and create the factors usually presented as ‘structural’” (Goodwin & Jasper 2004: 27). The emphasis on the political has in particular been said to have largely obscured the role of the cultural dimension, such as the capacity of movement’s themes to resonate with cultural values. Also structural (in the sense that they are beyond the movement’s sphere of immediate influence), cultural opportunities are, however, distinct from political institutions (Polletta 2004).

Still another criticism is aimed at the contextual limitation of the conceptualization of political opportunities. Given the (geographical, historical, and disciplinary) context in which this approach developed, it embedded social movements into an historically and geographically specific political process that was conceptualized as rooted within the nation-state, “party democracies,” and mature welfare states. These three dimensions of Western democracies have been challenged, however, in the evolution of the political and societal fabric at the turn of the millennium. In particular, neoliberal globalization as well as other general evolutions in contemporary democracies have produced a shift of power from the nation-state to international governmental organizations; from parties (and representative institutions) to the executives; and from the state to the market. Additionally, some recent major changes in political parties have been mentioned as affecting their interactions with social movements. In the past, participation developed especially within political parties, where the reference to common values permitted the formation of collective identities. Recent developments reduced the identity-building functions of political parties – which not only lost members, but have substituted activists with media experts, contributing to growing electoral volatility and declining identification with parties. Finally, neoliberalism produced a retrenchment of the welfare state. Recent research has therefore addressed social movements’ adaptation to these changes, as well as the need to revisit the conceptualization of political opportunities towards a more dynamic, processual understanding of contentious politics (e.g., della Porta 2009).

Additionally, the research on transnational activism and the Global Justice Movement stimulates reflections on the range of opportunities and constraints that various international institutions, located within the multilevel political system, offer to social movements. Such elements as a consensual culture and a reciprocal search for recognition are available, for example, for the United Nations, but not for the (much more closed and hostile) international finance and trade institutions such as the World Trade Organization (WTO), International Monetary Fund, and World Bank. Social movements that target international institutions look for the specific leverage offered, for example, by the unanimity rules of the WTO,
which make alliances with some states particularly relevant, and by access to the international experts and formal channels of consultation with regard to the International Labour Organization. In recent research, intergovernmental organizations emerged as complex and fragmented institutions, composed of different bodies that provide external actors with differentiated opportunities.

Finally, the conceptualization of political opportunities has been said to reflect a mainstream conception of politics and democracy that social movements themselves have constantly contested (Cefai 2007; della Porta 2009). The theorization of the political process approach – even though enlarging the domain of politics to social movements – seemed to have inherited some of the (mainstream political science) minimalistic and procedural conceptions of democracy, limiting the role of social movements at the “input” of the political process. Through the seminal work by Charles Tilly (1978), as well as Michael Lipsky (1965), a modified version of Easton’s political system model seem to have penetrated social movement studies. Even though stressing the presence of conflictual interests and identities, research in social movements has located them at the border of the “black box” where decisions are taken, and stressed their need for alliances with powerful gatekeepers (as political parties or elites) to make their voice audible.

Recent research has in fact focused the attention on the transformation in the conceptions of politics and democracy that social movements not only prefigure in their internal structures, but also are often able to introduce in public institutions (della Porta 2009). The representative conception of democracy, with its emphasis on representative power and majority voting, is only one of the existing normative visions of democracy. On the basis of, among other things, pressures from social movements, the existing democratic regimes indeed mix the majoritarian and representative elements of democracy with others derived from associative, direct, participatory, deliberative conceptions of democracy. The labor movement has (often successfully) challenged the liberal, individualistic conception of rights, bringing about the recognition of collective civil and political rights, as well as social rights as part and parcel of democratic citizenship. So-called “new social movements” have asked for, and sometimes obtained, a broader space of participations, producing some institutional changes. And visions and practices of democracy centered around the development of public spaces are relevant for today’s movements, even finding some resonance in institutional reforms. As Tilly (2004) noticed, if there is no doubt that democracy was essential for social movements, social movements, with their challenging vision and practices, have been essential for the development of institutional democracy well beyond its minimalistic definition.

Finally, the concept of political opportunities has addressed movements in democratic systems. Only recently, research on non-democratic regimes has stressed that, even in situations of strong repression, social movements can emerge and survive, in some cases finding niches of alliance within the governing elites, in some cases opposing them in transnational alliances for democracy. Studies on social movements in authoritarian regimes (e.g., Wiktorowicz 2004) indicate that the concept of political opportunities and constraints could be useful, but should be adapted in order to understand the interactions of social movements in authoritarian regimes.

In sum, contextualizing movements’ opportunities and effects in the interactions of complex national institutions with complex transnational ones requires enriching our analytic tools, especially where we are weaker: that is on the analysis of contested democratic fields and compound policies (della Porta & Tarrow 2004).

Political process theory
DOUG MCADAM

McAdam used the term “political process model” to designate the theory of movement emergence sketched in his 1982 book, *Political Process and the Development of Black Insurgency, 1930–1970*. In the book, he posed the theory as an alternative to two other perspectives. The first was what he referred to as the “classical strain model,” at the time best exemplified by the “collective behavior” perspective. But McAdam also critiqued and sought to distinguish his model from the newer resource mobilization framework. Over time the distinction between these two perspectives has been blurred by incorporating elements of both into a more general theoretical synthesis that emphasizes the simultaneous importance of “political opportunities,” “mobilizing structures,” and “framing processes.”

In its original formulation, however, McAdam stressed a somewhat different set of three explanatory factors, which, in combination, were held to explain the onset and development of most political movements. The three factors are: expanding political opportunities, established organizations, and the social psychological process of “cognitive liberation.” The first factor refers to those dramatic events and/or cumulative change processes that render established regimes more vulnerable or receptive to challenge; the second focuses on the extent to which “insurgents” have access to the kinds of existing organizations or informal networks thought to serve as the organizational locus of emergent mobilization. Together, McAdam argues, these two factors “only offer insurgents a certain objective ‘structural potential’ for collective political action. Mediating between opportunity and action are people and the subjective meanings they attach to their situations” (McAdam 1982: 48). The real catalyst of a movement then is the process of “cognitive liberation” by which some critical mass of people come to “define their situations as unjust and subject to change through group action” (51).

Over time, however, this original formulation and especially McAdam’s stress on the critical importance of these subjective processes, has given way to a more generic rendering of the model that emphasizes the singular role of political opportunities in the origins and development of movements and, more generally, the reciprocal relationship between institutionalized politics and social movements. Indeed, in referencing the theory, the term “political opportunity” is sometimes used interchangeably with “political process.” And the common thread that unites those who are routinely cited as proponents of “political process” theory is the shared focus on political opportunities (Tilly 1991; McAdam 1982; Tarrow 1983, 1998; Kitschelt 1986; Kriesi et al. 1995).

In all its various guises the model has been used as the basic framework for explaining the origins of a large and diverse set of movements. These would include: the US women’s movement (Costain 1992); liberation theology (Smith 1991); peasant mobilization in Central America (Brockett 2005); the nuclear freeze movement (Meyer 1993); the Italian protest cycle of the 1960s; and the pace and character of new social movements in France (Duyvendak 1995) and West Germany (Koopmans 1995), among others.

Besides the increasing focus on political opportunities and general neglect of the other two components of the original model, work in the political process tradition came over time to exhibit other subtle forms of variation. Two distinctions are particularly relevant here. The first involves the distinction between the more “stable” and “variable” aspects of a given “political opportunity structure.” Perhaps the most prominent proponent of the former approach is Hanspeter Kriesi, who
along with his students, has sought to understand variation in the strength and character of the “new social movements” in various Western European countries on the basis of stable differences in the formal structural properties of those countries’ political systems (Duyvendak 1995; Koopmans 1995; Kriesi et al. 1995). In his groundbreaking 1986 analysis of antinuclear movements in four Western democracies, Kitschelt provides an even earlier model of this comparative research focus.

We can contrast this concern with how stable differences in the formal structures of political systems shape movement dynamics to the numerous studies that seek to understand how the emergence and development of particular movements are shaped by the variable expansion and contraction of political opportunities over time. McAdam used just such an analysis of the origins, development, and decline of the American civil rights movement to formulate his original version of the political process model. Other works in this tradition would include Costain’s (1992) analysis of the US women’s movement, and Smith’s (1991) study of the origins and ultimate decline of liberation theology.

The other distinction is between those scholars who treat political opportunities as an objective feature of systems of institutionalized power and those that stress the necessarily subjective, constructed nature of political opportunities. It should be clear that this second distinction is not entirely independent of the first. It makes sense that scholars who are centrally engaged in a comparative analysis of the stable features of political systems would conceive of “political opportunities” as an objective, if variable, property of those systems. Not surprisingly, it was Kriesi and his colleagues who popularized the use of the term “political opportunity structure,” to refer to these objective system properties.

Consistent with McAdam’s original formulation, however, a good many movement analysts have continued to assert the social construction of perceived opportunities (or threats) as the necessary catalyst of collective action. In an important 1996 article, Kurzman took movement analysts to task for equating political opportunities with objective structural weaknesses, insisting that at least for the case of the Iranian revolution, insurgents managed to construct perceived opportunities in the absence of any clear structural vulnerabilities. Similarly, in her analysis of Chile’s transition to democracy, Noonan (1995) highlights the critical role played by the “mothers of the disappeared” in constructing opportunities and fashioning particularly resonant frames that simultaneously shamed state officials and galvanized the opposition movement.

Indeed, uncomfortable with what they see as the structural bias inherent in the POS concept, some culturally oriented movement analysts have begun to theorize and research the “discursive opportunities” and “discursive opportunity structures” that they see as critically implicated in the origin and development of social movements (Ferree 2003; Koopmans & Olzak 2004; McCammon et al. 2007). Among the most promising foci in these works is an emphasis on how other institutions – the media, courts – facilitate or constrain the prospects for framing by movement actors. More importantly, however, the work serves to underscore the general importance of social construction, framing, and other discursive practices to an understanding of social movements and contentious politics.

A case can be made that in its various guises the political process model is the dominant theoretical perspective on social movements, at least within the sociological study of social movements. That does not, however, mean that the model has been free of criticism. On the contrary, as the dominant perspective, it has invited lots of critique. Some of these complaints have in fact been noted above. Critics have found fault with the perspective on at least four counts:

1. structural bias — Any number of critics have decried what they see as the “structural bias” inherent in the political process model and, more specifically,
the concept of “political opportunity structure” (Noonan 1995; Kurzman 1996; Polletta 1999; Goodwin & Jasper 2007).

2. rationalist bias – In stressing the importance of political opportunities, the political process model betrays an implicit cost/benefit account of collective action. Movements emerge, the perspective suggests, when “opportunities” reduce the costs of organizing. Not surprisingly, then, the model has also been criticized for being overly rationalist in its underlying view of political action (Aminzade & McAdam 1999).

3. neglect of emotions – if the model has tended to privilege a kind of implied rationality, it has also neglected, critics charge, the critical role of emotions in shaping the dynamics of contention (Aminzade & McAdam 1999; Goodwin & Jasper 2007; Andreas 2007; Gould 2009).

4. narrow focus on states as targets and neglect of non-political movements – Finally, scholars have found fault with the perspective for its general stress on states as the central target of movements (King & Soule 2007; Armstrong & Bernstein 2008), and for not paying sufficient attention to categories of movements other than conventional political struggles (Smilde 2005).

I think it fair to say that the political process perspective has been enriched by these criticisms even as it has continued to help shape the theoretical and empirical agenda of social movement scholars.

Political Process Theory

Social psychology of movement participation
JACQUELIEN VAN STEKELENBURG and BERT KLANDERMANS

The social psychology of movement participation is concerned with the question as to why people participate in social movements. As social psychology explores the causes of the thoughts, feelings and actions of people – and primarily how these are influenced by social context – it has a lot to offer to the study of movement participation.

INDIVIDUALS IN MOVEMENTS

Over the years grievances, efficacy, identity, emotions, and social embeddedness have been proposed to explain movement participation.

Grievances

Grievances are at the heart of movement participation, be it moral indignation about some state of affairs, or a suddenly imposed grievance, feelings of relative deprivation, feelings of injustice, or the experience of illegitimate inequality (Klandermans 1997). Suddenly imposed grievances refer to an unexpected threat upon people’s rights or circumstances (Walsh 1981). Moral outrage results when important values or principles are violated. Illegitimate inequality is what relative deprivation and social justice theories are about.

Feelings of relative deprivation result from comparison of one’s situation with a standard – be it one’s past, someone else’s situation, or a cognitive standard such as equity or justice (Folger 1986). Relative deprivation based on personal comparisons is referred to as egoistic deprivation and relative deprivation based on group comparisons as fraternalistic deprivation (Runciman 1966). Fraternalistic deprivation is particularly important for engagement in protest (Major 1994), while the combination of egoistic deprivation and fraternalistic deprivation is the strongest predictor of protest (Foster & Matheson 1999). Moreover, the affective component – feelings as dissatisfaction and indignation about outcomes – has more influence on movement participation than the cognitive component – the observation that one receives less than the standard of comparison (Van Zomeren, Postmes, & Spears 2008).

Feelings Social justice theory explains how feelings of injustice translate into protest (Tyler & Smith 1998). Two classes of justice judgments are distinguished: distributive and procedural justice. Distributive justice approximates relative deprivation; it refers to the fairness of outcomes. Procedural justice refers to the fairness of procedures (being treated with respect, dignity; Tyler & Smith 1998). People care more about procedures than about outcomes. Therefore Tyler and Smith propose procedural justice to be a more powerful predictor of movement participation than distributive justice.

Efficacy

Because grievances are ubiquitous whereas protest is not, social movement scholars began to question the effects of grievances on movement participation. The social psychological answer to this insight is efficacy. Efficacy refers to the individual’s expectation that it is possible to alter conditions or policies through protest (Gamson 1992). The relationship is straightforward: the more effective an individual believes protest participation is, the more likely she or he is to participate. Mummendey and colleagues (1999) propose that group rather than personal efficacy predicts protest participation. Furthermore, Klandermans (1997) shows that people are more likely to participate in movement activities when they believe this will help to...
redress their grievances at affordable costs. Efficacious and ineffectivacious people take different routes to social change though: while normative forms of protest like petitioning and demonstrations tends to attract highly efficacious people, non-normative forms of protest are more likely to attract less highly efficacious people.

Identity

The more people identify with a group the more they are inclined to protest on behalf of that group (Reicher 1984; Simon et al. 1998; Stryker, Owens, & White 2000; Simon & Klandermans 2001). Why is group identification such a powerful motivational push to movement participation? First of all, identification with others is accompanied by an awareness of similarity and shared fate with those who belong to the same category. Furthermore, the “strength” of an identity comes from its affective component; the more “the group is in me” the more “I feel for us” (Yzerbyt et al. 2003) and the more strongly I am motivated to participate on behalf of the group. Collective identification, especially the more politicized form of it, intensifies feelings of efficacy (see Van Zomeren et al. 1998; Van Zomeren, Postmes, & Spears 2008). Next to shared fate, shared emotions, and enhanced efficaciousness, identification with others involved generates a felt inner obligation to behave as a “good” group member (Stürmer et al. 2003). When self-definition changes from personal to social identity, the group norm of participation becomes salient; the more one identifies with the group, the more weight this group norm will carry and the more it will result in an “inner obligation” to participate on behalf of the group. Together these dynamics explain why group identification functions as a “stepping stone” to politicization.

Emotions

Anger is seen as the prototypical protest emotion (Van Stekelenburg & Klandermans 2007). Anger moves people to adopt a more challenging relationship with authorities than subordinate emotions such as shame or despair. Van Zomeren et al. (2004) show that group-based anger is an important motivator of protest participation. There exists a relation to efficacy: People who perceive the ingroup as strong are more likely to experience anger and desire to take action; people who perceive the ingroup as weak are more likely to feel fearful and to move away from the outgroup (Devos, Silver, & Mackie 2002; Klandermans, Van der Toorn, & Van Stekelenburg 2008). In explaining different tactics, efficacy appears to be relevant too. Group-based anger is mainly observed in normative actions where efficacious people protest. However, in non-normative violent actions contempt appears to be the more relevant emotion (Fischer & Roseman 2007). This suggests two emotional routes to protest: an anger route based on efficacy leading to normative action and a contempt route as the situation is seen as hopeless invoking a “nothing to lose” strategy leading to non-normative protest (Kamans, Otten, & Gordijn 2011).

Group-based appraisal theories of emotions have introduced emotions to the social psychology of movement participation (see Van Zomeren et al. 2004). Appraisal theory of emotion conceives appraisal, emotion and action as the means by which people perceive and cope with events in their social world. Hence, two persons can appraise the same event differently and have different emotional responses. Appraisal theory was developed to explain personal emotions experienced by individuals. Yet, Smith (1993) extrapolated personal appraisals to group-based appraisal with the main postulate that people can experience emotions based on their group membership, thus “I” feel for “us” (Yzerbyt et al. 2003).

Social embeddedness

Social embeddedness plays a pivotal role in the context of protest. Networks provide space for the creation and dissemination of discourse critical of authorities, and it provides a way for active opposition to these authorities to grow (Paxton 2002). Discursive processes take place to form a consensus that makes
up the symbolic resources in collective sense-making (Gamson 1992; Klandermans 1997). The more political discussion occurs in social networks, the more people are able to gather information and the more they will participate in politics (McClurg 2003). Klandermans, Van der Toorn, and Van Stekelenburg (2008) provide evidence for such mechanisms, immigrants who felt efficacious were more likely to participate in protest provided that they were embedded in social networks, which offer an opportunity to discuss and learn about politics. People are informed of upcoming events and social capital as trust and loyalty accumulate in networks to provide individuals with the resources needed to invest in protest (Klandermans, Van der Toorn, & Van Stekelenburg 2008). In their networks people talk politics by which the factuality of the sociopolitical world is constructed and people are mobilized for protest.

CONTEMPORARY SOCIAL PSYCHOLOGICAL APPROACHES

In providing answers to the question of why people participate in movements, we separately discussed grievances, efficacy, identity, emotions and social embeddedness, but obviously in practice all these concepts are interwoven. And this is precisely the focus of contemporary social psychological approaches: combined, multiple pathways to movement participation.

Simon and colleagues (1998) were the first to propose a dual path model to protest participation in which they distinguished between an instrumental pathway – in which efficacy figured prominently – and an identity pathway guided by processes of identification. Rather than replacing instrumentality as an explanatory paradigm, identification added to the explanation as a second pathway. Van Zomeren and colleagues (2004) also propose a dual path model, comprising an efficacy and emotion path. The importance of emotions as motivators is shown, again without replacing the instrumental pathway. Van Stekelenburg, Klandermans, and van Dijk (2009) combined grievances, efficacy, identity, and emotions. This model assigns a central, integrating role to processes of identification (van Stekelenburg, Klandermans, & van Dijk 2009). In order to develop the shared grievances and shared emotions a shared identity is needed (see figure).

The more people feel that interests of the group and/or principles that the group values are threatened, the angrier they are and the more they are prepared to take part in protest to protect their interests and principles and/or to express their anger. These pathways are meta-analytically confirmed and modeled in the so-called Social Identity Model of Collective Action (SIMCA; Van Zomeren, Postmes, & Spears 2008).

The next step for the social psychology of movement participation will be to theorize on when people take what pathway and why. Yet, compared to 25 years ago, the social psychology of movement participation has become richer,
more sophisticated, and as such has a lot to offer to the study of movement participation.

Political science and the study of social movements

MASSIMILIANO ANDRETTA

Social movements have been studied from the perspective of several disciplines—sociology, anthropology, social psychology, economics, and political science. When we conceive of social movements as political phenomena we need to take seriously their relations with the political context in which they act. Clearly, many, if not most, social movements are embedded in political institutions (Tarrow 1994). For this reason, the discipline of political science is of importance in understanding the close link between political institutions and social movements, and how politics matters in shaping social movements in different contexts.

It is especially in relation to the political process approach that political science has become a central discipline in social movement studies. This is for several reasons: first, because political institutions affect social movements’ strategies, interests/identities, organizations and actions; second, because power is central in social movements’ constitutive goals; and third, because social movements are bearers of policy ideas, frames, and goals. All those issues have been addressed, in part, by social movement scholars by means of comparative politics, which also is a central methodology in the discipline of political science.

In as much as political science has been helpful in addressing various research questions and issues within the social movement community, the latter has also contributed to the main subfields of political science. In this entry I briefly discuss how the study of social movements has contributed to a number of these subfields, namely, political participation, political parties, international relations, and democratic theory.

POLITICAL PARTICIPATION

If one looks at the classic studies on political participation, it is striking to observe the amount of the literature dedicated to electoral behavior. This is understandable since elections are at the center of the operation of democracy. But it is also the case that citizens often have alternative ways to make their voices heard apart from casting ballots. Research has shown that people not only combine different types of participation quite often (Barnes et al. 1979), but that there has been an increasing tendency for people to engage in nonconventional forms of action (Norris 2002) through participation in social movement and protest events.

Certainly one of the most important contributions social movement studies has made in understanding the more nonconventional forms of participation is showing that participation is not only a matter of different resources and values, but that the set of means or actions citizens have at their disposal is partly culturally and politically encoded, and that it is built through a historical collective process. The most important work on this aspect is by Charles Tilly, who first introduced the concept of “collective action repertoire.” Tilly taught us that the collective action repertoire is not unlimited but constrained by political institutions and political culture, even if there is some space for collective creativity (Tilly 1978). Subsequently, social movement scholars have noted that this repertoire has been enlarged since the mobilizations of the 1960s, and that one of the major factors affecting tactical choice, or influencing tactical action, is the political opportunity structure in which collective actors are embedded. But scholars
also have stressed that political opportunities are mediated by actors’ ideology, frames, and values (Dalton 1994).

POLITICAL PARTIES

Political parties are just as important as electoral behavior in political science analyses. Political parties are, in fact, seen as the most important actors in the classic democratic theories, and their functions, behaviors, and organizations are therefore constantly monitored. If political science has correctly warned that political parties do not act in a vacuum and that their features strongly depend on the relations they have with a state’s institutions, party systems, and electors (Gunther et al. 2002), social movement scholars have focused on the way in which parties are influenced by challengers and vice versa. For instance, della Porta and Diani, reviewing the broad literature on the relationship between social movements and parties, isolate six factors that influence to what extent parties (those of the Left, but the argument can be applied to those on the Right as well) are responsive to social movements’ claims: the rigidity of Left–Right division, the existence of party divisions, electoral instability, proximity to government, weight of the parties in governmental coalitions, and their openness toward movements’ claims (2006: 202–207).

At the same time, if political parties are mediators between state and citizens, “they are far from indifferent to social movement pressure” (215).

Thus, there are a number of studies which underline how social movements have been able to influence political party behavior, for instance by pushing them to take part in a protest campaign, by showing how a party’s ideology is consistent with social movements’ claims, or by activating social movement activists who are also party members. As Goldstone (2003: 4) has recently put it “in the United States and Western Europe, political parties and social movements have become overlapping, mutually dependent actors in shaping politics to the point where long-established political parties welcome social movement support and often rely specifically on their association with social movements to win elections.” Other scholars have found the same kind of interdependence in Latin America (Hochstetler & Friedman 2008).

Indeed, it has been said that political parties are less and less able to perform their traditional function of collective identity building, and thus they need social movements to do this job. Social movements have even built their own parties, and this applies both to recent New Left and Green parties as well as to the older and stronger mass parties linked to the labor movement.

INTERNATIONAL RELATIONS

Social movement studies are increasingly addressing the field of international relations. As the process of globalization has accelerated, social movement campaigns have addressed global issues such as human rights, the environment, and social justice (della Porta, Kriesi, & Rucht 2009). Scholars have also underlined the way in which social movements are questioning the global governance structures that are growing in order to solve problems that national states are less and less able to address (della Porta et al. 2006). If international relations theorists have traditionally focused on national states’ responses to the international anarchical order, social movement studies demonstrate that there are other transnational actors beside states that intervene in shaping global politics (Khagram, Riker, & Sikkink 2002). If the dominant realist/neorealist approach in political science has focused only on states’ strategies, properties and resources, and the liberal/neoliberal one has underlined the influence of market actors, social movement scholars are providing new insights on the way in which complex relations between states, market actors, and civil society interact at the global level to produce new ideas and norms and, in some cases, new international regimes.
THEORY AND PRACTICES OF DEMOCRACY

In dealing with empirical research in these and other fields of political science, social movement scholars have started to reflect upon the implications of their findings for democracy theory. Social movements in fact challenge the very basis of modern democracies, namely political representation. As Kitschelt (1993: 15) claimed, “social movements . . . invoke an ancient element of democratic theory that calls for an organization of collective decision-making referred to in varying ways as classical, populist, communitarian, strong, grassroots or direct democracy against democratic practices in contemporary democracies labeled as realist, liberal, elite, republican or representative democracy.” Some of the most important contributions on alternative democratic norms of the past have indeed been inspired by social movement mobilizations.

More recently, scholars have found that social movements are trying to overcome the classic dilemma between representative and direct (or participatory) democracy by reflecting upon, calling for, and practicing some forms of deliberative democracy (della Porta et al. 2006). In these views, the complexity of the world and its myriad problems pose almost insurmountable challenges for standing democracies, as data on citizen (dis)satisfaction consistently show (Norris 2002). Representative democracies are not always able to include citizens’ opinions in their decision making, and do not allow for a full, inclusive, and collective reasoning on problems and solutions. This, the argument follows, brings about suboptimal decisions, inefficient outcomes, declining trust, and therefore contested institutions. Social movements have recently pushed for new inclusionary models of decision making, and tried to implement these deliberative mechanisms within their own organizations. Some scholars argue that social movement practices and ideas about how democracy should work can complement actual democratic institutions, and some politicians are starting to implement them (for example, the practice of participatory budgeting in many cities in the world, the experimentation of deliberative pools in the US and Europe, or the many forms of citizens’ inclusion in local decision making).

Transnational social movements are also calling for a deliberative democratic reconstruction of world politics.

CONCLUSION

Just as social movements and politics are inherently intertwined, so are the fields of social movements and political science. This entry points to the obvious fact that the discipline of political science has provided theories, concepts, and methods relevant to the study of social movements, but especially shows how social movement studies have contributed in broadening the substantial knowledge in some subfields of political science. This applies also to other subfields in political science not covered here, such as local government, public policies, regime change, democratization, and organizational studies.

Politicized identity
JACQUELIEN VAN STEKELENBURG, ANOUK VAN LEEUWIN and DUNYA VAN TROOST

Politicization of identities is key to the dynamics of contention. Protest movements are built on politicized identities and they are populated by people with politicized identities. Politicization of identities is simultaneously a characteristic of collectivities and people. There exists a division of labor between students of politicization of identities. Sociologists tend to study politicization at the collective level on the supply side of contentious politics, while social psychologists typically focus on the individual level of politicization at the demand side of politics (cf. Klandermans 2004). The politicization of the supply side of protest refers to the characteristics of protest movements. Is it a movement people can identify with? Is the movement able to frame personal problems into political claims? The politicization of demand refers to the potential of protestors in a society. It relates to the problems people perceive in a society and whether people attach political meaning to these problems. In order to understand how the division of labor conceptually and empirically affects the study of this phenomenon, we will briefly elaborate on the concept of identity.

Identity is our understanding of who we are. Simon and colleagues (1998) succinctly describe identity as a place in society. A place is a metaphorical expression for any position on any socially relevant dimension such as nationality, ethnicity, gender, age, and so forth. A person has a personal identity and several social identities. Personal identity refers to self-definition in terms of personal attributes, whereas social identity refers to self-definition in terms of social category memberships (Tajfel & Turner 1979). Collective identity concerns cognitions shared by members of a single group (Taylor & Whittier 1992). Hence, collective identity is a group characteristic – group members’ shared beliefs, destiny, and feelings – while social identity is a characteristic of a person – the idiosyncratic remake derived from these shared beliefs, destiny, and feelings. Group identification forms the link between collective and social identity. The stronger the group identification, the more the shared beliefs, destiny, and feelings comprised in the group’s collective identity are incorporated in the individual’s social identity. However, individuals do not incorporate the complete picture, but rather a selection of what a collective identity encompasses. These idiosyncratic remakes of collective beliefs at the individual level create a variety in the content of social identities. Indeed, not all Americans, Muslims, workers, women, or gays have identical social identities, yet they do feel American, Muslim, and so on. Importantly, identities vary in strength, and identifying more or less strongly with a group makes a real difference, especially in political contexts. The more people identify with others involved, the more they will incorporate shared destiny, shared emotions, and enhanced efficaciousness (see Simon et al. 1998; Yzerbyt et al. 2003; Van Zomeren, Postmes, & Spears 2008). It is therefore the strength of group identification rather than group identification per se that influences group members’ readiness to view themselves and act in terms of their group membership (Huddy 2001).

Salience of a collective identity does not necessarily make that identity politically relevant; collective identities must politicize to become the engine of collective action. Politicization of identities begins with the awareness of shared grievances for which an external enemy must be blamed. Next, claims for compensation must be leveled against this enemy. Unless appropriate compensation is granted, the power struggle continues. If in the course of this struggle the group seeks to win the support of others, they must identify with the group.
of third parties, such as more powerful authorities (e.g., the national government) or the general public, identities fully politicize (Simon & Klandermans 2001). Politicization of identities and the underlying power struggle unfold as a sequence of politicizing events that gradually transform the group’s relationship to its social environment, whereby the tactical choices are again shaped by identity (Polletta 2009).

What distinguishes politicized collective identity from collective identity? First, raised consciousness: “the growing awareness of shared grievances and a clearer idea of who or what is responsible for those grievances reflect a distinct cognitive elaboration of one’s worldview providing group members with a meaningful perspective on the social world and their place in it” (Simon & Klandermans 2001: 327). The second distinction is about the relation with other groups. A politicized identity provides antagonistic lenses through which the social world is interpreted. This intergroup polarization defines other groups in the social and political arena as “pro” or “con,” thus as allies or opponents. The third distinction concerns the unique behavioral correlates of politicized collective identity, namely, politicized group members are more likely to engage in collective action directed at the government or the general public to force them to intervene or to take sides.

The theoretical division of labor reflects in the phenomena that are studied. Sociologists study collective identity by examining such phenomena as the group’s symbols, rituals, beliefs, and the values its members share. Social psychologists study group identification by examining what it means to an individual to belong to the group and will thus implicitly or explicitly refer to the pride of being a member of the group, to the individual’s beliefs, sentiments, and commitment to the group (Klandermans & Roggeband 2007; Van Stekelenburg and Klandermans 2007; Van Doorn et al. forthcoming). Not surprisingly, the same division of labor can be found for politicized identities.

**POLITICIZATION OF SUPPLY**

Central to the sociological literature is the work of Taylor and Whittier (1992), who clarify both theoretically and empirically how strong bonds existing in social networks shape political actors. Within these networks individuals come to see themselves as part of a group when some shared characteristic becomes salient and is defined as important. As a result, boundaries are drawn between “a challenging and a dominant group” (1992: 175). These boundaries are not clear cut, stable, and objectively visible, but exist in the shared meaning attributed to group membership by group members. The second component is consciousness. Consciousness consists of both raising awareness of group membership and the realization of the group’s position within society, in comparison to other groups. This position must be perceived as illegitimate or unjust to make group membership politically relevant. The third component is negotiation. Within and outside their networks, people negotiate in order to change symbolic meanings of daily life’s thinking and acting – “the politicization of daily life” – and to free the group from dominant representations or to undermine the status quo in the power balance between groups in the larger system. Social movement organizations do their utmost to politicize an identity by framing personal grievances in political claims and by offering their supporters the opportunity to act upon these political claims. Hence, political and identity entrepreneurs use their power, resources, and creativity to pull a collectivity together and to turn grievances into claims. As a consequence, organized identities are more likely to mobilize than unorganized identities.

**POLITICIZATION OF DEMAND**

From a social psychological perspective, group identification is crucial to politicization of an identity. People who strongly identify with a social movement organization feel an “inner obligation” to participate on behalf of
the group (Stürmer et al. 2003). The more identities politicize, the more aggrieved and efficacious people feel and the more they participate in movements of change. Politicized identities are dual identities. González and Brown (2003) coined the term “dual identity” to point out that one individual can at the same time identify with two – competing – groups. For instance, workers going on strike can at the same time identify with the union and with the company. Two competing identities that are active at the same time cause “cross-pressure” (Oegema & Klandermans 1994). However, this does not mean that dual identification is detrimental to protest participation. On the contrary, workers who are loyal to the company are the ones who will make the effort of acting collectively against it – in a legal and peaceful way (Simon & Ruhs 2008; Simon & Grabow 2010). Simon and Ruhs (2008) showed that dual identification – with both an ethnic minority and the nation as a whole – spurred protest, a finding replicated and further specified by Klandermans, van der Toorn, and van Stekelenburg (2008). They report that immigrants who display a dual identification tend to be more satisfied with their situation than those who do not display such identity, but if they are dissatisfied, they will be more likely to participate in protest. Recently, Langner (2010) developed a measure of politicized collective identity in terms of social identity content that assesses individual differences in the political meaning of an identity. The more group members attach political meaning to their identity, the more likely they will engage in protest.

Hence, sociologists study politicization at the collective level on the supply side of contentious politics, while social psychologists focus on the individual level at the demand side of politics. In reality, politicization of identities involves a mesh between individual and collective levels. We can learn from work that focuses on a single level, but neither is adequate by itself if we want to understand how politicization of identities translates into protest. Interdisciplinary work that treats politicization as the interplay between the two levels – between collectivities actively “pulling” a collective identity together and people being “pushed” onto the streets as political meaning is attached to their identities – is needed. When people participate in protest staged by a social movement organization, this is the result of mobilization that successfully brought demand and supply together. In unraveling politicizing identities an interdisciplinary approach focusing on politicization processes of supply and demand might be helpful.

Population ecology and social movements
DEBRA MINKOFF

The population ecology of social movements takes as its starting point theories of organizational evolution. First elaborated by Hannan and Freeman (1977, 1989), what came to be known as organizational ecology provides a research paradigm for scholars interested in understanding how diversity in organizational forms develops and changes over time. Drawing on evolutionary models, organizational ecologists focus on competition and environmental selection as the central mechanisms driving the creation and institutionalization of new organizational forms. In addition to competition over scarce resources, processes of legitimation are also important in explaining how new organizational models become established. A central theoretical principle is that the development of organizational populations is “density-dependent”: early on, increases in the number, or density, of successful organizations improve the legitimacy of the forms and provide a template for action that creates resources and incentives for organizational formation; as the population expands, however, competitive pressures drive down the founding rate and increase the failure rate of existing groups.

Building on resource mobilization theory’s emphasis on the role of formal organizations as carriers of social movement goals (McCarthy & Zald 1977), the population ecology of social movements provides a framework for analyzing changes in the organizational composition of social movement industries and sectors.

The earliest application of organizational ecology in the field of social movements focused on the evolution of the contemporary women’s and civil rights movements in the US. In a series of publications, Minkoff (1994, 1995, 1999) examined various aspects of social movement and organizational development, from the influence of density-dependent legitimation and competition on organizational founding, failure, and change to the role of organizational density in the spread and decline protest cycles (Minkoff 1997) and civil rights policy gains (Meyer & Minkoff 2004). Subsequent studies have taken up such issues as organizational mortality and the decline of the post-cold war American peace movement (Edwards & Marullo 1995), transnational coalition-formation in the environmental movement (Murphy 2005), the institutionalization of the self-help/mutual aid movement in the US (Archibald 2007), the comparative ecology of immigrant organizations in Berlin and Amsterdam (Vermeulen 2006), and the “sequencing” of national and transnational environmental organizations (Johnson & McCarthy 2005).

Other researchers have drawn on organizational ecology to analyze different aspects of social movement diversity and its broader impacts. Some exemplary studies include Olzak and Uhrig’s (2001) application of the concepts of niche overlap and niche localized competition to understand the consequences of tactical overlap between new social movements in West Germany and Olzak and Ryo’s (2007) extension of theories of density-dependent legitimation and competition to explore how tactical and goal diversity influences social movement vitality and success in the case of the black civil rights movement. Soule and King’s (2008) comprehensive integration of resource mobilization and resource partitioning theories illustrates the affinities (and differences) between these two approaches, specifically with respect to how competition and industry concentration influence tactical and goal
specialization and how specialization influences organizational survival across the peace, environmental, and women’s social movement industries. King and Cornwall (2005) usefully deploy the specialist/generalist distinction in applying organizational learning theories to social movement strategies, positing retention, adaptation, and diffusion as the main mechanisms by which movements, normally prone to inertia, evolve strategically. Organizational diversity has also been linked to policy outcomes in the environmental movement (Johnson 2008), as have issue competition and legitimacy with respect to congressional attention to rights issues (King, Bentele, & Soule 2007).

Organizational ecology is considered to be “heterodox” by many sociologists, both because of its reliance on evolutionary thinking and its more quantitative orientation (Hannan 2005). However, an ecological approach to social movements is distinctive in that it examines macro-level processes that are most amenable to quantitative research designs and methods. Further, it shares with resource mobilization and political opportunity theories the insight that the prospects for activism are constrained by the political and social context, adding the importance of organizational dynamics in understanding the mechanisms that shape the mix of available options for social change.

Postmaterialism and social movements
PETER MILLER

Postmaterialism is a general theory of value change, developed in large part by Ronald Inglehart. It describes a shift in individual and societal priorities from survival-based needs to needs related to self-expression. Two hypotheses describe the underlying logic of this change in values. First (the scarcity hypothesis), an individual’s priorities reflect the larger socioeconomic context insofar as the individual places the highest value on those things which are in short supply. Second (the socialization hypothesis), there is a time lag between the socioeconomic context and the individual’s value priorities, largely because one’s basic values reflect the context of one’s pre-adult years (Inglehart 1990: 68). Consider each of these hypotheses. First, scarce resources form, to a large degree, an individual’s perspective on the world. Consider the lengths a starving man would go to acquire food. We would expect him not to be dissuaded by laws banning theft if his life was on the line. However, we would expect a man who has no fear of starvation to have a contrasting view of the world, due to the latter’s material security. Second, the shift in priorities is not immediate. Giving a starving man a single loaf of bread will probably not cause the man to turn his attention away from an all-consuming search for food, but a sustained trajectory toward material security may cause the man to shift his attention away from the search for food. Conversely, reducing one’s material security can, over time, lead to a reversal in value priorities away from postmaterial needs for self-expression. Thus the cultivation of postmaterialist values is dependent upon contextual factors including the level of material security during one’s upbringing, but also the economic conditions during the time of a survey measuring the prevalence of postmaterial values (Duch & Taylor 1993).

As the name suggests, postmaterialism is a framework for individual and societal priorities that supplants a set of priorities related to material (i.e., survival) needs. The materialist paradigm focuses on economic growth and increasing standards of living above all else. While postmaterialism recognizes the importance of these materialist objectives, it incorporates societal concerns for the quality of life (e.g., weighing economic growth against environmental degradation) and individual needs for self-expression (e.g., a desire for meaningful work and the quality of the work experience rather than income alone). The goals that fueled the emergence of industrial society are, in the postmaterial paradigm, less important than concerns for environmental or personal well-being (Inglehart 1997: 77–78). Postmaterialism refers to a set of goals individuals strive for only after material security has been realized (Inglehart 1997: 35.)

How can we recognize survey respondents who express postmaterialist views? Cross-national surveys, the World Values Survey in particular, categorize people as postmaterialists according to their ranking of the following four-item battery of national priorities (a 12-item battery is also used, however the simpler form is more common).

- Maintain order in the nation.
- Give people more say in the decisions of the government.
- Fight rising prices.
- Protect freedom of speech.

Materialists tend to privilege the first and third options, while postmaterialists favor the second and fourth items. Those respondents who select one of each are generally considered to have a “mixed” set of priorities (Inglehart 1981: 884; 1990: 74–75). While the segment
of the population identified as postmaterialist may be small (in the order of 15–25%), Inglehart has found that postmaterialists tend to occupy elite sectors of the employment pool:

The pure Post-Materialist type comprises only about 8 percent of the manual workers, and 7 percent of the farmers; in these occupational groups, pure Materialists outnumber Post-Materialists by ratios of at least five to one. Post-Materialists continue to outweigh Materialists in the student milieu. This is significant, but not particularly surprising. What is surprising is the fact that among those less than 35 years old with jobs that lead to top management and top civil service posts, Post-Materialists outnumber Materialists decisively: their numerical preponderance here is even greater than it is among students. (Inglehart 1981: 892, emphasis in original.)

The tendency for postmaterialists to be found among elite sectors of society led Inglehart to label these rising technocrats “The New Class” given their societal position and postmaterialist worldview (1990: 331).

A profound finding of the cross-national survey research on postmaterialism is the clustering of a wide range of opinions on political, social, and religious beliefs along a two-dimensional space (Inglehart & Welzel 2005: 48–76). A factor analysis of public opinion data included in the World Values Survey reveals a great deal of the difference between materialist and postmaterialist views can be mapped in a space where the x-axis is a spectrum running from survival to self-expression needs and the y-axis is a similar spectrum from traditional to secular-rational authority structures. Traditional values describe a set of beliefs and values, including the importance of God, a rejection of abortion, a strong sense of national pride, and a deference to authority. Secular-rational respondents will express opposite views on each of these topics. The survival versus self-expression dimension addresses “a syndrome of tolerance, trust, emphasis on subjective well-being, civic activism and self-expression” (Inglehart & Welzel 2005: 52). Respondents expressing survival values tend to agree that

men make better political leaders than women, to be less accepting of foreigners or alternative lifestyles (including homosexuality and the de-emphasis of the two-parent family), and more supportive of authoritarian governments. As we might expect, self-expressive respondents hold opposite views on these subjects. The theoretical expectations of postmaterialism are found through empirical analysis of public opinion data.

SOCIAL MOVEMENT ACTIVITY BY POSTMATERIALISTS

Postmaterialism de-emphasizes deference to authority and social conformity while accenting individual autonomy, civic activism, and subjective well-being. As such, we might expect postmaterialists to be more likely to voice their grievances collectively, such as by means of a social movement organization (see Snow, Soule, & Kriesi 2004 for a summary of the literature on defining social movements). Cognitive mobilization is one mechanism that increases the likelihood that postmaterialists engage in elite-directing and elite-challenging behavior. Cognitive mobilization is defined as the “development of the political skills that are needed to cope with the politics of a large-scale society” (Inglehart 1990: 372). It can be operationalized as levels of formal education, political information, and cognitive skills (Inglehart 1997: 307). Critically, cognitive mobilization includes skills such as communications which are highly valued in the service economic sector, as opposed to routinized labor practices often found in the manufacturing sector.

High levels of educational attainment are associated with greater degrees of cognitive mobilization – and, thus, more likely to be associated with postmaterialism (Inglehart 1997: 152) – as well as forms of political participation, ranging from signing a petition to joining a protest (Verba, Nie, & Kim 1978; Verba, Schlozman, & Brady 1995; Barnes & Kaase 1979). As we might expect, postmaterialists are more likely to participate
in conventional forms of participatory activity, and in elite-challenging forms of participation, such as a protest or demonstration (Inglehart 1997: 308–315). Inglehart suggests three reasons why postmaterialists are more likely to engage in these participatory activities: first, postmaterialists are able to invest their energy in concerns other than immediate physiological needs; second, postmaterialists tend to be an emerging minority who feel their priorities are not shared by the majority; third, the disruption inherent in unconventional political action (e.g., protest) may be less negative to postmaterialists because the actions threaten things postmaterialists give lower priority to than materialists (Inglehart 1990: 310). Postmaterialism contributes to a set of participatory activities, ranging from petition signing to protest movements.

POSTMATERIALISM AND ECOLOGICAL POLITICAL PARTIES

Postmaterialist values are present in a variety of social movements, including womens’ movements, organized labor movements, and groups organized around environmental and antinuclear issues. Let us consider one example of collective action and political organization that clearly expresses postmaterialist values: the German Green Party.

Initially an out-growth of the antinuclear movement in Germany in the 1970s, the Greens gained their first seat in the Bundestag (the German lower house of parliament) in 1983. The party is dedicated to the postmaterialist ideals of environmental protection, gender equality, and the limited use of military force. The Green Party was pivotal following the 1998 elections where the left-of-center Social Democrats fell short of an outright majority of seats in the lower house. As a result of interparty negotiations, the Greens became the junior member of the ruling coalition and their leader, Joschka Fischer, became vice chancellor and foreign minister until the fall of the coalition in 2005. As of the 2009 elections, the Greens have 68 seats in the lower house of parliament (67 of which came from party list votes).

There is a clear relationship between postmaterialism and voting for an ecological party. For example, postmaterialists were 23 times more likely to vote for the West German Green Party in the 1980s than materialist voters (Inglehart 1990: 384). Inglehart suggests that ecological parties introduce a new postmaterialist dimension to the classical Left–Right political spectrum, contrasting with the materialist program advanced by parties like the Republikaner in Germany or the National Front in France (Inglehart 1997: 243–252). The presence of these postmaterialist parties, then, serves two functions: first, to give a voice to the segment of the electorate expressing postmaterialist policy preferences. Second, to induce other parties to move toward their policy preferences as a means to capture the postmaterialist segment of the electorate.

Green politics are becoming increasingly prevalent in European states. The Greens are currently in a governing coalition in Ireland (since 2007). Green or ecological parties hold a number of seats in the French and Scandinavian parliaments, though the parties in these countries have limited experience in government, at least when compared to the German party. That being said, evidence suggests that Green parties do better under a proportional representation electoral system. These electoral systems generally have more political parties than majoritarian electoral systems. In the British House of Commons, for example, there is only one Green member of parliament.

The concept of postmaterialism has been subjected to considerable scholarly attention over the last three to four decades. We have seen that postmaterialism informs a great deal of the change in priorities following a sustained period of economic development (in accordance with the socialization hypothesis) that results in securing the material requirements for survival (the scarcity hypothesis). In any society postmaterialists tend to be a nontrivial minority, though they tend to be overrepresented among students and elite-level managers.
and bureaucrats. Furthermore, Green political parties tend to reflect postmaterialist values. Though Green parties represent a small segment of the electorate, occasionally these parties have joined governing coalitions and been able to implement policies consistent with the set of postmaterialist priorities.

Precipitating events and flashpoints
PETER B. OWENS

It is often the case that certain critical events can have enormous impacts on the dynamics of collective action. When such events appear to “trigger” or “spark” collective action by convincing potential participants that action is necessary or desirable, or mark a critical turning point in the dynamics of a particular pattern of mobilization, they may be thought of as precipitating events. These events will tend to fall along a varied range of characteristics. Some may be violent and traumatic, such as an assassination or an instance of police brutality, while others may be relatively civil or even celebratory, such as the election of a supported political candidate or the victory of a sports team. Some events may appear to be relatively isolated and singular, while others may occur in a cumulative pattern over time. An event might be planned and executed by movement participants, or be completely unexpected. One event might trigger explosive episodes such as riots, while others might lead to long-term changes in a cycle of protest, such as shifts in a movement’s strategy. Despite such variation, the defining feature of a precipitating event is that it serves as some form of social-cognitive “trigger” that defines, in part, the forms of collective action that occur in its wake.

Early theorists of collective action utilized the concept of precipitating events to explain the emergence of collective action in the context of underlying structural conditions. Smelser’s (1963) “value-added” model of collective behavior locates precipitating events as one of several necessary but insufficient conditions for collective action to take place. Within this conceptualization, precipitating events serve as “evidence” that links underlying structural “strains,” and the collective beliefs they engender, to a concrete situation or experience. They “confirm the existence, sharpen the definition, or exaggerate the effect” of some underlying structural problem within a group’s collective beliefs (Smelser 1963: 249), and thus help to make eventual mobilization possible. In a study of early twentieth-century American race riots, Lieberson and Silverman (1965) found that the majority of riots were set off by some form of initial confrontation. These confrontations became precipitants of racial violence through a real or perceived violation of group mores by a member of another racial group. However, violations were only sufficient to produce riots in the presence of underlying conditions of economic deprivation and sociopolitical exclusion, which precipitating events highlighted and exemplified.

Conceptualizations of precipitating events as primarily a manifestation of pressures brought on by underlying structural strain have given way to more nuanced approaches that highlight the interactional and situationally contingent effects of such events. For instance, the “flashpoints” model developed by Waddington and colleagues (Waddington, Jones, & Critcher 1989) defines precipitating events as only “triggering” disorderly episodes in the presence of numerous contextual factors. These factors range from relatively micro-level variables, such as the quality of interactions between authorities and participants, and how participants understand the nature of a conflict situation, to increasingly macro-level factors such as existing political and ideological debates on relevant issues. Within this model, issues of perception and interpretation are placed on equal footing with larger structural and political factors in understanding how certain events trigger episodes of disorder. Such critical events, then, serve as both symbolically and structurally charged focal points that disruptive collective action becomes focused around.
It is understandable that many scholars have utilized precipitating or “flashpoint” events primarily to explain relatively spontaneous and disruptive forms of collective action. Such usage may be thought of as both a reflection of, and response to, popular explanations for riots and disorders emphasizing underlying conditions that are “sparked off” by a particular incident (Waddington, Jones, & Critcher 1989). However, scholars of social movements have also incorporated analyses of the effects that critical or precipitating events may have on broader patterns of mobilization. Rasler (1996) incorporates an analysis of four critical “triggering” events into larger patterns of repression and concession during the Iranian Revolution. She finds that one critical political event (the election of a reform-oriented prime minister), and two critical incidences of deadly repression (the burning of the Abadan cinema and the “Black Friday” massacre), contributed both to increased levels of protest and greater spatial diffusion of protest in the following months. Similarly, Walsh’s (1981, 1988) exploration of the Three Mile Island nuclear accident demonstrates how the accident, and resulting evacuation, transformed nearby communities into “hotbeds” of antinuclear activism. The precipitating accident generated what Walsh terms “suddenly imposed grievances,” spawning widespread grassroots mobilization of the local population. While antinuclear activist groups had existed prior to the accident, it was only afterwards that they were able to successfully mobilize large numbers of participants in nearby communities. Snow and colleagues (1998) argue that the creation of such sudden mobilizing grievances may be linked to the disruption of the taken-for-granted routines and structures of everyday life, which they term the “quotidian.” Critical events, then, may not only trigger spontaneous eruptions of collective action, but can also have enduring effects on mobilization dynamics and the environments that collective action occurs within. These effects may be particularly acute if the event significantly disrupts the day-to-day lives of large numbers of people.

While precipitating events have moved from a central theoretical role in explaining collective action and crowd behavior (Smelser 1963), to a more contingent and interdependent role in overall patterns of mobilization, it remains hard to deny that certain events can powerfully shape the dynamics of many forms of collective action. However, it is important to note that the effects of precipitating events on ensuing collective action do not necessarily inhere from any objective content of the events themselves. An event that serves as a critical “trigger” for one type of collective action in one social context may have very different or no effects in another. For example, an instance of police brutality may “trigger” riots in multiple cities, or more localized protests in one city, or no collective action may occur at all. It is the social contexts that events occur within, and the ways in which various social actors draw from these contexts to construct meaning around them, that largely determine whether or not an event may serve as a precipitating event. Precipitating events are not strict manifestations of underlying structural problems, nor are they inherent symbols of existing beliefs or grievances. Rather, these events serve as social-cognitive focal points around which action and meaning are constructed and negotiated.

Prefigurative politics
DARCY K. LEACH

The term prefigurative politics refers to a political orientation based on the premise that the ends a social movement achieves are fundamentally shaped by the means it employs, and that movements should therefore do their best to choose means that embody or “prefigure” the kind of society they want to bring about. On one level, this commitment to means–ends consistency reflects what Weber called a “value-rational” logic of action, in which action is guided by values rather than instrumental efficiency. But a prefigurative orientation is motivated by more than a commitment to moral action in its own right; it has been pursued as an alternative to both vanguardist and structural-reformist strategies for social change. Rather than looking to a revolutionary vanguard to seize existing power structures and implement revolutionary change on behalf of the masses or to trade unions or political parties to leverage reforms within the existing system, a prefigurative approach seeks to create the new society “in the shell of the old” by developing counterhegemonic institutions and modes of interaction that embody the desired transformation. In this sense, a prefigurative strategy is based on the principle of direct action, of directly implementing the changes one seeks, rather than asking others to make the changes on one’s behalf.

THE PREFIGURATIVE TRADITION

The first prefigurative movements were anarchist and syndicalist responses to the early stages of industrialization and bureaucratization in Europe. Other early examples include the Paris Commune in 1871, the “council communist” insurgencies in Russia, Italy, and Germany after World War I, the anarchist collectives in the Spanish Civil War, and the Hungarian uprising of 1956 (Boggs 1977). For much of its history, the prefigurative impulse was only characteristic of the beginning stages of a rebellion and faded as the movement became more centralized (Arendt 1963). From the 1960s onward, however, the approach has become both more clearly articulated and more widespread, such that one can now identify a stable prefigurative tendency or wing in a wide range of movements around the world, most notably in women’s, environmental, autonomous, peace, and indigenous rights movements, and on a more global scale in the movements against neoliberal globalization (Day 2005; della Porta et al. 2006; Graeber 2009).

FORMS OF PREFIGURATIVE PRACTICE

How the commitment to aligning means and ends affects political practice depends on the central ideals of the particular movement. Most commonly, the focus has been on implementing more participatory forms of self-governance, be they workers’ councils, collectives, and cooperatives in the economic realm (Boggs 1977; Rothschild and Whitt 1986), or sociopolitical structures such as soviets, communes, affinity groups, spokescouncils, direct action networks, and people’s assemblies. In whatever sphere of social life, and whether they are conceptualized as prefiguring nonviolence (Lakey 1968; Epstein 1991), gender equality (Harris & King 1989), participatory democracy (Breines 1982; Polletta 2002), or autonomy (Katsiaficas 1997; Leach 2009), these forms all share a decentralized, directly democratic, and often consensus-based authority structure. Some movements have created dense networks of such organizations, forming “temporary autonomous zones” (Bey 1991) or more
permanent social movement “scenes” (Leach & Haunss 2009) to undergird the movement and prefigure a more egalitarian way of life. The Independent Media Centers, Peoples’ Global Action, and the World Social Forum are examples of current efforts to create prefigurative networks on a global scale.

ASSESSING PREFIGURATIVE MOVEMENTS

Because prefigurative revolutionary strategies envision that more and more people will choose the movement’s alternative institutions and modes of interaction until they gradually replace those of the old system, their success should be measured in terms of the sustainability, purity, and proliferation of the prefigurative models. Very little empirical work has been done to assess this at the societal level, but case studies suggest that while many models have proven fairly sustainable, they often lose their prefigurative character over time and have yet to supplant mainstream institutions. Boggs (1977) notes three common patterns of decline in prefigurative movements: Jacobinism, in which popular forums are repressed or their sovereignty usurped by a centralized revolutionary authority; spontaneism, a strategic paralysis caused when parochial or antipolitical inclinations inhibit the creation of broader structures of effective coordination; and corporativism, which occurs when an oligarchic stratum of activists is co-opted, leading them to abandon the movement’s originally radical goals in order to serve their own interests in maintaining power.

As theories of social movements have often assumed instrumentally rational actors and bureaucratic organization, prefigurative movements are often misconstrued or appear as anomalous cases in social movement research. More comparative research on value-rational actors is needed to better understand such movements’ varying degrees of success and assess the viability of a prefigurative strategy for social change.

Protest cycles and waves
DONATELLA DELLA PORTA

THE INTENSIFICATION OF PROTEST IN TIME AND SPACE

Social movement studies have traditionally stressed conflict as a dynamic element in our societies. Social movements are conflictual not only because of their stakes, but also because of their forms of action. Defined in the sociology of social movements as a “resource of the powerless” (Lipsky 1968), protest has been considered as the main repertoire of action – or even the modus operandi – of social movements.

From the 1960s on, researchers of political participation have added to the traditional forms of participation (such as discussing politics with others or working for political parties or their candidates), then unconventional forms of political participation, such as signing petitions, participating lawful demonstrations, boycotts, withholding of rent or tax, occupations, sit-ins, blocking traffic, and wildcat strikes. Further research in political participation, based on surveys, has time and again observed a growing legitimation of these forms of protest, up to defining this expansion of the repertoire of political participation as what appeared to be a “lasting characteristic of democratic mass publics” (Barnes et al. 1979: 524). In the 2000s, “Protest politics is on the rise as channel of political expression and mobilization” (Norris 2002: 221).

Forms of protest expanded especially during periods of intense contention. A widespread observation in social movement studies is that protest events tend to cluster in time and space; cycle, waves, campaigns, and tides are concepts developed in order to define “a punctuated history of heightened challenges and relative stability” (Beissinger 2002: 16).

The first concept introduced in social movement studies in order to describe this phenomenon is that of protest cycle, defined as:

- a phase of heightened conflict and contention across the social system that includes: a rapid diffusion of collective action from more mobilized to less mobilized sectors; a quickened pace of innovation in the forms of contention; new or transformed collective action frames; a combination of organised and unorganised participation; and sequences of intensified interactions between challengers and authorities which can end in reform, repression and sometimes revolution. (Tarrow 1994: 153)

Cycles are composed of an ascending phase, a peak, and a declining phase. In his analysis of the cycle of protest of the late 1960s and early 1970s in Italy, Tarrow observes some mechanisms (of imitation as well as reciprocal learning), that he considers as regularly occurring during intensification and deintensification of protest.

Similarly, the concept of wave recognizes the unequal distribution of protest over time: “periods of relative quiet alternate with waves of intense mobilization that encompass large sections of societies, and quite often affect many societies simultaneously,” even if denying the existence of a regular, “periodically recurrent sequence of phenomena” (Koopmans 2004: 21).

Cycles or waves of protest are often composed of interrelated campaigns, a series of interactions connected to each other from the thematic point of view and oriented towards a common aim (della Porta & Rucht 2002). Protest campaigns on abortion rights for the women’s movements, or against the deployment of Cruise and Pershing II missiles for the peace movement are well-known illustrations.

Developed to describe nationalist protest, the concept of protest tides also points at “not only a powerful, substantively related stream
of mobilization within a mobilizational cycle, but also a transcultural and transnational phenomenon” (Beissinger 2002: 31).

CYCLICAL DYNAMICS

The concepts of cycles, waves, campaigns, or tides all attempt to describe and explain periods of intensified protest. As Mark Beissinger observed “Most important for understanding the politics underlying events is the fact that events and the contention over identity which they represent are not distributed randomly over time and space. Their appearance is structured both temporally and spatially” (2002: 17). As in culture and the economy, there is indeed a recurrent dynamic of ebb and flow in collective mobilization.

The concept of protest cycle also points at some regularities in cycles: protest rises and declines following some specific sequences. Mobilization proceeds “from institutional conflict to enthusiastic peak to ultimate collapse” (Tarrow 1994: 168). Research aimed to single out some main determinants of both the ups and the downs of mobilization.

During the ascending phases, protest spreads geographically and socially, through cognitive, affective, and relational mechanisms. Precipitating circumstances produce a radical destabilization of social relations within a polity, and the increased unpredictability of interactions favors the diffusion of protest, as movements borrow (successful) inventions from each other (Koopmans 2004). By demonstrating the vulnerability of the authorities the first movements to emerge lower the cost of collective action for other actors (Tarrow 1994). Through process of imitation and learning, spin-off movements mobilize, sometimes in alliance, sometimes in opposition to the previous ones (della Porta & Tarrow 1986). Organizational dynamics are also involved. Social movement organizations cooperate and compete with each other, investing resources to intensify mobilization. As Tarrow notes about cycles of protest, “After gaining national attention and state response, they reached peaks of conflict that were marked by the presence of movement organizers who tried to diffuse the insurrections to a broader public” (1994: 168). During cycles of protest new social and political actors emerge, as collective identities are created during intensely emotional moments. Events are linked sequentially to one another across time and space: “in the narrative of the struggles that accompany them, in the altered expectations that they generate about subsequent possibilities to contest; in the changes that they evoke in the behavior of those forces that uphold a given order, and in the transformed landscape of meaning that events at times fashion” (Beissinger 2002: 17).

Protest cycles, however, unavoidably decline, following similar relational, cognitive, and emotional mechanisms. Authorities tend to increase repression, but also to learn how to better target it against the emerging actors. Often, they aim at dividing the movement, through a mix of co-optation and exclusion. Also, once innovative forms of protest tend to lose their newsworthiness. If spin-off movements contribute to the mobilization of other groups, inventing new forms of action, enlarging the protest claims, and winning some concessions, they also push elites and countermovements to form law-and-order coalitions (della Porta 1999). At the individual level, intense activism tends to lead to disappointment and a return to private life.

CYCLES AND FORMS OF PROTEST

Research has also observed some cyclical dynamics in the forms of protest, moving from innovation to institutionalization and radicalization. Protest includes nonroutinized, unconventional, novel ways of affecting political, social, and cultural processes. Its forms vary, however. First, their capacity for disruption changes. They can be more or less radical in nature, ranging from more conventional petitioning to more conflictual blockades, and including a number of episodes of violence. Forms of action can also be
distinguished according to the “logic,” or modus operandi, which the activists assign them: logic of numbers, of testimony and of damage, the latter being reflected, in its most extreme form, by political violence. In violence against property the costs are still largely economic, but the logic becomes increasingly “military” in violence against persons. In all these events, however, violence has both symbolic and instrumental aims.

The first theorization on cycles of protest assumed some typical evolution at this level. The emergence of protest is characterized by innovation. In the initial stages of protest the most disruptive tactics are often to the fore, promoted by new social and political actors. Disruptive, innovative forms of protest initially attract media attention, surprise authority, and, appearing successful, tend to be emulated by other social groups. The use of the same forms of action reflects, but also often facilitates, reciprocal identification.

As the cycle of protest extends, processes of institutionalization but also radicalization develop. First, the authorities tend to channel the protest, through selective repression of some actors and some forms of action, and acceptance of others. Also, formal organizations emerge out of the protest and previously existing ones (such as unions or parties), that had been challenged in the beginning of the cycle, regain control. Moreover, “Participants, at first enthused and invigorated by their solidarity and ability to challenge authorities, become jaded or disillusioned. Authorities, instead of calling out the troops or allowing the police to wade into a crowd, infiltrate dissenting groups and separate leaders from followers. Routinization follows hard upon disruption” (Tarrow 1994: 112).

At the same time, there tends to be, however, a process of radicalization. While at the outset of protest violent action is usually limited in presence, small in scope, and unplanned (often the unforeseen result of police intervention during innovative forms of protests), as protest develops, violent forms of action initially spread more slowly than nonviolent ones. Clashes between demonstrators and police or counter-demonstrators, that start out as occasional episodes, tend to take on a ritual quality. Their very presence increasingly intimidates the moderate, accelerating their exit from the movement, and contributing to a demobilization. Also, the newsworthiness of protest tends to decline with its use, and the mass media tend to refocus attention; radical actions succeed in getting attention, but at the price of a broad stigmatization. The final stages of the cycle thus see both processes of institutionalization and of radicalization, as indicated by a growing number of violent actions.

**CONTEXTUALIZING CYCLES**

Concepts such as cycles, waves, campaigns, and tides have the merit of helping locating single protest events as well as social movements within the broader historical context to which they belong. They stress that each protest event builds upon previous ones, and that its forms as well as the reaction in the broader environments are influenced by those previous ones. Additionally, the evolution of individual movements – be they nationalist, labor, or new social movements – cannot be understood in isolation from that of other, cooperating and/or competing, ones.

While assisting the contextualization of research on social movements, the reflection on cycles of protest (and related concepts) has been criticized for its tendency to too quickly generalize from specific historical circumstances. Theorization on the evolution of cycles of protest developed in particular on the Italian protests between the mid-1960s and the mid-1970s, when small groups began to specialize in increasingly extreme tactics, built up an armory for such action and occasionally went underground (della Porta 1995).

Comparative analyses have pointed at some specific characteristics of specific cycles. For instance, radicalization in a violent form does not seem to be an unavoidable consequence of cyclical dynamics. Looking at left-wing social
movements in Europe, it has been observed that if in the 1970s there had indeed been a tendency to maintain media attention and “threat potential” through an accentuation of extreme forms of action, since the 1980s, a growing moderation in the repertoires of collective action has been noted. A new cycle of protest that developed between the end of the 1990s and the 2000s, including forms of nonviolent direct action, did not undergo radicalization processes (della Porta 2007).

Second, even in the 1970s, the spread of violence during the same cycles of protest varied by country. Cycles of protests during the formation of the nation-state led to a repertoire of centralized political activity and social movements organized at the national level (Tilly 1978), while recent challenges to the state have led to the development of multi-level social movement organizations (della Porta & Tarrow 2004). In particular, radicalization happened in some cases but not in others, as it was influenced by political opportunities as well as relational dynamics, rather than being determined by either structural constraints or fixed patterns of evolution (della Porta 1995).

In addition, if the choice of protest forms is limited by a series of factors internal as well as external to protest itself, actors maintain a capacity to reflect and act strategically. This means that they learn from past experiences about the advantages and disadvantages of specific tactics, trying to avoid previous mistakes. Already in the 1980s, the Italian left-wing social movements had developed a strong criticism of the violence of the 1970s. Beyond strategic thinking, normative concerns change, with the movement cultures, influencing the evolution of successive cycles. As James Jasper (1997: 237; see also Taylor & van Dyke 2004) observes, “tactics represent important routines, emotionally and morally salient in these people’s lives.”

The challenge for future research is, therefore, to combine the reflections on how cyclical dynamics interact with those on specific contextual conditions as well as movement cultures.

PROTEST EVENTS AND CONTINGENT EVOLUTION

A different type of criticism to a deterministic view of cycles of protest develops from the observation of the contingent and open-ended developments of protest events. In research on protest cycles, waves, campaigns, or tides, protest events have been mainly conceptualized as aggregated collective action. In social movement studies, protest has in fact been mainly studied through protest event analysis, oriented to collect information on an aggregate of protest events, and explained on the basis of political opportunities and organizational resources. More recently, some scholars suggested instead looking at the effects of protest on the social movement itself, by focusing on “eventful protest.” Historical sociologist William H. Sewell has promoted an “eventful temporality [that] recognizes the power of events in history” (1996: 262). If events are a “relatively rare subclass of happenings that significantly transform structure,” an eventful conception of temporality is “one that takes into account the transformation of structures by events” (1996: 262, emphasis added).

This way of looking at events tends to correct the structuralist bias that has been noted in first research on protest cycles (Koopmans 2004), by looking at the ways in which contingency affects the given structures by fueling mechanisms of social change: organizational networks develop; frames are bridged; personal links foster reciprocal trust. The events have a transformative effect, in that they “transform structures largely by constituting and empowering new groups of actors or by re-empowering existing groups in new ways” (Sewell 1996: 271). In this sense, the protest events that form cycles are not considered as determined by their context, but as constituting arenas in which collective experiences develop through the interactions of different individual and collective actors, who with different roles and aims take part in them.

With reference to “eventful temporality,” the concept of “transformative events” has
been developed to single out those events that have a particularly high capacity of agency. As McAdam and Sewell observed, “no narrative account of a social movement or revolution can leave out events... But the study of social movements or revolutions – at least as normally carried out by sociologists or political scientists – has rarely paid analytic attention to the contingent features and causal significance of particular contentious events such as these” (2001: 101). Moments of concentrated transformation have been singled out, especially in those highly visible events that end up symbolizing entire social movements – such as the taking of the Bastille in the French Revolution or the Montgomery Bus Boycott in the American civil rights movement. These represent critical junctures altering the cultural meanings or signification of political and social categories and fundamentally shaping collective loyalties and actions.

Beyond these few turning points, many protest events have cognitive, affective, and relational impacts on the very movements that carry them out (della Porta 2008). During protest events, new tactics are experimented with, signals about the possibility of collective action are sent, feelings of solidarity are created, organizational networks are consolidated, and sometimes public outrage at repression is developed. Events that were initially constrained by the external structural conditions, help therefore in redefining the conditions for a successive chain of events. As Beissinger has observed for nationalism, it “needs to be understood not only as a cause of action, but also as the product of action. This recursive quality of human action – the fact that action can function as both cause and effect – and the significance of this for the study of nationalism are the central theoretical issues this books seek to address” (2002: 11). Not only do protest events reproduce, rather than just consuming, resources of solidarity and collective identification (Fantasia 1988; Rochon 1998), but they are also “contentious and potentially subversive practices that challenge normalized practices, modes of causation, or system of authority” (Beissinger 2002: 14). Research on cycles of protest should therefore address the ways in which events “become turning points in structural change, concentrated moments of political and cultural creativity when the logic of historical development is reconfigured by human action but by no means abolished” (McAdam & Sewell 2001: 102).

Protest event research
SARAH A. SOULE

Social movement research has developed a rich tradition of using data on collective action and protest events (hereafter “events”) that is culled from various sources (e.g., news reports, police records). Event data has been used by scholars to answer questions about the causes of ethnic violence and collective action (Olzak 1992), citizen protest of various types (Soule & Davenport 2009), and strikes (Biggs 2005). Event data has also been used to analyze the outcomes of social movements (Soule et al. 1999; Olzak & Soule 2009), including the policing of protest (Soule & Davenport 2009). A major benefit of this type of data is that it facilitates both comparative and historical research (Tarrow 1996), while also allowing for quantitative research on social movements (Olzak 1989). Additionally, there is often no better alternative (Franzosi 1987).

DATA SOURCES AND METHODS

The most common source of protest event data is the news media, whether from traditional newspapers (Rucht & Neidhardt 1998; Soule & Davenport 2009), less traditional newspapers (Davenport 2010), newswires (Schrodt & Gerner 1994), or Internet sources (Earl and Kimport 2010). However, researchers routinely use the following additional sources to construct a catalog of events: police records (McCarthy et al. 2008), records of permits filed for upcoming protest events (McCarthy, McPhail, & Smith 1996), annual reports by private or public agencies (Braun & Vliegenthart 2009), activist calendars (Hadden & Tarrow 2007), archival materials (Tilly 1986), and participant observation (Gillham & Noakes 2007). Of course, many researchers use a combination of sources in an effort to paint a complete picture of protest in a given time or place.

Some scholars use indexes to locate candidate events (Olzak 1992), while other scholars scour sources in their entirety for evidence of any event (Olzak & Soule 2009). Additionally, some scholars opt to look for events on each and every day of the given time period of inquiry, while others opt to sample some days or weeks or years of a given period (Hadden & Tarrow 2007).

Once a catalog of events is collected, scholars then typically use content coding techniques to summarize the information provided by the source and, in most cases, to provide a numeric representation of the information for quantitative analysis. Most scholars code information about the number of protesters present, location of the event, goals or claims of the event, tactics used by protesters, presence and extent of violence at the event, and police response to the event.

POTENTIAL BIASES AND SOLUTIONS

Most scholars agree that there are two potential sources of bias associated with event data (Earl et al. 2004): selection and description bias. Description bias refers to how well the source describes what actually happened at a given event. Selection bias is a function of the fact that not all events will be covered by a given source and the possibility that what is covered is not a random sample of all events that took place. Simply put, not all protest is covered by newspapers, nor do police attend all protest events (thus they do not issue reports on all protest), and not all protest is permitted.

With respect to description bias, scholars usually try to triangulate among sources in an attempt to get a more complete picture of what actually happened at an event (Soule 1997; Davenport 2010). However, this proves impractical when compiling large event catalogs.
With respect to selection bias, a number of practices are becoming commonplace. First, because scholars have found that larger, more intense (i.e., violent), events are more likely to be covered by the media and are more likely to draw police presence (hence to be picked up in police reports), it is important to include controls for the size of the event, the use of violence, and the use of extreme tactics (Larson & Soule 2009). Second, some scholars (Soule & Davenport 2009) use a series of simulations to ascertain how over-reporting of certain kinds of events may impact the results. By randomly deleting violent, intense, or large events, and then re-running statistical models, these scholars show that their findings remain stable until about 40–50 per cent of the “intense” events are removed. While we do not know precisely the extent of over-reporting of such events, this provides some confidence that the results remain stable, even if we assume a fairly high amount of over-reporting.

Third, because scholars find that events that are close to the source are more likely to be covered in a source (Oliver & Maney 2000), most quantitative research now includes statistical controls for the distance of the event from the news source (Soule & Davenport 2009). Usually this is done via including dummy variables for the location of the event (for example, including a dummy variable for New York City events, if using the New York Times). Others only collect information on events that are located in the same city or state as a source (Snow, Soule, & Cress 2005) or analyze student events reported in campus papers (Van Dyke 2003).

Fourth, some scholars note that the reporting of events in newspapers, in particular, is likely affected by the broad editorial policies and/or the political leanings of the newspaper (Davenport 2010). This has led some quantitative scholars to include time period measures for different editorships in an attempt to control for editorial practices. One could also imagine constructing a time-varying measure for the political leanings of the newspaper by studying the overall history of the newspaper, including the history of the ownership (e.g., family vs. corporate) of the paper (Davenport 2010: 186).

Fifth, some scholars note that newspapers, in particular, are subject to biases associated with media attention cycles, which can make it difficult to discern whether or not observed fluctuations in levels of protest are due to actual fluctuations or due to fluctuations in media attention to the issue (Soule et al. 1999). One way this has been dealt with is to collect generic measures of media attention to a given issue area and include this as a statistical control in quantitative analysis. For example, when studying levels of women’s protest events, Soule and colleagues (1999) include a count of articles on women’s issues that was generated from the Readers Guide to Periodic Literature to control for media attention to women’s issues.

CONCLUSION

The field of social movements has learned a great deal from studies using protest event data; in fact, many of our most central theories have been developed by scholars who used this kind of data. Many of the findings from the body of literature using protest event data have been replicated by scholars using other kinds of data (Earl et al. 2004). Thus, there is no sign of a decline in the usage of protest event data. This is because movement scholars have asked themselves if the best available data (however flawed) are worthy of analysis and because they have studied the biases and come up with some creative solutions. This, of course, is no different from analysis of the quality of other kinds of social scientific data (e.g., social surveys, reports of crime). Berk (1983: 392), for example, notes that sample selection bias is pervasive in most social science data and that the question should not be whether bias exists, but “whether the bias is small enough to be safely ignored.” On this note, it is important to take the question of bias seriously and to follow steps to reduce this bias, while also suggesting further remedies and sharing these
with the wider scientific community. However, the field is far from ready to cease using event data.

4 PROTEST EVENT RESEARCH

Public opinion and movements

KATEŘINA VRÁBLÍKOVÁ

Although public opinion would seem to be a crucial factor for achieving a large-scale mobilization and impacting politics and public policy, it has not yet received much attention in the social movement literature. There are probably a number of reasons for this lack of attention: (1) data on public opinion suitable for social movement scholars are not usually covered in publicly available opinion surveys and to gather them is costly; (2) requirements for data gathering would be even more demanding than for standard surveys because more developed research designs going beyond one survey at one time, such as public opinion across geographical units or longitudinal data, are needed; (3) public opinion is frequently studied by political science, while social movements are a primary focus of sociology. The following will first define what public opinion is, and how social movements can influence it, and then present two ways in which public opinion can play a significant role for social movement activism.

Public opinion can be defined as a distribution of opinion statements regarding a given issue in a society (Zaller 1992: 36). It is closely related to the way it is measured, in opinion polls. Public opinion researchers point out that public opinion, the results from opinion surveys, should not be understood as an aggregation of people’s pre-existing “true attitudes” towards a particular issue. Actually, people very rarely have fixed attitudes that they would reveal when responding to a survey question. Rather, individuals balance various considerations and, as a result, public opinion is a count of a “range of reactions” rather than stable “true attitudes” (Zaller 1992: 34). Nevertheless, this is not to say that public opinion expressed in opinion surveys is inauthentic or not perceived as real by political actors. It is only to say that public opinion is permanently reconsidered, open to change and unstable.

Also, the social movement literature has long ago acknowledged that identities, interests, and attitudes toward specific policy issues are not fixed and that only a few people are able to transform their grievances into political consciousness. Together with other political actors social movements play an active role in mobilization of public opinion. They can put a completely new issue on the public agenda, as women’s movements did with issues that were until that time considered only personal. Social movements can bring new perspectives on already existing issues, reframe them, and try to influence the direction of public opinion towards particular issues. For example, protests against the war in Vietnam tried to change the direction of public opinion towards it. Lastly, social movements can make an already existing favorable general opinion of their issue more salient. There are many issues that almost always receive majority public support such as human rights, environmental, and health issues. However, they are often buried among issues perceived as more important at a given time and social movements can help increase their visibility. For instance, civil rights protests in the US managed to increase public attentiveness to African American civil rights during the heyday of the movement in the 1960s (Burstein 1985).

Social movement literature has paid a lot of attention to the process of how social movements can influence public opinion, interpretative schemata, identities, and political consciousness by providing identification and interpretation of social problems through framing processes (Snow et al. 1986), which can lead to consensus mobilization (Klandermans 1984). However, acknowledging that social movements mobilize public opinion is
not to say that they would or could completely manipulate people’s minds. There always has to be a resonance between existing prior values in the population and a mobilizing issue. That is why the existing public opinion and generally shared values can be regarded as the cultural opportunity structure (Gamson & Meyer 1996; McAdam 1996) that puts external constraints on how movements can be successful and what persuading strategies they can use. In order to be successful in their consensus mobilization, social movements’ framing should resonate with generally shared values and opinions (Snow et al. 1986). For social movements it is easier to shape public attitudes towards specific policy issues that are unstable and vulnerable to persuasion strategies of political elites, including social movements, than to change deeply rooted core values that are fairly stable over time (Zaller 1992). For this reason, when social movements want to influence public opinion towards a specific political issue, they strategically frame it and link to the cultural opportunity structure represented by the generally accepted value structure in the society.

Public opinion is important to social movements for two reasons. First, supportive public opinion is a necessary precondition of larger protest events. If people do not support the goal of social movement activity they are unlikely to take part in it. People having sympathetic views towards a social movement and its goals constitute the so called “specific action potential” from which social movements can draw the actual participants of their protest events (Klandermans 1984). This reservoir of supportive people sets limits within which an action mobilization can succeed. When it is small, social movements cannot hope for a large-scale popular mobilization. At the same time, by shaping public opinion, social movements actively help establish constituencies of people supporting their political views, from which they can later recruit individual participants (Klandermans 1984). Changes in public opinion can be fast and substantial in both directions and significantly influence the scope of individuals mobilizable into action. For example, the longitudinal study of activist mobilization by the Dutch peace movement done by Oegema and Klandermans (1994) shows that the loss of support and sympathy for the movement was one of the two most important accounts of why people originally supporting the movement and planning to sign its petition against cruise missiles did not end up doing so.

However, not all social movement organizations intend to follow consensus mobilization with action mobilization. For some social movements public opinion is a more important goal than the action itself. As the director of the Greenpeace European Unit put it “we are less interested in having tens of thousands of people in Brussels, although we have also participated in mass demonstrations, but it is much more about creating an image...that can catch people’s attention and that can illustrate the problem” (Cisar 2010: 740). Similarly, collective action itself can be used to shape public opinion. Some action repertoires of social movements are primarily focused on influencing public opinion and are not based on mass mobilization such as happenings, political theatres, hunger strikes, and terrorist attacks. These repertoires are intentionally focused solely on influencing public opinion where ordinary citizens play only the spectator role and do not act themselves.

Second, large-scale protests or supportive public opinion are usually not the ultimate goal for the majority of social movements. Rather, they mobilize public opinion and individuals into protest action because they want to pursue policy changes. In the literature there is no general agreement on how social movements, public opinion, and policy outcomes are related, and therefore several theories exist. One group of researchers argues that it is primarily public opinion that matters for policy change and not the activity of social movements. Social movements can influence policy outcomes only when their action is mediated by public opinion (Burstein 1985, 1999). This means that social movements have only an indirect impact on
policy outcomes and that public opinion functions as the intervening variable. But, still, it is primarily public opinion that influences policy outcomes and can do it independently of social movements. The theory explains that without the support of a wider public, political leaders, who seek re-election, do not have any reason to positively respond to the requirements of social movements because they do not represent the majority of society. Politicians will change the policy only if they think that the demands of social movements are supported by the majority of citizens and are important enough for people to base their vote on them. For example, Costain and Majstorovic (1994) show how the American women’s movement mobilization increased the public awareness of gender issues that consequently influenced the legislative action in this area. Burstein (1985) shows that the civil rights movement had an impact on policy changes through heightening the salience of the issue of African Americans’ rights.

Some other studies give support to a different relationship. They show that both social movements’ activism and favorable public opinion have their independent impact on policy outcomes. In other words, public opinion is not necessary to mediate the effect of social movements that can influence politics directly. For instance, McAdam and Su (2002) show how different types of protests influenced congressional voting on the war in Vietnam in conjunction with changes in public opinion on the issue.

A third group of studies suggests a more complex perspective on the relationship between social movement activism and public opinion. According to these authors, public opinion and social movement protests have a combined effect and interact together to increase the likelihood of policy change. The studies show that social movement activism moderates the influence of public opinion on policy changes (e.g., Agnone 2007). They explain that in addition to the independent effect of both public opinion and protests, protest mobilization increases the saliency of supportive public opinion that leads to a higher likelihood of policy impact. For example, Agnone (2007) shows how the effect of favorable public opinion on the number of passed federal laws supportive of the environment was increased when accompanied by more protests by the US environmental movement.

Public order management systems

PATRICK RAFAIL

Public order management systems (POMS) are “the more or less elaborated, more or less permanent organizational forms, their guiding policies and programs, technologies, and standard policing practices that are designed by authorities for supervising protesters’ access to public space and managing them in that space” (McCarthy & McPhail 1998: 91). Variations in the features and styles of policing protest have received extensive analyses in recent years, but comparatively little systematic attention has been paid to the organizational structures that institutionalized police practices are embedded within. Three major components of POMS are apparent in contemporary Western democracies: (1) spatial and temporal restrictions on protest, grounded in a widespread adoption of advanced permitting systems; (2) training regimens and technologies designed to help the police more effectively contain and control demonstrations; (3) an emphasis, at least rhetorically, on the police negotiating with key participants and organizing groups before and during events.

Advanced permitting systems have become sufficiently widespread that applying for a permit is a staple component of organizing a demonstration in many Western democracies. Permitting systems are generally framed by governments and police departments as creating legal and procedural infrastructure intended to provide an accessible and rule-governed channel for activists who wish to organize protest events. Yet, scholars have also noted that permitting systems impose various restrictions on the time, location(s), activities, and duration of protest events. Indeed, permits may facilitate the tightening spatial control over demonstrations by the police (Gillham & Noakes 2007), and have been increasingly used to restrict dissent to specific “protest zones” (Zick 2009). Permits are typically granted by municipal governments or police departments and are often required for demonstrations. As such, applying for a permit reflects asymmetries in power and resources between protesters and the state, and some scholars have claimed that the permitting system is a form of tacit state control over dissent (Mitchell and Staeheli 2005).

A second major attribute of contemporary POMS is linked to changes in police training and technology over the last 30 years. Traditionally, training for public-order policing taught officers to engage with crowds as individuals or with a partner. In contemporary POMS, this has evolved towards a more comprehensive, squad-based approach to controlling large gatherings (McPhail & McCarthy 2005). Changes in training regimes are clearly seen in the widespread diffusion of police paramilitary units (PPUs). Several studies (e.g., Kraska & Paulsen 1997) suggest that there has been a routinization of police reliance on paramilitary units for daily operations over the last 30 years, and many different police departments have made extensive use of PPUs at high-profile events, including the 1999 World Trade Organization protests in Seattle, the 2001 G8 protests in Genoa, and 2010 G20 protests in Toronto. Police have also increasingly relied on less-than-lethal weapons such as pepper spray or tear gas during demonstrations, and traditional technologies such as barricades are being used to more effectively separate a large group of protesters into manageable clusters. Such uses of pens and barricades complement the adoption of “protest zones” mentioned above, as these technologies can be used to create physical structures demarcating the boundaries of designated free-speech areas.

Contemporary POMS, at least in their accompanying rhetoric, also emphasize a more
give-and-take relationship between protesters and police, grounded in negotiation before and during protest events. This denotes a considerable break from the 1960s wave of protest where the police relied primarily on coercion and intolerance to protest (McPhail, Schweingruber, & McCarthy 1998). This creates an incentive for more professionalized social movement organizations to cultivate cooperative and durable relationships with the police, and such practices have been linked to the historic decline in more coercive protest control over the last 50 years. However, significant and regular exceptions to negotiation-based strategies occur with what appears to be an increasing frequency. For example, Vitale’s (2005) analysis of the tactics used by the New York Police Department during several recent protest events suggests that the NYPD has become decidedly more hostile to negotiating with protesters. There remains a paucity of research examining how the police interact with more radical movements or groups that refuse negotiation with authorities.

Finally, it is important to emphasize that POMS represent ideal typical constructs that vary considerably across police departments within and between nation-states. For example, Rafail’s (2010) comparison of contemporary protest policing in Montreal, Toronto, and Vancouver, Canada, finds that only the police use of force and protester pre-mobilization consistently predict arrests at protest events, while a variety of protester behaviors and other factors had variable effects across the cities. Wisler and Kriesi (1998) compare protest policing in Zurich and Geneva, Switzerland, and suggest that factors such as the legitimacy of demonstrations and local histories of contention influence the tactical repertoires of the police and challenging groups. Overall then, even within nation-states having strong traditions of social movement mobilization and highly institutionalized POMS, the daily operation of protest control strategies is strongly predicated on locally constructed factors and relationships between activists and the police, which vary widely.

REFERENCES AND SUGGESTED READINGS

The public sphere is hard to define in terms of boundaries – it has in principle no limits. We can try to separate it from the private sphere; yet even here claims abound that the private is political, thus undermining a clear separation of the sites where public communication takes place from sites where private communication takes place. We can try to separate it from the economic sphere or from other spheres; yet the porosity of the boundaries is obvious. Some sites succeed better than others in keeping the public sphere outside for a time. Often such attempts collapse. Boundaries move in and out of other spheres of social life, and no definition can be given that clearly delineates either a spatial boundary (as the concept of public space insinuates) or a functional boundary (private versus public) or a thematic one (things you do not talk about, i.e. tabooed topics, and things you talk about). This difficulty has preoccupied one of the most sensitive functionalist thinkers, Luhmann, who struggled with the problem of how to make sense of what he finally called the “reality of the mass media” (Luhmann 2000).

The public sphere is constituted in acts or practices which seek to make public what others may try keeping from becoming public. There is also the other movement of keeping private what others want to make public (e.g., talk shows, Facebook, etc.). This particular character of the public space prevents us from treating it as a clear entity with boundaries. Rather, it emerges from moving boundaries. This also explains the variety of theories of the public sphere (Ferree et al. 2002).

The birth of the public sphere has been located in the nineteenth-century struggle of an emerging civil society trying to emancipate itself from the authoritarian state. This idea has found its classical expression in the early work of Habermas published in 1962 (Habermas 1989), rephrased yet basically remaining unchanged in later reformulations (Habermas 1992). He combines two arguments: a cognitive argument which gave an important role to intellectual debates in the making of a public sphere, and a genuinely sociological argument in identifying sites which escaped control from authoritarian censure and enabled actors to coordinate their activities, thus constituting a realm of civil society as the counterpart of the state. An expanding number of sites and a particular cognitive debating mode generate what contemporaries have described at times as opinion publique, the opinion uttered in public, or Öffentlichkeit, an ideal space where cognitive orientations prevail over normative orientations. It crept into society yet did not become identical with it. Öffentlichkeit imposed itself upon the parts of society as a kind of reflexive image of society, and its apotheosis became the attempt to identify this emerging collective voice with the civil society claiming its emancipation from state authority.

Given the normative idealization of the rise of the public sphere, the observation of a fall of the public sphere made increasing sense given the empirical evidence of its real functioning. The diagnosis of a fall is linked to the power resulting from the control of the means of symbolic production that have become available by the emergence of a public sphere. Habermas described this process of control as a structural transformation of the public sphere which, on the one hand, became part of the capitalist organization of mass communication and, on the other hand, part of the regulatory state emerging from the debris of the old regimes. It is a double appropriation of the public sphere: one by capitalist market forces, which made profits from organizing public communication through mass media; the other by the state, which used the mass media for its self-presentation to the public – the civil society and later on the proletarian and rural society.
Habermas himself withdrew his negative account of this phase, which would have led to the theory of the self-destruction of the public sphere. The ambivalence remained, however. The public sphere turned out to be an ideal instrument for mobilizing democratic sentiments, especially through mobilizing the working classes. Yet it also served well for mobilizing antidemocratic sentiments and movements. The rise of fascism in Europe cannot be explained without a reference to the role of public communication. The economic rationalization of mass communication and the rise of control capacities of the state generated a public sphere which turned the cognitive mode of public debate on its head. Transforming its cognitive mode into an aesthetic mode of communication, the emotions of the public became addressable, which went far beyond the direct mode of addressing people of traditional rulers. By doubling the direct presence by the indirect presence of words and pictures, a public sphere emerged which pushed the project of control of the emerging public sphere to its extreme.

Another transformation, the second one, is the increasing presence of voices within the public sphere. Putting people on the public stage and thus peopling the public sphere with its constituency is realized in the modern entertainment industry. The public sphere gives a voice to the people—they can say what they want, they can even break taboos and talk in public about things nobody would have dared to talk about before. This characteristic of the contemporary public sphere—giving a voice to almost everybody—produces ambivalent effects: democratic institutions are not only exposed to the volatility of mass media staging, but they become dependent upon this volatility.

Being exposed to cycles of attention or indifference to politics in the course of its transformations, the public sphere is undergoing a third transformation: the “normalization” of the public sphere. Normality is often associated with the loss of the critical capacity of the public sphere. Taking up an argument by Habermas against the story of the decline of the public sphere, we have to reckon with counterprocesses triggered by a “normative power” or “argumentative power” inherent in the idea and practice of the public sphere. Simply by engaging in a public debate with others we implicitly accept rules which are oriented toward “rational understanding” as a mechanism of agreement by consensus. Empirically, this does not mean that our action is oriented toward such agreement and consensus. Defending believing in the “illusion” of the rationality of public debate provides “critical power.” The public sphere is forced by this illusion to make invisible the power of the argument which often succeeds but at critical junctures fails. It is in these junctures that social movements gain momentum and take serious issue with the illusion upon which the idea of a public sphere is based.

Quotidian disruption
ELIZABETH BORLAND

Quotidian disruption refers to the breakdown or interruption of everyday practices, routines, and expectations which leads to a heightened likelihood of the emergence of collective action. The word “quotidian” means the routines of daily life, and encompasses the everyday practices we all take for granted. A modern variant of breakdown theory, the central argument of the quotidian disruption model, proposed first by Snow and colleagues (1998), is that actual or threatened disruption of the quotidian is the key element which connects social breakdown to movement emergence.

PRECURSORS TO QUOTIDIAN DISRUPTION

The quotidian disruption model has precursors in classical breakdown theory, one stream of the strain theory which dominated the early literature on social movements until it was displaced by resource mobilization theory. Breakdown theories of collective action posit that all sorts of collective action – from riots to revolutions – arise when social order breaks down and can no longer exert control over social actors (see Useem 1998 and Buechler 2004 for reviews). Individuals living in societies that have experienced social disintegration are released from this social control and are therefore more likely to participate in collective action.

Though the critiques made by proponents of resource mobilization theory challenged the assumptions and empirical accuracy of breakdown theory, and led to its decline in the 1970s (see Useem 1998 and Buechler 2004 for a summary of arguments by resource mobilization critics), some movement scholars continued to advance arguments in support of the importance of breakdown for social movements. In their work on poor people’s movements, Piven and Cloward (1977) argued that disadvantaged groups will only make demands when they face exceptional “social dislocations.” They pointed to how the Great Depression and the modernization and migration of the 1960s in the United States led to the disintegration of communities which had previously regulated and structured everyday life, paving the way for large-scale mobilization. They maintained that movement grievances and claims are shaped by daily experiences with social dislocation, rather than the mobilization of resources by social movement organizations. In models predicting movement success, Goldstone (1980) found support for these arguments: Social breakdown was a better predictor of success than organizational variables.

Subsequent work by Walsh (1981) on activism in the wake of the Three Mile Island nuclear disaster introduced the concept of “suddenly imposed grievances” which is relevant for the development of the quotidian disruption model. Walsh found that the sense of immediate threat which affected local communities after Three Mile Island had an important effect on mobilizing activism. Evacuees from the area – the individuals who found their lives most disrupted by the disaster in its immediate aftermath – were most likely to organize, a finding which contradicts the predictions of resource mobilization theory. For quotidian disruption, it is this notion that rupture of the daily order of life leads to activism, rather than the suddenness of the accident, which is critical (Snow et al. 1998).

THE QUOTIDIAN DISRUPTION MODEL

Though scholars of collective action had previously noted that movements are most likely to arise when the patterns of everyday life are...
threatened, the term “quotidian disruption” was first introduced by Snow et al. (1998) in an article that advances a new model to help us understand collective action in the wake of social disruption. They argue that social movement scholars were too hasty in their dismissal of breakdown theory, and refine breakdown arguments to fit a wide variety of movements.

Quotidian disruption adds two elements not present in earlier breakdown models: insights from cultural theory and prospect theory. Cultural arguments derived from Bourdieu (1977) and Foucault (1983) contribute the notion of the quotidian as being made up of daily practices and habits, routines which vary depending on one’s position in the social structure. In addition to these practices, the quotidian also includes a cognitive component of routine expectations, which Schutz (1962) terms “natural attitude.” Snow and his colleagues also draw from cognitive psychology’s prospect theory (Kahneman & Tversky 1979), which argues that people are loss averse, so they will risk more to prevent the loss of what they already have than to gain something new. Therefore, when the quotidian is disrupted and people are faced with the loss of their subsistence routines or other things that are central to their everyday experiences, they are more likely to mobilize in protest.

In their model, Snow and colleagues build on previous research as well as original fieldwork to elaborate four conditions in which quotidian disruption leads to an increased likelihood of collective action. The first condition is based on Walsh’s (1981) previously mentioned research on Three Mile Island: accidents which disrupt the daily order of life, particularly those that can be blamed on human negligence, are likely to generate collective action. The second condition is that threatened or actual violations of people’s privacy or safety will cause people to mobilize in order to restore control over these aspects of daily life. This condition is derived from research on anti-drunk driving activism, anti-busing efforts, and a wide variety of NIMBY (not-in-my-backyard) movements that organize to repel the incursion into neighborhoods of threats like waste dumps or group homes. The third condition is elaborated on using the authors’ fieldwork on mobilization by homeless people. They find that an increase in the demands for scarce resources and/or a decrease in available resources will cause changes in subsistence routines, and this disruption will likely generate protest. The final condition builds on work on prison riots by Useem and Kimball (1989): Changes in the structures of control and social organization which cause dramatic shifts in daily routines, such as in the case of highly regulated settings like prisons, are likely to lead to collective actions to modify the new regulations. Though different, each of these four conditions involves a disruption which is experienced collectively, rather than at the individual level. Also, they are similar in that each disruption does not have a resolution within normal institutionalized channels.

In addition to specifying these conditions, Snow and colleagues connect quotidian disruption to collective action framing, and the mobilization of resources. They suggest that some types of framing and resources may be less important for movements that organize in the wake of quotidian disruption. They suggest that individuals who are motivated to organize because of threatened losses may not need as many organizational or other resources, or as much motivational framing, as in other types of collective action.

APPLYING QUOTIDIAN DISRUPTION

As a modern variant of breakdown theory, the quotidian disruption model is part of a broader trend to reexamine and renovate breakdown theory in recent years (see Useem 1998; Van Dyke & Soule 2002; Buechler 2004; Snow, Soule, & Cress 2005), but the model has not been applied or tested sufficiently in the literature on social movements. The quotidian disruption model is a particularly useful variant on breakdown theory because – unlike earlier versions of the theory – it allows for
the breakdown of everyday routines as well as strong social network ties (Buechler 2004). By emphasizing the disruption of the quotidian, rather than the breakdown of social control and the disintegration of communities, the model can help us understand how people maintain solidarity even when faced by quotidian disruption, and how they capitalize on social ties to organize in the face of such uncertainty. Therefore, applying quotidian disruption to recent cases in which people’s everyday lives are shaken by natural and/or human-made disasters, such as Hurricane Katrina or the earthquake in Haiti, could help us see how people build community in their aftermath.

However, the fact that the model emphasizes a combination of local community-level disruption and individual-level experiences is one reason why quotidian disruption has not been examined using hypothesis testing in statistical models. Snow, Soule, and Cress (2005) raise this problem in their study of homeless protest using a large sample of protest events in 17 cities; they test strain models using city-level data, but – like most scholars doing quantitative protest event research – they do not also have individual-level data which would be necessary to test quotidian disruption.

Qualitative research that examines collective action in the wake of social crises may be better suited to understand this link between the community-level and individual-level processes that are captured in the quotidian disruption model. Borland and Sutton (2007) examine quotidian disruption in the wake of Argentina’s 2001 economic crisis, focusing on how individual women were mobilized to participate in collective action. They find quotidian disruption to be a helpful concept because the notion of the quotidian recognizes variation depending on one’s position in the social structure. They argue that in the case of Argentina’s economic crisis, quotidian disruption was gendered, as it challenged everyday domestic practices and taken-for-granted assumptions about women’s place in society. Thus, an important strength of the quotidian disruption model is that it can shed light on how social movement activity varies among different social groups.

Radical flank effects
HERBERT H. HAINES

Radical flank effects (RFEs) are interactive processes involving radical and moderate factions of social movements and third parties outside those movements. They result in detrimental and/or beneficial impacts of radical group actions upon the reputations and effectiveness of more moderate collective actors—typically social movement organizations. The relative “radicalism” or “moderation” of actors is generally defined in terms of the degree of legitimacy that is imputed to their objectives, rhetoric, and tactics by relevant external audiences. Radical flank effects were first studied systematically by Haines (1984, 1988) in his investigations of the American civil rights/black power movements, but other scholars had made reference to RFE-like phenomena in earlier works on the civil rights (Killian 1975), feminist (Freeman 1975), labor (Ramirez 1978) and antinuclear (Barkan 1979) movements.

Broadly speaking, RFEs may take negative or positive forms. Negative radical flank effects resemble “backlashes,” and they occur where the actions of “extremists” damage the ability of more moderate actors to mobilize and to achieve their goals. For example, audiences outside a movement may fail to differentiate the unpopular ideas and actions of its radicals from those of its moderates (see Hoffman & Bertels 2009), seeing all movement participants as equally offensive and threatening. Even if such audiences do make a distinction between factions, they may hold the moderates responsible for the emergence of extremists. Similarly, authorities sometimes use extremist threats as a pretext to either ignore or suppress moderates and radicals alike.

It is positive radical flank effects, however, that have attracted the greatest interest from social movement scholars. Positive RFEs occur when the actions—or even the very existence—of radical groups work to the benefit of a moderate faction in various ways. For instance, disruptive tactics or inflammatory rhetoric employed by radicals may attract greater public attention to issues that moderate actors have long addressed with limited success. The presence of a radical flank may also allow moderates to portray themselves as the “reasonable” and “responsible” voices within the larger movement (Elsbach & Sutton 1992; Conner & Epstein 2007; Hoffman & Bertels 2009). And by enhancing the moderates’ reputations in this manner, the radical flank may also increase moderates’ attractiveness to potential contributors of funds and other resources (Haines 1984). Finally, radical flanks may use disruption or violence to create crises which authorities and other target groups attempt to resolve through accommodating longstanding moderate demands (Jenkins & Eckert 1986; Haines 1988; Conner & Epstein 2007). While it is possible that moderate and radical factions in “strategically articulated” movements (Downey & Rohlinger 2008) might cooperate in order to bring about positive RFEs intentionally, this is a risky strategy that could easily backfire if exposed. Moreover, it requires radicals to sacrifice their own objectives in order to further those of other groups. Thus, it is reasonable to assume that positive RFEs are almost always unintended results of movement fractionalization.

Researchers have identified a number of important issues regarding radical flank effects that merit further attention. First, there have been attempts to define “radicalism” and “moderation” in more precise ways (Downey & Rohlinger 2008; Hoffman 2009), which may eventually aid in the analysis of RFEs. Second, some scholars have suggested that there are other types of RFEs that are not fully accounted for by the simple positive–negative dichotomy. Rather than being passively impacted by radicalism, for example, moderate...
groups may be forced to shift their tactics and ideologies toward those of the radical flank (Gupta 2002) to avoid becoming irrelevant. These under-theorized forms may produce more complex and emergent impacts than those analyzed to date. Finally, there is a need to clarify whether positive RFEs typically occur as the result of elite strategies to co-opt or “channel” insurgency (Jenkins & Eckert 1986; cf. Piven & Cloward 1977) – to the ultimate detriment of the constituents of movements – or as fortuitous dynamics that ratchet up social change in ways that are genuinely beneficial to those constituents (Haines 1988).

Radicalism
REMY CROSS

The term “radicalism,” as used within the milieu of political and social movements, can have several different usages. Primarily there are three ways of looking at it: as a process, as a practice, or as a set of beliefs. It is a process in the sense that radicalism, whatever its form, is rarely born whole cloth. Rather, it is usually a journey from a nonradical state towards a more radical state. The practice of radicalism is most commonly associated with a set of tactics and strategies that lie outside the bounds of accepted political or religious protest, often verging on illegality. Radical beliefs, or ideologies, typically hold that the potential for desirable change lies outside the realm of legitimate modes of challenge and expression within the targeted institutional arena.

Because radicalism, and those associated with it, are generally regarded by their institutional targets as operating beyond the legitimate boundaries of protest and challenge, radicals and radicalism represent a kind of deviant behavior and expression. Like social deviance, radicalism represents the extremes of a wide central distribution of acceptable political behavior and can often include criminality, but for reasons of belief rather than personal gain. Pushing for an agenda or goal that lies outside of the field composed of peer organizations and state authority places that agenda or goal in the sphere of radicalism.

What is radical, however, is always situational and highly dependent upon both the norms of the movement and what state and institutional actors are willing to accept on the part of the movement. Movement norms can vary widely from movement to movement; the labor movement allows for a higher degree of direct confrontation than a movement such as education reform where similar tactics are more likely to be seen as radical. Similarly, the types of acceptable protest behaviors expressed in France are often seen as more radical by American observers, but contrasted with the extremely limited range of activity allowed in more totalitarian states where even simple marches can be seen as radical. Regardless of the type, whether it is part of a process, a set of practices, or a belief system, radicalism is situated at the edge of what is considered appropriate political practice within a society.

Whether radicalism manifest as a set of practices or a belief, it rarely springs fully fledged out of nothing. Instead it represents a point along a continuum of political behavior that groups and individuals move towards over the course of their activity. When speaking of radicals and radicalism, there is always talk of “becoming radical.” Della Porta (1995), writing about the European radical leftist groups of the 1960s and 1970s, records that they spoke of becoming increasingly radical as they became more enmeshed in the movement and it began to take over more of their lives, but it was always a process that required time and close proximity to fellow travelers.

Radicalism can also apply to practices or actions that are characterized by bystanders or participants as radical. This is usually applied to groups that employ strategies or tactics outside the realm of what is normally acceptable, often verging into the realm of illegal action. Political process advocates such as Tarrow (1998), and resource mobilization theorists like McCarthy and Zald (1977), root this move towards radical practice in resource deficits, either of traditional resources or access to elites, since radical acts are often relatively resource low. This lack of access is seen as a factor pushing some movements or offshoots towards more radical tactics and strategies.

Finally, radicalism can refer to beliefs about how best to achieve movement goals. Radical beliefs develop out of a sense that currently accepted pathways to social change are
insufficient and that extraordinary measures must be taken. Piven and Cloward (1977) believed that radicalism would rise as elites became increasingly less in tune with the demands of a movement. This is echoed by Tarrow’s (1998) thesis that contention emerges in cycles and that elites would favor those movements that were quicker to institutionalize, leaving those unable to do so with the choice of radicalizing to remain viable, though for Tarrow the choice to radicalize is one that would ultimately result in the demobilization of the movement. The implication of such possibilities is closely related to the idea of the radical flank effect (Haines 1984).

The shift in focus towards more process and resource-oriented theories of social/political change over the past few decades is what prompted, in part, a view of radicals as disenfranchised movement actors who were relegated to the outskirts of legitimate activity due to their lack of resources and insider access (McAdam, Tarrow, & Tilly 2001). However, the recent resurgence of both leftist radical movements, such as animal rights, deep green environmentalists, indigenous rights, and antiglobalization advocates, as well as right-wing groups such as religious fundamentalists, antistatist and nativist groups, have brought attention back to the role and process that radicalization plays in both practice and belief systems.

Rational choice theory and social movements
KARL-DIETER OPP

Scholars who systematically apply rational choice theory (RCT) to explain social movement phenomena are a minority. Examples are Oberschall 1980, 1994; Klandermans 1984; Taylor 1988; Chong 1991; Karklins & Peterson 1993; Marwell & Oliver 1993; Pfaff 2006; Wood 2008; Opp 2009a, 2009b. For applications of game theory, which is not discussed for limitations of space, see Chong 1991; Pierskalla 2010. This may suggest that RCT is a deficient theoretical approach, and that other perspectives are better suited to explain social movements and political protest. Is this conclusion correct? This question will be addressed here.

RATIONAL CHOICE THEORY: THE GENERAL MODEL AND VALUE-EXPECTANCY THEORY

The most general version of RCT consists of three propositions. The first is that human behavior is goal-directed: preferences determine behavior that is considered relevant to achieve the actor’s goals. This is the preference proposition. Goal-attainment depends on behavioral opportunities or constraints (i.e., benefits and costs). These are events that facilitate or impede goal attainment. This is the constraints proposition. For example, an individual may wish to express his or her discontent about a government decision. This goal could be achieved if there is a demonstration against the respective decision (i.e., a behavioral opportunity).

What happens if an individual’s goals cannot be achieved simultaneously? For instance, an activist has to decide how much time he or she will spend on the job or to organize social movement activities. The utility maximization proposition holds that individuals do what they think is best for them. The activist will look at the consequences of the different options available to him or her. For example, will a reduction of the time spent on the job decrease the likelihood of promotion, and how does he or she value this?

RCT is formulated for individual actors. But the theory is also applied to explain the behavior of collective actors like a government. This is only possible if goals and constraints or opportunities can be ascribed to collective actors. This is possible, for example, if the major decision makers have common goals. The decisions of a social movement are often made by a steering committee whose members try to achieve certain common goals. The constraints they face are, for instance, the available resources like money or support by organizations. Conflicting goals may be, for instance, to act immediately to influence a government decision or to enlarge the resource base as a first step in order to increase the chances of success. The actors will weigh the costs and benefits (including the likelihood of success) of the given alternatives and choose what they think is best (utility maximization).

A more specific version of RCT is value-expectancy theory (VET), also called expectancy-value theory (see e.g., Eagly & Chaiken 1993: 231–241). The theory explains which of the perceived behavioral alternatives an individual will perform. For example, a student may consider whether to work for an exam or join a protest group. The perceived behavioral alternatives will normally not coincide with the real alternatives. Our student has actually numerous other alternatives such as going to the cinema or jogging that will never be considered. The choice of a perceived behavioral alternative depends on the perceived consequences of the behavior. The student may reason that working for the
exam may improve his or her grade, whereas not joining the group will not increase the success of the protest group.

Two aspects of behavioral consequences are important: their subjective probability (the extent to which a person believes the consequences will obtain) and their utility (the extent to which a person values the consequences). The student may think that working for the exam will very likely lead to a better grade, and may value this very positively. Probability and utility of a given consequence have a multiplicative (i.e., interaction) effect. In other words, the effect of the utility depends on the value of the probability. For example, if the subjective probability of a behavioral consequence is zero (such as influencing the success of a demonstration) the utility will not have any effect on the respective behavior. Assume the sum of these products of the behavioral consequences for a given behavioral alternative is relatively high. This means that a behavior has a relatively high value for a person (i.e., the utilities and probabilities of the behavioral consequences are relatively high). The theory states that the behavior with the highest value (net utility) is chosen.

How is VET related to the general rational choice model described above? Preferences in the general model are equivalent to the utilities in VET. The subjective probabilities refer to the (perceived) opportunities and constraints. The claim of VET that the behavior with the highest value is performed means that utility is maximized – given the behavioral alternatives. Although the variables of the two versions of RCT are identical, VET is more informative: it specifies, for example, exactly the relationships between preferences on the one hand and opportunities and constraints on the other.

**THE WIDE AND THE NARROW VERSION OF RATIONAL CHOICE THEORY**

Applications of RCT in economics are often restricted to material costs and benefits. For example, the decision to buy a good depends on the price of the good and the consumer’s income. It is further assumed that reality is perceived correctly, at least in the long run, that actors are fully informed, that actors calculate before they act, and that the objective utility is maximized (i.e., actors do what is best for them, from the perspective of an omniscient observer). Another assumption is that actors are egoistic; their only concern is their own well-being. This is the narrow version of RCT. Explanations of behavior often require a wide version which does not make these restrictive assumptions. For a characterization and detailed discussion of these versions see Opp 1999; advocates of a wide version in sociology include Boudon (e.g., 1996), Esser (e.g., 1999), and Hedström (2005). For example, the wide version holds that beliefs may be wrong, that altruism is a possible human motivation, and that individuals do what they think is best for them in the given situation. Showing “solidarity” or conforming to norms are possible motivations in the wide version. This model is compatible with the idea of bounded rationality.

Pamela Oliver (2009), a prominent social movement scholar, gives a correct account of modern RCT:

“Rational choice” sociologists have studied the effects of decisions motivated by principles like altruism, adaptive learning, conformity, ideology and identity-maintenance. Much of the work in this tradition focuses not on individuals, but on collectivities, and is concerned with how the structure of relations among individuals affects both choices and the consequences of choices... At the same time, I believe that work done in the broad rational choice tradition has made huge contributions to understanding complex social processes. I am particularly excited by the ongoing formal work on collective action that continues to offer new insights.

This is in line with a wide version of RCT. Many critics, especially in the social movement literature, attack a narrow version. This is clearly the target of Fireman and Gamson’s article (1979). More recently, McAdam, Tarrow,
and Tilly (1996: 26) claim that RCT is stuck in an “extremely narrow – and generally materialist – conception of incentives.” This does not hold for the wide version.

**EXPLAINING PROTEST PARTICIPATION WITH RATIONAL CHOICE THEORY**

In applying RCT to explain specific behaviors such as protest participation (see the references at the beginning of this entry) it must be determined empirically what the preferences and constraints (i.e., the incentives) are. They cannot be derived from the theory. This is obvious, given the great variety of protest situations and individuals that are involved in protests. Compare, for instance, the demonstrations against the Iraq War in 2003 on the one hand and the Leipzig Monday demonstrations in 1989 against the communist regime. The researcher has to formulate hypotheses about the incentives which may be relevant. These hypotheses must then be tested.

It would be useful to find a sort of inventory of possible preferences and constraints (or, in terms of VET, behavioral consequences) that often determine participation in protest events (for the following see the references at the beginning of this entry). Various empirical studies suggest such a list of possible incentives. A good starting point is the grievances that motivate individuals to participate. These are preferences to bring about collective goods such as peace or less pollution. RCT implies that even if there are strong discontents protest is only likely if there is some likelihood that protesting diminishes the grievances. Thus, strong discontent only matters if individuals perceive that they are influential. To be sure, a single individual’s participation is negligible in a large group like a demonstration with 100,000 participants. But empirical research indicates that individuals often overestimate their political influence – an example that beliefs may be biased. If this is true, strong grievances affect participation even in large groups, contrary to Olson (1965).

Does (perceived) influence of the group contribute to protest participation? From a rational choice perspective, the question arises why an individual should be willing to participate if the group is successful anyway. In other words, perceived *individual* and not *collective* efficacy should have a positive effect on protest behavior. But collective efficacy might have indirect causal effects on protest: it would be dissonant to believe that joint action is efficacious but that the individual’s contribution is futile. Thus, if collective efficacy is high it is to be expected that individual influence is high as well.

Individuals often accept a *protest norm*: under certain conditions they feel an obligation to protest. The acceptance of protest norms is thus a determinant of protest participation.

Another finding is that integration into social networks (i.e., having many friends or acquaintances or being a member of groups) is related to protest behavior. Rational choice theory would predict that network integration only matters if this is related to incentives to protest, such as social encouragement of protest. Thus, membership in a golf club will not be conducive to protest, whereas this is to be expected for membership in environmental groups.

This list of possible incentives is often used in social movement research that is not based on RCT. However, the list also indicates some differences with this literature. This concerns, for example, the effects of collective efficacy and membership in social networks.

Is RCT compatible with the idea that frames affect protest participation? Assume it is observed that unorganized individuals align their frames to those of a social movement because movement activists have convinced unorganized individuals that their beliefs are not consistent with the facts. Why do unorganized individuals change their frames? An answer could be that retaining a belief that is considered incorrect would be dissonant or psychologically stressful. This means that changing a belief that is regarded as inconsistent with reality yields psychic benefits, whereas retaining it is costly. This is implied by
the theory of cognitive dissonance (Festinger 1957) which is a version of RCT.

“Collective identity” is often defined as identification in the sense of having some emotional attachment to a group or movement (see e.g., Klandermans, van der Toorn, & van Stekelenburg 2008). Focusing on this relatively clear concept, identifying with a group support of the group is a (selective) incentive: for those identifying with a group support of the group is a benefit whereas not acting in the interest of a group is a cost (see e.g., Hirschman 1970, who speaks of “loyalty”; Friedman & McAdam 1992; Opp 2009a: 221–227).

MICRO–MACRO EXPLANATIONS: THE RATIONAL CHOICE APPROACH

The previous sections focused on rational choice theory, that is, on propositions that explain individual behavior. Major social movement theories such as the political opportunity structure (POS) or resource mobilization (RM) perspectives refer to the macro level: POSs are properties of collectivities like cities or countries. Can a theory about individual behavior help to explain macro phenomena (such as social movement) or relations between macro phenomena (such as the relationship between POSs and collective protest)? The rational choice approach answers this question in the affirmative. This is a research program, also called methodological or structural individualism. Its basic idea is that macro phenomena are an outcome of individual actions or, in general, properties of individuals. For example, “growth” of a social movement means that an increasing number of individual actors join or support a movement. Movement “growth” is thus a result of the decisions of individual actors. These decisions depend, according to RCT, on the incentives for individual participation. There is thus a micro-to-macro relationship: individual behaviors aggregate to collective action.

Explaining movement growth by pointing to increasing incentives to join or support movements is not satisfactory: the question is why the incentives have changed. McCarthy and Zald (1977) argue that a general increase of societal resources (such as free time or higher income) motivates individuals to divert part of these resources to social movements. Thus, a macro change has influenced certain incentives of individuals. There is thus a macro-to-micro relationship.

This example illustrates the basic thrust of micro–macro explanations: they consist of three components: a macrotheory (increase of societal resources leads to a growth of social movements), a microtheory (i.e., a theory about individual behavior like RCT) and propositions that connect the macro and micro level (so-called bridge assumptions). We will return to this explanatory procedure later.

It is important to note that methodological individualism does not require RCT. It is only presupposed that some microtheory is applied. Nonetheless, one may advance micro–macro explanations as a fruitful explanatory strategy.

MICRO–MACRO MODELING AND SOCIAL MOVEMENT PHENOMENA

Rational choice theorists argue that micro–macro explanations yield new and interesting insights. This holds, in particular, when findings on the macro level are unexpected. Assume, for instance, that political opportunities opened up: a leftist new coalition government comes to power. However, protests did not increase, as would be expected. How can this be explained?

POSs are often defined as phenomena that increase the perceived chances of success of citizen activities, that is, perceived collective efficacy (see figure 1). Assume that the seizing of power of the new leftist government increased perceived collective efficacy. There is thus a positive effect of the respective macrovariable on a microvariable, as figure 1 shows. Does this suffice to bring about increasing protests? To answer this question we need a micro-theory of political protest. Let this theory assume
that not only perceived collective efficacy, but grievances and the other variables listed in figure (see the lower panel) are the major factors that explain individual participation in protest actions. The participation of individuals aggregates to the macrovariable “frequency of protest events.” Why did the opening of POSs not raise protest activities? A possible explanation is that the new coalition had only a weak impact on the incentives to protest: it affected only perceived collective efficacy. The pre-existing incentives, which may be the major factors for participation, did not change. (Note that the relationship on the macro level is a correlation and not a causal relationship. The reason is that the macrorelationship is explained by the intervening variables on the micro level. The independent macrovariable has only an indirect causal effect on the dependent macrovariable.) This illustrates that a micro–macro explanation leads to a deeper understanding of why macro propositions are valid or invalid.

Our reading of the social movement literature indicates that the major authors typically engage in micro–macro explanations, without spelling them out explicitly. For example, Klandermans (1984) wishes to provide “social psychological expansions of resource mobilization theory.” On the one hand, he applies value-expectancy theory. This is an expansion of RM theory because so far this perspective is not founded on a microtheory. The question is how VET is related to propositions of the RM perspective. This could be effected if macro–micro links between the RM variables on the macro level and the variables of the microtheory suggested by Klandermans are established. But this is not done in a systematic way, but only insinuated. For example, Klandermans claims that the strength of the union (a macrovariable) has some effects on independent variables of value-expectancy theory. In addition, he mentions other micro–macro relationships without specifying an explicit micro–macro model.

A long list of quotations from the major authors in the field could be added where similar micro–macro explanations are insinuated but never worked out in detail (see Opp 2009a, 2009b). The previous arguments suggest that engaging more systematically in micro–macro explanations would improve social movement theory considerably.
A RESEARCH PROGRAM TO INTEGRATE SOCIAL MOVEMENT PERSPECTIVES: THE STRUCTURAL-COGNITIVE MODEL

The fact that social movement scholars engage in micro–macro modeling suggests that this is a fruitful explanatory strategy. Why then not move from implicit to explicit and systematic micro–macro explanations? This explanatory strategy can be called the *structural-cognitive model* (SCM) (Opp 2009a: 327–350). The basic idea is to overcome the separation of macro perspectives on the one hand (the RM and POS perspectives) and micro perspectives on the other (framing and identity perspectives). The SCM model suggests that both types of perspectives can be integrated — hence the name “structural-cognitive” model. Figure 2 provides an outline of this research program.

The macro level (see the upper part of the figure) consists of the macro propositions that have been suggested in the social movement literature, in particular in the RM and POS perspectives. However, these propositions are no longer isolated from the micro level in the SCM. Instead, they are explained by linking them to the micro level. This implies that we get to know under what conditions macro propositions hold. This is the major difference with previous scholarship.

The micro level could consist of an expanded wide version of RCT that includes framing theory (see Snow et al. 1986). This theory refers to sets of cognitive elements (i.e., frames) that include variables of RCT such as grievances, norms, or beliefs (like efficacy). These factors are also included in RCT. However, hypotheses on frame alignment imply that incentives are explained. Framing theory thus extends the theory of rational action: it explains what has been regarded by rational choice theorists as given.

Rational Choice Theory and Social Movements

Repertoires of contention
DONATELLA DELLA PORTA

REPERTOIRES AS CONSTRAINTS AND RESOURCES

A repertoire of contention comprises what people know they can do when they want to oppose a public decision they consider unjust or threatening. In the definition developed by Charles Tilly, it includes the “whole set of means [a group] has for making claims of different types on different individuals” (1986: 2). Repertoires refers to “claims making routines that apply to the same claimant-object pairs: bosses and workers, peasants and landlords, rival nationalist factions, and many more” (Tilly & Tarrow 2006: 16). While the first conceptualization of repertoires of action has been criticized for focusing only on public display of disruptive action, in his most recent work Tilly (2008) has talked of broader contentious performances, stressing the constant innovation in the various forms of contentious politics.

A main idea is that, as in its theatrical variant, a repertoire of contention is constrained in both time and space. In any given period, knowledge concerning “what is to be done” to protest is limited, as “far from the image we sometimes hold of mindless crowds, people tend to act within known limits, to innovate at the margins of the existing forms, and to miss many opportunities available to them in principle” (Tilly 1986: 390). Rooted in the shared subculture of the activists, repertoires contain the options considered practicable, while excluding others. Usually forms of action emerge as a by-product of everyday experiences: for instance, the barricades derive from the tradition of using chains in order to block access to neighborhoods at nights or in times of turmoil (Traugott 1995: 47).

Traditional forms of action are then handed down to new generations of activists, who tend to adapt them to changing conditions. In fact, “the theatrical metaphor calls attention to the clustered, learned, yet improvisational character of people’s interactions as they make and receive each other’s claim” (Tilly & Tarrow 2006: 16). As in the repertoire of commedia dell’arte or jazz the general rules of performance are constantly varied, with some space for improvisation (Tilly 1986: 390). The public march developed centuries ago out of the practice of electoral banqueting, and survived until today, with an adaptation of rituals and structures (such as the closing rally and the stewarding of marches) (Favre 1990).

THE HISTORICAL EVOLUTION OF REPERTOIRES

As well as conceptualizing the repertoire of protest, Charles Tilly has made an important contribution to the study of contention by linking its characteristics to historical processes, such as industrialization and the formation of the nation-state. Studying protest in France, he observed that from the mid-seventeenth to the mid-nineteenth century the repertoire of protest was parochial in scope, as protests targeted local actors or the local representatives of national actors, and relied on patronage “appealing to immediately available powerholders to convey grievances or settle disputes, temporarily acting in the place of unworthy or inactive powerholders only to abandon power after the action” (Tilly 1986: 392). For instance, peasants burned down mills in order to oppose increases in the price of bread; assemblies converged on the private residences of the crowd’s enemies; funerals were turned into the occasion for denunciations of injustice.
In the nineteenth century, a new repertoire of protests started to develop, including actions such as strikes, electoral rallies, public meetings, petitions, marches, insurrection, and the invasion of legislative bodies. Differently from the previous one, the modern repertoire is national, addressing seats and symbols of the national public power, and autonomous, as “instead of staying in the shadow of existing powerholders and adapting routines sanctioned by them, people using the new repertoire tend to initiate their own statements of grievances and demands” (Tilly 1986: 391–392). Rather than organizing episodically at the local level, as members of preconstituted communities, in modern politics they build permanent, national associations in charge of representing their particular interests. Whereas the older repertoire tended to use the same type of action as the authorities, taking advantage of official celebrations or occasions, using forms of caricature or temporary substitution, the new one invented autonomous forms, with the deliberate organization of assemblies and occasions for action. This new repertoire responded to a new situation in which politics was increasingly national in character, and industrial development reduced the role of communities (Tilly 1986: 309).

Besides its national scale and autonomous character, the modern repertoire is characterized by its modular quality: it is used by a variety of actors to achieve a variety of objectives. In traditional societies the repertoire was specific, direct, and rigid: “In a society divided into orders, isolated by poor communication and lack of literacy and organized into corporate and communal groups, it was rare to find forms of collective action distinct from the conflicts that gave rise to them” (Tarrow 1994: 35). The consolidation of the nation-state, the expansion of the means of communication (whether roads or newspapers) and the growth of private associations favored instead the development of a new, general, flexible, and indirect repertoire. This in its turn facilitated the diffusion of protest and the mobilization of new and diverse groups within the population.

A NEW REPERTOIRE?

Even without denying that “performances evolve over time,” Tilly and Tarrow (2006: 12) stress continuity, as improvisations occur on shared scripts. It is true that the main forms of action which emerged with the French Revolution—boycotts, barricades, petitions and demonstrations—are all still present (and even dominant) in the panorama of contemporary protest. However, new elements can also be identified.

First, mobilizations are more and more transnational in nature. Even though most protests still take place at the local or national level, increasingly often countersummits have contested international governmental organizations and world social forums and global days of action have developed beyond national borders.

Second, in addition to newspaper and television, computer-mediated communication has transformed the ambitions and capacity for intervention of social movements. Not only is communication cheaper through the Internet, but it is also more horizontal, allowing for a broader autonomy from the mass media.

Third, the modern repertoire of protest had tended to adopt forms of action which reflect a particular logic of action. The attempt to influence decision-makers traditionally rested on a demonstration of strength, either in numbers (mass demonstrations, petitions, and so on) or, to use a military analogy, by inflicting maximum damage on the enemy for minimum losses (strikes, barricades). This type of political logic has not been abandoned in recent movements, but another, more symbolic logic has also been employed, the logic of bearing witness, designed to convince rather than to win (della Porta et al. 2006). Forms of ethical consumerism developed within this logic.

Fourth, performances adapt to different generational tastes (Jasper 1997: 250). So, for instance, the rituals of marches have changed from those oriented to show unity and organization to more theatrical ones, giving space to
a colorful expression of diversity and subjectivity that reflect cultural changes. In the recent demonstrations of the global justice movements, the younger cohorts of activists have changed the images of marches, with their taste for a more playful and spontaneous outlook (della Porta 2009).

Transformations in the very characteristics held to be essential for the emergence of the modern repertoire can explain such changes. Capitalism developed from nation-state-based industries to multinational corporations. While the nation-state has certainly not disappeared, it is now flanked by sub- and supranational entities which possess increasing powers. New means of communications have developed. As happened in the shift from the ancient to the modern repertoire of protest, social movements seem to adapt their protest tactics to these broad contextual changes.

Resistance
DANNY TROM and DANIEL CEFAI

The uses of the concept of “resistance” have multiplied in the printed literature, even if without success in the attempts to define it in an unequivocal way. That notion implies the dimensions of habit, imagination and judgment. It lies short of any organized action, collective and public, of any obvious social unrest. Being infrapolitical, resistance expresses a will to elude a power, a predominant norm, or a social control. It deploys in the background of everyday life. It does not form a consistent repertoire of action, but rather shows itself by means of such practices as trickery, concealment, smartness, double meaning, humor, feigned ignorance, work-to-rule, absenteeism. It comes with all the dynamics of contention.

One can point to three intellectual sources of this concept. Michel de Certeau (1984) was the first to define a kind of oppositional action called “tactics.” It includes all the invisible practices of cunning, by which the “dominated” fill out the dominant order, playing with the constraints it enforces. Rather than confronting the power face to face, these tactics will nestle in the interstices of the disciplinary apparatuses and open free spaces of autonomy. Elaborated within a dialogue with Michel Foucault’s micropolitics of daily life, the notion of “tactics” allowed room to maneuver on the battlefield of everyday practices, instead of the regular institutional class struggles.

A second source of the notion of resistance is to be found in works on the moral economy of the dominated classes, peasants or workers, in the tradition of E.P. Thompson (1971). Here again, the focus shifts from institutional organization and organized struggle to subcultures, more or less autonomous, which English workers share and use as frames and resources to resist the exploitation in an expanding capitalist economy. Then resistance means a silent revolt, fed from popular traditions of solidarity, against the abuses of authority, felt as illegitimate, on the part of the ruling class.

A third source of the notion of resistance is the notion of hegemony formulated by Gramsci (1988), intended as an extension of Marx’s statement according to which the values of the dominant classes are also the dominant values of the time. As a counterpoint to material struggles, it stresses the power of legitimation of ideas, values, and discourses. Resistance in this case means a capacity of the workers to free themselves from the dominant ideology, and produce counterdiscourses and narratives that overthrow the established values.

The prejudice of the apathy of the dominated thus gets invalidated. Subaltern and powerless actors are able to avoid, to bypass, or to divert power to their advantage by means of a whole set of diffuse attitudes and practices, either individual or common, concealed from the eyes of the dominant groups, yet accessible to the researcher.

James Scott’s case studies on the peasants of Malaysia are a good illustration of the notion of resistance and have become models for a number of later inquiries. In Weapons of the Weak (1985), Scott shows how subordinates resist, in everyday life, the invasiveness of the market economy, on the one hand by relying on traditional forms of mutual help and assistance; on the other by elaborating innumerable practical and symbolic activities, in complicity with their peers, but in secrecy with respect to the dominant groups. In Domination and the Art of Resistance (1990), Scott stresses the hidden transcripts, a collective oppositional narrative, concealed from the public sphere, where facades of deference and obedience are displayed. Diversion of ceremonies, inversion of the dominant talk, mockery of judicial power, complaints without having to spell things out, are elements which concur in the collective making of counter-rituals and symbols, the
circulation of which contributes to the sharing of a common experience among the dominated. Scott clearly emphasizes what is at stake in the core of the notion of resistance: The capacity to withstand the cultural hegemony of the dominant groups is to be investigated through ways of acting which do not crystallize in strategies of power. The "subaltern groups" are neither passive, nor resigned. They resist in such various contexts as in race relationships, factory work, or political ceremonies.

If those who are enduring injustice and are exploited have an objective interest in overthrowing the established order, they may estimate the cost of open opposition to be too high. In that sense, the notion of resistance presupposes a theory of action alternative to the theories of false consciousness or the incorporated habitus, as bases of compliance with an unjust and repressive order. While the works of Burawoy (1979) or Willis (1977) demonstrate how any kind of resistance comes to be functional in connection with the reproduction of the dominant order, Scott analyzes how resistance is an infra-institutional tactic of bypassing, side-stepping, or turning over the dominant order. The question of the degree of reflexivity of the actors remains open. Dominators and dominated may take the acts of resistance as part of a game of reciprocal accommodation.

Internalization of norms or the enforcement of belief often account for the manufacture of consent. But resistance studies endow the actors with a relatively clear awareness of the injustices they are enduring. Their action is underground as far as a structure of control and punishment constrains it. As soon as they cross the border between unofficial, secret, tacit, local compromises to public, open, explicit, overall conflicts and claims, they leave the regime of resistance.

Resonance, frame
HOLLY MCCAMMON

One of the most utilized concepts in social movement framing studies is “frame resonance.” Snow and Benford (1988) introduced the term to account for the ability of a collective action frame to resonate or appeal to a targeted audience. They ask, “[u]nder what conditions do framing efforts strike a responsive chord or resonate with the targets of mobilization?” (1988: 198). In order to answer this query, one must explore both the properties of the frames themselves and the characteristics of the broader cultural environment in which collective action framing takes place. That is, the source of frame resonance lies in a conjunction of the content of framing and ideational elements in the wider cultural milieu. Frames resonate because a segment of individuals find them convincing, or as Gamson (1992: 135) states, they find them “natural and familiar.” Identifying the precise circumstances in which movement frames achieve this persuasive status, then, is the critical question researchers confront. When will a collective action frame rouse the interests of bystander publics, elected officials, institutional authorities, or potential social movement recruits?

In answering this question, a number of scholars point to the importance of salient values or beliefs. Snow and Benford (1988) tell us that highly resonant frames are those that articulate centrally held ideas for target audiences. The greater the correspondence between themes identified in a frame and the core values and beliefs of those receiving the frame, the more likely framing audiences will find the frame compelling. Empirical support for the importance of belief centrality is pronounced. In a study of the US women’s-suffrage movement, McCammon and colleagues (2001) find that where proponents of the franchise for women relied on “separate spheres” framing, or arguments stating that the ballot for women would better allow women to protect the domestic sphere, activists were more likely to succeed in their quest for voting rights. Traditional beliefs that women’s place was in the home predominated in the late nineteenth and early twentieth centuries. Suffrage activists strategically tapped into such beliefs to further their suffrage cause. Trevizo (2006) arrives at a similar conclusion in her explanation of how peasant protesters in Mexico drew on national myths, narratives, and ideology to reduce the willingness of state agents to use repression to quell the revolt.

Other researchers, however, say that resonant collective action frames often do more than simply invoke dominant ideas residing in the broader culture. Maney, Woehrle, and Coy (2005) concur that activists routinely harness dominant cultural elements in their discursive work, but these researchers emphasize that movement actors also frequently challenge those ideas, by defining oppositional beliefs or even alternative worldviews (see also Piven & Cloward 1977; Mansbridge & Morris 2001). Collective actors, thus, also generate frame resonance by tapping into or bolstering feelings of discontent or a sense of injustice or unfairness, and they begin to articulate for their audiences alternative responses or challenges to the usual routines and practices. McAdam (1994: 38) remarks on civil rights leader Martin Luther King’s ability to capture both “the culture of the oppressor” and “the culture of the oppressed.” Rohlinger (2002) tells us that the National Organization for Women sought to balance cultural themes dominant in broader society with its own organizational identity, and Hewitt and McCammon (2004) find that frames balancing “cultural resonance and contestation” are more effective recruiting frames than are those that simply resonate or simply contest. Finding a framing middle ground that offers resonance to both movement sympathizers and
a broader public is an ongoing rhetorical challenge for movement activists.

Students of social movements point to other ways in which frame resonance occurs. Snow and Benford (1988) state that more resonant frames are those with “empirical credibility” and “experiential commensurability.” That is, frames that define circumstances that fit with audiences’ perceptions of the world around them are more likely to be convincing. Similar to belief centrality, there is substantial empirical support showing that the empirical credibility of a frame can enhance its resonance and, therefore, its persuasive capacity. In a study of the 1989 Chinese Democracy Movement, Zuo and Benford (1995) find that student leaders succeeded in winning support more broadly among citizens because their frames identified problems in Chinese society, such as corruption, profiteering, and increasing inequality, that were evident to many Chinese residents. Einwohner’s (2009) study of Jewish resistance in the ghettos during World War II demonstrates that mobilization was most likely when empirically credible frames detailing the Nazis’ plans for genocide were available. Babb (1996), however, warns that while social movement framing efforts may resonate ideologically, they can at the same time fail to be empirically credible. And, in the end, the lack of empirical grounding will undermine the movement’s ability to gain constituents, even when framing aligns with salient beliefs.

Finally, Snow and Benford (1988) indicate that frames encompassing a broader range of beliefs and values will also often be more resonant than frames limited, say, to just one key attitudinal or value domain. Frames can be extended to incorporate additional issues, goals, or agendas, and this can heighten their appeal. Gerhards and Rucht (1992) examine leaflets from anti-International Monetary Fund (IMF) protests in Germany and show that “bridging phrases” were successfully used by activists to encourage participation by a variety of groups, such as peace, environmental, women’s, neighborhood, and labor groups. The bridging phrases revealed alignment between the goals of the anti-IMF activists and the interests of these various groups. Discursive efforts that use a broadened scope to widen their appeal can help build coalitions among challenging organizations and strengthen already existing alliances. But as Snow and Corrigall-Brown (2005) discuss, there is no specific scope to framing that works under all circumstances. Some movements can benefit from narrow framing strategies that formulate focused and detailed constructions of the problem at hand (see, e.g., Cress and Snow 2000), whereas, as Gerhards and Rucht (1992) demonstrate, broader framing can also provide benefits.

While many researchers who study frame resonance focus their attentions on the qualities of the frames themselves, qualities that give these rhetorical devices greater resonance, others have turned their energies to understanding the broader cultural and political environment in which activists must operate, environments which provide a stock of cultural matter on which collective actors can draw in their efforts to shape resonant frames. Koopmans and Statham (1999) coin the term “discursive opportunity structure” to point to elements in the cultural landscape that make some movement frames more resonant than others. Steinberg (1999) introduces the notion of “discursive fields,” where hegemonic discourses facilitate and constrain resonant framing options for activists. Oliver and Johnston (2000) draw our attention to ideologies or belief systems that reside in every political culture.

Others provide more specific understandings of the contextual elements that augment frame resonance. Both Ferree (2003) and Pedriana (2006) suggest that legal discourse provides fertile ground for study of highly resonant framing constructs. According to Pedriana, “legal rules and norms, statutory texts, administrative regulations and guidelines, and judicial rulings” are critical cultural resources activists can draw on as they deploy discursive tactics. Notions of rights, due process, privacy, property, and contracts allow challengers to invoke the power of the law as they make their claims for social and political change.
In another approach to the cultural context, Hunt, Benford, and Snow (1994) encourage researchers to consider how individual and collective identities are articulated in social movement frames. Along these same lines, Ernst (2009) suggests that researchers must consider the presence of privileged identities in the broader culture, particularly those privileged by race, class, or gender hierarchies and how such identities can enhance or limit frame resonance. Finally, other scholars move beyond the cognitive dimensions of frame resonance to explore how salient emotions can prime some framing approaches for resonance. Schrock, Holden, and Reid (2004) describe how “emotional resonance” occurs for potential members of the transgender support movement when the movement utilizes collective action frames that invoke key themes in the emotional lives of potential movement members.

Revolutions
RENE ROJAS and JEFF GOODWIN

In common parlance, “revolution” has come to mean virtually any fundamental change. Transformations of ways of thinking, technologies, and even fashions and consumer goods are often described as “revolutionary.” Social scientists, however, generally define revolution in one of two ways. For some, a revolution refers broadly to any extralegal overthrow and transformation of a political regime or state by a popular rebellion, whether by violent or nonviolent means. (Although some state officials may support revolutionaries, a revolution differs from a coup d’état, which refers to the overthrow of a government by political elites, often led by military officers, with little if any popular support or active participation by ordinary people.) Others define revolutions more narrowly as only those historical episodes in which the overthrow of a regime or state is accompanied by or facilitates fundamental changes in a society’s economic institutions and class structure (e.g., the French, Russian, and Chinese revolutions). This latter type of revolution is often called a “social revolution” (or “great revolution”) in order to distinguish it from those revolutions (or “political revolutions”) that entail new political orders, but little, if any, change in economic or class structures (e.g., the English and American revolutions). Of course, what begins as a political revolution may end up being a social revolution.

For some analysts, including Marxists, revolutions necessarily involve a substantial redistribution of property or the creation of a new type of economy or “mode of production.” Yet other analysts argue that revolutions may radically alter everyday life for millions of people – through political and perhaps cultural change, for example – without entailing much economic change. However defined, most social scientists agree that social revolutions have been relatively rare, if momentous, occurrences. By most counts, fewer than two dozen major social revolutions have taken place during the past two centuries (see table).

Prior to the French Revolution of 1789, the word “revolution” was generally applied in its literal sense to political affairs; the word referred, that is, to a return to some prior state of affairs. “Revolution” was thus synonymous with “restoration.” With the French Revolution, however, the word itself was revolutionized. It no longer suggested a cyclical return to the status quo ante, but rather a linear progression to a radically different (and presumably superior or more advanced) type of society. After the French Revolution, “revolution” became not just a popular term and a social science concept but also a moral ideal and even imperative for many millions of people. Myriad rebellions and insurgencies have occurred over the past two centuries with the explicit aim of deposing oppressive political authorities and, often, remaking the social order from top to bottom. When such rebellions obtain substantial popular support, one may speak of the existence of a “revolutionary situation.”

There have been hundreds of revolutionary situations around the globe during the past two centuries. Most popular rebellions or insurgencies, however, do not succeed in overthrowing the state. If the state’s armed forces remain strong and cohesive, rebellions are typically defeated or confined to peripheral regions within the national territory. Most revolutionary situations, in other words, do not result in actual political, let alone social, revolutions. A revolution typically requires the prior weakening or collapse of the state’s “infrastructural power” – the state’s capacity, that is, to enforce its will upon the society that it claims to govern. While revolutionary movements themselves sometimes muster the power to incapacitate states (by winning over...
military officers, soldiers, and government officials, for example), such movements just as frequently overthrow states that have already been fatally weakened by interstate wars, economic and fiscal crises, and/or elite divisions and conflicts.

Many social scientists view violence as an essential characteristic of revolutions and many, if not most, have in fact involved considerable violence among the parties contending for state power. Foreign states, moreover, have often intervened militarily in revolutionary conflicts or attacked newly installed revolutionary governments. Some revolutionary regimes, furthermore, have employed considerable violence in order to reorganize society along new lines, and some have perpetrated genocides or mass murders or have attacked neighboring countries.

Still, the extent of violence in revolutions is quite variable, and some have occurred with comparatively little bloodshed. Some social scientists, furthermore, have detected a trend in recent decades toward nonviolent revolutions. For these reasons, violence is best viewed as a potential and variable component of revolution, not as one of its defining characteristics. “Nonviolent revolution” is not an oxymoron.

Whether one employs the broader or narrower definition of revolution, the concept clearly stands apart analytically from such kindred forms of political conflict as wars (interstate or civil), popular rebellions, social movements, riots, and coups d’état. Historically, however, these latter forms of conflict have often been closely connected with revolutions or revolutionary situations. Interstate wars sometimes help to cause revolutions by weakening states, as well as by inflaming popular grievances, including perceived threats to nationhood or national identity; in turn, revolutions often result in interstate wars, usually because foreign powers seek to destroy those revolutionary movements or regimes they perceive as threats. For their part, popular rebellions or revolutionary movements create revolutionary situations, which often result in civil wars, and they bring about actual revolutions if such movements successfully seize state power. Similarly, social movements that initially seek reforms within the existing political system become revolutionary movements if they ultimately attempt to overthrow the state, which often happens when the political order breaks down or when the state persistently refuses to implement the reforms desired by such movements. Spontaneous riots, furthermore, may help to precipitate revolutions, and they have occurred frequently as a result of the breakdown of political authority that characterizes revolutionary situations. Finally, coups may become “revolutions from above” if their leaders mobilize masses of people and implement radical political or socioeconomic changes. In sum, while revolutions, and especially social revolutions, are a distinctive and comparatively rare form of political conflict, they are often connected, whether as cause or consequence, with other and more frequently recurring types of conflict.

Note: The listed dates are conventional markers that refer to the year in which revolutionaries initially overthrew extant political authorities. Revolutions, however, are best conceptualized not as events, but as processes that typically span many years.
CLASS CONFLICT, POLITICAL REGIMES, AND REVOLUTION

Classical Marxist theories of social revolution have focused on the confrontation between classes with conflicting economic and political ends. Indeed, the trajectories of the major revolutionary conflicts of the modern era have been largely patterned by the aims and struggles of opposing class forces. Class conflict is, no doubt, the principal factor driving most revolutionary situations and outcomes. However, in revolutionary situations classes (or class coalitions) do not directly confront each other as discrete and monolithic adversaries. Revolutionary struggles are shaped by state institutions, political parties, and other organizations and networks as well as by the resources and ideas mobilized by each of these. Furthermore, the dynamics of such struggles are seldom linear or uniform. Revolutionary conflicts are punctuated by critical moments that disrupt existing political arrangements and thus shift the balance of power between opposing forces. Finally, the political dimensions of class contestation are significantly impacted by developments in the international arena, chiefly conflict and competition among states – contests aggravated by the uneven global development of capitalism – but also transnational ideologies and flows of resources.

A particular mode of economic production, at a particular level of development, is characterized by a specific structure of social classes and, at a very general level, defines the interests of such classes; it simultaneously shapes the features of political regimes, understood as the formal and informal rules of governing institutions and processes. Class structures do not directly determine political rules and behavior. Instead, political regimes constrain the political interventions of class actors, at times reducing if not altogether suppressing the political influence of others. In short, class conflict is mediated by the institutional configuration of the existing political regime.

Political regimes mediate among competing segments of dominant classes and also establish the possibilities for cooperation among otherwise adversarial class forces. As a given class structure allows for a range of possible rules demarcating the political participation of organized social groupings, regimes can be more or less democratic. The degree of democratic opening of a regime refers to both the formal, procedural rules of citizenship and governance as well as the substantive political integration of nonelites. Regimes, in short, can be more or less inclusive in terms of the nonelite sectors that are given institutionalized access to political influence and material welfare. In addition, the level of economic development also offers regimes varying degrees of organizational and ideological resources, tools wielded by the state as well as by political and civil associations representing various social groupings and advancing their interests. Finally, and perhaps most importantly, political elites – institutional leaders and ruling politicians – while generally attuned to the needs and demands of economic elites, can present a more or less unified response to the claims of nonelite groups. The efficacy and adeptness of state actors and institutions in addressing demands from below, the forms and intensity of the fights around these demands, and the cohesion and flexibility with which elites confront rising struggles are crucial in understanding the emergence (or absence) of revolutionary situations. History has shown that revolutionary conflicts almost always emerge in authoritarian political contexts in which nonelites are repressed and excluded from power – yet have some capacity for collective action – and elites are badly divided.

REVOLUTIONARY SITUATIONS

Revolutionary situations can be understood as moments when regimes come into sharp conflict with mobilized nonelite forces, that is, when the rules of political competition and incorporation can no longer manage or accommodate the competing interests and demands of the groups they are meant to govern.
A revolutionary situation arises when the conflict is acute enough to open the possibility of deep political and social change. Lenin famously stated that revolutionary situations display “three major symptoms”: (1) when there is a crisis, in one form or another, among the ‘upper classes’, a crisis in the policy of the ruling class, leading to a fissure through which the discontent and indignation of the oppressed classes burst forth . . .; (2) when the suffering and want of the oppressed classes have grown more acute than usual; (3) when, as a consequence of the above causes, there is a considerable increase in the activity of the masses, who . . . are drawn both by all the circumstances of the crisis and by the ‘upper classes’ themselves into independent historical action (Lenin 1915: 213; emphasis in original).

Since Lenin’s time, scholars of revolutions have developed these basic insights. Perhaps the most crucial “symptom” Lenin lists – acute “suffering and want” – typically involves a sharp decline in material conditions. Accordingly, some scholars of revolution understand revolutions as a product of “relative deprivation.” More likely, what Lenin had in mind are disruptions of everyday life which unsettle people’s routines and thereby instigate their defiance of economic and political elites. In this sense, revolutionary situations require what Piven and Cloward refer to as the weakening or breakdown of “the regulatory controls inherent in the structures of institutional life” (1977: 11). Economic crises, wars, and even natural disasters typically cause these dislocations. The consequences are felt in the immediate lives of ordinary people, who endure the loss or deterioration of work, are sent into bloody and often unpopular wars, or suffer the breakdown or even collapse of institutions upon which their survival depends – work, markets, transportation, and schools.

At the regime level, furthermore, such shocks disrupt the existing balance of political forces. In order to preserve regime stability, political elites may feel compelled to seek new allies, incorporating new sectors of nonelites – who consequently find themselves with enhanced influence – and perhaps discarding old allies. On the other hand, some elites may respond to profound social dislocations by attempting to exclude formerly incorporated sectors or significantly elevating the costs of their incorporation. These dislocations may also place increasing strain on politically excluded groups which had found relatively stable means of securing their reproduction. As disturbances redefine the inclusiveness of the regime and activate nonelites in new ways, political alignments are redrawn and the balance of power shifts. Acute shocks typically release nonelites from passivity, activating their grievances through new organizational structures and institutional avenues. In sum, one precondition for revolutionary situations consists of massive disruptions that break down routinized systems of social stability and control. Subsequently, explosions of nonelite mobilization may place regimes under great duress.

In fact, while such dislocations may be necessary for the emergence of revolutionary situations, they are clearly insufficient. Lenin identifies another indispensable condition for revolutionary situations: The shock must provoke “fissures” among elites that fracture the foundations of the regime. Elite divisions and the resulting destabilization provide an opening that may itself magnify pressures from below and which newly mobilized nonelites can exploit. Such a crisis typically occurs when the usual consensus over arrangements for settling competing elite claims collapses as wars and state-led efforts at economic modernization generate growing fiscal pressures. As elite agreement over how the costs of fiscal and institutional reform should be distributed disintegrates, the institutional coherence of the regime comes under enormous strain. The state’s capacity to control and enforce its will and rules upon the population within the territory that it claims to govern – that is, its infrastructural power – may begin to contract and even collapse.

Elite conflict and state breakdown may follow two scenarios. In the first, a crisis, such as
a fiscal emergency provoked by international war or competition, may generate instability as elites resist the burdens imposed by state officials. The ensuing institutional crisis in the regime, involving the disintegration of state power and legitimacy, then serves to facilitate and exacerbate rebellion by subordinate groups that are mobilizing through existing collective structures. This is the model offered by Theda Skocpol in her influential book, States and Social Revolutions (1979). In the second perspective, the shock unleashes mounting and threatening pressure from below by nonelite political forces. No longer bound by the institutions of social control, their growing, uncontrollable unrest generates the crisis among elites who are pulled into opposing directions by the developing insurgency itself. One elite faction might prefer to restrict the influence of nonelites, extracting more resources to cover fiscal gaps, clamping down on democratic rights or even resorting to coercion; other elites, by contrast, might prefer reformist incorporation, resigning themselves to accommodating nonelite demands in order to preserve their overall rule. In this view, were it not for the additional stress from nonelite demands, elites might converge on a unified and stabilizing response, preventing regime collapse. In either scenario, the cohesion of the police and armed forces is crucial for preventing the fall of the regime. If the costs of war, repression, and/or reform divide weaken the military and undermine its ability to act in a unified and decisive manner against popular protest, then revolution becomes likely or even inevitable.

In short, the second condition listed by Lenin and emphasized by so-called “political opportunity” and “state-centered” theorists, involves elite division and institutional collapse which either results from or results in nonelite responses to systemic dislocation. In either event, ruling elites find it impossible to coexist in harmony under the existing regime. The revolutionary crisis intensifies as the actions of disaffected elite segments impair the efficacy of state institutions.

These conditions, when combined, would seem to be sufficient to produce a revolutionary situation. After all, if nonelite actors are thrust into action owing to the erosion of the regulatory capacity of key institutions, and elite divisions lead to a collapse in the state’s infrastructural power, a powerful insurrection would seem to be at hand. However, Lenin raises a third condition. He adds that nonelites, “drawn both by all the circumstances of the crisis and by the ‘upper classes’ themselves,” must also increase their “independent historical action.” By “historical” Lenin means a qualitatively superior ability to act collectively on the part of insurgents who are seeking a new social order. The final ingredient that he has in mind is the capacity of nonelite forces to take advantage of the institutional shock and collapse in order to place radical transformation on the national agenda. Simply stated, an existing regime is likely to weather a weakening of state institutions and pressures from below if nonelite groups are incapable of organizing into a political force that can effectively threaten it.

For such capacity to take shape, two requirements must be met. First, the activated insurgent groups must enjoy leverage over the existing regime. This condition is met when the insurgents’ roles in important institutions are necessary and/or highly valued, which gives their threats of withdrawing their contributions to such institutions more disruptive force. That is, when nonelites enjoy “structural power” rooted in their essential institutional roles, their capacity for generating costly disruptions is enhanced. In the context of shock and crisis, elite vulnerability to effective leverage grows. At a micro-level, this is the mechanism identified by Michael Schwartz (1976) in his study of radical protest movements. Moreover, this capacity is reinforced when elite factions, responding to crises, formalize nonelite leverage by bringing them into governing institutions. Overall, the position of elites becomes weakened relative to their nonelite adversaries, increasing the fragility of the regime; if would-be insurgents fail to exercise such leverage, elite domination
remains robust. On a more macrohistorical level, this is the basis for Trotsky’s argument (1961) that the uneven development of capitalism in Russia gave industrial workers unprecedented influence and allowed them to turn a struggle against autocracy into a fight for radical social and economic transformation. Trotsky’s theory, in turn, was a variation on Marx’s classical formulation that increased industrialization would lead to larger and larger concentrations of (and cooperation among) workers, resulting in their overwhelming leverage over the entire social order as crises became more pronounced. The central point is that the structural position of insurgents must translate into the capacity to undertake “historical” action which challenges elite power.

Second, a capacity for “independent” and “historical” action requires the political and ideological resources necessary to convert increased activity and leverage into decisive action. Viewed in this manner, Lenin grants strategic importance to organization, tactics, and ideas. These factors involve the ability of insurgents to obtain, process, produce, and deploy information among their followers. Such tactical and ideological dimensions of action cannot be viewed as the mere epiphenomena of economic structures and institutional opportunities or, even worse, as wholly inconsequential. Clearly, ideas and ideology play an important role in the origins and outcomes of revolutions. However, they do not operate as autonomous forces that drive the larger political arena in which revolutionary situations unfold. Viewing the role of ideas as “scripts” constructed from existing symbolic fields and superimposed onto new historical arenas, albeit with adaptive modifications, as some have argued, is misleading. After all, radical ideologies have existed and appealed to large numbers of people in most if not all modern regimes. They have seldom, however, resulted in successful movements, much less in revolutionary situations.

The added effects of culture, broadly understood, operate when particular ideologies closely match and are able to exploit a shifting balance of forces that weakens regime elites. In other words, the effective deployment of ideologies and the agency of their “carriers” are circumscribed by, though never reducible to, existing material and political conditions. When dislocations and state crises offer openings for challenges by nonelite actors, the tactical decisions of activists and the framing effects of ideas can, in the final analysis, be decisive. When the strategies and ideologies promoted by revolutionaries give meaning to and resonate with nonelites, and when they are not only consistent with but also promote increased popular mobilization, thereby maximizing its disruptive impact, they can be the final necessary ingredient that endows them with the momentous capacity to “make” revolution. In fact, Lenin ended his famous statement on revolutionary situations with an important qualification: “Not every revolutionary situation,” he explained, “gives rise to a revolution; revolution arises only out of a situation in which the above-mentioned objective changes are accompanied by a subjective change, namely, the ability of the revolutionary class to take revolutionary mass action strong enough to break (or dislocate) the old government, which never, not even in a period of crisis, ‘falls’, if it is not toppled over” (Lenin 1915: 213; emphasis in original).

DEMOCRACY, AUTHORITARIANISM, AND REVOLUTION

As noted, revolutionary situations are much more likely to arise in authoritarian and repressive political contexts than in democratic and liberal ones. In fact, no popular revolutionary movement has ever overthrown a long-consolidated democratic regime. The great revolutions of the cold war era, for example, toppled extremely repressive colonial regimes (as in Vietnam and Algeria), personalist dictatorships (as in Cuba, Iran, and Nicaragua), and the Soviet-imposed single-party regimes of Eastern Europe. But none overthrew a regime that even remotely resembled a democracy.
In fact, revolutionary movements tend to prosper when states sponsor or defend—with violence when necessary—economic and social arrangements that are widely regarded as unjust. In certain societies, economic and social arrangements may be widely viewed as unjust (i.e., as not simply unfortunate or inevitable), yet unless state officials are seen to sponsor or protect those arrangements—through legal codes, taxation, conscription, and, ultimately, force—revolutionary collective action aimed at overthrowing the state is unlikely. People may blame their social “superiors” or employers for their plight, for example, or even whole classes of such elites, yet the state itself may not be challenged unless there exists a widely shared perception that it stands behind and defends those elites.

Revolutionaries also fare well, other things being equal, when the state legally or forcibly excludes aggrieved groups from state power or resources. For even if such groups come to direct their claims at the state, they are unlikely to seek its overthrow if they manage to attain some significant share—or believe they can attain such a share—of state power or influence (e.g., through elections or bureaucratic influence). Even if such groups view their political influence as unjustly limited, their access to state resources or inclusion in policymaking deliberations will likely prevent them from becoming radicalized. In fact, the political incorporation of mobilized groups, including the putatively revolutionary proletariat of Marxist theory, into parliamentary and other political institutions has typically served to de-radicalize them. Such groups often view this sort of inclusion as the first step in the accumulation of greater influence and resources; as a result, they are unlikely to jeopardize their relatively low-cost access to the state by engaging in “disloyal” or illegal revolutionary activities. Exclusionary authoritarian regimes, by contrast, tend to “incubate” radical forms of political contention. Those who call for revolution tend to prosper under such regimes, because they come to be viewed by many people as more realistic and potentially more effective than political moderates and reformists.

Indiscriminate, but not overwhelming, violence by weak states against mobilized groups and oppositional political figures also unintentionally helps revolutionaries. For reasons of simple self-defense, people who are targeted by the state may arm themselves or join clandestine groups. People whose families or friends have been victimized by the state may also join or support revolutionaries in order to seek revenge against the perpetrators. Indiscriminate state violence may also be viewed by the general population as illegitimate or unjust, especially if the targets of this violence are making demands or claims that are widely perceived to be just. Unless state violence is directed at unpopular groups or is simply overwhelming, then, indiscriminate coercion may backfire, producing an ever-growing popular mobilization, often (though not always) led by armed movements, and an even larger body of indignant sympathizers. Revolutionary movements may thus prosper not so much because of their ideology per se, but simply because they can offer people some sort of protection from, and means for striking back at, authoritarian states. Political groups and parties have generally turned to disruptive strategies, including armed struggle, only after their previous efforts to secure change through legal means were violently repressed. Under repressive conditions, ordinary people often view armed struggle as a legitimate and reasonable means of political contestation.

Finally, like political exclusion, indiscriminate state violence also reinforces the plausibility and legitimacy of revolutionary ideologies, that is, ideologies that (1) proclaim the existing order to be fundamentally unjust and (2) envisage a radical reorganization of the political system and perhaps of society as well. In other words, violent, exclusionary regimes often unintentionally bolster the popularity of their most radical social critics—religious activists, socialist militants, and radical nationalists, for example, who view existing institutions as more or less completely corrupt,
incapable of reform, and thus requiring a thorough and even (if need be) violent recon-
struction. Precisely which radical group, if any, will come to lead or dominate a revolutionary movement, however, is contingent upon a great many factors, including how much coercive force it can muster and how well (or poorly) its ideology resonates among political activists and ordinary people.

Authoritarian and repressive states, in sum, unintentionally facilitate the development of revolutionary movements by generating or reinforcing popular grievances, contributing to widespread feelings of moral outrage, focusing those feelings on the state, foreclosing possibilities for peaceful reform, enhancing the plausibility and legitimacy of revolutionary ideologies, and (often) compelling people to employ disruptive and even violent strategies in order to defend themselves and to pursue effectively their collective interests and ideals.

By contrast, more liberal and democratic regimes tend to pacify and institutionalize, but hardly do away with, class and other forms of social conflict. Elections have been aptly described as a “democratic trans-
lation of the class struggle.” Democracy “translates” and channels a variety of social conflicts – including, but not limited to, class conflicts – into party competition for votes and the lobbying of representatives by “interest groups.” The temptation to rebel against the state, which is rarely seized without trepidation under any circumstances, is generally quelled under democratic regimes by the knowledge that new elections are but a few years off, and with them the chance to punish unpopular incumbent rulers. In addition, democracies have generally provided a context in which popular protest can win concessions from economic and political elites, although this often requires a good deal of disruption, if not violence. But armed movements that aim at overthrowing elected governments rarely win much popular support, unless such governments (or the armies that they putatively command) effectively push people into the armed opposition by indiscriminately repressing suspected rebel sympathizers. By and large, however, the ballot box has been the coffin of revolutionaries.

This does not mean that political radicalism and militancy go unrewarded in democratic societies. Democracy, to repeat, by no means eliminates social conflict; in fact, in many ways democracy encourages a flowering of social conflict by providing the “political space” with which those groups outside ruling circles can make claims on political authorities and economic elites. Not just political parties, then, but a whole range of interest groups, trade unions, professional associations, and social movements can become the organizational vehicles of political life in democratic polities. These institutions of “civil society,” however, are generally just that – civil. Their repertoires of collective action include electoral campaigns, lobbying, strikes, boycotts, demonstrations, and civil disobedience – forms of collective action that may be quite disruptive and undertaken for quite radical ends, but which are not aimed at bringing down the state.

Democracy, then, dramatically reduces the likelihood of revolutionary change, but not because it brings about social justice. Formal democracy is fully compatible with widespread poverty, inequality, and popular grievances of all sorts. This is why extraparliamentary movements for social justice so often arise in democratic contexts. But, again, these movements almost always view the state as an instrument to be pressured and influenced, not as something to be seized or smashed. Revolutionary movements, for their part, develop not simply because people are angry or aggrieved, but because the state under which they live provides no other mechanisms for social change, violently repressing those who peacefully seek incremental reforms.

Past waves of democratization, alas, have in fact been regularly followed by antidemocratic waves. Yet this should give relatively little comfort to revolutionaries, for only a very few of the resulting authoritarian regimes were toppled by revolutions. As emphasized earlier, revolutionary movements, even those
with extensive popular support, rarely succeed in seizing power unless the authoritarian regimes that they confront are very weak or suddenly weakened. That said, the spread of democracy will not necessarily render revolution passé as a form of political struggle. Radical leaders and parties have sometimes been able to amass a broad following in democratic contexts and to win elections. Perhaps during the twenty-first century we will see some democratically elected governments attempt to revolutionize economic and political institutions. As yet, however, the democratic route to revolution has never been successfully traveled.

Selective incentives
PAMELA OLIVER

Selective incentives are private goods made available to people on the basis of whether they contribute to a collective good. Selective incentives can either reward participants (or contributors) or punish nonparticipants. The concept of selective incentive is important for focusing attention on the factors besides the group goal that affect people’s desire to participate in social movements. Selective incentives can be material, solidary, or purposive. The concept of selective incentive is embedded in a rational choice or cost/benefit approach and originates with Mancur Olson in The Logic of Collective Action. Collective or public goods have the property of nonexcludability: if they are provided to any member of a group, they cannot be excluded from other group members. Nonexcludability can lead to the free rider problem or collective dilemma wherein rational individuals should prefer to let others pay for collective goods. “Only a separate and selective incentive will stimulate a rational individual in a latent group to act in a group-oriented way . . . The incentive must be ‘selective’ so that those who do not . . . contribute to the attainment of the group’s interest, can be treated differently from those who do” (Olson 1965: 51). Formal theorists since Olson have moved far beyond his original statement to show how the interplay between collective goods and selective incentives can produce complex and even surprising collective action dynamics.

Olson emphasized material incentives. Some movement leaders are paid, and some movement organizations sell things like magazines, insurance, or vacations. Physical coercion has often been important for maintaining mass actions like strikes. Some theorists prefer to restrict the concept of selective incentives to material good. However, most theorists recognize two other broad types of incentives: solidary and purposive (Clark & Wilson 1961). The concepts of solidary and purposive selective incentives provide a way of talking within a rational action framework about the importance of social influence, ideology, and identity.

Solidary or social incentives are intangible benefits of participating (or not participating) in collective action deriving from the approval or disapproval of other people, or from the intrinsic pleasure or displeasure in being with them. Socializing with friends or approval from others for participating are nonrival social incentives that everyone who participates can share. Movement participants tend to be friends with other participants and have friends who approve their participation. Leaders and those who sacrifice much can be given prestige and honor for their efforts (Willer 2009).

Purposive or moral incentives are intangible benefits of participating (or not) that arise from internalized norms and values in which a person’s self-esteem depends on doing the right thing. They may feel an obligation to witness or make a public expression of their beliefs. These purposive incentives are tied to larger religious, ethical, or political ideologies and are often linked to a person’s socialization. Those who participate in movements over time often develop a movement or activist identity in which their sense of self depends on being an activist. People motivated by purposive incentives are focused on being the right kind of person who does the right kind of things.

The interplay between collective goods and incentives can become quite complex, and formal theorists have explored these relations. Selective incentives cannot in general “solve” collective dilemma because using incentives entails the second order problem of paying the costs of incentives (Oliver 1980). Rewards to cooperators have different cost structures...
from punishments to noncooperators, these varying with the nature of the production function for the level of collective good provided as it depends on the number of contributors (Oliver 1980). Heckathorn (1990) shows that sanctioning systems can promote or hinder the group good depending on the value of the good, the strength of the sanction, monitoring capacity, and the level of intergroup control. Heckathorn (1993, 1996) show that the composite of the original production function for the collective good and the production function for the incentive jointly determine a complex space with regions that differ in their strategic dilemmas and the difficulty of promoting collective action. In some regions, people will rationally use incentive systems to enforce collective action that benefits none of them. Kitts (2006) shows that incentives such as prestige, in which the value of the incentive declines with the number who share it, can paradoxically promote norms against collective action when the value of the incentive is high relative to the value of the collective good. These and other complex formal analyses of incentives provide tools for understanding why groups sometimes successfully organize to challenge authority or provide for the common good and other times fail to do so.

REFERENCES AND SUGGESTED READINGS

The notion of situational analysis has different origins. The most relevant, historically, are Max Gluckman’s ethnography of a conventional crowd, that met at the “inauguration of a bridge in Zululand,” and Goffman’s innovative ecology of public encounters and gatherings, as exposed in Behavior in Public Places (1963). In the first case, the situational analysis was highlighting the link between face to face relationships and exchanges, and the macro-processes of the colonial society in Rhodesia; in the second case, it intended to discover an “interactional order,” meaningful in itself, “loosely coupled” with social structures. Both meanings can be found in the literature on social movements.

SITUATED INTERACTIONS: MICROMOBILIZATION AND MICRECRUIMENT

The first models of collective behavior postulated that small interactions of contagion generated crowd phenomena, as those mythified by Le Bon’s crowd psychology. But these situations of excitation, milling and imitation remained hypothetical. When markets substituted for crowds, in the 1960s literature on social movements, social trends and processes were then taken as aggregations of individual strategies and decisions. The situation became a cluster of microconstraints and opportunities the individual deals with in order to maximize, through utilitarian rational subjective choices, his/her chances of success, and better the ratio between investments and benefits.

These two models had too simple a vision of the causes and motives of engagement in social movements. Situational analysis should start with the definitions of the situation endorsed by the people and focus on situations of interaction that make them sensitive to public problems or change their biographic experience – driving them, for example, to conversion to a Japanese Buddhist movement (Snow & Machalek 1983) or to a more indirect connection to the women’s movement (Taylor 1989). Instead of constructing factors of commitment or recruitment from outside – drawing on the perspectives of resources mobilization, political process, or organizational field – situational analysis should try to account for the meaning-contexts in which the people are involved and embed microdecisions of mobilizing (McAdam 1988) in daily situations. This shift means, in terms of methods, to practice life-story, ethnography, or microhistory, instead of applying psychosocial, structural, or rational hypotheses.

INTERACTION ORDER: PUBLIC GATHERINGS

Analyzing situations means spotting and scanning meaning-contexts, in close-ups, with thick descriptions. One could go back, as a reminder, to the classical series of questions: “What was done? (act) When and where? (scene) By whom? (agent) How and why? (agency and purpose),” Goffman (1963) proposed to analyze the “interaction order” that emerges on the occasion of social gatherings such as public meetings or protest marches. He enumerated the joint activities required for gathering: the allocation of participation roles, the footing or framing devices, the regulation of mutual involvement, the focusing of audience attention, the distribution of rights and obligations, the shielding of backstage from the front-stage, the sanction of improper behavior, and the managing of emotions and consent. An ethnographic inquiry of co-presence situations was set up, relevant to settings of
occupations, meetings and marches, riots and strikes.

Following Goffman’s trail, a few researchers developed such a program of inquiry. Snow, Zurcher, and Peters (1981) suggested an ethnographically based dramaturgical model for assessing interactions among constituent collective elements of crowds, whether celebrations or protests. McPhail and Wohlstein (1983) described accurately the elementary components of “assembling process” in public demonstrations: vocal expressions, rhythm alignments, collective locomotion, and practices of coordination. Gamson (1985) proposed a typology of meetings to investigate: constituents among themselves and with their leaders, with officials, and with the media. Benford and Hunt (1982) studied how audiences are enthralled by methods of scripting, staging, performing, interpreting, and emotions managing. And Lofland fieldworked a sit-in at the California Capitol, as a case of crowd lobbying – later wondering how to reconstruct cycles, waves, and campaigns of protest out of microsituated acts, gatherings, and events (1985).

LIFE-WORLD EXPERIENCES AS CONSEQUENCES OF SOCIAL MOVEMENTS

Situational analysis is important in another perspective. Gusfield (1981) contrasted the qualities of “fluidity” and “linearity” of social movements. Social movement organizations are not war machines or protest firms, the success or failure of which can be measured by the efficiency and profitability of their strategies. Field investigations have to disclose their diffuse and minute consequences in daily life, due to interaction chains between people, who share common experiences (e.g., while engaging in awareness-raising groups), or who appropriate meanings (e.g., while taking part in audiences of public performances). These practical and symbolic consequences, either intended or not, live in one’s biographical situation, and are different from material outcomes. Situational analysis of new social movements has to describe beliefs, affectivities, sensibilities, representations, arguments, narratives, as well as moralities – the sense of rightness, justice and legitimacy – which are continuously invented and tested in face-to-face situations.

These remarks direct us to go back to situated meaning-making activities. We could take as an example, closer to Gluckman than to Goffman, Fantasia’s (1988) description of the strike of Clinton Corn, Iowa, in the 1970s. Striking is not merely applying a repertoire of action according to strategic calculations. It means choosing a way of living, organizing new forms of coordination with colleagues in picket lines or protest marches, investing in new forms of reciprocity and solidarity – thus developing a new “class consciousness.” The analysis shifts to the microtransformations of people’s experiences and relationships – for example, the disruption of daily rituals and routines and the upheaval of class, genre, and race boundaries, when women become the breadwinners and men the homekeepers. New interpersonal ties are set up. A new web of connections in the neighborhood and at the factory transforms the blue collars’ and city dwellers’ identities. The uses and meanings of private property, mutual aid, or institutional trust change as the worlds of home, work, and politics mix. The strike, as a social movement, is thus scrutinized through the lens of situational analysis.

Social capital and social movements
BOB EDWARDS

INTRODUCTION

Scattered mentions of “social capital” or similar terms date back at least to the 1920s, yet the concept did not gain currency and widespread use until popularized by the work of Robert Putnam in the 1990s. By the time Putnam’s book *Bowling Alone: The Collapse and Revival of American Community* came out in 2001, criticisms had already emerged regarding the scope of social, economic, and political processes social capital was said to affect, the lack of clarity in its conceptualization, and about both the validity and reliability of how it was being measured (Foley, Edwards, & Diani 2001). In the years since, the scholarly literature using some conceptualization of social capital has exploded, with the term appearing in the titles of over 300 books and upward of 6000 scholarly articles. The diversity of definition and elasticity of measurement evidenced in much of the recent literature confirms concerns expressed a decade ago that social capital was becoming merely a catch-all concept capable of solving any problem from local to global and thus problematic.

Nevertheless, “social capital” should not be dismissed as a passing fad by those interested in social movements. It is a quintessentially sociological concept that has long been identified as both an important resource facilitating social movement mobilization and a significant outcome produced by social movement activities. A careful conceptualization of social capital that differentiates it from other forms of capital – material, human, cultural – has much to offer the study of social movements and provides a much needed analytical corrective to overly economic and individualist theories of social innovation and political change. The remainder of this entry clarifies the theoretical origins of social capital, defines it, and discusses its importance for social movements as both a resource and an outcome.

FOUR TRIBUTARIES OF SOCIAL CAPITAL THEORY

Four tributaries of theorizing have shaped current conceptualizations of social capital in the recent social science literature. The work of Robert Putnam popularized a notion of social capital which ties it to the societal production of collective goods such as civic engagement, a spirit of cooperation, or generalized trust and reciprocity, which are presumed to be unambiguously good and equally available for use by all members of a given society. In this tributary social capital is a social-psychological and cultural phenomenon congruent with Talcott Parsons’ melding of Durkheim’s macrosociology and Max Weber’s social psychology into the structural-functionalism tradition predominant in American political science since the 1950s. This view oversimplifies social capital by relabeling an older conceptualization of culture as the ideas, norms, values, and attitudes that get internalized by individuals in a society through a socialization process that resembles a sponge soaking up water. Students of social movements who wish to use the civic culture theory underlying this conceptualization of social capital should engage the arguments of Almond and Verba (1963) directly.

By contrast, the three remaining tributaries of social capital theorizing have much to offer people interested in better understanding political and social movements. That associated with the work of Pierre Bourdieu stresses differential access to resources via the possession of more or less durable relationships, socially constructed through “an endless effort at institution” (Bourdieu 1986: 249). In Bourdieu’s
view the fundamental structures that produce and reproduce access to social capital are neither the utility maximizing behavior of individuals, nor self-regulating markets, but networks of relationships connecting individuals, groups, and organizations. Where Bourdieu builds his notion of social capital on essentially Durkheimian microfoundations, James Coleman (1988) incorporates a similar understanding of social capital into a more economistic theory grounded in the rational choice of individuals. Bourdieu’s macrosociology owes its greatest debt to Marx, while Coleman’s methodological individualism remains solidly within the functionalist tradition of Parsons. Third, social network scholars have been working for several decades to develop an empirically based theory of social structure and action in which the resources embedded in specific networks are accessible to facilitate the actions of individuals within that network by virtue of their network location (Lin & Erickson 2008).

Despite their differences, the theoretical tributaries represented by Bourdieu, Coleman and Lin are broadly compatible for three reasons. First, they see social capital as relational and embedded in specific social networks and contexts. Second, social capital, like any other resource, is neither evenly distributed, nor equally accessible to all social movement actors in a given society. Third, all three recognize that social context influences the “use value” of social capital for the movement. By contrast, the civic culture tradition discussed above tends to downplay or outright deny the relational and context-dependent nature of social capital at the heart of the concept’s analytical usefulness.

WHAT IS SOCIAL CAPITAL?

Social capital is best conceived as networked access to resources. Social capital is a relational and structural concept referring to the ability of individuals or groups to utilize their social relations and positions in various social networks to access a variety of resources, and to accumulate a reservoir of accessible resources by consciously investing in social relations.

Unlike the political culture conceptualization of social capital, the three other tributaries of social capital theory all take the analogy with financial capital seriously. Despite their differences, they conceptualize social capital as resources embedded in and accessible through social relations that facilitate the flow of goods and services to individuals and groups in a society. Social capital is not, in these views, a collective good that individuals appropriate directly from their broader culture. Rather social capital is embedded in social relations and access to it, or any other resources it makes available, is not distributed equally among the individuals, organizations, or social movements in a society.

SOCIAL CAPITAL IN SOCIAL MOVEMENTS

That dense levels of pre-existing social organization among adherents facilitates the emergence, mobilization, and varied activities of social movements is one of the most consistent findings to emerge from nearly four decades of social movement research. Until recently social movement researchers seldom discussed these findings in terms of “social capital,” though if one reviews that body of work from the vantage point of recent theorizing, it becomes apparent that the structural and relational variant of social capital advocated here has long been an important element in the analysis of social movements.

Researchers have highlighted several forms of social organization that have served as the mobilizing structures for social movements: infrastructures, social ties and networks, groups, coalitions, and organizations. Infrastructures are the social-organizational equivalent of public goods like the postal service, roads, or the Internet, that facilitate the smooth functioning of everyday life. They are non-proprietary or open-access social resources. By contrast, access to social networks, coalitions, and especially groups and formal organizations can be limited by insiders. Thus, access to
resources embedded in them can be hoarded by insiders and denied to outsiders, often intensifying existing inequalities among groups in their ability to utilize crucial resources of other kinds. Because the resources embedded in various forms of social organization are not equally accessible to all members of a given society, social organization per se does not constitute social capital though it does increase the likelihood that social movement actors will be able to access resources. Social movement actors can be said to have social capital when resources are both present and accessible, in other words when they are actually available for use.

In order for social movements to convert social resources (the “raw materials” of social capital) into social capital two distinct, but necessary, components must be present. First, individual or collective actors must perceive that a specific resource is present in their social context. Second, they must have an exchange relationship that brokers individual or group access to a resource. Exchange relationships exist between two entities when resources of various kinds are made available and accessed. Exchange relationships are, however, not reducible simply to “social ties” in a strictly structural sense though they are closely related. All exchange relationships involve ties, but a tie per se only indicates the opportunity for an exchange and does not carry with it the social or cultural meaning of a relationship between entities. Thus, in a strictly structural analysis of social ties, networks or other forms of social organization are necessary, but not sufficient, for understanding social capital. Without some knowledge of the content of the social relations and of the specific resources available through them, one cannot assess the amount of social capital an individual, organization, or movement actually has at its disposal.

SOCIAL MOVEMENT AGENCY AND SOCIAL CAPITAL

In closing, the role of social movement agency and strategy in producing and utilizing social capital merits emphasis. Social movement organizations (SMOs) often seek to overcome resource scarcities in several ways. Resource aggregation refers to the ways a movement or organization converts resources held by dispersed individuals into collective resources that can be allocated by movement actors. Such efforts both rely upon and build social capital as they access existing resources, pool them, and make them available for specific movement purposes. Similarly, social movements often co-opt or appropriate resources by utilizing relationships they have with nonmovement organizations and groups to access resources previously produced or aggregated by those other organizations. Perhaps most importantly social movements self-produce needed resources through the agency of their own SMOs, activists, and participants. Movements produce social-organizational resources when they found new social movement organizations, develop networks, and form issue coalitions (Diani 1996; Minkoff 1997). All of these endeavors utilize social capital to gain access to resources and produce new social capital as an important outcome of collective action.

Social change and social movements
KENNETH T. ANDREWS

Do movements matter? The impact of movements on patterns of social change is one of the most enduring topics in the study of protest and social movements, and it has gained considerable attention in recent years. Understanding this complex topic requires careful attention to several interrelated issues including conceptualizing social change and appraising whether movements matter and, if so, how. Debates continue regarding how significant movements are for explanations of social change, the conditions under which movements matter, and the movement characteristics associated with greater or lesser impact.

CONCEPTUALIZING SOCIAL CHANGE

The first challenge that scholars face is defining social change in a way that is useful and meaningful. In earlier scholarship, analysts focused on success to gauge whether movements achieved core goals. However, success or goal attainment models were criticized for assuming high consensus and stability on movement objectives and ignoring the unintended consequences of movements. Movements often have many objectives that change over time. Unintended impacts occur, for example, when movements motivate other groups to mobilize. In current scholarship, social scientists prefer impacts, consequences, or outcomes and use these terms interchangeably.

What impacts, consequences, or outcomes should scholars consider? Amenta’s “collective benefits” criterion provides the most useful framework in which he recommends identifying outcomes in relation to the benefits or costs to a movement’s constituency (see Amenta 2006; Amenta et al. 2010). Andrews (2004) builds on this framework by arguing that scholars should focus on outcomes across extended time periods and across multiple domains to assess the durability and breadth of movement influence.

Movement influence on social change may be direct as when authorities respond to protester demands. More often, movement influence is indirect or mediated by established political actors (Soule & Olzak 2004; Amenta 2006), the news media (Gamson 1990; Andrews & Caren 2010), public opinion (Agnone 2007), or other processes.

Movement consequences can be differentiated by their substantive domain – political, economic, and so forth. Undoubtedly, scholars have made the most progress studying the political consequences of movements in democratic societies – especially public policy. Cultural, economic, and biographical consequences are the three other domains that have been the focus of recent scholarship.

Studies of movement consequences have built on the work of political scientists to identify distinct stages in the policy process. This typically includes agenda setting, policy alternatives, policy adoption, and implementation. Above all else, this research has shown that movement influence is greatest at the earliest stages by drawing the attention of political elites to a movement’s claims (Soule & King 2006). Movement influence is considerably reduced in the crafting of policy alternatives or the passage of legislation. Other work on the political consequences has examined the implementation of policy, the election of movement supported candidates to office, and the impact of movements on political parties (Andrews 2004).

Cultural approaches to the study of social movements have grown in recent years, and scholars are beginning to examine the cultural consequences of movements (Earl 2004). This work is wide-ranging, reflecting the many ways...
that culture has been conceptualized in movement studies and in the social sciences. One strand of work considers the formation of new frames and collective identities as important outcomes of movements. For example, Rochon (2000) argues that critical communities of intellectuals forge the core ideas that movements diffuse into the broader society. Movements may also alter media discourse, public opinion, or scientific and intellectual communities (Ferree et al. 2002; Frickel & Gross 2005).

Although political process approaches shifted attention away from the economic causes and consequences of movements, scholars have been returning to enduring questions about the impact of strikes and labor organizing (Martin 2008). This work points to organizational competition and innovative organizing models as critical for labor movement gains. In addition, organizational and movement scholars have begun work on the impact of movements on markets including the formation of alternative markets, products, and regulatory systems (Bartley 2007; Schneiberg, King, & Smith 2008) and boycotts and protest targeting the behavior of large corporations (Ingram, Yue, & Rao 2010).

Beyond the political, cultural, and economic consequences described here, scholars have investigated the biographical, demographic, and legal impacts of movements. In addition, the impact of movements on subsequent movements—either by provoking counter-movements or inspiring allies—is another critical legacy of some movements. Here, scholars have identified the ways that movement ideas, tactics, organizational models, identities, and personnel directly and indirectly influence future movements.

MOVEMENT CHARACTERISTICS AND SOCIAL CHANGE

Why are some movements more impactful than others? Two major debates have organized scholarship on this question concerning organization and disruption. First, scholars have considered whether organization enhances movement influence, or more precisely what kinds of organizations and resources matter. Early debates considered whether formal, bureaucratic, and mass membership organizations increased the likelihood of achieving movement goals (Gamson 1990). Piven and Cloward (1977) contended that mass membership organizations promote the routinization of protest and undercut leverage for what they call “poor people’s movements.” This question spilled into a related question of whether disruption is the primary source of movement leverage. Evidence remains mixed, with some studies showing that disruption imposes costs on targets that may motivate concession (King & Soule 2007). Others find that strong organizations and leadership structures yield gains even in the absence of disruption (Cress & Snow 2000).

Moving beyond the organization and disruption debates, recent work has considered whether organizational and strategic diversity and adaptability facilitates movement impact. Andrews’ “movement infrastructure” model integrates these insights by arguing that movements with diverse leaders, organizations, and resources are better able to secure gains. The underlying insight is that movement impact may depend on several mechanisms including disruption, persuasion, or negotiation/bargaining (Andrews 2004). Adaptation may allow challengers to maintain strategic advantages by catching targets off guard or develop more persuasive arguments, and organizational and leadership diversity may facilitate innovation and multiple mechanisms of influence (Ganz 2000; McCammon et al. 2008).

SOCIAL, ECONOMIC, AND POLITICAL CONTEXT

Efforts to understand the consequences of movements must consider several important factors beyond the movement itself. At the most basic level, threats to spuriousness must be appraised. In other words, the factors that
explain the rise of movements may account for their apparent impact. Not surprisingly, scholars have focused most on the dimension of the political opportunity structure – especially electoral competition and elite allies – given the relatively large number of studies on policy outcomes. More recently, public opinion has been examined based on the hypothesis that favorable opinion may be necessary for movements to impact the policy process. We should expect to see an increasing number of studies that consider the ways economic and cultural contexts shape the possibilities of movement impact as scholars consider outcomes in these domains.

Another important development is the formation of more complex models of movement influence. In particular, some theoretical expectations identify contingent effects – for example, that militant tactics will be effective in some situations but backfire in others. Amenta’s “political mediation” model (2006) moves in this direction by specifying that different political contexts alter whether and how movements matter. For example, the theory would expect modest forms of mobilization to yield benefits in regimes where barriers to participation are low and political authorities are favorable toward the movement and its constituency.

SUMMARY AND FUTURE DIRECTIONS

Although considerable gains have been made in recent years, the study of movement consequences remains underdeveloped in comparison to other major topics such as movement origins or differential participation. Scholars have developed strong conceptual frameworks for examining consequences, and there are exemplary studies using a wide range of methods. Further work is needed that draws systematic comparisons across movements, that provides a much closer analysis of the interactions between movements and their targets, and that considers the consequences of movements for social inequality.

Social class and social movements
KLAUS EDER

THE STATE OF THE ART

The link between social class and social movements refers back to the assumption of Karl Marx that in some specified cases the formation of social classes is connected with the mobilization of these classes. Social movements then become what Marx has called “Klassen für sich,” classes conscious of themselves. Marx points to the small tenants in France as a famous example of a class not capable of developing a collective consciousness of itself and therefore being unable to act collectively. He referred to them as a “sack of potatoes.” Regarding the industrial worker, Marx was much more optimistic because of the intersection of two critical factors: (1) the presumed centrality of the conflict this emerging class would address; and (2) the social conditions that link the proletarian workers via their concentration in the industrial workplace and the urban housing conditions which makes communication and strong relationships among them more probable.

This Marxian analytical model for explaining social movements as the mobilization of social classes in space and time has been applied to research on the working poor and their capacity for collective action (Piven & Cloward 1979) as well as on farmworkers and peasants (Paige 1975; Landsberger 1976; Jenkins & Perrow 1977). The latter research plays an important role in research on peripheral capitalism where the issue of a class outside industrial production and linked to food production is the starting point for analyzing peasant movements, especially in Latin America. These “forgotten” classes are often linked to populist mobilizations, which points to an emerging nexus of class and mobilization in present-day societies (Albertazzi & McDonnell 2007).

Yet the most important debate has taken place in the core capitalist countries, triggered by the rise of the new social movements beginning in the second half of the last century. Here the debate was turned on its head: it did not begin with the idea of changing social relations of production or changing relations of power, but started with the outcomes of such relations, namely the series of protest events in the second half of the last century, a phenomenon that has continued with the rise of transnational activism. Here the issue of class emerged in search of a social basis for these movements similar to the one that Marx identified earlier.

The prominent idea guiding this search for explaining the rise of the new social movements in the analytical tradition of Marx (and Weber) is the assumption that the new social movements are an outcome of the mobilization of the middle classes. A partial theory pointing in that direction has been the argument that fascist movements have been (and still are) an outcome of mobilizing the middle classes (of the untaming of the petty bourgeois) (Elliott et al. 1982; Kriesi 1989; Eder 1993; Maheu 1995). The counterargument (Pakulski 1993a) has pointed to the dissolution of class in the course of the increasing social differentiation of groups in modern societies, with the result that the concept of class should be dropped. In retrospect, both camps have been right: classes are as complex as they have ever been, but they were also complex when Marx wrote The Eighteenth Brumaire (1852). The expectation that classes would crystallize into a few antagonistic forces has proved wrong; but this is not to say that complex class structures no longer generate classes as groups sharing certain properties. Thus, the issue turns into an empirical issue: What are the boundaries of the groups that were mobilized in the new
social movements and that are still mobilized in today’s transnational activism.

CONCEPTUAL ISSUES

The classic idea of Marxian sociology that social movements are the expression of the interests of suppressed classes is half the truth. Inequality and being situated on the negative side of this social relation can be an important source of motivation for collective action. Yet those on the positive side of this social relation, those who are well off, might engage in collective action, but for reasons that have less to do with being disadvantaged than with moral reasons which define a given social relationship as unacceptable or simply against a sense of justice. Religious movements have often had this orientation, and the movement of the Enlightenment could be counted as a case of that.

Such material and moral interests, that address an unequal social relation, mingle with elements which define social relations among people who are similar or dissimilar and not necessarily unequal to each other. Ethnic movements, nationalist movements, or communal movements are movements that address boundaries between people that affect social relations of (non)recognition. In these cases, the concept of class alone is not so useful, since there are other factors that lead to group alignments and relations.

When dealing with class and social movements, we should be cautious about mixing these two forms of relation since it can lead to the fallacy of false averaging across cases. The link between class and social movements varies within the type of phenomena of collective action in which class-related issues of social relations, namely inequality, constitute the site for collective action. Marx was right in arguing that societies in which class relations are no longer embedded in moral bonds of hierarchical dependencies are cases in which we should expect collective action on unequal social relations to become the dominant mode of social conflict.

What Marx did not take adequately into account has been the mobilization of well-off classes against social inequality in the name of some norms of justice. Such “altruistic” social movements emerged in older societies when religious prophets dissociated from the dominant groups in order to act as proxies for the disadvantaged. This tradition is equally found in the emerging industrial society of the nineteenth century when welfare groups mobilized to counter the effects of early capitalism and it is continued – visible even by its naming – in the global justice movement.

The distinction between equality-oriented and recognition-oriented social movements is first of all an analytical one. The separation of networks of equal social relations from social relations of recognition requires clear methodological rules for separating effects of class from nonclass effects on collective action. Therefore, it is misleading to argue that the extent to which class does not covary with collective action is a proof of the causal effect (or non-effect) of class. What needs to be figured out is under which conditions the coupling of class and collective action is operative and to what extent it connects to nonclass parameters in generating collective action. Even the complete decoupling of class and collective action is possible – which presupposes a situation in which issues of unequal social relations are neutralized in favor of identity conflicts over recognition (an example being collective action based on nothing but struggles for boundaries, such as nationalist or fascist movements). The debate on the changing role of class in social movements is important, yet it becomes useless as long as it is framed in terms of an end of class in social movements (Pakulski 1993b; Pakulski & Waters 1996). Apart from being premature, such claims can only hold in situations that are underspecified. The historical variability of situations is so wide that any attempt to generalize will lead to contradictory results which inhibit further research. To find a temporal pattern in the rise or decline of class in social movements can only be linked to processes in which unequal social relations
are weakened in the long run. It would be sufficient to claim that declining inequalities will lower class-determined action. Yet even this link might have to be relativized by symbolic factors defining what constitutes an illegitimate violation of equality. It is to be expected that the competition of groups related to each other as unequal will continue to shape the evolution of societies. Therefore we will still have to reckon with class and with its variations.

CHANGING PERSPECTIVES

Class and social movements can be seen from both an individual and a group perspective. Taking the individualist perspective, classes are aggregations of objective and subjective properties of individuals. Yet such conceptions produce nothing more than classes on paper, statistical constructions of possible groups with shifting boundaries in time and space. In network-analytic terms, we can engage in block-modeling of classes. Such classes on paper yet do not produce causal effects. They need some “glue” that makes sense of being positioned unequally or being deprived of recognition.

Classes are therefore groups of people that share some idea of being positioned in the world. Within these groups the variation of subjective properties might vary to the same, and even to a greater, extent than between groups. What makes an aggregate of individuals a group (or a class as a special case of a group) is shared meaning. Social movements take up such meaning and give to it a radical interpretation, often via framing processes and often in conflict with the class from which they emerge. Once we take class not simply as an aggregate of individuals, but as an emergent group level phenomenon on the methodological level, the link between class and social movements can be turned into the empirical issue of identifying different degrees of the group relationship of people sharing social positions in a society. The issue is not so much the theory but the methodology which helps or hinders us to see the way in which groups, as meaningful networks of actors, provide the ideas and the actors to form social movements. Moving from variable-oriented individualistic accounts of class to network-analytic accounts is therefore important in order to reanimate the old issue of class and social movements. In this way, we avoid the declaration of the death of class which has had a perverse effect: the death of research on the link between class and social movements.

REFERENCES AND SUGGESTED READINGS

Social control is such a widely recognized concept that one would suspect that a consensual definition of it exists. That is not the case. While one can generally define social control as the formal and informal processes that socialize, sanction, and/or reward individuals for conformity, and produce social regularity, specific definitions of social control vary widely (see Meier’s 1982 discussion on this point and his fascinating history of the concept). In its broadest definition, childhood socialization plays an important role in social control, ongoing social influence processes such as shaming rituals play critical roles in informal social control, and law enforcement and the legal system play critical roles in formal social control. Moreover, social control can involve fairly innocent creations of conformity that generally bring great social good (i.e., driving on the same side of the street and acknowledging and abiding by common rules of the road) or can involve a dark side where conformity is achieved through the loss of liberty, individuality, and free expression. Perhaps because of this breadth and dimensionality, Sutton (1996) has argued that the concept goes too far and is too imprecise; he recommends abandoning the term altogether and using a more precise term such as sanctioning instead.

Nonetheless, in the study of social movements, social control has a far more well-defined set of meanings and can play an important conceptual role in uniting work on control processes. I discuss the various ways in which social control has been used in social movement research and related fields and then discuss how its conceptual utility in social movement scholarship might be much higher than in other areas.

REPRESSION AS SOCIAL CONTROL

The most obvious place in which social control is relevant to the study of social movements is through the study of repression. Repression operates to control and/or constrain protest, or to entirely prevent protest in some cases. However, despite the almost endless routes for controlling or constraining protest, repression researchers focus heavily on coercive state action at the expense of studying private repression and noncoercive forms of repression (e.g., channeling). Earl (2004) argues that by repositioning repression under the rubric of social control, or studying what she refers to as the “social control of protest” or, more briefly, “protest control,” scholars could more easily recognize the array of social actors (private and varying types of public actors) that may attempt to control or constrain protest and the wide variety of actions such actors could use to accomplish their goals.

For instance, company towns are complex social control systems that very effectively prevent the emergence and/or spread of protest and yet these have only infrequently been the source of social movement research (see Gaventa 1980 as an exception). Similarly, what Ferree (2005) has referred to as “soft” repression – which includes ridicule, stigma, and other forms of shaming and silencing – is easy to categorize as a form of protest control even if repression scholars have been slow to recognize the relevance of these actions. At the most general level, then, reference to the social control of protest is an attempt to broaden the repression research agenda to include less coercive, even less formal, and often private forms of protest control.
SURVEILLANCE STUDIES AND SOCIAL CONTROL

Although repression researchers have examined covert repression (e.g., Cunningham 2004) and surveillance as a type of repression (e.g., Marx 1974, 1979, 1988; Boykoff 2007), an entirely separate field of “surveillance studies” has emerged over the last few decades. This field has largely emerged from research on information technologies and legal research on privacy (see Marx & Muschert’s 2007 discussion of the development of surveillance studies). For instance, the dramatic rise of public surveillance systems like closed-circuit television systems and private and government use of large consumer and voter databases has led to concerns about the development of surveillance societies.

Repression researchers and surveillance studies scholars have overlapping concerns: most obviously, both are concerned with the use of surveillance as a form of social monitoring and social control, the tools and methods used to accomplish surveillance, and the consequences of surveillance for activism. Of course, surveillance studies also examine topics of less interest to social movement scholars (e.g., the use of hitherto private information in legal settings). But the overlap between the two areas is substantial enough that one might expect notable interactions between the areas. This is largely not the case. The two sets of scholars often publish in separate journals, have distinct scholastic identities, and have different primary literatures (social movement studies versus information studies, for instance). Key theorists also differ between the two areas: for instance, Foucault is a critical theorist for most surveillance studies scholars but of less central concern to most repression researchers. For a clear contrast in the tone and nature of inquiry in these two areas, compare works like Cunningham (2004) or Marx (1979) from social movement studies to Ball’s (2009) work in surveillance studies.

Yet, as I will discuss below, under a rubric of social control, the question for social movement scholars becomes what they can learn from surveillance studies about the monitoring and control of citizens generally and protest specifically. That is, if social movement scholars were to be concerned with the social control of protest, rather than repression as it has been classically studied, many of the main research questions in surveillance studies would be seen as of great import in social movement research.

CENSORSHIP AS SOCIAL CONTROL

Social movement scholars have been interested in censorship, particularly when studying social movement activism in nondemocratic states. For instance, Ball (2005) points to the need to find alternative ways to track state violence since regimes are likely to cover up and then censor news about state-based attacks on civilians.

Nonetheless, there is a wide and sprawling literature on censorship that is neither confined to repression studies nor social movement studies. For instance, while all of the following touch on the edges of social movement studies, none have not been central to the study of repression: (1) research on the censorship of artistic expression; (2) debates about pornography, its effects, and its proper regulation; and (3) legal debates about the boundaries between free speech versus material that is properly censored even in a democratic state. Below, I take up how research agendas might be altered if they were reoriented around social control and hence included more of the research terrain on censorship as relevant to social movement studies.

THE LEGAL SYSTEM AS SOCIAL CONTROL

In a provocative article, Oliver (2008) argues that social movement scholars have been ruefully indifferent to trends in mass incarceration in the US. Over the past several decades, the percentage of people (particularly minorities)
in the US that are in jails or prisons or on probation or parole has skyrocketed. Oliver argues that the disproportionate imprisonment of people of color has dramatically affected the mobilization potential of the civil rights movement. Yet, repression researchers have not seen mass incarceration as a form of repression, in part because there is no evidence that mass incarceration was intended to affect the civil rights movement. Oliver notes that, whether there was intention or not, there is a demonstrable effect of mass incarceration on the civil rights movement and that this deserves further interrogation.

This move would represent a major fusion between repression research and sociolegal research. But, that fusion is hard to make when concepts like repression seem to require intention. A study of the social control of protest, though, would not necessarily see intention as a necessary element of social control and therefore might more readily recognize and facilitate this kind of research.

SOCIAL CONTROL PROCESSES WITHIN MOVEMENTS AND ORGANIZATIONS

Almost entirely unnoticed by repression researchers are the ways in which movements try to regulate their own members. This issue was an obvious theme of older research on religious and utopian movements (e.g., Kanter 1968) and of contemporary research on groups that vigorously police membership (e.g., Scientology: Peckham 1998), but is otherwise a relatively neglected area of social movement scholarship generally. However, if repression research were broadened to research on the social control of protest, these internal control dynamics would be much more apparent.

SOCIAL CONTROL AS AN INTEGRATING CONCEPT

In each of the areas above, I have tried to show the potential research connections between existing areas of research and/or empirical phenomena and core concerns of repression researchers. However, as Earl (2004) argued, the concept of repression has become so stylistically defined that it now conceals from study as much as illuminates. Social control, while too broad a concept to be useful to some research areas (see Sutton’s argument about social control as a concept in sociolegal studies), offers precisely the breadth and connection to other areas that repression as a concept increasingly lacks. Whether the social control of protest will become a vigorous area of study, or whether research will remain defined around repression, remains to be seen.

Social control errors
WILLIAM A. GAMSON

Social movements that are unhappy with the choices of authorities must be handled in some fashion. The most basic distinction in how authorities respond to movement pressure is between (1) changing their decisions and policies, and (2) making some effort to control the social movement. The former response deals with the content of the unhappiness by modifying outcomes; the latter deals with controlling the source of the pressure for change. If social control is successful, there will be no need for outcome modification.

Successful social control allows authorities to maximize their room for maneuverability and this has several advantages (Gamson 1968: 115): (1) authorities are freer to exercise their own personal preferences; (2) if they have no particular preferences, they can use their authority as a resource to influence the decisions of other authorities in which they have an interest; and (3) effective social control increases slack resource, making influence cheaper. As Dahl (1961: 309) writes, “Slack resources provide political entrepreneur[s] with [their] dazzling opportunity.” They can influence at bargain rates when the competition has been removed by effective social control.

Major social changes through the influence of social movements can occur for two basic reasons: bad decisions or social control errors. Authorities may make decisions which adversely affect such a large and influential group that even the most skillful efforts at social control are not enough to contain the pressures for change. Or, the techniques of social control used may be so clumsy and ineffective that they stimulate greater mobilization rather than containing the pressure.

Movements may try to increase their effectiveness by deliberately trying to create social control errors. Such errors may be quite important in accelerating the pace of change. They may lead a social movement to new allies and increase the commitment of their supporters. They may also lead to the loss of legitimacy and trust in existing authorities and thus weaken the ability of officials to enforce their decisions and make new commitments. And they may create such serious instability that bystanders will now find the status quo intolerable.

In this situation, the natural advantage that accrues to those supporting the status quo switches to those who support change (Gamson 1968: 191). This possibility has on occasion led some social movements to welcome a worsening of social conditions on the grounds that the resultant crisis will enhance the possibilities of more fundamental social changes. Unfortunately, from the standpoint of movements, many different kinds of changes may follow and the relative probability of changes that are deplored may be enhanced even more than the probability of the changes desired.

Hence, while social control errors may accelerate the pace of change, a group which deliberately tries to create them is playing with fire. Authorities, as Dahl (1961: 320) points out, “have access to extensive political resources which they employ at a high rate with superior efficiency. Consequently, a challenge to the existing norms is bound to be costly to the challenger, for legitimist professionals can quickly shift their skills and resources into the urgent task of doing in the dissenter.”

SPECIFIC SOCIAL CONTROL ERRORS

Still, the application of social control is a delicate business, requiring discipline and intelligence on the part of the authorities if it is to dampen and remove pressure more than stimulating it. The shattered remains of many administrations and regimes testify to the fact
that serious errors are made. More specifically (Gamson 1968: 191–192):

- Removal of partisan leaders by exile, imprisonment, or execution can backfire. It offers a movement with strong secondary leadership an opportunity to mobilize its supporters to the fullest and to draw in sympathetic bystanders, especially if the pretext for repression is weak and unconvincing. However, such repression may be successful if the movement is weak and the regime is sufficiently strong, making repression an extremely dangerous social control technique for a movement to invite.

- Attempts to degrade and slander social movement participants can arouse sympathy and support for them among bystanders. If there is latent support, such actions may bring it into the open and thus strengthen the group. It may also succeed in scaring off some supporters, perhaps at the same time it helps the movement grow. Verbal attacks can do both at the same time by polarizing the attitudes of potential supporters.

- “Over persuasion” can create pressure for change through what one might call a “Frankenstein mechanism” (Gamson 1968: 193). Authorities may, in order to mobilize supporters for their policies, make strenuous efforts to persuade through their greater access to the mass media and other forums. If such efforts are successful, the same officials may find themselves under fire from the very people most persuaded. For example, having made strenuous efforts to convince constituents of the righteousness of a war, the convinced may use the administration’s own arguments to press for dramatic military action which the officials are reluctant to undertake.

A Frankenstein mechanism may also succeed in stimulating expectations which go unfulfilled. Broken promises fail to stimulate pressure when they are regarded with cynicism, but making such promises more credible without fulfilling them makes them more likely to create increased pressure for change rather than reducing it.

In conclusion, the application of social control by authorities to reduce the pressure of social movements is typically double-edged. If applied skillfully, it offers authorities a number of advantages. But it can very easily backfire and often does. And when it does, such social control errors can provide social movements with increased opportunities for bringing about social change.

Social movements
DAVID A. SNOW

Social movements and related phenomena, such as protest demonstrations and revolutions, are collective actions through which aggrieved collectivities give voice publicly to various grievances and press relevant authorities to attend to the associated claims and/or demands. The grievances generally range from political and religious oppression to socioeconomic inequalities to procedural and/or rights-based inequalities to all kinds of lifestyle concerns and perceived social and environmental harms. Although there are more institutionlized and typically less public forums in which collectivities can express their grievances and concerns, particularly in democratic societies, social movements have functioned as an important vehicle for articulating and pressing an aggrieved collective’s interests and claims for much of human history. Certainly many of the most significant events and changes throughout the course of human history – such as the rise and spread of Christianity and Islam, the Reformation, and the French, American, Russian, and Chinese communist revolutions, for example – cannot be fully understood apart from the operation and influence of social movements. Similarly, many of the world’s most influential and famous figures – such as Jesus Christ, the apostle Paul, Muhammad, Martin Luther, Lenin, Gandhi, Mao Zedong, Martin Luther King, Jr, and Nelson Mandela – gained their celebrity and influence, in part, from the movements with which they were associated and/or lead. And, today, it is difficult to name a contested social issue with which a social movement is not associated on at least one side of the issue. Whatever the issue – abortion, animal rights, border control, civil rights, human rights, democratization, environmental warming, gender equality, gun control, immigration, labor and unions, nuclear weapons, religious freedom, war, water conservation and control, and world poverty – one typically finds one or more associated social movements. Whether we live in a “movement society” or world, as some scholars have suggested (Meyer & Tarrow 1998), there is little question but that social movements are important social phenomena and that our understanding of the social world, both past and present, is partly beholden to our understanding of social movements and the activities and events with which they are associated.

CONCEPTUALIZATION

As with many concepts in the social sciences, there is little consensus as to how best to define social movements. Some scholars emphasize the strategic, rational, and organized character of social movements (McCarthy & Zald 1977; Tilly 1978); others focus on the networked and coalitional character of movements (Diani 1992; della Porta & Diani 2006); some accent the ideological element of movements (Zald 2000); still others emphasize the “manifestly political” character of movements as a form of contentious politics with one or more governments as a claimant or target of claims (McAdam, Tarrow, & Tilly 2001); and some scholars argue for a more inclusive and elastic conceptualization, one that conceives of movements broadly as collective challenges to institutional, organizational, and cultural domains other than just the state or the polity (Snow 2004; Snow & Soule 2010). However, one does not have to choose one emphasis or focus over another so long as it is recognized that each conceptualization accents a particular dimension or aspect of social movements, much like the case of the storied description of an elephant rendered by six blind men on the basis of the part they touched: all parts were important features of the elephant but alone could not
provide a complete picture of the beast in the absence of the other parts. And so it is with social movements. Thus, whatever dimensions of movements a scholar might accent, it can be argued that all social movements share a number of characteristics that together define the phenomenon. First, all movements are change-oriented in the sense that they seek or oppose change, although there can be considerable variation in the level and degree of change sought; second, movements are, as a consequence of this change-orientation, challengers to or defenders of existing institutional structures or systems of authority, be they political, religious, corporate, educational, or cultural; third, movements are collective rather than individual enterprises; fourth, they act outside of existing institutional or organizational arrangements, although in varying degrees, with some movements employing only extra-institutional tactics and others working within institutional channels while also engaging in some extra-institutional collective action; fifth, they operate with some degree of organization, ranging from a single social movement organization (SMO) to a network or coalition of movement organizations that may vary in the degree to which they are tightly or loosely coupled; and, sixth, social movements typically display some degree of temporal continuity — they are relatively episodic but rarely fly-by-the-night fads that are here today and gone tomorrow.

TYPES OF MOVEMENTS

Although all social movements can be defined in part by the above characteristics, they can also be differentiated in terms of these characteristics. The most common axis of such differentiation concerns the degree or amount of change pursued, which makes sense since the promotion of or resistance to change is the raison d’être of virtually all social movements. The most basic distinction in this regard is between reform and revolutionary movements. A more subtle distinction is provided by Smelser’s (1962) differentiation between norm-oriented and value-oriented movements. Norm-oriented movements are said to seek relatively limited but specific system changes, mainly with respect to rights and rules of access and participation in the various societal institutions. Examples might include movements that have sought to change labor laws, decriminalize marijuana, expand or restrict immigrant rights, and criminalize or decriminalize abortion. Value-oriented movements, in contrast, seek more fundamental changes in cultural values and institutional structures and practices, as with movements that seek to redefine the fundamental rights and privileges of personhood and citizenship, like the Gandhi-led Indian Independence Movement and the African American civil rights movement, or those that have sought to recalibrate the very structure of political governance and association and the values on which they are based, as with the French and American revolutions.

Wallis (1984) provided a similar typology with his distinction between world-rejecting and world-affirming movements. Although developed to capture differences mainly among religious movements, this dichotomy parallels the norm- and value-oriented distinctions. The world-rejecting movement, like the value-oriented movement, condemns the dominant social order, including both its values and institutional arrangements, as with the Jim Jones movement that ended in mass suicide. The world-affirming movement, like the norm-oriented movement, is less contemptuous of the prevailing religious or social order and thus seeks more selective changes in specific segments of that enveloping order, as with the Liberation theology movement in South America (Smith 1991).

By focusing on the amount or degree of change sought, the above schemes provide one basis for differentiating among movements, but they are incomplete because they neglect the fact that change can have a different focus or occur at different levels. This oversight was addressed by the anthropologist Aberle (1966) in his research on the Peyote religion among
the Navaho Indians in the southwest region of the US. He differentiated among movements based both on the degree of change and the locus or level of change sought, directing attention to the target of change, which can vary from the individual level to some aspect of the broader structure. Based on the cross-classification of these two dimensions, Aberle derived four generic types of movements: alternative movements, which seek partial change in individuals, as in the case of the therapeutic and self-help movements that proliferated in the US in the 1970s and 1980s; redemptive movements, which seek more complete or total rather than partial change among individuals, which was the objective of various religious movements that flowered in the 1970s, such as the Hare Krishna and Unification Church (Moonies) movements; reformative movements, which seek limited but focused changes in the social system like the normative and world-affirming movements noted above; and transformative movements, which are akin to value-oriented and revolutionary movements.

An alternative approach to differentiating social movements takes a more historical approach, contrasting movements clustered in different historical areas. Differences in the amount and locus of change sought are not ignored, but the crucial criterion is the affinity between certain historical trends or changes and movement goals. Perhaps the most cogent illustration of this approach is found in Mannheim’s *Utopia and Ideology* (1946), wherein he identifies four major waves of movements in so-called modern times: chiliastic movements expressed in some religious movements and peasant revolts; liberal humanitarian movements associated most dramatically with the French and American revolutions; conservative movements expressed most fully in fascism and Nazism; and socialist movements associated mainly with international communism but also influencing labor movements in the US, Europe, and elsewhere. Extending Mannheim’s historical approach, Turner (1969: 391–395) has argued that “major eras in history have differed in the dominant sense of injustice which underlay the major movements of the time and dictated the main direction of social change,” contending that both the liberal humanitarian and socialist conceptions of injustice have been exhausted and that “a new revision is in the making.” Foreshadowing aspects of new social movement theory, Turner argued that the emerging change preference concerned the yearning for a satisfactory sense of personal worth, dignity, and identity. New social movement theory emerged in the 1980s in Europe to analyze the so-called new social movements that began to surface in the 1960s and which were seen as being different from the older, materially based working-class and labor movements associated initially with Marxism. In contrast, the new social movements – such as the environmental movement, human rights movement, and gay, lesbian, bisexual, and transgender (GLBT) movement – are driven by concerns with procedural rights and various life style issues (Larana, Johnson, & Gusfield 1994; Buechler 1995; Kriesi et al. 1995).

A final basis for differentiating among movements relates to strategic and/or tactical differences. Perhaps the foremost example is the distinction between violent and nonviolent movements. Although the use of violence may occur intermittently in a movement’s career, some movements are sometimes defined in part by their strategic use of violence, as with terrorist movements, or nonviolence, as with the US civil rights movement and the Indian Independence Movement. Strategic or tactical actions are also pivotal in McAdam, Tarrow, and Tilly’s (2001: 7–8) distinction between constrained contention and transgressive contention. In the case of the former, “well established means of claims making” are employed, which is to say that they are institutionalized or routinized; whereas in the case of transgressive contention, some parties embroiled in the contention “employ innovative collective action” – that is, the claims or means are “either unprecedented or forbidden within the regime in question.”

Clearly there are a number of alternative ways of differentiating and typologizing social movements. What is important is to be
cognizant of the different axis of differentiation and not to assume that the conditions that account for the emergence and operation of movements of one type necessarily apply to all types of movements.

FOCAL ANALYTIC ISSUES AND QUESTIONS

As the study of social movements has evolved to the present, most inquiries and research are guided by a variant of one or more sets of four focal questions. First, there is the long-standing concern with conditions underlying the emergence of social movements. Here there are two associated questions: Since movement adherents are generally stirred to action by a combination of grievances and a sense of efficacy, what are the processes and mechanisms that account for the generation of these mobilizing sentiments? And, since the occurrence of social movements is nested temporally and spatially rather than randomly distributed across time and place, what specifically are the sets of contextual conditions that facilitate or constrain the emergence and flourishing of social movements? The second orienting question concerns the issue of micromobilization or recruitment and participation processes. Here there is a subset of questions as well: What is the character of movement participation? What are the different ways of participating? And who are the determinants of who participates in social movement activities, and why? Why do only certain individuals come to participate in movement activity while other similarly situated individuals remain on the sidelines? The third focal question concerns the dynamics of social movements. What happens once a movement has surfaced and it is, so to speak, up and running? More concretely, how are social movements organized and led, and how do they go about the business of strategically pressing their claims and dealing with the various relevant actors within their field of operation? What or who are the relevant actors that constitute the movement field of action, and what are their relationships? And what are the various mechanisms and processes associated with the operation and functioning of social movements? The fourth general focal issue concerns what many scholars and social movement activists consider as the bottom-line question: What difference do movements make, and for whom and in what ways? Do social movements play an important role in challenging authorities and generating impending social change? Are there other functions that they perform? What, in short, are the consequences or outcomes of social movements?

Answers to these questions understandably draw on a range of overlapping perspectives and processes, including political process theory, resource mobilization theory, ecological and spatial perspectives, framing processes and theory, cultural perspectives, social psychology, as well as other perspectives and points of view, all of which can found among the various entries included in this encyclopedia.

Social movement industry

JOHN D. MCCARTHY

Individual social movement organizations (SMOs) play a significant role in mobilizing social movement activity and it is common for scholars to take the powerful analytic advantage of aggregating all of the SMOs that identify themselves with a particular social movement in their analyses. Such aggregates of SMOs have been termed social movement industries (SMIs), conceptualized as similar to the many industrial categories of firms that compose an economy. All SMIs in a nation make up the social movement sector (SMS) (McCarthy & Zald 1977). The size and structure of SMIs has been hypothesized to have important consequences for the likelihood of a social movement’s success (Zald & McCarthy 1980).

One of the major challenges for researchers of SMIs has been the difficulty of generating a census of SMOs and therefore the possibility of creating representative samples of those that compose an SMI, since a fully exhaustive list of national or local SMOs rarely if ever exists. A major source for research on national SMIs in the US has been the Encyclopedia of Associations (e.g., Minkoff, 1995, 1997; Johnson 2008). Not without its critics (Brulle et al. 2007), several analyses suggest it is reasonably comprehensive (Martin, Baumgartner, & McCarthy 2006; Walker, McCarthy, & Baumgartner forthcoming). Researchers have also employed national lists of SMOs compiled by movement actors themselves (e.g., Edwards 2003; Edwards & Marullo 1995 for PMOs; Brulle et al. 2007 for EMOs), multiple lists of local SMOs (e.g., Andrews & Edwards 2005 for EMOs), and, as they become more comprehensive, Internal Revenue Service records of nonprofit organizations have also begun to be used (McVeigh 2006 for civil rights SMOs). Systematic evidence gathered from the organizations composing SMIs has been used to assess a diverse set of theoretical expectations about industry level dynamics, including the consequences of competition among their constituent SMOs, the structural conditions that affect an SMI’s density through time, and the consequences of an SMI’s temporal fluctuations in density on social movement outcomes.

As social movements emerge and grow their constituent SMOs proliferate such that mature SMIs typically are composed of many SMOs with a few very large ones and many more smaller ones. As an SMI grows and “the number of SMOs increase they differentiate in terms of ideological/constituency constellations and in terms of the functional niche they occupy” (McCarthy & Zald 2002: 538). Although the constituent SMOs may come together for some shared purposes either of protest or of collective representation, they compete for resources from sympathizers and adherents, and they conflict over leadership of the movement as a whole, over who should represent the movement to authorities and the larger public. Moreover, as more resources are available, specialization of function may occur. Some SMOs may become information-gathering organizations, provide legal services, or lobbying services to other SMOs committed to the broad general goals. (McCarthy & Zald 2002: 583)

Competition, then, is thought to have important effects upon the development of SMIs and research has shown that competition among
SMOs within a social movement industry can affect founding and disbanding rates and hence the total density of the industry at any point in time for ethnic civil rights and women’s movements (Minkoff 1995, 1997), the overall level of tactical and goal diversity of the civil rights movement industry (Olzak & Ryo 2007), the radicalization of tactics among the “new social movement” industries in Germany (Koopmans 1993), and the specialization of tactical and goal repertoires (Soule & King 2008).

Social movement leaders engage in diverse activities as they seek to advance their social change goals, an important one of which is the creation and development of new SMOs (Edwards & McCarthy 2004). A number of environmental factors beyond the important effects of competition among the SMOs in an SMI have been shown to contribute to higher rates of the founding of new SMOs, including sociopolitical legitimacy (Archibald 2008 for HMOs), levels of outside patronage, and extent of protest by movement actors (Minkoff 1995 for civil rights SMOs). Factors that affect the survival of the SMOs in the “racial-ethnic” and women’s movement industries include legitimacy, size, and stability of social change repertoire (Minkoff 1993).

The joint consequences of the emergence of new SMOs and the disbanding of existing ones results in an SMI organizational capacity level at any point in time, and research has begun to evaluate the impact of SMI capacity on social movement outcomes. Social movements may achieve diverse outcomes, including changes in public opinion, norms and values, as well as social structural and both minor and major policy changes. However, thus far research focused specifically upon the impact of SMI capacity on movement outcomes has concentrated mainly upon political agenda setting and legislative outcomes. For instance, women’s suffrage organizational capacity was found to have impact in getting women’s issues on state legislative agendas, but to be less important for the passage of suffrage bills (King et al. 2005). And, similarly, environmental movement organizational capacity over three decades in the US had direct effects in getting environmental issues on the federal legislative agenda, but little direct impact on the passage of environmental laws (Johnson, Agnone, & McCarthy forthcoming).

Social movement organization (SMO)
JOHN D. MCCARTHY

Traditional approaches to understanding the emergence and mobilization of social movements focused primarily upon fluctuations in the hearts and minds of aggrieved individuals. Analysts of social movements inspired by the accelerated founding rates of more or less bureaucratically organized groups of citizens in the 1960s – joining early risers in the organizational field some of which, such as the National Association for the Advancement of Colored People (NAACP), had emerged in the nineteenth century – began to focus more directly upon the central mediating role that social movement organizations (SMOs) play in mobilizing social movement activity. Zald and Ash (1966) first systematically deployed the concept in their classic paper that effectively challenged the universality of Roberto Michels’ (1949) “iron law of oligarchy.” Denotatively bounding the SMO, their analyses referenced civil rights movement organizations of the 1960s, including the Congress on Racial Equality (CORE) and the NAACP, as well as the American Communist Party and the Women’s Christian Temperance Union (WCTU). The concept was later more clearly specified by McCarthy and Zald (1973: 1218): “A social movement organization (SMO) is a complex, or formal organization which identifies its preferences with a social movement or a counter-movement and attempts to implement those goals.” In subsequent years, the term and its acronym, SMO, have come into widespread use as scholars have sought to understand patterns of SMO emergence, variations in SMO structure, and functioning.

There exists wide agreement that social movements, however bounded, are increasingly likely to include one or more SMOs, even though social movements themselves are not exclusively defined by the actions of the SMOs that identify their preferences with them (Oliver & Marwell 1992). There is extensive theoretical and empirical overlap between the category of SMO and its close conceptual cousin, the interest group, historically the province of political scientists and consisting of “any organization or institution that makes policy-related appeals to government” (Baumgartner & Leech 1998: xxii). Not all SMOs make appeals to government, including notably many religious and cultural ones, although there has been a dominance of attention by analysts during recent decades to those that do. The more closely associated concept advocacy organizations, or groups that “make public interest claims either promoting or resisting change that, if implemented, would conflict with the social cultural, political or economic interests or values of other constituencies or groups” (Andrews & Edwards 2004: 481) has gained wide currency lately as a more easily operationalized alternative to the SMO, although the two terms are often used interchangeably.

SMOs typically seek to mobilize a diverse range of resources including material and human, as well as moral, cultural, and social organizational. (Edwards & McCarthy 2004). SMOs deploy a variety of technologies of mobilization, including, importantly, the recruitment of adherents. Rank and file participation in movements is heavily dependent upon the recruitment efforts of SMOs (Schussman & Soule 2005). SMOs also manage the interdependencies of adherents and activists committed to the movement. If a movement effort endures beyond a single event and links several networks of adherents and activists, a more or less formal organization (at a minimum a mailing list, a name, and a set of controllers of the mailing list and attendant resources) is
likely to develop. Although many SMOs may be relatively small, enduring movements with substantial members may develop larger SMOs that link adherents in different locales and even countries. (McCarthy & Zald 2002: 537)

Notably, SMOs deploy a variety of tactics in seeking to bring about change, and typically, but not always, these include signature forms of public protest, including importantly demonstrations, boycotts, and petitioning campaigns.

Recent cross-sectional research in the US shows (McCarthy & Zald 2002) that (1) most SMOs are small locally based groups managed mainly by volunteers, but a significant minority of them nevertheless employ paid staff; (2) a large proportion of local SMOs are linked to national SMOs through federated structures; and (3) while the common image of a social movement leads to the expectation that SMOs are composed primarily of individual members, large proportions of them include other organizations, as well as individuals as members, many include only other organizations as members, and a significant proportion have no members at all, but are managed by staff who speak on behalf of collective actors who have no involvement in the SMO. This latter social fact undermines the assumed broad scope of the “free rider” problem – that is that most of the members of a social category who stand to benefit from a social change do not participate in seeking it – in analyses of movement mobilization. And a theory of organizational behavior is more appropriate for accounting for why other organizations join SMOs.

Several observers have noted the prominence of SMOs without members in major social change campaigns during the last decades of the twentieth century, speculating that memberless SMOs have begun to dominate the US national SMO landscape, and that such dominance may explain the coterminous decline in civic engagement during the same period (McCarthy & Zald 1973; Skocpol 1999). A systematic assessment of trends in the founding and density of women’s, human rights, and peace movement SMOs during that period, however, undermines such an account. Instead, individual membership-based SMOs continue to make up a majority of national SMOs in these fields, and, in practice, the memberless organizations typically work closely with membership-based ones, enhancing their efforts at seeking social change rather than substituting for their efforts (Walker, McCarthy, & Baumgartner, forthcoming).

REFERENCES AND SUGGESTED READINGS

Many social movements at varying stages of mobilization may exist in a nation’s society at any time, or there may be very few struggling to exist. Understanding that variation in social movement mobilization across national societies remains a relatively unexplored arena of social science research. Social movements in most nations are importantly defined by the social movement organizations (SMOs) that identify with their goals, even though much collective action by social movement actors is not directly associated with SMOs. Nations differ dramatically in the extent to which they encourage and facilitate or discourage and repress SMOs. All the SMOs in a nation with roughly comparable goals, issue orientations, or ideological congruity constitute its social movement industry (SMI). All the SMIs in a nation constitute its social movement sector (SMS). The size and orientation of a nation’s SMS is a function of the amount of resources devoted to social change (whatever its substantive focus across the ideological spectrum), the associational supports provided by the larger society, the democratic or authoritarian orientation of the state, and the relationship of the movement sector to the political party space. The size and shape, or configuration, of the SMS varies between nation-states and over time within them (see McCarthy & Zald 1977, 2002).

Among the most important factors that are thought to affect the size and configuration of the SMS in any nation are: (1) the extent to which all citizens are free to publicly assemble and to organize associations to pursue social change; (2) the nature and density of its civic infrastructures; (3) the capacity for and the extent of repression of collective action in general and of SMOs in particular; (4) the features of a nation’s party structure; (5) the amount of discretionary wealth of a nation’s citizens; and (6) the level and social location of its citizens’ discontent.

Legitimate national legal regimes that support and defend the formation of dissident formal organizations can be expected to allow discontented citizens and their representatives to organize more widely. As well, nations with dense civic infrastructures facilitate the development of SMOs though both direct and indirect sponsorship. The dense and variegated landscape of religious organizations in the US (including congregations, denominations, and para-church groups) is important in accounting for the vigor of its SMS as well as to its distinctive substantive shape privileging minority civil rights and issues of personal morality. And nations with dense mobilization of labor associations can be expected to see much more widespread social movement mobilization around issues of class and inequality. Repressive regimes inclined to discourage mobilization by SMOs possess many mechanisms for effectively doing so and, when used selectively, repression can affect not only the size of the SMS but also its substantive shape. A nation’s political elite may favor one SMI over others, encouraging its allies and discouraging its opponents, ultimately shaping the SMS. Features of multiparty parliamentary political party systems may channel collective action through structures like the Western European “Green Parties” in contrast to nations with two-party systems like the US, where environmental SMOs flourish more widely. In addition, the permeability of a nation’s party structure as well as the ability of social movement supporters to create viable parties can affect the extent to which discontented citizens and their representatives chose to mobilize party structures rather than SMOs. There is an expectation that rich nations, all other things being equal, will exhibit more vigorous SMSs as a result of their more extensive levels of
financial discretionary government and citizen resources (McCarthy & Zald 1977).

SMIs can be characterized by their general configuration along a number of dimensions, including ideological, religious, issue specific, political, and cultural. Among the most important factors thought to affect the political configuration of a nation’s SMS are its political opportunity structure (POS) and its political party structure (Garner & Zald 1985; Tarrow 1988). Critics of the comprehensive impact of POS upon a national SMS suggest that it is not as helpful in explaining the density of cultural and personal change SMOs. As well, national SMSs may vary considerably in their protest potential and characteristic mix of protest forms, illustrated by the unusual dominance of the use of petitions to register dissent in Switzerland (Kriesi et al. 1995).

Researchers have generated a number of systematic estimates of the SMI or issue configuration of the US SMS, including Gamson (1975) for a sample of the peak SMOs of national social movements active during the 1856–1945 period employing historical records; Minkoff and colleagues (2008) for national level advocacy organizations at the turn of the twentieth century using multiple available lists of such SMOs; Larson and Soule (2009) for all SMOs reported in the New York Times between 1965 and 1975 as having participated in a protest event; and Amenta and colleagues (2009) for the entire twentieth century using an exhaustive list of all SMOs mentioned in any regard in the New York Times. The latter estimate shows that of the total mentions of SMOs during that period, almost 75 percent refer to SMOs making up just ten “social movement families,” or SMIs. These are, in order of prominence: labor; civil rights, African-American; veterans; feminist/women’s rights; nativist/supremacist; environment/ecology; civil rights, Jewish; civil liberties; antirwar; and conservative (Amenta et al. 2009: 642).

Theoretical expectations about cross-national variation in the size and shape of national SMSs remain to be systematically tested as the result of the difficulty of generating comparable evidence about the number, type, and size of SMOs in more than one nation at a time. Recent efforts to comparatively catalog national nonprofit sectors, for instance, illustrate the difficulties of data collection about national associations (Salamon & Anheier 1997). Notable exceptions are the theoretically well-informed comparisons of the “new social movement” sectors in the Netherlands, Germany, France, and Switzerland by Kriesi (1996) and comparative rates of national participation in transnational social movements by Smith and Wiest (2005).

REFERENCES AND SUGGESTED READINGS

Mancur Olson stated: “Rational, self-interested individuals will not act to achieve their common or group interests” (1965: 2). Since no one is excluded from the benefit brought about by the achievement of public goods, individuals free ride and leave the costs of their production to others. Only *individual inducements*, that is “a separate and selective incentive will stimulate a rational individual . . . to act in a group-oriented way” (51). In Olson’s utilitarian theory, personal and instrumental incentives become the main motivator of actors’ participation in collective action.

One of Olson’s main contributions is to have highlighted the difficulty of motivating participation in collective action. By raising awareness that an aggrieved population will not necessarily struggle to defend its common goods, scholars were forced to recognize that, rather than being an obvious phenomenon, collective action is an exception worthy of explanation. However, despite the beauty of a parsimonious explanation of the rational choice theory to explain why people participate, Olson’s model fares poorly. A wide range of studies emphasizes the virtual absence of instrumental incentives in motivating individuals to participate in collective action (e.g., Walsh & Warland 1983; Knoke 1988; Seyd & Whiteley 1992). Many scholars state that selective incentives are too narrowly focused to give an adequate account of why people join collective action (Clark & Wilson 1961; Moe 1980).

STRETCHING A CONCEPT

Since the explanation of collective action through instrumental is insufficient, scholars developed *alternative bases of motivation*. Clark and Wilson (1961) were among the first to expand Olson’s concept. Besides instrumental incentives, they added two other inducements: social and purposive incentives. Individuals are induced to join political parties because this brings them into contact with like-minded individuals, and because they thereby enable political parties to realize their policies and achieve their ideological goals.

Clark and Wilson’s work led to numerous studies that expanded the range of selective incentives. Concept stretching implied opening up the *Pandora’s box of human motives*. Thus, actors could be motivated either by purposive incentives (political goals), collective incentives (the value of the expected public good), social incentives (the expected reaction of others), solidarity incentives (searching for the company of like-minded individuals), identity incentives (searching for a community of people), or normative incentives (fairness and equity values). This nonexhaustive list of incentives defined a set of inducements that Opp (1985) nicely labeled “soft incentives.” Thus, besides instrumental inducements, a set of soft incentives entered into play in explaining individuals’ participation.

Two schools of thought should be distinguished among scholars who have expanded the concept of selective incentives: those remaining *within* the utilitarian paradigm, and those scholars developing soft incentives *outside* this theoretical framework. Both schools stress distinct social mechanisms. For scholars staying within the conceptual perimeter of the utilitarian paradigm, individuals mobilize because of personal rewards or coercion. For example, Opp (1988) emphasizes that social control of others incites individuals to contribute to contentious politics. For Chong (1992), individuals are induced to collaborate in collective action to enhance their reputation. The social mechanism at stake closely resembles Olson’s explanation: *personal incentives* incite actors to
join collective action. In contrast, for scholars who expand the concept outside the utilitarian paradigm, individuals mobilize because of their identification to a group, the value of the public good, the potential success of collective action, or because of their personal norms. The social mechanisms are twofold. For some authors collective incentives induce participation (Clark & Wilson 1961; Knoke 1988; Klandermans 1997). Individuals are prone to participate because of the intrinsic value of the collective good, and not because they receive private and indivisible goods. Other scholars stress another social mechanism: norm-oriented action (e.g., Marwell & Arms 1979). Individuals’ norms, such as fairness, solidarity, or equity, induce them to participate in collective action.

**SOCIAL AND SOLIDARITY INCENTIVES: SLIPPERY DEFINITIONS**

Social and solidarity incentives belong to the family of soft incentives, designated as being either within or outside the utilitarian paradigm. How do we distinguish one from another? It is a difficult question since in the literature we are faced with slippery definitions of those concepts. Solidarity incentives include the idea of group attachment, suggesting identification to a collective actor (Clark & Wilson 1961; Walsh & Warland 1983; Oliver 1984). Individuals are induced to participate because they identify with the collective actor, they share social ties with the group, or they are searching for the company of like-minded individuals. By contrast, social incentives involve various definitions. For some scholars, social incentives include emotional attachment, thus overlapping to a certain extent with the concept of solidarity (Knoke 1988). For others, they refer to norms, such as fairness and equity (Marwell & Arms 1979). For Klandermans, they mean an individual’s expected reaction to others. For Opp, they mean individuals’ integration into networks inspired by moral principles. In other studies social incentives comprise social and recreational activities offered to participants in return for contributing to a collective action (Knoke 1988).

Solidarity and social incentives often overlap. However, the difficulty for both concepts, particularly for social incentives, lies with the various definitions endorsing them. Slippery definitions render comparison impossible, and also make them useless as heuristic tools for research. In addition, studies mobilizing Olson’s concept of selective incentives face another important shortcoming: selective incentives are no longer selective. In revisionist models, incentives have become a catch-all concept, which has lost its explanatory power since any incentive explains why individuals participate in collective action. Thus Olson’s model is now devoid of its predictive strength (Green & Shapiro 1994). Expanding the concept has resulted in slippery predictions and post hoc embellishments, a criticism that specifically concerns scholars who remain within the rational choice theory. They thus evade problematic evidence that utilitarian motives are not sufficient to explain collective action. For example, Moe adopts a contortionist posture to explain why the pursuit of collective goals is in itself a selective incentive: “if group policies reflect (individual’s) ideological, religious, or moral principles, . . . he may consider the free-rider option morally reprehensible” (1980: 118). The same problem applies to Opp and Chong. Behind “moral duty” and “reputation” actually lies conformity to norms that explain why people promote common goods.

For scholars expanding the concept of incentives outside the rational choice theory, they use an inappropriate sociological terminology. In fact, they are discussing motives rather than incentives that favor individuals’ mobilization. Attachment to a group, feelings of solidarity, or willingness to promote political goals are not incentives in the sense that the rational choice theory has elaborated as a concept. For those scholars it would be more fruitful to restrict their study within the concept of motives or “raisons d’agir” and try to specify why those motives do play a role. They need to emphasize what social mechanisms are at stake.
TO MOVE FROM “THE LOGIC OF COLLECTIVE ACTION” TO MULTIPLE LOGICS

The stretching of the concept of incentives offers a clear finding: instrumental motives are, by far, not the only motives for participating in collective action. Multiple motives are what incite actors to join social and political movements. Whereas we started with a logic of collective action, the concept stretchers have introduced other logics, so that we now have to move on to the multiple logic of collective action (Sorber & Wilson 1998). Instrumental incentives could mobilize certain individuals to join a collective action. For example, actors could be tempted to support a group defending retired people by claiming higher reductions for them for entertainment activities. But many other motives bring actors to support collective action. For example, identification with a group and a feeling of solidarity induce actors to join collective action (Huddy 2001; Stryker, Owen, & White 2000). Ideological and moral concerns push several actors to mobilize (Goodwin, Jasper, & Poletta 2001; Passy & Monsch 2009). Moral expression by aggrieved people in order to attain dignity in their lives motivates certain actors to join protest movements. Those motives cannot be understood within a unique utilitarian perspective since they are grounded in different sociological logics that need to be clarified if we want to better understand why people participate in collective action. The utilitarian paradigm that gave birth to Olson’s The Logic of Collective Action relied on a monist conception of human motives that failed to understand mobilization. This monist conception led several scholars to stretch a concept in order to stay within this monist and universal understanding of human motives. Since solidarity, ideology, emotion, and other motives favor activists’ action, we now need to move toward a plural conception of human motives. We certainly lose on explanatory parsimony, but certainly gain a better understanding of social reality.

Social problems and social movements

JOEL BEST

Both the sociology of social movements and the sociology of social problems experienced intellectual revivals that began in the 1970s. The study of social movements shifted from accounting for movements’ members’ discontent, to an effort to understand why movements succeeded or failed, based on models that emphasized framing, resource mobilization, opportunity structures, and identity politics. Similarly, the study of social problems turned from the analysis of harmful social conditions to an emphasis on the process by which social problems were socially constructed.

Obviously, the two fields overlapped. Social movements often play key roles in constructing social problems. Armand L. Mauss, one of those engaged in developing the constructionist perspective during the 1970s, actually argued that social problems were “a variety of social movement” (Mauss 1989: 34). However, Mauss’ framework proved less influential than those of other theorists, such as Herbert Blumer (1971) and Malcolm Spector and John I. Kitsuse (1977), and most sociologists studying the construction of social problems came to view their subject matter as related to – but not the same as – social movements (Troyer 1989). That is, there is widespread consensus that many – but not all – social movements engage in social problems construction, and that many – but not all – social problems are constructed by social movements.

THE SOCIAL CONSTRUCTION OF SOCIAL PROBLEMS

In everyday talk, social problems are understood to be troubling social conditions – crime, poverty, and so on. However, this is not a useful definition for analytic purposes; the category of troubling conditions – everything from suicide to climate change – is too diverse to be analytically useful; moreover, there is no agreement across time and space about which conditions should be considered troubling. Thus, social arrangements that disadvantage women have been viewed as natural and just in some societies during some historical periods, but understood to be a social problem (“sexism”) in others. Constructionist theorists define social problems, not as conditions, but as a social process, the process by which conditions that some people consider troubling come to be defined as social problems. This approach draws attention to the process of claims-making, in which actors (claimsmakers) argue that some condition is troubling and therefore demands society’s attention and concern. To study crime as a social problem, then, refers to analyzing the process by which claims are made about crime’s troubling properties.

This process is most visible when new issues come to public attention. Thus, the spread of cell phones led to a host of new claims: that radiation from cell phones (or cell phone towers) caused cancer; that cell phone users carried on loud conversations that annoyed those who could overhear; that using cell phones while driving was dangerous; that adolescents were “sexting”; and so on. In each instance, claimsmakers sought to draw attention to problematic aspects of cell phones. Constructionists often analyze claimsmaking rhetoric by distinguishing among grounds (basically what claimsmakers present as the facts), warrants (the values they invoke), and conclusions (their proposals to address the issue) (Best 2008).

Claimsmaking is competitive. There is a social problems marketplace where many claims compete for attention; the media only publicize some claims, and not all issues find their way onto policymakers’ agendas. Claims attract varying degrees of opposition.
Valance issues are not controversial; few people are willing to speak out in favor of child pornography. But position issues (such as abortion) feature opponents whose claims contradict one another. Whether a particular claim succeeds can depend, not just upon having effective rhetoric, but the ability to gain a hearing amidst the overall clamor of rival claims (Hilgartner & Bosk 1988).

The social problems process involves multiple constructions: in addition to the claimsmakers’ initial constructions, the media often reconstruct claims to fit their conventions for reporting; policymakers reconstruct the issue yet again to conform to political and institutional constraints on new policies; new policies are reinterpreted by the social problems workers charged with implementing those policies; and that implementation often inspires further constructions – critiques and new claims about needed reforms. In other words, at every stage in the social problems process, people are defining and redefining what’s wrong and what needs to be done; it is this interpretive work that constructionists view as the essence of social problems.

SOCIAL MOVEMENTS IN THE SOCIAL PROBLEMS PROCESS

Obviously, social movements often engage in claimsmaking. When the civil rights movement demanded an end to racial segregation, or when Mothers Against Drunk Driving (MADD) emerged to campaign against drunk driving, SMOs served as the leading claimsmakers, the ones whose protests attracted media coverage and pressed policymakers to take action. A particular SMO can construct many problems; for instance, over more than a century, the National Association for the Advancement of Colored People (NAACP) has engaged in specific claimsmaking campaigns against lynching, school segregation, hate crimes, and many other forms of racial injustice.

At the same time, many social problems are constructed by other actors in the social problems process, with little or not SMO involvement. In some cases, members of the media are the first to draw attention to a new social problem. In other cases, the initial claims come from medical authorities, scientists, or other experts, from government agencies, or from politicians. While journalists, scientists, and politicians may sympathize with the goals of a social movement, they may not be members of particular SMOs. For example, few of the claims about the various problems related to cell phones have originated with SMOs.

Constructionist analysts distinguish between insider claimsmakers who are members of the polity, with established ties to policymakers, such that they can press their claims directly, and outsider claimsmakers who lack such connections, and rely on attracting media coverage and arousing public opinion in order to gain attention for their causes (Benford & Hunt 2003). When activists organize a protest march, gather signatures for petitions, give press interviews, and so on, they are acting as outsider claimsmakers. Over time, an SMO may gain ownership of an issue; thus, when some new aspect of drunk driving emerges, the media and policymakers tend to seek out MADD’s views, just as the National Rifle Association is seen as the leading voice of those opposed to gun control (Gusfield 1981). Well-established SMOs become members of the polity with direct access to policymakers; such organizations have the option of choosing to press their claims through outsider tactics (such as mobilizing protests) or insider tactics (such as lobbying).

Claims that originate outside SMOs may nonetheless be adopted by SMOs. For instance, the initial claims about stalking originated in media reporting, however, the established movement against domestic violence took over the cause, assumed ownership of the stalking problem, and quickly began organized lobbying that led to passage of dozens of federal and state antistalking laws (Lowney & Best 1995). Such adoptions can be vital; SMOs have personnel, budgets, and other resources needed to maintain claimsmaking campaigns during
Social problems and social movements

the period—sometimes years, even decades—it takes to change policies. In contrast, media claims that don’t get picked up by SMOs tend to fade quickly, as coverage inevitably shifts to newer, fresher topics (Best 1999). SMOs’ resources also allow them to remain interested in issues in the aftermath of policymaking, and continue to monitor, assess, and critique how policies work. This can inspire new rounds of claims making. It is a rare issue that can be resolved in a single cycle of claims making and policymaking, and the longer an issue’s history, the more likely SMOs are to play key roles in its construction and reconstruction, as illustrated by the NAACP’s long campaign against the many facets of racial discrimination.

Social movement theories and the study of social problems

When analyzing cases where SMOs are actively involved in claims making, sociologists of social problems are able to draw upon many of leading theories of social movements. The most obvious similarities between constructionist analyses of social problems and social movement theory involve discussions of framing (Benford & Hunt 2003). Framing—efforts to shape how prospective members, the media, or policymakers understand a movement’s cause—is a form of claims making. Thus, discussions of social problems rhetoric parallel framing terminology: what are called grounds, warrants, and conclusions in the social problems literature parallel what students of social movements call diagnostic frames, motivational frames, and prognostic frames. Similarly, movement scholars’ analyses of how the media package social issues resemble social problems theorists’ studies of media practices (Gamson & Modigliani 1989).

Analysts of both social problems and social movements are interested in the conditions under which campaigns succeed. Most claims making campaigns do not lead to new policies. There is considerable competition in the social problems marketplace; many claims fail to attract attention from the press, the public, and policymakers. Claims makers may face, not just indifference, but counter claims, and they may engage in prolonged efforts to refine their campaigns. Here, social movement theories of resource mobilization and opportunity structures offer conceptual vocabularies for understanding the conditions which foster—or inhibit—successful claims making.

Social problems theory and the study of social movements

Social movement analysts who adopt the conventional view that equates social problems with harmful social conditions are likely to view social problems merely as sources for grievances that, in turn, can serve as the basis for social movements. This is not an especially helpful insight, in that grievances are ubiquitous, and cannot provide a sufficient explanation for movement activity.

In contrast, the constructionist approach to studying social problems has more to offer students of social movements. From a constructionist perspective, social movement activity can be seen as part of the larger social problems process. This has at least three implications for the study of social movements. First, SMOs make claims, but their claims must compete with those of other sorts of claims makers, including experts, the media, and officials; recognizing this broader competition can help explain the relative success of different campaigns. Second, SMOs cannot maintain complete control of their claims as they move through the various stages of the social problems process; media coverage transforms and translates claims for audiences, and policymakers and social problems workers rework SMOs’ claims to fit the demands of their institutions. This continual process of reconstruction helps explain the mixed success of many SMOs’ campaigns. Third, the social problems process can be seen as cyclical; claims lead to policies that inspire new claims. Students of social movements might consider how
this larger process affects movement activities; claims seeking to establish new policies require different rhetoric and face different receptions than those arguing for policy modification.

In sum, the sociologies of social movements and social problems are complementary; each offers useful insights for the other.

Political socialization and social movements
OLIVIER FILLIEULE

Political socialization (PS) has been defined in various ways in the literature. Among the most frequently encountered definitions is the one that equates PS with mere learning, that is, the state of a person’s political knowledge and comprehension. Other definitions focus less on an individual’s knowledge inventory than on the developmental sequence by which such knowledge and comprehension are acquired, whereas others focus on the continuity over time of such knowledge and attitudes. However, PS is more and more defined as the gradual development of the individual’s own particular and idiosyncratic views of the political world, the process by which a given society’s norms and behavior are internalized. This has three main theoretical consequences: primary and secondary socializations are equally important in the socializing process; it follows that not only family and school are central instances of socialization but also many other institutions active in the life spheres of work, affective ties, voluntary work and political engagements; and the political dimension is in play in all socialization processes and doesn’t correspond to a specific domain of activity or designated institutions.

If research on PS decreased dramatically during the 1980s, declining civic participation and social capital has helped the renewal of the field. Prompted by such trends, one can note a resurgence of scholarly inquiries not only in the field of PS. We then show how individuals can be politically oriented by their socialization towards protest behavior and in turn durably affected by their participation in social movements. This will bring us to discuss methodological questions and propose some directions for future research.

THE DEVELOPMENT OF A RESEARCH FIELD

Four basic ideas about the ways political dispositions might vary with age or life stages have been most common in the literature.

The persistence model suggests that the residues of preadult learning persist through life, perhaps even hardening with time. This asserts a simple main effect of age, with dispositions acquired primarily in the preadult years (Hess & Torney 1967). This idea of lasting effects of early experiences was derived from psychoanalytic and learning theories and largely assumed rather than tested directly. The difficulty stems from the fact that any correlation of age with political attitudes potentially reflects three different confounded effects: cohort (birth cohort), life cycle (age at measurement), and period (year of measurement). That is why the persistence viewpoint faced strong critical...
reviews in the 1970s and 1980s (Searing, Schwartz, & Lind 1973), suggesting that “the primacy principle” had been overstated and that, at best, the evidence for it, such as adult retrospective accounts of their own attitudes or longitudinal studies, had been quite indirect. Long-term longitudinal studies appeared, implying that partisan tendencies change more after the preadult years than the persistent view would allow (Jennings & Niemi 1981). Strongly nourished by the rising influence of rational choice theories, revisionism went as far as stating that perhaps people were constantly revising their thinking, in some quite reality-based, data-oriented manner.

Some researchers then called for recognition of more openness to change through the life course than the persistence theory allowed, for example that “Change during adulthood is normal. The life course should be understood as a more integrated and contingent whole” (Sapiro 1994: 204) and that “learning and development are not completed by adulthood. Rather, they constitute a life long process” (Sigel 1989: viii). This gave way to the lifelong openness model, which suggests that dispositions have an approximately uniform potential for change at all ages and that age is irrelevant for attitude change. Unfortunately this model has been largely unexplored. The first volume on adult socialization appeared only at the end of the 1980s (Sigel 1989). This important series of studies examines the political effects of discontinuities within adulthood, such as entering the workplace, serving in the military, immigrating to a new country, participating in a social movement, getting married, or becoming a parent. Each of these cases incorporates three elements that potentially can affect political attitudes: crystallization of an individual’s own unique identity, assumption of new roles, and dealing with the unanticipated demands of adulthood. This line of research has been particularly convincing in stressing the fact that neither childhood nor adolescence adequately prepare mature adults for all the contingencies with which they have to cope over their lifetimes. Hence the necessity to adopt a lifespan perspective that takes into account the impact that individual-level events as well as macro-level ones have on the maintenance, modification, or abandonment of values and orientations to which the individual may have subscribed at an earlier point in his or her life. However, the authors agree upon the fact that all these specific discontinuities also occur most often in late adolescence and early adulthood, which means that the model here is quite close to a third view, the impressionable years model.

This model suggests that dispositions and attitudes are particularly susceptible to influence in late adolescence and early adulthood but tend to persist thereafter. A special instance of the impressionable years hypothesis is the generational effect (Mannheim 1952). This occurs when a sizable number of those in the supposedly impressionable life stage (late adolescence and early adulthood) are subjected to a common massive pressure to change on some particular issue. Three propositions are behind this model: youth experience political life as a “fresh encounter,” in Mannheim’s words, that can be seldom replicated later; dispositions and attitudes that are subjected to strong information flows and regularly practiced should become stronger with age; and the young may be especially open to influence because they are becoming more aware of the social and political world around them just at the life stage when they are seeking a sense of self and identity. Some important surveys support the formative years hypothesis, for example, Jennings’ (2002) research about the durability of protesters as a generational unit. As well, there is other research which suggests that American cohorts coming of age in the 1960s constitute a distinctive political generation.

Finally, there is the life-cycle model, which argues that people are attracted to certain attitudes at specific life stages, such as radical ideas in their youth and conservatism in old age (Jennings & Niemi 1981). This model is captured by the French saying: “He who is not a radical at 20 has no heart; he who is at 40 has no head.” Cohort analysis has been the
primary analytic technique used to test the life-cycle hypothesis and has revealed no significant diminution with age in the number of self-professed Left-oriented people nor any correlation between conservatism and aging.

To summarize, the contemporary resurrection of socialization research points to the now widely shared idea that dispositions, attitudes, and behavior change throughout life, especially during the formative years (i.e., between 15 and 25), and that some, possibly much, early learning is of limited consequence for adult political behavior. As a consequence, participation in social movements not only depends on PS, but also has to be considered as having potentially socializing effects, which means that social movement organizations and protest events have to be studied as explicit and implicit socializing agents.

SOCIAL MOVEMENTS, DISPOSITIONS, AND SOCIALIZATION PROCESS

Explicit and implicit PS through parental influence, school, and other varied institutions, such as churches and youth organizations, are considered as being among the main factors explaining involvement in social movements, but the systematic influence in early years of PS is too often overstated. Sharing the same set of dispositions with other members of an activist group is still not enough to explain commitment. In most cases, the mediation of significant others (i.e., relatives, friends, colleagues, or even mentors such as teachers or priests) is necessary though not sufficient. For example, social psychologist Molly Andrews (1991), who collected and analyzed the lifelong commitment of British socialist activists from the 1930s to the 1980s, identified three major factors of political involvement: intellectual stimuli, the role of political movements, and tutelary figures. In this case, class position, family influence, and formal education hardly counted in fostering commitment. It was first through the direct experience of labor conflicts or political meetings and the influence of trade union political work that they progressively came to join the party. Most of the time it was a neighbor, schoolmate, or older friend from the occupational life-sphere who played the role of initiator.

This stresses the fact that joining cannot be understood as the result of a linear form of socialization, with cumulative and mechanical effects that can be visualized. Just as sociologists of deviant behavior have overcome the deterministic explanations of deviance, sociologists of commitment have turned towards the analysis of “activist careers,” drawing directly on the symbolic interactionism toolkit. Applied to political commitment, the notion of career helps to understand how, at each biographical stage, the attitudes and behaviors of activists are determined by past attitudes and behaviors, which in turn condition the range of future possibilities, thus resituating commitment across the entire life cycle (Fillieule 2010).

However, the almost exclusive analytic concern with the institutional consequences of protest and the subsequent neglect of its independent psychological effects is certainly one of the major blind spots of contemporary social movement research. One of the most promising directions for future research would be to evaluate the degree to which a social movement transforms individual patterns of political thinking and behavior and outline the ways in which it does so. To date, three main empirical domains have been explored, paving the way for future research.

First, research on 1960s American activists has addressed the question of the biographical consequences of social movement participation on the life-course, based on a series of follow-up studies of former movement participants, suggesting that activism has a strong effect both on political attitudes and behaviors as well as on the personal lives of the subjects, like occupational orientations and marital status (Marwell, Aiken, & Demerath 1987; McAdam 1989; Whalen & Flacks 1989). However, in addition to having a narrow focus on New Left highly committed activists of the 1960s, these studies are less interested in the very process
by which movements act as socializing agents than by its long term effects, as measured by statistical indicators (see McAdam 1989 and Whalen & Flacks 1989 for exceptions).

A second direction of research deals with the study of black student activism in the civil rights and black power movements and of riot participants (Gurin & Epps 1975; Sears & McConahay 1973). It explores environmental influences as well as the impact of activism on political ideology and adult resocialization, suggesting, among other interesting results, that the riots themselves appeared to have generated a type of “riot ideology” that further resocialized not only the direct participants but those who only vicariously experienced them; a result that has recently been confirmed by studies on not-so-committed participants (Sherkat & Blocker 1997; Wilhelm 1998). But the value of this research lies primarily in analyzing how movements accomplish their socializing role, teaching young blacks to question the overall white system of domination through specific organizational mechanisms like mass meetings, workshops, and citizen and freedom schools.

A third research focus stems from feminist research and examines the development of a gender consciousness through the women’s movement (Whittier 1995). The reason that this movement has served as an active agent of socialization is partly because one of its central goals is to change women’s self-understanding: that is, to provide a social space in which women can consider and negotiate their social identity as women and its relationship to politics. The most well-known strategy for such development is the consciousness-raising group, which has spread around the world. Also important in relation to consciousness raising has been the call for “separatism,” demonstrations, and symbolic political acts like “Freedom Trashcans” or “Take Back the Night” events.

Beyond the specific case of the women’s movement, feminist research suggests that all protest movements may operate like gender workshops. Indeed, activism can play a liberating role for women in permitting them to leave the domestic universe and acquire social skills previously inaccessible to them. This is the reason why, even in movements where women are kept in positions of subjugation, mere participation can foster emancipation. The Black Panther Party, for example, which planned to link black liberation to a collective memory reinvented and nourished from a precolonial African culture dominated by men, served as a place for political training and consciousness raising about patriarchy and sexism.

Finally, it is clear that a social movement can have profound and widespread socialization effects on individuals in society by transforming their sense of identity and politicizing the resulting social identification. Beyond the results aforementioned, much work is needed in order to build a comprehensive and solid theoretical model for the study of the multiple socializing effects of social movements. One possible point of departure is the Goffmanian notion of “moral career,” which directs attention to the socializing effects of various formal and informal organizational constraints (status, proposed or reserved activities, leadership, and so on). Indeed, organizations do a lot of work in socializing their members, understood as role taking, which allows individuals to identify the different roles they face and correctly fulfil their customary tasks. This secondary socialization can, at times, assume the form of explicit inculcations, the goal of which is to homogenize activists’ categories of thought and their way of acting within and in the name of the organization. Most of the time, know-how and activist wisdom amounts to a “practical sense,” what Bourdieu refers to as “the anticipated adjustment to the requirements of a field, what the language of sports calls the ‘sense of the game’ (like ‘sense of place,’ ‘the art of anticipation,’ etc.),” acquired over the course of a “long dialectical process, often described as a ‘vocation,’ by which ‘we make ourselves’ according to what is making us and we ‘choose’ that by which we are ‘chosen’” (Bourdieu 1980: 111–112). This process takes place outside of our conscious awareness. If, following Gerth and Wright Mills (1954: 173), an institution “leaves its mark” on social
actors who are part of it “by modifying their external conduct as well as their private life,” then we need to examine both the content and the methods of the process of institutional socialization. Three dimensions may be distinguished: the acquisition of “know-how” and “wisdom” (resources), a vision of the world (ideology), and the restructuring of sociability networks in relation to the construction of individual and collective identities (social networks and identities) (Fillieule 2010).

AVENUES FOR FUTURE RESEARCH

A major flaw in PS research stems from the fact that it is largely ahistorical, doesn’t put emphasis on contextual effects and has been remarkably unconcerned with the very process of socialization. To be sure, these shortcomings are not specific to PS studies. Observational studies are rare in political science and for the most part we study the product and assume it is the result of the process. However, to study process, the process needs to be observed, not merely inferred. This is particularly the case in PS. Largely because survey research has been the dominant method of choice, research attention has typically focused on individuals and their attributes as units of analysis. As a result, literature is still scarce that has actually studied and observed the manner by which “agents” do or do not make influence attempts. To study the process of PS, we need to think of different methods of inquiry and observation and undoubtedly will have to resort to a variety of methodologies, including field methodologies, such as participant observation and ethnography, the collection of life histories, simulations, and in-depth clinical techniques.

Beyond that radical change in methodologies, research could explore several avenues that have been neglected until now. We conclude by briefly mentioning some possible directions among others. One potential line of investigation would be to explore more systematically the socializing effects of political events and communication about them (Tackett 2006). Indeed, vivid political events should be important catalysts because they can have traumatic effects and stimulate heavy information flows. Events may have an impact at any age but depending on the position in the life cycle, the socializing effects will differ, from strengthening and substantiation for older people to conversion and alternation for youngsters. The hypothesis here, in line with the impressionable years model, is that people should especially recall events as important if they happened in their adolescence or early adulthood.

Two directions could be taken here. First, the effects of direct participation on political protest should be explored. Developing further research in this direction is all the more important in the subfield of social movements since some research suggests that younger participants often favor unconventional modes of action such as demonstrations and blockades, which then often constitute their first significant involvement with the political system, therefore having strong cognitive effects. The dramatic growth of the antiglobalization movement all over the world, with its strong appeal to young generations, is no doubt a rich field for studying such processes and their possible effects on subsequent movements (Fillieule et al. 2004). Research should also focus on the impact of political events on “engaged observers” and even “bystander publics” in the vein of Stewart, Settles, and Winter (1998), who suggest that those who were attentive to the movements in the 1960s but not very active in them, showed lasting political effects years later. Such inquiries could also suggest some interesting questions on how groundbreaking movements can play an important role in resocializing other groups to the politics of protest, as for example the American civil rights movement did with many subsequent movements.

Another fascinating field of research in PS concerns intergenerational effects of political socialization. Here again, social movement research has a lot to say in various directions. First, regarding parental influence on their offspring in a context of political unrest, it is
reasonable to ask: How long and in what magnitude parental influence persists over time in periods of upheaval like those of the mid-1960s, or when the political environment contains forces antithetical to parental inclinations. Understanding how political engagement plays out in such cases, and tracing its implications for intergenerational change, constitutes an important challenge for future research. But the prospect that offspring can also influence parental attitudes, especially in domains in which offspring introduce more “modern” attitudes to families, should also be taken into account. Recent research on protest marches of 2006 in the US (Pantoja, Menjivar, & Magana 2008) or more generally on political behavior of early adult immigrants and its effects on their parents is ripe territory for future work on political socialization and social movements.

Solidarity and movements
ROBERT D. BENFORD

Participation in a social movement often occurs out of a sense of solidarity. People become movement adherents when they feel they share with others a sense of enthusiasm and devotion for the group (Hunt & Benford 2004). Herbert Blumer (1939) referred to such shared feelings as esprit de corps. From his vantage point, esprit de corps has two dimensions: a body of confederates that are seen as a collectivity and a spirit that entails feelings of close identification with that group. The corpus feature of solidarity calls attention to the body of actors that comprise a group. Some organizations such as the military, police, athletic teams, marching bands, and so on, project an image of an actual corporal entity by having members wear uniforms and engaging in coordinated drills such as marching. In the present context, social movement organizations employ banners, placards, T-shirts, and bumper stickers to mark their membership boundaries. The spiritus feature of solidarity pertains to the feelings of belonging to a collectivity.

In this sense solidarity bears a close family resemblance to the more contemporary concept, collective identity (Melucci 1988). Collective identity tends to be used to refer to the ongoing social construction of cognitive, moral, and emotional connections with a broader community or social movement (Polletta & Jasper 2001). Solidarity, by contrast, tends to be employed somewhat more narrowly to refer to shared feelings and sentiments about a specific group. In practice, the two concepts are often used synonymously. Solidarity has been conceptualized as having two basic foci: internal and external. Internal solidarity is focused on the specific group or movement organization to which a person belongs and to the other members of that collective. External solidarity pertains to the identification of and identification with groups to which an individual does not belong (Hunt & Benford 2004). Social movements devote some of their framing activities toward constructing internal and external solidarity.

Social movement organizations also actively promote feelings of solidarity. For example, in the early 1980s the autonomous Polish trade union, Solidarność (Solidarity), strategically promoted a collective sense of identification with the plight of its shipyard workers that extended to Polish workers in other industries, as well as stimulating a sense of solidarity among citizens throughout Eastern Europe living under totalitarian rule, and eventually to movement allies around the world (Payerhin & Zirakzadeh 2006). Such a collective sense of oneness and the ensuing culture of solidarity (Fantasia 1988) contribute both to empowerment within a movement as well as heightening concerns on the part of the movement’s opponents about the movement’s potential to disrupt the status quo. Thus, a protest chant frequently heard at social movement marches and rallies amplifies both the sense of solidarity and the threat to their opponents: “The people, united, will never be defeated!” Movement adherents in turn tend to view a threat to any single member as a threat to all members. This sense of solidarity is best represented by the International Workers of the World rally cry: “An injury to one is an injury to all.” In short, solidarity is an identification with a collectivity such that an adherent feels as if a common cause and fate are shared (Hunt & Benford 2004: 439).

Traditionally, scholarship on solidarity tended to focus on the social construction and enactment of solidarity, particularly pertaining to boundaries and boundary work. More recently, scholars have turned to how people feel about their experiences participating in social movements and collective action and how those feelings are also at times subject to manipulation. But emotions can serve to
both facilitate and constrain collective action. Further research is needed on the conditions under which a sense of solidarity yields feelings that promote or diminish the prospects of sustained participation in social movements.

Spillover, social movement
NANCY WHITTIER

Spillover refers to the influences that social movements have on each other. Social movement spillover takes place through both direct and indirect paths through which one social movement affects another’s ideology, frames, tactics, membership, organizational structure, or available cultural or political opportunities. These and related phenomena are also referred to as diffusion (McAdam & Rucht 1993; Soule 1997) and “spin-off movements” (McAdam 1995). The study of social movement spillover focuses on the paths, types, and mechanisms of influence. The types of social movement spillover can be broken down into two broad categories. First, movements can lead to new challenges, by changing the overall level of protest or opportunities for protest, sparking "spin-off" movements (McAdam 1995), or provoking countermovements. They can also affect or enable later waves of the same movement. Second, social movements can alter the form of other protests. Activists define themselves, frame their issues, develop tactics, and establish organizations with reference to what other collective actors have done. These effects can occur between movements that are contemporaries or across time.

A range of movement characteristics can spill over from one challenge to another, including frames, collective identities, tactics, organizational structure, and relations with authorities (Meyer & Whittier 1994). Social movements that emerge early in a protest cycle may establish frames that strongly influence those of subsequent and contemporaneous movements. For example, the civil rights movement’s emphasis on equality based on minority group status became a master frame that continues to shape the frames of movements across the political spectrum (Isaac & Christianson 2002). Influential movements can also promote new frames that supplant or modify existing master frames. The feminist movement’s emphasis on women’s oppression and its framing of individual problems as social in origin, in the “personal as political” frame, influenced how movements such as the peace, anti-nuclear, environmental, and numerous others (Meyer & Whittier 1994). Collective identities develop as a result of participation in social movements. Activists, many of whom participate in more than one social movement, carry their collective identities from cause to cause (Taylor et al. 2009). Further, a collective identity created by a social movement becomes publicly available for activists to adopt or challenge. For example, the collective identity “feminist” may be claimed by organizations that are not working directly on gender issues, as in a group that promotes a feminist approach to environmentalism. Movement tactics also often spill over from one challenge to another. Charles Tilly’s notion of repertoires of contention captures this phenomenon, in which social movements in a given era tend to draw from the same set of tactics. This spillover can occur across ideological divides. For example, the “Tea Party” movement in the US following President Obama’s election adopts many of the direct action and protest tactics originated by movements of the Left 50 years earlier.

Spillover occurs through several different routes. Spillover occurs through direct routes, including contact between personnel or organizations; and indirect routes, including the changes that one movement brings about in the larger social movement sector, culture, or political opportunities that affect other movements. When social movements share personnel, as when the activists are part of more than one movement at the same time or over their lives, these personnel can bring the influence of one movement directly into another. Coalitions between movement organizations around shared goals are another route.
for influence. Separate movements may also be linked to each other through networks, including participation in a common social movement community that shares institutions (such as gathering places), culture or activist art, and events (such as festivals). This overlapping participation provides another route for spillover. Further, when one social movement affects the larger cultural or political context, these changes reshape other social movements as well (Meyer & Whittier 1994).

Subcultures and social movements
GREG MARTIN

Subcultures and social movements are both empirically and analytically quite different creatures. In one formulation, youth subcultures are seen as groups subordinate to the dominant middle-class culture because they derive from a working-class “parent” culture, although they “exhibit a distinctive enough shape and structure to make them identifiably different from their ‘parent’ culture” (Hall & Jefferson 2006: 7). Thus, subcultures might be characterized as “interests that operate within the confines of the existing social order,” while social movements are conceived as “forms of solidarist action which force the conflict to the point of breaking through the system’s compatibility limits” (Melucci 1996: 28). It is largely for these definitional reasons that the study of subcultures and social movements studies have remained relatively separate and distinct. Fusing the fields, however, reveals two areas of commonality: (1) similar ideas and debates about how to conceptualize subcultures and social movements; and (2) shared concerns over the effectiveness of cultural politics (Martin 2002).

DELINQUENT GANGS, SUBCULTURES, AND STYLE

The concept of subculture was used in some early analyses of delinquent gangs to show how delinquency had social and cultural origins and was not the outcome of individual pathology. Delinquent gangs were regarded as collaborative solutions to “status problems” encountered by young men in working class neighborhoods (Cohen 1955). Others were critical of those who assumed delinquent gangs had an underlying organization and structure, which tended to “autistically distort gangs and gang behaviour towards a gestalt of clarity” (Yablonsky 1959: 112). In reality, Yablonsky argued, most gangs are “amorphous, diffuse and malleable,” and resemble “near-groups,” which he positioned midway on a continuum between cohesive “gangs” and disorganized “mobs”; the near-group being a convenient vehicle for youths who are “emotionally disturbed” and lack social skills. Accordingly, delinquent subcultural processes might not necessarily lead to gang formation, but could culminate in looser, more diffused collectivities (Downes 1966).

Although later subcultural theorists distinguished gangs or groups from broader and more loosely structured subcultures (Fine & Kleinman 1979; Hebdige 1979), the bulk of subsequent work carried out in the 1960s and 1970s by those working in Britain under the auspices of Centre for Contemporary Cultural Studies (CCCS) or “Birmingham School,” dealt with reasonably tight-knit, distinctive, and coherent subcultures (Hall & Jefferson 2006). That approach was driven partly by a political desire to show how working-class youth subcultures were internally coherent despite official perceptions of them as lawless forms. Hence, the CCCS used the concept of homology to show how the focal concerns, music, and dress of these subordinate groups fitted together organically to form a unified (and spectacular) subcultural “style.”

For the CCCS, working-class youth subcultures were symptomatic of the disintegration of working class communities that occurred in Britain as a consequence of postwar reconstruction and rehousing policies. However, subcultures only provided symbolic solutions to the concrete problems associated with these transformations, and offered no “real” solutions to the general problem of being in a subordinate structural location. No solutions, that is, to unemployment, dead-end jobs, educational disadvantage, low pay, and de-skilling. The
symbolic solutions of working-class youth subcultures were manifest in their style. The mod style, for example, was an attempt to realize, although in an imaginary way, the conditions of existence of socially mobile white-collar workers; the dress and music of mods reflected hedonistic images of the affluent consumer.

Therefore, working-class youth subcultures were unable to transcend the “real relations” of being in a subordinate class position. Instead they expressed and resolved that common class problematic “magically.” Moreover, their critiques of capitalism and modern institutions were confined to the level of culture. Accordingly, they were unable to enter the arena of “proper politics,” nor challenge the institutional basis of their class subordination. This applied to working- and middle-class subcultures alike, which marked their final “tragic limit,” and raised “the whole question of the status and viability of cultural politics and of a struggle waged exclusively at the level of lifestyle” (Willis 1978: 175). The ultimate failure of working-class youth subcultures in postwar Britain was captured in the title of the seminal book produced by the CCCS: Resistance through Rituals (Hall & Jefferson 2006).

AFTER SUBCULTURE

The CCCS were criticized for romanticising working-class culture and for seeking to find revolutionary potential in young delinquents (Martin 2002: 75). However, the most trenchant criticism came from a group of researchers associated with the “Manchester School.” Their argument was that, by the 1990s, the concept of subculture no longer reflected—if indeed it ever did—the social reality of youth, pop, and deviance. They emphasized the fluidity of positions, poses, and desires, claiming that fixed identities and meanings in youth style dissolved in the 1980s (Martin 2002: 77). This transition was summed up in the phrase: “subculture to clubcultures” (Redhead 1998). Acid house music and rave culture epitomized the way various styles mixed on the same dance floor and attracted a range of disparate groups; from football hooligans to New Age hippies (see Martin 2002: 77).

“Post-subculture” theory is premised on the postmodern notion that young people shape and construct lifestyles and identities unfettered by the former restraints of class and social structure. The concept of subculture thus becomes replaced by terms like “neo-tribe” or “lifestyle choices,” which encapsulate identities and forms of association that are elective not ascribed, temporary not permanent, and fluid not fixed (see Bennett 1999). While subsequent post-subcultural work claimed to map the terrain “after subculture” (Bennett & Kahn-Harris 2004) and go “beyond subculture” (Huq 2006) others have insisted upon the continued relevance of subculture, style, and social class as analytically useful categories (Martin 2009).

SOCIAL MOVEMENTS AS SYMBOLIC CHALLENGES

Some early work on delinquent gangs and subcultures looked at them from the perspective of collective behavior theory, using the concept of social movement (Pfautz 1961). Pfautz argued that, because they were not goal oriented, delinquent gangs were akin to Blumer’s (1953) expressive social movements. However, that analysis underestimated the potential gangs had for generating and maintaining a culture of their own. Moreover, despite recognizing that movements developed a culture, Pfautz believed mobilization to be the goal of social movements and consequently assigned minimal significance to their culture and internal structure (Downes 1966: 17).

Typically, this conception of social movements equates them with mass mobilizations. It also suffers from “political reductionism,” seeing social movements only as actors in the political system (Melucci 1989), whereas “contentious politics” is but one permutation of social movement activity; others include religious and cultural extra-institutional challenges (Snow 2004). These perspectives
focusing on the relationship of social movements to the state and polity thus tend to ignore the hidden cultural dimension of social movements, which is significant because, among other things, it is the culture of movements—submerged in pre-existing networks of everyday life—that makes mobilization possible. In this way, the network of groups that constitutes a social movement serves as a platform for mobilization, since the movement network shares a culture and collective identity. Furthermore, in some contexts, “oppositional subcultures” (or countercultures) can provide the impetus for mass mobilization and eventually the formation of political parties (Johnston & Snow 1998).

For Melucci (1989, 1996), contemporary movements mount symbolic challenges to dominant homogenizing cultural codes by communicating to the rest of society the message of difference. They do that by living out alternative lifestyles. In this sense, the “medium is the message.” In order to communicate a clear and coherent message, movements must generate a collective identity. That is not easy given social movements consist of a plurality of meanings and orientations. Accordingly, a constructivist approach is required that reveals the processual nature of collective action whereby individual activists and groups interact and negotiate with one another to resolve conflicts and tensions so as to build and sustain a collective identity. By contrast, previous analyses of social movements have tended to reify collective action, treating it as a unitary empirical phenomenon (Martin 2002: 81).

CONVERGENCE, DIVERGENCE, CRITICISM

Like some early theories of subcultures and the post-subculture perspective, Melucci’s constructivist approach scrutinizes the formal characteristics of social movements, and is critical of those who impose a sense of clarity upon complex collective phenomena. Moreover, just as many subcultural studies were influenced by symbolic interactionism (e.g., Cohen 1955; Hall & Jefferson 2006), the focus in contemporary studies of social movements on processes of collective identity formation acknowledges the influence of the symbolic interactionist tradition (Martin 2002: 85). Similar to post-subculture theory, this brand of “new” social movement theory is also associated with the “cultural turn” and postmodern ways of thinking. It is premised on the view that the “former unity (and homogeneity) of social interests has exploded” (Melucci 1989: 172) and, therefore, that the new conflicts no longer revolve about class. Rather, we inhabit a “complex society” wherein social movements are correspondingly heterogeneous, fragile, and complex (Bartholomew & Mayer 1992). Building on the accomplishments of past movements and, in particular, the establishment of the welfare state, contemporary social movements are increasingly oriented to “postmaterial” values about quality of life and cultural recognition and are less concerned with “old” issues relating to material redistribution and economic survival (see Martin 2001).

In their effort to avoid political reductionism, some new social movement scholars have been accused of “cultural reductionism” (Bartholomew & Mayer 1992). It is argued they put too much faith in the efficacy of symbolic challenges and ignore the prospect that to be successful in attaining their goals movements must connect to “institutionally immanent possibilities” (Giddens 1991: 155), which might entail engaging with policy makers, political actors and the state. This criticism is reminiscent of the CCCS’s point about the magical or imaginary resistance of youth subcultures ultimately being ineffective because they did not participate in “proper politics.” Like post-subculture theory, new social movement theory is predicated on a surplus model of abundance, opportunity, and choice. That not only prevents it from considering the persistence of “old” economic issues in contemporary struggles but also means it cannot make sense of collective action.
that is a response to social and economic restructuring processes variously associated with post-Fordism or neoliberalism, which have involved, inter alia, an increase in precarious labor, the dismantling of the welfare state, and the reversal of many of the achievements of previous social movements. Consequently, movements for civil rights and redistributive justice reappear to fight against new forms of social polarization and marginalization and deregulation of the workforce (Bartholomew & Mayer 1992).

State building and social movements
MICHAEL P. HANAGAN

Since at least 1780, consolidating states have been providing an unusually fertile terrain for the development of social movements. Compared with other states, consolidating states are more contiguous, with better-defined borders and also more centralized, with an increased monopoly over violence. They are better able to identify their population, to protect it, and to serve it (or exploit it) than other states. But the association between states and social movements was typically more complex. Between 1780 and the present, empires formed the major alternative to consolidating states and while social movements originally developed within consolidating states they spread almost worldwide, to land-based empires, and to colonial empires. As they spread from consolidated states to empires, the tactics of social movements more or less retained their familiar form but profoundly changed their content. In our discussions of nineteenth and twentieth-century social movements, analysts often consider consolidating states as independent entities, but many consolidating states in the modern era were also metropoles, capitals of colonial empires. This entry looks at: (1) social movements in consolidating states, (2) land-based empires, and (3) colonial states and empires.

CONSOLIDATING STATES AND METROPOLES

The invention and spread of social movements mark the age of popular politics, an age when reformers not only claimed to speak for aggrieved populations but when aggrieved populations claimed to speak for themselves. Let us take one social movement tactic, the demonstration, as an example. By the 1820s and 1830s in England, monster demonstrations were used by the first social movement organizations to champion suffrage expansion and Catholic emancipation.

Implicit in the demonstration was the assumption that popular support for a cause was politically desirable. In an era of war and revolution, in return for centralization and enormously increased revenues, consolidating states extended rights to subjects who assumed a new and powerful identity, that of citizen. In Great Britain in 1832 and in France between 1789 and 1848 suffrage was extended to some male citizens. After the defeat of Napoleon it looked as if citizenship might disappear entirely from the European continent but, using mass demonstrations, by 1848 concepts of citizenship were again on the march. Arising on the basis of newly won rights, social movement tactics such as demonstrations emerged as tools for expanding rights.

LAND-BASED EMPIRES

In the 1880s and 1890s demonstrations spread to the world of land-based empires of czarist Russia, Austria-Hungary, the Ottoman Empire, and even the Chinese Empire. In this period, land-based imperial states flourished in many parts of the world and were typically larger than metropoles but not colonial empires. Land-based empires relied heavily on coercion and engaged extensively in war making; imperial states possessed several distinct social compacts and significant elements of indirect rule. The states that formed the imperial core were deeply antidemocratic. Although originating in democratizing states, social movements and their characteristic forms of protest, such as demonstrations, also occurred in imperial states lacking any vestige of democracy.

Within land-based empires intimidation and force were used regularly against popular
contentious action and empires possessed almost no institutions for popular expression. As the important example of early twentieth-century czarist Russia shows, social movements adapted themselves to the special features of land-based imperial states.

In the wake of the Napoleonic Wars, and developing at an accelerated pace in the early years of the twentieth century, there was a growing recognition on the part of the czarist government of the need for an authoritarian popular politics to combat Western ideals of citizenship. To respond to the challenge of citizenship, the czarist bureaucracy sought to rally people with the slogan “Nationality, Orthodoxy, Autocracy.” The anti-Semitic Black Hundreds of the 1900s represented an effort to build a state-backed popular movement. Russian autocrats engaged in a massive “invention of tradition” as instanced by efforts to make the czar’s coronation in 1896 a public event with massive crowd participation. In the event it ended badly with hundreds of spectators trampled to death when participants heard that the gifts provided by the government in its effort to increase participation were about to run out.

The contradictions of land-based empire provided one means for schooling discontented urbanites in the demonstration form of social protests. In the English and French metropoles ongoing demonstrations reinforced by pamphlets and newspapers provided means for familiarizing masses of people with demonstrations’ rules and conduct. How to initiate demonstrations where political organization and dissident newspapers were illegal?

But Saint Petersburg, the greatest center of worker militancy in czarist Russia, was less than two hundred miles east across the Gulf of Finland from Helsinki, capital of a province of the Russian Empire with its own constitution, where at the turn of the century demonstrations were legal and strikes common. Saint Petersburg workers could read about Finnish demonstrations in the newspapers and learn from migrant workers. A democratizing Finland, hostile to czardom, was the natural point of entry for illegal radical publications, printed abroad.

Illegal newspapers played a role in introducing the demonstration in the southern Russian city of Saratov in 1902. In his memoirs the future Bolshevik revolutionary Semen Ivanovich Kanatchikov described the first May Day demonstrations. Meeting secretly, activists planned the demonstration; some wanted to carry weapons but eventually they agreed on an unarmed march with banners that read “Down with the Autocracy,” “The Eight Hour Day,” and “Long Live Socialism.” Little bands of radicals clumped along the sidewalk, then suddenly they unfurled their banners and seized the street. One spectator, frightened by this unfamiliar spectacle, shouted that a riot was going on but most spectators quickly accommodated themselves, grabbed for the leaflets, and carried them away in their pockets. One bold worker jumped on a cart to address the crowd only to discover that he hadn’t any idea of what to say. Startled authorities eventually responded, clubbing the fledging demonstrators and arresting their leaders.

While the forms of the demonstration are recognizable their content changed in the context of the land-based empire. In capital cities and core provinces, demonstrations sought not only to make claims on elites or on the government but to demonstrate the illegitimacy of the existing social order. By their very existence demonstrations challenged the central political myth that a Russian-speaking population, steeped in orthodoxy, supported the autocracy. In 1900 in metropole England or France demonstrations were tools for peacefully articulating claims and negotiating and bargaining about them, in Russia they were valuable in themselves and the authorities routinely responded with violence. In a war-weary Russia, an illegal demonstration for International Women’s Day began the revolution in February 1917.
COLONIAL STATES AND METROPOLES

In the colonies of metropoles with consolidating states, social movements spread in the 1920s and 1930s but, where they occurred, they too took on different meanings from those in Western Europe and the US, and also from those in land-based empires. Around 1900, a particular type of empire, the colonial empire, controlled a large portion of the world. Colonial empires were regimes of loosely organized and relatively decentralized states dominated by a single consolidating state (or metropole). Colonies played a relatively low profile role in world diplomacy; most of their military effort was devoted to policing their own populations. The great paradox of colonial governments was that while they possessed almost unchecked power over their subjects, their own power was dependent upon and subordinated to geographically distant metropoles in Europe, North America, or Japan where citizen rights were expanding.

While metropoles were often democratizing states, colonies were usually composite states combining elements of autocracy and citizenship. Take the case of the vast Indian colonies. Although administered by a tight-knit bureaucracy and trim military force, British rule (the Raj) did not penetrate very deeply into Indian society; a small contingent of British officials reinforced by an only somewhat larger group of natives ruled a vast population. Britain could rule only insofar as it left many features of local life untouched. The Indian Empire, like colonies in general, was no such repressive armed behemoth as the Russian Empire; demonstrations emerged in an environment in which protesters confronted and responded to both an authoritarian Raj and a democratizing English polity. In the 1910s and 1920s India may have been democratizing but, if so, at a slower rate than England.

In the late nineteenth and early twentieth century increasing numbers of businessmen, soldiers, and students returned from Britain to India with a knowledge of British politics. In London, visitors such as Gandhi observed demonstrations and assimilated concepts of citizenship to traditional Indian political ideas. By the early twentieth century, mass demonstrations were a common phenomenon in British India and colonial activists found support for their legal status among metropole reformers, some of whom, such as a prominent British socialist, condemned the Raj as rule “in the Muscovite manner.” Supported by metropole reformers many Indian dissidents claimed the rights of metropole citizens. In 1923, when a working-class party organized the first May Day demonstrations, it scheduled two simultaneous events, one in a popularly accessible location, the other across the street from the Madras High Court building, a direct assertion of the right to demonstrate on May Day. Both demonstrations went peacefully but many of the participants were later jailed as communists engaged in a “conspiracy against the king.”

The contradiction between the claims for metropole-type citizenship and the reality of colonial repression was at the center of the dynamic element in colonial politics. Generally peaceful demonstrations occurred during Gandhi’s famous march to the sea, protesting British taxation. The drama of the march actually captured an international audience for Indian protest. Yet violence was always a possibility and the salt marchers were brutally beaten when arrested. In British India the demonstration did not attain full recognition as a legitimate unchallenged form of protest, as shown by the Amritsar massacre. In Amritsar in 1919 Brigadier-General Reginald Dyer machine-gunned a peaceful crowd of Indians attending a rally protesting the incarceration of Indian nationalists, killing almost four hundred people, and severely wounding a thousand in order to keep the natives in their place. Dyer was never punished and his military career was in no way hindered by his murder of hundreds of Indians. Gandhi often claimed that it was this massacre that led him to abandon his faith in British rule.

The status of social movements and social movement tactics in colonies was always contradictory. Successful colonial social movements appealed to local activists searching to
mobilize constituents, to social movements in metropoles that viewed autocratic rule in the colonies as a threat to their existence, and sometimes to global audiences. Social movements mobilized within elaborately structured colonial polities that varied greatly in their recognition of citizenship either at the local and national level or at the colonial and metropole level. Anticolonial movements tried to take advantage of disparities in citizenship practice but they were frequently victims of them.

In conclusion, social movements may have originated in consolidating states but they did not long remain there. Social movements and social movement tactics spread from democratizing polities to undemocratic polities, but as they did so their character changed. In metropole nations, as shown by the example of the demonstration, contentious social movements became tools of peaceful bargaining and negotiation. In imperial contention, there remained elements of bargaining but social movements such as demonstrations challenged the very basis of the political order and almost always involved violence. In colonial empires contentious social movements sought to use metropole models, reformist allies, and indigenous political traditions to carve out a space for themselves, but this space grew and contracted in response to the interaction of colonial and metropole social movements, the involvement of colonial social movements with metropoles, and to changes in colonial policy. However similar in form, colonial social movements profoundly differed from those in the metropole.

State breakdown and social movements

AGNIESZKA PACZYNSKA

As Mancur Olson pointed out in his 1965 book, The Logic of Collective Action: Public Goods and the Theory of Groups, one of the great puzzles of social dynamics is how people overcome collective action problems and organize to pursue common goals. What conditions facilitate and which hinder the emergence of social movements, what allows social movements to persist over time, and what accounts for their impact on social and political dynamics are some of the key questions that scholars have explored over the last few decades.

One of the key dynamics that facilitates the emergence of social movements is the processes of state breakdown. When previously cohesive state structures begin to fracture and weaken, and elite conflicts spill into the public arena, a space opens for social groups to mobilize more readily. The costs of mobilization decline as the state becomes either less willing or less able to deploy repression. At the same time, the appearance of new elite allies facilitates social movements’ ability to achieve their goals. By lowering costs of collective action and increasing the probability of success, periods of state breakdown are often accompanied by a rise in the number of social movements. At the same time, the emergence of social movements and collective challenges to state authority can contribute to the weakening of state structures and in some cases to state breakdown.

This explanation of collective action and social movements came to be known as breakdown theory. The theory sought to explain a wide variety of contentious collective action, including protests, riots, rebellions, and revolutions. What the different variants of the breakdown theory had in common was that they viewed these collective, contentious dynamics unfolding when “the mechanisms of social control lose their restraining power” (Useem 1998: 215). In other words, the breakdown of state structures, when combined with social pressures and strains, was seen as directly contributing to the emergence of collective action.

STATE BREAKDOWN, CHANGING POLITICAL OPPORTUNITY STRUCTURE, AND REVOLUTIONS

State breakdown theories argued that social groups become more active and engage more readily in protest activities in periods of social crisis and breakdown (Goldstone 1980). Scholars argued that these structural changes provided a more compelling explanation of when contentious collective action emerges than such variables as ideology, movement organization, or strategies and tactics. As Skocpol notes “no successful social revolution has ever been ‘made’ by mass-mobilizing, avowedly revolutionary movement . . . in no sense did (radical) vanguards ever create the revolutionary crisis they exploited. Instead . . . revolutionary situations have developed due to the emergence of politico-military crises of state and class domination” (Skocpol 1979: 17).

Social revolutions, and particularly the role that the breakdown of state institutions had in creating conditions that facilitated revolutionary transformations, generated much interest among scholars (Skocpol 1979; Goldstone 1980; Goldstone, Gurr, & Moshiri 1991; Tilly 1993; Goodwin 2001). In many of these accounts, an especially potent revolutionary mix combined fiscal strains experienced by the state, growing disunity within the political elite, and increasing public grievances.

Changes in structural conditions thus either hinder or facilitate the emergence of contentious collective action, including
social movements. These changes in what Eisinger (1973) called the political opportunity structure provide incentives for individuals and groups to mobilize. A number of conditions seem to be particularly significant in facilitating the emergence of collective action. These include: (1) the relative openness or closure of the political system; (2) changing elite dynamics and in particular the emergence of splits within the elite; (3) the appearance of new elite allies; and (4) the state’s changing capacity and/or willingness to repress its opponents (McAdam 1996; Tarrow 1998).

The changing political opportunity structure affects social actors’ assessment of the potential consequences of their collective action and whether such action is likely to succeed or fail. How these judgments are made, however, is complex and is shaped by the context in which individuals are making these assessments. Rational choice accounts, for instance, point out that individuals making decisions about whether or not to participate in collective action engage in a cost–benefit assessment. Shifts in political opportunity can change this calculus and make participation the preferred strategy. In conditions of bounded rationality, for example, a shift in the political opportunity structure that provides additional information about state’s declining capacity to repress can lead individuals to see participation in collective action as less costly. Alternatively, state repression might facilitate mobilization by shifting the perceived time horizons from long to short term (Chong 1991).

The changing political opportunity structure affects the patterns of social mobilization if this change is perceived by social actors. In other words, social actors need to recognize that a changing structural environment has created a new opening for collective action. As Tarrow points out, not all individuals are equally willing to test the degree of openness. Often, it is the so-called early risers who expose the state’s vulnerability to challengers and thus signal to other social actors that mobilization is possible.

The dominant position of breakdown theory came under challenge in the 1970s when scholars began to focus on other variables to explain the emergence of social movements other than the breakdown of the state, in particular, the key role of resource mobilization, and especially of dense social networks, that individuals and groups could draw upon as they engaged and challenged the states. The growing focus on the importance of framing in the emergence and success of social movements also challenged state breakdown theories. Although studies that emphasized the key role of resource mobilization and framing added new insights to our understanding of the complex dynamics of social movement emergence, growth and decline, success and failure, they did not displace but rather supplemented state breakdown theories.

EASTERN AND CENTRAL EUROPE AND THE MIDDLE EAST AND NORTH AFRICA

The popular protests that swept through Eastern Europe in the 1990s and the Middle East and North Africa (MENA) in the first half of 2011 underscore how rapidly political opportunities can shift and how the dynamics of social movement emergence themselves can reshape political opportunities not just within a state but across state boundaries. Regional early risers, in the case of MENA, Tunisia, and Poland in the case of Eastern and Central Europe in 1989, can signal the shifting openness and cohesiveness not just of the state that the emerging social movement is confronting, but of the regional context as well. In other words, the inability or unwillingness of one state to respond with force to a collective challenge to its authority, and the breakdown of the state that follows, can signal to potential challengers in neighboring countries that effective confrontation with the state is possible and that a state that had appeared cohesive may in fact be torn by factionalism, and be brittle or weak. Demonstration effects can change perceptions of political opportunities.
This signaling across state boundaries is of course not always reliable. Eastern and Central Europe, for example, witnessed a wave of social mobilization and state breakdown but these dynamics were varied as they unfolded and were shaped by the domestic context of each country. Thus, while some transitions and state fracturing proceeded peacefully, in Poland and Czechoslovakia, for example, in Romania the toppling of the Ceausescu regime was violent, as was the breakdown and splintering of Yugoslavia. Likewise, in the case of MENA, the dynamics of collective mobilization and challenge to the state were shaped by the internal structures of state and society as well as the state’s international relationships.

While state breakdown opens up political space for collective mobilization and the emergence of social movements, social movements can also emerge because they are stimulated more by shifting external political opportunity structures that contribute to undermining state cohesion and even state breakdown. In other words, the fall of the communist regime in Czechoslovakia was precipitated by the emergence of collective action in opposition to the state. But this collective challenge was stimulated not by shifting domestic political opportunity structures that signaled the weakening of the state but was rather more of a consequence of shifting regional opportunity structures. Similarly, the 2011 Libyan state breakdown was stimulated more by regional signaling of changing opportunity structures than a shift in internal dynamics within the Libyan state.

Furthermore, as Tilly observed, the dynamics of state breakdown and revolution are not uniform across time and space and in fact vary significantly. Nonetheless, certain temporal and regional patterns can be discerned in how revolutionary processes, democratization, and social movement dynamics unfold. This is because “within a given region and period many states share political arrangements, national and international, [and] rough similarities and explicable variation appear in the experiences of connected states with revolution” (Tilly 1995: 1600).

GLOBALIZATION AND CHANGES POST 9/11

Since the 1990s, the relationship between state breakdown and the emergence of social movements has drawn attention from a different perspective. The September 11, 2001 attacks heightened concerns in Washington and other countries of the Global North about the global consequences of insecurity and state breakdown in the Global South. The “failed” and “failing” states in this perspective are seen as fundamentally changing the political opportunity structure for organizing collective action. These “ungoverned” spaces, where the state has either effectively broken down or where its writ does not extend across most of the territory it nominally controls, are thus seen as opening political space to groups who can challenge not only local order and state authority but can potentially affect the political, social, and economic dynamics of a whole region or, as in the case of groups like al-Qaeda, can have global reach.

More recent studies have also noted the growing importance of transnational linkages and alliances in facilitating the emergence of social movements. International factors have always played a key role in accounting for the pressures contributing to state breakdown. In particular, fiscal strains resulting from external military ambitions or threats have been noted by many scholars as weakening the state and making it more susceptible to revolutionary upheavals (Skocpol 1979; Goldstone 1980). The era of globalization has ushered in new opportunities for social groups to forge alliances across borders. This in turn has affected factors that shape the political opportunity structures. Individuals and social groups in closed political systems with few domestic elite allies can now turn, at least under some circumstances, to look for international allies and supporters. These international linkages can
thus provide new incentives for social movement mobilization, even when the domestic political opportunity structure appears unfavorable (Keck & Sikkink 1998; Tarrow 2005). In some cases these transnational movements seek to advance liberal goals and universal rights but in other cases new transnational actors pursue parochial forms of hypernationalism and reinforce traditional forms of power (Adamson 2005). Transnational rebels (Saleyhan 2009), diaspora networks, and transnational crime may contribute to state breakdown and opportunities for domestic social movements to mobilize.

Strain and breakdown theories
STEVEN M. BUECHLER

One classic explanation for collective action involves structural strain or societal breakdown. The logic is that when chronic strain or acute breakdown undermine societal integration, the social controls and moral imperatives that normally constrain collective behavior are weakened. Strain or breakdown thus allows or "causes" collective action that would otherwise be contained.

CLASSICAL STRAIN AND BREAKDOWN THEORIES

Emile Durkheim is sociology's preeminent theorist of social integration. In traditional societies, such integration arose from common beliefs and collective morality. As societies grew in size and complexity, such unifying forces weakened and integration became a problem. Anomie refers to insufficient regulation of behavior while egoism involves excessive individuation. Both signify broader problems of social integration that contribute to dysfunctional outcomes, including suicide. The same logic applies to many types of unconventional behavior.

European theorists of crowd behavior directly linked social breakdown to collective behavior. In their view, "(t)he cause of civil violence . . . was the breakdown of rational control over human behavior through the spread of what one might call 'crowd mentality'" (Rule 1988: 83). Crowds were thought to create intense and volatile emotions that drove collective behavior. In the early twentieth century, Robert Park (Park & Burgess 1921) imported these ideas into US sociology and laid the foundation for the collective behavior tradition.

Herbert Blumer subsequently established collective behavior as a recognizable subfield in sociology. For Blumer (1951), collective behavior is largely spontaneous, unregulated, and unstructured. It is triggered by some disruption in standard routines of everyday life that promotes circular reaction or interstimulation with the qualities of contagion, randomness, excitability, and suggestibility. It is this social unrest that facilitates collective behavior in the form of crowds, masses, publics, and social movements. Turner and Killian (1987) later emphasized how collective behavior may also promote emergent norms and incipient forms of order through symbolic communication and interaction. This approach nonetheless assumes that collective behavior is triggered by some disruption in normal social routines. Moreover, the elements of contagion, excitability, spontaneity, and emotionality sharply set it off from conventional behavior. Finally, this approach has been widely interpreted as seeing collective behavior as irrational, disruptive, dangerous and excessive. Rightly or wrongly, this negative image of collective behavior played a major role in the subsequent decline of strain and breakdown theories of collective action.

Another version of strain theories involves relative deprivation (Geschwender 1968). Here, strain takes a social-psychological form as people assess their current situation against reference groups or past or anticipated future situations. Whenever they find a benchmark that implies they could or should be better off, relative deprivation exists and this psychological strain can trigger collective behavior. Through cognitive dissonance or frustration–aggression mechanisms, such psychological strain provokes collective behavior.

Smelser (1962) provided a structural-functional version of strain theory in the form of a value-added scheme of six factors that are individually necessary and collectively
sufficient for collective behavior to occur. Structural conduciveness means the social structure permits some form of collective behavior to emerge. Structural strain refers to ambiguities, deprivations, conflicts, and discrepancies in social structure. Generalized beliefs are (inherently irrational) cognitive schemata that focus grievances. Precipitating factors provide an immediate catalyst. Mobilization for action is the culmination of these background processes. If effective social controls are in place, this sequential emergence of collective behavior can be aborted; hence the breakdown of such controls is a final determinant. Smelser thus weaves strain and breakdown into a macrostructural theory of collective behavior.

Mass society theory is a final variant that revives Durkheim’s concerns with anomie and egoism. For this perspective, modernity promotes massive social structures and erodes intermediate groups that provide social anchors for individuals (Kornhauser 1959). Without such groups, isolation, depersonalization, and alienation prevail. Mass society theory predicted that the most isolated, alienated individuals would be most likely to participate in collective behavior. Although this prediction proved spectacularly unsuccessful (because isolated actors are no more likely to join collective behavior than any other collective undertaking), the theory reiterated the premise that some type of social strain or breakdown causes collective behavior.

The concepts of strain and breakdown connect an otherwise diverse group of social thinkers who invoked them to explain collective behavior. In the mid-1970s, an authoritative overview of social movement theory defended these concepts as crucial explanations for collective behavior and implied that strain and breakdown theories had a bright future (Marx & Wood 1975). Less than ten years later, however, a similar review did not even mention strain or breakdown (Jenkins 1983). The contrast between these two assessments hints at the paradigm shift that occurred from the mid-1970s to the mid-1980s in the study of collective action. During this decade, strain and breakdown theories all but disappeared.

**FROM COLLECTIVE BEHAVIOR TO RESOURCE MOBILIZATION AND POLITICAL PROCESS**

Strain and breakdown theories virtually disappeared because they were seen – rightly or wrongly – as inextricably linked to a collective behavior paradigm that came under relentless criticism. Careful analysis of 1960s urban riots faulted strain explanations for obscuring the political dimension of protest and the rational orientation of protestors. Resource mobilization and political process theorists argued that breakdown theories suffered from “irreparable logical and empirical difficulties” (Tilly, Tilly, & Tilly 1975) and that explanations emphasizing solidarity among protesters always provided better explanations. These theorists rejected the mechanistic linkages between individual discontent and group action and the emphasis on psychological states over political interests (McAdam 1982).

The resource mobilization and political process alternatives challenged the accepted wisdom about collective behavior in several ways (Buechler 2000). They rejected the equation of social movements with short-lived riots, crazes, panics, or fads. Movements were rather seen as enduring, patterned, and even institutionalized expressions of political struggles over conflicting interests and scarce resources (McCarthy & Zald 1977; Tilly 1978). In defining movements as normal, rational, challenges by aggrieved groups, these new paradigms equated collective action not with deviance or social disorganization but with political or organizational conflict. More broadly, these perspectives rejected deterministic imagery for an agency-centered approach in which actors’ purposes, interests, and goals were foremost. The presumably rational, political nature of such actors and their interests displaced explanations emphasizing marginality, deprivation, frustration, tension, and strain. In all these ways, strain and breakdown imagery was eclipsed by new concerns
with the mobilization of resources and dynamics of contention.

These shifts led to the aforementioned review article that made no reference to strain and breakdown as explanations of collective action (Jenkins 1983). These concepts were driven underground in three ways. First, direct criticisms challenged them on their own terms. Second, the rise of the resource mobilization and political process paradigms undermined the collective behavior tradition within which strain and breakdown theories had been embedded. And third, the research program of these new paradigms rendered strain and breakdown marginal to social movement theory. By the mid-1980s, strain and breakdown theories appeared completely moribund, but a closer look reveals a more interesting story.

THE PERSISTENCE OF STRAIN AND BREAKDOWN THEORIES

While resource mobilization theory established a new paradigm for the study of social movements, strain and breakdown theories persisted at the margins. One example is the role of state breakdown in the explanation of revolutions. Goldstone (1991) argued that revolutions follow similar causal processes involving state breakdown, revolutionary contention, and state rebuilding. State breakdown arises from a conjunction of state fiscal distress, elite alienation and conflict, and a high mobilization potential among the general populace. In this interactive model, all three elements must be present if a full revolutionary challenge is to unfold. By emphasizing external, deterministic background factors, the causal imagery of Goldstone’s theory recalls the classical collective behavior tradition with its emphasis on strain and breakdown.

Breakdown theories also feature prominently in Piven and Cloward’s (1977) work on poor people’s movements. They emphasize the extent to which social structures normally limit opportunities for protest and diminish its force when it does occur. It is the relatively unusual breakdowns in society’s regulatory capacity and everyday routines that provide rare but potent opportunities for mass defiance. Piven and Cloward (1992) explicitly defend breakdown theories – what they call the malintegration (MI) approach – as robust explanations of disruptive rather than normative forms of protest, and they criticize resource mobilization theorists for blurring the distinction between the two. They also challenge “solidarity” explanations by arguing that horizontal organization among challengers is rarely sufficient; effective protest also requires the more unusual breakdown of vertical integration that normally constrains challengers.

A more recent reformulation of breakdown theories locates the link between social breakdown and collective action in the disruption of the quotidian nature of social life (Snow et al. 1998). The latter refers to taken-for-granted, daily practices and routines that comprise habitual social action, along with routinized expectations about the social world. “When the quotidian is disrupted, then, routinized patterns of action are rendered problematic and the natural attitude is fractured” (Snow et al. 1998: 5). In this way, a specific type of breakdown is seen as the impetus to collective action. To actually produce that outcome, the disruption must be experienced collectively and it must not have a normal, institutional resolution if it is to provoke collective action (1998: 6). Examples of such disruptions may be found in “suddenly imposed grievances,” intrusions or violations of community space, and changes in taken-for-granted subsistence routines or social control structures. This account challenges the presumed dichotomy between breakdown and solidarity by specifying that breakdown refers to patterns and expectancies of everyday life rather than associational ties between individuals. Thus, the breakdown of everyday routines can occur alongside strong ties within groups, and it is this combination that may be most likely to promote collective action.

The contributions of Goldstone, Piven and Cloward, and Snow and colleagues illustrate
how strain and breakdown have persisted as explanations of at least some forms of collective action. More broadly, this history illustrates how classical concepts and theories never completely disappear from the discipline, though they may undergo significant revision. Indeed, if there is any cumulative progression in the development of sociological explanation, it may arise from a dialectic whereby classical notions are thoroughly challenged but persist in revised and more carefully specified forms. This process seems evident in the persistence and perhaps even the return of strain and breakdown approaches in social movement theory.

IS “OPPORTUNITY” THE NEW “STRAIN?”

It can even be argued that strain and breakdown theories have returned to mainstream social movement theory in a major, albeit disguised, fashion. There is considerable conceptual overlap between what classical theorists mean by strain or breakdown and what political process theorists mean by opportunity (Buechler 2004). What separates the approaches and obscures the similarities is the valuational bias of each set of concepts. The terms “strain” and “breakdown” inherently connote negative, problematic conditions to be prevented, avoided or repaired. As these terms functioned in the classical collective behavior paradigm, there can be little doubt that they conveyed negative value judgments about the appropriateness of collective behavior. It was not just the notion of breakdown as a neutral causal mechanism that provoked the ire of resource mobilization and political process theorists; it was also the halo of negative value judgments surrounding the concept that drew their fire.

The concept of opportunity was tailor-made for this debate. On the one hand, it provided the transvaluation sought by resource mobilization and political process proponents that allowed them to paint collective action in a positive light. Particularly in the US context, the concept of “opportunity” inherently signifies something to be sought, desired, seized, enjoyed, valued, and maximized. On the other hand, it preserved a way of talking about changes in structural conditions and cultural contexts that facilitate collective action. By substituting the concept of opportunity for that of breakdown, newer paradigms retained a powerful explanation for collective action while reversing the valuations placed on that action. There are as many different versions of opportunity in recent approaches as there are variations on breakdown in the classical tradition; the following examples merely illustrate some ways in which “opportunity” has become a substitute for “breakdown.”

The concept of opportunity has been there from the beginning in Tilly’s (1978) mobilization model of collective action. Most basically, it was defined as the increased vulnerability of other groups or governments to actions of a contender pursuing its interests. Opportunities emerge when the established order becomes vulnerable to the actions of contenders and when their costs of acting are reduced. McAdam’s (1982) political process model also recognized a central role for opportunity in the emergence of collective action. Alterations in political opportunity structures reduce power discrepancies between authorities and challengers and increase the cost of repressing protest. Once again, increasing strain or breakdown is mirrored in increased power for challengers relative to authorities and increased costs of social control for authorities. Tarrow (1994) also recognizes opportunity as a crucial variable in the emergence of social protest. While some types of opportunity are relatively consistent features of the political environment that correspond to a notion of social strain, others are more variable (unstable alignments, divided elites) and correspond to a notion of breakdown. In all these ways, where a classical theorist sees strain or breakdown, a political process theorist sees opportunity. While the valuations placed on these concepts are often opposed, they do essentially the same work in each theory as external, variable conditions that alter the balance of power between
authority and contenders, and hence the likelihood of collective action itself.

Under closer scrutiny, some noteworthy differences between breakdown and opportunity emerge. Strain and breakdown theories have been invoked to explain a very broad range of collective behavior whereas opportunity is usually cited to explain political, state-centered conflict. Opportunity explanations implicitly rest on a rational calculus of costs and benefits whereas strain and breakdown accounts may be better suited for explaining more spontaneous or transient forms of collective action. In these and other ways, these concepts retain distinctive connotations and implications.

While strain and breakdown theories remain somewhat marginalized in social movement theory, opportunity is a well established element in a theoretical synthesis of political opportunities, mobilizing structures, and framing processes (McAdam, McCarthy, & Zald 1996). While opportunity and breakdown are not the same thing, they do the same work in each respective theoretical tradition. Both refer to external, variable processes that increase the likelihood of collective action. To the extent that opportunity has become a stand-in for strain and breakdown, the latter never really disappeared from social movement theory.

CONCLUSION

From the classical era of sociology until well into the twentieth century, strain and breakdown theories provided crucial explanations for collective behavior. In the 1970s, such theories were dismissed by ferocious criticism that ushered in new paradigms. This criticism was directed at the logical and empirical flaws of those approaches as well as the negative imagery of collective behavior implicit in them. Alongside this antagonism to breakdown explanations, new assumptions about agency, rationality, politics, and organization led to different questions and answers than the classical collective behavior tradition. Nevertheless, strain and breakdown approaches persisted in various formulations at the margins of social movement theory. Finally, it can be argued that the concepts of strain and breakdown never really disappeared from social movement theory as much as they went underground and reappeared in the guise of a new conceptual language about opportunity. Given recent pronouncements about new syntheses emerging in social movement theory, perhaps it is time for an active reconsideration of the role of strain and breakdown in any such synthesis.

Any successful effort in this direction will require three levels of specification. Most obviously, we need greater specificity about what it is that undergoes strain or breakdown. Second, we need greater specificity about the mechanisms by which any type of strain or breakdown is translated into collective action. Third, we need greater specificity about what types of collective action are most likely to emerge from specific types of breakdown and strain. The classical collective behavior approach presumed an extremely broad spectrum, from panics, crazes and fads to riots, rebellions, and revolutions. Recent social movement theory has fractured the spectrum and claimed movements as its domain while paying less attention to other forms of collective action. This is precisely where a revised breakdown theory may have its greatest relevance. For example, the distinction between routine forms of collective action deriving from resource availability and nonroutine forms responding to strain and breakdown needs to be further explored if we are to specify which types of collective action are most likely to be associated with social strain and breakdown.

Finally, while we introduce greater specificity to notions of strain and breakdown, we must do the same with the concept of opportunity so we can then explore the relationships between strain, breakdown, and opportunity more carefully. To do so promises to advance social movement theory while also providing a fascinating test of the extent to which concepts embedded in antithetical theoretical traditions are capable of genuine synthesis.

Strategy
JAMES M. JASPER

Derived from the ancient Greek word for a military commander, “strategy” has two common meanings. In business it is a broad plan, and in military terms, similarly, it is what is done before the battle begins (in contrast to the tactics that lower officers use to implement the commander’s strategy during the battle). In contrast, as an adjective, strategic and strategic action refer to interactions among players who have both ends and means, and who each realize that the others are also acting strategically to get what they want. In this latter sense, strategy covers almost everything that social movements do.

The most obvious strategic engagements are between movements and their opponents, but there is also strategic interaction between movements and their potential allies or recruits, the media, and various government agencies. As is obvious from this list, strategic interaction is not always conflict. It is still strategic when protesters endeavor to persuade supporters to send them funds, or judges that their cause is just. In all these cases, they are trying to get something from others. Players’ ends and means, as well as the arenas in which they interact, are the core of strategic action.

GOALS

The goals of social movements vary enormously. Some want to change society, others to block changes. Some want rights or material benefits for the groups they represent (such as the labor movement); others seek protections or advantages for others (the animal rights movement). Some groups are focused on local issues (NIMBYs), others on global ones (Attac). In addition, every social movement has multiple goals.

Many theories assume one kind of goal. Political opportunity theories were designed to explain movements aimed at political inclusion and power for members of a group. Rational choice models often assume participants want material rewards. Many approaches define social movements as efforts by oppressed or excluded groups, or as efforts to influence authorities’ decisions. In older work, movements were often classified as either expressive or instrumental in their goals. (In fact, most movements have both expressive and instrumental goals, with one focused on audiences internal to the movement and the latter on external audiences.) Little attention has been paid to the variety of goals, and the potential conflict among different goals. These are interesting dynamics, of which I shall mention several.

First, individuals have goals that imperfectly coincide with the stated goals of a group, so that they often try to pursue their personal ends at the same time as (or even instead of) group ends. The more compatible these are, the more work a movement gets out of its participants. But powerful leaders have considerable ability to use movements to attain their own goals, rather than the other way around. They can use the fame they derive from leading a movement to advance their own careers, for example, as happened in the New Left (Gitlin 1980).

There is also a Survival or Success Dilemma: once a group is formed, its members (and especially its paid employees) have an interest in its survival, which may sometimes interfere with the goals it was formed to pursue in the first place (Piven & Cloward 1977). This is connected to the Today or Tomorrow Dilemma: short-run goals may interfere with long-run goals. For instance, a movement victory may inspire countermobilization by its opponents, who may turn out to be more effective in the long run (Jasper & Poulsen 1993).
Another pair of strategic dilemmas suggests how movements change over time through interaction with other players. There is a Dilemma of Shifting Goals (Jasper 2006: 75). Activists may wish to abandon some goals as unrealistic, or they may add goals that they come to feel are important and attainable. In other words, it is strategically realistic to adapt goals to available means. But some supporters may feel betrayed; opponents can accuse you of being duplicitous. This links to the Articulation Dilemma: the more you specify what your goals are, the more you attract those who share them, but the more accountable you will be for failing to reach them. Articulation makes it more costly to shift goals.

Much research remains to be done on the sources of goals and the potential conflicts among them. Individuals and factions within an organization battle over what the organization’s officially stated goals will be, through processes that are still poorly documented.

MEANS

Strategic players have three basic families of means at their disposal: they can use physical coercion or threat, they can persuade others, or they can pay others to do what they want them to (Jasper 2006: ch. 4). Although they may use all three, social movements rely heavily on persuasion to accomplish their goals. To the extent they rely more on coercion, they become a rebel army or a band of criminals. To the extent they rely more on paid staff, they shade into the status of interest groups.

The threat of coercion is a way to disrupt economic and political systems, a strategy that Piven and Cloward (1977) believe is the only path open to those without monetary and other capacities. In a parallel inquiry, Gamson (1975) found that groups using violence were more likely to attain their goals (which he reduced to benefits for represented groups and recognition for the protest organizations). These works were an important breakthrough in our understanding of the effects of different strategies, shattering a complacent pluralist intuition that disruptive protest was somehow bad. Instead we see the Naughty or Nice Dilemma (Jasper 2006: 106): aggressive tactics can attain some ends, safe choices obtain others. Aggression runs the risk of arousing repression by authorities and the erosion of public support, but if it can seize gains that are hard to reverse later, it is often worth it.

Scholars have given greater attention to the means that activists use to persuade rather than coerce others. Foremost have been the processes by which mobilizers must find the right frames to appeal to participants and potential participants (Snow et al. 1986), diagnosing a problem and motivating work toward a solution. Moral shocks (Jasper 1997), dizzying experiences that challenge a person’s assumptions about the world, are a similar concept meant to get at the processes by which recruits are first attracted to a movement. Over time, it has become apparent that framing and moral shocks are most effective in the context of social networks, motivating those already involved and sometimes pushing them toward more radical tactics. For instance Gould (2009) demonstrates that lesbian and gay activists moved toward more disruptive tactics in the late 1980s because of the moral shock of the US Supreme Court decision, *Bowers vs. Hardwick*, upholding antisodomy statutes.

In the affluent nations since the late twentieth century, protest groups have often paid staff to conduct many basic activities instead of relying on volunteers, a process famously analyzed by McCarthy and Zald (1977). Groups that choose this route come to depend on their financial backers, and frequently turn into interest groups. In addition, professional activists emerge who can move from one cause to another, bringing their specialized skills with them—for a price. With paid staff comes bureaucracy, which often undermines some of the basic moral goals of the protest groups.

Means and ends conflict in this and other ways. Foremost, in the Dirty Hands Dilemma, there are certain goals that can only be obtained through means that are morally suspect (Jasper
For some participants, money and bureaucracy fall in this category, making it hard for them to sustain organizations. A few movements, notably nonviolent movements, define themselves by the tactics they reject on moral grounds, although often recognizing that more aggressive tactics might help them get what they want sooner. A good example is the American animal rights movement, which in its early years obtained powerful propaganda about the abuse of animals through spies and burglars.

Tactics originate from either invention or borrowing from other movements. Tactical innovation seems to occur through interaction with opponents, in a kind of strategic game (Ganz 2009). Diffusion of tactics is better studied (Soule 2004). The transmission mechanisms include direct influence through social networks (Morris 1981) and indirect inspiration through reportage by the media (Myers 2000). Far from simple contagion, diffusion involves varying degrees of active consideration on the part of either those transmitting or those adopting (and adapting) innovations. Because strategic innovation always carries risks, protesters try to solve the Innovation Dilemma by observing what the costs, benefits, and risks have been for others before they do something new themselves.

DECISIONS AND DILEMMAS

Little attention has been given to how activists make decisions about what to do, leaving the impression that they simply follow the scripts and routines they have learned in or from other movements, or what Charles Tilly called a repertoire of contention. But it is precisely the ability to choose among options and to invent new actions and arguments that sometimes allows “David” to defeat “Goliath” (Ganz 2009). Good choices are more likely, according to Ganz (2009), in groups with regular, open, and authoritative deliberation; diverse networks of supporters; knowledge about diverse tactics to choose among; resources drawn from supporters rather than outsiders; accountability to supporters; and leaders drawn from inside and outside local groups with personal commitments to the cause. What is crucial is feedback about what is working, and flexible reactions to that feedback; in a word, the ability to learn.

The most basic strategic choices typically take the form of dilemmas: each option comes with a long list of potential benefits and risks, some known and some not, as well as various costs. There are dozens of such dilemmas, such as Naughty or Nice and Dirty Hands. Other common ones include the Extension Dilemma over whether to build a broad team with more resources or a small and better focused team; the Organizational Dilemma over whether to devote time to creating a formal organization supported by a stable flow of resources or to attract supporters to singular, especially disruptive, events; and the Janus Dilemma of balancing attention to one’s own members or to outsiders (Jasper 2004, 2006).

Such basic questions cannot be debated at every group meeting. As Tilly suggests, most are ignored in favor of familiar routines. But even when not faced as explicit dilemmas, they are still there as underlying trade-offs. Much of the strategic creativity of organizers arises when they take on one of these trade-offs, realizing that there are other ways to do things. Leaders with experience in other contexts are especially good at seeing these openings.

PLAYERS AND LEADERS

Attention to decisions and dilemmas highlights who exactly it is who is making the decisions. Scholars often write loosely about “social movements” as making decisions or undertaking actions, but none think of movements as coherent entities. They are composed of formal organizations and individuals who feel as though they share enough goals to call themselves a social movement, a term of collective identity that suggests purpose and power. The label is largely a hortatory rhetorical tool.
In even the most democratic of groups, some individuals have more influence than others. In most there is some formal division of labor. As part of their role, formal leaders set agendas, guide discussions, and make a number of smaller decisions on their own. Alliances of protest groups negotiate their stated goals and their means through formal mechanisms, although here too the decisions often come down to a small group of individuals. Factions, too, struggle to set agendas and formulate public statements. Organizations and movements are as much an arena for internal contention as a player in external contention. Careful catalogs of all relevant players in a conflict, internal and external, can help avoid much confusion.

Once we recognize the human beings who make decisions, we can see a range of additional mechanisms at work. For instance, people attach moral value to their means as well as their goals. They also know how to do some things and not others. Together these give people a “taste in tactics” (Jasper 1997: ch. 10) that is partly independent of the perceived efficacy of the tactics; tactics are rarely neutral means about which protesters do not care. Thus protesters face dilemmas having to do with clashes between means and ends.

A universal leadership challenge derives from the Janus Dilemma: some leaders are more effective at reaching external audiences, others at appealing to or managing a group’s own membership. Given the different expectations and goals of insiders and outsiders, it makes sense that few leaders are effective at both, perhaps one reason that leadership teams made up of insiders and outsiders often are more successful (Ganz 2009). Similarly, individuals who try to act as brokers between groups frequently find they are not fully trusted by either.

We come now to two topics that scholars have addressed extensively, to see how they are related to strategies.

CAPACITIES

A group selects means of action to take advantage of the capacities it has or can mobilize. This simple insight inspired the resource mobilization theory of social movements (McCarthy & Zald 1977), which focused on how those without extensive financial resources could appeal to those with them, but also how paid staff could attract time resources from volunteers. In the first flush of this paradigm, any advantage came to be called a resource, including cultural meanings and psychological states. My own preference is to restrict the term to money and the technologies and services it can buy.

There are other useful capacities for a movement to have. Leaders with experience, intelligence, and know-how tend to make better decisions (Ganz 2009). This kind of intelligence can often substitute for resources. Organizations, too, can develop mailing and phone lists, offices, and social networks, partly independent of the individuals who work in them. One of the most important capacities is reputation, of both individuals and groups. Considerable work is devoted to reputation building, such as the “WUNC displays” that Tilly (2004) described: protests designed to demonstrate the moral worth, unity, numbers, and commitment of participants. Even here there are dilemmas: portray yourself as a victim of evil, and you gain sympathy from outsiders but undercut your own team’s confidence in their strength to act; portray yourself as heroic and your team feels strong, but others may not think you need their help.

Organizers also try to arouse the right emotions in themselves and their rank-and-file members. Foremost, perhaps, is confidence: faith in your own abilities and ultimate success. This gives participants the energy to undertake any number of activities, just as a lack of confidence deflates energy. Interaction rituals, in which members are brought face to face in emotional arousal to ratify their group’s basic values, stir emotional energy that carries over into other activities. The emotions of strategic engagement are still poorly understood, partly because they have a way of blending ends and means together (accomplishing one goal generates emotional energy that helps attain the
next one). But scholars increasingly recognize that emotions are an essential part of action, not an irrational undermining of it (see Jasper 2011 for a review).

ARENAS

Strategic action is aimed at capturing the rewards available in specific arenas, which we can envision as combinations of rules, expectations, material support, and rewards. Players adapt their actions to those arenas, looking for opportunities to get what they want. In some cases, new arenas even inspire the creation of new players who are especially suited to the new opportunities. This is the great insight of Charles Tilly and the political process theory he developed. Protesters develop repertoires of action that seem appropriate to each arena (and indeed a distinct repertoire to deal with each player in that arena). This perspective helps us understand changes in tactics over long periods of history.

Movements that manage to match their strategies to their institutional arenas are more likely to obtain their goals. For movements oriented toward public policy, as Amenta (2006) found in his study of the Townsend Movement, assertive strategies work only when elected politicians are uninterested or opposed and when bureaucrats are weak or opposed to the movement; otherwise, electoral or legislative arenas are more promising. Working within the system, however, always runs the risk of co-optation, in which the survival of the protest group or benefits for its leaders begin to crowd out its original goals. Working within one institutional arena takes attention from others, and many arenas turn out to be “false arenas” in that they become powerless when newcomers join them (Jasper 2006: 169).

In the end, the question of arenas returns to the issue of the players with whom movement groups interact. Just as we need to understand the strategic considerations of protesters, we need to understand the goals, means, dilemmas, and so on of these other actors. Considerable work has been done on the media and on the police, for instance. The idea of “multi-organizational fields” was coined to focus on these many interactions (Curtis & Zurcher 1973), although the term “field” often conflates the players and the arenas in which they operate. Future research might usefully concentrate on the interactions among these various players to balance our inherited focus on the arenas in which they interact.

Survey research
BERT KLANDERMANS

Survey research is a frequently employed research design in social movement studies (Crist & McCarthy 1996). As there are quite a few excellent source books for researchers who want to apply survey methodology (e.g., Robson 1993), I will restrict myself to the specificities of survey research in the context of social movement studies (see Klandermans & Smith 2002 for a detailed discussion).

In social movement research, survey techniques are employed both with individuals and organizations as the unit of analysis. In the prototypical individual survey a sample of individuals fills in a questionnaire encompassing questions about knowledge, beliefs, attitudes, behavior, demographics, and other personal characteristics. In an organizational survey spokespersons of social movement organizations are questioned about their organization’s structure, resource acquisition and allocation, tactics, policy, and the like.

Survey research can use cross-sectional or more sophisticated longitudinal or comparative designs. While intellectually more demanding and more costly, survey designs that draw comparisons across movements, space, or time provide empirical leverage that can help advance theories of social movements. The intelligent use of such designs turns surveys into a powerful tool for the study of social movements.

THE USE OF SURVEY RESEARCH IN THE STUDY OF SOCIAL MOVEMENTS

The most frequent use of surveys is for description: the description of members, of participants, of potential participants, of different types of participants (male/female, black/white, young/old, etc.), and of their opponents. The key questions of this type of research are who participates and who doesn’t, and do different types of participants have different motives to participate? Sometimes these studies are simple descriptions and sometimes they root in theories that are tested against survey responses. An example of the latter is Opp’s work within a rational choice theoretical framework on the antinuclear power movement in Germany (1989) and of the democratization movement in former Eastern Germany (Opp & Gern 1993). The problem with such studies is that they often lack a proper standard of comparison. In order to understand the dynamics of participation one needs to compare participants with nonparticipants. It is not enough to assert all kinds of characteristics of participants, one needs to know whether such characteristics are typical for participants or not. But what is a proper comparison? Participation is a process that can be conceived in four steps (Klandermans & Oegema 1987). Each step can be thought of as a crossroad where people can move toward or away from participation: becoming a sympathizer or not, becoming a target of a mobilization attempt or not, becoming motivated to participate or not, and overcoming barriers to participation or not. Comparisons must be made between people at the same crossroad, that is, between sympathizers and nonsympathizers, between targets and nontargets, between those who are motivated and those who are not, between those who did overcome barriers and those who didn’t. If we don’t separate these comparisons, our comparison of participants with nonparticipants encompasses each of the four types of nonparticipation and thus is blurred.

But there is more to comparison than distinguishing participants from nonparticipants. I maintain that it is far more informative to survey several smaller samples in a comparative design, than one large sample noncomparatively. Six times fifty interviews with two
different groups of informants at three points in time will tell us considerably more about movement participation than three hundred interviews with one group at a single point in time. It is such comparisons that help us to understand movement participation. After all, movement participation is a process, and we cannot investigate a process with a single shot measure.

Comparative designs may incorporate comparisons of movements, comparisons of movements across space or time, or some combination of these comparisons. Such comparisons are rare. Yet, comparative research of movement participation is important. It tells us that what holds for a participant in the one movement, or at one point in time, or at one place, is not necessarily true for a participant in the other. Comparisons across different social movements are uncommon. One example we find is Klandermans’ (1993) comparison of participants in the labor movement, the peace movement, and the women’s movement. This comparison used similar measurements and concepts within a unified theoretical framework and found that a different mix of motives spurred participation in each of these movements.

Comparisons of space are the most common. The surveys by Opp and others in Germany, Israel, and Peru (1995) are examples. These authors investigated participation in legal and illegal protest in the three countries. Their results suggest that the simple association between ideology and protest behavior can vary widely according to country context. Findings like this demonstrate the importance of comparison of space.

Comparisons of time are equally important, as levels of participation tend to go up and down. Klandermans’ research on the peace movement provides a dramatic example. In June 1985, he and his colleagues interviewed samples of the Dutch population. Sixty-nine percent said that they would sign a petition against the deployment of cruise missiles in the Netherlands. The interviews were repeated again in November, when just two-thirds of those who said that they would sign reported that indeed they signed. Of the initial petition supporters remaining, two-fifths indicated that in fact they wanted to sign but failed to do so, but three-fifths said that they had never wanted to sign. Had we only interviewed our sample in November, we would not have found this group of people who changed their positions completely (Oegema & Klandermans 1994).

HOW IS SURVEY RESEARCH DONE?

The first decision a researcher must make when considering a survey research design is what unit of analysis is most appropriate to the questions being asked. Obviously a first choice is whether one is principally concerned with answering questions about individuals or organizations.

**Sampling**

Once we have identified the unit of analysis for our study, we must find a sampling frame (the list of individuals or organizations that comprise the research population). This is often the real problem in social movement research. Once we find an appropriate sampling frame, sampling is a technical matter. Our research population can be (some subset of) the general population or the participants in a social movement. If the general population is the research population one can use a telephone book, postal codes, postal addresses, or population registers as sampling frames. Far more complicated is it to sample subsets of the population or movement participants. Often, reliable lists of individual members of some subgroup are either not available or not accessible to third parties for privacy reasons.

Sampling movement participants can be even more cumbersome as many movements do not have reliable lists of participants. Sampling potential participants in order to find actual participants is usually not very efficient. Actual participants amount to only a small proportion of the mobilization potential. One may
easily end up approaching 10 to 20 potential participants in order to find one active participant. Another option is to sample participants at events: the people who attend a meeting, take part in a demonstration, sign a petition, and so on. Apart from the technical problems of sampling participants at events it is obvious that the kind of activity influences who participates. The people who attend a meeting are not necessarily the same as the people who participate in the demonstration or who sign the petition. Yet, all three are and probably see themselves as participants in the same movement.

Choosing the type of survey

Survey questionnaires can be mailed to respondents, completed in face-to-face or telephone interviews (often computer assisted), or transmitted via the Internet. Each of those techniques has its advantages and disadvantages.

1. Costs. Face-to-face interviews are the most expensive form of data collection, and the Internet is the cheapest option. Mailing questionnaires is cheaper than telephone interviews, but the difference between the two is much smaller than one would be inclined to believe, especially if the interviewers are inputting responses directly into a computer database.

2. Response rates. Each survey method influences response rates differently: face-to-face interviews have the highest response rates, and mailed questionnaires the lowest. Telephone interviews occupy a position in between, but nearer to face-to-face interviews than to mailed questionnaires. So far, the Internet generates large unsystematic samples. If one knows some characteristics of the population one can easily create a weighted sample out of the response.

3. Timing. Surveys take time. However, telephone and Internet surveys can be organized on much shorter notice than mail and face-to-face surveys. Someone who has access to the appropriate facilities can organize a telephone or Internet survey almost overnight. The Internet is by far the speediest form of data collection.

4. Substance. Not every kind of question can be asked via each approach. For example, knowledge cannot be assessed in mailed questionnaires or via the Internet; open questions fare better in interviews. Mailed questionnaires and questionnaires on the Internet have the advantage that people can take their time and work on their response when it suits them. Telephone interviews need to remain limited in length.

Response rates and nonresponse bias

Nonresponse threatens the reliability and validity of our findings more than sample size. Therefore, researcher effort should emphasize achieving high response rates rather than large samples. Indeed, it is better to draw a smaller sample and aim at as high a response rate as possible, than to draw a large sample to compensate for low response rates.

Questionnaire

The typical survey questionnaire in the social movement domain encompasses a mixture of questions regarding knowledge, opinions, and attitudes about the movement and its goals; reported participation in movement activities in the past and intended participation in the future; perceived costs and benefits of participation; ideology and identity; affective components such as commitment to the movement, and demographic characteristics such as gender, age, profession, income and education, position in social networks and political affiliation. Organizational surveys might ask about an organization’s goals, structure and procedures, strategies and activities, involvement with members or volunteers, and resources. It would be worth the effort to standardize questionnaires. Indeed, one would be able to compare the results from different studies even if different researchers, in different places or on different movements conducted them.
LIMITATIONS AND ADVANTAGES OF SURVEY RESEARCH

1. **Questions.** Surveys are certainly not appropriate tools for addressing all research questions in social movements. Research that takes the individual as its unit of analysis necessarily restricts itself to the explanation of individual opinions, attitudes, and behavior. It can help us to understand why individuals participate in social movements once they have emerged, but is not able to tell us much about the emergence of social movements.

2. **Costs.** Properly designed surveys are time consuming, and they can be expensive. As most survey costs cover telephone, mail, and personnel to interview or code or enter the data in the computer, anything that can cut down on those items reduces costs.

3. **Logistics.** Organizing a survey cannot be done overnight. Designing and printing questionnaires, preparing questionnaires for computer-assisted interviewing or for use on the Internet, drawing samples, organizing a mailing, or hiring interviewers are time-consuming matters.

4. **Information.** One is dependent on what informants are prepared to tell us. The answers to our questions can be socially desirable answers. There is no guarantee that people are telling the truth. Although sometimes informants may provide false responses, attempts by survey researchers to assess this potential problem revealed no indications that it takes place on a large scale.

5. **Quantitative method.** Necessarily, the measures used in surveys are fairly superficial. Feelings and emotions, people’s uncertainties, doubts and fears, all the inconsistencies and the complexities of belief systems are matters that are not easily tapped with survey questionnaires.

However, if used properly, survey research is a powerful tool for the study of social movements, especially if employed in comparative designs. Rather than conducting large-scale, single-shot surveys, researchers might put their time and resources to more productive use by comparing smaller samples drawn from different movements, places, or at different points in time.

Tactical interaction and innovation
DOUG MCADAM

The concepts of tactical interaction, tactical innovation, and tactical adaptation were introduced by McAdam in a 1983 article in American Sociological Review. Tactical innovation refers to the introduction of new and novel tactics by movement actors. McAdam defines tactical adaptation as “the ability of [movement] opponents to neutralize these [innovative] moves through effective tactical counters.” Taken together these two “define an ongoing process of tactical interaction in which insurgents and opponents seek, in chess-like fashion, to offset the moves of the other. How well each succeeds at this task crucially affects the pace and outcome of [movement activity]” (1983: 736, emphasis in original). McAdam goes on to demonstrate the utility of these concepts by showing empirically that the pace of insurgency in the US civil rights movement waxed and waned in accordance with these two processes. Peaks in protest activity correspond to the introduction and spread of tactical innovations (e.g., bus boycott, sit-in, Freedom Rides, etc.), while valleys reflect the gradual development of effective tactical counters by social control forces.

Besides the pace of insurgency, McAdam also sees the success of the movement as at least partially attributable to the novel tactics. They serve, in his view, to offset the institutional powerlessness of Southern blacks, disrupt public order, and put effective pressure on an otherwise reluctant federal government to intervene in support of the movement. In similar fashion, McCammon et al. (2001) credit novel tactics – including picketing and other public demonstrations that defied gender prescriptions – with helping suffragettes to finally win the franchise. Kurtz (2002) attributes the successful strike by clerical workers at Columbia University in 1991–1992 to a series of innovative and disruptive tactics that simultaneously served to dramatize the plight of the workers and to embarrass the University’s board of directors.

So if new and novel tactics accelerate the pace and positively shape the outcomes of movement activity, why don’t all movements seek to devise and employ such innovations? Besides the obvious fact that innovations are, by their very nature, rare and hard to produce, various strands of movement scholarship have also identified a number of ways in which movements are constrained in their choice of tactics. Three such constraints are worth noting. The first is captured by Charles Tilly’s (1977) concept of the repertoire of contention. In introducing the term, Tilly sought to make a simple, but critically important, point. In seeking ways to press their collective claims, insurgents are largely constrained by the tactical forms and techniques available and known to them. These “forms and techniques” comprise the normative “tool kit” (Swidler 1986) or repertoire specific to a given time and place. In general, we can expect movement actors to rely heavily – if not exclusively – on this repertoire in devising ways to press their claims.

The tactics employed by movement groups also reflect narrower cultural conventions or affinities. As Taylor and Van Dyke (2004: 276) note, “Frequently activists adopt strategies and tactics not simply because they have been shown to be effective, but because they resonate with the beliefs, ideas, and cultural frames of meaning people use to make sense of their situation and to legitimate collective action.” Thus there is an expressive function to the adoption of tactical forms as well as an instrumental one. Movement groups adopt tactics to express their affinity with a broader culture of protest or to affirm their identity as a certain kind of activist (e.g., anarchist, New
Leftist, pacifist, etc.). This amounts to a second constraint on choice of tactic.

Finally, it has been argued that the organizational basis of movement activity also shapes the tactical choices made by activists. Consistent with a long line of theoretical work starting with Weber (1958) and Michels (1962), considerable empirical evidence appears to show that more established groups and formal social movement organizations are more likely to use conventional tactics and strategies (Michels 1962; Piven & Cloward 1977; Rucht 1999; Van Dyke, Soule, & McCarthy 2001). Embedded as they are in the institutional establishment, such groups eschew innovation in favor of accepted practices.

Given these various constraints, perhaps the operative question is not why don’t more groups engage in innovative action, but under what presumably rare circumstances are we likely to see the introduction of novel tactics? We can discern three partial answers to this question in the movement literature.

The first is suggested by McAdam’s work on tactical innovation during the heyday of the civil rights movement. We can expect the pace of tactical innovation to accelerate during those rare periods of sustained, intense contentious interaction that define the very peak of movements/revolutions. Tarrow’s (1989, 1998) concept of the “protest cycle” implies a second answer to the question of when we might expect to see greater or lesser innovation in the tactical repertoire. The implication is that new and novel tactics cluster at both the beginning and end of the cycle. Tactical innovations help to set the cycle in motion, but also occur at the end as the movement splinters and radicals frustrated at the slow pace of social/political change gravitate toward ever more violent forms of contention.

The third and final answer to the question focuses not on the timing of tactical innovation, but the kinds of groups who are more likely to embrace new tactics. One line of research associates disruptive and innovative protest with highly decentralized and participatory forms of movement organization (Staggenborg 1988; Jasper 1997; Polletta 2002). Another finds that “actors who occupy subordinate positions economically and socially and who lack access to institutionalized political and economic power are more likely to engage in disruptive [and innovative] protest” (Piven & Cloward 1977; Scott 1985; Van Dyke, Soule, & McCarthy 2001).

Regardless of when these innovations occur or at whose initiative, it is by such means that the repertoire evolves and once new and novel forms become part of the normative kit bag that constrains subsequent tactical choice.

Tactics

BRIAN DOHERTY

When we refer to the tactics used by social movements we mean forms of action that have been deliberately chosen with the aim of influencing or coercing one or more of opponents, the general public, and fellow movement activists. These features are so central to the nature of social movements that consideration of movement tactics inevitably entails an understanding of other aspects of social movements, including strategy, the nature of protest, and movement identity, all of which affect how tactics are understood. Yet, as many have noted, while accounts of tactics used in particular protests are ubiquitous, conceptual analysis of tactics per se and especially of how movements choose their tactics is relatively rare (Taylor & Van Dyke 2004; Smithey 2009).

There are a number of reasons for this. First, if tactics are deliberate choices made by groups it is often difficult to ascertain who made the choices and how: Activists interviewed after the event may give self-serving and inaccurate accounts of how decisions emerged. Second, movement tactics are relational in that their effects depend on the response of others outside the movement and they cannot always be sure how their opponents, and, where different, the authorities and even their adherents will react. Particular tactics may be determined by an expectation of their likely impacts on the behavior of others, but these expectations may be misplaced and opponents may counter movement tactics successfully.

MAJOR THEMES

Despite these challenges, there are common themes in the analysis of tactics that provide useful resources for the analyst of social movements. The major dimensions of this work fall under the headings of protest event studies; repertoires of contention; and movement identity, habitus, and activist biography.

Protest event studies

Blumer (1969) in an early analysis of movement tactics eschewed any effort to specify them because he argued that they were so variable and dependent on context. Nevertheless the burgeoning number of surveys of protest events have classified the most common forms of protest action into the most frequently observed types. These include marches and rallies, strikes, boycotts, petitions, occupations, sit-ins, blockades, sabotage, and street theatre. Landmark studies have shown how some movements with similar aims in different countries pursue contrasting tactics (Kriesi et al. 1995), and also that movements need to change their tactics over time to maintain an advantage over their opponents. McAdam’s (1983) survey of the US civil rights movement’s protests showed that when new tactics such as sit-ins and Freedom Rides were used they put the supporters of segregation on the defensive and inspired more protest action by the movement as a whole. However, tactical innovation was quickly followed by tactical adaptation which neutralized the temporary advantages gained by the movement.

Most quantitative surveys of protest seek to explain social movement strategy in relation to the political opportunities and resources available to protesters. Tactical choices in this approach can seem to be largely shaped by external factors such as the degree of repression, the availability of allies, and rational calculations of the chances of success. This makes tactics a consequence of strategy. For example, a movement that chooses to emphasize its worthiness is most likely to pursue tactics that are dignified, and unlikely to alienate potential supporters. Movements in democracies that
choose tactics based on these strategies will favor conventional forms of action such as well-marshaled demonstrations organized in conjunction with the police. Relatedly, movements which seek mass support are less likely to pursue disruptive and provocative tactics that might exclude those unwilling or unable to take part, especially if the costs of repression are high, as in authoritarian regimes. Movements with few activists are more reliant on the solidarity and commitment of their members and, if their aims are radical and their sense of injustice is strong, they often choose forms of action that are more militant and confrontational, which may in turn attract more attention from the media. Studies have shown that disruption and confrontation can be effective for movements of the poor and excluded (Gamson 1975; Piven & Cloward 1977). Gamson’s (1975) analysis of 53 protest groups in the US between 1800 and 1945 showed that disruptive and violent tactics could lead to movement success, particularly when combined with a large membership, a bureaucratic organization, and specific and limited aims. Morris (1984) also highlighted the importance of stable bureaucracy in the success of the sit-in as a tactic for the civil rights movement because it allowed for rapid decision making, the mobilization of finance and legal support, and the coordination of strategy.

But the effects of strong bureaucratic structures on tactical success have also been challenged, since it has been argued they can also lead to deradicalization as movement leaders seek to protect the organization’s status at the expense of the movement’s wider goals (Piven & Cloward 1977). There are also small movements with informal organizations in which protesters demonstrate the intensity of their commitment by putting their bodies on the line without seeking to harm their opponents physically. The affinity groups of radical environmentalists protesting new roads, GM crops, or climate change are an example of an apparently effective use of nonviolent disruption, often sustained over many years without a bureaucratic organization. In these cases the vulnerability of protesters is skillfully exploited to maximize the contrast with powerful or violent opponents in media coverage. Della Porta and Diani (2006) usefully divide these kinds of tactical choices into the logic of numbers, in which legitimacy and authority come from evidence of mass support, the logic of bearing witness, in which the tactic depends on an appeal to moral authority and evidence of the commitment of the protesters to their cause, and the logic of material damage in which the aim is to impose costs on your opponent.

**Repertoires of contention**

While the variety of protest tactics has grown, researchers on movements have been struck by how limited and regularly repeated are the sets of tactics used by most movements. Tilly (1995) used the term “repertoire” to emphasize the extent to which forms of protest are like the performance of a piece of music or dance. Protest tactics come from what participants already know how to do, they must be comfortable and familiar with them, and while they may be open to some improvisation the pace of innovation is usually slow, not least because the performance involves other participants, who also learn what to expect. As movement tactics become more familiar to their targets they create less uncertainty and are often institutionalized in the legal system, as in the legislation governing strikes and demonstrations. Tilly developed the concept of repertoires in his magisterial analysis of the gradual shift from parochial claims, violent action, and local networks to national political demands, nonviolent action and national organizations in Britain between the 1750s and 1840s, during which time the major features of modern protest tactics first became available for popular use.

Once particular forms of protest become recognized parts of public life they can be taken up and adapted by other movements with completely different aims: demonstrations, boycotts, and petitions can all be used by a movement but also by its opponents in a countermovement. In May 1968 in Paris, the
mass demonstrations of students and workers were countered by a huge rally of supporters of de Gaulle. Tarrow (1998) calls such forms of protest “modular,” drawing attention to the way in which this transferability demonstrated the normalization of particular tactics. He argues that forms of protest are classifiable as either conventional, disruptive, or violent. While many contentious episodes combine all three, in modern democracies forms of action that were previously seen as disruptive have tended to become increasingly conventional as public authorities and protest groups learn what to expect of each other. Tactics that wrong-foot opponents and disrupt normal politics are often, therefore, the most effective.

The concepts of repertoire and modularity rest on assumptions about collective learning which point towards the role of culture and tradition in linking everyday life and movement action. This suggests that protest tactics are likely to be affected by what political scientists call path dependency, in which the combination of structural constraints from state institutions and the weight of tradition limits the possibilities for tactical innovation. This is in some ways at odds with much of the popular perception of changing forms of protest tactics. For instance, the use of cell phones to coordinate “People Power” demonstrations in the Philippines was noted in 2001; in the Arab Spring in 2011 social media were said to be crucial in bypassing the control of information by states and encouraging participants to take the risk of mobilizing in public. Many of these tactical uses of new communications technology can be connected to wider trends observed in protest and political participation away from collective forms of participation: Movement organizations and their associated activist culture are limited to a small minority, but larger numbers are prepared to take part in occasional action (Dalton 2008). The “Occupy” movement of 2011 is a further example of this. These mass mobilizations may be initiated by experienced activists but they spread fast because social media have reduced barriers to participation and the protests are much less under the control of membership-based mass organizations. Moreover, through the use of Facebook and Twitter the narrative of the events and their meaning is reported by many more voices than was the case in previous mobilizations. Academic understanding is struggling to keep pace with the rapidity of these changes in communication and political participation.

Movement identity, habitus, and activist biography

The analysis of protest events and repertoires of contention has contributed to the understanding of movement tactics by showing the range and variety of those movement tactics that gain most public attention, but this needs to be complemented by analysis of the internal processes within movements and especially how movement identity shapes and in turn shaped by its tactics (Taylor & Van Dyke 2004; Smithey 2009). Protest event surveys generally exclude consideration of tactics that are not reported publicly, such as sabotage, the forms of small contention in authoritarian regimes, analyzed as “weapons of the weak,” and insider agitation within established institutions. Even if some might question whether such covert actions are “protest” it is clear that they are still part of a movement’s tactical repertoire. Second, protest event surveys leave out those elements of tactics that are governed by the creation, maintenance, and development of internal movement organization and its collective identity.

The split between public and political social movement action and less visible and non-political social movement base privileges a conventional and narrow conception of the political as located in governmental institutions, as distinct from the broader view of the political as involving power relations in wider society. Since feminist movements have challenged the narrow view of politics as obscuring the way in which power operates in the private sphere and is reinforced through dominant discourses, it is not surprising that those who study women’s movements have challenged the limits of the contentious politics definition of protest as public claims-making and also
affirmed the importance of the link between movement identity and tactics (Taylor & Van Dyke 2004). One example is the December 1982 “Embrace the Base” protest at the US Air Force base at Greenham Common in the UK. Around 30,000 women surrounded the base, decorating the fence with symbols of life that contrasted symbolically with the purpose of the base as a location for nuclear-armed Cruise missiles. Although the gates were briefly blockaded, the effectiveness of this action was in its powerful symbolism, which combined the feminist assertiveness of a women-only action with a rupture of the acceptance of the normality of a nuclear weapons base. The long-term effects on movement solidarity were significant in that it inspired a network of hundreds of local women’s groups who provided support for the permanent camps of women at the base. It also led those involved to take more militant action, so that for instance they no longer agonized as they had done initially about whether cutting the fence of the base was a form of violence (Roseneil 2000).

Those who focus their attention on the cultural aspects of social movements argue that the links between tactics and movement identity can only be understood if we see activist identity as a process through which those involved construct a sense of “them” and “us,” with consequential emotional dynamics, and with the aim of understanding the world in order to change it. Rupp and Taylor’s work on drag queens (2003) shows how drag performances were a tactic that successfully challenged biological understandings of gender and essentialist categories of sexual identity for those that went to see them. Thus a form of entertainment, with no direct claim on the state, was also a deeply political protest tactic.

Crossley (2002) draws on Pierre Bourdieu’s idea of *habitus* to define how the experience of activists over time helps us to understand the relationship between individual biographies and their shared practice in movements over time. An activist habitus is based on the practices that become part of the movement’s collective identity. Insofar as this reflects what activists know how to do, it seems similar to the idea of repertoires, but habitus establishes a clearer link between individual experience and changes over time. Crossley showed the different tactics favored by experienced and politically cynical activists in the psychiatric survivors movement, who were more likely to challenge those in authority, and those less experienced, who were more inclined to be optimistic about being listened to by those in authority. He also points out that those who were lawyers tended to use legal tactics, academics favored research, and those in the media favored media-focused campaigns. This was not only a rather obvious case of efficient use of resources, but reflected a deeper sense of what kinds of tactics these individuals had faith in and which were consistent with their own life choices. This suggests that the tactical repertoires favored by movements are likely to reflect the experience of their adherents in other parts of their lives and also shows that not all tactics are equally available to all groups.

*Biographical approaches* can provide convincing explanations of cases that otherwise seem to be at odds with the regular mechanisms and processes that have been used to explain tactical choices in social movements. In 1943 in Berlin several hundred women whose Jewish husbands and children had been seized by the Nazis were able to prevent their loved ones from being deported by staging a noisy, visible, and defiant demonstration in Rosenstrasse. The women did not know each other, so they had no organization, no collective identity, no established repertoire to draw on, and no examples of recent successful anti-Nazi protest to copy. A close analysis of the women’s biographies (Stoltzfus 2001) provides an explanation for their actions. For a decade they had resisted pressure from the Gestapo to divorce their husbands, and discrimination and harassment from neighbors, an experience which set them apart from their countrywomen. Thus, while love and loyalty were a powerful motivation, they had also developed a practice of individual resistance that enabled them to take spontaneous action at the decisive moment.
METHODOLOGY AND THEORY: DEVELOPING THE UNDERSTANDING OF TACTICAL CHOICES

The Rosenstrasse protest shows that it is useful to make an analytical distinction between two elements of tactical choice: first, the decision to choose particular forms of action—which involves planning and calculation—and second, the relational moment when the tactic is put into action, and others react. In the Rosenstrasse case, there was no collective planning, this action was as close to spontaneous as a protest can be, but in this it is similar to other examples that remind us of the importance of decisive but unplanned actions taken in the heat of the moment (e.g., Ayuero 2003). In the decisional sphere movements’ collective planning will be affected by the anticipated reaction of others and they can also intend to express elements of their collective identity or frame their message through the choice of a tactic. In the interaction sphere, movements lose what had previously been an imagined full control of their action, because things may not go to plan. This idea is stressed in Foucauldian theory, which argues that protest or “resistance” is never pure opposition and necessarily always contains and reproduces elements of the system that is being challenged.

It is notable how this distinction mirrors one in literature produced by activists on tactics. Manuals such as Alinsky’s Rules for Radicals have been an important reference point for academic work but there is little evidence that activists have made much use of the academic work on tactics. Activist manuals are much more likely to focus on the pragmatic question of “what works,” whereas for academic analysis the most interesting question is “why that tactic rather than another?” There are numerous manuals on how to organize planning for protests and on what to expect and how to act during protest actions. The methods-oriented literature on nonviolent action (NVA) (Sharp 2005) has been acknowledged as influential by many movements, including the “color movements” of Eastern Europe in the 2000s. It is in some ways an indictment of the sociological social movement literature that it has not been used in the same way by activists. NVA texts tend to offer examples of methods that have worked in ways that activists can see as transferable to their own struggles. The call by Tilly and Tarrow (2007) for a focus on discerning regularities in the mechanisms and processes that explain collective action could be seen as providing a means by which more systematic knowledge of tactics might emerge, but since their approach is also acutely sensitive to historical and political context, it always leaves open the question of other possible causal explanations, as good social science must.

The difference between the social science focus on post hoc explanation and the practical methods of NVA can be illustrated in an examination of cases where the same tactics are used in different contexts. In the US Plowshares protest activists poured blood on missiles in an action that was rooted in Christian theology; in Thailand in 2010 supporters of ousted prime minister Shinawatra also poured blood on the steps of the central government building: the reasons given to explain this tactic varied, but none was rooted in Christian theology. For those interested in effectiveness, it is the symbolic power of blood that links the two events, but for a sociological explanation that alone is not enough, before we could say that this tactic is “the same,” we would need to know what the link is between identity and habitus and specific movement repertoire in each case and that is why the study of tactics in movements requires a different approach to that found in the more pragmatic literature on activist tactics.

REFERENCES AND SUGGESTED READINGS

Most scholarly interest on social movements has been focused on movements themselves; the types of tactics they employ, what resources they use, and how they mobilize rank and file to bring about social change. The actual target of movement activism is less well examined. Generally, in modern democratic societies, the assumption is the state is the primary granter of benefits, and therefore the most logical target of protest, although other institutions also function in that capacity (Snow 2004). Moreover, targets vary in their vulnerabilities to movement pressure; some are more susceptible to challenges than others. In what follows I explore the importance of targets in relation to social movements and protest.

Perhaps the most significant theoretical task is identifying precisely who or what is the potential target of protest. Again, the vast majority of early research largely conceived of protest as directed against the state. This made good empirical and theoretical sense for a number of reasons. First, in many case studies of specific movements, the state was the primary granter of benefits. The civil rights movement, which sought equality for African Americans under the law, the peace movement of the late 1960s/early 1970s protested for an end to the Vietnam War, and the antinuclear weapons movement’s goal of nuclear disarmament all were primarily either contesting actions by the state or pressing the state to address specific grievances. Theoretically, the growth of the welfare state in most democratic countries resulted in a single target that encompasses a wide range of services and actions; thus, it was logical that movements would target the state to redress grievances.

Despite these realities, there is a growing recognition that other, nonstate actors can be and are frequently targeted by movements. For example, van Dyke, Soule, and Taylor (2004) found that almost half of the protest events reported in the New York Times target actors other than the state. Unions, for example, have long won benefits at the point of production by targeting businesses through strikes and other actions. Other groups have also targeted businesses; the civil rights movement, for example, employed boycotts to force white-owned businesses in the South to desegregate. Indeed, the issue of discrimination at work, be it based on gender, race, or sexual orientation, is an important potential source of movement activism against corporate actors. More recently, corporations have come under scrutiny for their business practices, and a growing number of groups are pushing for greater corporate responsibility in issues ranging from sweatshops to environmental practices (Soule 2009).

There are at least two reasons why corporations have become an increasingly important locus of social protest. The first is simply the growing power of these actors. They have won an increasing array of legal protections, and their centrality in the growing global economy means they are a touch point for issues ranging from labor, immigration, and free trade debates. This growth in corporate power occurred during the state’s shift towards neoliberalism. A major consequence of this is that the state no longer plays a role in mediating conflicts between actors; thus, in the case of corporations, actors with grievances must directly challenge the firm, rather than using the power of the state as an intermediary.

And while corporations are one logical locus of nonstate protest, other targets are also quite common. The student movement of the 1960s obviously directly challenged the authority of higher educational institutions. As health care becomes increasingly difficult to obtain, movements have begun to challenge experts’ definitions of disease in order to secure treatment for constituents. More recently, there have been...
cases of protest against religious organizations, not surprisingly, given their role in hot button issues such as abortion, gay marriage, and other social issues. A more challenging, but no less important, target of social movements is the general public. Changing people’s attitudes towards particular issues has long been at the forefront of issues surrounding gay rights, environmental protection, and antidrunk driving, for example. This reflects the importance of culture as a locus of contention; reorienting values and beliefs can be particularly difficult for a movement, and groups often rely on the mass media as a vehicle for changing individual attitudes and behaviors (encouraging recycling, for example).

Targets matter because the specific target chosen has a number of implications for movements’ tactical considerations. Recent evidence suggests that while the state has the widest range of claims made against it, the tactical repertoire used by movements is narrower and more institutionalized than those targeting corporate actors or institutions of higher education. This is due in part to the fact that in the US there are numerous institutional channels and actors that can be used by movement actors to effect change by the state. Corporations, in contrast, have a much more closed structure and therefore invite a more contentious set of tactics. Additionally, the state is the sole wielder of legitimate force, and the threat of repression may also lead to more mainstream tactics by state-centric movements.

It is also important to consider how targets vary in their vulnerability to protest. At the state level, a politician who is dependent upon the voters for continued service may be a more appealing target than a career bureaucrat whose power rests on technical, rather than political, authority. Firms, too, vary in the degree to which they can be influenced by third parties. It is much easier to employ a boycott against a highly visible company producing consumer goods than a firm whose client base is other corporate actors. Recent scholarship on campaigns by unions to influence corporations has argued that no two “corporate campaigns” look alike because no two firms have the same set of vulnerabilities.

Given the differences among potential targets of protest, and the range of actors movements target today, it is important to seriously consider how this shapes the ability of social movements to effect social change. The waning role of the state in mediating conflict, the growth of global trade, and the changing religious landscape in the world all will play an important role in how social movement scholars think about targets.

Technology and social movements

ALICE MATTONI

The history of social movements developed in parallel to technological changes in societies. From the invention of the press to the diffusion of television, communication technologies gave social movements new opportunities of expression and organization. Frequently, therefore, social movements met, appropriated and reshaped technological devices and supports that were at the same time opportunities and challenges for grassroots political participation. Technology intertwines with social movements at different levels. At the instrumental level, technology has an impact on mobilizing structures, organizational patterns, and protest activities of social movements. At the symbolic level, social movements have an impact on discourses about technologies and their role in societies, often including new technological visions in alternative systems of meanings. Finally, at the material level, social movements have an impact on technological supports and devices, in that activist technical knowledge and competencies lead to alternative and creative use of technology.

At the instrumental level of mobilization, technological devices and support are key resources for social movements. Technology may change the environment in which social movements and protest activities take place. For instance, technological advancements in the transport sector contributed to render people’s travelling across the globe safer, quicker, and cheaper. Activists benefited from this technological change that had a role in fostering face-to-face communication amongst activists belonging to different political, cultural, social, and economic contexts. In turn, this technological advancement facilitated the creation of international social ties and the construction of transnational alliances in cycles of protests, like the Global 1968 movement and the more recent Global Justice Movement.

At the symbolic level of mobilization, social movements have an impact on technologies in that they elaborate knowledge and develop discourses about technological topics, transforming them in contentious issues. For instance, environmental movements elaborate alternative and contentious discourses about technologies and the way in which they should be employed in societies (Pickerill 2003). Past and recent waves of mobilizations emerged against the construction of technologically advanced infrastructures having a supposed negative impact on the environment. The diffusion of digital camcorders in urban areas and the trading of private, digitalized data led to the emergence of digital surveillance in both the online and offline environment as a new contentious issue.

At the material level of mobilization, social movements have an impact on the actual use of technological devices and supports. For instance, the free and open software movement stresses the emancipatory potential of information and communication technologies that should be freely available to everyone and developed according to an open-source attitude. Moreover, the free and open software movement also engages in media activism practices that enable and support the adoption of such technologies in societies at large. Activists in social movements, moreover, sometimes begin to use existing technological devices and supports in an innovative manner engaging in a prefigurative employment of technology that will gain broader diffusion in the future. The collaborative informational website Indy-media, for instance, is based on a technological platform that allows users to produce alternative pieces of news at the local, national, and transnational level. Exploiting the potentialities of information and communication...
technologies, therefore, activist groups who created Indymedia proposed one of the first examples of Web 2.0 applications.

One of the most recent technological innovations has been the creation and diffusion of communication and information technologies. As it happened with the introduction of other technologies in the past, emerging computer networks first and then the establishment of the Internet and the Web at the end of the 1990s contributed to change different aspects of social movement and protest activities, presenting an entirely new set of challenges and opportunities that activists continue to explore today.

The rise and wide use of information and communication technologies by activists lead to a vivid debate with regard to social movements and political participation. Some scholars argue that this technological innovation fosters new forms of political participation, such as the creation of spontaneous communities of activists who do not share the same physical space, but act in the same technological environment (Rheingold 2002). Other scholars argue that the online realm remains strictly linked to the offline, material geographical environment in which internet users are embedded (Rogers forthcoming). Information and communication technologies need infrastructures rooted in the physical space to work and situated technological devices allowing the connection with the online realm. The use of each technological device, from mobile phones to Internet relay chats, is situated and linked to a pre-technological environment. It is exactly this situated use that contributes (or not) to the creation of opportunities (and constraints) for social movement and protest activities. In addition, other scholars noted that activists tend to use old and new technologies in a cumulative manner, because emerging technologies are often interpreted through the lenses of older technologies (Dunbar-Hester 2009) creating multimodal communication channels resting on mixed technological structures (Gillan, Pickerill, & Webster 2008). Although there are valuable exceptions, further investigation is still needed in order to understand the actual (re)appropriation and (re)combination of technologies in and by social movements at the local, national, and transnational level.

REFERENCES AND SUGGESTED READINGS

Social movements sometimes emerge in response to threats. Over recent years, the literature on social movements has emphasized the importance of political opportunities in fostering mobilization. When actors see that the political environment is becoming more receptive to their claims, for example, if new allies appear in the institutional political environment, then they will be more likely to mobilize to take advantage of the opportunity. Research shows that political opportunities have influenced a range of movements, including civil rights (McAdam 1999), women’s (Costain 1992), and environmental movements (Almeida & Stearns 1998), to name just a few. However, a growing literature demonstrates that threats can be important triggers for mobilization as well.

Threats involve social conditions which may result in the loss of a group’s power or resources. Tilly (1978: 134–135) long ago theorized that both political opportunities and threats inspire mobilization, and, in fact, suggested that threats may be a more powerful motivator to action, saying “a given amount of threat tends to generate more collective action than the ’same’ amount of opportunity.” This argument is based on the work of social psychologists which finds that people tend to inflate the value of things they already possess, and therefore are more likely to take action when someone is trying to take them away. Similarly, Snow and his colleagues (1998) suggest that people are inspired to mobilize when their taken for granted way of life is disrupted, when the quotidian is disturbed. Recent research finds that real or perceived threats have been important factors in the emergence of a variety of movements, including the Ku Klux Klan (Cunningham & Phillips 2007; McVeigh 2009), militia groups (Van Dyke & Soule 2002), environmental movements (Jasper 1997; Smith, Walsh, & Warland 1997), progressive movements in Latin America (Almeida 2003), and the AIDS movement in the US (Tester 2004).

Researchers find that threats can involve a loss of political or economic power, or threats to health and safety. For example, Van Dyke and Soule (2002) find that the militia movement emerged in the US in the 1990s in response to economic changes, including the loss of manufacturing jobs and farms, as well as political threats from women and minorities.

While there is growing research on the role of threats in mobilization, a number of important tasks remain for future research. I argue that two questions in particular are in need of further scholarship: the conditions under which threat mobilizes, and the relationship between threat and grievances.

Almost by definition, mobilizations motivated by increased threat are reactive. Reactive movements involve efforts to defend existing rights or privileges when those are being challenged, in contrast to proactive movements which involve efforts to gain additional rights (Tilly 1978). Thus, threats to resources or power trigger reactive mobilization. However, it’s unclear whether threat is a sufficient condition of mobilization, or whether threats only mobilize in conjunction with other social conditions. Almeida (2003) finds that, in El Salvador, a slight opening in political opportunities afforded progressive groups the opportunity to form new organizations, which then were ready to take action when the semi-authoritarian government began repressing political action. Without having had the opportunity to organize, the groups never would have been prepared to take action in response to the repressive threat. Similarly, Van Dyke and Soule (2002) suggest that militia group members mobilized in the US in response to political and economic threats, but
that they also enjoyed resources and the opportunity to mobilize. Thus, it remains unclear whether threats are sufficient conditions for mobilization, or whether they typically act in concert with other factors.

While threats may inspire mobilization, they don’t always do so (Goldstone & Tilly 2001). Maher and Einwohner (Einwohner & Maher n.d.; Maher 2010), show how in an extremely repressive context, Nazi death camps and Jewish ghettos, whether or not active resistance occurred depended on a variety of factors. Although residents in all locations faced threats, resistance was more likely to emerge in those contexts where the threat was seen as lethal, imminent, credible, applicable to themselves, and impervious to any action taken in resistance (i.e., when death was seen as inevitable). Einwohner and Maher theorize that, in highly repressive contexts, collective action depends on individual interpretations of the threat’s severity, temporality, credibility, applicability, and malleability. Further work needs to explore when threats in less repressive settings lead to mobilization.

Threats almost by definition involve grievances. While grievances were one of the dominant explanations for movement emergence through the 1960s, they were largely discredited and abandoned in the 1970s and 1980s, as scholarship increasingly demonstrated that resources, organization, and political opportunities better explained the timing of mobilization for groups such as African Americans. As scholars recognize, earlier grievance models of mobilization are limited by their emphasis on irrational motivations to action. However, grievances can create real and rational reasons for collective action. In addition, while scholars have argued that grievances are ubiquitous and do not explain mobilization, research on reactive movements shows that changes in structural conditions are often associated with mobilization. Cunningham and Phillips (2007), for example, show that the presence of a long-standing NAACP chapter does not explain Klan mobilization in North Carolina in the 1960s; however, the formation of a new chapter is associated with Klan organizing. Thus, long-standing grievances may not be what Snow and Soule (2010) call mobilizing grievances. However, social conditions change, and sometimes lead to mobilization. Future scholarship needs to further elaborate the relationship between threats and grievances.

Violence and social movements
CHARES DEMETRIOU

The study of the intersection of social movements and violence is diverse. This is so, principally, because the forms of violence under study are all encompassing, ranging from police arrest of peaceful protesters, to protest by throwing food at politicians, to protest by lethal, indiscriminate violence on civilians. Nevertheless, in the social movement literature, the mainstream approach to the study of these phenomena takes the position – sometimes by default – that neither the various forms of violence nor the various types of the groups engaging in violence need to correspond to particular theories, but rather both action and groups should be studied through the more general conceptual frameworks and theoretical presuppositions characterizing the literature. This position is partly a consequence of the fact that the study of these phenomena developed within the broader study of social movements. Thus, for example, research on the American civil rights movement of the 1960s covered not only the peaceful tactics of this movement but also state violence in response to these tactics, as well as the violence wielded by the radical branches of the movement, most notably the Black Panthers. The conceptualizations and theories pertaining to the study of the phenomena connecting social movements to violence, therefore, have not claimed autonomy within the general literature on social movements, but rather have relied heavily and approvingly on this literature.

FOCI OF RESEARCH

While the study of social movement-related violence has not promoted particular theories, the phenomena studied do feature particular characteristics requiring conceptualization and explanation. Chief among these characteristics is the turn to violence, that is, the ways in which violence enters a social movement’s realm. More particularly, when social movements employ violent tactics intentionally and persistently, a series of questions about the determinants of such an outcome are raised. Some of the most basic questions relate to the extent to which these determinants can be attributed to factors at a macro-level (deprivation, suppression, ideology formation, and spread, etc.), to organizational factors at a meso-level (movement splintering, resource mobilization, change in opportunity structures, etc.), or to more immediate factors at a micro-level (strategic choice, inadvertent escalation of claims, reaction to events, etc.).

In navigating through such determinants, substantive accounts of the emergence of violence have followed the broad evolution of social movement research, from reliance on structural models to reliance on models of social interaction. Though the latter models often attempt to comprehensively assess determinants at all levels, they privilege the meso- and micro-levels, in which they particularly identify dynamism and contingency. Certain key dynamics are therefore located on these levels, such as dynamics of radicalization and of social movement splintering. For example, in the context of the 1960s and 1970s Northern Ireland, Robert White (1998), Lorenzo Bosi (2006), and others have found that the radicalization of tactics in the street by the civil rights movement, the Unionist countermovement, and the security forces amounted to an interactive process of radicalization which eventually created an opportunity for the Irish Republican Army (IRA) to mobilize and jump-start its own campaign. Along the way, this radicalization process precipitated the splintering of not only the civil rights movement but
also of the IRA, creating the particularly violent Provisional IRA.

According to models of social interaction, however, radicalization – whether of ideological narratives, of political positions, or of tactics of contention – is expected to develop not only through interaction between the movement and its opponents, but also through interaction within the movement itself. Thus, for example, intramovement interaction helps explain the Red Brigades emergence out of the Leftist Movement in 1970s Italy, the Weathermen’s emergence out of the student movement in 1970s US, the Tanzim’s emergence out of the Fatah movement in the 1990s occupied territories in Palestine, and so on. Social movement splintering is part of intramovement dynamics as well, and is often the last step before the adoption of violence. But splintering need not always happen, as is the case when the mainstream organization of a movement radicalizes its tactics to the point of itself adopting violence. Examples of this particular phenomenon include the violence perpetuated by the Haganah, the armed section of the core Zionist movement in the British Mandate of Palestine, and EOKA, the armed section of the Greek Nationalist movement in 1950s Cyprus – examples which suggest that the phenomenon may relate most particularly to ethnonationalist movements.

Another general characteristic of the phenomena connecting social movements and violence regards changes in the stream of contention as violence enters the scene. On the most abstract level, the question raised is how, if at all, the process of contention changes with the introduction of violence? A series of more particular questions follow from this. With violence entering the scene, the claims and counterclaims originally initiated by a movement may be overshadowed by violence-related discourse and decision making. Hence a particular question asks whether there is a shift in the object of contention, and, if yes, of what kind and of what duration. The context of Northern Ireland provides an illustration of this issue as well, since the radicalization of the civil rights movement produced a shift in claims, from policy reforms claims to sustained antipolity claims, while from the side of the state, quite typically, counterclaims of law and order emerged to become prevalent and durable. Furthermore, the progression of violence may follow patterns of escalation and de-escalation, such that, for example, violence is met with more violence before yielding to negotiation, defeat, or other nonviolent developments. What are, then, the cycles of violence? And how do the forces sustaining violence compare with those precipitating the resort to violence in the first place?

An additional general question is raised in the same vein: Given that all social movements orient themselves towards an audience, how does the contention–public relation change once the repertoires of contention include violence? Here, too, an array of subquestions follows. How do a movement’s relations with supporters, opponents, or third parties open up or close down the option to violence? How do these relations change with the onset of violence? What are the moral answers offered in the discourse that emerges in the context of violence, and how do these answers compete with each other? How does the legitimacy of the movement and of the state change once violence becomes part of the contention? Regarding the last question, for example, research on the aforementioned EOKA campaign in Cyprus, waged against the British colonial authorities, found that the legitimization of EOKA vis-à-vis the Greek Cypriots – as well as the increased delegitimization of the colonial state – pivoted on the ongoing certification of the armed group by the traditional leaders of the nationalist movement and by a broader collusion of forces valorizing the EOKA militants. This context bestowed on EOKA enough legitimacy to pursue a wide range of violent tactics (Demetriou 2007).

OVERLAPPING RESEARCH TRADITIONS

While a particular body of theory under the rubric “violence and social movements” has
not developed, there has developed in recent years a contradistinction at the conceptual level between this broad form of inquiry and the broad form of inquiry under the rubric “terrorism studies.” Developed mostly in subfields of political science, mainstream terrorism studies are typically extensions of security studies and build on previous research on internal war (civil war, insurgency, urban guerillas, etc.). Though they overlap empirically with studies in social movements and violence, mainstream terrorism studies tend to avoid the term social movement and to eschew systematic usage of the social movement literature.

In terrorism studies, there is a burgeoning polyphony of what terrorism is – psychological effect on a public; acts intended to generate such an effect; coercive diplomacy using violence; categorical violence; violence against democracies; socially and politically unacceptable violence; violence within asymmetric contestation; and so on (Thackrah 2004). To many scholars of social movements, including most notably Charles Tilly and those subscribing to his school of thought, terrorism studies are problematic precisely because they treat as uniform a varied group of phenomena. Thus, the critics hold, instead of acknowledging the diversity of their subject matter, terrorism studies presume its cohesion, failing along the way to identify terrorism as a distinct set of phenomena featuring coherent cause–effect relations. Furthermore, these critics find fault in many substantive accounts within mainstream terrorism studies, most particularly with regard to a tendency to essentialize the groups that are said to employ terrorism. Even when terrorism is defined as a tactic or a strategy, the argument goes, there is a tendency to slide into synecdoche of sorts – that is, to build the description of the organizations that utilize terrorist tactics around these tactics first and foremost, thereby ignoring or downplaying their other tactics, strategies, or organizational scope. This is particularly problematic, the critics maintain, because in the overwhelming number of cases of so-called terrorism, terrorist tactics are not the group’s main – or at least, not consistently the main – means of contestation.

More fundamentally, social movement scholars fault terrorism studies on account of (un)critical thinking. These scholars recognize quite readily that the term terrorism is value laden with political meaning, particularly pejorative meaning which partisans in a contention, most typically the state, attach to the behavior of their opponents. To many social movement scholars, therefore, adopting such a heavily political term as an analytical category is inappropriate. To be sure, a nascent group of terrorism studies scholars has advocated what it calls “critical terrorism studies” exactly as a way to check on such lack of reflexivity (Jackson, Smyth, & Gunning 2009). Having maintained the term “terrorism,” however, this group of scholars may in turn be criticized for extending the life of a dubious term.

In short, scholars of social movements and violence reject the conceptual distinction between terrorism and political violence, whether a genus–species distinction or otherwise. Instead, they take the position – sometimes explicitly, sometime implicitly, and always with exceptions – that the term “terrorism” should be abandoned in favor of the more abstract and politically neutral term “political violence” (cf. Goodwin 2009).

UNRESOLVED ISSUES

Given the wide scope that characterizes the study of violence and social movements, the issues which future study can tackle are many and varied. To single out but one issue here, there is the question of comparisons between violent and potentially, but not yet, violent movements. This area of research has been understudied due to the predilection of comparativists to select cases on either violent or nonviolent social movements, but not on both. Yet even the limited comparison of exclusively violent social movements provides hints about the merits of the more comprehensive form of comparison, because in it – and, indeed,
in some case studies too – one may find cross-temporal comparisons of violence and nonviolence. For example, studies of left-wing protest in West Germany in the 1980s analyze both escalation and de-escalation of violence, the latter arriving as both the movement and the state developed tactics of violence avoidance, hence an implicit comparison of violence with potential-but-not-yet violence (della Porta 2008). Such is also the case with Hafez’s (2003) comparison of Islamic movements. While his research design sets up a comparison of exclusively violent social movements, his analysis allows us to see the movements’ trajectories before and after the onset of violence. Thus we see that in Algeria and Egypt protracted and expansive episodes of Islamic political violence took place in the 1990s but that the movements’ ideological and organizational formation was in place long before that. The violent and nonviolent phases of the movement trajectories are therefore explained, according to Hafez, by increases in institutional exclusion and suppression of the movements by the respective predatory governments, a change happening in the early 1990s.

If implicit comparisons of violence and nonviolence in processes of contention are useful, therefore, such comparisons carried systematically by design promise to be particularly profitable. However, there is a hurdle in advancing such a comparative research direction: sophistication regarding patterns of radicalization is required, for what needs to be compared are precisely patterns which lead to violence with patterns which are potentially conducive to violence but do not generate it. Generalizations and widely accepted conceptualizations about such patterns are yet to be established.

Violence against oneself
OLIVIER GROJEAN

Since the beginning of the twentieth century, self-injury or self-harm that is not related to cultural or religious norms has been distinguished from suicidal practices and associated with various pathologies. Thus, following Durkheim’s work, suicide became a social fact that sociology could not ignore, but deliberate self-inflicted violence without suicidal intent (e.g., cuttings and burns, body modifications) remained until recently mainly a concern for psychiatry. This probably explains the rarity of sociological research on self-inflicted violence with a political dimension, such as hunger strikes, self-mutilation, or immolation, while there have been dozens of publications on suicide bombings, especially since 2001.

From a social movements’ perspective, “violence against oneself” can be defined as deliberate action that consists in damaging or even destroying one’s own body to protest or support a cause. This rough definition is based on three premises. First, it considers that these actions, often understood as nonviolent (Gandhi), can actually be analyzed within the frame of violent practices. Second, it does not strictly distinguish modes of action that inevitably lead to the death of activists and those that imply only “controlled” violence; the survival rate after immolation seems to be very significant, while hunger strikes can lead to the death of dozens of activists. Finally, it does not exclude suicide attacks, which really encompass a dimension close to the phenomenon of self-destruction (Gambetta 2005). In this respect, violence against oneself can be part of an “action repertoire” (Tilly 1978).

But contrary to modes of action generally studied, violence against oneself is exercised on an individual scale, and aims sometimes to defend strictly personal causes. This is the case of a civil servant on hunger strike against an administrative decision, of a self-mutilating prisoner demanding to be cleared of a charge, or of a dismissed worker hanging himself in his factory. Notwithstanding, violence against oneself can support an individual cause with a collective purpose, a collective cause, and can even be collectively organized (this is less often the case for self-mutilation). Thus, oral explanations, written statements, or martyrs’ testimonies, constitute a way of “building collectiveness” and of publicly demonstrating the political aspect of the endured suffering.

Another specificity of violence against oneself is its frequent use by resourceless actors. It is the case of prisoners (Bourgoin 2001), of undocumented migrants (Siméant 1998), or of soldiers who try to be declared unfit for fighting. But, sometimes, resourceful actors engage in a hunger strike; individuals with various competences immolate themselves to protest against a military intervention; or radical activists with a broad action repertoire cease to eat, set themselves alight, or blow themselves up, trying to reverse the course of history (Grojean 2006). Violence against oneself then appears to be a “strategic move” (Schelling 1960: 160), used when resources are inappropriate to change an intolerable situation.

This perspective first questions the cultural component of action repertoires.
Self-mutilation was already a way to avoid military service under the Roman Empire, but some forms of violence against oneself derive from pre-existing social practices. Techniques of fasting in common use in Ireland or India were used as a means of protest by the British suffragettes and then became widespread all over the world. Buddhist rituals of immolation became charged with political meaning after the famous action of Thich Quang Duc in 1963 in Vietnam, and then became more frequent. Recounting the genealogy of these techniques, from their politicization to their appropriation in very different contexts, can be helpful in order to analyze processes of learning, reinterpretation, and adaptation that go with “tactical innovations” (McAdam 1983).

Second, violence against oneself invites us to think of the links between demands and modes of contention. Indeed, it mostly emerges when claims are related to the fundamentals of the social, political, ethnic, or religious identity of the engaged actors. The demand or contestation of a status, the will to be treated with dignity, are not only expressed in a symbolic way, but embodied in this self-inflicted torture. Stigma reversal (Goffman 1986) fits into the scheme of negotiation when the strategy spreads over time: actors are calling out to public opinion and trying to reveal the opponent’s guilt. But when demands are (suddenly) less likely to receive a positive answer, a non-negotiation strategy can prevail and take the form of a unique move, meant to show determination.

Finally, this perspective makes more complex the notions of cost and risk. The soldier who mutilates himself to escape a quasi-certain death seems to act according to a cost-benefit analysis, yet actors can be engaged in more complex logics, that imply self-esteem and relation with their group, values and rewards systems, and relationships with the opponent. The point is no longer to minimize cost, but to build it in as a legitimating element of the struggle (Biggs 2003); the aim is not to alleviate risks, but to control them (self-mutilation), to shift them onto the opponent (hunger strikes and some immolations) or to suppress them (suicide attacks, cf. Bozarslan 2004).

Voluntary associations and social movements

EDWARD T. WALKER

Voluntary associations are “organized, named collectivities in which the majority of participants do not derive their livelihood from their activities in the group” (Knoke & Wood 1981: 8; see also Berry 1977; Walker 1991). The concept of a “voluntary association” has deep roots in the history and thought of American political development. Indeed, as de Tocqueville wrote in Democracy in America (1838), his celebrated account of his 1831 visit to the US, “no country in the world has made better use of association than the United States and nowhere has that powerful instrument been applied to a wider range of purposes” (de Tocqueville 2004: 215). Indeed, long traditions in US political thought have held that associations are schools of self-reliant citizenship and democratic practice through which interests and preferences are newly formed rather than predetermined. Associations offer a space outside the bureaucratic and electoral demands of the state, while also remaining relatively insulated from the pecuniary interests and competitive pressures of the market. Scholars of voluntary associations have highlighted the means by which nonpolitical forms of civic organization, such as neighborhood groups, fraternal organizations, and, in a well-known instance, choral groups, provide not only social integration and the participatory norms, social networks, and feelings of trust that accompany it (Putnam 2000), but they also indirectly socialize participants into active and engaged citizenship.

Although also firmly established in the American tradition going back to the Boston Tea Party and American Revolution, the concept of a “social movement” has focused scholars’ attention on a largely different set of concerns. The most direct difference is that a social movement is broader than any given association, whether political or nonpolitical: above all else, a social movement is an interaction among multiple parties. More specifically, social movements involve “a sustained interaction between a specific set of authorities and various spokespersons for a given challenge to those authorities” (Tilly 1984: 305). As such, they represent an episode of dynamic, public interaction between established authorities and activists seeking change in an institutional context. Organizations active in voicing such claims against authorities are social movement organizations (SMOs). These share many characteristics with voluntary associations, but are often distinguished by their commitment to using tactics outside of established channels of influence within the institutions they seek change (for a contrasting perspective, see Burstein 1999), although voluntary associations often become active in movements and provide a foundation for transgressive action, and mature SMOs often operate in a very similar fashion to established voluntary organizations. I return to these points shortly.

A growing body of scholarship has sought to integrate research on social movements with insights from studies of voluntary associations. This research has highlighted: (1) whether SMOs – especially large, national organizations – promote the social capital of participants to the extent that traditional voluntary associations do; (2) the similarities between SMOs and other kinds of voluntary associations in their concerns over resources, staffing, and legitimacy pressures; (3) the means by which voluntary associations often provide a crucial foundation for movement mobilization.

First, do SMOs promote the social capital of those they mobilize? Many analysts of public participation overlook social movements as sources of social capital, either because...
they assume that movements promote incivility and public mistrust, or because the episodic nature of participation in social movements may not build the long-standing ties that benefit communities and facilitate democratic governance (for a critique of this position, see Foley and Edwards 1996). In addition, certain social movements are exclusive in nature, thus providing participants with the inwardly focused form of social capital (“bonding”) rather than an inclusive and open (“bridging”) form. Analysts often worry that highly politicized organizations, beyond the concern about their exclusivity, promote civic mistrust and polarization.

This question, of course, is rooted in the context of declining civic participation in the 1970s and 1980s, which took place at the same time as a vast expansion of national SMOs focused on federal policy domains (Walker 1991; Berry 1977; Walker 2009). How is it possible that our society underwent an expansion of advocacy organizations simultaneous with decreasing levels of public engagement and civic trust? Or, more directly, how could an expansion of advocacy be compatible with a contraction of civic activism? The most widely accepted solution to this problem was found in arguments by Putnam (2000) and Skocpol (2003), both of whom, with some variation in evidence and tone, pointed to the fact that many of these new SMOs lacked structures for facilitating deep member engagement. Many of these groups have no membership in the strict sense, in that constituents’ engagement with the organization is limited to participation via the web or direct mail, through which such groups would request that participants write checks or advocacy letters. Although the evidence is clear that there was a numeric growth in these “associations without members,” their proportional representation in advocacy fields has been remarkably stable since the 1960s (Walker, McCarthy, & Baumgartner 2011). Thus, while it may be the case that national SMOs today do not promote the social capital of their members in the same way as comparable organizations did two generations ago, this change does not appear to be due to the growth of so-called checkbook organizations.

In addition, despite the concern that SMOs—especially national organizations—are less directly participatory and that they do more to agitate conflicts rather than establish societal cooperation and consensus, others have argued that such organizations build particular kinds of social capital that traditional voluntary associations neglect. For instance, as Minkoff (1997: 615–16) argues, such SMOs bring considerable benefit to socially marginal groups whose interests might have remained ignored, they provide a channel outside traditional routes of public claims-making, they promote political participation and the generation of identities, and they offer a model to others whose voices would otherwise be excluded from public debate.

Second, a well-established yet still expanding body of research investigates how SMOs and other kinds of voluntary associations, as organizations, face similar sorts of processes in their operations. Although their goals, identities, practices, and ideals may be worlds apart, organizations from labor unions to fan clubs to radical environmentalist organizations face considerable organizational pressures to maintain legitimacy, cultivate external resources, recruit and train staff, and be responsive to external publics. Organizations in the peace movement, for instance, were found to have faced strong age-based liabilities of organizational collapse, similar to local community groups in low-income areas (Walker & McCarthy 2010). Importantly, much of this research has successfully imported frameworks from organizational theory into studies of advocacy, including organizational ecology (with its focuses on resource partitioning, niches, and density dependence), neo-institutionalism, and resource dependency theory. Whether called an SMO, nonprofit, interest group, or voluntary association, such groups in civil society nonetheless remain formal and complex organizations and can productively be analyzed as such (Andrews & Edwards 2004). And, while such ideas are recognized in resource mobilization approaches
to social movements, some have gone further in suggesting that organization-theoretic approaches particular to the corporate sector should be applied to organizations supplying advocacy “products” (Prakash & Gugerty 2010).

Third, although scholars of civic engagement have long recognized the role that voluntary associations play in political socialization, for their part they have paid less attention to how voluntary associations may either transform into SMOs or may simply provide infrastructures for movement mobilization. It is clear, however, that in political mobilization by community groups and civil rights activists, movement entrepreneurs rely upon the existing structures of civil society such as religious congregations, labor unions, local charitable groups, nonprofit service providers, and other associations in order to facilitate institutional change. Rather than build structures out of whole cloth, social movement actors often do their best to co-opt ready-made social network ties on behalf of movement purposes, just as they engage in a form of cultural bricolage in constructing new organizational forms.

There continues to be room for expansion in these lines of theoretical and empirical inquiry, as scholars increasingly acknowledge that social movements and voluntary associations are overlapping rather than merely independent, parallel areas of investigation. Scholars, then, should recognize that both of these types of action in civil society generate forms of social capital, share similar organizational processes, and yet are uniquely implicated in mobilizing civic and political activism.

War and social movements
PAUL D. ALMEIDA

Social movements operate under a variety of political environments. One of the fundamental tasks for movement scholars in the twenty-first century centers on classifying a delimited number of political climates and corresponding forms of mobilization likely to emerge. This entry analyzes the political context of war and the multiple ways students of collective action approach social movement activities in relation to hostilities between nations and internal civil wars. Interstate and civil wars generate a wide variety of social movements related to different dimensions of violent conflict, while civil wars may originate at times from the repression and radicalization of more conventional forms of collective action.

A common means to examine social movements and wars between at least two nations involves analyzing anti-war movements. Indeed, advancement in theory construction from the late 1970s through the early 2000s has benefited from using antiwar movements as empirical case studies (McAdam & Su 2002). Early research on youth and social movements and applications of resource mobilization theory examined the anti-Vietnam War movement in the US and Europe. These studies found that the motivational mechanism of the threat of being drafted pushed many young people and students in the US into active mobilization against the war. Indeed, Flacks (1988: 164) asserts that by 1965 the student antiwar movement in the US was organizing the largest student demonstrations in 30 years in reaction to conscription and the escalation of hostilities in Southeast Asia. Antidraft movements in the US go back at least to the New York City Drafts Riots in 1863 against conscription into the Union Army during the American Civil War (Meyer 2007). More recent work on the peace movement has examined popular mobilization against the wars between the United States and Iraq (Meyer & Corrigall-Brown 2005; Coy, Woehrle, & Maney 2008) where mobilization is based less on the threat of the draft (since conscription is voluntary) and more on moral and humanistic concerns. Hence, peace and antiwar social movements may derive from direct grievances (fear of mandatory conscription) or from principled moral sentiments against war and its accompanying violence.

The emerging peace movement literature in the 2000s has added to our knowledge on rainbow coalitions and the transnational mechanisms of coordinating international actions. In short, these studies investigate how peace movements overcome the fundamental collective action difficulties of cooperation between disparate social groups (Van Dyke & McCammon 2010) and generate wide and diverse coalitions across multiple nations. For instance, the February 15, 2003 antiwar demonstrations against the imminent invasion of Iraq occurred in nearly 800 cities in dozens of countries on every continent with millions of participants, making it the largest coordinated day of protest in world history (Walgrave & Rucht 2010). Transnational peace activist ties on the Internet likely facilitated this unprecedented outpouring of global opposition. An interesting area of future inquiry would be to explain the cross-national variation in mobilization against the 2003 invasion of Iraq, which could examine a range of important theoretical propositions such as national level Internet connectivity, religious affiliations, past transnational mobilization, a country’s level of participation in the invasion, and so on. Transnational social movements have also appeared over conflicts in Northern Ireland (Maney 2000), Central America (Perla 2008), and many other world regions whereby diaspora immigrant communities and political exiles play fundamental roles in establishing peace and/or solidarity organizations to influence the outcomes of
wars in their distant home countries. Con-
science adherents and constituents (McCarthy
& Zald 1977) that do not benefit directly from
an end to foreign wars may also play major
roles in solidarity and peace organizations
attempting to end violent conflicts and external
interventions by more powerful nations. These
groups and individuals may be motivated to
participate on religious, ideological, and moral
grounds (Smith 1996; Erickson-Nepstad 2004).

Social movements in relation to civil wars
can be broken into two dimensions: (1)
social movements and cycles of protest that
escalate into insurrectionary and revolutionary
forces that may result in prolonged civil
wars with the established authorities; and
(2) social movements pacifically mobilizing
within a country to end civil wars. Cycles
of protest have largely been investigated in
democratic contexts (Tarrow 1989; McAdam
1995). However, when waves of protest
occur – heightened periods of mobilization
by multiple social groups across a national
territory (Tarrow 1989; Koopmans 2004;
Almeida 2008) – in a nondemocratic state,
the wave may become increasingly radicalized
by the onset of state repression leading
insurgents to take up arms and slide into civil
war, including ethnonationalist movements
(Johnston 2008). For example, protest waves
in Guatemala and El Salvador in the late
1970s resulted in both nations falling into
civil war when heavy state repression pushed
popular movements into more insurgent and
violent forms of collective action (Brockett
2005). The actions of the insurgent army in
relation to the civilian population may be
determined by the resources of rebels on
the eve of civil war. For example, Weinstein
(2007) found in a comparison of guerrilla
armies in Mozambique, Uganda, and Peru that
insurgents with natural resource endowments
and wealth (e.g., diamonds, coca, etc.) or
foreign support abused civilian populations
via looting and forced recruitment while
resource poor antistate insurgents were more
likely to draw civilian support via solidarity
incentives and nonmaterial motivations.

Antistate insurgents may also demonstrate
a decline in their armed activities with a
return to democratization either brought on
by the insurgents themselves or other external
forces. Goodwin (2001), in an examination
of dozens of third world insurgencies during
the cold war, predicts fewer successful armed
revolutionary insurgencies in the twenty-first
century with the growing infrastructural power
of the state and the increasing number of
at least nominal democracies in developing
countries.

Often social movements emerge within civil
wars striving to halt political violence and
achieve a long-term peace. In the 1990s and
early 2000s, a variety of women’s organizations
(including Protestant Christian and Muslim
market women) coalesced into a powerful
oppositional social movement in Liberia (the
Liberian Women’s Initiative) demanding an
end to the country’s horrendous civil war that
involved child soldiers, mutilation, and rape
as common strategies by multiple warring
factions. The women organized dozens of
street demonstrations and held sit-ins outside
the prolonged peace negotiations, insisting that
the male-dominated armies terminate the civil
war that had cost 250,000 lives and nearly one
million displaced (African Women and Peace
Support Group 2004). The Liberian women’s
sit-ins outside peace negotiations in Accra,
Ghana, and their boycott of sexual relations
with male partners acted as especially assertive
tactics in pushing a final peace agreement to
end the second civil war in 2003. In El Salvador,
a wide civil society alliance of 70 civic organi-
zations originally coordinated by the Catholic
Church – the Permanent Commission of the
National Debate for Peace (CPDN) – emerged
on the political scene in the late 1980s and
early 1990s to also effectively pressure the
government and guerrilla forces to end the
12-year long civil war via social movement
actions such as educational workshops, public
assemblies, and street demonstrations.

Peace movements and social movements
operating inside countries experiencing inter-
nal wars also find themselves subject to violence
and accusations that they are sympathetic to or even a front for one of the warring factions (Brockett 2005). Social movements in these special contexts must strike a delicate balance to avoid serving as the targets for governmental or insurgent violence. They must choose tactics and symbols that demonstrate their autonomy, pacific nature, and independence from the armed groups embroiled in conflict. Finally, both civil and interstate wars result in a whole host of new social movements as a consequence of large-scale violence and displacement of populations. Such collectivities include movements for the rights of war refugees, relatives of victims of war violence, and other human rights groups (e.g., mothers and families of the disappeared in Latin America in the 1970s and 1980s), as well as a multitude of issues associated with veterans of the conflict (e.g., disability services, pensions, and other social benefits) whereby at times these demands become expressed via social movement type campaigns.

World-system and social movements
ROBERT K. SCHAEFFER and L. FRANK WEYHER

Proponents of the world-system perspective have argued that the modern world-system first took shape in Western Europe and the Americas between 1450 and 1650, the "long sixteenth century" (Wallerstein 1974, 1980, 1989). Although social conflict was endemic during the early modern period, "antisystemic" movements emerged only in 1848 (Arrighi, Hopkins, & Wallerstein 1989). Class and status-based movements subsequently seized state power as a means of changing the inequalities associated with the capitalist world-system during the next century. However, they found it much more difficult to reduce structural inequality or transform the system than they had imagined, which led to a new round of global protest in 1968. This time movements directed their anger not only at powerful capitalist states in the core but also against states where antisystemic movements had taken power and antisystemic movements that had organized labor unions and political parties. To appreciate these developments, it is useful to recount the history of struggles by social movements in the modern world-system.

During the long sixteenth century, a capitalist world-economy emerged in Western Europe and the Americas. Unlike previous empires in Rome or China, which consisted of a single, self-contained world-economy administered by a single state or "empire," the modern world-system consisted of a single world-economy administered by multiple states. This allowed profit-seeking capitalists, not tax-seeking bureaucrats, to organize the economic system (Wallerstein 1974: 257). "Capitalism has been able to flourish precisely because the world-economy has had within its bounds not one but a multiplicity of political systems," Wallerstein argues (1974: 348). From the outset, capitalists and states in Western Europe, what Wallerstein calls the "core" of the world-economy, organized a global division of labor that allowed them to obtain a disproportionate share of the wealth produced by people who contributed to commodity production in the "periphery" and "semi-periphery" (1974: 349). This structural inequality, which resulted in "the concentration of advantages in one zone of the world-system [the core] and the concentration of negative effects in the other [the periphery]," has been a durable feature of the modern world-system, which subsequently expanded and incorporated the rest of the world (Wallerstein 1996: 312).

During the early modern period, oppressed peasants, workers, sharecroppers, slaves, and indigenous people "were all rambunctious in their various ways" (Arrighi, Hopkins, & Wallerstein 1989: 29). But their riots and rebellions were often short lived and "served as safety valves for pent-up anger or ... as mechanisms that ... set minor limits to exploitative process" (Wallerstein 1974: 357, 1996: 65). Workers did not then have the capacity to organize sustained opposition to the emerging system or the ability to think strategically about how to press for "fundamental social change" (Arrighi, Hopkins, & Wallerstein 1989: 29; Wallerstein 2004: 65). As a result, "spontaneous violence had the effect of throwing paper on a fire. The fire flamed up but just as quickly went out. Such violence was not a very durable fuel" (Wallerstein 2004: 64).

Although workers were unable to organize sustained opposition to the system of inequality, the ruling classes struggled successfully to expand the world-economy and create effective states that could secure their wealth and power. Although the "crisis of feudalism" had earlier threatened ruling class factions – landed aristocracy, urban bourgeoisie, state bureaucracy – their struggles...
to create a multicontinental, multistate world-economy enabled them to weather the crisis (Wallerstein 1996: 42).

Of course, ruling class factions also often fought ferociously with other factions, struggles that resulted in Dutch, English, American, French, and, later, Latin American “revolutions.” But during the early modern period, factions of the ruling class struggled against each other more or less on their own, without much interference from the lower classes (Wallerstein 1974: 354). Their struggles were not “revolutionary” because they “marked neither basic economic nor basic political transformation” nor altered the structure of the world-economy (Wallerstein 1989: 52). Still, these “intrabourgeois” struggles, which “were internal to the ruling strata,” were important because they gave ruling class factions the opportunity to create states that could provide them with economic assistance, military protection, an efficient bureaucracy that did not burden them with excessive taxes, and a mechanism to settle their internal disputes (Wallerstein 1980: 113, 120, 1996: 50–57, 63). Ruling classes in the Netherlands and England managed to do this better than ruling classes in France, Spain, or Poland, and the latter were subsequently assigned subordinate economic and political roles in the world-system.

Although popular insurrections generally proved ineffective during the early modern period, in 1848 workers for the first time created both durable organizations and political strategies that enabled them to struggle effectively against ruling strata (Arrighi, Hopkins, & Wallerstein 1989: 256). Wallerstein describes the discovery of organization as “the great innovation in the technology of rebellion,” an invention that helped “prepare the ground politically for fundamental social change” (Arrighi, Hopkins, & Wallerstein 1989: 30; Wallerstein 1991: 20–21, 1996: 66, 2004: 65). Organization made it possible for oppressed people to keep the flame of struggle burning and, sometimes, to ignite a wider conflagration.

After 1848, antisystemic movements developed organizations based both on “classes” and on “status-groups,” which included both ethnic-religious “nationalist” groups and “feminist” women’s groups (Wallerstein 2004: 68, 73). Because each of these three movements “insisted that its grievances be dealt with first,” they did not “find much common ground” (Wallerstein 2004: 70). But while socialist, nationalist, and feminist movements had important ideological differences, they all set the seizure of state power as a strategic goal because they thought that state power would enable them to “transform societies” and end inequality (Arrighi, Hopkins, & Wallerstein 1989: 37; Wallerstein 1991: 30, 2004: 73). Of course, each of these movements debated how state power might best be achieved. Some adopted peaceful means (obtaining the franchise and using the vote to acquire power), while others advocated violent insurrection.

Between 1848 and 1968, antisystemic socialist and nationalist movements took power in a number of states around the world: social democratic movements in the core; communist and nationalist movements in the decolonized periphery and semi-periphery (Arrighi, Hopkins, & Wallerstein 1989: 33). Although women have become heads of state, they have done so as leaders of socialist or nationalist movements, not feminist ones. As Arrighi and colleagues noted, “Seen from the vantage of 1848, the success of anti-systemic movements has been very impressive indeed” (1989: 33).

But while a number of antisystemic movements “have come to power in a large number of states,” Wallerstein argued that “post-revolutionary regimes continue[d] to function as part of the social division of labor of historical capitalism” (2004: 71). The seizure of state power was an “unfulfilled revolution” because while “changes in state structures have altered the politics of accumulation [they] have not yet been able to end them [emphasis added]” (Arrighi, Hopkins, & Wallerstein 1989: 34; Wallerstein 1996: 71–72).

Wallerstein suggests that antisystemic movements failed to alter the structure of inequality for two reasons. “First of all, state structures are embedded . . . in the interstate system, and their
degree of autonomy is strictly limited” (1991: 35). As a result, whatever their ideological goals, state officials quickly discovered that “control of the state machinery of a state . . . affords less real power in practice than it does in theory” (Arrighi, Hopkins, & Wallerstein 1989: 57; Wallerstein 1991: 27). This should not be surprising, given the fact that capitalist states were “one of the central institutional achievements of historical capitalism” in the early modern period (Wallerstein 1996: 48).

Second, when antisystemic movements took power, they typically became more concerned with keeping power than making change, a process akin to Robert Michel’s “iron law of oligarchy,” and this made them more “reformist” than “revolutionary” (Arrighi, Hopkins, & Wallerstein 1989: 102; Wallerstein 1991: 25). The determination to hold power at all costs transformed the social movement cadre into bureaucrats, and they became, in effect, “betrayers of the cause” (Wallerstein 1996: 68–69).

As a result of these two developments, “antisystemic” movements proved either unable or unwilling to use state power to promote revolutionary change. In retrospect, Wallerstein suggests that movements should have viewed the seizure of state power as a tactical goal, not a strategic goal (1991: 36). They should instead have been prepared to relinquish power and maneuver politically, as Antonio Gramsci recommended, “since it is in the process of movement, of mobilization, that the really constructive power of movements lies” (Wallerstein 1991: 36).

Although Wallerstein views the strategy adopted by antisystemic movements after 1848 as problematic, he argues that the eruption of “new” antisystemic movements in 1968 demonstrated that oppressed people understood this. So they revolted not only against capitalist states in Western Europe and the US, but also against “old” antisystemic movements that had seized state power or had organized bureaucratic labor unions and political parties (Arrighi, Hopkins, & Wallerstein 1989: 113, 98). “We cannot understand 1968 unless we see it simultaneously as a cri de coeur against the evils of the world-system and a fundamental questioning of the strategy of the old left opposition to the world-system” (Arrighi, Hopkins, & Wallerstein 1989: 101).

The world-system approach can provide a wider context for the study of social movements, a field that has become narrower in recent years (Dickinson & Schaeffer 2008: 29). The collapse of communism, the rise of China as a capitalist state, and the decline of the labor movement have persuaded many social movement scholars to abandon the study of “big” movements organized broadly along class and national lines, and focus instead on the particular organizational forms and public activities of identity-based movements that mobilize more selectively (Dickinson & Schaeffer 2001: 3–158, 2008: 12–13). Postmodern critiques of “universalism” further encouraged many scholars to eschew big ideas and look instead at movements that adopted more modest goals, such as obtaining civil rights (Dickinson & Schaeffer 2008: 29–31). Although the labor movement has been largely written out of social movement scholarship in recent years, labor scholars have urged consideration of “social movement unionism,” that mobilizes people not just as workers but also as members of diverse communities (Clawson 2003; Weyher & Zeitlin 2005: 29). The study of social movements would benefit not only from a reconsideration of “old” social movement traditions but also from an analysis that places movements in the kind of broad historical context that the world-system perspective can provide.

By the same token, world-system scholars might explore how social movements contribute to change, even if the change they seek does not result in world-systemic “revolution,” a standard set very high. Moreover, they might pay more attention to the emergence of female-centered social movements, which emerged in response to changes in the global, gendered division of labor (Dickinson & Schaeffer 2001: 161). These female-centered movements have not only challenged capital and the state, they have also tried to “organize independent work
and social relations outside the system,” what Tamdgidi calls “other-systemic movements” (Dickinson & Schaeffer 2001: 252; Tamdgidi 2001: 326). By “combining the conceptual frameworks of world-system and social movements” and “integrating feminist insights,” scholars would better understand “social movement dynamics and … [their] tactics and strategies” (Moghadam 2009: 11–12).

Aboriginal peoples’ movements (Australia)

MAGGIE WALTER

Australian Aboriginal peoples’ movements have been central to Aboriginal resistances to disposessions and discriminations since European colonization began at the turn of the nineteenth century and continue into present times. Aboriginal organized protest has coalesced around three political and social criteria: the articulation of a direct claim; the organization of activities involving Aboriginal community members around this claim; and the adaptation of the colonizers’ socio-legal practices as tools to advance these claims. An early example is George Walter Arthur and other Tasmanians’ campaign to reverse the forced dispossession and exile of the Tasmanians. Activities included the establishment of a newspaper to voice their claims and, in 1847, a petition to Queen Victoria claiming breach of promise by colonial authorities. The Tasmanians remained imprisoned on Flinders Island, but with the legacy of documentary evidence that the Tasmanians never relinquished sovereignty. Petitions against dispossession and living circumstances were also made by a number of Aboriginal protest movement leaders in New South Wales and South Australia in the latter part of the nineteenth century, again unsuccessfully (Attwood & Markus 1999).

The first formalized Aboriginal activist movements emerged in the early twentieth century. In 1924 Fred Maynard led the formation of the Australian Aboriginal Progressive Association which appealed, unsuccessfully, to the New South Wales and Commonwealth governments and King George V for the recognition of Aboriginal citizenship rights (Maynard 1997). In the 1930s the Aborigines Progressives Association (APA), organized by William Cooper, William Ferguson, and Jack Patten, coordinated the 1938 National Day of Mourning. This action protested the formal celebration of the one-hundred-and-fiftieth anniversary of Australian colonization and included the presentation of an Australian Claim of Civil Rights Manifesto to King George VI and a ten-point plan to Prime Minister Lyons to remediate the lack of legislative reform to provide Aboriginal rights.

In the mid twentieth century Aboriginal protest movements focused on achieving civil and social rights. The most well known, and successful, was the political movement aligned with the 1967 referendum to change the Australian Constitution. The referendum sought to repeal section 51 (xxvi) to allow the Commonwealth to make laws with respect to Aboriginal people and section 127 to allow Aboriginal people to be counted in the national census. Led by activists such as Faith Bandler, and organizations such as the Federal Council for the Advancement of Aboriginal and Torres Strait Islanders (FAATSI) this movement achieved an unprecedented 90 percent “Yes” vote. The positive result was built on a platform of earlier social movement actions demanding change. The 1965 “Freedom Rides” organized by Charles Perkins and Sydney University students had highlighted entrenched racial discrimination and the 1963 bark petition to the Federal House of Representatives by the Yirrkala people protesting at the excision of their land for mining demonstrated continuing dispossession.

In the 1970s and 1980s Aboriginal movements focused on extending citizenship rights using a variety of activities and campaigns. The Aboriginal Tent Embassy in the national capital of Canberra was set up in 1972 and remains today despite being torn down, raided, and declared illegal almost continually since its establishment. The courts have also been used by political movements, with at least initial success, to reclaim Aboriginal sovereignty. In 1992, the Australian High Court legally recognized

the claims of Eddie Mabo and other claimants to the possession, occupation, use, and enjoyment of the lands of the Murray Islands. The legislative response to this ruling, The Native Title Act (1993), however, places substantial barriers to their achievement. Aboriginal protest movements were also instrumental in the 1989 establishment of the Royal Commission into Aboriginal Deaths in Custody and the 1997 Bringing Them Home, National Inquiry into the Separation of Aboriginal and Torres Strait Islander Children from Their Families.

The activities of Aboriginal social and political movements have been circumscribed during the latter 1990s and 2000s. The incursion of market forces ideology has not only limited Aboriginal rights advancement, it has effectively rolled back some of the gains already achieved. In 1996 the Wik people’s case in the High Court confirmed that the granting of pastoral leases did not necessarily extinguish native title. This 1998 legislative response, however, reversed the intent of this ruling and largely extinguished land rights entitlement under leaseholds. The policy formation acceptance of the concept of self-determination has also been formally rejected and made manifest by the 2005 abolition of the Aboriginal and Torres Strait Islander Commission (ATSIC). The result is the effective elimination of the formal Aboriginal political voice. In 2007 Aboriginal civil rights were overturned again via the suspension of the Racial Discrimination Act (1975) to allow the military-led intervention into 72 Northern Territory Aboriginal communities. The on-going intervention has seen compulsory acquisition of Aboriginal land and unprecedented control of multiple aspects of Aboriginal peoples’ lives (Walter 2010). Contemporaneous Aboriginal social movements in Australia, therefore, are currently preoccupied with defending basic human rights. Yet, while many, if not the majority, of Aboriginal social and political movements were not immediately successful their legacy is critical to current and future action for Aboriginal rights, recognition, and sovereignty in Australia. Now as then, social and political movements largely develop from the grassroots of Aboriginal communities and organizations. Scholarship in this area focuses on the capacity of Aboriginal protest movements, historically and contemporaneously, firstly to challenge injustices and dispossessions and secondly, to make use of the apparatus of the nation-state within these challenges (Attwood & Markus 1999; Walter 2010).

ACT UP (AIDS Coalition to Unleash Power)

BRETT C. STOCKDILL

Outraged by the lack of concerted effort to fight the AIDS crisis, queer activists formed the direct-action AIDS organization, ACT UP, in 1987. They were enraged because tens of thousands of people, disproportionately gay and bisexual men, had died of AIDS, yet governmental, mass media, medical establishment, and other institutional responses were characterized by homophobia and genocidal neglect. Beginning with the first chapter in New York City in March 1987, activists soon established over 80 chapters in the United States, including Puerto Rico, and over 30 elsewhere, including Australia, Canada, and Europe. ACT UP’s repertoire of innovative, confrontational tactics was decisive in publicizing myriad aspects of the HIV/AIDS crisis, increasing government HIV/AIDS budgets, preventing new HIV infections, galvanizing research, reshaping clinical drug trials, securing access to services and treatment for people living with HIV/AIDS, and fighting repressive legislation including calls to quarantine people with HIV/AIDS. ACT UP empowered people living with HIV/AIDS and challenged homophobia, racism, sexism, and other inequalities fueling the AIDS crisis. In the process, the organization ignited gay and lesbian pride, cultivating rebellious queer identities and political action that celebrated sexual difference and envisioned a more just and inclusive world. Most ACT UP chapters declined in the early to mid 1990s but a few continue to do vital AIDS activism today.

EMERGENCE

Massive AIDS deaths fueled by systemic homophobia and other inequalities during the 1980s catalyzed the creation of ACT UP. During the first five years of the AIDS crisis, gay men and lesbians channeled their horror and anguish into service provision and nonconfrontational AIDS activism, such as lobbying and candlelight vigils. However, as deaths rose, the 1986 US Supreme Court’s *Bowers v. Hardwick* ruling, which upheld the criminalization of homosexual sex, ignited rage in gay and lesbian communities and prompted widespread street protests in cities across the country. Gay and lesbian activists formed new militant organizations – such as Citizens for Medical Justice in San Francisco, Dykes and Gay Men Against Repression/Reagan/the Right Wing (DAGMAR) in Chicago, and the Lavender Hill Mob in New York City – that linked the Supreme Court ruling with the AIDS crisis and subsequently grew into the first ACT UP chapters in 1987 (Gould 2009).

PARTICIPANTS AND ORGANIZATIONAL DYNAMICS

ACT UP members were predominately lesbians and gay men, and largely white and middle class, but included significant numbers of people of color and working-class people. Many joined ACT UP in response to the grief of watching loved ones die of AIDS. Many members, particularly gay men, were living with HIV/AIDS and refused to merely sit back and die. Some participants, particularly middle class, white gay men, had little prior activist experience. Others, particularly lesbians, had participated in earlier leftist organizing efforts including the gay liberation movement, the women’s movement, lesbian feminism, and anti-imperialism. This activist experience, combined with an embrace of gay and lesbian culture, shaped ACT UP’s egalitarian organizational structure and practices, defiantly queer political analysis and savvy, provocative, in-your-face tactics.
ACT UP’s organizational structure was, “non-hierarchical, decentralized, and democratic” (Gould 2009: 190). Much of the strategic planning occurred in committees, caucuses, and affinity groups. While these smaller groups brought ideas for campaigns and actions to be discussed at general meetings, they enjoyed a large degree of autonomy provided they adhered to the organization’s core principles of nonviolence, participatory decision making, the positive valuation of lesbian and gay sexualities, the empowerment of people living with HIV/AIDS, and defiance of institutional and cultural bigotry driving the epidemic.

In a homophobic, AIDS-phobic society, shared experiences such as sexual and gender outlaws grappling with illness and death bolstered solidarity among members. Public expression of affection and eroticism – particularly homo-affection and homoeroticism – as well as the common use of campy humor further strengthened bonds between participants. In turn, the collective experience of being in the streets and putting their bodies on the line together forged intense cohesion in ACT UP.

TACTICS

ACT UP’s membership and organizational milieu produced deep and sophisticated scientific expertise that informed an array of direct-action tactics. Through extensive research, ACT UP members acquired vast knowledge of the epidemiology, science, and sociology of HIV/AIDS. Armed with data and analysis, members utilized protest to secure meetings with government and other officials, such as those in the US National Institutes of Health (NIH), to demand more concerted responses to the AIDS crisis. Their expertise developed to the point where scientists felt compelled to read ACT UP fact sheets, background papers, and other documents (Epstein 1996).

ACT UP’s direct-action tactics included phone and fax zaps, marches, rallies, die-ins, and civil disobedience. One illustrative example is the ACT UP/Chicago-led protest against the Cook County Board of Commissioners for their refusal to admit women into the AIDS ward at Cook County Hospital. ACT UP’s Women’s Caucus, supported by the PISD (People with Immune System Disorders) Caucus and People of Color Caucus, blocked traffic in the center of a busy downtown Chicago intersection by creating a symbolic AIDS ward with 16 mattresses displaying slogans about women and AIDS. The women lay on the beds and refused to move. Police arrested over one hundred protestors. The Cook County Board agreed to open the AIDS ward to women the next day.

ACT UP was particularly innovative in utilizing art, video, agitprop (agitational propaganda), and street theater to highlight the injustices of the AIDS epidemic (Crimp & Rolston 1990; Bordowitz 2004). ACT UP/New York’s 1987 gay and lesbian pride parade float, trimmed with barbed wire and driven by a man in a Ronald Reagan (then US president) mask, depicted an AIDS quarantine camp. Internment camp guards on the street wore gas masks and yellow rubber gloves. The organization was also extremely sophisticated – and successful – in securing media coverage of their grievances and actions.

ACT UP challenged the homophobia undergirding the AIDS crisis. Their cultural defiance included publicly embracing the right to be queer. Activists spoke openly and explicitly about lesbian and gay sex, publicly displayed queer affection, distributed thousands of condoms and dental dams, and unfurled banners promoting safer sex at public events such as major league baseball games and the US Republican Party national convention. As a symbol of queer pride, ACT UP popularized the pink triangle, which gay men were forced to wear in concentration camps during the Nazi holocaust in the 1930s and 1940s. The ACT UP slogan SILENCE=DEATH, placed below the pink triangle, encapsulated their mission to value queer lives and defy the status quo.
Though much of its organizing focused on confronting homophobia, ACT UP also challenged systemic gender and racial oppression that further exacerbated the AIDS crisis. Women’s and people of color caucuses conducted educational outreach among women and communities of color, sponsored conferences, worked with community-based AIDS organizations, and led workshops on sexism and racism within ACT UP. Women’s caucuses criticized the framing of AIDS as a gay male disease, demanded increased research on and services for women, and led several protests that forced the US Centers for Disease Control to expand its definition of AIDS to include common AIDS-defining opportunistic infections among women. Lesbians played a pivotal role in women’s caucuses; they educated people both in and outside ACT UP about the roles of sexism, racism, and classism in the AIDS crisis and spearheaded campaigns around related issues such as HIV/AIDS among intravenous drug users and prisoners (ACT UP/New York 1992).

OUTCOMES

ACT UP’s tactics led to a number of significant victories such as the expansion of government AIDS budgets, the speedup of medical research, and increased access to life-prolonging experimental therapies. ACT UP activism led to the transformation of governmental HIV/AIDS research – and scientific research in general. ACT UP forced the US Food and Drug Administration to expedite its drug testing process and to provide people with AIDS with access to experimental drugs before their approval. These changes were coupled with ACT UP’s success in securing the involvement of AIDS activists in the design and implementation of clinical drug trials (Epstein 1996). In turn, the organization forced pharmaceutical corporations to reduce the cost of AIDS drugs. ACT UP and other AIDS activists secured increased funding for HIV prevention and more compassionate AIDS-related health care and services for people living with HIV/AIDS, including women and people of color. ACT UP worked with community-based organizations to establish needle exchanges, a critical means of preventing HIV transmission among intravenous drug users. ACT UP also collaborated with prisoners and former prisoners to improve prisoner access to prevention and treatment information, social support, and drug treatments.

ACT UP also effectively challenged the tremendous stigma and bias against those affected by HIV/AIDS, including repressive AIDS legislation, workplace discrimination, and refusal of medical treatment. The organization also exposed the distorted and inadequate media coverage of the crisis as well as the vilification of people living with HIV/AIDS by right-wing ideologues, providing a counter-narrative that humanized and empowered HIV-positive people while simultaneously promoting queer sexualities.

DECLINE

Despair and internal conflict within ACT UP coupled with increasing political conservatism on the national level and state repression targeting the group contributed to ACT UP’s decline in the early 1990s. Despite ACT UP’s stunning victories, effective treatments were still lacking, and intense despair resurged amidst the ever-increasing deaths of friends and lovers. Many members were dead or dying by this time, and survivors grew increasingly burnt out – physically and emotionally – from the daily onslaught of the AIDS crisis. Deborah Gould (2009: 396, 424) argues that while ACT UP had effectively harnessed grief to collective anger and collective action, its “... emotional habitus prohibited despair, and that made it difficult to deal with that bad feeling ... [Despair] depleted many ACT UP members’ activist energy, replacing their rousing desire and forward momentum, sometimes even their anger, with frustration, exhaustion, and immobility.”
Without an outlet for feelings of despair, political differences intensified among members, leading to polarization in the organization. A significant number of members, typically but not exclusively HIV-positive white gay men, were reluctant to focus energy and resources on the racism and sexism intertwined with the epidemic. Instead, they prioritized getting “drugs into bodies” and resented the efforts, primarily by members of women’s and people of color caucuses, to address the impact of HIV/AIDS on women and communities of color. Factionalized conflict between the two camps led several chapters to splinter. For example, some members of the Treatment and Data Committee – which pushed scientists and government officials to speed up drug testing and approval – left ACT UP/New York to form other organizations such as TAG (Treatment Action Group).

The surging conservative backlash against gains by civil rights, feminist, and lesbian and gay movements aggravated internal conflicts, particularly as reported HIV/AIDS cases climbed among people of color. Jeffrey Edwards (2000: 487) writes that, “the withering of a broader ‘rainbow politics’” was accompanied by “an expanding white racial backlash in the larger [US] society” that spilled over into ACT UP and the broader lesbian and gay community, galvanizing infighting, shattering solidarity, and isolating the organization politically.

Within this context, political repression took an increasing toll. Police brutality, criminal prosecution, and surveillance and harassment by the FBI and other US law enforcement entities drained time, energy, and resources from fighting AIDS and intimidated AIDS activists. For example, echoing earlier efforts to quell dissident movements, the state used a grand jury to divide queer/AIDS activists in Colorado and to indict three members of ACT UP/Denver in 1993 for protesting the AIDS-phobia and homophobia of the Catholic Church (Stockdill 2003).

These and other factors, such as a decrease in mainstream media coverage of the AIDS crisis, contributed to the decline of ACT UP chapters across the nation. The early 1990s saw a shift in many lesbian and gay communities away from radical street protest and toward a politics of respectability. In part driven by sheer exhaustion, some framed the access a few AIDS activists gained to the scientific research establishment as evidence that confrontational tactics were no longer necessary. This perspective was buttressed in the United States by then newly elected President Clinton’s seeming support of both AIDS and lesbian/gay rights activists’ demands. Some members left the group to work in the burgeoning AIDS industry and/or in more assimilationist political campaigns such as gay marriage and gays in the military (Gould 2009). By the end of 1995, most ACT UP chapters were defunct, though ACT UP/New York and ACT UP/Philadelphia persevere today.

LEGACY

ACT UP’s legacy is considerable. Many HIV/AIDS organizations in the fourth decade of the AIDS crisis have roots in ACT UP, including the Treatment Action Group (TAG), Housing Works, and a number of needle exchange programs. To the extent that millions globally now have access to life-saving treatments, ACT UP deserves some of the credit. In challenging the shame and stigma connected to lesbian, gay, bisexual, and transgender identities, as well as linking AIDS to other issues such as housing, incarceration, sexism, racism, capitalism, and militarism, ACT UP provides a model for confrontational queer political struggles against crisscrossing oppressions. Its imprint can be seen in the proliferation of queer pride, theory, studies, and collective action as well as the use of art and film/video in antiglobalization and other movements in the 1990s and 2000s. Mainstream social movement scholars have largely overlooked ACT UP despite the fact that much of its history has been archived (e.g.,
ACT UP Oral History Project). This history provides crucial lessons for social movement scholars as well as contemporary and future activists.

Penal abolitionist movement
RENÉ VAN SWAANINGEN

There have been abolitionist movements against slavery, torture, prostitution, capital punishment, and prison. This entry focuses on the latter alone. When the term abolitionism is used in relation to criminological issues, it generally dismisses penal definitions and punitive responses to criminalized problems, and proposes their replacement by dispute settlement, redress, and social justice. More generally, it refers to the abolition of state (supported) institutions that are no longer felt to be legitimate. The word abolitionism as currently understood in criminology is adopted from the North American antiprison movement of the early 1970s. Here Quakers, most notably, take up their historical mission from the antislavery movement. They see prison as an institution that today fulfils the same social functions as slavery did till the late nineteenth century: disciplining the (mostly black) underclass. This American penal abolitionism is mainly grounded in religious inspiration, and less in considerations of the counter-effectiveness of criminal justice, as is the case in Europe (Bianchi & van Swaaningen 1986). The European abolitionist social movements of that era were prisoners’ unions and more intellectual radical penal reform movements (van Swaaningen 1997). This more academic abolitionism has its roots in symbolic interactionism and social constructionism, with a strongly Foucauldian focus on discipline in a carceral society.

Despite what the literal meaning of the verb ‘to abolish’ suggests, penal abolitionism cannot be conceived in absolute terms. Abolitionists do not argue that the police or courts should be abolished. The point is that crime is not to be set apart from other social problems and that the social exclusion of culprits seldom solves any problem. The penal system itself is seen as a social problem, and “penality” is rejected as a metaphor of justice. Abolitionists question both the ethical calibre of a state that intentionally and systematically inflicts pain upon other people, and the credibility of the penal system, partly because generally accepted goals of general and special prevention cannot be supported with empirical data.

Penal abolitionism knows a negative and a positive momentum. It implies a negative critique of the fundamental shortcomings of the penal system to realize social justice, and aims at the prevention and control of criminalized problems by social means. In this negative phase, depenalization (pushing back the punitive character of reactions) and decriminalization (against the labelling of social problems as crimes) are the central topics. Cohen (1988) characterizes abolitionism’s destructuring moves as: decarceration, diversion (away from the institution), decategorization, delegalization (away from the state), and deprofessionalization (away from the expert). In the positive phase, a distinction is to be made between penal abolitionism as a way of thinking (an alternative way of understanding crime and punishment) and as a way of acting (a radical approach of penal reform). In the first sense, abolitionism is an example of a replacement discourse (Henry & Milovanovic 1996). In the second sense, it moves between Pepinsky and Quinney’s (1991) “peacemaking criminology” and Braithwaite’s (1989) theory of reintegrative shaming. It is more modest than the first, for it is oriented toward mechanisms of social control rather than toward rebuilding community spirit in a broader sense, and is embedded in a more radical, dismissive position on the penal system than the latter.

Initially, penal abolitionists pointed their arrows at the prison system. Around 1980, the attention shifted to (the pros and cons)

of noncustodial alternatives. Warnings against the net-widening effects of such sanctions were contrasted with their potential value in the attrition of the penal system. In this respect, Mathiesen’s (1974) penal action theory has been quite influential, as it argues that alternatives to prison should remain “unfinished” in order not to be absorbed by a penal rationale. He distinguishes between positive reforms, which ultimately strengthen the penal system, and negative reforms, which are of an abolishing kind.

Other penal abolitionists have focused on the penal procedure. In the early 1960s, Bianchi (1994) concluded that anomie is partly caused by criminal law’s false pretension to reflect consensual opinions on norms and values, and by the fact that decisions are forced upon people without paying attention to the question whether these correspond with their own vision of the problem. In order to overcome such a hegemonic definition of the problem, Bianchi proposes an assensus model: a palaver-like session where the directly involved parties in the dispute themselves define the nature of the problem during the procedure, rather than starting from legal categories and “objective” truth-finding. Assensus is a way between the consensus model of criminal law and the dissensus embedded in conflict models. These two perspectives imply a fight over the representation of the facts instead of a focus on the follow up. With these contentions Bianchi rejects both functionalist and conflict sociology. Instead, he adopts a normative position oriented to informal justice and argues, in quite the same line as Christie (1981), for a model of participatory justice. By accusing the penal system of intentional pain delivery, Christie compares it with torture. Today, we find the rejection of torture self-evident. In the future we may look at prisons in quite the same way.

The development of (counter)criteria for penal intervention is another theme abolitionists deal with. As absolute criteria against penalization, Hulsman mentioned in the early 1970s the tendencies to (1) impose moral convictions and to (2) use criminal law as a stick behind the door for social work interventions. He also rejects penal intervention (3) when the frequency of the act implies that it cannot be controlled because the system’s capacity will be exceeded, or (4) when it does not contribute to any form of welfare, dispute settlement, or redress. According to Hulsman, we do not need to wait for radical political reform or structural analyses in order to start with decriminalization: coercion needs legitimation, giving up on coercion does not. This pragmatic, political approach makes Hulsman’s perspective an interesting challenge for those “intellectual sceptics” who advocated radical penal reform but were paralyzed by all the structural configurations it implies, which leads them to the idea that nothing works.

According to Hulsman, the main change lies in a transformation from a top-down vision of reform within the limits of penal rationale to an approach from below, in which the language from the “life-world” is adopted. Hulsman rejects the idea that crime would consist of any ontological element. It is just a label selectively applied to some problems, whereas crimes are not fundamentally different from non-criminalized social problems. Real solutions are blocked as soon as you call a problem a crime. Crime is an inadequate social construction. Next to Berger and Luckmann’s social constructionism, Hulsman is also notably inspired by Gusfield’s ideas on the culture of social problems and Galtung’s distinction between blue (liberal-capitalist), red (socialist), and green (post-material environmentalist) developments in society. Hulsman places his penal abolitionism in this latter strand. He focuses on the organic and small-scale, life-world level of society (van Swaaningen 2010).

It is often argued that penal abolitionism would be a postmodern perspective of criminology. In respect to its rejection of the grand narrative of law and its replacement discourse of smaller narratives of dispute settlement in the life-world, abolitionism is indeed postmodern avant la lettre. Some of these postmodern tendencies are, however, confusing and
problematic. Even if we accept that crime is no category that reflects an ontological reality, it remains a historical and sociological reality. As long as social problems are criminalized, “crime” remains a social construction that deserves a specific research attention. Yet the inclusion of smaller narratives rightly adjusts the dominance of critical criminology’s macrosociological focus.

Abolitionist ideas on dispute settlement are based on weaker empirical ground than the critique of the penal system. A lot of trust seems to be put in people’s communicative capacities, through which conflicts can be settled in a rational way. Penal abolitionists stress the importance of a human input in legal procedures, and challenge the dominant focus on technical legality, which excludes nonexperts from the process which should be oriented to the settlement of social problems. In order to do justice to this inclusive, participatory character, people must be able to tell their own story, be listened to, have a say in the way of settlement, be able to question the universality of norms, before any formal element becomes actually relevant. It seems, however, realistic to assume that people will not always come to an agreement and that someone will probably have to overrule an endless palaver. This raises as a minimum the yet unanswered questions of who is going to do this, according to which standards, and how a solution can be advanced without coercion.

In today’s academic debate, penal abolitionism is mainly discussed as one of the many critical criminologies of the twenty-first century. This does not mean, however, that it has become insignificant. Many of its visions have been adopted by and integrated into other criminological perspectives. Now popular perspectives, such as constitutive criminology (Henry & Milovanovic 1996) or restorative justice (Braithwaite 1989) are grounded in abolitionist thought. Penal abolitionism’s major merit is that it offers a fundamentally different vision of crime and justice (cf. Ruggiero 2010). Its epistemology provides a useful basis for creative empirical research into penal and social control.

Agrarian movements
(United States)
DONNA A. BARNES

No comprehensive treatment of social movements would be complete without attention to the rich tradition of agrarian movements throughout American history. Organized protest by farmers goes back to the 1600s and extends to the present. This entry aims to provide a general overview of the major movements initiated by farmers in the United States, with attention to the commonalities and differences among those movements.

The first notable protest on the part of farmers goes back to the 1670s in the Chesapeake area of Colonial America where tobacco was grown as an export crop. Overproduction led to dramatic declines in the market price of tobacco. The economic plight of tobacco farmers intensified when Britain imposed a tax on colonial tobacco. In 1676, discontent led to Bacon’s Rebellion, an armed insurrection of backcountry farmers.

In the eighteenth century, there were several significant agrarian revolts aimed primarily at tax policies. The Regulators movement emerged in North Carolina as a result of the anger of small farmers over their less productive farmland being taxed at the same rate as the alluvial, coastal lands owned by wealthy planters. They blamed the excessive taxation for the growing number of farm foreclosures. Eventually the conflict led to the Battle of Alamance in 1771 where the militia decisively defeated a force of about 2000 Regulators. There was a similar armed uprising in Massachusetts in 1786 known as Shay’s Rebellion where small farmers protested taxes, court seizures of the property of indebted farmers, and imprisonment as a punishment for nonpayment of taxes and debts. Unsuccessful in achieving relief through political or legal channels, Shayites turned to violence before being defeated by the militia.

The Whiskey Rebellion was directed toward the unpopular Whiskey Act of 1791, which imposed an excise tax on whiskey to service the national debt. Whiskey producers were given two options: a flat fee or a per-gallon fee. Small farmers adopted the injustice frame, protesting that the huge distillers were the only ones who could afford the flat fee, which significantly reduced their tax burden. Furthermore, most small producers were too far from markets or lacked the farm-to-market roads to get their grains to market. They had no choice but to turn their grains into spirits, but often did not have sufficient cash reserves to pay the tax. Another armed tax revolt known as Fries’s Rebellion was organized by small farmers in Pennsylvania to protest new taxes imposed by Congress on real estate in the late 1790s. The militia was used to crush both rebellions.

Organized protest by small farmers became much less common in the first half of the nineteenth century for several reasons: First, the Louisiana Purchase in 1803 provided vast new expanses of land, which served as an escape valve for agrarian discontent. Second, the election of Thomas Jefferson to the presidency ended the rule of the Federalists who had favored merchants and bankers over agriculture. Government policy shifted to selling farmland in small parcels to homesteaders, rather than land speculators, and excise taxes on commodities such as whiskey were repealed. Finally, the extension of voting rights to all white males during this time period bolstered the perceived efficacy of addressing grievances through individual action on election day.

Colonial and pre-Civil War agrarian rebellions shared some common characteristics. First, they shared commonalities in terms of both their diagnostic and prognostic or strategic frames (Snow & Benford 1988).
source of their problems, they focused on hardships created by taxation and debt repayment during times when profits from commercial agricultural production were minimal or in areas where agriculture was largely subsistence-oriented and underdeveloped in terms of a cash economy. In regard to the strategic framing process, they initially sought redress of their grievances through legal and political channels. But when such efforts were unsuccessful, they shifted to violent tactics. Second, they faced a political opportunity structure (McAdam 1982) that made it difficult to address their problems through legitimate political channels. Property qualifications for voting rights meant that most politicians were from affluent backgrounds and were indifferent, if not hostile, to the problems of small farmers. Finally, farmers in small rural communities often shared a common church and social life in local inns and taverns, which facilitated the mobilization of collective action by making a refusal to participate in protest activities awkward. However, the suppression of agrarian rebellions was aided by their localized character, which was largely due to the limited nature of communication networks during this era.

In the post-Civil War years, the closing of the frontier eliminated an escape valve for agrarian discontent, and persistently low agricultural commodity prices led to a resurgence of agrarian movements. One of the first movements to emerge was the Grange. In terms of its diagnostic frame, it argued that the most serious grievances facing farmers were rooted in the insufficient competition in agricultural purchasing and marketing systems and the monopolies that existed within the railroad industry. To address these problems, it proposed farmer-owned cooperatives and government regulation of railroads.

The success of the Grange was undercut by a deepening agricultural depression and by its anemic protest ideology that cautioned farmers not to abuse other classes since all classes were essential to the proper functioning of society. Internal conflict also arose due to its efforts to stymie discussions of politics. It fared poorly once a competing farmers’ organization, the Farmers’ Alliance, emerged and embraced a more insurgent ideology. The Alliance marked the beginnings of a massive protest movement by small farmers that eventually led to the emergence of the People’s Party. The Farmers’ Alliance and People’s Party are collectively referred to as the Populist movement, the largest agrarian movement in American history.

At its peak in 1891, the Alliance had about three million members. Its growth was fueled by an insurgent diagnostic frame that attacked the lack of sufficient competition in agricultural purchasing and marketing systems and, unlike the Grange, blamed local merchants, middlemen, bankers, and an increasingly oligopolistic manufacturing sector for the high cost of goods and high interest rates.

In regard to strategies, the Alliance pushed for trade agreements wherein it promised the business of its membership to the merchant who agreed to the lowest mark-up on wholesale prices. Such agreements improved the well-being of its members only marginally, and the Alliance soon pushed for the creation of farmer-owned cooperative stores, as well as cooperative action in marketing. It established cotton yards to bulk the cotton of its members in hopes of securing a better market price and advocated withholding cotton from the market if better prices were not forthcoming. It also pushed for a boycott of jute bagging for cotton bales when the price of jute soared due to the machinations of the “jute trust.”

While achieving short-term success, the cooperative strategies floundered as the agricultural depression deepened and more farmers became dependent on crop-lien financing. With this financing, farmers were advanced supplies and goods throughout the year in return for a lien on their cotton crop. They were typically charged interest on their credit line for the entire year, even though some of the credit was not used until close to harvest. The annualized interest rate was 20 percent or higher. They were also charged “time prices” on goods and supplies, which were considerably
higher than cash prices. Crop-lien financing established a condition of peonage, with farmers delivering themselves to the control of the lien merchant until their account was paid in full. They could only trade with the lien-holder and lost flexibility in the marketing of their cotton because the lien came due at harvest, which precluded their participation in Alliance cooperative endeavors.

The growing inability of farmers to participate in cooperative activities pushed the Alliance toward a bolder plan. Its subtreasury proposal called upon the federal government to build warehouses and elevators in every county that produced $500,000 or more of farm commodities where farmers could store nonperishable farm products as collateral for a low-interest government loan. If implemented, it would have shattered the crop-lien system of finance. However, the proposal was harshly attacked, and Democratic politicians steadfastly refused to endorse it. Their refusal was the single most important factor pushing the small farmer movement to support a third-party revolt.

The Alliance, however, was a rickety bridge to the People’s Party. Many southern Alliance-men were slow to endorse the third party, choosing instead to extend efforts at pressure politics within the Democratic Party. Nevertheless, the People’s Party became a sufficient threat to push elites in many southern states to restrict suffrage on the basis of educational and/or property qualifications. As a result, in many rural areas where the Populist movement had once thrived, the electorate shrunk significantly. This, coupled with successful efforts by Democrats to coopt the movement by endorsing its “free silver” monetary reform demand, ensured the movement’s demise.

The cooperative vision of the Grange and Alliance movements, however, survived and awaited a time where different economic conditions allowed for its successful implementation. Consistent with the tenets of the Resource Mobilization theory, times of greater prosperity provided the resources to properly capitalize farmer-owned cooperatives. The National Farmers Union (NFU) adopted a strategic frame focused on cooperative marketing. By its peak in the south in 1912, it had bought or built more than 1500 cotton warehouses and had bypassed middlemen to secure sales contracts directly with US and British textile manufacturers. While crop-lien dependency limited its growth potential in the South, its growth among wheat and corn farmers in the Great Plains and Midwestern region was phenomenal. In addition to its successful cooperative ventures, it used its large membership as leverage to secure legislation advantageous to its members. It persists as an organization to the present, and has chapters in 31 states.

Declining crop prices once again prevailed in the 1920s. Fearing a return to the agrarian rebellions of earlier times, the federal government pushed for a county-agent extension system allied with land-grant colleges. The county agents were organized into state Farm Bureaus and eventually a nationwide American Farm Bureau that survives to the present. Its primary focus is on political lobbying on behalf of agriculture. During the Great Depression, it was instrumental in developing and implementing the New Deal farm program, which entailed production quotas with disproportionate benefits for large farmers. Given its ties to the government and its determination to stand against agrarian radicalism, it is often depicted as a large farmer, agribusiness organization rather than a grassroots farmer movement.

Despite efforts to forestall agrarian radicalism, during the Great Depression two grassroots agrarian movements emerged, the Farmers’ Holiday Association and the Southern Tenant Farmers’ Union (STFU). Both faced unfavorable political opportunity structures, with governmental authorities often complicit in the use of violence against movement participants. The former called for withholding crops from the market until farmers could obtain a cost-of-production price. It harassed farmers who did not participate in its withholding actions and patrolled farm-to-market roads to prevent goods from reaching market. It also called
for tax and mortgage relief and intimidated buyers at foreclosure sales. In regard to the STFU, it emerged to address the dire effects on tenant farmers of the New Deal production quotas. In a stunning break with tradition, it created a biracial union to protest the injustices of the New Deal programs, which were disproportionately benefiting large landowners. It pressured the Department of Agriculture and Congress to stop tenant evictions, which violated the terms of the Agricultural Adjustment Act. It also utilized direct action tactics such as wage negotiations for cotton pickers, strikes, and picketing. It would remain a presence in the South until cotton production was significantly mechanized in the 1940s.

Greater mechanization of crop production and the so-called Green Revolution increased agriculture productivity in the post-World War II era in a sector long plagued by overproduction. The National Farmers’ Organization (NFO) emerged in the mid-1950s amid collapsing prices on many farm commodities. Its major goal was to ensure that its members recouped the cost of production, plus a reasonable profit. Its primary strategy was withholding, and its withholding from cooperatives drew attention to the fact that they were often run by managers whose business practices were indistinguishable from those of large agribusiness conglomerates. It received considerable media attention for slaughtering hogs in defiance of low prices and for milk dumping during its dairy campaign in the late 1960s. Its involvement in cooperative marketing continues today.

Rollercoaster pricing on farm commodities during the 1970s and 1980s created a serious farm crisis. Many farmers were caught in the downward spiral of crop prices and rising debt loads as a result of having borrowed heavily to expand the size of their farms. They had been advised by farm experts that the survival of the family farm depended on reaping benefits from economies of size. The American Agricultural Movement (AAM) was founded in 1977 to pressure the government to increase commodity price supports. It used tactics such as tractorcades, whereby farmers clogged roadways with their tractors, to focus media attention on the farm crisis. But in the end, price supports were only modestly increased. It continues to lobby for higher farm price supports and a ban on agricultural imports until “100% parity” is achieved. The 1980s also saw the creation of the National Family Farm Coalition (NFFC), which politically lobbies for a reduction of corporate control of agriculture in favor of a more sustainable, economically just food and farm system. Presently, it represents 24 grassroot organizations in 32 states.

The major challenge to contemporary farm organizations like the AAM, NFFC, NFO, and NFU lies in the contraction of political opportunity as a result of the fact that less than 2 percent of Americans now earn a livelihood from farming. In an effort to address this challenge, they engage in frame-alignment efforts (Snow et al. 1986) whereby they stress to non-farmer audiences the message that vibrant rural communities are best built upon a solid foundation of strong family farms, and that economically viable rural communities are vital to the health, security, and economic well-being of the nation.

Agrarian movements will continue to play a role in American society. The research focus on increasing production, such as the development and use of bovine growth hormone to increase milk production, will almost certainly create excessive supply relative to demand. Falling prices, which have periodically plagued agriculture since the 1600s, will be a recurrent problem. When protests arise, leaders will have a rich repertoire of strategies from which to choose: cooperatives (both for purchasing and marketing); political advocacy for farmer-friendly legislation, such as higher price supports or a moratorium on farm foreclosures; third-party advocacy; and direct action tactics, such as tractorcades, boycotts, withholding, striking, picketing, and even armed rebellion.

AIDS activism
OLIVIER FILLIEULE

The AIDS epidemic first appeared as a public issue in the USA during the summer of 1981. It was then that the first stories were published in medical journals and in the gay press reporting the emergence of mysterious new illnesses among gay men, and it is the gay community, perhaps to a unique degree, which mobilized first and took part in all aspects of the management of the epidemic. This included the provision of social aid and healthcare to people with AIDS, gay or not, the conduct of research, lobbying for funds and other government intervention, the creation of educational programs and negotiations with legislators and health insurers (Altman 1994; Kramer 1994; Fillieule & Duyvendak 1999).

AIDS activism falls into the broad category of HSMs (health social movements) (see Brown et al. 2004). It has given way to research in the areas of social movements, medical sociology, and social studies in science. AIDS movements, like other types of HSMs, centrally address a common health-related interest, and seek to bring about social and political change by challenging political and professional authority and cultural norms. They have engaged in many different types of collective action, including legal challenges to discriminatory laws, public health education campaigns, advocacy, protests, strikes, and boycotts. Altogether, AIDS movements in Western countries have produced change in healthcare policy, delivery, and regulation; they have pushed medical science toward innovation and encouraged changes in funding; they have struggled to democratize institutions that shape medicine. In that respect, social studies in science have been crucial to understanding how AIDS movements have contributed to the re-framing of medical science to advance their causes, challenging the science of health and healthcare (Epstein 1996).

One can underline two striking features of AIDS movements compared to other HSMs: First, a great number of them orient their action simultaneously toward greater access to healthcare, highlight health disparities and inequality, and challenge the underlying science of health and healthcare, blurring the usual HSMs’ typology proposed by the literature (Brown & Zavestoski 2005). Second, because they had to fight the double stigmatization of homosexuality and disease in a context of great institutional homophobia, they depend more than other movements on a highly politicized collective identity (Broqua 2005), as well as emotional underpinnings of moral outrage, anger, and indignation to motivate action (Gould 2010).

SOCIAL RESPONSES TO AIDS

The AIDS literature distinguishes a number of major phases in the structuring of the struggle over time, which more or less correspond to the epidemic’s evolution (in terms of its prevalence and scientific advancement but also in terms of public framing of the disease), the pace of state intervention (and its consequences in terms of public funding, political representativeness within public agencies, development of employed work, and professionalization), and the creation of a multi-organizational field (see Epstein 1996 and Gould 2010 on the USA; Fillieule & Duyvendak 1999, Pinell et al. 2002, and Broqua 2005 on France; Rosenbrock et al. 2000 on Europe).

Five distinct phases in the social responses to AIDS so far can be distinguished. The boundaries between these are not clear cut. Each country exhibits around a generally shared trajectory its specific configuration and some features recur throughout, though with different
emphases. Nevertheless, each period has its own distinct characteristics.

The emergence of AIDS as a public issue: 1981–1982

This phase is characterized by two major features. First, an awakening sense of anxiety amongst those most immediately affected (the so called four H’s): homosexual men, heroin users, members of the Haitian community, and haemophiliacs. However, with the causes of the illness unknown, and the fear of the possible effects of AIDS on the achievement of gay liberation increasing, the responses remained contested and confused. Those who advocated sexual abstinence or safer sex were denounced for encouraging discrimination and delivering the community back into the embrace of medical discourse (Weeks 1989). In the USA, for example, the National Gay and Lesbian Task Force (NGLTF) was thus opposed to health measures which, in their view, restricted their sexual freedom, for instance the banning of saunas (Shilts 1988). Second, this period saw the development of the characteristic style of governmental response that was to dominate the subsequent years: widespread indifference and what could be called “institutional shadenfreude.” Many factors explain this situation: In the United States and the United Kingdom (and to a lesser extent elsewhere in Europe) the AIDS epidemic occurred at the very moment that the state was reducing government expenditure. There was also the overwhelming fact that AIDS was a disease that seemed to be confined to marginal communities at a time when the view that the gay revolution had already gone too far had become more widely prominent (Weeks 1989). Above all, the virulent homophobia of political elites prompted the earliest negligent and punitive institutional responses in the 1980s (Crimp 1990; Patton 1990) and contributed to blinding society to AIDS among women and people of color because it was only seen as a “gay disease.”

Moral panic: 1982–1985

The stigmatization of people with AIDS and its identification as a “gay plague” or “gay cancer” were central to the second phase (Weeks 1989). Now identified as a distinctive set of diseases with definable modes of transmission, AIDS became the bearer of a number of political, social, and moral anxieties, including issues such as sexual promiscuity, permissive lifestyle, and drug use. This period was characterized by three main features: First, the rapid escalation of media and popular hysteria which fed potent streams of homophobia and racism, and facilitated the development of “rituals of decontamination,” with lesbians and gay men being refused service in public venues, children with the virus being banned from schools, and the dead being left unburied (Weeks 1989). Second, in 1983–1984 the Human Immunodeficiency Virus (HIV) was at last identified and in 1985 a test for HIV was developed. This opened new opportunities for responding to the disease, offering a way to build “diagnostic,” “prognostic,” and “motivational” framings (Snow & Benford 1988). Indeed, these events made tens of thousands of people aware for the first time of the deadly threat surrounding them. Previously, the only people really interested in the discovery of an effective treatment were those positively diagnosed as having AIDS, many of whom could not actively engage in the campaign due to the state of their health. Those diagnosed HIV positive, but not yet showing symptoms of full-blown AIDS, were obviously more strongly motivated to campaign. In the end, the discovery of HIV lead to anti-viral research, and then to a new and attainable demand that medical treatments be made available as soon as possible. As a consequence, this period saw the emergence of a massive self-help response from the lesbian and gay communities. Organizations such as the Gay Men’s Health Crisis in New York, the Terrence Higgins Trust in London, or Aides in France became, in the absence of coherent national strategies, the main vehicles of health education, social
support, and political lobbying for the cause (Altman 1987: esp. ch. 5; Pinell et al. 2002; Chambré 2006).

This phase is reflected in increasing involvement of public authorities in the struggle against an epidemic the public image of which started to change as a result of the first data emanating from AIDS tests. Because of the fear that AIDS might infiltrate the so-called general population, governments begin to respond on a larger scale by setting up public campaigns aimed at preventing the spread of the virus, as well as significantly increasing the funding of self-help groups. As a consequence, voluntary groups underwent a dual process of differentiation and of institutionalization with the multiplication of associations orientated toward specific groups of people (hemophiliacs, blood-transfusion patients, drug-addicts, and children), in addition to a significant “professionalization,” as paid staff increased and demands upon their services increased. In this context, a new alliance between the medical profession and the communities at risk began to be forged. The desire to integrate into the decision-making structures of the state and the diversification of the groups of people under its charge had several effects: First, the increasing enrollment of heterosexual women, participating in a spirit of solidarity, motivated by their professional involvement in the (traditionally female) field of health and social services (Patton 1990). As a result, homosexual volunteers started to feel a sense of dispossession, as much from the growing de-homosexualization within the associations as from the fact that AIDS sufferers had been deprived of a direct voice in deference to professionals speaking on their behalf (one starts to speak of an “AIDS establishment” and of the “AIDS business”). Second, the methods of managing the AIDS problem through associations went hand in hand with a political neutrality which prevented the adoption of any critical stance vis-à-vis the numerous and obvious deficiencies of governmental politics, especially in terms of prevention (Fillieule & Duyvendak 1999; Gould 2010).

In the fourth phase, which ran up to the middle of the 1990s, AIDS turned into a chronic affair, which led to the first erosion of its special status. This phase is also marked by the establishment of new associations, with the objective of giving the sick back their voice, of clearly establishing a link between homosexuality and AIDS, and of refusing to cooperate with the political authorities who were clearly not doing everything they could to fight the epidemic. This regeneration of the associational set-up is mostly due to the creation of ACT UP (AIDS Coalition To Unleash Power), an agit-prop style radical group formed in New York City in March 1987 that used theatrical, direct-action tactics. ACT UP chapters soon sprouted up across America, quickly forming a national direct-action AIDS movement, totaling more than 80 chapters in the country and around 30 internationally at its peak (Stockdill 2003; Broqua 2005; Gould 2010). ACT UP chapters used direct action tactics (marches, die-ins, sit-ins, phone and fax zaps) to target antiviral drug prices, poor government funding for research and prevention, the slow development of AIDS medical research, and inaccessible clinical trials (Epstein 1996; Stockdill 2003; Broqua 2005; Gould 2010). The coalition also challenged cultural norms that condemned homosexuality. This cultural defiance included throwing condoms at public officials, same-sex kissing in public places, and unfurling banners promoting safer sex at public events. ACT UP’s mission to emphasize the value of queer lives and vocally defy the status quo was encapsulated in the powerful slogan “silence=death” which appeared on T-shirts, banners, and posters, along with the symbol of the pink triangle that gay men were forced to wear in Nazi
concentration camps during the second World War.

A fifth phase began, more or less, with the discovery and marketing of Highly Active Antiretroviral Therapies (HAART) in 1996–1997, with numerous political and social consequences. First and foremost, new antiretroviral therapies extended potential lifetime dramatically, offering new perspectives to People Living With AIDS (PLWA), based both on hope for a better and longer life, and the return of material constraints (mainly in terms of work and bread and butter issues). HAART considerably modified the public image of the epidemic. This gradually shifted from that of a fatal illness to that of a chronic disease, resulting in a certain social and political demobilization. In terms of activism, the period is characterized by a tendency of long-term activists to burn out, often exhausted by the intense demands of their total investment in the cause (Maslanka 1996; Fillieule & Broqua 2005), which they then replaced with more sporadic involvement of diminished intensity. This “burnout” phenomenon, combined with growing despair due to the absence of significant progress in finding a cure and/or a vaccine largely explains why after 1995/1996 there are no longer national, mass-based grassroots movements in developed countries. For example ACT UP was largely defunct after 1995 in the United States (Gould 2010), and if it still exists in France, it has experienced a dramatic decrease in terms of volunteer flux, as well as mediacial and political influence (Broqua 2005). In turn, many grassroots AIDS service organizations became increasingly institutionalized during this period. The end of the 1990s witnessed further bureaucratization and a parallel shift away from protest within many AIDS agencies.

Another important trait of the fifth phase is the growing awareness of the AIDS epidemic as affecting certain people more than others. In the USA, AIDS strikes minorities more than whites (Stockdill 2003), and around the globe those who are poor or disenfranchised. Indeed, it is one of the most catastrophic phenomena that has impacted, and continues to impact, people’s lives in sub-Saharan Africa and other developing countries. Large numbers of NGOs are now working in prevention, support, and care projects funded by international donors and in collaboration with Western grassroots movements. Each organization implements a combination of intervention strategies, depending on their funding base, ranging from condom distribution to posters and providing care for PLWAs. These organizations work typically in the context of poverty and are concerned with poor people’s well-being. They try to deliver better services by building partnerships with other actors. However, partnerships often mean that NGOs construct themselves in regular and predictable ways to benefit from the international resources relations. In the near future, one can expect the emergence and development of advocacy-oriented groups, more activist-oriented groups engaged in direct action, and pursuing democratic participation in scientific or policy decisions of the most deprived populations of the south.

LESSONS FROM AIDS MOVEMENTS

It is quite astonishing that social movement researchers have remained largely uninterested in AIDS movements considering their political importance and socioeconomic impact all around the world. Another striking fact is that most of the research has been conducted by gay and lesbian researchers, pointing to the existence of a latent homophobia in the academy and the fear of being stigmatized as homosexual and/or living with AIDS. However, research on AIDS movements has greatly helped to pose new theoretical questions and to constructively criticize the dominant paradigm in the field. Above all, by widening their definition of social movements’ strategies and tactics, scholars in the field have blurred distinctions between insiders and outsiders and, as a consequence,
challenged the utility of the “political opportunity” model.

The diversity of AIDS movements can be summarized by a strategy and agenda continuum. At one end of the continuum are advocacy-oriented social movement organizations, working within the existing system and biomedical model, using smooth tactics (e.g., education), and tending not to push for lay knowledge to be inserted into expert knowledge systems. At the other end of the continuum, activist-oriented groups engage in direct action, challenge medical practices, and pursue democratic participation in scientific or policy knowledge production by working largely outside the system. Because of this diversity, AIDS movements involve a degree of collaboration that blurs the distinction between experts and lay people, movement insiders and outsiders, and between challengers and the state. They merge as state officials, scientists, and others who may not typically be thought of as “within the movement” but can work together (Brown et al. 2004: 64). In the same vein, one cannot easily explain the birth or the decline of AIDS movements by mobilizing the political opportunity model. AIDS movements are strongly rooted in the illness experience and the exigency of health demands: “Those with ill health and/or limited access to needed medical services do not have the luxury of waiting for ripe political opportunities before mobilizing, and they often organize despite political constraints. Furthermore, by emphasizing change in science and medicine, [these movements] focus contention against arenas other than State and political bodies” (Brown et al. 2004: 59).

Finally, the strongest contribution of AIDS research to social movement theory certainly lies in the emphasis put on the personal, lived experience of social movement activists. As a matter of fact, as Morgen stated (2002: 230), one cannot “understand the agency of political actors without recognizing that politics is lived, believed, felt, and acted on all at once. Incorporating the experience of social movement involvement into analysis and theories about social movements may be difficult, but it adds a great deal to what we can learn about politics, social transformation, and political subjectivities” (see also Goodwin, Jasper, & Polletta 2001 for similar remarks). This emphasis on the transformation of personal experiences into collective action and how identities can be shaped by these experiences has been central in AIDS movement research, introducing the subjective experience of the disease and the biological body as the source of movement identity (Stockdill 2003; Broqua 2005; Fillieule 2010; Gould 2010) and by vividly illustrating the importance of “intersectionality” (i.e., interlocking systems of oppression generated by class, race, gender, and age differences). Hence internal movement divisions are often influenced by activists’ own experiences with inequality as well as their prior political experience (Stoller 1998; Stockdill 2003).

Ainu indigenous rights movement (Japan)
Kiyotaru Tsutsui

Social movements by the Ainu, an indigenous people in Japan, started in earnest in the 1970s, influenced strongly by the expanding global indigenous rights movement, and have achieved some significant successes since then. The Ainu today are descendants of populations that have inhabited northern parts of Japan for thousands of years but have been pushed northward by mainland Japanese governments throughout history. As the Meiji Restoration (1868) established a modern state in Japan, the Meiji government incorporated northern islands in Japan as the Hokkaido prefecture in 1869, making official the Ainu’s subjugation to mainland Japanese. The government encouraged mainland Japanese to move to Hokkaido and implemented policies to assimilate Ainu populations into the Japanese mainstream. This policy, symbolized by the 1899 Hokkaido Former Aborigines Protection Act, destroyed the traditional Ainu ways of life and their communities and threw them into severe poverty. Although the Japanese government took remedial measures to improve their living conditions, these measures were not a result of Ainu activism. Some Ainu associations emerged during the democracy movement in Japan (mid-1920s to early 1930s), but the Ainu’s ethnic/indigenous identity was confined primarily to cultural spheres, such as in novels and poetry. Heavily reliant on government welfare, their political voice was largely muted, especially as Japan entered World War II.

Even after the end of the war, the Ainu’s dependence on the government did not fade immediately, as many Ainu leaders of the time still had the mentality that assimilation was the best way to improve their lives. Ainu leaders formed the first truly Hokkaido-wide Ainu organization, the Hokkaido Ainu Association in 1946, but the organization was not so much a political organization as a mutual assistance association to funnel government welfare. The Hokkaido Ainu Association’s activities fizzled out fairly soon, and in 1961 it even changed its name to the Hokkaido Utari Association, fearing that the term “Ainu” (a neutral term that means “human” in Ainu language) had such derogatory connotations that it reflected negatively on the members. This symbolized the lack of indigenous/ethnic pride, much less political activism, among the Ainu in this period.
