In the 1970s, as waves of leftist activism in Japan slowly reached Ainu communities and as Ainu leaders traveled to indigenous communities abroad and learned about the indigenous rights that they could claim, Ainu indigenous rights activism emerged for the first time. Several Ainu movement organizations were founded that were more politically active and focused more on indigenous rights than previous Ainu associations. The most influential movement organization, however, was the Hokkaido Utari Association, which was by far the largest Ainu organization. In 1984, reversing its long-term support for the Hokkaido Former Aborigines Protection Act on the ground that it provided minimum welfare protection for the Ainu, the Hokkaido Utari Association proposed a Draft New Ainu Law, which claimed many indigenous rights, such as protection of indigenous culture and attainment of economic and political autonomy. From this point on, the goals of Ainu social movements shifted from assimilation and acceptance into the Japanese mainstream and the attainment of greater welfare provisions toward acknowledgment as an indigenous people and the pursuit of indigenous rights. As indigenous rights movements were expanding globally, Ainu activists used international forums and networks to pressure the Japanese government. While they lobbied
politicians and staged protests domestically, they leveraged international forums effectively to pressure the Japanese government. Most prominent such examples include an appeal to the UN Commission on Human Rights in 1986 and a speech by the Director of the Hokkaido Utari Association in the UN General Assembly in 1992, as well as many statements made by Ainu leaders at the UN Working Group on Indigenous Populations and the UN Permanent Forum on Indigenous Issues. These activities bore fruit as the Japanese government first recognized the Ainu as a “distinct” group in 1987, then as an “ethnic minority” in 1991. Then, after years of deliberation on the Draft New Ainu Law, the government legislated the Ainu Cultural Promotion Act in 1997, taking only the cultural component of what the Hokkaido Utari Association had proposed. The government still refused to acknowledge the Ainu as an indigenous people, for fear that such a recognition would entail significant material compensations. The government agreed, however, that when a declaration on indigenous rights passed in the UN, it would change its position on the Ainu’s indigenousness. When the Declaration on the Rights of Indigenous Peoples was adopted in the UN General Assembly (and which Japan voted for) in 2007, the government moved quickly to pass a resolution in the Diet (national parliament), recognizing the Ainu as an indigenous people in 2008. The government has established committees to examine appropriate policies for the Ainu since the Diet resolution. In the meantime, the Hokkaido Utari Association changed its name to the Hokkaido Ainu Association in 2009, reclaiming its old name and affirming its indigenous pride.

Alinsky, Saul (1909–1972)

MARIA K. DILLARD

Saul David Alinsky (January 30, 1909–June 12, 1972) was one of the most influential social reformers in post-World War II US history. The legacy of his work and his writings are considered to be foundational to modern community organizing in the United States. Alinsky’s ideas about organizing for change have come to be known as his own method. Alinsky is the author of *Reveille for Radicals* (1946), in which he details a political philosophy and methodology for radicalism, and *Rules for Radicals* (1971), in which he sets forth principles of community organizing through a call for revolution. Alinsky’s contributions, particularly his work with the poor, have earned him international recognition and notoriety.

Alinsky grew up on the South Side of Chicago, where he received his education at the University of Chicago. He did graduate work in criminology and then went to work as a criminologist for an Illinois state prison (Alinsky 1971). During the 1930s, Alinsky started the Back of the Yards Neighborhood Council in Chicago. This coalition brought together the Catholic Church and the Meatpackers Union and was able to achieve major landmark concessions from the meatpacking industry. His organizing work was focused on improving the lives of the poor and working-class communities of Chicago, California, Michigan, New York City, and elsewhere in the United States (Horwitt 1989). In 1940, he started the Industrial Areas Foundation (IAF), which remains active today within the United States and internationally (IAF 2010). Alinsky and his foundation started a training institute for organizers and shifted their focus to organizing the American middle class during the 1970s (Alinsky 1971).

ALINSKY’S IMPACT

Alinsky’s ideas are believed to have altered American democracy (Time 1970). His teachings have influenced professional community and labor organizers and leaders, disciples like Fred Ross and Edward T. Chambers, movement leaders like César Chávez and Dolores Huerta, and prominent national leaders like Hillary Clinton and Barack Obama, among many others. His impact has been compared regularly to that of Thomas Paine. Paine, one of the Founding Fathers of the United States, is known for his radical vision for society. As an author, intellectual, and revolutionary, he was among the first to advocate against slavery, war, and poverty, and for social programs for the working class and elderly (Bernstein 2009). The writings of both Paine and Alinsky have inspired change and created controversy. In part, this judgment of his impact is a result of the influence of Alinsky’s work on the civil rights movement, the farm-workers’ movement, and the political protests of the Vietnam era, as well as many modern movements that evolved from the grassroots political organizing of the 1960s. During nearly four decades of organizing for social change, Alinsky was a polarizing figure because his methods were extremely confrontational and were aimed at empowering the poor and people of color to act against the enemy and change the conditions of their lives. His ideas continue to create controversy today (Vogel 2010), serving as further testament to his lasting legacy.

THE ALINSKY METHOD

In *Rules for Radicals* (1971), Alinsky laid out basic principles to guide radical organizers and the “People’s Organizations” they established. The principles of his organizing method begin with an emphasis on the education of...
organizers and communication, an organizer’s most essential quality. Alinsky (1971) identified the organizer’s function clearly: “to agitate to the point of conflict” (117). The organizer is also charged with cultivating a unified opposition to a clearly identified enemy, which includes the organizer being clearly in solidarity with the people being organized. Organizers were encouraged to focus on a limited number of strategic targets, in part to ensure success. An organization that experiences more small victories was better able to gain the confidence of community leaders. The members of the “People’s Organizations” should be convinced of a great and unbridgeable distance between the enemy and themselves. In this way, compromise was not an acceptable goal. For Alinsky, the ultimate goal of the process is simply to “crush the opposition” (1946: 150).

Alinsky also proposed 13 specific rules for direct action tactics that serve as guidance for the interaction of People’s Organizations with their opposition. These rules include never going outside of the experience of the people who are being organized, while going outside of the enemy’s experience as often as possible. Alinsky (1971) believed that an organization’s tactical choices should be informed by the people using them, the amount of time required for deploying the tactic, the strength of diverse tactics and actions, and the degree to which a tactic contributes to the strategic pressure placed on the opposition.

THE ALINSKY IAF LEGACY

In the later years of Alinsky’s life, the IAF became stagnant. However, following Alinsky’s death, the IAF underwent a significant transformation that included a revision of the IAF method of organizing and the pioneering of the congregation-based organizational form. The new leaders of the organization, Edwards Chambers, Richard Harmon, and Ernie Cortes, analyzed the successes and failures of the IAF and through this process discovered patterns of movements and community organizations (Rogers 1990). They used this information to rebuild a stronger, more solid organizational force, relying on relationship building and an emphasis on values as key strategies.

Faith-based values conferred critical resources on congregation-based organizations (CBOs) operating within the IAF. CBOs benefited from dense community networks, an improved ability to reach consensus on issues, and additional legitimacy based on ties to religious organizations (McCarthy & Walker 2004; Swarts 2008). These benefits are part of the story provided by Mark Warren (2001) in a rich account of the successful replication of the congregation-based organizational form within the IAF’s Texas network.

Despite the importance of CBOs, the IAF remains essentially a political organization, focused on issues related to community life and not on controversial social issues. Its targeted political base is within all types of voluntary institutions (e.g., religious congregations, homeowner groups, recovery groups, parents’ associations, immigrant societies, schools, seminaries). This base is used to compete, confront, or cooperate with leaders in the public and private sectors. As efforts to recreate the IAF’s approach to organizing emerged, the use of Alinsky’s radical direct action tactics remained a part of the IAF’s repertoire. Today, this legacy continues through the IAF’s active presence in multiple states and countries and through the work of approximately 150 professional IAF organizers (IAF 2010).

Alinsky’s method of organizing represented a departure from previous conceptions of community organizing in which professional agencies were externally imposed on the community only to play a superficial role in the community’s life (Alinsky 1941). According to Alinsky, the Back of the Yards Neighborhood Council was an experimental demonstration of his method that represented “the mobilized sentiment of the community as articulated through their indigenous organizations” (1941: 802). When a community is organized and moved to act, Alinsky believed it became a movement (1941).

American Revolution

PATRICK GRIFFIN

The “American Revolution” has confounded historians since the late eighteenth century. It still does. The term, usually unbounded by quotation marks, is freighted with a great deal of baggage. It always has been. In their famous debates on the eve of the Civil War, Abraham Lincoln and Stephen Douglas portrayed the revolution as the touchstone of American identity, the event that made Americans exceptional. The freed slave turned abolitionist Frederick Douglass also saw the revolution as an event that made Americans exceptional, but in his eyes, exceptionally hypocritical. For Americans today, it still conjures up all sorts of images ranging from muskets and Betsy Ross, to the states’ rights and the pursuit of happiness. More critically, it still serves as focus for the basis of civil life. It still frames debate of who Americans are and what they would like to become. The modern Tea Party movement is a vivid example. So too those who argue that the Tea Party gets the revolution wrong. They have, critics suggest, picked the right event to understand what makes Americans American, but they have interpreted it incorrectly.

Historians see things in a similar light. They have debated whether it was a failure or not, and whether it focused on the struggle for home rule or who was to rule at home. Some have argued that it was a measured revolution, one less radical and violent than the French Revolution. Others believe, because it did not liberate slaves, Indians, or women, that it was not a revolution like, say, France’s. Progressive in language and intent, it failed to live up to its promise. Americans may have gained political independence but not personal independence. These are still the terms of debate, as they have been ever since the revolution itself. In effect, scholarly debate about the meaning of the American Revolution reflects broader cultural debates within American society. What all of these voices – popular and scholarly, past and present – have lost sight of is what made “the American Revolution” a revolution.

If it is viewed as a process, the American Revolution appears like a revolution, in that it had a beginning, a middle, and an end. It also remade the face of society even if it did not transform society as some hoped. That transformation, it should be added, ran more deeply than the transition from British to American rule. The process of revolution revolved around the idea of sovereignty: where ultimate power was to be located, how it would be legitimated and exercised, and upon what ideas it would be based. The origins, outcomes, and progression of the process centered on sovereignty. Moreover, the idea of an “American Revolution” emerged from the ways the process played out in America, or how the process cohered to distinctive American characteristics. The revolutionary process canonized contradictions that had animated this society from the colonial period. In many ways, viewing America’s revolution as an American process offers a way to integrate different scholarly views of the American Revolution and to pull together some of the monographic work done on the American Revolution over the past generation.

ORIGINS

America’s revolution began in many ways as a struggle over how Britain’s North American colonies would be integrated into the British state after the Seven Years’ War. In fact, the events leading up to revolution resembled a British civil war. In many ways the American colonies were some of the most British places in the world. Over the course of the eighteenth century, what had been English colonies strewn up and down the Atlantic coast
were becoming British provinces. Through the movement of peoples, goods, and ideas, the colonies were coming to resemble Scotland and Ireland, that is marchlands with distinctive histories and peoples also tied together through and to the English center. In the seventeenth century, English men and women had migrated to America. In the eighteenth, Scots and Irish immigrants streamed into port towns. Planters and merchants built English-style Georgian houses. Men and women from all stations increasingly imported consumer goods from England, Scotland, and Ireland. Moreover, the first experience colonists had as “Americans” involved the movement of English preachers such as George Whitefield traveling from colony to colony. The event or phenomenon we know as the “Great Awakening” was an Atlantic-wide phenomenon that drew all ranks of Americans from all of the colonies to the British center. Americans, especially Benjamin Franklin, also consumed British ideas. A number of prominent men became members of Britain’s Royal Society. All in all, Americans were growing closer to Britain by the 1750s. Their culture, like that of Britain’s other provinces, drew its cultural inspiration from the center.

This is not to say that the colonies were carbon copies of Britain. Like each of Britain’s provinces, the colonies were more like variations on a common rule. Slavery was the defining institution of economic, social, and political life in the southern mainland colonies, in much the same way it was for the Caribbean colonies. Indians lived on the edges of white settlement to the West. Throughout British North America, land was more readily available, and because of this, common men had greater access to political participation. Nonetheless, these were British provinces in much the same way Scotland and Ireland were; that is, societies with distinctive tensions and social configurations sharing officially sanctioned cultures centering on Protestantism, maritime commerce, and political freedoms.

With the Seven Years’ War, this dynamic became more pronounced. Beginning in 1754, the British fought the French on every known continent of the world. America, particularly its frontier regions, became the central theater of operations for what would be known in America as the French–Indian War and to the British and the French as the Seven Years’ War. British officials dispatched armies and material to American port towns. Local American militia units fought side-by-side with redcoats. The effect of wartime experiences was to yoke the colonies more closely to Britain. By the end of the war, Americans, like their fellow subjects in England, celebrated the victory over France. Americans such as Franklin and the Boston minister Jonathan Mayhew prophesied that the empire would grow in strength, power, and unity.

The war, however, also created unforeseen problems. Land and debt proved the two most pressing issues. The British national debt had ballooned by the end of the war. Meanwhile, with the signing of the Treaty of Paris in 1763, which brought the war to a formal conclusion, Britain now controlled land from Hudson Bay to the Gulf of Mexico and from the Atlantic Ocean to the Mississippi. They divided this empire into two parts by drawing a “Proclamation Line” down the Appalachians. West of the line, they would rule indigenous peoples as part of a territorial empire. East of the line, they would look to incorporate colonists politically into the British state. The Proclamation Line, then, dealt with the issue of space. Legislation would address the question of revenue. The passage of revenue provisions such as the Sugar Act and Stamp Act were meant to address the issue of debt while treating Americans exactly like other provincials.

Colonists, of course, exploded. The Stamp Act, in particular, drew their ire. The act was designed to tax stamped paper that would be used for official documents in the colonies and for everyday goods, such as newspapers. With even the rumor of its passage, colonists rioted, remonstrated, and wrote pamphlets championing their rights as Britons to consent and contesting parliament’s authority over them. On the one hand, resistance to what parliament
was trying to do emerged from principle: taxing colonists without their consent was un-British, flying in the face of the ideological bases of Britishness itself. On the other hand, rioting in cities revealed how local tensions, many socio-economic and tied to a postwar recession, were finding a release through taking to the streets. Up and comers, like Samuel Adams, who encouraged active popular resistance, hated the well-connected officials who governed the colonies. The lower sort despised the well-heeled. Similar sorts of tensions animated every British province. It should be noted, however, that the passage of similar measure in Ireland and Scotland also occasioned violence. America, however, lay 3000 miles away. Coercing the colonies would be difficult. Because of distance, moreover, British patronage had its limits. And Americans did not fear an “other” like Scottish lowlanders fretted over highlanders and Irish Protestants feared Catholics. The equivalent in America – Catholic France – had been banished by the Treaty of Paris. Making America British politically, in other words, would be a difficult proposition.

In 1766, parliament relented, repealing the Stamp Act but passing in its place a Declaratory Act. The passage in 1766 of this Declaratory Act, which made the point that the British parliament was supreme in America, declared that the ideal of sovereignty that tied England to Scotland and Ireland would be extended to the American colonies. This act, like its Irish counterpart passed in 1719 made the case that parliament could legislate for American affairs “in all cases whatsoever.”

Parliament continued to pass laws, which the colonists continued to resist. The Townshend Duties resulted in more riots and pamphlets. These measures, named after the Chancellor of the Exchequer, Charles Townshend, placed taxes on the goods of empire, those things not produced but consumed in the colonies, such as glass, paint, and tea. In these years, Americans also created local committees of correspondence to coordinate inter-colonial resistance. They also made the first halting steps toward non-importation and boycott. Tensions, in other words were not relieved. Nor were they tamped down by coercion, though the British made such gestures in 1768. In the wake of further unrest, troops were dispatched to Boston to try to defend parliament’s prerogative. The “Boston massacre” was the result. For a few years after British troops killed a few American subjects – whom John Adams referred to as “a motley rabble of saucy boys, negroes, and mulattoes, Irish teagues and outlandish jack tars” – quiet returned to much of America. That state of affairs ended in 1773 with the passage of a Tea Act designed to resurrect the fortunes of the failing East India Company. The company would be able to sell tea directly to consumers, at a cheaper price. Americans, decrying monopoly, took to the streets again. A small number dumped some of the tea into Boston Harbor. What would be later called the “Boston Tea Party” proved the last straw for parliament. Now pressing for more effective measures, most of its members voted to pass a series of Coercive Acts to bring Americans to heel. The port of Boston would be closed until the tea was paid for; the military would govern the colony of Massachusetts; and democratic privileges were revoked.

The act spelled the end of British rule in America. In 1774, Americans met as part of a Continental Congress to discuss common strategy. Although some moderates still insisted on sending olive branch petitions to the king, more believed that British sovereignty was compromised. Congress also passed “the Association,” a plan to ensure that Americans did not consume British goods or export American goods to the British Isles. Meanwhile, each of the colonies sent goods to relieve the beleaguered Bostonians. What had been ad hoc associations were playing quasi-sovereign roles.

Similar dynamics gripped the West. As soon as the British passed the Royal Proclamation of 1763, poorer settlers took advantage of the measure to squat on lands beyond the reach of civil law. Speculators hatched new plans for the West as well, figuring it was just a matter of time before a more pliant ministry allowed settlement or the creation of new western colonies.
Indians struck back. Violence seethed in the western areas. Soon officials in America suggested bending the line to relieve pressure. In 1768, Crown officials, who were also principals in speculative schemes, signed a treaty with the Iroquois at Fort Stanwix, ceding the Kentucky country to future settlement. The Indians who regarded the region as theirs, especially the Shawnees and Cherokees, began launching new raids on settlements. Although the ministry in Britain tried to disavow the treaty, the West teetered in an unmanageable direction. As the violence escalated, and as the British proved unable to contain it, the ministry decided to abandon the West. In 1772 and 1773, as more troops were needed in the East, a number of key western forts were abandoned. The West devolved then into a state of nature. The British parliament tried to reassert some control of the vast space they inherited after the Seven Years’ War, passing in 1774 the Quebec Act, which allowed Catholics in the province to practice their religion freely. More critically, the act also tried to establish a civil government for the western regions north of the Ohio River. American colonists considered the act odious—after all, it too flew in the face of the ideology of Britishness. But by this time, the West was lost. Like the East, the British program of sustaining sovereignty in America had failed.

THE STRUGGLE FOR SOVEREIGNTY

When British authority had effectively collapsed, Americans vied with one another to restore sovereignty. They also vied with the British. The period between 1774 and the mid to late 1780s was defined by this dynamic. As different groups competed, some people began finding their voices for the first time. Women played disproportionately important roles in non-consumption and in policing compliance with resistance to British rule. They did not do so as progressive revolutionaries but as guardians of a moral order as deference was collapsing. Slaves ran away in unprecedented numbers, many to join the British cause. A number of commanders offered the slaves of “rebels” the opportunity to support the British cause—some as soldiers, most in supporting roles—if they ran away to British lines. Thousands of slaves, then, saw the tumult of revolution as a way to declare their own independence. Indians, particularly young men, also saw the chaos of the period as an opportunity to assert their claims to land. This was the case with Cherokees and Shawnees. Delawares at first vacillated, but with time most cast their lot with the British. And, of course, poorer white men were playing important political roles as members of local committees. In other words, in the years of war, Americans were becoming politicized, and as this happened the older deferential attitudes that tied society together were coming undone.

The War of Independence was part of this process. Indeed, the American and British causes were the two most viable programs for reconstituting sovereignty in this fallen American world. In 1776, after violence had broken out throughout the colonies, members of the Second Continental Congress declared independence. In so doing, they suggested that the British had turned their backs on the ideals of Britishness itself, and the king, far from being a protector, was acting as an aggressor. Parliament had overstepped its bounds. The social compact, in other words, had been annulled. In its place, Congress—now a sovereign entity—was reconstructing the social compact. Congress also created an army with George Washington as its commander. He was one of the few Americans with substantive military expertise and, as a Virginian, Washington could testify to the fact that independence was not only a New England affair. Americans of all stripes, particularly young men who were worrying about their future in a world pinched by economic woes, allied to the cause. This trend was pronounced throughout the colonies, from Virginia to Philadelphia, and Maine to the countryside around Boston. Indeed, the first months of the war were defined by what
was called the *rage militaire*, a moment of mania for all things military.

All Americans did not agree. About 20 percent of all Americans remained loyal to the Crown. Highland Scots tended to remain loyal, as did Anglicans from the North and those who had served as British functionaries and officials. The numbers fluctuated with the fortunes of war and differed from region to region. In parts of the backcountry of the Carolinas, for instance, the decision to remain loyal or not depended on how one’s neighbors went. Because the region was fraught with tension before the war, the stakes for choosing were high, and would explain the appalling levels of violence in the region during the war years. But ultimately, the decisions of individuals to support the American cause or to remain loyal were tied into the contest for sovereignty. Most loyalists saw the rebellion as unnatural. They saw the rebels as those who were shredding the social fabric with no regard for order. They also thought that many of their neighbors were choosing the losing side. Loyalists encouraged the British ministry to believe that American hearts and minds could be won back to the Crown. If regions could be militarily secured or isolated, America could be brought into the fold.

The British more or less followed this strategy. After early losses around Boston, they set their sights on New York and securing the Hudson River corridor. Holding this would isolate New England from the other rebellious colonies. Early commanders also hoped to land a *coup de grace* against the symbol of American pretensions to sovereignty, the Continental Army. The British failed on both counts.

In fact, the weaknesses of the American army ensured the British could not land a deathblow. Washington struggled to instill basic discipline in the first years of warfare. Unseasoned and undisciplined troops could not withstand the British, and at their first real pitched battle on Long Island, they were surrounded by the British and ran. But they lived to fight another day. Throughout 1776, Washington ran to stay one step ahead of the British, retreating up the island of Manhattan, through Westchester, and the finally across New Jersey. By the end of the year, his exhausted troops crossed the Delaware, burning their boats as they did so. A British force settled in for Christmas across the river in Trenton. Desperate for some victory, and worried as the enlistments of many of his troops were due to expire, Washington crossed the Delaware on Christmas Eve and surprised the British and their Hessian allies in the barracks at Trenton. Washington followed up this victory by defeating the British in a small skirmish at Princeton. Hardly the stuff of myth, but it did hold Washington’s army together.

The British also blundered their way to defeat. Most famously, a British army was surrendered to the American northern army, largely composed of local militia in 1777. In that year, General John Burgoyne tried to march down the Hudson River corridor from Quebec. As he tried to get to the Hudson River, his men ran low on supplies. His Indian allies began to desert him. The Americans, coming from a region rife with social tensions in which they viewed the British cause as the cause of powerful local landlords, attacked, defeating Burgoyne’s army. With his defeat, the French recognized the American republic and signed on to an alliance. What had been a colonial rebellion now became a war with a hated ancient enemy.

As the war years continued, many American communities erupted along their fault lines. In other regions, the war eased tension or gave them direction, muting violence. In regions of the South, for instance, white communities mobilized to raise slave patrols to ensure that violence and discord did not get out of control. Anxious that their labor force would flee, southern planters had a stake in order. In regions close by, such as the backcountry, violence escalated to almost Hobbesian dimensions. When British forces landed in the South after Burgoyne’s debacle, both dynamics were amplified. In others still, the war liberated people. With war, women took on roles as deputy husbands, acting in place of husbands and
fathers. They also gained greater visibility as society was thrown back on a subsistence basis. During periods of shortage, they ensured that merchants did not hoard or price gouge. The lower sort had also found voices. The poorest men, including immigrants, were serving in the Continental Army. For instance, more than a quarter of the army was Irish. One tenth was African-American. Frontier folk had to fend for themselves, especially as the war became more violent with the French alliance. After the early strategies had failed, policymakers in Britain began to turn to frontier warfare to sap American strength out East. They turned to some of the nations of the Iroquois and to disaffected Indians living along the western borders of the rebellious colonies. Washington responded by dispatching an army to destroy Iroquoia, creating a humanitarian crisis for Britain’s western forts. Most frontier settlers, however, had to fend for themselves. As the British began launching mixed Indian-ranger raids on isolated settlements, settlers began raising their own units, usually to savage nearby Indian communities. In one grisly episode, a force from Washington County, Pennsylvania, killed 96 peaceful Delawares. These people – like other groups – were, in effect, becoming self-sovereign in the crisis of sovereignty.

The British realized that they could not make good on their claims to the colonies in 1781. In that year, they lost another army, this time at Yorktown, to a combined American–French force. With the surrender, a British band played a seventeenth-century tune called “The World Turned Upside Down.” Referring to the English Civil War, during which normal relationships were inverted, the tune spoke to what had happened to America in the eighteenth century. Not only had an upstart army defeated a battle-tested European force, but, in addition, people who had been subjects in a world defined by deference had become, in the tumult of revolution, self-sovereign citizens. The Battle of Yorktown eventually led to a ceasefire. Finally, in 1783, a treaty was signed in Paris bringing the war to a formal end.

OUTCOMES

The war had ended, but not the revolution. Certainly, order did not prevail. The American United States were–not was–sovereign in a legal sense. Sovereignty, however, had little substantive meaning. The new multi-state state could not protect its borders; it could not enforce its laws; it could not secure domestic authority. It also struggled with a postwar recession and the stagnation of international trade. Debt proved perhaps the most confounding issue faced by all. Individuals had little money, states owed millions, and the federal government under the aegis of Congress owed tens of millions to its citizens and to other nations. In the West, violence continued almost unabated. Raids by disaffected Indians were sponsored in some cases by the British, who refused to leave some frontier outposts on American soil because of prewar debts that had gone unpaid and because loyalists had not been compensated for property confiscated during the war. Some settlers on the western and northern frontiers were threatening to secede. Perhaps most critically, men and women, black and white, settler and Indian, had been living in a society without legitimate limits for years. Violence had defined the tenor of existence for many places. Unrest was the rule of thumb in others. And throughout the states, people had been acting in self-sovereign fashion for more than a decade. Reconstituting order would not be easy.

In solving these vexing problems, the new nation had some advantages and disadvantages. On its side was the fact that America’s counterrevolutionaries had fled. Tens of thousands of loyalists, including former slaves who had served with the British military, had left for Britain, the Caribbean, and especially British Canada. Because of their flight, the terms of debate within the United States would be limited to participation in the struggle against Britain. Debate occurred within the context of sacrifice for the American cause, as a return to British sovereignty was literally out of the equation. On the minus side,
however, the nation was hamstrung by its political framework. Outside of organizing the West for future expansion into new states, the Articles of Confederation proved disastrous for efficacious government. They also did not inspire the confidence of legitimate government. The articles were stitched together during the war as a provisional league or alliance between sovereign states to prosecute the war. Like the quasi-sovereign institution that gave birth to them – Congress – the articles grew more from exigency than design. Each state had one vote in Congress, so that the smallest could thwart the wishes of the rest, the executive had no substantive power, and most damningly, the confederation government had no ability to tax. This meant that states maintained their autonomous and sovereign status in theory and in practice. Given the problems confronting the new republic in the 1780s – and debt was perhaps the most alarming one – a weak central government would not be able to bring order to a society crippled by war and reeling from revolutionary unrest.

The crisis came to head in 1786 in western Massachusetts. In that year, settlers in the region, most of whom had fought for the patriot cause, were struggling with high taxes, foreclosures, and eastern legal claims on their property. Under a former officer named William Shays, these self-styled regulators sought to overthrow local governance. Alarmed, easterners raised an army to dispatch the Shaysites. As many conceded that such disturbances were likely to continue, representatives from a number of states decided they had to act to secure the union and ensure that order would prevail. So in 1787, delegates met in Philadelphia to “re-vise” the articles. By the end of this convention, they had created a new constitution.

The Constitution was one part of an emerging revolution settlement that created a new, more efficacious governing structure for the United States. The new frame of government placed more power in the hands of the central government. Popular voices, though canonized with an invocation of popular sovereignty – “We, the People” – were muted through a division of powers and buffers such as the Electoral College. At the same time, financiers reorganized the nation’s debt. The central government would also assume this authority. The nation secured its border a few years later with treaties with the British and with the Spanish. Finally, in 1794 the nation also established its ultimate authority in the most vexing region, the West, by dispatching armies to destroy a Native American confederation and to suppress rebels who were threatening secession over an excise on whiskey. By 1800, with Thomas Jefferson’s election as president, the citizens of the United States had come to a broad consensus over a number of key issues: the nation’s political economy – one based on western expansion and on commercial and industrial development in the East; the limits of political discourse – a citizenry that knew the bounds of liberty and that feared French-style radicalism; and that through efficacious laws and the judicious use of violence, the new nation could and should enforce its sovereign status.

The outcomes of revolution reflected the constraints and possibilities of the period and of the colonial history of the states. Outcomes also involved negotiations that centered on bringing a disorderly process to a close. Some of these negotiations proved peaceful; others involved coercion. In this calculation, some people lost. Slaves would not be freed. Southerners, particularly elites from South Carolina and Georgia, would not accede to union without guarantees for their “peculiar institution.” The Constitution, to the contrary, put the institution in a virtual lock-box. Indians would be forced off their land to ensure tranquility in the East and commercial development for the new nation. Women would not be given rights equal to men – though they had not clamored for such rights – but would be considered the guardians of republican virtue. Poorer men would also cling to the margins of society, be it on the frontier one step ahead of speculators or in eastern cities as wage laborers. They would, however, gain unprecedented political rights. The cost of the revolution settlement, therefore,
was born on the backs of some groups, while others earned the proverbial half-loaf. The settlement of revolution, therefore, reflected the ways order had broken down in diverse societies, how the process played out in such locales, and the negotiations that took place to end the disorder of revolution and to knit these places with their distinctive histories together in an orderly and stable whole.

The idea of the “American Revolution” emerged from this dynamic. The notion of the “American Revolution” as the touchstone of identity took shape within a generation of the event itself. The earliest historians—most notably David Ramsay and Mercy Otis Warren—did not agree about the political implications of the revolution but agreed that it had made Americans an exceptional people. Both of these histories acknowledged the limitations of the revolution, especially as they pertained to slavery; but they believed that the necessity of union trumped freedom for all. The person of Thomas Jefferson, the author of the Declaration of Independence and a slaveholder, epitomized this seeming contradiction. Indeed, a veneration for the founders—or their demonization—suggests that the idea of the “American Revolution” is bound up in the idea of paradox. But those paradoxes the “American Revolution” canonized were tied to the process of revolution. This had been a revolution. It had also been American.

Royster, C. (1996) A Revolutionary People at War: The Continental Army and American Character,
Amnesty International
PIERRE MONFORTE

Amnesty International (AI) is probably the most important international nongovernmental organization acting for human rights. It was founded by a lawyer – Peter Benenson – in London in 1961, for the defense of the “forgotten prisoners” in Portugal and for freedom of expression. Soon, several national sections were created and the organization extended its activities to the fight against torture, disappearances, and the death penalty. Today, Amnesty International has 2.2 million members, supporters, and subscribers active in 150 countries. Its mission is the defense and promotion of “internationally recognized human rights.” It was awarded the Nobel Peace Prize in 1977 for its international campaign against torture.

Amnesty International can neither be categorized as the constituent of an “old” or of a “new” social movement. It is not organized around a shared socioeconomic interest, nor around a shared ideology or identity. Also, it is centralized and professionalized, but it has a significant activist basis. This originality is mainly linked to its international character and it is visible in three main areas: its mission; its repertoire of collective action; and its organizational structure.

MOBILIZING FOR THE DEFENSE OF INTERNATIONAL HUMAN RIGHTS: THE “MORAL AUTHORITY” ARGUMENT

The nongovernmental organizations working for the defense of international human rights are among the oldest organizations active at the international or transnational level: for example, the International Society for the Abolition of Slavery originated in 1839. It is however in the 1960s and 1970s that most of the organizations of the “transnational human rights movement” (Smith, Pagnucco, & Lopez 1998) were created, in the context of the cold war and the decline of the international human rights order that emerged after the Second World War. Amnesty International (like Human Rights Watch or the World Organization Against Torture) was created in order to promote a universal vision of human rights. The objective was to defend human rights independently from states’ ideological and political considerations during the cold war, and so to denounce human rights abuses in the East and in the West systematically. In the view of these organizations, human rights abuses could be denounced without endorsing the political or ideological cause of those who were victims, and so without giving support to regimes which could also commit abuses. In this regard, the juridical instruments available at the international level – the Universal Declaration of Human Rights in particular – provide a “moral authority” (Hopgood 2006) that situates individual rights above states’ politics. This strategy of “diplomacy of conscience” (Clark 2001) explains why AI traditionally refuses to take position in favor or against any form of political or economic system.

THE INTERNATIONAL CAMPAIGN: A PRAGMATIC REPERTOIRE OF COLLECTIVE ACTION

Amnesty International’s repertoire is mainly based on the design and implementation of international campaigns. This repertoire is pragmatic because it is based on the formulation of concrete demands addressed to governments through a normative vocabulary (the respect of an international convention or the liberation of a prisoner for example). It is also pragmatic because all members are
Amnesty International asked to play an active role in its implementation. Three main modes of mobilization are interrelated in the definition of these international campaigns. The first – and most common – is the direct call against a particular case of human rights abuse. A good example is the monthly Postcards for Prisoners campaign launched in 1965. The second is to act through lobbying campaigns at various levels. At the international level, AI has a privileged access to international organizations thanks to its consultative status given by the United Nations, the Council of Europe, and UNESCO since the 1960s. This has permitted AI to play a crucial role in the adoption of new instruments such as the UN Convention against Torture, which came into force in 1985. At the national level, AI’s goal is to trigger a “boomerang effect” (Keck & Sikkink 1998): its sections lobby governments, demanding them to respect their international engagements or to adopt new international instruments. Finally, AI’s repertoire targets the public opinion. It launches global campaigns of consciousness raising through communiqués in the media, symbolic actions, or the distribution of educational material. Amnesty International’s work of investigation is fundamental in these three forms of collective action. Its research team launches regular public reports on specific cases (such as the Mumia Abu-Jamal case in 2000), or more general issues (such as the political killings by governments in 1983), which set the terms of the international campaigns.

Acting Globally and Locally

In organizational terms, Amnesty International’s originality lies in the fact that it conciliates a strong supranational professionalized and centralized structure with a wide local activist basis. The relations between both levels are guided by democratic principles. AI’s central structure is composed of the International Secretary and the Secretary General, the Senior Directors, and the International Executive Committee. They coordinate the work of 50 national sections, 20 committees, and hundreds of local groups. The biennial International Council Meeting gathers together representatives from all sections and committees and adopts AI’s general orientations. These are then translated into international campaigns by the International Secretary. Until recently, the autonomy of the national sections was limited: their role was to implement missions defined by the central agencies. For example, only the International Secretary could write a report and define a specific “case” (an individual defended by AI). This led to strict limitations about what a section could do about human rights abuses in its own country (the Work on Own Country Rule). It could also lead to tensions between the definition of the international campaign and national specificities.

Amnesty International’s Evolution in the 2000s

The International Council Meeting held in Dakar in August 2001 introduced significant changes in the organization and mission of Amnesty International. These changes were mainly motivated by many of its members who were also involved in the emergent global justice and peace movement and who urged AI to play a role in it (Poinsot 2004).

Concerning the organizational structure, more autonomy was given to the national sections and structures and to the local groups, who are now allowed to produce their own reports. More importantly, AI’s mission was extended to the promotion and defense of social, economic, and cultural rights. This led the organization to work against discriminatory practices concerning women or ethnic minorities, for example. This evolution is recent and AI’s mission is still essentially focused on the defense of civic and political rights. It is, however, a significant evolution as it could lead Amnesty International to become a generalist organization.

Antiapartheid movement (South Africa)

INEKE VAN KESSEL

The origins of nationwide organized protest against first segregation and then apartheid in South Africa can be traced back to the founding of the South African Native National Congress (SANNC) in 1912. After the Union of South Africa was established in 1910, the political rights and economic security of black people came under increasing attack. Following the defeat of the Boer Republics in the Anglo-Boer War (1899–1902) reconciliation with the defeated Afrikaners was achieved at the expense of black South Africans. Laws restricting African landownership and African mobility underpinned a system of racial segregation devised to compel Africans to become wage laborers on white farms or in white-owned mines and industries.

Organizations representing the interests of nonwhite South Africans began to appear in the last quarter of the nineteenth century. Educated Africans founded newspapers and organizations to express their concerns. The Natal Indian Congress was launched in 1894, followed in 1902 by the African People’s Organization that represented the interests of educated colored people. However, the South African Native National Congress was the first political organization to be constituted on a national rather than regional basis, with the aim of extending citizenship and franchise to all South Africans on a nonracial basis. In 1923 it changed its name to the African National Congress (ANC).

In its first decades, the ANC’s leadership was mainly drawn from the educated elite, while traditional chiefs were also represented in its hierarchy. Most of the senior leaders had attended mission schools where they had imbibed the universalist ideals of Christianity, progress through education, and liberal democracy. The founding of the SANNC was a response to the Natives’ Land Act (1913) that restricted African landownership to the Native Reserves, about 7 percent of South Africa’s territory. The ANC’s preferred tactics initially consisted of petitions, publications, and deputations to London but these proved ineffective.

During the social upheaval of the 1920s, the ANC was eclipsed by more militant movements, notably the Industrial and Commercial Workers’ Union (ICU), which included dock workers and industrial laborers, as well as farm workers. The Communist Party of South Africa (CPSA), formed in 1921, was another catalyst toward more militant methods of protest and resistance. In 1927, the ANC’s new president, Josiah Gumede, traveled to Moscow with the CPSA’s James la Guma, which marked the beginning of a relationship between the ANC and the Communist Party that has endured in one form or another ever since (Dubow 2000: 13). Both African nationalism and communism became part of the political tradition of the ANC. The communist tradition stressed nonracialism and class solidarity, while the nationalists championed racial and national interests. The balance of power between the two would shift back and forth over the following decades but these competing traditions produced an ideology with broad popular appeal, offering a middle ground for an African nationalism with egalitarian ideals. The ICU and the CPSA did not, however, manage to sustain a mass following during the 1930s, and the ANC split into factions.

URBANIZATION

In the 1940s, the ANC entered a phase of mass politics under the leadership of Alfred Xuma, a medical doctor who had trained in the
United States and Europe, and the organization revived its organizational structures, improved its financial situation, and extended full membership rights to women. This decade saw rapid urbanization. As South Africa had joined the Allies during World War II, thousands of white soldiers and nonwhite auxiliaries left for the front, leaving the main urban centers facing a labor shortage. As blacks flocked to the towns, the strict controls on the movements of Africans were temporarily relaxed. Trade unions rather than nationalist organizations became the main mouthpiece for workers' grievances. In 1945, membership of the revived ANC stood at around 4000, while the Council of Non-European Trade Unions represented over 150 000 workers in more than 100 affiliated unions. The trade union movement however suffered a massive setback when a strike by more than 70 000 African miners in 1946 was violently suppressed by the police.

ANC YOUTH LEAGUE

A decisive push toward a modern, more radical nationalist movement came with the formation of the ANC Youth League in 1944. Xuma was initially opposed to an autonomous youth branch and a more militant mode of action but the Youth League gained control of the ANC's National Executive at the ANC conference in 1949. Its Programme of Action bore the stamp of Anton Lembede, a young lawyer from Natal who emphasized the need for African pride and self-reliance while rejecting the paternalistic influence of both white liberals and communists. He dismissed communism as an ideology alien to Africa, a sentiment that for some years was shared by Nelson Mandela. Lembede's philosophy, which he himself had labeled "Africanism," was an impediment to the formation of broad alliances which involved non-African organizations, such as the Indian Congresses and the multiracial Communist Party.

The Youth League jealously guarded the principle of African leadership and was averse to joint campaigns with communists or Indian activists. In spite of some confrontational activity, pragmatism and flexibility tended to prevail, particularly after the 1948 victory of the National Party, which started implementing its rigid policies of apartheid or "separate development."

BECOMING A MASS MOVEMENT

The ANC then embarked on a campaign of boycotts, strikes, and civil disobedience, which transformed it into a nationwide mass movement for the first time. However, peaceful protest and civil disobedience failed to stop the apartheid state’s repressive machinery. Crushing black protest served to increase the popularity of the National Party government.

A landmark in mass mobilization was the Defiance Campaign that was launched in 1952 in protest at unjust laws. This campaign of civil disobedience was largely inspired by Gandhi's principle of satyagraha, the nonviolent tactics of noncooperation and noncompliance, which he had first tested during his years as a lawyer in Natal. The Defiance Campaign was conducted by an alliance that became known as the Congress Alliance, a broad multiracial and ideologically diverse spectrum including the ANC, the South African Indian Congress, the (Colored) African People’s Organisation, the SACTU trade union movement, the Federation of South African Women, and the communists. Anticipating the official ban in 1950, the Communist Party had dissolved itself and many African communists had shifted their energies to the ANC while white communists regrouped in the Congress of Democrats.

The Defiance Campaign was planned to coincide with the official celebrations in June 1952 of the tercentenary of Jan van Riebeeck's arrival at the Cape of Good Hope. By defying unjust laws, notably the pass laws and the segregation of public transport, post offices, parks, and other public amenities, the ANC hoped to swamp the police stations and prisons with
volunteers and render apartheid unworkable. Between June and December 1952, over 8000 resisters were arrested and jailed. Participation was patchy, with the Eastern Cape and the Transvaal being the main centers of protest. The Defiance Campaign subsequently achieved iconic status in ANC historiography, producing much of the imagery and the repertoire of protest that would continue to inspire later generations of antiapartheid protest. But it failed to achieve its aim: no laws were withdrawn, the state apparatus continued to operate, and the government responded with more repressive legislation and measures.

FREEDOM CHARTER

The 1950s was a decade of unprecedented mass politics. Urban protest joined with rural uprisings through organizations of migrant workers and clan networks. Mass protest was not, however, translated into sustained organization. A celebrated moment in ANC historiography was the Congress of the People in 1955, a gathering of over 3000 who convened to adopt the Freedom Charter. The Charter lists a series of civil liberties and welfare provisions in housing, healthcare, and education. But two clauses would prove divisive. The Charter proclaims that South Africa belongs to all who live in it, black and white. This was contested by the Africanist tendency in the ANC who believed that Africans had prior rights. The other clause was that ownership of the mines, banks, and monopoly capital would be transferred to the “people as a whole.” Opponents argued that the process had been guided by communists who had managed to include this demand for nationalization of the pillars of the economy. ANC historiography stresses the broad participatory process that preceded the drafting of the charter, which was to become the founding document of the Congress Alliance.

RACE AND CLASS

The communists, now operating underground in the reconstituted South African Communist Party (SACP), developed an ideological underpinning of their alliance with the nationalists in a “two-phase strategy.” In the first phase of the liberation struggle, a broad alliance of workers and middle class would bring about the “National Democratic Revolution,” after which the forces of the left would continue to the second phase, the communist revolution. Africanists interpreted the multiracial message of the Freedom Charter as a betrayal of the Programme of Action initiated by the Youth League. In their view, the conflict had to be defined primarily in racial terms: oppressed Africans versus white domination. In 1959, the Africanists, led by Robert Sobukwe, broke away and founded the Pan Africanist Congress (PAC). It would later fade into insignificance but in about 1960 it made a more propitious start in Africa and around the world than the ANC had. The Pan-African message and the glorifying of pure black nationalism was very much in tune with developments elsewhere on the continent, while the anticommunist message made the PAC more palatable in Western capitals.

While the ANC and the PAC embarked on a competitive drive for mass support, the state’s response to the Freedom Charter was a massive crackdown. By charging 156 activists of the Congress Alliance with treason, it succeeded in paralyzing much of the movement for five years. However, the accused did manage to use the courtroom as a platform to publicize their antiapartheid cause until the Treason Trial finally ended with the acquittal of all the accused in 1961.

Meanwhile, both the ANC and the PAC had been planning antipass protests. To preempt a mass ANC campaign, the PAC led a march by thousands of people who were going to hand in their passes at the police station in Sharpeville in the industrial triangle south of Johannesburg on March 21, 1960. But the police panicked and opened fire, leaving 69 people dead. In the next few days, waves of protest intensified in various parts of the country and, on April 8, both the ANC and PAC were banned and a State of Emergency enabled the police to crack down on
protesters with impunity. Initially, large-scale capital flight and fears of more revolutionary upheaval caused an economic downturn but confidence was soon restored and the economy embarked on a period of unprecedented growth. The limitations of peaceful protest had become all too obvious and the ANC and PAC started planning armed resistance.

ARMED RESISTANCE

The ANC initially limited itself to largely symbolic sabotage actions or “armed propaganda.” While the ANC attempted to avoid casualties, the PAC’s armed wing, Poqo, was not averse to attacking whites. Promising freedom by 1963, the PAC harbored a naive belief in the spontaneity of mass action, hoping that spectacular deeds of revolutionary violence would spark off a general insurrection. Although armed resistance would escalate later, it never became a real threat to the military might of the apartheid state but did lead to an atmosphere of insecurity. Only after neighboring states had achieved independence did armed incursions become a viable option.

The amateur nature of the ANC’s initial attempts at armed resistance was revealed in 1963 when the police arrested its leadership, which had gone underground, in a raid on a farmhouse in the Johannesburg suburb of Rivonia that served as their headquarters. The subsequent Rivonia Trial ended in life sentences for Nelson Mandela, Walter Sisulu, and the six others who were charged with sabotage.

BLACK CONSCIOUSNESS (BC)

In the early 1970s, a new movement emerged, initiated by students and radical clergy, notably Steve Biko and Barney Pityana. The first priority of the Black Consciousness movement was psychological liberation: freeing Africans of their sense of inferiority. BC followed in the Africanist tradition of the Youth League and the PAC but was more sophisticated. Black was now defined in an inclusive sense, accommodating coloreds and Indians too. It was influential among students in secondary and tertiary institutions and served as a source of inspiration for the Soweto high school students who on June 16, 1976, marched in protest at the introduction of Afrikaans as a medium of instruction in black high schools. Rioting spread and by the end of the year some 600, mostly young, people had died. In 1977 Biko was beaten to death in police custody, thus becoming a martyr to the BC cause. The Soweto revolt rapidly achieved iconic status in liberation history. Many graduates of the 1976 revolt were to play key roles in the revival of mass protest in the 1980s.

THE ANC IN EXILE

After his acquittal in the Treason Trial, the ANC sent Oliver Tambo abroad to set up an organization in exile. Under his moderate and inclusive leadership, the ANC remained a broad alliance. In exile, the alliance with the SACP became strategically significant as it assured a steady supply of military resources while Tambo’s diplomatic skills slowly paved the way for the ANC’s acceptance in Western capitals as well. The framework of the alliance solved the problem of accommodating non-racialism in an African nationalist movement. While the ANC emphasized African leadership, at the Morogoro conference in 1969 it opened up membership to “minority groups,” that is whites, coloreds, and Indians. Over the years, the ANC has cleverly managed to target a variety of domestic as well as international
REVIVAL OF INTERNAL RESISTANCE

The 1970s witnessed a revival of political activity, first on the labor front and subsequently in black high schools. Wildcat strikes in Durban in 1973 persuaded more enlightened employers that a trade union movement, even if militant, was preferable to spontaneous unorganized protest. In 1979 the government legalized the black trade union movement, which would later become a powerful force in the antiapartheid alliance.

While these instances of protest in the 1970s were largely isolated and spontaneous, diverse strands of protest in the 1980s coalesced into a broad alliance against apartheid, the United Democratic Front (UDF), which was launched in 1983. Youth and students were the powerful driving force but they had realized that an alliance with workers’ movements was essential if they were to have any lasting impact.

The UDF was initially conceived as an ad hoc movement that was set up to contest the 1983 Constitution that had granted voting rights to coloreds and Indians while continuing to exclude Africans. The UDF’s boycott campaign of the elections for separate parliamentary houses for coloreds and Indians was a resounding success. Although the UDF had not planned its future strategy beyond this campaign, a series of rallying points arose when local township protests turned violent and were suppressed by a massive show of force by the police and the army. In July 1985 a state of emergency was declared but the massive crackdown did not end the waves of protest. Investors lost confidence in the future of South Africa, which led to a refusal to renew loans to the government and a collapse of the currency. The international solidarity campaign to isolate South Africa through boycotts and sanctions now gained momentum.

At its peak between 1984 and 1986, South Africa experienced an unprecedented explosion of often violent protest and harsh repression. Many instances of protest and revolt occurred spontaneously and were not controlled by the UDF or directed by the ANC in exile. As street battles escalated, the dividing lines between political activists and township gangs became blurred.

The UDF’s front-formula proved suitable for accommodating a wide variety of affiliates, including youth and student organizations, township-based residents’ organizations known as civic associations, church-related organizations, trade unions, and women’s groups, as well as the revived Indian Congresses. The UDF deliberately projected a rainbow image, ensuring a racially representative panel of Africans, Indians, coloreds, and whites was always present at important gatherings. Its inclusive strategy succeeded in attracting large numbers of colored people in the Western Cape as well as progressive whites in various parts of the country. Ideologically eclectic, the UDF nevertheless clearly identified with the banned ANC but also managed to absorb a significant part of the Black Consciousness generation. It developed an effective working relationship with the largest trade union federation, the Congress of South African Trade Unions (COSATU), which was formed in 1985. Initially, the newly legalized unions focused on building a strong union organization but, almost inevitably, they found themselves drawn into the political arena.

A rival federation, the National Council of Trade Unions (NACTU), inspired by the legacy of the Black Consciousness Movement, was formed in 1986. Total union membership at this point stood at around 1.5 million. The trade union movement was a powerful ally
at the national level but members also played a prominent role in community organizations at township level. Their experience in mobilizing and organizing around workplace issues proved a valuable asset for community organizations tackling the rent crisis, insecurity on the streets, and public transport issues.

The UDF’s repertoire of actions proved suitable for mobilizing large numbers of nonpolitical followers. The civic associations focused mostly on bread-and-butter issues which were perceived as nonpolitical. Involvement in political activity was considered risky but participation in rent protests was seen as relatively low risk and could deliver immediate benefits. As township residents stopped paying rent increases and later stopped paying rent altogether, their disposable incomes grew. High school students also focused on immediately relevant issues, such as demands for free textbooks and an end to corporal punishment. Religious leaders provided legitimacy for challenging the apartheid state, something that was increasingly projected as a moral duty. The UDF infused bread-and-butter issues with a wider significance. It reintroduced the ANC as the prime focus of antiapartheid resistance by popularizing its imprisoned and exiled leadership, its symbols and colors, and its political program, as enshrined in the Freedom Charter.

As the 1980s progressed, a substantial number of UDF followers developed a millenarian perspective of a nonracial, egalitarian society based on participatory politics. The fall of the Berlin Wall in October 1989 provided the decisive push toward a negotiated settlement in South Africa as the government no longer feared that the ANC, if elected, would automatically bring the communists to power as well. While the ANC assumed power in 1994, the PAC and its offshoots were relegated to the margins and lost all credibility as a political alternative.

KEYS TO THE ANC’S ULTIMATE VICTORY

Saul Dubow succinctly sums up the factors that ultimately led to the ANC’s victory. First, for most of its history, the organization had exercised policies of moderation and inclusion, with its leadership disposed to seeking the political middle ground. It had been able to absorb militant Africanists and radical Marxists while sticking to its moderate policies. Second, as the oldest African resistance movement, the ANC had accumulated enormous reserves of symbolic capital: its survival for three decades in exile and imprisonment was an achievement that conferred authority and legitimacy on it. Of crucial importance was the powerful image of the imprisoned leadership on Robben Island, who were unwaveringly loyal to the cause and a shining example of moral authority. While imprisoned, they were not tainted with the inevitable foibles and mistakes of active politicians. Their long stint in jail made Nelson Mandela and his peers into larger-than-life symbols of the struggle for a just society (Dubow 2000: 107–109).

While the ANC became institutionalized when it became the ruling party, the mode of popular action that originated with the UDF continues to inspire a new generation of social movements that is addressing issues such as the HIV/AIDS pandemic, the housing crisis, and land issues.

Anticolonial movements
KURT SCHOCK

Anticolonial movements (which may be referred to as national liberation or independence movements) are organized struggles to resist formal external subjugation and promote self-determination.

More militarily powerful societies have been subjugating less powerful ones throughout history – at least since the emergence of states in the horticultural and agrarian eras – and it continues to this day. The formal process of colonization generally refers to the conquest of the Americas, Asia, and Africa by European powers during the sixteenth to the twentieth centuries (Easton 1964). Colonization involved the coercive or violent expropriation of land and resources of indigenous societies by more militarily powerful countries. This was often accompanied by the exploitation of labor, the destruction of indigenous culture, and environmental degradation. Western forms of administration and extractive export-oriented economies replaced indigenous political and economic relations. Colonization was typically justified as a method for “civilizing” non-Europeans.

Colonization of the Americas by the Spanish and Portuguese began in the sixteenth century and continued through the eighteenth. In the seventeenth and eighteenth centuries the English, and to a much lesser extent the French and Dutch, colonized parts of the Americas as well. Parts of Asia were first colonized in the sixteenth century by the Portuguese and Spanish, followed in the seventeenth century by Dutch colonization of the East Indies and English colonization of parts of South and Southeast Asia, and French colonization of Indochina in the nineteenth century. This was followed in the late nineteenth century by the era of “high imperialism” whereby European powers, which had controlled coastal enclaves in Africa for centuries, began seizing the entire continent. Seven European powers – England, France, Spain, Portugal, Belgium, Germany, and Italy – divided the continent into 40 colonies without regard for indigenous states or societies. By 1914, only Ethiopia and Liberia remained independent of European control.

Colonization provoked anticolonial movements that varied with regard to ideology and strategy. Early anticolonial movements in the Americas adopted democratic ideals of the Enlightenment. Contact with Western ideas among the elite in Asia and Africa led to the adoption of nationalism as the most potent frame of anticolonial movements (Emerson 1960; Anderson 1991). In different places, nationalism was infused with liberalism and/or Marxism. Awareness of anticolonial movements in other countries promoted transnational solidarities, which were sometimes manifested in Pan-African or Pan-Asian blends of nationalism and internationalism. Strategies for self-determination ranged from petitioning for constitutional reform to mass-based nonviolent or violent direct actions.

THE AMERICAS

The earliest anticolonial movements occurred in the Americas. From 1765 to 1775 revolutionaries in the 13 English colonies organized numerous campaigns of nonviolent resistance against English rule, including boycotts, political noncooperation, and the formation of parallel political institutions (Conser et al. 1986). The struggle turned violent in 1775, when armed militias confronted English troops in the Battles of Lexington and Concord, and continued until the surrender of the English in 1781. The nationalist revolutionary movement was infused with liberal ideas of the Enlightenment and culminated in the formation of a democratic state.
Subsequent anticolonial movements in the Americas were inspired by the liberal ideas of the American and French revolutions, as well as by nationalism. The violent rebellion in Haiti against French rule, from 1791 to 1804, culminated in Haitian independence. Most Spanish colonies in the Americas – from Mexico to Argentina – attained independence between 1810 and 1825; however, these struggles were as much civil wars as they were anticolonial movements. The royalists, composed of Spanish and Spanish Americans, fought against the independistas, composed of Spanish Americans, mixed races, indigenous peoples, and slaves of African descent. Brazilian independence from Portugal in 1822 also resulted from a liberal movement that took up arms against the monarchy.

**Asia**

Anticolonial movements in Asia emerged in the nineteenth century and gained momentum in the twentieth, especially during World War II when imperial Japan challenged the rule of Europeans in Asia. In Southeast Asia, anticolonial movements mobilized against British rule in Burma and Malaya, Dutch rule in the East Indies, and French rule in Indochina. Ho Chi Minh, inspired by the liberalism and nationalism of the American and French revolutions as well as the anti-imperialist ideology of Marxism, led the anticolonial movement in Vietnam. The Vietminh, a broad national front, engaged in armed guerrilla struggle against imperial powers for four decades, defeating the French in 1954 and the Americans in 1975.

In British India, peasants and tribals sporadically waged local rebellions against the East Indian Company from the seventeenth century onward. The first major widespread revolt, the Rebellion of 1857, led to the dissolution of the East India Company and direct rule by the British Crown. From the 1850s onward, various elite-based organizations lobbied and petitioned the British for constitutional change. A nationalist independence movement began to take shape with the founding of the Indian National Congress (INC) in 1885, which petitioned and negotiated with the British for increased self-rule, gaining only modest concessions.

The anticolonial movement was transformed after the return of Mohandas K. Gandhi to India from South Africa in 1915. Gandhi differed from moderates, who pursued constitutional methods, and extremists who were willing to use violence to attain independence. Assuming a leadership position within the INC, Gandhi transformed it from an elite to a mass-based organization that became the vehicle for mass-based campaigns of nonviolent protest and noncooperation that contributed to Indian independence, attained in 1947.

**Africa**

Anticolonial movements in Africa emerged after World War I and gathered strength after World War II. At the Bandung Conference in 1955 leaders of independent states of Asia and Africa called for increased efforts to promote independence and human rights, which facilitated transnational solidarities and support for anticolonial struggles. The United Nations was also influential in promoting decolonization. The United Nations’ Resolution 1514, the Declaration on the Granting of Independence to Colonial Countries and Peoples, adopted by the General Assembly in 1960, provided increased leverage to anticolonial movements.

In the British Gold Coast, Kwame Nkrumah led the struggle for independence. He was inspired by the Pan-African ideology of W.E.B. Du Bois, as well as by Gandhi’s strategy of nonviolent resistance. In 1950, through the Convention People’s Party, Nkrumah began organizing mass-based campaigns of “positive action” – nonviolent strikes, boycotts, and noncooperation. The campaigns gave momentum to the anticolonial movement, which culminated in the independence of Ghana under the leadership of Nkrumah in 1957.

In Portuguese Africa anticolonial struggles in Guinea-Bissau, Angola, and Mozambique were shaped by Amilcar Cabral, an influential theorist and activist who promoted Marxist ideology and a strategy of guerrilla warfare (Cabral 1979). The protracted struggles precipitated a coup in Portugal in 1974, which led to the overthrow of Salazar and a democratic transition. The democratic government subsequently withdrew from its remaining colonies in Africa and Asia.

Throughout Africa the indigenous elite denounced the hypocrisy of Europeans whose ideals of liberty and equality diverged sharply from their racist and oppressive colonial policies (Derrick 2008). Bourgeois nationalist movements in Africa that emerged in the interwar period became increasingly radicalized following World War II with the adoption of Marxist ideologies and strategies for social change. Frantz Fanon, who grew up in French-ruled Martinique and later participated in the anticolonial struggle in Algeria, was influential in this regard.

GANDHI AND FANON

Gandhi and Fanon were two influential theorists and practitioners of anticolonial movements whose political thought remains relevant today; the former for his theory of nonviolence and the latter for his analysis of the relation between racism and imperialism. Both Gandhi and Fanon criticized the hypocrisy of European powers, adopted nationalism, and mobilized direct action to promote self-rule. Yet they diverged sharply with regard to the strategies they promoted and their visions of postcolonial society.

In The Wretched of the Earth, Fanon argues that violence is necessary for national liberation as the violence of the colonizers can only be defeated with greater violence (2005). He viewed violence as a legitimating force for newly independent nations. Fanon imitated the violence of the colonists and embraced Western “development” albeit in a Marxist variant. Gandhi, by contrast, attempted to break from the Europeans not only by attaining independence but also by rejecting Western violence and “development.” Gandhi promoted a decentralized and self-sufficient rural economy. He also maintained that the British ruled India not because of their superior violence, but rather because India had given herself to them. Gandhi identified the critical role of indigenous collaboration and cooperation in the subjugation of India. In Hind Swaraj he states the “English have not taken India, we have given it to them” (1997). This crucial insight was the basis of his mass-based campaigns of noncooperation and resistance.

RECENT AND CONTINUING MOVEMENTS AGAINST EXTERNAL SUBJUGATION

Although the formal process of European colonization ended, the subjugation of countries by more militarily powerful states continues. Racist ideological justifications have been disregarded in favor of justifications based on “national security.” These attempts at subjugation, however, have been problematic in an era of human rights and self-determination.

Subjugation has occurred through direct military conquest and incorporation of territory into more militarily powerful states, such as the Chinese occupation of Tibet in 1950 and the Indonesian occupation of East Timor in 1975. Similarly, in the aftermath of World War II, Russia incorporated much of Eastern Europe into the Soviet Bloc. These subjugations subsequently led to nationalist “anticolonial” movements for self-rule. The nonviolent Solidarity
Movement in Poland in the 1980s contributed to the end of Soviet rule in Poland and triggered nationalist movements throughout Eastern Europe and the Soviet Union (Beissinger 2002). In East Timor, a guerrilla insurgency against Indonesian forces was ineffective, but after the movement shifted to nonviolent resistance and cultivated international grassroots support, independence was attained in 2002. The Tibetan struggle is ongoing.

Furthermore, the United States continues to engage in violent invasions and occupations, despite its failure to impose its will on Vietnam through military force in the 1960s and early 1970s. In the first years of the twenty-first century the United States invaded and occupied Afghanistan and Iraq, triggering ongoing violent insurgencies for self-determination that draw on nationalism and Islamic fundamentalism.

Anticrime movements in Latin America
DIANE E. DAVIS and GRAHAM DENYER WILLIS

Legacies of authoritarianism and contested state formation have left Latin America awash in violence (Davis 2010), with rates of homicide, murder, kidnapping, and robbery on the rise. Cities have been particularly hard hit, owing to unemployment, income inequality, and other structural causes including neoliberal economic reforms and drug trafficking (Astorga 2002). With minimal progress in curtailing violence despite government efforts otherwise and limited public trust in state capacities to reduce criminality due to high rates of police corruption (Davis 2006) or a weak judicial system (Ungar 2002), citizens take security matters into their own hands. Their actions coalesce in an array of anticrime social movements, broadly defined here as collective action targeted against the perpetrators or enablers of rampant criminality and insecurity.

Because anticrime social movements are a relatively new phenomenon, departing in conceptual, discursive, and strategic ways from Latin America’s long history of citizen mobilization around democracy and regime change, the field is in its infant stages. Only recently have scholars started to systematically identify the predominant strategies and tactics employed by citizens to fight against crime (Bergman 2006) with most attention to date focused on Brazil (Denyer Willis 2009), Mexico (Alvarado 2006), Colombia (Moser & McIlwaine 2004), and Central America (Cruz 2006). Initial concern with anticrime collective action traces to the 1990s when citizens adopted vigilante tactics like community lynching to punish criminals and establish social order in the face of an ineffective legal system (Goldstein 2004). First examined by anthropologists preoccupied with traditional forms of popular justice in village settings (Godoy 2006), vigilantism caught the attention of social movement scholars when increasing numbers of urban-based citizens engaged in neighborhood-based lynching, vigilantism, and other forms of community retribution. The turn to violence rather than formal criminal procedures and court processes soon became identified as a form of self-help collective action and a means of proactive protection against those who produced an environment of abuse and fear.

Despite its appearance in both richer and poorer parts of Latin America, ranging from Bolivia and Guatemala to Brazil and Mexico, lynching remains a “weapon of the weak” (Scott 1985) deployed primarily by the excluded and politically or economically marginalized citizens who lack political access to the state or have been denied other more conventional resources for mobilization or collective action. Those with more resources and a history of political influence prefer to employ traditional social movement tactics and organizational strategies in the fight against crime, ranging from marches and other forms of coordinated protest to public advocacy and the deployment of new media technology (Davis 2006). Many citizen-led anticrime organizations use web tools and social networking sites such as Orkut to mobilize social and political support. Because these organizations derive their influence from the numbers of citizens they can mobilize, they differ in form, content, and impact from citizen crime “watches,” community policing programs, and individual adoption of gating and other private security measures. These activities may enable individual citizens to make some headway in establishing security and reducing crime at the neighborhood level, but they neither attack the root sources of the problem nor ensure that problems of rampant criminality reach the larger public agenda. Anticrime movements, in contrast, engage a
wider constituency beyond the neighborhood, call attention to state failures in solving these problems, and seek a transformation in the political, economic, or social conditions that allow criminality to flourish unabated.

With concern about crime widespread and trust in government low, many anticrime social movements avoid the state in the search for partners in the struggle against crime (Fuentes 2005). Efforts to target or engage the legislative process also remain limited, given the weakness of the courts and the abuses of political parties (Ungar 2002), although those organizations with access to international NGOs and legal consultants, such as the regionally active Lawyers’ Committee for Human Rights, increasingly place such reforms on the legislative agenda. These trends have led to a bifurcation of anticrime movements into two distinctive camps: one concerned with social order and forceful criminal punishment, and the other with human rights and democratic accountability. The former are best seen in “hard line” citizen movements that target criminals and whose members are willing to work in tandem with local police or the business community in seeking legislation and resources for incarcerating perpetrators. This frequently means support for new laws that enhance police powers no matter the cost in human rights, often by criminalizing youth behavior and restricting access to public space. In contrast, the latter movement activists seek to guarantee human rights while also reducing violence (Goodale & Engle Merry 2007). They prioritize notions of democratic accountability and equality of gender and/or socioeconomic status, using an international legal regime of human rights and its attendant discourse. They are more willing to bypass the state and instead work with NGOs and multilateral agencies in the development and deployment of their anticrime activities and legislative aims (Fuentes 2005); and when they do engage the state, it is to seek increased accountability from government agencies and to argue for a democratic rule of law and a more responsive judiciary capable protecting both citizens and criminals.

To the extent that rights-oriented anticrime movements share elective affinity or organizational membership with those who in prior decades struggled for democracy and rights in the face of authoritarian excess, their appearance on the scene contributes to democratic deepening while also laying the foundation for a more legitimate, accountable, and democratic rule of law. But their efforts are countered by an increasing proportion of citizen movements that remain unmoved by human rights objectives and whose main goal is to reduce crime, even when it means sacrificing transparency and accountability, ignoring government abuses of power (Beckett & Godoy 2008), and tolerating “illicit” means of controlling criminals, including support for parallel state actors or local community leaders tied to criminal networks (Arias 2006).

Antiglobalization movements
JAMES GOODMAN

The “great globalization debate” began in the late 1980s with a series of proclamations as to the newness of the phenomenon. Ranging across multiple social science disciplines, globalization theory asserted that social relations were becoming increasingly deterritorialized (Held, McGrew, & Perraton 1999). Subsequent revisions forced recognition of historical parallels, thus historicizing the claims, and allowed a rereading of the accounts, in terms of their discursive foundations, as globalist ideology. The debate continues, with investigations of post-globalism, in the aftermath of a more unilateralist world politics, as a state of affairs beyond globalization, rather than simply a throw-back to pre-globalist conditions.

Along with other fields in the social sciences, social movement studies has itself undergone a 20-year process of globalization. Methodologically, as an interdisciplinary field crossing political and historical sociology, cultural studies and political science, social movement studies has been highly permeable. Nevertheless, from within this field, international social movements have generally been examined from a comparativist perspective. Rarely have movements been analyzed as in the first instance international or global phenomena, and addressed in terms of the transnational flows that they may generate. Only relatively recently has social movements studies become actively engaged with international relations debates (see Tarrow 2005). A shift can be tracked especially in the aftermath of the 1999 “Battle of Seattle,” widely taken to have announced the presence of “antiglobalization” movements on the world stage (Smith & Johnston 2002).

If we date the globalization of social movement studies from the 1990s, to what extent does that reflect a broader globalization tendency amongst movements themselves? Certainly, we can posit a wave of “antiglobalization” movements from that period, a transnational “cycle of contention” perhaps (Tarrow 2005). The foundations, we may say, were established in the 1980s with national mobilizations, north and south, against neoliberal prescriptions at the national level. In the context of a post-cold war wave of interstate institution-building, the revolt against neoliberalism shifted from national into transnational contexts. Connectivities across north and south are established in joint campaigns from the early 1990s against interstate neoliberal governance, such as through the “Fifty Years is Enough” campaign against the World Bank and IMF, the Other Economic Summit process in the EU, the APEC counter summits in the Asia-Pacific region and, certainly most powerfully, with the Zapatista’s 1994 uprising against the North American Free Trade Agreement.

A lineage can now be tracked from the Zapatista’s 1996 “International Encounter Against Neoliberalism,” to the creation of People’s Global Action, which itself initiated many of the key antiglobalization protest repertoires, to the development of the World Social Forum, and what came to be called the “Global Justice Movement,” led in the main by large northern nongovernmental organizations (see della Porta 2007). The upswing of the cycle built on existing transnational advocacy networks such as Jubilee 2000, but also led to the creation of new transnational and global activist networks, such as peasant international, Via Campesina, and the WTO-focused Our World is not For Sale network, as well as the Peoples Global
Antiglobalization movements (Reitan 2007). The cycle was partially demobilized with the US-led “War on Terror” in September 2001, but found new traction in the context of the war in Iraq, staging the world’s largest mass demonstration in February 2003. Subsequently, Global Justice movements have played a key role in the emergent Climate Justice movement, including its direct action wing in the form of Climate Camps, which themselves claim a direct lineage from the PGA (Goodman 2009).

Accounts of social movement globalization reproduce debates between hyperglobalist and skeptical globalists over whether globalism and its antiglobalizations are superseding nationally constituted frameworks for political community. Such preoccupations have tended to de-historicize the globalization phenomenon, assuming that we start with nationally constituted politics, and that sometime from the 1960s were witness to a process of globalization that may or may not affirm national politics. These accounts reify the national and treat contemporary “antiglobalization” as somehow a new phenomenon. As such they can be blind to the historical precedents and continuities. These are signified, not least, in the echoes of the early twentieth-century Mexican revolution for the latter-day Zapatistas: here, those often credited with initiating the protest cycle are themselves bound into an historical dynamic of peasant and indigenous uprisings centered on the Mexican state.

Viewed through the lens of history it is clear that successive waves of globalization are associated with global countermobilizations. If we define globalization as the extension of social relations across continents, then we can identify mercantilist globalization as perhaps the first substantial wave of globalization. Here, trading posts, militaries and missionaries extended the power of European countries across continents (Held, McGrew, & Perraton 1999). Yet, in the same breath, mercantilism was associated with the emergence of nationalism, the first and perhaps most powerful antiglobalization movement. Movements against empires in South America, as Benedict Anderson famously documented, coalesced around the idea of the nation, and from the seventeenth century became the “creole pioneers” of a global wave of nationalist movements (Anderson 1991).

A second great wave of globalization, from the eighteenth century, was centered on the extension of industrialism and the modern colonial state. In establishing globally disseminated antagonisms, between industrial classes and between the colonized and the colonizers, this wave of globalization laid the foundations for the rise of international socialist and communist movements and anticolonial movements. These movements were centered on the national state, but also transcended it, in promulgating universalizing cosmopolitical norms of socialism, communism, and anti-imperialism. These “antisystemic” movements, as Wallerstein calls them, transformed global politics with the remarkable extension of postimperial welfarism, communist statism, and postcolonial developmentalism through the twentieth century (Arrighi, Hopkins, & Wallerstein 1989).

Finally, in the latter decades of the twentieth century we were witness to a third wave of globalization, taking the form of corporate-led neoliberal globalization. Antiglobalization movements in this period targeted a particular kind of globalization, with its own vehicles and drivers, quite distinct from its antecedents. Viewed from a vantage point that recognizes earlier waves of globalization, we can appreciate both the potential role of contemporary antiglobalization, in terms of world historical agency, as well as its inherent limitations. Clearly, globalism sets the pace: the process of coalescing into what are best characterized as “Global Justice movements,” and the consequent emergence of justice globalism, as Steger calls it, is predicated on the globalization of corporate power, and its projection on a world scale, as exemplified in the hegemony of neoliberal globalism. From a political process perspective, the opportunity structures for antiglobalization are defined by globalization: how that structure of power is targeted by movements and how opportunities are thereby
DEFINING ANTIGLOBALIZATION

Antiglobalization movements politicize the exercise of power, and force new visions and aspirations into play, and as such can be constitutive of world political relations. The historical record suggests that antiglobalization movements may be defensive or oppositionalist, but it also suggests that by challenging the global projection of power they prefigure the necessity for new forms of political community, embodied in new ideological claims. Debates about this creative power of antiglobalization, as a transformational force as well as an oppositional force, are reflected in terminological disputes over how to define the current movement.

Movements that challenge contemporary globalization are often pejoratively labeled as “antiglobalization” in order to marginalize their critiques (Ayres 2005). Taking “globalization” as a fact of life, the “anti” label suggests an orientation that is backward-looking: to act against globalization is to act against the future, to be new-age luddites, or worse, defensive xenophobes. There are a variety of attempts at shedding the “antiglobal” label, by asserting a universalizing aspiration. Often a different globalization is asserted, a “peoples globalization,” a globalization-from-below perhaps, geared to global justice (della Porta 2007). The “alter-globalization” concept encapsulates this position in calling for “alternative” globalizations, explicitly rejecting defensive forms of antiglobalization in the form of communalism, localism, or nationalism (Hardt 2002).

In practice, though, antiglobalization begins with the refusal of globalist ideology, and as such has strong oppositionalist elements. That opposition is framed by specific institutions and identifications, and is never immediately “global.” Antiglobalization may be inspired by universal norms and produce shared transnational agendas, but in practice is always embedded in immediate social relations and struggles. The process of mobilization is consequently much less smooth than some cosmo-political models may suggest it to be. Indeed, defining antiglobalization exclusively as a universalizing impulse can erase, or worse, condemn, nonglobal alternatives.

Analysis of possibilities for challenge and transformation requires a broader scope, to understand alternatives to globalization, through deglobalizing localisms or nationalisms, as much as alternative globalizations (Bello 2006). As Castells notes, globalizing forces and associated legitimating identities are in the first instance opposed through particularist resistance identities, which may or may not prefigure more transformative “project” identities (Castells 1997). These “militant particularisms” are the foundation for broader-based social movements capable of instigating revolts against the assertion of abstract globalism, whether in its neoliberal or justice modalities (Harvey 2000).

The point is borne out in the practice of antiglobalization, which has centered on the refusal of globalism. For antiglobalization, the assertion of veto power has been central, and may be seen as a precondition for building alternatives. It is important, then, to adopt a definition of “antiglobalization” that encompasses universalist and more particularist expressions, allowing a broader scope for theorization and engagement. We may, then, arrive at a definition of “antiglobalization” movements that embraces the full panoply of oppositionalist localism to reformist cosmopolitanism. Such an inclusive approach does not impose pre-set criteria for inclusion in the movement, and foregrounds the realm of mobilization that stands at its center.

PERSPECTIVES ON ANTIGLOBALIZATION

Reflecting political traditions, perspectives on antiglobalization are rooted in particular places. This is clearly demonstrated in the
field of social movement studies, which bifurcates between the American political process school and European new social movement approaches. In part the divide is epistemological, between positivist and interpretivist traditions: while US social movement scholarship is centered on the development of conceptual tools to be deployed across history and place, European counterparts are more concerned with interpreting the historical trajectory of movements and to produce general theories of social change (della Porta 2007: 235).

Both traditions are defined against the Marxist lineage of social movement studies, with the political process school adopting a broadly non-Marxist stance, while new social movements approaches are more clearly positioned as post-Marxist. The political process school rejects the project of exploring the structural foundations of social movements, and dwells instead on the institutional “superstructure,” thus embedding recent “antiglobalization” struggles in institutional formations rather than social relations. New social movement approaches embed interpretations in cultural relations, breaking with Marxism in arguing the “new social movements” of antiglobalization originate in the cultural hierarchies of globalized postindustrial society. Neo-Marxist approaches retain a focus on material power and how it is manifest through mobilizing structures (giving neo-Marxism a special explanatory power under the most recent wave of corporate-led globalization).

The three orientations center on conflicting interpretations of the dominant sources of power in globalizing late-modern society, and replicate wider fault-lines in globalization studies. These macro-theoretical disputes between the intellectual traditions of liberal-institutionalism, post-Marxism, and neo-Marxism generate disputes over whether the key global power-sources are institutional, cultural, or material, and produce diverging predictions about the likely sources of contestation and transformation.

Institutional power

A focus on institutional power interprets antiglobalization mainly in terms of the interstate political process. Weakly legitimated international organizations are seen as offering political opportunities for movements, to extend accountability and participation in these newly empowered sites of political decision-making (della Porta et al. 1999). Like their counterparts in the early days of state formation, social movements exploit these opportunities and engage in “strategic framing” to contest institutional power. In the process, new transnational mobilizing resources become available. New realms for widened participation may be opened up, diffusing transnational repertoires, and transforming movements from national into transnational actors (Smith & Johnston 2002).

The question of political process, not surprisingly, most clearly reflects the more institutionalized components of antiglobalization. These are led by the large international non-government organizations (INGOs), presenting themselves as civil society representatives at odds with interstate structures. These organizations integrate cosmopolitan values with a relatively privileged worldview to enable critical accommodation with dominant sources of institutional power. Instead of limiting the power of intergovernmental agencies, INGOs attempt to change the way it is exercised, persuading interstate negotiators to incorporate compensatory side agreements into the policy framework. At the same time INGOs are engaged in constructing and institutionalizing alternate global norms, for instance, in relation to the regulation of the environment, the workplace, the status of women, or the administration of justice (Guidry, Kennedy, & Zald 2000). Here, the experience of the World Social Forum is perhaps most instructive.

Taken together, these groupings are said to constitute a relatively institutionalized “Global Justice Movement” (GJM), grounded in national contexts and networked internationally through “Transnational
Advocacy Networks” (TANs) (Keck & Sikkink 1998). In its more formal roles the GJM takes on a series of mediating roles, communicating policy failings to elites, engendering policy adaptation, legitimizing institutional power, and normalizing dominant discourses. Confrontation between globalizing elites and subordinated peoples is displaced into intra-motion conflicts, and “antiglobalization” is institutionalized, perhaps creating a transnational “movement society.” There is, though, a question of whether INGOs, and the TANs they establish, can in any meaningful sense be understood as social movements. Some elements of national “movement society” may translate to the transnational level, in a scale shift that creates new sites for transnational contention (Tarrow 2005). The challenge this leaves is to explain why some sites emerge, as against others.

Cultural power

Social movements that contest the cultural power of globalization are especially emphasized by post-Marxist sociologists, such as Melucci, who focus on cultural conflicts of postindustrial societies, and their transition to “programmed,” “information,” or “network” societies (Melucci 1996). As national information society is globalized it is increasingly confronted by cross-national communities of resistance. Antiglobalization is seen as exemplifying these conflicts, as movements for autonomy against globalized info-society. The process whereby movements construct “communal heavens” against globalizing forces can be mapped across the globe: the resistance identities on which these movements are based are likely to be highly defensive; although, as some claim, these may develop in a more open-ended way to produce project identities geared to broader social transformation (Castells 1997). Across these movements the urge for autonomy valorizes the embedded experience, of embodied and affective collective action. As such, for instance, MacDonald characterizes such movements as “experience movements,” where the core of collective action is not some relatively fixed communal identity, but more the process of experiencing collective action itself (MacDonald 2006). These types of resistance are relatively open, governed by “fluidarity,” not “solidarity,” ranging across subjective moments rather than tied to a specific collective identity. Here collective action is enacted not so much through movement organizations as through embodied and affective experience in movement actions, what McDonald calls the “public experience of self” (McDonald 2006).

Many antiglobalization movements conform to this model: their key task is to regain subjectivity, to engage in “subjectification” as Touraine characterizes it, against cultural domination of globalization (Touraine 1995). Wherever globalization is experienced as a threat to existing subjectivities, rather than as an opportunity for new global orientations, the response is likely to manifest in efforts at marking-out and constructing personal, communal, local, or national autonomies as alternative foundations for political legitimacy. These autonomy movements are defined as ends in themselves, not as means to broader goals, and are aimed at securing a radical break with dominant ideologies, with liberalism as well as with neoliberalism. There are limits to this privileging of autonomy, and situations where it may become counter-productive, as a barrier to broader cross-cultural agendas and solidarities. To understand how movements have gone beyond a process of endless particularist skirmishing on the fringes of globalized power, we need to theorize less contingent connectivities.

Material power

In contrast with the political process school and with new social movement interpretations, the neo-Marxist approach has focused on material power under globalization. Here antiglobalization is interpreted as principally a revolt of subordinated classes against the political manifestations of globalized corporate power. Rather than “scaling-up” models developed for the national level, neo-Marxists have tended to take an explicitly global frame, interpreting capitalism since its inception as by definition a globalizing force. Since the 1970s, for instance,
World System theorists have sought to show how state power and the social power of dominant classes has combined to stabilize global capitalism. Shifts from one world order to the next, or from one globalization to the next, were linked in these accounts to conflicts in the mode of accumulation (Arrighi, Hopkins, & Wallerstein 1989). Here, specific forms of resistance are seen as shaping the capacity to accumulate and the direction of change – a dialectical reading that sees the world capitalist system locked into battle with a range of antisystemic movements.

Others apply concepts of the Marxist Antonio Gramsci to the same problematic, focusing on how material contradictions shape ideological conflicts between hegemonies and counter-hegemonies (Gill 2002). The key process of forging a counter-hegemonic bloc capable of challenging globalism is then directly linked to movement structures for deliberation – such as through dialogic social forums, or through the creation of media hubs or convergence centers. The capacity to define commonality within diversity becomes a central preoccupation (Stephen 2010).

Other rereadings of the Marxian tradition in terms of globalism recognize the individuated character of revolt: for Hardt and Negri, for instance, antiglobalization manifests as a “multitude,” which (paradoxically) agglomerates mass individual reflexivity into revolutionary agency. Within this “distributed network . . . each struggle remains singular and tied to its local conditions but at the same time is immersed in the common web” (Hardt & Negri 2004: 217). Here the extension of a common field strengthens rather than undermines the singularities of its participants, displacing both institutional hierarchy and fragmented difference politics.

Whether antiglobalization is interpreted as an antisystemic movement, a counter-hegemonic bloc, or as a multitude, this articulation of different orientations into a shared movement is the central concern. A transnational capitalist class may be evident (Sklair 2000), but does this prefigure resistance? Global capitalist unity may be strengthening, but this does not necessarily generate a global anticapitalist response.

CONCLUSION

In 1998 Tarrow asked whether there is a transnational dynamic to contention (Tarrow 2005: 193): perspectives outlined here suggest at least three dynamics. These reflect contrasting interpretations of the primary source of power under globalization, that drive diverging predictions about the likely levels, modes, and vehicles of contestation. It may be that one perspective can and should be privileged over the other two. One source of power – be it institutional, info-cultural, or material – may play a constitutive role in global politics. Indeed, given the corporate character of the contemporary wave of globalization, neo-Marxist approaches may offer much in terms of an explanatory frame that addresses the current power play.

Yet, as noted, in many respects a focus on material power can fail to theorize the required counter-bloc. Sensitivity to the cultural logic of mobilization, and to institutional targets, may be vitally important: mobilizing collective identity may well be more meaningfully addressed through a cultural lens. Likewise, in practice the political institutions of corporate globalization are often most immediately visible, and the question of how such institutions are contested is a central conundrum.

At a certain level of abstraction it is possible to separate out the three approaches, and pose their explanations one against the other. In the concrete practice of antiglobalization, though, the tools they offer may be overlapping, and selectively deployed. In practice each perspective responds to a particular dimension of power under globalization, and there is ample evidence that all three forms of contestation have a role to play in reshaping global politics. Each approach has its own built-in limitations, and it may be that these can only be overcome if all three channels for contestation are related. It may be argued that a key factor
in challenging corporate globalization is this ability to concertize contestation.

REFERENCES AND SUGGESTED READINGS
Antifeminist movements refer to organized opposition to group activism for women’s rights. They are examples of countermovements, which typically mobilize in reaction to perceived successes of the initial movement (Mottl 1980; Lo 1982; Zald & Useem 1987). Antifeminist mobilization is an indication that the feminist movement has begun to be taken seriously as a threat to the status quo. Perceived feminist successes alter the political opportunity structure, forcing opponents into public activism to halt movement momentum (Meyer & Staggenborg 1996). Antifeminist movements are also a form of protest movement, challenging the legitimacy of the feminist movement as women’s representatives and rejecting feminist goals as antithetical to women’s interests. As reactive movements, antifeminist movements explicitly counter feminist claims. In contrast, the tactical position of the feminist movement is to ignore the opposition so as to minimize its importance. As the countermovement grows and becomes increasingly difficult to disregard, the feminist movement may change tactics and dismiss the opposition as insignificant and illegitimate in order to present the appearance of strength relative to emergent rivals. The ensuing competition forces interaction between the movement and its countermovement as each seeks political advantage.

The relationship between feminism and its opponents manifests some unique features compared to other historical examples of movements and countermovements. Unlike segregationists and civil rights groups or prohibitionists and liquor interests, the leadership and membership of feminist and antifeminist organizations are overwhelmingly drawn from the same female constituency. While there are many examples of minority group ambivalence or fear of reprisals from the powerful in pursuit of equal rights, the organized opposition of beneficiaries to group rights is rare. Feminist confrontation with antifeminism presents a strategic dilemma, for highlighting divisions among women undermines movement legitimacy. Partly for this reason, feminist organizations have been much less likely than antifeminists to identify women as their opponents. Histories of the women’s movement have often characterized the opposition as composed primarily of corporate interests and men’s organizations, an assertion that went unchallenged for decades.

The constraints of societal gender norms constitute another distinctive feature of the relationship between feminist and antifeminist movements. By asserting its right to equality in public life, the feminist movement challenges deeply embedded customs and values; to achieve popular support, feminist rhetoric may reframe their demands as consistent with women’s traditional responsibilities and recast movement goals from self-interest to societal improvement. On the other side, political activism thrusts women antifeminists into the contradictory position of engaging in the very behaviors they denounce among feminists. Both groups negotiate these social norms, seeking ways to cast themselves as true exemplars of womanhood and their opponents as imposters.

Scholarly investigation of antifeminist movements has been scant relative to research on feminism. It generally focuses on two periods of antifeminist mobilization, corresponding to the main waves of feminist activism. The first phase of sustained antifeminist activity in the United States emerged in the 1890s, following the unification of the suffrage movement into one national organization focused on the vote (Marshall 1997). The challenge confronting women on both sides of the suffrage question was how to make...
claims on the state as outsiders to the political process. Antisuffragists at first resolved this dilemma by using men to represent their position in legislative hearings. While this tactic enabled early women antisuffragists to remain in the background consistent with traditional gender norms, it hindered their effectiveness in challenging suffragist claims of majority support among women. Women’s antisuffrage organizations were nonetheless very active behind the scenes, monitoring suffrage progress through state legislatures throughout the country and sending money, literature, and paid organizers to speak against enfranchisement. Despite their admonishment of suffragists for conspicuous behavior, most opposition leaders were active in the women’s club movement, including patriotic-hereditary societies that emphasized the superiority of their social class. They used these networks to great advantage to monitor suffrage activity and recruit new members. Extensive kinship ties linked the antisuffrage leadership to prominent male politicians, lawyers, bankers, and industrialists, which provided funding for their activities and informal access to political elites. These channels of political influence partly explain why antisuffrage rhetoric claimed repeatedly that women had substantial political influence without the ballot.

Antifeminist rhetoric made the case against woman suffrage by rebutting the movement’s claim that enfranchisement was a woman’s right. They countered that suffrage was desired by only a small minority of women and thus violated democratic principles. In their view, suffrage was a radical experiment that would prove harmful to society. Antisuffragist writings dismissed the suffrage argument that voting would uplift their gender by countering that it would impose an undue burden on women’s important family responsibilities. Politics demeans rather than elevates, they argued, and woman’s political participation would only undermine her moral influence on family and society. During the Progressive Era, as suffragist rhetoric switched to the expediency argument that female enfranchisement would reform society, antisuffrage writings maintained that women’s traditional charitable works produce more social benefits than does the ballot. Changing with the times, antisuffragists switched from religious support for their position to increasing reliance upon scientific evidence, appropriating the evolutionary theories of Herbert Spencer, the nascent eugenics movement, and modern views of scientific motherhood. As the suffrage campaign adopted more overt political tactics and switched its goal to passage of a federal amendment, the antisuffrage movement had little choice but to escalate its level of activism. The antisuffragists established a national antisuffrage organization, rented storefronts, lobbied Congress, and largely imitated their opponents while blaming their suffrage sisters for forcing them from their homes. With women’s enfranchisement in 1920, a reduced legion of antisuffrage activists reorganized into self-proclaimed patriotic societies and helped defeat feminist-sponsored social welfare legislation by tainting it with the socialist label. The political activation of conservative women that began with suffrage continued in opposition to the federal programs of the New Deal and participation in the isolationist movement leading up to the Second World War.

The second wave of antifeminist mobilization similarly followed perceived gains by the feminist movement. In the United States, two 1973 Supreme Court decisions legalizing abortion are widely regarded as judicial responses to feminist demands that abortion is a woman’s right. Large numbers of women, many motivated by religious values, quickly mobilized into a “pro-life” movement that asserted the sanctity of motherhood and framed abortion legalization as degrading rather than liberating women. Women activists on both sides of the abortion issue held distinctive worldviews on a wide range of issues, including women’s roles (Luker 1984). At the same time, the feminist movement was making rapid progress toward
ratification of a federal Equal Rights Amendment (ERA) that Congress had recently passed; in just its first year of eligibility, 30 states ratified the ERA. With passage imminent, new women’s organizations formed to halt feminist momentum. Phyllis Schlafly, who became the national leader of the anti-ERA movement, was a longtime conservative activist who labeled the Equal Rights Amendment the “extra responsibilities amendment.” According to antifeminist rhetoric, the ERA was a threat to women’s privilege; it would force women out of their homes and liberate men of the responsibility to support their families (Mansbridge 1986). They described feminists as women who wanted to be men and as radical subversives whose proposals like childcare services for employed mothers promoted a socialist agenda. This time the antifeminist movement had greater success; as they shifted public debate from equal rights to controversial changes in women’s roles, political support waned and the amendment was defeated.

The activation of antifeminist women in the 1970s achieved greater political influence as part of the New Right movement (Himmelstein 1990; Lienesch 1993). A focus on social issues distinguished this latest form of right-wing mobilization, described by some activists as a culture war. This expanded conservative agenda encompassed antifeminist and antiabortion positions as well as traditional women’s issues such as education, which concentrated on monitoring textbooks for liberal bias, returning prayer to school, and revising sex education curricula to focus on abstinence. The rhetoric of the New Right is explicitly antifeminist, claiming that changes in women’s roles are responsible for a host of social problems, including increases in divorce, nonmarital childbearing, and juvenile crime (Klatch 1987). They blame the feminist agenda of women’s independence for rendering men superfluous and confused over their roles, opening the door to deviant behaviors such as homosexuality. According to right-wing women, feminist demands for equal rights legislation have produced a bloated government bureaucracy that is expensive to maintain. While the New Right has become a strong force in electoral politics, one downside of its success is the eclipse of women’s contributions to the coalition by more visible men’s groups.

The contemporary antifeminist movement has changed over time, as the New Right appropriated liberal rhetoric and tactics to broaden its appeal (Moen 1992). Antiabortion organizations such as Operation Rescue borrowed sit-ins from the civil rights movement as a method of political protest and reframed the pro-life message to parental choice, defense of the rights of the unborn, and even women’s health. School prayer is portrayed as an issue of religious freedom, while liberal opponents are accused of bigotry and intolerance toward a persecuted religious minority. The rhetoric of choice extended to the campaign against homosexual rights; the right-wing argument that homosexuality is a chosen lifestyle has been incorporated into public debate on whether homosexuals merit the same legal protections as other minority groups. While continuing to uphold traditional values, antifeminist organizations have demonstrated an ability to innovate in pursuit of their goals. Still to be investigated is the recent appropriation of the feminist label by right-wing women politicians whose policy proposals remain solidly antifeminist.

Anti-Japanese colonization resistance (Taiwan)

WAN-YAO CHOU

There were two stages in the Taiwanese anti-Japanese colonization resistance. The first stage was armed struggles against Japan’s takeover which took place between 1895 and 1915. The second was characterized by nonviolent movements led by intellectuals from 1920 to 1936. In terms of methods, goals, and participants, very few connections existed between these two modes of anticolonial activity.

In April 1895 the Ch’ing court ceded Taiwan to Japan under the terms of the Shimonoseki Treaty. Amidst chaos and the chagrin of islanders, Japan sent an army to claim this new colony in May of that year. The islanders resisted Japan’s takeover furiously. It took the Japanese army more than four months to bring the entire island under its control. But underground anti-Japanese activities continued and rebellious “plots” were sporadically discovered by the colonial authorities. In 1915 there occurred the Ta-pa-ni Incident, which was bloodily suppressed. In its aftermath, 866 of the 2000 or so people prosecuted were sentenced to death, though their sentences were reduced to life imprisonment later on. This was the last, and also the largest, anti-Japanese armed struggle on the part of the Han Taiwanese, while the fierce revolt known as the Musha Jiken (Wu-shé shih-chien in Mandarin) by aboriginals came as late as in 1930.

The bloody crushing of the Ta-pa-ni Incident made continued armed struggle infeasible. The majority of those involved in armed “riots” came from the lower strata of society. Meanwhile, a new generation of Taiwanese intellectuals who had a Japanese modern education had emerged in the colony. Many of them were studying in Japan itself, and especially in Tokyo, in the early 1920s. Inspired by Woodrow Wilson’s principle of self-determination and other modern political ideas, young Taiwanese in Japan proper, with the support of leaders from the landed gentry – Lìm Hi‘an-tông (Lin Hsien-t’ang in Mandarin) and Chhòa Húi-ju (Ts’ai Hui-ju) – founded the New People’s Society (Shinmin kai). Its members, persuaded by the arguments of Lìm Têng-lók (Lin Ch‘eng-lu), initiated a movement that sought to establish a parliament in the colony – the Taiwan Parliament (Taiwan gikai). Home rule was the ultimate goal, and the proposed parliament aimed to counter the autocratic rule of the general-governor of Taiwan. The movement resorted to using the citizens’ right of petition guaranteed by the Imperial Constitution. It was named “The Petition Movement for the Establishment of Taiwan Parliament,” and was warmly supported by Taiwanese back home. In order to gather momentum for the movement as well as to improve the cultural qualities of the islanders, an organization called the Taiwan Culture Society (Taiwan bunka kyókaig) came into existence in 1921 under the leadership of Chiu‘Éi-súi (Chiang Wei-shui) and Lìm Hi‘an-tông. The society offered various events and activities, and had a tremendous impact on all parts of the populace.

The Taiwan Parliament movement suffered a setback in December 1923 when the majority of leading activists were arrested by colonial policemen on the accusation of violating “police security law.” The prosecution was widely viewed as a political suppression of the Taiwan Parliament movement by the colonial authorities, and in the end it only increased the visibility of the movement. Popular support reached its highest point in 1928 when the annual petition, containing more than 2000 signatures, was submitted to the Imperial Diet. However, a year earlier the split of the Taiwan Culture Society had dampened the solidarity of anticolonial communities.

As in most colonies, anticolonial forces in Taiwan consisted of leftists (communists, anarchists, etc.), liberals, and conservatives. The members of the New People's Society already demonstrated differences in their intellectual outlooks and there was conflict within the movement. In 1927 the Taiwan Culture Society was taken over by leftists and discontinued its support for the Taiwan Parliament movement. Meanwhile the farmers' movement was in the process of being formed. In 1926, the Taiwan Farmers Union (Taiwan nōmin kumiai) was established and enjoyed island-wide support. It had a membership of 25,000 in 1929. A year earlier, in 1928, the Taiwan Communist Party had come into existence in Shanghai, China. Some leading figures now returned to Taiwan to promote communism, though secretly as it was illegal, and founded a united front with the Taiwan Farmers Union and the Taiwan Culture Society. In 1929 and 1931 the three groups encountered iron-fist suppressions by the authorities and were reduced almost to nonexistence.

Having lost the Taiwan Culture Society to the leftists, core advocates of the Taiwan Parliament movement founded the Taiwan People's Party (Taiwan minshū-tō) in 1930 and continued to promote the movement. The party was disbanded the next year. The petitions repeatedly failed to be accepted in the Imperial Diet, resulting in decreasing enthusiasm on the part of islanders. With no prospect of success and the rise of rightists in Japan proper and on the colony, the leaders of this movement and decided to end the movement in September 1934. By then, they had submitted 15 rounds of petitions in 14 years to no avail. In 1936 the highly respected Lim Hián-tông was hit by a rightist Japanese activist at Taichū Park, and this symbolized the end of the anticolonial activities of the colonized. What awaited the islanders was the “Becoming Imperial Subjects” movement (kōminka undō) imposed by the General-Government of Taiwan, and which left no room for any kind of anti-Japanese resistance.

In sum, the Taiwan Parliament movement was the most important channel of nonviolent anticolonial resistance on the island. The establishment of the movement was the first time the intellectuals of the colony had regarded Taiwan as a single unit in their discourses and political projects. Thus, the movement helped crystallize the concept of “Taiwanese.” But the legal, if not conservative, method (i.e., via petition) limited the advocates’ imagination of home rule. The independence of the colony never emerged on the proclaimed anticolonial agenda, which perhaps had a far-reaching impact on the postwar history of Taiwan.

Antinuclear power movements (in general)

WOLFGANG RÜDIG

OVERVIEW OF MOVEMENT DEVELOPMENT

Opposition movements against the civil use of nuclear power can be found as early as the late 1950s but it was only in the 1970s and 1980s that mass movements against ambitious nuclear construction programs were mobilizing in many Western democracies. Conflict intensity varied between countries; particularly fierce conflicts involving violence could be found in France and West Germany. By the early 1980s most countries had either abandoned plans for nuclear power or had successfully implemented their construction programs. While the Chernobyl accident of 1986 provided the background for a brief movement revival, the absence of new construction projects had removed the main stimulus behind the movement, and activity specifically targeted against nuclear power had effectively ceased in most countries by the early 1990s.

The exact effect of the antinuclear movement on the implementation of nuclear programs remains a matter of debate. Several countries abandoned all nuclear activities following protest; elsewhere, individual projects were stopped or delayed but many nuclear facilities were successfully completed, with electricity generated by nuclear power forming an important part of the energy economy. Beyond effects on the completion of nuclear construction projects, a number of other impacts can also be identified. In some countries, a climate of public opinion was created which made further nuclear activities difficult. This applies particularly to any projects concerning the disposal of nuclear waste but also provided an obstacle to a potential revival of the construction of nuclear power stations. The movement against nuclear power also had a strong impact on the organization of ecological movements. In many countries, nuclear power was a defining issue for a new generation of radical, modern environmental campaigning organizations. After the end of antinuclear mobilization, they embraced other issues and often have dominated the environmental field of social movement organizations since the 1980s. In some countries, the antinuclear movement also provided the main focus for the foundation of a new type of party, called ecologist or green parties, that campaigned on radical antinuclear positions. Green parties proved to be diligent followers of an antinuclear agenda, placing not just new construction but the phasing out of all nuclear activity on the agenda of government when these parties entered coalitions in some Western European countries in the late 1990s. While antinuclear movements have largely disappeared from public view in most countries since the late 1990s and early 2000s, the prospect of a revival of nuclear power construction in the late 2000s has reignited interest in the study of opposition to nuclear energy.

DEVELOPMENT OF SOCIAL SCIENCE RESEARCH ON ANTINUCLEAR POWER MOVEMENTS

Sociologists and political scientists started to research antinuclear movements from a social movement perspective in the late 1970s following the high profile of antinuclear mobilization earlier in that decade. The main approach at first was that of the case study, with several authors who later were to become major figures in the field publishing their first monographs on case studies of antinuclear conflicts in Germany and Switzerland (Kitschelt 1980; Rucht 1980; Kriesi 1982). The work of Alain...
Touraine, whose team had examined a range of social movements and turned their attention to the (French) antinuclear movement in late 1970s, first introduced a distinctively sociological perspective (Touraine et al. 1980). Touraine saw the antinuclear opposition potentially as “the” social movement in a process of social transformation to create a postindustrial society. While his methodological approach of “sociological intervention” found few followers amongst students of antinuclear movements, his work placed the movement firmly on the sociological agenda.

More influential became the interpretation of antinuclear movements as part of a new generation of so-called “new social movements.” This European approach to social movements sought to integrate their study into a theoretical framework inspired by authors such as Habermas and Offe who regarded “new social movements” as evidence of the legitimation crisis of late capitalism. While this approach provided a new theoretical perspective, its empirical use was limited and it was unable to explain the wide variety between countries in the strength of antinuclear mobilization.

Cross-national analyses trying to explain the strength and weaknesses of antinuclear movements had started to appear in the early 1980s. These studies were at first predominantly descriptive overviews not informed by specific theoretical approaches whose authors came to the field as experts on technological controversies and energy policy rather than social movements. This had changed, however, by the late 1980s when the first of a series of systematic attempts to explain the international development of antinuclear movements were published by European social scientists.

Of seminal importance was Herbert Kitschelt’s (1986) article using the concept of “political opportunity structure” to explain the differences in mobilization and impact of antinuclear activities in four countries. This reflected the strong influence that “resource mobilization” approaches by that time had exerted on European social scientists interested in the study of social movements. Kitschelt’s analysis has stood the test of time very well, and his basic insights have not been superseded by later analyses.

A rival approach was pursued by Rüdig (1990) who sought to draw on older social movement concepts such as “relative deprivation” to explain differences in the emergence of antinuclear movements, focusing in particular on the incidence and strength of local opposition movements. An alternative way to analyze the emergence of antinuclear movements could have been provided by the idea of movement “frames”: Gamson and Modigliani (1989) carried out a detailed analysis of media discourses of nuclear power in the United States, suggesting that the rise of antinuclear public opinion was associated with a “reframing” of the nuclear issue. No comparative efforts, however, were made to test the usefulness of the framing perspective for the explanation of cross-national differences in the emergence of antinuclear movements.

The 1990s saw a range of more sophisticated comparative efforts. Joppke (1993) carried out a detailed comparative study of antinuclear movements in the United States and West Germany, using a range of theoretical approaches as a heuristic framework. Joppke argued that “collective behavior” approaches had been unjustly neglected and added important insights into the dynamics of antinuclear movements. Fuchs and Rucht (1994) reported results of four surveys in five European countries carried out in the 1980s with data on the support for and probability of joining antinuclear groups. One of their findings was that the mobilization potential for the antinuclear movement was declining, but that there was significant overlap with other “new” social movements. This appears to be the only published study drawing on this dataset whose results are mainly interpreted in a qualitative way.

Moving beyond comparative case studies, Hanspeter Kriesi and his research group engaged in the theoretically and empirically most sophisticated effort thus far to explain new social movements in Western Europe, based on
the “protest event” methodology. Comparing data from four countries (Germany, France, Switzerland, and the Netherlands), Kriesi and his team confirmed a series of hypotheses derived from “resource mobilization” approaches. With specific reference to the antinuclear movement, they found no or little support for alternative approaches based on grievances (such as relative deprivation) or frame alignment (Kriesi et al. 1995).

While the comparative case study and protest event approaches dominated attempts to understand the cross-national differences of movements, other systematic efforts to collect data on antinuclear activists and explain participation in such movement remained confined to studies at the national level.

In the United States, the nuclear accident at Three Mile Island (TMI) in 1979 stimulated a number of empirical inquiries. Apart from analyses of local opposition in the vicinity of TMI (Walsh 1988), a number of surveys of participants in antinuclear demonstrations were carried out in 1979 (Ladd, Hood, & Van Liere 1983; Scaminaci & Dunlap 1986) and 1984 (Jasper & Poulson 1995). However, compared with the huge body of empirical studies of other social movements in the United States, such as the civil rights and peace movements, work on nuclear energy remained rather limited and marginal in scope. Apart from Downey’s (1986) ethnographic study of the Clamshell Alliance, Kowalewski’s (1995) survey of the dynamics of a local movement opposed a nuclear waste facility, and Jasper’s (1997) exploration of the emotional aspects of antinuclear activism in California, there appear to be no published studies involving detailed empirical inquiry of antinuclear movements and their supporters. The main reason appears to be that antinuclear mobilization, and the salience of the nuclear issue in the national political debate, did not reach the high level that could be found in some West European countries – with the possible exception of a brief period after TMI.

Despite the high political salience of the issue in Europe, one struggles to identify seminal empirical studies going beyond qualitative case studies with the exception of those following the protest event methodology based on media reporting of protests. The main exception is the work of Karl-Dieter Opp, who managed to carry out a number of surveys which included radical opponents of nuclear power in Germany throughout the 1980s. These data, collected mainly by carrying out general surveys of public opinion in areas which had experienced significant nuclear conflict, were the basis of a series of high profile publications. Opp’s work is mainly inspired by rational choice theory which is employed in a number of variations to try to explain the participation of individuals in antinuclear activities (Opp et al. 1984; Opp 1986).

With the exception of a survey of members of a local Swiss antinuclear group carried out by Kriesi (1982), there appear to be no empirical studies that have been made in Europe of members of specific antinuclear organizations. The relative weakness and marginality of antinuclear movements in Britain, as in the case of the United States, contributed to a lack of detailed empirical research.

In Continental Europe, where nuclear energy had a higher political salience, one reason for this absence of empirical work based on survey data gathered from movement activists and groups themselves can be found in the high degree of confrontation and violence in the antinuclear movements. It would have been difficult if not impossible to survey demonstrators in countries such as France and West Germany, particularly as many antinuclear activists in the 1970s and 1980s strongly rejected empirical social science approaches as “positivist” and likely to favor the interests of the “state” or the nuclear industry. Kriesi (1982: 274–287) reported how his proposal to carry out a survey of antinuclear activists in Switzerland generated strong opposition and his great difficulty convincing at least one group to cooperate with the study. Opp circumvented this problem by identifying opponents with the help
of general attitude surveys in locations that had experienced a high level of antinuclear opposition rather than approaching antinuclear groups directly (Opp et al. 1984). A critical attitude to survey research also extended to parts of the social science community, with some researchers preferring to pursue qualitative approaches or concentrating on the theoretical refinement of interpretations of the wider social significance of antinuclear movements.

While the emergence and development of antinuclear movements, and the processes of micro-mobilization that attracted activists to it, are thus under-researched, one area that has been the subject of continuous systematic attention after the effective end of antinuclear mobilization is the policy impact of antinuclear movements. An early attempt to assess the impact on the basis of a careful comparison of cases (Flam 1994) has more recently been supplemented by more systematic empirical studies. Giugni (2004) provides a rigorous attempt to analyze the policy impacts of antinuclear movements (as well as ecology and peace movements) relying mainly on time-series analysis. Comparing the United States, Italy, and Switzerland, Giugni found the overall policy effect (operationalized in terms of government spending) of antinuclear movement mobilization to have been weak. Italy is the only country having experienced a direct effect of antinuclear activity. Taking account of the interaction between mobilization, political alliances, and public opinion, Giugni also diagnosed an impact for the United States, but not for Switzerland. Overall, antinuclear movements have had less of an impact than ecology movements but a higher impact than peace movements.

A far wider range of countries, 18 in total, is analyzed by Kolb (2007) who applies qualitative comparative analysis (QCA) to understand movement impact in terms of the development of nuclear energy programs. Kolb shows that public opinion on nuclear energy was the most important predictor of movement impact, particularly after the 1986 Chernobyl accident. The strength of movement mobilization by itself was not sufficient; its role was conditioned by the opportunities that movements could take advantage of.

One limitation of these impact studies is that they quite narrowly focused on policy outcomes, and furthermore only considered the impact of these movements up to the mid-1990s at best. The late 1990s introduced a new dimension, with green parties negotiating limitations on nuclear activities as a condition of entering national governments, particularly important in Germany (Rüdig 2000). Also largely unexplored are the long-term impacts of the antinuclear movement on individual and collective behavior. This would be particularly important in countries which have experienced mass mobilization, for example in Germany where a fairly high degree of antinuclear activity had been sustained up to the late 2000s and government plans to extend the lifetime of nuclear power stations produced an instant surge of protest in 2010.

Finally, a further limitation that applies to the literature on antinuclear movements has been its concentration on a relatively small number of countries, essentially the United States and selected Western European countries. Social movement scholars have generally not analyzed antinuclear mobilization in the rest of the world. Many incidents of mobilization may have gone unnoticed and unstudied. There are some notable exceptions, however, which could be indicative of a far wider degree of mobilization outside of Western Europe and North America: Dawson (1996) compared antinuclear movements in three Eastern European states in the context of the collapse of communism, García-Gorena (1999) presented a detailed case study of a local antinuclear movement in Mexico, and Ho (2003) provided a detailed analysis of the development of antinuclear protest in Taiwan. Beyond the study of actual mobilization, the analysis of cases with a lack of protest activity, particularly focusing on countries with a high level of nuclear
generation such as Canada, would also enhance our understanding of antinuclear movements.

FUTURE CHALLENGES

The antinuclear power movement in the 2000s can be seen as a movement “in abeyance.” While issues of nuclear waste disposal continued to provide stimuli for protests over the years in several countries, the main period of antinuclear mobilization appeared to have ended by the late 1980s. The 2010s could possibly see the beginning of a new wave of movement activity in response to the relaunch of nuclear construction programs in Western democracies. New nuclear power stations are under construction in Finland and France, and governments in the United States and the United Kingdom have announced their intention of stimulating such construction projects in the near future. Furthermore, the nuclear accident at the Fukushima nuclear plant in Japan in March 2011 has reignited nuclear debates in several countries.

Faced with new programs of nuclear construction, how likely is a revival of the antinuclear protest? General public attitudes in the 2010s are probably more pro-environmental and critical of nuclear power than some 40 years ago, when movements had to revolt against an apparent pro-nuclear social and political consensus. Environmental groups and green parties have established a major foothold in many political systems. Major events, such as nuclear accidents, are also one way to revive opposition. Other factors, however, could make strong opposition less likely. An important aspect is the new “framing” of nuclear power in the twenty-first century as a contribution to combating global warming. Furthermore, there is the existence of a large number of long-standing nuclear host communities which are likely to welcome further nuclear construction, thus limiting the potential of strong local opposition that tends to emerge from “green field” sites. Both renewed mobilization and a possible failure of the movement to reemerge provides social movement scholars with interesting analytical challenges, making the study of antinuclear power movements not just an historical task but also an enterprise with contemporary relevance.

antinuclear power movements (in general)

Antinuclear movement in Japan

DANIEL P. ALDRICH

Japan remains the only nation in the world to have experienced the horrors of atomic weaponry at Hiroshima and Nagasaki, but the government initially suppressed public debate on the topic and the postwar occupation authorities temporarily banned research on nuclear power (Yoshioka 1999; DiFilippo 2003). Thus, there was a lag between the bombings and the start of broader antinuclear movements, which began in the 1950s as a result of widespread anger over the deadly exposure of Japanese fishermen to radioactive fallout. Antinuclear power movements evolved alongside antinuclear weapons associations as Japan’s commercial atomic program moved forward. Japan’s unique history created broad sympathy for antinuclear ideologies, with many prominent authors writing about the victims of the atomic bomb, known as *hibakusha*, in works such as Ibuse Masuji’s *Black Rain*. This sympathy did not prevent the Japanese government from creating an advanced commercial nuclear program with attempts at a closed fuel cycle and the use of mixed-oxide (MOX) fuel. Although the government promotes nuclear power domestically and sells nuclear technology and training to other nations, it has stood by its Three Non-Nuclear Principles (not possessing, manufacturing, or permitting nuclear weapons in Japanese territory) and has not pursued nuclear weapons.

The focusing event for antinuclear social movements came in the mid-1950s, after which a number of organizations formed at the national level; some have supported nuclear power while opposing atomic weapons, and others have opposed both. In March 1954, radioactive fallout from a hydrogen bomb test in the Marshall Islands exposed 23 crewmen onboard the fishing boat Lucky Dragon Number 5 to high doses of radiation. As radio operator Kuboyama Aikichi passed away from radiation sickness in September 1954, housewives in Tokyo were mobilizing a petition—the Suginami Appeal for the Prohibition of Atomic and Hydrogen Bombs—which garnered more than 30 million signatures (more than half of Japan’s voting population) by August 1955. In September 1955 *Gensuikyō* (*Gensuibaku Kinshi Nihon Kyōgikai*, the Japan Council against Atomic and Hydrogen Bombs) organized as the earliest national antinuclear movement; connected to the Japan Communist Party (JCP), it has opposed nuclear weapons while often supporting nuclear power. In 1965, the Japan Socialist Party and Šōhyō split off from Gensuikyō to form the Japan Congress against Atomic and Hydrogen Bombs (*Gensuikinin*) which opposed both nuclear energy and weapons. Under public pressure, Prime Minister Eisaku Satō laid out the Three Non-Nuclear Principles in 1967 which were adopted (but not written into law) by the Diet in 1971. The year 1969 marked the first large scale antinuclear demonstrations from fishermen, who mobilized 1000 boats to protest the government-run nuclear facilities at Tōkaimura. In 1975 nuclear chemist Dr Takagi Jinzaburo founded the Citizens’ Nuclear Information Center (CNIC, *Genshiryoku Shiryō Jōhōshitsu*) and soon afterwards the *Hangenpatsu Undō Zenkoku Rengakai* (National Liaison Conference of Anti-Nuclear Movements) began publishing the *Hangenpatsu Shinbun* (Anti Nuclear Newspaper) (Tabusa 1992). These movements tapped broader concerns about nuclear technology in general; such suspicions came to be known as *kaku arerugi* (nuclear allergy).

While national level organizations regularly hold rallies, marches, and protests against both nuclear weapons and plants, local civil
society organizations have proved the most effective at altering nuclear power schemes. Regular surveys have confirmed that more than three-quarters of Japanese citizens oppose nuclear weapons and annually more than one million visitors – many of them Japanese children – come to Hiroshima Peace Memorial Park. In potential host communities for nuclear power plants, fishing cooperatives (gyogyō rōdō kumiai) – which hold property rights that must be acquired by developers – derailed a number of siting plans due to concerns about the effects of hot waste-water discharge from the plants (Lesbirel 1998).

To counteract concerns about atomic energy, the Japanese government worked with the regional utility companies using a two-pronged strategy: developers sought to site nuclear plants in rural coastal villages where civil society was diminished and potential resistance weakest, and government agencies like the Agency for Natural Resources and Energy used a multifaceted set of central government policy instruments to move local residents toward accepting nuclear power (Aldrich 2008). These tools include the institutionalized redistributive mechanism known as Dengen Sanpō (The Three Power Source Development Laws), which provides millions of dollars in subsidies, loans for attracting business and job retraining, and infrastructure projects to often impoverished and depopulated rural villages (Aldrich 2005).

Toward the end of the twentieth century, a fatal accident at the Japan Nuclear Fuel Conversion Company (JCO) and cover-ups of accidents at multiple reactor sites amplified concerns about the safety of nuclear power, as have admissions that US military craft have brought nuclear weapons into Japanese territory. Protests against the use of MOX fuel and fuel recycling facilities continue, as seen in October 2009 when more than 7000 citizens mobilized in Tokyo’s Meiji Park. Overall, the Japanese antinuclear movement has slowed the government’s trajectory for commercial nuclear power (so that lead times for nuclear construction have more than tripled since the 1970s), but has not stopped its momentum; on the other hand, US–Japan security arrangements in combination with broader sympathy for hibakusha have reinforced the government’s abstention from nuclear weapons.

Antiracist movements in Europe
CARLO RUZZA

In Europe, antiracist protest activities are a relatively less frequent and durable manifestation of a strong and fairly institutionalized cultural current of legally embedded antiracist values. Antiracism as a value informs a number of social arenas in which different types of actors contribute to defining and expanding conceptions of citizenship and antiracist policies, sometimes using contentious political repertoires. Their efforts also include judicial activism, advocacy at different levels of governance, initiatives in the public sphere, and sensitizing campaigns in social organizations such as workplace organizations, churches, and educational establishments. Antiracist activities also emerge in specific professional contexts, as with the police and probation professionals.

Antiracism has traditionally focused on biological racism but it increasingly responds to cultural essentialist definitions of racism, and to the ethnic and religious discrimination manifest, for instance, in the Islamophobia and anti-Semitism that characterize several European societies.

Historically, antiracist mobilizations have at times intensified and accompanied momentous societal restructuring, as in the case of the civil rights movement in the United States or that of the South African struggle against apartheid. However, in recent years, antiracist mobilizations in Europe have been more limited. Social and political actors are often only occasional participants in protest events and remain focused on furthering antiracism in the broader context of a set of interrelated cultural and policy initiatives inspired by related movements, which also include a focus on expanding human rights and enhancing social justice in specific policy sectors. As European societies absorb growing numbers of refugees and migrants and deal with the resulting tensions represented by extreme right formations, European antiracist mobilization has become increasingly and distinctly defined in terms of a countermovement advocating social integration, access to public services, and the legal entitlements of radicalized minorities.

Hence, in order to understand European antiracist mobilizations, it is necessary to review their (1) countermovement character, (2) their fragmentation of action repertoires, objectives, and philosophies, and (3) their distinctive supranational opportunity structures.

COUNTERMOVEMENT CHARACTER

The countermovement character of antiracist mobilization lies in its oppositional stand against the diffusion of culturally racist frames in the popular press and in mainstream center-right parties, and in its reactions to a public opinion that sees the new citizens of European countries as competitors and threats to security. Antiracism is therefore a countermovement because it opposes a strong current of opinion. It is also a countermovement because it opposes the right-wing movements that perpetrate concerted attacks against minorities. In recent years a composite family of social movements of the right have appeared in Europe. The uniting nationalism that characterized earlier right-wing movements has expanded to incorporate related frames which include ethno-nationalist xenophobic groups yearning for a revival of ethnic community. In this context, antiracism has, on the one hand, remained defined in relation to a set of state-supported legal entitlements connected to discourses of human rights, and thus has come to function partly as
an institutionalized ideology. On the other 
hand, antiracism has become increasingly 
mapped on the left of the left–right axis as 
a countermovement embedded in militant 
antiracist groups, left-leaning political parties, 
and social institutions such as the trade unions. 
It is in relation to this aspect of antiracism that 
contentious action repertoires have been more 
likely to emerge, and consequently antiracist 
mobilization has often been characterized as 
a countermovement. This countermovement 
character has been colored by distinctively 
national philosophies which have, for instance, 
differentiated the United Kingdom and 
French expressions, in one case adopting a 
multiculturalist philosophy and in the other 
an assimilationist one (Lentin 2004). 

The constituencies involved in these anti-
racist mobilizations are, on the one hand, 
resource-poor migrants, and on the other, con-
science constituencies of left-liberal activists 
whose activities are weakened by the diffi-
culty of establishing links with the migrant 
population and the awareness of an unsup-
portive public opinion climate. This coun-
termovement ethos has been strengthened by 
key geopolitical episodes of recent decades. 
The September 11 attacks and related events 
have sparked anti-Islamic sentiments which 
have been interpreted in antiracist terms by 
the entire left-liberal social movement sec-
tor (Alleyne 2010). However, as a reactive 
movement, antiracist mobilization has often 
emerged in contexts of social isolation – facing 
a relatively unsupportive public opinion which 
sees nonwhites as unwelcome migrants and 
as competitors for jobs and resources of the 
welfare state.

FRAGMENTATION AND COMPETING 
CULTURAL FRAMINGS

Limited mobilization effectiveness is also 
related to the movement’s internal cultural 
fragmentation. Scholars have identified several 
competing cultural framings of antiracism that 
are thought to hinder its viability (Gilroy 1990). 

This particularly applies to framing tensions 
resulting from lack of solidarity between the 
different movement components which are 
too fragmented in terms of occupational, 
religious, and ethnic background to agree 
on objectives and methods (Bonnett 2000). 
In recent decades, in several EU countries, a 
revival of ethnic assertiveness has occurred, 
a consequence of which has been a rejection 
of the previous antiracist’s unifying category of 
“black” as insensitive to cultural and religious 
diversity. This has divided the movement, 
with some advocating a curb to self-defeating 
multiple ethnic identities, and others arguing 
for separate ethnic identities to unite in 
a coalition of mobilized groups. A related 
debate takes place regarding the connection 
of antiracist mobilization to class and gender 
conflicts. For some, antiracism is a primary 
goal, and for others it needs to be addressed 
in the context of the struggle against other 
forms of exclusion. Antiracist frames are also 
widely used by other movements such as peace 
movements – particularly in relation to their 
activities to protest against ethnic wars – but 
they play an role auxiliary to these movements’ 
main frames.

In recent years, movements have to some 
extent overcome their internal divisions when 
a response to racial attacks has newly uni-
ted them, reinforcing their countermovement 
character and strengthening countermovement 
organizations and unaffiliated groups of indi-
viduals. Antiracist urban riots have occurred 
in poor urban neighborhoods in France and 
the United Kingdom: notably in the United 
Kingdom poor areas like Peckham and cities 
like Bristol and Birmingham in the eighties 
and, in France, Paris in 2005 (Begag 2007). 
They consist of confrontations between the 
police and youth generated by simmering eth-
nic tensions related to poverty and social exclu-
sion. The organizational setup that supports 
them is often relatively weak and short-lived 
because stable organizations do not have time 
to develop because grievances emerge in pop-
ulations lacking the resources to produce such 
organizations.
Antifascist antiracism has also emerged in restricted contexts, such as football, a sport in which racism is frequently manifest. There are coordinated national campaigns like the “Show Racism the Red Card” initiative in football, which has retained relevance for decades (Long & Spracklen 2011).

To sum up, it has been argued that European antiracist movements are fragmented along a set of dimensions. Some seek to attain coalitions of separate ethnic identities, others more overarching identities. There is at times a focus on institutional arenas which clashes with a focus on antifascist protest. A focus on education and cultural initiatives targeting majority culture clashes with the goal of strengthening community-based organizations aimed at politicizing ethnic and religious identities. However, whilst antiracism is a fragmented movement, there are also broadly ranging generalist organizations that unite the movements' various components, such as “SOS Racisme” in France, which focuses on both militant antifascism and cultural and institutional initiatives.

Although thematic and organizational fragmentation has hindered mobilization, it has helped to diffuse antiracism throughout the institutional fabric of European societies. One then finds a wealth of grassroots organizations campaigning against “institutional racism” in various domains, organizations engaged in policy advocacy, migrant organizations acting as public interest groups and lobbies, government-sponsored organizations that are often semi-autonomous, and institutional mediators that exert antiracist functions in specific contexts such as health institutions (Fella & Ruzza 2012). Some of these organizations are integrated into umbrella groups represented at the EU level. However, the relative distribution of these types of organizations is differentiated within Europe, with France expressing a less institutionalized tradition, the United Kingdom exhibiting both institutionalized and un-institutionalized groups, Scandinavian countries exhibiting strong state-sponsored antiracism, and the Mediterranean rim exhibiting a strong contribution of conscience constituency activists with bases in the Catholic Church or in leftist parties (Flam & Lloyd 2008).

SUPRANATIONAL OPPORTUNITY STRUCTURES

A diffusion of antiracism has also occurred in supranational contexts where issues of legal legitimacy and human rights are paramount. One such context of particular importance is constituted by supranational and transnational institutions such as the European Commission and Parliament, the Council of Europe, and the United Nations. At the EU level, a powerful coalition of institutional actors and human rights activists has spearheaded antiracist legislation and successfully contributed to the diffusion of antiracist concerns in all European institutions. With the approval of two specific antiracist directives, the antiracist movement has found in the EU distinctive opportunities for mobilization and for judicial activism connected to the creation of a Europe-wide legal base to engage in and legitimize antiracist action. In the EU context, antiracist activities are utilized by a set of bureaucratic actors to gain legitimacy, and are therefore supported and resourced. This has also had a particular enabling impact on the political opportunities of the Mediterranean rim countries, where a relatively recent migrant population is still unable to mobilize itself. Antiracist activities are then often supported by an indigenous base of conscience-constituency activists empowered by the legitimacy and resources that EU support furnishes.

Antislavery movement
MARISSA D. KING

The movement to abolish slavery and end the slave trade, which began first in Europe and then the United States at the end of the eighteenth century, was one of the first modern social movements. The abolition movements in France and Britain, which sought to end the slave trade among the colonies, and the movement to end slavery in the United States shared critical qualities that set them apart from earlier reform efforts. In the early eighteenth century, social protests were primarily short-lived outbursts mounted by loosely connected groups that were geographically constrained and emphasized local demands. In contrast, the antislavery movement was sustained, formally organized, transcended disparate geographies, and often directed their claims toward the state. The birth of the modern social movement was defined by a shift in the repertoires of contention – the set of actions activists use to assert their claims – from parochial, bifurcated, and particular to cosmopolitan, modular, and autonomous (Tilly 1995; Tarrow 1998). The antislavery movement’s innovative early utilization of the media, religious organizations, and formal organizations in its organizing efforts was key to the movement’s ability to develop a sustained geographically dispersed movement that transcended national boundaries and acted as a catalyst for the abolition of slavery, thereby making it one of the most significant modern social movements. Moreover, it was one of the first social movements to transcend national boundaries, making it one of the earliest transnational social movements.

In both the United States and Europe the earliest efforts to abolish slavery and the slave trade were undertaken by elites who sought reform through judicial appeals. The movement to abolish slavery can be traced to 1542 when Spain enacted a law to abolish slavery in its colonies. The law was repealed shortly thereafter and further attempts to end the slave trade in Europe would not gain momentum again until the late 1700s. In the latter half of the eighteenth century, antislavery reformers in the United Kingdom once again began efforts to end the slave trade through legal means. The trial of John Sommerset, a captured runaway slave, in England in 1772 drew considerable media attention to the antislavery cause and marked the beginning of concerted antislavery organizing in Britain. While several attempts were made to end slavery through legislative means in the late 1770s and 1780s, an organized antislavery effort in Britain did not take root until 1787 with the establishment of the Committee for the Abolition of the Slave Trade. Many of the early antislavery organizing efforts in Britain relied on informational campaigns and mass petitions. By 1792, the year after slavery was outlawed in the French Empire (this was later repealed by Napoleon), the antislavery movement had gained momentum throughout the British Isles with over 400,000 people participating in petitioning efforts. The war between Britain and France, which began in 1793, slowed the momentum of the antislavery movement. However, attempts to end the slave trade through legislative means continued and the efforts were finally met with some success in 1806 with the passage of the Foreign Slave Bill. The Foreign Slave Bill outlawed the export of slaves from Africa to any colony that was recently acquired, substantially reducing the size of the slave trade. The following year the General Abolition Act was passed and its enactment in 1808 ended Britain’s participation in the slave trade. With the end of the slave trade in the British Empire, British abolitionists and the British government began using political and economic power to end slavery in other countries. Through a series of treaties and negotiations, Britain convinced Spain to curb its slave trade in 1817, followed shortly
thereafter by Portugal and France. British anti-
slavery organizers were also closely aligned with
and committed to helping antislavery activists
in the United States.

Much like early antislavery societies in
Britain, members of the earliest antislavery
societies were often prominent white politi-
cians, lawyers, philanthropists, and business-
men, including such notables as Benjamin
Franklin and Alexander Hamilton. The first
antislavery societies in America, which consti-
tuted the center of antislavery organizing in the
United States, were the Pennsylvania Abolition
Society founded in 1775 by a group of promi-
nent Quakers, the New York Manumission
Society, founded in 1785, and the American
Convention of Abolition Societies, founded in
1794. These early societies supported a pre-
modern social movement, one that depended
on the peculiarities of local resources and
whose targets were often local slave owners.
The early antislavery organizations advocated
gradual abolition of slavery and their tactics
emphasized voluntary manumissions, legal
aid for blacks, and petitions to state gov-
ernments. This style of local legal activism
and elite organizing dominated the early
years of the American antislavery movement.
The antislavery movement in the United
States became increasingly modern with the
founding of the American Anti-Slavery Society
(AASS) in 1832. The AASS adopted a regional
federated structure comprising nested local,
state, and national chapters. This federated
model, which first became popular among
civic organizations and temperance societies in
the 1820s, enabled a franchise-like expansion;
it reduced mobilization and coordination costs
by providing a template for organizing and a
way to link local groups to a nationwide effort.

With organizational changes came changes
in ideology and tactics. In contrast to ear-
lier elite-based antislavery societies that sought
manumission and gradual abolition, the AASS
initiated a popular grassroots campaign to pro-
mote immediate abolition. Rather than having
prominent citizens sign petitions or bring law-
suits, the AASS sought to build widespread
support among the citizenry to end slavery
through a moral transformation that would
turn the entire populace into abolitionists. To
that end, the AASS relied on emotive appeals,
traveling agents, the propagation of literature,
and the formation of local societies. A con-
tinual tension within the American antislavery
movement that was not faced in other coun-
tries was whether to gradually get rid of slavery
through manumission or through a large scale
antislavery effort. Over time and under the aus-
pices of the AASS, immediate abolition gained
in popularity.

The number of antislavery societies re-
ained quite small from the 1790s to the
1820s because early antislavery societies had
a narrow membership base. There were never
more than 20 antislavery societies in the years
before 1820 and fewer than 65 before 1830.
The number of antislavery societies grew
explosively in the 1830s: from 47 in 1825 to
429 in 1835 and over 1600 in 1839, at which
point the organized antislavery movement
peaked. In 1840, the antislavery movement
began to fragment over what role women
should play and whether abolitionists should
engage in political action. This fragmentation
happened, in part, because antislavery societies
embraced a broad and therefore heterogeneous
constituency. After 1840, the antislavery move-
ment never regained its earlier organizational
unity. After 1840, the antislavery movement
became increasingly intertwined in politics
and eventually war. Slavery would be abolished
in the United States due to political action at
the end of the Civil War in 1865.

Both in the United States and in Britain,
the antislavery movement grew from a limited
movement that relied on elite-based antislavery
societies, petitions, and lawsuits to a large-scale,
geographically dispersed movement that tran-
scended national boundaries. The transition in
both continents to becoming a modern social
movement was aided by changes in organi-
zational structure and tactical repertoires. In
the early decades of the antislavery movement,
there were few resources and little infrastruc-
ture to support, sustain, and coordinate social
movement organizations. But over the next six decades, many supportive institutions began to flourish: the press exploded, and religious revivals contributed to the largest expansion of organized religion to date. Without the resources and infrastructure provided by these social institutions, organizing for reform would have proved formidable, if not impossible. Antislavery organizers benefited from and utilized extensively the burgeoning press, religious institutions, and formal organizational structures. In doing so, they not only helped the antislavery movement develop into one of the earliest modern social movements but also deployed many of the organizing tactics that would be central for many later social movements, including the civil rights movement.

In an effort to transform into a social movement with a broader base of support, antislavery organizations in the United States and the United Kingdom increasingly utilized traveling agents, the media, and local societies to gain support for their cause. Religious organizations were also critical to the spread of the antislavery movement. The movement both in Britain and the United States first took root among Quakers and then spread to and through other religious organizations. Churches were extremely powerful because they provided an extensive preexisting organizational infrastructure, a platform for making a compelling moral case against slavery, and they provided legitimacy and resources for the movement. These worldly religions, which were undergirded by a principle of disinterested benevolence in which the faithful have a moral responsibility to reform society as a whole, were particularly central to the antislavery movement. Similarly, the propagation of literature, petitions, and other forms of print media were critical for the development of a broad-based sustained antislavery movement. Hundreds of publications devoted to the antislavery cause were developed throughout the movement. These publications were supported and circulated beyond regional boundaries through the efforts of antislavery agents, who traveled from town to town espousing the antislavery cause. Agents actively courted the press, particularly local newspapers and magazines, and wrote articles that would appeal to local audiences because periodicals could spread the cause faster and farther than lecturers. Finally, the efforts of antislavery organizers to transcend local boundaries and develop a sustained movement was facilitated by a federated organizing structure that spread the movement in a franchise-like expansion. The organizational and tactical innovations deployed by the antislavery movement that allowed it to become one of the earliest modern social movements and one of the first modern social movements were not unique to the abolition movement. Both the temperance and early women’s movement, contemporaries of the antislavery movement, employed similar tactics and repertoires of contention. Thus, the tactics that diffused within the antislavery movement across national borders also transcended movements.

Antiwar and peace movements
DAVID S. MEYER

INTRODUCTION

War built the modern nation-state, and the modern nation-state made the modern social movement possible. To maintain (or extend) borders and wealth, the modern state developed a bureaucratic structure to extract its citizenry’s sons and dollars, and that bureaucratic structure provides both a target and an interlocutor for challenging movements. Often, those movements challenge war and preparations for war. Peace and antiwar movements mobilize for a variety of goals, ranging from stopping the prosecution of particular military campaigns to stopping the preparations for war to creating a more just and pacific world through social services and citizen diplomacy. Antiwar and peace movements seek to constrain their own states and often reach outside national borders to cooperate with those who share their beliefs. Although some people are so committed to peace politics that they are virtually constantly mobilized, larger and more social movements emerge only when the costs and threats of war and war preparations become particularly visible.

Peace activists rarely win outright victories by preventing wars, but their actions often matter in other ways, changing public opinion, forcing policymakers to alter their goals, or undermining the institutional or political infrastructure that supports war-making. They can also build transnational ties that can serve as the basis for stronger campaigns in the future, making the prosecution of war more difficult. They have also provided the infrastructure for campaigns on other issues; the historic peace churches, for example, provided the infrastructure for the abolitionist movement, and antiwar activists advocated both women’s rights and state-provided social services – as well as international cooperation.

Campaigns against war, including both protest and grassroots efforts at international cooperation, have a history that is, at least, as long as the history of war. The end of World War II, however, marks a significant change in their history. The introduction of nuclear weapons into world politics through devastating attacks on Hiroshima and Nagasaki made great wars seem less and less possible. They also moved the international system from one in which several great powers competed for dominance, cresting and declining in influence, to one in which superpowers maintained a permanent military presence (and threat of war), organizing the world system around a great military and ideological conflict, while (mostly) replacing wars among the great powers to proxy wars in less powerful and less wealthy states. World War II changed not only the international political order and the possibilities and conduct for war, but also the opportunities for activists to fight against it. The permanence of the threat and preparations for war meant that activists found cause to challenge governments even in the absence of actual fighting; like war, the possibility of peace mobilization was also always imminent.

While the possibility of nuclear war has remained a constant presence in world politics, antiwar movements and antinuclear movements have waxed and waned in response to political conditions. For the most part, vigorous antiwar movements have been limited to democratic states, which afford internal opponents sufficient political space to organize and mobilize, although even liberal democratic states have used the excuse of war to limit political freedoms. Until recently, antiwar movements have grown as the costs, both human and fiscal, of conducting wars grew and became more evident. Antiwar movements become more
powerful when well-established, but generally marginal, pacifist opponents of war in general join with larger groups who oppose a particular war — often for a wide variety of reasons.

The story for antinuclear movements is broadly similar. Movements against particular weapons systems and the arms race in general have waxed and waned in response to the visibility and volatility of nuclear weapons policies. During much of the nuclear era, their efforts were largely invisible, sustained by a core of pacifist, anti-interventionist, and international humanitarian organizations with relatively small constituencies. On occasion, however, opposition to nuclear weapons policies has spread beyond these relatively marginal groups to engage large sectors of the population and mainstream politics.

Paradoxically, peace movements played an important role in maintaining a relatively stable nuclear balance, growing and diversifying when authorities threatened to escalate the arms race. In recent years, for example, as the number of nuclear weapons deployed by superpowers has declined rather steadily, peace movements have been largely absent from the debate. In contrast, the movements were most visible when the West was visibly and actively augmenting its nuclear arsenals. Governments work to manage their opposition by using the resources of the state to legitimate a particular war and discredit their opponents as disloyal and naive. Activists have to work to maintain a sense of urgency while simultaneously demonstrating their patriotism and good sense (Woehlre, Coy, & Maney 2008). This is a difficult balance to maintain, possible on a large scale only in unusual circumstances.

Opportunities for peace movement mobilization are characterized by visible splits among policymakers and strategic experts that spill outside the boundaries of political institutions. The peace movement takes advantage of splits among elites and exploits anxieties in the broader public by stoking public fears of the dangers of war and criticizing the costs and risks of more aggressive foreign and military policies. Movement activists have been far more successful at opposing state policies than promoting alternatives.

HISTORY AND BACKGROUND

During the relatively brief episodes of wide public attention and extensive mobilization, we see broad coalitions of activists emerge and alternative policies seem possible. As movement actors mobilize, they forge coalitions with more institutionally oriented actors. Although these alliances make it easier for a movement to get alternative perspectives out to a broad public, they also limit the extent of just how alternative those perspectives will be. These periods end when government makes some kind of accommodation with public concerns, often by moderating the policy disputes that provoked mobilization in the first place. We can see the general process through which peace campaigns grow and decline by offering a broad historical background and then sketching the most significant instances of broad mobilization since World War II.

Dating back to the 1600s, the historic peace churches — the Quakers, Church of the Brethren, and Mennonites — served as the core of a peace movement, and advocated social justice as well as nonviolence (DeBenedetti 1980; Chatfield 1992). Religious activists also worked for the abolition of slavery, fair treatment of native Americans, and the rights of women. Stopping war was only one part of the faith-based reform agenda. Beginning in the 1800s, secular peace societies focused on the issue of international war and its prevention, and organized international meetings to coordinate their efforts.

By the beginning of the twentieth century, peace activists tried to imagine and effect a new international framework that could prevent wars. At the individual level, activists organized young men to sign “peace pledges” signifying their refusal to fight for their countries. And they pushed for greater international coordination, sometimes advocating a supranational organization or even a world government. The
failure of the League of Nations to prevent World War II, and the new security era occasioned by the aftermath of that war, altered the political circumstances for activists permanently.

The first political opponents of nuclear weapons were the scientists who had helped develop them. Even while working to create atomic weapons, many scientists had misgivings about their use, but saw the threat of Hitler’s Germany as so great that they put their doubts aside (Herken 1987). Formal efforts to share scientific data internationally and to use the first nuclear bomb as a demonstration strike rather than an attack on a city were unsuccessful, and then the devastation of Hiroshima and Nagasaki spurred a broader public debate. Several groups of scientists formed by the end of 1945 to focus on public education about nuclear weapons, most notably the Federation of Atomic Scientists, which published The Bulletin of the Atomic Scientists featuring a “doomsday clock” assessing the threat of nuclear war on its cover. They sought to inform the public debate.

Initially, mass media, politicians, and clerics focused debate on the weapons’ destructiveness and potential applications. Norman Cousins’ influential essay, “Modern Man is Obsolete,” published in the Saturday Review just a week after the bombing of Nagasaki, helped to frame the debate and critique of atomic weapons. For Cousins, nuclear weapons represented a new problem for which there was only one solution: world government. This remedy found limited support which declined as the United Nations developed. Efforts to create an international regime for the control of nuclear weapons failed because of Soviet intransigence and American disinterest and took a back-seat to less focused discussions of the morality of nuclear weapons. By 1948, the cold war struggle crowded out most of those concerns, as the West sold nuclear weapons as a tool to combat global communism in general, and the Soviet Union in particular (Divine 1978; Boyer 1986; Wittner 1997–2003, vol. 3). In essence, fear of communism overshadowed fear of nuclear weapons, and the promise of nuclear energy legitimated ongoing research on weapons.

THE TEST BAN

If peace protests in the immediate aftermath of World War II lacked a clear policy agenda, this was assuredly not the case for the movement’s reemergence in the 1950. A new provocation, specifically the public discovery that dangerous radioactive fallout was a product of nuclear testing, combined with a more open political environment occasioned by the death of Soviet leader Joseph Stalin and the end of the Korean War. This pattern of opportunities, threats, and organization coinciding repeats in stories of successful mobilization (Meyer 1993). Antinuclear protest would come from leaders internationally, expert scientists in the United States and Europe, and radical pacifists at the grassroots.

In March 1954, radioactive fallout from the BRAVO tests in the Bikini Islands covered “The Lucky Dragon,” a Japanese tuna trawler, contaminating its crew and catch, and drawing international attention to the hazards of atomic testing. Pope Pius XII, Jawaharlal Nehru, the British Labour Party, and the Japanese Diet immediately appealed to the United States to stop nuclear testing and negotiate a test ban, and opposition to testing was a leading edge in making broader claims about the wisdom and morality of nuclear arms in general (Divine 1978).

While the Eisenhower administration, internally divided, temporized on test ban proposals, activists focused on the dangers of radioactive fallout, as scientists published their research on fallout in public venues, including the Bulletin of the Atomic Scientists. A group of international scientists issued the “Einstein–Russell Manifesto,” which called for an end to testing and the arms race, and this effort led to a series of more than 200 Pugwash international meetings of scientists that continues to this day.

Even as international figures made moral and political arguments grounded in science,
Grassroots activists staged dramatic actions to protest the nuclear arms race. Groups of activists publicly refused to cooperate with civil defense exercises in the United States, and worked hard to trespass on nuclear test sites, including, most dramatically, Albert Bigelow’s effort to sail a yacht, *The Golden Rule*, into a South Pacific nuclear test site. In 1956, British citizens staged an Easter demonstration in Aldermaston, where Britain was developing its own nuclear weapons. The newly founded British Campaign for Nuclear Disarmament (CND) would stage annual marches from Aldermaston to London to protest the arms race generally, and Britain’s participation in it, and activists in other English-speaking nations formed sister CND groups that staged protests and marches as well (Wittner 1997–2003, vol. 2).

Activist efforts bounced in and out of electoral politics, depending upon the prospects of success. To quiet political opposition, by 1957 officials in the United States and Great Britain moved toward negotiations on a test ban. Eisenhower and Khrushchev presided over a testing moratorium 1958 to 1960. In the 1960 presidential campaign both Richard Nixon and John Kennedy promised, if elected, to secure an arms control agreement on testing. When negotiations stalled, President Kennedy presided over a series of visible nuclear tests that reawakened the antinuclear movement. Nobel prize winning scientist Linus Pauling, who was a visible antinuclear activist, pressed the issue both at a White House dinner in 1962 and outside the White House in protest the following evening. Antinuclear activism spread throughout Western Europe. Kennedy used antinuclear activist Norman Cousins as a conduit for negotiations with Khrushchev, securing an agreement to ban atmospheric testing. This Limited Test Ban Treaty in 1963 made it very difficult for peace activists to make broad claims and build coalitions, and many activists turned to other issues, including student activism on free speech, civil rights, and economic justice in the United States (Meyer & Whittier 1994).

**Against the Vietnam War**

By 1965, longtime peace activists in the United States and elsewhere turned their attentions to the Vietnam War. As the American commitment to the war grew, so did the need for draftees to fill military billets, and so did opposition to the war. As the numbers of troops deployed increased, media coverage of casualties, particularly on television, drew public attention to the risks and costs of war (DeBenedetti & Chatfield 1990). A war that was clearly costing more lives and money than policymakers promised generated increased opposition. The draft meant that a substantial slice of political opposition to the war was directed around the interests of young men who would be forced to fight. Civil disobedience grew, as increasing numbers of young men refused to register for the draft, burned their draft cards, or fled the country, most commonly to Canada. Opposition to the war, in a context of increasing activism, stoked a radical wing of the movement which included fringe groups willing to use violence. Large-scale campus-based teach-ins and protests, augmented by smaller and even more dramatic actions, made it increasingly politically costly to conduct the war. The political splits in the Johnson administration and the Democratic Party more generally, also fed by conflicts over civil rights, helped Republican Richard Nixon win the Presidency in 1968.

Although the antiwar coalition grew broader, opposition to the war never commanded a majority of support and the most dramatic and disruptive protests were polarizing. By 1972, the US Congress effectively legislated the end of the war by withholding funding to continue the draft and provide supplies to continue fighting the war. The antiwar movement can claim substantial credit for provoking opposition to the war, raising the costs of conducting the war, and serving an agenda-setting role in which the merits of US foreign policy received an unusual degree of scrutiny. The difficulties of conducting the war, both abroad and at home, eventually led to US withdrawal. Once again, the peace movement dissipated, after
an apparent victory, but also like the earlier episodes, the movement left behind an enlarged residue of peace movement organizations and trained activists potentially available for new rounds of mobilization.

THE ANTIBALLISTIC MISSILE DEBATE

Overlapping the antiwar movement was a narrower campaign against the deployment of antiballistic missile systems. When Secretary of Defense Robert McNamara proposed a “light” missile defense system, he engendered opposition from both hawkish critics who demanded more and peace activists who opposed missile defense – or, minimally, didn’t want to live near nuclear missiles even if they were ostensibly designed for defense.

Scientific opponents of the ABM publicized their differences with the administration through journal articles and testimony before Congress, working in groups founded in the test ban campaign. They also worked to educate and mobilize citizen activists, nationally in groups like SANE, and locally in cities slated to be protected. Unable to achieve their goals through conventional politics, institutionally oriented scientists turned to mass politics (Primack & Von Hippel 1974). Activists sponsored teach-ins and rallies in cities where ABMs were to be deployed, including Chicago, Seattle, and Boston. These efforts were coordinated by groups like the new Union of Concerned Scientists, formed to organize scientific opposition to the war in Vietnam. Surprised that it was facing criticism from the cities due to be “protected,” rather than those left “undefended,” the Nixon administration redefined a narrower mission for the weapons system, relocating missile sites from metropolitan areas to more remote – and less visible – locales. Nixon also began negotiations to limit ABM systems as a precursor to the 1972 SALT treaty (the ABM treaty stayed in effect for nearly 30 years, until President Bush announced the United States’ withdrawal from the accord).

While American activists questioned the costs and effectiveness of missile defense, European political leaders publicly worried if a “defended” United States would be less committed to their defense. NATO called for a sign of a strategic United States commitment to European defense. The 1977 “dual track decision” to deploy intermediate range nuclear weapons in Western Europe provided a target for peace activists that ultimately unified European and American activists, and refocused activist attention on peace issues.

END AND THE NUCLEAR FREEZE CAMPAIGN

As European activists opposed the NATO dual track decision, American activists sought a unifying focus for their own efforts. The pacifist American Friends Services Committee commissioned Randall Forsberg to draft a proposal to unify a variety of goals and campaigns, as President Carter’s foreign policy grew increasingly bellicose and costly. Forsberg’s “nuclear freeze” proposal, advocating a “bilateral” halt to the deployment, production, and testing of nuclear weaponry, became a catalyst for uniting diverse opposition. Ronald Reagan’s landslide election in 1980, bringing Republicans to control of the Senate, ushered in efforts to implement a dramatically more aggressive and expensive security posture, eschewing arms control efforts to focus instead on an aggressive military build-up (Meyer 1990). But the election offered activists a bit of encouraging news; in three Western Massachusetts electoral districts, voters endorsed a referendum supporting the nuclear freeze (a campaign organized by a draft resister, Randy Kehler).

Activists in Western Europe used the planned dual track modernization as a vehicle for criticizing superpower politics that threatened European security and sovereignty. New antinuclear movements in Western Europe emerged strongly in 1981, focusing specifically on stopping the so-called “Euromissiles,” but offering broader criticisms of the conduct of the cold war (Thompson & Smith 1981). Demonstrations in Amsterdam,
Brussels, Paris, London, Rome, and Bonn each attracted hundreds of thousands of activists. European activists, most notably historian E.P. Thompson, appealed explicitly to their counterparts in the United States for help. Peace activists surrounded NATO bases and threatened to physically disrupt the introduction of these new weapons onto the bases. The deployment issue set off massive protests and a new generation of peace organizations in the Federal Republic of Germany, Great Britain, the Netherlands, and Italy, forcing new national elections and party realignment. Although the conservative parties won reelection and the intermediate range missiles were deployed, the decision took its toll on the alliance. Further modernization plans were abandoned as previously allied Western European conservative parties became unwilling to risk further opposition.

Activists in the United States used the freeze proposal, frequently offered in state and local referenda and town meetings, as an opportunity to conduct public education campaigns. By 1982, the freeze movement commanded broad public attention, winning numerous referenda, demonstrating overwhelming support in public opinion polls, and rallying one million people in Central Park (Meyer 1990). The broad movement coalition made it difficult for activists to define consensual goals and, as the movement grew, they were increasingly divided on the meaning of the proposal (Benford 1993) that so many supported. Responding, the administration announced a new commitment to arms control, signaling the beginning of the end for the movement (Meyer 1990).

Reagan’s arms control proposals, offered more for domestic political reasons than international response, had unexpected effects. When Soviet General Secretary Gorbachev accepted the disproportionate cuts in nuclear forces Reagan had proposed, the administration was cornered: it could not reject its own proposals. This forced flexibility on arms control proved to be critical in ending the cold war (Kaldor 1990; Meyer & Marullo 1992). The movements won far less than they hoped, yet turned out to be more important than they imagined.

ORGANIZING FOR PEACE AFTER THE COLD WAR: PERSIAN GULF WARS AND BEYOND

Acknowledging the importance of public support, and the risks of opposition, the United States adopted a posture that strictly limited the possibilities of American use of force abroad: all deployment of American forces had to be easily explainable to the public, extremely likely to succeed, limited in time, and with easy and quick exit strategies. The Persian Gulf War, conducted by President George Bush, demonstrated both the influence and the limitations of the peace movement. Bush’s military buildup in the Gulf, a response to Iraq’s invasion of Kuwait in 1990, quickly generated an antiwar response, organized by the longtime pacifist core of the peace movement. The immediate threat of war afforded groups with different ideologies – pacifist, anti-interventionist, and multilateralist – to join forces quickly in opposition to pending military hostilities. Despite a rapid movement response, the administration conducted a military campaign that effectively marginalized the peace movement, negotiating support from European allies and, once battle started, overwhelming the severely outmatched Iraqi armed forces through air attacks.

The peace movement virtually disappeared as soon as bombing began, and the full-scale war lasted little over a month.

In 2002, however, as President George W. Bush prepared for a second war against Iraq, opposition grew globally, including critics of the war, as well as those who had a range of other grievances with the Bush administration. Activists formed broad coalitions in the United States (Meyer & Corrigall-Brown 2005; Heaney & Rojas 2008) and internationally (Walgrave & Rucht 2010). Massive demonstrations were coordinated in major cities around the world, and were largest in countries that supported the war. Although the efforts affected
the rhetoric and military strategy of the initial war campaign, they did not stop the bombing, as the United States led a coalition that defeated, and occupied, Iraq in 2003. President Bush maintained a commitment to an all-volunteer army and refused to seek taxes to fund the war, making it difficult for activists to maintain a mobilization as attention shifted to other issues. Many activists against the war refocused their efforts into broader campaigns against corporate globalization. As with previous campaigns, opposition to the war has waxed and waned since it commenced. Paradoxically, the election of President Barack Obama bought the United States more space to conduct the war, as opponents of the war have been unable to stage a broad challenge to the Democratic government that they supported on many other issues.

Peace and antiwar movements respond to the broader political context and the policymaking process. Elite actors, particularly scientists and strategic experts, mediate between the state and protest movements, identifying which aspects of policy are most vulnerable to assault, legitimating and sometimes aiding insurgent movements, and proffering solutions to the political problems movements cause. Peace movements emerge when institutionally oriented actors lose faith in the efficacy of institutional politics, and the movements that emerge contain great diversity. The cyclic nature of movement challenges reflects the shifting attention of elite actors from institutional venues to extra-institutional ones. Successful movements win access to policymaking for some of their allies, but not necessarily the policies they seek.

Antiwitchcraft movements in Africa
JULIEN BONHOMME

Movements aimed at the eradication of witchcraft periodically sweep across Sub-Saharan Africa. One of the best documented is the Mcape, which has been observed in different parts of Eastern Central Africa throughout the twentieth century by anthropologists such as Audrey Richards, Max Marwick, and Roy Willis. As opposed to witchdoctors who provide individual protection against witchcraft, these movements operate on a larger scale and aim at more radical objectives: they offer protection for the whole community and claim to root out all evil once and for all. Witchcraft is addressed as a general and collective threat, rather than being related to interpersonal conflict stemming from the family. The excessive ambition of antiwitchcraft movements explains their transient and recurrent nature. New movements are constantly emerging, rapidly gaining, then losing popularity when they fail to fulfill their promise, hence paving the way for the next movement to appear on this highly competitive marketplace. Compared to more structured cults, antiwitchcraft movements have little formal organization and rely on their leaders’ charisma and reputation. They are deterritorialized movements, often led by itinerant witch-finders who cross ethnic and national boundaries. Antiwitchcraft movements are centered on mass cleansing (and must therefore be distinguished from more brutal witch-hunts). When the witch-finder arrives in a village, he authoritatively lines up all the inhabitants and proceeds to identify the witches by divination. He then asks the alleged witches to confess their evil deeds and surrender their harmful “fetishes” or “medicines.” These paraphernalia are publicly destroyed or piled up at crossroads as a demonstration of the witch-finder’s supremacy. The accused are sometimes “branded” with razors, but are not put to death nor banned from the community. Finally all villagers are administered a witch-cleansing treatment, which is said to protect the innocent and kill those who will attempt to revert to witchcraft.

The literature dealing with antiwitchcraft movements in Africa revolves around two main questions: Are these movements essentially modern? Are they proto-political movements? Since Audrey Richards’ seminal article, anthropologists and historians have tended to consider antiwitchcraft movements intrinsically modern. These movements incorporate many Western elements as icons of modernity. The witch-finders dress in European clothes (unlike traditional witchdoctors), use mirrors for divination and imitate colonial bureaucratic practices, such as stamps, written documents, and waiting lines. In French Equatorial Africa, the Ngol movement appropriated the figure of General de Gaulle, viewed as a “fetish that overcomes all other fetishes.” Antiwitchcraft movements are considered to be inherently associated with the colonial situation: the brutal and rapid social change brought about by colonization causes anomie, which results in an increase of witchcraft, which in its turn leads to the emergence of antiwitchcraft movements. Following Jack Goody’s critique of the anomie explanation, historians have shown that twentieth-century movements in fact continued precolonial traditions. Antiwitchcraft movements predate colonial times and, one should add, extend as well to postcolonial times. Yet colonial rule has undeniably stimulated the rise of new movements by prohibiting the traditional methods of witchcraft control, notably the poison ordeal, which was widespread in Africa. As Mary Douglas has claimed, antiwitchcraft movements have
emerged to fill the gap left by the suppression of precolonial ordeals. Colonization has encouraged a shift from judicial procedures controlled by local headmen and centered on punishment toward more popular movements centered on confession, healing, and purification.

Witch-cleansing movements have a strong millenarian dimension. They announce the imminent revitalization of society and give hope of a morally regenerated life and a new order free of all tensions. Roy Willis has described the “impression of incipient revolution” when witch-finders take over villages to perform mass cleansings. This atmosphere of “miniature revolution” raises the issue of the political potential of witch-cleansing movements. According to Willis, antiwitchcraft movements are proto-institutions specific to rural Africa, while more structured institutions, such as independent churches and political parties, developed in urban centers. Authors like Georges Balandier and Terence Ranger have even argued that antiwitchcraft and other millenarian movements represent “the prehistory of modern nationalism” in Africa. Ranger has however reconsidered his position and acknowledged that these movements cannot be reduced to a proto-political stage in the evolution of anticolonial protest. Directed against native witches and not colonizers, antiwitchcraft movements have more to do with local politics. They most often express conflicts between generations. Young men – those with low status in traditional society – are the ones who press to call in a witch-finder (usually an enterprising young man himself) to cleanse the village. Conversely, village elders are scapegoated: they are the ones accused and publicly humiliated during the witch-finding ceremony. Moreover, the so-called evil objects confiscated are in fact paraphernalia of the old cults controlled by the elders, which were commonly used as protections against witchcraft. By asserting the superiority of new antiwitchcraft medicines over old ones disguised as witchcraft, witch-finding movements thus give young men the opportunity to challenge the elders’ authority and overturn – if only temporarily – the social order.

Anti-World Bank and IMF riots
LESLEY J. WOOD

Anti-World Bank and IMF riots are sometimes called “austerity protests.” These are large collective actions that include political demonstrations, general strikes, and riots triggered by grievances over state policies of economic liberalization urged by the International Monetary Fund (IMF) as conditions on obtaining loans. These “structural adjustment” conditions may involve the reduction of government subsidies and/or the increasing price of basic staples like food, water, and domestic gas. Most of the time the participants demand lower prices, restored government subsidies, wage increases that will compensate for higher prices, or jobs. Sometimes they demand the rejection of foreign debt.

There have been several waves of these demonstrations. The first wave took place between 1976 and late 1992, in 39 of approximately 80 countries that had loans from the IMF, peaking between 1983 and 1985 (Walton & Seddon 1994: 42). During this time, some 146 incidents of protest occurred. In the late 1990s there were a series of austerity protests in the Central American countries of Honduras, Nicaragua, and El Salvador, as well as Colombia, Brazil, and Bolivia. This wave lasted into the early 2000s, especially in Latin America – and included episodes in Argentina (2001), Peru (2002), Costa Rica (2000), and Guatemala (2001) (Almeida 2007). The latter part of this wave coincided with a series of disruptive protests that took place at the summits of the International Monetary Fund in Europe and North America from 1999–2001. These summit protests were combined with simultaneous global days of action against the IMF and World Bank. Most recently, there have been a series of austerity protests during the economic crisis of 2008–2009, most notably in Eastern Europe and the Philippines.

CHARACTERISTICS

Walton and Seddon (1994) examined the features of the first wave of IMF and World Bank riots and found that they were typically large, urban actions – ranging in size from thousands in Cairo and Sao Paulo to hundreds of thousands in national strikes in Argentina, Yugoslavia, and India. Usually, the protests began in the largest cities and sometimes spread to other cities.

IMF and World Bank riots typically target the institutions perceived as responsible for the changes. These may include government buildings, treasuries, or national banks. At times, looters may attack supermarkets and clothing stores. In the cases where fuel and transportation subsidies are part of the austerity package, buses and gasoline stations may be burned. International dimensions of austerity are recognized symbolically in attacks on travel agencies, foreign automobiles, luxury hotels, and international agency offices (Walton & Seddon 1994: 43). Participants are usually a cross section of urban poor and working class. Much of the time, other segments – students, teachers, church groups, public employees, shopkeepers, or professional groups – join them. Once mass discontent is evident, political parties may adopt the anti-austerity cause in bids for national office (Walton & Seddon 1994: 44). Occasionally, these protests have become political crises that topple the national government (Sudan, Turkey, Philippines, Haiti, Poland).

CAUSES

Walton and Seddon argue that the reason for the emergence of these protests is an
increasingly integrated global system – that was exacerbated by the international debt crisis and a regimen of institutionally coordinated austerity policies or structural adjustment programs – tied to the policies of the IMF and World Bank (Walton & Seddon 1994: 23). Walton and Ragin (1990) and Walton and Shefner (1994) show that countries with multiple IMF agreements, large urban populations, dense civil-society organizational networks, and high rates of unionization are the most likely to experience popular unrest.

The debt crisis developed in the 1970s, when many international banks were attempting to find sites for investing their reserves. At the same time, many newly independent nations needed to borrow funds in order to finance their development. However, by the late 1970s, many of these nations were unable to pay back their loans because of a worldwide recession, increasing interest rates, oil price shocks, and declining world commodity process (Walton & Seddon 1994: 40). As a result, these governments needed to borrow more money. However, by this time, the IMF had embraced a neoliberal framework that involved imposing stringent conditions on borrowers in order to restructure their economies along neoliberal lines (Klein 2007). These conditions included currency devaluations, reduced public spending, privatization of state-owned corporations, elimination of protections and subsidies of local agriculture and industries, wage restraints, and higher interest rates to reduce inflation and enhance competitiveness. The effects of these changes were felt quickly and intensely by wide sectors of the population. As a result, protests erupted.

Joseph Stiglitz, the chief economist from the World Bank who was fired in 1999 for his criticisms of bank policy argued that the IMF riot was a predictable response to structural adjustment. When a nation is “down and out, [the IMF] takes advantage and squeezes the last pound of blood out of them. They turn up the heat until, finally, the whole cauldron blows up” (Palast 2001). Naomi Klein (2007) argues that the speed and severity of such reforms was a form of “shock treatment.” Such transformations necessitated increased militarization of these societies in order to ensure that the adjustment policies were implemented.

ANUC (Colombian peasant movement)
LEON ZAMOSC

To end the Colombian civil war known as La Violencia (1948–1957), the Conservative and Liberal parties agreed in 1958 to reconcile under the National Front, a 16-year coalition regime based on administrative power-sharing and presidential alternation (Kline 1980: 71–72). In 1961 Congress passed an Agrarian Reform Law but, bowing to the landowners’ interests, the first two governments of the National Front took no serious steps to redistribute land (Tobón 1972). Determined to implement the reform, the next president, Liberal politician Carlos Lleras (1966–1970), promoted legislation granting land rights to tenants and sharecroppers and boosted the capabilities of INCORA, the Institute of Agrarian Reform. In 1967, he also launched an initiative to establish ANUC, the National Peasant Association of Colombia, as a state-sponsored organization that would promote peasant involvement in the provision of rural services and in the agrarian reform program (Zamosc 1986: 50–54). From the start, it was clear that Lleras expected that, as a peasant force pushing for land redistribution, ANUC would exert the pressure that was needed to overcome the landowners’ opposition and facilitate INCORA’s work. In the organizational campaign, promoters from the Ministry of Agriculture scoured the countryside instructing peasants about their rights, forming local and regional peasant associations, and grooming promising activists into a national leadership (Zamosc 1986: 54–60). When ANUC’s national congress met in 1970, the number of registered members was about one million. The response had been especially strong in the areas of traditional haciendas (large estates), where tenants and sharecroppers wanted land of their own; and in the piedmont forest frontiers, where peasant colonists demanded infrastructure and services (Zamosc 1986: 61–62).

Initially, ANUC fulfilled its official role sending representatives to the state agencies and channeling demands from all the peasant sectors. It also expressed readiness to support the next National Front government on condition that it would maintain the agrarian reform policy (Escobar 1982: 11–14). Then, when it became clear that the new Conservative president Misael Pastrana (1970–1974) was not keen on land redistribution, ANUC went on the offensive. In February 1971, thousands of peasant families participated in a wave of coordinated land invasions affecting hundreds of haciendas throughout the country (Zamosc 1986: 74–91). The confrontation strengthened the more radical leaders, activists, or sympathizers of leftist parties who saw the peasant struggles as part of a revolution and exhorted the grassroots to continue the expropriation of the landowners through direct action (Zamosc 1986: 114–115).

Facing the radicalization of the peasant movement in a country in which revolutionary guerrilla movements were expanding their presence in the countryside, the elites of the National Front closed ranks to stop ANUC in its tracks. With the endorsement of Conservatives and Liberals (including many former reformists), Congress called for a national accord on agrarian reform. In January 1972, politicians and entrepreneurs met with government officials and agreed to pass legislation hardening the criteria for land expropriation and favoring the development of capitalist agriculture (Zamosc 1986: 97–99). To curb ANUC, Pastrana’s government stepped up harassment against the radical leaders and encouraged Conservative and Liberal activists to split and set up a parallel ANUC with official support (Zamosc 1986: 100–104).
Land invasions, previously handled through INCORA’s mediation, were now severely suppressed by the rural police, and a blind eye was turned to the activities of armed gangs organized by landowners.

For the rest of Pastrana’s administration, the struggle for land was accompanied by mobilizations in the areas of colonization, where ANUC staged rallies, blockades, and civic strikes aimed at forcing the government to respond to demands for roads, bridges, and basic services (Zamosc 1986: 93–94). Adopting a more contemporizing approach, the first post-National Front president, Liberal Alfonso Lopez Michelsen (1974–1978), showed willingness to negotiate these demands. He was also proactive in the areas of established peasant economy, where the government and international financial agencies launched an Integrated Rural Development Program that offered credit and other supports to smallholders’ services (Zamosc 1986: 124–125). In the regions of land struggle, he warned against new land invasions and pushed legislation that was intended to alleviate the peasant pressure by enabling landowners to admit sharecroppers without risking expropriation (Zamosc 1986: 126). Denouncing the 1975 Sharecropping Law as an attempt to circumvent the land issue, radical ANUC called for a renewal of the invasions. But the weak response confirmed that the movement had entered a decline. In addition to repression and ANUC’s internal political divisions, other factors contributed to defuse the land conflicts, including the fact that the most contentious groups had received land after the previous invasions, increasing rates of rural–urban migration, and new occupational alternatives in the marijuana economy and in Colombian and Venezuelan capitalist agriculture (Zamosc 1986: 130–139).

To adjust to the changing conditions, radical ANUC focused on championing the demands of the agricultural proletariat and the peasant cooperatives established after the previous land struggles. But these attempts failed, the former because of the difficulties in organizing itinerant workers under piecework pay, and the latter because the movement insisted on unrealistic stances such as rejecting government credit or titles that implied any payment for the land (Zamosc 1986: 139–145, 165–178). After an unsuccessful attempt to create a peasant political party in 1978, ANUC’s leaders acknowledged that they had been cornered and proclaimed that the only option was reconciliation with the pro-government ANUC, a goal that was eventually accomplished when Liberal president Julio César Turbay (1978–1982) sponsored a reunification congress in 1981 (Zamosc 1986: 196–200). From then on, ANUC languished as a bureaucratic shell of state-paid leaders who uncritically supported the policies of all incumbent governments. In the second half of the 1980s, independent peasant organizations, including some splinter groups of the former radical ANUC, protagonized a brief cycle of struggles as part of a broader national wave of civic protests (Zamosc 1990: 47–56). By then, however, conditions for peasant organizing were rapidly deteriorating as a consequence of the aggravation of political conflicts and the expansion of cocaine trafficking (Zamosc 1990: 56–62, 67–70). Caught in the crossfire between the military, leftist guerrilla organizations, and paramilitary groups, the Colombian peasantry would not be able to return to the national political scene as an organized social class.

April Revolution (Korea)
JAESOK SONN

The April Revolution refers to the protest movement against the dictatorship in South Korea, which took place in April 1960, and its aftermath. It is also known as the April Uprising or simply by the date of the peak day of the revolt, the “4.19.”

The government of Syngman Rhee, the first democratically elected president in Korea, performed poorly in all aspects of administration. It failed to defend the south from an invasion by the north in 1950 which developed into the three-year Korean War. War survivors had to live in one of the poorest countries in the world, suffering high unemployment and soaring consumer prices while the ruling Liberal Party and bureaucrats enjoyed wealth and power. The regime seriously undermined its legitimacy by revising the Constitution in 1954 – without going through a proper process – in order to allow the president to serve three terms.

Rhee ran for the third term while his trusted colleague, Yi Ki-bung, became a vice-presidential candidate. Their landslide victory, in particular the fact that 80 percent of the vice-presidential votes went to Yi, in the election of March 15, 1960, was considered fraudulent. In fact, there had already been citizens’ protests against government-sponsored campaign activities even before the election, and the police clashed violently with the protesters by the end of election day.

University students began to organize protests. On April 18, students at the Korea University held the first major rally since the election, protesting against election fraud. This rally prompted student activists in other universities and high schools to organize their own demonstrations the next day. On the morning of April 19, the student protesters of the Seoul National University, the nation’s most prestigious university, began to march downtown and thousands of citizens quickly joined them.

While demonstrations occurred across the country, Seoul held a particular importance. Downtown Seoul hosted major national institutions including a few university campuses, the National Assembly Building, and the presidential residence within a radius of 2 kilometers. News of the protests quickly spread through the busy streets but also through the radio network which carried the news of the protests. The people flooded into the National Assembly Building and another group moved onto the presidential residence. As the protesters overwhelmed the police, the police fired live bullets at citizens, especially near the presidential residence. Martial law was declared in Seoul and other cities in the afternoon.

By the end of the day, the crowd dispersed, but the protest continued after April 19 in those cities where the martial law had not been declared. Four days later, Yi resigned as vice-president-elect. On April 25, some of the university professors held their own march to the National Assembly Building and issued a statement explicitly demanding that Rhee step down. As one of the most respected social groups, the professors’ participation morally certified the protests. The next day Rhee announced his resignation. Approximately 186 civilians were reportedly killed and 1600 wounded nationwide during this period (Kim 1983: 5).

When the first elected president became a dictator, and his 12-year rule was exacerbated by a war and poverty, there was no civic life in Korea that cultivated civic mindedness or political consciousness. There was hardly a national civic association that connected citizens across region and class. Naturally, protests were mobilized without any formal organization or coordinating agents. Demonstrations developed spontaneously from preexisting institutions and informal networks with
little or no preparation. Although students played a pivotal role, the participants came from all walks of life who shared a sense of anger at the injustices in society and the poor performance of the regime. However, their goals beyond kicking Rhee out of presidency were as vague as their rhetoric of “justice” and “democracy.” As soon as Rhee resigned, citizens cleaned up streets and went back to their normal life while political reforms were largely left to existing professional politicians.

Despite these crucial weaknesses of the uprising, the regime fell rather quickly. The state apparatuses were still poor at this time meaning there was no efficient communication or execution of decisions. The police were not ready for large-scale demonstrations and they were exhausted by a single-day protest. This authoritarian state also did not control the media, so immediately after the election the newspapers began to publish editorials criticizing the ruling party. The martial law commander, General Song Yo-chan, prohibited the army from opening fire without his specific order, released most of the detained demonstrators, and maintained the military’s political neutrality, all of which effectively incapacitated the Rhee regime. Some other military officers also tried to avoid harming citizens, and this played one of the key roles in bringing a successful end to the uprising with no additional bloodshed. The ruling party leaders were fragmented over what to do, while the Cabinet resigned in the middle of the crisis. Rhee himself showed poor understanding and judgment of the situation.

The immediate aftermath of the revolution was somewhat chaotic. The new ruling Democratic Party was far from a revolutionary political force and it proved to be quite ineffective in political and social reforms. Even worse, it failed to bring political stability by engaging in factional fights, and eventually split into two parties.

The April Revolution nevertheless had “revolutionary” impacts, as its experience turned some citizens to mobilize organized, persistent movements for political and social reform. Political parties based on progressive or leftist ideologies reappeared. Reunification with North Korea had been a taboo subject because the memories of the war were still fresh, but some youth groups began to advocate it actively.

These revolutionary potentials, however, were never realized, as they were ended abruptly by a military coup led by General Park Chung-Hee on May 16, 1961. The junta immediately took control of the media and banned all political activities. This marked the beginning of three decades of military dictatorship in South Korea.

Asylum rights protest campaigns
PIERRE MONFORTE

Immigration and asylum are, by definition, global issues which concern transnational actors. However, the definition and implementation of immigration and asylum policies relate to state borders and are therefore traditionally entrenched in national contexts. For this reason, even if social movements mobilizing to defend the rights of migrants and refugees have regularly used international norms to increase their rights at the national level (Soysal 1994; Guiraudon 2000), they have rarely organized collective actions across borders: they have limited their action to the national level and have mainly addressed their demands to state authorities. However, since the mid-1990s, these movements have increasingly mobilized in order to address international – and in particular European – institutions. Groups and networks have constructed networks, discourses and collective actions which go beyond borders, and they have organized significant and regular transnational campaigns.

The first transnational mobilizations for the inclusion of migrants and refugees were constructed by groups that seized opportunities to influence national policies at the international level. They followed a path toward the “externalization” of collective action (Balme & Chabanet 2002): the mobilization of networks targeting supranational institutions and advocating for the emergence of European and international competencies in order to put pressure on nation-states. As they claimed that international institutions would define more liberal standards than nation-states, they organized beyond borders and worked in close cooperation with them (in particular, the United Nations and the European Commission), with the aim to increase their influence. They are composed of vast networks of member-associations coordinated by a centralized and professionalized European or international social movement organization. This organization has the double task to maintain permanent contact with supranational institutions and to coordinate regular transnational campaigns targeting numerous national actors simultaneously. These campaigns are based on institutionalized forms of collective actions: they use lobbying techniques to influence national actors and they bring expertise to international institutions in order to support their work.

A good example of these campaigns is that organized during the negotiations for the ratification of the Tampere program for the European integration of immigration and asylum policies in 1999. A network of NGOs and lobby groups established close contact with the European Commission and provided it with legal expertise and legitimacy in order to gain more influence vis-à-vis member states. Simultaneously, they lobbied member-state representatives to advocate for increasing delegation of competencies to the Commission. This campaign was influential as the negotiations resulted in an extensive program of harmonization of immigration and asylum policies in which the Commission was led to progressively become the central actor.

At the global level, a good example is the international campaign for the ratification of the UN International Convention on the Protection of the Rights of Migrant Workers and Members of Their Families. It is organized by a network of organizations working in collaboration with the United Nations Economic and Social Council and which coordinates the lobbying for the ratification of this convention by northern states.

Since the beginning of the 2000s, new networks have developed new forms of
transnational campaigns for migrants’ and refugees’ rights. They construct “European (or international) social movements” (della Porta & Caini 2009): they organize across borders and target both supranational and national institutions and policies. These networks are mainly composed of grassroots organizations and they only cooperate sporadically with the networks active around European and international institutions: their campaigns distinguish in terms of strategies as well as in terms of objectives. Differently than the groups mobilizing since the 1990s, they are more reactive than proactive; their campaigns do not promote international policies on these issues; they react to their definition and implementation, and, for them, supranational institutions and policies are a target rather than a support. Their campaigns aim to draw public attention to the role of European (including the EU Commission) and supranational institutions (such as the IOM), alongside national governments, in the definition of restrictive immigration policies. They mobilize, for example, against the detention of migrants in Europe, and for freedom of circulation. In comparison with the first groups, these networks are less centralized and professionalized. Moreover, they base their mobilizations on both pluralist and contentious repertoires of collective actions with the aim to mobilize public opinion at large. Finally, differently than the first group of transnational actors, they construct links with transnational movements mobilizing around related issues such as the peace movement or that against precarious working conditions. Consequently, their campaigns often have a broader focus than just immigration and asylum policies, and thus, they have more general objectives than those organized by the first group of networks. Even if campaigns defined around a specific goal (such as the withdrawal of the European directive on the return of undocumented migrants in 2007–2008) exist, most of them have more general objectives. In fact, their main goal is to raise public awareness regarding the consequences of northern countries’ immigration and asylum policies.

A good example of these campaigns is the “European action-day for the right to stay and freedom of movement” which was organized annually in several European cities simultaneously in the middle of the first decade of the 2000s. It was organized by grassroots activists and consisted of symbolic – and sometimes violent – street demonstrations against “Fortress Europe.” This campaign was directly linked with the “Euromayday” movement against precarity, as many activists were involved in both networks.

At the global level, a good example is the organization of the annual World Social Forum on Migration since 2005. In line with the World Social Forum, it aims to bring together grassroots mobilizations and it links the defense of migrants’ and refugees’ rights with a critique of the global economical order.

The progressive definition of mobilizations across borders shows that transnational campaigns for the rights of migrants and refugees are accompanying, and are also the result of, the increase in supranational competencies regarding immigration and asylum policies. These campaigns thus illustrate the emergence of new action fields for social movements at the European and international levels. They represent, therefore, an illustration of the general trend toward Europeanization and globalization “from below” (della Porta et al. 2006).

REFERENCES AND SUGGESTED READINGS

Asylum, refugee, and immigration movements in Australia represent distinct, as well as overlapping, repertoires of collective action on behalf of others who are often silent, or silenced in public debates. Various categories of newcomers have differential rights as noncitizens, residents, or “illegals” and these differences are also reflected in the emergence and vigor of social movements in defence of the “rightless” (Agamben 1998; Dauvergne 2008). These movements have formed, engaged in forms of protest, advocacy, and collective action, and subsided in various waves in reaction to public policy that seeks to restrict the rights of migrants. In Australia such restrictions have manifest in forms of border control, in limiting access to courts and judicial review processes, through detention, and through deportation. Often the most vulnerable groups of migrants have been the targets of such measures, and it is these groups that movement actors have been engaged in defending.

Social movements on asylum and refugee issues proliferated in number and in range of activities from the early 1990s. These movements are distinct from political networks and lobby groups that formalized through movement activity and civil society organizations in the era of “new multiculturalism” from the early 1970s as advocates for migrant groups and migrant voices. As a “classic country of immigration,” Australia has long had a proactive approach to immigration with a yearly quota for newcomers including a quota for refugee and humanitarian entrants. Individuals who meet the criteria of the United Nations Refugee Convention are selected for entry to Australia on an annual basis. In distinction from this process, asylum seekers arrive by air and by sea in a spontaneous fashion, fleeing conflict and various forms of persecution, and subsequently apply to engage Australia’s protection obligations. That is, asylum seekers have fled their country of origin, but have not yet had their claim for refugee status tested and substantiated through the administrative and legal processes of the country they are entering (DIAC 2009). While Australia has not received large numbers of asylum seekers compared to other Western countries, the response of successive Australian governments to asylum arrivals since the early 1990s has been among the toughest in the world. Those people arriving by boat have been subject to particularly harsh treatment. In 1992 Australia introduced mandatory and non-reviewable detention for all asylum seekers who arrive without authorization (usually without valid travel documentation). The policy extended to children and unaccompanied women. In addition, by 2001 Australia had adopted “off-shore” processing, where asylum seekers who arrived by boat were sent to third countries to have their asylum claim processed (MacCallum 2002; Marr & Wilkinson 2003; Corlett 2005; Tazreiter 2006). More recently some of these approaches have been softened, though detention remains as an enforceable “deterrent” for asylum arrivals.

These harsh and punitive approaches of successive Australian governments to the arrival of asylum seekers has been the trigger for the emergence of social movements, coalitions, and the strengthening of civil society. Indeed, civil society organizations have proliferated into both national and transnational networks, triggered by a suite of interrelated human rights issues including asylum, refugee, and immigration issues, as well as human trafficking and the rights of temporary migrants. Some movements also focused on a number of broadly related issues under the umbrella of human rights, including indigenous rights, racism, and
discrimination against minorities, and linked with human rights-oriented movements such as Amnesty International.

The major issue that has galvanized movement activity and indeed was the impetus for a range of new social movements in Australia is the issue of immigration detention and the related practices of forced removal or deportation of individuals (ERC 2004; Corlett 2005). In the early years of the detention regime, such movement activity was limited to relatively small groups of Australians who were well informed about the detention regime and its effects on detainees: lawyers, nuns and priests, and researchers. This close-knit group had active links with networks and movements outside Australia, but could rely on little support from the wider population within Australia (Tazreiter 2010). Some vibrant social movements emerged in this early period on specific issues. For instance, the sanctuary movement was a highly mobile and effective movement that emerged in the early 1990s to protect East Timorese asylum seekers who were threatened with return to a then unstable East Timor, under the control of Indonesia. The sanctuary movement worked through a network of “safe houses” that could be activated to protect individuals from deportation. Eventually this network of safe houses numbered some 15,000 around Australia.

A range of asylum- and refugee-oriented movements emerged over the last two decades in response to the policies, procedures, and political rhetoric outlined above. It is noteworthy that many of these movements have also worked on defending the human rights of other vulnerable groups and as a result have contributed to debates on Australian values and Australian identity. Some of these movements have had longevity, others have abated, and some have transformed into nongovernmental organizations. Social movement activity on asylum and refugee issues peaked from the mid-1990s to the mid-2000s. Some of the most powerful movements to emerge in this period include the Refugee Action Coalition, Children out of Detention (ChilOut), A Just Australia, Rural Australians for Refugees, and GetUP (O’Neill 2008). Many faith-based organizations and loose coalitions also strengthened the grassroots base of social movements.

It is noteworthy that Australian movements and more formalized organizations on asylum, refugee, and immigration issues have had a long-standing presence and influence in international forums such as the various organs of the United Nations. Australian movement actors have also influenced and participated in repertoires of action by transnational movement actors. In turn, Australian social movements on refugee, asylum, and immigration issues have been strengthened at various points in history by the external pressure from transnational social movements on the Australian political process.

ERC (Edmund Rice Centre for Justice and Community Education and Australian Catholic University) (2004) Deported to Danger: A Study of

The Black Power movement emerged in the mid-1960s United States inspired by the victories of the civil rights movement, and responding to its limitations. Civil rights mobilization had successfully pressured the federal government to dismantle de jure segregation, but was incapable of redressing persistent black ghettoization. Black Power activists sought to combat institutionalized racism characterized by poor-quality education, a lack of jobs, political marginalization, and containment policing.

Beginning in 1964, as the federal government touted the end of legal segregation, violent ghetto rebellions broke out in cities across the country. Usually triggered by incidents of police brutality, these uprisings targeted both government institutions and white-owned stores. The most notable rebellions took place in Watts in 1965, and Detroit and Newark in 1967. There were over 160 uprisings in 1967 and almost as many again in 1968 following the assassination of Martin Luther King, Jr.

The ideas of Malcolm X became the key reference for many young black activists. Criticizing moderate civil rights leaders, X argued that black Americans were a colonized people who needed to fight back by acquiring economic and political power. He embraced black nationalism, supported armed self-defense, and looked to the black masses as the agent of the “Black Revolution.” Important antecedents to Black Power include Robert Williams’s efforts at armed self-defense in North Carolina, the Lowndes County Freedom Organization’s campaign to build independent black political power in Alabama, the civil rights struggle in the North, which oriented itself around such issues as employment discrimination and unequal education, as well as the Nation of Islam and Garveyism.

The slogan “Black Power” entered the popular lexicon in June 1966, when hundreds of civil rights activists, led by Stokely Carmichael and Martin Luther King, Jr, converged in Mississippi. In the course of the demonstration, divisions arose between the younger activists, who wanted the march to be black-only and to be protected by a militant group of armed blacks, and the old guard led by King. After Carmichael was arrested and subsequently released, he addressed a rally, proclaiming, “What we gonna start saying now is ‘Black Power.’”

The Black Power slogan posed the question of how broader African-American liberation could be achieved. SNCC, which had played such an instrumental role in the movement against southern segregation, led the ideological turn toward Black Power, but failed to connect this with effective action. CORE, another leading civil rights organization, embraced Black Power in 1966, promoting black capitalism and separatist nationalism, but soon collapsed. RAM propagated revolutionary nationalist thinking, but had little organizational following. Cultural nationalists, most prominently Ron Karenga’s “US” organization, looked to the potential for a black cultural renaissance that recaptured African traditions, but minimally engaged in politics. Black Power activists were loosely linked ideologically by their advocacy of black nationalism, popular insurgency, self-defense, cultural pride, and their critique of the civil rights movement’s orientation around nonviolence, gradualism, and integration, but initially lacked a coherent practical politics.

The idea of Black Power came to life politically in Oakland, California in late 1966, when community college students Bobby Seale and Huey Newton garnered a small
following by arming themselves, patrolling the police, and promising to prevent police brutality. Soon, hundreds of armed “Black Panthers” were rallying on street-corners to protest the police killing of an unarmed young black man. The Black Panther Party rejected the legitimacy of the US government and saw itself as part of a global revolutionary struggle against imperialism. Following the assassination of Martin Luther King in April 1968, the Panthers quickly became the center of black politics nationally. By the end of the year, the party opened offices in 41 cities, from Seattle to Chicago to New York, and from Winston-Salem to Omaha to Los Angeles.

The FBI and local police nationwide responded to the Panthers with an unparalleled campaign of coordinated and brutal repression and vilification. They fed defamatory stories to the press. They wiretapped Panther offices around the country. They hired dozens of informants to infiltrate Panther chapters. The FBI forged documents and paid provocateurs to promote violent conflicts among Black Panther leaders— as well as between the party and other black nationalist organizations—and congratulated themselves when these conflicts yielded the killing of Panthers. Often, they put down all pretense and simply raided Panther establishments, guns blazing. In one case, equipped with a map of the apartment drawn by an informant, police and federal agents assassinated a prominent Panther leader in his bed while he slept, shooting him in the head at point blank range.

In late 1968, the party shifted focus to organizing free breakfast for children and other community programs. In 1969, every Panther chapter organized community services, and these programs soon became the staple activity for party members nationwide. The programs gave party members a way to address the basic needs of their constituents as they challenged the legitimacy of the government in their communities. The party also forged alliances with New Left radicals, and embraced a cross-race anti-imperialist politics. In the face of the most virulent direct repression, the party continued to expand.

The liberatory spirit of Black Power left few social and cultural spheres unaffected. Black students led struggles for educational self-determination. Black militants in the labor movement challenged both the companies they worked for and their own unions. The Black Arts movement developed new aesthetics that promoted cultural pride and celebrated blackness. Women within the Black Power movement challenged patriarchy, contributing to the broader women’s liberation movement.

But revolutionary nationalism could not be sustained. As the federal government rolled back the Vietnam War and instituted affirmative action programs—while continuing to deploy intense repression against black activists—the movement unraveled. In the early 1970s, Black Power organizations spiraled into violent factional conflicts and fell into decline.

The Black Power movement left a lasting legacy, including huge growth in the number of black elected officials, greater access to higher education, the creation of African-American studies programs, improved federal hiring practices, and increased social service funding. But the persistence of stark economic inequality and institutional racism is a reminder that the movement’s emancipatory vision remains unfulfilled.

Buraku Liberation Movement (Japan)
JOHN H. DAVIS

During the roughly nine decades since its inception, the Buraku Liberation Movement (Buraku Kaihō Undō) has worked to eliminate the social prejudice and structural inequities that characterized life for many burakumin, residents of former outcast districts. Although official caste designations were abolished in 1871, many burakumin continued to be targets of discrimination. The Buraku Liberation Movement emerged as a national phenomenon in 1922 with the establishment of the National Levelers Association (Zenkoku Suiheisha). This organization adopted a strategy of direct confrontation known as tetteiteki kyūdan or “thoroughgoing denunciation” against individuals accused of discriminating against burakumin. The focus of the group gradually expanded beyond critiquing the actions of individuals to scrutinizing systemic discrimination manifest in institutions such as the military, police, school, and government administrations. The activities of the organization came to a close in 1942 as one of several organizational casualties resulting from domestic pressures stemming from the intensification of the ongoing war effort. Following the end of World War II, the Buraku Liberation Movement was rekindled in 1946 with the establishment of the National Committee for Buraku Liberation (Buraku Kaihō Zenkoku linkai), which changed its name in 1955 to the current Buraku Liberation League (Buraku Kaihō Dōmei). The movement continued to focus its attention on systemic manifestations of discrimination and ratcheted up pressure on governmental entities to accept responsibility for eradicating prejudice against buraku residents. During the postwar years, much of Japan experienced improvements as the country went through a period of rapid economic growth. Progress rarely extended to buraku areas, however. National surveys revealed significant gaps between the general population and buraku residents, who experienced higher levels of poverty exacerbated by high unemployment and low educational attainment. Moreover, social prejudice against those residing in buraku districts continued to manifest itself in areas such as marriage and employment discrimination.

One of the most significant political achievements of the Buraku Liberation Movement was spurring national and local governments to pass the 1969 Law on Special Measures for Dōwa Projects. During the 33 years of its enactment, funds allocated to officially recognized dōwa districts, the administrative term for buraku, were used to pave roads, replace dilapidated housing with new apartment complexes, and establish facilities such as clinics, gymnasiums, and senior citizen centers to deliver a range of services to community residents. The economic position of many buraku households was improved thanks to programs such as housing subsidies, employment assistance, and scholarships for youth designed to boost education levels and thus facilitate a transition into better paying jobs. Remarkable progress has been made overall, but hundreds of buraku across the country were not officially designated as dōwa areas and, consequently, were not able to benefit from the various programs underwritten by the government.

The Buraku Liberation Movement has used a variety of strategies over the years to combat discrimination. The most controversial continues to be thoroughgoing denunciation, the tactic inherited from the National Levelers Association. Participants confront those accused of committing a prejudicial act against burakumin and submit them to a series of
questions aimed at clarifying the facts of the matter and ultimately securing an apology if a transgression is revealed to have taken place. In response to a number of false claims made by those masquerading as burakumin and a couple of rare cases in the past when the confrontations sparked violence, the process has been streamlined and brought under the supervision of the organization. Also, government representatives are present to witness formal proceedings which typically take place only after a number of fact-finding sessions between interested parties in order to ascertain whether or not there are sufficient grounds for convening a denunciation session.

Though less well known than denunciation sessions, one of the most effective aspects of the Buraku Liberation Movement has been the regular access they have had to local levels of government through negotiation sessions designed to bring continuing needs of buraku residents to the attention of various governmental entities. The annual meetings represent a sustained dialogue that frequently results in clarification of not only lingering problems but also the various policy limitations and bureaucratic hurdles that exist and, potentially, how they might be circumvented.

The recent trajectory of the Buraku Liberation Movement has moved increasingly in the direction of articulating its concerns through a human rights framework, something which has allowed it to seek support for its cause from a larger audience at home and abroad. For example, for more than four decades movement participants have mobilized to protest the arrest and conviction of Kazuo Ishikawa as an example of anti-buraku prejudice in the criminal justice system. The annual protest marches in Tokyo have expanded to include not only representatives from buraku communities across the country protesting anti-buraku discrimination but also several citizens groups who advocate reconsideration of the Sayama case due to the human rights infringements which seem to have occurred at various junctures. The case has also been brought to the attention of the United Nations Human Rights Committee on a number of occasions, including most recently in 2008 when Ishikawa himself got special permission to leave the country and affirm his innocence in person before the committee. The Buraku Liberation League has also been more active on the international human rights stage. In 1988 the organization founded a human rights NGO called the International Movement Against All Forms of Discrimination and Racism (IMADR) which was granted consultative status with the United Nations Economic and Social Council in 1993.

REFERENCES AND SUGGESTED READINGS

The Bolivarian Revolution is the name for the democratic social revolution occurring in Venezuela. It is named in honor of Latin American liberator Simón Bolívar and loosely defined is a populist revolution aimed at achieving democratic socialism and offering an alternative to the perceived destructive powers of unbridled imperialistic global capitalism. Since 2005, it is also often referred to as twenty-first-century socialism. The Bolivarian Revolution began in Venezuela during the presidency of President Hugo Chávez. Although Chávez is often mistakenly credited as its sole engine, the movement, due to its democratic nature, is powered largely by the people. This is not to say that Chávez has not been its most influential advocate and a necessary (though not sufficient) requisite for its viability so far, but rather that the movement has since taken on an independent nature and is proving to be truly people-driven.

Although started in Venezuela, the Bolivarian Revolution has since swept through much of Latin America and the Caribbean, largely via a number of international coalitions, primarily ALBA (the Bolivarian Alliance for the People’s of our Americas, in the English translation). There are currently eight member nations of ALBA—Venezuela, Cuba, Bolivia, Ecuador, Nicaragua, Antigua and Barbuda, Dominica, and Saint Vincent and the Grenadines (Honduras was also a former member but withdrew after President Manuel Zelaya was ousted in a coup). ALBA has been successful in setting up a number of non-traditional trade deals—the exchange of oil for doctors, for example—and has also instituted its own currency—the SUCRE—to replace the US dollar for all electronic transactions between member nations.

### IDEOLOGICAL FOUNDATIONS

Hugo Chávez assumed the presidency of the Republic of Venezuela on February 2, 1999. That same day, in his first act as president, he decreed a referendum to convene a Constitutional Assembly for rewriting the Constitution. On April 25 of that same year, the citizens of Venezuela, with a 92% majority of those voting, said “yes” to a Constitutional Assembly. The next step was the election of the members of the assembly. Perhaps most telling of the widespread endorsement of Chávez at that time is the fact that 125 of the 131 elected members were allied with Chávez. The Constitution itself was then subjected to another national referendum. On December 15, 1999, the new Bolivarian Constitution of Venezuela was approved by an overwhelming 71.8% of voters. This marked the first time in Venezuela’s history that a constitution was approved by popular referendum and, more importantly, the dawn of a new era in Venezuelan life and politics. On December 20, 1999, the National Constituent Assembly in Caracas proclaimed the Constitution of the Bolivarian Republic of Venezuela and with it, the legal foundation of the ideological tenets of the Bolivarian Revolution.

The 1999 Constitution is among the world’s longest and most inclusive and is also considered by many to be among the world’s most “advanced” (Wilpert 2007). There are a number of innovations in the 1999 Constitution that merit this categorization, including gender inclusiveness (the language includes both the male and female forms, not simply neutered forms, women’s work in the house is recognized as economic activity and thus is eligible for social security, etc.), protections...
for the environment, recognition and political guarantees for indigenous populations, two “non-traditional” branches of government (the Citizen’s and Electoral), a decentralization of power from higher levels to lower levels (public planning councils, popular referenda, etc.), a commitment to regional integration, a distinction between law and justice to imply that the law is not always just, and it “guarantees the right to life, work, learning, education, social justice and equality, without discrimination or subordination of any kind” (Constitution 1999: 5). These are just a few of the many features that make the 1999 Bolivarian Constitution of Venezuela (henceforth called simply the Constitution) innovative not just in the history of Venezuela, but in the history of the world.

The best understanding of the economic foundation of the Bolivarian Revolution can perhaps best be found in the Constitution itself. Title VI – Socioeconomic System – Chapter 1 – Socioeconomic Order and the Function of the State in the Economy – is the real heart of the Constitution in terms of presenting a potential alternative to capitalist forms of economic globalization. It is here where the foundations of the new socioeconomic order are most explicitly addressed (although the support for the foundations is to be found throughout much of the rest of the Constitution). It is thus in this section where one will find the bedrock of the legal tenets for twenty-first-century socialism.

The economic regime of the Bolivarian Republic of Venezuela is based on the principles of social justice, democratization, efficiency, free competition, protection of the environment, productivity and solidarity, with a view to ensuring overall human development and a dignified and useful existence for the community. The State, jointly with private initiative, shall promote the harmonious development of the national economy, to the end of generating sources of employment, a high rate of domestic added value, raising the standard of living of the population and strengthen the economical sovereignty of the country, guaranteeing the reliability of the law; the solid, dynamic, sustainable, continuing and equitable growth of the economy to ensure a just distribution of wealth through participatory democratic strategic planning with open consultation. (Constitution, Article 299)

This article is arguably the heart of the Constitution, and of the economic foundations of the Bolivarian Revolution itself.

MATERIAL RESULTS

Instantiation of the Bolivarian ideology has occurred first through the sweeping changes in political power holders, then through Plan Bolivar 2000, and finally, and most completely, through the vision of twenty-first-century socialism and the ever-growing number of social missions devoted to carrying out and making real the promises made in the Constitution. The Constitution represents a twenty-first-century vision of socialism, one that builds from its capitalist roots rather than trying to destroy them. "In other words, the 1999 constitution has become more than ‘just’ a constitution. It is a political project towards which pro-Chávez Venezuelans want to move the society” (Wilpert 2007: 43).

The prime years of the implementation of the neoliberal economic model in Latin America (early 1980s to early 1990s), saw a general reversal in growth rates, increasing poverty, and increased social inequality. Previous to the 1980s, Latin America had been enjoying relative growth and a continuously declining poverty rate (for example, from about 65% in 1970 to about 25% in 1980). The 1980s, however, have come to be known as the “lost decade” both because there was little to no economic growth and because many of the gains in social equity made during previous decades were reversed. For example, the years between 1980 and 2006 saw the GDP per capita grow at only about 15% while the years 1960–1980 saw a regional average of over 82%. Moreover, inequality, as measured by the Gini coefficient, increased dramatically during this time so that by the 1990s there was unanimous consensus that Latin America was suffering the highest levels of
inequality in the world (Korzeniewicz & Smith 2000). In essence, “The new regime of open markets has, by and large, favored those with the recourses to succeed in them, leaving the rest to fend for themselves” (Portes & Hoffman 2003: 75). During the 1980s, Venezuela experienced a marked decline in the standards of living of most people. For example, the real GDP peaked in 1977 but declined by 26% per capita between 1978 and 1986. Additionally, poverty rose from 17% in 1980 to 65% in 1996. The effects of neoliberal policies in terms of declining GDP per capita were stronger and longer lasting in Venezuela (Weisbrot & Sandoval 2008).

So how successful has the Bolivarian Revolution been in reversing the negative trends brought by neoliberalism? We can begin by examining the macroeconomic indicators of traditional importance to those at the World Bank and International Monetary Fund, who are generally considered the guardians of the global economy. Since 2003, the GDP has grown by over 87%, there have been 17 successive quarters of economic growth with an average increase of GDP of 11.2%, unemployment has been reduced from 18.4% in 2003 to 8.3% as of June 2007, the minimum wage (the highest in Latin America) has overtaken the inflation rate since 2004, only 7.35% of the GDP is directed toward foreign debt, which has been cut in half, the poverty rate has decreased from 55.1% in 2003 to 24.2% by the end of 2009, the extreme poverty rate has decreased from 30.2% in 2003 to 9.4% by first half of 2007, and the Gini coefficient has decreased from 0.487 in 1998 (the year Chávez took office) to 0.420 in 2007. As a point of comparison, the Gini of the United States increased from roughly 0.40 to 0.47 during that same time period.

While macroeconomic indicators provide a useful means of comparison, perhaps more important to our understanding of the Bolivarian Revolution is an examination of the more material consequences of the economic policy for the people (although all of the above also have direct effects on the people). During the Chávez administration, social spending per capita has increased 218.3% (so, more than tripled), and has increased from 8.2% to 18.8% of GDP in 2008. Further, there are now 12 times as many primary care physicians in the country, access to potable water has increased from 80% to 92%, daily caloric intake increased from 2200 in 1998 to 2700 in 2008, while the rate of malnutrition dropped from 21% in 1998 to just 6% in 2007. In terms of education, preschool attendance has increased from 40.3% to 54.6%, high school attendance has increased from 82.8% to 93%, more than 1.4 million adults have participated in literacy campaigns (including Mission Robinson and the “Si, Yo Puedo” program of Cuba), there are more than 3600 new schools, university enrollment has more than doubled to 1.6 million under the Chávez administration, and UNESCO has declared Venezuela among the top five countries in the world in terms of access to universal education. Additionally, there are now more than 16 500 food stores throughout the country that offer subsidized food to the poor, the proportion of people receiving old-age pension has increased from 19.6% to 32% between 1999 and 2006, the infant mortality rate has declined from 21.4 to 13.7 deaths per 1000 between 1998 and 2007, formal employment is up from 44.5% in 1998 to 49.4% in 2007, and there has been an increase of 2.3 million jobs (1.8 million in the private sector alone). These indicators highlight the types of material gains to the predominantly poor of Venezuela.

PARTICIPATION IN THE MOVEMENT

One of the key goals of the Bolivarian Revolution is to build and enhance a direct participatory democracy. The Bolivarian Movement, and the Chávez administration itself, seem to have the support of the people. Chávez first ascended to the presidency in 1998 with 56.2% of the vote, the new Bolivarian Constitution was approved in 1999 by 72% of the vote, Chávez was elected under the new constitution with 59.8% of the vote, won a
recall referendum in 2004 with 58% of the vote, and won the 2006 election with 62.9% of the vote. It is also worth noting that in the 2006 election Chávez won a majority in each of the 23 Venezuelan states, including the home state of his opponent, Manuel Rosales. And although the Chávez administration lost a constitutional referendum in December 2007, it was by less than 1% of the vote. Overall, it seems Chávez has enjoyed clear and sustained support.

Although such statistics provide an indication of support, they say little about actual political participation. Thus, what is even more significant than his statistical victories is that Chávez managed to double his support in raw numbers of voters from 3.7 million in 1998 to 7.3 million in 2006. Indeed there are great indications that the people, both pro and anti, have felt an increasing surge of political participation. There were 9 million registered voters and 7.5 million votes cast in 1998, numbers that increased to 16 million and 12 million respectively by 2006. The years between 2004 and 2006 alone saw an increase of 1.7 million registered voters. And in 2006, voter turnout was 75%, making it the highest percentage in Venezuelan history. Thus, regardless of political orientation, the Chávez administration has witnessed a significant boom in democratic participation. Some have argued that the transformation has been from a right to participation to an obligation to do so (Ellner 2008).

It isn’t just the number of registered voters and the number of people actually voting that is on the rise in Venezuela, it is also the opportunities to engage in electoral activity. From the time Venezuela first became a representative democracy on January 1, 1959, until Chávez took office in February of 1999, there had been 15 electoral contests in the country. In the 13 years Chávez has been in office, there have been 11 electoral contests. Thus, and perhaps most key to a true democracy, not only are participants in the process increasing, but so are the opportunities for participation.

It is also worth noting that under Chávez, Venezuela’s elections have received unprecedented attention and scrutiny. In order to ensure smooth democratic functioning and appease international concerns, the government of Venezuela has opened their election process up to international observation. During the 2006 election, for example, there were 1400 observers on hand including 10 representatives from the US-based Carter Center, 130 from the European Union, 60 from the Organization of American States, and 10 from the Mercosur Common Market of the South countries. All observers, even those from opposition sources, declared that elections in Venezuela were free and fair.

Social support for many of the programs put forth by the Bolivarian Revolution in Venezuela is no doubt due, in part, to the increasing social inclusion of the people. Women (for a while four of the five national branches of government were headed by women – all but the executive branch), Afro-Venezuelans, indigenous peoples (according to Article 125 of the Constitution, native peoples will be included in the National Assembly, where they are guaranteed at least three seats, as well as in federal and local entities with a native population), the elderly, disabled, and most notably the poor have all seen an increase in social protections via the new Bolivarian Constitution, attention via the missions, and inclusion through community councils. These minorities, in turn, appear to be the true engine of the Bolivarian Revolution in Venezuela, and elsewhere.

Recyclable materials collectors movement in Brazil and South America

MARIA CECILIA and LOSCHIAVO DOS SANTOS

Increasing joblessness and homelessness in Brazil in the last 20 years has led to the development and spread of a new strategy of income generation among some poor and homeless individuals: collecting and recycling discarded mass produced objects and materials.

The activity of recyclable material collectors on Brazilian city streets has been visible for several decades, but it was only in the early 1980s that the first initiatives arose to organize them through associations or cooperatives. In the city of São Paulo, at that time, a group of church workers began helping the homeless, some of whom were facilitating their subsistence by collecting and selling the waste discarded by homes, industries, and commercial establishments in the downtown area. These homeless people began holding meetings at a community center, which became the meeting point for these collectors. The idea of collecting was initially pursued for the purpose of obtaining money to afford a religious party during Easter.

The history of the organization of the collectors and the homeless includes numerous violent confrontations and evictions. In 1985, in a political conflict with the municipal administration of the city of São Paulo, the collectors marched through the main streets of São Paulo, demanding the right to circulate with their carts in the downtown area, thus manifesting their political voice.

The first recyclable collectors cooperative in Brazil was founded in 1989 by 20 groups of collectors. They called themselves the Cooperative of Autonomous Paper, Cardboard, Scraps, and Reusable Materials Collectors (COOPAMARE). In 1990, the Association of Collectors of Paper, Cardboard, and Recyclable Materials (ASMARE) was created in Belo Horizonte, based on sociopedagogical work developed by the street pastoral of the Belo Horizonte archdiocese. In 1993, the Belo Horizonte project of selective collection was implemented in partnership with ASMARE by the superintendency of urban cleaning (SLU), helping give a “semipublic status” to the work of the collectors’ cooperative (Dias 2007). Today, ASMARE is one of the largest Brazilian cooperatives and the only one to have a recycling plant run by the collectors themselves (Silva 2006; Rutkowski 2008).

The organization of the work of these collectors gradually began to generate income and, throughout the 1990s, motivated the articulation and expansion of cooperative work in several Brazilian cities. Thus, the collectors, the majority of whom are now formally organized into work and income generation cooperatives, established the basis of the National Movement of Recyclable Materials Collectors (MNCR) in September 1999, at a meeting in Belo Horizonte with nongovernmental organizations, the government, and the private sector.

The national movement was officially created in June 2001 when more than 1700 collectors from all over Brazil attended the first National Conference of Paper and Recyclable Materials Collectors on the campus of the National University of Brasília. The attendees joined in writing a political agenda articulating and advocating their rights, as well as establishing partnerships with different sectors of civil society.

During the congress, the Letter of Brasilia was written: “For the end of trash dumps, recycling by collectors, at once!” It summarized the main guidelines and demands of the MNCR: proposals for MNCR actions to be taken concerning the executive branch of government, the productive chain of recycling (includes the process of managing solid wastes from the moment they are discarded, triage, packing in

bales, sale of material, transport logistics, processing by industry, and developing the market for the new product; Gonçalves-Dias 2009), and the citizenship of the homeless.

The collectors demanded that the executive branch guarantee that they would receive funds and subsidies with a view to their social inclusion through work. They also demanded qualification for their work, proposing the inclusion of their militants in the federal government’s national plan for professional qualifications, the adoption of policies and measures that would enable their technological improvement, as well as the eradication of trash dumps in the country.

As for the productive chain of recycling, the requirement was to create institutional devices that would ensure that recycling was performed as a priority by social companies of recyclables collectors. And as regards the citizenship of the homeless population, one of the main points was the requirement that the homeless be recognized by including them in the national demographic census performed by the Brazilian Institute of Geography and Statistics (IBGE).

In 2003, in Caxias do Sul, Rio Grande do Sul, the first Latin American Congress of Collectors took place. Collectors from Uruguay and Argentina participated, thus demonstrating the strength of the organization among the movements in South America. During this event, the statement known as the Letter of Caxias do Sul was written, spelling out who the collectors are in the throwaway society:

This struggle is not new. It is the result of a long history of women and men who, working as collectors, ensured survival from what society discards and throws away. It is a history in which we discover the value and significance of our work: collecting and recycling disposable materials, we are environmental agents and we help clean the cities. The organization of associations and cooperatives created the possibility of work and income for the more excluded sectors of society... recycling life itself. (MNCR 2003: 1)

In addition to spelling out the social identity of this collective, the Letter contained claims and guidelines for collaboration between government, cities and collectives, and one of its commitments was “to work for a greater integration of the communities of our cities with the collectors’ organizations, through policies and programs of environmental education, ensuring cooperation for separating and delivering recyclables, for controlling the actions of government, for valuing the work of collectors, for participating in public policy management forums” (MNCR 2003: 1).

In the opening session of this event Dona Geralda Marçal, who had been a collector since the age of eight, stated that “Collectors do not need cesta básica [basic food], we want to have our own factory for recycling materials.” This dream came true with the inauguration of the Plastics Factory – owned and managed by the collectors in the city of Belo Horizonte in 2005.

As to government initiatives, in the federal sphere, in 2003 the Interministerial Committee for Social Inclusion of Recyclable Materials Collectors was instituted by presidential decree. The purpose of the committee is to implement the interministerial project: “Trash and Citizenship: Fighting Hunger Associated with the Inclusion of Collectors and the Eradication of Trash Dumps,” with MNCR representing the collectors.

In 2003, the federal programs began the transfer of funds to municipalities for the eradication of dumps and for elaborating integrated management plans for integrated management of urban solid waste, with a component including collectors. Among the plan’s requirements was support for the organization of collectors and establishing selective collection partnerships. In 2005, the second Latin American Congress was held in São Leopoldo with the participation of 1050 collectors from Argentina, Brazil, Chile, and Colombia.

In 2006, the federal government instituted the rule that recyclable waste discarded by the agencies and entities of direct and indirect federal public administration must be
donated to collectors’ associations and cooperatives. A great achievement of the collectors was the creation in 2007 of a national policy of basic sanitation, which rules on contracts and bidding. The modification involves the authorization to employ recyclable collectors associations or cooperatives, without the need for bidding, to carry out recyclable solid waste collection.

In turn, the national policy on solid wastes proposed in 2007 is still going through channels. This project foresees the integration of the collectors into the recyclable wastes collection processes. It also foresees a form of integrated management, and the requirement for the municipality to elaborate the integrated management plan for solid wastes, including the recyclable collectors. Under discussion in the Brazilian parliament, this bill has undergone several changes.

The changes made in 2008 instituted principles such as “polluter pays,” and were limited to industries manufacturing agricultural pesticide, batteries, fluorescent lamps, tires, and electric and electronic products. They also make it mandatory for the municipalities to implement management plans for waste integrated to those of basic sanitation. In addition, fiscal incentives are seen as lines of credit, with lower interest for activities that generate less waste, and recycle or implement selective collection systems.

In 2008, in Bogota, Colombia, the third Latin American Congress was held, with delegates from Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, Guatemala, Mexico, Nicaragua, Peru, Puerto Rico, Paraguay, Venezuela, and Haiti. And, in August 2010, the government signed the national law of solid waste, which has an impact on collectors’ work through the possibility of waste incineration.

From the beginning, the dynamics and characteristics of expansion of the recyclables production sectors in Brazil and elsewhere has depended on the labor force of thousands of collectors, working under precarious conditions. Collectors are turning their fragile situation into a relevant economic and social asset. Through their efforts, catadores (collectors) move from extreme vulnerability in garbage dumps to more socially secure, economically viable, and environmentally conscious citizenship.

Gradually the cooperatives have improved their physical situation and many now have electricity, running water, and bathrooms. Collectors are engaged in the development of an environment-friendly economy as they clean the city. The materials they find are sorted and reintegrated into the productive cycle. Although they play an important role in urban waste management, they receive no health, housing, social security, or education benefits. They are looked upon as dirty people, and even delinquents, rather than productive members of society. Yet they are better off than before they organized themselves into a growing trans-South American movement.

Chávez, César Estrada (1937–1992)

J. CRAIG JENKINS

César Estrada Chávez was a civil rights activist, community organizer, and founder of the United Farm Workers of America (UFWA), the first union to successfully organize agricultural workers in the United States. A self-educated follower of Gandhi’s nonviolent protest strategy and Catholic theories of penance, he began his organizing career in 1952 with the Community Service Organization (CSO), a civil rights organization for urban Mexican Americans in California. In 1958, he became executive director of the CSO but, due to an abiding commitment to organizing farm workers, resigned in 1962 to found the National Farm Workers Association, the predecessor of the UFWA. In August 1966, he became director of the United Farm Workers Organizing Committee (UFWOC), a merger of the NFWA and the Agricultural Workers Organizing Committee (AWOC/AFL-CIO), which he led until his death on April 23, 1993. Chávez’s major contribution was applying a nonviolent protest strategy to the challenge of organizing farm workers, a group that suffered intense discrimination, little community cohesion, and high levels of poverty, even as they labored in the most profitable sectors of American agribusiness. In 1994 Chávez was posthumously recognized with the Medal of Freedom, the United States’ highest civilian honor, for his work on behalf of Mexican-American civil rights and the rights of farm workers to organize, and in 2003 a US commemorative postal stamp was issued in his honor.

Chávez was born on a small family farm outside of Yuma, Arizona to Juana and Librado Chávez. In 1937, his family lost their farm and migrated to central California to work in the fields. Over the next decade, Chávez attended over 30 schools, eventually dropping out in the eighth grade when his father was no longer able to work. In 1952 he joined the CSO as an organizer in San Jose, California, working with Fred Ross, who had been trained by the famed community organizer and activist Saul Alinsky (1909–1972). Chávez worked on Mexican-American civil rights issues, especially racial discrimination in the schools and public facilities (including “whites only” restrictions in theaters and restaurants), conducting language and citizenship training, and organizing voter registration drives. A key tactic was the “house meeting,” in which volunteers used their personal networks to recruit others. Frustrated that the CSO was unwilling to organize farm workers, Chávez resigned in March 1962 and moved to Delano, California, to found the NFWA.

The NFWA focused on cooperative shopping, burial insurance, and a credit union. By 1965 there were several thousand members in the Delano area. In the summer of 1965, Chávez recruited student volunteers who had been involved in the southern civil rights movement and several clergy to organize rent strikes and school discrimination protests. Like Chávez, they were paid five dollars per week plus room and board. In September 1965, Filipino members of the AWOC called a strike in the Delano table-grape harvest. The NFWA joined the strike, with strong support among the workers, but the growers refused to negotiate, hiring immigrant workers as replacements. Chávez called for a boycott against Schenley Industries, a liquor conglomerate with a small grape ranch, and he organized a 340-mile march on the state capitol in Sacramento, California, to publicize the boycott. Media coverage led Schenley, which had major liquor trade labels to protect, to sign the first agricultural union contract. The next target was the DiGior- gio Corporation, an agribusiness giant with vulnerable grocery trade labels, which agreed to a union recognition election that the union

won. The NFWA and AWOC then merged to form the UFWOC (AFL-CIO).

The UFWOC next organized a table-grape strike, which received broad worker support but was broken by immigrant workers, many of whom were undocumented. In fact, in the grape harvest, well over half of the labor force was undocumented. Mounting a three-year grape boycott energized by Chávez’s 25-day fast, farm workers picketed grocery stores across the country. This cut national grape sales by over a third and closed off foreign exports, leading to an industry-wide contract in August 1970. Strikes and a boycott against iceberg lettuce, however, failed to produce contracts. Lettuce was harder to target. Growers confused the issue by signing “sweetheart” contracts with the Teamsters, and they intimidated workers with violence. Chávez decided to support state collective-bargaining legislation to allow workers to be able to vote for their union of choice, leading to the Agricultural Labor Relations Act (ALRA) of 1975, which created secret ballot elections and negotiations in the state of California. The UFWA won most of the elections, and by 1980 it had over 45,000 members. In 1983 California Governor George Deukmejian closed down the ALRA Board, and subsequent legislation weakened its authority, undermining many of the UFWA contracts. In 1986 Chávez kicked off a third grape boycott, focusing this time on the issue of pesticide use, which was a major health hazard to workers as well as to consumers of grapes. After Chávez’s death in 1992, the UFWA signed new contracts under more favorable political conditions.

Chávez’s tactical brilliance and commitment to “La Causa” (the cause) were legendary. Recognizing the organizational and political difficulties in organizing agricultural strikes, he and the UFW cadre devised a nonviolent protest strategy focused on boycotts, demonstrations, and publicity, including hunger strikes that enlisted broader community support. Countering frustrations that might lead to strike violence and violent attacks against strikers, Chávez conducted three major fasts framed in terms of religious penance and claims for worker dignity. In addition to appealing to the moral identity between workers and growers, his fasts called for personal sacrifice and discipline, which energized workers and garnered broader community support.

In the last decade of his life, Chávez became obsessed with internal control, using “thought control” tactics that drove out many of the original UFW cadre and undermined the innovative spirit that had made the UFW successful. Nonetheless, his dedication and efforts in the field of civil rights and community organizing provided a model for organizing the “unorganizable.”

REFERENCES AND SUGGESTED READINGS

The Christian Identity movement (CI) is the product of a marriage between various marginalized knowledges and British Israelism (BI). The betrothal was consummated in Southern California during the 1930s and 1940s by recently arrived Dust Bowl immigrants carrying with them evangelical Methodist/Baptist enthusiasms. While there are many CI congregations, the most notable is the Church of Jesus Christ Christian (Aryan Nations (AN)). When AN was headquartered in Idaho, it spawned a number of terrorist activities in the decades after the 1980s, most notably those of The Order. The Order was implicated in murders, robberies, armored car heists, and arsons. It ended in a fiery shootout with federal agents in 1985.

The theology of BI holds that after their exile (circa 700 BCE), the tribes of Israel migrated over the Caucasus Mountains. Hence, their racial type: Caucasian. They subsequently settled in European countries, the names of which allegedly point to their tribal origins (e.g., Denmark = the tribe of Dan, Jutland = Judah, and Macedonia = Moeshe [Moses] + Dan + ia [land of]). The implication is that white Europeans (the Saxons) are Isaac’s Sons, not just the Jews; and the promises granted Isaac in the Bible are theirs. BI considers Jews a fraction of Israel, but not its entirety. Nonetheless, Jews are to be treated patronizingly as a “younger brother.”

BI was cultivated by English society matrons and retired colonial officers. It therefore evinces a characteristically understated British restraint. After it was transmitted to America, however, its chief carriers became self-educated “scholars,” non-ordained Bible thumpers, Klansmen, and McCarthyites. In their hands, BI was melded into the American cultic milieu of pyramidology, UFO cultism, “biblical economics,” alternative medicine, apocalypticism, conspiratology, and most notably, Judeophobia.

In CI Jews are viewed either as devotees of a “Satanic religion,” Judaism (regardless of their race), or as members of a non-white race (regardless of their faith). If the latter, they are said to be descended either from Cain (who was conceived by Eve after being impregnated by Satan) or from Mongol Khazars (whose forefather, Esau, sold his birthright for a bowl of lentils). Whatever the case, Jews are accused of involvement in a conspiracy to impose “ZOG” (Zionist Occupation Government) on the world. All recent historical “tribulations” are attributed to a cabal headquartered in “Jew York City” and in “Kosher Valley” (Hollywood): from equal rights for minorities (“His dream, our nightmare”) to 9/11 (“an inside job”); from global warming (“a hoax”) to feminism (and the “abortion holocaust”); from economic boom and bust (both of which are phases of a plot to indeb and eventually enslave white folk) to compulsory vaccination programs (“that sicken our youth”); from rock ’n roll (“the Devil’s anthem”) to the presidential election in 2008 of “Kenyan-born Muslim” Barack Hussein “Osama.”

CI prophecy maintains that these and related events are all signs of the Last Days. But unlike Christian fundamentalism, which claims that believers will be “raptured” into Heaven prior to Christ’s Second Coming (the doctrine of pre-millennialism), CI is post-millennial. It insists that Christ will come only after “God’s battle axe and weapons of war” (white people) have defeated “the sons of darkness” in a final battle. In the meantime, they are obligated to occupy secular institutions in order to reconstruct society on Old Testament lines: reinstating mandatory Sabbath, together with slavery and concubinage; putting an end to interest-taking on loans; stoning...
to death disobedient children; executing abortionists, “witchcrafters,” and sodomites (who “wait in their lusts to rape”); discontinuing public welfare programs for “Negro beasts who eat the flesh of men”; and either exiling nonwhites from the country or treating them as guest peoples without rights. Nonwhites are said to have no natural rights because, unlike white “spirit” people, they have no souls. This is “proven” by their lack of shame, as indicated by an inability to blush when blowtorches are put to their faces. According to CI, “not everything that walks on two legs is human.”

CI is broadcast through a variety of largely underground media: short wave radio, Internet web sites, blogs, taped sermons, pamphlets, local access TV, prison “outreach,” and self-published books. However, the most important vehicle for disseminating CI is the annual conclave, where “the great minds of the Aryan movement” gather. Here, activists learn about survivalism and natural pharmacopeia, as well as white folk songs, dance, and dress. They may also undergo paramilitary training where they shoot at “runnin’ Nigger” targets and at faces of prominent Jews.

Besides uniting the community, these media also offer opportunities to validate CI claims. There are four kinds of proofs: (1) Citation of ancient legends. One of these is that the coronation stone in Westminster Abbey is the same as that upon which Jacob laid his head the evening he was named Israel; (2) Numerology. One argument is that 1776, the year of America’s founding, occurred exactly 2520 years—in other words “seven Bible years”—after Israel was taken into captivity by the Assyrians; (3) Etymology. “British” is said to be a corruption of the Hebraic words brith (covenant) + ish (people). Thus, the British are the real “people of the covenant,” not the Jews; (4) Bible promises. God promises that if Israel remains faithful to this covenant, she shall be “a company of nations” that dominates the globe. That Britain was indeed the world’s foremost imperial power during the Victorian era “proves” that she is Israel. That Judah’s scepter has since passed to Manasseh (America)—“A city on a Hill, the New Jerusalem”—is due to the fact that Britain failed to uphold its side of the bargain with God. And if America does the same then, like Britain and the ancient Israelites before her, it too shall lose God’s favor.

REFERENCES AND SUGGESTED READINGS
The Central America Solidarity movement emerged in the early 1980s when US citizens sought ways to support Nicaraguans, Salvadoreans, and Guatemalans who were fighting for human rights, economic justice, and democratic freedoms. Solidarity activists also worked to obstruct US political, economic, and military intervention in Central America.

BACKGROUND

Central America’s conflicts stem from major inequalities created during colonization. Starting in the sixteenth century, Spanish settlers seized the best arable land and set up large plantations. Thus the land became concentrated in the hands of a small, wealthy, European minority who institutionalized policies to ensure their ongoing control of the region. In contrast, the majority of Central Americans were landless and lived well below the poverty level. By the 1960s, numerous popular organizations formed in Nicaragua, El Salvador, and Guatemala to challenge these inequalities and improve the lives of the poor. Liberation theology, which posits that the Bible teaches liberation for the oppressed, contributed to this trend. But activists soon experienced severe state repression, including incarceration, torture, and assassination. Many concluded that social change could only be instigated through armed struggle and thus revolutionary movements emerged: the Sandinista National Liberation Front (FSLN) in Nicaragua, the Farabundo Marti National Liberation Front (FMLN) in El Salvador, and the Guatemalan National Revolutionary Unity (URNG). Nicaragua’s revolutionary movement seized power in 1979, shortly before Ronald Reagan was elected president of the United States.

Once Reagan assumed office, his top foreign policy priority was to stop the spread of socialist revolutions in Central America. Toward that end, he authorized the US Central Intelligence Agency to form a counterrevolutionary force, known as the Contras, to overthrow Nicaragua’s Sandinista government. Realizing that they could not defeat the Sandinistas through a direct military confrontation, the Contras began attacking the country’s economic infrastructure and destroying government projects aimed at improving living standards (such as schools and health clinics). The strategy was to create widespread social dissatisfaction so that Nicaraguans would oust the Sandinista government. While Reagan was working to reverse Nicaragua’s revolution, he also tried to defeat the Salvadoran insurgency. His administration sent billions of dollars in aid and weapons to the Salvadoran government, despite its horrific human rights record and sponsorship of paramilitary organizations that had killed numerous religious leaders including El Salvador’s archbishop, Oscar Romero, and four North American churchwomen (Nepstad 2004).

SOLIDARITY ORGANIZATIONS

The assassination of Archbishop Romero and the North American churchwomen in El Salvador mobilized religious communities in the United States. One of the most prominent faith-based organizations was the Sanctuary movement, which began in 1982 when a Presbyterian church in Tucson publicly announced that it was intentionally breaking immigration laws by helping Central Americans cross the border and then harboring them. Initially, Sanctuary activists assisted refugees in the asylum process. Yet over 97 percent of Guatemalan
and Salvadoran asylum applicants were denied, largely due to government policies favoring those fleeing communist regimes. Thus activists decided to invoke an ancient Judeo-Christian practice of creating a safe haven for those fleeing persecution (Cunningham 1995). They also recruited churches and synagogues throughout the country to participate. Eventually, 400 religious groups were involved in a “new underground railroad” that illegally sheltered those fleeing Central America’s violence and repression, preventing them from deportation (Coutin 1993; Smith 1996).

Another important faith-based solidarity organization was Witness for Peace. This organization began in 1983 when 30 US religious leaders traveled to Nicaragua’s war zone to gather facts about the Contra War. The group noticed that Contra forces did not attack while they were present, largely because the counterrevolutionary group did not want to jeopardize their US funding by killing American citizens. Realizing that their presence deterred attacks, the religious leaders decided to establish a long-term presence in the region (Griffin-Nolan 1991). Eventually, the organization developed a two-pronged strategy: (1) sending long-term volunteers to live and work in war-zone villages to decrease Contra attacks, and (2) sending thousands of short-term volunteers who would travel to Nicaragua and then return to do educational and media work to change US policies. Within a decade, Witness for Peace sent over 4000 people to Nicaragua on short-term trips and roughly 200 volunteered on a long-term basis (Smith 1996).

Secular organizations were also active in solidarity work. The most prominent were the Committee in Solidarity with the People of El Salvador (CISPES) and Nicaragua Network. CISPES formed in 1980 to oppose US support for the Salvadoran regime and to organize financial aid for grassroots groups in El Salvador. Nicaragua Network provided material aid, particularly to war-zone communities, and sponsored national speaking tours for FSLN representatives (Perla 2008).

In the mid-1980s, when Contra attacks in coffee regions devastated the Nicaraguan economy, Nicaragua Network started a program called Nicaragua Exchange that sent brigades of US volunteers to help harvest coffee (Nepstad & Smith 1999).

MOVEMENT DECLINE

The Central American Solidarity movement declined by the early 1990s, due to several factors. The Contra War had taken a severe toll on Nicaraguans, who voted the Sandinista government out in 1990. Additionally, a 1991 peace accord brought El Salvador’s civil war to an end. Finally, when George H.W. Bush became president, he shifted US foreign policy priorities toward the Middle East.

Chinese communist revolution

JIN XU and DINGXIN ZHAO

The communist revolution of China was led by the Chinese Communist Party (CCP), which was founded in 1921 in the wake of the May Fourth movement. The CCP began as a very small Marxist-inspired left-wing intellectual club, with little political influence prior to its alliance with the Chinese Nationalist Party (GMD) in 1924. The GMD were motivated to ally with the CCP in order to obtain support from the Soviet Union in their fight with the northern warlords. With the help of the CCP, the GMD was remodeled from a loose organization into a Leninist party, and the GMD also received financial and other support from the Soviet Union. Meanwhile, the CCP also developed quickly by infiltrating the GMD-controlled army and by expanding its organizations in the urban and rural areas of southern China. While the alliance between the GMD and CCP brought great success for both parties, tensions also grew as the parties pursued different agendas. After the initial military success against the warlords during the Northern Expedition, a growing number of the GMD’s leaders and generals became very unhappy about the CCP’s infiltration into the GMD-controlled army as well as about the CCP’s radical property redistribution policy, which was implemented in the territories recently occupied by the GMD’s Northern Expedition army. As a result they no longer wanted to share the power with the CCP. In early 1927, shortly after Northern Expedition troops occupied Shanghai, the GMD started to purge the CCP-controlled organizations in the city and labeled the CCP an illegal organization. The purge soon spread, with hundreds of thousands of CCP members and their sympathizers arrested and killed. In response, the CCP staged several military uprisings in late 1927 in places where they had strong influence. While all these uprisings were easily suppressed by the GMD army, the surviving members of the CCP were able to retreat to mountain areas and conduct guerrilla warfare.

The Chinese communist revolution can be roughly divided into three stages according to the nature of the warfare. The first is the guerrilla war stage from 1927 to 1936. In this period, while the CCP was initially able to greatly expand its base, it ran into problems with radicalism – its radical land redistribution policy hurt not only the landlords but also the well-to-do peasants, its ruthless internal power struggle led to massive purges and killings of its own cadres, and finally its overconfident military strategies were unable to withstand the assault of the GMD army. Many of these radical policies were, of course, initiated by the young radicals who had returned from the Soviet Union with minds full of theories but little practical experience. On the other side, the GMD was able to defeat or co-opt the northern warlords and unify a large part of China by the early 1930s. With their hands freed by this unification, the GMD launched two massive military campaigns against the CCP-led Red Army and finally forced the Red Army to abandon all their guerrilla bases in southern China and start the famous Long March in late 1934.

The Long March was initially just a poorly planned escape from the GMD army’s onslaught, but it turned out to have a long-lasting impact on the development of the communist revolution that was not intended by the leaders of either the GMD or the CCP. First, the CCP lost about 90 percent of its soldiers during the Long March. Yet, the soldiers who remained in the army were those who were most loyal to the communist cause and many of them were going to play a key role in the communist revolution. In other
words, the defeat actually helped the CCP to sieve out its core elements which were crucial to its later expansion. Second, before the Long March, the CCP was heavily dominated by the dogmatic leaders who had a Soviet Union background and were very much under the influence of Moscow. The war, and the pure needs of survival, severely tested the leaders of the CCP. As a result, those CCP leaders who were able to make more pragmatic decisions rose to the top while the dogmatic leaders with a strong Soviet Union background lost their complete domination. After the Long March, Mao Zedong rose to become the CCP’s most powerful leader.

The GMD was unable to wipe out the Red Army during the Long March. Its failure, however, had less to do with Mao’s wise leadership than with a set of conditions produced by Japan’s invasion. In the middle of the Long March, CCP propaganda gave a new meaning to the Long March – marching north to resist the Japanese invasion. This new frame was made possible by the heightened Japanese aggression in China and by the countrywide intensification of anti-Japanese feelings, and was thus sympathetically received even among some GMD leaders. Moreover, when the Red Army entered Shaanxi province, the GMD army stationed there mainly consisted of troops who had retreated from Manchuria after the Japanese occupied the region in 1931. Still humiliated by their nonresistance to the Japanese invasion, these soldiers were very reluctant to fight the Red Army, who now expressed their desire to unite with the GMD to resist the Japanese invasion. This situation greatly upset Jiang Jieshi, who believed that the Red Army could be eliminated in Shaanxi by just one more campaign. When Jiang went to Xi’an in the winter of 1936 to force the local generals to carry out his order, however, he was put under house arrest by the local GMD generals in what came to be known as the Xi’an Incident. The ensuing dramatic push for a peaceful solution to the incident ended in another GMD–CCP alliance between 1937 and 1945, after which the second stage of the communist revolution began.

The second stage was crucial to the success of the communist revolution. Soon after the outbreak of the anti-Japanese war in 1937, the Japanese occupied much of the northern and coastal areas of China. Yet, the Japanese only controlled the cities, leaving the countryside clear for the CCP to establish their guerilla bases. In only two years, the CCP was able to boost its army tenfold to 400,000 troops. By 1945, when the Sino-Japanese War ended, the CCP army had grown to over 1.2 million. Furthermore, in 1937, while Mao was already the most powerful leader in the CCP, the party was still very much under significant influence from the Soviet Union, through many of the dogmatic cadres who had returned from there. By 1945, however, Mao’s leadership was fully consolidated, in part thanks to the Yanan Rectification Campaign (Selden 1971). Finally, between 1937 and 1945, the CCP continued to expand its guerilla bases and established village-level government in places under its control. The Japanese attacks on the CCP bases and their atrocities in the end only helped the CCP to solidify its bonds with the local peasants (Johnson 1962; Chen 1986). By 1945, the CCP government already controlled a territory containing 130 million people and had a very effective taxation system as a result of its strong local bonds and the village-level government it had established during the war.

The GMD and CCP engaged in a showdown between 1946 and 1949, soon after the Japanese surrender. This final stage of the communist revolution ended with the defeat of the GMD army and the founding of the People’s Republic of China. The quick defeat of the GMD by the CCP was a surprise to many international observers. Even though the CCP had commanded over 1.2 million soldiers and a territory with a population of 130 million, the GMD had commanded 4.3 million soldiers and controlled a territory with 350 million people. Moreover, while the best CCP troops were only armed with Japanese weapons, 22 elite divisions of the GMD army were equipped with the best
American firearms. The military conditions were very much in favor of the GMD army at the beginning of the showdown. Yet, even though the GMD’s defeat was not inevitable, the following set of structural constraints and strategic mistakes fostered the quick demise of the GMD regime.

First, while the GMD regime controlled a much larger territory in the richer parts of China, it actually faced more resource constraints. The GMD regime did not have the highly effective village-level government that the CCP had established during the anti-Japanese war period, and thus had a much weaker extractive capacity in comparison with its communist counterpart. Moreover, whereas the GMD army needed money for military procurement and to pay for soldier stipends, the CCP army required very little to cover such expenses (the soldiers of the CCP army were volunteers, and the CCP army obtained most of its weapons from the defeated GMD troops). The GMD regime thus faced serious inflation and experienced a financial crisis as the war went on, creating conditions for communist success (Jin 2002). Second, after the Yanan Rectification Campaign, Mao rose to become the CCP’s paramount leader, allowing him to decide upon and implement coherent military strategies. The GMD leader Jiang Jieshi, however, did not wield as strong an authority over the GMD as Mao did over the CCP, nor did he have firm control of those GMD troops which originated from the warlords’ forces. The weaker leadership and the lack of cooperating spirit and fighting will of some GMD generals were always a big problem for the GMD army. Third, the GMD was a much looser organization in comparison with the CCP. The CCP agents could, therefore, easily infiltrate the GMD army and organizations in order to collect intelligence and even to influence the troops to change their allegiance to the CCP at a number of critical moments during the GMD–CCP showdown.

Finally, and perhaps most importantly, all the above issues were amplified because of the GMD’s poor military strategies. Between 1946 and 1948, the GMD changed its military strategies several times. In the first year, the GMD army waged a frontal attack on CCP bases, with the occupation of cities as a major goal. The GMD army also fought wars inside CCP-controlled areas and committed large numbers of troops to defend the newly occupied territories. On the other hand, the CCP made the elimination of GMD troops rather than territorial defense their primary goal. It also moved its troops around to induce the chasing GMD army to overextend itself and then launched surprise counterattacks. The GMD army’s manpower, supply system, and intelligence simply could not sustain this kind of war. It was not until 1947, after experiencing repeated defeats and the loss of over a million soldiers, that the GMD adjusted its strategy, now aiming at gaining the upper hand only in a few strategically crucial places. Had the GMD adopted this strategy earlier, it is more than likely that its major goal could have been achieved. By now, however, the CCP army had grown to almost two million and the CCP government had gained even wider support in places under its control, in part thanks to its popular land reform policy. The CCP army waged counterattacks in late 1947, and its offensive culminated in late 1948 when it staged three major campaigns, killed or captured about 1.5 million GMD soldiers, and wiped out almost all the elite units of the GMD army. Although this, for the GMD, disastrous end to the three campaigns, especially the Huaihai campaign, was not inevitable, the aforementioned weaknesses of the GMD regime were manifested in almost every step of the campaigns’ development. The GMD army became virtually defenseless after these setbacks. In April 1949, the CCP army crossed the Yangzi River and sacked the GMD capital, Nanjing. On October 1, Mao announced in Tiananmen Square the establishment of the People’s Republic of China, marking the success of the revolution.

The Chinese communist revolution had long-lasting impacts on the history of modern China. On the positive side, the revolution
had greatly strengthened state power and transformed China from a disintegrating empire into a modern nation-state. Although China was still a poor country up to the early 1990s, it could no longer easily be bullied by foreign powers as it used to be. The rise of communist China, thus, afforded great pride to the Chinese, especially the educated population which had a stronger national consciousness. Moreover, through a series of campaigns, the CCP targeted landlords, GMD loyalists, and other traditional elements of Chinese society. While these campaigns involved a high level of brutality and human cost that should never be ignored, they wiped out or greatly weakened many traditional elements that had blocked the Chinese modernizers’ dream of establishing China as a modern state with an industrialized economy. The CCP also took serious measures to improve public health, public education, and the status of women in China. While it is easy to point out the many limitations and side effects of these policies today, it should not be ignored that life expectancy, educational standards, and the status of women all experienced a huge improvement in the 1950s and 1960s (e.g., the average life expectancy of the Chinese was only 35 years before the communists came to power but had increased to 68 years by 1978). These are not only good things in themselves, but they also prepared for China a population with the skills and qualities needed for the economic breakthrough after the 1980s.

The economic performance of the communist regime under Mao was rather mixed. On the one hand, before the death of Mao in 1976, China was able to develop an industry that could produce almost everything. This created for China a body of experienced workers and technicians for its later takeoff. On the other hand, its industry produced low-quality products and was run with very low efficiency. By the 1980s, when the economy of GMD-controlled Taiwan had already taken off, China remained a very poor nation. Like any social revolution, the Chinese communist revolution also went through phases of radicalism after the CCP took power and this resulted in a very high level of brutality and human cost. What especially bear mentioning are the state-initiated Great Leap Forward (1958–1960) and Cultural Revolution (1966–1976). The Great Leap Forward was a radical industrialization movement and the direct cause of the Great Famine (1959–1961), during which about 30 million Chinese died of hunger. The Cultural Revolution (1966–1976) was a movement supposedly aiming at those CCP power-holders whose mentality and actions had seriously deviated from the egalitarian communist ideals, but turned out to be a mass movement that induced the Chinese to struggle against each other at almost every level, resulting in millions of deaths and bringing China to the brink of economic and moral bankruptcy.

Communication rights

The notion of communication rights encompasses a set of human rights as they apply to the contemporary communication environment. Communication rights represent an evolution of Article 19 of the United Nations Universal Declaration of Human Rights, which provides for freedom of opinion and expression. They include the right to privacy, the right to participation, the right to speak one’s own language, the right to access and share knowledge and information, and the right to self-determination (CRIS 2005). They are believed to “support people’s capacity to communicate in their general interest and for the common good” (CRIS 2005: 13).

Historically, communication rights are linked to the idea of a “right to communicate,” which emerged in the 1970s, when Jean D’Arcy, a French diplomat and former director of the Radio and Visual Service at the Office of Public Information of the United Nations, wrote an article entitled “Direct Satellite Broadcasting and the Right to Communicate” (D’Arcy 1969). Although D’Arcy did not specify what he meant by the right to communicate, his utopian vision informed the debate on the New World Information and Communication Order (NWICO). The NWICO debate emerged in the 1970s within the United Nations Educational, Scientific, and Cultural Organization (UNESCO), spurred by a group of nonaligned countries concerned with the imbalances in global communication flows which were believed to contribute to underdevelopment. Following these concerns, in 1980 UNESCO appointed an International Commission for the Study of Communication Problems, chaired by Irish Nobel laureate Seán MacBride. The Commission sought to analyze communication problems in modern societies and propose solutions to further human development through communication. The MacBride Commission filed a report entitled “Many Voices, One World,” identifying communication as a human right and supporting the recognition of the right to communicate. The report read:

Communication needs in a democratic society should be met by the extension of specific rights such as the right to be informed, the right to inform, the right to privacy, the right to participate in public communication – all elements of a new concept, the right to communicate. In developing what might be called a new era of social rights, we suggest all the implications of the right to communicate to be further explored.

(UNESCO 1980: 265)

The idea of a NWICO, however, was later abandoned as the United States and the United Kingdom withdrew their support to UNESCO. Nevertheless the debate survived outside of institutional arenas, as progressive media professionals, journalists’ associations, and academics began slowly to regroup around the MacBride Roundtable, an advocacy group which met annually from 1989 to 1999 (Vincent, Nordenstreng, & Traber 1999). But it was not yet a grassroots mobilization, and experts and progressive intellectuals played a prominent role (Milan & Padovani 2011).

More recently, social movements and the organized civil society started again to champion communication rights both as independent initiatives and in institutional arenas. In 1993, a group of nongovernmental organizations and individuals concerned with communication rights launched the People’s Communication Charter: its 18 articles claimed that communication systems should serve “human needs and rights” and that people should be empowered through media access and possibilities for participation. Learning from the failure of NWICO, the Charter’s advocates tried to build up support among international
networks of grassroots organizations, calling for cooperation between nongovernmental organizations and governance institutions. By the end of the 1990s, several coalitions for the democratization of communication were formed outside institutions. They included the Platform for Democratization of Communication, created in 1996 and committed to the democratization of communication infrastructure and institutions, and the international campaign Voices 21. Observers called it “a new NWICO in the making which sees itself as a network of networks based in civil society” (Vincent, Nordenstreng, & Traber 1999: x).

In 2001, the Platform for Democratization of Communication initiated the Communication Rights in the Information Society (CRIS) campaign. CRIS gathered NGOs and individuals from different countries, and served as an umbrella group to represent civil society values and interests at the United Nations World Summit on the Information Society (WSIS). The WSIS, organized by the International Telecommunication Union, was the first UN meeting to discuss communication and media issues in relation to development. It was a multi-stakeholder forum: civil society was called to participate on an equal footing with government and business actors.

CRIS was the most vocal supporter of the principle of the “right to communicate” at the WSIS (Thomas 2006). During the WSIS first phase (Geneva 2003) the CRIS campaign organized the World Forum on Communication Rights, a counter-event with the objective of showcasing what communication rights meant in the life of people (Padovani & Pavan 2009). In 2004, CRIS launched the Global Governance and Communication Rights project. The project resulted in a toolkit designed to help social movement actors to advocate for communication rights in their respective countries (CRIS 2005).

In November 2004, the European Forum on Communication Rights took place in London. A side event to the European Social Forum, it was organized by groups such as Indymedia concerned with the lack of debate on communication issues at the forum. It offered an occasion for both radical and advocacy-oriented media activists to network in the run-up to the second phase of WSIS, in Tunis. With the WSIS coming to an end in 2005, international mobilizations for communication rights became less prominent and less frequent. However, communication rights still serve as a crucial point of reference for communication and media activists across the globe.

Consumer movements
FRANCESCA FORNO

The term consumer movement indicates a specific area of activism made up of individuals, informal groups, and organizations seeking to empower people both as buyers, enabling them to get the most for their money, and as a political force, striving to rewrite the rules of the marketplace.

Unlike other social movements, the consumer movement only rarely takes on the form of widespread and spontaneous outpourings of grassroots consumer discontent and tends to rely mainly on the actions of individual activists and groups whose goal is consumer welfare.

Within the consumer movement, a distinction is made between organizations for whom consumer issues are of primary importance and those for whom they are of secondary concern (Meyer 1989). Pure, or core, consumer organizations are groups that look upon the advancement of consumer welfare as their principal goal. This is the case of organizations such as consumer federations, consumer unions, antismoking groups, and the many single-issue consumer groups focusing on areas such as automobiles, airlines, health, energy, and insurance.

Secondary consumer organizations, on the other hand, are classed as all those groups with which consumer organizations occasionally form alliances. These may embrace a wide range of groups such as those campaigning in support of organized labor, farm workers, the elderly, the natural environment, corrupt government, corporate accountability up to and including members of a range of occupational and industrial groups.

Consumer organizations may also be differentiated with regard to their ideological views. For instance, certain groups claim that their primary duty is to promote the interests of low-income consumers, whereas others see their role as championing the interests of all consumers.

Groups within the consumer movement may also be distinguished between reformists and radicals (Meyer 1989). The reformist wing of the consumer movement is made up of those organizations focusing on a relatively narrow set of problems, such as a lack of information or hazardous products. Reformists believe that solutions to consumer problems may be achieved by working with businesses and through existing governmental institutions. This is why their main activities take place mostly in legislative, regulatory, and juridical settings.

Unlike reformists, radical-wing consumer organizations view consumers’ problems as indistinguishable from those of a broader class of “citizen” problems, such as the environment, pollution or workers’ exposure to dangerous substances or working conditions. In this view, the problem of consumers lies in governments’ lack of political capacity, or willingness, to manage private corporations so as to ensure that the social, environmental, and even the economic needs of their citizens are met. This distrust of government’s capacity leads radicals to shy away from legislative and regulatory arenas. Rather than lobbying and voting, radicals prefer actions which activate citizens’ purchasing power, such as boycotts, buyouts (affirmative buying), and consumer cooperatives.

While the repertoire of market-based actions were deployed by social movements of different types well before market capitalism and the consumer society were established (Freedman 1999; Glickman 2009), the birth of the consumer movement, as we know it today, was a result of the massive changes produced by the early stages of the Industrial Revolution, and dates back to the late nineteenth- and early twentieth-century attempt to control food and drug adulteration in the United States (Mayer 1989).
In the early days of consumer movements, consumer organizations concentrated on unsafe products and environmental hazards, and used lobbying, voting, and journalistic exposés in order to press for government protection. In the United States these initial efforts led to the passing of the Pure Food and Drug Act and the Meat Inspection Act in 1906. A major role during this initial mobilization process was played by a number of citizen’s groups, especially those made up of women such as, for example, the National Consumers League (NCL), an organization originally founded to improve the working conditions of women and children through selective boycotts.

During the 1920s and 1930s the US consumer movement grew in response to the broadening impact of industrialization. In America these years saw the establishment of the Consumers Union (CU) and the attempt to provide consumer representation in federal government.

While the consumer movement began in the United States, after World War II consumer organizations gradually also took shape outside America. Before 1960, three major organizations had been founded in Europe: Consumentenhand in the Netherlands (1951), the Union Beige des Consommateurs (now the Association des Consommateurs) in Belgium (1957) and Union Federale de la Consommation in France (1961). Between 1947 and 1957, consumer activism also grew in Denmark, the Federal Republic of Germany, Switzerland, Japan, Kenya, France, Hungary, Italy, Canada, and Belgium. Press campaigns in favor of consumers in these countries played a significant role in creating the concepts of consumer protection and consumer interests.

The economic boom in several countries after the war increased the standard of living, providing individuals with more leisure time to enjoy their purchases. Over these years, the efforts of consumer organizations concentrated on the methods through which products were promoted and in particular on the impact of advertising. Another important issue in this period was production safety. Especially in the wake of Ralph Nader’s experience in the United States, consumer protection associations significantly increased their credibility in the eyes of the general public, establishing themselves as defenders of individual purchasing power and the transparency of trade. The strength achieved by consumer organizations both in America and many other Western countries led to the recognition of a number of “consumer rights.”

The successes achieved by consumer organizations contributed to a further institutionalization of the movement. From the mid-1980s, consumer activism experienced a moment of stalemate. However, this did not entail a reduction in consumer organizations’ capacity to influence government decisions, but rather that many pro-consumer actions had become institutionalized in the form of governmental agencies as well as numerous laws and regulations.

In mid-1990s – through to the first decade of the twenty-first century – consumer activism once more started to take on a certain prominence in public debates. Among consumer organizations, radical groups began to gain centrality. The increase in boycotts, combined with the relative weakness of other forms of radical politics, has led some commentators to argue that the act of consumption was becoming increasingly suffused with citizenship characteristics and considerations (Scammell 2000). In late 1990s not only did the number of boycotts and buycotts considerably increase, but consumer activists also started to organize themselves around many apparently new topics, establishing alliances with a wide range of other groups.

The prominence of a more radical view within the consumer movement of these years should be understood in relation to a renewed enthusiasm for the “grassroots participation” as observed within the Global Justice Movement. The cycle of protests that emerged at the turn of the twentieth century not only favored the convergence of and collaboration among actors for whom consumer issues were of primary and secondary importance. During the mobilization process, the role of market-based actions gained prominence as
many movement organizations thought that these forms of pressure better adapt to a situation in which political institutions (both national and supra-national) were lacking in the political capacity to regulate and solve the serious environmental and human rights problems associated with corporate globalization (Micheletti 2003; Micheletti & McFarland 2010).

In order to draw attention to the poor working conditions of workers in developing countries, students and labor organizations organized several boycotts of sweatshop-made goods during these years. Movements such as the “fair trade” movement experienced an unprecedented success. Also a number of environmental movement organizations started to use market-based tactics to present their cases. By stressing the close relationship between overconsumption and ecological depredation, some environment-consumer organizations started to emphasize the importance of leaving a smaller carbon footprint by limiting purchases: either by returning to a “simple living” or “voluntary simplicity” or by purchasing environmentally friendly products.

Gaining support for their claims is always a difficult task for social movements of any type, but it is even more difficult for consumer organizations, as the benefits they try to deliver do not regard a specific segment of society but everyone in general and in a widespread fashion. While most people favor the general goal of enhancing consumer welfare, few really feel the motivation or obligation to become a consumer activist, assuming that the consumer movement will persevere with or without their contribution.

Although today there has been little systematic study into the factors that facilitate or hinder the potential of consumer movements to succeed, two general sets of factors have been indicated as connected to the outcomes of consumer organizations (Meyer 1989). The first are environmental-exogenous factors and refer to those sort of serendipitous events, such as scandals and accidental environmental disasters, which by setting the legislative wheels in motion have often opened up opportunities for consumer organizations to push for more general reforms in the areas of consumer rights and safety.

The way in which consumer movement organizations frame their aims and strategies is also important. Here it is often stressed that consumer organizations have two important levers: consumers’ fears and consumers’ pockets. Research by psychologists and economists has shown that people tend to be particularly sensitive to product risks that produce violent accidents, effect many people simultaneously, and are not fully known before one engages in the activity (Slovic, Fischhoff, & Lichtenstein 1982).

The capacity of consumer movements to build consensus around their claims depends also on social, economic, and political opportunities. Consumer organizations are more likely to prosper in a society of highly educated and wealthy consumers whose expectations regarding the quality of life are on the rise. The lot of consumer organizations may also be improved by increasing economic competition, which can lead to political divisions among businesses.

Differences in institutional settings also provide part of the explanation as to why consumer movements succeed and fail, or have not taken off at the grassroots level to the same extent in all countries. While nongovernmental consumer groups have long existed as a grassroots social movement in the United States, Canada, and Australia, in almost all European countries, consumer issues have traditionally been more institutionalized. In Northern Europe, for instance, stronger state involvement in consumer protection measures has meant consumers have not had to organize specifically consumer-based independent organizations in order to achieve their goals. To some extent, this has been because the government has taken the initiative on many consumer issues. In other countries, especially developing countries, business and commercial interests have clearly eclipsed consumer voices within national public and private institutions and thus large-scale grassroots consumer movements have never
emerged, and consumer organizations have had very little impact on economic and social policy (Darley & Johnson 1993).

Contemporary social and political movements in Russia
OLEG GUBIN

BASIC DATA AND CONSTITUTIONAL FRAMEWORK

Contemporary Russia appears to have a diverse and pluralistic social and political movement society. According to the Russian State Statistical Committee, there are 119,247 public associations registered with the Ministry of Justice as of January 1, 2010, with 5303 of them registered in 2009. Most of these associations are represented by 54,113 public organizations and 43,542 trade unions. The data also show a continuous growth of social movements, the number of which was 1808, with 117 emerging in 2009. In addition, the state statistics point out the existence of 746 national-cultural associations, of which 96 came into existence in 2009. These ethnicity-based groups reflect the complex multi-ethnic composition of the Russian Federation. And finally, 253 branches of international NGOs operate in Russia, including human rights watch groups (Russia in Figures 2010). These data indicate that Russian people actively exercise their constitutional rights on assembly, association, and peaceful joint actions. The Russian Constitution (particularly articles 29, 30, 31) and various federal laws (the Federal Law on Public Associations, the Federal Law on Countering Extremist Activities, the Federal Law on Political Parties, and the Federal Law on Assemblies, Meetings, Demonstrations, Processing, and Picketing) grant those rights and provide a legal framework for collective actions. The Federal Law on Public Associations defines social movements in terms of mass public associations that pursue jointly social, political, and other socially useful purposes, supported by the participants of the movements. According to the Law on Public Associations, social movements must have: (a) a governing body in the form of congress, conference, or general meeting; and (b) a permanent governing elected body which, in the case of state registration, shall exercise the rights of a legal entity on behalf of the social movement. The public organization represents the membership-based voluntary association, established on the basis of joint action to protect the common interests and achieve the statutory goals of the associated people. The law requires a formal registration of the social movement with the Ministry of Justice in order for it to pursue its activities legally. The authorities may ban social movements for extremist activities and for fueling ethnic and racial hostilities. Also, the law requires the permission of local authorities to be gained in order to engage in collective action in public places.

SOCIAL MOVEMENTS

Post-communist Russia demonstrates constant growth of new social movements, such as LBGT, sports fan movements, environmentalists, and antiglobalism. The Russian antiglobalists regularly participate in anti-capitalist actions during G-8 summits. In 2005–2010, the movement attempted consolidation into the Antiglobalist Resistance Initiative, held social forums and conferences, and launched the webpage anti-glob.ru. The growth of the environmentalist movement is evidenced in the increasing numbers of student ecological squads. In 1959–1960, the first student ecological squad emerged in the Faculty of Biology, Moscow State University. For 50 years, student-ecologists established over 120 protected ecological zones, conducted more than 15 scientific-practical conferences, promoted 12 government environmental acts,
chased and prosecuted about 5000 poachers, and developed conservation programs for rare species of plants and animals. In 2010, over 40 student environmental-defense squads, the Russian Ecological Movement Green (formerly the Green Party), the EcoDefense of the Moscow Region, and the Russian chapters of Greenpeace and the World Wildlife Foundation actively pursued environmental agendas in Russia. In 2010–2011, the new ecological Movement for Protection of the Khimki Forest, the largest forest park north of Moscow, came to the fore. The movement, supported by many Russian environmentalist groups, Yabloko Party activists, and New Lefts, is determined to halt the construction of the Moscow–Saint Petersburg shortcut highway. The Khimki Forest movement, due in part to considerable domestic and international resonance, has become comparable to the famous Baikal movement.

The rise of LGBT communities appears no less impressive (Baer 2009; Kondakov 2010). During the Soviet era and until the early 1990s, homosexuality was outlawed and homophobia flourished. The first LGBT organizations emerged in Moscow in the mid-1980s. In 1989–1993, LGBT activists published a newspaper, Theme, held an International Gay and Lesbian Film Festival, and openly protested against the criminal prosecution of gays. In August 1993, 27 local organizations created the nationwide Gay, Lesbian, and Bisexual Association Triangle, but the Moscow authorities denied the group registration, stating that its activities were “contrary to public morals.” However, the Russian federal authorities, under pressure from the European Union, modified their position. On October 9, 1991, the Ministry of Justice – after lengthy litigation – registered the LGBT organization Wings, which provided assistance to LGBT people, was concerned with the prevention of HIV, and sought the elimination of the criminal prosecution of male homosexuals. On May 27, 1993, the Russian authorities overturned the prosecutions of homosexual men. In January 1999, homosexuality was removed from the official list of diseases, and homosexuals were granted the right to serve in the army. In 2005–2006, the human rights project GayRussia.ru came into existence and the Russian LGBT Network lgbtnet.ru, the first all-Russian interregional LGBT organization, also began to function. In 2005–2009, the LGBT network held gay parades, festivals, marches for equality, and pickets on a broader scale, despite failing to obtain permission from the authorities, disruption by police, and beatings by Nazi skinheads. In October 2010, the LGBT organization Equal Rights for the first time obtained court recognition of the illegality of the ban on LGBT public mass rallies.

Unlike the steady growth of the LGBT movement, the women’s movement, another minority social movement, experienced ups and downs. It reached its height in 1991–1995. In 1993, the party Women of Russia, with 8.13 percent of the vote, finished fourth in the parliamentary elections and formed its own faction of 23 deputies in the state Duma. However, in 1995, the women’s party finished fifth, with 4.61 percent of the vote. Failing to cross the 5 percent barrier, the party Women of Russia lost the status of an independent parliamentary faction. After 1995, the women’s movement fragmented and localized in gender studies centers. It attempted to revive as the all-Russian movement in 2008 at the Second All-Russian Women’s Congress, the first congress having been held a hundred years ago in 1908. In February 2010, the gender faction of the Yabloko Party, Council for Consolidation of Women in Russia, and the regional public organization Women and Information held the conference “Women’s Movement in Russia: Past, Present, and Future” (Михаилова 2010). The conference materials indicate that despite its uneven development, the women’s movement in Russia fought for equal constitutional rights with men, against sexism and domestic violence, and in favor of greater representation of women in the political establishment and top managerial positions. However, as compared to the Soviet-era, women in post-communist Russia have lower political representation, and
more problems with employment opportunities and the glass ceiling (Малахов and Романов 2006), and experience a greater degree of sexual harassment at work. Also, Russian women carry the main burden of household work and child rearing. The skyrocketing divorce rate, which surpassed that of the United States, has made the living conditions of women more difficult and contributed to the expansion of gender inequality in post-communist Russia. All of these factors contributed to the left turn in the contemporary Russian women’s movement, as evidenced at the Third All-Russian Women’s Congress, “The Hope of Russia,” held in April 2011.

Another type of social movement that gained strength and popularity in contemporary Russia grew out of sport fans associations, especially soccer derbies, with their particular subculture, characterized by dressing in colorful clothes, singing hymns and songs, talking and yelling in slang expressions, expressive crowds, and often aggressive behavior. The soccer derby movement was already strong in the USSR and during Perestroika. Then, in the early 1990s, it declined but revived after 1995. In 2011, almost every notable soccer and hockey team in Russia has its own movement of rapid fans. The mass media and Russian sociologists often link soccer fans with hooliganism and with nationalist and homophobic behavior (Гапиев 2010). Thus, in December 2010, thousands of Moscow soccer fans, in response to the murder of one of their fellows by visitors from the Caucasian region, launched a series of aggressive protests (known as December 2010 Interethnic Unrests), loaded with anti-immigrant slogans like “Russia for Russians,” “Moscow For Moscovites,” and “Russians-Forward.” In order to calm down the soccer fans’ protests, Prime Minister Putin met with them and attended the murdered soccer fan’s tomb.

Several other contemporary Russian social movements are seen to be unique Russian phenomena. The Committees of Soldiers’ Mothers monitor violations of their sons’, who are serving in the Russian Army, human rights. The All-Russian Association of Car Drivers fights corrupt police patrollers and driving rules violations by VIP persons, and provides independent expertise on car crashes which involve top ranking businessmen and public officials. The Association in Defense of the Rights of Consumers constantly monitors and publicizes the quality of goods and services provided by private corporations and department stores. The social movement Business Russia represents the interests of the struggling medium and small businesses. Overall, contemporary social movements in Russia reflect a plethora of interests and aspirations of newly emerged social groups and communities.

POLITICAL MOVEMENTS: MEANING INCOMMENSURABILITY, SOCIAL CHOICES, AND LEXICONS

Political movements Left Front, the Vanguard of the Red Youth, and National-Bolsheviks, nationalist Russian All-National Union and Movement Against Illegal Immigration, right-wing Russian Image, and militant-fascist Slavic Union-Slavic Force together with Nazi skinheads, anti-Kremlin coalition Strategy-31 and PARNAS (Party of People’s Freedom “For Russia without Arbitrariness and Corruption”), and pro-Kremlin Ours, Youth Guard, and Young Russia all actively participate in the Russian political process. Their encounters with political opponents imbed meaning incommensurability that occupies the center-stage in the Russian political movement sector. The concept itself stems from Kuhn’s methodological and semantic incommensurability (Hoyningen-Huene & Sankey 2001). According to Kuhn, competing paradigms imbed incommensurable meanings, or meaning references, of the same theoretical and empirical phenomena. Proponents of incommensurable paradigms profess opposite worldviews and constitute irreconcilable scientific communities. Later Kuhn developed the concept of structured lexicons and their partial incommensurability,
which denotes that competing paradigmatic lexical structures, while excluding each other in substantive meaning references, may partially overlap in secondary meaning references (Gubin 2009). By analogy, we view political movements developing complete or partial incommensurable political paradigms. The hard core of political paradigms is constituted of lexically structured social choices. The accent on the “social choice” emphasizes, in accord with Sen’s Nobel Prize winning lecture (Sen 1998), the communal and joint nature of the political movement’s aspirations and intentions. In sum, social-choice paradigms develop distinct worldviews, offer social choices to the Russian public, provide self-identification and identification of opponents and allies, and produce joint actions and encounters—all glued together by political lexicons and labels that carry on manifest and latent meaning incommensurability.

The meaning incommensurability has been noted in the homophobic labeling of LBGT movements as immoral by the Moscow city authorities that appeared incommensurable with LBGT’s self-identification and LBGT’s definition by the European Union and, apparently, by the federal Russian authorities. The meaning incommensurability has been no less intense in the political movements sector. In a sign of political meaning incommensurability, Russian authorities banned several ultranationalist organizations, including four of the most visible: the National Bolsheviks, Russian National Unity, the Slavic Union, and the Movement Against Illegal Immigration. These movements emerged in the aftermath of the dissolution of the Soviet Union and the immigration of Muslims from the Caucasus and Central Asia to traditionally Christian Orthodox and Slavic regions. In order to legitimize themselves, the Russian nationalists appeal to the patriotic rhetoric, refer to the crimes committed by immigrants, and claim that over half of Russians support or sympathize with regularly held Russian marches and such demands as “Russia for the Russians,” “Russian Order on Russian Soil,” and “Deportation not Naturalization.” However, the Moscow City Court, which banned the four most popular nationalist movements, did not find anything patriotic in their ethnically hostile and racist discourse and extremist actions. In May 2011, the local Moscow court included slogans “Russia for Russians” and “Orthodoxy or Death” in the Federal List of the Extremist Materials, published by the Russian Ministry of Justice. In banning the most notorious nationalist political movements, the Russian authorities acted incommensurably with human rights groups, which claimed that emblems with swastikas, right-wing extremist discourse, and militant actions of the above-mentioned political movements were fascist and racist and fueled ethnic hostilities and animosities. In addition, the Russian authorities, in efforts to breakdown the Nazi Skinheads movement (Belyakov 2011), put behind bars many Nazi skinheads, including those from the murderous Shultz-88 (founded on the anniversary of Hitler’s birthday on April 20, 2001), the White Wolves, and Mad Crowd, all known for terrorizing people of non-Slavic appearance. Overall, the Russian authorities sent a zero tolerance message to the remaining nationalist political movements, such as Russian All-National Union, Russian Public Movement, Slavic Image, Slavic Force (emerging from the remnants of the banned Slavic Union), and the Union of the Russian Folk, that glorification of the supremacy of the white race and scapegoating immigrants are incommensurable with Russia’s commitment to multiethnic, multinational, and multicultural state building.

Another heated focus of the incommensurability of political meaning in the Russian political movement sector deals with the assessment of Yeltsin’s era compared to Putin’s social-choice paradigm. Pro-Western liberal democratic movements and associations like the Moscow Helsinki Group, Solidarity, the United Civic Front, the recently founded PARNAS, the youth wing of the Yabloko Party, and the anti-Kremlin coalitions Other Russia and Strategy-31 interpret Putin’s paradigm shift in terms of authoritarian-corruptive
departure from the liberal democratic 1990s. Commensurably with the liberal-democratic lexicon, the banned National Bolsheviks as well as the leftist Vanguard of Red Youth, Defense, and Left Front also emphasize the rise of authoritarianism and corruption under Putin and Medvedev’s presidencies. These anti-Kremlin political movements, self-identified as antisystemic oppositions, regularly organize protests such as the Marches of Dissent, Days of Wrath, Days of Anger, and monthly rallies of Strategy-31 for freedom of assembly without the authorities’ permission. These joint actions are held under such banners as “Putin Must Go,” “For Russia without Corruption,” “Down with the Police State,” and “Down with Autocracy.” However, the anti-Kremlin protests attract small numbers of people – only between a few hundred and a couple of thousand. Such low participation, together with miserable voting for Gorbachev in the 1996 presidential elections (he scored half a percent of the votes) and for the liberal Union of the Right Forces and Yabloko Party (which together scored less than 3 percent of the votes in the 2007 parliamentary elections), underscore a dramatic decline of popular support for the liberal movement in Russia.

On the other side, the self-proclaimed democratic and antifascist pro-Kremlin youth movement Ours and its allies the Youth Guard, Young Russia, Locals, and New People, interpret Putin’s social-choice paradigm as Russia’s pragmatic-restorative breakthrough from the oligarchic-criminal capitalism of 1990s on the one side, and as a valuable starting point for constructing new Russian sovereign democracy and economic modernization on the other. The Manifesto of Ours (published on the website nashimol.ru.) partially represents the new Russian democratic lexicon. In this discourse, Russian liberals, while in power during the 1990s, pursued – acting on the advice of Western advisers – economic and political shock therapies that destroyed the Soviet institutional system. However, such a necessary departure from state socialism happened without its synchronous replacement by an efficient democratic infrastructure. Lack of a synchronous replacement and adequate democratic state-building caused system and social disintegrations, undermined national security, sent the economy into freefall, flooded Russia with immigration, and instigated interethnic violence. The Russia of the 1990s deteriorated into oligarchic-criminal capitalism, and fell into the hands of mafia syndicates, corrupted plutocratic regional elitist clans composed of former communist apparatchiki, and semi-criminal oligarchs (Gubin 1995a; Kagarlitsky 2002). Privatization led to the concentration of the most profitable oil, gas, and natural resources industries in the narrow circle of oligarchs, creating skyrocketing inequality and feelings of social injustice (Gubin & Kosttioutchenko 1997). Instead of transforming Soviet Russia into a democratic core country in the global economy, the liberals of the 1990s pushed Russia toward the economic periphery that lost the country not only the status of superpower but also drastically reduced its influence in neighboring regions. Moreover, the Russia of the 1990s, unlike rising China, became a country in decline with declining global influence, a downsizing population, and system-wide corruption. In sum, Russia in the 1990s was rapidly falling down into a failed Weimar-type of statehood with fascism and neo-communism on the rise (Gubin 1995b).

In the Pro-Kremlin youth movement’s lexicon, Putin’s pragmatic-restorative breakthrough saved Russia from the systemic failure of its statehood, prevented a communist takeover of Russia, and undermined right-wing nationalist political movements. The malfunctioned and chaotic multiparty polyarchy of the 1990s – from which communists on the one side, and right-wing nationalists of misspelled Zhirionovsky’s Liberal-Democratic Party and fascist movements on the other benefited the most – was replaced by the sovereign democracy system. The term “sovereign democracy” was invented by the Kremlin to label the new Russian political organization. The hardcore of this system, also called “managed democracy,” constitutes the superpresidential vertical of
power (Fish 2005) and a modern multiparty system, with the pro-Kremlin United Russia Party in the center-right, Justice Russia and the Communist Party on the left, and Zhirinovsky’s Liberal-Democratic Party on the right wing. The Kremlin initiated a legal prosecution of criminal nouveau riches. Khodorkovsky, the richest of the oligarchs, was accused of tax evasion and put behind bars. Others, like the notorious financier Berezovsky, fled from Russia to the West. Industrial and financial oligarchs, who stayed in Russia, began to pay taxes, repaid owed salaries to employees, and so began the industrial revival of Russia. The state-owned Russian corporations Gazprom, RosNeft, and Energy System of Russia regrouped Russia’s massive oil, gas, and energy resources in the hands of the state. With their active involvement, Russia under Putin accumulated about half a trillion dollars in foreign currency reserves. In 2009–2011, the Kremlin launched a circulation of regional elites aimed at removing the most corrupt regional barons of the Urals region, Moscow, and the autonomous republics, and began breaking down corrupt regional political dynasties and the privatization of public offices by Yeltsin’s liberal-democratic era officials. Finally, the Kremlin launched youth movements with the purpose of cultivating cadres capable of modernizing Russia and protecting Russia’s sovereign democracy from fascists and communists on the one side, and Western liberalism on the other. These youth movements, such as Ours and the Youth Guard, actively pursue social activities, ranging from holding patriotic rallies that bring together from tens to hundreds of thousands of people, to caring about kids and veterans, demanding the closure of illegal casinos, and monitoring the quality of goods and services in supermarkets.

In response to the downgrading liberal-democratic reforms of the 1990s and the glorification of Putin’s social choice paradigm, Russian liberals fought back with pro-Kremlin lexicon on almost every front. The Russian liberals argue that Putin’s authoritarian turn prevented Russians from attaining the quality of life in Western democracies, and that the relative economic revival of the first decade of the twenty-first century happened not due to Putin’s economic policies but was predetermined by the free-market economic reforms of the 1990s and by high prices for oil and other natural resources. Most notably, the liberal political movement – through gazeta.ru, Radio Freedom, Radio Eco of Moscow, and anticorruption pamphlets (Немцов 2009; Немцов, & Милов 2010) – points out that the corruption level during Putin and Medvedev’s presidencies far exceeded that of Yeltsin’s era, and that Putin’s friends – former KGB associates, and relatives of members of the Putin/Medvedev administrations – occupy, without merit, top managerial positions in private and state-owned companies and thereby enrich themselves immensely. Moreover, Russian liberals denote that the so-called sovereign democracy lacks most of Dalh’s (1982) democratic features and represents a parody of true democracy, as evidenced by the abolition of direct elections for governors and senators and by the oligarchic power transfer from Putin to Medvedev. Among other things, liberals point out that the new Russian multiparty system is reminiscent of communist Eastern Germany, that the ruling United Russia Party represents a worse copy of the CPSU, that the presidential and parliamentary elections were swamped by massive falsification, and that the pro-Kremlin youth movement Ours resembles the Chinese Red Guard of the Cultural Revolution. Liberals stand behind the civic movement to free Khodorkovsky from political imprisonment by Putin’s regime. They believe that Khodorkovsky’s trial was set up by the Kremlin and that this indicates that there is no independent judicial system in Russia. The website sova.ru of the Information-Analytic Center Owl reports that Russian authorities do not do enough to stop xenophobia and racist attacks on immigrants by Russian ultra-nationalists and neo-Nazis. In 2010, according to the Moscow Helsinki Group, Russian Marches were held in 30 cities and towns as compared to 20 cities and
towns in previous years. Over 5500 members of nationalist movements participated in the most populous single Russian March held in Moscow’s Lublino district. In November 2010, the Russian nationalists founded the Russian Civic Union with the dubious objective of forming a coalition of nationalists with anti-Kremlin democratic opposition (Костенко 2011).

In turn, the pro-Kremlin movements argue that the main problem is not the underdevelopment of Western-type liberal democracy in Russia, but Western liberal democracy per se. Liberal democracy, especially of the American type, is no less troubled than communism, as evidenced in high income inequality, multi-trillion dollar American debt, the 2008 global financial meltdown, Wall Street criminality and mismanagement, two-party dictatorship, and mass media control by big corporations and by proponents of the Republican and Democratic parties.

In the lexical-symbolic incommensurability between liberal democrats and pro-Kremlin youth movements, the new Russian socialist movement of the Left Front and independent trade unions, such as the Union of Socialist Trade Unions and Interregional Trade Union of Automobile Industry, also made a distinct antiliberal stand. The New Left and trade unions express great concern for the deterioration of social democracy, especially working-class living conditions, salaries, and benefits. The New Left discourse emphasizes that the liberal democratic reforms of the 1990s broke down the Soviet safety net of guaranteed employment and affordable housing as well as eroding socialized healthcare and world-class public education and science. The new Russian socialists are unhappy that the Russia of the 1990s copied the Western liberal democratic pattern of wealth accumulation in a small group of oligarchs at the expense of middle- and working-class well-being. They protest against transforming the socialized healthcare system into an American-type private healthcare system with millions of people uninsured and skyrocketing healthcare costs. Another concern deals with the expansion of paid education and the deterioration of public education. The New Lefts point to the unacceptably low wages of working- and middle-class professionals as compared to the unjustifiable skyrocketing wages and bonuses of top managers and the wealth multiplication of the oligarchs. In 2011, independent trade unions and new socialists successfully protested against the proposal by one of the richest Russian oligarchs, Prokhorov, to extend the working week to 60 hours and to allow workers’ firing due to deteriorated economic conditions. In the view of the new Russian Lefts and trade unions, the liberal-democratic 1990s undermined the equal opportunity structure for working- and middle-class professionals that existed in the Soviet Union, and the Putin/Medvedev regime did not do much to reinstate that system. Moreover, under the Putin/Medvedev regime income inequality increased, working-class control over production was not reinstated, and the healthcare system and public education continue to degrade. Also, Putin is blamed for missing the chance during the 2008 global financial crisis to either nationalize or buy back the companies which were privatized during the 1990s, and instead providing financial support to the oligarchs. In the view of the New Left, post-communist Russia did not come close to the European social democracies and continued to model itself on the American corporate-type of capitalism. While the Putin/Medvedev regime flirts with corporate capitalism, the physical and moral degradation of Russian society – evidenced in the drastic downsizing of its population, family deterioration with high divorce rates, and the growth of orphanages, prostitution, and drugs abuse – continues. Notably, the Russian New Lefts realize that their critique of the 1990s and Putin and Medvedev’s presidencies appears partially commensurable to that of the Russian communists. In order to delineate themselves from the communists, the new socialists indicate that the KPRF has become integrated into the Kremlin’s dubious managed-democracy
model, represents a pseudo-opposition to the Kremlin, and, therefore, is ill-suited to pursue European-type social democracy.

To summarize, incommensurability in Russian political movement society indicates that Russia continues its search for a post-communist political identity. In this search, the liberal democratic model, as well as its communist alternative, has lost legitimacy. The new Russia’s political identity is very much determined by the Kremlin-set distinct sovereign democracy model. In May 2011, Prime Minister Putin launched, ahead of the 2012 presidential elections, the People’s Front Movement – a coalition of social and political organizations, which are intended to continue Kremlin’s model of sovereign democracy and the restorative modernization of Russia. Right-wing political movements, weakened by the Kremlin, have regrouped and search for a way in to the political system. Liberal democrats, although in decline, are also regrouping vigorously and are trying to make a political comeback. The New Lefts and independent trade unions push Russia toward the European style of social democracy. Overall, corruption remains a major obstacle for Russia’s democracy and modernization. It is in this context that the various conflicting social movements described continue to thrive.

By the time of Mao Zedong’s death in 1976, the Chinese economy was on the verge of collapse and the Chinese people were leading very poor lives. In this context, grievances mounted all over China. Facing this dire situation, the Chinese government embarked on market-oriented reform and an open-door policy in 1978. During the reform, the Chinese state was quickly transformed from a totalitarian regime to an authoritarian regime with growing toleration toward social diversities. Most Chinese no longer believed in the communist ideology, and the legitimacy of the state relied increasingly on the government’s performance, especially in its capacity to deliver a fast-growing economy and better life to the people (Zhao 2001, 2009). The legacies of the Maoist era and the post-Mao transformation of the state–society relationship opened up the space for and shaped the development of contentious collective actions (CAs) in post-Mao China.

The development of CAs in post-Mao China can be roughly divided into three phases. The first phase began with the Xidan democracy wall movement in 1978 and ended with the military crackdown of the 1989 Tiananmen student movement. After a few quiet years, Deng Xiaoping launched a new wave of economic reform in 1992. The new social problems brought about by the reform ushered the development of CAs in post-Mao China into the second phase. Hu Jintao became the president in 2002 and adopted a set of policies that were quite different from the previous administration. The new policies together with new social conditions brought the development of the CAs into its third phase.

Many CAs broke out between 1978 and 1989, the most famous ones being the Xidan democracy wall movement in 1978–1979, the sent-down youth movement in the late 1970s, and waves of student protests between 1986 and 1989. In comparison with the CAs breaking out after 1992, the CAs which happened between 1978 and 1989 were more likely to escalate into large-scale protests drawing millions of participants, and more likely to have central government as the target. The CAs acquired these characteristics for two major reasons. Firstly, the Chinese government under Mao’s leadership had implemented many radical policies. When a policy went wrong, it always affected a large number of people and generated state-centered grievances. For instance, millions of urban youths were sent to work in rural areas during the Cultural Revolution. They staged waves of CAs after the Cultural Revolution in order to return to cities. Secondly, the way the state responded to the rising CAs was also an important factor shaping CAs in the 1980s. Most top Chinese leaders at the time were veterans who joined the Chinese Communist Party (CCP) in the 1920s. Between the late 1970s and late 1980s, facing the challenges of the potentially antiregime prodemocracy movements staged by intellectuals and students, the CCP veterans opted for outmoded repressive measures out of their loyalty to the CCP. Yet, the reform environment did not allow the Chinese government to turn truly repressive because this would damage China’s international reputation and business environment. In the entire 1980s period, half-hearted state repression was always accompanied by further reforms. While the Chinese society became increasingly open, Chinese intellectuals and students were increasingly antagonized. This antagonism, in
conjunction with China’s late-1980s economic crisis, triggered the world-famous 1989 Tiananmen student movement (Zhao 2001).

After the military crackdown on the 1989 student movement, political control was greatly tightened and key leaders of the movement were either exiled or jailed. Most foreign observers at the time believed that the repression marked the end of China’s reform. Quite unexpectedly, Deng Xiaoping reignited a much bolder economic reform wave in 1992 that has lasted until today. The reform was overall a great success. China has now risen to become the world’s second largest economy and the living standards of most Chinese have greatly improved. New social problems have emerged with the success, however, including but not limited to growing inequality, official corruption, massive worker layoffs, heavy tax burden on farmers, environmental degradation, and the encroachment onto farmland for urban expansion. It was in the context of these new social problems that the CAs in post-Mao China entered a new stage. In comparison to CAs in the 1980s, CAs in the 1990s were mostly economic rather than politically oriented. They were also considerably smaller in scale and targeted local businesses and local government rather than central government.

The emergence of new forms of CAs had much to do with the change in state–society relations in the 1990s. With the rise of the market economy, other than the people who were working in large-scale state-owned enterprises, the lives of most Chinese were now less shaped by the policies of central government but more by the performance of local businesses and local government. Naturally, when things went wrong, people held local business owners and government representatives responsible. The less political and localized nature of the social conflicts also made central government less nervous. While the Chinese government had no general guidelines in dealing with the CAs in this period, it was clear that central government discouraged the use of violence by local government officials in dealing with CAs focusing on economic rather than political issues. In general, the Chinese central government’s attitude toward CAs in this period was rather hands-off—as long as a local government’s handling of a protest did not allow the conflict escalate to runaway proportions and attract strong international and domestic criticism, central government would not interfere. The attitude of the Chinese government further strengthened the new CAs’ localizing and nonpolitical tendency.

The localizing and nonpolitical tendency of the new CAs in the 1990s also resulted from changes in Chinese intellectuals. In the 1990s, while most intellectuals did not believe in the communist ideology and many of them also objected to the regime’s authoritarian rule, they were-by-and-large the beneficiaries of China’s economic success. After the mid-1990s, mainstream intellectuals in China were able to enjoy new middle-class or even upper middle-class lives. Naturally, they were no longer so eager to seek immediate and radical social changes as they were in the 1980s. Moreover, into the 1990s, Chinese society became increasingly complicated and the state gradually turned into a soft authoritarian regime giving intellectuals more freedom to express their views, particularly in scholarly venues. A more complicated society in conjunction with a freer environment fostered differentiation of social thoughts in China (e.g., liberalism, nationalism, conservatism, neoleftism) and decreased the possibility for the Chinese to be mobilized under a single antiestablishment ideology. This also contributed to the rise of small-scale economic-oriented CAs.

Yet, the rise of new forms of CAs did not mean that the Chinese state had gained the capacity to channelize social conflicts into institutional frameworks. The Chinese government strengthened its letters and petitions system and wanted to use this to placate social conflict. The effort was not effective, to say the least. As the Chinese society became increasingly complicated as a result of reforms, issues that
were raised in the letters and petitions sent by complaint-filers were too numerous, and in most cases they could not be dealt with by the administrative branch of the government. The Chinese government also placed various restrictions on free associations and sometimes punished those who made such attempts. Such government actions, however, greatly lowered the organizational capacity of those who were aggrieved, and prevented the Chinese from gaining a sense of political reality through protracted conflict and negotiation.

THE THIRD PHASE (2002–PRESENT)

The third phase of CAs took shape in the beginning of the twenty-first century and the pattern has become clearer than ever in recent years. In comparison with the CAs of the second period, CAs in this period acquired the following characteristics: (1) NGOs have mushroomed and played more important roles in urban-based middle-class CAs; (2) CAs take on much wider issues than before and have overall become more proactive and better organized; (3) riots and ethnic violence have increased in scale and rate of occurrence; (4) rights and citizenship have emerged to become the master frames of many CAs (Zhao 2010).

These new developments are the result of many social changes brought about by China’s most recent development, including but not limited to a general increase of the level of education accompanied by the quick rise of the new middle class, the widespread use of the Internet and cell phones, a great expansion of Chinese media’s coverage on protests and riots, mutual learning and the spread of effective protest strategies, and the rise of rights consciousness among ordinary Chinese people. Most importantly, however, the new phase was also shaped by the Chinese government’s patterned behaviors in dealing with CAs. In recent years, violent repression is increasingly less of an option for the Chinese state because of international pressure and domestic public opinion. The Chinese government could not even use legal means to regulate the protests and riots effectively because government officials have done many things not in accordance with the law, and consequently ordinary Chinese have little respect for many aspects of it. On top of this, the Chinese government still places various kinds of restrictions on free association and tries hard to prevent interest-group politics from achieving full-scale development. Many CAs in China today are thus still poorly organized. Rioting is frequently the outcome when an injustice frame (norm) emerges among a large number of aggrieved people who circulate rumors following an incident.

If we are asked to use one word to capture the Hu Jintao administration’s new strategy in dealing with CAs, that word would be paternalism. We do not want to portray the outcome of this strategy as a total failure because it has, at least for now, prevented the rise of large-scale protests, an outcome that the regime very much desired. On the other hand, the paternalistic strategy also meant that the Chinese government missed an opportunity to institutionalize protests into the less destructive, reform-oriented, interest-group politics form of social movements we see in the United States today.

In part for the purpose of dealing with the rising tides of CAs, the Chinese government under the Hu Jintao administration has tried hard to improve its performance, including its capacity to deliver more and better public goods to the people. Such efforts have in fact made the current Chinese regime a very effective government in many respects and have greatly contributed to China’s superb economic performance and to a quick and general rise in people’s living standards. Yet, most Chinese do not appreciate much of what they have gained in recent years. What is worse is that as the government becomes increasingly active in taking care of the people’s welfare, more and more issues in China are re-politicized, in the sense that the Chinese people are again starting to hold the state responsible whenever something goes wrong. In the end, while the Chinese live much better lives in recent years, they are not satisfied.

The Chinese government under the Hu Jintao administration employs a wide range of
strategies to pacify a CA once it breaks out. Yet, the only effective measure that it has at this stage is to distribute money to satisfy people’s demands. The Chinese government still has the luxury to do so, thanks to the revenues they have generated from China’s superb economic performance. On the other hand, this strategy further increases people’s demands and leads to the rise of populism. This is certainly not a unsustainable strategy.

In conclusion, if the Chinese government holds on to its current strategy of dealing with CAs, another revolution-like turmoil similar to the 1989 Tiananmen student movement will very likely break out when the Chinese economy slows down. Yet, to make a bold policy change, the Chinese government must take the risk of engaging in more fundamental political reform and shift the foundation of state power from performance legitimacy to legal-procedure legitimacy (Zhao 2009). For the Chinese government, whether to take on bold political reform or to maintain the status quo is a very difficult question.

Cuban revolution
SILVIA PEDRAZA

The triumph of the Cuban revolution in January 1959 was one of the most popular political events of the twentieth century. A social movement that the majority of the Cuban population initially applauded, and for which many risked their lives, the Cuban revolution captured the imagination. Romantic in its execution, expressing a call for social justice, it also had vast international support. Yet by the end of the century, 40 years later, around 15 percent of its population had left Cuba as a result of their process of political disaffection, disappointment, and sense of betrayal. Among those who sought refuge in other lands, many had once been ardent supporters of the revolution.

The changes – political, social, economic – that took place in Cuba in mid century were so dramatic, profound, and irreversible that they truly deserve the name of “revolution” in the original sense of “taking a full turn.” Two caudillos shaped the history of the Cuban revolution: Fulgencio Batista, who relied on the support of the army; and Fidel Castro, who relied on the support of the common people. They completely polarized the Cuban people. Some fought for or against Batista’s government; others fought for or against Fidel’s government; still others fought twice – first, against Batista, then against Fidel. In the end, it was the republic that fell – vanquished both by Batista’s and Castro’s dictatorships.

Initially, Cubans shared in the euphoria of the revolution’s success, but when the revolution entered a more radical phase the exodus of political émigrés increased dramatically. With breathtaking speed, in a couple of years the revolution moved through distinct stages. Amaro (1977) captured them as: first, democracy; then, humanism; followed by nationalism; thereafter, socialism; culminating in Marxism–Leninism. The United States’ punitive policy – cutting the sugar quota, instituting a trade embargo, and backing the exiles’ invasion of Cuba – no doubt aided the rapidity of this transition. If we define revolutions by their outcomes (cf. Goldstone 2001), the Cuban revolution initially was a political revolution that aimed to restore the republic, to achieve democracy. It became a social revolution under Fidel Castro’s leadership – a radical transformation of the total structure of Cuban society.

In the initial stage of democracy, Cubans who fought for the revolution wanted to restore the rhythm of constitutional elections that Batista’s 1952 military coup had brought to a halt soon after the promulgation of the new 1940 Constitution, in which Cubans took pride. Cuba then had a multi-party system with a strong Christian, social-democratic ideological current. Batista became aware that he would not win the national elections and usurped political power. Oblivious to the cruelty his police force was able to inflict on the students and the peasants, Batista became most unpopular. This stage began with the 26th of July Movement that brothers Fidel and Raúl Castro organized and spearheaded, and which took its name from the day in 1953 when they attacked the Moncada army barracks in Santiago de Cuba. It lasted until the first few months of 1959, when the provisional government issued the first social reforms. While at that time Cuba enjoyed one of the highest socioeconomic standards of living in Latin America, social inequality (social class, race, city/countryside) was vast. Cuba’s economy mostly centered on sugar production; the middle classes eschewed politics; the labor movement was strong; and most Cuban trade was with the United States.

The revolutionary armed struggle encompassed two major movements. One was the 26th of July movement, centered in Oriente province, where the rebel barbudos (bearded men) fought in the Sierra Maestra, under the
undeniable charisma of Fidel Castro, and, later, in the Escambray Mountains, in Las Villas, under el Ché Guevara. The other was the student movement, organized as the Directorio Revolucionario Estudiantil, whose university student combatants fought in Havana and other cities, under the leadership of José Antonio Echeverría. A committed Catholic who fiercely upheld constitutional principles, Echeverría’s life and leadership were extinguished during the Directorio’s suicidal attack on the Presidential Palace in 1957. The death of Frank País in Oriente province had a similar effect. Thus, Fidel Castro emerged as almost a legend, and the undisputed leader of the opposition. His entrance into Havana in a caravan in the first few days of January 1959 was an apotheosis. For many years, the acme of the public plaza, the euphoria of the crowds chanting in the revolutionary plaza, characterized the revolution when most of the institutions of civil society tumbled. There was a profound transformation of Cuba’s political culture. Fidel Castro insisted that such vast popular support was a new source of legitimacy, a form of democracy. In a mostly Catholic country, initially the Catholic Church supported the revolution. But increasingly the church became divided, and ultimately it opposed the revolution, not because of its Christian aims of helping the poor, ending racial discrimination, and alleviating extreme social inequality, but because of the communist means by which it sought to achieve them, harming the rights of others.

The second stage of the revolution was characterized by its insistence on humanism: “bread with liberty,” as Fidel Castro described it. When he visited the United States in April 1959, Castro emphasized that the revolution was not communist but authentically Cuban – not red but green, green as Cuba’s palm trees. With the Provisional Government in place, the moderates in the government instigated important social reforms – agrarian reform, tax reform, rent control – to integrate the socially marginal groups in Cuba, such as the peasants and the blacks. But soon the Catholic Church was silenced by the government after denouncing the communist course of the revolution, independent television and newspapers were taken over, and the electoral system collapsed when jubilant crowds chanted around Castro “What do we need elections for?” Under the weight of Castro’s enormous popularity, Cubans allowed civil society to collapse.

This second stage came to an end when Huber Matos – a comandante who had fought for the revolution – wrote Castro a letter in October 1959, denouncing the fact that the revolution was being handed over to the communists. For this, he was arrested and served 20 years in prison. The rule of the moderates had come to an end (cf. Brinton 1965). Thousands of Catholics protested in a National Catholic Congress march, during which the patron saint – la Caridad – was carried in a procession, while shouting “Social justice, yes; communism, no!” To Matos and many others who had fought for the restoration of democracy in Cuba, the revolution had been betrayed. Cuba by then lacked civil liberties, dissent was not tolerated, and terror reigned with the swift executions of the opposition.

The third stage of the revolution was that of nationalism, emphasizing “Yankee” imperialism, which until then had been a minor theme in the revolution (cf. Domínguez 1978). In 1960 the Cuban revolution set out on its definitive course – the diplomatic and economic war between the US and Cuba ensued, culminating in the hemispheric trade embargo, and the Soviet Union became Cuba’s protector. This political and economic relationship lasted 30 years, during which the Soviet Union buoyed Cuba’s sinking economy with a very generous subsidy, in exchange for Cuba helping to spread communism in the third world. A profound confrontation between the church and the state developed, as did the armed opposition to the Castro government. The government called the opposition “counterrevolutionaries”; they called themselves “revolutionaries.”

The fourth stage was that of socialism, which began when large Cuban and American enterprises, latifundios, and private property were
nationalized in 1960. The exiles’ Bay of Pigs invasion of Cuba in April 1961 failed under President John F. Kennedy’s ambivalence about the operation he had just inherited. Months later, Castro for the first time declared he was and had always been Marxist–Leninist. From then on, the Cuban revolution was consolidated and politics was shaped into the single vanguard Party behind the charisma of the maximum leader (Pérez-Stable 1999). With the influence of the United States effectively counterbalanced, the Cuban nation became firmly embedded in the Soviet orbit. Nationalism, the fight against US imperialism, and the nation under siege became major themes in the Cuban revolution, themes that Fidel Castro regularly fanned the flames of in his speeches, and which gave him a newfound source of legitimacy (Domínguez 1978).

Amaro and Portes (1972) portrayed the different phases of Cuban political immigration, showing how the exiles’ principal motivation for leaving changed over time. With the unfolding of the Cuban revolution, over the years “those who wait” gave way to “those who escape,” and they to “those who search.” Bringing the analysis up to date, one can add “those who hope” and “those who despair” (Pedraza 2007). In the first wave of the exodus, those who left were Cuba’s elite: “those who wait” waited for the United States to rescue Cuba from the consolidation of communism only 90 miles away. The refugees of this first wave came to the United States driven by Cuba’s overturning of the old order and sharp turn toward communism. In the second phase, still largely a middle-class exodus, now it was more middle than upper: middle merchants and middle management, landlords, middle-level professionals, and skilled unionized workers. At the same time, over 14,000 children left alone through Operation Pedro Pan, their parents afraid that they would be educated by the state in the Soviet Union (Torres 2003). “Those who escape” wanted to escape an intolerable new order. Fidel and Raúl Castro labeled them gusanos, or counterrevolutionary “worms.” The October Missile Crisis in 1962 ended the first wave of the exodus (Thomas 1977). Thereafter, emphasis was placed upon the enemy within and all criticism was considered a “counterrevolutionary activity” (Amaro 1977). The Cuban revolution had multiple causes: Batista’s illegitimate dictatorship; the vast inequalities of class, rural poverty, race, and gender; Castro’s enormous charisma; and an anti-American nationalism. Under their multiple impacts, the political revolution became a social revolution.

With the revolution consolidated against its external enemies—the exiles and the US government—in the next stage the revolution was consolidated against its internal enemies. The new communists (led by the Castro brothers) wrestled power away from the old communists, men and women of high ideals who had belonged to the Party for nearly 40 years, as well as Che Guevara, despite them having the Soviet Union’s support. Moreover, the new government successfully discredited the counterrevolution, imprisoning those who challenged it. Major debates took place between Che Guevara and Fidel Castro with regards to the best course for the revolution (whether to incentivize work via moral or material incentives; whether to spread revolution throughout the third world). This resulted in Che Guevara’s guerilla warfare in Bolivia, where he died isolated. Though Cuba’s foreign policy failed in Latin America, it was a success in Africa from the 1970s on, particularly in Angola and Ethiopia. Victory there, the Castro brothers expected, would decide whether communism or capitalism would rule the world.

During these years the second major wave of the Cuban exodus was initiated. In the fall of 1965 a chaotic period ensued when hundreds of boats left from Miami for Camarioca, where they picked up thousands of relatives to come to the United States. In response to President Lyndon Johnson’s “open door” policy that welcomed refugees from communism for eight years, the United States and Cuban governments administered an orderly air bridge, the Freedom Flights which brought to Miami more than a quarter of a million Cubans, whom
the Cuban Refugee Program swiftly processed and relocated. Cuba barred from exit young men of military service age, as well as professionals, and technical and skilled workers, such as doctors (Clark 1992).

This wave of immigration was largely composed of the working class and “petite bourgeoisie”: employees, independent craftsmen, small merchants, and skilled and semi-skilled workers. To spread access to a basic education and healthcare, young, educated Cubans went to live in the countryside, working in literacy campaigns to educate the poor, illiterate peasants, and in public health campaigns to provide basic healthcare. At the same time, the impact of the hemispheric trade embargo imposed by the Organization of American States in 1964 resulted in profound economic dislocations; the exodus drained technical and administrative skills and Cuba failed in her attempts to cease being a sugar monoculture, and to industrialize and diversify. According to Amaro and Portes (1972), “those who search” sought better economic conditions. Yet their distinction missed the reality that while life in Cuba grew harsh for all, it turned particularly bitter for those who had announced their dissent by declaring their intention to leave. Not only were they unemployed, but they also lost all their belongings, were ostracized as enemies, and were forced to do “volunteer work” in agriculture.

After the air bridge ended, the émigrés came from Cuba’s “middling service sectors:” cooks, domestics, hairdressers, taxi drivers, and small retail merchants (Portes, Clark, & Bach 1977). They left Cuba during the period in which Castro launched a new “revolutionary offensive” in Cuba, confiscating many thousands of small businesses, “pushing” out the little entrepreneur and his employees. The Cuban government labeled them parásitos, or “parasites.”

The social transformations the Cuban revolution effected were so pervasive that they always “pushed” Cubans. America, in facilitating the migration, always “pulled” them. Together, they set in motion a system of political migration. The loss of the educated, professional middle classes indeed proved erosive to the Cuban revolution, but it also served the positive function of externalizing dissent. At the same time, in the United States the arrival of refugees who “voted with their feet” also served to provide the legitimacy necessary for foreign policy actions during the tense years of the cold war (Pedraza-Bailey 1985).

With the economic transition to socialism achieved, in the seventies the Cuban government established the shape of the political system. In 1970, Fidel Castro staked the honor of the country on achieving the national goal of cutting 10 million tons of sugar. The failure of the massive mobilization of Cubans all over the island to cut sugar cane began this new phase.

In America, there was a chasm between Cuban exiles of different political generations: those who came of age during certain critical periods of Cuban history (cf. Zeitlin 1966), and those who came of age during the time of the civil rights and anti-Vietnam War movements. In December 1977, 55 progressive young people broke through 19 years of hostility, abuse, and isolation. Grouped as the Antonio Maceo Brigade, their visit to the island left behind a profound mark. In Cuba, Jesus Díaz filmed it: the film 55 Hermanos (55 Brothers and Sisters) captured their search for cultural identity and, for some, their political identity. Widely shown in Cuba, it proved heartrending: evidence of the suffering that exile had brought both those who left and who were left behind.

In 1978, a “Dialogue” took place between the Cuban government and representatives of the Cuban community in exile, as a result of which the Cuban government agreed to the release of political prisoners, to promote the reunification of families rent apart by the exodus, and to allow Cubans in the United States to visit their family and their homeland. The gusanos respectfully became “members of the Cuban community abroad.” The Cuban community split into the opposing camps of those who supported and opposed the Dialogue. Exile violence erupted in Miami and New Jersey, against those who were trying to build bridges
with Cuba. Still, close to 4000 political prisoners were released as a result of the Dialogue. Since then, hundreds of thousands of Cubans have returned to the island every year, seeking the family they loved and the vestiges of the life they once led.

After the Cuban Refugee Program ceased in 1974, and the political prisoners were gradually released, few expected the chaotic flotilla exodus that burst in April 1980 and lasted until September, bringing over 125,000 more Cubans to America. From Miami, thousands of boats manned by relatives sped across the 90 miles of sea to Cuba’s Mariel Harbor. At times they succeeded in bringing their families, other times they brought whomever angry officials put on the boats. Toward the end, this included Cuba’s social “undesirables”: those who had been in prisons (whether they had committed real crimes or had only succeeded in challenging the state), mental patients, and homosexuals. The Castro government called them “antisocial elements” – escoria, or “scum.” No longer the immigrants of the transition from capitalism to communism, they were the children of communism itself. President Jimmy Carter’s ambivalent government policy both welcomed them “with open hearts and open arms” and delimited the flow. Most were young men who were single or without their families; the proportion blacks was higher than ever before; and they were overwhelmingly working class (Bach 1980). Many had been in prison. According to the Immigration and Naturalization Service, of the 124,789 Mariel refugees around 19 percent, or 23,970, admitted they had been in jail in Cuba. Of those who had been in prison, 5,486 were political prisoners, while 70 percent had been jailed for minor crimes, such as vagrancy or participation in the extensive black market, that were crimes in Cuba but not in the United States. The Cuban Ley de la Peligrosidad (Law of Dangerous Behavior) made some forms of dissent, such as participating in the black market, dodging military service or desertion, or refusing to work for the state, “anti-social” behavior, punished by prison terms. Of those who had been in jail, the immigration service considered only 7 percent to be serious criminals (Montgomery 1981).

Given their youth, the Marielitos clearly constituted a different political generation (cf. Mannheim 1952), one whose coming of age happened long after the early revolutionary struggle, at a time when problems of freedom of expression were particularly acute for artists and intellectuals, and at a time when homosexuality, particularly, was scorned and dealt with by prison sentence. “Those who hope,” is what I termed them (Pedraza 2007).

The collapse of communism in the Soviet Union and Eastern Europe, on which Cuba had been enormously dependent for trade and economic subsidies, ushered in a new period in Cuba, which Fidel Castro euphemistically called “a special period.” From 1989–1993, a decline took place in gross domestic product of one half and in investment by two-thirds (Mesa-Lago 1994). Coupled with the tightening of the embargo (the Torricelli Law) in 1992, the impact was felt in deteriorating healthcare and education, both of which had been the pride of the revolution. As the twenty-first century opened, Venezuela’s Hugo Chávez came to the rescue, as Cuba opened up its economy to trade, investment, and tourism. But abject need and hunger became the reality of Cubans’ lives and remains so today. At the same time, the dissident movement grew and developed into a social movement. Despite different political thrusts (e.g., democratic socialist, environmentalist, Christian Democrat), all dissidents in Cuba increasingly called for a new democratic opening, and a liberalization of the political structures that both Fidel and Raúl Castro adamantly refused. Hence, both economic and political want drove the emigration of the “new Cubans,” together with the ever-present desire for the reunification of families still rent apart.

The new Cuban exodus took several forms (cf. Rodríguez-Chavez 1993), with illegal emigration being the major one. Cubans became so desperate that they left on balsas – rafts, tires, or other makeshift vessels – risking death due to starvation, dehydration, drowning, or sharks. In the summer of 1994, the political
crisis deepened when the Cuban coastguard overturned a tugboat of people who were trying to escape with powerful shoots of water, killing over 40 adults and children. This was followed by massive riots on August 5th, when thousands of Cubans protested in the streets in the center of Havana, the largest protest event of its kind to date. Castro gave orders to the Cuban coastguard not to discourage illegal emigration from Cuba’s shores. Immediately, thousands of balseros put out to sea, hoping to reach Miami. The US coastguard rescued close to 34 000 Cubans at sea. “Those who despair” is how I categorized them (Pedraza 2007).

Abrupt policy changes made the Cubans – for the first time – unwelcome in the United States. Under orders from President Bill Clinton and Attorney General Janet Reno, the US coastguard blocked their progress and directed them to Guantanamo (the US base in Cuba), where over 30 000 people lived in tents until they were allowed entry to the United States and were relocated. “Cuba bleeds,” headlined Liz Balmaseda (1994), “and the drops are called rafts.” Data from the 2009 American Community Survey show that of the 991 385 persons born in Cuba, 46.3 percent arrived from 1990 on, in total about 459 000 people (US Census Bureau 2009).

Cubans are now beginning to build a civil society that is independent of government. Still weak and fragile, one of its pillars is religion. After years of being silenced, beginning in the mid-1980s, a significant religious revival gradually took place in the churches and synagogues. This was spurred by Pope John Paul II’s visit in 1998. The new religious institutions became much closer to the common people than before. As Hirschman (1970, 1993) underlined, the relationship between exit and voice is usually inverse. Certainly over the years the massive exit out of Cuba impeded the development of voice-protest. But in recent years the dissident movement sought to have Cubans’ voices heard. It found expression in magazines such as Vitral and Convivencia, edited by Dagoberto Valdés, and in documents such as La Patria es de Todos (Our Nation Belongs to All) and the Proyecto Varela. They demanded change in Cuba, including: the right to free expression and a free press; the right to free association; amnesty for political prisoners; the right to form small, private enterprises; and a new electoral law and free elections. As Osvaldo Payá, leader of the Movimiento Cristiano Liberación (Christian Movement for Liberation) expressed it, “Let no one else speak for Cubans. Let their own voices be heard in a referendum” (Payá-Sardiñas 2001). Moreover, intellectuals and artists began to carve independent paths, and independent labor unions sought to form. But the Castro brothers replied with derision – calling them grupusclos (infinitesimally small groups) – and with increased repression. Many citizens who challenged the state were imprisoned in what came to be called “the Cuban Spring” of 1993. Writing in the mid-1950s, Merleau-Ponty (1973) expressed it succinctly: “Revolutions are true as movements but false as regimes.”

The women who were relatives of these political prisoners engaged in a nonviolent protest. Every Sunday Las Damas de Blanco (The Ladies in White) walk throughout Havana, dressed in white, drawing attention to their demand for their men to be released. Early in 2010, the tragic death of Orlando Zapata took place. Zapata was a black, working-class Cuban who was imprisoned for founding a nonviolent, independent political group. His death laid the repressive political conditions in Cuba before the whole world. Soon thereafter, the courageous hunger strike of Guillermo Faríñas (a sociologist and journalist from the city of Santa Clara) on behalf of these prisoners pushed the Cuban government to release many of them. Half a century after the triumph of the Cuban revolution, it is evident that the seed out of which democracy will once again spurt has been planted in Cuba.

Culture jamming
ASA WETTERGREN

Culture jamming is a movement answering to the characteristics of contemporary movements suggested by, among others, Alberto Melucci. It concentrates on symbolic forms of protest and resistance, struggles for personal autonomy and diversity, and is active in a subsystem of a complex global society. Culture jammers are generally organized in networks of small friendship- and/or skill-based groups, or individual “solo” activists. There is a shared cultural framing in the assessment that commercial media and culture support mega-corporate interests and power by manipulating and subjugating a creative and freedom-craving human nature, undermine democracy by making people politically disinterested, exploit limited social and natural resources, and colonize public space. The latter includes media space, to which access is largely governed by financial resources. In addition the proliferation of unsubstantial commercial messages such as ads, commercials, and entertainment drowns the voice of politically engaged citizens.

There have been groups of activists adhering to the term culture jamming since the American audio-collage band Negativland coined it in 1984 (Dery 1993; Klein 1999; Lasn 1999). The mobilizing frame and the key techniques of “semiological guerrilla warfare” (Eco cited in Dery 1993) date further back, to the 1950s and the French Situationists. From the leading Situationist intellectual, Guy Debord, who delivered a fiery critique of the “society of the spectacle” in his book with the same title in 1967 (Debord 1994), through American cultural critic Mark Dery’s “culture jammer’s manifesto” in 1993, and ex-marketing man Kalle Lasn’s book Culture Jam – The Uncooling of AmericaTM in 1999, the key theme is a call to revolt against the expansion of the commercial “mono”-culture, the proliferation of commercial media, the entertainment industry, and the “seduction” of democratic citizens into alliterate, politically ignorant “consumer drones” (Lasn 1999).

The Situationists advocated détournement (“turning around,” “turning upside down”) as a tool to create “situations” – ruptures in the commonly shared reality illusion created by capitalist media (Best & Kellner 1997). In a similar vein, culture jamming in a broad sense embraces groups and individuals who deconstruct the messages of corporate power by targeting key symbols – consumer objects, brands, chain stores, websites, or other symbols vital to the discursive framing of the world that underpins corporate domination – and tampering with them in ways that uncover the hidden logic of power and simultaneously state the autonomy of the protester(s) from “corporate mind control.” The political message of culture jamming, as it may be extracted from Dery and Lasn, advocates radical democracy, grassroots participation, community building, social and cultural diversity, and sustainable development. The Situationists were a group of neo-Marxist artists and intellectuals rejecting the separation between art and politics. The fusion of culture, politics, and economy is characteristic of culture jammers who make their political statements through art, music, theater, graphic design, technological inventions, and so on. Jammers, however, avoid positioning themselves in the political left–right spectrum and they rarely condemn capitalism, consumption, or the contemporary media and communication technology development on the whole. In line with many contemporary movements jammers are unlikely to deliver any wholesale ideological packages. Dery’s manifesto and Lasn’s book are exceptions but they are also very inclusive, regarding participants, means, and ends. Culture jamming thus sustains a fluid and cosmopolitan sense of collective identity. Focus is on the dissemination of ideas (Wettergren
2 CULTURE JAMMING

that in the long run is hoped to create a social and political impact.

While culture jamming is primarily an American/Western phenomenon, the largest effort to advocate culture jamming as a worldwide movement against global corporations and commercial culture so far has been made by the Media Foundation Adbusters, founded by Lasn in Vancouver, Canada, in 1989. Other well-known groups are the San Francisco Billboard Liberation Front, Reverend Billy and the Church of Stop Shopping, the Yes Men, Electronic Disturbance Theater, and the Bureau of Inverse Technology. These examples represent a typical broad span of action repertoires, inherent to the idea that a jammer uses his/her skills and symbolic capital, whatever they are, to convey the message.

A prominent feature of culture jamming is the use of fun and humor (Wettergren 2005; Wettergren 2009). Humor eases the transmission of messages as it makes audiences laugh and awakens curiosity. By successfully provoking “the enemy” with humorous actions, culture jammers harvest micropolitical victories that reinforce their point about the “real” face of corporate power. In activist networks humor is also a recognition signal and a celebrated sign of ingenuity; successful examples are widely disseminated and commended.

REFERENCES AND SUGGESTED READINGS

The Cultural Revolution, the full name of which was “the Great Proletarian Cultural Revolution,” was a political movement launched by Mao Zedong, the supreme leader of the Chinese Communist Party (CCP). Its goal was to rectify the CCP, which Mao considered to have become over-bureaucratized since it took power in 1949. Mao also wanted to revive the revolutionary spirit of the war period in order to maintain his personal charisma and domination within the CCP. The movement, however, took on a momentum of its own as a large number of the Chinese masses participated in it and became entangled in factional fights.

After taking power, and especially after adopting the Soviet Union’s economic model, the Chinese communist party-state went through rapid bureaucratization in the first half of the 1950s. This development not only contradicted Mao’s vision of a good society but also undermined his personal power. Criticizing the whole trend of development as conservative, Mao pushed for his radical populist strategy of modernization – pursuing miracle-like economic goals through continuous mass campaigns. With his unchallengeable charismatic authority within the CCP and among the Chinese population, and through shrewd political maneuvers, Mao could always get his radical policies adopted by the CCP. However, these policies produced only disastrous results. Mao’s Great Leap Forward movement, for example, induced a severe famine between 1959 and 1961, during which over 30 million Chinese died. In the early 1960s, in order to get out of this economic disaster, Mao’s designated heir apparent Liu Shaoqi and his other colleagues adopted a set of more moderate economic and social policies, which brought rapid economic recovery and greater social diversity. These new policies offended Mao both ideologically and personally. In the meantime, the relationship between China and Soviet Union worsened further, and this convinced Mao that the communist revolution in the Soviet Union had gone astray and that China faced the same danger. Discontented with his colleagues’ deviation from his radicalism and his own marginalization in the daily operation of the state, Mao believed that Liu Shaoqi and other party officials had abandoned his revolutionary direction and turned to Soviet Revisionism. For these reasons, he radicalized Chinese politics in 1962 by emphasizing the imminent danger of capitalist restoration and the predominance of class struggle in China. Meanwhile, under his own advocacy, his personality cult escalated. This radicalization led to the launch of the Cultural Revolution, through which Mao attempted to reverse the trend of bureaucratization and routinization in his regime and to revolutionize Chinese society in order to ensure his absolute domination and the pursuit of his vision of communism.

Mao’s Cultural Revolution can be roughly divided into two stages. The first lasted from 1966 to 1968, during which time Mao officially endorsed a quasi-free mass mobilization against the party-state authorities in order to root out the so-called “capitalist roaders in power.” It was also a strategy to dismantle the quasi-absolute political authority of the party-state bureaucracy. This stage ended with the military repression of the radical mass organizations. The second stage lasted from late 1968 until Mao’s death in 1976, during which time Mao abandoned free mass mobilization and conducted his movement through the party-state bureaucracy. In other words, the Cultural Revolution took a semi-institutionalized form.
On the eve of the Cultural Revolution, Mao secured the backing of two groups at the top of the Chinese leadership. The first were the Maoist intellectuals such as Jiang Qing (Mao’s wife), Chen Boda, Kang Sheng, and Zhang Chunqiao. They later became the core members of the so-called Cultural Revolution Small Group (CRSG) and acted as Mao’s personal apparatus during the Cultural Revolution. Mao also had the support of the defense minister Lin Biao, who controlled the Chinese army and had played a major role in boosting Mao’s personality cult in the early 1960s. The movement started in November 1965 when Mao secretly authorized Yao Wenyuan, a party propagandist in Shanghai, to write an essay attacking a historical play written by Wu Han, deputy mayor of Beijing, as counterrevolutionary. In the following months, several top military and civilian party officials considered to be the obstacles to the launch of the Cultural Revolution were purged. Meanwhile, the CRSG was established to control the CCP’s propaganda machine and guide the Cultural Revolution. On May 25, 1966, under the manipulation of the Maoists, Nie Yuanzi, a party cadre at Peking University, posted a big-character poster attacking the school party leadership. A week later, Mao secretly ordered the broadcast of the content of this poster, accompanied by high praise, through the national radio network. This instantly incited student rebellion against school authorities in Beijing. Soon Mao ordered that classes be suspended in order that the students could make revolution. The mass upheaval was launched.

Facing unprecedented chaos in schools and universities in June 1966, Liu Shaoqi, who was the Chinese president at the time, and other top party leaders including Deng Xiaoping, were at a loss about the direction of the movement. They dispatched “work teams” – groups of party officials organized from the top – to campuses, in part to suppress the radical tendencies of the movement. But Mao soon denounced Liu and Deng’s handling of mass mobilization as a bourgeois repression of the mass movement and praised a quasi-autonomous middle-school student organization called the Red Guards as the vanguard of the Cultural Revolution. Soon, student Red Guards were organized across the country. The movement was formally announced at the Eleventh Plenum of the Eighth Party Congress convened at Mao’s initiative in early August 1966. Liu Shaoqi and Deng Xiaoping were criticized and lost their power, while the Maoists gained domination. Meanwhile, Mao designated Zhou Enlai, the Chinese Premier, to take charge of the daily running of his regime amid the chaos created by his movement. A document titled the Sixteen Articles was issued as the guideline of the movement, whose ambiguities and contradictions concerning the movement’s targets bred confusion and division among the masses and the party officials in their understanding of the nature and target of the movement.

In August and September 1966, student Red Guards rushed to the streets to smash the so-called “Four Olds” (old culture, old customs, old thoughts, and old habits). Many historical relics and cultural objects that were regarded as traditional and Western by the radical students were destroyed, and many people, from intellectuals to ordinary people with “bad” class labels, were persecuted and even beaten to death by the combative students. In October 1966, the movement took a more radical turn when Mao denounced the party authorities for their resistance to attacks by those most radical Red Guard organizations. From then on, student attacks upon local party authorities became the movement’s new direction, and new Red Guards of different political agendas mushroomed. In late 1966, dissatisfied with the Red Guard factionalism, Mao lifted the ban on free worker mobilization. Soon the workers took to the streets and divided into pro- and anti-local authority factions. Mao gave official support to the latter. The party-state authorities had to formally abandon their defenders and “support” the rebels. Disappointed, the former pro-authority mass organizations also put on the banners of rebellion. By the end of 1966, the party-state authorities across the
country had become largely paralyzed. Political and economic disorder prevailed. The regime was in crisis.

In January 1967, under the support and manipulation of the Maoists, the radical rebels in Shanghai seized power from local government. Mao was inspired and called on the rebels across the country to seize power from their local party authorities and to establish a new revolutionary order. But the power seizure soon resulted in nationwide chaos as the rebels split into opposing factions in their fight over power. The crisis deepened and Mao had to order the local military to intervene and support the "leftist" mass faction. Meanwhile he abandoned Shanghai’s “Paris Commune” model and opted for a Three-in-One Revolution Committee (i.e., the Revolution Committee should be composed of local military officials, former civilian party officials, and representatives of the mass rebels) as the new model of authority organization.

In February 1967, taking advantage of Mao’s moderation, some top veteran officials protested against the chaos and persecution brought by the Cultural Revolution. Mao was deeply offended and turned against them. The CRSG then replaced the CCP Politburo to become the CCP’s decision-making organ. In the provinces, during February and March 1967, facing chaotic mass factional struggles, the local military tended to support the former pro-authority mass forces and severely repressed the unruly rebels in order to restore order. Meanwhile, the resumption of economic production brought back former civilian party officials. The pre-Cultural Revolution order seemed to be on the way back in the provinces. Discontented with this development, Mao removed military control of the mass forces and gave a huge boost to the otherwise suppressed rebel factions in April 1967. Nevertheless, the movement did not develop in the direction that Mao had apparently expected. The reenergized rebel factions’ violent confrontation with the mass forces associated with the local military led to a state of civil war across the country in the summer of 1967. Faced with this crisis, Mao had to denounce the local military leaders and dispatch the Field Armies in the name of supporting the local rebels. In most parts of China, the mass forces associated with the local military were denounced as the “conservative faction” and declined.

From August 1967 to April 1968, in a general climate of moderation, Revolution Committees began to be established in large numbers in the provinces under the leadership of Field Army officers. Yet in the process of forming Revolution Committees, largely due to the issue of the division of power within each committee, the rebels in many parts of China further split into pro-military and antimilitary factions. After various failed co-optation attempts, the military suppressed the latter. Unhappy with this development, Mao radicalized the direction of the movement again in late March 1968. This gave the suppressed rebel factions an opportunity to attack the military leaders and the newly formed Revolution Committees. A new round of factional war between opposing rebel factions ensued in many parts of China. Facing the return of crisis, Mao had to order the military to repress the antimilitary rebel factions and restore order to his regime. By then, Mao seemed to have become completely disillusioned with the faction-ridden anarchic mass movement. As a result he ordered the disbanding of all mass organizations.

In late 1968, middle and high school students were sent to the countryside in the name of receiving reeducation from the peasants. Meanwhile, a Clarifying Class Ranks Campaign was waged, which allowed the local military leadership to purge and repress all non-obedient forces. The movement thus concluded with the ascendancy of the military. By August 1971 military leaders presided over 22 of the 29 provincial Revolution Committees. In the meantime, Mao turned to the reconstruction of the party organization. The Ninth Congress of the CCP was held in 1969. During the Congress, Mao’s theory of Continuous Revolution was elevated as the regime’s official guideline. Mao’s cult became ritualized and he was able to get a
series of radical policies implemented. Though the CRSG was formally disbanded as an organization, its members became a prominent political force under Mao’s aegis. The Politburo was restored as the CCP’s decision-making organ.

Though the country had become relatively stabilized by 1971, the power struggles among the elite became increasingly fierce as Mao grew old and the traditional balance within the CCP broke down due to the struggle among the different Cultural Revolution forces. By 1971, Mao became increasingly wary of Lin Biao’s power and the military domination of his regime as a consequence of the Cultural Revolution. Mao’s power balance tactic led to the ascendance of Zhou Enlai and some of the moderate veterans. Yet, as the radical phase of the Cultural Revolution became part of the past, the radical Maoists of the CRSG felt increasingly marginalized when normalization set in. Indeed, both Lin Biao and Zhou Enlai agreed that the Cultural Revolution had finished and that the current task was to stabilize the political order and pursue national economic development. The radical Maoists, whose power depended upon political radicalization and mass mobilization, could feel that the pre-Cultural Revolution order was being restored, so they tried to interfere with the daily work of the government and assert their radical power. This infuriated Lin Biao. The conflicts between the CRSG members and Lin Biao’s military faction, which had started as early as 1968, escalated with Lin Biao’s military faction immediately gaining the upper hand. This result, however, generated great anxiety in Mao. The CRSG members were the carriers of Mao’s ideology of Continuous Revolution. Their marginalization actually meant the negation of the radical politics of the Cultural Revolution. Mao’s denouncement of Chen Boda, who had shifted to the side of Lin Biao from the CRSG groups, signaled Lin Biao’s fall into disfavor. Mao began to make public remarks along the lines that the military needed to be rectified; he also restored the CRSG’s formal organizational status. With the atmosphere becoming increasingly portentous for Lin Biao, he and his family tried to flee to the Soviet Union and died in a plane crash in September 1971. Lin Biao had been a major symbol of the Cultural Revolution. He was even praised as the “closest-comrade-in-arms” of Mao and his status as successor to Mao was written into the CCP constitution. His fall caused the immediate questioning of the Cultural Revolution by the population. People even began to doubt Mao’s personal quality as a supreme leader. Negative opinions of the Cultural Revolution were on the rise. The whole development dealt a fatal blow to Mao. He became extremely anxious about people’s judgment of the Cultural Revolution as well as its legacy in Chinese history. Lin Biao’s death and the ensuing denouncement of him thus signaled the bankruptcy of the Cultural Revolution.

Lin Biao’s fall also led to a large-scale purge of military leaders and the demilitarization of the regime. The civilian bureaucracy headed by Zhou Enlai ascended in 1972. Taking advantage of Mao’s moderation after the death of Lin Biao, Zhou made great efforts to bring the Chinese government back into normal operation. He brought back large numbers of veteran CCP cadres who had been denounced during the Cultural Revolution, and implemented a series of educational and economic policies that were the opposite of the radicalism of the Cultural Revolution. The most symbolic event of this reversal was the rehabilitation of Deng Xiaoping, the second biggest “capitalist roader in power,” to assist Zhou in managing state affairs in 1973. These new developments made those CCP leaders who had benefited greatly from the Cultural Revolution increasingly uneasy. Their struggles with the old CCP veterans headed by Zhou Enlai intensified. Mao himself was also wary of Zhou’s policies, fearing that these new developments would not only contradict the values of the Cultural Revolution but also undermine his historical legacy. With Mao’s approval, the Maoists launched the “Criticize Lin and Criticize Confucius movement” in late 1973, a movement that was actually aimed at
Zhou Enlai. But it incited a mass mobilization similar to that of the Cultural Revolution, for which Mao no longer had the stomach. Mao had to stop the campaign to restore order.

Increasingly disappointed with the Maoists for their lack of day-to-day administrative experience, Mao designated Deng Xiaoping as the successor to Zhou in December 1974 when Zhou’s health was in a serious condition. Mao even asked Deng to take charge of both the CCP and the government when he became increasingly disillusioned with his administratively inexperienced loyalists. But Deng was not Mao’s ideological successor. He was determined to pursue economic development rather than the politics of the Cultural Revolution. Mao was finally convinced by the Maoists that Deng’s policies were actually against the Cultural Revolution. Mao demanded that Deng officially display his support for the Cultural Revolution, but Deng refused. This angered Mao. A campaign against Deng was immediately launched across the country to criticize Deng and the so-called countrywide rightist tendency. The country was radicalized again. But Mao died just a few months later, in September 1976. After his death, the major Maoist members, Jiang Qing, Zhang Chunqiao, Wang Hongwen, and Yao Wenyuan, the so-called Gang of Four, were removed from power by a military coup in 1976. Hua Guofeng, Mao’s designated successor, was put in power but soon lost it due to his determination to continue Mao’s politics of the Cultural Revolution. Deng Xiaoping took power again and China turned in a direction very much opposite to the ideals of the Cultural Revolution.

Mao’s Cultural Revolution had brought enormous negative consequences. Politically, the frequent oscillation between radicalization and moderation created political instability and unpredictability. Under the radical discourse of class struggle, to be on the losing side of a political struggle was extremely costly. Thus political instability, added to radicalism, created a political culture of life-and-death factional power struggles in Chinese politics, which also induced widespread political apathy and cynicism among the Chinese population at large. Institutionally, the Cultural Revolution caused systemic chaos. In order to de-bureaucratize the party-state, Mao artificially cut off bureaucratic functions and offices, and sent cadres to labor camps for re-education. But in reality, these offices and functions had to be filled in other ways so that the system could still operate. Moreover, Mao’s antibureaucratic campaigns usually resulted in the growth of the bureaucracy because political activists had to be rewarded and the usual reward was to be promoted into the bureaucracy. Altogether, Mao’s antibureaucratic policies created a kind of administrative chaos within the party-state. Under the radical Maoist ideology and repeated antibureaucratic campaigns, the bureaucrats lived in insecurity.
and fear while their privileges had to be kept hidden or at least disguised. Hence the bureaucracy in the last years of Maoist rule was burdened with a heavy ideology and an aberrant functioning logic.

The Cultural Revolution also generated disastrous economic and social consequences. First, political instability and radicalism produced economic stagnancy. People lived in poverty during the Cultural Revolution. Both psychological fear and economic scarcity forced people to use personal networks and bribery to obtain benefits. Second, the radical practice of class struggle during the Cultural Revolution destroyed social ties and trust, and bred a general ethos of fear and distrust in Chinese society. After the destruction of any sign of traditional or Western culture and the installation of the hegemony of Maoist ideology, the Chinese people lived in cultural poverty during the Cultural Revolution. During the movement, millions of young people were sent to the countryside because of, among several other factors, the lack of job opportunities in cities. These sent-down youth suffered greatly from ideological disillusion and the absence of a decent education. They became the losers during the post-Cultural Revolution period when education was emphasized.

The Cultural Revolution had brought China to the brink of economic collapse by the time of Mao’s death in 1976. It compelled the CCP, under the new leadership of Deng Xiaoping, to initiate economic reform and an open-door policy that effectively ended the Maoist radical strategies of modernization. Yet, the negative legacies of the Cultural Revolution lasted. Largely as a result of the Cultural Revolution, the Chinese during the 1980s increasingly no longer believed in communism and the regime lost its ideological legitimacy. Meanwhile, some Chinese people started to question the root cause of the Cultural Revolution and many of them found the solution in democracy. Pro-democracy movements in China never ceased in the late 1970s and 1980s, and they culminated in the 1989 Tiananmen student movement. The Cultural Revolution has other legacies as well. As the tragedies of the Cultural Revolution gradually become a remote past, and as social inequalities and government corruption become rampant, the idealism of Mao’s Cultural Revolution has gained new ground since the late 1990s. In today’s China, leftist intellectuals write articles and books to give new interpretations and meanings to the Cultural Revolution. Some poor people dream about an egalitarian and uncorrupted Cultural Revolution past that they have conjured up in their minds. Some of the old Red Guards have become more and more nostalgic for their idealism and youthful devotion during the Cultural Revolution, whether or not they are successful in this increasingly materialistic world. But the Cultural Revolution was a disaster in Chinese history, though as with any revolution its meanings are going to be redefined by those who are unhappy with the current authorities and who have a strong desire for utopia.

REFERENCES AND SUGGESTED READINGS

Most sources agree that the contemporary disability rights movement began sometime in the 1960s or perhaps the early 1970s (Percy 1989; Stroman 2003). Unlike the African-American civil rights movement, the disability rights movement has not been characterized by concentrated periods of time where many large-scale and/or violent protest events occurred (Barnartt & Scotch 2001). Instead, disability activism has tended to come in the form of service provision, lobbying, and other exercises of traditional and institutional political influence. While much disability activism is directed at improving funding and availability of services to the disabled community, it is important to understand that there is often a significant divide, and sometimes even real conflict, between the goals of the community of service providers and those of disability rights movement activists.

While the civil rights-based stream of the movement is often treated as if it is synonymous with the entirety of the disability rights movement, in fact the disability rights movement is actually the product of the convergence of three different streams of reform efforts. The three areas of mobilization are: (1) deinstitutionalization, which focuses on reducing the number of people with disabilities living in state-run or charitable, residential facilities or hospitals; (2) independent living, which fights to increase the capacity of the individual, whether in institutions, community settings, or personal homes, to live as independently as possible; and (3) civil rights activism, which attempts to protect and expand civil rights and antidiscrimination policies to cover people with disabilities in the realms of education, employment, criminal justice, and other areas.

The primary constituency of deinstitutionalization activism tends to be people with developmental, psychological, or severe physical disabilities or some combination of them. Activism in this vein is a direct response to the fact that throughout much of the twentieth century parents of children with physical and especially developmental disabilities were typically encouraged to place their children in state-run or charitable institutions (Dybwad & Herr 1979). The only alternative for most families was to find some way to provide financial and other support for the person’s entire life. People with developmental disabilities and their advocates (the most common advocates were parents whose offspring had these disabilities) were particularly critical of residential hospitals and care facilities, since such institutions were characterized by diminishing returns over the long term. That is, while such facilities might help an individual develop coping techniques in their youth, by the time someone reached adulthood the facilities no longer taught new skills but rather were holding facilities for these “patients.” Increasingly, people began to argue that most of these “patients” could live on their own in far less restrictive environments and that they had a right to do so. Thus, for these activists the role of government should be to fund programs that allow people to live outside of institutions and to restrict the power of the residential institutions as much as feasible for those individuals who must reside in them.

People with developmental and severe psychological impairments are behind people with physical impairments in terms of gaining freedom and independence. This gap is largely due to the fact that scientific understanding of these impairments and technologies for “treating/rehabilitating” people with these sorts of impairments has been slower to develop...
disability rights movement (United States)

than for people with physical impairments. Whereas there were tremendous advances in treating people with a variety of physical disabilities (e.g., better prosthetics and motorized wheelchairs) in the period around the two world wars, effective treatment of mental illnesses, particularly severe and/or recurrent episodes of depression and anxiety or acute illnesses like schizophrenia or bipolar disorders, was lagging behind far into the late part of the twentieth century. As treatments improved, people began to advocate both for improvements in residential institutions and hospitals, and against the idea that these institutions should be life-long placements for most people. Rather, the goal of these facilities should be to provide people with care that would allow them to return to mainstream society as soon as possible. While professionals who provide services to people with disabilities in community settings (noninstitutional or collaborative community housing) are often regarded as allies in this stream of activism, service professionals who run state and charitable facilities tend to be the targets of reform. Policymakers are encouraged to put into place strict oversight of the facilities so as to encourage a high level of care and protection of the rights of residents with disabilities.

INDEPENDENT LIVING ACTIVISM

Independent living activism is an outgrowth of a nineteenth- and early twentieth-century stream of disability-related activism that focused on the rehabilitation of people with disabilities. Rehabilitation focused on healing the body “as much as possible” and then helping the person to get a job. Almost all of the activists involved in the movement for independent living had themselves been beneficiaries of rehabilitation programs. These programs often offered them opportunities that many agreed defined adulthood, such as the ability to drive, to go where one pleased, and to be an active member of civil society. Independent living focused on how a person could accomplish this with the least amount of outside help. But, as activists focused on living independently, they simultaneously recognized that active interpersonal discrimination as well as institutionalized arrangements made such involvement more difficult. For example, architectural barriers represented a significant problem for the wave of post-polio wheelchair users who provided a lot of the organizational energy of the nascent disability rights movement centered in Berkeley in the late 1960s and early 1970s. The leading institutions for the advocacy of independent living have been the Centers for Independent Living across the country, especially the Berkeley Center for Independent Living in Berkeley, California, and the National Center for Independent Living (NCIL) in Washington, DC. As a movement, the push for independent living has found the most support among the elderly and those with physical disabilities. While it is an outgrowth of the rehabilitation movement of the earlier period, the independent living movement differs in that it is a service-based movement that focuses on the control of such services by people with disabilities. The idea that it is consumer-driven has two implications. First, advocates hold that people with disabilities who use the services are the best judge of what they need and should have control over hiring and firing aides, as well as determining what kinds of assistive technologies best serve them. Second, most believe that the providers of such services should be people with disabilities whenever possible. Perhaps the most influential aspect of independent living is that it treats access to assistive technologies and home aides not as a benefit of charity but as a right of all individuals.

CIVIL RIGHTS ACTIVISM

Influenced by the focus on human rights in both deinstitutionalization and independent living, the third arm of the disability rights movement is comprised of activists mobilized
around creating legal institutions that establish and protect the civil rights of individuals with disabilities. Activism in this area has consisted of the use of lawsuits and lobbying to extend civil rights to people with disabilities as a category – the rights of people with disabilities to vote, hold jobs, and otherwise participate in mainstream life – and to remove the stigma of second-class citizenship from people with disabilities. The Americans with Disabilities Act is the culmination of work in the area of disability policy. A leading organization in this struggle has been the Disability Rights and Education Defense Fund (DREDF) – a legal and advocacy group that fights for the rights of people with disabilities. Disabled activists, including both lawyers and nonlawyers, founded DREDF in 1979. DREDF maintains offices in Berkeley, CA, and Washington, DC, and was originally affiliated with the Center for Independent Living. As such, DREDF represents a link between the civil rights and independent living branches of the disability rights movement.

DIFFERENCES AND LINKS AMONG THE THREE STREAMS OF ACTIVISM

The primary way in which the three streams of activism might be differentiated is that (at least historically) individuals with developmental and mental impairments were far more likely to argue that the issue of deinstitutionalization (or in the language of many in the independent living movement, deincarceration) was their primary concern or focus. On the other hand, groups that traditionally had not faced institutionalization on account of impairment, like the blind and deaf, were less likely to begin their activism from within the independent living movement and more likely to begin with the issue of civil rights. The impairment group that provided the biggest link between the three were people with physical disabilities, especially a large population of polio survivors, who often had severe mobility impairments and required significant mechanical and medical assistance. The polio survivors were highly likely to have experienced institutionalization after sustaining their impairment and many regarded themselves as fortunate for having managed to escape these facilities. But being reintegrated into their homes and families made them aware that other young people in their families or neighborhoods were being groomed for lives that included work and family, whereas they were assumed to have a lifelong dependency on their parents/family. As a result, many of these individuals felt that without substantial government help they faced a future of institutionalization when their primary caregiver (usually a parent) was no longer able to look after their needs. So they were interested in independent living as well. Finally, their experiences in having difficulties in being admitted to mainstream schools and/or finding employment after completing rehabilitation programs led to their commitment to civil rights activism.

It is true that these three streams of activism continue to have somewhat distinctive organizational bases and, as such, differ in the particular policy focus they adopt. Nevertheless, they are united in defining their constituency as people with disabilities and by their common adoption of the civil rights discourse as an ideological resource for organizing and justifying their goals and rejection of the medicalization (people with disabilities are patients subject to the authority of medical and other service professionals), and, to a lesser extent, rehabilitation frames, which prior to the rise of the civil rights frames had been the dominant frameworks in the area of disability policy. These frames continue to be influential but are often either challenged or supplemented by claims based on the civil rights of people with disabilities. An advantage of the civil rights frame is that it offers a way to overcome cost–benefit analyses, which have historically been used as an argument against creating or expanding programs to the most severely disabled individuals. If one gets rehabilitation or other assistance based on whether or not one will make enough money to become fully dependent, then many people with disabilities will be excluded, in part because officials can use the likelihood of
facing discrimination and continuing to need assistance in the future as a reason not to enact particular laws and policies. However, the civil rights framework treats access to services and protection against discrimination as basic human rights and can thus neutralize the cost–benefit framework.

The most famous acts of civil disobedience in the disability rights movement were a number of sit-ins in 1977 at Department of Housing, Education, and Welfare (HEW) offices protesting the Nixon administration’s failure to promulgate regulation for Section 504 of the Rehabilitation Act (Percy 1989; Scotch 2001). While the 1973 Act had four parts, Section 504 was (and is) generally regarded as the most important aspect of the law as it was the first general disability rights legislation in the United States. It states: “No otherwise qualified individual with handicaps ... shall, solely by reason of his handicap, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance,” and is directly modeled on Title VI, Section 601 of the Civil Rights Act of 1964. The pro-regulation protests began on April 5, 1977, when disability activists gathered at the Capitol building in the morning and marched to the HEW offices in the afternoon. On the same day activists held demonstrations outside HEW offices in nine other cities. The longest sit-in was the one in San Francisco that ended on April 30, 1977, two days after HEW Secretary Califano signed the regulations for Section 504.

Throughout the 1970s and 1980s, culminating with passage of the Americans with Disabilities Act in 1990, the disability rights movement succeeded in getting a number of new laws passed, including those protecting the rights of children with disabilities to receive high quality, and when possible, mainstream education, as well as laws insuring access to housing and public transportation for people with disabilities. The most comprehensive policy achieved by the disability rights movement is the Americans with Disabilities Act of 1990. The law establishes that people with disabilities have a right to equal opportunities in the realms of employment, public transportation, public accommodations and communication.

Defending Diaoyutai Islands movement and pan-Chinese nationalism (Taiwan)
A-CHIN HSIAU

It was not until the 1970s that the authoritarian rule of the government of the Republic of China (ROC) controlled by the Chinese Nationalist Party (KMT) in postwar Taiwan met significant challenges and major political and cultural changes occurred. The “Defending Diaoyutai movement” (Baowei diaoyutai yundong) launched by college students in northern Taiwan in the spring of 1971, which was originally started by Taiwanese students in the United States, was part of the turning point.

In 1945, when Japanese colonial rule in Taiwan ended, the KMT government took the island over and declared it a province of the ROC. As the KMT lost the civil war that raged on the Chinese mainland to the Chinese Communist Party (CCP) in 1949, the defeated regime relocated to the island of Taiwan, where more than one million mainland refugees flooded in. Postwar Taiwanese society under the KMT was profoundly shaped by the mainland exile experience.

For the KMT government, which kept reiterating its determination to fight against the CCP-ruled People’s Republic of China (PRC) and retake the Chinese mainland, the 1960s was a decade of consolidation and the successful repression of the opposition. Like many countries, Taiwan experienced a surge in the youth population and the rapid growth of higher education in the early postwar period, especially in the 1960s. As a result, a new, highly educated generation, including members of local Taiwanese and mainland background, was emerging. Since the rise of modern Chinese nationalism at the turn of the twentieth century, the Taiwanese youth that came to maturity in the 1960s was the first generation that the KMT state had successfully imbued with its particular version of Chinese nationalism in a peacetime situation. The KMT doctrine dominated the younger generation’s education and exerted a powerful assimilating effect on their political attitudes. Government-initiated patriotism and anticommunism prevailed. Unlike in the United States, Europe, Latin America, Japan, and other places in the world that experienced the upheavals of the sixties caused by student movements, college students and young intellectuals in Taiwan did not create any of the significant turmoil which typified this decade. The KMT’s tight political control created a politically docile younger generation.

At the end of 1969 Taiwan and Japan began to dispute the sovereignty of the Diaoyutai Islands (called the Senkakus Islands in Japan), a group of small uninhabited islets about 120 sea miles northeast of Taiwan, at a time when the United States was preparing to return them to Japan together with Okinawa and the rest of the Ryukyu Islands in accordance with its reversion settlement with Tokyo. A report that there might be vast undersea oil reserves in this area further compounded the controversy in which the PRC also laid claim on the Diaoyutais. Although the KMT government kept asserting sovereignty, the United States sided with Japan. Meanwhile Taiwanese overseas students in America began discussing, disseminating, fund-raising, and organizing for an overseas movement to protect the Diaoyutais. They held marches in major US cities from January to April 1971. In Taiwan, in April 1971 college students, mainly in the north, began holding campus meetings and marches and writing letters to the government, showing strong Chinese nationalist sentiment. On the day in June when America and Japan signed the transfer of sovereignty over the Ryukyus...
(including the Diaoyutais), students organized an off-campus protest march in Taipei that drew about a thousand people. The march reached the American and Japanese embassies, where letters of protest were delivered. College students in other places in Taiwan also held on-campus marches and issued written protests. However, the agreement had already been signed, and the local movement to protect the Diaoyutais quickly vanished.

The loss of the contest against Japan for Diaoyutai was only the beginning of the dramatic diplomatic failures Taiwan experienced in the 1970s, including the loss of the seat representing all of China in the United Nations to the PRC and the beginning of the normalization of US–PRC relations through the signing of the Shanghai Joint Communiqué (February 1972). Taiwan severed relations with an increasing number of countries, such as Japan, when they recognized the PRC. Domestically, the KMT government encountered acute social problems caused by rapid economic growth, such as uncontrolled urbanization, the decline of rural areas, an unequal distribution of wealth, and labor disputes.

Although the Defending Diaoyutai movement died away, college students and young intellectuals awakening to Taiwan’s crises began to openly challenge the political establishment and cultural traditions. They became a new social force that demanded democratically driven sociopolitical reforms based on a “return-to-reality” (huigui xianshi) ideology. Developing a clear generational consciousness, they also occupied a central role in a rising “return-to-native-soil” (huigui xiangtu) cultural trend. Despite its enthusiasm for advocating political reforms, the KMT adjusted itself to a limited degree and rejected demands such as the full election of central government representatives. After two years of reformist discourse following the Diaoyutai incident, the college students and young intellectuals were suppressed into silence by the authoritarian government. Still, many of them had tried to find alternative ways to realize their reformist aspiration, such as engaging in the emerging opposition movement led by young local Taiwanese politicians Huang Xinjie and Kang Ningxiang, which, along with new cultural trends, in turn brought about political democratization and cultural “indigenization” (bentuhua) that cast off the “exile mentality” in the ensuing decades.

REFERENCES AND SUGGESTED READINGS
Social movements in Eastern Europe have a long history. Despite problems with defining the region, most scholars tend to locate it in the postsocialist countries of Europe, which re-gained independence after the fall of the Iron Curtain. One of the most significant movements in the world during this period was Solidarność, which emerged in Poland in 1980. Solidarność developed from a trade union and reportedly had 9–10 million members (approximately 25% of the population). In the Fall of Nations in 1989/1990 hundreds of thousands of people went into the streets protesting against the communist regimes, and this contributed to the collapse of the Iron Curtain. A large variety of movements evolved from that time, with some becoming quite vibrant. Although there are important differences among the countries in Eastern Europe that shape social movements, some parts of the movements’ histories and characteristics are common. These differences and commonalities, crucial for the composition of the movements and their repertoires of action, are a result of the movements’ histories, legal systems, and political situations.

PACIFIST MOVEMENTS

Some of the movements that emerged in Eastern Europe during the communist era did so in response to the communist regimes and associated problems. For example, in the mid-1980s pacifist movements began to grab the attention of the public in Eastern Europe. Peace marches in Dresden were soon followed by similar actions in other parts of the region. At the same time many groups emerged that demanded the abolition of compulsory military service. The military draft resulted in at least two years in the army and abandoning compulsory military service was not raised by the pro-democratic dissidents. Addressing the needs of young people resulted in support for this campaign and the creation of an objectors’ movement. After abandoning the compulsory military service, some of the groups raised antimilitary claims connected to the current political situation: protests were organized against the war in Iraq, the enlargement of military bases (Hungary 2004), or the installation of US military bases (Poland and the Czech Republic 2008–2010).

HUMAN RIGHTS MOVEMENTS

Calls to respect human and citizens’ rights were one of the main concerns of the pro-democratic opposition in the region. Activists facing charges for political reasons were presented as prisoners of conscience. Demands that governments respect human rights were a call for political rights and freedoms. After the regime changes and democratization took place, many human rights groups developed into NGOs, shifting their focus mainly onto ethnic minorities. Some groups focused on the citizens’ rights of excluded groups in society (LGBT people, disabled persons), and there is a growing interest in migrants’ rights which are threatened by new policies as well as by the actions of the radical right-wing groups. Many of the actions are carried out nowadays by local chapters of international non-governmental organizations such as Amnesty International.

ENVIRONMENTAL MOVEMENTS

Environmental movements in Eastern Europe have a growing history, reaching back to the
mid-1980s, when they became part of the anti-authoritarian movement, though they were skeptical also toward some ideas proposed by opposition groups. Earlier there had been nature conservation groups, which were sanctioned by the regimes and were without political claims. Due to their involvement in the anticommunist movement they were trusted throughout society. During this era two events had a major impact on the formation of the environmental movement: one was the catastrophe at Chernobyl in 1986, and the second was the plan to build a hydro-power plant on the Danube River, which led to the establishment of the famous Danube Circle. In the mid-1990s certain trends emerged and became visible in the environmentalist movement: the most radical referenced such Western groups as Earth First! or the Animal Liberation Front, and created radical wings of the movement, often associated with social centers and other alternative groups. They not only engaged in clashes with the police and security personnel while blocking highway construction sites, but also refused to compromise in many cases. Others chose the organizational model of NGOs, providing expert knowledge in conflict situations and introducing educational programs. In some countries attempts were made to establish Green parties, however without any major successes.

Many of the ecological groups in Eastern Europe have strong ties with their Western counterparts, using their models of organization, having access to their resources, or participating in international networks. Some of them transformed into local chapters of organizations like Greenpeace.

LGBT MOVEMENTS

Relatively new are the LGBT (lesbian, gay, bisexual and transgender) movements. Spreading across the region, they call for equal rights (regarding inheritance, taxation, medical information, and the like) for LGBT people. They also use symbolic actions, in particular a constant presence in the public sphere, to mark their position within society. Their annual demonstrations, called equality marches or parades, are often attacked by right-wing extremists and football hooligans, and in some cases are banned by the authorities. Because of the social controversies these groups engender, they receive little political support from the mainstream political parties. Many of the claims of LGBT movements resemble the claims of human rights movements as they call for equal rights and equal protection from the state.

FEMINIST MOVEMENTS

Women’s issues are raised mostly by NGOs and more organized groups. However, grassroots movements raise these issues on the occasion of particular protests/campaigns. For example, every year on March 8 (International Women’s Day) there are demonstrations organized by women’s groups and slogans relating to women’s issues are chanted. One of the best-known feminist groups from Eastern Europe is Femen from the Ukraine, which caught the attention of the mass media through the use of naked bodies in their actions, even though this tactic is criticized by many feminists. Occasionally women’s issues are brought to public attention by other social movements in relation to other issues, such as workers’ rights or social exclusion.

OTHER SOCIAL MOVEMENTS
(ALTERGLOBALISTS)

In Eastern Europe there are also many less structured social movements. Arguably the most significant one is the alterglobalist movement that emerged after the demonstrations that accompanied the meeting of the International Monetary Fund and World Trade Organization in September 2000. These protests, involving around 30,000 demonstrators, were one of the biggest protest events in the region
since the fall of the Iron Curtain. Since then, the alterglobalist movement seems to be in decline in Eastern Europe, with the demonstrations and actions mobilizing fewer people. However, the networks and modes of action established during the peak of the movement’s activities still seem to be somewhat influential, as they have provided the foundation for further actions and campaigns, including the introduction of a novel repertoire of actions in the region. Through its networks, culture jamming, street parties, and ad-hoc-formed coalitions became part of the activists’ everyday lives.

POPULAR MOBILIZATIONS

Eastern Europe has also experienced many spontaneous social mobilizations in which many pre-existing groups took part. Campaigns such as Impuls 99 in the Czech Republic at the end of the 1990s and the Orange Revolution in the Ukraine in 2004 mobilized many people, but left few structures afterward. They should be regarded as social reactions to political problems; however their impact and the methods used link them closely to social movements. What is interesting is the emergence of right-wing social movements. From the skinhead movement that is present (more or less visibly) in the region, to groups connected with political parties, these mobilizations are becoming increasingly important. The right-wing-inspired mobilizations in Hungary after the political crisis in 2006 resulted in the rapid growth of Magyar Garda – a paramilitary organization closely cooperating with a right-wing political party. There have also been many spontaneous mobilizations that were rooted in economic factors, especially in the early 1990s as a response to reforms of social welfare systems and taxation (Kubik & Ekiert 1999). These mobilizations, although mobilizing large numbers of people (in particular workers) in strikes and demonstrations, have not resulted in stable formations after the time of contention. Small and radical trade unions have been established but their impact on workers is unnoticeable, and the larger trade unions have much more politicized and moderate agendas.

CHALLENGES FOR THE MOVEMENTS

Low level of mobilization. There are few main challenges that are common for the various social movements in Eastern Europe. One of the most often mentioned issues is the low level of mobilization within society. Mostly in relation to civil society, many authors point to the decline in mobilization, social participation, or trust toward social institutions. What is interesting is that the low level of trust toward institutions and politics (cf. Howard 2002) is used for mobilizing people by the populist and right-wing political parties. All of them have in common slogans against the old regime, unclear connections with the communist era, and proposals to build not only new structures, but new societies based on nation and tradition.

Dependency on local issues. Another challenge for social movements in Eastern Europe is the problems they have with universalizing their claims. Most of the mobilizations have local character and nationwide campaigns are sporadic and rare. Many of the groups are focused on problems in their neighborhoods rather than on national or regional policies that might cause these problems. Even the alterglobalist movement – by definition transnational and cosmopolitan – varies largely from country to country depending on local characteristics and political opportunities. Occasionally the local issues raised by the movements are linked to global problems and the effects of global changes, as has often been the case with campaigns against gentrification or environmental campaigns.

Dependency on big cities. Nearly all social movements in Eastern Europe are located in big cities, mostly capitals. Metropolitan areas provide both the proximate population necessary for protest actions and the audience to receive the claims of the movements. Some
of the movements are strictly connected with urban life: critical masses (McDonald 2006) focus on problems of urban transportation and gather cyclists who ride together in big groups (the biggest is held in Budapest with thousands of people cycling through the city center) that paralyze the traffic. And, because mostly young people get involved in social movements in Eastern Europe, proximity to high schools and universities determines the area of action. The rare examples of social movements active in smaller towns relate either to a local conflict (for example over environmental protection of a certain area) of a NIMBY (Not In My Back Yard) nature, or are an action of a group coming from a big city. In the case of environmental protests at Mt Zengő (in Hungary in 2004) or in the Rospuda valley (in Poland in 2007/2008), local citizens were neutral or even against the activists protesting for environmental protection of the area.

Professionalization and turning into a “third sector.” Another of the challenges is the process of professionalization of social movements, when groups move from being grassroots mobilizations to becoming rank-and-file organizations. Because of the dominance of the NGO model and the preferences for a third sector way of functioning, many groups become economically dependent on granting authorities. Most of the resources come from national or local authorities and the European Union, and less from big business. Competition over grants and formal (legal) limitations tends to de-radicalize the actions of the social movements that move into the fields of education or expertise provision. According to the critics of this situation, it leads to de-radicalization of the groups and de-politicization of their claims. Such critics claim that the focus is now more on finding the cure for the symptoms than looking to make changes at the source of the problem (i.e., politics).

Links with subcultures. Many of the social movements have strong ties with subcultures or countercultures. This process started in the mid-1980s and continued over the years, linking radical ecologists, antimilitarists, anarchists, and squatters with music scenes and subcultural environments. This linkage has two consequences: the first is the challenge of reaching broader audiences and making their claims more visible. Many people do not support the statements of these movements because of their subcultural connections. The second consequence is the enclosure of the social movements in their own environment. What often becomes most important in these cases is the orthodoxy of the movement; following principles rather than strategically and/or pragmatically pursuing policy or social change. This is also often the reason for movements not cooperating with other actors in the social sphere, such as, for example, political parties which are the “enemy” for some subculturally oriented groups. For many of these groups being an activist is a choice of lifestyle rather than action; for instance most of the ecologists are also bicycle-activists and almost all of them are vegetarian. Rather strict expectations toward newcomers result in a big circulation of participants and small numbers of activists. In addition, the conflicts between the neo-Nazis and antifascists are framed as clashes among two subcultures, since both seem to be closely connected with music scenes. Even in the case of radical right-wing parties their militant factions are close to the subculture; on the other hand the most popular form of organization, the Antifa, emerged from the punk and hardcore music scene.

Difficulties for the left-leaning movements. Because of the socialist path and the rejection of it by the post-transitional elites, being defined as leftist became problematic in Eastern Europe. Besides Die Linke in Germany, which has the strongest support in the former DDR, and the Communist Party in the Ukraine, most of the mainstream political parties prefer more neutral labels. Formally being social-democratic, most of their programs are liberal, leaving some space for the social claims of the right-wing parties. Because of anticommunist sentiments, many usually left-oriented groups, such as the autonomist groups, have not emerged in Eastern Europe,
or are marginal. In addition, struggles over the hegemony of language can be observed on the left–right axis, which is mostly won by the right. The same situation is evident with economic and social claims: right-wing parties and groups have developed a broad range of claims that would be more appropriate for leftist movements.

*Relations with the rest of the civil society.* Relations between social movements and other segments of the social and political scene are complex. First, most of the tensions arise around the concept of independence. Many of the groups are dependent on local or national authorities for their financing or other resources, such as offices. Also the popular system of competing for grants for particular projects makes it more difficult for these groups to run long-lasting campaigns. Social movements tend to be more independent and this autonomy is regarded as one of their main virtues; cooperation with actors is thought to undermine this independence. These independent social movements are also often antisystemic (often inspired by anarchism), which results in the rejection of political parties as potential partners. Coalitions are formed within the same types of groups, with the occasional support of marginalized extraparliamentary political parties. Also, cases of investigation and infiltration of social movements by the police and intelligence services generate suspicion toward cooperation with social movements. However, many of the reported cases of surveillance and counter-actions seem to be exaggerated. Most of the movements are left alone by police forces, and legal systems impose few restrictions on activism and public protest. The aforementioned connection with subcultures results in the exclusion of social movements from public debates and mainstream politics. The use of violence (in particular the alterglobalists, anarchists, and antifascists are accused of this) or its potential use marginalized some movements in an area that some (Kopecký & Mudde 2003; Kotkin 2009) call the “uncivil society,” characterized mainly by the use (or the will to use) violence.

*Changes in modes of operating.* The opening of the borders with Western Europe had an impact on the organization and repertoires of action for social movements in Eastern Europe, even though many groups were supported by organizations from the West before 1989 (e.g., human rights groups, environmentalists) and there was a diffusion of tactics and ideas between the two sides of the Iron Curtain (e.g., the Situationist-inspired Orange Alternative in Poland, and the actions of the Danube Circle in Hungary and Czechoslovakia). But the 1990s brought a significant change in cooperation, allowing for a more intensive flow of resources, ideas, and organizational patterns. For many movements, the most important date was the alterglobalist protests in Prague in 2000; for the first time large-scale protests were being organized in Eastern Europe with the input of activists from Western Europe. Since then it is possible to observe the changes in the repertoires of action, moving the focus from street protests, sit-ins, and strikes to more creative actions such as culture jamming, street performances, and the use of Internet-based communication. In addition, many of the initiatives have moved to the Internet in the form of independent media portals (copying the style of Independent Media Centers – the indymedia, not necessarily using the same name). Cooperation with foreign partners has also been seen in the participation of groups from Eastern Europe in global events, in particular in counter-summits and European and World Social Forums. In this case, the limited resources of the groups from Eastern Europe resulted in declining participation (mainly because of the costs involved) in these events, but the organizing modes were adapted locally. Nearly all of the countries of Eastern Europe held local Social Forums, and local counter-summits or antiborder camps were held in many places around the region.

Earth’s Color March
(Mexico)

AQUILES CHIHUI AMPARÁN

The Earth’s Color March was the name of the journey made by 24 leaders from the Zapatista Liberation Army (EZLN), including Subcommander Marcos. The Zapatista delegation was accompanied by Mexican men and women from various ethnic groups, members from domestic and international civil organizations, and celebrities such as Portuguese writer and Nobel Prize winner José Saramago. The delegation departed in a convoy of over 60 buses from Chiapas on February 24, 2001, and arrived in Mexico City on March 11. The marchers were pushing for a reform to the Constitution to have the rights of the indigenous peoples of Mexico recognized, the establishment of an autonomous government, and power over the resources in the areas where they live.

As early as 1996, a Law Initiative on the Constitutional recognition of indigenous peoples’ rights, prepared by a joint commission of deputies, senators, and the Peacemaking Commission (Cocopa), was completed as part of the San Andrés Treaty agreements between EZLN and the then government, at that time presided over by Ernesto Zedillo Ponce de León. Although the EZLN had approved the bill’s draft as presented by Cocopa, Ernesto Zedillo’s administration had a number of reservations about it, claiming passing it would be equal to endangering the country’s territorial integrity. This opposition led to the breakup of negotiations between Mexico’s EZLN and the federal government.

The situation changed with the 2000 presidential election, where victory was on the side of the conservative opposition party, Partido Acción Nacional (PAN), whose candidate was Vicente Fox Quesada. During his inaugural speech, Fox said he would have Cocopa’s bill draft sent to Congress as one of the first measures of his government. The draft was sent to Congress on December 5. The EZLN responded on December 2 announcing they would send a delegation to Mexico City which would consist of EZLN male and female commanders, including their military chief Subcommander Marcos so as to endorse the passing of Cocopa’s bill in Congress.

The delegation left San Cristóbal de las Casas, Chiapas, on February 24, just after a demonstration consisting of some 20,000 indigenous people, representing the Zapatista grassroots. During the demonstration, Commander Marcos delivered a speech explaining the march’s name: “Ours is the march for indigenous dignity. The march of those of us who are the color of Earth and those who are all colors at the Earth’s heart.” The metaphor “Earth’s Color March” was given at least three connotations: it is a demand for the recognition of the multiplicity of indigenous identities (Earth’s color is just another color in the globe); it references the prime role of indigenous peoples as the earliest inhabitants of the land now called Mexico; and finally, it references the elementary identity shared by indigenous peoples and “Mother Earth,” highlighting a symbiosis between indigenous cultures and nature.

The march’s itinerary was intended to allow the EZLN to symbolically and physically meet most indigenous communities in the country. In fact, the rally passed through the states of Chiapas, Oaxaca, Puebla, Veracruz, Tlaxcala, Hidalgo, Querétaro, Guanajuato, Michoacán, Estado de México, Guerrero, Morelos, and Mexico City. During the march, different mass meetings were planned, gathering thousands – according to the press, the number was somewhere between 5000 and 30,000 – mainly indigenous people. In addition, at each mass meeting it was common to have a spokesperson from the indigenous organizations in the community. One of the
high points of the march was the participation of Zapatista delegates at the National Indigenous Council’s (CNI) 3rd National Conference held from March 2–4 in the Purhépecha community of Nurio, in Michoacán. At the mass meeting in Mexico City’s main square, the Zócalo, on March 11, the support shown to the EZLN was overwhelming, gathering some 200,000 people who welcomed the Zapatista delegation.

The Zapatista delegation met with members of the Congress on March 21, 2001, in the midst of such expressions of support. One of the peak moments of the encounter was Commander Esther’s speech from the lower house’s stand to demand the passing of Cocopa’s bill of law. The Zapatistas left Mexico City on March 30 to return to Chiapas following the meeting. Shortly after, in April, 2001, the deliberation process for Cocopa’s bill was begun. Later that month, the Congress approved a constitutional amendment related to indigenous rights and cultures. The multicultural nature of the Mexican nation was recognized, as well as the right of indigenous peoples to autonomy. However, this right was only limited to the mediation of internal conflicts, through internal arbitration, but the right to have administrative control over resources and territories was not included. The constitutional amendment was contested by the CNI and the EZLN as they considered it did not confirm the spirit of Cocopa’s original bill and because it, in fact, did not recognize the right of indigenous peoples to autonomy.

As a result, despite being one of the largest collective actions ever undertaken by indigenous peoples, the Earth’s Color March failed in its demand for the provision of self-government to Mexico’s indigenous peoples. Hence, the claim for the constitutional recognition of autonomy for indigenous peoples continues to be a matter of contention for Mexico’s indigenous movement.

ETA: Basque nationalist and separatist organization

DIEGO MURO

ETA is the acronym for Euskadi Ta Askatasuna (Basque Country and Freedom), a separatist armed group seeking an independent socialist state for the Basque Country. According to ETA supporters, the Basque homeland (Euzkadi or Euskal Herria) is made up of seven provinces (Vizcaya, Guipúzcoa, Álava, Navarra, Basse-Narre, Soule, and Labourd) currently under Spanish and French sovereignty. ETA is mainly operative in Spain where it has been responsible for over 820 deaths, many of them members of the Spanish security forces or politicians who oppose ETA’s separatist demands.

ETA was formed in July 1959 by a group of young middle-class nationalists dissatisfied with the passivity of the historical party of Basque nationalism, the Partido Nacionalista Vasco (PNV), against the Franco Dictatorship (1939–1975). Initially devised as a student resistance movement, the members of ETA (etarras) came to the conclusion that the Basque homeland was oppressed and needed to break free. At the ideological level, ETA combined traditional Basque nationalism, revolutionary socialism, and anticolonialism. The ideological corpus was gradually built up during ETA’s assemblies, gatherings at which ETA adopted tactical, strategic, and ideological positions. At the strategic level, ETA adopted the theory of “action-repression-action” in 1964. The tactic would start a cycle in which every action was followed by state repression that, in turn, would encourage a larger revolutionary action starting the cycle all over again (Sullivan 1988).

During the Franco dictatorship, popular Basque opposition coalesced behind the armed group, especially after the organization came to prominence during the Burgos Trials (1970) when 16 ETA members, among them two women and two priests, were brought before a military tribunal. Their trial sparked off an avalanche of national and international protest that included pleas from various European governments and the Vatican. ETA’s most noteworthy action (ekintza) during Francoism was the 1973 assassination of the president of the Spanish government and political heir of Franco, Admiral Luis Carrero Blanco.

When the Spanish transition to democracy (1975–1978) got under way after the death of General Franco in 1975 most observers hoped ETA would renounce violence. On the contrary, ETA became fiercely opposed to both the democratization and devolution processes and killed 284 people between the years 1975 and 1980. ETA leaders argued that the Spanish democracy was nothing but a cosmetic change to the authoritarian nature of Spain and gradually increased the number of killings, bombings, and kidnappings. Basque separatism also expanded from a clandestine armed group to a complex network of organizations also known as Basque Movement for National Liberation (MLNV; Movimiento de Liberacion Nacional Vasco). The central organizations of the MLNV were the armed group ETA, the political party Herri Batasuna, the trade union LAB, and other political and cultural groups representing feminists, youth, ecologists, prisoners’ relatives, and so on (Muro 2008: 10).

During the 1980s, authoritarian practices within Spain gave ETA’s legitimacy a boost. Judicial investigations confirmed that the Spanish state had funded a paramilitary organization called GAL (Grupos Antiterroristas de Liberación; Anti-Terrorist Liberation Groups) which committed assassinations, kidnappings, and torture against alleged ETA members. Between 1983 and 1987 the “dirty war” against ETA claimed a total of 27 lives, including ten people with unclear connections to ETA.
Most of the incidents occurred in the cities of the French Pays Basque. In addition to state terrorism, international NGOs such as Amnesty International denounced cases of ill-treatment and human rights abuses of prisoners in police custody.

In 1992, the arrest of three top commanders in southern France started the military decline of ETA and marked a turning point in the bilateral counterterrorist cooperation between France and Spain. The Spanish government later decided to target ETA’s support structure and judicial procedures were initiated against organizations suspected of financing or supporting ETA operations. During the 2000s, different political wings of ETA were banned (Herri Batasuna, Euskal Herritarrok, Batasuna, Acción Nacionalista Vasca, Partido Comunista de las Tierras Vascas), while other building blocks of the MLNV network were accused of the crime of connivance with terrorism (Jarrai-Haika-Segi, Egin, Euskaldunon Egunkaria, Egin Irratia, Xaki, Ekin, Askatasuna, AEK, Udalbiltza, etc.). ETA’s social support was also eroded by shifting Basque public opinion which believed that political violence had become the main obstacle for the separatist cause. A series of controversial killings and the toughening of antiterrorist measures at the global level following the attacks by Al-Qaeda resulted in a steady loss of support.

Official peace negotiations have been held between the Spanish government and ETA on at least four occasions. The first round of negotiations took place during the Spanish transition in the late 1970s; the second round happened in Algiers between 1986 and 1989; the third round in Zurich in May 1999; and, finally, the fourth round in 2006 in Loiola (Basque Country). The last peace talks were called off by the government in December 2006, immediately after ETA exploded a van loaded with over 200 kilograms of explosives in the car-park of Madrid’s Barajas international airport. All these processes of dispute resolution failed to find any common ground. Whereas the Spanish government was willing to discuss “technical” issues (prisoners, refugees, and so on) ETA wanted to enlarge the scope of the negotiations to discuss “political” issues such as the right to self-determination (Clark 1990: 226). Under increasing pressure to lay down its weapons, ETA last declared a temporary ceasefire on September 5, 2010.

Ethnic movements
DINA OKAMOTO

Organized by groups whose distinctiveness is based on national origin, culture, language, religion, territory, or phenotype, ethnic movements are enacted with the purpose of promoting or resisting social change. Ethnic groups express grievances or claims on behalf of the larger collective through organized group efforts which are often directed at governmental actors and institutions or other ethnic groups. The target of an ethnic movement can vary depending upon its goals, which can include improving the status of minority groups, influencing policy, or demanding independence. Like other social movements, ethnic movements are enacted, in part, outside of institutional channels and may threaten the status quo. While many ethnic movements are peaceful, those associated with secessionist and separatist movements may engage in ethnic violence. No matter what tactics and strategies are used, the emergence of ethnic movements within multi-ethnic states – the vast majority of countries around the world – presents a challenge to democratic nations and civil societies.

Early scholars considered ethnicity to be natural, biologically based, and inherent to social life. Moving away from this primordialist approach, Weber (1968: 389) defined ethnicity as “a subjective belief in common descent.” His definition emphasized the notion that ethnic attachments were not based on blood ties, but a belief in blood relationships, or what people perceived to be true in terms of common descent. Other scholars have added to this definition to include shared kinship and ancestry, a common history, and symbols which capture the core of the group’s identity (Shibutani & Kwan 1965; Horowitz 1985). This conception of ethnicity reflects a process where group members define their own self-concepts, histories, and identities, which suggests that ethnic boundaries are not rigidly ascribed (Barth 1978). Thus, ethnic movements are built upon real or imagined shared attributes and experiences related to ancestry, history, language, and culture. This shared sense of “we-ness” can be referred to as a collective identity which defines ingroup and outgroup members, and reflects the potential for collective action in pursuit of common interests (Snow 2001).

PANETHNIC MOVEMENTS

In the United States, some of the largest and most successful ethnic movements have been pan-ethnic, where different national-origin groups organize a collective movement, often along racial lines, to improve their social and economic status. Despite differences in language, culture, religion, and phenotype, ethnic groups build a shared panethnic identity that emphasizes shared experiences and histories vis-à-vis the dominant group in the United States. Ethnic groups have learned that organizing along particular lines – those that are recognizable to the state and create strength in numbers – can bring visibility to their claims and interests, as well as material benefits in social, economic, and political arenas. Not only do pan-ethnic movements represent an expression of collective identity, but they also serve as a political strategy aimed at cultural or instrumental goals.

As an example, Mexicans, Cubans, and Puerto Ricans built a Latino ethnic identity and organized to fight for access to housing, employment, and education (Padilla 1985). Similarly, Chinese, Japanese, and Koreans organized as Asian-Americans and developed pan-Asian institutions to counter violence and hate crimes against their communities (see Espiritu 1992). Changes in immigration, citizenship, and civil rights legislation in the 1970s represented new sociopolitical opportunities for these ethnic movements to build
new identities and organize to address issues of social and economic inequality. Despite the fact that these national origin groups had very different histories of immigration and patterns of adaptation in the United States, they participated in a series of successful pan-ethnic protests, and were able to improve the status of their respective groups. These ethnic movements highlight the fact that taken-for-granted, broader groupings assigned by the state are composed of multiple, diverse ethnic groups, and that a certain level of agency and coordination among ethnic group members is necessary to create such an identity and grouping.

Ethnic movements in the United States typically involve minority groups who are attempting to address issues of racial and ethnic exclusion and discrimination. Majority or dominant group members, such as whites in the United States, have developed movements based upon a racial status and identity, but because overt racism is not considered legitimate in public arenas today, claims are not often made upon the basis of a white racial identity, which tends to be associated with privilege and power. Instead, claims are made on behalf of a group’s civil rights and at times upon a shared culture and identity that immigrants or racial minorities threaten. Studies of right-wing extremists and racist movements may be considered ethnic movements if they are associated with an ethnic claim.

THE EMERGENCE OF ETHNIC MOVEMENTS

When ethnic groups face inequalities that are sanctioned, legitimated, or ignored by the state, they may collectively organize to remedy them, leading to the emergence of ethnic movements. But such movements do not simply arise when economic and political demands are unmet by the existing institutional arrangements; ethnic groups must also develop distinctive social identities (Hechter & Okamoto 2001).

The state often plays a role in the formation of durable group identities through its state building efforts, the categorization of minority groups, and the implementation of policies targeted at ethnic groups. When a dominant group creates a new administrative category comprised of distinct groups, this sets the stage for broader group identities. Colonial-era and contemporary state policies and practices categorized ethnic groups on the basis of race, language, or culture and treated them accordingly. In turn, this encouraged ethnic group members to form new, broader identities.

In the US case, official census classifications for race helped to create a sense of group membership and constitute groups who may engage in collective action efforts. When social and political institutions adopt these official racial categories and implement policies based upon them, this can also facilitate the group formation process. During the 1970s and 1980s, Native Americans began to identify across tribal boundaries in response to successful land-claim awards, affirmative action policies, and other racially based set-aside programs. These new policies increased the symbolic and material value of racial identities, and affected how ethnic group members saw themselves when navigating mainstream institutions and everyday life. Ethnic group members reshaped their identities to be based upon a shared history and culture, paving the way for a renewed ethnic identity among Native Americans and a visible pan-tribal movement (Nagel 1995).

Other conditions can encourage the development of distinctive ethnic identities and also increase the potential for ethnic groups to engage in collective action. In particular, when labor markets are segmented on the basis of ethnicity, a shared identity may arise among group members who are concentrated in similar jobs and occupations (Hechter 1999). Centralized workplaces and cooperative work strategies often contribute to high levels of interaction where group members come to depend upon one another for successful work outcomes, reinforcing ethnic boundaries. Additionally, group solidarity will increase if the positions
in the labor market are only available to ethnic group members because they live and work together in an ethnic economy or have sole access to particular occupations because of closed social networks. These dynamics lead to the development of shared interests and experiences, and provide a basis for group solidarity, especially if the institutional arrangements reinforce unequal access to resources and opportunities and disadvantage group members. Thus, the segregation of ethnic groups can encourage group formation and lead to ethnic movements.

Ethnic group inequalities clearly provide incentives for collective action, but political opportunities must be available for ethnic movements to emerge. Shifts in power that disrupt the normal functioning of society can often create such opportunities. When the state is perceived to be in crisis, insurgents and ethnic entrepreneurs can take advantage of the resulting instability and encourage ethnic groups to participate in movement activities. Barring regime changes or other dramatic shifts in power, other kinds of political opportunities can encourage the emergence of ethnic movements. National political contexts and configurations of citizenship shape the possibilities for ethnic groups to collectively organize on a sustained basis in the public arena. Specifically, institutional openings in the formal political structure such as ease of access to naturalization, voting rights, and state-sponsored antidiscrimination agencies should constitute a supportive political environment which can improve the prospects for collective organizing among groups who traditionally do not have access to political power (see Koopmans et al. 2005). But ethnic movements are not simply a response to the state; they can also be a response to other ethnic groups who represent threats or challenges to a current group’s dominance in social, economic, or political arenas. When ethnic groups come into contact with one another in labor markets and other social institutions, competition for scarce resources heightens ethnic group boundaries, and encourages ethnic movements (Olzak 1992). For example, when the US government mandated the racial integration of public schools in the late 1960s, whites felt threatened. A breakdown in racial segregation resulted in higher rates of black–white contact within a context of scarce resources – good public schools, safe neighborhoods – and in response, whites participated in protests to defend their all-white spaces (Olzak, Shanahan, & McEneaney 1994). Thus it is when local environments begin to integrate that established groups are likely to feel that they are losing out, and in response may engage in protest and exclusionary activities. But when examining ethnic movements associated with minorities in the United States, competition does not seem to be the driving factor. For ethnic and racial minorities, increasing intergroup contact and integration are typically equated with social mobility and new opportunities. Ethnic and racial groups may organize and participate in protests, but it is not because they are defending their group boundaries in social and economic arenas against new groups who are encroaching upon their access to scarce resources; instead, they are responding to threats from the dominant group (see Okamoto 2003).

THE IMPACT OF ETHNIC MOVEMENTS

Ethnic movements can address historical inequalities and affect state policies, but they can also gain recognition or acceptance for stigmatized ethnic groups. Ethnic collective action efforts can raise the social status of ethnic groups and transform the meanings associated with them. Participating in ethnic movements based on a shared culture, language, or territory can also encourage a sense of belonging, citizenship, and pride among ethnic group members.

Equal Rights Amendment (United States)
JANE MANSBRIDGE

The movement for the Equal Rights Amendment (ERA) to the constitution of the United States promoted a policy change central to the liberal branch of “second wave” feminism in the United States. That movement illustrates several dynamics, including those of abeyance structures, communicative distrust, the politics of contingency, the role of moral incentives in collective action problems, “deafness” in social movements, decision by accretion, participatory decentralization, and movement/countermovement interaction.

The Equal Rights Amendment was originally introduced into the US Congress only three years after women won the suffrage in 1920 in the “first wave” of the feminist movement. The militant branch of the suffrage movement, the National Woman’s Party (NWP), proposed the amendment, which read, “Men and women shall have equal rights throughout the United States and in every place subject to its jurisdiction. Congress shall have power to enforce this article by appropriate legislation.”

Proponents and opponents agreed, after many drafts trying to avoid this outcome, that in this wording, “equal rights” meant “ending special protections” (Zimmerman 1991). This feature alienated the more socialist, Progressive, and labor union women, who had struggled in the absence of a strong working-class movement in the United States to achieve hour and wage laws that applied at least to women and children.

As issues like this split the suffrage movement and as the momentum of the first wave faded on having attained its goal, a dwindling number of the highly educated, mostly professional, women of the NWP who clustered around Alice Paul in Washington continued to introduce the amendment in Congress every year. The deep commitment demanded by the NWP, the exclusivity of its membership, its political centralization in Washington, and its culture of gender separatism, extreme mutual loyalty, and devotion to Paul, combined with a small continuing resource stream from bequests, allowed the organization to persist through a period otherwise unfavorable to feminism. Verta Taylor (1989) terms such persistent nodes abeyance structures. Their continuity allows some pre-existing activist networks, a repertoire of goals and tactics, and a collective identity to pass on to the next generation. Although the US Department of Labor Women’s Bureau, established in 1920, opposed the ERA until 1969, it also served as a feminist abeyance structure within the federal government. Working in tandem with formal advisory bodies that could set agendas and pass resolutions, it provided the financial and convening resources that helped sustain and legitimate feminist ideas over time. Women from these bodies helped initiate the National Organization for Women (NOW) (Duerst-Lahti 1989).

In the 1950s and 1960s momentum slowly built for an ERA among Republicans and even among some Democrats, as Eleanor Roosevelt and others came to support the United Nations charter, which affirmed the “equal rights of men and women.” The passage in 1964 of Title VII of the Civil Rights Act marked a crucial turning point. The NWP had suggested and lobbied for adding a ban on discrimination against women to the proposed act, designed to prevent discrimination against blacks (Rupp & Taylor 1987). Southern congressmen supported this amendment while many progressive members opposed it, both thinking it surely would kill the act. Yet although the amendment succeeded, the act itself passed narrowly. Its effects on women had not fully emerged in 1967, when the fledgling National Organization for Women adopted the ERA as its cause and several union members resigned in protest.
But by 1970 the federal courts and the Equal Employment Opportunity Commission had interpreted Title VII to invalidate protective legislation. The main reason for Democrats and labor to oppose the ERA was now removed.

In 1970, the Pittsburgh chapter of NOW disrupted Senate hearings to insist on action on the ERA. Proponents then struggled to remove crippling amendments in the Senate, having to work with Birch Bayh on the Judiciary Committee, which had no women members. The activists exemplified the communicative distrust common in the absence of descriptive representation when they rejected with little discussion Bayh’s strategic advice for wording that paralleled the Fourteenth Amendment (Mansbridge 1999). Yet when the ERA with its original wording finally reached the Senate floor for a vote in March 1972, the big congressional battles had been successfully fought backstage or earlier and the amendment passed overwhelmingly.

When the amendment went to the states, it passed almost all of the first 30 with votes that were unanimous or almost unanimous. By late 1973 it had stalled. The countermovement, led by Phyllis Schlafly, had begun to organize, focusing on the unratified states. Having begun with bases primarily in Washington and the large cities, ERA proponents had few state coalitions. In 1973 the Supreme Court ruled in Roe v. Wade that state laws forbidding abortions in the first and second trimesters violated the “right to privacy” implicit in the Constitution. Opponents linked the abortion issue to the ERA as parts of a feminist attack on the family. Fundamentalist churches, ending their longstanding decision not to become involved in politics, played a major role in the opposition. By 1977 only 35 of the required 38 states had ratified, leaving proponents with the need to achieve majorities in the legislatures of three of the remaining states: Alabama, Arizona, Florida, Georgia, Illinois, Louisiana, Mississippi, Missouri, Nevada, North Carolina, Utah, and Virginia. All were Mormon or Southern states, except Illinois, which required a three-fifths majority for ratifying constitutional amendments and had a Southern culture in its lower third, surrounded by Missouri and Kentucky. When the extended deadline for the ERA passed in 1982, none of these states had ratified.

The ERA and abortion battles together brought fundamentalist churches into politics and greatly strengthened the rise of the “New Right,” placing gender issues in its core (Spruill 2008). The Republican Party, having been the main support of the ERA in its early history, began to reduce its ERA sponsorship in Congress in 1971 (Costain 1992). By 1980, Ronald Reagan actively opposed the amendment in his presidential campaign.

While the amendment was before the states, support for the ERA in public opinion surveys split along lines that would become familiar in the new “culture war” politics of the 1980s: Southerners vs. the East and West coasts; large households vs. the childless; old vs. young; country vs. city; religious fundamentalists and heavy churchgoers vs. agnostics and Jews. Older divisions disappeared. Men supported the ERA as much as women, blacks as much as whites, and in many surveys the working class as much as the middle class. Under the impact of the countermovement, support for the ERA did not rise over this period, but the number of people with no opinion dropped slightly and those opposed correspondingly rose (Mansbridge 1986).

Subsequent analysis revealed that both pro-ERA and anti-ERA organizations in the states had an independent direct effect on ratification, but that effect was amplified by having Democratic or Republican majorities respectively in the state assemblies – an interaction that Soule and Olzak (2004) called the politics of contingency. The effects of movement organizations on the legislature show up particularly in the first stages of the policy process, in the introduction of legislation, while the effects of public opinion on the legislators are greatest in the highly consequential final voting stages (Soule & King 2006).

After the ratification attempt had failed, Mansbridge (1986), writing from the perspectives of movement organizing and deliberative democracy, argued that one cause was the
tendency of social movements to be trapped in a dynamic of deafness, in which the very moral and solidary incentives that lead participants to work hard for a cause also keep them from hearing, crediting, and believing they have to respond to, opponents’ arguments. Yet the dynamics of collective action problems, with their nonexcludable “public goods,” make selective material incentives almost impossible and moral and solidary incentives invaluable. A prime example was the proponents’ decision by accretion to interpret the ERA as requiring Congress to draft and send women into combat on the same basis as men, even though the Supreme Court would almost certainly not have interpreted the amendment that way. That decision was not made consciously but rather incrementally, without explicit discussion, through the mutual interaction of many actors driven by moral, not strategic, considerations. Because less than a quarter of the US adult population at the time favored sending women draftees into combat, the opposition seized on this interpretation. The voluntary and polycephalous, or many-headed, nature of social movements also generated the common pattern of participatory decentralization, in which no central organization can control what enthusiastic volunteers might do. For example, in Hawaii feminist constitutional lawyers were arguing that laws denying funding to abortions were unconstitutional under their state’s ERA at the same time that ERA proponents were arguing in Illinois and the other unratified states that a federal ERA would in no way promote abortion.

Reva Siegel (2006), analyzing the productive roles of conflict and movement/countermovement interaction in creating constitutional culture and change, later pointed to exactly the opposite dynamic, in which the ERA proponents moderated their interpretations of the amendment in reaction to the countermovement. Asking why the US courts faced little opposition when they eventually adopted an interpretation of the Fourteenth Amendment that did “virtually everything” the ERA would have done, she credits the accommodations both the movement and the countermovement made in their presentation of the issues. Her prime examples are abortion and same-sex marriage, which proponents were forced again and again to deny would be affected by an ERA (and therefore presumably also by the weaker Fourteenth Amendment). Meanwhile, opponents had to approve of the Fourteenth Amendment being applied to gender in order to show that the ERA would be superfluous.

Both analyses are right because both dynamics were going on at the same time. ERA proponents were tempted to deafness, which triumphed in the combat example, but were sometimes forced to hear, as in the abortion example. After the ERA died, the National Organization for Women, freed from a need to appeal to middle America, scrapped the ERA and devised in its stead a Constitutional Equality Amendment (CEA) that, being purely aspirational, required no accommodation. With clauses stating broadly and in a form that courts would find hard to interpret that “through this article, the subordination of women to men is abolished,” and that prohibited discrimination and stereotyping on account of “indigence,” the CEA had no prayer of passing Congress by the two-thirds of each house required for a constitutional amendment. Yet the CEA responded to the needs of the activists themselves, who wanted an amendment they could believe in (Mansbridge 2004). Maryann Barakso (2004), studying the National Organization for Women, and Diana Mutz (2006), studying the general tension between actively participating in politics and “hearing the other side,” have confirmed and built upon the analysis of the dynamic of deafness. After the ERA, no other issue directed a significant part of women’s movement organizing toward making a feminist case to mainstream women in the public sphere.

FARC (The Revolutionary Armed Forces of Colombia)

WILLIAM AVILÉS

The Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia, or FARC) is the largest guerrilla army in Latin America and has waged a military campaign against the Colombian state since 1964. The tactics involved in their guerrilla war have ranged from the defense of isolated rural communities from military assaults, ambushes of military and police patrols, and militarily complex offensives destroying entire military bases, to the planting of landmines to protect coca crops or militarily sensitive areas. Since the mid-1960s FARC has expanded from a few hundred combatants in a few departments to a military presence in more than half of the country and approximately 20,000 combatants by 2002. As of this writing their numbers have declined from this height to estimates of 8000–9000 combatants. Neither the end of the cold war, the demobilization of guerrilla armies in Central America nor the relative democratization of the Colombian state with the 1991 constitution have led FARC to give up its armed struggle. FARC’s commitment to take power to establish a socialist society remains an officially stated goal. However, a specific political and social agenda short of a socialist revolution has been clear for some time. In different failed peace processes during the 1990s and 2000s FARC has demanded agrarian reform that eliminates large landholdings, the earmarking of 50 percent of the national budget toward welfare, education, health, and housing, a moratorium on the foreign debt, alternative development in the “war against drugs,” and the substantial reduction in the size of the Colombian armed forces (Kline 2007: 72–73). In almost five decades of war its military strategies have thus far been unable to bring these reforms about, let alone take national power.

FARC’s origins rest in the bloody internal conflict of La Violencia which involved partisans of the Liberal and Conservative parties waging a war for regional and national power throughout the country. The exclusionary politics of both parties as well as the country’s longstanding inequality in land ownership were central preconditions for La Violencia. Approximately 200,000 died in this conflict which was partially resolved with a military coup in 1958 and an agreement (the National Front) which divided political power between the Liberal and Conservative parties excluding other parties from the political process. The failure of this agreement to address rural poverty, land inequality, the exclusion of radical parties, and the lack of security guarantees led some armed militias affiliated with the Communist Party to retain their weapons while securing a degree of autonomy/authority over a few rural enclaves. In 1964, with the extensive assistance of the US military and guided by the anticommunist National Security Doctrine, the Colombian government sought to militarily wipe out these communist-defended communities, referred to by conservatives as “independent republics.” However, the approximately 48 armed guerrillas commanded by Pedro Antonio Marín (a.k.a. Manuel Marulanda) survived this attack and within two years officially established FARC in the 1966 Second Guerrilla Conference with an estimated 350 recruits (Rochlin 2003: 98). It was at this conference that FARC committed to a prolonged armed struggle and to guerrilla warfare that would extend throughout the country (Leech 2011: 16). FARC’s relative success in continuing this struggle to the present day and its refusal to unilaterally demobilize is the result of a number of factors.

First and foremost, Colombia’s geography has facilitated the continuation of this armed insurgency. The country is divided by different...
mountain ranges and much of the eastern and southern regions of the country are lowland tropical jungles. FARC’s structure has taken advantage of this geography, decentralizing its forces throughout much of Colombia’s sparsely populated rural regions in different “fronts” consisting of anywhere from 50 to several hundred soldiers each. FARC is organized in a relatively well-structured army with a respected line of command headed by the group’s central seven-member secretariat and a central high command made up of approximately 30 commanders.

The rise of the illegal drug economy in Colombia, especially the growth of coca production in the 1980s and 1990s in regions of Colombia where FARC historically has had a presence, has also been an important contributing factor to their continued struggle. FARC has and does act as an informal governing authority in those areas of the country relatively untouched by the formal state. They are involved in establishing law and order, adjudicating disputes and taxing the legal and illegal enterprises operating in these zones. The lucrative nature of the illegal drug industry and Colombia’s rise as the number one producer of coca and cocaine in the world by the end of the 1990s facilitated the growth of FARC’s military capabilities, strengthening a belief amongst some of the leadership that a military victory was possible. This belief was strengthened between 1996 and 2000 as FARC successfully destroyed important military bases and captured scores of Colombian military personnel as prisoners of war. The growing military capacity of FARC was not simply a product of increasing resources, but also reflected the large pool of potential recruits that Colombia’s infamous land inequality and rural poverty continues to provide to FARC. Colombia is one of the most unequal countries in the world and the concentration of land ownership has steadily increased in the more than three decades of Colombia’s economic opening to capitalist globalization.

State and para-state repression has also been important to the continuity of FARC’s armed struggle. Since the 1980s FARC has not only been engaged in a conflict with the formal state, but they have also fought right-wing paramilitary groups. These paramilitary groups were financed by narco-traffickers, cattle ranchers, and other large landowners frustrated with FARC kidnappings, extortions, or demands that traffickers pay coca growers a higher price for their product. Paramilitary groups targeted individuals and members of social movements and labor unions viewed as politically suspect. These groups were primarily responsible for the destruction of the leftist political party the Union Patriotica (UP) which emerged during the 1980s peace process as a potential vehicle for FARC’s re-entry into politics. In the five years after its creation in 1985 the UP lost over 2000 of its members, including its presidential candidate for the 1990 election. The experience of the UP convinced many in FARC that a ceasefire without pre-conditions, or FARC’s demobilization without obtaining important political concessions, would be a mistake given the history of state and para-state repression of the unarmed revolutionary Left in Colombian politics.

The expansion in the power of paramilitary groups and the continued use of kidnapping as a tool to raise funds for FARC’s war were key factors in ending the last serious attempt at a negotiated solution to the internal conflict in 2002. Since 2002 the Colombian state has been dedicated to the military defeat of FARC on the battlefield. With the aid of billions of dollars in military aid from the United States progress has been made in reducing FARC’s territorial presence, reducing the number of its combatants, and in disrupting its line of command through the targeted assassination of members of FARC’s secretariat. FARC has been weakened by this extensive military campaign and has faced general repudiation from a majority of Colombians (as reflected in nationwide anti-FARC protests in February 2008) due to their continued reliance upon kidnapping to help finance their activities. FARC’s continued recruitment of minors and its use of landmines and rudimentary “cylinder bombs”
that have maimed/killed innocent civilians have also contributed to the group’s loss of political legitimacy in the eyes of many.

Nonetheless, by 2011 there were again signs that FARC was at least still militarily relevant. Between 2007 and 2010 FARC’s military activities increased from a little over 1000 actions (such as military ambushes, sniper fire, and bombing of electric pylons) to over 1900 actions. These military actions represented more “hit-and-run” guerrilla tactics as opposed to the concentration of large units of guerrilla forces that took place in the late 1990s. At the time of writing FARC is still able to inflict important losses upon the Colombian military and police, maintain a degree of popular support in certain rural regions, and access financing from the legal and illegal economies operating in their zones of influence.

Farabundo Martí National Liberation Front (El Salvador)

The Frente Farabundo Martí para la Liberación Nacional (FMLN) was officially established in El Salvador in October of 1980 as a coalition of five left-wing political factions – the People’s Revolutionary Army (ERP), the National Resistance (RN), the Communist Party of El Salvador (PCS), the Popular Forces of Liberation (FPL), and the Central American Workers’ Party (PRTC). Augustín Farabundo Martí was a communist organizer in the late 1920s and early 1930s. He was executed along with other political leaders in January of 1932 by the regime of General Maximiliano Hernández Martínez. Each of the five FMLN political forces maintained their own armed militias by late 1980. With this unification of the armed left in El Salvador, the FMLN launched a general offensive against an unelected military-civilian junta in January of 1981. The offensive failed to dislodge the prevailing regime after two weeks of heavy fighting on a national scale. However, the FMLN was able to secure rearguards in eastern and northern provinces and garner enough civilian support to sustain an armed conflict against the government until a United Nations-backed peace accord was signed and put into place in January 1992. The formation of the FMLN and its political existence since the peace accords demonstrate its indispensable relationship to social movement mobilization.

The origins of the FMLN can be traced back to the 1960s. After 30 years of one-party rule (1932–1962), military administrators liberalized the political system by allowing relatively competitive elections and legalizing the existence of several important civil society organizations. A national teachers’ association was legalized (ANDES-21 de Junio), and two major labor federations and several agricultural cooperatives founded by the Catholic Church. At the same time, three new universities were built, and the national university student population quintupled in the 1960s. This political opening or “apertura” launched an unprecedented wave of nonviolent collective action between 1966 and 1972, including major strikes and street marches by the newly legalized social sectors. The protest campaigns usually centered on basic economic rights and policy reforms such as teachers’ pensions and salaries and expanded university budgets. By the early 1970s, hundreds of thousands of people were reported to be participating in social movement activities (Almeida 2008). In 1972, the military government closed down this period of political liberalization by holding fraudulent presidential and parliamentary elections and then occupying the public universities with the army and national guard.

In the early and mid-1970s, new radical revolutionary organizations began to surface on the political landscape, such as the People’s Revolutionary Army (ERP), the National Resistance (RN), the Popular Forces of Liberation (FPL), and the Central American Workers’ Party (PRTC). A majority of the leaders of each of these new revolutionary organizations played vital roles in the nonviolent protest wave of the late 1960s and early 1970s. They served as leaders in labor unions, teachers’ associations, student organizations, Catholic youth groups, and agricultural cooperatives. In the 1960s state repression was more selective, targeting particular social movements and participants. By the mid-1970s a clear upswing in state coercion was taking place. The use of political “disappearances” was becoming more common and a series of major massacres of unarmed civilians by the security forces occurred between late 1974 and 1976. The civic organizations established in the 1960s began to form umbrella structures in alliance with the
clandestine revolutionary parties representing social movements from several social sectors (students, peasants, shantytown dwellers, labor unions, human rights campaigners, women, and teachers) in single organizations. The new umbrella organizations unleashed a more militant wave of disruptive protest between 1977 and 1980 that involved the occupation of churches, embassies, worksites, and government ministries to escape state repression and demand the release of political prisoners. Semi-proletarianized agricultural wage workers also seized plantations during this period. By the middle of 1980, the level of state repression reached such alarming levels that street protests were too dangerous and the revolutionary parties increasingly moved to an insurrectionary strategy, culminating in the solidification of the FMLN in October 1980. Hence, the formation of the FMLN was brought about by a decade-long interaction between social movement radicalization and state repression.

By early 1981, El Salvador had fallen into a protracted civil war. The newly elected Reagan administration viewed the Salvadoran insurgency through the lens of cold war geopolitical control and greatly ratcheted up the amount of financial and military support for the extremely repressive Salvadoran government. The FMLN spent the next ten years as primarily an insurgent guerrilla force battling the government army to a standstill. In the mid-1980s, state repression eased from the near genocidal levels of the early 1980s, an estimated 40,000 people having been killed between 1979 and 1984 (Stanley 1996). Social movements began to reappear in the city (human rights groups and labor unions) and the countryside (agricultural cooperatives), demanding human rights, an end to economic austerity policies, and the deepening of agrarian reform. The loose ties of some of the emerging social movements to the FMLN made them susceptible to targeted government repression and harassment until the end of the civil war in 1992 (Brockett 2005).

With the signing of the Peace Accords in early 1992, the FMLN transitioned into an electoral political party for the first time, although the Communist Party of El Salvador had participated in elections before the civil war. As the political environment transitioned from civil war to a neoliberal democracy, the FMLN gradually shifted to electoral politics. The FMLN competed in its first election cycle in 1994, winning a few municipal governments and 21 seats in the 84-member legislature. The leftist party slowly evolved into the largest opposition party, winning more votes in each election cycle. The dominant party in executive power, the National Republican Alliance (ARENA), began a series of neoliberal reforms in the 1990s, including the privatization of the banking system, telecommunications, electricity, and pensions. In late 1999, the ARENA government moved to begin a partial privatization of one sector of the public health system, the Salvadoran Social Security Institute (ISSS). Doctors and healthcare workers in the public health sector immediately launched a social movement campaign against the impending privatization. The public health workers enlisted the support of public sector unions, nongovernmental organizations (NGOs), women’s groups, and the FMLN political party in the protest campaigns against privatization.

The healthcare antiprivatization crusades had two phases: 1999–2000 and 2002–2003. Each campaign was marked by massive demonstrations and strikes (Almeida 2012). Both waves of antiprivatization protest occurred during the parliamentary election cycle. The FMLN took up the privatization issue as its own and won more seats than ARENA in the legislature in 2000 and 2003 in the heat of the antiprivatization protests. The FMLN also provided organizational resources to the antiprivatization campaign by encouraging its rank-and-file members to join the protests during the party’s weekly public gathering in downtown San Salvador (the Tribunas Abiertas). Finally, FMLN mayors and members of parliament personally protested in the street marches and road blockades during the antiprivatization campaign. This relationship between the FMLN and social movements
on the streets continued throughout the first half of the 2000s in campaigns against the Central American Free Trade Agreement (CAFTA), water privatization, and the rising cost of living. This dynamic of a political party participating in collective action outside of parliament is akin to social movement unionism and has been termed “social movement partyism” (Almeida 2006; Almeida 2010). In 2009, the FMLN also successfully channeled this social movement momentum as an important component in winning the presidential elections, displacing the 20-year long reign of the neoliberal ARENA party.

Falun Gong (China)

YANFEI SUN

Falun Gong, also known as Falun Dafa, started as a qigong movement but increasingly acquired a stronger religious character. It organized the largest demonstration since the Tiananmen Square protests of 1989, which precipitated the Chinese state’s crackdown on Falun Gong. However, Falun Gong activists inside China persisted in protests over the years. Meanwhile, Falun Gong groups outside China have used diverse means to publicize their cause and attack the rule of the Chinese Communist Party (CCP).

After the Cultural Revolution, the Chinese state relaxed its control of society; the Chinese people, with their new found freedom, were exploring and experimenting with alternative ideologies and practices outside of the state orthodoxy. Subsequently, all kinds of “social fevers” swept across China. It is in this context that qigong, a breathing and movement exercise with ancient roots that promises healing power and the development of human potential, as well as spiritual enhancement, aroused the Chinese people’s enthusiasm. The development of “qigong fever” also benefited from the support from high-level officials and scientists as well as enthusiastic media coverage. Back in the 1980s and most of the 1990s, thousands of people exercising qigong in parks or other public spaces were a daily scene in Chinese cities. Renowned qigong masters traveled extensively in China to give lectures and lead training sessions, and built a national network of practice sites. Falun Gong emerged during the late part of qigong fever.

Falun Gong was founded by Li Hongzhi in 1992. Initially following the path of other qigong groups, Falun Gong soon distinguished itself from the rest of the qigong movement by acquiring a strong religious character. Combining qigong practices with his own idiosyncratic understanding of Buddhism and Daoism, and the kind of parascience concerning prehistoric civilizations and extraterrestrials that was popular in China at the time, Li created a new syncretic religious system. Truthfulness, compassion, and forbearance were declared as the fundamental characteristics and principles of the cosmos. Practitioners were supposed to cultivate these characteristics in their pursuit of enlightenment. They were also urged to study Li’s writings, in particular Zhuan Falun, intensively. Li claimed that he was not just a qigong master with supernormal physical and healing powers, but a god-like figure capable of assuming countless incarnations to protect his followers and installing a spinning wheel of energy in the abdomen of each Falun Gong practitioner, as well as a savior figure holding the key to the secret of the cosmos and human salvation. More than any other qigong group, Falun Gong resembled a moral community with strong bonds between Li and his followers. It also developed a nationwide hierarchical network with local practice sites, instruction centers, main instruction centers, regional branches, and national headquarters. These characteristics not only facilitated the rapid expansion of the group with many millions of practitioners prior to the state’s crackdown, but also contributed to Falun Gong’s extraordinary mobilization capacity and perseverance in the face of outside critiques and state suppression.

Starting from the early 1990s, the voices of qigong critics and detractors, most of them with a strong scientific mentality, were increasingly heard in the media. In comparison with other qigong groups, Falun Gong responded to media criticism with much less intolerance and more militancy. Between June 1996 and April 1999, it organized letter-writing campaigns and staged some 300 demonstrations, demanding corrections and apologies from the media responsible. On April 25, 1999, some
10,000 Falun Gong practitioners went to Beijing and demonstrated outside Zhongnanhai, the residence compound of the top Chinese leaders, following a clash between the Tianjin police and local Falun Gong demonstrators. Alarm ed by the mobilization potential of the Falun Gong group, the Chinese state, instead of yielding to the demands of Falun Gong demonstrators, waged a nationwide crackdown: a special agency was created to deal with Falun Gong, Falun Gong paraphernalia were confiscated, Falun Gong leaders were arrested, practitioners were coerced to recant their beliefs, and those who refused to renounce their beliefs were subjected to detention and imprisonment. The state declared Falun Gong a “heretical cult,” and launched a massive propaganda campaign to denounce it.

While many Falun Gong practitioners discontinued practice in the wake of repression, the situation certainly did not go as China’s top decision-makers might have expected. Disregarding the danger, some Falun Gong activists in China engaged in acts of protest by distributing Falun Gong materials door-to-door, lodging appeals at local, provincial, and central petitioning offices in Beijing, staging protests in Tiananmen Square, and even hijacking state television broadcasts to replace regular state-run programming with Falun Gong content. In short, state repression energized the Falun Gong activists with a strong sense of martyrdom.

Falun Gong groups outside China responded to the suppression with demonstrations, street exhibitions, lobbying Western governments, staging protests during Chinese leaders’ visits, filing human rights lawsuits against certain Chinese leaders whom they held responsible for masterminding the suppression, and denouncing the CCP. To publicize its cause, Falun Gong also created its own media outlets – the Epoch Times newspaper, New Tang Dynasty Television, Sound of Hope radio station and multiple websites, and formed a performing arts company that gave performances around the world. In December 2004, Falun Gong launched a campaign to urge CCP members to renounce their membership to avoid the apocalyptic calamity. According to the Epoch Times, the number of people who have disavowed association with the CCP had reached 91,053,834 as of March 13, 2011. While this figure can in no way be true because the total CCP membership only amounted to 77,995,000 by the end of 2009, it must have given Falun Gong believers a sense of invincibility and sustained their morale. In conclusion, the Chinese government’s repression has created for itself a most pugnacious and tenacious enemy, thousands of times more powerful than the overseas democracy movement. This is certainly not what the Chinese government anticipated.

Fascist movements
SVEN REICHARDT

HISTORICAL BACKGROUND

Political and long-term causes

Fascism belongs to the “family” of right-wing authoritarian and radical nationalist movements and regimes. Fascist movements regard the state as an organic whole and omnipotent principle transcending class interests, economic tensions, and ethnic conflicts. Fascism and authoritarianism rejected and repressed Marxist socialism, liberalism, ethnic minorities, and laissez-faire capitalism. One may distinguish between authoritarian, reactionary, corporatist, and fascist movements and regimes according to the degree of mass support used to mobilize society and the forms of violence and murder used to dominate society.

Fascist movements gained significance mainly within right-wing authoritarian forms of government, especially when conservatives failed to establish broad social connections and gain acceptance by means of moderate nationalism and/or respect for their economic competence. Fascist movements also arose where the parliamentary system developed late and, thanks to oligarchic traditions, was not fully established even after World War I. Lack of acceptance for a multi-party system, free elections, and corresponding changes of government, as well as skepticism toward free and rational political debate, characterized this right-wing authoritarianism, which provided fertile ground for fascist movements.

The destruction of the multi-ethnic empires after World War I, the weakening of traditional conservatism, the intensification of state interventions in technology and business, as well as the strengthening of aggressive nationalism against wartime adversaries, promoted a new nationalism in the 1920s and 1930s, especially in the Mediterranean and East-Central Europe. Fascism aimed to cleanse a purportedly unitary and indivisible nation of enemies, developing organicist and racist notions of society.

Socioeconomic preconditions

It is now generally accepted that fascist movements did not draw on the support of the “panicking” middle classes (Falter 1991). The three major socioeconomic explanations for the rise of fascism – late industrial and democratic development and/or economic backwardness; sudden and profound economic crisis; and social tensions caused by heightened class conflict – emphasize that fascist movements did best in countries that were neither particularly backward nor had completed a steady and protracted modernization process.

Recent scholarship has questioned the assumption that class should be central to our understanding of fascism. Instead it stresses that explanations for its rise need to incorporate a set of complex social preconditions like youth, military experience, education, religion, and regional peculiarities (Mann 2004). The rise of fascist movements is poorly understood as the product of material and status-based interests of social groups. Social contexts were not causal explanations, but merely created opportunities. Fascist collective action cannot be derived from psychological dispositions or social problems. Fascists were neither the puppets of capital nor the rejoicing (or more aptly, thrashing) third party in societies rent by class struggle. Instead of deriving fascism from social circumstances we should look instead at what fascists actually did.

Short-term causes and the impact of World War I

The following political and social changes after World War I and the Russian Revolution played a key role in the process of supporting fascist
movements: a widespread acceptance of social welfare models influenced by eugenics; fantasies of a potentially total and state-directed shaping of society, fueled by planning for war; radical populist nationalism oriented toward communal ties; the spread of anticommunism and antifeminism; the deployment of violence and militarism as political instruments; and the attraction of theatrical politics with charismatic elements.

The mass mobilization of society during World War I made elitist political forms less tenable; social conflicts erupted in the class-stratified army and on the home front in response to hunger and hardship. Young soldiers’ experience of violence, the sometimes extreme flows of refugees, and territorial shifts within the European nations created important preconditions for fascism’s emergence.

The period following World War I witnessed a militarization of public opinion and the political culture, in which the “metamorphosis of the political” expressed itself in a dramatization and emotionalization of the political, stoked by the mass media. World War I engendered a “fundamental crisis of representation” (Weisbrod 2000) through mass media transmissions of glorious promises invoking heroism and sacrifice. This visual, dramatic, and violent charging of the political corresponded to social distribution battles and rationalizing tendencies, culminating in the “compulsively normalized society” of fascism, which propagated “introspection instead of intellect, feeling instead of analysis, community instead of social contradictions, ideals instead of interests.” The utopian model of a society pacified in this manner thus highlighted the repressive features of social norms and discipline (Peukert 1989).

The young men who had experienced the front only in the accounts of fathers and older brothers succumbed to the propaganda of unflappable superiority in the face of mortal danger that flourished after 1918. The image of cool masculinity parted with the nineteenth-century cult of conscience. The martial absoluteness of the heroic, determined, and violent man was attractive particularly for nationalist youth, who sought to shield themselves from the presumed unmanly weakness of returning shell-shocked veterans. The fascist movements’ glorification of youth fell on fertile ground, given the socioeconomic problems of young men and the changes in and crisis of the male image (Herbert 1996; Wildt 2010).

International constellations

Between the Convention of Lausanne of January 1923 and World War II, more than 40 million people were forcibly resettled according to ethnic, religious, or linguistic criteria (Aly 1999). The massive frontier shifts after World War I, some of which conflicted with ethnic self-attributions and promoted or “invented” this ethnicization, not merely spawned a number of irredentist demands, but also fostered a new type of nationalism and racism. Particularly in the new nations in Southern and East-Central Europe, the combined economic, military, political, and cultural crisis after World War I inspired calls for order, security, and hierarchy as well as the emergence of a value system oriented more toward the sacred than the secular, and more toward national than class interests, which promoted the advent and development of fascism (Mann 2004).

The thesis that fascist movements succeeded in establishing themselves in countries where the communist and socialist movement had been especially powerful and class conflict particularly intense no longer holds up to scrutiny. In all European countries – with the notable exception of the Soviet Union – the violence of fascist movements surpassed the violence of socialists in the immediate postwar period. But fascist activities and successes in the various European countries were not consistently an immediate response to communism, since most fascist coup attempts and violence occurred only in the 1930s, far too late to be considered responses or even “understandable reactions” (Nolte 1987) to left-wing violence. Yet it was more the demonization of the socialist foe and the virtually hysterical (liberal) bourgeois bewilderment and fear, conjured up by memories of the Russian Revolution and
the unrest of 1918–1919, that continued to lend the violent fascist politics of the 1930s the appearance of communicative appeals to the bourgeoisie and heightened its intransigence. This was the source of fascism’s image as a nationalist force for order and a militant protector of capitalist property relations.

All classifications for comparing fascist movements aside, neither Nazism nor Italian fascismo, the Hungarian Arrow Cross under Ferenc Szálasi, or Zelea Codreanu’s Romanian Iron Guard can be understood in isolation. Italian fascism’s function as a “historic indicator” (Schieder 2008: 149–249) in the 1920s and early 1930s was as significant for European fascist movements as the cultural transfer and linkages between fascisms. At the time of the Great Depression, with widespread anxiety about the future and disgust with the present, Italian fascism, in particular, appeared to offer a model. People sought stability and orientation in an authoritarian alternative to the parliamentary system and democracy, in the introduction of corporatism, which supporters hoped would provide a third way between capitalism and socialism. Arthur Moeller van den Bruck’s 1922 dictum “Italia docet” was on everyone’s lips (Schieder 2008: 149–184).

A European network of fascist movements had emerged in the 1920s and 1930s. A transnational history of these diverse mutual receptions, contacts, and exchange relationships that explores the chronology of their reciprocal influences and transformation processes remains to be written, but such an inquiry is certainly needed in order to understand the divergences and convergences of European fascisms (Woller 1999; Reichardt & Nolzen 2005).

FASCIST MOVEMENTS AS POLITICAL PRACTICE

Overall, in its movement phase, fascism was characterized by a combination of five traits:

1. A high degree of violence and militancy. Particularly in their early phase, fascist movements adopted a violent style, and their combat groups embodied vitality, intransigence, youth, militarism, camaraderie, discipline, virility, and physical violence. Violent actions were the actual meaning and object of fascist combat groups. The struggle against “Marxism,” communists, and social democrats was their central purpose. Paradoxically enough, it was frequently also this very violence that appeared to promise the middle classes peace and order.

The violent destruction of traditional groupings and the “rapid reintegration [of their members] into a wholly new group formation” were key characteristics of the fascists and their “gospel of violence” (Mannheim 1952: 150–156). Violence became the “decisive principle” (Neumann 1988: 467) of their social organization and an expression of fascist volition. The violent acts themselves performatively produced a myth that represented their self-image and served the purposes of mobilization. For the fascists, acts of violence were indicative of a creative will to live, an act of freedom, collective decisiveness, and heroic deeds. The intellectual misgivings of critical reflection were sacrificed to aestheticized action. Fascist street fighters presented themselves as diffusely dangerous and aggressive, targeting not one particular group, but anyone outside the martial manliness in their own ranks. A propensity toward racism and a cult of violence, camaraderie, and the glorification of danger and adventurism as revolutionary gesture belonged to the fascist repertoire (Reichardt 2009).

Violence, as a polyvalent manifestation of fascist movements, lent them their unmistakable stamp: thematically in political attitudes, symbolically in propaganda style and movement/party aesthetic, organizationally in the paramilitary combat
groups, physically at movement/party events and everyday “party work” in the streets. Violence enhanced group cohesion within and propaganda outward. It was intended to show that fascists were not all talk and no action. The cult of violence and action as well as the violence-prone lifestyle demonstrated intransigence and mocked any willingness to compromise or rational modes of the finding of justice. Even fascist regimes were incapable of a regulated resolution of political conflicts, belligerently oriented towards foreign expansionism.

2. The absence of stable organs of decision-making or a bureaucratic movement structure. Fascist organizational work concentrated on propaganda to mobilize the base and foster aggressiveness. The polycratic rule within fascist movements, marked by constant rivalries, did not, however, prevent a strong attachment to the movement among the core membership. The integrative principles of Bund (Schmalenbach 1922: 35–105) meant that their entire lives increasingly took place within the organizational life of the movement. The largely informal but effective organizational structure formed a new type of political entity as social movement, which integrated the whole person with all aspects of his/her existence.

Fascist movements were characterized by the nonformalized, highly personalist organizational form of communion, combined with a quasi-military organization of the masses. The initiation process, isolation from the outside world, uniforms, lists of regulations, systems of privileges and penalties, informal control by comrades, pressures to conform, and use of specialized jargon all created an informal normative code alongside official instructions, which acted as a second, disciplinary sublife. The propensity for violence and the emotional and romanticized ideal of camaraderie were not in conflict, but mutually reinforced each other.

The high proportion of paramilitaries within fascist movements—half of all fascists in Germany and Italy, for example, and a good deal more in Romania—almost inevitably led to tensions between the paramilitary lifestyle and cult of violence and the strategy for taking power through parliamentary elections. This created polycratic power relations and inner instability, for which fascisms had to compensate with the figure of the charismatic leader, increased militarization and hierarchy, the redemptive promise of quick success, perpetual momentum, and violent activism.

The fascist movements were thus marked by two permanent and paradoxical pairs of tensions: First, the tension between the centrifugal force of polycracy and the significance of the charismatic leader, which had no regulated relationship with each other and required continual renegotiation. Second, there was the tension between the increasingly routine nature and perpetuation of violent acts and the propagandistic trumpeting of their extraordinary nature. In order to balance this tension, fascist movements were virtually obliged to radicalize their violence constantly.

3. Affinity between the “leader principle” and the movement’s structures. In contrast to the compromise politician, the charismatic leader was eminently suited to embodying the movement’s faith in the future. The emotionalization and aestheticization of politics was accompanied by the ornamentalization of the masses and the closed crowd, as well as a sacralized glorification of violence. In many respects, fascist movements assumed the character not of a “political religion” but of a form of sacralized politics (Gentile 1996). The constant use of religious terms such as sacrifice, faith, resurrection, or spirit was directed against the alleged moral decay of a society branded as hedonistic, skeptical, and rationalist. A mystical certainty of salvation and victory
and repeated reminders of the necessity of struggle characterized the sacralization of fascist politics. This attitude of redemption by ruthless combat, as well as proclama-
tions of immortality and the impending advent of a destined everlasting dominion, constituted two sides of the same sacralized mode of politics.

In fascism, the figures of the uncanny, the sublime, and the adventurous mingled with a leader/follower relationship that has been characterized as a “paradox of mutual subordination” (Gumbrecht 1998: 383–389). While the leader had to embody the collective whence he emerged, he also remained lofty and isolated from the masses. His propagandistically polished solitude became a condition of his political charisma. The leader existed between the poles of his followers’ trust and affirmation and elevation above the mass. Paradoxically, the leader had an at once rigid and loose power relationship with his adherents, since his charisma proved itself only in interaction with, and in the faith and acknowledgment of, his followers. The opportunity for charismatic rule and the charismatic formation of community were rooted in the connection between mass body and individual heroism (Gumbrecht 1998). Fascists presented and staged themselves as “totalitarian democrats,” they combined populism and hierarchy.

4. An asserted monopoly on male youth and a self-image as the “organized will of youth” against the “gerontocratic” and “effeminate” democracies. This propagandistic thrust, which the generational conflict in postwar societies intensified and stylized, was effect-
ively underlined by the fact that fascist par-
ties could claim the lowest average age and the largest percentage of male members of all parties of their day. Fascist propaganda associated the elements of maleness and youth with dynamism, energy, and future. The cult of male youth underlined the fascist claim to represent a new, fresh force, an awakening, and an avant-garde. Like palingenetic nationalism and the charis-
matic cult of the leader, youthfulness was strongly aestheticized in fascism and, like integral nationalism, assumed a compensatory function that consisted of papering over the tensions and conflicts within the socially heterogeneous fascist movements.

5. Fascist movements assumed an eclectic, vague, and sacral political stance marked by an emphasis on nation and race. Fascism manifested itself not in a unified ideology graspable in terms of the history of ideas, but far more in the historical protagonists’ bodily behavioral routines, collective interpretive models, symbols, and subjective assignments of meaning, which were in turn anchored in their actions. Fascism focused on the “political field” (Bourdieu) in which what counted were power struggles, affects, and emotions as well as strategic aims, while its implementation in the “intellectual field,” where what counted were coherent ideologies, doctrines, and ideas, remained secondary (Breuer & Bach 2010).

A key element of fascist meaning systems was racism and an extreme, palingenetic and integral nationalism, which fostered chiliastic attitudes. The masculine, military, and hier-
archical image of a community marked by fanatical anticomunism and racism as well as (male) homosocial sociability manifested itself in fascism’s radical nationalism, which was rehearsed practically in daily marches and funeral ceremonies, and cemented by symbols from flags to uniforms. The reference to vio-
ence and the will, to military tradition, the army, and the comradely community belonged to this circle of organic, integral nationalism, whose obsession with purification and unifor-
mity constructed a clear image of the enemy both within and outside the nation.

This connects to the racism of all fascist movements, which made “ethnic cleansing” a main objective against the “inferior” races. Racism was explicitly installed as a counter-
model to class-based social hierarchy, and
expressed itself often in anti-Semitism, which permeated not just the Nazi movement, but also Romanian fascism under Zelea Codreanu, Hungarian fascism under Ferenc Szálasi, the Croatian Ustasha under Ante Pavelić, and (to a lesser degree) Italian fascism. Although a convincing integration of racism, ethnic cleansing, and genocide remains a desideratum in theories of fascism, it has become unmistakably apparent in recent years that Italian fascism also had racist and anti-Semitic traits and in this respect differed from Nazism not structurally, but only as a matter of degree.

CONCLUSION

Fascism may be understood as a form of political and social practice that articulated itself in the symbols, rituals, and world-views of a racist and "ethnically" homogeneous society (Paxton 2004). Nationalist militarists organized in mass organizations and allied with traditional elites enforced the fascist cult of unity and purity, community and will.

Fascist street politics successfully occupy the newly vacant field of political relationships in historical situations of a profound crisis of democracy, in which the legitimacy of political parties, government, and the state were increasingly tenuous. In such situations fascists transformed previously loose contacts with traditional power elites into alliances. Because alliances with traditional elites did not succeed everywhere, many European fascisms failed to develop beyond the movement phase.

Fascism was a type of social movement that adopted a radical opposition to the parliamentary system and the socialist labor movement, not least in violent public propaganda. In their political style and techniques for capturing power, fascists coupled repression with acclamation.

Fascism underwent changes, and needs to be (re)defined according to its founding, movement, implementation, regime, and radicalization phases (Paxton 2004; Schieder 2008: 7–28). Nonetheless, strong similarities between the fascists existed in ideologemes, propaganda forms, organizational structures, militarism, and the practice of violence, particularly in the movement phase (Kershaw 1994).

Fascism was a political paradox because it combined populist mass enthusiasm with civil subordination, order with destruction, conservative stability with dynamic, youthful mobility, and fanaticism with opportunism. The rejection of liberal democratic society and socialist movements alike was expressed in the massive use of violence to “purify” the nation, with the ultimate aim of foreign expansionism. Fascism’s radicalness was fostered by a structure of rule stabilized by charismatic leadership, permanent propagandist mobilization, and a shared attitude toward life (Broszat 1970, 1983). While the capacity for open discussion and compromise was limited among communists by ideological dogmatism, among fascists it was the intransigent lifestyle and cult of the will that hampered these mechanisms. What united fascisms was above all a certain political practice, which made use of an aestheticized cult of the will and of violence. This expressive side of fascist cultural practices influenced its ideological side. Both were tightly intertwined and mutually influential.

First Nation sovereignty movements (Canada)

RIMA WILKES

Most of British Columbia is Aboriginal territory. It is Aboriginal territory because indigenous peoples have never ceded their land or rights via treaties. According to the 1763 Royal Proclamation, treaty-making is the only way the crown (or government) can acquire territory. Despite this legal rule, the government in British Columbia has sold Aboriginal land, and rights to the resources contained on this land, to third party interests, with the justification that this land is “crown” land. The ongoing situation in British Columbia provides one example of the grievances of First Nations peoples in Canada. Elsewhere in the country, both federal and provincial governments have also sold indigenous people’s land and resources to third-party interests, expropriated land for roads, military bases, and military training exercises, failed to provide adequate compensation for land use, as well as failed to provide sufficiently for housing, health, and education as spelled out in the terms of the Indian Act. Indeed, since 1973 although hundreds of claims have been formally submitted to the federal Claims Commission, an average of only four per year are settled (Ramos 2006).

Indigenous peoples in Canada have mounted a significant challenge to this state of affairs. Since the late 1960s, they have affected a sustained program of collective resistance. Nineteen sixty-nine is considered a key date, and the beginning of the contemporary phase of mobilization, since this was the year when indigenous people used mass protest to block the White Paper, federal legislation designed to eliminate “Indian Status” (Sanders 1985). Research quantifying actions finds over 500 separate events have taken place since this time (Blomley 1996; Ramos 2008). Event analysis shows that the number of events began to rise steadily throughout the 1980s and peaked in the 1990s, with over 100 events in 1990 alone (Wilkes 2004, 2006). Since then there have been about 10 to 20 of these kinds of collective events in Canada per year.

These events are especially remarkable for their use of dramatic tactics such as road and rail blockades and land and building occupations. Many of these tactics and the strategies used in these events have been chosen as a means of emphasizing the sovereignty of First Nations. For example, in 1985, Haidas used road blockades to prevent Western Forest Products from logging Lyell Island, part of their traditional territory in what was then called the Queen Charlotte Islands (now called Haida Gwaii) in British Columbia. They also emphasized their nationhood and land rights by dispensing travel permits to tourists visiting the region (York 1989). Later that decade, the Lubicon people of Northern Alberta and the Temagami First Nation of Northern Ontario also engaged in road blockades in order to stop resource extraction on their land (Ferreira 1992; Hodgins, Lischke, & McNab 2003).

Tensions between the government and indigenous peoples mounted during the 1990s. Most notable is the Oka Crisis, a 78-day standoff from July 11 to September 20, 1990, between Mohawk warriors and the Quebec police and Canadian army. The roots of this conflict dated back several hundred years but came to a head when the town of Oka sold land that was to be held in trust, to a golf course developer. Mohawks from Kanesatake set up a barricade and, when it was stormed by Quebec police, one police officer was killed (Smith 2000). The federal government later sent in the army. This event is generally considered a catalyst signaling a new kind of militancy in indigenous resistance movements in Canada. It led to hundreds of support protests and, at
many subsequent events, people continue to fly the Mohawk flag as an important symbol of indigenous rights. The wearing of military fatigues by warrior societies is also now standard practice, designed to emphasize that indigenous-state disputes are between nations (see e.g., Alfred & Lowe 2005).

Since Oka, there have been numerous other major events. Among them are the 1995 Ipperwash crisis, 1995 Gustafsen Lake Standoff, 2001 Sun Peaks Dispute, and the ongoing dispute at Caledonia (see Edwards 2001 and Lambertus 2004 for detailed accounts of the first two events). Although these events have successfully drawn media attention to the issue of indigenous rights, this coverage is often less than favorable (Miller 2005). Still, these events have clearly forced the hand of governments, who have had to quickly negotiate and settle numerous issues, many of which had been dragging on for decades. For this reason, these and other collective action events have and continue to be essential and important components of social change.

The Free Speech Movement (FSM) was a protest by students at the University of California, Berkeley during the 1964–1965 academic year. The events, an early instance of sixties student activism, were the first case of large-scale unrest on a college campus.

An impetus for the FSM was a letter – dated September 14, 1964 – that dean of students, Kathleen Towle, sent to student organizations. It stated that university property could no longer be used “for the purpose of soliciting party membership or supporting or opposing particular candidates or propositions in local, state or national elections” (Pierovich 1965: 35). Specifically, administrators were clearing a strip of university land at the main entrance to campus, no longer allowing posters, tables, fund raising, and other efforts to “support or advocate off-campus political or social action.”

The letter touched off negotiations between the student organizations and university administration, as well as student protests. While students argued for constitutional free speech and the ability to put academic ideas into action, administrators stressed upholding university and state law, countering that political recruitment and fundraising were not intellectual endeavors. Over the next several months, the protesters established a formal group, the “Free Speech Movement,” that met with university administration and student government. In addition to these negotiations, the protests involved student petitions, all-night vigils and sit-ins, demonstrations and rallies, and a strike by teaching assistants. The group also distributed an FSM Newsletter. Furthermore, protesters organized actions on other California college campuses. The movement gained support from celebrities, including Joan Baez, James Baldwin, and Bertrand Russell.

These events happened in the context of an increasingly tense political atmosphere on the Berkeley campus, as well as an increase in student protest in general. A key player in the FSM was the university chapter of the Student Non-Violent Coordinating Committee (SNCC), especially its main spokesperson Mario Savio. Also, the protests began just weeks after the culmination of the Freedom Summer activities in Mississippi, from which many of the activists involved in FSM – including Savio – had just returned (Savio, Walker, & Dunayevskaya 1965).

The FSM was highlighted by two dramatic “sit-ins.” On September 21, Dean Towle established a new area near the administration building, Sproul Hall, for student organizations to gather. Soon students began to defy regulations against collecting funds, with officials punishing detractors. On October 1 at noon, university police arrested former student and FSM activist Jack Weinberg for soliciting money at a table. After police placed Weinberg into a patrol car, a crowd quickly surrounded them. The protesters – at times numbering into the thousands – remained around, and atop, the car and inside Sproul Hall until the next evening, when student leaders negotiated a resolution with university administration. Weinberg was inside the increasingly drooping vehicle the entire time. “He was fed sandwiches and milk through an open window” (Pierovich 1965: 41). Weinberg was then booked, but the university did not press charges.

The second sit-in occurred in early December. On November 28, the university administration sent letters to two student protesters, accusing them of inciting the crowd during the October 1 and 2 protests. The letter also requested their presence at a disciplinary hearing. In response to this action, the FSM held a rally on December 2, where students occupied all four floors of Sproul Hall. The sit-in lasted until early the next morning, when more than
600 police officers disrupted the rally, then entered the building and emptied it floor by floor. Most arrestees “went limp,” with police either dragging or carrying them out. It took 12 hours to completely empty Sproul. The police reported 716 arrests, while the university reported 814, and 768 people appeared at the arraignment (Pierovich 1965: 66).

The events largely concluded on December 8, when the Berkeley Academic Senate passed a resolution that political activity should not be restricted, on or off campus, unless it disrupted university functions. Also, the resolution stipulated that students involved in FSM protests would not face discipline from the university. A brief “Filthy Speech Movement” occurred in March 1965, when relatively small protests took place the day after campus police arrested a student displaying an obscene sign.

Outcomes of the FSM include the growth of the New Left, as it was a defining event influencing future campus protests and student activism (Gitlin 1989; Cohen 2009). It was also a polarizing event that, in 1966, ironically helped propel conservative Ronald Reagan into office as California governor (DeGroot 1996; Dallek 2000). Yet many conservative and religious student organizations at Berkeley were supportive and involved in the protests. Today, the University of California, Berkeley campus contains several memorials to the events, including a “Free Speech Movement Café” in their Moffitt Library.

Freedom Summer (United States)

DOUG MCADAM

Freedom Summer is the colloquial term by which we now refer to one of the major campaigns in the US civil rights movement. Known at the time simply as the Mississippi summer project, Freedom Summer was the brainchild of Robert Moses, veteran field secretary for the Student Non-Violent Coordinating Committee (SNCC). Though officially sponsored by a coalition of civil rights groups, the SNCC was the driving force behind the 1964 project. The ostensible goal of the project was to register as many black voters as possible in advance of the 1964 presidential election. But there was perhaps a more important underlying aim. At the time of the project the SNCC had been working in Mississippi for three years with little to show for its effort. The organization’s work in the state was at a stalemate. By bringing a large number of Northern, mostly white student volunteers to the state to work during the summer, the organization hoped to break the stalemate. More to the point, they hoped that the presence of the white volunteers would bring the national media as well, helping to dramatize the continued denial of civil rights to black Mississippians as well as the ongoing violence against civil rights workers in the state.

The project proved to be a watershed event in the civil rights struggle. In the end, more than 1000 mostly white, Northern college students participated in the project. Three workers were kidnapped and later killed during the first week of the project. In all four volunteers died during the summer. Another 80 suffered serious injuries and more than 1000 were arrested. Sixty-seven black churches, homes, and businesses were burned or bombed over the course of the summer. But the violence insured the media’s presence and its sympathetic coverage of the project increased the pressure on the federal government to take more decisive action in support of civil rights. In addition, the mountain of evidence collected by the project of systematic obstruction and intimidation of would-be black voters helped to underscore the need for, and generate crucial momentum on behalf of, the 1965 Voting Rights Act.

There was more. In a brilliant strategic move, project organizers took an alternative delegation to the 1964 Democratic Convention in Atlantic City, New Jersey, and challenged the seating of the regular, lily-white, Mississippi delegation. In the end the challenge failed, but it eventually led to a series of reforms that opened up the delegate selection process and brought much-needed diversity to the party. In the immediate aftermath of the project, however, the SNCC’s disillusionment at the failed convention challenge accelerated the organization’s move toward separatism and Black Power.

Beyond the project’s “real world” impact, Freedom Summer is important to social movement scholars for another reason. It was the focus of a unique study of movement recruitment and the longer term impact of activism. Seeking only a list of project participants, in 1982 McAdam stumbled upon the original applications for 720 volunteers and another 300 students who had been accepted by project organizers but, for whatever reason, never made it to Mississippi. The discovery of “before” data on both the volunteers and “no-shows” allowed McAdam to systematically study the process of “differential recruitment” to the project. Among other things, his findings (1986, 1988, 1993) highlighted the critical role that prior organizational and interpersonal ties played in mediating the recruitment process. Applicants who had ties to civil rights organizations and/or knew others who made it to Mississippi were themselves more likely to participate in the project. Conversely, lacking
ties to such groups and/or knowing another “no-show” decreased the applicant’s chances of taking part in the project.

Using information on the applications, McAdam then tracked down as many of the applicants as possible and using survey and interview data systematically assessed the longer term biographical effect of participation/nonparticipation on the lives of his subjects. In a number of publications (1988, 1989, 1992), including the 1988 book, *Freedom Summer*, McAdam showed that for all their similarities going into the project, the volunteers and no-shows looked very different 20 years later. In general, the volunteers remained far more leftist in their political orientations and far more active in movement politics in the mid-1980s than the no-shows. In addition, their personal lives also seemed to bear the enduring imprint of their commitment to the politics they had espoused 20 years earlier.

Finally, the study offered powerful evidence of the critical role played by the volunteers in some of the other major New Left movements that emerged in the mid-1960s. McAdam presents evidence of the important pioneering roles played by the volunteers in the antiwar movement, the emerging women’s liberation struggle, and the 1964 Free Speech Movement at UC Berkeley. His was thus one of the first systematic empirical demonstrations of “movement spillover” to appear in the literature.

French Revolution
ANDREW WERNICK

In the cascade of uprisings that followed Louis XVI’s reluctant convening of the Estates General to address a fiscal and political crisis precipitated by imperial overreach, failing harvests, and the bankruptcy of the French state, the monarchical, feudal, and ecclesiastical pillars of what was immediately dubbed the ancien régime were swept away. By the end of 1789, spurred on by great popular enthusiasm, the Estates General had transmogrified into a unicameral National Assembly, the privileges of the nobility and clergy had been abolished (willingly for some), and an interim body had been set up to draft a new constitution, to be modeled, at first, on that of post-1688 England. As well, the Assembly had proclaimed a charter of Rights and Duties of Man and Citizen, including religious freedom, and formally ended feudalism and serfdom. While Paris was the center of these activities the revolution had spread to other urban centers like Lyons and Marseilles, and the rural poor had taken matters in their own hands, refusing taxes, tithes, and seigneurial dues, and looting châteaux and religious houses. The capital itself was awash with section committees, political clubs, agitational newspapers, and, beginning with the July Days and the storming of the Bastille, the increasingly radical actions of the laboring and artisanal sans-culottes.

Still stronger measures followed. A Civil Constitution was imposed on the clergy, then a loyalty oath; the property of self-exiled aristocrats was confiscated; local militias were formed to defend the revolution. Finally, the king and queen, reluctant to cede powers and after an attempted flight from Versailles, were dragged to the Tuileries by an immense crowd. After a renewed revolutionary upsurge, a National Convention was elected to replace the National and Constituent assemblies and settle the constitutional question once for all. This it did by trying and executing the king, abolishing the monarchy, and (on September 22, 1792 – the zero point of a new calendar) declaring a republic. Assuming executive authority in a perceived national emergency, the Convention and its committees (principally the Committee of Public Safety) ruled till the Thermidorean reaction led to its demise in 1794. Besides such measures as wage and price controls, conversion to metric, and educational reform (the Grandes Écoles), the Convention vigorously pursued war against the republic’s encircling continental enemies. War was declared against Austria, the Dutch Republic, Spain, and England. Mass conscription was introduced, as well as revolutionary tribunals for traitors within. All this came amidst growing divisions in the revolutionary camp while a conservative backlash spread in rural areas like the Vendée, and the court and exiled aristocrats intrigued with Austria and other European powers to restore order through military intervention. The climax came in 1793–1794 with the Terror, the Jacobin ascendancy, and Robespierre’s Republic of Virtue, replete with a new, deist, civil religion.

After an army-backed coalition of moderates and conservatives joined forces to overthrow first the Jacobins then the Convention, the radical phase was over. A new constitution in 1795, replacing the more forthrightly democratic one that the Convention had drafted, gave governmental power to a five-man Directory. In 1799 this in turn was pushed aside in Napoleon’s coup of 18th Brumaire, leading to his installation as emperor in 1802, a Concordat with Rome, and the formal end of the first republic. Napoleon’s ascension marks the point at which not only the republic but the mass activism in which it was born came to an end. At the same time, however, the revolution was continued externally in military campaigns that swung from defense to offense and were infused with

enthusiasm for bringing French reason and law as well as French domination to conquered territories. It is not easy to say when, in fact, the French Revolution ended. The one solemnly celebrated by the modern French state is that of May to October 1789, with the “second revolution” of 1791–1792 left in the shade. For Marx it ended with Thermidor; for Comte with the overthrow of the Directorate. There is a case for saying that it did not end even in 1815 with the defeat of Napoleon and the Bourbon restoration, in that a republican form of government was not established in France until 1871, and then only after five further regime changes and three insurrections.

Outside as well as inside France the historical impact of the French Revolution was immense, especially in the century prior to the earthquakes of the twentieth century. In addition to the geopolitical effects – a weakened France, British naval supremacy, the rise of Prussia, the revolutions of 1848, and further afield, the slave revolt in Ste-Domingue, the modernizing Egypt of Mehmet Ali, and the beginnings of Ottoman decline – the revolution and its bewildering succession of tableaux burned itself into the European imaginary. Causes and consequences were hotly debated and a multitude of meanings could be read in. Clashing interpretations, as in the work of Burke, de Maistre, Guizot, de Tocqueville, and Marx, provided a crystallization point for modern political ideologies. For Kant, the international wave of disinterested sympathy that greeted the events of 1789 validated his optimistic understanding of the prospects for public enlightenment; for Hegel, Napoleon embodied the Weltgeist and the whole revolutionary episode revealed the dialectical movement of matter-mediated spirit. Chou En Lai’s quip concerning the historical significance of the French Revolution, that “it’s too early to tell,” suggests that the reverberations (not least in China) continued well into the twentieth century.

For sociology, the French Revolution has a three-fold significance. First, as an endlessly fascinating and controversial topic for analysis and reflection, both ideographic and comparative; secondly, as an epochal event which can serve as a marker for the emergence of modern industrial society, and thus of its own field; and thirdly as an important, indeed agenda-shaping, factor in the emergence of sociology itself as a distinct area of inquiry. In the post-classical period – after the further ruptures of 1914, 1917, World War II, and 1989 – the revolution’s impact has faded, and these three orders of significance have become easier to disentangle. But for classical sociology they were very much bound up together. Indeed, major schools of nineteenth-century sociological thought in large measure defined themselves through their different interpretations of, and positions taken toward, the French Revolution and its legacy.

This is most evident in France, where sociology – which in Durkheimian form became official doctrine during the Third Republic – arose explicitly in response to the revolution and the chronic instability left in its wake. For Durkheim, modifying a framework he had taken over from Saint-Simon and Comte, the revolution had been a watershed event in the structural transition from one social type to another. However, its work had been mainly negative and reconstructive institutional reforms – most notably, professional associations to replace the guilds, and a secular-republican-educational replacement for the church – were needed to complete the process and resolve the grand crise. On the moral-religious side, at the same time, the passionate mass eruption of 1789 had been a founding moment, a “collective effervescence,” in which new, socially renovating, values and symbols were born. These, with some liberal and Kantian inflection (to emphasize the sacredness of the morally autonomous subject), provided the cornerstone for a unifying and integrative morale whose quasi-religious reproduction, through commemorative ritual (like Bastille Day) and civic education, was vital to the solidarity of a highly individuated and task-differentiated industrialism. Sociology itself, in this scenario, was both the scientific
explicator of the scene, and the logos, not to say theology, of (post-revolutionary) society itself.

Keen to distance himself from the socialism of Saint-Simon and the “absurdities” of the later Comte, Durkheim stressed the liberal Enlightenment pedigree of this new science, with Montesquieu and Rousseau important forerunners. However this is not the whole story. As Robert Nisbet pointed out in his notable 1943 essay, the formation of French sociology owed a great deal also to the Catholic organicism of counterrevolutionary thinkers like de Maistre and de Bonald. Besides developing, in individual/society terms, an integralist concept of social order and its maintenance through time, they had been the first to thematize la société itself as an irreducibly trans-individual plane of reality with its own discoverable laws. If this debt is passed over by Durkheim, it is not so in the sociologies of St Simon and Comte who had sought, explicitly, to synthesize what could be learned from de Bonald and de Maistre about social integration with Condorcet’s progressivist account of anthropological and social development.

But it was not only via the conservative reaction and the problematics of order (and, with Burke, of custom and tradition) that the French Revolution brought society and the social onto the modern intellectual agenda. The revolution also made salient a host of issues to do with inequality, class, and the distribution of wealth. Those issues sharpened of course with the rise of the market, factory production, and large-scale capitalism, and not only in France. Indeed, whether from the angle of social administration and state policy, or from that of critique and action from below, the study of social inequality and its consequences came to be a prominent element in the development of sociology everywhere. With further axes of inequality (ethno-cultural, sexual, etc.,) coming under scrutiny, they remain so today. Nonetheless it was the French Revolution that initially, and indelibly, brought these issues into play. What began as a revolt in the middle strata of the Third Estate, and ignited the justice demands of every section of the population, revealed the social question underlying what had been thought of (in the American Revolution for example) as a political one regarding law and the form of the state. It was in France, too, from Rousseau’s Second Discourse and Siéyès’ What Is the Third Estate? to Saint-Simon’s proto-class analysis of the revolution itself, that concepts and language for examining social inequality were forged, thence through Hegel’s and Marx’s appropriations, to become embedded in the dialectical sociologies that developed across the Rhine.

For Durkheim, and Saint-Simonianism generally, post-revolutionary turbulence and its persistence was to be explained in terms of the revolution’s incompleteness. Conflicts and crises in the new industrial society were ones of transition, occasioned by vengeful or dysfunctional survivals from the displaced feudal order, or by the insufficient development of organization and moral culture in the now more central activity of production. For Marx, however, the French Revolution had been only the penultimate transformation. The transition it marked was not simply to industrial (production and science-centered) society but to capitalist society: a formation in its own right, with its own potentially transformative contradictions and antagonisms. The year 1789 and its sequel was – giving the term a greater precision than it had for contemporaries, or for liberal historians like Guizot – a bourgeois revolution: the overthrow of a lingering feudalism’s dominant land-owner class, and of the state that expressed/protected that dominance, by a new ruling class rising to power on the basis of capitalist property and production relations. Social conflict did not end, then, with the abolition of the aristocracy and the establishment of a formal (and limited) democracy. In wage labor the capital-owning class was raising up an antagonistic force which could overthrow it in turn, paving the way for a socialized industrialism in which class and class conflict would finally disappear.

Marx’s fine-grained account of modern French history (e.g., in The 18th Brumaire of Louis Napoleon) was by no means as
schematic as this may sound. He attended to cultural and semiological elements like the Roman symbolism in which republican and Napoleonic politics were dressed, as well as the specific complexities of class and class conflict at each of the moments he examined. More formulaically, however, and in its linkage of class with democratic/republican politics, the French Revolution became a model for the wider category of “bourgeois revolution” which, in one form or another, was seen by orthodox Marxists as necessary in a society’s successful transition to capitalism. In certain respects it even served as a model for the proletarian revolution itself, for example in the *Communist Manifesto*’s characterization of a pre-revolutionary situation, of the struggle for state power, and of the way in which a portion of the ruling class (including elite-trained intellectuals like Marx and Engels) moves to the side of the one rising against it.

Among the classical founders of sociology, Weber’s relation with the French Revolution was the most complicated. The Germany of Bismarck and the Kaiser – in which, tenaciously but without illusion, he supported the liberal party of reform – linked a fast developing capitalism in the West with an autocratic order dominated by the Junker/landowners of the East. With a politically and ideologically weak bourgeoisie there had been no bourgeois revolution, nor was there a prospect of one. When parliamentary democracy arrived with the Weimar Republic (whose constitution Weber helped draft) it came as the result of a catastrophic military defeat followed by an abortive socialist uprising, amid a rising tide of nationalist fanaticism.

At issue for Weber in promoting expanded powers and legitimacy for the Reichstag was not only – in line with the Third Estate moderates in 1789 – the need for democratic control over the arbitrary policies of Kaiser-appointed ministers. There was also a need to counter state bureaucracy and the reduction of politics to administration, an issue to which he considered the socialist Left, and the whole legacy of republicanism, to be blind. Freedom and substantive reason were both at risk, threatened in politics as in other spheres by the seemingly ineluctable course of rationalization, that is, the domination of thought and action by formalism, calculation, and instrumentalism reason.

For Weber rationalization was the key to Western modernity, defining both its historical uniqueness – whence his *Protestant Ethic* and comparative study of civilizations – and its deepest problem. The French Revolution had itself advanced the process, in for example the centralized reorganization of the state, the civil code, the reform of weights and measures, the new calendar, technocratic schools, and the weight of lawyers (reflecting the “rationalization of trials”) in the new political class. The French Revolution also offered a cautionary example of the three ideal types of authority and their dynamic – the traditionalism of the *ancien régime* giving way to the legal rationality of constitution making, and then to the charismatic authority of Napoleon. In effect, Weber provided a sociological translation of Hegel’s critique of the one-sidedness of the French Cartesian and objectivist form of reason. However, Weber departed from Hegel not only in making Calvinism rather than Lutheranism the key bridge to modernity, which de-privileged Hegel’s “German” path to modernity. He also emphasized the historical contingency of chains of social action, the irreducibility of the “war of values,” and the impossibility of any epistemologically privileged perspective, whence his favoring an ethic of responsibility over any moral absolutism. Thus like Nietzsche, but as a post-Enlightenment liberal, Weber broke from all teleologies, religious and secular, including those that drew energy from the French Revolution as Idea.

While the themes of classical sociology left their imprint on the sociologies of the twentieth century, the European transition to capitalism and modernity receded as a preoccupation, and subsequent reflection on the French Revolution was shadowed by different events. Against the displacing backdrop of the Russian Revolution, and for its partisans, 1789 was viewed through
the prism of 1917, with Robespierre and the Jacobins playing the part of Lenin and the Bolsheviks. For Trotsky, the rise of Stalin was Thermidor. In a parallel way, but on the Right, Carl Schmitt’s influential notion of a “state of exception” drew from the writings of Rousseau and the Abbé Sièyes to provide a jurisprudential framework for Germany’s national-socialist revolution, with the emergency powers seized by the Convention as a paradigm. In a cold war context, after the eventuating horrors of the thirties and forties, the revolutionary government of the Convention and the Committee of Public Safety could also be seen (by Talmont for example) as the modern forerunner of totalitarianism, in both communist and fascist forms. In which regard, for liberal political theorists, the Terror and its genesis were important material for considering the complex links between liberal democracy and its opposite; just as, for military historians, the Convention’s lever en masse and the grande Armée of Napoleon merited examination as foreshadowing the twentieth century’s mass armies, total war, and ideologically driven projects of world conquest.

Interest in the dark side of the revolution is also evident in the post-World War I vicissitudes of the Durkheim School, that is, if we trace a line through Mauss on potlatch and Halbwachs on sacrifice to the Collège de Sociologie and Bataille. For Bataille, the regicide and decapitations of the Terror served as reference point for thinking through – with the aid of ethnography, Freud’s Totem and Taboo, Marx, de Sade, Nietzsche, and much else – the contemporary significance of (human) sacrifice, and its place in the symbolic founding and renewal of (a) community. From a Left-existentialist angle, but still in the French tradition of thought about social being, the Terror provided Sartre’s Critique de la Raison Dialectique with a model for the pledge group in his typology of modes of collective praxis. For the Christian anthropologist Girard, it provided an instance of the scapegoating mechanism at the heart of originary violence. With respect to large-scale macronic themes, lastly, the virulent negativity that Comte, following the Catholic counter-revolutionaries, dubbed négativisme has a place in the genealogy of nihilism, and in its Nietzschean deployment as a critical cultural category.

Speculative in nature, these lines of thought have been pursued around, rather than in, the more circumscribed forms of sociology that became established in the United States and elsewhere in the decades after World War II. Within mainstream sociology itself, empirical study of the French Revolution became, in effect, a topic within the sub-fields of political sociology and the sociology of social movements. To this latter development Charles Tilly’s work on social movements and Theda Skocpol’s comparativist approach to the French, Russian, and Chinese revolutions made a pioneering contribution, as did Barrington-Moore’s study of peasant movements and their place in modern state formation. Overlapping with renewed sociological interest, and enriched by archival research, the detailed course of the revolution, and the conditions in which it occurred, has received fresh scrutiny by historians as well, leading to further debate about its specific historical character and significance.

On the Marxist side, Georges Lefebvre’s and Albert Soboul’s examination of the successive but interacting uprisings of aristocrats, bourgeois, peasants, and sans-culottes complexified the orthodox account while maintaining its main lines. However, Alfred Cobban’s 1964 critique of “the social interpretation of the French revolution” challenged both the centrality accorded to class struggle and the very notion that it was a “bourgeois revolution.” This initiated a revisionist interpretation whose most prominent proponent was François Furet. Pointing to the underdevelopment of French capitalism, the absence of a real bourgeoisie, and to the incorrectness, on the other hand, of any analysis of the ancien régime as feudal, Furet argued that, with all its complications and unintended consequences, the revolution should be taken at its word, namely as an Enlightenment-inspired revolution against despotism. It was a
political not social revolution, concerned with the establishment of a new kind of state and political discourse. For Habermas, relatedly, what the revolution instantiated, with its free press and endless assemblies, was the rise of the (bourgeois) public sphere, a process that had begun with the salon society and “Republic of Letters” that had intellectually fueled it.

A focus on modernity and democracy led also to a reconsideration of de Tocqueville’s argument that the revolution, while democratic, was also centralizing, continuing a process that had begun with Versailles and the ministries of Louis XIV. How continuous has been a matter for debate. For Tilly, there was a sharp contrast between the venal and localized administrative apparatus of the ancien régime, with its sale of offices and commercialized tax-farming, and the rationalized system of departments, civil service training, and Civil Code that the revolution firmly installed. Further challenges to established interpretations came from those who insisted that “internalist” accounts were insufficient and that the international context had also to be taken into account. The external background to the fiscal crisis of the 1770s and 1780s, Theda Skocpol reminds us, was France’s defeat by England and Austria in the Six Years’ War. Support for the winning side in the American War of Independence only worsened the incapacity of the monarchy to meet the costs of defense and empire. France was in decline as a Great Power. What was apotheosized in the revolution was “the nation”; what swept onto the stage was a movement of national regeneration. For Immanuel Wallerstein the revolution needed to be understood in the still-wider context of capitalism as a developing world system. Framed in these terms, the question of its class character, and whether it was essentially social or political, was beside the point. It was not, in principle, a “bourgeois revolution,” for France was already, however unevenly, integrated into the Atlantic-centered world capitalist economy. For that system the revolution was nonetheless an important event, on the one hand ushering in what became the dominant modern forms of political ideology, popular movements and (adaptively oriented) social sciences, and on the other hand helping to normalize change and the problems of its management as a constant of capitalist development.

More recently, attention has turned to the prominent role of women in the revolution and to its contradictory gender politics, in which, for example, a masculinist definition of “active citizenship” was sustained against a suffragette movement (led by Olympe de Gouges) that was suppressed in the Terror. Lynn Hunt’s The Family Romance of the French Revolution introduces to this a psychoanalytic dimension. Among other previously sidelined areas, the aesthetic side of the revolution – its neo-classicism, allegorical style, propaganda art, theatrical spectacles, and so on – has been greatly studied but largely as a specialty within art history, and awaits a more fully sociological treatment. For the future, the growing importance of issues to do with secularism and the public sphere, and clashing forms of universalism within an emerging global polity, may prompt further examination of the revolution’s significance in relation to modern state formation, globalization, and civil religion. Despite its slippage into pastness there is nothing to suggest, in short, that the echoes are silent, or that the French Revolution’s productiveness as a site for sociological reflection is yet exhausted.

de Maistre, J. (1847) Essay on the Generative Principle of Political Constitutions. Little Brown, Boston. (Orig. pub. 1809.)
Friedan, Betty (1921–2006)
MONICA THRELFALL

Friedan is widely considered to be the founder of modern US feminism, and as this ushered in the second wave of feminism in Europe and later sparked off new first waves in many other countries until it became a worldwide movement, it is not surprising that Friedan sometimes claimed to have changed the course of human history. Certainly Friedan, born soon after World War I, was well in advance of her era’s thinking when she undertook her original project to examine whether housewives were happy with their lot. But her first book containing the bombshell of women’s pervasive discontent was also timely as it was published in the same year as the official Kennedy Commission on the Status of Women’s report American Women, which also questioned women’s exclusion from nondomestic life. The discrimination of women was on the agenda, and the moment for sex equality had come.

Born Elizabeth Goldstein in Peoria, Illinois, on February 4, 1921, Friedan experienced ostracization at school for being Jewish, retreating into the world of books – her father was said to have limited her to five a week. She became active in Marxist and Jewish circles from an early age. Upon attending Smith (1938–1942), an elite women’s college, Friedan felt snubbed by fellow students. A prize-winning scholar, she edited the college magazine and graduated summa cum laude as one of the best students of the year. After another scholarship to undertake graduate work in psychology, Friedan left academia for journalism, writing for left-wing and trade union publications, publishing scathing articles about women’s unequal pay and opportunities. Yet she was sacked by the United Electrical Workers Union in 1952 when discovered to be pregnant.

In the late 1950s Friedan made the discerning decision to get back in touch with her unloved Smith College contemporaries with a questionnaire about their lives. A classic piece of inductive research with no set hypothesis to test, the 200 responses revealed how 90 percent of these highly educated women felt empty. Living as housewives, they regretted using their minds so little – a frustration Friedan called “the problem that has no name.” Her initial article went unnoticed but her book about these revelations, The Feminine Mystique (1963), exposed the lie of feminine fulfillment as wife and mother, and went on to sell three million copies.

Friedan not only became one of the major activists for women’s liberation, but arguably had the highest national profile, as she was co-founder and first president of NOW, the National Organization for Women (1966); organizer of the nationwide Women’s Strike for Equality (1970); part of the team led by Gloria Steinem that established the National Women’s Political Caucus (1971); and one of the leaders of NARAL-National Association for the Repeal of Abortion Laws (1969). The latter successfully pushed for the legalization of abortion, obtained through the Supreme Court’s 1973 Roe v. Wade decision.

After these groundbreaking successes, Friedan’s politics diverged from that of other leading feminists, tending toward conciliatory stances on abortion, lesbian rights, and pornography, in a bid to make the women’s movement more mainstream, to address employment issues, and to avoid divisive topics that generated political animosity and laid the movement open to the charge of extremism. She led NOW to distance itself from lesbian causes, which she is alleged to have called “the lavender menace” in 1969. As Marilyn French wrote of Friedan’s next book, It Changed My Life (1976), Friedan became a bridge between the conservative and radical elements of feminism because the movement she was instrumental in launching moved
toward a politics with which she could no longer fully identify. Her call for a dialogue between the sexes became clearer in *The Second Stage* (1982), in which Friedan expressed her conviction that heterosexual women should feel free to love men and be centrally involved with their children and family life. “Our failure was our blind spot about the family,” she claimed (203). It was “the new feminist frontier.” She was certainly prescient about the family problem, at least for European feminism as it turned in the 1990s to focus on family-friendly policies, reconciling employment with family life through extended maternity and parental leave schemes. By the turn of the century, the politics of care was key to feminism, as reflected in the slogan “Mothers Matter, Caregivers Count,” as NOW currently proclaims.

By the time of *Beyond Gender: The New Politics of Work and Family* (1997), Friedan had read and responded to the new economic era – controversially – by envisioning feminism leaving sexual politics behind to become part of a wider movement and discourse that would foreground the needs of women, men, and children against the forces that were making family life ever more difficult. She called for a more livable society in the face of corporate downsizing, joblessness, and diminishing incomes. Nonetheless, in her concern to address the majority of the public, she underplayed the oppressive side of family life and its frequent violence. But 15 years and a world crisis later, her perceptiveness regarding the deteriorating environment of family life in the United States remains well evidenced.

Friedan also used her exceptional intellectual powers on her own ageing process. At 72 she published the encyclopaedic *The Fountain of Age* (1993), some 700 pages that have the “readability of a novel,” as one reviewer put it. It too launched into new territory, configuring a new problem without a name, the age mystique. She decried the medical model of age that equated aging to overall decline, calling it an injustice to older workers that precipitates lost opportunities for all, and denounced the media’s blackout of images of anyone over 65. She developed psychotherapist Eric Ericson’s term *generativity* – the wholeness of age that enables the elderly to see their life in the image of a single branching tree, and to affirm all of it, surmounting past obsessions and delusions (614). She believed “The new explosion of human age has to have some function in the survival of the whole community, stretching into the future. In evolutionary terms, the function of age has to go beyond reproduction to contribute in some other way to the survival of the species” (637) – which contrasts markedly with the current paradigm.

Friedan made her definitive impact as a US civil society leader bolstered by her originality – being the first of her era to have key insights into women’s oppression, by her leadership ability to found nationwide organizations, and by her combination of scholarly brilliance with straightforward written expression. She possessed a journalistic openness to taking in facts on the ground – even when they were unpalatable to society (exclusive homemaking frustrates educated women) or to the US women’s movement (women want to marry men, bear their children, and nurture their family). With a powerful intellect fully at the service of the political cause, she pushed ahead of feminist contemporaries in her thinking. Katie Roiphe called her (US) feminism’s foremost visionary and thinker.

But unfortunately for feminism, she was unable to make lasting alliances with the leading US feminists and her political career was closed off by early disappointments. Though reputed to expect too much deference from others, over-emphasizing her singular personality – as Germaine Greer famously did in her hyper-critical 2006 obituary – is to miss the point. The respect due to Friedan lies in her perceptiveness regarding the problems she saw besetting society and her creativity in dealing with them, always seeking to throw light, avoid obfuscating language, and focus on political solutions. But by confining herself to writing she was unable to influence the socioeconomic trends she perceived as damaging to the lives...
of average women and men from the 1980s onward. Friedan died on February 4, 2006, aged 85, and is survived by her three children.

Friends of the Earth
CLARE SAUNDERS

Now an international network with chapters in 76 countries uniting 5000 local groups and over two million members, Friends of the Earth (FoE) was first established in the United States in 1969 by David Brower. Brower was motivated by his disenchantment with the more moderate Sierra Club and the Audubon Society, which he considered were co-opted by corporate interests and weakened by the “wise use” agenda. Consequently, academic commentators have noted that the foundation of FoE marked the beginning of a “second wave” of environmentalism, more politically oriented and anticorporate than the “first wave” conservation organizations that preceded it (Dalton 1994).

In 1971, Brower set off across Europe to network FoE, beginning in Paris. Les Amis de Terre was the first European FoE organization to be founded, followed shortly afterward by FoE England. Although Brower would have liked the organizational structures of FoE US to be imported directly to the English chapter, the founders – drawn from existing green networks, including those behind the publications Resurgence and The Ecologist – resisted. They eventually agreed that so long as the organization worked within a remit conducive to the broader FoE agenda, they would be allowed to be a part of the network (Lamb 1996: 35–36). According to Sandbrook, FoE England’s first director, “the deal was simple, just ‘railway lines’ to live within” (in Lamb 1996: 38). The “railway lines” principle has continued to distinctly shape Friends of the Earth International (FoEI).

FoEI was established in 1971 by newly formed groups in France, Sweden, England and the United States to facilitate joint campaigns, initially against nuclear power. In 1981, the joint secretariat, which is currently based in Amsterdam and has around 15 staff members, was established to improve capacity for transnational campaigning.

The minimal requirements upon prospective members of FoEI are that they: have mechanisms for internal democracy; adhere to FoEI’s general mission; can and will contribute to at least one of FoEI’s campaigns; and that they have campaigning experience (Doherty 2006). These fairly nonprescriptive membership requirements result in stark differences between national FoE chapters. For example, BUND (Bund für Umwelt und Naturschutz Deutschland), otherwise known as FoE Germany, and Amigos de la Tierra (FoE Spain) are both federations of previously existing environmental organizations, which, in the 1970s, expressed a willingness to take on board the more radical ambitions of second-wave environmentalism. Yet they drastically differ in size – FoE Germany has over 2000 local groups, and FoE Spain has only six. In contrast, FoE Philippines, also known as the Legal Rights & Natural Resources Center-Kasama sa Kalikasan, consists of a group of environmental lawyers, which networks with grassroots campaigners. This diversity is part of what makes FoE so distinct from other transnational environmental organizations like Greenpeace and WWF, which are much more hierarchical and considerably more prescriptive about the characteristics of their national chapters.

Not only is there organization diversity within FoEI, but there are also a range of ideological positions, different geographical settings and political climates, and variable degrees of power in the network. For example, many southern groups are ideologically opposed to the World Trade Organization, whereas others, such as FoE Canada, have entered into dialogue with it. Some country groups – like Colombia – are heavily repressed, and others are welcomed to sit on governmental round tables. Thus, it is hardly surprising...
that, despite the one-country one-vote policy in FoEI annual general meetings, some southern FoEI organizations have historically felt marginalized by what they had perceived to be a northern-dominated agenda. Doherty (2006), however, clarifies that, in practice, there is no simple north–south divide in FoEI. Indeed, some northern FoE organizations have overtly promoted southern agendas for some time (Rootes 2006). Despite disputes, the FoEI network has managed to sustain itself through its open, honest, and transparent conflict resolution and decision-making processes (Doherty 2006) and through having a broad mission statement.

The current mission of FoEI is to “mobilize, resist, transform” around its key campaigns on climate justice, food sovereignty, economic justice, forests and biodiversity, resisting oil and gas mining, and water. Its vision is:

A peaceful and sustainable world based on societies living in harmony with nature . . . This will be a society built upon people’s sovereignty and participation. It will be founded on social, economic, gender and environmental justice and free from all forms of domination and exploitation such as neoliberalism, corporate globalization, neo-colonialism and militarism. Gandhi, Mahatma
(1869–1948)

LESTER R. KURTZ

Mohandas Karamchand Gandhi, often known as Mahatma Gandhi, is widely cited by contemporary activists as a source of inspiration and strategies. Gandhi was arguably unparalleled at mobilizing resources, taking advantage of – and creating – political opportunities, and effectively framing such messages as justice, equality, and independence or freedom (Swaraj, self-reliance). His legacy has almost become a cliché among movement organizers worldwide.

Raised in an Indian household, Gandhi was trained as a lawyer in London. His father was the diwan (chief minister) of a small princely state in the British Raj and his mother a pious Hindu with a tolerance for other traditions; this combination of faith and politics shaped his activism. Experiencing raw racism in South Africa while working as an attorney for a Muslim trading firm, Gandhi developed a repertoire of resistance that became a mainstay of social movements. On September 11, 1906, he launched his first campaign of nonviolent noncooperation with a new law that required all Indians to carry an identity pass manifesting their second-class citizenship. He transformed the traditional Hindu idea of a spiritual community, the ashram, into a base for movement organizing, bringing together people across religious, cultural, class, and caste divisions in a way that decades later inspired civil rights activists in the United States.

Gandhi was traditional, although far from orthodox. He incorporated multiple traditions into his worldview and strategies – Hindu, Christian, Islamic, Jain, Buddhist, and ironically, secular British legal theory. He was, as Erikson points out, always a “counterplayer,” a scathing critic and paradigm challenger, not only of the British Empire but of Western industrial civilization. His drawing from these cultural traditions was not just a matter of ideology but a use of cultural capital for mobilizing institutions on behalf of social movements, primarily the Indian independence movement, but also on behalf of women’s liberation and the reform of the caste system, as well as the construction of a new nonviolent, just social order. Central elements of his strategies came from those spiritual traditions, refashioned for purposes of movement mobilization: the tactics of the fast (hunger strike) and pilgrimage-marches, daily prayer meetings to mobilize and inform adherents of ongoing actions and to build movement solidarity, and the frames he used to reach out to multiple audiences from the Indian masses to Hindu and Muslim communities, British Christians, and others, were all transformed elements of these traditional cultures that he made revolutionary.

At the root of Gandhi’s success in mobilizing against British colonialism in his native India, the “Jewel in the Crown,” was his concept of noncooperation and nonviolent resistance, what he called Satyagraha, literally holding fast to the Truth (Satya) or nonviolent struggle – sometimes called Truth Force or Soul Force. This approach synthesizes the two contradictory ethical traditions about how to respond to injustice, the warrior and the pacifist. The Gandhian activist fights like the warrior but, like the pacifist, avoids harming.

Armed only with this idea of nonviolent struggle and a set of strategies and tactics for noncooperation with the colonial system, Gandhi mobilized the great mass of the Indian population. He transformed the independence struggle from one between a small group of indigenous and colonial elites, plus a few marginal armed insurgents against the military might of the British Empire, into a mass struggle of the Indian people, testing the
ability of occupying forces to control an entire population that refused to cooperate. In the end, people power prevailed, as it more often does, as Stephan and Chenoweth demonstrate in their book *Why Civil Resistance Works* that compares success rates of Gandhian-style nonviolent resistance with violent insurrections over a century. The major determining variable for success of campaigns to end a foreign occupation, overthrow a dictator, or secede, was the level of participation. Gandhian nonviolent resistance was more successful in mobilizing activists because of lower physical, moral, and information barriers to engagement in a campaign for change.

Gandhi’s strategies and tactics were skillfully framed to create opportunities in the face of overwhelming political and military control of the British Empire. The two key campaigns—the Cloth Boycott and the Salt March—were highly symbolic but also “framed,” as Snow et al. (1986) put it, to confront the power structure. At the core of his approach was an understanding of power that challenged political realism: power grows out of multiple sources, not just the state and its military, and even the tyrant cannot rule without the consent of the governed. By refusing to cooperate, a system is rendered ungovernable.

Gandhi’s call for a boycott of British cloth in 1920 strategically attacked the British system built on the technological advances of its textile industry that relied on raw materials from and markets in its colonies. Rather than buying British cloth, Gandhi declared, Indians should make their own, simultaneously giving people an opportunity to resist British exploitation, participate in the independence movement in a low-risk but visible way, and benefit themselves, the movement, and Indian society at large economically. The spinning wheel became a low-risk symbol of resistance while simultaneously mobilizing unused labor resources for economic development.

Gandhi’s Salt March in 1930 was dramatic and symbolic noncooperation, strategically focused on a specific goal that mobilized widespread participation and prompted civil disobedience that overloaded the colonial system and its prisons, all the while inspiring and empowering people to act. Marching through the Indian countryside with an entourage that increased daily, Gandhi was met by spinning freedom fighters and local officials whom Gandhi called upon to resign their posts in the Raj. He involved women and “untouchables” in the movement, crossing gender and caste lines to transform fundamental aspects of Indian society in a way that far outlasted the movement, although some criticized him for broadening the agenda beyond independence, bringing in other issues.

The marchers arrived at the Indian Ocean on the anniversary of a bloody massacre of unarmed demonstrators by British troops at Amritsar a decade earlier. As Gandhi picked up salt from the shore in defiance of British law, he engaged in a type of repression management that takes advantage of what Smithey and Kurtz (1999) call the “paradox of repression,” in that efforts to clamp down on a movement often backfire against a regime, creating internal divisions and moving public opinion in favor of the opposition. The march itself became a memorial highlighting the injustice of the massacre and British rule itself, which attempted to control even the daily lives of South Asians who relied on salt as a preservative.

Gandhi’s rethinking of conflict and power had an impact on social movement theory and strategies for decades to come. Noted conflict scholar Johan Galtung argues that Gandhi is to conflict what Einstein and Newton are to physics—he gave us an altogether new paradigm for thinking about contentious politics as something positive. Conflict is not necessarily to be resolved, but can be creative and should sometimes be provoked, although carried out nonviolently. His understanding of power involves a similar challenge of conventional thinking. Moreover, one should (1) respect one’s opponents as people, fighting the structure rather than those who represent it; (2) refuse to cooperate with unjust power (noncooperation); and (3) create alternative
systems of power through nonviolent civil resistance.

Gandhi’s legacies in the field of social movements are iconic, if often misunderstood and debated, they are used to legitimate campaigns by everyone from Martin Luther King Jr and the American civil rights struggle to the 1989 East European revolutions, the 2011 Arab uprisings, and the 2011 Occupy Movement, but were also quoted at the United Nations by US President Ronald Reagan.

The Indian Freedom movement inspired anticolonial movements elsewhere, with some movements explicitly modeled after Gandhi’s, notably Kwame Nkrumah and Julius Nyerere’s, the latter claiming that Gandhi’s success “made the British lose the will to cling to empire.” A. Philip Randolph, Mordecai Johnson, Benjamin Mays, and other African-Americans began exploring Gandhi’s mobilizing techniques as early as the 1920s and a Yale Seminar on the Negro Church in 1931 passed a resolution contending that African-American churches should develop “a type of leadership that would do for America and the Negro race what Gandhi has done for India and what Jesus has done for the world.” Gandhi-mentored activists George Houser and Bayard Rustin tutored Dr King and the Montgomery Improvement Society on Gandhian tactics, and the American Friends Service Committee sent the Kings to India to consult with Gandhi’s colleagues. Human rights and ecological movements drew upon Gandhi’s inspirations, strategies, and tactics worldwide, disseminated through religious institutions (especially churches), NGOs, and various committed activists.

Whereas King baptized Gandhi’s nonviolence, giving it a Christian frame, American scholar Gene Sharp secularized and systematized it after spending time studying Gandhi in India in the 1940s. Coretta Scott King wrote the foreword to his first book on Gandhi as a political strategist, and his three-volume outline of The Politics of Nonviolent Action published in 1972–1974 analyzed Gandhi’s theory of power and change, providing historical examples of 198 categories of nonviolent actions that had had some impact when used by various movements worldwide.

Sharp criticized Gandhi for his religious rhetoric and spiritual aura, as well as his personal charisma, claiming they were counterproductive, especially when trying to diffuse civil resistance strategies and tactics to other resistance movements globally. His later elaborations of nonviolent civil resistance were translated into many languages and used by activists to challenge dictators and shake power structures; his From Dictatorship to Democracy continued to guide many of those who shaped the 2011 insurgencies from Cairo to New York.

Gay and lesbian movement

STEPHEN VALOCCHI

The gay and lesbian movement refers to the manifold collective efforts to benefit people with same-sex desire. A movement for gays and lesbians could not have happened until “the homosexual” emerged as a distinct person rather than just a set of acts. This occurred in the late nineteenth and early twentieth centuries as the result of the efforts of sexologists to define and control nonnormative sexual and gender practices in Europe and the United States. Although an organized movement to reverse the negative discourse of the sexologists first appeared in Germany in the late nineteenth century, this effort was short-lived. The first sustained activities, organizations, and network-building for the positive recognition of lesbians and gays and the improvement of their social and political conditions appeared in the United States in the 1940s and 1950s with the establishment of three organizations: the Mattachine Society, the organization for men which devoted itself mainly to social support in a climate of profound public hostility; the Daughters of Bilitis, the organization that concerned itself with the unique challenges of women with same-sex desire at a time when women were supposed to be dependent on men for economic and social support; and One Inc. which existed only as a monthly magazine and promoted the view that gay people, rather than psychiatrists or lawyers, are the most qualified to speak for themselves. With the exception of One Inc., these organizations stressed respectability and the desire to be accepted into mainstream society.

In the 1960s, the gay and lesbian movement entered a new phase as social movements created a more militant climate for disenfranchised groups in the United States and forced the movement to shift its focus, strategy, and goals. Although this shift happened at different rates in different locations, the iconic event credited with this shift to a more liberation-based social movement was the Stonewall riots of late June 1969 when a routine police raid on a gay bar in Greenwich Village in New York City met resistance by the patrons and sparked several nights of rioting. In its aftermath, the movement devoted itself to two somewhat conflicting goals: the pursuit of civil rights reforms such as the passage of antidiscrimination legislation and the elimination of sodomy laws, as well as demands for more fundamental social change aimed at eradicating heterosexism and sexual repression. By the end of the 1970s the liberationist impulse dissipated but a rights-based approach proved somewhat more successful. Regardless of the particular goal – liberationist or reformist – the movement embraced the strategy of “coming out of the closet,” making public one’s identity as gay or lesbian. This assertion of a collective identity proved beneficial to the movement since it gave gays and lesbians access to the language of pride, history, and shared oppression used by other minority groups.

The development of the movement during this time cannot be told without reference to the tensions between men and women in the movement and to their subsequently different trajectories of community building. Post-Stonewall collaboration between men and women was sporadic as women experienced homophobia in women’s liberation groups and sexism in male-led gay groups. Nonetheless, the profound influence of the women’s movement led many women to build lesbian feminist organizations defined more by women’s resistance to patriarchy than by women’s sexual desire for other women. This tendency led in the 1980s to the development of women-identified institutions, from bookstores and cafes to sexual assault and rape crisis centers. During this
same time gay men were building their own networks of community institutions but these were of a more commercialized nature in the form of bars, nightclubs, neighborhoods, and sex clubs. Both types of community building proved useful in creating an infrastructure for future mobilizations.

Given the association of gay men with a liberalized sexual culture and lesbians with feminism it is not surprising that the visibility of the gay and lesbian movement in the late seventies and eighties led to the rise of a significant countermovement in the form of the religious Right. This countermovement complicated the terrain of the movement and forced it to re-orient its rhetoric, strategies, and goals to respond to the claims of this organized opposition. Perhaps more important, many of the campaigns by the religious Right directed at state and local civil rights laws and ordinances were successful in reviving the rhetoric of immorality from the earlier pre-Stonewall era. The election of a conservative Republican administration in 1980 also left the gay and lesbian movement vulnerable and the community without political support when AIDS starting killing thousands of gay men.

The AIDS epidemic had several consequences for the movement. First, issues of treatment, care, and funding came to dominate the agenda of the movement in the eighties and early nineties. Second, it led to the establishment of a dense network of AIDS service, advocacy, and treatment organizations that emerged fairly rapidly due to the already established community- and health-based resources of the gay and lesbian community. Third, its widespread impact brought many more people “out of the closet” and into the movement and propelled the movement into a period of heightened mobilization. Fourth, because of the involvement of many lesbians in this new mobilization and in those care-giving organizations, it led to a closer association between men and women in movement initiatives than had been the case since the 1970s.

The epidemic was also partly responsible for a brief but notable shift in focus for some segments of the movement in the 1990s. Dissatisfied with the narrowly rights-focused, assimilation-based goals of the movement, a new militancy invigorated the movement, first in the form of ACT UP (AIDS Coalition to Unleash Power), then with organizations such as Queer Nation and the Lesbian Avengers. These organizations rejected the standard definitions of gay, claimed the more nonnormative moniker of “queer,” and embraced direct-action strategies that were directed both at social institutions like the government and the medical establishment and at the general culture seen by these activists as homophobic, sexist, and anti-pleasure.

Various internal challenges also characterized the movement at this time all of which signaled a loosening of the dominant identity categories of gay and lesbian. Women and men of color, bisexuals, and transgendered activists challenged the white middle class nature of the movement and its notion of a fixed identity defined by sex of object choice and insisted the movement take their concerns seriously. These fissures became visible in the organizing for the national marches on Washington, DC in 1979, 1987, and 1993. Many women in the nineties also rebelled against the rigid definitions of lesbian feminism by rejecting the androgynous styles and sex-negative attitudes of some segments of this community, embracing leather and s/m sexual repertoires, and reviving and re-eroticizing butch-femme modes of style and embodiment.

The most recent developments in the lesbian and gay movement can be understood against the backdrop of the somewhat more favorable political climate of the 1990s and 2000s, the repeal of sodomy laws in 2004, the heightened cultural visibility of gays and lesbians in the media, and the growth of centralized advocacy organizations. Taken together these developments led the movement to pursue several top-down policy initiatives. The issue of gays in the military consumed much of the movement’s attention throughout this period,
first in organizing to push President Clinton to make good on his campaign promise to end discrimination against gays and lesbians, then in trying to undo the damage done by Clinton’s “Don’t Ask Don’t Tell” policy which had the effect of expelling from the military men and women who expressed any statement of same-sex desire or affiliation. These efforts continued until 2010 when Congress finally voted to repeal the directive; implementation, however, has been delayed pending “further investigation.”

The movement and the nation have also been captivated by the push to legalize same-sex marriage in the United States. Partly in response to court challenges in Hawaii and Massachusetts, the movement has marshaled tremendous resources to support these lawsuits, but also to prevent anti-same-sex marriage bills from being introduced into state legislatures and in Congress, and more recently to push for legally recognized “bona fide” same-sex marriage. Both of these policy initiatives – gays in the military and same-sex marriage – signal a return to a rights-based, assimilation-focused orientation to the gay and lesbian movement. This shift has also relegated other pressing issues of concern to the margins of the movement.

Until the late 1980s with a couple of exceptions (Altman 1993; Adam 1978), the gay and lesbian movement was not systematically studied by sociologists. Until that time homosexuality was mainly studied in the context of deviance, subcultural formations, and the formation of a homosexual identity via symbolic interaction. It was mainly the impact of the social movements of the sixties that transformed sociology’s understanding of homosexuality from a deviance perspective to the study of a minority group. It was also due to the development of theoretical frameworks that viewed collective action not as a consequence of collective alienation and irrational exuberance but as (organized and rational) politics by other means. The resource mobilization and political process approaches to social movements called attention to the structure of opportunities in the political environment and the quantity and quality of resources of the constituency which in turn affect the emergence and success of social movements directed mainly at the state. New social movement approaches emphasize a wide array of post-scarcity movements sometimes organized on the basis of social identities and directed not primarily to the state but to challenge “stigmatizing public discourses and representations” (Seidman 1993: 108). More recently, social constructionist perspectives that emphasize the symbolic and interactive nature of all aspects of social movements have been revived and revised as a corrective to the overly rationalist basis of these earlier approaches.

Since the 1980s sociologists who have studied the movement have focused on five sets of issues. The first set involves research on the structural conditions that led to the emergence of an organized movement. This research has stressed the importance of the rise of industrial capitalism, changes in the nature of the family accompanying capitalism, the impact of bureaucracy on intimacy among men, and the rise of medical science. These factors taken together had contradictory consequences: on the one hand, they created the contexts whereby individuals with same-sex eroticism could turn desire and practices into an identity and find others in urban areas that did the same. On the other hand, these same factors named the identity as pathological, established a medical and regulatory apparatus to police the identity, and created the (homo)phobia regarding expressions of same-sex emotional intimacy or sexual expression. These conditions generated the political opportunities or threats, resources and organizations, and grievances that led to mobilization on the basis of a sexual identity.

A second set of issues involves research on the goals of the movement. The initial impulse of the movement had been the desire to change the way the culture views homosexuality: the movement emerged in a society that saw homosexuality as sin, sickness, or crime. Later, the movement shifted to working for civil rights through the state and other social institutions.
This dual emphasis of the movement on changing culture and changing laws and policies makes it an interesting case study for sociologists since it allows them to engage issues of reform versus structural change, assimilation versus transformation. Work on this issue has focused on specifying the historically variable conditions which influence whether movement actors will focus on politics, culture, or some combination of the two. This research strategy brings together the concerns of political process and resource mobilization approaches with political climate, resources and networks, and the concerns of new social movements’ and social constructionist perspectives on changing norms and belief systems and with building a collective identity.

The third set of research issues involves the ways that the movement constructs and reconstructs collective identity. Collective identity refers to the “shared definition of a group that derives from members’ common interests, experiences and solidarity” (Taylor & Whittier 1992: 172). Another unique feature of the gay and lesbian movement derived from the socially constructed nature of sexuality is its concern with defining the constituency: who is the “we” that the movement represents? This feature has proven more pressing as conflicts between men and women, between whites and people of color, and battles over the inclusion of bisexuals, transgendered, and intersexed persons have taken place. These battles are about the collective identity of the movement. Research on this issue seeks to explain how the boundaries are established and who gets to police them. It focuses on the material, organizational, and symbolic factors such as the class interests supporting the collective identity, the organizational structure that prevents other competing definitions from taking shape, and the symbolic messages embedded in the collective identity about “respectability” that is then communicated to the larger culture.

Related to this set of issues is a fourth focus on framing. Framing refers to “an interpretive schemata” (Snow & Benford (1992): 137) that distills the message or messages of the movement for several purposes: to recruit a constituency, create a collective identity, craft strategy, and gain outside support. Framing is fraught with dilemmas for all social movements since frames try to satisfy a number of potentially conflicting agendas. For the gay and lesbian movement this is particularly significant given its framing as both a political and cultural movement, the fractious nature of the collective identity, and the strength of the countermovement. Research on this issue has typically demonstrated the tensions occurring between a civil rights framing strategy – a dominant frame of many social movements – and other strategies derived from the varied nature of the movement. Frames such as sexual liberation or institutional heterosexism have competed with the civil rights frame and these competing frames rise and fall in tandem with internal struggles around collective identity and the external opportunity structure. More recent research on the “decision-making processes” of the movement has rejected the overly rationalist assumptions of the framing approach and has reintroduced anger, shame, frustration, grief, and other emotions as important determinants of the shape of collective action.

A fifth focus is the impact of queer theory and politics on the study of the gay and lesbian movement. Queer theory has called attention to the instability of sex and gender categories and stresses the performative nature of identities thought to be rooted in anatomy or culture. Queer politics extends this deconstructive analysis and critiques the gay and lesbian movement for its essentialist definition of sexual identity and its stabilization and normalization of the identities of gay and lesbian. According to this critique, identity-based strategies for social change deny the fluidity inherent in sexuality and invalidate the experiences of others with nonnormative sexuality that may not easily fit the class and race or Western-inflected definition of the identity. In addition, identity-based strategies reinforce the boundaries between gay and straight, man and woman, and thus reproduce the hierarchical relationship between the dominant and
the subordinate terms of the sex/gender system. This challenge to the essentialist model of sexual identity of the traditional gay and lesbian movement was first made by ACT UP with its boundary-crossing and label-disrupting tactics and by bisexual and transgendered people who exemplify the kind of boundary-crossing embraced by queer politics.

Research on the movement that has used queer insights has focused on the internal and external pressures that influence when identity-stabilizing and identity-deconstructing frames and strategies will be used noting both the concrete gains made through interest-group politics and the cultural challenges made through identity blurring queer politics. These insights have also been used to assess the subtle but effective normalizing work that takes place inside gay and lesbian politics and organizations. A queer-inflected understanding of social movements has also broadened the repertoire of collective action to include strategies such as political theater, performance art, music, and drag. This broadening dovetails with the cultural concerns of the movement as well as with the deconstruction of sexual and gender identities that now inform some segments of the contemporary movement. The challenge for sociologists in our future work is to extend, refocus, or alter our theoretical models of emergence, development, and impact to explain collective action repertoires as diverse as the sit-down strikes of the 1930s and the drag shows of the twenty-first century.

Global Justice Movement

CHRISTOPHER ROOTES and NIKOS SOTIRAKOPOULOS

The “Global Justice Movement” (GJM) has been employed as an umbrella term to denote a diverse constellation of organizations, groups, and networks, working with varying degrees of cooperation on a broad range of issues – from the indebtedness of the world’s poorest countries, the inequities of the global trade in goods and services, international peace and environmental degradation, to the human rights of workers and immigrants, especially in less economically developed countries. These issues are linked by an emerging consensus amongst activists that their root cause is the neoliberal agenda, or “Washington consensus” (George 2003), that dominates global economic arrangements.

The term does not command a consensus among analysts and commentators, but coexists with a variety of others frequently used to denote all or part of the same range of issues, actors, and forms of action. Thus the terms “antiglobalization movement,” “alterglobalization movement,” “alternative globalization movement,” “movement for democratization from below,” and “movement of movements” have been and continue to be used, especially, but not only, by activists. Each of these terms, however, has disadvantages: “antiglobalization” is insufficiently discriminating insofar as it suggests opposition to all the dimensions of globalization when, in fact, GJM activists embrace and celebrate many aspects of globalization, including intercultural communication and relatively unfettered migration; it is specifically neoliberal globalization to which they object. GJM activists are then enthusiasts for a different or alternative globalization, hence the term “alterglobalization,” whose principal disadvantage is that it has no meaning in colloquial English.

“Alternative globalization movement,” however, is too imprecise to have meaning beyond activist circles. The “movement for democratization from below” adequately characterizes only one aspect of the movement, and is silent about the element of just distribution of resources and opportunities that animates most GJM activists, while “movement of movements” is insufficiently specific about the range of movements that are embraced by the GJM.

If the constellation of groups and concerns that is embraced by the GJM is broad, so too is its action repertoire – or, more precisely, the action repertoires of the various groups and individuals who are networked in the movement. These range from the direct and sometimes illegal, occasionally even violent, actions of autonomous “affinity groups,” to the organized lobbying of conventionally organized nongovernmental organizations (NGOs).

Following Diani’s (1992) “consensual” definition of a social movement, we conceive of the GJM as a network of formal and informally organized organizations and individuals who have in common a concern to campaign or protest, in one way or another, against the global neoliberal agenda, and who are engaged in collective action toward that end. This definition allows us to cast the net fairly wide, and allows for cross-national and temporal variation in the composition of campaign coalitions and activist networks, and the forms of action in which they are engaged, and the specific targets to which their action is addressed.

While this conception of the GJM may differ from activists’ views of the “direct action” or “anticapitalist” movement, it allows us to chart important changes in NGOs and other movement organizations as they have become increasingly aware of the nondemocratic nature of the institutions of the international financial, economic, and trading system that relentlessly pursue the neoliberal agenda, and its effects upon the issues with which those NGOs and
movement organizations are particularly concerned. NGOs working on trade, development, aid, racism/immigration, human rights, environmental, and peace issues are increasingly networked one with another, within nation-states and transnationally, and increasingly they challenge the key institutions of global capitalism. Although their linkages with more informal activist groups and “disorganizations” may not be close or stable, to restrict our conception of the GJM to such less formal activist groupings would be to omit from consideration organizations that give continuity to the movement between major protest events and that act as intermediaries in the translation of popular and activist opinion into formal politics.

The movement is, then, pluriform and diverse, a heterogeneous network linking local, national, and international campaigns on various issues arising from or associated with the numerous alleged evils of neoliberal globalization, which include: intensified exploitation (a global “race to the bottom” in wages and social welfare); increasing social inequality; political inequality (within states and among them); cultural homogenization; and increased environmental destruction (Kiely 2005: 166).

THE GJM: BEGINNINGS

The roots of the GJM extend far back into European history. The international socialist movement can be seen as a precursor; not only was it centrally concerned with justice for those who were disadvantaged by the capitalist system and the terms of trade that capitalist states imposed upon the world, but it was virtually global in its reach, mobilizing, or attempting to mobilize, not only the industrial workers of the most industrialized capitalist states, but extending solidarity to the colonized peoples of the capitalist periphery, actively recruiting intellectuals and activists from among them, and seeking to mobilize on a truly global scale. If the international socialist movement was compromised and divided by the pathologies of Soviet communism, it survived in most countries as a significant current in intellectual and activist life, if only rarely as a major player in mainstream electoral politics. Some of its influence was, nevertheless, continued in dilute form in the politics of social democratic and labor parties and trades unions, notably in Western Europe. The influence of the socialist, social democratic, and labor movements is apparent in the modern GJM, but it is conjoined with other strands.

The modern GJM has often been dated from the “Siege of Seattle” of November 1999, when between 30,000 and 90,000 people, drawn from or mobilized by a broad coalition of campaigners, including anarchists, leftists, trade-unionists, environmentalists, religious groups, NGOs, local and international activists, and violent and nonviolent protesters, besieged the World Trade Organization (WTO) Ministerial Conference. Seattle was, however, the sensation that caught the attention of the mass media rather than a true beginning. In the immediately preceding years, there had been mobilizations against the North American Free Trade Agreement (NAFTA) and the Multilateral Agreement on Investment (MAI), the recourse of transnational corporations to sweatshop labor to produce consumer goods, and numerous protests in the global South against privatization and corporate exploitation. The battle in Seattle may have taken the media by surprise, but it was the product of months of planning and organizing, had antecedents in various prior campaigns, and reflected broader social, economic, and political changes (Bhaskar 2011).

A major inspiration for these acts of rebellion in the global North and, for many, the symbolic starting point of the GJM, was, however, a movement in the global South: the Zapatista uprising in the Mexican province of Chiapas. The transnational Zapatista solidarity network both helped to sustain the rebellion in Chiapas and, in its opposition to the NAFTA, was one of the bases from which other protests against neoliberal globalization were organized, often with the aid of the then
new communications technologies of the Internet (Olesen 2004). The international Zapatista encuentros (encounters) in 1996 in Chiapas and 1997 in Spain attracted activists from over 40 countries and forged links between Mexican peasants, landless Brazilians, and Indian farmers, amongst others. One development from these was People’s Global Action, a network dedicated to unmediated interaction, diffusion of information, and coordinating actions globally among autonomous groups and grassroots movements committed to direct action and civil disobedience as the most effective form of struggle against encroaching capitalism.

THE RADICAL STRAND OF THE GJM

For some critics, the anticapitalist and direct activist strand of the GJM, having borrowed many elements from earlier new social movements, is essentially antipolitical, focusing on symbolic and cultural forms of resistance because that, its advocates believe, is where the relations of power are rooted, rather than in conventional political arenas and institutions (Morland 2004: 32). As John Holloway (2005: 17), a writer influential in radical circles of the movement, put it: “what is at issue in the revolutionary transformation of the world is not whose power it is, but the very existence of power.”

For such observers, the central locus of the GJM is not the realm of the political but that of civil society, indeed that of a global civil society constituted by “a supranational sphere of social and political participation in which citizens, groups, social movements, and individuals, engage in dialogue, debate, confrontation, and negotiation with each other and with various governmental actors – international, national, and local – as well as the business world” (Anheier, Glasius, & Kaldor 2001: 4). This global civil society is contentious and open-ended, and it is itself a product of globalization.

From the point of view of an activist, this global civil society “refers to active citizenship, to growing self-organization outside formal political circles, and expanded space in which individual citizens can influence the conditions in which they live both directly through self-organization and through political pressure” (Mary Kaldor, cited in Kiely 2005: 198). One can understand the movement only by seeing how “its dynamics have been shaped by an underlying and quite ferocious contest over people’s interpretations and understandings of the supposed benefits of neoliberal economic policies” (Ayres 2004: 11). This “ferocious contest,” it is suggested, finds fertile ground in the emergent global civil society, for the movement considers the “mobilization of popular opinion” against the elites of the globalization process to be its most successful weapon.

The foundation of this global civil society is a transformed political economy. In the era of immaterial labor, biopolitical production by labor is characterized by autonomy (workers not needing capital in the course of immaterial production, irrespective of whether capital then comes and parasitically appropriates the products of such production) and cooperation (drawing from and at the same time producing common knowledge), a cooperation which is facilitated by rhizomatous horizontal networks. It follows then that these three – autonomy, cooperation, and horizontal networks – will also be the characteristics of the movement that challenges the neoliberal political-economic order or “Empire” (Hardt & Negri 2009: 353).

Similarly, for Chase-Dunn and Gills (2005: 53), the characteristics and values of the movement are: the struggle for social justice; inclusiveness (especially of those marginalized in or by the dominant neoliberal order); solidarity; equality; diversity and unwillingness to be subsumed under a single identity; peace and nonviolence; loose organizational networks; and its ad hoc nature.

These characteristics are mirrored in the movement’s distinctively prefigurative politics (Carter & Morland 2004: 87). The movement is not a means toward an apocalyptic utopian end; rather, it is mostly an endless process
of experimentation and a quest for ways in which tomorrow’s dreams can be realized in the present and how the movement itself can be a model for a free world. The by now clichéd motto “be the change you want to see in the world” is embodied in this radical strand of the GJM.

It is this creative, prefigurative politics that led Hardt and Negri (2009: 102) to argue that the best term to denote the movement was not “antiglobalization” but “alterglobalization,” as it embodies not only resistance to globalization, but also an alternative to it. The movement has not, however, proposed a holistic alternative model to the neoliberal capitalist paradigm. Its major slogan – “another world is possible” – signifies that the movement does not purport to prescribe a model for the future. Certainly, parts of the movement have made specific proposals: Attac (Association pour la Taxation des Transactions financière et l’Aide aux Citoyens or “Association for the Taxation of Financial Transactions and Aid to Citizens”) proposes a global tax on financial transactions in order to fund the alleviation of poverty and inequality; and the participatory economics project, PARECON, has detailed plans for the organization of society and economy in a future free society (Albert 2004). The inherent problem with these projects, however, is that they appear as isolated plans lacking any structural and holistic strategy for change. The radical camp is not lacking in plans and ideas for the future. What it seems to lack is a strategy for realizing such plans.

This is not to suggest that the movement has not been tactically innovative. Graeber (2002: 66) celebrates the novelty and the imaginative aspects of the movement because, through its organizational characteristics, it paves new paths for activism: “The effort to destroy existing paradigms is usually quite self-conscious.” Where once it seemed that the only alternatives to marching along with signs were either Gandhian nonviolent civil disobedience or outright insurrection, groups like the Direct Action Network, Reclaim the Streets, Black Block, or Tute Bianche have all, in their own ways, been trying to map out a completely new territory in between. They are attempting to invent what many call a “new language” of civil disobedience, combining elements of street theater, festival, and what can only be called nonviolent warfare. Graeber mainly refers here to the anarchist strand of the movement, but this new language of civil disobedience is indeed one of the main characteristics of the GJM.

The result is a rich and growing panoply of organizational instruments – spokescouncils, affinity groups, facilitation tools, breakouts, fishbowls, blocking concerns, vibe-watchers and so on – all aimed at creating forms of democratic process that allow initiatives to rise from below and attain maximum effective solidarity, without stifling dissenting voices, creating leadership positions or compelling anyone to do anything which they have not freely agreed to do. (Graeber 2002: 71)

Predictably, as also happened with the radical movements of the 1960s onward, such a movement comes with its own subcultural expression, one distinctive characteristic of which is the carnivalesque and grotesque attitude in protest (Langman & Halnon 2005: 273).

In many respects, the radical strand of the GJM marks a conspicuous revival of anarchism as a political philosophy and practice: “Anarchism is the heart of the movement, its soul; the source of most of what’s new and hopeful about it” (Graeber 2002: 62). From the mid-1990s, the world has seen “the full revival of a global anarchist movement on a scale and on levels of unity and diversity unseen since the 1930s. From anti-capitalist social centers and eco-feminist farms to community-organizing, blockades of international summits, daily direct actions and a mass of publications and websites – anarchy lives at the heart of the global movement” (Gordon 2008: 3). Indeed, the three key elements of modern production presented by Hardt and Negri – cooperation, autonomy, and network organization – immediately bring to mind anarchist principles (Juris 2008).
The anarchist strand of the GJM has undoubtedly given fresh air to radical movements, as it triggered an international wave of protest which was probably unique in its geographical extent and the hopes it inspired. The movement consciously attempted to learn lessons from the struggles of those in the South, notably the Zapatistas, who might be considered to constitute an informal vanguard of the movement. The movement thus became a platform where the South met the North, a forum where various radical ideologies coexisted and co-developed. But did it have any tangible success? In the short term, its aim was the blocking of the conferences of economic elite institutions such as the IMF, WTO, and G8. Partially successful though this was, elite summits keep happening, the only difference being that for some time they were held in places such as Qatar, which are comfortably remote from any possibility of significant protest. Although many considered this a victory, it did nothing to impede capitalist elites from making decisions and continuing to affect the fates of billions of people. The second, midterm target was the destruction of the consensus around neoliberalism and the delegitimization of organizations such as the IMF. Yet, in the aftermath of the global financial crisis of 2008–2009, although it is not uncontested, neoliberalism appears as vigorous as ever and the role of the IMF has been enhanced. The long-term aims – the smashing of capitalism and the state – seem as remote from realization as ever.

What prevented the radical antiglobalization movement from achieving even limited victories? Chase-Dunn and Gills (2005: 54) point to four interrelated absences: of coherent ideology, of strategy, of formal organization, and of a political platform. The movement spent a lot of time dealing with issues of internal organization and its prefigurative politics, thus avoiding such “dangerous” questions and, despite its rhetoric, set the threshold low. It celebrated the fact that it posed a degree of resistance, without actually examining how successful this resistance has been. There was considerable emphasis on big events such as counterdemonstrations at large elite meetings but such “summit hopping” (Gordon 2008: 3), whilst it produced some powerful images, neither produced any politics nor ensured any continuity. Even Naomi Klein, one of the main instigators and voices of the movement, lam- pooned “summit hopping” protesters as “a movement of meeting stalkers, following the trade bureaucrats as if they were the Grateful Dead” (cited in Kiely 2005: 215).

The ad hoc coalitions that took their names from the dates of the protests they organized – J18, N30, A16, S11, S26 – left little trace beyond archived web sites. However, although summits such as those at Seattle, Genoa, Gothenburg, and Prague were moments when the radical movement was most visible, the GJM includes many other less demonstrative forms of protest, campaigns, and activism, such as those for relief from or cancellation of international debt, the rights of indigenous peoples, environmental protection and justice, protests against the construction of roads and dams, Internet activism, the building of co-ops, infoshops, and alternative media (Kiely 2005: 160).

**NGOs**

To focus upon the direct action networks that have engaged in protest at international summits is to overlook the long process of development of humanitarian, aid, trade, and development NGOs that gathered speed in the years following World War II, and the stages through which such NGOs went as they developed successively more radical analyses of the poverty and injustice they sought to relieve, and correspondingly more ambitious and more overtly political interventions to address those ills (Saunders 2009).

It also overlooks the more proximate development of Jubilee 2000, a Christian-inspired transnational campaign to cancel the debts of the poorest countries and its successors (Rootes & Saunders 2007), which combined lobbying
with mass activism, and inspired the Drop the Debt campaign leading up to the G8 Summit in Genoa in 2001. Aid, trade, development, and humanitarian NGOs were also involved in street protests as well as lobbying at subsequent summit meetings, media coverage of which focused upon the more contentious protests of radical activists.

CROSS-NATIONAL VARIATION

The GJM has not had the same character or followed the same trajectory in every country in which it has developed.

One of the more prominent of the new organizations association with the GJM, the Attac network, was founded in France in 1998 but thereafter spread to over 40 countries. Campaigning for the introduction of a “Tobin tax” on financial transactions, and for “the regulation of financial markets, the closure of tax havens, the introduction of global taxes to finance global public goods, the cancellation of the debt of developing countries, fair trade, and the implementation of limits to free trade and capital flows” (www.attac.org/en/overview, accessed Sept. 10, 2011), Attac quickly became important in France and, after a false start, in Germany (Kolb 2005), but not in the United Kingdom.

Perhaps the most distinctive organizational innovation of the GJM was the development of the World Social Forum (WSF) and its national, regional and local derivatives. The WSF was set up as a deliberate riposte to the World Economic Forum’s annual meeting in Davos, Switzerland. An umbrella embracing all the diverse strands of the GJM – including Old Left parties, new movements, human-rights organizations, environmental NGOs, and others – the first WSF in Porto Alegre, Brazil in January 2001 attracted 12,000 people. Supported by substantial funding from the Ford Foundation, by the mid-2000s, WSFs in various locations in Asia and Africa as well as South America, were attracting up to 150,000 participants, drawn mostly from countries of the global South, but also including many from the global North. These social forums assembled the many strands of the movement for discussion and to share information, but they were also occasions for demonstrative protest according to timetables set by the movement itself.

From their beginnings in the global South, social forums spread first to Europe, where European Social Forums have been held at least biannually since 2002, and later to the United States. Despite their success in the South, their progress in the North has been uneven: in Italy they flowered briefly before declining, and in the United Kingdom they never became established. Nevertheless, social forums persist at local level in many countries.

It has been suggested that the movement in the United States was cut short by the refo-cusing of media attention and the challenge of mobilizing in the wake of 9/11 (2001), the War on Terror, the allied military intervention in Afghanistan, and the subsequent invasion of Iraq. There is no doubt that many activists who had previously been involved in antiglobaliza-tion protests were drawn into antiterror protests and that opposition to the war in Iraq became a strand of the GJM (the call for a February 15, 2003, global day of action against the Iraq War was made at the November 2002 European Social Forum and reiterated at the January 2003 WSF), but the antiterror movement did not simply subsume or eclipse the GJM. Even in the United States, substantial protests were mounted in Miami in 2003 on the occasion of negotiations designed to introduce a Free Trade Area of the Americas (FTAA), which subsequently collapsed. Moreover, social forums also developed in the United States: local or regional social forums emerged in the United States as early as 2004; the first US Social Forum was held in Atlanta in 2007 and the second, in Detroit in 2010, attracted over 15,000 people.

Whatever its impact in the United States, renewed warfare in the Middle East did not inhibit the development of the GJM in Europe. Even in the United Kingdom, the United States’
closest ally in Iraq and Afghanistan, the development of the GJM continued, with the supporters of aid and development NGOs far outnumbering radical activists. Jubilee 2000, whose most dramatic act was the encirclement of Birmingham in 1998, was succeeded by the Jubilee Debt Campaign many of the affiliates of which, in 2005, spearheaded the Make Poverty History (MPH) campaign. MPH was remarkable for several reasons. Its massively successful pop concerts in London, New York, and other cities were politically ambiguous; the concerts, for many who attended them, were just spectacular pop concerts. Similarly, the ubiquitous white plastic wristbands, soon to be replicated in a variety of colors, quickly became a fashion item rather than a declaration of support for the campaign. But the concerts were belated outcomes of a campaign that had been building for more than a year in anticipation of the meeting of the leaders of the G8 nations at Gleneagles in Scotland in July 2005, which was immediately preceded by a march in Edinburgh of nearly 250,000 people, the largest demonstration in the history of the Scottish capital.

If the GJM appeared in many countries of the North to be in abeyance after 2005, the protests of 2011 might be seen as evidence of its revival. Inspired by the most celebrated protest of the Arab Spring – the occupation of Cairo’s Tahrir Square – the movement that began on May 15, 2011, with the indignantos encampment in Puerto del Sol in Madrid was soon followed by a similar occupation of Syntagma Square in Athens. On September 17, Occupy Wall Street began in New York, quickly gained numbers, and on October 15, was emulated by over 950 protests in over 80 countries. Although the numbers of participants varied from a few hundred in Tokyo to tens of thousands in Madrid and Rome, this was a convincing demonstration of the emergence of a global movement against the social inequalities that have grown increasingly massive with the pre-eminence of transnational corporations and that have since 2008 been made even more extreme by the consequences of the global financial crisis. The novel element of these latest protests against neoliberal globalization is the demand for intergenerational justice sparked by sharply rising rates of youth unemployment, especially among college and university graduates, but the extensive transnational solidarity, aided by electronic communications, testifies to its continuity with earlier manifestations of the GJM.

CONCLUSION

Whatever its contradictions, the GJM does not so much contest modernity as oppose a particular, neoliberal conception of modernity with an alternative vision of modernity that insists upon three fundamentally modern principles: participatory or deliberative democracy; democratically accountable international and supranational political and economic institutions; and the critique of injustice and pursuit of social equality on a global level. It is thus not antimodern so much as it articulates a crisis in the forms of politics and democracy during the present epoch of modernity (Wennerhag 2010).

Its forms of action extend beyond the protests at international elite summits on the one hand, and the mobilizing efforts of humanitarian and environmental NGOs on the other. Most conspicuously in the World Social Forum and its regional, national, and local iterations, the GJM has sought to mobilize “transnational counter-publics” and to construct “forms of popular deliberation that would be democratically more legitimate than the global institutions that are criticized by the movement” (Wennerhag 2010: 29). Often organized across national borders, the social forums have challenged nation-state-based politics and, because, unlike the summit meetings of the global institutions, the World Social Forums have been organized in the global South and, because of the linkages among local, national, and regional social forums, they make a credible claim to be truly global. Because they have brought together so many diverse strands of civil society they have been genuinely and broadly pluralistic.
Contrary to claims that it is “antipolitical,” the GJM articulates a demand for the democratization of global political and economic institutions; it draws political attention to the democratic deficit of global institutions and the simultaneous weakening of democratic nation-states, as well as making a political issue of the increasing social inequality produced by market-oriented global policies.

The GJM presents some difficulties to analysis in terms of social movement theory. The movement has been so widespread and diffuse that it is difficult to fit comfortably to schemas that were mainly constructed to describe and analyze different kinds of movements mobilized within single nation-states. Yet despite its theoretical and strategic flaws, the GJM can be seen as a continuation and development of the new social movements that sprang up in the aftermath of the turbulent 1960s, though adapted to a different sociopolitical environment and with its own distinctive characteristics. Nevertheless, in terms of the formal requirements for the existence of a social movement, the episodic character of GJM activity is troublesome. The requirement of durability and continuity over time (Snow, Soule, & Kriesi 2004: 10–11), imprecise though it is, may appear too demanding to accommodate a movement that was generally barely visible outside moments of spectacular protest. This problem is, however, acute only if one’s focus is restricted to the radical direct activist strand of the movement. If one adjusts one’s optic to encompass the plethora of aid, trade, development, humanitarian, and environmental NGOs, campaigns, and social forums that, from the 1990s onward, converged upon questions of global social justice, the existence and persistence of the GJM is less problematic.

Global Justice Movement in Europe
DONATELLA DELLA PORTA

Composed of supra-national networks of individuals and organizations, the Global Justice Movement (GJM) has developed at the turn of the millennium, mobilizing in transnational events and demanding social justice and participatory and/or deliberative democracy. Especially since the second half of the 1980s, international summits were often accompanied by protest counter-summits, that took place in the same locality as the official intergovernmental gathering. Transnational mobilizations of this type have also targeted European Union (EU) institutions. One of the first of them was the European Marches against unemployment, insecurity, and exclusion addressing the Amsterdam summit in 1997; two years later, 30,000 mobilized on the same issues at the EU summit in Cologne (Mathers 2007). These marches played an important role in the emergence of the European wave of protest that became visible in the July 2001 anti-G8 demonstrations in Genoa (della Porta et al. 2006). In fact, since Amsterdam and Cologne, counter-summits have contested all of the main EU summits.

Since 2002, protesters have also met yearly in European Social Forums, which developed as macro-regional experiences of the World Social Forum, but then gained autonomy. The first European Social Forum in Florence in November 2002 was followed by a second one in Paris in 2003, a third in London in 2004, a fourth in Athens in 2006, and a fifth in Malmo in 2008. The large success of the first European forum – with 60,000 activists from all over Europe participating in three days of debate, and between 500,000 and one million activists in the closing march – was the result of networking among groups and individuals with different political and social backgrounds – unionists, feminists, environmentalists, pacifists, and so on – that continued in subsequent years (della Porta et al. 2006).

Comparative research indicated that the GJM is made of different constellations in different European countries (della Porta 2007). In the first (in countries such as France, Italy, Spain), disruptive protest dynamics appear as more dominant; networks are denser and more decentralized, with participation of both informal groups and formal associations; and the issue of global justice is linked with a struggle against neoliberalism at home within a global discourse and a conception of radical participatory democracy. In all of these cases, although more traditional NGOs were also present, the transnational network developed as activist based and protest oriented. In the second constellation, including countries such as Germany and Great Britain, collective action relies largely on lobbying and media campaigns; strong associations and NGOs are more visible, although not unchallenged; global justice issues are framed especially, although not exclusively, in terms of solidarity with the South; and associational conceptions of democracy prevail. The GJM is supported by well-endowed NGOs, among which protest is “rehabilitated” thanks to the frustrating results of more moderate techniques.

By all these different actors, the criticism of the existing international organizations is, however, linked with the demands of different policies and politics at the European and global level. The European Social Forum presents itself as the first step in the construction of a critical public sphere for the critical discussion of the European Union. The policies of the European Union are criticized as essentially neoliberal, advocating the privatization of public services and the flexibility of the work market, with resulting increases in work insecurity. The consequences of the
global justice movement in europe

process of European integration are described as dangerous for solidarity, while on migration issues the European Union is accused of “building a fortress.” On these issues, European social democracy is criticized as supporting economic policies of privatization and deregulation of a neoliberal type.

The emerging critique is however not of “too much” Europe, but of not enough social Europe. Under the banner “another Europe is possible,” more social rights and social justice were demanded. A (stigmatized) “Europe of the market” is contrasted with the (desired) Europe of the citizens. Despite criticisms – even the most radical, leveled at the “Europe of markets” – social movement organizations that participate in the transnational activities of the Global Justice Movement express support for the construction of “a different Europe,” presenting themselves as belonging to “a European movement.”

This image of “critical Europeanism” is confirmed when looking at the attitudes of the activists of the Global Justice Movement. According to surveys at different meetings of the European Social Forum, activists from different countries express strong criticisms of the actual politics and policies of the European Union (della Porta 2009). There is consensus among activists that the European Union strengthens neoliberal globalization, with a shared mistrust in the capacity of the European Union to mitigate the negative effects of globalization and safeguard a different social model of welfare. The ESF surveys also indicate mistrust in EU institutions, with only a tiny minority expressing high levels of trust in them. However, the activists of the European Social Forum express both a high affective identification with Europe and a certain level of support for the building of a European level of governance. In this sense, social movement activists represent a “social capital” of committed citizens that, although critical, might represent an important source for the building of a European citizenship.

This complex attitude toward the European Union follows various evolutions. An important one is an increased Europeanization of social movement organizations. Research on hundreds of SMOs active on social, environmental, and civil right issues confirms that, although critical of the European institutions, they do address those institutions and even promote a European identity (della Porta & Caiani 2009). More and more, social movement organizations share a tendency to coordinate their action at the cross-national level and to address (especially via lobbying) the European institutions (Ruzza 2004; Balme & Chabanet 2008). They are also particularly well connected transnationally, in some cases even opening European offices, or acting at the European level through European partners.

The building of European networks and identity in fact follows the belief that the process of European integration has had and will continue to have a strong impact on civil society organizations. The (perceived and real) growth in EU competences has contributed to the politicization of the debate on Europe. The fact that national actors have held the integration process responsible for restrictive economic policies and cuts in public spending has contributed to increased worries about the consequences of European integration. In this situation, contrasting demands are addressed to the European Union, which is perceived as a relevant level of governance.

As the construction of the nation-state contributed to the focusing of protest at the national level, the construction of European institutions provides occasions for the creation of supranational networks and identities through continuous and contentious interactions of various political and social actors around EU institutions (Imig & Tarrow 2001; Tarrow 2005; della Porta & Caiani 2009). Networking has then an impact on identity building, contributing to the development of a European identity, with the symbolic construction of “another Europe.” Again as it happened with the labor and other movements during
the construction of the nation-state, the Euro-
pean GJM represents a critical social capital
for European institutions, contributing to the
emergence of a European public sphere (della
Porta 2009).

Tarrow, S. (2005) The New Transnational Con-
Grassroots movements
LYNN HORTON

Much research has recognized the increasing prevalence and importance of grassroots movements, particularly in contemporary struggles over globalization. A number of case studies explore the goals, tactics, and trajectories of specific grassroots mobilizations in such areas as environmental justice, indigenous land struggles, women’s rights, and slum dweller movements. While more systematic, comparative examination of such movements is relatively limited, it is possible to identify a set of common elements that broadly characterize grassroots movements. These include status of members, scope of activities, forms of leadership and participation, and global linkages. Grassroots movements also often experience tensions between their role as incubators of innovative, even radical, ideologies and practices and the necessity to further transform themselves into more institutionalized social movement organizations.

A key facet of grassroots movements is the shared subordinate status of members (Piven 2006). The subdominant position of grassroots movement members may be linked to social class, gender, race/ethnicity, sexual orientation, and other axes of inequality. In contrast to earlier perspectives that linked grassroots mobilization to emotional frustrations and irrational motivations, more contemporary studies suggest that grassroots actors mobilize in response to the intensification and widening of specific grievances (Turner & Killian 1987). Grassroots activists initially mobilize because they, their families, and communities are directly threatened or impacted by such issues as environmental contamination, sexist and racist beliefs and policies, and economic transformations linked to corporate-dominated globalization.

Along with subdominant status, grassroots movements have also been closely linked to specific, bounded localities such as rural communities, indigenous territories, and low-income urban neighborhoods. Such grassroots spaces are essential in the formation of identities, ideologies, and interests that precede collective mobilization (Polletta 1999). Shared local space enables movement members to develop and participate in dense, horizontal networks and facilitates sustained face-to-face interactions through which shared meanings are constructed and reinforced. Grassroots movements may arise in a more spontaneous manner in these spaces of everyday life. In other cases, they may be a more self-conscious project of members seeking to build alternative ideologies and practices from the bottom up. The local base and subdominant member status of grassroots movements also tend to limit their access to resources and they rely primarily on the unpaid labor of highly motivated and ideologically committed volunteers.

Research suggests that the recent expansion and high levels of activism of grassroots movements in a number of different countries are linked to both global structural transformations and specific national political processes. In particular, grassroots movements emerge in response to the advance of corporate-dominated globalization. In regions such as Latin America, such reconfiguration of state–markets relations—in particular the withdrawal of governments from past economic interventions, redistribution measures, and social supports—has deepened subsistence insecurity of the poor majority (Alvarez, Dagnino, & Escobar 1998). In response, diverse grassroots movements have surged in recent years to challenge such market fundamentalism and the privatization and commodification of the commons. Castells (2004) emphasizes that the locus of such grassroots mobilization has shifted from the workplace to urban neighborhoods where
the lack of sufficient state investment in the means of collective consumption has fomented widespread protests.

While local, decentralized control is a central characteristic of grassroots movements, the global scope of these economic and social transformations has influenced some to develop coalitions and alliances with other social movements and nongovernmental organizations (NGOs) located in geographically and culturally distinct zones in processes of grassroots globalization (Appadurai 2000). In what Harvey (1996) terms “militant particularism,” the ideas and practices developed in localized movement spaces are expanded and universalized to potentially become effective on a transnational scale. Network participants share broadly inclusive precepts of alternative economic models and social and environmental justice, while keeping intact the diversity of the grassroots movements that form part of these coalitions. Participation in such global networks may enable grassroots movements to transcend the constraints of their local identities and immediate needs (Brysk 2000). Transnational allies provide information and resources not available at the local level. They implement advocacy campaigns directed at multiple countries and global institutions which grassroots movements would have difficulty accessing on their own (Keck & Sikkink 1998).

Research suggests that an important strength of grassroots movements is their efforts to bring about social change from the bottom up (Peet & Watts 2004). They attempt to embody the type of society that they seek to build, nurturing counter-hegemonic belief systems and developing innovative democratic practices. Community and neighborhood settings provide a social and conceptual space that enables subordinate groups to penetrate dominant beliefs and develop and appropriate alternative visions and practices. Tactics of grassroots movements often incorporate confrontation and direct action. Grassroots ideological commitments are particularly important in retaining members where movements have limited resources. In part because grassroots movements are less dependent on external resources they may also exercise a greater degree of autonomy to hold more radical and emancipatory ideologies. Such beliefs and values challenge dominant racial/ethnic, gender, and class hierarchies, and forms of development and capitalism. Important cultural work takes place inside of grassroots movements which seek to expose and destabilize dominant structures and beliefs.

Grassroots movements strive to keep the locus of control and movement leadership at the local level. Leadership structures are egalitarian, more dispersed and decentralized, and direct participation in decision-making is emphasized. Grassroots movements highlight and value local knowledge and direct experiences of their members which have often been devalued by dominant groups. Such practices of participatory democracy within social movements are not merely instrumental and often arise out of ideological commitment. Grassroots women’s groups, for example, have attempted to practice egalitarian, mutually supportive social relations that value emotion and empathy. Grassroots movements help construct the mobilizing structures that are available to activists. Within these movements members may gain self-respect, assertiveness skills, capacity to act collectively, and advance their proficiency in leadership and political organizing.

Other research, however, cautions against assigning an overly deterministic role to the particular structural forms of grassroots movements – dense, horizontal ties and face-to-face interactions – in shaping ideologies and normative movement goals. This approach suggests that cultural challenges and counterhegemonic ideas may also emerge through weak links with external actors. In developing countries, grassroots movements have linked, for example, with NGOs and religious organizations. Research also suggests the grassroots and local movements cannot automatically be equated with democratic practices. Rather local and community spaces
also incorporate unequal power relations, factionalisms, and corruption as is present at national levels (Hickey & Mohan 2004).

Social movement scholars characterize grassroots movements as an important initial emergent phase of collective action. Limited resources, outreach capacity, and reliance on volunteers suggest, however, that if grassroots movements are to be sustained and effectively advance their causes they need to develop more formalized organizational and leadership structures (Turner & Killian 1987). As grassroots movements institutionalize as social movement organizations they are better able to mobilize supporters and obtain the resources and external support that is often critical to long-term effectiveness.

Concerns have been raised, however, about such professionalization and bureaucratization of grassroots movements (Alvarez, Dagnino, & Escobar 1998). As grassroots movements are more subject to government regulation and dependent upon external resources, pressures increase to conform to more reformist master frames. In addition, a shift to a more professional, hierarchical leadership may signify a loss of flexibility and responsiveness and the emancipatory and empowering daily practices of grassroots movements. There is also a risk that professional movement administrators, who are not directly vulnerable to or affected by social issues, may advance their own distinct perspectives and interests at the expense of movements’ less powerful participants. Likewise, to the degree to which grassroots movements engage more directly with state actors and political parties they may be caught up in clientelism and factionalism, co-opted, or placed in the role of providing state services (Hickey & Mohan 2004).

Grassroots movements have served as an organizational base for more sustained and formalized social movements. Despite their relative lack of resources, they play a role in bringing to the forefront the perspectives and needs of subordinate groups. They have provided a space for the development of counter-hegemonic and innovative practices and have contributed more broadly to processes of democratization on a global scale.

Greenpeace
WILLIAM MARKHAM

Greenpeace is a large, highly visible social movement organization, which combines environmental goals with crusading for peace. It is a multilevel organization, with international, national, and local units. Its international reach and broad support allow it both to influence transnational corporations, international treaties, and regulatory agencies and to operate within nations.

Greenpeace originated in 1971 during the wave of social movement mobilization in Western Europe and North America when its Canadian-based founders attempted to sail ships into US nuclear weapons testing areas. Environmental issues soon came to dominate its agenda, and new chapters quickly formed in the United States and Western Europe. Greenpeace International was organized in 1979. Many chapters enjoyed rapid growth in the 1980s, but during the 1990s most chapters experienced significant declines, including a near collapse in the United States, followed by stabilization or slow growth.

Greenpeace’s national chapters are so tightly intertwined with Greenpeace International that their emphases and activities are difficult to distinguish. According to its Internet site, Greenpeace focuses on a limited number of areas, including energy and climate change, oceans, forests, toxics, sustainable agriculture, and disarmament and peace. In total, it has about 2.9 million supporters and a budget of €197 million, with 28 national and regional chapters. It is governed by a council elected by representatives from these chapters. Greenpeace Germany is the richest and most influential chapter.

Greenpeace is highly centralized. Individual chapters are bound to Greenpeace International by a contract, which entitles them to use Greenpeace’s name but imposes strict requirements, including nonviolence, nonpartisanship, independence from business and government, and participation in international campaigns. Individual chapters are also typically highly centralized. Greenpeace Germany, for example, has only 40 voting members, most from paid staff, Greenpeace International, and local activists; donors have no direct voice, and local groups of volunteer activists are closely controlled. Greenpeace justifies this model in terms of efficiency and quick decisions, its large size, and its international scope; however, lack of democracy has led to criticism from political opponents and Greenpeace staff and activists.

Greenpeace depends heavily on individual donors, which it believes guarantees its independence. Most contributions are small, and Greenpeace screens larger gifts for conflicts of interest. It accepts no funds from government or corporations, and its publications contain no advertising. Other important revenue sources include bequests and foundation grants, supplemented by revenue from interest on financial reserves and the sale of publications, logo merchandise, and green products. Greenpeace fundraising is highly professionalized, relying heavily on mass mailings, supplemented by Internet fundraising and donations at information stands. The great majority of supporters are passive donors; only a small minority become volunteer activists. Critics argue this strategy fails to deepen supporters’ knowledge or mobilize them. Instead, professionals plan and execute campaigns that are “marketed” to donors. They also criticize Greenpeace’s fundraising expenditures; however, these are actually comparable to similar organizations.

Greenpeace’s agenda is reformist, but the changes it advocates are more far reaching than those promoted by most peer organizations, and its methods, including sharp criticism of business and government, are often confrontational. Its trademark is spectacular actions designed to focus attention on environmental
abuses. These have included driving rafts between whalers and whales, sailing ships into nuclear testing zones, and climbing smokestacks to protest air pollution. These professionally planned, nonviolent protests are key for Greenpeace’s self-understanding and image. They provide striking, action-filled images and sometimes involve law violations.

To succeed, Greenpeace must capture media attention, and it works hard at this. Its actions make good copy, and many of its campaigns, for example, against genetically modified foods, also attract media attention. Its press offices are large and very professional. Greenpeace holds press conferences, answers inquiries promptly, provides contact persons, issues regular news releases, and offers striking visuals. When its campaigns receive favorable coverage and capture public sympathy, they attract supporters, generate pressure on government and business, and burnish Greenpeace’s reputation; however, confrontation and law violations are sometimes viewed skeptically by moderate environmentalists and the public. They also allow opponents to characterize Greenpeace as extremist and can lead to reprisals. In 1985, French agents blew up a ship Greenpeace intended to sail into a nuclear testing zone, and Bayer chemicals once sued Greenpeace Germany when it installed a faucet on a waste discharge pipe to draw samples. More recently, German authorities threatened revocation of its tax-free status.

Because its visibility and reputation are key, Greenpeace carefully monitors its image. Despite occasional gaffes, such as misstating the amount of oil in the Brent Spar platform, which Greenpeace occupied during its campaign against sinking it in the North Sea, Greenpeace generally enjoys a favorable press. Nevertheless, critics accuse it of choosing easily winnable battles and characterize its actions as stunts that cater to media preferences for striking, oversimplified stories. Greenpeace responds that it also takes on complex issues and that its campaigns focus attention on neglected problems and increase environmental awareness.

Greenpeace also publishes newsletters, magazines, and pamphlets, maintains a massive, professional Internet presence, lobbies national governments and international agencies, organizes petition drives and boycotts, conducts research about environmental problems, provides policy reports, sponsors demonstration projects for green technologies, and offers services such as green energy. Its involvement in traditional nature protection is minimal, and it shies away from endorsing political parties or candidates. It is represented at numerous international bodies, such as the International Whaling Commission. Although known for acting alone and prizing its autonomy, Greenpeace does sometimes cooperate with other NGOs through joint statements, press releases, joint campaigns, or participation in umbrella organizations, and it works with selected businesses.

Guerrilla movements
TIMOTHY P. WICKHAM-CROWLEY

Major sociopolitical upheavals during the twentieth century brought vividly to our attention the role of guerrilla movements in (near-)revolutionary settings, and often led to a casual confabulation between guerrilla movements, as such, and revolution. The writings, theorizing, and biographies of Marxist revolutionaries often led to such a conceptual admixture, including those of Vladimir Lenin, Mao Zedong, Vo Nguyen Giap, and Ernesto “Che” Guevara (Guevara, Loveman, & Davies 1997), and Carlos Marighella in his manual for the urban guerrilla. That confabulation remains strong, even if we recognize that precisely the same strategy has also been used by fighters of the right to attack left-wing regimes, notably against the Sandinista government of Nicaragua in the 1980s, but also many other instances of non-leftist, ethnic irredentist movements scattered around the world.

Yet the practice of guerrilla warfare—“guerrilla” literally means “little war”—antedated by millennia those twentieth-century revolutionary struggles, and even old military theories like those of Sun Tzu seem to be describing, even advocating, something like guerrilla warfare (aka “insurgency”). Typical guerrilla tactics include wide-ranging mobility and quick dispersal; ambushes; lightning attack-and-withdrawal tactics against columns and supply lines; waylaying messengers and in general denying the enemy intelligence about one’s own forces; and securing more and better weapons from defeated opponents. Thus, guerrilla warfare is likely the most ancient form of war, and humankind has consistently reinvented it whenever a people is faced with a violent struggle against a foe superior in numbers, technology, or both. Thus Laqueur (1976), in his sweeping historical review of guerrillas, draws our attention all the way back to the ancient Hittites, whose king angrily deplored those (“cowardly,” perhaps?) enemy forces who would attack his troops and people while they slept, yet melt away into the darkness before his own forces could respond.

Before proceeding we must banish a confusion. Guerrilla warfare is a strategy for eliminating and/or seizing state power, and its tactics are those just described. Terror and terrorism, by contrast are specific tactics, acts of violence that systematically injure or kill unarmed civilian populations, whether they consciously target civilians or simply engulf them indiscriminately (Wickham-Crowley 1991: ch. 3). Such actions in principle could be carried out by individual, collective, or institutional actors against their opponents. A single, powerful empirical generalization should end the intellectually sloppy conflation of insurgents with terrorists: governments already in power have been far more likely to inflict terror and indiscriminate death upon civilians than have the insurgents who oppose those governments, as Tilly pointed out on many occasions (Tilly et al. 1995). We need only look to the terror campaigns directed at their own peoples by governments during the French Revolution, in the Soviet Union under Stalin (including the “terror famine” and the great purges), and by the Cambodian Khmer Rouge once in power (1975–1979). As that last example also shows, however, guerrilla movements have historically varied in visiting terror upon civilian populations. Some guerrilla movements employed widespread terror even before their ascent to power, as did the Khmer Rouge; others a good deal of terror, yet not really of that scope (Peru’s Shining Path); while yet other guerrilla movements used almost no terror during the insurgent years (Fidel Castro’s 26th of July movement, 1956–1958).

Are recent, worldwide guerrilla movements, as they are understood and (nowadays) much studied by scholars, precisely the same thing
as our millennia-long exemplars of guerrilla warfare? There are evident points of convergence. First, both phenomena clearly involve (a) collective actors (b) engaging in nonquotidian activities, seeking (c) to transform a political system by means of (d) a selected tactical repertoire, which certainly includes massed and violent attacks on their opponents. Second, most variants of historical guerrilla warfare, and also “formalized” guerrilla movements of recent decades, seem to qualify as “state-seeking movements,” to use Tilly’s term, whether they are defending and/or attempting to restore a now-defunct political status quo or simply opposing an incumbent regime. In that respect, then, they both share with many (most?) social movements the goal of changing the political and social order of society. Yet one clear point of nonconvergence remains: the popular and automatic association of guerrilla warfare with revolutionary leftism is misguided given any number of insurgencies which have waved rightist political colors.

The truest divergence between centuries-old versus more recent variants of guerrilla activity lies elsewhere. In most historical instances guerrilla warfare emerged as a by-product of war/invasion involving two different peoples, and therefore one’s guerrilla forces could usually rely upon local knowledge and the guaranteed support of one’s own people to foster effective resistance against ethnic outsiders. With the increasingly common use of revolutionary insurgency by portions of the local populace seeking to unseat incumbent native rulers, those elements of ethnic solidarity no longer assure the silent consent (minimally) or the vigorous active participation (maximally) of one’s own people with the insurgents. Thus the modern revolutionary insurgency is, or intends to become, a civil war in which the populace will eventually (be forced to) side either with the guerrilla movement(s) or with the government in power, a choice that is not an obvious one, given the common ethnicity often shared by all parties. With support now problematic in all respects – and “support” for guerrillas can mean anything from failing to report armed insurgents in the vicinity to vigorous participation in the guerrillas’ forces – it is not surprising that twentieth-century revolutionary writing (and many nineteenth-century military theories) about guerrilla warfare have always focused on securing and maintaining popular support, and denying the same to the incumbent regime (and occasionally to other, competing revolutionary organizations as well).

HOW AND THROUGH WHOSE EFFORTS DO SOME GUERRILLA MOVEMENTS GROW AND EXPAND?

To analyze guerrilla movements of recent decades requires us to concretize the matter sociologically: just who are these insurgents? Since Weber’s writings on the world’s religions, sociologists have cautioned against confusing the social origins of the great religions’ prophets and founders with those of the ordinary believers. Most students of social movements likewise remain sensitized to such membership disjunctures for the movements they study, but the bifurcated social origins of the leaders versus the led within typical guerrilla movements are so deep as to warrant special attention and analytical care. The elite and leadership and commanding officers within guerrilla movements and other revolutionary organizations are almost everywhere drawn from highly educated persons whose origins are in the upper-middle or upper classes within their own societies, and many scholars have thus validated Mannheim’s classic analysis of the politics of the intelligentsia (Gouldner 1979; Wickham-Crowley 1992; Colburn 1994). Yet the rank and file of arms-bearing guerrillas, stricto sensu, and even more so the entire social-support apparatus in the regions where they operate, are typically composed mainly, often overwhelmingly, of selected groups of agrarian villagers and cultivators. Some guerrilla groups in Colombia since the 1960s – peasant-based from their inceptions – provide the only clear, major exceptions to that rule. Even later groups
like the Zapatistas, who went into action in 1994 in Chiapas, Mexico, clearly echo this long-established pattern, despite their claims to novelty. Those other revolutionary groups, often labeled “urban guerrillas” in Germany, Italy, and several South American nations, have been even more strictly composed of the highly educated drawn from higher social classes (Russell & Miller 1977), but we will not consider that variant more closely herein since urban guerrilla tactics are really a special case of terrorism, rather than guerrilla warfare in its classic forms.

With regard to the gender and racial/ethnic composition of guerrilla groups, most began as overwhelmingly male-staffed organizations, whether in Latin America or elsewhere, with women often left in thoroughly marginal roles when permitted to join. Beginning with the urban guerrilla groups that appeared circa 1970 in both Europe and Latin America, there was a distinct shift: women entered in far higher percentages and many became more central to the overall command structure. By the 1970s and 1980s, the Latin American (and perhaps African) rurally based guerrilla organizations became ever more gender-egalitarian in membership and command opportunities, in both urban and rural wings (Wickham-Crowley 1992: chs 2, 9), even if many issues and conflicts about gender remained. The ethnic and racial composition of guerrilla groups often came to be slowly more aligned with the populations of the territories where the guerrillas operated most securely (as with the Guatemalan or Peruvian indigenous peoples who moved into these groups in the 1970s and 1980s). Yet, in many world conflicts the guerrilla movements’ foundations were often rooted in ethnic differences and conflicts as such, as in most of Africa and much of Asia (e.g., Sri Lanka’s “Tamil Tigers”). Hence an element of ethnic irredentism or separatist nationalism characterized these revolutionary civil wars, with corresponding echoes of those age-old, inter-ethnic settings for guerrilla warfare.

Wherever acute social distances separate a leadership and a prospective rank and file, such conditions merely intensify the modern problem of guerrillas trying to draw the heretofore uncommitted into what will be a civil war against one’s own co-nationals. The insurgents of our era cannot automatically and reliably secure popular support, provision of resources, or actual armed enlistment in their collective and armed campaigns against incumbent governments. Thus the question is raised: which guerrilla movements grow strong(er) and consolidate their support within (at least parts of) the national population, and within what time frames? That problem-feature of recent guerrilla movements dovetails very closely with themes that have always engendered the interests of sociologists and others who study social movements, and careful empirical studies of guerrilla movements in light of certain theories and their predictions may bring “bad news” for loyalists of several theoretical camps.

For example, Mancur Olson (1965) famously argued that large-scale social movements of all stripes would be bedeviled by “free riders” rather than active, resource-providing, deeply engaged participants. Yet Salert (1976) and Wickham-Crowley have argued that Olson’s theory badly predicts the actual (i.e., high) levels and sources of commitment witnessed among guerrillas and other revolutionaries (Wickham-Crowley 1991: 17–19). Since rational choice theory also lies close to Olson’s position, it follows that its proponents seem unable to do more than translate some small parts of existing theories into its own language (see Skocpol 1994: 321–326). Alternatively, Wood has shown, via her careful analysis of insurgency and the peasantry in El Salvador, how both rational choice theory and Olson’s specific perspective must be theoretically recast (and radically so) into a metric of nonmaterial values, if they are to be of any use for understanding mass recruitment into revolutionary organizations (Wood 2003: 226–274).

For their part, the theorists who propounded resource mobilization (RM) theory argued that the nature, extent, and depth of grievances are
not really all that important in fueling and helping to expand social movements. Such claims are partly supportable in the present topical context: guerrilla organizations clearly are “doing” the task of mobilizing popular resources and channeling them into certain directions and tactics, and their organizational failures (i.e., military or political defeats) do typically lead to movement decay. Yet RM theory’s earlier (if now abandoned) claim, that the scope and shape of grievances are not deeply critical for movement growth, is clearly insupportable if applied to the study of insurgencies. Many studies, often done with finely grained regional and temporal sensitivities, have repeatedly demonstrated the massive relevance of grievances to guerrilla movements and to their success or failure in recruiting and maintaining popular support, including economic grievances (Paige 1975; Scott 1976; Booth 1991; McClintock 1998), political grievances (Goodwin & Skocpol 1989; Goodwin 2001), or both (Wickham-Crowley 1991: ch. 5; Wickham-Crowley 1992).

There is greater promise in the literature about revolutionary and guerrilla organizing if we instead look to matters of culture. Smelser (1962) argued a half-century ago that the emergence or diffusion of a shared set of “generalized beliefs” is crucial to the formation of social movements in general. Despite persuasive critiques targeting some aspects of his concept, we should note there is nothing inherently “conservative” in pointing to the formation of shared beliefs as a crystallizing element in the formation of opposition movements (cf. Gramsci’s notion of “counter-hegemony”). Such shared beliefs do not have to typify all of the belief-elements nor all members within a guerrilla movement, but just enough to enable cooperation on some core goals (e.g., land reform and the end of government violence). And it is certainly not true that the rank and file of guerrilla movements went through a process of “consciousness raising” and moved toward the Marxist stance typical of their leaders. The literature now thoroughly confirms that peasants and other lower classes participate in guerrilla movements or engage in insurrection in pursuit of classically agrarian interests, not the Marxist aims of the intelligentsia who often lead such organizations (see Wolf 1969; Paige 1975; Scott 1976; Skocpol 1979; Wickham-Crowley 1991: ch. 4; Wickham-Crowley 1992).

Yet human cultures do vary in their patternings, and that statement applies as well to regional subcultures within nations, which may predispose certain regional populations (but not others) toward rebelliousness and guerrilla sympathies. Wickham-Crowley (1992) pursued that issue with region-specific detail for multiple Latin American national insurgencies and found that guerrilla movements profited when they operated in areas with strong antigovernment rebellious histories. With more range and conceptual subtlety, Foran (2005: esp. 21–23) argued that historical experiences and emotion, formal ideologies, and cultural idioms collectively served to develop—or not!—political cultures of opposition across his several dozen cases, and those oppositional cultures serve as one of the linchpins of his overall theory of revolutionary failures, successes, reversals, and “non-attempts.” And with still more subtlety and depth, Selbin’s (2010) work now crystallizes more than a decade’s worth of research and writing about the power of social narratives and popular story-making in the making of revolutions themselves. So maybe “generalized beliefs” do matter in the making of guerrilla-based revolutions after all, albeit a modified and less magical conception of generalized beliefs perhaps more akin to master frames.

From a different perspective, many have argued for economic correlates of support for, and the success-rate of, guerrilla insurgencies. First, the overall living standards of rural populations can be damaged by global economic depressions felt locally (that is, a “world-system” condition), by the bite of the tax collector, and by the “take” of their harvests demanded by landlords; in the face of such intense material deprivation, peasants
may thus rebel, if opportunities arise (Scott 1976). Similarly, in trying to understand the peasantry’s (varied) support for and enlistment with the Central American and Peruvian guerrilla insurgencies, Booth (1991) and McClintock (1998) examined both the economic damages caused by landlord actions and by government (in-)actions and often the outright loss of land itself.

In a related vein, the expansion of export agriculture is seen by both moral economy theory (Scott 1976) and class conflict theory (Paige 1975) of agrarian revolution as a key prime mover behind massive and increasing forms of peasant discontent and rural uprisings. While neither theory focuses on guerrilla organizations, both theories can deeply illuminate the actual patterns of peasant support and nonsupport for Latin American guerrilla movements over the last half-century (Wickham-Crowley 1992: chs 6, 10), and the work of Foran (2005) suggests a broader, more global applicability of these ideas. Wickham-Crowley also confirms many of Paige’s correlations between sharecropping and migratory-labor forms of cultivation, and a predisposition to support and join guerrilla movements, but also suggests a similar pattern for squatters as well.

Goodwin (2001) has been the most persuasive advocate of the political interpretation of the (varied) success-histories of guerrillas who tried to unseat incumbent regimes. Although his work draws on the geopolitical and macrostructural ideas of Skocpol (1979), Goodwin’s work more narrowly has focused on guerrilla movements as such. Those movements include “persistent insurgencies,” a situation of regime-insurgent stalemate which occurs where regimes are able to rain terror down on specific regions and peasantierras within their national territories, but are unable to assert decisive “infrastructural power” and actually govern those regions. Strikingly, guerrilla movements might persist even in the face of democratization trends and the emergence of nationally competitive elections, conditions which usually have doomed insurgencies to progressive political irrelevance (cf. Wickham-Crowley 1992: chs 8, 11). From Goodwin’s perspective, the very structure of regimes and also the political actions taken by state managers (notably indiscriminate violence) are likely to predict whether or not insurgencies actually develop and mount an effective challenge to incumbent governments.

**WHICH GUERRILLA MOVEMENTS HAVE ACHIEVED GREATER SUCCESSES?**

Both general theorizing about social movements and specific studies of guerrilla movements can be brought together to better understand the latter, and perhaps to qualify some of the claims of the former. In a like vein, much attention has been given to understanding why some guerrilla movements—once they consolidate their strengths and secure supporters—succeed in seizing state power, while others do not. That important issue of failure/success nicely parallels Gamson’s classic study of historical social movements of all stripes in the United States (1990), wherein he sought to discern why some social movements “succeed.” The issue of insurgents’ failures/successes is often deeply intertwined with a related—but not identical—question, when scholars ask why some regimes experience social-revolutionary transfers of power while others do not. The difference between those two questions is an historico-empirical one: did the old regime face an insurgency which can be viewed as bringing about its collapse, or were other forces more fundamental to that transition? Such closely related questions can focus directly on insurgency-instigated regime collapses (Wolf 1969; Wickham-Crowley 1992; Goodwin 2001), on regime collapses in which the issue of insurgency is ancillary (Skocpol 1979), or some mix of those two types of situations for the past and/or future (Foran 2005).

Over more than two decades, Goodwin, Wickham-Crowley, and Foran all have essayed systematic comparative studies designed
specifically to explain both the successes and the failures of guerrilla-based revolutionary movements, following the “model” for such success/failure theorizing established by Skocpol (1979: esp. 155–158). Each author also makes some use of the Boolean-algebraic model of “Qualitative Comparative Analysis” espoused and explained by Charles Ragin (1987). Goodwin’s argument came earliest (in a 1988 dissertation), and was later condensed (in Goodwin 2001; but also see the Loveman and Davies contributions to Guevara, Loveman, & Davies 1997). In his consideration of four cases, each from postwar Southeast Asia and from 1970s–1980s Central America, Goodwin concludes that only “exclusionary dictatorial regimes” with narrow support-bases are likely to be overthrown by such revolutionary insurgencies, evidenced in the revolutionaries’ accessions to power only in Vietnam and in Nicaragua, but not elsewhere in those two regions. Wickham-Crowley (1991: ch. 7; 1992: chs 8, 11, 12) similarly concluded that the best predictor of whether or not Latin American regimes in the years 1956–1990 fell to guerrilla-centered insurgencies – only in Cuba and in Nicaragua – was not their own military power nor even the depth of US support for the incumbent regimes they opposed. Instead, only strong insurgencies (generated by conditions consider previously herein) confronting a “sultanistic” type of regime or (his term) “mafiacracy” actually seized state power. Whatever the particular label applied to them, such highly personalistic forms of civilian-cum-military rule are by some recent consensus uniquely vulnerable to overthrow by guerrilla-centered yet broad-based oppositions, if regime opponents are strong enough to complete the task. In contrast, Wickham-Crowley argues that collective military regimes supported by the upper classes and also competitive electoral democracies are likely to face down any insurgencies that confront them. Finally, Foran (2005) has greatly broadened both the analytical scope and the universe of cases under consideration, and thus his five-element theories which explain the “classic” social revolutions and also the successful anticolonial revolutions are correspondingly complex. Only the anticolonial revolutions were rooted in a broad-based yet guerrilla-centered coalition, and they succeeded where such an opposition “enjoyed” the advantages of a system characterized by dependent development, narrow and oppressive colonial rule, the formation of a nationalist and also socialist political culture of opposition, and a conjunctural downturn which favored the opposition. Foran’s further analyses of his failed cases, even those involving substantial guerrilla movements, reinforce his claim that all elements in his “five-factor” theoretical model were necessary for the revolutionaries to seize state power from the incumbents.

REFERENCES AND SUGGESTED READINGS

Central leader of the Cuban Revolution and iconic “heroic guerrilla,” Ernesto Guevara Lynch de la Serna was born in Rosario, Argentina to a well-read, left-of-center, politically active middle-class family. Life-long study of Marx, Engels, and Lenin began in the mid-1940s. Guevara explored a tumultuous, radicalizing Latin America before and after becoming a physician in 1953.

Events in Guatemala transformed Guevara into a revolutionary Marxist. Worker, peasant, and student mobilizations drew him and his first wife Hilda Gadea to Guatemala City in 1953, where elected president Jacobo Arbenz approved limited land reform. The radical couple studied Engel’s *Anti-Duhring* and Guevara met Cuban militant and Fidel Castro ally Antonio Lopez. In mid-1954 mercenaries backed by Washington entered Guatemala to oust Arbenz, and overturn pro-peasant land tenure policies. Guevara volunteered to fight the invasion. Arbenz refused to distribute weapons, resigned, and a right-wing dictatorship seized power. Ernesto and Hilda resettled in Mexico and continued in-depth study of Marx’s *Capital*.

In July 1955 in Mexico City, Guevara was recruited by Fidel Castro, whose July 26th Movement was organizing an urban underground and rural irregular army to topple Cuban dictator Fulgencio Batista. From December 1956 Guevara served the rebel army as physician, soldier, literacy teacher, and Marxist educator. He adopted the moniker “Che,” was the first promoted to the highest rank of *comandante* (major), launched Radio Rebelde – the insurrection’s official voice – and initiated agrarian reform in rebel-held territory. Guevara unified revolutionary forces in central Cuba into Rebel Army Column 8. It captured Santa Clara, the isle’s third largest city, on January 1, 1959, forcing US-backed strongman Batista to flee to the Dominican Republic.

In May 1959 the revolution challenged latifundista elite and foreign agribusiness prerogatives. Guevara coauthored the Agrarian Reform Law that protected small peasants, redistributed land, and limited ownership to 3300 acres. As National Bank president, he sold Cuban gold reserves in the US to prevent confiscation. Sweeping nationalizations in 1960 signified Cuba’s socialist transformation. Minister of Industry Guevara, responsible for 70 percent of industrial enterprises, conceived and applied a system of socialist political economy distinct from Soviet and Eastern European models employed elsewhere in the state-owned sector. Che shepherded scientific and technical research and development; and introduced advanced statistics, mathematical modeling, and computers to monitor the economy, reduce costs, and increase labor productivity. He championed voluntary labor.

Major Guevara created the Revolutionary Armed Forces (FAR) Department of Instruction to spread literacy and political education within FAR. During the October 1962 Missile Crisis he commanded troops in western Cuba. Che helped unify the July 26th Movement, Popular Socialist Party, and Revolutionary Directorate into the Communist Party of Cuba founded in 1965.

Guevara’s revolutionary internationalism synthesized the legacies of Simón Bolívar, José Martí, Marx, and Lenin, and Cuba’s radical global agenda placed it at the center of world politics. In tandem with Fidel Castro, Che was the audacious and frank voice of the Cuban Revolution, and he spearheaded official initiatives in Africa, Asia, and Europe. Cuban socialism challenged the West and

Guevara’s three diplomatic tours of the USSR cemented the alliance. However, by 1964 he was disenchanted with bureaucratized, vitiated Soviet socialism, and leery of Moscow’s foreign policy (Gleijeses 2002). In February 1965, Che was blunt, “The socialist countries have the moral duty to liquidate their tacit complicity with the exploiting countries of the West” (Guevara 2000). He regularly met Third World militants and political leaders, reached out to independent Africa, aided its liberation movements, and condemned the US war against Vietnam.

On April 1, 1965, Guevara renounced his Cuban posts and citizenship in order to promote socialist revolution in Latin America. As extant political and military conditions were not yet favorable, he led a secret April–November 1965 Cuban military mission to Congo Brazzaville to aid the Supreme Revolutionary Council of the Congo. The unsuccessful campaign prepared Cuban fighters who accompanied Che to Bolivia.

Cuba supported Guevara in Bolivia. He aimed to unify, train, and expand Latin American revolutionary forces. In November 1966 Che assumed command of National Liberation Army (ELN) combatants from Bolivia, Cuba, and Peru. ELN guerrillas hoped to lead a mass movement of workers, peasants, and youth to defeat Bolivia’s dictatorship, inspire anti-capitalist revolution throughout the Southern Cone, and drag Washington into a military quagmire, thus aiding the Vietnamese Revolution. On October 8, 1967, CIA-advised Bolivian troops captured Guevara. La Paz and Washington agreed to execute him on October 9.

Guevara theorized on building socialism and political-military strategy. He criticized Soviet and Eastern European political economy, predicting these societies were headed toward capitalism. “Socialism and Man in Cuba” (Guevara 2000) argues socialism cannot be built using “the dull instruments left to us by capitalism (the commodity as the economic cell, profitability, individual material interest as a lever, etc.).” The use of capitalist economic methods reproduces bourgeois behaviors and motivations. He identifies “the two pillars of the construction of socialism: the education of the new man and the development of technology.” Without human solidarity, political consciousness, popular control of the economy, and voluntary labor as a social duty, the transition to socialism is impossible. According to “Guerrilla Warfare: A Method” (Guevara 2000), “guerrillas are the fighting vanguard of the people . . . directed toward . . . the seizure of power. They have the support of the worker and peasant masses.”

Hackers
JAMES E. STOBAUGH and B. REMY CROSS

Computer hacking and online protests have increasingly become options for social movement organizations (SMOs) looking to disrupt oppositional institutions or gain exposure for their cause. While many, and perhaps most, SMOs maintain at the very least an online presence in the form of a website, some groups have begun to use online communication as a means of advancing their own goals (Wray 1999).

SOCIAL MOVEMENT ATTENTION

Recently movement scholars have started to recognize that social movements are increasingly turning online for a variety of movement activities and, along with this recognition, has come an interest in online activism (Rohlinger & Brown 2009; Earl 2010). Much of this recent scholarship has overlooked the relationship between SMOs and how they use hacking and hackers.

This neglect may be due, in part, to the reluctance of many movement scholars to recognize less mainstream or marginal disruptive movement tactics. However, Cloward and Piven (2001) recognize the usefulness of hacking as a form of SMO disruption. They find that it was successfully used in protesting the WTO meeting in Seattle and could be used by other movements, especially as more business is increasingly done online. They warn though that as more commerce is conducted online, efforts to prevent disruption by hackers will increase.

MOTIVATIONS OF HACKTIVISTS

Not all SMOs make use of hacking as a tactic, but an increasing number are and the reasons for utilizing this tactic tend to fall into four broad categories of motivation. The first, and likely most common, motivation is that hacking allows the SMO to continue its stated mission and goal and that attacking an opponent via the Internet or their communications network reflects the sort of grievances that initially spurred mobilization.

However, many hackers engage in hacktivism out of the belief that “information wants to be free” (Brand 1987: 202). This belief sees privacy, and private information, especially that held by public officials and agencies, as being something that should be made public (Vaidhyanathan 2004). To hackers, the act of hacking, and hacktivism, is a way of bringing sunshine into a political system that is overly concerned with secrecy, so they often lend their talents to movements in need of their expertise.

Third, there are hackers for whom the political aspect of what they do is secondary. This includes hackers who do it for the thrill of the experience, the “seduction of the crime” as Katz (1988) has explained. And fourth are those hackers who work for SMOs but do so only as a job with no personal attachment to either the cause or the act of hacking. In both cases the hacking is not motivated by any sense of loyalty to a movement’s cause.

METHODS OF DISRUPTION

There have been numerous examples of hacktivism throughout the last three decades but they broadly fall into three different types: hacking that is intended to gather protected or sensitive information; hacking meant to expose or embarrass an opponent; and hacking meant to disrupt an opponent’s systems and communications. In the hacker community, what can often be viewed as acts of sabotage or vandalism are viewed as electronic civil disobedience (Critical Arts Ensemble 1996).
Hacking first developed as a means of accessing secure and private information and it is still used in this way by many groups who want inside or privileged information on their opponents. This type of hacking is most commonly done in such a way as to keep it under the radar so that the perpetrators can continue to monitor the communications of their opponents.

Closely related to the act of private information gathering are attempts to use this kind of data to publicly expose or embarrass opponents. Hacktivists expose misinformation or falsehoods perpetrated by their opponents by hacking into their private and protected networks and then posting this information to sites like Wikileaks, which hosts documents and information “liberated” by hackers.

Hacking meant to entirely disrupt an opponent often features the crashing of vital systems to disrupt communications. One of the most common methods used by hackers is the denial-of-service attacks. These attacks target a website with an excessive amount of Internet traffic which makes it impossible for legitimate requests from users to get through and results in the targeted website going offline. This method has been employed repeatedly by the Internet group Anon, an anonymous online organization comprised of internet pranksters, in their online battle against the Church of Scientology (Stobaugh et al. forthcoming).

CONCLUSION

Hacking, as a movement tactic, is a way for groups with less power to disrupt or invert the established relationships and systems that their opponents or state actors use and rely upon. While hacking can have many motivations, its rise and sustained popularity as a tactic has gone hand-in-hand with our increasing reliance upon digital networks of communication. As technology changes and evolves ever more rapidly, so will the ways that hackers attempt to challenge authority. The true worth of hackers, hacktivists, and hacktivism is in the jujitsu it allows small groups and individuals to use against larger and better-organized opponents, a tenet that has been the core of many social movements.

REFERENCES AND SUGGESTED READINGS

Hamas (Palestine)
JEROEN GUNNING

The Islamic Resistance Movement, better known by its Arabic acronym HAMAS, was founded at the start of the first Palestinian Intifada between December 1987 and January 1988. It began as the resistance wing of the Palestinian Muslim Brotherhood, established in the mid-1940s as the Palestinian branch of the Egyptian Muslim Brotherhood. By the mid-1990s, Hamas had eclipsed its parent organization and had become the main opposition party to Fatah (Hroub 2000; Mishal & Sela 2006).

Hamas is neither a monolithic organization nor always internally consistent. Hamas’s declared goal is the liberation of all of historic Palestine and the establishment of an Islamic state in the entire area. It has become best known for its suicide bombing campaigns against Israeli civilians, and it has waged a long and bloody struggle against Israeli occupation. However, it has similarly shown readiness to make tactical compromises, for instance by engaging in ceasefires, or standing in elections that were a direct result of the Oslo peace talks and thus implicitly premised on the notion of a two-state solution. Its supporters range from the Islamically conservative to the aspirational middle classes, and from the implacably militant to the more politically and socially pragmatic. It has a strong record of efficient social services provision and many of those who voted for it in the 2006 elections were secular Palestinians who had grown disillusioned with the divisions and corruption at the heart of the ruling Fatah party, and believed Hamas would be better at governing Palestine. Since the ousting of Fatah from Gaza in 2007, Hamas has both shown ruthlessness in suppressing opponents and concern for maintaining public legitimacy. In short, Hamas answers to multiple constituencies and many of its apparent contradictions stem from the heterogeneity of its supporters and their sometimes divergent interests (Gunning 2007; Sayigh 2010).

Contrary to popular depictions, Hamas is not strictly speaking a “religious movement” – although academic opinion is divided on this issue (cf. Gunning 2007; Hoffman 2006). While there are prominent clerics in the organization, its leaders are predominantly secular professionals, such as engineers, medical doctors, and lecturers. Its leaders are elected by internal ballot, rather than appointed by religious decree, and many of its supporters consider themselves to be average, rather than zealots, in terms of religious orientation. While Hamas’s ideology draws heavily on religious texts and imagery, its goals are just as much inspired by nationalistic notions of self-determination and modern political models, such as elected legislatures. The targets of its violence are largely secular and its campaigns of violence can be said to follow a predominantly secular logic, shaped by changing political opportunity structures, internal organizational tensions, and constantly contested frames.

In many ways, Hamas is a product of the socioeconomic, political, and ideological changes that rocked the Palestinian territories during the 1970s and 1980s. Its members are predominantly drawn from the new, university-educated lower middle classes, which emerged from the profound changes in the labor market resulting from the interplay between modernization and occupation (Robinson 1997). The rebirth of its parent organization in the 1970s was fueled by the reunification of the Gaza Strip and the West Bank under Israeli occupation, the resurgence of the Egyptian Muslim Brotherhood, the meteoric rise of the Gulf States following the 1973 Arab–Israeli War, and the success of the 1979 Iranian revolution. The regional Islamist resurgence provided existing local networks with the additional ideological impetus and resources necessary to compete against an
increasingly dominant Fatah. The ever more violent confrontations between the Israeli Defense Forces and the Palestinian resistance factions in the lead-up to the Intifada provided the context within which the Brotherhood’s youth became increasingly radicalized and averse to their elders’ opposition to violent resistance. Competition with Fatah, and fear of marginalization following the outbreak of the Intifada, was what finally triggered the internal “coup” that resulted in the formation of Hamas.

Fear of marginalization was similarly a factor in Hamas’s decision to participate in the 2006 elections – just as it was a factor in its turn to suicide bombing in 1993–1994. Having boycotted the 1996 elections on the grounds that they were a product of the Oslo peace process, by 2006 Hamas could participate without being seen to legitimize the by then all-but-dead peace process. For the first time, public opinion polls had seen the gap between Hamas and Fatah narrow to within a few percentage points, enabling Hamas’s pragmatists to persuade the hardliners that participation, even if it meant observing a ceasefire, would enable the organization to translate its popularity into political power. Hamas’s controversial suicide bombing campaigns during the al-Aqsa Intifada (2000–2005) had given it prominence, alongside its welfare provision. By contrast, Fatah was suffering from internal division, following the death of its founder, Yasser Arafat. Using a mixture of modern canvassing techniques and shrewd strategizing, Hamas won two-thirds of the seats in the Legislative Council.

The international boycott that followed Hamas’s 2006 election victory reversed the gains the pragmatists had made and brought the hardliners back to the fore (Gunning 2010). Material support for pro-Fatah security forces fueled an arms race between Hamas and Fatah, culminating in the “pre-emptive coup” which saw Hamas oust Fatah from Gaza in 2007. Since then, Hamas and Fatah have ruled increasingly autocratically in their separate fiefdoms of the Gaza Strip and the West Bank (although the Arab Spring has brought the two sides nominally closer in a “National Unity” government). Ideology (of both the secular and religious variety) has played a part in these dynamics. But one cannot understand Hamas’s evolution without also considering the changes in political opportunity structure (including the international opportunity structure), organizational dynamics (including rivalry between pragmatists and hardliners, and with Fatah and more radical Islamist groups), and changes in broader master frames (including the impact of the Arab Spring on popular perceptions of Hamas and Fatah).

Health movements (United States)

VERTA TAYLOR and MAYER ZALD

Health social movements are collective campaigns to bring about change in medical and public health policy, beliefs, research, and practice. In American society, social movements attempt to influence healthcare at many levels. At the macro level, movements historically have mobilized a range of interest groups and moral and political values both to advocate and forestall national health insurance and to modify existing programs, such as Medicare, Medicaid, and Veteran’s healthcare benefits. Social movements also develop around alternative specializations and different systems of diagnosis and treatment, seeking to reshape professions, organizations, and modes of service delivery. Health-related collective action that addresses the way we think about, understand, and experience disease is also pervasive in American society; movements use and create emotions, identities, and ways of framing health issues to politicize the illness experience. Finally, larger social movements in the United States concerned with inequalities of race, gender, ethnicity, class, and sexuality target medical power and authority, campaigning for equal access and health equity.

Although health movements share many of the attributes scholars associate with other social movements, research on health movements has only recently begun to acknowledge the broader literature. In part this is because social movement scholars debate whether collective challenges that do not target the state can rightly be considered social movements. Over the past decade a less state-centered conceptualization of social movements has emerged rooted in a multi-institutional model of politics that recognizes that the government and state institutions are not the only source of authority in modern society. According to this perspective domination and power are reproduced in various institutions, such as religion, the family, capitalist markets, education, and healthcare through classification and meaning systems that determine the allocation of resources. Viewing society as a multi-institutional system, we should expect social movements to challenge not only the state, but any social group, organization, or institution in which authority is constituted.

While the state has a unique capacity to establish rules that govern other institutions, it is by no means the only source of authority in health systems, nor is it necessarily the most influential. Health movements have sought to challenge political power, professional authority, corporate interests, and personal and collective identity. Health-related social movements address the provision of and access to healthcare services, contest traditional assumptions and scientific research regarding disease diagnosis and causation, challenge the authority of science and medicine by promoting personal understanding and experience of disease, mental health, and disability, address health inequality based on race, ethnicity, gender, class, and sexuality, and challenge the authority of medicine, science, governments, and corporations such as the drug and hospital industries.

THE ORIGIN AND TYPES OF HEALTH MOVEMENTS

The healthcare system in the United States is permeated by social movements to a much greater extent than in most developed nations. The abundance of health movements can be explained, in part, by the state’s historical reluctance to develop a national health insurance system or single provider system guaranteeing access to medical services and, in part, by the larger sociopolitical context, which makes
the United States more movement prone than many nations. A multi-institutional approach suggests that to understand the emergence of health movements, we must examine the larger field of contention in which they operate because each institutional field has its own logic, rules, and regularities. Institutional boundaries, however, are vulnerable to political contestation, new practices, and even the development of new institutional logics. One aspect of an institution that structures the context of political action is how open or closed it is to challenges.

In the biomedical complex, power is reinforced by scientific authority, the standardized education and licensing of physicians and other health professionals, the structure of hospitals, managed care, the policies of health insurers, and the federal bureaucracy. If the bureaucratization and corporatization of healthcare would seem to make the biomedical complex resistant to change, the faith in medical and therapeutic approaches to human problems that underlies the moral economy of US healthcare together with disease-based and reductionist approaches to illness, which have led to medical specialization, provides the opposite impetus. Beginning in the 1980s, specialization, privatization, and the corporatization of health services began to erode the authority of physicians. These changes created political opportunities that have made the healthcare system more conducive to supporting the aims of movement actors.

Further, the fractionalization of authority across different levels of the public, private, and nonprofit divides produces multiple targets and levels for collective action. On the most macro level movements interact with professions, political parties, labor unions, insurance industry lobbyists, the pharmaceutical industry, managed-care organizations, and a variety of other groups to establish or forestall national and state-level plans, to authorize large new programs such as national health insurance or more limited national programs, and to modify existing programs, such as Medicare, Medicaid, and Veteran’s healthcare benefits. Movements also develop around alternative specializations and different systems of diagnosis and treatment. At this level, movements attempt to reshape professions, organizations, and modes of service delivery. Movements also coalesce around the way people think about, understand, and experience disease, and they use emotions, identities, and new ways of framing disease and health-related issues to politicize the illness experience. Finally, larger social movements in the United States concerned with inequalities of race, gender, ethnicity, class, and sexuality spill over to the medical sphere, addressing issues of unequal access and health equity.

Analyzing the range and nature of health social movements in the United States, Phil Brown (2007) identifies three types: health access movements, which seek equitable access to health services; embodied movements, which address disease, disability, or illness experience by challenging science on etiology, diagnosis, and treatment; and constituency-based movements, which address health inequality based on race, class, gender, ethnicity, and sexuality.

THE DYNAMICS OF HEALTH MOVEMENTS

The organizational and cultural logic of a particular institutional arena influences the structural forms through which a movement mobilizes. In addition, the women’s, civil rights, gay and lesbian, environmental, and other movements that emerged out of the 1960s and 1970s cycle of protest have spawned a variety of subsequent movements, and these movements have influenced the mobilizing structures, frames and collective identities, and tactics of health movements.

Mobilizing structures. The mobilizing structures, or forms of organization, that propel health movements range from formally structured national organizations such as the National Women’s Health Network, National Black Women’s Health Project, the National Asian Women’s Health Organization, and the
National Latina Health Organization, to more loosely structured local networks, such as direct action, self-help, and support groups such as the Boston Women’s Health Collective, creators of the bible of women’s health, Our Bodies Ourselves and ACT UP (AIDS Coalition to Unleash Power). Broad-based health movements, such as the breast cancer movement, HIV/AIDS movement, environmental health justice movement, women’s health movement, disability rights movement, and psychiatric consumer movement mobilize through a variety of overlapping formal organizations, networks, and self-help groups. Because institutional movements adapt their organizational forms and tactics to the rules, practices, and discursive context of the institutional field, the hallmark of most health movements is hybrid organization, or mobilizing structures composed of a mix of lay and expert activists.

**Framing and collective identity.** Health movements mobilize through: (1) new frames or interpretations of problems that resonate with the beliefs and practices of adherents, constituents, the medical establishment, and other actors in a field of contention; and (2) collective identities around a disease and potential set of causes that becomes politicized through collective action. The collective frames used to justify health movements that target the state mirror the therapeutic state’s use of discourses of illness and health, but also draw upon core American values pertaining to freedom, choice, personal responsibility, and savings. Constituency-based health movements concerned with health inequality, which are often spin-offs from earlier broad-based movements, borrow from the master frames that shaped orientations and strategies of earlier movements and countermovements to justify their claims. For example, the language of gender and power in women’s self-help movements serves to punctuate and explain a host of problems that trouble women. In health movements, the reframing of illness, which allows people to cast off the passive patient role, counter stigma, resist treatments with dangerous side effects, and develop alternative explanations for the cause of their disease is central to collective identity construction. Brown (2007) describes the process of transforming an individual disease into a collective identity focused on health and social inequalities as a politicized illness experience.

**Tactical repertoires in institutional contexts.** Health movements develop insider and outsider tactics that mirror institutional rules and practices suitable for employment in relation to the elements of the institutional field most likely to give leverage in pursuing or resisting change. Professional groups attempting to change healthcare policies or programs tend to use insider tactics, such as strikes, petitions, courts, and legislative bodies to press their claims. Patient and consumer groups also create organizations to lobby physicians, corporations, researchers, and government agencies, such as the National Institute of Health and the National Institute of Mental Health, for the redefinition of disease categories. Health movements also originate among patient and consumer groups with a deep sense of mistrust of institutional authorities, and these movements have often resorted to outsider tactics, including street demonstrations, direct action, and boycotts. Three tactical innovations are associated with embodied health movements. First, is self-help or reliance on experiential knowledge and mutual support as an alternative to professional knowledge; second is coming out or strategic identity disclosure to empower people disenfranchised by disease classifications, reimbursement policies, and practices of health institutions; and the third is the use of lay knowledge, such as popular epidemiology and bibliotherapy, to challenge biomedical discourse and power.

**THE IMPACT OF HEALTH MOVEMENTS**

From self-help and disease-oriented patient groups, to groups organized to combat toxic environments, to movement-like activities of mobilized health professionals, to coalitions of groups organized to change national politics,
health movements interact with and sometimes come into conflict with the medical profession, health corporations, government health organizations, and interest groups. To say that health movements have had impact on the health system at many levels is not to say they always achieve their intended effects. Nor is it to say that movements are the most important drivers of change in health institutions. Over the past 50 years, health social movements have, nevertheless, played a major part in the medicalization of all sorts of human maladies and conditions – from childbirth and depression to gender identity disorder and erectile dysfunction – and this has contributed significantly to the expansion of the bio-medical complex in US society.

Hizb ut-Tahrir
EMMANUEL KARAGIANNIS

Hizb ut-Tahrir al Islami (the Islamic Liberation Party – hereafter Hizb ut-Tahrir) was founded by Taqiuddin an-Nabhani, an Islamic scholar of Palestinian origin in East Jerusalem in 1953 (Taji-Farouki 1996). The party gradually expanded to become a truly international movement with branches from Morocco to Indonesia. From the 1980s onward, Hizb ut-Tahrir has also managed to establish branches in Western countries which have sizeable Muslim communities, including Great Britain, Germany, Denmark, Spain, France, the United States, and Australia. Since the 1990s, Hizb ut-Tahrir has also become active in the former USSR and China. The current leader of Hizb ut-Tahrir is Ata Abu Rashta, a Palestinian civil engineer who studied in Cairo and served previously as party spokesman in Jordan, but his whereabouts are unknown.

Interestingly, Hizb ut-Tahrir views itself not as a religious organization, but rather as a political party whose ideology is based on Islam. In reality, it is a selective interpretation of the Koran that provides the basis for Hizb ut-Tahrir’s ideology. The group claims that the roots of Muslim decline lie in the de-Islamization of the ummah (i.e., community of believers); namely a decline in spirituality and religious observance. Hizb ut-Tahrir has not only provided a straightforward explanation for the Muslim world’s problems, but it has also put forward a strategy for the revival of the ummah.

The proposed strategy consists of two parts. The first is the need for Islamic law, sharia that justly regulates all aspects of human life—politics, economics, and ethics. The second is the need for an authentic pan-Islamic state, because a just society can be established only within such a political entity. Therefore, Hizb ut-Tahrir has campaigned for the reestablishment of the Caliphate that existed in the seventh century under the Prophet Muhammad and his first four successors. For this purpose, the group has envisaged a three-stage program of action, modeled after the three stages that the Prophet Muhammad experienced en route to the establishment of the first Islamic state in Medina:

• First stage: recruitment of members.
• Second stage: Islamization of society.
• Third stage: peaceful takeover of state and then jihad against nonbelievers (Members of Hizb ut-Tahrir in Britain 2000: 32).

Since Hizb ut-Tahrir operates largely clandestinely, its membership cannot be estimated accurately. Judged by the high number of individuals attending its events in countries where Hizb ut-Tahrir is legal (e.g., United Kingdom, Indonesia) and the number of arrested members in the Middle East and Central Asia, it is clear that the organization has hundreds of thousands of members and sympathizers. Despite being an international organization, most literature and communiqués are published from London. The group has also used the Internet to spread its messages. Hizb ut-Tahrir has increasingly played a leading role in many pan-Islamic issues, mobilizing large numbers of people to protest, for example, against the US invasion of Iraq or Israel’s actions in Lebanon and Gaza.

HIZB UT-TAHRIR AS A TRANSNATIONAL SOCIAL MOVEMENT ORGANIZATION

Hizb ut-Tahrir is more than just another Islamist group; it is a social movement organization (SMO) which is part of a larger social movement, namely political Islam. The latter is a diverse world of Islamic charities, political parties, violent and nonviolent groups. Dieter Rucht has drawn attention to those SMOs that have become transnational in terms of...
recruitment, issues, and organization (Rucht 1999: 207). According to Rucht, transnational social movement organizations (TSMOs) consist of closely interrelated groups that originate from more than one country. In addition, Louis Kriesberg argues that TSMOs have two distinct characteristics (Kriesberg 1997: 16–17). First, they attempt to influence the public opinion, political elites, NGOs, and international organizations at the national, regional, or global level. Second, there is a division of labor within TSMOs with members from developed countries complementing the efforts of those from less developed countries. More specifically, TSMOs sometimes provide funds and safe havens in one country from which campaigns can be launched in another (Kriesberg 1997). Furthermore, Jackie Smith suggests that a primary aim of many TSMOs may be to forge a new global identity for their members in which loyalty to the organization prevails over loyalty to states (Smith, Pagnucco, & Chatfield 1997: 72).

Hizb ut-Tahrir certainly fits the description of a TSMO since it consists of many closely interrelated national branches that subordinate to an international organization. Although breakaway groups have appeared from time to time, Hizb ut-Tahrir remains remarkably united under the rigid control of the all-party leader. Hizb ut-Tahrir’s propaganda machine has targeted a diverse audience that includes the wider public, the media, human rights organizations, national governments, and international organizations. In addition, there is an apparent division of labor within Hizb ut-Tahrir, as illustrated for example by the British branch’s campaigns against the arrest and torture of members in Central Asia and elsewhere. By advocating the break-up of existing Muslim states, Hizb ut-Tahrir has forged a new transnational identity for its members, centered on the ummah (the community of believers).

Homeless protest movements (United States)
DANIEL M. CRESS

Protest activity by homeless people was arguably the most significant social movement by poor people in the United States over the three decade period, 1980–2010. Newspaper accounts of homeless protests were reported in over 60 cities during the 1980s with more than 500 protest events reported in 17 of those cities between 1984 and 1990 (Cress 2009; Snow, Soule, & Cress 2001). Beyond its empirical importance, homeless protest sheds theoretical insight into social movement activity because of the seemingly unlikely possibility of homeless people being able to sustain ongoing mobilization or achieve significant concessions. This entry examines the emergence, organization, and outcomes of homeless protest and concludes with a discussion of how protest by the homeless influences our understanding of social movements more broadly.

EMERGENCE AND PARTICIPATION

The emergence of protest by the homeless came on the heels of the significant increase in homelessness that followed the recession of 1982. An array of macro-level factors including the restructuring of job opportunities for the poor and working class, the decrease in affordable housing, and the erosion of social support contributed to a significant increase in homelessness in major cities throughout the United States (Rossi 1989; Wright 1989; Burt 1992). The policy response, both private and public, was to create an infrastructure of shelters and soup kitchens to meet the immediate and basic needs of homeless people.

The initial emergence of activism by homeless people in the mid-1980s was directed at both the prevalence of homelessness and the response to it. While advocates for the homeless pushed for increases in services, many homeless activists decried these approaches as institutionalizing the homeless problem and instead called for permanent, affordable housing, jobs, an end to police harassment, and more humane treatment in the services being provided (Cress 1993; Wagner 1997; Wright 1989). In addition, some homeless protest may be triggered by either the defense of marginal space in urban areas where the homeless have typically had greater access, or the right to prime space where the homeless have been harassed by merchants or the police (Snow & Mulcahy 2001).

This understanding is supported by work that suggests that variation in homeless protest around the United States was shaped in part by local levels of resources and economic strain (Snow, Soule, & Cress 2005). On the resource side, protest occurred at greater levels in communities with higher per capita incomes and higher levels of transfer payments to the needy. Yet, homeless protest was most likely to take place in cities that had greater disparity between income levels and housing costs, declining manufacturing jobs, higher poverty rates, and higher unemployment rates. These factors were translated on the micro level in that homeless activists who participated over the long haul were more likely to report higher levels of strains and grievances than those who did not participate or only did so in one event (Corrigall-Brown et al. 2009).

ORGANIZATION AND RESOURCES

If the prerequisites for collective action require social networks, indigenous organizations, resources, and some modicum of social power, then the homeless would seem an unlikely group for sustained protest. Yet, homeless
protestors were able to organize widely and over several years as indicated above. How did this happen? In part, this was shaped by the organizational fields in which the homeless existed. Cities that had more service provider and activist organizations tended to foster a climate for ongoing homeless protest through the provision of resources.

For the most part, homeless social movement organizations (SMOs) that maintained viability had resource support from benefactor organizations. These groups, typically social gospel organizations like the Catholic Workers or American Friends, supported homeless protestors with an array of resources, the most important being strategic and tactical support and leadership. Some homeless SMOs that lacked benefactor relationships did maintain ongoing protest if they were able to secure these resources internally (Cress & Snow 1996).

Most of the homeless SMOs were informal organizations with a small leadership cadre that proposed ideas about actions that other homeless people then supported. Yet, roughly half of the homeless SMOs also incorporated as nonprofit entities (Cress 1997). In some cases, this incorporation was pursued to gain resources for charitable work or organizational legitimacy. In other cases, it was involuntary – the homeless group was a part of a larger organization that was already a nonprofit or the homeless SMO was required to incorporate as part of a settlement of protest in order to gain the outcomes. The pathway to nonprofit incorporation, rather than incorporation per se, had an influence on the tactical choices of homeless SMOs. Those whose incorporation was part of a plan for greater organizational legitimacy were more likely to maintain their militancy. Those who were part of a larger nonprofit organization or who incorporated for charitable reasons or as a condition of concessions were more likely to moderate their tactics or disintegrate.

OUTCOMES

Homeless protest ranged in its effectiveness from city to city. In some cases, the homeless had little to show for their efforts. In other cases, homeless people came to control tens of millions of dollars in housing and service assets (Cress & Snow 2000). In general, homeless protest was able to secure four types of outcome – representation, resources, rights, and relief. Representation refers to the homeless having input on policy task forces and service provider boards that have concern with their interests. As noted at the outset, homeless people were often not in agreement with the responses to their conditions. Representation gave them at least the ability to be heard and have influence on these responses. Resources refer to homeless protestors being able to secure assets for their SMOs. Given the centrality of resources to ongoing mobilization, obtaining office space, supplies and, in some cases, outright control of service provision was central to ongoing mobilization.

Homeless protest was also effective in securing basic civil rights for homeless people. These types of outcomes included protection from police and merchant harassment, and securing the right to vote, attend school, or obtain welfare benefits in the absence of a permanent address. Finally, homeless protest was able to secure some modicum of relief for the homeless. This relief came in the form of accommodative programs such as shelters and soup kitchens or access to showers and storage facilities. In some cases though, homeless protest was able to secure restorative programs that helped get homeless people off the streets. These included such things as jobs and permanent housing – the very things that motivated homeless protest in the first place.

So what contributed to the ability of homeless protest to obtain concessions? Two factors were most important: the first was maintaining homeless SMO viability through securing the requisite resources for ongoing mobilization; the second was having coherent and specific framing of the homeless problem and the solution contributed to SMO effectiveness. The tactics utilized by homeless SMOs were more complex in relation to obtaining concessions. Militant tactics were most effective in cities that
were unresponsive to the homeless issue, but where the homeless had political allies on city councils. However, militancy backfired in cities that had been more responsive to the homeless problem.

THEORETICAL CONTRIBUTIONS

Collective action and protest by the homeless have made significant contributions to our understanding of social movements more generally. In regards to movement emergence, homeless protest has underscored the role of resources and strains. While resource flows have been posited as a significant factor in movement activity, this has more often been asserted rather than demonstrated. Ironically, resource-based approaches to understanding social movements tended to displace strain and grievance arguments, but in the case of homeless protest, strains and grievances have been equally important to understanding the emergence and level of protest.

Homeless protest has also raised issues about the underlying dynamics in social movement participation. In particular, the centrality of network connections and biographical availability has been less relevant to understanding homeless participation. Instead, a common collective identity and a sense of collective and personal efficacy combined with a heightened experience of strains and grievances were more important predictors of participation. The broader point is that it is important to understand the population in question and the micro-contexts of mobilization before assuming a general model of participation applies.

The role of organizations and resources in sustaining mobilization are also underscored by homeless protest. Again, this has been asserted but rarely demonstrated in other work. Additionally, Piven and Cloward 1977, writing specifically about movements of the poor, question the utility of organization building, arguing that it becomes an end rather than a means. While this may be the case for some movements they studied, it was clear in the case of homeless protest that organizational carriers were central to its ongoing mobilization and ability to secure outcomes.

Finally, homeless protest sheds light on understanding the conditions under which movements are able to obtain concessions. In particular, it underscores the importance of framing for obtaining concessions. Most work on framing has centered on its role in gaining participants, but it is clearly important for obtaining concessions as well. Homeless protest also underscores the complex interaction between tactics and the political environment. The debate over the influence of disruption (versus the political environment) on movement outcomes is more complex than the either/or scenario often presented. The success or failure of disruptive tactics is dependent upon the political environment that includes the sympathies of office holders as well as the responsiveness of public agencies (Cress & Snow 2000).

Human rights movements

ALISON BRYSK

Millions of human rights activists around the world have crafted a new way of doing politics, based on bringing principle into practice. These principles are summarized in the Universal Declaration of Human Rights: “All human beings are free and equal in rights and dignity.” It begins by using global communications to capture the hearts and minds of global publics. Coalitions of local and global activists pressure governments “from above and below,” and put new issues on the agenda – from forced disappearance to female genital mutilation. Human rights campaigns provide information on global suffering, affecting images that promote identification with victims, the formation of solidarity networks, and explanations that trace international connections.

Although they struggle against a massive and unceasing tide of war, exploitation, and “death by government,” human rights campaigns have saved the lives of countless refugees, political prisoners, and forced laborers. Such protests have contributed strongly to transitions to democracy in many Latin American countries, South Africa, and the Philippines, and former political prisoners became the first democratic leaders of Poland, the Czech Republic, South Korea, and Timor. At the global level, nongovernmental groups drafted many provisions of the UN Convention on the Rights of the Child, while indigenous movements played an important role in creating the UN Working Group on Indigenous Peoples. Similarly, the International Criminal Court is the result of a steadfast campaign by a coalition of dozens of movements advocating human rights, the rule of law, and global governance.

DEFINITION

Human rights movements are organizations, campaigns, and issue-networks that seek to enact the fundamental rights inscribed in the Universal Declaration of Human Rights. Such movements run the gamut from local self-defense of vulnerable citizens (Argentina’s Mothers of the Disappeared) to national campaigns for regime change (Iran’s Green Revolution) to global movements for the universal defense of a fundamental freedom or social condition (the International Commission of Jurists). Local human rights movements generally seek to transcend partisan political identities, and derive their power from a combination of Gandhian nonviolent collective action and globalized information politics (Ackerman & Duvall 2000). Global human rights organizations like Amnesty International, and NGOs with a human rights focus, like the International Committee of the Red Cross, follow much of the generic organizational logic of mandate, leadership, and resource mobilization – like bureaucracies and firms (Hopgood 2006). Human rights campaigns are also often catalyzed by less institutionalized transnational issue-networks that include social movements, international organizations, and experts, in fluid habitual exchanges that pressure states from above and below (Keck & Sikkink 1998). An additional element of advocacy mobilizes transnational identities, such as trade unionists defending their threatened colleagues in Colombia, Christians pressing for religious freedom for their co-religionists in China, and women’s groups campaigning to have genocidal rape designated as a war crime by the International Criminal Court.

The unifying theme of these diverse movements is the pursuit of universal human rights. The overall rubric of human rights is
protection of the individual from the abuse of authority – especially but not only the state – as well as self-determination regarding fundamental freedoms of movement, expression, and social participation. While the citizenship traditions of established democracies usually claim to guarantee these rights within a state, universal human rights claim a wider spectrum of entitlements than civil rights, do not depend on membership in a particular society, hold all societies to a common minimum standard regardless of cultural and political history, and are inherent and inalienable. Universal human rights specifically protect noncitizens such as stateless refugees, victims of war crimes enacted by a foreign state, and subjects of nonstate authority such as workers.

HISTORY

The nineteenth-century trans-Atlantic movement against the African slave trade was one of the earliest principled international mobilizations for human rights, and secured the formal abolition of the traffic in human chattels. During the same century, growing costly collisions among rising European powers led to recognition of the horrors of war as a violation of universal standards, and the establishment of the International Committee of the Red Cross (ICRC) as a humanitarian service and advocacy group. The ICRC’s push for the Geneva Conventions led to a designated role as a monitor of war crimes – the first international legal recognition of a human rights movement. Decades later, the horrors of the Holocaust inspired a massive effort by NGOs to catalyze and monitor the Universal Declaration of Human Rights and associated UN mechanisms (Korey 1998).

The flagship global organization Amnesty International, established in 1961 to advocate for “prisoners of conscience,” now comprises millions of members in over 150 countries. Amnesty International has secured the freedom of around one-third of its subjects from diverse regimes. Along with peers like Human Rights Watch, Amnesty’s nonpartisan annual reports on country conditions and monitoring of conflict situations and emerging abuses often influence global and bilateral condemnations and sanctions. Amnesty campaigns against torture and the death penalty as well as illegitimate detention, and a core membership activity is letter-writing campaigns by global mass publics to “name and shame” repressive governments.

A generation later, Human Rights Watch developed as an information-gathering and parallel advocacy centerpiece of the movement, centered in the United States (while Amnesty is headquartered in London). Human Rights Watch emerged in the waning days of the cold war as a global umbrella for national and regional committees such as the Helsinki Watch groups in Eastern Europe, which sought to shield local dissent through holding the Soviet Union to its international treaty commitment to civil liberties under the Helsinki Accords. Parallel efforts in the Americas during the 1980s struggled for accountability for abuse by US-backed military dictatorships, and eventually spread to Africa as well. Human Rights Watch has an expert rather than mass membership base.

From the 1980s onward, human rights movements have mushroomed in numbers, membership type, geographic reach, and claims. Thousands of nongovernmental grassroots organizations monitor and defend human rights, from Tibet to East Timor. Reaching beyond expert and legal advocates, Latin American activists pioneered campaigns by relatives of victims – a protest repertoire that diffused worldwide. While human rights began as a legal defense of the lives and physical integrity of political dissidents and religious or ethnic minorities from the malfeasance of dictatorships, its mandate has expanded to chronic deprivations of economic and social rights. Human rights organizations increasingly take on issues like labor exploitation, land rights, and access to essential medicines, while development NGOs like Oxfam have moved to adopt a rights-based approach (Nelson & Dorsey 2008). A growing number of human rights movements struggle for
collective identity rights and accountability of nonstate actors like multinational corporations for abuses connected with globalization. The unexpected take-off and impact of international indigenous rights movements illustrates both of these trends, with greatest strength in Latin America but worldwide diffusion (Brysk 2000). Since the 1990s, the subjects of human rights movements have been expanded to previously unrecognized groups such as children, people with disabilities, and sexual minorities. Part of the history of the human rights movement is the reframing of various forms of social problems and marginalization as a problem of human rights – thus, one of the leading gay rights organizations in the United States is now called the Human Rights Campaign (Bob 2009).

**TYPOLOGY**

In terms of function and origin, human rights movements can be roughly mapped as overlapping clusters of institutional reformers, advocates, affected populations, and norm-promoters (based on Brysk 1994). Institutional reformers are generally civil libertarians who challenge the legal basis or operation of a government that is discriminatory or repressive. Such movements are often founded by or comprised of lawyers and usually play a critical role in gathering data and documenting evidence and patterns of abuse. Examples range from Argentina’s CELS (Centro de Estudios Legales y Sociales) to the American Civil Liberties Union.

The oldest tradition of humanitarian advocacy speaks for victims who cannot speak for themselves: one of the oldest human rights organizations is the Anti-Slavery Society, founded in Britain over a century ago. A variation on this arose during the 1980s, when solidarity or accompaniment was carried out by Witness For Peace and Peace Brigades International, whose members serve as “unarmed bodyguards” for local populations at risk of human rights abuse. These types of movements operate by a logic of solidarity rather than argumentation, are more likely to protest and lobby both target and home governments, and usually have a nonexpert “conscience constituency” based in democratic, developed countries. Prominent current examples include the Free Tibet movement and the Darfur campaign.

From the late twentieth century, directly affected populations began to organize on their own behalf, usually aided by the protection of international organizations and access to global communications. These are generally the most locally based movements, and are often focused on symbolic protest, agenda transformation, and standard-setting. The fastest growing movements of affected populations include relatives of the disappeared, women’s groups, and ethnic minorities or groups stigmatized by social status (such as India’s Dalit).

Finally, cutting across these traditional genres but with some distinctive identity and mode of operations, there are normative constituencies organized around religious or professional identity that come to mobilize as human rights movements. Church-based liberation movements were critical advocates against military dictatorships in Latin America, against apartheid in South Africa, and for development and indigenous rights worldwide. Newer movements that seek to project a professional ethos for the realization of rights protection and empowerment are exemplified by Doctors without Borders and the writers’ group PEN.

Meanwhile, globalization has generated novel forms of advocacy that span these genres, notably transnational professional self-defense networks and multi-movement coalitions across transnational issues. The New York-based Committee to Protect Journalists, in this model, monitors and protests harassment, prosecution, and assassination of journalists worldwide. They have recently been quite active in Colombia, where dozens of journalists are assassinated each year. Similarly, the American Association for the Advancement of Science and Scholars at
Risk advocate for academic freedom and the protection of threatened intellectuals.

Another growing form of internationalism consists of nonhierarchical coalitions of human rights organizations within regions. One of the first such coalitions was the Federation of Families of the Disappeared (FEDEFAM), founded in Argentina in the 1980s to unite national human rights organizations comprised of relatives of the disappeared. In Africa, one of the few NGOs credited with making some progress on the region-wide and culturally sensitive issue of female genital mutilation is a regional NGO network, the Inter-African Committee (Welch 1995).

There are also informal human rights partnerships between northern NGOs, including those that are not traditional human rights organizations, and grassroots groups. The Amazon Alliance, for example, unites northern environmentalists with Latin American indigenous peoples’ organizations. Along these lines, the Sierra Club, together with Amnesty International, has launched a campaign to protect environmental activists worldwide, with featured cases in Mexico and Ecuador, and a special focus on the responsibility of multinational corporations. In Mexico, anti-logging activist Rodolfo Montiel – winner of the 2000 Goldman Environmental Prize – was declared a prisoner of conscience, and as a result of this pressure was eventually released by the Mexican government. Networks often combine labor, religious, and human rights groups on the Northern side. The Texas-based Coalition for Justice in the Maquiladoras, for example, is comprised of the Interfaith Center for Corporate Responsibility, the American Friends Service Committee, Human Rights Watch, and the United Auto Workers.

HOW THEY WORK

International human rights movements monitor, lobby, protest, and reform laws, governments, and institutions. Country-specific campaigns, increasingly mobilized via the Internet, shield some local advocates and bring pressure to bear on repressive regimes. Global advocates for human dignity also construct cosmopolitan institutions for prevention and accountability, such as UN treaty bodies, national truth commissions and tribunals following dictatorships and conflicts, and international prosecutions for genocide, torture, and war crimes. Human rights campaigns dedicated to identifying transnational abuse have also introduced new forms of leverage through boycotts, and new mechanisms of global governance such as codes of conduct for multinationals. New forms of standard-setting, like the Convention on the Rights of the Child, highlight new populations, construct new rights, inspire willing governments, and embarrass laggards.

How do these activities cause social change, in the face of governments’ monopoly of force? Margaret Keck and Kathryn Sikkink depict human rights appeals as a “boomerang” launched by a powerless civil society that reaches around the state to secure transnational pressure “from above and below.” They outline particular pathways of symbolic politics, information politics, power-based leverage, and rule-based institutionalization (Keck & Sikkink 1998). In terms of symbolic politics, charismatic leadership, public intellectuals, and causes célèbres (famous prisoners or victims) often play an unusually strong role in mobilizing human rights movements: from Nelson Mandela to Aung San Suu Kyi. Alison Brysk further maps the conceptual political work of human rights campaigns as inserting new subjects such as women or noncitizens into existing rights regimes, crafting new mechanisms to secure accountability from various venues of authority, and discovering new norms to make rights claims for new or unrecognized forms of power relations (Brysk 2005).

ONGOING ISSUES

Rights to life, freedoms of expression and assembly, protection from torture and arbitrary arrest, remain powerful tools against
states and government agents. But globalization has brought the spread of corporations that violate employees’ rights in sweatshops, epidemic diseases like AIDS, new forms of conflict, and legacies such as landmines (which kill 70 people each day). To enforce these standards on global and private actors, activists also participate in global civic initiatives that bypass governments. For example, a human rights issue-network harnessed willing states and legitimate producers to set up an international certification scheme to stem the trade in “blood diamonds,” whose illicit export has contributed to war crimes in several notorious African conflicts.

New forms of communication allow victims to videotape their plight, advocates to flood governments with faxes, web sites to mobilize urgent action alerts. But the effectiveness of global consciousness and pressure on the states, paramilitaries, and insurgents responsible for traditional human rights violations varies tremendously. And access to the new global mechanisms of communication is distributed unevenly, so that some of the neediest victims – like the illiterate rural poor or refugee women – are the least likely to receive global as well as domestic redress.

While the growth of regional coalitions and issue-networks has increased participation of the global South, the human rights movement still struggles for ways to better reflect a global constituency. Incorporating the global South means introducing new faces, new issues, and new venues to the human rights struggle. International movements and institutions now usually try to include representatives of more societies, but they face ongoing barriers of finance, education, and freedom in the sending countries. And even appointed national representatives from developing countries are often relative elites who are unrepresentative of their own nation’s diversity of identity and opinion. For affected groups in the global South, human rights activism often requires a risky lifetime commitment, beyond the occasional boycott or letter-writing of the Northern advocate.

Another challenge for the global South is some divergence of the urgent issues of survival and interconnected dilemmas of development from the Northern-generated structures of international law. Rights conceived as individual, adversarial boundaries of nonintervention may not address threats to collective self-determination, or the enabling resources needed to access legal rights. A legalistic rights framework moves slowly, and still usually depends on a functional state authority to enforce it. The lingering legal heritage of human rights may be especially problematic for women, and others subject to discrimination and subjugation by nongovernmental authority (Merry 2006).

CONCLUSION

Human rights movements are a vital part of the struggle for fundamental human dignity worldwide. From their roots in episodic protest against repressive governments, thousands of human rights networks and campaigns have grown to constitute an uneven but significant global civil society. Such movements now advocate for every aspect of the human condition, using a combination of normative appeals, mass mobilization, and institutional reform at the global and national levels. Despite some limitations, this form of people power has become our best hope for a world in which all are “free and equal.”

Hunger strikes

JOHANNA SIMÉANT

Hunger strike can be defined as a public fast, combined with a claim aimed at confronting an adversary or an authority that is likely to satisfy this claim. Most of the time it endangers the health, and sometimes the life, of the hunger striker. British suffragettes and Irish nationalists are the two groups who had the most significant input into introducing hunger strikes within the repertoires of contention in modern nation-states at the beginning of the twentieth century. Although the word appeared only in the nineteenth century, fasting as a form of protest has a longer history, either within the private sphere or in political matters. Significant precedents were the collective fasts of Virginia, Rhode Island, and Massachusetts performed against the United Kingdom before the American War of Independence.

Whereas more institutionalized and routinized forms of protest get academic interest, hunger strikes, along with other forms of violence against the self (mutilations, immolations, suicide bombings, etc.) have gained very little attention in social movement studies. This lack of interest is probably due to the fact that hunger strikes are considered as too individual, too residual and sometimes irrational, and relevant for psychological studies only, as they are often associated with anorexia (Orbach 1986). But those arguments are questionable. First, many groups (undocumented migrants, political prisoners, etc.) resort collectively and regularly to hunger strikes. The boundary between individual and collective protest is an issue, more than a clear-cut distinction, for all social movements. Second, although data-collecting on hunger strikes is difficult, a low estimate based on press data reveals that as many as 75 hunger strikes were carried out outside prisons in the year 2008 in France, and this level reaches 180 through Internet sources (Siméant 2009). Waismel-Manor (2005), also relying on press data, estimates that between 1976 and 2001 there were 164 hunger strikes in Israel and 312 in the United States. Hunger strikes are a central element of prison repertoires of contention all over the world (each year about a thousand hunger strikes occur in French prisons). Third, irrationality can by no means be a way to qualify and delegitimize hunger strikes: every protest action has its reasons – notwithstanding their not befitting a strict rational choice model.

Uses and meanings of hunger strikes are quite diverse. Any culturalist interpretation of hunger strikes should be considered with caution. Some traditions undoubtedly bear a particular affinity with hunger strikes in Irish and Indian history (cf. the practice of the creditor’s fast). But hunger strikes can be observed all over the world, in quite different religious and cultural settings. Moreover, hunger strikes oscillate between two different universes of meaning: one is linked to nonviolence (and here the Gandhian heritage and its diffusion seem significant), the other has more affinities with violence (often, previously suffered) in contexts where it cannot be used against authorities.

It is however true that resorting to hunger strikes is often associated with groups suffering different forms of domination: women having no access to voting, colonized people, national minorities and foreigners, prisoners and prisoners’ wives, isolated persons endangered by administrative decisions, and so on: all kinds of persons seeing, de facto or de jure, their access to conventional participation restricted. The prevalence of collective hunger strikes is more important in those groups, who often do not seem to enjoy enough social consideration to go it alone in hunger strikes. Hunger strikes therefore engage an idea of the lack of value of people who are reduced to their bodies (as working or reproductive bodies).
If they do lack political resources, those protesters however do not lack a significant political socialization that seems to let them feel authorized to protest in such a vocal way. Even in conflicts around the workplace, a biographical study of protesters shows an inherited propensity to individual protest, linked to a high conception some individuals can have of their social role, and that has led them to conflicts with different institutions.

Primary and secondary socialization (in terms of profession, religion, politics, speaking out loud, etc.) has therefore a link with hunger strikes, even if this socialization can be a late one, linked to an interactive radicalization process between the individual and the institution (that is why carceral socialization plays such a role here).

Hunger strikes are therefore frequently associated with status claims built as nonnegotiable. They cannot, however, be considered only as the weapons of the weak. Renowned protesters can also put their fame in the balance. Hunger strikes have to be studied synchronically within the global repertoire of contention. They call for an audience and a third party to question authorities, and rely on the possibility of a public opinion (be it international), and are closely linked to contemporary politics of pity, more than mass media only. Controversies about the reality of hunger strikes show that they are also perceived as an ordeal and a test of the protesters’ authenticity and commitment to their cause.

Whatever the reasons for a hunger strike, this means of action also has its own logic once begun: the handling of the strike’s credibility, the control of defections in the case of collective strikes, strategic interactions with authorities that try to confront the humanitarian strategy of hunger strikers by accusing their supporters, or to delegitimize hunger strikers when they can be accused of having resorted to violence, and so on. The policing of protest also takes another dimension, both strategic and symbolic: force-feeding, a method which has a double aim – avoiding deaths, and recalling to the protesters that they do not have the control they claim over their bodies. If most hunger strikes succeed at least partially, as they call attention to a cause, even on a very local level, they do not always obtain the substantial changes they claim. What is certain, however, is that if hunger strikes are not always effective, a death by hunger strike is always considered as a moral defeat for the contested power. It is a risk that states take when facing hunger strikers accused of terrorism.

Indian Independence Movement
JOHN T. CRIST

Until Gandhi’s return to India from South Africa in 1915, protest against the British had been episodic and mostly localized. The era of the Indian Independence Movement (1917–1947) emerged as Gandhi assumed the leadership of the Indian National Congress – the INC, or Congress, the principal vehicle for nationalist opposition – and radically altered its composition and tactics. Through the INC and his own independent cadres of nonviolent activists, Gandhi forged a popular nationalist coalition of urban elites and rural masses against foreign occupation. Under his guidance, Congress adopted the tactics of nonviolent direct action, civil disobedience, and noncooperation in loosely structured national campaigns that together comprised a sustained challenge against colonial occupation over three decades.

The Indian Independence Movement evolved concurrently with the expansion of institutions of local self-government sanctioned by the imperial government. In 1919, the Government of India introduced a policy of “dyarchy,” which assigned administrative control of areas like public welfare, education, and agriculture to locally elected provincial assemblies. At the provincial level, elected officials served as ministers who were responsible to legislative assemblies for administration of provincial government. Dyarchy also established an Imperial Legislature, but it was much less powerful than the provincial bodies, and the viceroy held unrestricted powers to veto imperial legislation. In all new bodies, the administration of most revenue collection, banking and currency policy, foreign affairs, and police and military activities were reserved by the central (colonial) Government of India. Dyarchy was later abolished at the provincial level in 1937, and elected provincial ministers were given substantial control of provincial affairs, but India was left still without independence, and government preserved its imperial interests firmly.

Against this backdrop, Gandhi and the Congress embraced a mass direct action strategy to leverage their power to pressure for expansion of access to and control of government and eventually for independence. Founded in 1885, the structure of the Congress during its first several decades could accommodate neither a direct action strategy, nor mass participation. Gandhi reasoned that nationwide campaigns of nonviolent action were only feasible with a large, flexible, and diverse organization that penetrated India’s diverse cities and sprawling countryside, home to more than 700,000 villages. His restructuring of the formal Congress party organization in 1920 ranks among his most significant political accomplishments – “a landmark in the direction, composition and structure of institutional politics” (Brown 1972: 297). The new constitution aimed “to decentralize the party organization by constituting branches in every district and taluka of British India” (Frankel 1978: 28), even on down to the village in many localities. Thus under Gandhi’s presidency, Congress transformed from a stately association of English-speaking professionals to a mass-based, multilingual, and federated entity that reached “within the range of literate peasants, small town traders and lawyers in all parts of India” (Brown 1972: 299).

Under Gandhi’s direction and armed with a newly invigorated organization, Congress pursued a dual strategy of mobilization for votes and mobilization for protest. It regularly fielded many hundreds of candidates for offices in local, provincial, and national elections that it won consistently and overwhelmingly (when it did not opt for electoral boycott). At key points
in its struggle with the raj, and in alliance with a dense network of Gandhian activists and direct action organizations, Congress also opted for more contentious tactics.

The weapons of nonviolent protest, civil disobedience, and noncooperation – deployed on a scale unprecedented in human history – proved to be immensely popular with the Indian public. The first period of peak mobilization was 1917–1924, which included a prominent regional satyagraha (or resistance campaign) among peasants in Champaran, Bihar (1917), a limited nationwide satyagraha against wartime constrictions on civil liberties (the anti-Rowlatt Bill satyagraha, 1919), and the first mass national nonviolent movement, the Noncooperation Movement (NCM), 1920–1922. From a strategic point of view, the NCM was a highly successful “series of local protest movements, [but] not a withdrawal of collaboration at key points in the structure of the raj” (Brown 1972: 347), as its organizers originally conceived. Throughout the 1920s, as a result of lessons drawn during the NCM, Gandhians and Congress focused on building links between urban nationalists and India’s vast agrarian communities and small towns. In the pursuit of *sarvodaya* (“universal uplift”) – Gandhi’s ambitious agenda for social welfare, religious reform, and nationalist self-reliance – *satyagrahis* (adherents of satyagraha) and Congress workers fanned out across the countryside to conduct literacy training, health and sanitation education, and other “constructive work” among the poor. This foundational organizing greatly improved the participation of rural communities in mass protest and civil disobedience during the 1930s.

After the widely heralded success of the Bardoli antitax satyagraha among peasants in Gujarat (1928), Gandhi and the Congress were emboldened to return to a mass direct action strategy – the Civil Disobedience Movement of 1930–1934 (CDM). This was the most dramatic and spectacular of Congress’ mass campaigns, involving many millions of Indians in protest aimed at ousting the British. The CDM was launched by Gandhi’s famous Salt March, a 240-mile trek on foot from Gandhi’s ashram in Ahmedabad, through hundreds of villages in Gujarat. Upon his arrest for an illegal public display of salt making on the beach at Dandi, organizers across India launched mass civil disobedience. In addition to thousands of demonstrations, rallies, and protests, Congress and the *satyagrahis* boycotted foreign cloth and liquors shops, broke the salt laws, refused payment of land revenue and local police taxes, broke laws prohibiting access to forest resources, published illegal newspapers, socially boycotted and harassed public servants and officials, picketed government schools, and so forth. Within the first year, according to official statistics, over 60,000 protestors had been jailed nationally (Brown 1977: 124).

In March 1931, nearly a year after the Salt March, Gandhi struck a deal with the Government of India that suspended civil disobedience in exchange for negotiations on constitutional reform, release of civil disobedience prisoners and properties confiscated during the CDM, the unbanning of the INC, and the end of the salt tax. Brown (1977) explains Gandhi’s move as an effort to salvage a direct action campaign that was running out of steam and to enhance the negotiating leverage of Congress. Other analysts – and many in the nationalist movement – saw suspension as a tactical blunder on Gandhi’s part. When the negotiations at the Round Table Conference of 1931 failed to result in a tangible outcome, Congress resumed civil disobedience in 1932, but it faced decisive repression from the Government of India and never regained its momentum. By 1934, the CDM had petered out.

While the use of nonviolent tactics during the CDM dramatically challenged British authority and delivered countless local successes to organizers, noncooperation tactics on a mass scale ultimately failed to pressure the British into retreat. Similarly, the withdrawal of the British in 1947 had little to do with nonviolent tactics. The Civil Disobedience Movement had ended with mixed results over a decade prior to the official decision to withdraw from India. From 1935 onward, Congress abandoned the
protest strategy and pursued electoral politics as the Government of India Act of 1935 greatly expanded the electorate and Indian control over the legislature (Low 1997). In 1942, the next (and last) nationwide civil disobedience campaign – the “individual satyagraha” strategy of the Quit India Movement – was formally disconnected from the Congress organization and was quickly and effectively repressed. The hurried retreat of the British from India in 1947 was rather the result of two developments that affected the political calculation among officials in London and New Delhi about the prospects for long-term rule: (1) the unexpected defeat of Churchill (a staunch advocate for continued empire) and the Tory Party to Labour in the first election after World War II; and (2) severe ethnic and military riots between 1945 and 1946 that necessitated massive government response and raised the entirely unpopular specter of a colonial war on the heels of the most devastating war in human history (Sarkar 1983).

Despite the failure of civil disobedience to deliver independence, the power to conjure millions of Indians into the streets in opposition to British policy and British rule left Congress “formidably positioned and armed to negotiate India’s future with the British” (Brown 1989: 215). On August 15, 1947, in a triumph for the nationalist movement, Congress elected Jawaharlal Nehru – Gandhi’s protégé, veteran of the nationalist struggle, and an ardent secularist who appealed widely to elites, intelligentsia, and youth – to lead independent India as its first prime minister. Congress’ popularity with the voting public remained supreme for 30 years of free parliamentary elections in independent India, until it lost the general election in 1977. Unlike many other postcolonial situations, the movement’s party-building strategy proved an asset for stable democracy long after colonial retreat.

But the Congress movement fell short in other regards. For instance, despite Gandhi’s deep commitment to Hindu–Muslim unity, and some early successes in cross-communal alliance building (for example, the early Khilafat Movement, 1920–1922), the Congress did not sustain a meaningful coalition with Muslim leaders or convince Muslim voters that it would protect their interests. Some contemporary critics argue that Gandhi’s own rhetoric – steeped as it was in Hindu tradition – significantly restricted the appeal of the nationalist message to Muslim audiences. Communal riots (i.e., Hindu–Muslim violence) swept India in the years before independence (especially 1946), a sign that Gandhi took to mean his movement had utterly failed.

Some critics saw Congress’ mobilization strategy as inherently conservative because it avoided confrontations with India’s indigenous capitalist and agrarian elites. This is not surprising since nationalists relied heavily on business and elite support to fund movement activities and election campaigns. Moreover, Gandhi “firmly believed that a direct attack on the propertied classes ... would in the long run have a disastrous effect” (Frankel 1978: 44), that is, uninhibited violence. This explains why for instance, Congress often led no-revenue campaigns among peasants to resist British land taxes, but refused to lead no-rent campaigns against exploitative landlords, even though rent was typically more burdensome than tax for the rural poor. Much scholarship has demonstrated that Congress frequently struggled to oppose, co-opt, or halt protest that happened outside of its orbit (Guha 1983; Amin 1995; Pandey 2002).

Quite apart from its impact at home, the Indian Independence Movement resonated in contexts well beyond South Asia. As the earliest, most celebrated victory in the wave of decolonization after World War II, many in the colonized world looked to India for inspiration as they devised their own strategies to pressure for independence. For example, Kwame Nkrumah adopted civil disobedience and other Gandhian tactics in the struggle for independence for Ghana in 1953. The successes of the Indian Independence Movement also influenced the evolution of strategic thinking among civil rights leaders in the United States, most notably Martin Luther King, Jr, but many others as well. Between 1919 and 1955,
the African-American press extensively covered developments in the Indian anticolonial struggle, regularly drawing parallels between the plight of India’s masses and blacks in the American South (Kapur 1992). Prominent civil rights leaders visited India throughout this time to meet with nationalist organizers (including Gandhi) and learn more about the politics of civil disobedience, and they hosted Congress organizers for tours of the United States.

Finally, the iconic figure of Gandhi has become a seemingly permanent fixture in global protest culture, not to mention global public discourse. Organizers invoke his name, his image, and fragments of his ideas in popular movements against unjust authorities around the world. Gandhi’s ideas have figured prominently in the US peace movement, the anti-Vietnam War movement, among Christian pacifists, the antinuclear weapons movement, the vegetarian and animal rights movements, the antiapartheid struggle in South Africa, in Europe’s Green movement, and the so-called “colored” revolutions of Eastern Europe after the collapse of the Soviet Union (Hardiman 2003), among many others.

Indigenous movements in Latin America

PATRICIA RICHARDS and JEFFREY A. GARDNER

Indigenous resistance has been a central aspect of Latin American history since the Spanish invasion, and in the late twentieth century, indigenous movements emerged as one of the most significant social actors in the region. This was related to the collapse of leftist class-based politics as well as the use of extreme state violence against the indigenous in the context of civil wars and other struggles. Correspondingly, scholarship on the indigenous has shifted in focus from issues of cultural extinction and survival to the relationship of indigenous movements to nation-states, transnational networks, issues internal to indigenous movements, and methodological challenges.

Indigenous rights claims have long butted up against the limits of liberal democracy. Liberal citizenship is based on the idea that rights inhere in the individual. While indigenous citizens do seek equal protection in terms of civil, political, and social rights, many of their claims inhere in the collectivity. For instance, indigenous movements demand the return of their territories, control over natural resources, and the right to self-determination or political autonomy. Likewise, they seek cultural rights, including to speak their own language and learn it in schools, practice intercultural healthcare, and use their own customary laws and legal systems. Indigenous claims combine ethnic and class concerns, encompass political and cultural aspects of collective belonging, and address the need for redistribution (focusing on material claims related to ongoing colonial dispossession), as well as formal recognition (through legal and constitutional changes) of the status of the indigenous as peoples with rights as such.

Until the late twentieth century, mesticismo (racial and cultural mixing among peoples of European, indigenous, and African descent) was the dominant nation-building discourse in much of Latin America. While this ideology symbolically incorporated the indigenous into the nation, by asserting a universal citizenry based on individual rights, it also effectively silenced collective indigenous claims to land and political autonomy. In the mid-twentieth century, indigenous people throughout the continent joined peasant and revolutionary movements, attempting to address some of their claims through a class-based framework. Indigenous peoples and leaders were among the targets of repressive regimes across the region, which, often with CIA support, engaged in state violence (and, in the Guatemalan case, genocide) against them.

With the end of the cold war, indigenous movements had a window of opportunity. Wars and dictatorships throughout the region were settled by peace accords, democratic elections, and reconciliation processes, and indigenous movements often either had a seat at the table or found elites more willing to listen to their claims. Other trends and events between the 1970s and 1990s facilitated this opening. NGOs, the church, and the UN system appeared as ready allies for indigenous movements, providing some of the initial resources – both material and symbolic – to aid in building movements, framing demands, and attracting international attention. Additionally, class-based movements at least temporarily lost their salience in the post-cold war period. Indigenous movements expressed growing dissatisfaction with their earlier alliances with those movements, arguing that their claims were often sidelined. They thus endeavored to strengthen movements focusing on their own claims. This process became increasingly internationalized, culminating in the 500 Years of Resistance celebrations held in 1992, the indigenous response to the quincentenary of Columbus’s arrival on the
continent. Other events around this time drew worldwide attention to indigenous concerns and demands. In 1989, the International Labor Organization adopted Convention 169, recognizing important indigenous rights. In 1990, CONAIE (Confederation of Indigenous Nationalities of Ecuador) began the Inti Raymi uprising, occupying public buildings and blocking roads in order to demand resolution to land conflicts. In 1992, Rigoberta Menchú, a K’iche’ Maya leader of the Comité de Unidad Campesina, a peasant organization targeted by the military during Guatemala’s civil war, was awarded the Nobel Peace Prize, and the United Nations named 1995–2004 the International Decade for the World’s Indigenous People.

Nevertheless, indigenous peoples throughout the continent, already poorer than their nonindigenous counterparts, faced the impacts of neoliberal reforms, administered beginning in the 1980s, to a much greater extent. This fed into indigenous resurgence, as demonstrated most forcefully in the founding of the Zapatista movement in Mexico. At the same time, governments began adopting multicultural policies and constitutional reforms, including intercultural health and education programs, land regularization, constitutional recognition, ratification of international documents recognizing indigenous rights and, in some cases, even granted limited autonomy. These steps were taken at least partially in response to indigenous demands. Scholars and indigenous movements have argued, however, that multicultural discourses and policies are used to generate consent for the neoliberal project, and tend to emphasize cultural recognition and diversity at the expense of material restitution and redistribution of real control over the use of land and other natural resources (Hale 2006). After years of negotiating and engaging in dialogue with the state, some movements have turned inward, seeking solutions and alternatives from within indigenous norms, traditions, and worldviews.

Some scholars argue that at the beginning of the twenty-first century Latin American indigenous movements entered a “post-neoliberal multicultural” era. This position is advanced most convincingly in the cases of Bolivia and Ecuador, where sustained and often bloody protest against neoliberal states were led by CONAIE in Ecuador and a range of indigenous organizations and parties in Bolivia. These actors sought to expand their constituencies by making demands that encompassed material inequalities as well as ethno-national claims. Their efforts brought about the election of Movimiento al Socialismo candidate Evo Morales as Bolivia’s first indigenous president and the formation of constituent assemblies to write new constitutions in both countries. Both constitutions now recognize the countries’ plurinational character and guarantee a range of indigenous rights.

Transnational mobilization has been central to the growing strength of Latin American indigenous movements (Brysk 2000). As early as the 1970s, indigenous organizations from throughout the Americas have met in international forums such as the Primer Congreso Indio de Sudamérica, held in Peru in 1980. These interactions have facilitated the development of common discourses and strategies around autonomy and other rights. Transnational movements, such as COICA (Coordinator of Indigenous Organizations of the Amazon River Basin), which coordinates actions among indigenous organizations from the nine countries that share the Amazon Basin, have been another product of these connections. The transnationalization of indigenous movements has been facilitated by NGOs and the UN system. A Working Group on Indigenous Peoples, set up by the UN Economic and Social Council, began working on a Declaration on the Rights of Indigenous People in 1985, which was adopted by the General Assembly in 2007. International documents such as the Declaration and ILO Convention 169 have become important tools for indigenous movements, which use them to pressure governments for change and to advance their cause in international forums such as the Inter-American Court of Human Rights. An example is the 2001 Awas Tingni case in which the IACHR
found the Nicaraguan government in violation of indigenous territorial rights after it granted a forestry company a concession on indigenous lands. Only at the end of 2008 did Nicaragua comply with the decision by granting land title to the community, indicating the difficulties of enforcing international law as well as its possibilities. Indigenous movements have also utilized contacts within the UN system, such as the Special Rapporteur for Indigenous Rights, and NGOs like Human Rights Watch and the International Federation of Human Rights, to establish observational missions and submit reports pressuring governments to meet their indigenous rights commitments.

Issues and debates internal to movements, including the character of goals and demands (discussed above), as well as movements’ strategies and tactics, are another area of scholarly inquiry. While observing that indigenous identities, like all others, are socially constructed and reflect tradition as well as contemporary ideas and practices, some argue that focusing on cultural revitalization has led to essentialism on the part of movements, which can ultimately be detrimental to achieving their goals. For instance, tensions have erupted at times within movements when some members are accused of lacking authenticity because they have “Western” education, wear “Western” clothing, engage in “Western” practices, or do not speak the language. Movements’ emphasis on culture as a source of difference also may feed into the accusation on the part of the state and elites that those involved in advancing movement claims are not authentic Indians, which they define in terms of traditional practices and their own stereotypical ideas about what characteristics define indigenous identity. In response, some indigenous activists have sidestepped these debates by focusing on the political aspects of collective claims.

Substantial attention has also been paid to gender dynamics within indigenous movements. While feminist movements have sometimes accused indigenous women of being manipulated by men, beseeching them to concentrate on the interests they share with all women, male leaders have accused indigenous women who speak up about gender inequalities of being “Westernized” and disloyal to the movement. Likewise, governments have used the argument that women’s individual rights are violated by indigenous norms and justice procedures as a means of denying collective rights to indigenous people (Speed 2008). These pressures make it difficult for indigenous women, whose lived experiences and subjectivities lie at the intersection of these identifications, to express their own priorities in an unsplitterd way. Nevertheless, they have made creative use of indigenous norms of reciprocity, autonomy, duality, and complementarity to simultaneously make a case for gender equality in indigenous movements and insist that the rights of the people are also women’s rights.

The relationship between scholars and indigenous communities has, historically, been one in which the scholar extracts knowledge without reciprocation. Increasingly, indigenous movements and organizations demand that scholars develop their research agendas in conversation with movement actors and contribute to the wellbeing of the people. This has led to methodological innovations, including activist research aimed at decolonizing academic work and “co-labor” initiatives, in which indigenous and nonindigenous researchers work in teams in all phases of research and engage in critical reflection along the way (Leyva, Burguete, & Speed 2008; Speed 2008).

Latin American indigenous movements have relevance for all scholars interested in the content and future of democracy in a globalized world. Areas for future research and development include the continuing struggle to back up formal recognition with meaningful material redistribution, how alliances might best be utilized without resulting in marginalization of indigenous priorities, how autonomy might best be put into practice with or without the formal approval of existing nation-states, how the rights of indigenous nations that span existing geopolitical borders might be recognized, and how indigenous movements, many of which conceive of rights as not just possessed by
individuals or collectivities, but by elements of nature and Mother Earth herself, might form a leading force in efforts to protect a planet increasingly in peril.

The Iranian revolution took many experts and scholars by surprise. Iran had been one of the most rapidly industrializing third-world countries and possessed a powerful, loyal army and secret police able to repress and demobilize all opposition. Compared to many other twentieth-century revolutions, armed struggle played little role in the overthrow of the Pahlavi dynasty, which came to power in 1925 when Reza Shah Pahlavi ousted the previous dynasty. Instead, Iran’s urban population, organized in part through mosque networks, carried out the mobilization and collective actions that formed the basis of the revolution.

More importantly, the revolution’s outcome diverged sharply from other modern revolutions where revolutionary movements fought in the name of secular ideologies, such as nationalism or socialism. Iran’s revolution, in contrast, produced theocracy.

In other ways, the revolutionary struggles in Iran resembled other recent revolutions. Major social classes and collectivities that had been excluded from the polity initiated the revolutionary struggles. They opposed the old regime’s repressive nature and demanded political freedom, democracy, and a greater egalitarian distribution of wealth and income. They also called for independence and an end to foreign domination and exploitation. During the revolutionary struggles, Ayatollah Khomeini, too, emphasized those same demands, promised political freedom and, once in power, repeatedly declared that the Islamic Republic would be egalitarian and serve the interests of the mostazafin, the downtrodden and the oppressed.

Most explanations of the revolution have relied on one of two themes. Some theorists emphasized the role of large-scale processes, such as urbanization, industrialization, and commercialization, which transformed the Iranian social structure and undermined traditional values and belief systems. According to these theorists, rapid social change led to dislocation, normative disturbance, and disorientation. To reintegrate themselves into the community and reaffirm their collective cultural identity, dislocated individuals and groups embraced an Islamic revival in the decade prior to the revolution. The second alternative theme highlighted the role of Islamic ideology. Some theorists focused on the importance of Shi’i revolutionary discourse in transforming social discontent into a revolutionary crisis. Others found in the Shiite belief system and, in particular, the story of Hussayn’s willing martyrdom in the just cause of resisting the usurper caliph, Yazid, inspiration for devout Shiites to oppose the regime in the face of repression and death. A third theme which is presented below accents the political vulnerability of the shah’s regime and the policies and processes that led to the eruption of conflicts, collective action, formation of broad coalitions, and the revolution.

The shah faced major challenges to his rule in the 1950s and again in the 1960s, but both times he succeeded in weakening or eliminating his opponents and establishing exclusive rule. The first round of challenges erupted in the early 1950s between liberal-nationalists, led by Prime Minister Mohammad Mosaddegh, and the monarchists, under the leadership of the shah himself. The two camps clashed over many issues, including control of the state apparatus and the army, the extent of power exercised by the royal family and the monarch, the nationalization of oil, economic inequality, land reform, and civil liberties and democratic rights. With the help of the CIA-backed coup d’état, the shah succeeded in removing Mosaddegh and his allies from power. At the same
time, however, the shah antagonized supporters of the liberal-nationalists, particularly the important bazaaris, merchants, shopkeepers, and artisans who constituted the main base of support for the liberal-nationalists.

The shah’s reform policies provoked a second round of conflicts in the early 1960s. Many Iranians supported the reform measures but the policies antagonized two powerful groups. Not surprisingly, the landed upper class opposed land reform, which would have taken away a great deal of its resources. This class was politically powerful and controlled roughly 58 percent of the parliamentary seats in 1961. The second group that opposed the reforms was the Shiite clergy. A sizable segment was against the proposed land reform because the religious establishment and some clerics controlled extensive land holdings. Many other clerics opposed the proposed social reforms including greater women’s rights, which they deemed non-Islamic or anti-Islamic. Despite the eruption of protests in a few major cities, the shah succeeded in repressing the opposition and proceeded with the reforms. In the process, however, he lost the support of two key allies, the landed upper class and the clergy.

Although the social basis of the shah’s support was reduced, he was able to centralize power in his own hands. With a powerful army, a secret police, and support from the United States, the shah ruled Iran with an iron fist. Despite rapid economic development and the rise of a new middle class with modern education and professional skills, the shah centralized the power structure and maintained an exclusive state with a narrow base of support consisting of the military, the secret police, the bureaucracy, and a small class of capitalists in the modern business sector. The extreme centralization of power and formation of an exclusive polity rendered formal political institutions and elections irrelevant for the majority of the population.

With firm control over the power structure, the shah embarked on programs to develop the economy. Increased oil revenues enabled the state to intervene exclusively throughout the economy. The government became the nation’s single largest banker, industrialist, landlord, and employer. State-sponsored development produced impressive economic growth as the country’s GNP per capita rose from $450 in 1972 to more than $1987 in 1978.

Increased revenues generated robust economic development, but also produced economic disparities largely due to state development policies. Government policies favored the interests of large, modern manufacturing and ignored the small, traditional sector, which employed more than two-thirds of the urban industrial workforce. Committed to capital accumulation, the state repressed and demobilized the labor movement, banned strikes, and reduced workers’ capacity for collective bargaining. State development strategy also ignored the plight of the agricultural sector and the rural population. Combined with corruption and cronyism, these economic policies increased the uneven distribution of income in Iran and enabled the royal family to become the wealthiest in the country, owning and controlling a big portion of the modern business sector. The Gini coefficient, a measure of income inequality, was higher in Iran in 1969–1970 than any country in the Middle East, Southeast Asia, or Western Europe, and equaled or exceeded Latin American countries for which data were available. The oil boom in subsequent years only worsened the inequalities in the distribution of wealth and income.

Declining oil revenues in the mid-1970s forced the government to initiate policy changes. By 1977, reduced government expenditures brought about an economic recession, as ambitious projects were scrapped, and access to bank credits was restricted. Recession and declining oil revenues affected the entire economy and society. The GDP, which had grown by 17.2 percent in 1976, suddenly sank to −1.3 in 1977 and then plummeted to −11.9 in 1978. Along with mounting economic inequalities, the recession adversely affected broad segments of the population and set the stage for the emergence of social conflicts.
External pressures in the mid-1970s introduced an element of vulnerability into the political situation. Amnesty International accused Iran of being one of the world’s “worst violators of human rights.” Jimmy Carter singled out Iran in the 1976 US presidential campaign as a country where human rights had been violated. American congressmen began to question the wisdom of selling so much weaponry to a regime where power resided solely in one man. In response to these pressures, the shah, dependent on US support, initiated small policy changes in the government’s treatment of political opponents. In March 1977, the government released 256 political prisoners and in May permitted the International Red Cross to visit political prisoners. The government also legalized civilian trials for political opponents who criticized the government. These changes in turn encouraged mobilization and political opposition against the government.

MOBILIZATION AND COLLECTIVE ACTION

Scholars of the Iranian revolution have often explained the 1979 overthrow of the Pahlavi regime in terms of the rise of an Islamic movement that inspired Iranians to challenge the shah, confront his powerful army, and embrace martyrdom to bring down the monarchy. These analysts ignore the complexity of revolutionary processes. They cannot account for the fact that various collectivities entered the revolutionary struggles at different times and presented diverse claims. The majority of individuals who participated in the struggles did not volunteer to give their lives, but instead expected to improve their lives. Their deaths were the result of political repression, not a desire for martyrdom. In fact, people mobilized through the mosque because it was a relatively safe, secure place to mobilize.

Analyses of the timing and context of revolutionary struggles can reveal much about their causes. If broad segments of the population had actually adopted an Islamic ideology and were willing to give their lives in its defense, then the 1975 uprising of Qom clerical students would have provided a prime opportunity for Iranians to demonstrate this ideological conversion and give their lives. Although most scholars of the revolution have ignored the clerical student uprising of 1975, it provides an excellent test case for the ideology hypothesis. On June 5, more than 1000 clerical students took control of the Madraseh-e Faizieh-e, a school for training clergy, in the religious city of Qom. Clerical students from an adjacent school, the Madraseh-e Khan, soon joined the rebellion. The protesters raised a red flag, a symbol of Shiite martyrdom, high enough to be seen throughout Qom. They also elevated a banner that read: “we commemorate the anniversary of the great rebellion of Imam Khomeini.” In a very daring act the students broadcast tapes of Khomeini’s fiery 1963 speeches against the shah. As news of the Qom events spread to other cities, protests also erupted in the religious city of Mashhad, where two clerics and approximately 30 clerical students were arrested. The students immediately received the support of Ayatollah Khomeini himself, who endorsed the clerical students’ protests from exile in Iraq. In a message of condolence to the Iranian people, he congratulated them for the “dawn of freedom” and the elimination of imperialism and its “dirty agents.”

Despite Khomeini’s support, press reports covering the events, and heavy casualties, the clerical student insurgency went completely unnoticed by most Iranians. Popular response to the Qom revolt was very limited. Although leftist students in Tehran and Tabriz protested the repression of Qom clerical students, no mourning ceremonies were held by the clergy or the public, and no bazaar shut-downs occurred anywhere in the country. The failure of the rebellion and the absence of broad support for the uprising, which took place barely two years before the eruption of revolutionary struggles, challenges ideological explanations of the Iranian revolution.

When the revolutionary struggles did erupt in 1977, it was not religious collectivities
but leftist students who initiated some of the most important collective actions that marked the beginning of the insurgencies that eventually culminated in the revolution. Most student activists in the 1970s subscribed to a secular, socialist ideology, which was expressed throughout the country every year in the observance of Shanzdah-e Azar. On that day, students commemorated the slaying of three students by the government in 1953 during the visit of then-Vice President Richard Nixon. Shanzdah-e Azar became the unofficial student day and was always marked by rallies and protests. Prior to the revolutionary struggles, university students never commemorated June 5, the date of the 1963 rebellion sparked in part by the arrest of Ayatollah Khomeini. Student protests marking Shanzdah-e Azar in 1977 were so intense that by the end of the fall term, many colleges and universities were almost completely closed down. Student mobilization and collective action played an important role in promoting mobilization by other groups and collectivities.

Intellectuals, too, joined the struggles for change in the fall of 1977. With a few notable exceptions, the majority of Iranian intellectuals did not embrace an Islamic ideology but rather adopted some form of socialism or nationalism. Intellectuals’ ideological tendencies were evident during 16 poetry nights held in Tehran in the fall of 1977. Of 64 poets and writers who participated, 66 percent were secular socialist, 28 percent were liberal-nationalist, and only 6.3 percent followed some sort of Islamic ideology. The poetry nights, which attracted thousands of intellectuals, youths, and students, were eventually ended by government repression.

Bazaaris, adversely affected by the economic downturn and the government’s antiprofiteering campaign, soon joined the antigovernment movement. Concentrated in the historic business district of Tehran, bazaari supporters of Mosaddegh’s National Front illegally reestablished the Society of Merchants, Guilds, and Artisans of the Tehran Bazaar (SMGATB) in October 1977. Activists of the SMGATB promoted the cause of political freedom in Iran, were in the forefront of political mobilization, and even helped other bazaaris expand their struggles. Many of the SMGATB’s leaders had struggled for decades against the dictatorship and developed political skills to organize and mobilize bazaaris. They were also resourceful, possessed their own printing presses, and encouraged religious bazaaris to issue public statements, which they printed. They even distributed Khomeini’s statements and tapes through their trading networks. Leaders of the SMGATB provided space for special prayers on September 4, 1978, to mark the end of the fasting month of Ramadan. When leading members of the SMGATB met with Khomeini in France in the fall of 1978, he asked them to resist pressures to reopen the bazaar, thereby tacitly acknowledging their importance and position.

Bazaaris’ protests were primarily political in nature and directed against the dictatorial nature of the state, although they also spoke out against various elements of the government’s economic policies. All 15 protest statements issued by bazaaris from January to December 1978, mentioned government repression, evidencing a high degree of consensus. In addition, 53 percent of bazaaris’ protest statements condemned the despotic nature of the state. An equal number of statements protested imperialist influence and the government’s dependence on foreign powers.

The opposition was forced by government repression to mobilize through mosques, which provided some safety from attacks. People participated in the mosque-led 40-day cycles of mourning in 1978 and shuttered their businesses in large cities to protest government repression and killing of demonstrators.

A fresh opportunity for mobilization emerged in the fall of 1978 with the appointment of a new prime minister, Sharif-Emami, who promised liberalization and political freedom for all political groups except communists. Before the appointment of Sharif-Emami, approximately 70 cities had experienced some form of collective action. By the time he left office, antigovernment collective
Sharif-Emami’s proposed reforms offered nothing to the working classes, who seized the opportunity and began to mobilize and demand change. Workers who had previously been involved in strikes or been arrested or imprisoned used informal networks in the workplace to form secret cells and committees with trusted coworkers and organize collective actions. White-collar employees soon joined in with their own strikes.

Initially, the demands of workers and white-collar employees, unlike those of bazaaris, were mainly economic and primarily defensive in orientation. With few exceptions, economic issues were paramount, and job-related problems were a close second. All strikers demanded higher wages, and most also insisted on allowances or loans for housing expenses and medical insurance. Many complained of pay inequities, especially in sectors where foreign workers were employed. Some protested arbitrary promotion rules and secret “rewards” by heads of bureaucracies. Because most strikers worked in state-owned enterprises or were employed in government bureaucracies, their direct target was, of necessity, the state.

As strikes continued, economic issues gave way to political demands, notably by segments of the working classes who were more concentrated in large state enterprises and possessed greater skills and solidarity structures. Some striking oil workers, for example, demanded the expulsion of various department chiefs, while others demanded freedom for all political prisoners, the dissolution of SAVAK (the secret police), the lifting of martial law, dissolution of government-sponsored unions, the formation of independent labor unions, and freedom for all political parties. As workers became increasingly political, their demands were neither Islamic nor revolutionary in nature. They did not clamor to overthrow the state or form an Islamic republic. Nevertheless, within the Iranian context, workers’ demands for changes were radical.

In response to spiraling social conflicts, the shah returned to a policy of repression on November 6, 1978, and appointed a military government. The army occupied all strategic institutions, including oil installations, radio and television stations, and newspapers, which had just successfully concluded a strike. Military rule appeared to work for a brief period as most strikers went back to work.

Bazaaris, however, responded to the military government by initiating unprecedented, protracted shutdowns in major cities and disrupting trade, which electrified the conflicts. Labor strikes soon resumed, and committees sprang up everywhere to coordinate strike activities and demand political change. Oil workers were critical in the final stage of the conflicts. In late November, they announced their intention to establish a national oil workers’ organization to coordinate strikes and prevent their collapse. Once the organization was formed, they walked out of work on December 2 and announced that they would fight until victory.

Although early on the clergy had been slow to mobilize, the expansion of the struggles and the arrival of the month of Muharram enabled the pro-Khomeini faction of the clergy to play a leading role in the conflicts. With their control over mosques, the clergy succeeded in mobilizing a significant political force during the Tasoua march on December 11. The main non-leftist opposition groups drew up separate lists of individuals who could act as marshals for the Tehran processions. The National Front provided 2500 marshals, while the militant clergy were able to provide only 1400 people for the event despite months of struggles. The Freedom Movement supplied 800, and Mujahedin supporters provided a few hundred people. Because the numbers were not adequate for such a large march, organizers called on the public to volunteer as marshals. On the day of the march, more than 70,000 people, most of whom were not ideologically affiliated, showed up and volunteered to act as marshals. Organizers quickly distributed armbands to the volunteers and proceeded with the march. At the conclusion of the march, the pro-Khomeini clergy announced on loudspeakers that another march would be held
on Ashura, the following day, and directed the marshals to introduce themselves to their local mosques that evening. In this way, the militant clergy were able to absorb tens of thousands of ideologically unaffiliated volunteers into their own ranks. The following day, December 11, the pro-Khomeini clergy controlled the streets of Tehran during the Ashura march. With their enhanced capacity, they called for the shah’s overthrow and the formation of an Islamic republic during the march.

Labor strikes and bazaar closings disrupted all social and economic activities and paralyzed the government. At the end of December, workers and employees representing 23 state ministries and private sector organizations formed a central council to coordinate the strikes. The council rejected any compromise with Prime Minister Bakhtiyar who they charged represented “imperialism and dictatorship,” and instead they formally acknowledged Khomeini as leader of the people’s “anti-imperialist, antidespotic” movement. Employees of 11 other government ministries announced on February 7, 1979, that they would only obey a government nominated by Khomeini. The broad coalition created a revolutionary situation, destabilized the armed forces, and eventually ousted the monarchy on February 11.

In short, Ayatollah Khomeini emerged as the undisputed leader of the revolution by emphasizing people’s principal demands for independence, freedom, and social justice. He carefully avoided doctrinal issues during the revolutionary struggles but, once in power, he imposed a theocracy that led to the breakdown of the revolutionary coalition that ousted the shah. The breakdown happened so swiftly that less than four months after seizing power Khomeini began urging the people and the intellectuals not to abandon the mosques. He was able to maintain power by promising greater economic advantages for the poor and by means of harsh repression. Between the summers of 1981 and 1985, Khomeini’s regime executed or killed approximately 12,000 opponents of the state. Repression has continued to be the key to the survival of the Islamic Republic.

Northern Ireland civil rights movement
LORENZO BOSI

In October 1988, *Fortnight*, the leading and longstanding current sociopolitical affairs review in Northern Ireland, celebrated 20 years of the regional civil rights movement (hereafter, CRM), by offering a meticulous discussion on the topic. The editorial started like this: “For, warts and all, the Civil Rights Movement was the only moment this century when a politics that was defined by something other than unionism or nationalism seemed suddenly to be possible” (*Fortnight*, Oct. 1988: 3).

Inspired by the US civil rights movement of the 1960s, the CRM, in its early first stage (1963–1967), attempted to achieve reforms by publicizing, canvassing, documenting, and lobbying for expanded civil rights. With the regional population divided two-thirds Unionist (who want Northern Ireland to remain part of the United Kingdom, mainly Protestant) and one-third Nationalist (who want to re-unite Ireland and bring an end to the Northern Ireland state, mainly Catholic), it was the minority who felt the brunt of discrimination. Nationalist interest groups, laborists, liberals, communists, traditionalists and Marxist republicans, and the “new” leftists despite their differences agreed initially on five main demands (Purdie 1990): one man, one vote, which meant the extension of the local government franchise from ratepayers to all those over 21; an end to gerrymandering (the deliberate practice of redrawing the electoral district or constituency boundaries with the aim of achieving electoral results for a particular party), which meant Unionists were elected even in districts with Nationalist majorities; an end to injustice in the system of public housing provision; an end to discrimination in public and private employment practices; and the disbanding of the B-Specials, a special constabulary, which many Nationalists viewed as simply sectarian. In response to a series of societal and political changes in the aftermath of the new political settlement that followed World War II (Bosi 2008), the above-mentioned different political actors started to challenge the institutional practices that favored the Unionist hegemony by pressing for equality of rights and social justice, whilst deliberately avoiding the traditional Nationalist and Republican aspiration to re-unite Ireland and bring an end to the Northern Ireland state.

The reluctance of the Unionist establishment to deal with the CRM’s demands together with the international situation in 1968, which saw widespread street protests across Europe and North America (Bosi & Prince 2009), moved the CRM’s leaders to challenge the sectarianism and the political immobilism of the region by marching into the streets. In this way they intentionally obliged the authorities to get involved in defending the marches from the growing Loyalist countermovement, or openly supporting sectarianism in front of the new mass media and consequently undermining Unionist hegemonic control. Peaceful civil rights demonstrations descended into violence in October 1968 when marchers in Londonderry defied the Royal Ulster Constabulary (RUC) and were violently beaten to break up the march (Peatling 2007). This provided recognizable instances of outrage and anger that galvanized both activists and supporters regionally and internationally for the CRM. The CRM organized then large-scale marches, sit-ins, and occupations that placed severe pressure on the state and provoked Westminster intervention to force the Northern Ireland government to make concessions (Bosi 2006).

The reforms introduced late in 1968 failed to deliver fully on the CRM’s program, including one-man-one-vote and the repeal
of the repressive Special Powers Act (or Civic Authorities Act), of 1922, which authorized the Minister of Home Affairs, in states of emergency, to order indefinite arrests and internment without an imminent charge or trial, to command searches of private property without a warrant, to issue curfews, to ban organizations, and to prohibit meetings and processions. After a brief cessation, the civil rights marches continued, organized at first by a group called People’s Democracy (PD) at the beginning of 1969. This was mainly a group of students. It represented the optimism of the postwar generation, which thought that change from below was possible. They felt part of a transnational community which was fighting imperialism and capitalism during the 1960s. Once again, the reaction of the Loyalist countermovement and the RUC was heavy-handed and only served to inflame the Nationalist community further. Heightened sectarian tension became more difficult to control, and civil disobedience events began to descend into occasions of civil disorder (Ó Dochartaigh 2005). As violence increased, moderates gradually withdrew from the CRM while Republicans came to particular prominence in the local defense committees that emerged in predominantly Nationalist working-class areas (Ó Dochartaigh 2005).

The street confrontations between civil rights activists, on the one hand, and the Northern Ireland police and the Loyalist countermovement, on the other, resulted in an increase in intercommunal violence by 1969. Further conflict in the summer of 1969 led to the British government taking the decision to deploy troops on the streets of Northern Ireland. The Troubles, which were to see the loss of 3700 lives and more than 40,000 injuries, had just begun. As events began to spiral out of control with the emergence of the Provisional IRA the British were convinced of the need to introduce internment by the Northern Ireland government (detention without trial). What remained of the CRM, under the main umbrella organization NICRA, campaigned against internment and at one of its rallies in Londonderry on Sunday 30 January, 1972, the British Army shot dead 13 demonstrators and injured another 14 (Ó Dochartaigh 2005). “Bloody Sunday” effectively marked the end of the use of mass street demonstrations to achieve civil rights.

The subsequent decades of violence cannot be explained solely in terms of the mobilization of the CRM, which clearly marked a watershed for the region, but neither can they be understood without a full comprehension of the development of the CRM during the 1960s in the regional context. On the other hand, the CRM was a determinant in introducing and legitimizing the themes of civil and human rights which are now at the base of the stabilization of the region with the Good Friday Agreement (1998).

Irish Republican Movement  
ROBERT W. WHITE and FRANCIS K. WHITE

The Irish Republican Movement has its origins in eighteenth-century republican political philosophy, which also inspired the American (1776) and French revolutions (1789). In the 1790s, the United Irishmen tried to unite “Catholic, Protestant, and Dissenter” and create an Irish Republic independent of England. Unlike their American and French counterparts, the United Irishmen’s rebellion of 1798 failed. However, they remained an inspiration for rebellions against the British in 1803, 1848, 1867, and 1916, and insurgent actions by Fenians (including armed campaigns against the British in Canada and a bombing campaign in England) in the 1860s, 1870s, and 1880s. Contemporary Irish Republicanism has organizational antecedents that date from the 1840s: Irish Republicans active as “Young Irelanders” in 1848 became Fenians; Fenians participated in the 1916 Rising and the Irish War of Independence (1919–1923); veterans of 1916–1923 were active in Irish Republican organizations into the twenty-first century.

Many organizations and individuals have claimed the label “Irish Republican,” including: constitutional political parties like Fianna Fáil: The Republican Party; a left-wing organization named Saor Éire (Free Ireland); paramilitary organizations named Saor Uladh (Free Ulster) and the Saor Éire Action Group; the militant women’s organization Cumann na mBan (Association of Women); and paramilitary/scouting organizations for young people, Na Fianna Éireann (for boys) and Cumann na gCailíní (for girls). However, the Irish Republican Movement is usually associated with two organizations: the Irish Republican Army (Óglaiigh na hÉireann – Soldiers of Ireland) and the political party Sinn Féin (Ourselves or Ourselves Alone).

Sinn Féin (formed in 1905) and the Irish Republican Army (dating from 1916) are separate organizations. Following the unsuccessful Easter Rising of 1916, an IRA guerrilla campaign complemented by a Sinn Féin political campaign destabilized British rule in Ireland. In response, with the Government of Ireland Act (1920), the British partitioned Ireland into the six counties of Northern Ireland – which remain a part of the United Kingdom – and the 26 counties of the Irish Free State. Northern Ireland’s population was predominantly Protestant and pro-Union while the vast majority of the Irish Free State’s population was Catholic and sought a united Ireland (they were “nationalists”). The Anglo-Irish Treaty (1922) confirmed partition and split the Irish Republican Movement. In 1922–1923, a pro-treaty government in Dublin, led by former IRA members and Sinn Féiners, won a civil war with anti-treatyites. Pro-treatyites formed the core of what would become the political party Fine Gael.

The anti-treatyites who remained in the IRA and Sinn Féin refused to accept the legitimacy of the governments of Northern Ireland (Belfast) and the Irish Free State (Dublin). This stance placed them on the political sidelines. In 1925 and 1926, respectively, the IRA and Sinn Féin split over the issue of participation in the Dublin parliament. Led by 1916 rebel leader Eamon de Valera, those who accepted the state formed Fianna Fáil: The Republican Party. In 1927, in an attempt to forestall repressive legislation, Fianna Fáil entered the Free State parliament. From the 1932 election, Fianna Fáil has dominated southern Irish politics. And into the 1970s many Irish political leaders were former gunmen who at one time rejected the Dublin parliament.

After 1926, Sinn Féin and the IRA were increasingly marginalized and isolated. In the mid-1930s, left-leaning activists formed Republican Congress as a socialist alternative.
The Republican Congress was short-lived, but several members, including Frank Ryan, fought on the republican side in the Spanish Civil War. Between 1939 and 1945, IRA veterans pursued a military campaign in England and Ireland. Fianna Fáil, in government, was especially active against the IRA; former comrades were executed and allowed to die on hunger strike. The IRA campaign was a dismal failure.

As a counter to Fianna Fáil, Irish Republican veterans led by former IRA Chief of Staff Seán Mac Bride (whose father the British executed in 1916 and whose mother was an inspiration for Yeats), formed the political party Clann na Poblachta. Clann na Poblachta participated in a coalition government (1948–1951) that included Fine Gael and the Irish Labour Party, in Dublin. Under this government, and with Mac Bride as Minister for External Affairs, the Free State was declared the Republic of Ireland and the country withdrew from the British Commonwealth.

While they rejected the approach of Clann na Poblachta, Irish Republicans in Sinn Féin and the IRA recognized that they had to confront their political isolation. In the late 1940s, the two organizations were brought together. They remained separate, but with overlapping members, especially at the leadership level, and with the IRA as the dominant partner. In 1955, two IRA prisoners in Northern Ireland, put forward as Sinn Féin candidates, were elected (as abstentionists) to the House of Commons. The IRA’s “Resistance Campaign” (1956–1962) was supported by Sinn Féin, which was banned in Northern Ireland from 1957 until 1974. The IRA campaign ended in failure.

In Northern Ireland, Unionists (primarily Protestant) discriminated against Nationalists (primarily Catholic). In the 1960s, the US civil rights movement inspired a similar movement in Northern Ireland. Peaceful protests by the Northern Ireland Civil Rights Association (NICRA) and a student-led organization, People’s Democracy (PD), were confronted by counterdemonstrations. The resulting conflict was exacerbated when officers of the Royal Ulster Constabulary and Loyalist (loyal to the British Crown) vigilantes actively supported the counterdemonstrators. In August 1969, in the midst of widespread rioting, British troops were sent to Northern Ireland as peacekeepers. And the Irish Republican Movement split over how to best approach the situation.

The “Official” IRA and “Official” Sinn Féin, led by veterans of the 1940s and 1950s, argued that they could combine guerrilla war with radical, but constitutional, politics and achieve a united Ireland; they recognized the Dublin, Belfast, and London parliaments. The “Provisional” IRA (December 1969) and its political wing, “Provisional” Sinn Féin (January 1970), were also led by veterans of the 1940s and 1950s, but they maintained the tradition of rejecting constitutional politics. Based on past experience, including Fianna Fáil’s anti-IRA activities, they argued that involvement in parliament would lead to compromise, reform instead of revolution, and failure. The Officials are often portrayed as more left-wing and progressive than their Provisional counterparts and they did develop an interesting relationship with the Soviet Union. They also concluded that their armed campaign was a mistake and declared a unilateral ceasefire in May 1972. By this time the Officials were arguing that the ongoing Provisional IRA campaign was counterproductive, sectarian, and terrorist. There were deadly feuds between the Provisionals and the Officials in 1972, 1975, and 1977.

Late in 1974, the Officials split again, which led to the creation of the Irish National Liberation Army (INLA) and its political wing, the Irish Republican Socialist Party (IRSP). This split also was acrimonious and there were deadly feuds between the Officials and the INLA/IRSP in 1975 and 1977. Over time, “Official” Sinn Féin changed its name to Sinn Féin/the Workers’ Party (1977) and the Workers’ Party (1982). Members of the party were elected to the Dublin parliament in the 1980s and 1990s. In 1992, in part because of continuing allegations that there remained a military wing, the Workers’ Party suffered another split and was decimated. Several members left to
form a new party, Democratic Left, which was moderately successful and in the mid-1990s helped form a coalition government, with Fine Gael and Labour, in Dublin. In 1999, Democratic Left merged with the Labour Party. The INLA and IRSP are remembered for their involvement in prominent events that include the assassinations of Conservative MP Airey Neave (1979) and Loyalist paramilitary Billy Wright (1997), and for internecine feuding and splits.

From 1969 to 2005, the Provisional IRA and “Provisional” Sinn Féin (henceforth, Sinn Féin) were the key actors of the Irish Republican Movement. Their stated goal was a 32-county democratic socialist republic. As unrest escalated in the north of Ireland, the Northern Irish and British states responded with repression, including internment without trial (1971) and Bloody Sunday (1972; British soldiers shot dead 13 anti-internment protesters; a fourteenth died later). In defense of their communities, large numbers of young people joined the Provisional IRA. Between 1972 and 1994, the Provisional IRA was associated with several high-profile events, including: “Bloody Friday” (1972, 21 bombs killed nine people in Belfast); the Kingsmills massacre (ten Protestant workers were shot dead); the La Mon Restaurant bombing (1978, a firebomb killed 12 people); and, on the same day in 1979, the assassination of Lord Mountbatten and the Warrenpoint Ambush (two strategically placed bombs killed 18 British soldiers).

As the founders of the Provisional IRA were arrested or killed, younger people moved into leadership positions. In 1981, Irish Republican prisoners on hunger strike for political status demonstrated that the movement had more support than the authorities claimed; IRA prisoner Bobby Sands was elected to the House of Commons (he later died after 66 days without food) and IRA prisoners Paddy Agnew and Kieran Doherty (the latter died after 73 days without food) were elected to the Dublin parliament. The electoral interventions brought new recruits and helped spur change. In 1983, Gerry Adams, from Belfast, succeeded Ruairí Ó Brádaigh, from Longford, as president of Sinn Féin, formally demarcating the transition to a younger, Northern-based leadership.

The IRA had been prosecuting a guerrilla campaign for more than a decade, but without success. Echoing the “Officials,” the new leadership considered the possibility of complementing that campaign with constitutional politics. This began the process of transforming Sinn Féin into a constitutional political party. At the 1986 Ard-Fheis (Convention), Sinn Féin’s constitution was changed to allow elected members to take their seats in the Dublin parliament; the new leadership – notably Martin McGuinness – promised they would never take seats in a Northern Ireland parliament and that they would support armed struggle until a united Ireland was achieved. A minority of the delegates walked out of the Ard-Fheis and formed Republican Sinn Féin (RSF). RSF’s leadership was largely the same people who had founded Provisional Sinn Féin in 1970. They held to their belief that constitutional politics would lead to compromise and failure.

Between 1969 and 1994, more than 3600 people died in the Irish conflict. Those responsible for the deaths were (approximately): Irish Republicans (2130); Loyalists (1050); the British army (300); the police (50); and others/unknown (80). Yet, there was no evidence that a united Ireland was on the horizon. In August 1994, the Provisional IRA declared a unilateral cease-fire, supported by Sinn Féin. Republican Sinn Féin accused them of compromising and selling out. About six weeks later loyalist paramilitaries declared a cease-fire and it appeared that the conflict would end. The Continuity IRA then revealed itself and it became public that the Provisional IRA had split in 1986. RSF is viewed as the political wing of the Continuity IRA.

Because of limited progress, the Provisional IRA renewed its campaign in February 1996, but in order to include Sinn Féin in an ongoing peace process, the cease-fire was re-instituted in July 1997. The Provisionals endorsed the Mitchell Principles, which mandated: nonviolence; weapons decommissioning; and that
Northern Ireland’s future would be democratically determined by its citizens – which would defer a united Ireland indefinitely, as the majority are pro-Union. This provoked another split and the creation of the Real IRA. Some Sinn Féiners publicly criticized the leadership and formed the 32 County Sovereignty Committee; they were expelled. The renamed 32 County Sovereignty Movement is viewed as the public face of the Real IRA. The Omagh Bombing (1998), which killed 29 people, is attributed to the Real IRA.

Sinn Féin supported the Good Friday Agreement (1998), its members took their seats in the Northern Ireland Assembly, and former Provisional IRA commander Martin McGuinness became Deputy First Minister of Northern Ireland. In 2005, the Provisional IRA formally ended their campaign and completed the decommissioning of their weapons. Today, Sinn Féin is the largest nationalist party in Northern Ireland and has 28 (of 108) seats in the Northern Ireland Assembly. Party representatives hold four (of 166) seats in the Dublin parliament and five (of 646) seats in the House of Commons (from which the party abstains). Sinn Féin also has several councilors elected at the local level throughout Ireland.

The Continuity IRA, the Real IRA, and a small group calling itself Óglaigh na hÉireann are small but remain active. Republican Sinn Féin has one locally elected councilor, in the Republic of Ireland. The 32 County Sovereignty Movement does not contest elections. In 2006, a small group of Sinn Féiners in Dublin, concerned that the party was watering down its commitment to socialism, formed yet another Irish Republican political organization, Éirígí (Rise!). Two Provisional Sinn Féin councilors have joined Éirígí.

The Irish Republican Movement is important for many different reasons. Irish Republicanism has influenced Nobel laureates (William Butler Yeats, George Bernard Shaw, and Seamus Heaney), other important writers (e.g., Séan O’Casey, Brendan Behan, Roddy Doyle), and filmmakers (e.g., John Ford and Neil Jordan). Irish Republicans have become statesmen: Eamon De Valera, President of the (rebel) Irish Republic, Taoiseach (Chief) of the Irish Free State/Republic of Ireland (1932–1948; 1951–1954; 1957–1959), and President of the Republic of Ireland (1959–1973), was also President of the Council of the League of Nations (1932) and President of the Assembly of the League of Nations (1938). Seán Mac Bride helped found Amnesty International, served as Assistant Secretary-General of the United Nations, and was awarded the Nobel Peace Prize (1974) and the Lenin Peace Prize (1977).

The 1916 Rising marked the beginning of twentieth-century colonial insurgencies against the British imperial system. Irish Republicans of the 1916–1923 era influenced political activists as varied as Jawaharlal Nehru and V.I. Lenin. Tom Barry’s *Guerrilla Days in Ireland* is a classic account of an insurgency. Menachem Begin was influenced by Irish rebels and, through *The Revolt*, influenced later Irish rebels. In the 1950s, IRA volunteers saw themselves as part of a worldwide anticolonial struggle that included liberation movements in Algeria, Cyprus, and Vietnam, among other locations.

Women have played an important role in Irish Republican politics. In 1918, Sinn Féin candidate Constance Gore-Booth Markievicz became the first woman elected to the House of Commons. She did not take her seat in London, but did become Minister for Labour in the rebel government in Dublin, Dáil Éireann. In 1969, 21-year-old Bernadette Devlin (now McAliskey), of People’s Democracy, became the youngest (at the time) member of the House of Commons. The women’s movement influenced Irish Republicanism: whether or not women should have a separate organization (Cumann na mBan) or serve as IRA Volunteers remains an important question. Between 1969 and 1998, several Cumann na mBan Volunteers and women who were members of the Provisional IRA died on active service.

Irish Republican politics allow for interesting comparisons. In the United States, civil rights protesters, including students, engaged in high-risk activism that generated
some political violence but by the 1970s also brought significant social change. In Northern Ireland, civil rights protesters, including students, helped lay a foundation for a violent insurgency that lasted more than a generation that achieved a debatable level of social change.

For scholars and students, the Irish Republican Movement provides an opportunity to address fundamental issues: the efficacy of peaceful versus violent protest; the biographical consequences of activism; the role of state repression (between 1969 and 1998, the British army killed more Catholic civilians (138) than it did Irish Republican paramilitaries (121)); the causes and consequences of factions and splits; the pursuit of revolution or reform; and the transformation of armed struggle into constitutional politics.

Islamic movements
ASEF BAYAT

Broadly “Islamic movements” refer to the diverse religious trends in the Muslim world that want to reorganize society with reference to Islam. The complex and multifaceted nature of the phenomenon has stirred multiple designations, including “Islamic radicalism,” “fundamentalism,” “revivalism” or “resurgence,” “Islamic activism,” and “political Islam,” each stressing particular aspects of these movements. Thus, “fundamentalism” highlights the scripturist essentialism, pointing to the traditionalism of the movements, or a belief in the exclusive possession of a unique truth. “Revivalism” and “resurgence” underline the religious at the expense of the political content of these movements, and “Islamic activism” is intended to account for the inclusion of various types of activities – political, social, and cultural – that emerge under the rubric of Islamic movement.

Academic and policy circles are increasingly using the terms “Islamism” or “Islamist movements” instead of “Islamic movements” to underline the prevailing collectives with political underpinning and contemporary relevance. Islamist movements then are those which strive to establish some kind of an Islamic order – a religious state, sharia law, and moral codes in Muslim societies and communities. Association with the state is a key feature of the Islamist movements, one that differentiates them from such religiously inspired but apolitical collectives as the Jama’at-i Tabliq-i Islami, which is a broad transnational movement that is not interested in holding governmental power, but is involved in a missionary movement of spiritual awakening among Muslims. The primary concern of Islamism is to forge an ideological community; secular concerns such as establishing social justice or improving the lives of the poor are to follow only from this strategic objective.

The Islamists’ insistence on holding state power is framed in terms of the doctrinal principle of “command right, forbid wrong.” This broad Koranic dictum remains contested with varied interpretations about what constitutes “right” and “wrong,” who is to command or forbid them, and how. Historically, it was largely the Islamic jurists or Muslim zealots who took it upon themselves to command right and forbid wrong in, for instance, prohibiting wine, prostitution, or singing. But in modern times, modern movements and states have increasingly assumed that role. Islamist movements then are determined to control state power because they consider the state to be the most powerful and efficient institution that is able, whether through da’wa (preaching) or duress, to spread “good” and eradicate “evil” in Muslim societies. It follows that the Islamists’ normative and legal perspective places more emphasis on people’s obligations than their rights; people are perceived more as dutiful subjects than rightful citizens. In order to achieve salvation and true happiness, they are to abide by “Islamic values,” the meaning of which is determined by movements’ leaders.

VARIATIONS

But Islamic movements vary considerably – in terms of areas of activity, types of organizations, visions of an Islamic order, and different ways in which to achieve such an order. The reformist trend aspires to establish an Islamic state, but wishes to do so gradually, peacefully, and within the existing constitutional frameworks. This strand rejects the use of violence and hopes to operate within the nation-state by invoking many democratic norms; it focuses on mobilizing civil society through work in professional associations, NGOs, local mosques, and charities. The original Muslim Brothers in Egypt and their offshoots in Algeria, Syria, Sudan, Kuwait, Palestine, and Jordan represent this
trend. Others include the locally based Party of Justice and Development in Morocco, as well as Erbakan’s Rifah Party in Turkey. Many groups associated with the Muslim Brotherhood seem to adopt a somewhat Gramscian strategy of establishing moral and political hegemony in civil society expecting that the state will turn Islamic in the long run following the Islamization of society. Yet, their actual cooptation within the legal political structures tend, to use Olivier Roy’s phrase, to “social democratize” these movements. The Islamic parties in Jordan, Morocco, or Indonesia are argued to have paved a reformist path similar to that of European social democracy (Roy 1998).

The revolutionary or militant trends, such as the Jama’a al-Islamiya in Egypt, the Algerian FIS, or Lashkar Jihad in Indonesia resort to violence and terrorism against state agencies, western targets, and non-Muslim civilians, hoping to cause a Leninist-type insurrection in order to seize state power which would then unleash the Islamization of the social order from above. But such militant Islamists differ from current Jihadi movements, such as the groups associated with al-Qaeda. Whereas militant Islamism represents political movements operating within certain nation-states and targeting primarily the secular national state, the Jihadis are transnational in their ideas and operations, and often represent apocalyptic “ethical movements” involved in “civilizational” struggles, with the aim of combating such highly abstract targets as the “west” or societies of “non-believers” (Devji 2005). For many of Jihadis, the very struggle itself or jihad becomes an end in itself. And on this path, they invariably resort to extreme violence both against the self (suicide bombing) and their targets.

A good number of Islamic-oriented groups are not in fact Islamist, strictly speaking. A growing trend that I have called post-Islamist wants to transcend Islamism as an exclusivist and totalizing ideology, espousing instead inclusion, pluralism, and ambiguity. In Iran, it took the form of the “reform movement” of 1997–2004 under President Khatami. Besides Iran, a growing number of Islamic groups also exhibit some aspects of “post-Islamism.” The pluralist strategy of the Lebanese Hezbollah since the early 1990s, which led to a split in the movement, the Egyptian al-Wasat Party, which emerged in the mid-1990s as an alternative to both militant Islamism and the Muslim Brothers’ “authoritarianism,” the discursive shift in Indian Jama’at-i Islami toward more inclusive, pluralistic, and ambiguous ideological dispositions, Saudi Arabia’s “Islamo-liberal” trend of the late 1990s, which sought a compromise between Islam and democracy, and not to mention the fairly democratic approach of the Turkish Justice and Development Party (AKP) toward political participation, each of these displays some diverse aspects of post-Islamist trend in Muslim societies in recent years. Post-Islamist movements aspire to more or less secular democratic states, but wish to promote pious societies (Bayat 2007).

Global events since the late 1990s (the Balkan ethnic wars, the Russian domination of Chechnya, the Israeli reoccupation of the West Bank and Gaza under Likud, and the post-9/11 anti-Islamic sentiments in the West) created among Muslims a sense of insecurity and feeling of siege. This in turn heightened their sense of religious identity and communal bonds, generating a new trend of “active piety,” a sort of missionary tendency quite distinct from the highly organized “apolitical” Islam of the Tablighi movement in being quite individualized, diffused, and inclined toward Salafism. The adherents of such piety aim not to establish an Islamic state, but to reclaim and enhance the self, while striving to implant the same mission in others.

What constitutes the social bases of Islamist movements? Modernist interpretations view Islamism as a movement of “traditional” Muslims (e.g., the ulema or clerical class, merchants, and the urban poor) who forge alliances to resist Western-style modernization. Evidence, however, suggests that Islamism has received support more or less from different social groups – traditional and modern, young
and old, men and women, better-off and lower classes. But the core constituency of Islamist movements comes from the modern, educated but often impoverished middle classes – professionals, state employees, college students, and graduates. The fairly popular idea that the urban poor and slum dwellers become the natural allies of Islamism – because of their intrinsic religiosity, social dislocation, and their need for community – is exaggerated. Indeed, the relationship between the Islamist movements and the urban poor remains mutually utilitarian. The urban poor lend pragmatic support to Islamists in exchange for tangible gains (services, aid, or social protection) in more or less similar ways that they forge alliances with secular and leftist groups (Bayat 2010: 171–184). On the other hand, although some leaders come from the clerical class (like Ayatollah Khomeini in Iran, Hasan Nasrullah in Lebanon, or the militant Jebha Ulema within the Egyptian al-Azhar), the bulk of the Islamist leadership in the Muslim world remains lay activists rooted in modern education and professions. In fact, the majority of the traditional and quietist clerics oppose Islamism for its politicization and secularization of “spiritual realm” and ulma’s place in it.

HISTORIES

Contemporary Islamism, therefore, is distinct from the premodern movements framed in Islamic idioms. Most premodern trends, notably those associated with the thirteenth- and fourteenth-century jurist Ibn Taymiyya, Indian Shaikh Ahmed Sirhindi (1564–1624), and the eighteenth-century scholar Muhammad ibn Abdel Wahhab of Arabia, were concerned with retaining “purity” and disallowing innovation in religious ideas and practices. They opposed many rituals, such as worship of saints, which had become part of the religious culture. On the other hand, most of the late nineteenth-century religious movements developed primarily as a response to Islam’s encounter with the European colonial conquest and modernity in conditions where the Muslim Ottoman Empire was in decline. But the actual responses varied. Some, like the Indian Shah Waliullah, opted for preserving Islamic heritage in the face of encroaching modernity in the late nineteenth century; his ideas inspired the Deobandi movement of traditional Islamic thought which led to the establishment of thousands of traditional madrasas (schools) throughout the Indian subcontinent which continue today. Abul ala Mawdudi, a leader of Indian Jama’at-i Islami and one of the most influential ideologues of new Islamism, was a product of such Deobandi schools, the ideology of which, however, he later ceased to share. On the other hand, Jamal eddin al-Afghani (1837–1897), Muhammad Abdu (1849–1905), and Rashid Rida (1865–1935), cosmopolitan Muslim leaders in the Middle East, not only mobilized Muslim resistance against European colonialism, they also spearheaded the modernization of Islam to coexist and flourish within this emerging modernity. They pioneered what came to be known as “Islamic modernism” or “Islamic reform,” advocating modern technology, modern education, and rationality in religious thought (Watt 1985).

The ideological tenets of contemporary Islamism may at best be traced back to the Society of Muslim Brothers, which called for the Islamization of both society and the state with the Koran as the Constitution. Established in 1928 in Egypt by Hasan el-Banna and invigorated later by the writings of Sayyid Qutb (1906–1966), arguably the father of current militant Islamism, the Muslim Brothers fought against British rule in Egypt and campaigned for a nation governed by the tenets of Islam. In this fashion, the group formed the earliest strand of Islamism that came to overtake the Arab and the Muslim world in the last decades of the twentieth century. As an associational movement, the Muslim Brothers grew rapidly from only four branches in 1929 to 2000 in 1949, with some one million activists and sympathizers at its peak. It organized in
neighborhoods, NGOs, mosques, in youth and women’s associations, and sport clubs, as well as cooperatives both in urban and rural areas. It established branches in Arab countries and Europe. The group has survived intermittent waves of repression by Egyptian pashas and presidents. During Nasser’s rule, the movement was split into a revolutionary wing that subscribed to the views of Sayyid Qutb who advocated political action and revolution, and the gradualist reformist wing led by Hasan al-Hudaibi who called for da’wa or discourse to change attitudes and behavior in society. While the Muslim Brothers opted for a reformist strategy, Qutb’s political theology informed militant groups such as al-Jihad, Gama’a al-Islamiyya, and dozens of jihadi groups which have proliferated in recent decades (Qutb 1990). Qutb adopted some key concepts (e.g., jahili state and society; jahili society is one in which human, rather than God, is worshiped by human, and the jahili state is one that governs such a society) from Abul ala’ Mawdudi who in turn had been exposed to Marxist-Leninist ideas and the Indian Communist Party. But both lashed out at Western liberalism, secular nationalism, and imperialism which, according to Moroccan Abdul Salam Yassin, present themselves in the name of enlightenment, reform, nationalism, and rationality. The alternative social order was to be inspired by “Islamic principles.”

To this end, Mawdudi proposed some kind of “Islamic cosmopolitanism” to be governed by “theo-democracy” or a “divine democratic government,” the Iranian Ali Shariati offered “divine classless society,” and Sayyid Qutb, Islamic state and economy (Espósito 1983). Ayatollah Khomeini had spoken of “Islamic government,” but went along with an Islamic Republic in which valayat-i faqih (the rule of supreme jurist) assumed the central place – a “theo-democracy” Iranian-style.

Despite intellectual links to Mawdudi and Qutb, the current Islamist movements have been the product of a different era. In the Middle East, they have arisen largely since the 1970s – the decade of oil boom, economic growth, capitalist modernization, secular authoritarian regimes, cold war, and the aftermath of the 1967 Arab defeat from Israel. The Islamic Revolution of 1979 in Iran (with little connection to Muslim Brothers) bolstered a new global era of religious politics in the Middle East and beyond by offering a tangible model of Islamic rule. Thus, just months after the Iranian revolution, an armed militant group seized the Grand Mosque of Mecca to dislodge the Saudi rulers who in fact were pushed by such opposition to adopt more conservative Islamist policies. The Shia militants in Lebanon established Hezbollah in 1982 to fight Israeli occupation, evolving into a social movement/quasi-state wishing to create an Islamic regime. In Egypt Jihad and Gama’a al-Islamiyya expanded their operations, while the Iraqi anti-Saddam Islamist Party, Hizb al-Da’wa, received a big boost from the Iranian revolution. The Soviet presence in Afghanistan had already triggered the emergence of Islamic mujahedin who first fought the Soviet forces and then among themselves, paving the way for the rise of Taliban which in collaboration with al-Qaeda inaugurated a new era of radical Islamism at the global level.

INTERPRETATIONS

How then to interpret the rise of the new Islamism in the Muslim-majority countries? Some “modernist” interpretations perceive Islamism as a reactive antimodern entity. The encounter of Islamism (and Islam) with modernity, according to Bernard Lewis (and later Samuel Huntington) may even result in the “clash of civilizations” (Lewis 1990). Albert Melucci and Alain Touraine, for their part, view Islamist movements in terms of “regressive utopianism,” a sort of religious revival where actors seek their identity with reference to the past (Melucci 1996: 104). The second strand of interpretations views Islamism as signifying a quest for difference, cultural autonomy, alternative polity, and morality vis the universalizing secular modernity (Giddens 1987: 50). Islamist movements
denote a “quest for identity, authenticity, and community, and a desire to establish meaning and order in both personal life and society” (Esposito 1998: 20). Others interpret them as a search for certainty in this uncertain world, movements that attempt to “restore to the ‘post-modern’ world meaning, an ethic and an order which, it is claimed, have vanished in the collapse of all its certainties” (Kepel 1994: 3). Still other observers identify the emergence of new Islamism as the third phase (after political and economic) of anticolonial struggles – discursive struggles against Western modernity, struggles for cultural identity and independence (Burgat & Dowel 1993). These varied interpretations offer some valuable insights which allow us to explore the meaning of Islamist movements. Their difficulties, however, lie in their homogenizing tendencies, and in reducing the meaning of these multi-layered collectives to the discourse of leaders. The challenge is to discern what the different constituencies imagine and expect from their movement (see methodological issues below).

Broadly, the new Islamism emerged in societies with deep contradictions, where the opportunity for a massive educational expansion, economic development, virtual abundance of wealth (oil money), and a general social mobility went hand-in-hand with continuous political repression, marginalization, and a growing inequality. At this juncture the middle class marginals, now overwhelmingly educated, were becoming acutely aware of their exclusion, and so experiencing a strong “moral outrage.” Islamism came to mobilize those (largely middle-class high achievers) who felt marginalized by the dominant economic, political, and cultural processes in their societies. Having perceived both capitalist modernity and socialist utopia as failure, they opted for an “indigenous Islamic alternative.” In those cold-war conditions, the ruling regimes offered lip service and opportunity to Islamic alternatives for their anticommunist postures. Yet by adhering to their “authentic” model, the Muslim middle class discarded what they considered as their excluders – their national elites, secular governments, and these governments’ Western allies. So, they rejected “Western cultural domination,” its political rationale, moral sensibilities, and normative symbols, even though in practice they shared many of those traits as in their neck-ties, food, education, and technologies. In the Arab world, in particular, the political classes considered the long-standing occupation of the Palestinian lands by Israel and the US support for this, as further evidence of their subjugation at the broader global level. The way to liberation was the return to Islam (as Israelis had returned to Judaism). Thus Islamists endeavored to articulate a version of Islam that could respond to their political, economic, and cultural deficits. They imagined Islam as a complete divine system, with its superior political model, cultural codes, legal structure, and economic arrangement – one that could remedy all human problems. It could also offer Muslims a sense of self-respect, self-confidence, and autonomy in world views. And this maximalist construction of Islam went hand-in-hand with a populist language and social control, which inevitably otherized many citizens – including the non-conformists, seculars, ordinary Muslims, religious minorities, and many women. At the core of the Islamist paradigm, then, lay a blend of devotion and duty, virtue and exclusion (Bayat 2007: 6–7).

It is tempting to draw parallels, as some have, between Islamism and liberation theology in Latin America. The Islamists’ populist rhetoric and the religious frame seem to justify a comparison. But there are crucial differences. Liberation theology originally attempted to reform the church from within, but evolved later into a social movement in which the concerns of the dispossessed occupied a central place. Liberation theology originally attempted to alter the oligarchic control of the Catholic Church and its neglect of the poor, especially when socialist movements (e.g., the Cuban revolution) had undermined the church by fighting for social justice. Led by socially conscious theologians, the strategic objective of liberation theology was the
“liberation of the poor” which would frame the interpretation of the Gospel (Smith 1991). But Islamism has had broader social and political objectives than simply the welfare of the poor. The Islamists’ primary concern has been building an “ideological community” – establishing an Islamic state, implementing Islamic laws and moral codes which are expected to attend to such concerns as social development and the plight of the poor. In short, Islamist movements and Latin American liberation theology represent two distinct social and political trajectories. If anything, militant Islamism seems to have more in common with the Latin American guerrilla movements of the 1960s and 1970s than with liberation theology – not of course in their ideologies, but relative to their actors and the conditions under which they emerged.

CHALLENGES

Research on Islamist movements has flourished in recent years, in part because of its intellectual appeal but more for its global political significance. While we certainly know more today about Islamism than two decades ago, a number of methodological challenges hamper rigorous analysis. First, the subject of inquiry remains perplexing, for it refers to not the same but different things, of which only few may be characterized in terms of social movements. Thus, reference is made to revolution (Iran 1979), the state (Iran, Sudan, the Taliban), quasi-state (Hezbollah during the civil war), political parties (Rifah or Virtue parties in Turkey), guerrilla organizations (e.g., Jihad in Egypt), and clerical groupings (e.g., radical ulama in Iran or Egypt). Second, much of the analyses of the movements draw on discourse and little on practice. This is in line with Castells’ emphasis that social movements should be seen by their “own words” (1997: 71). The approach aims to correct structuralist reductionism by looking at what actors actually say they want, but it falls short of rectifying the gaps and even contradictions between what actors say and what they actually do. The challenge is to integrate and explain incongruent words and deeds. Third, such discourse-based analyses are usually informed by words of articulated leaders. This method assumes an image of social movements as homogenous and harmonious entities, ones which are identified with and represented primarily by leaders (who incidentally have an interest in presenting a coherent picture of their movements). But Islamist movements carry multiple discourses by their diverse fragments and constituencies (leaders, cadres, members, sympathizers, free riders, and so on), who often imagine shared perceptions with other adherents (Bayat 2005). Given the fragmented nature of these collectives, who speaks for the movements? How are we to integrate such disparate and possibly contradictory words, deeds, and perceptions to build a reasonable narrative of movements and their meanings?

REFERENCES AND SUGGESTED READINGS

Japanese “new” religious movements (1930–present)
GENTARO MIZUGAKI

The term new religious movements (NRMs) refers to religious movements that emerged worldwide in the twentieth century, as distinguished from institutionalized religions such as Christianity, Judaism, Buddhism, Islam, or unorganized folk religions.

Although NRMs demonstrate different features in different parts of the world, most of them have some characteristics in common, such as an emphasis on lay people rather than clerics, globalized sources of doctrines and views of the world, and loose membership. There has been academic interest in NRMs in Africa, Japan, and in the West, where NRMs have played conspicuous roles.

In Japan, Shintoism, Buddhism, and Confucianism in turn have manifested different ties with the regimes in different periods. None of them has been established firmly enough to make an exclusive monopoly of doctrines or teachings. This course of history provided the soil of religious tolerance in which hundreds of religious movements could be germinated recurrently. The earliest of the Japanese NRMs which have survived to the present, such as Kurozumikyo, Konkokyo, and Tenrikyo, originated in the feudal Tokugawa era in the beginning of the nineteenth century.

Hundreds of NRMs emerged in the process of regime change and rapid social change after the Meiji restoration of imperial rule in 1868. While some NRMs such as Omotokyo (Great Origin) and Reiyukai occurred as charismatic or shamanic movements, some occurred as factional offshoots of another NRM, such as Honmichi from Tenrikyo, Sekai-Kyuseikyo (Church of World Messianity) from Omotokyo, and Rissho-koseikai from Reiyukai. Still other NRMs occurred as seceded from traditional religions, such as Soka Gakkai (Value Creating Society) from Nichiren Buddhism. Most of the NRMs stagnated or declined over the course of time due to gaps in successions, unsuccessful routinization of charisma, or failed prophecies, although some successful NRMs, such as Tenrikyo, grew to have millions of adherents.

Although the Meiji government encouraged modernization and westernization, it pursued social integration through theocratic state building. The imperial cult raised Shinto to a state religion, but magic practices or the healing cults of NRMs were kept under governmental control. Moreover, during rising militarism and totalitarian repression in the 1920s and 1930s, the traditional religions such as Shinto, Buddhism, and Christianity were regulated under the Religious Organizations Law (enacted in 1939) and mobilized as part of the war-time regime, and apocalyptic or radical movements such as Honmichi and Omotokyo were suppressed under the pretext of lèse-majesté and violation of the Peace Preservation Law (enacted in 1925).

After World War II, full-scale religious freedom was guaranteed under the constitution. However, anomie, uncertainty, and loss of confidence as a result of defeat, as well as the questioning of the system of the emperor, brought about the explosion of NRMs of all sizes, which McFarland (1967) called “the rush hour of the gods.”

In the 1960s, high economic growth changed the environment for religion. On one hand, industrialization and population shifts eroded family and community cohesion on which the traditional parish system of the Shinto shrine and Buddhist temple was based. On the other hand, improved standards of living and the spread of higher education changed the backgrounds and religious needs of adherents.

Some NRMs met not only old religious needs, such as the alleviation of poverty, illness,
or family trouble, but also new ones, such as feelings of loneliness, uncertainty, or personal feelings of meaninglessness. Successful NRMs, such as Soka Gakkai (about 17 million) and Rissho Koseikai (6 million), absorbed a large number of followers among new urban lower-class people detached from their homeland. Soka Gakkai founded the political party Komeito in 1961 for the purpose of Buddhist theocratic state building. Komeito participated in the recent ruling coalition.

The mass media has been one of the main agents of social control over NRMs, along with anticult movements. The press has often criticized influential NRMs, such as Tenrikyo, and Omotokyo in prewar times, and Soka Gakkai, Sekai-Kyuseikyo, Reiyukai, Rissho-koseikai, and the Unification Church in postwar times. Anticult movements that occurred in the late 1960s mainly targeted the Unification Church. Since the terrorism carried out by Aum-sinrikyo in 1995, anticult movements have diffused, but have targeted more NRMs.

Foreign propagation in the early NRMs and traditional religions was originally related to emigration to Hawaii, Brazil, and the colonized Asian area in the first half of the twentieth century. Tenrikyo in particular appealed to non-Japanese people in prewar times. Since the 1950s, other NRMs have followed this trend, for example, Sekai-Kyuseikyo and the Perfect Liberty in America, Seicho-no-Ie (House of Growth) and Sekai-Kyuseikyo in Brazil. In contrast, foreign NRMs such as Jehovah’s Witnesses, Mormonism, Christian Science, Scientology, the Hare Krishna Movement, and Rajneesh Meditation Center, have remained small scale.

From the 1970s on, however, a mystical and inner-directed attitude has grown little by little among the younger generation in Japan. Although the early NRMs survived stagnation, new NRMs which have emphasized miraculous experiences, such as Agonshu, Mahikari (True Light), Kofuku no Kagaku (The Institute for Research in Human Happiness), and Aum-sinrikyo, have been on the rise. These new religions are sometimes called “new-new religion” (Shin-shin shukyo), but not all of them originated at that time.

Researchers have pointed out the distinct features of the Japanese NRMs, such as female founders/leadership and a weak antigovernmental character (with the exception of Aum-sinrikyo). As globalization spreads, it is likely that different religious ideas and views of the world from different sources will affect the Japanese NRMs and make them complex and typologically diverse.

King, Martin Luther, Jr
(1928–1968)
THOMAS F. JACKSON

Recent scholarship on Martin Luther King, Jr looks beyond King’s eloquence as a charismatic orator who inspired masses of people to nonviolently protest segregation in America. We now appreciate more fully King’s religious background in sustaining his leadership. More importantly, we see multiple ways in which King was shaped and inspired by larger movements for racial and economic justice around the world. King did not initiate any of the local protest movements for which he became a spokesman and symbol. He was nevertheless a brilliant strategist of protest confrontations; a master at reaching national and international publics and elites through print and broadcast media; a mobilizer who inspired thousands of people to risk life and limb against forces of violence and repression; and, finally, a coordinator and mediator among a range of protest leaders whose power and talents have been overshadowed by King’s fame. Recent scholarship has especially focused on King’s final years, when his lifelong commitment to opposing the “evil triplets” of racism, militarism, and economic exploitation were most fully put into action. King’s final crusades against the Vietnam War, against big city apartheid, and against poverty and low wages were less successful than the Southern movement to dismantle legal segregation. But the full amplitude of King’s radical challenge to America’s political economy and foreign policy has now become more visible.

King was born January 15, 1928 in Atlanta, Georgia. His father and grandfather were prominent Baptist ministers and leaders of the National Association for the Advancement of Colored People (NAACP). King was educated in elite institutions – Morehouse College, Crozer Theological Seminary, and Boston University, where he earned a PhD in 1955. These elite settings prepared him well for national religious and political leadership, especially in his bargaining with elites. Yet early on King also became committed to democratic empowerment among those whom Jesus called “the least of these.” Appalled by breadlines during the Great Depression and by the fierce competition for low wage jobs between black and white workers that he witnessed in Atlanta, King became as critical of capitalism as he was of racism. He absorbed several philosophies of social change from his many mentors: the African American social gospel, which called for an active, politically engaged, even revolutionary Christian ministry; Gandhian nonviolence, which opposed hierarchies of power within oppressed communities as well as racism and imperialism; and interracial trade unionism, with its attendant calls for sweeping social democratic economic reform.

In 1955, as pastor of Dexter Avenue Baptist Church in Montgomery, Alabama, King rose to local leadership after his fellow NAACP activist Rosa Parks refused to relinquish her bus seat to a white man, and 40,000 black workers stayed off the buses for a year. President of the Montgomery Improvement Association, King sustained popular morale and became the movement’s spokesman and symbol through his deft handling of sympathetic media. King also coordinated support from northern liberals, churches, synagogues, and labor unions. Braving bombings and death threats, King rejected armed protection from supporters early in the struggle. He became an international symbol of a new southern militancy that favored nonviolent direct action protest over the strategies of litigation and lobbying practiced by the NAACP.

In 1957, King helped found the Southern Christian Leadership Conference (SCLC), serving as president until his death. The SCLC
could not replicate the Montgomery protest elsewhere; this loosely affiliated organization of local ministers mainly focused on registering voters before 1960. In travels to Ghana and India, King referenced the American struggle as part of a global movement against white supremacy and empire. Critical of communism, he was even more critical of the cold war arms race and anticommunism at home.

In 1960–1961, black student activists sat in at lunch counters, rode interstate buses in interracial teams, and ignited the largest wave of protest since the 1930s. The Student Nonviolent Coordinating Committee (SNCC) challenged King to follow them to jail, which he finally did in protests against Atlanta’s segregated department stores in October 1960. King inspired hundreds to go to jail in Albany, Georgia in December 1961. But students grew skeptical when he refused to join their freedom rides and when he mysteriously bailed himself out of Albany’s jail after promising to remain there with them. Ironically, King’s criticism of the FBI’s failure to protect civil rights protesters in Albany also provoked the ire of the powerful director of the FBI, J. Edgar Hoover. The FBI campaign of intimidation and disinformation against King’s alleged communist affiliations lasted until his death in 1968. For all this, King increasingly advocated that poor people’s daily needs for economic justice must be incorporated into antiracist organizing. He strongly supported New York’s striking black and Puerto Rican hospital workers in 1959. And, in the South, SCLC’s Citizenship Education Program moved beyond literacy and voter registration to agitate for job training and disability benefits denied blacks by the local Jim Crow welfare state.

King’s distinctive strategy of mobilizing large street protests to publicize racism was perfected in 1963, when SCLC joined in protests against lunch counter segregation and job discrimination in Birmingham, Alabama. Horrific images of violent police repression spread around the world, and the Kennedy administration was compelled to mediate. Hundreds of black communities across the nation joined in protests that won sympathy and threatened mass disruption. President Kennedy introduced legislation to outlaw discrimination in public accommodations and employment. King stirred the nation with his “I Have a Dream” speech at the August 1963 March on Washington for Jobs and Freedom, which demanded even stronger civil rights legislation, massive public works employment for the unemployed, and higher wages for all workers. King later coordinated protests in St. Augustine, Florida, which kept pressure on Congress to pass a much strengthened Civil Rights Act of 1964. This legislation proved inadequate in protecting voting rights and ensuring economic opportunity, however. So King led a dramatic march from Selma to Montgomery, Alabama for voting rights in March 1965, calling on his followers to take the next step, to “march on poverty.” In response, President Johnson introduced and Congress passed legislation that put federal registrars in southern counties. The Watts neighborhood of Los Angeles rose up in violent revolt against police in August. King traveled there to preach nonviolence and to pressure the mayor to release dollars from Lyndon Johnson’s new War on Poverty to the neighborhoods.

Poverty and big city segregation now loomed as the largest challenges to black equality. King took SCLC to Chicago in 1966 to join a coalition of neighborhood organizations calling for "an end to slums." He also called for national legislation that would make housing discrimination illegal and protect civil rights workers (this passed Congress only in the wake of his assassination two years later). King and SCLC organized marches on realty offices in white neighborhoods, where residents brutally attacked marchers. King extracted some small concessions from the realtors’ association and Mayor Richard Daley. But he also supported Chicago activists who built tenant unions and won jobs through mass boycotts. King mediated between moderate integrationist leaders and radical black power activists in an increasingly divided black freedom movement. Ever an integrationist,
now an avowed “democratic socialist,” King made concessions to Black Power strategies as conservative backlash gained momentum in the late 1960s.

As King explained to Congress in 1966, the struggle for “human rights” included the right “to live in a decent house” and the right to earn or receive “an adequate income.” In December 1967, after a fourth summer of urban violence and the election of conservatives to Congress, King announced the multiracial Poor People’s Campaign. Its aim was to pressure the government to strengthen the War on Poverty and wind down the war in Vietnam. In March 1968, 1300 Memphis sanitation workers demanded higher wages, safer working conditions, and municipal recognition of their union. A cross-class black coalition as remarkable as that of Montgomery in 1956 supported the workers, drawing national attention and the support of interracial unions. King lent his prestige and resources to their quest for economic justice. He was assassinated there on April 4, 1968.

Korean residents movement in Japan

DAVID CHAPMAN

In early 1945 approximately two million Koreans were living in Japan. At the end of World War II almost one and a half million returned to Korea and around 600,000 remained in Japan. In late 1945 the newly formed League of Koreans (Zainippon Chosenjin Renmei) called for the eradication of imperialism and militarism, the abolition of Japan’s Emperor System and the independence of Koreans in Japan. The first postwar large-scale protest of resident Koreans in Japan ensued, with a rally of many thousands held in Hibiya Park on December 28, 1945. Many of the protesters expressed grievances and demands relating to the protection of property, personal safety, salary payments, benefits, and the prosecution of those responsible for the massacre of Koreans during the 1923 Great Kanto earthquake.

Other protests by this group included a call for the reinstatement of voting rights; Korean representation in Japanese politics, lost at the war’s end; and opposition to the introduction of the Alien Registration Ordinance in 1947 requiring Koreans to be treated as foreign nationals. In October 1948 the amalgamation of a number of other breakaway groups of Koreans formed an organization called the Korean Residents Union in Japan (Zai-Nippon Daikan Kyoryu Mindan or Mindan) that proclaimed itself to be nonpolitical. This phase in resident Korean history was not only a period of struggle for legal status but also the beginning of political division amongst Koreans in Japan. This division reflected the separation of the Korean peninsula into a communist north and a capitalist south, creating a highly charged political context. The Korean War (1950–1953) exacerbated already emerging ideological differences. In 1955, after the demise of the League of Koreans, the General Association of Korean Residents (Zai-Nippon Chosenjin Sorengō Kai or Sorengō) was formed. This group supported the regime of the north whilst Mindan, mentioned above, demonstrated allegiance to South Korea. Pressure to declare affiliation for either the north or the south increased within the Korean community as did friction between Mindan and Sorengō.

In April 1948, under pressure from the Allied Forces and their policies on communism, Japanese authorities closed many Korean schools in Japan. Demonstrations against the closure of schools in Kobe and Osaka, later referred to as the Hanshin Education Incident (Hanshin kyoku jiken) led to the deaths of two schoolchildren and injuries to numerous others (Koshiro 1999: 115).

Issues related to legal status for Koreans in Japan remained contentious. In 1965 Japan and South Korea normalized diplomatic relations. As part of this an agreement on the legal status and treatment of South Koreans in Japan was created and allowed for the application of permanent residency for all South Korean nationals residing in Japan (kyotei eijii). The stringent conditions of this agreement imposed by Japan met with protests from both sides of the Korean community. Mindan members held a rally in Hibiya Public Hall on June 17, 1965 to demand equality in employment, welfare, and education whilst Sorengō, concerned with the absence of any recognition of North Korea in the diplomatic discussions, believed the development to be an impediment to reunification of the Korean peninsula and detrimental to the fight for the ethnic rights of Koreans in Japan (Yang 1994: 209–215).

The issue of equal access to employment for resident Koreans was crystallized by a legal case in 1970 in which a Korean resident took legal action against the Japanese electronics giant Hitachi for discriminatory employment practices. The company had withdrawn their
offer of employment once they realized that the applicant was not a Japanese national. Those supporting the litigant held a group denunciation (kyūdan) at Hitachi. This case and the accompanying protests divided opinion within the Korean community. Those opposed to the case were mostly older generation resident Koreans claiming that this type of action supported assimilation into Japanese society which would lead to a loss of Korean identity (Pak Kun o Kakomukai 1974: 4–5). The 1970s was also a time when concerns emerged amongst some younger second- and third-generation resident Koreans about the domination of first-generation resident Koreans and differences in opinion regarding integration into Japanese society (Chapman 2008).

During the 1980s issues such as fingerprinting, political representation, and equal access to public service positions became central concerns. The inclusion of mandatory fingerprinting in the 1952 alien registration law was contentious for resident Koreans from the beginning and led to widespread protests in the 1980s. Over 10,000 people in Japan, the majority of whom were Republic of Korea (ROK) nationals, refused to be fingerprinted. The majority of those refusing only did so for the three-month grace period, after which they agreed to be fingerprinted. This protest was well publicized in English newspapers at the time. Later, in 1992, the requirement was abolished for special permanent residents (the majority of resident Koreans were in this category) and in 1999 (effected in 2000) the fingerprinting requirement was abolished for all foreign residents in Japan. Appeals to the United Nations and the outside pressure that these appeals created were essential in forcing the Japanese government to respond by abolishing practices such as fingerprinting (Tsutsui & Shin 2008).

Japanese nationality is still a requirement for the right to vote in national elections and most prefectoral and municipal assemblies. The issue is of importance to Mindan which has been campaigning for this right since 1992. A bill allowing foreigners this right has been stalled in the Japanese parliament since 2000 with no immediate resolution in sight. Nationality in public service positions also remains a contentious issue for some resident Koreans. The recent (2005) decision by the Supreme Court against the right for a resident Korean nurse to sit a promotion exam made clear the Japanese government’s position on senior civil service positions being only open to nationals (McNeil 2005).

Kwang-ju uprising (Korea)

SUN-CHUL KIM

Also known as the 5.18 Kwang-ju people’s struggle (Kwang-ju minjung hangjaeng), the Kwang-ju massacre, or officially as the 5.18 Kwang-ju democratization movement (5.18 Kwang-ju minjuhwa undong), the Kwang-ju uprising refers to the Kwang-ju citizens’ ten-day resistance to the newly emerging military leadership of South Korea from May 18 to 27, 1980. The uprising was first triggered by the military’s brutal repression of what might have been an ordinary demonstration, and evolved into an armed resistance and a brief period of self-governance analogous to the Paris Commune of 1871. In the end, the uprising was put down by special army units, producing many casualties. The Kwang-ju uprising served as a turning point in the pro-democracy movement and left a deep imprint on South Korean politics and society. With the establishment of electoral democracy in 1987, the uprising gained official recognition as a democratization movement and is commemorated every year.

The Kwang-ju uprising grew out of a series of unprecedented events. After the sudden assassination of the authoritarian leader Park Chung Hee (1961–1979) in October 1979, the political climate in South Korea swung toward liberalization. By the spring of 1980, political bans were lifted and politicians started debating the blueprint for democracy. Hopes were high. However, the head of the Army Security Command, Chun Doo Hwan, had different ideas. Taking advantage of the power vacuum that Park’s death had created and of his position as the officer in charge of the investigation of Park’s assassination, he emerged as the de facto ruler of the nation by taking control of the military and the Korean Central Intelligence Agency through an intra-military coup. Gradually, Chun’s political ambition became apparent to the public and mass demonstrations started to erupt all over the country demanding the lifting of martial law and a firm commitment toward democracy.

It was in this context that, on May 17, Chun Doo Hwan effectively suspended all talks of democracy by arresting key political leaders and extending martial law to cover the entire territory. While the student movement leadership in Seoul had made a tactical decision to retreat from the streets, fearing military clampdown, their counterparts in Kwang-ju were committed to continuing their struggle. Upon hearing the news of the May 17 decree, on May 18, students in Kwang-ju gathered in front of Cheonnam University, only to be greeted by fully armed special airborne troops. Merciless repression ensued. News of the first killing brought citizens to the city’s main boulevard, but this only signaled the beginning. Innocent citizens, including children, women, and the elderly, became victims of indiscriminate killing in the following days.

In response to the military’s menacing violence, Kwang-ju citizens supplied arms from local police stations. Armed citizens called themselves the citizens’ army, and swiftly engaged in battle with the military troops. As casualties increased, late on May 21, the military vacated Kwang-ju and cut off all transportation and communication lines, effectively isolating the city from the rest of the nation. For the next five days, Kwang-ju became a liberated zone where the citizens governed themselves autonomously and peacefully. Citizens from diverse backgrounds voluntarily participated in maintaining peace, order, and the livelihood of its people. Self-governing committees were set up to work from the bottom up, food and other necessities were rationed out of whatever resources available, and the provincial office building became a focal point of citizen assembly on a daily basis. Peace was short lived, however. On May 27 the
military sent in 20,000 paratroopers, headed by tanks, and reoccupied the provincial office and the city. In the course of the reoccupation, several hundred died, with more missing and injured. A congressional investigation in 1988 officially announced the death toll at 191, although the real number has been a subject of dispute among South Koreans.

Subsequently, the ruthless state violence became a huge liability for the authoritarian ruler while the heroic resistance of the Kwangju citizens provided an inspiration for the pro-democracy movement. Like the Soweto uprising, which helped rejuvenate the anti-apartheid movement under the leadership of the ANC in South Africa, and the Gdansk strike, which gave birth to the Solidarity trade union movement in Poland, the Kwangju uprising was a transformative event that contributed to the rise of new cycles of protest at unforeseen levels. Most importantly, the city-wide participation of Kwangju citizens, the sense of community they had created, and their determination for democracy paved a new way for the South Korean pro-democracy movement, as activists, mostly intellectuals, reformulated their strategy from an intelligentsia-led movement to organizing the masses as the movement’s main pillar. In the course of this, thousands of student activists gave up their privileged status and penetrated the life spheres of ordinary workers, farmers, and the urban poor. These efforts bore fruit in 1987 when a series of nationwide demonstrations finally forced the authoritarian Chun government to concede democratic reforms, including direct election and the expansion of civil rights.

Research on the Kwangju uprising has expanded to encompass various aspects of the event, and significant contributions have been made concerning the contentious dynamics that developed in its aftermath. These include studies on the struggle over the meaning of Kwangju and the various dilemmas that arose with democratization, or institutionalization of the pro-democracy movement. Nonetheless, investigation of this topic is still in an incipient stage and it holds great potential for future research employing comparative perspectives and innovative methods.

Labor movement in Latin America
JOEL STILLERMAN

During the twentieth century, the labor movement profoundly affected the politics and societies of Latin America, the region including Mexico, Central America, the Caribbean, and South America. The labor movement is here defined as workers’ organizations with the capacity and willingness to engage in collective action. While labor protest dates back to slave brotherhoods and artisan associations formed after Spain and Portugal’s fifteenth-century colonization of the region, this entry focuses on the twentieth century, when trade unions were formed in many countries. Scholarship on the labor movement goes back at least to the 1920s, though it developed in earnest after World War II. Scholarly frameworks adopted in the study of the labor movement include modernization theory (Germani 1965), Marxism and dependency theory (Spalding 1977), social and cultural history (Levenson-Estrada 1994), comparative politics (Collier and Collier 1991; Murillo 2001; Burgess 2004), and social movements theory (Kay 2005; Almeida 2008).

HISTORICAL PATTERNS

During the twentieth century, labor politics and mobilization transformed in tandem with broad-scale economic and social change. From 1900 to 1930, when union activity was illegal in most countries and economies were based on mineral and agricultural exports, mutual aid societies and local anarchist- and socialist-led organizations staged sporadic strikes and protests. From the 1920s to the 1940s, in larger and more economically developed countries, conservative elites legalized collective bargaining and other labor rights to neutralize threatening mobilizations sparked by workers’ political exclusion, the Russian Revolution, and World War I.

With export decline during the Great Depression, many governments fostered a domestic industrial base and broadened public employment. Urban labor movements allied with dominant political parties or middle-class government reformers in support of improved wages, working conditions, and benefits. This period witnessed significant expansion and rising mobilization among workers’ organizations (Collier & Collier 1991).

As the “easy phase” of import-substitution industrialization ended after the Korean War, governments faced difficulties developing capital- and technology-intensive industries and economies faltered into inflationary spirals. During the 1960s and 1970s, domestic elites and middle classes rejected a highly mobilized working class, and supported military coups. The US military had trained these officials, promoting the cold war-based national security doctrine. Latin American militaries also feared that the ideas inspiring the 1959 Cuban revolution might spread throughout the region (Drake 1996).

Militaries took power in Argentina (1976), Brazil (1964), Uruguay (1973), and Chile (1973), and waged brutal counterinsurgency wars from the 1960s to the 1990s in El Salvador, Guatemala, Nicaragua, and Colombia. Unions allied to leftist or populist parties were among these regimes’ principal targets. Furthermore, throughout the region, the aftereffects of the 1970s oil price hikes and governments’ accumulation of foreign debt led to debt crises throughout the region during the 1980s. Under pressure from the International Monetary Fund, most governments reduced government spending, weakened union protections and benefits, and opened national economies to imports and investment. The results were catastrophic for unions and their political allies as employment in the traditional strongholds
of manufacturing, mining, and the public sector declined; unions became more difficult to organize and sustain; unions’ traditional party allies were chastened; and employment became more precarious throughout these economies. Nonetheless, during the 1980s and 1990s, unions capitalized on regime openings to stage or coordinate pro-democracy protests that helped topple authoritarian regimes (Drake 1996; Roberts 1998; Almeida 2008).

NATIONAL VARIATIONS

This broad picture belies important national variations. Collier and Collier (1991) argue that the mode through which political elites incorporated unions into the polity in the early twentieth century fundamentally shaped modern labor movements, party systems, and political trajectories. They argue that elites incorporated unions into the polity through labor laws (Brazil and Chile), traditional parties (Colombia, Uruguay), labor populist parties (Argentina, Peru), and radical populist parties that included agricultural workers (Mexico, Venezuela). Populist parties represented members of multiple social classes but had a strong union base and espoused a nationalist, anti-oligarchic ideology.

Each path of incorporation had a distinct political outcome. State incorporation and repression of labor parties led to political polarization, ultimately producing a broad coalition supporting military coups against labor and the left. Traditional party incorporation permitted pacts between parties, though the state militarized in opposition to labor unrest. These conflicts did not disrupt the party system. Labor populism fueled the power of populist parties, producing a stalemate between these parties and other political actors. These conflicts resulted in coups designed to prevent populist electoral success. Finally, the decision by radical populist leaders to create a broad coalition including rural workers and to move toward the political center allowed these regimes to build legitimacy and survive without military intervention.

In Brazil, however, the story did not end with the military’s rise in 1964. First, the Brazilian military, unlike most other governments of the region, chose to develop capacity in heavy industry through state sponsorship and foreign debt. As a consequence of this “second industrialization,” independent unions with Catholic Church support carried out enormous strikes that split business leaders from the regime (Seidman 1994). They also formed a new political party (the Workers’ Party), and eventually elected one of their own to the presidency, Luiz Inácio Lula da Silva.

In the current period in which free market democracies dominate most countries of the region, union responses to neoliberalism have varied. Mexican unions, under pressure from the ruling Institutional Revolutionary Party and insulated from workers’ democratic demands largely supported neoliberal policies. Venezuelan union leaders felt pressure from the Democratic Alliance party to which they are allied, and their constituents, and hence supported the government at some points and protested free market reforms at others (Burgess 2004). In Argentina, a united union movement allied with the president initially mobilized and then used their alliance to negotiate the terms of neoliberal reforms (Murillo 2001). Elsewhere, union protests against neoliberal policies have been largely ineffective (Drake 1996). Organizations representing women, victims of human rights violations, ethnically and racially subordinate groups, students, or the unemployed have displaced unions as the principal protagonists of protest (Roberts 1998; Almeida 2008).

In Central American countries, unions faced a much more repressive context than elsewhere and had few bases for organization due to the late development of industry. However, in El Salvador between 1925 and 2005, periods of modest regime liberalization allowed labor and other civic organizations to develop and engage in nonviolent protest; while the repressive periods that followed provoked more radical, violent labor and popular activism (Almeida 2008). In Guatemala, Coca-Cola
bottling workers built on skills, networks, and frames developed through preceding organization by Catholic Church volunteers and US anti-communist unions as well as transnational activists to stage a successful unionization drive in the 1980s in spite of severe repression (Levenson-Estrada 1994). Rural workers expressed initial loyalty to the Nicaraguan dictator Anastasio Somoza García, but shifted to the left after the mechanization of agriculture to join the broad-based Sandinista revolutionary movement that toppled the Somoza dynasty in 1979 (Gould 1990).

With few opportunities to oppose neoliberal policies at the national scale, activists in Mexico and Central America have built transnational alliances to demand rights from national and international authorities. The growth of these activist networks and strategies has different sources. In Mexico and Central America, the creation of free-trade zones for product assembly with US support has inspired the solidarity of US and European consumer movements, building on the legacies of human rights activism in Central America. Additionally, the North American Free Trade Agreement, passed in 1994, includes a labor-side accord, providing labor groups an incentive to develop cross-border ties. While the agreement itself offers unions little ground for enforcement of national labor laws, it has provided a forum and encouraged the creation of networks that have facilitated the use of legal and media tactics to gain influence over recalcitrant employers. Canadian unions promoted the creation of locally based nongovernmental organizations in Mexico, while US unions trained college students in union organizing, sparking the creation of United Students Against Sweatshops, a university-based organization that has battled global brands like Nike and Reebok in support of specific union campaigns in Latin America and elsewhere, and has pushed universities to develop codes of conduct prohibiting the purchase of athletic uniforms made by workers who do not enjoy internationally recognized rights to organize, assemble, bargain, and work in safe settings (Armbruster-Sandoval 2005; Kay 2005).

AREAS FOR FUTURE RESEARCH

Future scholarship might consider the possibilities for union or other forms of collective organization in the growing sectors of Latin American economies – retail, education, healthcare, and other private services; traditional areas of informal employment such as street vending – and among the unemployed. Further quantitative historical studies of protest events might point to long-term shifts in the forms and intensity of collective action (Almeida 2008). Scholars might also continue an existing focus on women’s role in organized labor and/or women’s organizations based in residential communities (French & James 1997). Additionally, researchers could further develop the incipient discussion of racial and ethnic divisions and their implications for class-based collective action (Chomsky 1995). Finally, work on transnational activism might consider the possibilities of and dynamics shaping international alliances within Latin America rather than ties with organizations in the US or Europe.

Labor protest in the European Union
LOUISA PARKS

The phenomenon of labor protest targeting the European Union remains relatively rare, yet the institutions of organized labor at the EU level (introduced below) have provided the infrastructure that protest requires – networks for communication (Gorges 1996: 310; Turner 1996: 327; on European Works Councils (EWCs), Erne 2008: 35). These in turn have helped overcome other obstacles to transnational protest (Gajewska 2008: 117; Parks 2009: 263). Imig and Tarrow, working with data from 1984 to 1997, note some increase in protest against the EU, and that 82.1 percent of these protests were by occupational groups (2001: 39), a trend that seems to be continuing.

The 1997 “Vilvoorde” protests against the closure of a Renault plant in Belgium were deemed a watershed (Erne 2008: 34), including a 100,000 strong march in Brussels (see Imig & Tarrow 2002), and General Motors workers participated in several transnational strikes between 2000 and 2007. Other examples of EU labor protests include the 2000 protests over the ABB Alstom Power (power generation plants) dismissal plan (see Erne 2008), and protests by dockers over the liberalization of port services in 2003 (for a detailed account see Turnbull 2006) and 2006. Protests organized through the European Trade Union Confederation (ETUC) (see below) have also become more common since the latter has begun to distance itself from a more right-wing Commission (Erne 2008: 38; Parks 2009: 198–199). In 2000 the ETUC organized a 70,000-strong protest in Nice calling for the inclusion of the Charter of Fundamental Rights in the treaty. Indeed, the ETUC organizes regular demonstrations at European Councils. The ETUC was also a major player in the protests against the “Bolkestein” directive on services in the internal market in 2006 (see Gajewska 2008: 110–111; for a detailed account, Parks 2009: ch. 6). A new “social movement unionism” has also been noted with the participation of national trade unions in the European social forums. The most important expression of this was in the European marches against unemployment (Taylor & Mathers 2002).

A brief introduction to the largest institutions of organised EU labor is useful in approaching this subject, since low levels of protest are broadly due to the fact that the latter came about “in the absence of mass popular demand of protest” (Turner 1996). The most prominent of these is the ETUC, the peak trade union organization and a federation of national trade unions. Founded in 1973, the ETUC became an official legislative player in the social dialogue in 1991 (for a summary of the ETUC’s history, see Gorges 1996; Martin & Ross 2001). Divisions between member unions have often hindered the ETUC’s work (Gorges 1996: 77). Its semi-institutional role and distance from rank-and-file members helps explain the low levels of labor protest in the EU (Martin & Ross 2001; Gajewska 2008: 105). Taylor and Mathers argue that the ETUC’s “commitment to European integration has made it difficult for it to oppose its specific trajectory” (2002: 97). Other barriers to EU protest contribute – the EU has been found to discourage protest by actively encouraging dialogue with third actors (Marks & McAdam 1999). In addition, transnational protests are complicated by problems of distance, a lack of face-to-face communication and therefore trust and collective identity, and resources. Finally, national trade unions remain rooted in national arenas and problems (Turnbull 2006), and may seek to protect their advantages even to the detriment of workers in other member states (Gajewska 2008: 108–109). EWCs
are another important institution of organized labor at the EU level. Created in 1994, they provide workers with information and consultation rights on management decisions at the EU level. However, these bodies were also dismissed as facilitators of protest (see Erne 2008: 34). EWCs are often used as tools by company managers, who provide information designed to encourage the nationalist tendencies of unions and to provoke bases in different European countries to work against one another (Taylor & Mathers 2002: 99).

To conclude, the case for labor protest in the European Union must not be overstated – the phenomenon remains rare, and the main tools for influencing the EU remain conventional and institutional (e.g., Erne 2008: 36).

Land movements in Africa

WILLIAM DERMAN

Land has become a major issue in Africa. However, the enduring importance of land has, for the most part, not been matched by social movements organized around land issues. Despite the vast dispossession that occurred due to colonial conquest, especially in the establishment of plantations in Central Africa and colonial seizure of land in eastern and southern Africa, anticolonial movements were based far more on the themes of independence and dignity in urban and union-based political parties. As noted by Bernstein there is little experience in modern African history of popular rural political organization centered on land and agrarian issues (Bernstein 2005: 88). This situation is distinct from that in parts of Latin America and Asia. This was less true of the later liberation movements struggling to end Portuguese, Rhodesian, and white South African domination where land was central to rural protests. As has been demonstrated by Isaacman, rural protests in Africa were an important part of political struggles but peasants engaged in subterranean protests, not social movements (Isaacman 1993: 263).

Having noted the more general point of rural protests, what have been land-based social movements? There was and is a diversity of social movements based on land in sub-Saharan Africa. These can be roughly divided between those in opposition to colonial rule or racial domination, and those in independent countries based on ethnic, class, or generational conflicts. More recent are new movements forming to oppose large-scale land acquisitions or landgrabbing and those based upon women’s land rights. The early movements were linked to struggles for national independence, with land having a varied importance in terms of the return of land from the colonizers as a core of a social movement, or land as one factor among many. The best known of these earlier movements is the Mau Mau (also, more appropriately, termed the Land Freedom Army). Without doubt the forcible expropriation of land from the Kikuyu was central to the independence movement. Transforming landowners and farmers into squatters was at the core of grievances and the restoration of land a key demand. The narrowness of the LFA among the Kikuyu and its allies led to their isolation after the negotiated independence, which saw land demands marginalized and the Kenyatta (and then other families) becoming the major landowners in Kenya.

For the two early self-declared revolutions in West Africa, that of Ghana and Guinea (Conakry), land was not a basis of organizing opposition to colonial rule. This was surprising for Guinea, since there was such a large population of serfs and slaves whose struggles for access to land were ignored by the Parti Démocratique de Guinée (Derman 1973). Next to Guinea, Guinea-Bissau saw a long armed struggle for independence from the Portuguese. Amilcar Cabral, its leader, formulated a strategy based upon the peasantry linked to a small working class.

This conflict over land and political representation foreshadowed the guerrilla wars in Guinea-Bissau, Angola, Mozambique, Namibia (Southwest Africa), Zimbabwe (Rhodesia), and South Africa. These have not been the only land struggles. The ongoing conflict in Darfur, the outbreaks of violence in Nubia, efforts to control pastoralist land in east and western Africa can partially be examined through a land lens. Hunters’ associations in Burkina Faso are organized to prevent Fulbe expansion in some rural areas (Hagberg 2007). And the new Kenyan constitution will permit long-standing communities to regain their land rights. What new movements will emerge around land remain to be seen. The linkages between colonial rule, political
opposition, race, and land have been well
documented, contemporary land movements
less so. The nature of land movements in
opposition to “landgrabbing” is just emerging.
In general terms, Africa, which had been
viewed as a land-abundant continent (with
some exceptions like Rwanda, Burundi, and
parts of Nigeria), is moving toward land
scarcity. This has introduced new dynamics
in rural areas, since the World Bank and
other organizations have been pushing for the
formalization of land rights while national
governments seek to maintain governmental
land ownership. From a gender perspective,
lineage systems have tended to become more
patriarchal as competition over shrinking land
and other resources has intensified.

The major contemporary debates revolve
around responses of rural peoples to the linked
processes of globalization, structural adjust-
ment programs, population increases, com-
modification of land, violent conflicts and
civil wars, inequalities in land ownership, and
women’s rights to land. Gender has now been
added to debates about the most desirable
forms of land tenure. Partially commercial-
ized agricultural production, the privatization
of land, land scarcity, urbanization, increased
commercialization, and the expansion of non-
agricultural incomes have lessened dependency
on kin-based land systems. This leads to con-
flicts over who has access and ownership rights.
Moreover, emerging social movements address
the causes of resource loss including forests,
water, land, and minerals. These movements
are likely to increase with the sale or leasing of
farming land to private or foreign government-
sponsored acquisition. This has also led to
new international efforts to protect land. The
most notable group is the International Land
Coalition, which is a global alliance of civil
society and intergovernmental organizations
to promote and secure equitable access to and
control over land for poor women and men
through advocacy, dialogue, knowledge shar-
ing, and capacity building. Through the web
they indeed organize globally (International
Land Coalition 2012).

There is another, longer, historical tradition
of social movements which seeks to know if
peasant movements can be revolutionary or
not. In the African contexts, one can ask how
and in what ways did social movements around
land contribute to anticolonial struggles, and
how and if they contributed to revolutionary
movements which aimed not just at over-
throwing the political rulers but sought eco-
nomic transformation. Independence move-
ments which relied on rural populations, often
glossed as peasants utilizing Mao’s classifica-
tion (Mao Zedong 1965) included the Partido
Africano da Independência da Guiné Cabo
Verde (PAIGC) in Guinea-Bissau and Frente
de Libertação de Moçambique (FRELIMO) in
Mozambique (Cabral 1969; Davidson 1981;
Mondlane 1983). A partial reworking of this
analysis forms the basis of Moyo and Yeros’
book (2005) on rural movements, which seeks
to link theories of resurgence of rural move-
ments in Africa, Asia, and Latin America. The
African examples they cite are Ghana, Malawi,
South Africa, and Zimbabwe. The only two
land movements that are actually discussed
in relation to the more general issues around
land alienation are the Zimbabwe National
War Veterans Liberation Committee and the
Landless People’s Movement in South Africa.

In the name of independence and revolution,
Zimbabwe and South Africa have chosen to
respond to the demand for land in very different
ways. In Zimbabwe the contrast in perspectives
couldn’t be greater. Moyo and Yeros argue that
the most important land reform since the end
of the cold war has taken place. They contend
that the social base for land occupations was
that of the rural semi-proletariat across gen-
der and ethnonational cleavages (2005: 189).
This “movement” was organized and led by
the war veterans’ association. The outcome has
been the removal of most white farm owners
from their farms, and the loss of employment,
homes, and schools for large numbers of farm-
workers, variously estimated between 150 000
and 300 000. Moyo and Yeros conclude that
the farmworkers were caught between sup-
porting landowners who were defending their
jobs or joining in with the land occupations in the hope that they would gain access to land. Debate around what happened to the farmworkers is essential in understanding the dynamics of how land was taken from white farmers and if the war veterans’ organization can be understood as a social movement or as an important vehicle for the implementation of the ruling party’s political program. Zimbabwean political scientist Sachikonye (2011) views the farm occupations as part of a strategy of coercive accumulation. In my view, the land expropriations were based on rewards to political followers, prevention of farmworkers and owners from voting in the 2000 parliamentary elections, greed, and corruption. Following the expropriation of farmland, Zimbabwe’s economy continued its fall and there was no ongoing national social movement to sustain land reform. Government imposed its two-tier program: A1, villagized, small-scale farms, and A2, or commercial farms combined with an unknown number of farms given intact to members of cabinet, the military, Supreme Court judges, and other powerful individuals with no accountability to maintain farm infrastructure or production. Debating the strengths and weaknesses of Zimbabwe’s land reform has intensified with the study by Scoones and colleagues (2010). While detailing successes by A1 farmers in the Masvingo Province, they ignore the violence, the dispossession, and the overall economic decline of Zimbabwe and do not provide evidence for a coherent land-based social movement.

Despite South Africa’s profoundly unequal division of land between whites and blacks, the absence of land-based social movements has been striking. This has not been for the lack of effort. Sihlongonyane (2005) describes and analyzes the efforts begun by the Programme for Land and Agrarian Studies (PLAAS) and the National Land Committee (NLC). In a series of efforts, the NLC and other land-focused organizations produced a Rural People’s Charter and Rural Development Policy Framework and Implementation Plan (RDI). These were to lay the groundwork for growing a social movement. Meeting in Bloemfontein in 1999, approximately 600 rural communities adopted it. However, the unexpected rise of the Landless People’s Movement (LPM), which sought to discredit the NLC and other land NGOs, and to push hard for land occupations, led to the unraveling of the national movement. According to Greenberg (2004), “the artificial, top-down character of the RDI, resting as it did on passive communities led by professional NGOs, led to its immediate collapse once funding for the big gathering in Bloemfontein was finished.” The creation of the LPM was founded on the basis that the land NGOs and the NLC were too close to government, too professional, too technocratic and, by implication, too white. In attempting to create a new oppositional movement to government and to the NLC, the LPM was unable to garner the support, resources, and broad leadership to be effective. In South Africa, the most dynamic responses to evictions come from urban activists, not from rural ones. Abahlali BaseMjondolo, Shack Dwellers, also known as AbM or the red shirts, is a new shack dwellers’ movement known for its campaigning for public housing. It is in alliance with the LPM in the Poor People’s Alliance. The Poor People’s Alliance refuses electoral politics under the banner No Land! No House! No Vote! Social movements around landlessness will be far more urban or periurban than rural in South Africa. For example, the case of Bokfontein blends farmland and urban and rural expansion. The residents of this community were evicted from nearby farms in Hartbeesfontein Dam in Northwest Province in 2005 to make room for commercial “development.” They were moved on to a farm known as Bokfontein. After only four years, the landowner wanted to sell the land to build expensive homes from which he would make millions. He said he would buy the community land nearby and the people were moved, forcibly, onto this new land which had no roads, toilets, or access to water. In August 2006 a neighboring community was forcibly removed by the municipality (local authorities) because its land was earmarked for low-cost housing. They were moved
in next to the first community in Bokfontein. The two communities became hostile to each other, creating no-go areas, but activists brought them together to force government authorities to provide services and jobs. Most of the services like education, electricity, water supply, and housing have been absent. This particular community used lobbying rather than violence to get their service delivery needs met.

Another set of land social movements have been established by women (Tripp 2004). These movements tend to be around issues of landownership, access, and inheritance. They do not occupy the land as a social movement tactic, but use a combination of tactics including lobbying, court cases, and demonstrations. They make their case for equality based upon three related grounds. First, the Convention on the Elimination of All Forms of Discrimination against Women, which most African nations have signed, which contains provisions which require states parties to modify social and cultural patterns which contain direct or indirect discrimination against women and to eliminate practices based on stereotyped roles for the sexes. Second, it is argued that the lack of landownership by women slows down development and contributes to poverty. Women would invest and improve agricultural practices more if they had security of tenure. Lastly, women should have the right to co-own land with their husbands as compensation for their labor in the fields, home, and caring for household members.

land movements in africa

The Landless Workers Movement (Movimento dos Trabalhadores Rurais sem Terra, or MST), for many years the largest and most active social movement in Brazil, organizes unemployed and landless farmworkers to take over idle, absentee-owned farmland. It challenges landowners and authorities and agitates for a broad agrarian reform. It grew out of land occupations beginning in 1978 in Brazil’s southernmost state of Rio Grande do Sul, led by activists from the Catholic Church’s Christian base communities and some Protestant churches under the inspiration of liberation theology. The movement was formally founded in 1984 near the end of a 21-year military dictatorship. It acts nationwide in a huge country with a great variety of local social, economic, and agricultural conditions, so its practice varies from place to place. Typically, however, the movement’s collective action can be described in three phases: occupation, camp, and settlement.

**Occupation.** Brazilian law provides that agricultural land that is not being farmed productively can be expropriated and redistributed to those who will farm it. Brazil’s vast size, unequal land distribution, rural poverty, and oligarchic domination assure that there is ample idle land and a large number of poor rural people seeking to work it. But the state does not typically initiate expropriation of eligible farmland. Instead, it only responds to direct action.

Though there are several competing occupation movements, the MST is by far the largest. It targets a property that appears to meet the criteria for expropriation, either because it is not being farmed productively or because the owner’s title is fraudulent; it also occupies public land. The movement recruits occupiers from among the rural (and sometimes the urban) poor. Several hundred families enter the targeted property at night and set up makeshift housing. They then seek to get the property expropriated. Joining a land occupation entails a high commitment, as occupiers leave their entire life behind and face discomfort and repression for a payoff that is uncertain and at best distant.

The occupation of a privately owned farm sets in motion a process of conflict among several parties: the occupiers, the landowner (and possibly allies on both sides), and various governmental authorities, including police, courts, and the federal agrarian reform bureaucracy. Typically, the landowner goes to court to get the occupiers evicted. An eviction may be peaceful or violent depending on negotiations between the occupiers and the police (Hammond 2009).

**Camp.** Evicted occupiers may be resettled on a different property, either state owned or already expropriated for agrarian reform. More often they erect a camp (acampamento) of shanties or tents nearby and wait for a decision on expropriation; if the camp is on public property they are usually safe from another eviction. The rural landscape is marked with dense groups of tiny shacks covered in black plastic where land occupiers are waiting it out. Expropriation usually requires a long legal process. Living in the camp for months or even years, occupiers undergo an intense process of politicization and discipline.

**Settlement.** If they win, the payoff is high: they get the property, create a settlement (assentamento), and farm the land, usually by some combination of individual and collective production. Successful settlements provide families a very good living compared to the rural poverty from which they come. Some even diversify production and sell their farm goods to multinational corporations to be marketed under nationwide brand names.
Weaker settlements struggle to survive or are abandoned. The settlers create not only a farm enterprise but a community. They build houses, supported by government credit. The movement establishes schools in its camps and settlements. The MST gives high priority to educating the settlers—who are generally poorly educated and often illiterate—and their children. The settlements provide work for men and women, and contribute to the movement’s national mobilizations. Though occupations are organized locally, the MST has a national presence. From its founding it has followed a militant strategy emphasizing the extralegal tactic of occupation to force expropriation and disruptive demonstrations in towns, cities, and the capital, Brasilia, rather than relying on more moderate, institutional forms of political pressure (Hammond 1999; Fernandes 2005). In many areas of the country police and privately organized goon squads have conducted violent raids on settlements. But the MST also takes full advantage of opportunities in institutional politics, most importantly to get land expropriated and win legal title, as well as enjoying government benefits like agricultural credit. The movement promotes a maximal program: each expropriation is viewed as a step toward a general agrarian reform of all latifundios (large agricultural property usually worked by seasonal wage labor) and, in the long run, socialism (Wright & Wolford 2003: 315–330). It is the most active land reform movement in Latin America and one of the leading national organizations behind Via Campesina, the international peasant movement.

Its practices are derived from Leninist and Christian base community principles, combining democratic centralism (Harnecker 2002: 271) and grassroots assemblies. Some have claimed that the MST organization is very democratic (Veltmeyer & Petras 2002), while others argue that it is highly authoritarian (Navarro 2007). According to Branford and Rocha (2002: 121), the MST has strong national leaders but the bases have a voice and relative autonomy.

That a rural movement in today’s Brazil can maintain a high level of mobilization and be (relatively) successful at winning land must be counted as surprising. The country is heavily urban, with a capital-intensive and highly productive agricultural sector that drives poor peasants off the land; though redemocratization spawned a vigorous wave of popular mobilization after years of repression, moreover, the cycle of protest soon peaked for urban movements, many of which—notably the women’s and community health movements—were co-opted into nongovernmental organizations implementing government policies. The MST, on the other hand, has maintained an independent, militant posture. Nor has it become too closely identified with the institutional left; though it supports Workers Party (PT) candidates and sometimes runs its own candidates on the PT ticket (and occasionally other parties’ tickets) for local office and parliament, it was highly critical of President Lula for reneging on the Workers Party’s historical commitment to agrarian reform and favoring large-scale agribusiness instead.

The fact that the MST stays mobilized despite fluctuations in governmental response can be attributed in part to its offering participants a chance at a valuable selective incentive in successful land occupations (Ondetti 2008: 226–227), and in part to the fact that the settlements have become vibrant communities that provide a base for ongoing politicization and mobilization of participants. The MST cultivates identification and commitment through political education and solidarity rituals such as artistic performances.

REFERENCES AND SUGGESTED READINGS

Vladymir Ilyich Ylianov (Lenin), the Russian revolutionary, is generally regarded as the founder of the Bolshevik social movement and the creator of the USSR. He realized Marx and Engels’ dream of a socialist revolution that would bring down capitalism and replace it with socialism – a society based, ideally, on the dictatorship of the proletariat, public property, and a centrally planned economy, with greater equality and social justice for working-class people. Despite the collapse of the USSR and the subsequent collapse of Soviet socialism in the 1990s, many Russians, especially those of 55 years and older, and those aged 18–21, view Lenin’s role in Russian history more positively (Ktdflf - wtynh 2011). Lenin’s cremated body remains in his mausoleum on Red Square, and Russian society is divided over its removal and burial according to the Christian Orthodox tradition.

Lenin was born on April 22, 1870 in Symbirsk (in the Soviet period renamed Ylianovsk), the provincial capital on the Volga River, into a family of the Russian educational intelligentsia. Upon graduation from his gymnasium with honors, he matriculated in the faculty of jurisprudence at Kazan University. His family came into the public eye after the execution of his older brother, Alexander, for participation in the attempted murder plot of Czar Alexander III by a small group of terrorist-revolutionaries. In response to his brother's execution, Lenin shouted the famous phrase, “We'll follow a different path!” He participated in student protests against samoderzhavia (Russian absolutism), for which he was arrested, expelled from university, and exiled. In exile, he became interested in Marx and Engels' revolutionary ideas. Marxism led him to pursue a “different path,” one based on an organized working-class social movement headed by its vanguard, the Communist Party. In 1895, Lenin became a founding member of the Union of the Struggle for the Emancipation of the Working Class. In 1903, at the Second Congress of the Russian Social Democratic Working Class Party, Lenin became a leader of the Bolshevik faction, which seized power in the 1917 revolution. After the 1917 revolution, Lenin headed the Soviet government. In 1918, he survived an assassination. Under his leadership, Soviet Russia emerged victorious in World War I and the civil war of 1918–1924. In 1921, he orchestrated a politico-economic paradigm shift from war communism to the new economic policy (NEP), which quickly restored the Russian economy. Lenin’s death on January 21, 1924 prevented him from overseeing the overwhelming success of NEP and resulted in its disruption by Stalinism (Volkogonov 1994).

Lenin became the most prominent Marxist and, according to Soviet officialdom, transformed Marxism into Marxism-Leninism. His portrait appeared next to Marx and Engels on communist red banners worldwide and at congresses of the Third International. The Leninist part of Marxism-Leninism was compiled during the Soviet era in over 50 volumes of his philosophical, political, economic, and sociological essays, monographs, articles, notes, and letters. Lenin’s major works include: The Development of Capitalism in Russia; What Is to be Done; One Step Forward and Two Steps Back; Who are the Friends of the People and How They Fight against Social Democrats; Imperialism, the Highest Stage of Capitalism; The State and Revolution; The Vital Tasks of the Soviet Power; Left-wing Communism: An Infantile Disorder; Materialism and Empiriocriticism; and Philosophical Notebooks. As Molotov, one of Lenin and Stalin’s interpreters, put it, “In every work by Lenin there is undermining of imperialism” (Ilyen 1991: 5).
Lenin’s contribution to social movement history and studies is manifold. The hard core of his sociopolitical doctrine constitutes class analysis and the construction of a class-based social movement of industrial workers. In his writings, especially in A Great Beginning: How to Organize Competition?, classes combine distinct economic, social, legal, and political features (Lenin 1978a). As economic phenomena, classes are determined by their relations to the forces of production, more specifically whether they own means of production and constitute the haves, the bourgeoisie-capitalists-exploiters, or own the labor power that throws them into the category of the have-nots, that is, laborers-proletarians-exploited. From a sociological point of view, classes are determined by their position in the social division of labor, which is distinct from technical–technological division into professional strata. The modern industrial society is divided into two major social classes of capitalists-employers and proletarians-employees, with capitalists appropriating and exploiting the labor of the proletarians. From a legal standpoint, Lenin argues, classes have a different “presence” in the construction of legal rights. In the bourgeoisie legal code, as Marx unveiled, the owners of the means of production appropriate surplus value produced by laborers-proletarians due to a legal trick, designed by capitalist-bought lawyers and legislated by capitalist-sponsored elected officials. The trick is concluded in the fictitious metamorphosis of “surplus value” – which is produced, as Marx discovered in Capital, by proletarians – into the so-called profit from private business activities managed and, therefore, owned by capitalists. This trick covers the secret of capitalist accumulation, exploitation, and injustice. Consequently, the first task of the communist vanguard is to unveil, through education, this bourgeois trick to the working people. The second task is to facilitate and lead the class struggle of proletarians that culminates in the socialist revolution. The socialist revolution not only establishes worker control over means of production (factories, plants, financial institutions) and provides universal employment, but also gives back, in the name of social justice and democracy, the surplus value to its producers, working people, in the form of real wages and pensions, on the one side, and free-of-charge housing, socialized healthcare, and public education, on the other. From a political standpoint, classes participate differently in the political process with capitalists included in, and proletarians excluded from, political organization and the policymaking process. In sum, classes appear in Lenin’s works as the distinct sum total of economic, social, legal, and political relations (Маркс, Ленин 1984).

Lenin’s famous motto, “Give us the organization of revolutionaries and we will turn around Russia,” outlines what is to be done to make the socialist revolution (Lenin 1969a). Lenin’s organizational theory revolves around two paradigmatic ideas: distinct membership structure and democratic centralism. At the Second Party Congress of 1903, which approved the Communist Party’s charter and program, Lenin argued that party members must formally join and register with one of the primary party organizations, follow the Party’s program and statute, participate in the activities of primary organizations, and be bound by party discipline. Lenin’s opponents viewed his membership concept as too strict and suggested a milder concept of membership based on support of, and participation in, the Party’s activities, but without formal registration with primary organizations and bondage to the Party’s program, statute, and discipline. Eventually, Lenin’s membership concept prevailed and scored the majority of votes, turning Lenin and his supporters into Bolsheviks, and his opponents, the supporters of the milder definition of membership, into the minority called the Mensheviks. Also, Lenin advanced the concept of democratic centralism, which meant: (1) collective decision making, (2) election of all party organs and officials from the bottom to the top, and (3) subordination of the lower party organizations to the higher elected organs. Both concepts of strict membership
and democratic centralism required full devotion and subordination of the individual to the party’s collective identity in the name of solidarity and efficiency of collective actions (Lenin 1980). Lenin’s opponents discovered in his organizational doctrine the totalitarian nature of Bolshevism and the Soviet state, while his supporters consider Lenin’s organizational theory as an efficient vehicle of building up a vanguard of the working-class movement capable to withstand and overcome the oppressions of the highly centralized capitalist state machine, with its secret police and military, its overarching surveillance, and oppressive legal code.

The concluding part of Lenin’s sociopolitical doctrine is made up of the revolutionary strategy and tactics of the working-class movement and their adjustment to the dynamic capitalist socioeconomic settings defined in terms of the political opportunity structure for socialist revolution. It is composed of theories of imperialism, revolutionary situation, and socialist revolution, and of class struggle paradigm shifts. Imperialism, according to Lenin, represents the highest and the last stage of capitalism, realized in its self-destructing tendency toward political and economic monopolies, volatility of financial markets, economic crises, and wars for the redistribution of sources of exploitation and surplus value (Lenin 1978b). The wars, like World War I, become an inevitable feature of capitalism, which exhaust its economic, financial, and human resources and bring it to the verge of collapse and the emergence of a revolutionary situation – the necessary precondition for the socialist revolution. The revolutionary situation, as Lenin states in the Collapse of the Second International, becomes evident in: (1) deep and overarching economic crises, depression, and recessions; (2) the people’s impoverishment; (3) the ruling capitalist clique’s inability to govern; and (4) the unwillingness of the lower classes – workers, peasantry, and soldiers – to live in the old way (Lenin 1969b). The revolutionary situation happens rarely and “ordains” the working class and its vanguard with a unique, once in a lifetime, opportunity for state power seizure. The Party must be fully prepared for that historic moment and act in unison and decisively. To be “fully prepared” meant, for Lenin, (1) to make an ideological and political paradigm shift from parliamentary work, demonstration, and street protests to the military power seizure; (2) to develop the party’s strongholds in the military and have militant mobile squads, like the Red Guard, in working-class communities to be deployed for the seizure of strategic infrastructures; and (3) to mobilize all primary party organizations for the quick takeover of the state machine, especially the executive branch, military command centers, police, and financial institutions. Upon power seizure, Lenin vowed to establish the dictatorship of proletariat and its vanguard party in place of the collapsed or dismantled old political institutions, accompanied by concrete measures meeting the vital demands of the lower classes (Lenin 1975). In the 1917 revolution, those measures included immediate distribution of land to peasants, establishment of workers’ control over industry and an eight-hour working day, a peace treaty with Germany, and promotion of social equality and justice – all implemented in the first decrees of Soviet power (Wade & Cummins 1991). These decrees secured the support of the working class, soldiers, and poorest peasants, who became major defenders of the revolution. Lenin rapidly instituted – on the basis of the soviets, self-governing and organizing bodies, founded and elected by spontaneous workers’ revolutionary initiative – the new socialist government. Also, he built up the Red Army and established a security and law enforcement apparatus. Methods of terror and exile, as well as military defeat of the Whites (the broad resistance, including military, to the soviets during 1918–1924), brought down the opposition and created the political stability needed for economic reforms. That reform came in the form of the NEP, which promoted a mixed economy, combining elements of the centrally planned and market
economy, state and privately owned enterprises, including joint ventures with foreign capital.

In the 1990s, a growing number of Russian historians portrayed Lenin, in line with Soviet-era dissidents and human rights activists, as a murderer and organizer of a state terror against its people. Those evaluations overshadowed the words of Einstein, Bertrand Russell, and George Bernard Shaw, praising Lenin — although disagreeing with some of his methods — for his fight for social justice, for his creative mind, and his extraordinary leadership. The Communist Party of the Russian Federation (KPRF), the successor to the collapsed CPSU and Lenin’s ideas, constitutes the second largest faction in the State Duma. KPRF is largely viewed as the only oppositional faction to the reigning pro-Kremlin United Russia Party and its mingling with the Kremlin Justice Russia Party and misnamed nationalist Liberal-Democratic Party. Lenin tends to be forgotten in times of capitalist economic expansion and remembered in times of depressions and recessions. His paradigm shifts and ideas, especially that of the NEP, helped lay the theoretical and pragmatic foundations for communist China’s contemporary triumphant economic reforms, paving the way, according to Валуев (2010), for the possible revival of Leninism in the twenty-first century, after its stunning defeat at the end of the twentieth century, which culminated in the collapse of socialism in the USSR and the USSR itself.

Liberation theology/base communities (South America)
 ROBERT SEAN MACKIN

Liberation theology is a radical, predominately Catholic movement of theologians, bishops, priests, nuns, and laity that emerged in the 1960s and 1970s across Latin America. Bishops, gathering in regional conferences, called for the church to abandon long-standing alliances with the rich and powerful and instead take the side of the poor and oppressed. Theologians, who wrote books and presented papers using Marxian concepts, put forward a new way of doing theology – from the perspective of the poor. It was the poor, gathering in small groups to discuss the Bible, known as base ecclesial communities (CEBs), which offered a new interpretation of scripture based on their experiences, leading to unprecedented grassroots activism. In the 1970s and 1980s CEB members were actively involved in revolutionary movements in Nicaragua and El Salvador, and in other parts of Latin America they played important roles in democratization movements.

The turning point for the liberation theology movement occurred at the second meeting of the Catholic Latin American Episcopal Conference (CELAM) at Medellín, Colombia, in 1968 (Smith 1991). The objective of the meeting was to apply the conclusions of the Second Vatican Council (1962–1965) to Latin America. Three conclusions of the conference set the agenda for the movement over the next several years. First, the Latin American church committed itself to the plight of the poor and oppressed seen in the notion of making a “preferential option for the poor.” Second, the bishops suggested the best way for the church to be in solidarity with the poor was to promote the base ecclesial communities (CEBs), which had been experimented with, first in Brazil and Panama, and later in Chile and Mexico. Third, the bishops argued – clearly inspired by dependency theory – that Latin America’s structural dependence on more developed countries resulted in “a sinful situation” whereby inhabitants of the developed countries became wealthier while the poor of Latin America struggled to survive.

One of the foundational texts of the movement, A Theology of Liberation (1973), was written by a young Peruvian priest, father Gustavo Gutiérrez, one of a number of liberationists who assisted the Latin American bishops with the composition of the key texts of Medellin. He made three key contributions. First, he outlined a new way of doing theology which emphasized “praxis,” defined as “actively living one’s faith” (McGovern 1989: 32). The concept of “praxis” has Marxian roots; however, it was also inspired by father Joseph Cardijn’s “see-judge-act” methodology, first used among the Young Catholic Workers of Belgium in the 1920s. Second, Gutiérrez emphasized liberation as a core theme of the Bible, drawing especially on the Book of Exodus which “showed God acting in history through a political action, which liberated the people from misery and oppression in Egypt, formed them as a people, and led to the construction of a new and more just society” (McGovern 1989: 10, emphasis in original). Third, he argued the church could not be neutral; this would help sustain an unjust status quo. He noted: “In our times and on our continent, to be in solidarity with the ‘poor’... means to run personal risks – even to put one’s life in danger” (Gutiérrez 1973: 301).

Liberation theology offered a radical critique of society and called the Catholic church to take a new role, one that was on the side of the poor and the oppressed. Opponents quickly mobilized a countermovement. Once elected general secretary of CELAM in 1972, Archbishop (and later Cardinal) López Trujillo...
of Colombia sought to limit the influence of liberation theology by removing progressives from key posts in CELAM (Smith 1991).

By the time of the third CELAM meeting in Puebla, Mexico, in 1979, many expected the conservatives and the newly installed pope John Paul II to distance the church from the radical conclusions of Medellín. But, in a surprising move, John Paul II endorsed CEBs in an address to the Puebla conference. Soon thereafter the bishops who gathered affirmed many of the core conclusions of Medellín, including that the church should make a “preferential option for the poor.” This, however, did not settle the status of liberation theology in the church.

In 1984 Cardinal Joseph Ratzinger, head of the Vatican’s Congregation for the Doctrine of the Faith, issued an “Instruction on Certain Aspects of the Theology of Liberation.” While acknowledging liberation as a legitimate topic for theologians, Ratzinger criticized three aspects of what he called “certain forms” of liberation theology which, he argued: (1) reduced faith to politics; (2) uncritically adopted Marxism; and (3) attacked authority in the church. Liberationists sought to downplay the chilling effect of the “Instruction,” noting that Ratzinger did not identify any individual theologian by name and that, in general, their ideas were consistent with those outlined by Ratzinger (McGovern 1989). For one thing, Gutiérrez had clearly indicated in his early writings that liberation was a complex process and should be understood at three interdependent levels: “at a socio-political level, as the full development of human persons, and, lastly, as liberation from sin” (Gutiérrez 1973; McGovern 1989: 224).

Much of the scholarly research on liberation theology has sought to explain the variability in liberation theology’s strength. Brazil, which emerged as a leading progressive church in the 1960s, has received extensive treatment. Mainwaring (1986) argues that the repression of the church by the military government which seized power from President João Goulart in 1964 was a crucial factor explaining the radicalization of the Brazilian church. Adriance (1986) explores how activists and priests from Catholic Action and Specialized Catholic Action movements, such as the Young Catholic Workers, played pioneering roles in the progressive Catholic movements of the 1960s and 1970s.

Liberation theology has influenced Christians beyond Latin America. In the US, liberation theology inspired black and feminist liberation theology as well as the Central American solidarity movement of the 1980s. Elsewhere, liberation theology’s presence can be seen among Christians in India, the Philippines, Africa, and Europe (Smith 1991). And it continues to inspire a new generation of theologians (Petrella 2005). Ironically, this third world movement has even influenced Catholic social doctrine, seen in Pope John Paul II’s analysis of “structures of sin” and the legitimacy of “struggle” for change (McGovern 1989: 224).

Lukang anti-DuPont movement (Taiwan)

MING-SHO HO

Originating as a seaport in the eighteenth century, Lukang is a commercial city and center of religious worship in central Taiwan (DeGlopper 1995). In March 1986, local residents launched a movement against the multinational DuPont company’s project to set up a titanium dioxide plant. The investment was welcomed by government officials and viewed as a major boost to stimulate the economy out of a recent recession; however Lukang residents, who knew of the 1984 Bhopal tragedy in India, were worried about the toxic hazard posed by another American chemical company. Under the leadership of a newly elected city mayor, who ran on an anti-DuPont stance, opponents organized the Changhua County Nuisance Prevention Association and staged a series of protests, including a local demonstration and a petition, in front of the presidential house in Taipei, which was unprecedented because Taiwan was still under the rule of martial law, which prohibited unauthorized mass gatherings. Despite the media campaign to showcase its safety commitment as well as an invited tour for local politicians to visit its US facilities, DuPont failed to win the confidence of the people of Lukang. In March 1987, the company announced the decision to suspend this controversial project. Upon receiving the news, Lukang people celebrated their victory by staging a religious festival to express their gratitude to their patron goddess, Mazu. Two years later, DuPont finally established their delayed plant in northern Taiwan (Reardon-Anderson 1992).

In hindsight, the Lukang protest played a critical role in the history of Taiwan’s social movements. Though not the first incident of anti-pollution protest, the unexpected victory of a small town over an American chemical giant enhanced the morale of Taiwan’s nascent environmentalism, which only began to flourish after the lifting of martial law in July 1987 (Ho forthcoming). Later, many Lukang activists participated in a number of environmental protests all over Taiwan, and thus were instrumental in spreading the technique of grassroots mobilization. Nien Hsi-lin, a former schoolteacher, was the chief architect of the Lukang movement, which in turn propelled him into an uninterrupted career of activism for more than two decades. Basically, the Lukang success consisted in the skillful mobilization of local identity to frame the industrial investment as a threat to the traditional way of life. Local identity became a powerful weapon because the Kuomintang regime had sought to eradicate indigenous culture and history in the name of Chinese nationalism. In addition, folk religion in the form of communal worship of a patron deity was also politically suppressed for the sake of modernization. Since the local resentment against these attempts of state control was endemic, the movement leaders were able to use the famous slogan “I love Lukang and don’t want DuPont” to secure broad-based participation by merchants, fishermen, and temple organizations. In other words, community solidarity expressed in religious rituals was highlighted in the struggle against a potential polluter, and this pattern of community mobilization was constantly repeated in the subsequent environmental protests in Taiwan (Ho 2005a).

The Lukang activists were also assisted by external allies. Though the Kuomintang still exercised strong censorship on the media at that time, the Lukang story was largely reported in a positive fashion, thanks to a number of environment-conscious journalists who also acted as informal consultants. Liberal college professors wrote sympathetic op-ed articles to urge moderation on the part of the government.
Due to the high visibility of the DuPont project, the embryonic student movement broke loose from the confines of the college campus. During the 1986 summer vacation, a contingent of National Taiwan University students conducted a field investigation, and later published their findings to emphasize the prevalent local fear of toxic threat. Prior to the Lukang movement, Taiwan’s environmentalism was mainly restricted to middle-class professionals whose effort was concentrated on educating the public and officials. Afterwards, journalists and professors were emboldened to work with the grassroots. The Taiwan Environmental Protection Union, organized at the end of 1987, was the product of this cross-class collaboration.

The Lukang movement also brought about political reverberations. At the end of 1986, political opposition organized the Democratic Progressive Party (DPP) for the Legislative Yuan election. The Lukang dispute convinced the opposition leaders that they could challenge the Kuomintang effectively on environmental issues. The fact that a DPP candidate, who capitalized on the anti-DuPont sentiment, scored a landslide in Lukang seemed to confirm this strategy. The young opposition party adopted a pro-environment platform which included the famous anti-nuclear clause. Since then, the political alliance between environmentalists and the DPP has been formed (Ho 2003) and persisted until the latter came into power in 2000 (Ho 2005b). Alerted by the widespread support for Lukang and DuPont’s retreat, the Kuomintang government also stepped up the modernization of environmental administration. The cabinet-level Environmental Protection Agency was set up in August 1987, in a gesture to regain public confidence.

Mandate of Heaven (China)

DINGXIN ZHAO

After conquering the Shang dynasty (circa 1600–1045 BCE), the rulers of the Western Zhou dynasty (circa 1045–771 BCE) claimed that they were able to come to power because Heaven had taken away the mandate of ruling China from the bad Shang king and passed it onto the virtuous Western Zhou rulers. The concept of “Mandate of Heaven” was created for a clear propaganda purpose, in part to suppress the resistance of the conquered population. Yet the lessons that the Western Zhou rulers learned from the demise of the mighty Shang state also compelled them to use the same message to educate their own people on the importance of being a good ruler. For instance, in an early Western Zhou document, it is stated that: “We should use the people instead of water as mirrors. Now that the Shang rulers have lost their mandate bestowed from Heaven, why should not we treat history as mirror and learn a hard lesson from the demise of the Shang state?” (Book of Documents 1980: ch. Jiugao). A similar message appeared in another document: “It is all contingent upon human conduct whether or not mistakes and evils will occur … Heaven cannot be trusted. Heaven will not take away the mandate that King Wen had received if only we carry on his virtuous conduct” (Book of Documents 1980: ch. Junshi). The Western Zhou rulers saw the heavenly mandate as precarious and believed that the only way to hold on to it was by governing well. In other words, while the Western Zhou rulers propagated the Mandate of Heaven concept, it was right conduct that they actually emphasized. This way of thinking later entered the teachings of Confucius and his followers during the Spring and Autumn (770–481 BCE) and Warring States (480–221 BCE) eras, and gradually became the single most important political concept in Chinese history.

The key to the Mandate of Heaven concept is the notion that rulers are able to influence Heaven’s will by good conduct, and when Heaven is unhappy about a particular ruler, it will send messages to the ruler in the form of natural disasters. Therefore, drought, flood, earthquakes, epidemics, and so on were all regarded in premodern China as messages from Heaven or even as signs that a state had lost its mandate. This encouraged rulers to work hard and also inspired countless peasant rebellions throughout Chinese history. While most rebellions were repressed, the idea of rising to rebel against an unfit ruler had a legitimate status in Chinese political culture. The Chinese were always ready to accept any one of the successful rebel leaders as the new ruler of China regardless of his original social status and ethnicity. In short, while premodern states in other civilizations tended to derive their legitimacy from traditional and divine sources, the legitimacy of the premodern Chinese state always had a strong performance dimension due to the centrality of the Mandate of Heaven concept.

In today’s China, while the mystic aspect of the Mandate of Heaven concept has gradually faded away, legitimation though good performance, the Mandate of Heaven concept’s most crucial legacy, still figures importantly in political life. After the 1980s, when most Chinese no longer believed in communism, the Chinese government had to increasingly rely on performance to boost its otherwise failing legitimacy. This has compelled Chinese leaders to work hard, which is a major reason behind China’s current economic success. Yet performance legitimacy is intrinsically unstable because it carries concrete promises from the governing to the governed, and is doomed to trigger political crises when they are not fulfilled. This problem is especially profound for the modern state because the modern state is development, rather than maintenance, oriented, and thus has a tendency to promise too much. Many of
the social protests, riots, and demonstrations in today’s China, from their styles of discourses, their repertoire of actions, to their patterns of interaction with the state, are shaped by the nature of the current Chinese regime, in particular its excessive reliance on performance as the basis of state legitimacy (Zhao 2009).

Mandela, Nelson (1918–)
INEKE VAN KESSEL

As one of the leaders of the resistance against apartheid in South Africa, Nelson Mandela constructed and lived different images of himself over the years to suit his various audiences at home and abroad. His roles included those of youth activist, volunteer-in-chief in campaigns of civil disobedience, lawyer, defendant, and prisoner, leader of the African National Congress (ANC), commander-in-chief of the ANC’s armed wing Umkhonto we Sizwe (MK), the world’s most famous political prisoner, president of South Africa (1994–1999), elder statesman, as well as that of universal icon in the struggle for justice and reconciliation.

However, Mandela’s opponents portrayed him differently, with the South African government framing him as a terrorist and a communist. The label “terrorist” was also used by the US government, which placed Mandela and other leading ANC members on a list of “terrorists” who were barred from entering the country unless a waiver was granted by the US secretary of state. Mandela’s name was finally removed from this list in July 2008, just before his 90th birthday.

Nelson Rolihlahla Mandela was born on July 18, 1918 in Mvezo, a village in the Transkei, which was then part of Cape Province. His father, Gadla Henry Mphakanyiswa, was chief of Mvezo as well as a privy councilor to the king of the Thembu, one of the Xhosa-speaking peoples in South Africa. After his father’s death, Mandela joined the household of the regent of the Thembu, Jongintaba Dalindyebo. As a ward of the royal house and a student at a Methodist boarding school, Mandela acquired qualities that would help him in his later life, notably discipline, self-control, a gentlemanly courteousness, as well as a certain aloofness. His aristocratic roots became an important building block in the construction of Mandela’s image as a born leader.

To escape from an arranged marriage, in 1941 Mandela traveled to Johannesburg where he met Walter Sisulu, a real estate agent and political activist who introduced him to a law firm where he started to work as an articled clerk. Sisulu also introduced Mandela to the ANC and to prominent members of the South African Communist Party (SACP) who provided him with Marxist literature. To encourage the ANC to adopt a greater militancy, Anton Lembede, A.P Mda, Oliver Tambo, Sisulu, and Mandela founded the ANC Youth League in 1944 and within five years it had acquired a majority on the ANC National Executive (NEC).

In 1950 Mandela was elected chairman of the ANC Youth League and joined the ANC NEC. At this time, he was a black nationalist firebrand who insisted that the ANC only participate in campaigns that were led and initiated by Africans. Fearing that the communists and activists in the South African Indian Congress would dominate resistance politics, he rejected alliances and disrupted communist meetings from time to time.

Mandela qualified as a lawyer in 1952 and in the same year was elected vice chairman of the ANC under the chairmanship of Chief Albert Luthuli. His first major involvement in mass protest was as volunteer-in-chief during the Defiance Campaign, a nonviolent campaign of civil disobedience against unjust laws, such as the segregation of public amenities.

After the proclamation of the Freedom Charter in 1955, Mandela was arrested and charged with high treason, along with 156 codefendants. All were acquitted in 1961, but by then the ANC had become a banned organization. As had been agreed beforehand, Mandela went underground while Tambo fled the country to establish the ANC in exile. Believing that nonviolent protest was no longer an option in view...
mandela, nelson (1918–)

of ruthless suppression by the state, Mandela and Sisulu persuaded the ANC leadership to set up an armed wing, Umkhonto we Sizwe (Spear of the Nation), and launch a campaign of sabotage activities. Mandela was appointed as its commander-in-chief.

Mandela spent six months traveling round Africa in 1962 to gather support for the ANC but, shortly after returning to South Africa, he was arrested and sentenced to five years in prison for leaving the country illegally and for leading an illegal strike. After serving only a few months of this sentence, he was taken back to Johannesburg to face charges of sabotage and planning an armed invasion. The police had raided a farmhouse in the Johannesburg suburb of Rivonia that was serving as the headquarters of the now underground ANC, and had confiscated numerous documents, including notes about guerrilla warfare in Mandela’s handwriting. These charges could carry the death penalty but the judge sentenced Mandela and the seven coaccused to life in prison. As in the past, Mandela used the courtroom as a platform to explain his convictions. His statement from the dock, where he expounded his ideals of a “free and democratic society in which all persons live together in harmony and with equal opportunities” is regarded as one of his most effective speeches and it became a master frame for subsequently mobilizing antiapartheid activists.

Seeing their imprisonment on Robben Island as an extension of their antiapartheid struggle, Mandela and his colleagues established a hierarchical structure to organize the ANC prisoners on the island, and insisted that all political prisoners use their time there to further their education. Mandela’s stature grew while in jail, turning him into an international symbol of the antiapartheid struggle. After the ANC-in-exile decided to personalize the campaign for the liberation of political prisoners in 1980, the “Free Nelson Mandela” campaign became a resounding success. To celebrate his 70th birthday in 1988, Hollywood celebrities participated in a pop concert at London’s Wembley Stadium in front of a live audience of 72 000 who sang “Free Nelson Mandela” while an estimated 200 million people watched it broadcast around the world.

After being transferred from Robben Island to a prison near Cape Town, Mandela engaged in secret discussions with minister of justice Kobie Coetsee to lay the groundwork for future negotiations. Nelson Mandela was released from prison on February 11, 1990 after the newly elected president F.W. de Klerk removed the ban on the ANC, the Communist Party, and other antiapartheid organizations. However, before negotiations could start, Mandela had to reassure his following that he had not abandoned his principles and his commitment to the armed struggle. In 1991, Mandela was elected president of the ANC at an ANC conference and he and De Klerk were jointly awarded the Nobel Peace Prize in 1993.

After the general election on April 27, 1994, Nelson Mandela was inaugurated as the first black president of South Africa. The reconciliation of former enemies was one of the main themes of his presidency (1994–1999), efforts that were not inspired by religious convictions but, as his biographer Anthony Sampson pointed out, by the political conviction that winning over individual Afrikaners was the best way of neutralizing their collective potential to undermine the new dispensation (Sampson 1999). The politics of reconciliation lent a moral dimension to Mandela’s charismatic leadership and also added to his international stature as a beacon of moral integrity. As biographer Tom Lodge concluded: “Few Third World insurgencies managed to combine in their leaderships such an effective mixture of guerrilla glamour and reassuring metropolitan respectability” (Lodge 2006: 192).

Mao Zedong (1893–1976)
MARC BLECHER

More than any other political figure in history, Mao Zedong led his state in many ways as if it were still a revolutionary social and political movement. And his leadership did indeed kindle such movements as significant social and political forces, promoting genuine “uninterrupted revolution” even after the establishment of the People’s Republic of China.

Mao was one of the founding members of the Chinese Communist Party (CCP) in 1921. Impatient with the slow pace of development of the labor movement, early on he struck out in an unorthodox direction for a communist by focusing on the countryside – he helped develop an incipient peasant movement in 1925, and became a leader of the Peasant Movement Training Institute. After the Guomindang (Nationalist Party) betrayed its alliance with the CCP in April 1927 by crushing the Shanghai labor movement, Mao set off to rural Hunan to lead the Autumn Harvest Uprising that same year. With its defeat, he led his supporters to the remote Jinggang Mountains to regroup, soon establishing rural governments (“soviets”) that carried out agrarian reforms. Their strength alarmed the Guomindang, which, after four failed military campaigns, finally dislodged them in 1935, sending the CCP retreating on the “Long March.” In 1936, the decimated Party set about reestablishing itself in the remote town of Yan’an. Over the next 13 years it rebuilt the revolutionary movement, this time with considerable support from urban progressives who journeyed there to participate in literacy, production, and political campaigns that exponentially expanded the communist movement’s popular support. This party-led social and political movement was a major contributor to the surprisingly swift victory of the CPP over the Guomindang in 1949.

Several scholarly debates swirl around the question of the Chinese revolution as a social and political movement. Chalmers Johnson (1962) argued that rural support had more to do with anti-Japanese nationalism than class conflict, to which critics responded that he overstated his case and that the two were inextricable (Pepper 2004). Shambaugh (1997) argued that the revolution was mainly a military affair, a position which has not attracted much following, and in any event the party’s military exertions would still have required a great deal of active popular support given the their reliance on guerilla warfare. Finally, the early accounts of the Yan’an movement, based as they were on official documents available in the 1960s, were too positive, and with the emergence of new sources required reevaluation that toned down and balanced but did not fundamentally undermine the argument that a vibrant and important movement led by Mao was a crucial driver of the Chinese Revolution (Selden 1995).

Though 1949 saw Mao became the preeminent leader of the Chinese state, he often continued until his death in 1976 to discharge that role in ways that, extraordinarily, were redolent of the populist, mobilizational impulses he had developed over the previous three decades. Land reform was conducted as a bottom-up affair in which farmers confronted their landlords directly in struggle meetings. Mao encouraged rapid rural collectivization in the mid-1950s, and farmers joined in willingly and often enthusiastically. In 1956, Mao, worried that the Soviet model of command central planning was producing bureaucratic elitist sclerosis, issued a popular call for “a hundred schools of thought [to] contend” in a debate to produce a more dialogical politics of socialism. It worked too well: When popular criticism poured forth challenging socialism itself, Mao joined his colleagues in prosecuting the 1957 Anti-Rightist
Campaign. Yet the very next year Mao’s movement impulses burst forth again as he conceived and promoted the Great Leap Forward, a crash program of economic development grounded in grassroots reorganization (“people’s communes”) as an antidote to command central planning, and relying on popular initiatives (like “backyard steel furnaces”) and voluntaristic labor mobilization. When the Leap produced disastrous economic contraction and a gargantuan famine, Mao was forced to issue a self-criticism and accept a reduced political role, while the economy was restabilized under bureaucratic control in the early 1960s.

Yet those very retrenchments only reignited Mao’s populist impulses. As early as 1965, he issued proclamations evincing concern about a “capitalist road” within the Communist Party, laying the groundwork for nothing less than a renewed bout of popular “class struggle” – this time against party elites. The Cultural Revolution erupted in 1966 as an unprecedented social and political movement in which the supreme leader of a state socialist country called on the masses to attack the state he headed. Once again they responded actively. For the next two years the country was engulfed in turmoil, as ordinary Chinese seized the initiative, attacking their leaders at all levels, from President Liu Shaoqi to grassroots leaders, while also savaging each other. Mao himself was the only one who could restore order, which he did only by dispatching military occupations of institutions across the country.

Mao’s leadership of the People’s Republic of China has, naturally, generated impassioned debates, several of which are germane to the question of social and political movements. Some have questioned the genuineness of Mao’s commitment to movement politics, arguing that he used it mainly as a tool in power struggles at the top (Chang 1975). While elite power politics is undeniable, so is the fact that Mao could have fought in much less mobilizational ways; yet he kept returning to them. Others have questioned the genuineness of popular initiative and support for collectivization, the Hundred Flowers, the Leap, or the Cultural Revolution, pointing out that participants were responding to Mao’s charismatic authority or to patron–client networks (Teiwes 1984; Walder 1986). Yet critics note that participants rapidly took the initiative and that the center had difficulty reasserting control (Perry & Li 1997; Blecher 2010).

When all is said and done, Mao appears to have been serious about the importance of popular social and political movements in creating a more participatory, movement-based model of state socialism than that seen in the USSR or Eastern Europe. Yet he also reserved for himself the role of mobilizing those movements in the first place and restraining them when in his view they spun too far out of control.

on State Socialism in China. M.E. Sharpe, Armonk, NY.

March First Movement of 1919 (Korea)

GI-WOOK SHIN

The March First Movement (Samil Undong) was the first nationwide nationalist movement in Korea. The Korean peninsula was “annexed” to imperial Japan in 1910 and, despite much armed resistance, Koreans experienced a decade of minimal rights under a brutal colonial regime. In the aftermath of World War I, and specifically indicated in the Versailles peace conference, the international climate began to change, giving Korean leaders a glimmer of hope for national independence from Japanese rule. Inspired by Woodrow Wilson’s idea for national self-determination for weak nations, Korean student and intellectual leaders in Tokyo published a statement in January of 1919 demanding national liberation from Japanese colonizers. Organizers hoped to spark resistance within the Korean community while simultaneously appealing for help at an international level. Even future president of South Korea, Syngman Rhee, who resided in the US, took part in the movement by attempting to attend the Versailles conference in an effort to personally appeal to President Wilson for Korea’s independence.

Throughout 1918 domestic and international leaders clandestinely collaborated to create a sort of underground movement both in domestic Korea and among Korean students and intellectuals abroad. Combining with the Christian and Korea’s native religion, Tonghak, religious communities provided an organizational base for mobilization, as a 33-member group formed that would spearhead the movement. Leaders concurred that the actual demonstrations should be staged precisely two days before the public funeral for the former Korean emperor Kojong. Not only had Kojong’s death marked a tangible end to the former Korean state, but thousands of Koreans were expected to participate in the mourning events. However, had demonstrations commenced at the same time as the scheduled public ceremony (March 3), heightened colonial government security would have most likely outnumbered and quashed demonstrators.

On March 1, 1919, nationalist leaders met at Pagoda Park in downtown Seoul and read aloud a declaration for Korean independence. Concurrent with the gathering in Seoul, representatives of the movement read the same proclamations in other cities such as Pyongyang. People poured into the streets to show support, igniting an eventual nationwide protest. The movement quickly spread across the country, uniting Koreans from all regions, occupations, educational levels, and social backgrounds. Caught by surprise, Japanese forces had trouble containing the revolt that took place throughout March and April and included more than 10 percent of Korea’s roughly 20 million people. Overall there were estimated to be 1500 demonstrations in 211 of Korea’s 220 counties. While nationalist leaders embraced nonviolence in an effort to achieve legitimate recognition of Korean sovereignty internationally, violent clashes with the colonial government did erupt. In one case, colonial officers locked protesters inside a church and burned it to the ground. In the end Japanese official figures of the dead reported 553 killed with over 12 000 arrested. These numbers were in stark contrast to those calculated by Korean nationalists, who put the totals at 7500 killed and 45 000 arrested. Even with such violent episodes, in the end the movement by no means urged social revolution.

The March First Movement failed to achieve national independence from Japanese rule but left important legacies for Korea. First, the years following 1919 marked a transition in colonial policy to incorporate more cultural...
aspects while continuing to deny political rights. Japanese colonists, wanting to appear “modern” in their colonial rule, began to loosen their grip on freedom of speech and assembly, promoting the publication of Korean newspapers and other media. Additionally, Koreans created the Provisional Government of Korea in Shanghai as a result of the demonstrations. This entity would subsist to provide leadership for the initial regime in South Korea after 1945.

Second, the failure to attain independence through March First divided Korean intellectual leaders into two groups: nationalist moderates and socialists/communists. The former deemed immediate independence as immature, stressing reform, education, and economic development as a means for a gradual liberation; one which Korea would be ready for. The contending socialist radicals comprised Korean nationalists abroad in Japan, China, and Siberia who enjoyed more freedom in education, were critical of the reformist approach, and pursued more direct resistance to colonial rule. Many subscribed to Marxist/Leninist ideals and were especially attracted to a new vision of social and political development, one that offered insight into the causes of Korea’s colonial subjugation. Many scholars cite the failure of March First as the primary origin for the division between moderates and communists that would incite a civil war after the 1945 liberation.

Finally, and perhaps most importantly, March First is celebrated as the first modern national social movement in Korean history. This is a particularly significant component to the contemporary story of South Korea. Reminiscent of March First in fervor and unity, the fight for democracy in South Korea during the 1980s came largely as a result of the successful mobilization of the Korean populace against the military dictatorship of Chun Do Hwan. Today, Koreans everywhere take pride in the ability to unite, despite differences, against a common cause and under the same nationalistic ideals.

Mau Mau revolt (Africa)

INGE BRINKMAN

At the end of the 1940s central Kenya experienced the growth of a movement that came to be known as Mau Mau. People were initiated into the movement through pledging an oath, a fact interpreted as “traditional” by the British colonial authorities. Yet, people in central Kenya saw it as a novelty, since for the first time women and children were also allowed to take this oath. Initially Mau Mau received much support amongst Kikuyu squatters working on the farms of white settlers in the White Highlands. Later the movement expanded into the Kikuyu Reserve, an area designed by the colonial authorities as the homeland of the Kikuyu and into Nairobi, Kenya’s buzzing capital. Much of the support came from people with little hope of a better future: poor people with little to lose.

The colonial authorities regarded Mau Mau as a threat to law and order, and in 1952 decreed a state of emergency. Political leaders were arrested and, with the aid of British troops, a repression campaign was mounted. Perhaps precisely because of the hard-line state repression, Mau Mau engaged in guerrilla war, waged from the forests of central Kenya. Initially, it seemed hard to quell the guerrilla struggle, but after large-scale military campaigns (estimates of the death toll on the Kenyan side range from 11 000 to 150 000) the rebellion ended. Although some groups of Forest Fighters (Mau Mau guerrillas) continued, the 1956 death of Dedan Kimathi, the most important Mau Mau general, is widely regarded as the end of armed resistance. In 1961 the state of emergency was ended, and in 1964 Kenya became an independent country with Jomo Kenyatta as its president.

Mau Mau was a complex movement. In the colonial interpretation, Mau Mau was a barbaric movement which employed violence against innocent colonial families, missionaries, and local Christians. After Kenya’s independence, Mau Mau was hailed as a nationalist, anticolonial struggle. Obviously the roots of Mau Mau resistance lay in grievances related to colonial rule, and its demands – land and freedom – had a clear anticolonial character. In the 1980s, social history gathered momentum in African studies, often with a neo-Marxist interpretation. In this approach, Mau Mau was seen not only as an anticolonial nationalist movement, but also as a civil war between the haves and the have-nots, between landless poor and wealthy landowners. Mau Mau was also an internal struggle about political responsibility, leadership accountability, masculinity, and adulthood. British historian John Lonsdale (1990) described Mau Mau as “an imploded Kikuyu debate.” To understand this “imploded debate,” we need to go back to the nineteenth century, when colonial rule did not as yet play a role.

Back then there was no shortage of land in the region; the most important economic factor was the mobilization of labor. The societies in this region were based on explicit socioeconomic differences in status, wealth, and political power. Young people and women, for example, had only limited say in the political process, and rich men acted as patrons for poor men, in which the former offered land use and protection in return for labor and political support. A poor man could slowly move up the social ladder; through hard work he could acquire land and so build up his own group of dependents: women and children. Marriage formed the gateway to social and political status; a man with a well-organized household was assumed also to be a good political leader. In this homely conceptualization of politics, marriage and the family were obviously crucial. Given the abundance of land and the possibilities of social mobility through
hard work, it was also clear that work ethics were paramount: good, hardworking rich people were opposed to criminal, lazy poor.

Much changed during the colonial era. Political power was largely transferred from the village councils to colonial-installed chiefs. People in the region were all assumed to belong to “the Kikuyu tribe” and ordered to live in the Kikuyu Reserve, which soon became overcrowded. Patrons no longer offered their clients a chance to acquire land, and so men from poor families stood little chance to gather a bride price, to marry, and to build up a household. In short, it became difficult to become morally good, adult, and politically responsible men. The value of land possession increased sharply, rendering matters more difficult for groups who were not allowed to possess land and only had usufruct rights – such as women and clients. The chance to acquire land became ever more limited and more and poor people remained poor, despite their efforts and hard work. The desperation of people without access to land, of the landless without a proper household, and of sons without the means to marry grew over the years.

These same constraints also held for the White Highlands, where many people of poor descent sought to increase their wealth by working on white settler farms. Yet the latter saw patron–client relations very differently and squatters no longer had any possibilities for upward mobility. Other men, and fewer women, without means tried their luck in Nairobi. And indeed some managed to build up a household without their families’ help and buy land around Nairobi with their wages. Yet the majority did not succeed and remained living in the slums, jobless and poor.

These poor people could no longer look for another patron or clear a new piece of land; the principle of reciprocal patron–client relations had become a hollow phrase and nowhere was there any land to clear. It is these poor people that came to form the core of Mau Mau. They tried to claim their rights as clients, to acquire land, and set up independent households through this movement. The land and freedom demands can also be interpreted in this light. These people tried to call upon patrons and landlords to be heard, to be offered a chance to prove themselves, to become adult and politically responsible. The established and wealthy Kikuyu families opposed these claims and as anti-Mau Mau they were regarded as “loyalists” by the British.

Upon independence Kenya came to be ruled by a powerful Kikuyu clique, but these were all wealthy patrons; the claims of the Forest Fighters were paid no heed to in an independent Kenya.

May Fourth Movement (China)
ANTOINE CADOT-WOOD

The May Fourth Movement, in a narrow sense, refers to a series of student demonstrations that occurred in Beijing on May 4, 1919. The demonstrations were in response to territorial concessions made by Chinese delegates at the Paris Peace Conference that ended World War I. In a broad sense, however, “May Fourth Movement” also serves as an umbrella term for a series of political, social, and intellectual movements that began nearly ten years prior, known collectively as the New Culture Movement.

The demonstrations of 1919 were in direct response to events surrounding the end of World War II. A considerable number of Chinese intellectuals had seen the conflict as a just war against unchecked German imperialism. In the wake of the 1918 Armistice that ended hostilities in Europe, many of these same intellectuals rejoiced, hoping that the fall of Germany signaled the decline of imperialism in general. They were particularly interested in territories in the Chinese province of Shandong, which had been annexed by Germany in the late nineteenth century and that they now hoped to see returned to China.

The Chinese diplomats sent to the Paris Peace Conference, however, rapidly discovered that Japan in 1917 had signed a secret agreement with France, Italy, and Great Britain, which promised to support Japanese claims in Shandong. The Chinese head of state Duan Qirui had himself signed a similar secret agreement with Japan in 1918, promising military concessions in Shandong in exchange for Japanese loans. In the face of these facts, the Treaty of Versailles handed Germany's former territory in China over to Japan. News of the Chinese delegation's failure reached Beijing on May 1, prompting an outcry that led on to large student demonstrations on May 4 against both foreign imperialism and the current Chinese government.

These demonstrations did not materialize out of nowhere, however. The May Fourth Movement has in retrospect come to encompass a wide range of movements that began after the Xinhai Revolution of 1911, which overthrew the Chinese imperial system, and continued well into the 1920s, under the heading “New Culture Movement.” It was a movement largely composed of intellectuals, some of the most notable including Cai Yuanpei (1868–1940), Chen Duxiu (1879–1942), Hu Shi (1891–1962), Li Dazhao (1888–1927), Fu Sinian (1896–1950), Lu Xun (1881–1936), and Luo Jialun (1897–1969). The man of letters had traditionally occupied a special place in Chinese society, as both scholar and imperial official. Many May Fourth intellectuals were trained partly in the classical tradition, and were thus burdened with balancing intellectual inquiry with service to their country.

The root of this movement lay in a series of humiliating military defeats in the late nineteenth century, which forced China to make territorial, economic, and military concessions to European and Japanese imperial powers. In response to this situation, various viewpoints emerged among Chinese literati on how to prevent China’s decline. These ranged from a reform of the Chinese imperial system that incorporated Western military technology to the removal of the imperial system altogether, on account of its being composed of a “foreign” ethnic group, the Manchus.

Both of these extremes, ironically, were eclipsed by the abolition of the Manchu Qing government in 1911. Those advocating the reform of the imperial system had faced a reactionary imperial court that finally succumbed to its own intrinsigence. The anti-Manchus, by contrast, found the Qing replaced by a series...
of warlords who ruled in a way similar to their imperial predecessors. Within two years, many revolutionaries found themselves in exile, where they began a thorough questioning of all aspects of classical Chinese culture, informed by the large number of Western texts translated by the Japanese since their own modernization half a century before.

By the time these intellectuals were able to return to China, they had decided that the reason for China’s decline was not lack of military power or a flawed political system, but fundamental flaws in Chinese culture. The majority gathered at Peking University in Beijing, where Cai Yuanpei became the chancellor; Chen Duxiu the dean; Li Dazhao the head librarian; Hu Shi a professor of philosophy. Most famous of all, perhaps, was the novelist and professor of literature Lu Xun, whose stories were blistering indictments of traditional Chinese social norms. Under the influence of such people, Peking University acquired a culture of student activism that would remain for the rest of the century, its students leading both the May Fourth demonstrations and the 1989 Tiananmen Square protests.

Over the next few years, Peking University’s professors and others would spearhead an effort to teach the next generation, in Chen Duxiu’s (1915) words, to be “Independent, not servile; progressive, not conservative; aggressive, not retiring; cosmopolitan, not isolationist.” Their effort would become known by the 1920s as the New Culture Movement, and it would reach its zenith in 1919 with the May Fourth demonstrations. Chen Duxiu, editor of the movement’s principal publication, New Youth, would characterize the twin slogans of the New Culture Movement as “science and democracy,” although the actual ideas that made up the movement were considerably more varied. They included the vernacularization of written language, the creation of a modern literature, the liberation of women and families, the modernization of medicine, and the struggle against imperialism. May Fourth intellectuals also played with a number of political philosophies, from Marxism to French ideas on democracy, to anarchism.

How the May Fourth Movement is remembered in China today is a story as complex as the movement itself. The demonstrations of 1919 are remembered largely as a patriotic protest against foreign imperialism and a treasonous government. The New Culture Movement is officially remembered for its nationalism and its introduction of Marxist thought into China, while dissidents still point to the slogan of “science and democracy” as a goal for a country they see as still distinctly undemocratic. Following a renewed interest in classical Chinese culture in the 1990s, however, the May Fourth Movement has also come under attack for its perceived outright rejection of classical Chinese thought and wholehearted adoption of Western ideas.

Media activism
ALICE MATTONI

Media activism can be understood in three different manners, going from broad to narrower interpretations: activism through the media, activism in the media, activism about the media.

Media activism is activism through media in the sense that activists use media technological devices in order to organize, promote, and account for social movement activities. For instance, activists can employ a mailing list to coordinate the organization of a strike, set up a website to sponsor a sit-in, and use hand-held digital camcorders to report a demonstration. In its broadest sense, therefore, media activism implies all those media practices by which activists mediate their own social movement activities (such as organization, promotion, and representation of protest events and campaigns), through the use of different media technological devices (today increasingly digital, like cameras) and resulting in a variety of artifacts diffused through alternative media channels.

In a narrower manner, media activism is also a form of activism in the media environment, assumed as the space in which to subvert symbols and icons representing those contentious topics activists engage with. An example of media activism in the media is the practice of culture jamming that aims at subverting dominant cultural codes. Culture jamming is rooted in past artistic vanguards and protest movements, like Situationist International, in which several groups of artists participated in the 1950s and the 1960s and whose subversive practices, like detournement, are also common amongst today’s culture jammer groups, such as AdBuster,™ark, and Negativeland, already active in the 1980s. Culture jamming may include broader disruptive practices directed toward the media, such as media hoaxes (Dery 1993). The creation of “media hoaxes” consists in organizing public events and constructing public characters which are then revealed to be false in front of media professionals and journalists. The aim is to expose the fragilities and contradictions of mainstream media and dominant cultures. Recent examples are media hoaxes organized by the Luther Blisset Project, the Yes Men, and the Chainworkers Crew.

With the growing importance of cyberspace, activism in the media environment also means performing protest events and campaigns in the online realm, developing various types of online actions like virtual sit-ins or the construction of fake websites (Costanza-Chock 2003). Some of these contentious electronic performances are also known as “hacktivism,” which is rooted in hacker culture and employs direct action in the virtual realm in order to disrupt cyberspace (Jordan 2002).

There is an even narrower conception of media activism, that is activism about the media and communication, seen as contentious issues and fields of struggle in themselves. This type of media activism could be seen as a social movement in itself, whose aim is to reform media policies at the national and transnational level. However, other authors prefer to consider activism about the media and communication as a connector between different movements (Hackett & Carroll 2006: 199), rather than a social movement in the strict sense. Activists engaged in contentious politics related to media and communication frequently change the media environment at the material level, especially in cyberspace: apart from engaging in protest performances, they also supply content, software, and infrastructures. The online encyclopedia Wikipedia, for instance, is a fairly good example of activism about the media producing public content online; over the past 20 years, the free software movement provided free and
open source software to perform a variety of tasks in the electronic environment; grassroots groups of activists engaged in the creation of information and communication infrastructures enabling other activists to perform a variety of media-related social movement activities.

Today, external boundaries of media activism are changing, especially with regard to activism through the media and, in particular, the production and diffusion of media contents. As for production, communication and information technologies are more accessible than in the past for a higher number of people. Although different forms of digital divide still exist, digital media devices are in general portable, easy to use, and low cost. This allows a faster mediated representation of protest events and campaigns and renders the practices at the basis of media activism feasible for those people who would not define themselves as activists, but rather as protest participants or sympathetic audiences. They document and circulate social movement activities without labeling what they are doing as “media activism.” In this case, media activism as a process of alternative communication production goes beyond the boundaries of activist groups. As for diffusion, the creation and pervasiveness of commercial social networking applications, like Facebook, has provided yet another place where content produced through media activist practices may be circulated. In this regard, media activism as a process of diffusion of alternative messages goes beyond the boundaries of alternative media, since it is circulated in commercial and profit-oriented contexts. The changing boundaries of media activism in contemporary societies require a redefinition of the very concept of media activism, a challenge for social movement practitioners and academic scholars in the field.

Mexican Revolution
ÁLVARO MATUTE

The Mexican Revolution started in the early years of the twentieth century and consisted of a set of events involving a number of social actors. Accordingly, the deeds and misdeeds that occurred as part of it served a variety of purposes. Some historians argue there were several rebellions, as opposed to only one revolution, and that all of them simultaneously converged in a major event referred to as the Mexican Revolution. The numerous geographical locations where actions unfolded highlight the diversity of the movement.

Early in the twentieth century, Mexico was facing hard times. In 1900 President Porfirio Díaz was reelected for a fifth term in office; however, that fact in itself was a sign of political instability. It also denoted a lack of political activity, as new generations of professionals were making attempts to gain access to high-ranking government positions. This situation was also occurring in most states – with the exception of Yucatán, where the governor was changed every four years. This state of affairs led to a feeling of dissension voiced by some groups. After the enactment of Lerdo’s Act, mandating the confiscation of church property (1856) – which also meant putting an end to collective property as a means to encourage the acquisition of private land by individuals – and the passing of subsequent laws concerning untended lands, many farming communities lost their commonly owned lands (ejidos), which became part of increasingly large rural estates (latifundios) that had emerged since the 1860s.

Emiliano Zapata was a revolutionary leader in the southern state of Morelos, where many farmers had seen their lands taken away to become part of the large sugarcane-producing haciendas. Factory workers were also discontented as they did not have access to basic rights such as freedom of assembly or the right to strike, and there were no regulations for establishing the minimum working age, the maximum number of working hours, or wage and social welfare policies. Although some mutualism and cooperativism trends were current at the time, they had not evolved into a consistently developed legislation, the exception being the state of Mexico, where laws were considered progressive to a certain extent. Associations having anarchist and anarchist-unionist leanings were formed, and the ideas stemming from Pope Leo XIII’s Rerum Novarum Encyclical (1891) spread and were referred to as Social Catholicism. The Catholic workers who affiliated with this movement held conferences and discussions and, like the anarchist groups, demanded solutions from those in power. In addition, the liberals – who followed the reformist tradition – had begun to complain about the rapprochement of some church and government leaders, and urged them to abide by the Reform Act, which dictated the separation of church and state. This set of political, agrarian, industrial, and religious factors eventually congealed into a revolutionary situation. Early in the twentieth century, the first signs of awareness of the situation surfaced among some citizens, who began to take steps aimed at implementing possible solutions.

Some actions led to others. In 1903, in the city of San Luis Potosí, liberal congressmen openly criticized the links of the state with the church. Three years later, the Liberal Party’s plan and agenda was drafted. Although such proposals did not overlook the church–state associations, it left the matter second to more pressing considerations such as political, economic, and social actions that had first to be put in place to accomplish reform. The plan and agenda covered issues concerning workers – such as maximum working hours and the minimum wage, and farmers – regarding new ways of preventing land from becoming idle. It also...
addressed the need for secular, public, and mandatory education. The ideas of this group were shared with massive clusters of workers through Regeneración, a newspaper published by Ricardo Flores Magón, the chief ideologist of the group, who, consequently, was persecuted, imprisoned, and finally sought exile in the US. On the other hand, Catholic workers developed the grassroots and organized meetings and conferences to discuss progressive labor reforms.

In cities, the professionals who were close to the political elite held heated debates about General Díaz’s succession. In articles, brochures, books, and general speculation they expressed their opinions on how the presidential succession ought to be tackled and their concerns as to whether or not Mexicans were ready for democracy. They also wondered whether or not it was possible to create new political parties. Speculation caught fire once they learned of President Díaz’s statement in an interview with reporter James Creelman, published in Pearson’s Magazine in March, 1908, that he would retire as soon as his term came to an end in 1910. Meanwhile, Francisco I. Madero, a grape grower living in San Pedro de las Colonias, in the northern state of Coahuila, shared his views on the dictator’s publicized retirement in his book La sucesión presidencial en 1910. In it, he expressed agreement with Díaz that, as the middle class had grown stronger, it was finally possible to bring democracy to the country. Other writers, however, were noticeably skeptical about the matter. One of them, Andrés Molina Enríquez – an evolutionist – came up with the most accurate analysis on the matter of democracy, warning it was still in the future. In his book Los grandes problemas nacionales (1909), he arrived at what today would seem a shocking conclusion: “considering the different ethnic and social groups had various forms of land ownership; and, given the vast diversity prevailing, it is impossible for the country to evolve. To make evolution viable, it would be necessary to move toward small land ownership and implement a miscegenation policy aimed at dissolving the gap breaking ethnic poles apart” (i.e., indigenous peoples, semi-nomadic peoples with no lands and those he referred to as Creole lords who owned huge rural estates). In his view, only a more homogeneous society would be able to have a democratic government. “Under the current circumstances personal dictatorship would just turn into party dictatorship.”

President Díaz changed his mind as 1910 arrived and decided to run for presidency again, this time with Ramón Corral running for vice president. The Partido Demócrata – formed in 1909 to endorse the candidacy of General Bernardo Reyes – was having problems; some of the party members had left and others were persecuted. The only contending party was the Partido Antirreeleccionista controlled by Francisco I. Madero, who organized the first electoral campaign ever in the history of Mexico. In his campaign trips, he noticed the uneasiness of citizens in a number of states concerning the reelection of governors. He managed to track down such worries to the source: Díaz’s never-ending reelectios. Madero was not harassed or persecuted and ran a successful campaign. However, as a result of fraud, the victory polls favored Díaz. Madero was imprisoned in San Luis Potosí and, while in jail, drafted the Plan de San Luis, urging his fellow countrymen to disown the deceitfully nominated authorities and calling for an uprising to start on November 20, 1910. Initially, just a few responded, but in the first three months of 1911 more insurgent groups joined the uprising, mainly in northern states. By May, with the map already showing a large number of revolutionary areas, the insurgent forces were concentrated in Ciudad Juárez, where the federal army and the insurgents engaged in a crucial battle. The victory of the Maderistas brought about immediate political consequences which turned out to be decisive: Porfirio Díaz stepped down as president and left for Europe, where he would spend the last five years of his life in exile.

Between May and November there was a period known as “Interinato” (temporary office), presided over by Francisco León
de la Barrera. Following a glorious journey from the border region to Mexico City, Madero was bound to face overwhelming difficulties once he reached the capital city. First, among the circles supporting him, there was a divide over who should run for vice president in the upcoming elections. The Partido Antirreeleccionista became fractured, which resulted in the creation of a new party: Partido Constitucional Progresista. Second, to honor Madero’s promise, the revolutionary forces had to be disbanded, but some of them – such as the Zapatistas – refused to comply until the new government fulfilled the commitments made to the agricultural sector. Furthermore, Madero’s advocacy of human rights – particularly concerning freedom of the press – took an ironic twist when journalists made him the target of blunt criticism. In spite of all this, Madero took office as president of Mexico in November 1911. Within a few days, the Zapatistas’ impatience surfaced with the Plan de Ayala, urging the government to take action so that communal property or ejidos could be returned to its original owners. It wasn’t long before further signs of anti-Maderism sprang up. General Bernardo Reyes crossed the border with the plan of overthrowing the new president, but failed in his attempt and was captured. In March of 1912 an old ally of Madero’s, Pascual Orozco, started a rebellion in the north. Meanwhile, the newly elected representatives of the Chamber of Deputies (XXVth) with a pro-government majority, started working on making laws intended to accommodate the nonconformists’ claims. In October, a new uprising started in Veracruz, led by General Félix Díaz, Porfirio Díaz’s nephew. He was soon defeated and sent to prison in Mexico City. The struggle against Orozco was the hardest of all and ended only when he lost a battle against General Victoriano Huerta, whose reputation increased after the victory.

President Madero now believed he had the country under control, but a new military uprising in Mexico City resulted in the liberation of generals Reyes and Díaz. Reyes was shot dead trying to assault the presidential palace. A scheme led by US ambassador Henry L. Wilson then succeeded: General Huerta was persuaded to betray the president and have him arrested in February 1913. The scheme involved several days of shootings known as “la Decena Trágica” (ten tragic days). Once he had had Madero killed, Huerta set up a dictatorial regime whereby the Chamber of Deputies was dissolved and his opponents were sent to prison or, in some cases, executed. Huerta became president but Venustiano Carranza, who had been appointed governor of Coahuila, disowned him and prompted the people to overthrow him by means of the so-called Plan de Guadalupe, drafted in March 1913. By then, the reforms that had led to the revolutionary uprising had been only partially implemented and the ones already in place lacked cohesion. Congress started a debate on the returning of ejidos to the previous owners and reforms to the labor system. Independent groups of farmers continued to push their demands, whereas workers – both the anarchist-unionists and the Catholics – drafted different proposals time and again in pursuit of social justice. Yet, it was clear that up to that point, the movements were still disconnected. Technically, the lack of articulation in the movement would prevent authors from referring to just “one revolution.” In the period 1913 to 1915 the revolutionary process became most complicated as various trends spread out to the different regions and only in 1915 did they start to show some convergence.

An army was formed by Carranza to fight Huerta, which was joined by several groups from the north, such as the army led by Francisco Villa, known as the División del Norte, and one from Sonora, the Cuerpo de Ejército del Noroeste, whose commander-in-chief was General Álvaro Obregón. Zapata, on the other hand, had not ceased to fight. Carranza gave the movement a national character by sending troops to the south and southeast and controlling ports and custom posts, thus gathering funds for his venture. From March 1913 to August 1914, the different rebellious groups
fought the federal army, which was defeated after decisive clashes such as the assault on the city of Zacatecas by the División del Norte and the surrendering of Guadalajara under the siege of Obregón’s army.

Disagreements existed among the different revolutionary groups: some targeted social reforms (e.g., land distribution), whereas Carranza opted to defer such demands until after the attainment of his political-military goals. In view of the increasingly worsening relations among insurgents, it was necessary to keep them together through treaties such as the Pacto de Torreón. Once Huerta was overthrown the different groups decided it was necessary to organize a convention to set up a program of reforms. The convention, later known as the Soberana Convención Revolucionaria (Sovereign Revolutionary Convention), began in October 1914 in Aguascalientes, upon Villa’s request, arguing it was neutral territory. The Convention declared itself as self-governed and disregarded Carranza, who decided to leave Mexico City as the seat of power, moving the government’s seat to Veracruz. During the Convention there was overt antagonism between the conventionists and the constitutionalists – the latter were loyal to Carranza. All members of the Sovereign Revolutionary Convention traveled to Mexico City. In December 1914, under the Pacto de Xochimilco, the Villistas and Zapatistas were united and became loyal – at least momentarily – to Eulalio Gutiérrez, the president elected by the Convention. Álvaro Obregón, however, decided to support Carranza.

In 1915 there was war between the different revolutionary armies: in El Ébano, near Tampico, General Jacinto B. Treviño, from Carranza’s army, defeated Villa’s supporter Tomás Urbina, and, in Celaya, Trinidad, and Santa Ana del Conde, Obregón finally defeated Villa at the expense of losing his right arm. Apart from the warfare there was combat on a different field; that of ideologies, arising from the enactment of socially driven laws and decrees intended to benefit the farmers’ and workers’ groups. Workers held meetings at Casa del Obrero Mundial with the backing of the constitutional army. Both groups merged in the Batallones Rojos (Red Battalions) to fight Villa. Keeping armies at war involved using most of the already scarce crops and cattle to feed the troops, a policy that brought about starvation on an extended scale. Moreover, the country was in monetary chaos. Every army mint house was issuing its own currency. To make things worse, as a result of the unhealthy conditions prevailing in cities and in the countryside, the country was plagued with outbreaks of epidemics.

In 1916, some revolutionary reforms were turned into a legislation soon to be enacted. The armies had stopped fighting, although rioting went on. Both the defeated convention members and the triumphant constitutionalists set themselves to making plans and laws aimed at fulfilling the demands that had initially fueled the struggle. The convention – it had survived in the territory controlled by Zapata – announced its Programa de Reformas (reform plan) based on many of the ideas promoted by Ricardo Flores Magón’s supporters, the Magonistas, since 1906, and on other thinking that had emerged during the revolutionary movement. Carranza ordered the appointment of the members of Congreso Constituyente (Constitutional Congress) in December 1906 and the Congress started sessions in the city of Querétaro. Carranza instructed them to hold deliberations on a plan for a constitutional reform. In the meantime, a substantial number of counterrevolutionary groups, including the ones led by Manuel Peláez, Félix Díaz, Alberto Pineda, and Juan Andreu Almazán, declared war on the constitutionalist government in different regions of the country. This fighting did not involve the forces of Villistas and Zapatistas, but hunger still prevailed in the country. In addition, citizens were often attacked by bandits, such as those commanded by José Inés Chávez García in Michoacán and Pedro Zamora in Jalisco and Colima. The American government had ordered raids to pursue Villa, who had led the assault on the city of Columbus, New Mexico, in March 1916.
The Congress closed sessions on February 5, 1917. Even though there were only representatives from the winning party at the Congress, its composition undeniably involved a social, professional, and generational variety of citizens. Carranza’s proposal was soon superseded by that of the left wing, whose proposals in the fields of education, religion, agriculture, and labor made the constitutionalist project look more modest, even though it was an attempt to follow the liberal tradition. The radicals known as the Jacobinos chose to take a step farther. Even though individual rights were set out, many of them were deferred until the state gained strength. According to the new ideas, a powerful government should rely on the figure of the president, who would face no restraints except the observance of the republican rules concerning the equilibrium of powers and the respect for individual rights. The nation would hold sovereignty over the entire territory, including minerals and hydrocarbons, and hold the power to transfer property to the citizens under a private system.

The new constitution mandates were: education shall be mandatory, free, and secular and must be regulated by the state; the nation owns all the land (including the subsoil) and the state has the power of ordering the fragmenting of very large estates; the provisions on the maximum working hours and the minimum wage shall be observed and social security benefits must be granted, while the hiring of children is banned. As far as the church was concerned, the names and nationalities of foreign priests would be thoroughly checked, and acts of worship in public spaces banned. The institutional figure of the president of the republic had also to be strengthened. Nevertheless, the successive administrations illustrate how implementing these concepts (i.e., turning constitution articles into laws and regulations), as well as ensuring law enforcement, was extraordinarily hard to achieve.

Venustiano Carranza was elected constitutional president in 1917. His administration showed some progress in the aspects listed above until he was faced with obstacles. The systematic enforcement of constitutional mandates had to be deferred, even to the point of moving them beyond the term of his administration. One of the most noticeable difficulties of his administration was the pressure from foreign countries and citizens to be allowed to own agricultural estates and subsoil resources. Carranza decided to take advantage of this situation by imposing heavy taxes on foreign-owned oil companies. This action rendered the treasury stronger. Apart from dealing with complaints by foreigners, Carranza had to tackle the church’s rejection of the constitution, and the municipalities’ lack of resources for implementing public education. The subsequent administration would have to work hard in the attainment of educational goals.

The Mexican Revolution did not reshape the nation radically, but it did serve to put into effect many reforms, namely the breaking up of large estates, the distribution of land among farmers, and the enforcement of advanced legislation for the labor sector. During the period 1920–1924, the constitution was amended to allow for the creation of the Secretaria de Educación Pública (Ministry of Public Education), a federal government agency meant to assist the municipalities in the handling of literacy programs and in bringing their cultural heritage closer to most people through the implementation of government programs. The strict enforcement of the laws regulating the relations between the state and the church led to the uprising known as Guerra Cristera (1926–1929) in the midwestern region of the country. Finally, subsequent to some administrations declaring the agrarian reform was over, Lázaro Cárdenas’ government (1934–1940) implemented a plan to systematically distribute the land and pass a decree that Mexico’s subsoil assets (i.e., oil deposits) were to be nationalized.

The chief outcome of the revolutionary movement consisted in the creation of a state headed by a central government, strong as it was founded on grassroots farmers and workers who endorse it in exchange for benefits. The state’s power lay in the creation of an army peopled mainly by common
citizens, and was enriched by the contributions of the middle class, who brought scientific, technological, and cultural progress. Since the 1920s—a time during which the ideology of the Mexican Revolution was renowned—it has been a widespread belief that national progress in every area was a direct consequence of the revolutionary movement. It is perhaps possible to affirm that the Mexican Revolution’s major goals were gradually attained—an idea to some extent consistent to Molina Enríquez’s thesis mentioned above—and that the landmark years of the revolutionary process were as follows: 1917, enactment of the constitution; 1920, retreat of forces that could star a rebellion against the government in office; 1929, creation of Partido Nacional Revolucionario, the political party that took on the role of interpreting the people’s aims and led the revolution; and 1940, when oil was declared to be the property of the nation and an equitable agricultural land distribution was finally accomplished. However, as Cárdenas’ term came to an end, it became evident that there would be no more policies inspired—strictly speaking—by revolutionary ideals. It may therefore be reasonable to assert that the events known as the Mexican Revolution occupied the years 1917 to 1920.

Apocalyptic and millenarian movements

JOHN R. HALL

Scholars invoke the terms “millenarian,” “millennialist,” and “apocalyptic” to refer to movements and sects that embrace ideologies positing the (typically traumatic) end of one era, promising relief from the sufferings of this world and its present age, and purporting to give rise to salvation in a new “golden age,” “heaven on earth,” or realized utopian social order. The strikingly broad range of movements that adopt such ideologies includes peaceful conversionist movements and militant religious social movements undertaking “holy war,” anticolonial movements, agrarian movements, and modern revolutionary political movements. Moreover, movements vary widely in their scale of organization and significance— from those that attract little notice beyond their participants to movements within early Christianity, the Protestant Reformation, and contemporary Islam that have been civilizational, even world-historical, in their consequences. Despite the ancient Middle Eastern origins of apocalypticism and millennialism, non-Western religions and ideologies— for example, Buddhism— have on occasion provided independent inspiration for such movements. Sometimes too, non-Western movements (for example, the nineteenth-century Tai Ping Rebellion in China) have synthesized local cultural materials with millenarian Christian ideas. In short, as rich veins of case study and comparative research document, millenarian and apocalyptic movements vary in ideology, organizational form, scale, and trajectory. The broad range of cases poses an important theoretical challenge— whether to focus on shared characteristics, or alternatively, to theorize alternative types of such movements.

The theoretical puzzle of millennialism and apocalypticism is signaled by the terms themselves. “Millennialism” in the narrowest sense refers to the thousand-year reign of Christ described in the Bible’s New Testament “Apocalypse of Saint John.” And the Greek word apokalyptein means “disclosure.” For Christian millennialists, disclosure signifies “revelation” about the end of history when God’s final judgment of— and victory over— the Antichrist and Satan is to take place. Millennialism, then, has to do with fixed temporal events, and since at least 1200 ce, when the Cistercian monk Joachim di Fiore unveiled his calculations about the three stages of world history, quintessential millenarian movements sometimes have focused on predicting the exact date of the anticipated second coming of Christ, the end of the world, or other decisive developments. However, even movements that evoke strong millenarian themes often display little interest in calendrical calculations, nor are they oriented toward the end of the world as such. Thus, millennialism has come to have a much broader— and looser— definition, centered on the anticipated arrival of an earthly utopia.

Overall, the apocalyptic offers a clearer basis for the conceptualization of the diversity of movements and sects centered on the end of one era and the beginning of another, because it is not inflected with meaning about a thousand-year period of time. The apocalyptic encompasses a broad array of ideologies and movements not necessarily focused on the actual physical destruction of the planet or its conditions of life (even if those are increasingly salient issues). Rather than the “end of the world,” the apocalyptic typically concerns “the end of the world as we know it,” an extreme cultural and social disjuncture in which dramatic events reshape the relations of many people at once to history” (Hall 2009: 3). Social researchers may affirm that the apocalypse is socially constructed in this way or
that, but nevertheless, study it with the same investigatory approaches toward (constructed) social realities employed in other research, for example, on bureaucratic organization.

In this light, it is possible to trace a rough genealogy of the apocalyptic in its ideological and organizational forms – from its ancient origins in Zoroastrian, Jewish, Christian, and Muslim thought and actions to modern-day secular and religious movements (Hall 2009). Already by the end of the first millennium of the modern era, apocalyptic movements took alternative forms – from groups expecting divine intervention, to efforts to convert others before the day of judgment, to pursuing the divine cause through violence against earthly oppressors, to “triumphalist” apocalypticism of a religion that spreads civilizationally to incorporate other parts of the world. In the European medieval era, both the Roman Church – through the Crusades – and heterodoxical and heretical movements elaborated on these possibilities. But it was the sixteenth-century Protestant Reformation, importantly shaped through retrenchment from the apocalyptically saturated “radical reformation,” that fundamentally altered apocalyptic conditions.

In the wake of the Reformation, European states took on the previously religious function of regulating the boundaries of legitimate religion, largely in efforts to “contain” apocalyptic movements. Equally important, on the basis of both Reformation and later Enlightenment developments, mystical strands that anticipated God’s imminent intervention (for example, Thomas Müntzer’s expectation during the sixteenth-century Peasants’ War in Germany that God would allow him to catch cannonballs in his sleeves) became displaced by modernizing rationalist discipline. Increasingly secularized on this new basis, the apocalyptic came to undergird the Reign of Terror in the French Revolution, and from thence, influenced secular Marxist and anarchist theologies of revolution and, subsequently, anticolonial movements (cf. Eisentadt 1999). By the twentieth century, the diverse lines of diffusion had become highly complex. At the dawn of the third millennium, the modern disjuncture between the religious and the secular apocalyptic was to become blurred by both quasi-political militant Christian movements and the sacred – secular conflict between al-Qaida and the Western allies.

How to take theoretical stock? In part because the apocalyptic is so strongly centered in matters of belief (and ones that ordinary people during ordinary times tend to regard as fanciful or paranoid, or both), theorizations might seem tilted toward the analysis of ideologies and cultural formations, rather than toward investigation of patterns of action, organization, movements, and the processes and mechanisms driving their trajectories. However, such ideologies and beliefs are strongly oriented toward social temporalities, and because social action both occurs within and itself constructs social temporalities – in relation to organizations, movements, and institutions – theorization of millenarian and apocalyptic phenomena offers a potential basis on which to transcend conventional dichotomies of culture versus organization, structure versus agency.

The key classical source for theorizing would have to be the pathbreaking study written by Karl Mannheim as the Nazis consolidated power in Germany – *Ideology and Utopia* (1936). Although Mannheim was centrally concerned with thought formations, not action and organization, he advanced the important thesis that ideological and utopian thought formations are fundamentally temporal in their imaginaries of social existence. He also showed that the empirical varieties of such thought formations can be charted in relation to a small number of ideal types, including, importantly for our purposes, the existential “chiliasm” that directly experiences the millennial moment at hand, and the “socialist–communist” utopia to be advanced through strategic conflict.

The largest wave of scholarship on apocalyptic and millenarian groups came in the 1950s and 1960s. At that time, developed countries trained the anthropological gaze on what
was then called the “third world” increasingly subject to decolonization movements, and the developed countries themselves experienced emergent countercultural and antiwar movements. In his classic study, Norman Cohn (1970) traced the ancient origins of millenarian movements and their flowering in medieval Europe in movements of “revolutionary millenarianism” and “mystical anarchism.” As Cohn’s inclusion of the latter category suggests, most seriously countercultural movements are “apocalyptic” in their initial break with an existing social order (and even “secular” groups invoke their causes as sacred). Such groups largely tend to emerge under conditions (often, as Barkun 1974 has noted, heralded by natural disasters) of felt or experienced crisis—of oppression by a more powerful group, of extreme economic hardship, of fundamental social changes that leave particular social strata feeling threatened (e.g., US whites in the Christian Identity movement), of divergent experiences by different social generations, or other developments that give rise to a broad countercultural milieu. However, the evidence is scant that actual calendrical eras, such as the end of the first millennium CE, are major drivers of apocalyptic movements (Hall 2009: 49). Indeed, especially in the United States, by the dawn of the third millennium, apocalyptic and millennial discourses have become so broadly diffused across rhetorical registers, and so deeply embedded in popular culture, that they operate as signifiers readily available on any occasion, across the political spectrum, and in diverse sectors of social life (Stewart & Harding 1999).

The problem of mapping the diversity has bedeviled inquiry. Apocalyptic and millenarian groups and movements have emerged among landless peasants, as movements of resistance, or sometimes, of honorable defeat, among native peoples facing colonial conquest. Sometimes movements have proposed physical escape to some promised land of redemption—to the New World for the English Pilgrims, back to Africa for Caribbean blacks in the Ras Tafari movement. Or, as in the case of Melanesian cargo cults, they have experienced re.sentiment to be resolved temporally, in an anticipated new era of abundant wealth. Some groups have sought to advance the date of promised redemption, either through the fulfillment of various prophetic requirements (e.g., conversion of certain numbers to the faith) or by performance of rituals (the cargo-cult construction of imitation airstrips to attract planes that would deliver the goods). At the extreme, movements like those Cohn described as “revolutionary millenarians” have sought to advance the arrival of the new order by taking matters into their own hands, no longer waiting for redemption but using violence to destroy the old order and make way for the new (Hall 2003). Vittorio Lanternari (1963) and Brian Wilson (1973) identified all these tendencies, and others besides, among what Lanternari called “religions of the oppressed.”

There are also affinities and connections between movements and other social phenomena. On the one hand, social bandits sometimes embrace millenarian ideology (and millenarian groups often engage in social banditry as a basis of want satisfaction), while, on a different front, millenarian movements may morph into, or become enmeshed within, broader revolutionary movements (Hobsbawm 1965: 58–59). Indeed, millennialism connects with major revolutionary movements such as the Puritan Revolution in England, Hindu nationalism, and liberation theology in Latin America (Lewy 1974). In any of various possible outcomes, a group may succeed to the point of transcending its tensed relationship with the rest of the world, become institutionalized, and increasingly accommodate to conditions of an established social order. Indeed, reflecting a possibility with ancient roots in Persian adoption of Zoroastrian ideas (Lincoln 2007), a movement that brings on a new established order may continue to embrace an apocalyptic rhetoric, transformed into triumphalism (Hall 2009: ch. 2 & 3).

Overall, movements that embrace apocalyptic and millenarian ideas are diverse, they
sometimes involve complex connections with
diverse other phenomena, and the scales of
action in which they occur are various—from
primary groups to transnational movements.
These complexities suggest three precepts:

- Differentiating apocalyptic and millenarian
  movements requires a battery of ideal types
  that clarifies alternative logics of ideology
  and organizational formation.
- Actual groups will vary in how closely
  they approximate a given ideal type, and
  sometimes hybrid groups will approximate
  various ideal types in different respects.
- Because such movements undergo often
  dramatic changes over the durations of their
  existences, they should be analyzed not as
  static structures but in relation to ideal types
  over historical time.

Given these precepts, by way of what concep-
tual frameworks might the array of movements
be understood?

Mannheim’s (1936) distinction between
chiliasm and socialist–communist utopia is
important, but insufficient to differentiate
empirical diversity, and it is centered on
ideology rather than social organization of
concrete movements (Hall 1978: 10–14, 18).
The (seemingly parallel) distinction of Norman
Cohn (1970) between mystical anarchism and
revolutionary millennialism also is too broad
to chart the diversity of movements, especially
given that mystical anarchism is not necessarily
millenarian. A different distinction, often made
in the study of Christianity, sets off “premil-
lennial” versus “postmillennial” groups on the
basis of whether the second coming of Christ is
anticipated to occur before or after a millennial
kingdom of God is established on earth. This
distinction is important, because premillen-

nialists are more likely to embrace the strong
apocalyptic expectations that can animate a
movement. However, the distinction is specific
to Christianity, and it is historically emergent
as well, gaining significance especially from the
eighteenth century, when postmillennialism
became linked with gradualist Enlightenment

Brian Wilson (1973) proposed a more devel-
oped typology. Beyond an “orthodox” baseline
of accepting the world more or less as it is, he
conceptualized seven alternative “responses to
the world”: (1) revolutionist, expecting God’s
imminent intervention to overthrow the world;
(2) introversionist, withdrawing into a sect of
true believers; (3) reformist, seeking gradually
but inexorably to align earthly social order on
the basis of divine guidance; (4) utopian, call-
ing for concerted human action to remake the
social world entirely; (5) conversionist, seeking
to bring widespread inner change to people,
whose sin and decadence are the sources of
evil in the world; (6) manipulationist, con-
cerned with effecting a new and more workable
relationship of individuals interacting with
the world; and (7) thamaturgist, employing
magical manipulations to achieve immediate
and local relief from travails (Wilson 1973:
21–30).

Both Mannheim’s and Wilson’s typologies
are keyed to alternative cultural formations—of
ideology or beliefs about salvation, respectively.
They thus offer rich bases for considering the
meanings associated with apocalyptic and mil-
ennial sects and movements. However, the
typologies are not based on any clear theoretical
axes of variation, and they are underdeveloped
in their capacities to flesh out how culture is
enacted, and with what tensions between beliefs
and organization.

A related, phenomenological approach (Hall
1978) constructs a two-dimensional typological
space based on (1) alternative social temporali-
ties (diachronic, synchronic, and apocalyptic),
and (2) alternative social enactments of reality
(natural, produced, and transcendental). Set
against synchronic and diachronic times are
two apocalyptic temporal orientations—pre-
apocalyptic, in which the end of an established
social order is anticipated as a real and immedi-
ate possibility, and post-apocalyptic, in which
escape from the old order purportedly has been
achieved, and the new circumstances are lived as
Apocalyptic and millenarian movements

evolve in everyday reality. The typology – based on alternative orientations to social temporality and social enactment – differentiates a variety of possible countercultural social forms that may emerge under broadly apocalyptic conditions, not all of them strongly apocalyptic or millennial. The commune is based on the anarchism of free-will association. Participants in the ecstatic association seek transcendence. And worldly-utopian groups – namely, the community and the intentional association – work to demonstrate the potential that alternative utopian bases of social organization have for ordering society at large (Hall 1978: 203–206, 208).

In relation to the apocalyptic, the key issues are when in time a movement posits its existence relative to the End Days, and how it positions its collective response to extraordinary times. The post-apocalyptic other-worldly sect claims to exist on the “other” side of the apocalypse, having “escaped” or otherwise established its life beyond the turmoil besetting the wider world. It thus enacts a “heaven on earth,” however construed. Pre-apocalyptic groups, on the other hand, remain on “this” side of the apocalypse and, accordingly, their trajectories depend on how quickly they anticipate the final trauma that will give way to the New Age, and what they construe as their role in the decisive events. A conversionist sect may simply seek to use the pre-apocalyptic moment as a basis in proselytizing to underscore the urgency of accepting salvation, or it may actually hold that sufficient conversions themselves will trigger the second coming of Christ, God’s final judgment, or some other event of the End Times. On the other hand, the apocalyptic warring sect seeks to advance the arrival of the new era through violence, including terror (Hall 1978: 206–207). Historically, such sects may operate under generally religious auspices, as al-Qaeda and militant/survivalist Christian groups in the United States claim to do, or they may be purely secular (for example, the Red Army Faction – or Baader-Meinhof gang – that operated in Germany during the 1970s). In either case, they invoke a value commitment to a sacred cause, following what Weber called an “ethic of ultimate ends” (Hall 1978: 206–207; cf. Wilson 1973: 23). Apocalyptic war, then, is the holy war described by Max Weber (1978: 473–474) – what Mark Juergensmeyer (2000: ch. 8) calls “cosmic war.”

No single typology will capture all empirical diversity, and trajectories need to be mapped over time. Internal dynamics (for example, the routinization of charisma classically described by Max Weber) will often shape movement groups. Also decisive is religious migration, which – as the histories of the ancient Jews, the American Pilgrims, the Mormons, and Peoples Temple (to name only a few) demonstrate – can both be spawned by apocalyptic efforts to escape evil forces, and give rise to apocalyptic conflicts in the Promised Land. More generally, apocalyptic trajectories will be shaped by concrete developments and a group’s own interpretations of them, often in interaction with other groups and a larger movement. Under such diverse circumstances, groups may seek to differentiate themselves from other movement groups by invoking fine-grained distinctions of theology, strategy, and tactics. Also, trajectories frequently are shaped in interaction with an established social order. Take two examples. First, the Weather Underground’s violent radicalization emerged in the wake of what its participants regarded as the failure of the wider anti-Vietnam War movement to affect US foreign policy. Second, the fiery 1993 denouement of David Koresh’s Branch Davidians near Waco, Texas, occurred during an ever-intensifying siege by governmental forces, themselves misled by cultural opponents (Hall, Schuyler, & Trinh 2000: ch. 2).

In yet another trajectory, a millennialist group that makes exact predictions about the world’s end faces a collective cognitive crisis when definitive evidence disproves its predictions. Yet this outcome does not necessarily spell the end of the movement, as was demonstrated after William Miller’s prediction about the world ending in 1844 failed to materialize, when some believers went on to found the Seventh-Day Adventist Church. Similarly,
after flying saucers failed to rescue a sect from doomsday in 1954, believers revealed that God had decided to spare the world (Festinger, Riecken, & Schachter 1964).

Millenarian and apocalyptic movements receive only episodic attention, largely contingent on the prevailing zeitgeist. The many open research questions concerning social movements in general are relevant to these groups as well, yet the special role of the sacred in such groups focuses attention on an issue of wider salience – the relation between culture, agency, action, institutions, and social formations. Some analysts would discount any substantial relationship between sacred ideology and movement developments, for example, suggesting that movement groups are basically rational in the collective choices they make, or that invoking the sacred may turbocharge a movement’s solidarity and sense of urgency, but has no significant independent effect net of other factors. Conversely, proponents of the Strong Program in cultural sociology initiated by Jeffrey Alexander will anticipate that cultural meanings have independent causal significance. The full range of such theories can offer useful clarification of alternative explanations, models, mechanisms, and processes. However, the empirical complexities and multiple explanatory issues concerning apocalyptic and millenarian movements suggest that explanations will be historically and situationally contingent. The central general task of research going forward is to map the conditions under which one or another process or mechanism takes hold, where one or another theory is salient. As we now recognize, apocalyptic movements can be both volatile in their trajectories and broadly significant in their consequences. Research on apocalyptic and millenarian movements thus merits pursuit with a new sense of urgency.

Molly Maguires (United States)
ANDREW MARTIN

The history of organized labor in most industrialized nations tends to be quite violent. This is especially true in the US, where employers often relied upon their own private security force, or the apparatus of the state, to quell labor unrest. Many labor unions during this period fell victim to a political and economic climate that granted business elites considerable discretion in ridding their workforce of union influence. Notorious instances included the lynching of Wobbly activists like Joe Hill, the Haymarket Riot of 1886 in Chicago, and a railway strike in 1877 that resulted in significant civilian casualties inflicted by state militia. These and other instances of violence, not surprisingly, led some unions, and many individual workers, to respond with violence of their own. The case of the Molly Maguires is an especially interesting historical example of the violence that sprang out of contentious industrial relations in America.

Labor organizations in the US have long relied on ethnic, religious, and racial boundaries to forge solidarity among members. The early years of the American Federation of Labor, with its emphasis on native-born, white skilled workers, is the most prominent example of this. Yet during the Industrial Revolution in America, when the labor process was becoming increasingly deskilled and repression of labor activism was common, other groups used pre-existing identities to create bonds among workers.

The Molly Maguires were not unique in this regard, as it was comprised largely of Irish-Catholic coal miners based primarily in northeastern Pennsylvania. The organization gained notoriety due to outbreaks of violence in the region in the mid to late nineteenth century. Its existence was subsequently used by the industrialists who controlled the mines as justification for repressing unionization efforts among the miners. Because of its illegal activity and informality of networks among members, the details of its membership, goals, and actions remain clouded in mystery. Indeed, the fact as to whether it was an “organization” or simply a loose collection of individuals who felt that violence was the only means of improving their lot is a matter of considerable debate among historians.

Despite this ambiguity, the Maguires did have their roots in the Irish countryside in the violence carried out by peasants seeking to protect their rights to land. With the growth of coalmining in the US, immigrants from Europe, including Ireland, came to work the coal fields, and they brought with them traditional means of confronting grievances, including the Molly Maguires.

Again, there is considerable speculation regarding the actual composition and activities of this group, and how influential it was in the coal mines of Pennsylvania. In particular, opponents of the Irish and the labor movement in the region at various times accused both the Irish-Catholic fraternal organization, the Ancient Order of Hibernians, as well as the main union of the mines, the Workingmen’s Benevolent Association (WBA), as serving as a front for the Maguires. Despite such claims, there is little actual evidence that this was indeed the case. Rather, it appears that such associations were made to incriminate both groups in the violence attributed to the Molly Maguires. In particular, the Maguires gained significant notoriety due to a series of assassinations and murders that were linked to the organization, 16 in all. These actions occurred during two separate periods.

The first wave took place during the American Civil War and was as much a struggle
against conscription as it was against the poor working conditions that marked the coal mines of the region. The Irish laborers identified primarily with the Democratic Party, and therefore opposed the war and efforts to raise an army through the draft. During the war there were six assassinations that were attributed to the Molly Maguires, and many of them were related to efforts by the government to draft Irish workers. With the conclusion of the war, violence waned, although it did not cease. Along with the end of the war, the rise of a unified labor organization, the WBA, contributed to the decline of violence in the coal fields. Unlike previous unions, this organization was quite successful in organizing mine workers across skill and ethnicity. Its roots were in the British model of industrial unionism and thus wholly opposed to the violence of the Molly Maguires. As such, it represented an important means by which the grievances for poor Irish mine laborers, including low wages and dangerous working conditions, could be expressed in a peaceful manner.

Yet this lull in labor violence in the coalfields proved to be short lived as major industrial changes led to renewed conflict between labor and management. Specifically, in the early 1870s the head of the Reading Railroad Corporation, Franklin Gowen, sought to consolidate the many small mine operators of the region and in the fall of 1874, under the leadership of Gowen, the large coal operators demanded serious wage concessions from the WBA, prompting a six-month long strike. This dispute weakened the union considerably, causing old ethnic tensions to flare up, and led to a new outbreak of violence, including eight murders and a number of acts of sabotage. The violence that arose during this period was more directly linked to the working conditions of the day, and often took the form of interethnic conflict, specifically between the Irish laborers and the more well-positioned Welsh immigrants, many of whom served as mine supervisors. Gowen knew that the union was the main obstacle to his control of the mines, and, using an antiunion press, sought first to attribute all of the violence during the strike as solely the responsibility of the Molly Maguires (a dubious claim at best) and second, to paint the WBA as merely a front for the Maguires (again, a dubious claim).

Using the considerable political power enjoyed by industrialists of the day, Gowen also hired Pinkertons detective agency to repress and infiltrate the Molly Maguires. Eventually, based upon rather weak evidence, most notably the testimony of a Pinkerton detective working undercover who had acted as an agent provocateur, 20 men were hung for the murders, including 10 on a single day. With this, the era of the Molly Maguires quickly faded. The legacy of the Molly Maguires remains sharply contested; earlier historical accounts tended to take at face value the claims made against them, but more recent, careful scholarship has both deflated such claims and put their activities within the context of the larger context of the contentious labor management relations that marked the day.

Although the Maguires portray a particularly notorious case of industrial violence, even for a period when such conflict was common, there are clear empirical benefits that can be gleaned from this struggle. First, the degree to which business and the state worked hand in glove is striking. For example, Franklin Gowen, who represented the interests of the mine owners and railroad, also served as the prosecutor in the main trial of the men suspected of murder. Clearly the interests of capital and the state were very closely aligned, and fundamentally opposed to the organization of workers into unions. The case also illustrates the extent to which business owners were willing to rely upon private forces, here Pinkertons, to ensure a union-free workplace. Violence by nonstate actors like mobs and vigilantes has long been a feature of working-class conflicts. It is evident also that unions during this period were often viewed suspiciously; in the case of the Molly Maguires there is virtually no evidence the WBA carried out or condoned any of the violence, yet the public was generally willing to believe accusations that this union was behind
it. Such belief allowed the state and mine owners to repress workers with little public opposition, thus effectively ridding the Pennsylvania coal mines of organized labor for many years.

REFERENCES AND SUGGESTED READINGS

The term “moral panics” (MPs) first appeared as an academic term at the beginning of the 1970s, in the well-established field of sociology of deviance and labeling, along with the emerging sociology of mass media. It was the pioneering studies of Jock Young (1971), on the social meaning of drug use, and of Stanley Cohen (1972), on the media-inspired confrontations between youths, which developed and effectively launched the concept of MPs to its present status as a central tool of sociological and media analysis, as well as a common phrase in popular discourse. Since then, the conceptualization of moral panics has benefited from several theoretical innovations. The original model drew mainly on symbolic interaction and labeling theory in relation to deviant behavior, but also on other theories, such as those interrogating collective behavior, social problems, and social movements. Ironically, the success of the concept has also resulted in loose or outdated theoretical applications (McRobbie & Thornton 1995; Cornwell & Linders 2002; Garland 2008) and increased questions about its efficacy (Ungar 2001; Hier 2008). However, the concept and theory of MPs retain all their pertinence and still offer us a heuristic analytical tool by which to study social movements.

DEFINITION

MPs are classically defined as struggles for moral hegemony over interpretations of the legitimacy (or not) of prevailing social arrangements and material interests. They are moral disturbances centering on claims by moral entrepreneurs that direct interests have been violated, sometimes expressed in terms of demonization of “moral deviants” (Victor 1998), sometimes with humanitarian undertones (Becker 1963), that are “wildly exaggerated and wrongly directed” (Jenkins 1998: 7). Indeed, MPs have to create, focus on, and sustain powerfully persuasive images of “folk devils” (Cohen 1972) that can serve as the heart of moral fears. These fears are seen as grossly disproportionate to the event or the activities of the individuals concerned (Hall et al. 1978; Goode & Ben-Yehuda 1994). As Cohen states it, a condition, episode, person, or group of persons emerges to become defined as a threat to societal values and interests; its nature is presented in a stylized and stereotypical fashion by the mass media; the moral barricades are manned by editors, bishops, politicians, and other right-thinking people; socially accredited experts pronounce their diagnoses and solutions; ways of coping are evolved or (more often) resorted to; the condition then disappears, submerges or deteriorates and becomes more visible (Cohen 1972: 1).

MORAL PANICS AND SOCIAL MOVEMENTS

In his foundational book, Cohen studied official and public reaction to conflicts between rival youth subcultures – the “mods” (for modern styles), who drove scooters, against the “rockers,” who rode motorcycles and wore leather – which gave way to street fights and property destruction after their unanticipated arrival in an English beach town. In the same vein as Young, Cohen identifies five categories of groups as being part of the collective process of MPs: control agents, politicians, lawmakers, moral entrepreneurs, and the mass media. He builds a five-stage model of MPs: behavior by folk devils is defined as a threat to societal values and interests; the threat is depicted in a recognizable dramatic form by the media; a rapid build-up of public concern
arises; public authorities, politicians, and moral entrepreneurs call for a strong solution to the problem; the panic recedes or results in social and institutional changes.

Hall and colleagues (1978) expanded upon Cohen’s concept of MPs by explicating the role of ideology in the media’s contribution to the process of a MP, particularly during times of political or socioeconomic crisis. Using Gramsci’s concept of hegemony and the signification of “common sense,” Hall and his colleagues contend that “the media tend to reproduce the definitions of the powerful” (1978: 57) while maintaining relative autonomy. They state that MPs are intentionally created to draw the public attention away from social and economic troubles and toward the particular subject of the MP for increased forms of social control.

These early English theorists were precursors to the social constructionist perspective, which does not take reality as a given, but as something that is produced by the actions of individuals and groups and their interpretations of how the world works. Critcher (2003) contrasts this British “attributional” model (i.e., defining MPs by their attributes) with an American “processual” model (i.e., defining MPs by the processes through which they pass). Indeed, American studies are particularly insightful in their analyses of the role of moral entrepreneurs and claim makers, therefore of organized collective interests and social movements.

For example, Goode and Ben-Yehuda explicitly incorporate the concept into the field of social movements. Social movements are defined as organized efforts by a substantial number of people to change or resist change in some important aspect of society, and their principal aim is to establish the legitimacy of a specific claim about a social condition. (Goode & Ben-Yehuda 1994: 116). Social movements are distinguished from pressure groups or lobbies on the grounds that they are mainly composed of outsiders without direct access to policymakers and legislators, and that their statements do not receive automatic attention in the media. In order to further their claims they must gain the media’s attention and attempt to secure legitimation for their definition of the reality or the condition being addressed. They do this by opposing good versus evil, and using the language of moral indignation. Their focus is on the worst aspects of the condition they are denouncing as if these were typical and representative. The authors assess three competing explanations of MPs: first, a grassroots model, that sees the sources of panics in widespread anxieties about real or imagined threats; second, an elite engineered model, in which an elite group manipulates a panic over an issue they know to be exaggerated, in order to divert attention away from their own inability or unwillingness to solve social problems. The main concern of a dominant social group (state, institutions, police, social workers) is to have an objective and conscious interest in developing the MP: a middle level social movements model. Here, the important trait, in the vein of Gusfield’s seminal work on prohibition leagues (1963), is the role of moral entrepreneurs who launch crusades that may become panics.

Subsequent studies of MPs have multiplied exponentially, including AIDS (Watney 1988), drug scares (Armstrong 2007), minority youth violence (Welch, Jenkins, & Harris 1999), child abuse and pedophilia (Jenkins 1998; Whittier 2009), satanism (Victor 1998), school shootings (Burns & Crawford 1999), and obesity (Fraser, Maher, & Wright 2010), among others. Although both the original model of MPs and its successive reformulations are very useful for social sciences, one has to take stock of the criticisms that have been formulated by scholars in the field of social problems, public policy, media, and social movement studies.

REVISIONS AND CRITICISMS

Many grounds for the rejection or revision of the concept of MPs can be cited. Listed below are six main concerns that may help to consider further the strengths and weaknesses of this key concept to the study of social movements. The
first criticisms discussed are easily answered, while the later oppositions raise valid questions against the theory.

Since its inception, the concept of MP has been used as a form of social critique. As Cohen himself observes, panic research has tended to focus on “cases where the moral outrage appears driven by conservative or reactionary forces...[where the aim of the research] was to expose social reaction not just as over-reaction...[but also as] tendentious (that is, slanted in a particular ideological direction) and...as misplaced or displaced (that is, aimed – whether deliberately or thoughtlessly – at a target which was not the ‘real’ problem)” (Cohen 2002: xxxi). However, things have recently changed and scholars working on topics as diverse as pedophilia (Whittier 2009), health-related problems (Fraser, Maher, & Wright 2010), or flag burning (Welch 2000) have shown that moral campaigns are not intrinsically conservative.

Second, critics such as Whittier argue that MPs approach to social problems is far too close to largely discredited “studies in crowd behavior that falsely suggest that people in groups or crowds adopt irrational behaviors or beliefs in a kind of mass hysteria in which their usual behaviors and norms fall by the wayside under the influence of the group” (2009: 17). Indeed, it is true that some scholars tend to assume too quickly that people are easily swept up in a collective process of media hype and false information and subjected to “conformity pressures that enforce consensual beliefs” (Victor 1998: 560). However, it has also become very clear that the term “panic” is only a metaphor and has nothing to do with physical panics. As Ben-Yehuda states it, “moral panics are not characterized by fright, flight, freezing, stampede or other behaviours associated – most of the time wrongly – with ‘panics.’ MP’s are characterized by speeches, sermons, preaching, negotiations, arguments, debates, legislation, law enforcement priorities, agenda setting and the like, all focused on moral issues” (Ben-Yehuda 2009: 2).

It has also frequently been said that moral panics are volatile phenomena. By their nature, panics would be fleeting and subside as quickly as they erupt. For example, Goode and Ben-Yehuda (1994) consider that the same issue may reoccur but individual panics cannot be sustained for long. Yet, however temporary they may seem, MPs may also pave the way to new institutional arrangements, as well as for long-lasting bureaucratic structures. Furthermore, even if a specific MP does not seem to immediately give way to routinization, its very occurrence may leave traces and have long-lasting cognitive effects. This has been illustrated by scholars working on police culture and the criminalization of social movements (Reiter & Fillieule 2006).

Other criticisms refers to the idea that the disproportional reaction to a particular deviance is a key attribute of any MP. As Goode and Ben-Yehuda argue, “the concept of moral panic rests on disproportionality” (1994: 38). It is evident where “public concern is in excess of what is appropriate if concern were directly proportional to objective harm” (1994: 36). A classic example is the 1980s missing children controversy in the US (Best 1990). A national campaign for missing children was boosted by the 1981 murder of a child in Florida whose parents consequently became prominent activists. The campaign claimed that 1.5 million children disappeared or were abducted each year in the US. Two federal laws set up a national system for recording missing persons (1982), and a National Center for Missing and Exploited Children (1984). However, from 1985 onward, attention to the issue declined as the media attacked the credibility of excessive claims. Even if Best’s work clearly illustrates the social construction of MPs, measuring the gap between the reality of a problem and its representation is in itself a difficult matter. Indeed, we simply remain “short of some reliable indication of what constitutes a realistic level of concern, anxiety or alarm” (Hier 2008: 178). In her study of child sexual abuse, Whittier (2009) strongly rejects sociological studies that take a social constructionist or social problem
approach to the issue and denies the fact that concern about child molestation run high only as a result of sensationalist media coverage and the claims of self-promoting “experts,” rather than as a result of real danger (Victor 1998; Jenkins 2001) She even shows that, in fact, the majority of criminal cases of child molestation are not even mentioned in the news coverage.

Criticisms of disproportionality are closely linked to the idea that the model of MPs is not well suited to fragmented and multicultural societies where experts, media, and the public do not speak with a unified voice. Here again, media coverage of child sexual abuse is a good example. In contrast to social constructionist arguments, rather than equating all sexual abuse with ritual abuse, media stories discuss other forms of child molestation, bringing more attention to other forms of abuse such as incest (Whittier 2009). A renewed MPs approach has to recognize that in multicultural societies, morality is constantly contested and negotiated. Moral consensus in such societies is not an issue taken for granted, and MPs may be launched by diverse competing moral entrepreneurs in various social arenas. Therefore, the entire issue of launching MPs within more general processes of moral entrepreneurship, legislation, policing, and regulation has to be reconceptualized. In the same vein, one must admit that the audience does not simply believe and act upon the messages it receives from the media. In this respect, the model allegedly fails to explain the role of the public as media audiences or a body of opinion (McRobbie & Thornton 1995; Cornwell & Linders 2002; de Young 2004).

Finally, and more damagingly for social movement research, classic MPs models tend to erroneously deny agency to “folk devils” themselves (Watney 1988; Cornwell & Linders 2002; de Young 2004). McRobbie and Thornton (1995: 571) convincingly stress the fact that in contemporary societies, stigmatized groups are less marginalized than they once were. “They not only find themselves vociferously and articulately supported in the same mass media that castigates them, but their interests are also defended by their own noches and micro media. So called folk devils now produce their own media as a counter to what they perceive as the biased media of the mainstream.”

Social movement research can help to enrich the MPs model by analysis of the interactions between deviantizers and stigmatizers on one hand, who try to create folk devils, and, on the other, folk devils who attempt the rejection or even reversal of stigmatization, though the latter attempts are not always successful (e.g., Snow & Anderson 1987). At the same time, social movement research could rely more on the theoretical foundations for the theory and concept of MPs, especially labeling theory, which offers powerful instruments to study interactions between stigmatizers and deviantizers and their targets. One of the more interesting questions to ask in this context would be when and why attempts to launch moral panics fail (Jenkins 2009).

Movement Toward Socialism (MAS–IPSP) (Bolivia)

ROBERT ALBRO

The Movement Toward Socialism (Movimiento al Socialismo, hereafter MAS) is the political instrument of Bolivia’s president Evo Morales. The story of Morales is well known. He grew up poor in a rural Aymara-speaking community of miners, and migrated to the lowland coca-growing Chapare region upon conclusion of his military service. In the early 1980s Morales became active in his local union of coca growers, and since 1988 he has been primary leader of the Six Federations of the Chapare, the region’s coca grower movement. He has continued as the titular head of the coca growers since 2006 while serving as Bolivia’s president.

The origin of the MAS cannot be understood except in the context of long-term coca grower resistance in the Chapare to the US-backed War on Drugs, initiated in the early 1980s in Bolivia. Efforts to eradicate coca – the active agent in cocaine – routinely pitted coca grower unions against US-trained Bolivian eradication agents, often with violent results. The politics of the coca growers combined sharp rejection of the US presence in Bolivia with defense of union autonomy, rejection of Bolivia’s traditional Bolivian class system, rejection of “Washington Consensus”-inspired neoliberal policies since 1985, and a discourse combining class with ethnicity. During the 1990s the coca growers increasingly framed their commitments in cultural and indigenous terms. Nevertheless, they remained marginal to national Bolivian politics throughout the 1980s and 1990s, despite coming to dominate the national agrarian union hierarchy.

The MAS was born from coca grower outreach beginning in the 1980s to cultivate ties with political parties from the Left. In 1995, on the heels of the 1994 “March for Life, Coca and Sovereignty,” the coca growers used their dominant position in the national union movement to adopt a “thesis of the political instrument,” aiming for the creation of a political party as a direct extension of their struggle. Concurrent with this the Bolivian government’s 1994 Popular Participation Law provided a means for the entrance of indigenous representatives into local political office. By the late 1990s the coca growers had become the dominant electoral force in the Chapare region.

This was the basis for Morales’ election to Bolivia’s congress in 1997, after borrowing the name of an obscure leftist party, the MAS, to run legally. In 2002 Morales was transformed into a national political figure when his MAS candidacy finished an unexpected second in the national presidential election. Morales won the presidential election in 2005 with a 54 percent majority of the vote, which was unheard of for Bolivia. Subsequently the MAS has continued to enjoy strong local support throughout the country – with the notable exceptions of the lowland departments led by Santa Cruz, which have opposed him – as well as a congressional majority. Morales was reelected to a second term in 2009. And despite some challenges the MAS has been the dominant local and national political force in Bolivia since 2005.

The MAS became a national political factor through its protagonism in the large-scale grassroots mobilizations in Bolivia between 2000 and 2005, where it orchestrated highly visible marches and participated in road blockades, alongside other social movement and indigenous actors, in the process driving two presidents from office. During this period of sustained social ferment and direct-action protest, the cause of the coca growers also came to be elided with broader political currents bringing together concerns for national
sovereignty, the rejection of neoliberalism, the promotion of indigenous rights and autonomy, with calls for a constitutional referendum and more comprehensive agrarian reform.

In the process the MAS presided over the collapse of Bolivia’s traditional political class and established parties, which had held sway over the country’s politics since the revolution of 1952. The MAS forged an unprecedented coalition across previous social divisions, including coca growers, worker unionists, indigenous peoples, disenchanted members of the informal economy, students, and a significant proportion of the urban middle class. The MAS effectively channeled a shared rejection of the political status quo. The MAS consistently avoids calling itself a political party, preferring to behave as if an expression of the grassroots (referred to as the “bases”). Particularly early on, MAS representatives were careful not to present themselves as politicians but as “spokespeople” for a base-driven consensus emerging from face-to-face rank-and-file union and indigenous community meetings. A major challenge for the MAS has been to maintain its diverse electoral base. The inclusion of nonindigenous Marxist intellectual Álvaro García Linera as Morales’ vice president is one expression of this.

Morales and the MAS represent a historic political transformation for Bolivia. Carrying out an agenda given it by Bolivia’s social and indigenous movements to “refound” the country, the MAS has moved away from the policies of “savage capitalism” of prior administrations, in the process nationalizing both its oil and gas industries. It has promoted the country’s nascent lithium industry, while seeking new economic partners other than the US. It has decriminalized the coca leaf and undertaken an active program of land redistribution, especially for indigenous migrants. Most historic has been the successful passage of Bolivia’s 2009 constitution, defining the state as “plurinational” and “communitarian.” It has enshrined a wide set of new collective rights specifically for indigenous peoples, formally recognizing a total of 36 indigenous languages and groups alongside the right to self-governance. It has further included recognition of indigenous forms of leadership, decision-making, community justice, territorial rights, and the right to manage their own resources and development.

The symbolic politics of the MAS has effectively capitalized upon lessons learned from new populist parties which appeared in the late 1980s, and which had success among Bolivia’s lower and working classes by focusing on their economic duress and their indigenous heritage. This includes regular usage of Andean languages alongside symbols of indigenous culture and identity. The MAS official platform is framed in terms of the Andean cosmological concept of material and spiritual balance, called “suma qamaña” (or “living well”). And the “refounding” of the Bolivian state is known as a “Pachakuti” – a millennial term referring to world renewal. The MAS presents itself as a means for the “decolonization” of Bolivia’s native majority after “500 years” of struggle. The MAS has also used an indigenous agenda as a basis for its foreign policy goals, in conjunction with currents of transnational indigenous activism. This was evident when in 2010 Bolivia hosted the First World Conference of the People on Climate Change and the Rights of Mother Earth.

If the MAS is often held up as an illustration of what happens when a social movement successfully aspires to governance, this process has not been free of conflict. In 2008 the MAS government grappled with a secessionist movement in Santa Cruz. And since 2005 it has faced strong criticism from different indigenous organizations that it is too top-down and not fully representative. In 2011 this occasioned a serious crisis of legitimacy for the MAS government when it quashed indigenous marchers seeking to halt the building of a new highway through their ancestral territory. Given the diversity of indigenous interests and claims upon the state, it has proven difficult for the MAS to represent them all. It is also unclear if the MAS can sustain its dominance if Evo Morales were to leave office in 2015.

Muslim activism in Europe
LASSE LINDEKILDE

For a long time Muslims in Europe, predominantly work migrants of the 1960s–1970s and their descendants, were ignored as political agents, both by authorities and academics. The sociology of religion has approached European Muslims in terms of religious identity, transformation of religious practices, and the institutionalization of Islam in different national contexts, but has largely ignored political manifestations (see Maréchal et al. 2003). Until recently, social movement studies considered religion an issue of the past (Kniss & Burns 2004) and rarely acknowledged it as a source of political activism.

However, over the past decade Muslim political activism has become a central political concern to Western European societies, and a fast growing field of research. This interest has been driven by a perceived challenge to secular democracies from Muslim activism in Europe, presumably demonstrated in high-profile cases such as the Rushdie affair, the affair des foulards in France, and the Danish Muhammad cartoons controversy.

TYPES OF MUSLIM ACTIVISM

Muslim activism in Europe is a diverse phenomenon in terms of mobilized identities, arenas of claims-making, types of demands, and so on. In practice the same religious doctrines give rise to different forms of activism and normative aspirations. From a majority society perspective much hope and effort has been invested in the mobilization of a “European Islam,” characterized by individualization and the belief that Islam should be practiced in private (Salvatore 2004). More prominent among Muslims has been the mobilization around neo-orthodox identities, stressing the right to be different, as in the fight for Islamic symbols in the public sphere, and the possibility of simultaneous strong affiliation with the Islamic community and societal integration (Schiffauer 2007). These types of Muslim mobilization and activism are often initiated and called for against the backdrop of ultra-orthodox Muslim communities, which reject the political struggle for recognition among Muslims in Europe, arguing the incompatibility of Islam and democratic participation.

The vast majority of European Muslims, who accept the terms of democracy, have raised a variety of political claims, some of a practical nature regarding religious practices, such as the building of mosques, Muslim burial grounds, veiling in public, and Muslim private schools. Such claims are often mobilized around arguments of equality of religion, referring to entitlements already given to other religions (Fetzer & Soper 2005). Other claims have been mobilized in reaction to public provocations of Muslims, such as the Scandinavian cartoon controversies, arguing for equal treatment, anti-discrimination, and freedom of religion (e.g., Lindekilde & Larsson 2009).

Muslim political claims in Europe have been cast using diverse repertoires of action. Considering institutionalized forms of political activism, European Muslims have (wherever possible) made use of their political right to vote and run for elections, in particular at the local level. Electoral participation by Muslims in Europe has generally been lower than among majority citizens, but has been shown to vary significantly across local and national contexts, depending on electoral systems and availability of Muslim candidates. Institutionalized channels of consultations with immigrant communities have also proven to be important to Muslim activism, serving as nurseries for Muslim political careers. The idea of official Muslim councils that provide authorities with a unified Muslim representation (as seen
in e.g., Belgium, Britain, and France) has been contested and has led to concerns about authority dependency, factionalism, and lack of representativity (Pfaff & Gill 2006). The legal system has also become an increasingly important forum for Muslim activism, as courtrooms become arenas of political claims-making (Amiraux 2005). Non-institutionalized forms of activism such as demonstrations, petitions, and “homeland claims-making,” have been shown to be more widespread in Muslim communities in countries with limited opportunities for procedural forms of political claims-making. Regarding Muslim participation in public debates, research points to national variance in the amount of claims raised by actors identifying as Muslims, issues raised, and justifications presented (Koopmans & Statham 2001).

DEVELOPMENTS AND TRENDS

Recent research on Muslim activism in Europe has striven to integrate insights from the sociology of Islam with social movement theory, acknowledging the diversity and complexity of Muslim experiences in Europe, while taking Muslim political activism seriously (e.g., Wiktorowicz 2004). This development has caused a shift away from explaining Muslim activism in terms of Islamic exceptionalism (e.g., its proclaimed decentralized, political, and conflictual nature), toward seeing it as driven by dynamics of contention similar to other forms of activism. Instead of taking the incompatibility of Muslim activism and secular democracies as its starting point, more research is looking to empirically investigate if and how Muslim activists are adapting to the political culture of their country of residence. Likewise, the practical, rather than the theological, manifestations of the relationship between Islamic thought and political activism are increasingly coming into focus (Bayat 2007).

Empirically some trends in Muslim activism can be noticed. First, Muslims in Europe are increasingly organizing in multiethnic organizations focusing on a Muslim identity rather than in ethnocultural (immigrant) organizations. This tendency reflects a trend among second-generation immigrants of searching for a more acultural version of Islam (Roy 2002), but should also be seen as a response to the intense politicization of Islam in European societies. Second, Muslim activism in Europe is becoming more female, giving rise to female Muslim organizations and claims of gender equality. Finally, it has been argued that Muslim activism in Europe has radicalized in recent years, giving way to more ultra-orthodox interpretations of Islam, including views of democratic procedures as haram, and acceptance/support of violence, including terrorism, as a means of political activism (Abbas 2007). However, the claim that Muslim radicalization is on the rise has yet to be substantiated, and further investigation into the determinants of such radicalization is needed.

REFERENCES AND SUGGESTED READINGS

Barely a decade into the twentieth century, the National Association for the Advancement of Colored People (NAACP) was founded. Its principal charge, issued by the cadre of white reformers, in addition to W.E.B. Du Bois and Ida B. Wells-Barnett, was to secure for blacks the rights guaranteed them by the Constitution. More concretely, the organization was originally intended to help black Southerners overcome what Aldon Morris calls the “tripartite system of domination” in which whites subjected them to social, political, and economic oppression (Morris 1984). The NAACP did so in manifold ways, most of which rested upon appealing to federal authorities for legislative and legal redress.

From the outset, a principal organizational priority was the preservation of the lives of black Southerners whose welfare meant nothing to white supremacists. During what has come to be known as the “lynching era (1882–1930),” the lives of well over 4000 blacks were snatched by mobs of white Southerners (Tolnay & Beck 1995). In this context, one in which blacks were murdered with impunity, the NAACP lobbied Congress to make lynching a federal crime. James Weldon Johnson, the NAACP’s first black chief executive, managed to persuade enough members of the House of Representatives to pass the Dyer Bill in 1922. Yet, like much progressive legislation that would eventually follow, Southern senators used the filibuster to kill it, claiming that the Dyer Bill ran afoul of states’ rights (Sullivan 2009). However, in 1930, the NAACP successfully lobbied Congress to derail the appointment of Judge John Parker, a North Carolinian jurist who thought blacks unfit to vote.

Ironically, the NAACP’s victory in sweeping aside formal segregation unleashed forces that would all but cripple the organization in the South. With the rise of “massive
resistance,” a campaign to at least forestall desegregation if not end it (Bartley 1969), the South retaliated against the NAACP, forcing it to play defense as the 1950s played out. Among other measures, southern state legislatures dusted off old corporate tax and registration laws to force the NAACP out of business and force it to reveal the names of its members. While the NAACP refused to comply, its access to courts was suspended, and the organization was largely driven underground in the South, both of which caused membership to plummet (McMillen 1994; Jonas 2005; Sullivan 2009).

While its ability to press for litigation stalled, and its history of lobbying Congress long over, the NAACP managed to continue to contribute to the movement. It did so through its ability to help mobilize its membership for the direct action protests that took place throughout the South in the late 1950s and early 1960s. Along with the black church and black colleges, the NAACP was one of the institutional pillars on which insurgency would come to rest. Indeed, each possessed ready-made networks amenable to rapid mass mobilization (McAdam 1999). Moreover, in the absence of local branch leadership provided by Amzie Moore, Aaron Henry, and W.W. Law, to name but three, it is not clear that the movement would have been as successful (Carson 1981; Payne 1995; Brooks 2004).

Through the early 1960s, it is beyond dispute that the NAACP realized its founding charge: securing equality for black Southerners. They are far better off now than they would have been otherwise. Of course, blacks elsewhere benefited from the work of the NAACP through this period, including winning in Shelley v. Kraemer (1948), in which the court held that attempts to enforce restrictive housing covenants would run afoul of the Constitution. Yet, as the 1960s wore on and bled into the 1970s, America’s oldest civil rights organization achieved fewer successes. The reasons for this are manifold.

Increasing resentment on the part of many whites, many of whom felt threatened by what they perceived as blacks’ improving status, and frustrated with the disturbances of the late 1960s, made it difficult for the NAACP to retain its support among progressive donors (Jonas 2005). In the face of this increasing hostility, the NAACP found it difficult to work with other civil rights groups. Part of this is due to the fact that the more progressive movement organizations, including the Student Nonviolent Coordinating Committee (SNCC), the Congress of Racial Equality (CORE), and, later, the Black Panther party, criticized the NAACP as too conservative when it rejected black power as necessarily antiwhite (Carson 1981). Further, it preferred to continue working within established institutional channels to ease the plight of blacks in the urban core, as other organizations continued to embrace protest as a means of redress. Moreover, the NAACP continued to aim for integration as a goal even as other social movement organizations began to move toward separatism as a tactical solution to the backlash (Lawson 2003). Further adding to its conservative image was the NAACP’s refusal to join with CORE and SNCC to take a hard line against the war in Vietnam (Hall 2003). Finally, the NAACP’s coziness with the Johnson administration further diluted its effectiveness by causing some to see it as successfully co-opted (Reed 1999). Ultimately, Nixon’s capture of the presidency summarily severed the NAACP’s access to the White House, spelling doom for the relatively conservative course it sought to chart, as the new administration worked to undermine all efforts for which the organization had fought; a pattern that continued in two of the next three administrations (Sitkoff 1981).

National Liberation Sandinist Front (Nicaragua)

SALVADOR MARTÍ I PUIG

ORIGINS

In July 1961 a group of young, radicalized Nicaraguans inspired by the experience of Cuba founded a guerrilla organization, the National Liberation Front (FLN), in order to take up arms against the Somoza regime. Later, after the first guerrilla campaigns, Carlos Fonseca, one of its founding leaders, added the epithet “Sandinista” to the organization’s name, making it the Sandinista National Liberation Front (FSLN), as of 1962. The main inspiration for the FSLN – as was the case with other Latin American guerrilla organizations – was the Cuban Revolution and the foco theory of guerrilla warfare (foquismo). Yet, in the case of the FSLN, the nationalist and anti-imperialist tradition started by Augusto César Sandino (1927–1933) also had an important influence.

Initially, the FSLN focused on carrying out guerrilla actions in the mountains in the north of the country. Although it enjoyed few victories over the 1960s, it did manage to create a type of “guerrilla legend.”

Over the following decade, the FSLN built a Marxist-Leninist ideological core and a solid organizational structure. However, during this period the FSLN also experienced internal conflicts that gave rise to three groups: the Guerra Popular Prolongada, which advocated carrying on with the guerrilla war; the Tendencia Proletaria, which wanted to organize the workers; and the Tendencia Insurreccional, which saw a need to establish alliances with sectors of the bourgeoisie and which called for insurrection.

It was in the second half of the 1970s that the FSLN began to gain real political influence. As of 1977 the Sandinistas carried out some spectacular actions (such as kidnapping the National Assembly), activated urban groups, gained the support of the middle class, and even co-opted members from high society.

It was in this way that the FSLN began to challenge (both on the streets and in the diplomatic arena) the regime of the Somoza family. Four elements were particularly important in this process: the position of the Carter administration in favor of human rights, the social impact of the assassination of Pedro J. Chamorro (a prestigious journalist opposed to the regime), the intense repression unleashed by Somoza’s National Guard, and the FSLN’s capacity to create alliances. Thanks to this combination of factors, together with the social support they enjoyed, on July 19, 1979, the “muchachos” of the FSLN reached the streets of Managua to proclaim the second victorious revolution in Latin America.

LA SANDINISTA POPULAR REVOLUTION (1979–1990)

The revolutionary process led by the FSLN (via a collegiate body of nine commanders, called the Dirección Nacional) had many objectives, of which three are worth pointing out: (1) democratization and mobilization, (2) the recuperation of national sovereignty, and (3) productive development and equality.

At the institutional level the revolution created a state which, although led by the FSLN, maintained considerable spaces of plurality and guaranteed individual and collective liberties. At the international level, Nicaragua quickly became associated with similar cases (such as the Cuban revolution) but also maintained a solid policy of alliances with countries from Western Europe and Latin America. With regard to economic policy, the revolutionary government carried out a profound agrarian reform and intense education and health campaigns. Consequently, in the first years of the
Despite this, the revolution soon found a ferocious and powerful enemy: the US government. The US administration led by Ronald Reagan designed a financial, political, and physical aggression – the Contra war – to end the revolutionary experience that, as was claimed, could extend throughout the region. Consequently, the counterrevolutionary war limited and changed many of the projects that the FSLN had initially planned. The Contra war aroused great interest in the international arena. Many considered the process to be a fight between David and Goliath, giving rise to a great wave of international solidarity throughout the world.

In 1990, after almost a decade of war, the weak Nicaraguan economy was on the verge of collapse. In these circumstances, elections were held in 1990 in the framework of liberal-democratic institutions created as a result of a Constitution drawn up in 1987. Daniel Ortega (president of Nicaragua since 1984) represented the FSLN against a broad coalition led by Violeta Barrios (widow of the journalist assassinated in 1978).

The winner of the elections was the “anti-Sandinista” candidate and for the first time in history a formation that reached power by arms gave up its power after defeat at the ballot box.

SANDINISMO AFTER THE REVOLUTION

After losing the elections and governmental power, the FSLN became a political party and managed to survive, becoming the main force in opposition in the country for 16 years. Nevertheless, after losing three consecutive elections, in 2006 (and again in 2011) it won the presidency of the republic with the leader who had lost in 1990: Daniel Ortega. Yet the FSLN that reached power had undergone a considerable organizational and ideological change. On the one hand, over the 16 years in opposition many of the resources of organizational power became concentrated in the figure of its leader and, on the other hand, its discourse became more moderated, moving towards more populist positions, with a notable influence of religion.

The FSLN’s capacity to survive and adapt from its foundation as a guerrilla group up until the present day has been immense. Currently the FSLN is a party in power which has become a personal platform for Ortega, very similar to that of Chávez in Venezuela. Nevertheless, there is one important difference: the FSLN maintains the symbolic heritage of having been a victorious guerrilla group and a vanguard party that saw a revolutionary project through.

National Organization for Women (NOW) (United States)

STEPHANIE GILMORE

The National Organization for Women (NOW) was the largest explicitly feminist organization of the post-World War II women’s movement, and remains active into the twenty-first century. NOW was founded in June 1966, at the third annual meeting of the President’s Commission on the Status of Women (PCSW); at this meeting in Washington DC, delegates refused to pass a resolution mandating the Equal Employment Opportunity Commission (EEOC) to hear cases related to on-the-job sex discrimination cases. Commissioners Aileen Hernandez and Richard Graham had been pushing the EEOC to hear cases of sex discrimination, but were outnumbered by three other commissioners who denied sex discrimination as a violation of Title VII of the Civil Rights Act. Sonia Pressman Fuentes, an EEOC attorney, suggested that women needed an organization to speak on behalf of women as the NAACP and other organizations had done for African Americans; she also coined the name “National Organization for Women.”

Scholars often point to NOW as the example of liberal feminism, and position it in juxtaposition to radical feminism. NOW leaders have always pursued social and cultural change by working within the current political system (as opposed to a radical call for the overthrow of patriarchal structures), but never did so exclusively. In its 1966 statement of purpose, NOW identified itself as an organization for women and for men who sought equality between the sexes. It also acknowledged social conditions that perpetuate inequality for women, including motherhood and marriage, and sought political solutions to oppressive conditions. In 1968, NOW came out in support of the Equal Rights Amendment (ERA) and women’s right to abortion. These stands proved controversial: union members were reluctant to support NOW because unions at the time opposed the ERA; religiously and politically conservative women rejected abortion rights.

In 1970, NOW announced a Women’s Strike for Equality for August 26, the 50th anniversary of the passage of the 19th amendment, which granted women the right to vote. Rather than coordinate a single strike, NOW encouraged people to “do your thing.” In New York City, thousands of feminists marched down Fifth Avenue at 5:00 p.m., while in Beaver Dam, Wisconsin, feminist Gene Boyer marched alone in front of her husband’s furniture store to commemorate the strike. Although media outlets declared the strike a failure, many activists acknowledge the strike as a major success for getting the organization’s name out into the public.

Several issues threatened to divide NOW. NOW was in the political spotlight for Betty Friedan’s infamous grousing about lesbians, reportedly calling them a “lavender menace” that would distract activists from the organization’s political agenda. In response, a group of lesbians and heterosexual allies took over
the 1970 Congress to Unite Women in New York City, bearing shirts with Friedan’s words. By 1971, though, NOW passed a resolution in support of lesbians’ rights as women’s rights. Throughout the 1970s, NOW became a leading force for the ERA and abortion rights. When the ERA passed Congress in 1972, NOW mobilized women and men through local and state chapters around the country, and chapter members often organized in state houses and the streets to encourage support for the amendment. NOW was instrumental in the 1979 ERA extension campaign, which extended the time that states could ratify the amendment until 1982. NOW members and ERA supporters underestimated the rhetorical and political power of the STOP ERA campaign, spearheaded by religiously and politically conservative women and men who saw constitutional equal rights as a violation of states’ rights as well as a natural gender order of men and women. In spite of the amendment’s defeat, NOW proved itself as a major political, feminist force. NOW also became a powerful voice in support of abortion rights and in opposition to the Right to Life movement that emerged in 1973 after the Supreme Court case, *Roe v. Wade*.

After the defeat of the ERA in 1982, which happened in concert with the rise of political and social conservatism, NOW membership declined. In response, NOW focused attention on electing women politicians and has been a significant force in a number of local, state, and national campaigns. It also pushed for significant social change, becoming a leading force in lesbians’ rights and same-sex marriage. It also shifted its focus from abortion rights to reproductive justice, embracing birth control, abortion, child care, and same-sex parenting. It has also joined in coalition with other social movements and organizations to address a wide range of issues, from welfare and women’s image in the media, to women’s on-the-job rights and racism as a feminist issue.

Modernity of nationalism
MICHAEL HECHTER

Nationalism is widely perceived to be one of the leading threats to order in the contemporary world. Many lives have been ruined or lost in its name and, partly as a consequence, nationalism swirls in perpetual controversy. Part of the problem is that it seems to be an uncannily protean phenomenon. Nationalist political demands differ from place to place and time to time: sometimes they are linguistic, sometimes they are religious, sometimes they are cultural in a rather more diffuse sense. Strong nationalist movements often emerge in a given territory, subside, and then suddenly reemerge years later to nearly universal surprise. While the literature on nationalism is voluminous and growing at an increasing pace, there still remains a lack of conceptual agreement among scholars of the subject.

There is one fact, however, on which nearly everybody concurs: nationalism is a modern phenomenon. Before the nineteenth century, some people may have professed nationalist sentiments, but never the majority of people in any society. At the same time, there is no consensus about why nationalism is modern. Some writers explain its modernity by appeal to the emergence of new ideas (Kedourie 1960; Berlin 1992). Others view it as a by-product of industrial capitalism (Gellner 1984). This entry provides a somewhat different explanation.

NATIONALISM DEFINED

A vast array of cultural and political events – from the rise of folk festivals and the production of painting, poetry and music exalting the nation, to the development of paramilitary organizations – can be, and have been, labeled nationalist. Given this variety of phenomena the complaint that the concept is incoherent should come as no surprise (Alter 1989: 4; Hutchinson & Smith 1994: 4). Understanding of nationalism may not be quite so feeble as these assessments suggest, however. The literature’s incoherence is more apparent than real. There is a wide, if implicit, agreement that nationalism refers to collective action designed to render the boundaries of the nation coterminous with those of its governance unit.

Although this definition appears to be simple, it is parasitic on the definitions of two separate entities, namely, the governance unit and the nation. One reason for the scale of the controversy surrounding nationalism is its sheer multiplicity. Another is that reliable comparative evidence about nationalism is scarce. The most comprehensive evidence has been assembled by Gurr (1993) and his associates. Using a worldwide sample of 227 “communal groups” (including 81 classified as ethnonationalist), Gurr analyses worldwide collective action that occurred in the 1980s. The principal determinants of collective action in his sample turn out to be, first, intergroup economic and political differentials, which enable political entrepreneurs to mobilize members of disadvantaged groups, and, second, political contexts which provide incentives and disincentives for protest and rebellion.

Are structural factors such as persisting group disadvantages and favorable opportunities (like those provided by democratic regimes) necessary causes of collective action? Evidently not. Since the fall of Franco, Catalan nationalists have managed to win substantial autonomy from the central government in Madrid. The Catalan government controls at least 110 000 jobs. These jobs are the fruit of past nationalist successes as well as the guarantor of future successes. But (pace Gurr) Catalonia has been anything but disadvantaged. Quite the reverse: It long has been one of the most privileged regions in Spain. No form of collective action is limited to the disadvantaged.
Nationalism arises from the relationship between governance units (including states) and nations, both being groups formed from more durable lower-level social units (Hechter 2000). It is the relationship of these units that serves to explain the mechanisms of nationalism.

Governance units and polities. The governance unit is that unit which is responsible for providing the bulk of day-to-day protection, legislation, rule enforcement, and dispute resolution to its members. In much theoretical writing this unit is called a polity, indicating its political sovereignty. Indeed, governance units often are also polities. But not all governance units are polities. The distinction between governance units and polities is crucial for explaining the modernity of nationalism.

The nation. Originally, the nation was a group of people born in the same place. In the European universities of the late Middle Ages, nations were groups of students who came from the same region or country. Following the French Revolution, a nation was the people of a given country, without distinction of rank and often in contrast to the ruling monarch. In its secondary usage, “nation” meant a strange people. Subsequently, a core definition of the nation has been enunciated by nearly every eminent scholarly and political authority (see the selections in Hutchinson & Smith 1994). Whatever else it may consist of, the term nation refers to a relatively large group of genetically unrelated people with high group solidarity.

Nations can be distinguished from other types of solidary groups by several criteria. In the first place, they are socially homogeneous. Nations are the largest of all solidary groups, save for religious ones. Unlike other kinds of groups, nations are endowed with a common sense of collective history, even if it is often of dubious accuracy. Nations generally have their own story – a history of the people – as revealed in oral and literary sources. This story provides a collective identity. Whether this identity is salient to individual members is always an empirical question. The preceding two factors serve to distinguish both nations and ethnic groups from other kinds of potentially solidary groups. Territoriality distinguishes nations from ethnic groups. Nations, then, are solidary, territorially concentrated, culturally homogeneous groups (like the Quebeccois), rather than ethnic groups (like American Jews, Algerians in France, and others often termed minorities). Although ethnic groups are also culturally homogeneous, they are not primarily concentrated in one specific territory of the state, and therefore cannot pose a realistic threat of seceding from it.

Group solidarity is jointly a function of members’ dependence and their control capacity (Hechter 1987). The greater the dependence and control, the greater the solidarity of the group. This mechanism lies at the heart of nationalism.

THE MODERNITY OF NATIONALISM

At this point, the necessary (but insufficient) conditions for the development of nationalism can be derived. If nationalism is collective action designed to make the boundaries of the nation and governance unit congruent, then it can only emerge when there is a disjuncture between the boundaries of the nation and those of the governance unit. For most of human history, however, there was no such disjuncture: the solidary groups within which individuals spent their lives were also governance units. Among hunter-gatherers, for example, families and local groups were governance units. Nationalism could not develop in such polities because political and cultural boundaries were congruent.

More surprising, nationalism is also unlikely to develop in larger polities such as premodern states. Due to the prohibitive costs of monitoring large groups (especially before the advent of modern communications), these larger polities could only be maintained on the basis of indirect rule. In a system of indirect rule, the central ruler exerts direct control only in his own domain. To simplify an admittedly complex picture, spatially distant territories must
be controlled by traditional authorities, who pay tribute to the central ruler in exchange for guarantees of their security and the right to rule within their local sphere (Bendix 1964: ch. 2). If the solidary group within which individuals spent their lives was also typically a governance unit, then nationalism could not develop in the premodern state. This governance unit was likely to be culturally homogeneous as well. Although many of the traditional authorities in rural areas of Europe and Eurasia initially were culturally distinct invaders (often the descendants of steppe nomads), they soon assimilated into the conquered peasantry, as did the Normans after their invasion of England. Culturally homogeneous governance units therefore often arose in equilibrium. This kind of social structure might lead to some forms of collective action, but it cannot lead to nationalism. Once again, cultural and political boundaries are congruent in this situation.

What about those localities in some parts of Europe east of the Elbe where traditional landed authorities remained culturally distinct from the peasantry? This kind of social structure – a hierarchical cultural division of labor (Hechter 1978) – indeed does have the potential to foster political conflict on cultural lines. Even then nationalism is unlikely, however, due to restricted political opportunities. After all, central rulers in the premodern state relied on traditional authorities precisely for their ability to exercise control in their own realms. Given an ample supply of labor, the prerogatives of the traditional authorities could be checked only by the force of custom (Weber 1968). The action of a lord who was both exploitative and culturally distinctive might spark rebellion in a given estate. But rebellion would be unlikely to spread to neighboring estates. In premodern city-states which were dependent on long-distance trade, the social structure was quite different. These relatively small polities tended to be culturally heterogeneous (for reasons analyzed by McNeill 1986), and therefore nationalism was unlikely to develop in them.

All told, therefore, indirect rule tends to inhibit nationalism. Since it preserves culturally distinct populations, however, its decay can easily lead to nationalist mobilization, as often occurs following the demise of empires. Nationalism could only arise after the advent of the modern state, which attempted to replace indirect by direct rule. In so doing, it created the conditions for the emergence of nations, those “imagined communities” that could demand sovereignty.

**WHY NATIONALISM FOLLOWS FROM DIRECT RULE AND THEREFORE REQUIRES THE MODERN STATE**

Direct rule made great strides on the European continent following the French Revolution (Tilly 1990). Direct rule fostered economic change by standardizing coinage, weights, and measures. It removed interregional barriers to trade and migration. It facilitated communications, thereby extending the reach of markets. Urbanization and industrialization were spurred in its wake. At the same time, direct rule brought about significant political changes by eroding the power of traditional authorities.

As direct rule progresses, one typical nationalist scenario takes place in the countryside. By usurping the power to tax and administer local justice, and by extending public education, direct rule weakens traditional authorities. The more literate a peasantry is, for example, the less dependent it is, for literacy lowers its cost of migration. Direct rule invariably decreases the power of all traditional authorities. In culturally distinctive regions, therefore, the traditional authorities are very likely to play the nationalist card in attempting to resist the incursions of the central state. The result is a top-down version of nationalism instigated by peripheral elites (Brass 1990). Even in culturally distinct regions whose traditional rulers assimilated to the culture of the center, direct rule spurs nationalism, for it permits the emergence of new leaders who could mobilize
the culturally distinct peasantry on nationalist grounds.

A bottom-up type of nationalism is more likely to emerge in cities, where massive shifts in social conditions produce new levels of uncertainty, particularly among the increasing number of displaced persons (Anderson 1986; Vail 1989). Once people migrate into urban areas, they face competition for scarce resources such as jobs, spouses, placement in educational institutions, residential space, and government services. The lion’s share of these resources is likely to go to individuals who organize effectively and act cooperatively. This gives people an incentive to join groups whose members act to favor one another in the battle for resources. These incentives hold across a wide variety of arenas. How do individuals decide what sort of group to join? They are likely to join that group which maximizes their expected benefits. The expected benefits of group membership, at least in part, are an increasing function of the size of the group, up to a point that is nearly half the size of the entire population (Chai 1996). In any large population center, the optimal size of a group therefore will be considerably larger than the number of migrants from any single community of origin (cf. Hannan 1979; Cederman 1995).

Yet groups cannot act effectively unless members share interests. In the absence of such shared interests, actions which help some members of a prospective group may hurt other members, and there will be little incentive for members who will be hurt to engage in the collective action. One way that a group of individuals can have shared interests in a particular outcome is if they have a common position in the division of labor (Hechter 1978). This gives them an interest either in raising the returns for the occupational roles commonly held, or in opening up opportunities for entry into other, more rewarding occupations.

The costs of organizing a group will be prohibitively high unless a simple set of criteria can be used to distinguish members from non-members. Large-scale groups must organize individuals who are unknown to each other. How then can members be distinguished from nonmembers? What must be found is a simple and clear-cut criterion so that individuals can estimate the prospective size and membership of such a group in order to decide rationally whether to join. The only criteria that meet these requirements are class criteria or ascriptive ones such as race, religion, language, customs, or region of origin.

The boundaries of such groups will be based on a simple set of markers embodying several conditions. The markers must generate a group of sufficient size to comprise a substantial portion of the population with the society. They must align with a common position in the population center’s division of labor. They must encompass communities of origin rather than crosscutting them. When no set of markers meets these conditions, no nations ought to form, even in the presence of structurally induced uncertainty. Where more than one boundary meets these conditions, then the boundaries of groups will be unstable as competing political entrepreneurs attempt to organize groups along alternative “crosscutting” cultural cleavages.

It is not the nature of the marker, therefore, but its salience that determines the potential political efficacy of social groups. The salience of markers is a social construction that waxes and wanes. Just as any individual marker can become salient under the appropriate conditions, so too it can become imbued with affect. The salience of a marker has both social and psychological components. The marker becomes socially salient when individual life chances are affected by possession of the marker. And a marker is psychically salient when those possessing the marker identify with one another.

The more that possession of a marker determines one’s life chances, the greater its psychological salience. A marker determines life chances to the degree there is a high probability that people born with it will have distinctive social networks and occupations. Salient markers contain a lot of information about their possessors’ life course; nonsalient ones contain
very little. The more salient the marker, the more it designates a collective fate, whether good or bad. Social psychologists have established time and again that when people are treated by others as members of a distinctive group, they come to identify with others so categorized (Tajfel 1981). The greater the salience of the marker, therefore, the more likely it is that the marked will identify with each other.

The more that cultural markers determine life chances, the greater the cultural – in this case, national – identification. When mobility between cultural groups is minimized, cultural identity will be strong. Ditto for classes. Markers tend to be most salient when they are ascriptive – that is, determined at birth – and difficult to shed. In societies where one’s membership in a category at birth determines the entire life course, escaping that categorical membership is well-nigh impossible. Hence the salience of cultural markers is greatest in societies having minimal intergroup mobility. When intergroup mobility increases, the salience of cultural markers declines.

Thus, by shifting dependence from local to central authorities, direct rule facilitates nationalism in two separate ways (Hechter 2000). It encourages local authorities to mobilize rural populations to protect their privileges. And it encourages newcomers to the cities to form national groups to compete for resources at the center.

CONCLUSION

The analysis explains why states were compelled to rely on indirect rule to control geographically extensive territories before the advent of industrial technology. Indirect rule tended to be based on culturally homogeneous governance units, in most of which culture had no political salience; therefore, nationalism was precluded as a form of collective action. The advent of direct rule has been historically uneven. Whereas the process began in the core of the world economy – in England and France in the late eighteenth century – it has occurred recently in more peripheral territories, as in Tibet. The historical unevenness of the advent of direct rule ought to explain variation in the timing of nationalism across the globe. Nationalism therefore should be correlated temporally with the onset of direct rule.

REFERENCES AND SUGGESTED READINGS

Prehistoric Native Americans developed complex societies that include confederations, nations, and empires whose only record lies in myth and folklore. Social movements in the historic period are noted as regional or ethnic movements responding to social changes brought by European and American societies that became pan-Indian movements as the US exercised uniform control over all Native Americans.

Revitalization movements used principles of accommodation to provide continuance for Native American societies and their cultures (Wallace 1956). Iroquois or Six Nation (Onondaga, Oneida, Mohawk, Cayuga, Seneca, Tuscarora) societies and their neighbors in the northeast were disturbed by colonialism and trapping enterprises brought by the English and French and the territorial expansion of the US. After the British victory over the French and the beginning of American expansion, a revitalization social movement began in 1799 inspired by the religious doctrine of Seneca prophet Handsome Lake and his Longhouse Religion (Wallace 1972, 1978).

Handsome Lake was uncle to Red Jacket and half brother of Cornplanter. He declared a spiritual vision to call for a reorganization of Iroquois society that incorporated an accommodation of Christian values and native continuance. His visions included meeting George Washington who had gotten halfway to heaven and Jesus who complained he had no followers (Wallace 1978: 446). Handsome Lake preached against drunkenness, sexual promiscuity, quarreling, and gambling. This was combined with an apocalyptic vision and an emphasis on witch hunting. He supplanted the traditional high god Tharonhiawagon with the Creator. Handsome Lake successfully added new visions to traditional structures and his movement emphasized male social power in what had previously been matrilineal areas of social and political life.

The instituting of reservation systems brought further pressure on northeast Native American societies and made Handsome Lake’s religious movement relevant for affected groups to find new social structures and emphasis that accommodated the growing impact of the emerging American nation. He was in touch with Thomas Jefferson and his movement debated whether they should be involved with the War of 1812. Handsome Lake continued to declare visions until he died in 1815.

Territorial displacement continued to spread westward in the nineteenth century creating conditions for Native American social movements. The Shawnee had a complex social system of clans and societies with numerous allies and social relations that developed negative interactions with the Iroquois, who drove them out of the Ohio Valley (Callender 1978: 622). The Shawnee joined the Mingo tribe in attacks on American settlements in 1777 and brought major devastation to American communities in Kentucky after the murder of Chief Cornstalk by the Americans, who attacked and destroyed Shawnee villages (Callender 1978: 631).

After returning to the Wabash area in 1808, a new leader created an intertribal movement to resist US expansion. Tecumseh arose as both a political and religious leader, accompanied by his brother Tenskwatawa, who served as visionary (Callender 1978; Drinnon 1990: 90–98; Eckert 1992; Edmunds 1983). Tecumseh frustrated Thomas Jefferson by agreeing to Jefferson’s wish to see Native Americans stop warfare, adopt agriculture, and embrace religion but advocating the religion as a revitalization of traditional elements as
guided by Tenskwatawa. Tecumseh further angered the American president by not only advocating peace and agriculture, but also promoting the united boycott of land sales to agents or citizens of the US (Drinnon 1990: 90–98). Tecumseh’s movement motivated a pan-Indian alliance, a unity by race that, like Handsome Lake’s earlier effort, sought to accommodate European and American social pressure by using many of its principles, such as the valuing of land as real estate, but with a native intention and benefit as the guiding principle.

General and future president William Henry Harrison directed the Battle of Tippecanoe to stop the movement in 1811. Tecumseh continued to travel from Ohio to the American South preaching his social movement doctrine until he was killed at the Battle of the Thames in 1813 (Drinnon 1990: 96). Tenskwatawa fled across the Mississippi to Kansas, where George Catlin painted his portrait. He died in 1837.

The Creek Confederacy under the leadership of Alexander McGillivray was effective in dealing with the Spanish, French, and the US until the death of McGillivray in 1793 (Weatherford 1988: 155–156). The confederacy was split by internal struggles after contact with the Shawnee prophets Tecumseh and Tenskwatawa (Martin 1991: 147). A religious reformation was organized, hallmarked by the use of red ceremonial clubs (batons rouges) that gave rise to the name of the movement: Red Sticks. The Red Sticks identified European culture as the enemy and admitted all racial and ethnic types into their ranks as long as they adopted the reforms and cultural emphasis (Weatherford 1988: 157). American white settlers were terrified of the uniting of blacks, Indians, and Spanish peoples into the Red Stick movement. The Red Sticks made a preemptive strike in 1813 at Fort Mims where Americans were marshaling for a campaign against the movement. Andrew Jackson led armies against the Muskogee-Creek and crushed their military force at the Massacre of Tohopeka or Horseshoe Bend on March 27, 1814 (Martin 1991: 162–163). Jackson sent the Creek to the Indian Territories with the Indian Removal Act of 1830 when he became president.

Native Americans in northern California began a Ghost Dance movement in 1870, also known as the Earth Lodge religion (Bean & Vane 1978: 670), that reacted to the increase in American influence after the 1846 Mexican War, the 1849 Gold Rush, the subsequent incorporation of California as a state in 1850, and the introduction of white settlers. Members represented the Nomlaki, Hill Patwin, Northern Pomo, other Pomoans, Wappo, Coast Yuki, Sinkyone, Lake Miwok, Coast Miwok, Calho, Wintu, Achumawi, and Sahsta tribes of northern California and tribes from Oregon. The movement worked to preserve the earth from destruction through the use of syncretist religious elements and philosophy that focused on dreamers or visionaries. This led to the Bole-Maru religion as an interethnic movement. A member of this Ghost Dance movement was Numu-tibo’o, a Paiute and the father of Wovoka.

The 1890 Ghost Dance movement was triggered by the visions of Wovoka who was struck down during a solar eclipse and arose to preach a pan-Indian doctrine that emphasized singing spiritual songs taught by Wovoka, dancing in circles, practicing abstinence from alcohol and a renewal of the world back in the control of Native Americans (Bean & Vane 1978: 671; Hittman 1990; Mooney 1991). The Ghost Dance movement was of major concern to the US authorities as it spread from California and Nevada across the country. Each ethnic group of Native Americans nativized the movement and its spiritual dimension to fit their own mythologies and regional concerns. The major common precepts held that by singing the songs, dancing, and holding to their vision, the white man would disappear, those who had been killed would be restored, and the land would once again flourish under the stewardship of Native Americans. The changed social environment of a continental US linked formerly separate ethnic indigenous groups and the Ghost Dance of 1890 became a national social movement.
Representatives of the Sioux and other Plains tribes traveled to meet Wovoka and learn his songs and dances, spreading them across the Plains (Brown 1970: 416–438; Mooney 1991). The Sioux organized their form of the Ghost Dance to include the return of the buffalo destroyed by the white men. The US army was used to crush the Ghost Dance, culminating in the Wounded Knee Massacre in South Dakota on December 29, 1890, when a small group of Sioux led by Big Foot were slaughtered in the snow by elements of the 7th Cavalry brought in to avenge the death of General Custer (Brown 1970: 439–445). The crushing of the Ghost Dance movement effectively ended the American Indian period in the US. The Ghost Dance, however, continued in disguised form among some tribes, with the Arapaho and Pawnee forming a hand game whose practice conveyed the same revitalization concepts as the dances, the social movement continuing as a folk tradition (Lesser 1978).

The twentieth century gave rise to Native American social movements based on pan-Indian identities and activities with increasing national focus, as ethnic distinctiveness faded in their relations with the US government and tribes were dealt with through a common Bureau of Indian Affairs, a division of the Department of the Interior. The Society of American Indians (SAI) was formed on October 12, 1911 by a diverse group of Native Americans who had achieved college educations, professional accomplishment, and were dedicated to creating a pan-Indian social movement that would use the courts and legislature to alter the social environment for Native Americans (Hertzberg 1971: 59). This movement marshaled those in the emerging Native American middle class to support initiatives and campaigns to change the social environment for native people on a national level and linked their cause with the Progressivists as well as the struggles of black Americans. The SAI promoted the cause of citizenship for all Native Americans and combated racism rather than dealing with individual ethnic cultural concerns. World War I stifled this movement, along with other social movements that had reacted to the industrial revolution (Hertzberg 1971: 155–178).

The 1930 Indian Organization Act was key to setting common social and governance structures among all indigenous tribes within the US and increased the possibility of pan-Indian social movements. The Bureau of Indian Affairs and Bureau of Land Management Policies, both within the Department of the Interior, caused pan-Indian social reactions and movements. Peyotism developed from 1938 onward as a form of social movement, as tribes from Oklahoma spread the use of vision-inducing mescaline imbibing as asserting a pan-Indian identity. Stock reduction policies on the Navajo reservation, the largest in the US, created relative deprivation sentiments that found relief by joining the peyotism movement (La Barre 1970: Stewart 1987). American reaction to the movement included outlawing the use of the sacramental peyote. This resulted in a furthering of the movement as it formalized into churches protected by the Constitution that included The Native American Church (La Barre 1970: 167–174).

Protests organized from the late 1960s onward by the American Indian Movement and other regional organizations included the occupation of Alcatraz Island from 1969 to 1971 (Fortunate Eagle 1992). Social change continued through advancing legislation with the American Indian Religious Freedom Act of 1978 (AIRFA), the Native American Graves Protection and Repatriation Act of 1990, and the assertion of sovereignty by individual tribes resulting in increased social and economic mobility.

Nazi movement (Germany)
WILLIAM I. BRUSTEIN

THE ORIGINS

Out of the chaos surrounding Germany’s collapse at the end of World War I sprang the German Workers’ Party. This party, which would eventually become the National Socialist German Workers’ Party (NSDAP), was formed on January 5, 1919, in Munich under the leadership of Anton Drexler and Karl Harrer. One of the party’s early recruits was Adolf Hitler. In a short space of time, Hitler made his presence felt, becoming the party’s most popular orator. Between 1920 and 1921 Hitler established his complete authority over the party. He added the words “National Socialist” to the party’s name and adopted the swastika as the party’s symbol and flag, and in February 1920 the party issued its official 25-point program. It called, among other things, for the union of all Germans within a greater Germany, repeal of the Treaties of Versailles and St. Germain, the establishment of colonies for Germany’s surplus population, the exclusion of Jews from citizenship, the appointment of only competent citizens to official posts (without regard to party affiliation), state promotion of the welfare and economic activities of its citizens, an end to non-German immigration, the improvement of national health and fitness levels through obligatory physical activities, and promotion of the common interest above self-interest. With regard to economic issues, the party demanded abolition of the “thralldom of interest,” confiscation of war profits, nationalization of syndicates and trusts, introduction of profit sharing in industry, improved old-age insurance, establishment and protection of a healthy middle class of artisans and merchants, implementation of land reform by means of “confiscation without compensation,” abolition of interest on mortgages, and prohibition of land speculation. The 25th and final point of the program called for the establishment of a powerful central government, along with diets and vocational chambers to implement the laws proclaimed by the Reich and the various German states.

Under Hitler’s leadership the Nazi Party before 1923 became a rapidly growing Bavarian regional movement, although Hitler’s initial attempt to seize power in Bavaria by means of a coup collapsed in November 1923. During Hitler’s brief 1924 imprisonment for his part in the failed coup, the Nazi Party fell into disarray. Hitler refounded the party in February 1925, two months after his release from prison. Later that year the Nazi Party replaced its “putschist” strategy with a strategy to gain power electorally, while establishing the foundations for a national organization. Between the reconstitution of the Nazi Party in 1925 and Hitler’s appointment as chancellor in January 1933, Hitler would remain its undisputed leader.

The NSDAP electoral strategy hit a major roadblock in the general elections of 1928. The Nazi Party polled a meager 2.5 percent. In contrast to the disappointing showing at the polls, the party’s recruitment of new members was extremely successful: membership grew from 27,000 members in 1925 to 108,000 in 1928. In 1929 the Nazi Party gained substantial visibility as a result of the national campaign against the acceptance of the Young Plan. The electoral fortunes of the party rose in 1929, as evidenced by strong showings in state and local elections in Schleswig Holstein, Lower Saxony, and Baden. The first major Nazi electoral breakthrough occurred in the general elections of September 1930. The NSDAP received 640,000 votes, or 18.3 percent of the total, and gained 107 seats in the Reichstag. As a
result, the party was second only to the SPD (German Social Democratic Party) in the size of its delegation. After the general elections of July 1932 the NSDAP replaced the SPD as the largest political faction in the Reichstag, with 230 seats. In the July 1932 election the NSDAP received 13,750,000 votes or nearly 38 percent of the total. In the election of November 1932 (the last free Weimar general election) the NSDAP experienced a loss of 2,000,000 votes and 34 seats. The NSDAP’s exclusion from government ended on January 30, 1933. In light of the tremendous popular backing for the NSDAP, President Hindenburg changed his thinking about a Hitler-led government and appointed the Nazi leader chancellor of Germany.

COMPETING EXPLANATIONS OF THE SOCIAL ORIGINS OF NAZISM

The breakneck rise of the Nazi Party from its beginnings as one of 42 racist and ultranationalist fringe groups in 1923 to its position as the most popular German political party in 1932 has been the focus of attention for more than 75 years. Four of the most prevalent explanations of the social origins of Nazism emphasize respectively its irrationalist, lower-middle-class, political confessionalist, and cross-class appeal. Each of these major explanations contains theoretical and empirical shortcomings. In particular, these treatments of the social origins of Nazism have placed disproportionate emphasis on Nazi followers’ reactive response, while ignoring the degree to which individuals’ support for the Nazi Party stemmed from their desire to improve their material condition. Moreover, with few exceptions, these treatments have relied on aggregate-level analyses of Weimar electoral and census data rather than individual level analyses to assess the empirical validity of competing explanations of the social origins of Nazism. An alternative explanation of the social origins of Nazism, a theory of interest-based adherence, is the principal focus here.

THEORY OF INTEREST-BASED ADHERENCE

Examinations of the ideology of the Nazi Party before 1933 have focused largely on Hitler’s writings in *Mein Kampf*. Thus, it comes as no surprise that most treatments of Nazi ideology stress the primacy of nonmaterial themes such as racism, anti-Semitism, hypernationalism, and xenophobia. We must ask, however, whether millions of Germans would have supported a party that only offered vacuous promises and generalities. The party positions that were enumerated in the official Nazi Party programs have been too often ignored. Unlike the frequently vague and outlandish ramblings of *Mein Kampf* (which relatively few people read before 1933), the party programs taken together are characterized by a substantial degree of coherence and considerable emphasis on material themes. This is not to argue that racism, anti-Semitism, hypernationalism, and xenophobia played no role in Nazi ideology; nor to deny that many people found the Nazi Party attractive because of its stance on these themes, but rather that these nonmaterial leitmotifs have received disproportionate emphasis in explanations of the rise of Nazism. The Nazi Party leaders were savvy enough to realize that pure racial anti-Semitism would not set the party apart from the pack of racist, anti-Semitic, and ultranationalist movements that abounded in post-1918 Germany. Instead, Nazi success can be attributed largely to the economic proposals found in the party’s programs, which, in an uncanny fashion, integrated elements of eighteenth- and nineteenth-century nationalist-etalist philosophy with twentieth-century Keynesian philosophy.
these were the 1930 agrarian program, the 1930 NSDAP employment program, the 1931 WPA document, the 1932 Immediate Economic Program, and the 1932 Economic Reconstruction Plan. NSDAP economics sought to create “a third path” between Marxist centralized state planning and laissez-faire capitalism. The Nazis were not the first in Germany to advocate or even to implement both nationalist-etatist and Keynesian economic principles, but they were the first to merge the principles of both schools in a seemingly coherent and innovative program. Among the ideas that the nationalist-etatist school contributed to Nazi economic planning were state socialism, autarkic development, and Lebensraum. The concept of state socialism was based on the principles that the economy should serve the interests of the state rather than the individual and that the state should oversee the direction of the economy. Proponents of nationalist-etatism argued that through a policy of autarky, Germany could become economically self-sufficient and pursue an independent foreign policy. The notion of autarky is based on the assumption that the needs of the national economy precede the needs of the international economy. Whereas the primary goal of German autarky with regard to monetary policy was to allow the state to create a state-controlled money and credit system, the geopolitical aims, stemming mainly from Germany’s precarious geopolitical position, were to negate the detrimental consequences of a naval blockade by Germany’s chief rivals (France, England, and Russia) of its world commerce. Nationalist-etatist thinking added that autarkic development could flourish only if Germany developed a continental economic zone (Grossraumwirtschaft, or Lebensraum). The nationalist-etatist thinkers saw eastern and southeastern Europe as the natural turf for Germany’s economic survival and growth. They envisioned a German-dominated economic union in which middle Europe would serve as a prime market for products of German heavy industry, while at the same time German agriculture would no longer need to rely primarily on protective tariffs for its survival but would be protected by trade agreements with the members of the economic union.

The Nazis were not breaking new ground when they advanced the ideas of state socialism, autarkic development, and Lebensraum in the party’s programs; the concepts had already become part of the German economic lexicon. The Nazi Party, however, was the first mass political party to make these nationalist-etatist concepts the core elements of its economic doctrine and to combine them with key notions from Keynesian economics. Nazi economists found much to their liking in Keynesian economics. Keynes’ *The Economic Consequences of the Peace*, which was critical of the Versailles treaty and the financial obligations it placed on Germany, brought Keynes to the attention of many members of the NSDAP leadership as early as 1920. Most important, the Nazi Party agreed with Keynes that if governments and central banks hoped to maintain full employment and reduce the likelihood of economic recession, they should urge investment in new capital goods, ensure a cheap money policy, and initiate public investment. Nationalist-etatist principles and Keynesian economics made for a good match. Autarky was realizable, according to the thinking in the NSDAP, through government-initiated investment in the nation’s infrastructure, including public works, residential reconstruction, resettlement, and reagrarianization. In the end, the marriage of nationalist-etatist thinking and Keynesian economics allowed the Nazis to design some rather novel but nevertheless concrete economic policies.

Other themes certainly helped the party to attract support. One that pervades many of the party writings was the establishment of a Völksgemeinschaft, or “people’s community.” This was seen as a means to overcome the historical divisiveness of class conflict. In a people’s community, social class would be abolished. Like most organizations, it was to be hierarchically arranged, with the leader at the top. Leadership was a function of accomplishment and was integral to the survival of the
community. The people’s community was to be racially pure, for racial homogeneity binds people to the community, whereas racial heterogeneity fosters disunity and leads to the deterioration of the native stock. The people’s community would also expurgate cultural bolshevism, while strengthening the traditional family way of life, or the three Ks of Kinder (children), Küche (kitchen), and Kirche (church). Whether the community was Protestant or Catholic did not matter in Nazi ideology, although the Nazis viewed the Catholic church as a greater threat because of its institutional independence and supranational status. The Nazis tried to depict National Socialism as a movement embodying the youth rebellion and combating Weimar foreign policy blunders and the “red scare.” The party professed to represent the youth of Germany as opposed to the Weimar gerontocracy. To appeal to young people, the Nazi Party emphasized its newness, antisytem politics, aversion to bourgeois formality, and dynamism. Colorful demonstrations and martial symbols and clothing were also intended to induce young males to join the movement. Nazi speeches and writings were frequently peppered with references to the threat of communism. The “fear of bolshevism” theme was dramatized in conjunction with the growth of support in Germany for the Communist Party: 1.7 million votes in 1925, 4 million votes in September 1930, and 7 to 8 million votes in February and March 1932. Much like the Italian Fascist Party, the NSDAP presented itself as a bulwark against the spread of communism. A particularly dominant theme of NSDAP propaganda before 1933 was the failure of the Weimar system. Opposition to Weimar became the thread with which the Nazis linked communism, loss of national self-esteem, economic decline, foreign policy blunders, and Jewish influence. The NSDAP promised the total liquidation of the Weimar system, which, according to the party, was responsible for the host of evils that had befallen Germany.

Finally, there is the issue of anti-Semitism as a principal theme of the Nazi Party before 1933. Without question the Nazi party leadership was strongly anti-Semitic, but by 1924–1925 they had concluded that for building a national party attractive to all German classes, the issue of anti-Semitism held insufficient appeal. Increasingly, anti-Semitic rhetoric was merged with economic and political issues and was used to preach to the already faithful. Hitler was astute enough as a politician to realize that his rabid anti-Semitism lacked drawing power among the German masses. Indeed, it appears that increasingly the Nazi Party relegated anti-Semitism to a role as backdrop to other more materialist appeals. Though the NSDAP de-emphasized its anti-Semitism between 1929 and 1933, the party did opportunistically employ the theme where it was thought that anti-Semitic rhetoric would work to attract support.

Many examinations of Nazi Party principles fail to capture the party’s uncanny skill at disseminating its positions and casting itself in the role of a winner. Both abilities played a crucial role in attracting support, for if people had been unaware of the party’s programs or if they thought the Nazi Party had no chance of achieving power, they might not cast their votes for or join the NSDAP. The NSDAP was one of the earliest parties to implement modern propaganda techniques, including whirlwind campaigns by airplane, highly coordinated press campaigns, films, slide shows, massive leafleting and postering, continual door-to-door campaigning, and direct mailings. The Nazis even established a speakers’ school where party faithful who possessed knowledge of particularly useful subjects and good verbal skills were trained and then deployed throughout the country to speak at party gatherings. The NSDAP’s strong electoral performance in 1930 dispelled any remaining notion that it was a second-rate party. If before 1930 Germans had considered joining the NSDAP simply as a means of demonstrating their dissatisfaction with older parties, the results of the 1930 election convinced many people that the party was a potential winner and that a National Socialist Germany was now possible. Moreover, many
Germans who before 1930 had adhered to regional parties and movements such as the Bauerbund and Landvolk movements, many of whose positions were similar to those of the NSDAP, switched their allegiance to the more nationally oriented Nazi Party. The party more than doubled its membership, increasing it from 389,000 to 806,294, during 1931. The NSDAP was certainly aware of the importance of public perception of it as a major party.

SELECTIVE INCENTIVES AND DISINCENTIVES FOR JOINING THE NAZI PARTY

The Nazi Party was organized on the basis of Gaue, or regions. In 1928 the 35 Gaue corresponded to the 35 Reichstag electoral districts. Below the Gaue were the Kreise (counties or districts) and within each Kreis were the Ortgruppen, or local branches. Large local branches in big cities were frequently divided into sections. The organizational structure of the Nazi Party was completely centralized: each new member had to accept the organization and the leader unconditionally, and local branches needed approval from party headquarters. Local branches were required to submit monthly activity reports to headquarters, and by 1931 each branch leader was expected to maintain a record on the performance of local branches. Party finances were strictly monitored. Income and expenditures had to be logged, and each year audits were conducted on local and regional finances and the reports sent to party headquarters in Munich. The party treasurer in Munich had the power to examine the books of any branch without notification. Yet party headquarters afforded the branches a fair degree of independence with regard to recruitment and activities. The party favored granting independence to local organizations in the hope that greater latitude would allow them to fashion a strategy reflecting their local conditions. The party rewarded the most efficient locals, for instance, by sending them the most popular speakers who, by drawing a large attendance, could produce more money for the local party’s coffers.

It is often believed that members of extremist movements constitute a separate subset of partisans: their fanaticism may predispose them toward physical confrontation or a desire for martyrdom. We should not doubt that zealotry characterized many Nazi Party joiners; however, many NSDAP supporters who decided to join the party were motivated largely by their perception of the costs and benefits associated with membership. Given the costs in time and money and the physical risks, the logical strategy for the average Nazi Party sympathizer would have been to vote for the party without joining it. Had joining the NSDAP been cost-free, many more Germans would have joined the party before 1933. Nazi followers who joined the party before 1933 acted on their perception that the costs of membership had become acceptable because of an increase in the incentives and/or a reduction in disincentives to joining.

Incentives to join the NSDAP

Before the Nazi Party came to power, the party had few material rewards to parcel out. The NSDAP obtained the bulk of its operating revenues from membership dues, sales of its newspapers, and entry fees charged for public rallies and meetings. Still, the Nazi Party possessed some tangible incentives to offer joiners. It is likely that many Germans who joined the party after its initial electoral breakthrough in September 1930 saw Nazi Party membership as a ticket to employment or career advancement in a future National Socialist Germany. In late 1930, the party used membership as inducement to attract civil servants, by hinting that in a Nazi state civil service jobs would go only to registered Nazi Party members. But even before Hitler’s appointment as chancellor the NSDAP had jobs to offer. Between 1925 and 1933 the NSDAP had developed a government-in-waiting, comprising numerous specialized
branches and departments. At both the regional and national levels, the party created bureaus staffed with members who were knowledgeable about legal, financial, agricultural, labor, medical, and cultural issues. This party apparatus created thousands of jobs. Unemployed or underemployed individuals with the requisite skills found job opportunities in the party that were unavailable elsewhere. Moreover, the party tried to establish contacts with local employers to hire party members and published a list of employment opportunities in the Völkscher Beobachter, the NSDAP’s principal newspaper. The Nazi paramilitary Sturmabteilung (SA) housed its members in hostels and barracks, where they received food and shelter. SA hostels frequently served as soup kitchens for unemployed members and on holidays distributed provisions to members’ children. During 1932, in the depth of the Great Depression, the NSDAP established the Winterhilfe or Winter Relief program for party members. For the unemployed, largely young and working class, the offer of employment, shelter, and food made joining one of the NSDAP’s organizations all the more enticing. But people probably did not join the party merely to obtain these benefits; the Communist Party, the Center Party, the Social Democratic Party, and the German Nationalist People’s Party each had similar resources to offer the unemployed. What initially attracted them to the Nazi organizations was the similarity between their interests and the NSDAP program.

Disincentives to joining the NSDAP

What is often ignored is that Nazi Party membership before 1933 entailed numerous costs and risks with relatively few material rewards. Party membership demanded numerous sacrifices on the part of joiners; they were obliged to pay membership dues, distribute party literature, attend party meetings, and participate in public rallies which took up time and financial resources. Before 1933, party membership dues constituted one of the principal sources of NSDAP revenues. The financial burden of monthly dues probably deterred many financially hard-pressed farmers, artisans, blue-collar workers, and service workers from joining the NSDAP. Such party activities as attending meetings, planning events, distributing party literature, and selling subscriptions to party publications required considerable expenditure of time and effort. We can safely assume that many Nazi adherents decided against membership because they believed they could not meet the requirements for active participation. Furthermore, joining the Nazi Party led in some instances to loss of business or employment. Weimar society consisted of many individuals and groups who disliked the Nazi movement and many shops and stores owned by NSDAP members were the target of boycotts, and membership in the party frequently led to members’ dismissal by unsympathetic employers. One of the most frequently cited examples of the potential costs of joining the Nazi Party, as far as employment went, was the government’s pronouncement in 1932 that membership in the NSDAP was incompatible with employment in the German civil service. All teachers and government employees, like public transport workers, had to sign a declaration asserting that they were not members of the NSDAP and had not participated in NSDAP activities. Thus, before 1933 many civil servants who sympathized with the Nazis probably decided to vote for the party and forgo joining it.

Voting for the NSDAP between 1925 and 1933 was unlikely to result in imprisonment. Nonetheless, membership in the Nazi Party carried with it some risk of arrest, which served as a clear disincentive to joining. The local police generally kept extensive lists of NSDAP, SA, and Schutzstaffel (SS) members. Both state and central government gave the police the authority to disrupt political meetings and to arrest anyone who failed to abide by official bans on uniforms, demonstrations, and public meetings. If anxiety over being arrested did not deter many from joining the Nazi Party, the fear of physical injury or death did. When we think of the role of political violence in the rise of
Nazism we usually associate it with the party’s strategy to intimidate and destroy its enemies and to attract the elements in society to whom physical confrontation greatly appealed. We tend to forget that before 1933 the Nazi Party itself was frequently the target of political violence and that fear of physical punishment may have dampened the many sympathizers’ desire to join the party. The principal adversaries of the NSDAP were the host of Communist Party paramilitary groups. Between 1930 and 1932, several hundred National Socialists were stoned, shot, or knifed to death by members of the Communist paramilitary organizations.

For many pre-1933 Nazi sympathizers, compatibility of interests was insufficient motivation to join the party. What made joining the party more attractive to these individuals was the offer of real or potential incentives, such as employment, money, and friendship, and the removal of disincentives, such as job dismissal, arrest, physical injury, and group ostracism. Once the Nazi Party came to power in January 1933, the equation changed dramatically. Incentives for joining the party became plentiful, and most disincentives evaporated. It is not implausible that if the Nazi Party had permitted all Germans who wanted to join the party after 1933 to do so, the ratio of voters to joiners would have approached one to one. Though the compatibility of people’s interests with the programs of the Nazi Party before 1933 cannot in itself explain why people decided to join, that factor nevertheless stands out as critical in explaining who joined the party and why. The persuasive power of incentives and disincentives should further elucidate why some people join high-risk political parties. It is highly unlikely that any positive incentives the German Communist Party or the Social Democratic Party might have offered to Nazi sympathizers would have sufficed to lure them away from the NSDAP. What brought Nazi sympathizers to the point of deciding to join the party was their perception that, among all the Weimar political programs, the Nazi Party’s most closely corresponded to their material interests. The production of positive incentives and the reduction of disincentives became a salient element in the decision to join the NSDAP only after people had already identified with the Nazi Party’s political programs.

Neo-Nazis in Europe and the United States

Pete Simi and Robert Futrell

Neo-Nazism refers to groups that emerged after World War II advocating for the fascist, nationalist, white supremacist, and anti-Semitic ideas of Nazi Germany. Neo-Nazi political activity is now an international phenomenon with groups located in Germany, Russia, France, England, the US, Canada, South Africa, and other countries around the world. Neo-Nazis embrace traditional Nazi symbolism, such as the swastika, describe themselves as national socialists, revere Adolf Hitler and the Third Reich, and promote eugenics to ensure the existence of a pure Aryan race.

Neo-Nazi ideologists

Neo-Nazi groups are part of an overlapping web of racist movements that include the Ku Klux Klan, Christian Identity believers, neo-Pagans, and racist skinheads. While some ideological and stylistic differences exist across these movement networks, members also agree on some basic doctrines. First and foremost, neo-Nazis imagine they are part of an innately superior biogenetic race (i.e., “master race”) that is under attack by race-mixing and intercultural exchange. Neo-Nazis see themselves as victims of a world that not only fails to acknowledge their natural superiority but also suppresses and destroys all things Aryan (Berbrier 2000; Blee 2002).

Neo-Nazis unite around genocidal fantasies against Jews, blacks, Hispanics, gays, and anyone else opposed to white power. Neo-Nazis desire a racially exclusive world where nonwhites and other subhumans are vanquished, segregated, or at least subordinated to Aryan authority. They idealize conservative traditional male-dominant heterosexual families and loathe homosexuality and interracial sex, marriage, and procreation. Neo-Nazi women are celebrated for domesticity, particularly for rearing committed White Power children to be the foot soldiers in a racial revolution.

Neo-Nazi ideology is amplified by the emotions that accompany it. Hatred of nonwhite races is a powerful and important emotional dimension of neo-Nazism. But hatred is also accompanied by feelings of pride, loyalty, affection, and racial kinship directed toward other neo-Nazis. These vitalizing and reciprocal emotions strengthen in-group solidarity that links neo-Nazi members around the world to the common goal of White Power (Jasper 1998; Taylor 2000).

Neo-Nazis in the US

Neo-Nazis in the US persist in networks organized through the Internet and the White Power music scene. Protected by the First Amendment, US neo-Nazis play a crucial role in supporting international racism and anti-Semitism by publishing literature and hosting web sites with material considered illegal under various European antiracism laws. Accurate counts of neo-Nazis are exceedingly difficult to perform, but according to the Southern Poverty Law Center, activism among American neo-Nazis grew at an alarming rate during the first decade of the twenty-first century (Potok 2010).

American neo-Nazism began in the mid-twentieth century when George Lincoln Rockwell formed the American Nazi Party (ANP) in 1958. The ANP popularized Holocaust denial among the American racist right and encouraged followers to join forces with Christian Identity churches (Simonelli 1999).
Since the ANP, the National Alliance and White Aryan Resistance have been two of the most influential US neo-Nazi networks. The late William Pierce, a former physics professor and early ANP member, founded the National Alliance in 1974. In 1978, Pierce authored *The Turner Diaries*, a novel which depicts a racist guerrilla war and a Ryder truck bombing of a federal building. Timothy McVeigh reportedly used the book as an inspirational blueprint for the 1995 bombing of the Alfred P. Murrah Building in Oklahoma City (McDonald 1989). National Alliance members use the group’s headquarters, a 346-acre farm in Mill Point, West Virginia, as an information clearinghouse for neo-Nazi propaganda. The headquarters hosts a publishing house for White Power books and magazines, the White Power music company Resistance Records, and neo-Nazi Internet activities. In 2001 the Alliance claimed 35 cells in 30 different states. Pierce’s death in 2002 dealt a severe blow to the group and the number of Alliance units dropped. However, Eric Gleiße and other new leaders have stepped in to continue Alliance activities.

Several groups splintered from the National Alliance following Pierce’s death. One of the most prominent of these splinter groups is Billy Roper’s White Revolution. Roper, a former high school history teacher with a master’s degree in anthropology, founded White Revolution in 2002. White Revolution draws upon Nazi-era ideals of *Volk* to celebrate Aryan racial kinship. Roper is noted for his efforts to pull together factions from across the movement for rallies, music shows, and other Aryan gatherings. White Revolution has an extensive web presence and chapters active in 16 states.

Tom Metzger’s White Aryan Resistance (WAR) emerged during the 1980s and 1990s as one of the most prominent multimedia clearinghouses for neo-Nazi ideology. Metzger founded WAR after traveling a circuitous route through several White Power activist networks. He began his career in right-wing extremism during the 1960s by joining the John Birch Society, but soon left the organization for groups more open to anti-Semitic advocacy. Metzger joined David Duke’s Knights of the Ku Klux Klan in 1975 where he became a Grand Dragon in California. After Metzger and Duke parted ways following Duke’s unsuccessful Congressional bid in 1980, Metzger founded the White American Political Association, which he eventually renamed the White Aryan Resistance. WAR has been in the forefront of the White Power Movement’s Internet presence, aggressively recruiting younger generations to the cause (Langer 2003).

Racist skinheads are the youngest neo-Nazi branch. The first US racist skinheads drew inspiration from disaffected English skins involved in the extreme right-wing National Front and the British National Party. In the late 1980s, US racist skinheads began to synthesize neo-Nazi ideals and symbolism and coalesced into networks of loosely organized gangs that congregate in skinhead crashpads and White Power music shows. The largest and most well-known groups, such as the Hammerskin Nation and Blood & Honour, have active cells around the world, an extensive web presence, and produce White Power concerts and festivals.

Skinhead culture began in Great Britain and developed in two waves through the 1960s and 1970s. The first skinheads emerged in Great Britain in the late 1960s as a response to deteriorating traditional working-class communities, a stagnating economy, and job competition with immigrants. While they did not initially associate with Nazism, they held ardently nationalist political ideals and fervently opposed foreign immigration (reflected in their affinity for violently attacking Pakistani immigrants, which they called “Paki-bashing”). The first skinheads “were aware that they attended the worst schools, lived in the poorest districts, and had the worst jobs with the smallest wages. They perceived hippies and students as idle layabouts living off the state” (Brake 1974: 181).

While the first wave of skinheads in Great Britain defined themselves along themes of nationalism, ultra-masculinity, and working-class concerns about lack of economic opportunity, they distanced themselves from
traditional, organized political parties and protest activities. British skinheads politicized in the late 1970s as established extreme right-wing groups such as the National Front and British National Party (BNP) attempted to draw disaffected white youth into their ranks. The second wave of skinheads spread beyond Britain and emerged in several other European countries as well as North America.

Many present-day Ku Klux Klan (KKK) groups now embrace neo-Nazi culture. The KKK reemerged in the late-1990s, following a long period of decline since its heyday as one of the most powerful political organizations in the US during the 1920s (McVeigh 2009). Klan groups drew in new recruits who rallied around immigration and economic concerns, combined with a “new racist discourse” of white victimization and white cultural heritage loss. The new wave of Klan activists are now tightly linked to neo-Nazi networks and have integrated neo-Nazi symbolism and rituals into long-standing KKK traditions. The “Nazification” of the KKK is evident in the Klan’s widespread use of the swastika and German Iron Cross emblazoned on traditional Klan robes, hoods, and flags, as well as wooden swastikas burned alongside wooden crosses at Klan rallies. The largest and most active Klan groups are the Empire Knights of the Ku Klux Klan, with outposts in 18 states in the south, northeast, and western US, the Church of the National Knights of the Ku Klux Klan, headquartered in Indiana with chapters in 20 states, and Brotherhood of Klans with 15 state chapters.

NEO-NAZIS IN EUROPE

Neo-Nazis are found around the world, but they are most prominent across Europe. Following World War II, neo-Nazi movements ebbed and flowed throughout Europe. Unlike their counterparts in the US, European neo-Nazis are much more involved in electoral politics and have organized various political parties across the continent. European neo-Nazis also participate in large rallies and festivals and coordinate ties with US groups through the White Power music scene and cyberspace (Bjorgo & Kaplan 1998).

Significant cross-national variation exists among European neo-Nazi movements. We focus on neo-Nazis in Britain, Germany, and Russia, countries which, for different reasons, are important sources of neo-Nazism. In Britain and Germany neo-Nazis emerged in the immediate aftermath of World War II while the growth of Russian neo-Nazis is a more recent development.

Great Britain

After the defeat of Hitler and the Third Reich, British far-right advocates were factionalized and varied in the degree to which they openly expressed neo-Nazi ideas. Colin Jordan, who founded the National Socialist Movement in 1962, was England’s most vocal neo-Nazi advocate. The National Socialist Movement was reconstituted as the British Movement in 1968 and Jordan campaigned on an openly neo-Nazi agenda with members wearing swastikas and using pictures of Adolf Hitler in the group’s promotional literature. Other early British neo-Nazi groups included the National Labour Party (NLP) founded in 1957, and the White Defence League (WDL) founded in 1958. By 1960 the NLP and WDL merged to form the British National Party. In 1967, members of these groups combined to create the widely known National Front (NF). During the 1970s, the NF grew to some 20 000 members across England, experienced electoral success, and began cultivating ties with racist skinheads. The NF remains active in twenty-first century British politics.

As in most countries, neo-Nazis in Great Britain are tightly linked to racist skinheads. The international neo-Nazi network, Blood & Honour (B&H) was founded in 1987 by legendary skinhead and White Power musician, Ian Stuart Donaldson (now deceased). Blood & Honour is active in at least 24 countries and has a significant presence in the White Power music scene. In 1992 Combat 18 (C18 – the
number 18 is code for Adolf Hitler as “A” and “H” are the first and eighth letters of the alphabet) formed as a radical splinter from B&H and became notorious for their violent tactics. By 2000 British authorities had arrested and incarcerated many of C18’s leading figures, however, the group continues to remain active with an international presence. In addition, the lone wolf terrorist David Copeland, the London Nail Bomber, whose 1999 bomb attacks killed three and injured over a hundred was affiliated with C18 at one time. Copeland was arrested in 2000 and received six life sentences for his crimes. More recently, in 2010 British authorities disrupted a neo-Nazi father and son team dubbed the Aryan Strikeforce who were planning attacks using ricin, one of the world’s deadliest poisons, to target Muslims, Jews, and blacks. Yet, neo-Nazi activity in Great Britain is relatively minor compared to activism in Germany and Russia.

Germany

After World War II, Germany passed stringent laws prohibiting the direct and explicit promotion of Nazi ideas. Despite these regulations, former members of Hitler’s Nazi Party continued after the war to advocate for the genocide of Jews and other non-Aryans. The Socialist Reich Party (SRP) was one of the first groups to emerge from these networks to organize efforts such as distributing anti-Semitic election leaflets and forming the Reichsfront in the image of Hitler’s stormtroopers. The SRP gained 11 percent of the Lower Saxony vote in 1951, prompting the federal government to challenge the party’s legality before the constitutional court. The SPR was declared illegal as an attempt to reestablish the Nazi Party and soon disbanded.

The National Democratic Party (NPD) is Germany’s most prominent present-day neo-Nazi political party. Adolf von Thadden founded the NPD in 1965 to unite “nationalist opposition.” Since the late 1960s the NPD has experienced some limited electoral success. Careful not to breach anti-Nazi laws, the NPD appeals to national pride and xenophobia. Although Jews are not openly targeted, the NPD vehemently attacks the state of Israel. The NPD also denounces “domination by alien big powers” and has demanded an end to the exclusive blame of Germany for World War II. In addition to electoral politics, the NPD sponsors White Power music concerts, political rallies, and protest marches (Virchow 2007).

German reunification in 1990 stimulated a new wave of neo-Nazi activity across the country, but especially in the former East Germany. Violent attacks by neo-Nazis on refugees, foreign immigrants, and Jews also increased (Anderson 1995). Since reunification, authorities have banned 17 neo-Nazi organizations and, in 2000, Germany became the first country to outlaw the neo-Nazi skinhead group Blood & Honour. After several years of declining numbers, neo-Nazi related crimes in Germany in 2009 increased from an annual total of 17 176 to 19 894. In addition, neo-Nazism seems to have a significant impact on German youth. A recent study found that 1 in 20 West German and 1 in 8 former East German male 15-year-olds claimed membership in a neo-Nazi faction (Pfeiffer 2009).

Russia

The recent rise of neo-Nazi groups in Russia has been dramatic. While Russia had less than a hundred neo-Nazi skins in the early 1990s, by 2005, more than 50 000 roamed Russia’s streets. Neo-Nazis are especially prominent in Moscow and St Petersburg where they are known to attack African and other nonwhite immigrants. In a 2009 survey of African immigrants living and/or working in Moscow nearly 60 percent reported being physically attacked because of their race (Dade 2009). In 2004, there were 44 racially motivated murders in Russia, many of which are known to have been committed by neo-Nazi skinheads. A year later, Russian neo-Nazi skins were responsible for murdering at least 28 people and assaulting another 366 people (Jackson 2006). In 2008, neo-Nazi violence resulted in the murder of 109 people and the injury of 486 (SOVA 2009).
neo-Nazis were responsible for murdering at least 70 people (Liss 2010) and members of one neo-Nazi skinhead gang, the White Wolves, were recently convicted of murdering at least 11 individuals. The White Wolves primarily target Central Asian immigrants, using knives and screwdrivers to viciously murder their victims. In addition to targeting racial minorities, antistate violence is an emerging trend in Russian neo-Nazi violence. In 2009, Combat 18 Russia claimed responsibility for the bombing of an express train traveling between Moscow and St Petersburg that killed 26 and injured 100 people.

Some of the largest neo-Nazi groups in Russia include Blood & Honour, Moscow Hammerskins, United Brigades 88 (H is the eighth letter of the alphabet; HH stands for Heil Hitler), and Skin Legion. Similar to other European countries, Russian neo-Nazis are active in electoral politics and have established political parties such as the National People’s Party (NPP). The NPP’s leader, Alexander Sukharevsky, is widely admired by neo-Nazi skins with a party membership of approximately 15,000. Since the fall of the Soviet Union, Russia’s neo-Nazis thrive in a larger context of normlessness most acutely illustrated by major economic breakdown. National survey data suggests that neo-Nazi political attitudes have mainstream appeal. For example, about one-third of Russians want to reestablish Jewish ghettos or settlements (Osborn 2005). The neo-Nazi problem in Russia has become so severe that authorities have recently banned the country’s largest neo-Nazi organization, Slavic Union (SS), and Adolf Hitler’s Mein Kampf.

NIMBY movements
ADAM DRISCOLL

The acronym NIMBY stands for “not in my backyard.” It is a term that has been used to characterize local, grassroots movements that are endeavoring to resist the siting of some unwanted land use in a particular neighborhood, community, or region. NIMBY movements have formed to oppose a wide array of undesirable entities that include environmental hazards (landfills, waste incinerators, polluting industries), perceived social hazards (homeless shelters, prisons, mental health facilities), and aesthetic offences (wind turbines, airports, cell phone towers). When viewed collectively, the general tendency of local residents to resist the siting of unwanted entities within their community has been described as the “NIMBY phenomenon” or the “NIMBY syndrome.”

Critical perspectives emphasize that the term can be applied in a pejorative, dismissive sense, where the motivations behind the movement are viewed as selfish and exclusionary. While NIMBY movements themselves have a tendency to be narrowly focused, small in scale, and relatively short lived, some do evolve into more broadly focused NOPE (“not on planet earth”) movements that can achieve large size and complexity as well as prolonged longevity. This entry explores the history behind the use of the NIMBY label, the various movements that have been characterized by it, and some of the unintended consequences of those movements’ efforts.

ENVIRONMENTAL NIMBY MOVEMENTS

The use of the term NIMBY originated in reference to community opposition of the siting of environmentally hazardous facilities that emerged in the 1970s. While it has later been more broadly applied to movements resisting a number of other unwanted land uses, its most common usage still refers to grassroots groups that are fighting the locating of an environmental hazard in their neighborhood or region. The emergence of these antitoxics movements was partially a response to a growing public awareness of environmental issues, fueled by such works as Rachel Carson’s *Silent Spring* (1962) and Barry Commoner’s *The Closing Circle* (1971). These building concerns particularly crystallized around the highly publicized Love Canal incident of the late 1970s, in which an elementary school was built over a chemical waste dump in Niagara Falls, NY. The various chemicals leached into both surface and groundwater and caused a series of health problems which led to widespread activism from community residents and eventual national media attention. The story of Love Canal sparked a widespread wave of public opposition to the siting of hazardous waste facilities (Szasz 1994).

Throughout the early 1980s, an increasing number of community groups across the nation organized around toxic waste issues, using an array of tactics to resist the intrusion of these unwanted land uses. This occurrence was not a coordinated, centralized movement, but rather a large number of groups independently organizing within a similar time frame around similar issues. Regardless of this lack of organizational cohesion, the NIMBY phenomenon did largely succeed in altering the political process behind hazardous facility siting decisions as individual movements in different communities continually succeeded in rejected proposed toxic land uses (Rabe 1994).

An unintended consequence of this explosive growth in grassroots resistance to the siting of hazardous facilities has been the concentration of unwanted land uses in poor and/or minority communities, as these are least able to mount a successful resistance (Bullard 1990). The sociological implication
of the NIMBY phenomenon is that if white, middle-, and working-class neighborhoods insulate themselves from environmental harm, those unwanted wastes and industries will be displaced elsewhere. Following the “path of least resistance,” they are far more likely to be sited in poor, powerless, minority communities than in affluent white suburbs. These regressive impacts of NIMBY movements have been empirically demonstrated by Saha and Mohai (2005), who use longitudinal analysis to demonstrate that racial, income, and housing disparities in the location of environmental hazards did not exist before the rise of environmental movements in the 1970s. It is only after environmental NIMBY movements started resisting the intrusion of unwanted land uses that disproportionate siting occurs. Thus, a cumulative effect of the NIMBY phenomenon has been the rise of environmental injustice (Bullard 1990).

While much of the research on both NIMBY movements and environmental justice has focused on community level resistance and outcomes in the US, the successes achieved by local groups can also manifest themselves at the transnational level as global environmental inequality (Pellow 2007). When environmental movements in developed nations succeed in resisting the siting of hazardous facilities and disposal sites and obtaining more strident environmental regulations at the state and federal levels, it becomes more difficult for business to locate polluting industries within the US and other developed nations. In response, these corporations are forced to look overseas for locations to house both polluting industries and hazardous wastes. In this way, the environmental policies of the US and other developed nations can be viewed as macro-level manifestations of the NIMBY phenomenon, where the “backyard” in question is the nation itself. Mirroring the unintended consequences of local level NIMBY movements, the increased environmental regulation in developed nations leads to hazardous wastes and facilities being sited in poorer nations that are starved of economic activity (Pellow 2007).

An example of this process can be found in the story of Philadelphia’s incinerator ash in 1986 (Pellow 2007). Since the late 1970s Philadelphia had been burning a substantial portion of its solid waste and burying it in a landfill in New Jersey. In 1984, New Jersey closed that landfill, partially in response to the protest activities of antitoxics and environmental justice movements. The city contracted a local firm to get rid of 15,000 tons of municipal incinerator ash. It was loaded onto a ship named the Khian Sea, which transported it to a series of less developed nations, seeking one that would allow it to dump its contents. A large portion of the ash was eventually unloaded onto a beach in Haiti under the false label of “soil fertilizer.” This series of events demonstrates how NIMBY movements and policies in developed nations can lead to environmental injustice on the global scale (Pellow 2007).

OTHER FORMS OF NIMBY MOVEMENTS

While the NIMBY acronym is most commonly used to describe movements organized to resist local environmental threats, the concept also applies to community groups that oppose a range of other socially undesirable entities, such as AIDS treatment centers, prisons, and substance abuse centers. Neighborhood movements fighting against this array of unwanted land uses have been studied by a number of scholars in a wide range of disciplines, including sociology, geography, economics, political science, and urban planning. Rather than focusing on identifying a universal model for all NIMBY movements, these works have shown that the NIMBY syndrome, as directed toward different unwanted land uses, likely has correspondingly different origins, mechanisms, and dynamics.

One area that has received a good deal of attention has been NIMBY movements directed toward human service facilities, which include homeless shelters and soup kitchens, free health clinics, and halfway houses. Unlike resistance to environmental hazards, where the perceived risks are attached
to inanimate substances and processes, movements opposing the intrusion of human service facilities into their neighborhood are required to engage in an element of frame management and stigmatization. In order to justify opposition to a humane service, the community residents must portray the patrons of these facilities as a risk to the safety and quality of life of the neighborhood (Takahashi 1998). For example, in the mid-1980s the city of Austin, Texas attempted to relocate and build a new Salvation Army facility to meet the demands of the growing homeless population. At every proposed new location, strident, organized community resistance emerged, characterizing the neighborhood residents as victims of the new facility. In each of these instances of resistance, the NIMBY movements focused on the character and nature of the homeless people who would be served by the Salvation Army. The homeless were repeatedly framed as dangerous criminals and rapists who would make the community not safe for women and children (Snow & Anderson 1993). In this way, community opposition to unwanted human service facilities involves an element of stigmatization, where those who use the unwanted facility are demonized and represented as threats to neighborhood residents (Takahashi 1998).

RECENT DEVELOPMENTS

The original use of the NIMBY label indicated that the associated movement does not necessarily object to the existence of the unwanted land use (as is characteristic of “NOPE” movements), but merely desires to have that land use situated at some location that does not directly impact the members of the movement. Thus, NIMBY movements can be viewed as an expression of the free rider problem, where individuals desire the benefits of the facility they are protesting, but they want some other community to bear the associated costs. Recently however, NIMBY groups have grown in their sophistication and understanding of the issues they oppose and some have turned to more comprehensive solutions than mere displacement. These movements have shifted from resisting the siting of particular land uses to opposing the root cause of the need for such facilities. Additionally, there has been a growth of what Barry Rabe (1994) terms “positive-sum politics,” in which the siting of unwanted land uses is placed in a broader, more cooperative political context that involves early and extensive public participation, negotiation of compensation and safety packages, and protections against exploitation. Other scholars have pointed out economic solutions to the NIMBY phenomena, such as the reverse Dutch auction, which transform siting decisions of unwanted land uses into a voluntary process, rather than a forced one (Inhaber 1997). Combined, these recent developments indicate both a potential reduced need for NIMBY movements as well as an increased sophistication of those movements’ goals and objectives.

REFERENCES AND SUGGESTED READINGS

The nuclear freeze movement was an American campaign against nuclear weapons based around an ostensibly moderate demand with radical implications: a negotiated and bilateral end to the testing, production, and deployment of nuclear weapons. Neither the freeze idea, nor opposition to the arms race more generally, was new in 1980 when the freeze emerged, amid resurgent allied antinuclear weapons movements across Western Europe. Astute activist opportunism, in conjunction with a series of more aggressive foreign policies from the US government, aligned to produce unusually heightened attention to national security policy in general, and nuclear weapons in particular. In this regard, the nuclear freeze movement loudly echoed previous periods of mobilization and concern, including antinuclear campaigns following the first use of weapons at Hiroshima and Nagasaki (1945–1947), surrounding the long debate about a ban on testing (1954–1963), and in opposition to the deployment of antiballistic missile systems in the US (1968–1973). Although some activists are constantly trying to draw public attention to the costs and dangers of nuclear weapons, they only succeed episodically. The cyclic mobilization against nuclear weapons reflects more vigorous institutional debates about nuclear weapons strategy.

After the Vietnam War ended, peace activists had a difficult time generating any kind of national campaign. Presidents Nixon, Ford, and Carter all modernized US nuclear forces and also negotiated arms control measures with the Soviet Union. All claimed they were doing everything possible to limit nuclear armaments and the possibility of nuclear war, and spending on the military declined after a Vietnam era peak in 1968. Effective management of the national security issue worked well enough to prevent the emergence of an overarching campaign. Activists did, however, stage smaller campaigns against particular weapons systems, most notably the B-1 bomber and the MX missile. In such efforts, however, they often played a subordinate role to elite allies, particularly the president. In the case of the B-1, for example, antinuclear activists found themselves lobbying members of Congress to support development of a nuclear-armed air launched cruise missile (ALCM) as an alternative.

After two years, President Carter visibly retreated from his announced inaugural goal of eliminating nuclear weapons, initiating a military build-up and taking a more hawkish foreign policy stand. In doing so, he was responding both to world events, including the Soviet invasion of Afghanistan, the Nicaraguan revolution, and Iranian militants taking American hostages in Teheran, and to increased domestic political pressure from conservative critics, who successfully organized to block Senate ratification of the second negotiated Strategic Arms Limitations Talks (SALT II) agreement.

In response to Carter’s new stance, activist groups worked to find a new idea to organize around. The pacifist American Friends Services Committee (AFSC) commissioned Randall Forsberg, then a graduate student in political science at MIT, to draft a proposal. Borrowing from earlier arms control proposals, from inside and outside governments in both the US and USSR, Forsberg’s “Call to Halt the Arms Race” began with a demand for a verifiable, bilateral, negotiated freeze on the nuclear arms race. She saw the freeze proposal as the first step in a complicated and comprehensive program to remake world politics (Forsberg 1984). She took the proposal to the 1979 conference of Mobilization for Survival, a group that had been working against nuclear power, and won some support, but the freeze was one of many proposals for action circulating.
The freeze failed to gain political traction in the 1980 presidential election, rejected by both Jimmy Carter and his opponent, Senator Edward Kennedy, at the Democratic convention, and then virtually disappeared during the electoral campaign. The freeze remained a solution in search of an opportunity: broad public concern with a national security policy problem.

Ronald Reagan’s landslide election in 1980, and his explicit commitment to “rebuild” what he saw as America’s neglected armed forces, was a devastating defeat for advocates of arms control and disarmament. There was, however, one bright spot in the election for activists: Organizers in Western Massachusetts had placed a nuclear freeze proposal on the ballot in three state senate districts. Although Reagan carried all three districts handily, the freeze also passed with strong majorities, demonstrating its public appeal.

When Reagan came into office, the freeze became more attractive to the public as the new President’s policies provoked domestic opposition. The administration repeatedly and forcefully emphasized its commitment to policies peace activists saw as bellicose. Administration officials were also unusually candid in their judgments about the possibilities of limited nuclear wars, the necessity of strategic superiority, and the futility of arms control; their rhetoric was untempered by qualifiers or guarded language about “options.” Instead, they publicly discussed fighting and winning nuclear wars, and their military spending and procurement supported those objectives. The administration also purged from the State and Defense departments more moderate scientists and strategists unconvinced of the possibility or desirability of a war-winning strategic posture, virtually forcing those officials to go public to express their views. Mass media attention followed elite criticism of the Reagan program, subjecting the president’s policies and advisers to an unusual degree of scrutiny.

Activists in Western Europe also challenged the Reagan program, calling on their counterparts in the US to do more. Antinuclear weapons movements in Western Europe emerged strongly in 1981, focusing specifically on stopping the NATO plan to deploy intermediate range nuclear missiles in five European countries (Rochon 1988). This “dual track” decision, taken in the Carter administration, called for the deployment of new nuclear weapons while simultaneously pursuing negotiations to limit them. The Reagan administration jettisoned the arms control portion of the proposal, engendering a great deal of public opposition, particularly in the nations scheduled to host the so-called “Euromissiles.”

Activists with diverse goals and approaches engaged in a broad spectrum of activities: Pacifists began direct action campaigns at military contractors, submarine bases, missile sites, and even the Pentagon; arms control advocates held educational events, sponsored symposia, and teach-ins, pressed local governments to adopt resolutions, and organized referenda campaigns. Media coverage of these efforts grouped virtually all opponents of the Reagan administration’s security policies under the banner of the “nuclear freeze,” and politicians and activists to a lesser degree followed. As the freeze coalition grew broader and broader, commanding support from more than two-thirds of Americans in polls, its definition got fuzzier and fuzzier. As generally explained in mass media, the freeze was an unfocused cry for arms control. As the movement grew, staging a June 1982 rally in New York City attended by some one million people, activists were increasingly divided on the meaning of the proposal so many supported. Mainstream political allies endorsed and amplified criticism of the Reagan administration, but redefined the activists’ preferred policy solution.

Freeze activism, vaguely defined, continued and brought increased public and government attention to nuclear weapons issues. Early in 1982, flanked by campaign leaders, Senator Kennedy announced that he would introduce a freeze resolution in Congress. When the resolution failed by one vote in the House of Representatives in 1982, activists pressed the issue in
the midterm Congressional campaigns, claiming credit for large Democratic gains in the House. In response, the Reagan administration actively sought to limit its political vulnerability on national security, softening its rhetoric and floating a series of arms control proposals mostly designed to be rejected by the Soviet Union and defuse public opposition (Bundy 1988). The House overwhelmingly passed an amended freeze resolution in 1983, although the resolution failed in the Senate.

As the freeze campaign made inroads in institutional politics the movement coalition frayed (Meyer 1990, 1993a, 1993b, 1993c). Institutionally oriented arms control groups cultivated Washington connections and tried to influence a variety of budget issues, urging Congress to push the president on arms control, ostensibly a more direct route to political influence than public education or mass demonstrations, but the scope of the policy debate narrowed. At the same time, many pacifist and left-liberal groups shifted their efforts to other pressing issues, including working against apartheid in South Africa and preventing US military intervention in Nicaragua. And a broad stream of the movement focused on the upcoming presidential election. Six of seven Democratic presidential hopefuls endorsed some kind of nuclear freeze proposal, including the eventual nominee, Walter Mondale.

The Reagan administration worked to ensure the election was not a referendum on either the freeze or its own national security policies. In January of 1984, Reagan announced an invigorated approach to arms control negotiations, and to restoring summit meetings with the Soviet Union, offering conciliatory rhetoric to both freeze supporters and the Soviets. In conjunction with his Strategic Defense Initiative, announced in 1983, these positions allowed the president to shift the terms of debate, attacking freeze supporters for defending the status quo, and promising eventual deep reductions in nuclear arsenals and a benign end to mutual nuclear deterrence. A strengthened Congressional opposition prevented the most aggressive aspects of the Reagan build-up, limiting the growth of military spending and pressing arms control. Although these changes were the result of the freeze movement, no one in the administration acknowledged this.

The nuclear freeze movement did not end the arms race, as some of its supporters hoped, much less remake US foreign policy. It was critical, however, in resurrecting and institutionalizing the previous bipartisan policy consensus, constraining the Reagan administration’s initiatives. It returned legitimacy and institutional access to advocates of arms control and nuclear restraint. And President Reagan’s arms control proposals, offered more for domestic political reasons than international response, had unexpected effects. The new posture offered incoming Soviet General Secretary Gorbachev a lever with which to reopen detente. Gorbachev accepted the disproportionate nuclear force cuts that Reagan had proposed, trapping the administration: It couldn’t reject its own proposals. This forced flexibility on arms control proved to be critical in ending the cold war (Meyer & Marullo 1992). The movement won far less than it intended, yet it turned out to be far more significant than anyone involved would have guessed.

“Orange” and “colored” revolutions in former Soviet Union

SARA TESCIONE

The term Orange revolution refers to the massive protest campaign that characterized the Ukraine in the aftermath of its 2004 presidential elections as a reaction to the manifest falsification of the electoral results by the incumbent authoritarian regime of Leonid Kuchma. Protests began on November 22, prompted by the widespread perception that the results of the vote between the pro-regime candidate, Viktor Yanukovych and the opposition candidate Viktor Yushchenko had been severely rigged in favor of the former. As the suspects of electoral fraud were confirmed by the numerous domestic and international election observers, an increasing number of protesters started to mobilize across the country, engaging in peaceful sit-ins, strikes, and rallies. Sustained pressure from hundreds of thousands of orange-clad protesters, who permanently camped at Maidan, Kiev’s Independence Square in below-zero temperatures for several days, led to negotiations between the government and the opposition and eventually to the decision of the Ukrainian Supreme Court to nullify the vote and call for a rerun of the elections. The final results of the internationally monitored second run-off on December 26 indicated the clear victory of opposition leader Viktor Yushchenko, who received 52 percent of the votes while 44 percent voted for Yanukovych. On January 23, 2005, following the certification of the results by the Supreme Court, Yushchenko was sworn in, thus becoming Ukraine’s third president since the country’s independence in 1991.

Ukraine’s Orange revolution was the most visible and internationally recognized episode of a series of similar electoral “revolutions” that in the early 2000s overthrew the authoritarian leaders of a number of former Soviet republics as a consequence of fraudulent and contested elections. These colored revolutions, as they have come to be known, represent some of the most controversial political developments in Central and Eastern Europe over the past decades. Largely unpredicted by scholars of postcommunist societies, their impressive displays of political popular participation and civic resistance seemed indeed to challenge long-held assumptions about the distinctive weakness and immaturity of postcommunist civil societies.

In the literature, two main explanations for the emergence of such mobilizations have been proposed. Most analysis focuses on the interplay of favorable domestic conditions, enlisting a number of endogenous “ingredients for success,” relating mostly to the hybrid, and consequentially weak nature, of the regimes in power (D’Anieri 2006). In pre-Orange Ukraine’s “competitive authoritarianism,” in particular, the mere persistence of meaningful formal democratic institutions despite the widespread use of authoritarian procedures – such as bribery, co-optation, and various forms of repression – created a number of windows of opportunity for the democratic opposition to challenge, weaken, and finally defeat the autocratic incumbents (Way 2005).

A second approach insists on the modular character of the colored revolutions, depicting them as the result of a somewhat broad process of international diffusion which channeled across diverse countries a specific “electoral model of democratization” (Bunce & Wolchick 2006; Beissinger 2007). According to this analysis, previous examples of electoral breakthroughs in the post-Soviet region, and in the Balkans, crucially impacted the unfolding of Ukraine’s very controversial presidential elections. In fact, Ukrainian democratic
activists capitalized on foreign experiences of civic resistance. One of the civic groups most active during the Orange revolution, PORA (It’s Time!), was clearly modeled after its Serbian and Georgian counterparts, Otpor (Resistance) and KMARA (Enough!) that had staged similar successful protests, respectively in 2000 and 2003.

The emergence of the Orange movement was favored by the thick layer of Western non-governmental and semi-governmental organizations and political foundations present and active in Ukraine since its independence. Some of these “external” actors, in addition to providing financial and material assistance to democracy promotion projects, played in some cases an active role in mediating the cross-national diffusion of the “revolutionary” know-how and nonviolent action repertoire. However, the effective role played by Western actors in the Orange revolution remains a subject of dispute and controversy among observers.

It is important to note that the label “revolution” immediately applied to the 2004 Orange mobilization (as well as to the other colored revolutions) seems more a catchy media slogan than the result of rigorous efforts of a scientific definition. Over time the concept of revolution has gradually evolved, departing from its classic definitions steeped in notions of class and violence, to include recent phenomena of democratic and nonviolent revolutions. Despite this, with regards to the Orange revolution, the revolutionary label seems problematic in a number of ways. In particular, Ukraine’s postrevolutionary trajectory, where the elements of continuity with the nondemocratic past seem to outnumber those of discontinuity, inevitably still raises important doubts on how to interpret the very nature of that “revolution.”

Otpor
OLENA NIKOLAYENKO

Otpor (“resistance” in Serbian) is a Serbian social movement that played a prominent role in removing Slobodan Milošević from power in October 2000. The movement articulated three major demands: (1) the depoliticization of universities, (2) freedom of the press, and (3) free and fair elections. More broadly, Otpor called for the turnover of power and the dismantling of Milosevic’s regime. Otpor grew from a group of a dozen university students in Belgrade to a nationwide movement with more than 70,000 members and more than 130 cells across Serbia. While young people formed the core of Otpor members, the movement enlisted support of various segments of Serbia’s population. In its efforts to undermine the repressive political regime, the social movement employed such methods of nonviolent resistance as graffiti, stickers, rock concerts, and street performances.

The social movement organized two major campaigns. The negative campaign titled Gotov Je (He is finished) targeted Milosevic as the culprit of all societal problems. Meanwhile, the positive campaign titled Vreme Je (It’s time!) was designed to boost youth voter turnout. One of the biggest accomplishments of the Vreme Je campaign was the fact that almost 86 percent of first-time voters cast a ballot in the 2000 election (Paunović et al. 2000: 39). The success of Otpor inspired civic activists in other countries to push for political change via nonviolent methods of resistance.

EMERGENCE OF THE MOVEMENT

Serbia under Slobodan Milosevic had evolved into a nondemocratic political regime (Sell 2003). In 1998, the parliament passed a new law on universities that removed the protection of academic freedom and curtailed the autonomy of Serbian universities (see Human Rights Watch 1999). The law aimed to staff universities with government loyalists and stifle dissent in the academic setting. The same year, the government passed a law that further clamped down on the independent media.

In response to the crackdown on the universities and the mass media, the social movement Otpor was formed in October 1998. During the NATO bombing period, between March and June 1999, the movement suspended its activities. Since then, Otpor has dramatically expanded its membership base. In February 2000, Otpor held a national congress at which it formally announced its transformation from a youth movement into a people’s movement.

ORGANIZATIONAL STRUCTURE

Otpor developed a horizontal organizational structure, with most power delegated to local cells. Each cell exercised autonomy in planning and executing its activities as long as Otpor members used nonviolent methods of resistance and articulated a message consistent with Otpor’s mission. Unlike the opposition political parties, the social movement had no visible leaders; they were hidden from the public eye. Instead, Otpor rotated its spokespeople each two weeks so that the government could not damage the reputation of the whole movement by discrediting or co-opting a few prominent members.

While Otpor was nonhierarchical, it was well organized. Otpor’s main office was divided into several departments charged with a specific set of tasks, for instance, human resources, networking, media relations. Furthermore, Otpor was split into two parts. Some Otpor activists worked upon the use-the-vote
campaign Vreme Je, while others focused their attention on the anti-incumbent campaign Gotov Je.

MOVEMENT RESOURCES

The international donor community made a major contribution to the financial resources of Otpor. In the aftermath of NATO bombing, the US government increased financial and technical assistance for civil society actors in Serbia. According to some reports (Cohen 2000), Otpor received more than $1 million in Western grants.

Another important resource that the social movement possessed was human capital. Otpor leaders built up a reservoir of organizational skills and protest experience through participation in student protests throughout the 1990s. Most Otpor leaders were veterans of the 1996–1997 student protest. The movement further strengthened its strategic capacities by applying Gene Sharp’s ideas about nonviolent action and the regime’s pillars of power (Sharp 1973, 2010). In particular, the movement participants were trained on how to break the hold of fear on the population and how to behave in case of arrest.

METHODS OF NONVIOLENT RESISTANCE

From its inception, Otpor adopted the principle of nonviolence. The social movement employed a wide array of tactics to operate in the repressive political environment. While the movement was denied access to national TV channels, Otpor reached citizens via local TV channels in several cities outside Belgrade. Using public space as a medium of mass communication, Otpor plastered streets with stickers and staged street performances infused with political humor. Otpor distributed more than one million stickers during the election year. Furthermore, within the framework of Vreme Je campaign, 33 rock concerts were held in cities and towns across Serbia.

INTERNATIONAL SIGNIFICANCE OF THE MOVEMENT

Serbia’s Otpor set an example for civic activists in other countries on how to stage nonviolent resistance to a repressive political regime and to use elections as an opportunity for propelling political change. The cross-national diffusion of ideas has contributed to the rise of similar social movements in nondemocracies (Collin 2007; Nikolayenko 2007). Inspired by Otpor, youth movements were formed in Belarus (Zubr, 2001), Georgia (Kmara, 2003), and Ukraine (Pora, 2004). Moreover, former Otpor members set up the Center for Applied Non-Violent Action and Strategies (CANVAS) and shared their expertise with civic activists in Myanmar (Burma), Egypt, Iran, Lebanon, and Zimbabwe.

Paris Commune

MICHEL OFFERLE

The Paris Commune of the spring of 1871 was essentially an emergent and makeshift government that ruled Paris from late March to May 28, 1871. It emerged largely as the result of a series of interconnected events: the Franco-Prussian War and France’s defeat; the fall of the Second Empire associated with an uprising among discontented French workers and other Parisian residents; the siege of Paris by Prussian forces and their defeat; the attempt to restore order within Paris, which failed on March 18; and the flight of the government to Versailles. Following the March 26 municipal election (with a low participation of 230,000 out of 485,000 registered voters), the Commune assumed control of the city. However, its reign was short lived, as it ended on the afternoon of May 28, with the surrender of the last barricade after one week of fires and street fighting. This week of fighting, known as “La semaine sanglante” (the bloody week), resulted in an estimated 15,000 to 20,000 insurgents killed or summarily executed. The few communes in the provinces lasted but a few days (Gaillard 1971; Aminzade 1993). The 72 days of the Commune’s existence have generated several thousands of books and articles (Lissagaray 1876; Le Quillec 2006), and it still generates scholarly inquiry and debate. The word “commune” is ambiguous: it harks back to the basic structure of the local French administration – a municipality (une commune); it evokes the insurrectional Commune of the 1792/1793 French Revolution; and it appears in ideologies of direct government from the 1850s onwards. The aim of the 1871 Commune was not merely governance; it was primarily military: to fight against the Versailles government (les “Versaillais”).

The Commune decreed various measures, some very specific but essential (upholding the impoverished National Guards’ pay, cancelling rent for the duration of the siege, free return of tools pawned by workmen); others more permanent (banning of night work in bakeries, separation of church and state, laicization of schools, 6000 francs cap on public workers’ salaries, abolition of draft and permanent military bodies, a ban on salary fines and withholdings by employers, and the proclamation of communal liberties, notably in the April 19, 1871 declaration). The declaration is a text to which scholars often turn in order to establish the respective weight of the Blanquist revolutionary socialists, neo-Jacobins, or Proudhonien internationalists who were part of the Council of the Commune. The declaration states that the Commune marks “the end of the old governmental and clerical world, of agiotage [financial speculation], monopolies, privileges, which are the cause of the proletariat serfdom, and of the misfortunes and disasters suffered by the nation.”

Did the Commune provoke municipal decentralization and consolidation of a patriotic republic ready to resume war against Prussia and opposed to the majority of monarchists who had signed the peace treaty, or did it portend a social revolution?

To understand the event, one can draw from nearly a hundred years of many Parisian insurrections and revolutions, from summer 1789 to spring 1871. Or might the Commune constitute a shorter conjuncture (Johnson 1997): popular mobilizations (unions and sections of the Internationale) caused by the liberalization of the Second Empire? During the siege of Paris by the Prussian troops, the frequency of “journées” (day of barricades) and mobilizations increased among an armed population organized by the Central Committee of the National Guard and the Central Committee of Paris’ 20 arrondissements.

But we might also be dealing with an a posteriori history, since the Commune, as early
as the publication of The Civil War in France (Marx 1871), becomes a laboratory of ideas for revolutionary entrepreneurs (Marx, Lenin):

“Its true secret was this: It was essentially a working class government, the product of the producing against the appropriating class, the political form at last discovered under which to work out the economical emancipation of labor” (Marx 1871: 171). This immediate interpretation, used by many Marxist scholars and maintained by the numerous marchers who commemorate the Commune, clashed with that of General Appert (1875), who published the numbers (36 309 taken in by police, representing 170 professions), which justified Versailles’ denunciation of the horrors and barbarity of the Parisian Convulsionaries, seen merely as a bunch of prisoners, prostitutes, lowlifes, rabble and drunks, often foreigners, often manipulated by agents of the Internationale and by illegitimate and bloodthirsty hostage-executing marginals. For a long time, these hasty generalizations constituted the template of the fear towards social movements, seen from the perspective of the maintenance of social order.

Against these two visions of the people, Rougerie (1971) attempted to demonstrate that those who had fought in the Commune, from top to bottom, were Parisian workers, of which they made up a good sociological and political sample (in the very broad sense of the term). The Communeux first and foremost hated their owners, their priests and, somewhat more marginally, their bosses.

Under the banner of the “new social history” and on the basis of “critical urban sociology,” Roger Gould (1995) sought to underline the peripheral neighborhoods’ strong mobilizing influence. He added the notion of “neighborhood community” to try to demonstrate that the mobilization of revolutionary neighborhood has to be understood in terms of overlapping ties and patterns among neighborhoods and the National Guard (citizen militia) insurgents, thus focusing attention on the multiplexity of locality- and organization-based, rather than just class-based, mobilization. As a result, solidarity is directed rather against the state than against a class (contrary to the June 1848 journées).

Tombs (1999) and Rougerie (in Latta 2004) have criticized this new version’s concepts, omissions, and methods: on the basis of the contemporary analysis of radicalization processes, the French historians explain that the Commune’s temporality is not one but plural: the September 1870 actors were not those of March or May 1871.

Once a politically “cold” event, the Commune has become a pregnant field for research on the sociology of mass mobilizations, as well as providing material for a more gendered cultural history (Gullickson 1996).

Patriot/militia movement in the United States
NELLA VAN DYKE

The patriot/militia movement has waxed and waned since it first came to the attention of the public in 1995. At its peak, in 1996, there were over 800 documented patriot/militia organizations in the US (Southern Poverty Law Center 1996). The number of organizations declined dramatically after that, possibly in response to a crackdown from law enforcement (Southern Poverty Law Center 1999), and as militia and patriot groups adopted a mode of organization known as “leaderless resistance” whereby they function largely underground (Southern Poverty Law Center 1999, 2002; Berlet & Lyons 2000). In 2000, there were 194 documented militia/patriot organizations, and the movement hit a low of 131 groups in 2007. What is remarkable is the movement’s explosion in 2009. According to the Southern Poverty Law Center (Potok 2010), the number of militia groups increased by 363 in 2009, a growth of 244 percent. Research on the emergence of the movement suggests that this explosive growth was likely fueled by both economic and political threats. After providing information on the movement’s history and ideology, the research on the movement’s emergence will be briefly reviewed, and in conclusion a speculation about the reasons for the increase in documented militia organizations in 2009.

MOVEMENT HISTORY AND IDEOLOGY

While the patriot/militia movement is relatively young in US social movement history, its roots stretch back decades. Members of the US public first became aware of the movement in 1995, with the bombing of the Oklahoma City Federal Building and the ensuing revelation that the perpetrator had ties to patriot/militia groups. However, the federal government was investigating these groups well before this time (Berlet & Lyons 2000). The movement’s most recent antecedents include the Minutemen of the 1960s, the Posse Comitatus, active from the mid-1970s until the mid-1980s, and the Order, active during the early 1980s. The modern movement stands in contrast to these earlier organizations, however, in that these were single organizations rather than an entire movement. Patriot and militia organizing follows a long history of conservative political thought and activism in the US, with its antigovernment, conspiracy-oriented philosophy sharing connections with the McCarthy-era communist witch hunts and the John Birch Society.

It is difficult to separate the patriot/militia movement from other right-wing movements, as they share many members (Berlet & Lyons 2000) and sometimes work together or attend conferences and rallies together (Stern 1996). However, there is no central organization to the movement, just loosely (if at all) connected organizations. The patriot/militia ideology reflects multiple themes from other conservative organizations and movements (e.g., confrontational antiabortion, pro-gun, white racist, far-right libertarian, and so on) (Berlet & Lyons 2000). The Southern Poverty Law Center (Potok 2010) reports that in 2009, the overlap between the militia movement and other extreme right-wing mobilizations became even more pronounced, as overtly racist commentary became more common on militia websites and militia antigovernment rhetoric was espoused frequently in a variety of conservative venues, including Tea Party movement events.

The ideological theme that unifies the patriot/militia movement is the belief that the US government has failed to represent its citizens and uphold the Constitution. Patriot/militia group members believe that the US government has become too involved in international politics, and that it is losing
its sovereignty to a socialist “New World Order,” managed by the United Nations. Government actions at Ruby Ridge in 1992 and Waco in 1993 are cited by movement members as evidence that the US government no longer supports the constitutional rights of its citizens, and that it intends to take all guns from citizens, in effect, making gun ownership illegal (Stern 1996; Berlet & Lyons 2000). Movement members believe that conventional political action is useless, and that citizens must arm themselves in order to fight back.

Antigovernment rhetoric is often combined with racism and sexism in the movement, although not all members are racist or sexist (Abanes 1996; Southern Poverty Law Center 1999). Some patriot/militia groups argue that the government is allowing women and minorities to gain too much political power at the expense of white citizens. In their analysis of patriot and militia rhetoric, Kimmel and Ferber (2000) argue that militia group members create an explanation for their economic woes by constructing an enemy that includes the federal government, women, and minorities. They show that movement members hold highly traditional views of gender, focusing on men as breadwinners and women as their passive helpers and suggesting that women’s empowerment means the oppression and emasculation of men. Some movement members are influenced by the Christian Identity religion, which holds that whites are the true chosen people, nonwhites are mud people, and Jews are the descendants of the devil. This religion provides a theological basis for their action, arguing that Anglo-Saxons have a birthright to establish God’s kingdom on earth. Thus, both racism and highly traditional views of gender roles are themes running throughout the movement.

FACTORS INFLUENCING THE EMERGENCE OF THE MOVEMENT

While the movement has not been well studied by social scientists, research suggests that its mobilization was fueled by both economic and political threats. Although the US economy overall was doing fairly well until 2008, the country experienced profound economic changes in the manufacturing and agricultural sectors at the end of the twentieth century. Millions of manufacturing jobs were lost between 1990 and 2009, and in the late 1980s and early 1990s, the country experienced what has been called the largest farming crisis since the Great Depression. Indeed in multivariate analyses, Van Dyke and Soule (2002) find that these economic changes fueled the growth of the movement; those parts of the country that lost a lot of manufacturing jobs and farms were more likely to host a patriot or militia organization in 1996. Freilich and Pridemore (2005) also find an association between loss of farms and patriot/militia organizing. Individuals with manufacturing and farming skills do not necessarily have the ability to secure positions with comparable pay in the new economy.

Although it is difficult to obtain valid information regarding the characteristics of organizations that are largely underground, consistent with the research described above, independent researchers suggest that the patriot/militia movement is populated by individuals who have been hurt by economic restructuring. Both Abanes (1996) and Snow (1999) suggest that patriot/militia group members are unskilled workers who face increasingly fewer employment opportunities, farmers, and middle-class individuals who have been hurt by economic restructuring. Thus, the research on the influence of economic change is echoed by that on movement membership.

In addition to mobilizing in response to economic threats, research finds that the movement has also been triggered by political threats and the perception that women and minorities are gaining political power to the detriment of white males. Van Dyke and Soule (2002) find that a higher level of women in state legislatures is associated with higher numbers of militia organizations. They also find that, at the county level, those counties which experienced an increase in their minority
population were more likely to host a militia or patriot organization. Other scholars show that states that have more of a paramilitary culture and more Gulf War veterans are more likely to host more patriot/militia groups (O’Brien & Haider-Markel 1998; Freilich 2003). They argue that a paramilitary culture emerged in the 1970s and 1980s in response to successes on the part of the women’s and civil rights movements as well as the American loss of the Vietnam War. Thus, there is some evidence that the movement is driven in part by threats to the perceived increasing power of women and minorities. The demographics of the movement are consistent with these findings: the movement is predominantly made up of white males (Snow 1999; Southern Poverty Law Center 1999; Kimmel & Ferber 2000), and others note a strong presence of military veterans (Kimmel & Ferber 2000).

CONTEMPORARY MOBILIZATION

The patriot/militia movement’s resurgence in 2009 is remarkable. As noted in the introductory paragraph, the number of groups increased by over 360 in 2009. The research described above suggests two possible triggering factors: economic downturn, and the election of Barack Obama to the presidency in 2008. 2008 saw the largest economic downturn in the US since the Great Depression, with unemployment rates reaching nearly 10 percent nationally, and local unemployment as high as 20 percent in some parts of the country. During times of economic stress, people look for someone to blame, and the federal government, as well as the increasing economic and political power of women and minorities, can make them feel that the government is to blame and that citizens need to mobilize and take up arms to protect their status.

The election of an African American Democrat to the White House is also undoubtedly one of the important triggers of the movement’s resurgence. Mark Potok (2010) of the Southern Poverty Law Center (SPLC) notes that patriot and militia web sites have been full of negative and racist comments regarding President Obama since his election. It is tempting to assume that this mobilization is driven entirely by racism, however, the SPLC (Potok 2010) did not find a significant increase in the number of white supremacist or hate groups in 2009. While racism is part of what motivates the militia movement, the movement’s central theme is a distrust of the federal government and a fear that the government will outlaw gun ownership. In the 1990s and 2000s this fear seems to have been especially heightened when Democrats were in power in the White House, probably because the Republican Party and others cast the Democrats as the party of big government, and as being opposed to gun ownership. The extent to which the recent mobilization has been driven more by economic downturn or political threats remains a task for empirical research to sort out.

4  PATRIOT/MILITIA MOVEMENT IN THE UNITED STATES

Peasant movements
DEBAL K. SINGHAROY

This entry summarizes the dynamics of peasant movements in both historical and contemporary terms. It highlights the nature of peasants’ political actions, the conditions that produce peasant movements, and the changing dimensions of peasants’ movements in the pre- and posteconomic liberalization world.

PEASANTS AND POLITICAL ACTIONS

Peasants have widely been described economically, as small producers, subsistence cultivators, landless agricultural laborers, sharecroppers, tenants, and part-time rural artisans who have been attached to land to eke out a living; culturally as unsystematic, unreflective, unsophisticated, and illiterate; socially as collectivities with predominantly primordial relations based on clan, caste, and ethnicity; and politically as underdogs deprived of knowledge for organized collective action who have historically borne the brunt of extreme forms of subordination and oppression in society. Interestingly, observers have attributed to peasants dichotomous social identities. On the one hand, they have been described as undifferentiated, conservative, and awkward social categories devoid of the potential for social movements of wider social concern and revolution; on the other hand, they are said to be progressive and autonomous social groups capable of concrete class actions. In the context of eighteenth-century peasantry in France, for example, Karl Marx described peasants as a social category in which members of the category are isolated from one another and “are formed by simple addition of homologous magnitude, such as potatoes in a sack form a sack of potatoes” (Marx 1974: 231). To Lenin, however, the peasantry in late nineteenth- and early twentieth-century Russia was differentiated by the unequal patterns of landholding, income, and by their contact with the market with revolutionary potentials (Lenin 1972: 497–498). Notwithstanding the dichotomous perceptions, the peasantry has played crucial roles in several great revolutions and social movements and in daily grassroots struggles.

Shanin (1984) has described three major types of political action peasants have pursued: independent class action seen during the Green Movement in Eastern Europe, the Peasant Union in Russia in 1905 and in China (1900–1926), and the Zapatista movement in Mexico; guided political action spearheaded by external political forces and power elite, like the Russian Cossacks, French Bonapartism, and the Maoist People’s Armies; fully spontaneous, amorphous political action as in food riots and passive resistance reflected in the spontaneous restriction of production by the Russian peasantry in the 1920s. Passive protest is an important art of peasant resistance that was practiced by Gandhi during India’s freedom movement (Shanin 1984: 251–263).

Since the late nineteenth century, the peasantry has evolved into socially differentiated social categories affecting the nature, forms, and sequence of their participation in revolutionary movements. In the revolutions of Russia, the middle peasantry played the crucial leading role while the poor peasants came in only at a later stage when the success of the movement was almost guaranteed. By contrast, in the Chinese revolution the poor peasantry provided both the leadership and the main force of the peasant revolution. In India, as the nationalist movement emerged, the peasantry took up its cause against feudal lords under the leadership of Mahatma Gandhi, who mobilized peasant support for the Indian National Congress (Alavi 1965: 242–243). Peasants took part in the Champaran movements (1917),...
Kheda Satyagraha (1918), and Bardoli Satyagraha (1928) to protest against the oppressive antipeasant measures of the British and in the civil disobedience movement for India's independence through nonviolent means. It is, however, observed by many scholars that the structural features of Indian society, which are dominated by caste, religion, and ethnicity, ensured that the peasantry played a passive rather than a revolutionary role in the country (Moore 1966). Whether or not the peasants would participate in revolution appears to depend on the circumstances, what Marxists call the historical stages, of participation in the revolution (Alavi 1965: 243) and on the structure of power and class alignments in the society (Moore 1966).

Historical evidence shows that while peasants often constituted a “break in the middle-and working-class revolutions” in the West, they played a crucial role in anti-colonial movements in countries like Algeria where “they have nothing to lose and everything to gain.” The starving peasant, outside the class system, is the first among the exploited to discover that only violence pays (Fanon 1971: 47).

Antonio Gramsci observed the peasantry in the context of Italy as a part of a larger sociopolitical order and not a discrete entity. They lacked unity and collective consciousness and participated in their own subordination by subscribing to hegemonic values and developing subaltern consciousness. To Gramsci, their subordination could be broken through an alliance of workers and peasants (Gramsci 1998). To Hobsbawm (1972), though “peasant-ness” of the peasantry can be defined by “subalternity, poverty, exploitation and oppression,” they are also capable of resisting attack and developing counterattack (1972: 13). Subaltern groups maintain an autonomous domain of politics in their own way to contest the structure of subordination through spontaneous mobilizations, as reflected in peasant uprisings and insurrections, unrest in the *hats* (local village markets), looting, and also in organized peasant movements (Guha 1982: 4–6).

Peasant resistance is also reflected in covert form through “hidden transcripts” as described by James Scott. In his view, subordinates in structures of domination have a fairly extensive social existence which is outside the immediate control of the dominant. Behind the scenes they are likely to create and defend a social space in which offstage dissent to the official transcript of power relations may be voiced. Every subordinate group creates, out of this ordeal, a “hidden transcript” that represents a critique of power as spoken behind the back of the dominant (Scott 1990: 4–15).

Besides these overt (protest, direct action) and covert (hidden transcripts) challenges, there is also a third form of contemporary resistance: *direct intervention to alter the labor and production processes*, especially to bring in indigenous forms of rural development.

Peasant societies have encountered varieties of challenges that can be clustered into pre-economic liberalization (until the 1970s) and postliberalization periods (since the 1980s). It is within these contexts that a number of peasant movements are summarized below.

**PEASANT MOVEMENTS 1930s–1970s**

**Anticollectivization movement, Russia**

Russia, under communist rule, took the initiative to collectivize private land owned by the peasantry in the late 1920s as a part of the Stalinist revolution from above, and proceeded to eradicate peasant institutions. The government recruited millions of party workers to frame the social base of the revolution that initiated all-out attacks on the peasants, their culture, and way of life. As the authorities tried to implement the collectivization initiative through coercion, the anticollectivization movement emerged, with thousands of peasant revolts. These revolts took the form of riots and disruption of meetings to organize collective farming, with the aim of frightening the party workers and reclaiming many of the properties taken for collective farming. In March 1930, Stalin stopped the process of collectivization.
However, it was initiated again in late 1930 and completed despite the peasants’ resistance (Viola 1996).

**Tebhaga movement, India (1946–1947)**

The British colonial land policy in India created a class of intermediary landowners with a dominant minority having social and economic command and a hapless majority suffering poverty, unemployment, and insecurity as agricultural laborers, sharecroppers, and tenants at the bottom of the agrarian hierarchy. In 1946, on the eve of independence, the undivided Bengal experienced a vehement outburst of peasant unrest known as Tebhaga Andolan, under the leadership of the left-dominated Bengal Kisan Sabha. Through this movement, poor peasants, who were mostly from a tribal and lower caste background, demanded “land to the tiller” and a two-thirds share of the produce for the sharecroppers instead of a half. The peasants asserted their rights by forcibly cutting and stacking the paddy in their own courtyards against the will of the landlords, resisted the police, and fought the united armed forces with traditional weapons. Though this movement spread rapidly across Bengal, it collapsed quickly in the face of repressive measures like killing, torture, and public flogging by the police and administration on the one hand, and lack of coordination among the peasantry and the collapse of their leadership on the other (Singh Roy 2004).

**Telangana movement, India (1946–1952)**

Through armed struggle in 1946–1952, the peasantry of the Telangana region of Andhra Pradesh engaged in a prolonged movement against the feudal land tenure system and its exploitative practices, such as landgrabbing, illegal taxing, forced and bonded labor, extra-economic coercion, rack-renting, debt, and daily humiliation. Under the leadership of the communist-dominated Andhra Maha Sabha, the peasantry took part in a guerrilla struggle to overthrow the Nizam (the princely ruler) of Hyderabad. The national government of India initiated military action against the Nizam in 1947 for resisting the merger with the Indian Union and subsequently against the peasants in September 1948. Several hundred peasant rebels were killed while facing the armies of the Nizam and of India. However, once the Nizam was overthrown by the Indian army in 1951, the Politbureau of the Communist Party of India called off the struggle and opted for parliamentary democracy to espouse the cause of the peasantry (Dhanagare 1983; Singh Roy 2004).

**Naxalite movement, India (1967–1971)**

Immediately after independence, the Government of India introduced an elaborate land reform programme with a view to minimize agrarian inequality, putting it on the path of progress and accelerated development. However, all over India a gap surfaced between the land reform laws and their implementation that led to downward mobility of peasants. The left-wing political parties in West Bengal had been mobilizing peasantry for the implementation of land reforms, and in 1967 a left-supported United Front Government came into power in this province with the promise of land reform. However, once in power it showed reluctance to implement the promise. The peasants of Naxalbari, under the leadership of the Communist Party of India’s Darjeeling District Committee of West Bengal, began taking possession of surplus lands forcibly, arming themselves with conventional weapons like bows and arrows and spears, and set up a parallel administration to look after villages. They also declared some “liberated areas.” Although the state objected by initiating police action, the movement spread like wildfire across the state and in many other parts of India, and pushed for the seizure of state power through guerrilla warfare within a Marxist-Leninist and Maoist ideological framework. Peasants, especially from tribal areas, overwhelmingly participated in this struggle. The Communist Party of India (Marxist-Leninist) was formed in 1969 to spearhead the movement across the country. However, the movement collapsed in the face of strong state action that
killed hundreds and arrested thousands. This movement continues to reappear in rural India, as more than a dozen of Naxalite groups are active in contemporary India under different names, covering more than one-third of the territory, mostly in deprived areas (SinghaRoy 2004).

Latin American peasant movements
Latin American history is replete with revolt and rebellion among the peasantry, initially against the Spanish and Portuguese and subsequently against the British, French, and the US. Some of the landmark movements associated with the peasantry include the Haitian revolution at the end of the eighteenth century against colonialism and slavery, the Mexican Revolution, starting in 1910, that culminated in the 1930s, ensuring agrarian reforms, the 1952 Bolivian revolt of peasants and miners for agrarian reform, the Cuban Revolution in 1959, leading to confiscation of US and Cuban-owned plantations, land distribution, and collectivization of smallholdings. The peasant movements in Peru in the 1960s and in Chile from 1966 to 1973 led to the redistribution of land among the peasants (Petras & Veltmeyer 2001). Other prominent movements connected to the peasantry and landless farm-workers that emerged between 1940 and 1980 include the Revolutionary Armed Forces of Colombia (FARC), in 1964, and the Landless Workers Movement (Movimento dos Trabalhadores Rurais sem Terra, MST), in 1978, which for many years was the best known social movement in Brazil.

African peasant revolts
Africa has also experienced a significant number of peasant movements, some of which scholars have described as peasant wars. The Mau Mau revolt in Kenya, the anticolonial uprising in Zimbabwe, and the Agbekoya uprising in western Nigeria are important examples. The many land movements in Africa can also be construed as peasant movements.  

CONTEMPORARY AGRARIAN SCENARIO (SINCE THE 1980s)
The agrarian scene in the contemporary world has been undergoing phenomenal change, widely characterized by continuing decline of the rural population, fewer people working in agriculture, and increasing stress on rural natural resources, namely land, water, and forest. These accelerating changes can be attributed to a confluence of factors: neoliberal economic policy, intervention of multinational corporations, phenomenal growth in agricultural production and trade, uneven food security both within and between countries, penetration of information and communication technologies with digital divides, and sharpened heterogeneity among peasants (Borras 2009: 9–16). This has been accompanied by the proliferation of multifaceted grievances and discontent in rural areas and internationalization of peasant movements linking them, via networks, regionally, nationally, and transnationally. Some examples follow.

National Confederation of Indigenous Nationalities (CONAIE), Ecuador
The National Confederation of Indigenous Nationalities (CONAIE) was formed in 1986 against the backdrop of the introduction of neoliberal policy by the state which had adversely affected the identity and interests of the Ecuadorian indigenous peasants, leading to a series of popular uprisings. From the early 1990s, the Ecuadorian peasants started protesting against state neoliberal policies, culminating in a series of concerted actions including the storming in 2000 of Congress and a brief takeover of the presidency. Through this movement, the peasants resisted concessions to transnational corporation and new economic development projects, which are perceived to be detrimental to the interests of indigenous peoples, the environment, and the local economy. CONAIE has committed itself to a process of noncapitalist modernization, an alternative form of development rooted
both in the indigenous peasant economy and in equitable participation in the country’s resources and national development process. Accordingly, CONAIE sees itself as a means of converting the country’s indigenous peoples from a “passive subject of change” into “an active social and political subject” and, in the process, of bringing about a state of development, democracy, and justice.

The Zapatista Army of National Liberation (EZLN), Mexico (1983–1996)
The Zapatista movement emerged in the 1980s in the Canada Tojolabal area of Chiapas in response to the privatization and weakening of the ejido – a land-holding system granted to the village in which peasants were given usufruct rights over specific plots of land and, in the best of cases, the commons. Though this system had some collective aspects to it, neoliberal technocrats in the government came to consider it unproductive and sought to privatize ejidal parcels. Additionally, the government’s official peasant union, the CNC (Confederacion Nacional Campesina or National Peasant Confederation) also developed to be a corporatist organization, and became widely discredited and seen as illegitimate among the peasants, thus contributing further to the armed uprising in Chiapas. Thus, the EZLN engaged in a guerrilla war against the state, with the aim of bringing an end to oppression and exploitation and instituting some form of socialism. On January 1, 1994, the Zapatista movement, with more than 3000 insurgents, seized Chiapas, just as the North American Free Trade Agreement came into force in Mexico. The movement sought to capture local state power through armed struggle to solve the agrarian crisis and provide leadership, health care, and development for peasants and landless workers. The EZLN attracted a large number of people from the peasant community, many of whom engaged in guerrilla rebellion directly or indirectly by protecting and safeguarding guerrillas, contributing new recruits, supplying provisions in the guerrilla training camp, participating in protests, and helping with community works to enhance Zapatista identity and hegemony in Chiapas. This movement has also been marked by noteworthy participation of indigenous women (Olivera 2005; Saavedra 2005) and has received national and international support.

The food sovereignty movement, Honduras
Since the 1970s, the Aguan valley of Honduras has been a site of agrarian peasant cooperatives. However, many of them were compelled to sell or surrender land to the Honduran government and the US military in the 1980s when the military wanted to convert it into training grounds to contain revolutionary movement in this area. Again, in the wake of state neoliberal economic policy, agrarian reform programs were sidetracked. Even though the US military withdrew in the 1990s, land was not returned to the campesina – the subsistence peasants; instead, it was passed on to more influential persons in violation of the legal position and history of landownership. The Honduras National Coordinating Council of Peasant Unions (COCOCH) was formed to resist this policy. This movement grew in influence against the backdrop of increasing landlessness and semi-landlessness, and the increasing dependency of Honduras on imports of basic food items from liberalized markets. The Via Campesina (see below) took up the cause of these peasants at transnational forums (Boyer 2010).

Autonomous peasant committee, China
The fast rate of economic growth achieved in China in recent decades is linked to the disruption and privatization of rural communes, and the creation of village township and village enterprises (TVEs) that provided employment to over 123 million workers. However, after an initial period of success the TVEs failed in most provinces, contributing to a decline in economic growth and large-scale migration of poverty-stricken workers from rural to urban areas. The rural peasant realized that the benefits of economic boom accrued to the
holders of power rather than to themselves. This situation led to waves of protests, resistance, and insurgency in rural China from the 1980s, involving millions of protesters in 21 provinces. Though these protests are localized, they have similar concerns about corruption, embezzlement, and related issues. These peasant protests took the form of violence or revenge against the cadres and new rich, and village elites. In some places, the collective actions involved prolonged blockades of traffic, setting fire to government vehicles and residences, and marching through streets, mountains, and fields. In Anhui, an autonomous peasant committee was formed by the protesters, demanding tax reduction and power to the peasants. In 1993 more than 15,000 peasants in Renshou County in Western Sichuan resisted the arbitrary raising of tax by the local cadres. They blocked traffic for six months, attacked government offices, and set vehicles on fire, with the movement spreading to many other areas (Walker 2006).

INTERNATIONALIZATION OF PEASANT MOVEMENTS

In the contemporary world international networking has emerged as a crucial dimension of peasant movements, as illustrated through the activities of the Landless Workers Movement and Via Campesina.

The Landless Workers Movement (MST), which began in Brazil, has acquired both national and international attention in the contemporary world, beginning most noticeably in 1999–2000, with the demand for greater credits and financing for small cultivators, smallholders, and impoverished landless rural workers. Although nationally focused, it also has a global focus, bringing together peasant communities from all over the world in solidarity to articulate their issues and struggles in the globalizing world. The slogan of the MST is “occupy, resist and produce.” It has occupied through the mobilization of poor peasants vast areas of unoccupied land, and secured credit to modernize agriculture, converting fallow estates into productive units. The MST has organized national marches into Brasilia of over 100,000 people, organized roadblocks, and has mobilized supporters throughout the country via the Internet. It has been a leading force in organizing urban alliances to counteract the neoliberal agenda of privatization and budget cuts, in the process mobilizing trade unions, political parties, university, and religious groups through a campaign called “Consulta Popular.” The MST pursues a “modernization from below with equity” strategy; in opposition to the elite modernization strategy favored by the Cardoso regime and its World Bank sponsors (Petras & Veltmeyer 2001).

The Via Campesina is a global movement of peasants, small and medium-scale farmers, rural women, farmworkers, and indigenous agrarian communities of Asia, the Americas, Western and Eastern Europe, and parts of Africa. It brings together rural organizations from all over the world in common forum to formulate policy alternatives to neoliberalism and to make their voices heard in GATT, and subsequently WTO deliberations and other discussions on agriculture and food that take place nationally and internationally. It has developed ties among 149 peasant organizations across 69 countries. The Via Campesina emerged in explicit rejection of neoliberal agricultural policies and as a direct response to the fact that the concerns, needs, and interests of people who actually work on the land and produce much of the world’s food are excluded in the GATT negotiations on agriculture. It also negotiates with the United Nations for international conventions on the rights of peasants along the lines of the Declaration on Rights of Indigenous Peoples (Desmarais 2002; Torres & Rosset 2010).

INSTITUTIONALIZATION OF PEASANT MOVEMENTS

Radical peasant movements have been transformed into institutionalized peasant movements in many parts of the third world. For
example, the mainstream Left political parties in India, like the Communist Party of India and the Marxist Communist Party of India, and even a section of the Naxalite movements that sponsored radicalism and militancy, have opted for parliamentary politics and reoriented the tactics of peasant mobilization through tactical revisionism. Through routinized mobilization, peasant movements have sometimes been co-opted at the grassroots, and peasants’ subordination in society has been reinforced as they have been unable to bring livelihood security to peasants, instead fostering dependency relations between the political party and the peasantry. While in some arrangements of subordination the peasantry has developed hidden transcripts of criticality against political leaders, sustained mobilization has made them articulate alternative multiple identities. These have taken the form of caste (Rajbansi statehood movement, Madiga reservation movement), regional autonomy (Telangana statehood movement), and gender (anti- and prohibition of arrack) movements in India. Despite the transformation of some peasant movements, peasant marginality and subordination continues, prompting the articulation of multiple identities and use of available resources to challenge the structure of their marginalization and subordination in society.

CONCLUSION

In the globalizing world, despite the fast process of industrialization and emergence of a knowledge economy, peasantry continues to survive as the last tribe of humanity characterized predominantly by poverty, insecurity, deprivation, and marginalization, and domination of various forms. The peasant movements in the contemporary world are at a crossroads and have taken multiple forms, from local resistance to global coalitions. The peasants are in a process of constructing new identities and using the strategies of resistance, both against internal and external subordination, articulated through everyday experiences of survival in the wider world.

Peasant rebellions of imperial China

HO-FUNG HUNG

China's imperial history was characterized by a dynastic cycle, in which the decay and collapse of a dynasty was often triggered by peasant rebellions. Many of these rebellions followed a similar pattern. A dynasty that prospered on the abundance of cultivable land and natural resources would inevitably encounter depletion of those resources when its population grew. Hardship inflicted by rising population–land ratio, in tandem with the concentration of landownership having developed over time, drove many to believe that the dynasty's mandate of heaven had gone and a new bearer of the mandate was about to emerge. When a new dynasty was established, the rulers usually expanded the available land by colonizing uncharted regions. They would also even out landownership. These measures, together with the relief of population pressure owing to turbulent dynastic transitions, created the foundation for the dynasty's heyday. Then resources would diminish again with rising population and the cycle would be repeated.

This cycle of peasant rebellion developed throughout China's imperial history. In late imperial times, after the fourteenth century, the rebels' ideology and organization underwent a significant change when the White Lotus religion and the respective sects gave most peasant rebellions a millenarian and utopian twist.

The origins of the White Lotus religion in China can be traced back to about 1100 CE. It represented a convergence of the religious traditions of Taoism, Buddhism, and Manichaeism. The core of the religion was the idea of cyclical kalpas (jie), a classical Sanskrit term meaning successive transformations of the world over immensely long periods of time. The religion's followers worshipped the Eternal Venerable Mother (wusheng naomu), the supreme deity controlling the recurrence of kalpas. Each kalpa was governed by a particular Buddha, and the present kalpa was governed by the historical Shakyamuni Buddha. When the current kalpa ended, the material world would be destroyed by horrific famines, diseases, and other catastrophes. The Venerable Mother would then send the Maitreya Buddha (lile fo) to earth and initiate a new kalpa. Followers of the religion were told to practice vegetarianism and to lead an ascetic way of life so that they would attain salvation and be brought back to the womb of the Venerable Mother during the calamitous kalpic transition (Overmyer 1976).

The White Lotus religion spread throughout China among the lower classes after the twelfth century. Independent and competing White Lotus sects proliferated (Gaustad 2000). At times, the White Lotus religion was appropriated as an ideology to call for rebellious action. In those instances, the content of the religion mutated with a utopian twist. It prophesied that, during the imminent kalpic transition, the Maitreya Buddha would be reincarnated, and his followers should aid his work of cleansing the world of corruption to earn their salvation. The new kalpa would be the dawn of an egalitarian world in which there would be no distinction between men and women, rich and poor, old and young.

The first major outbreak of a large-scale uprising with a White Lotus outlook was in the mid-fourteenth century, when White Lotus sects in the south declared in the midst of plagues and famines that the Maitreya Buddha had come and that people in search of salvation should take up their arms and overthrow the ruling Mongols. The Red Turban Army, to which Zhu Yuanzhang, the founder of the Ming dynasty, belonged, was one of the militant sects.
inspired by the White Lotus religion. After the establishment of the Ming dynasty in 1368, the new emperor persecuted the White Lotus sects aggressively, for he was well aware of the religion’s rebellious potential. But toward the mid-seventeenth century, White Lotus activism revived and fueled a number of major rebellions, contributing to the final collapse of the Ming.

The White Lotus religion was suppressed once again after the consolidation of the Qing dynasty that replaced the Ming in 1644. But the Qing government was never able to root out heterodox sects altogether. During the eighteenth century, White Lotus sects proliferated alongside a growth in mobile, landless vagrants, who found social support and spiritual comfort in sectarian activities. White Lotus sects occasionally initiated open revolts throughout the eighteenth century. None of these rebellions were as threatening to the Qing rulers as the White Lotus Rebellions that spanned four provinces in the empire’s southwest in 1796–1805. The repression of this rebellion emptied the imperial treasury and weakened the Qing state to a point of no return. The Taiping Rebellion in the mid-nineteenth century, which fused White Lotus sectarianism with newly imported Christian beliefs, aggravated the state crisis and triggered the disintegration of the empire, which eventually collapsed in 1911 (Hung 2011: chs 4, 6).

These millenarian rebellions never succeeded in creating the utopia the sectarian leaders initially promised, either because the leaders became emperor aspirants (as in the case of Zhu Yuanzhang and the Ming dynasty) or because the rebellion was crushed. But the tradition of such rebellions had successfully implanted an egalitarian and utopian consciousness among the peasants, who then became more receptive to the communist mobilization that strove to turn peasant rebels into modern revolutionaries in the early twentieth century (Perry 1980).

Peronism
FEDERICO M. ROSSI

Peronism is one of the main social and political movements of contemporary Argentina. Peronism owes its name to its founder Juan Domingo Perón – three times president of Argentina (1946–1952, 1952–1955, and 1973–1974). Peronism is a national-populist movement related to the first incorporation of laborers into Argentina’s political arena. The movement since then has evolved and diversified.

ORIGIN

The origin of Peronism is a highly contested issue. The core of the debate is related to the characterization of Peronism as a rupture or a continuity with the past development of the struggles of popular sectors (the poor and/or marginalized strata) for incorporation in and transformation of the political regime.

There are a number of factors that together explain the origin of Peronism. The massive internal migration of politically inexperienced poor people to the large urban areas during the 1930s produced a huge demographic change and the alienation of politically inexperienced new migrants (Germani 1973; Di Tella 1990). Simultaneously, there was an accumulation of Communist and Socialist union struggles that produced a disparity between the material expectations of redistribution and the few actual or perceived achievements obtained, which led old and new union leaders to support Perón for pragmatic and ideological purposes (Murnis & Portantiero 1971; Torre 1990). A group of politically unrepresented elites also found an opportunity to access power. Peronism included the emergent national industrialists as well as politically marginal civil and military right-wing and Social Christian intellectuals (Di Tella 1990; Brennan 1998). Last, the charismatic bond built between Perón and the popular sectors allowed for the replacement of much of the previous labor movement arrangements by ideologically transforming the popular sectors (James 1988; Plotkin 2003).

The combination of these elements built a populist multiclass coalition that worked until the 1955 coup against Perón (Di Tella 1990). However, from 1955 to 1973 the Peronist movement gradually added a youth left-wing sector and increased the role of unions while detaching the industrialists and right-wing elites. In this period the Peronist movement was proscribed and entered into a phase of state persecution that increased the movement’s radicalization, leading to the creation of Peronist guerrilla organizations.

IDEOLOGY

Justicialismo – a blending of the Spanish terms for social justice – is the ideology proclaimed by Peronism. The scholarship on the Peronist movement has produced a rich debate about its ideology, due to Perón’s changing discourse and scholars’ use of European analytic categories to explain a Latin American phenomenon. Justicialismo is founded on Social Christian values and has three basic principles: social justice, political sovereignty, and economic independence. In pursuit of these three principles, Perón elaborated two key notions. The first is related to the location of Peronism as a movement in a third position “equidistant from both idealism and materialism and, in terms of socio-economic models, counterposed itself equally to capitalism and communism” (Gillespie 1982: 18). The second is related to the societal model to achieve social welfare. The organized community idea is one of direct state intervention to assure harmony between laborers and employers (Perón 1951). The Peronist economic model could be considered as an emulation of the Scandinavian welfare states.
in a mixed economy with a central role for unions in corporatist arrangements. In comparative terms, Peronism is the equivalent for Argentina to the US New Deal, and Getúlio Vargas’ Trabalhismo in Brazil.

PERONISM AS A SOCIAL MOVEMENT

The great internal diversity of the Peronist movement has produced some confusion among scholars due to equating the electoral Partido Justicialista (PJ) with Peronism as such. As the Sozialdemokratische Partei Deutschlands is not the German labor movement, the PJ is not the Peronist movement, just the most important of a series of Peronist parties. Even Perón asserted that Peronism was not a party but a movement (Perón 1951), which was composed of four branches during the 1946–1976 period: (1) political, the electoral and patronage instrument based on the PJ; (2) female, created by Evita Perón after the enfranchisement of women and later underdeveloped; (3) labor, by far the most developed and structured sector, based on the Confederación General del Trabajo (CGT); and (4) youth, incorporated in 1971–1974 through the creation of a Peronist student movement and left-wing guerrilla organizations such as the Montoneros (Gillespie 1982; McGuire 1997). From 1955 the industrialists were gradually marginalized, through being represented in the weak Confederación General Económica.

Redemocratization in 1983 and neoliberal reforms from 1976 undermined the unions’ power as the PJ mutated into a patronage-machine party (Levitsky 2003). This new context produced a decline of the CGT influence inside the PJ during the 1990s. At the same time, the Peronist movement diversified, with the creation of the new union Central de Trabajadores de la Argentina (CTA) in 1992, and the piqueteros movement that mobilizes unemployed laborers in 1996. The PJ has been quite dominant but has been weakened by disputes within its constituency by alternative Peronist parties since the 1990s, such as the right-wing Movimiento por la Dignidad y la Independencia and the center-left Frente Grande.

In brief, Peronism can be studied as a movement because it is composed of a network of union, party, and social organizations that are interrelated through grassroots branches and informal gatherings, making use of contentious and routine strategies for electoral and other political purposes. The Peronist movement has transcended any specific protest with periods of latency and underground resistance networks during the 1955–1973 and 1976–1983 periods. Finally, as has happened with equivalent labor-based movements elsewhere, Peronism developed a popular political culture that unifies multiple actors and individuals, providing them with an identity that does not require membership.

POLITICAL POPULAR CULTURE

Historically Peronism was the movement that first incorporated workers into the nation’s politics. For this reason, the formation of the dominant laborers’ tradition in Argentina is intimately related to the Peronist movement. Peronism has an emblem, hymn, intellectuals, and is the hegemonic political popular culture of the poor people. Among the varied elements of the Peronist popular culture, Evita is the best-known figure, sometimes even worshiped as a saint comparable to the Virgin Mary (Karush & Chamosa 2010).

The Peronist popular culture is the most resilient element of the movement, resisting multiple persecutions and twists on elites’ discourses and practices. The neoliberal policies of Carlos Menem’s (PJ) presidency (1989–1995, 1995–1999) put into crisis some of the Peronist national-populist principles, while it showed the movement’s resilience. Martucelli and Svampa (1997) identified union, revolutionary, and party pragmatic types of Peronist militants during the 1990s. Auyero (2000) provided a detailed analysis of the clientelistic grassroots logics of the
PJ and the redefinition of the Peronist anti-establishment mythical origins.

In a new turn of Peronism, Néstor Kirchner’s (2003–2007) and Cristina Fernández de Kirchner’s (from 2007) center-left Peronist presidencies have promoted a redevelopment of some of the first incorporation and left-wing Peronist symbols and rhetoric while including part of the piqueteros and unions in the government coalition.

REFERENCES AND SUGGESTED READINGS
The *piqueteros*, or unemployed workers movement, is the main contentious actor in the resistance to the social consequences of neoliberalism and the struggle for reincorporation of the popular sectors (i.e., the poor and/or marginalized strata) into Argentina’s political arena. The name *piqueteros* (picketers) is based on the type of protest that made this movement publicly known – the picket on the national roads. The origin and characteristics of the *piqueteros* movement are traceable to four main processes: (1) the social consequences of the collapse of industrialization by substitution of the imports model and the application of neoliberal reforms that produced a massive and fast deindustrialization from the 1980s; (2) the territorialization of politics since redemocratization as a result of the dissolution of the main corporatist arrangements for solving popular sectors’ claims; (3) the adaptation to a democratic setting of left-wing groups that had participated in armed struggle during the 1970s; and (4) the creation of territories for political organization without risks for unemployed people, by some unions, human rights organizations, and Catholic Church dioceses in the 1980s and 1990s.

ORIGIN AND GOALS

The *piqueteros* emerged in two petroleum enclaves, in the Patagonian province of Neuquén and in Salta on the border with Bolivia in 1996–1997 (Sánchez 1997; Auyero 2003). Later the movement diffused to the city of Buenos Aires and its suburbs through networks of militants of Christian-based communities, left-wing groups such as the Movimiento Guevarista (MG), parties such as the Partido Comunista Revolucionario (PCR) and Patria Libre (PL), the Central de Trabajadores de la Argentina (CTA), and the Asociación Madres de Plaza de Mayo (Rossi 2011: ch. 5). In 1996, ‘The March against Hunger, Unemployment, and Repression’ was organized by militants of the PCR, the Trotskyist Movimiento al Socialismo, and the Partido Comunista de Argentina (PCA) (Flores 2007). In 1997, the first pickets in suburban Buenos Aires that succeeded in getting unemployment subsidies were coordinated (Svampa & Pereyra 2003). Since then the movement has spread throughout the whole country and is associated with a multiplicity of social movement organizations (SMOs).

The main immediate goal of the *piqueteros* is to recover full employment for the urban poor. This goal is related to the quest for reincorporating the popular sectors in the political arena. In a mid- and long-term perspective, each SMO has diverse goals based on their ideologies and repertoires of strategies. Some SMOs claim revolutionary aims, while others expect gradual reforms in coalition with governments.

THE MAIN SMOS

As with any movement, the *piqueteros* is composed of several SMOs (Table 1). This movement contains multiple ideologies but a common identity of “unemployed workers.” Although the number of SMOs that compose the movement has gradually expanded, it began with three main groups: the Movimientos de Trabajadores Desocupados (MTDs), the Corriente Clasista y Combativa (CCC), and the Federación de Trabajadores por la Tierra, Vivienda y Hábitat (FTV). Despite the ideological diversity of the movement, the *piqueteros’* rank-and-file share a Peronist, nostalgic, national–populist social matrix (Svampa & Pereyra

2003: 195–196) that is part of Argentina’s popular sectors’ political culture.

THE PIQUETEROS’ INTERACTION WITH THE GOVERNMENT

The piqueteros’ relationship with the government had been mostly defined as a clientelistic one. However, recent studies showed that the picture is much more complex (Lodola 2005; Quirós 2006; Pereyra & Pérez 2008; Rossi 2011). The piqueteros use a wide collection of contentious and routine strategies.

The piqueteros’ contentious repertoire is related to the use of the picket as a tool for blocking the distribution of products. Their territorialized type of mobilization is a result of being linked to the urban land occupations of the 1980s (Merklen 2005). This strategy generally follows a sequence. First, mostly in association with the municipality or with a local political organization, a piqueteros SMO organizes a picket by burning truck tires and putting tents in a road crucial for nearby companies in order to claim for unemployment subsidies and/or jobs. Second, usually under the decision of a federal judge, the Gendarmería (military police) arrive in order to secure the free transport of goods. Third, in most cases state brokers arrive at the picket site and negotiate with the SMO leaders in order to achieve a concerted solution. Fourth, if an agreement is achieved, the leaders will generally explain it to the people in the picket who will then deliberate in an assembly and vote on whether to accept the accord. Fifth, if unemployment subsidies are allocated, this will be done by the ministry of labor, as it is the responsible agency. In almost all cases the state will refuse to give actual jobs. Sixth, if the government is less eager to support the piqueteros’ request, the Gendarmería will usually repress the picket and secure traffic.
If such repression occurs in Buenos Aires, this will generally lead to supportive CTA strikes and/or mobilizations in front of the seat of government by other *piqueteros* SMOs, human rights and left-wing groups. Seventh, if the allocation of unemployment subsidies is effective, this will tend to produce more protests by the same and other SMOs.

The *piqueteros*’ institutional politics repertoire is based on access to state positions. The FTV, BP, ME, PO, and the MTD of La Juanita have achieved legislative seats. The FTV and CCC have participated in the Peronist Eduardo Duhalde (2002–2003) presidency. The FTV, BP and ME have participated in the Peronists Néstor Kirchner (2003–2007) and Cristina Fernández de Kirchner (2007–2011) presidencies. Due to strategic differences, the movement has been divided into two sectors since 2003. The social movement sector that has been participating in the governmental coalition is very much interested on accessing state positions. The other sector, which remained in opposition to the government, has been interested in establishing routine rapport with state agencies, but not in getting posts for their members. Overall, accessing the state has not meant participation in the employment public policy decision-making process. Rather, it has meant increased access to state resources and spaces for the noncontentious struggle to end or reduce the influence of neoliberalism in Argentina (Rossi 2011: ch. 7).

Poor people’s movements
ANNIKA ZORN

Poor people’s movements describes contentious collective actors that are considered to be particularly powerless or weak in resources compared to other members of a community. Often, the term is used to describe spontaneous mass protest by members of social groups that are at the lower end of a socioeconomic scale or in a particularly marginalized position in a society, such as the homeless or the unemployed. Research into poor people’s movements has shown, however, that these movements share similar organizational efforts and coordinated social action to other movement activity. This entry examines the shared characteristics of these movements, how studies of poor people’s movements over the past decades have changed, and the insights we have gained from studies on social movement activity of the poor for social movement theory.

Poor people’s movements are episodic and rare phenomena compared to other movements. Research into poor people’s movements points to the crucial role of the local roots of these movements and the importance of disruptive actions to compensate for the lack of power of the participants (Piven & Cloward 1977). In fact, disruptive repertoires are stored within local and often informal organizational networks. Poor people’s movements are often characterized, as well, by a particular tension between social service activities and political (protest) action.

Historical examples of poor people’s movements include the protest by the unemployed and the working class during the New Deal in the US. In the second half of the twentieth century the protest of welfare recipients in the 1960 and 1970s (Piven & Cloward 1977) and the protest of the homeless during the 1980s in the US (Cress & Snow 1996) are well-known examples of poor people’s protest. In Europe, protest of the unemployed is both commonplace and pervasive across the region (Chabanet & Royall 2010).

More recent studies have stressed the marginal position of social groups within society that are not necessarily first and foremost economically disadvantaged. These empirical investigations broaden understanding of what is conceived as poor people’s movements. For example, in France in the mid-1990s a movement of the have-nots (mouvement de sans) gathered homeless people, migrants, and unemployed. While belonging to the group of migrants or the unemployed means a higher risk of being poor, it is not necessarily the case. These groups are instead mainly characterized by their marginal position in society. The term poor people’s movements can therefore point to two distinct aspects: either to the fact that the protest is carried by the economically poor, or to the fact that the carriers of a protest are particularly powerless or are weak in resources. The latter and broader understanding has gained in importance over the last two decades.

In fact, the term poor people’s movement is sometimes used as an analytical focus rather than just describing an empirical phenomenon or a specific movement. For example, the civil rights movement of black Americans was often described as a poor people’s movement, but it pertained more broadly to black Americans in general. Similarly, the civil rights movement played an important role in relation to the welfare rights movement of the 1960s and 1970s in the US (see Piven & Cloward 1977).

In the tradition of Marxian analysis, poor people’s movements were often explained by social and economic inequalities. The social tensions and experienced grievances would politicize members of the disadvantaged social groups and lead to the outburst of protest actions. The social and political meaning of these movements – that is, their
supposed critique of the social and political architecture – was therefore often highlighted.

History has often told us a different story, however. Movement research of the past decades has shown that protest by the poor is rather the exception than the rule. In fact, grievances do not simply translate into protest. Also, these movements rarely have a revolutionary impetus or question society as a whole, but often point, instead, to specific weaknesses of the political system. Further, other actors, such as the Global Justice Movement, sometimes take up the role of advocating for interests of the poor. While variants of strain theory may add to our understanding of how and when poor people’s movements emerge, there seems to be no automatic and direct link between socioeconomic grievances and protest on issues of social and economic inequality.

During the later part of the twentieth century poor people’s protest was comparatively infrequent. In postwar Europe and the US, protest action was much more often carried out by members of the middle class who had more privileged access to resources necessary to organize protest action. These protest movements, summarized in the European context as the “new social movements,” seemed to dominate the movement landscape. New social movements no longer formulated social claims in line with former movements – the expression of class-based actors expressing their socioeconomic position – but as actors seeking new collective identities beyond their class position (feminist movement, peace movement, environmental movement). Whereas in the US context movements of the poor were more common, especially in relation to welfare rights and homelessness, in postwar Europe poor people’s movements were relatively rare for many decades.

Social movement researchers have offered various explanations as to why poor people infrequently organized collectively or found it difficult to do so. On the individual level it is argued that poor people are often socially isolated and lack important networks to get politically involved. Further, poor people are assumed to have a difficult time accessing the resources necessary to organize collective protest action. Also the welfare state was assumed to defuse social protest topics. The difficulty of constructing and maintaining a positive collective identity, while belonging to an often ascribed and stigmatized identity, has also been considered as a major obstacle to building a movement of the poor. Unemployed people, for example, often refuse to describe themselves as belonging to the group of the unemployed, as do some of the homeless. The observations, considered together, underscore the difficulty of sustained mobilization among the poor.

These observations notwithstanding, over the past two decades protest by the poor has attracted increased interest. In the US, valuable empirical research had been done on the homeless movements, while in Europe the main focus of the past 15 years was on the mobilization of the unemployed. Research on poor people’s movements has furthered our understanding of social movement activism by refining the concept of resources, the role of networks for movement activity, and the importance of a shared, collective identity. The research has also shown the importance of benefactor organizations for poor people’s movements, without dismissing the fact that some poor organizations create resources from scratch or importantly rely on individual resources. Further, research into poor people’s movements has stressed the role of countercultural networks for disruptive action of the poor. Often oscillating between social services activities and political protest, poor people’s movements sometime blur the distinction between social and political action. Finally, research has shown that access to informal organizations seems to be especially crucial for poor people’s movements, as these movements produce fewer written accounts than their richer counterparts.

Popular Assembly of the Towns of Oaxaca (Mexico)

SERGIO TAMAYO

Every May 15, Mexico commemorates teacher’s day. On June 14, 2006, in the southern state of Oaxaca, Section 22 of the National Education Workers Union (SNTE) sponsored, as they did every year, a routine mobilization for better wages. The teachers were assaulted by police helicopters and riot police on the orders of the state government, to stop the demonstration taking place in Oaxaca’s downtown. Due to police inefficiency and the resistance of the demonstrators, the police were not able to halt the demonstration, which generated considerable citizen reaction. As a result, the Popular Assembly of the Towns of Oaxaca (APPO) was created. It was formed by teachers participating in the general strike, neighborhood and district residents, nongovernmental organizations, indigenous towns, some municipal authorities, transportation officials, youth and students, communicators, peasants, members of religious orders, small businessmen and tradesmen, academics, artists, and intellectuals. The eclectic movement demanded the removal of the governor, because of his authoritarianism and corruption.

The teachers’ struggle in Oaxaca goes back to 1980, when unionists opposed their own leaders who were linked to the government and refused to lead union claims. Thus, the Democratic Teacher Movement and the National Education Teacher Coordinators (CNTE), a democratic trend inside the union, were formed. The 70,000 teachers of Section 22 were in contact with hundreds of rural and indigenous communities all around the diverse regions in the state: mountains, the coast, the isthmus, the tropical plain, and the central valleys. Oaxaca is one of the states in Mexico with the highest rural and urban poverty rates. It has 3.2 million inhabitants in 570 counties, the majority of whom are indigenous. Illiteracy and educational levels are alarming. Many do not even have electricity or drinkable water. Migration is constant toward both Mexico City and the US, as undocumented workers. Due to financial need, many enlist in the army – six out of ten Mexican soldiers are from Oaxaca. Social and ethnic polarization is severe. Eighty per cent of the population has an average income of two dollars daily per capita. The economic and political elite constitutes only 1 percent.

APPO represents many of these marginalized citizens in a context of an institutional legitimacy crisis. Nevertheless, Section 22 initially had social rather than political expectations, with the political aspect developing as the movement grew. To achieve better wages, teachers defined a traditional and habitual mobilization repertoire, including demonstrations and strikes, occurring each year from the formation of APPO. The government’s response was disproportionate repression, resulting in one social control error after another, and producing a dramatic political crisis.

The governor of Oaxaca was elected in 2004 for a six-year period, in fraudulent elections. Without political legitimacy, Ulises Ruiz substituted negotiation by authoritarian and despotic behavior, imposing public policies and repressing opponents. He obtained the support of legislators and mayors of the institutional party (PRI) and the conservative party (PAN); also of big businessmen, bankers, and media with huge investments in the state. During the presidential election campaign of 2006, the governor supported the PRI candidate and confronted the autocratic leader of the National Education Workers Union, who had promoted the PAN candidate. That year, there were several crises of governance all over the country; for instance: a huge national movement against the electoral
fraud headed by the political leader, Andres Manuel Lopez Obrador; the peasant conflict in San Salvador Atenco, opposed to the project of the construction of an international airport; the miners’ strike in the north; and the Zapatista Army of National Liberation (EZLN) in Chiapas in the south. President Fox was eager to hand over power to the new president of his own party.

APPO is a pluralist movement, formed by a group of organizations based on union and family and community bonds. More than 50 social and political reform groups, as well as autonomists, anarchists, and communists, gathered around the teachers’ union in a general strike. The repertoire of mobilizations included traditional and innovative actions: highway blockage, seven megademonstrations, long political walks to Mexico City, fasts, and peaceful occupation of radio and television stations as well as public offices, such as the state university, the chamber of deputies, the court, and Government House.

Two contentious actions had outstanding impact. They were the barricades and the *radio popular*, controlled by the people. Three thousand barriers were built. They appeared immediately after the police and the paramilitary forces tried to eject the demonstrators. There were permanent watch guards who were changed regularly, recruited from union groups and community residents. The radio station had 24-hour programming, which allowed the population to keep informed of the development of the movement and to be called together for resistance actions.

The government commenced social control operations. They designed a media campaign, with counterframings that directed attention away from the harshness of the conflict. This counterframing also stigmatized the APPO and accused it of social violence. The authorities placed the city of Oaxaca in a state of siege. This was reinforced with a military presence and more than 5000 policemen, battleships, helicopters, land vehicles, and hired gunmen, such as “tonton macoutes” from the period of Duvalier in Haiti. Terrorist acts perpetrated, it is believed, by the government, were blamed on the APPO, and interpreted as provocation, justifying the intervention of the government forces.

On October 31 the police violently ejected the four-and-a-half-month occupation. There were eight dead, including an American reporter, teachers, a child, and a sick resident. Fourteen were injured; 61 were arrested in Oaxaca and 20 in Mexico City. Nineteen people disappeared.

Subsequently, APPO refocused on designing mobilization repertoires to free political prisoners, asking for punishment of the guilty police and military, reorganizing the assembly, integrating a state council, and creating autonomous territories. On October 2, 2009, Section 22 of the union was once more strong enough to organize a very large demonstration in memory of the 1968 student massacre at Tlatelolco, in spite of the repression it had suffered in 2006.

REFERENCES AND SUGGESTED READINGS

Academic attention to populism has sharply increased in recent years. As Mudde (2004: 541) notes, thousand of books, articles, columns, and editorials have been written about it in the last two decades. Yet a commonly accepted definition is still lacking, with scholars disagreeing on categorization, labels, and boundaries between its different manifestations. Some also stress that there is an abuse of this term in public discourse. One of the difficulties regarding the definition of populism is that it has been applied (and adapted) to several very different historical phenomena (movements, parties, regimes, intellectuals), across various periods of time: from the American People’s Party of the late 1800s to postwar European movements such as the Italian Common Man’s Front (late 1940s), the poujadist (conservative reactionary movement to protect the business interests of small traders) French Union for the Defense of Merchants and Artisans (late 1950s), the Dutch Farmers Party (1960s), or the Danish Progress Party (1970s). Some scholars have argued that populism was a key feature of Mussolini’s and Hitler’s regimes (Mammone 2009).

Populism has been alternatively conceptualized as a political rhetoric that is marked by the “unscrupulous use and instrumentalization of diffuse public sentiments of anxiety and disenchantment” (Betz 1994: 4) and appeals to “the power of the common people in order to challenge the legitimacy of the current political establishment” (Abts & Rummens 2007: 407). It has been considered a “thin” or “weak” ideology that holds “society to be ultimately separated in two homogeneous and antagonistic groups: ‘the pure People’ versus ‘the corrupt elite’, and which argues that politics should be an expression of the volonté general (general will) of the people” (Mudde 2004: 543). A specific feature of this ideology is its “indeterminacy” that “responds to its need to be adaptable” (Ruzza & Fella 2009: 3). Finally, populism has been defined as a type of organization, characterized by the presence of a charismatic (new kind of) leadership (e.g., Taggart 2000; Eatwell 2003) and a special style of communication (Tarchi 2002), namely without intermediaries.

Definitions of the concept, however, generally converge in seeing as a core aspect of populism its focus on “the people.” Populist movements attempt to create a direct connection between the people and the political power, bypassing the electoral process. They often consider the people’s aspirations to be betrayed by corrupt political elites (Ruzza & Fella 2009) and suspect that a conspiracy against the people is taking place (Taggart 2000). The charismatic leader is the only one who embodies the will of the common people and is able to speak on their behalf. However, the very definition of the “people” remains ambiguous in the use of populists, and competing interpretations try to clarify who “the people” actually are, some seeing the people in terms of class or ethnicity (e.g., Di Tella 1997; Meny & Surel 2002), others referring to “the heartland,” namely a place in which “in the populist imagination, a virtuous and unified population resides” (Taggart 2000: 95; Mudde 2004). The centrality of the people notwithstanding, “elitism” is also seen as embodied in the logic of populism (e.g., Urbinati 1988).

THE EXPLANATIONS

In general, when analyzing the causes for the emergence of populism, one is confronted with three main types of explanations. First, there are those at the systemic/societal level which focus on socioeconomic conditions conducive to
populism, such as poverty, low levels of development, economic breakdowns, modernization crises, and situations of general change and instability. In more recent times, for example, the negative consequences of economic globalization have been pointed out (Rydgren 2005; Mudde 2007). Second, there are those who underline the political factors favoring the development of populism, relating it to political discontent with liberal democracy and broken promises of the representative system (Taggart 2004). In this regard, populism is interpreted as a syndrome of democracy, a “pathological form, pseudo- and post democratic, produced by the corruption of democratic ideals” (Mudde 2004: 541), as well as a serious threat to it (Mény & Surel 2002; Abts & Rummens 2007; Pasquino 2008). Paradoxically, however, populists themselves participate in elections and argue that they are “true democrats” (Albertazzi & McDonnell 2008). However, it has been noted that “populist parties are by nature neither durable nor sustainable parties of government. Their fate is to be integrated into the mainstream, to disappear, or to remain permanently in opposition” (Mény & Surel 2002: 18).

Finally, there are interpretations that insist on the crucial role played by populist leaders and the ability of populist movements to exploit social and political crises. In particular the presence of a charismatic leader – such as Jörg Haider, Jean-Marie Le Pen, Silvio Berlusconi, Umberto Bossi, Pim Fortuyn, Carl Hagen, Pia Kjærsgaard, or Christoph Blocher – adopting a certain style and rhetoric (Deiwiks 2009: 3), is seen as a crucial characteristic of populism (Pasquino 2008). Populists are successful due to their role as “taboo breakers and fighters against political correctness” (Mudde 2004: 554). They usually appeal to emotions of fear and enthusiasm, adopt a demagogic style and refer to resentment, offering easy solutions for complex problems. With such an unconventional style of campaigning, they are often able to gain the support of younger and less politically aware people and traditionally apathetic voters (Heinisch 2003).

POPULISM IN CONTEXT: LEFT/RIGHT, HISTORY, AND REGIONS

Moving from theoretical definitions to empirical cases, one is impressed by the enormous variety of populist movements (Canovan 1981) that sometimes show very few similarities. Indeed, there have been several waves of populist movements in various geographical contexts – such as in North America in the 1870s–1900s, in Russia and Eastern Europe in the 1870s–1920s, in Latin America in the 1930s–1950s and in Western Europe in the 1980s–2000s – assuming different characteristics, following different trajectories, and appealing to different strands of supporters.

When a typological criterion is adopted, we can distinguish between right-wing and left-wing populist movements. Whereas the latter identify the “people” in socioeconomic terms, such as the working class exploited by the bourgeois elite, the former refer to the ethnic nation (Abts & Rummens 2007). Today populism is above all found on the extreme or radical right (Betz 1994; Kopecky & Mudde 2002), as is, for example, manifested in Western Europe in the many radical right-wing populist parties which have successfully developed from the 1980s (e.g., the Austrian Freedom Party, the French National Front, the Dutch List Pim Fortuyn). These movements, beyond being characterized by nativism (nationalism/racism) and authoritarianism (Mudde 2007: 11–31), have an exclusive type of populism, since for them, “not only the [corrupt] elite but other groups as well (immigrants, ethnic minorities) are excluded from the pure people” (Rydgren 2007: 245). They tend to have a Manichean view of the world and an anti-establishment populist strategy, which distinguishes between “the corrupted” (politicians both from the government and the opposition) and “the saviors” (themselves).

Populism is also related to the radical left (Mudde 2004; Zaslove 2008), although, according to many scholars, this overstretches the concept. It is emphasized that left-wing movements also have populist anti-elite, antiglobalization, and/or anti-EU appeals.
Examples of such movements are the German left-wing party Die Linke, the Dutch Socialist Party, the Scottish Socialist Party, the Slovak Direction-Socialist Democracy, and the Lithuanian Labor Party. The new left-wing movements of the late 1960s–early 1980s in Western Europe (e.g., the new left and the Greens) have also been considered as raising “populist critiques” (Mudde 2004: 548).

However, there are important differences between left-wing and right-wing populism: while the populism of the new left refers to “an active, self-confident, well educated, progressive people”; populism on the right side appeals to a silent counter-revolution (Ignazi 2002), namely a “slightly conservative, law-abiding citizen, who, in silence but with growing anger, sees his world being perverted by progressives, criminals, and aliens” (Mudde 2004: 557). In sum, if left-wing populism stresses more participation and less leadership, right-wing populism wants the opposite. Beyond populism, on the fringes of the political spectrum, observers also accent the increasing importance in Western Europe of a type of “mainstream populism” (e.g., Tony Blair in the UK, see Mair 2002), as well as a “center-right populism,” considering Silvio Berlusconi one of the best examples in Europe of this category (e.g., Campus 2006).

Taking into account a geographical distinction in the manifestations of populism, we can observe that in the United States populism, which goes back to the agrarian movements of the nineteenth century and the US People’s Party, has today deep roots in mainstream politics, being associated with both Democratic and Republican politicians (Ware 2002). Here, populist appeals might rely on the traditional defense of individual liberties vis-à-vis the state (Michael 2003), also borrowing from several well-established American traditions, such as producerism (i.e., the idea that the true Americans are hard-working people, “fighting against parasites at the top and bottom of society”), anti-elitism/intellectualism, majoritarianism (i.e., “the will of the majority of people has absolute primacy in matters of governance”), moralism, and Americanism (Berlet, 2009: 26).

In Latin America, populism has a long history as well, dating back to the first half of the twentieth century. However, Latin American populism is of a more urban nature. Peronism, in the mid–1990s, has been its main manifestation, addressing the economic concerns of the emerging working class. Problems related to the democratic transition and the unstable economic situation of the 1980s–1990s, have been mentioned as important factors which favored the emergence of populist parties in this region (e.g., Carlos Menem in Argentina, Evo Morales in Bolivia, Alan García in Peru and Abdala Bucaram in Ecuador), some of them remaining in power for a long time. Today, in general, populism is considered a common feature in Latin America and, although vested with different programs and styles with respect to the past, still a rewarding strategy.

Regarding Central and Eastern Europe, after the Russian experience of the populist intellectuals’ movement of the 1870s, which tried to mobilize a peasant rebellion against the Tsarist regime (Taggart 2000), more recently populism is seen as a specific post-transition (and post-accession, after 2004) phenomenon, determined by the economic, political, cultural, and social problems that arose after 1989. Indeed, populist movements mobilize the sizeable strata of Central and Eastern European societies who are dissatisfied with the functioning of democracy and have lost their trust in the political establishment, promising a politics closer to the needs of the people (Rupnik 2007). However, it is arguable that examples of populist politics were present before EU accession (e.g., in Bulgaria, with the ex-tsar Simeon II; in Slovakia with Meciar; in Hungary, with Orban; and in Poland, with the parties Self-Defence, League of Polish Families, and Law and Justice Palonen 2009).

Pro-democracy of 1987 (Korea)
JAESOK SONN

On October 26, 1979, President Park Chung Hee, a military dictator who ruled South Korea for 18 years, was assassinated. Two months later, Chun Doo Hwan led a military coup that virtually secured his position as a commander-in-chief. In May 1980, he declared martial law and sent special forces to the city of Gwangju to crush protest, slaughtering at least 200 civilians. This massacre has become a very important collective memory for both the movement activists and the ruling elites.

Chun became president in August. Soon, he revised the constitution to limit the presidency to a single seven-year term while keeping the indirect election method to select the next president which advantaged the ruling party. Throughout the 1980s, there were continuous demonstrations against Chun’s dictatorship, especially by college students, demanding Chun’s abdication and a revision of the constitution that would allow more democracy. Chun responded to the opposition by severely repressing civil society and the public sphere.

1987 was the last year of Chun’s presidency, which heightened public concern about power transition. Chun suddenly suspended the discussion of constitutional revision on April 13 and decided to keep the existing constitution. In May, the people became infuriated when they found out that prosecutors had been covering up an incident in which they killed a student demonstrator by torture in January. On May 27, the National Coalition for a Democratic Constitution was officially launched by forming a broad alliance of diverse groups which led a nationwide pro-democracy movement. The movement reached its peak in June, so it earned a name “the June Uprising.” On June 29, the ruling party made several concessions to democratization which included a constitutional revision to elect the president by popular vote. The government estimated over 3000 rallies and 1 million participants in June (Chung 1997), and 13,000 persons in police custody during two weeks in that month. Over the year, the riot police shot more than 670,000 canisters of tear gas (Chung 1997).

While the pro-democracy protests began to quiet down, a new wave of protests started. From July through October, there were more than 3000 labor disputes across the nation. Wage increase was the most important issue, but, influenced by the recent uprising, the workers also demanded “democratization” of workplaces.

Most political discussions and activities were suppressed under Chun’s dictatorship. The majority of participants in the democratization movement of June 1987 were mobilized not through formal organizations but spontaneously in the public space while involved in their daily activities. Urban centers and university campus neighborhoods throughout the nation were the most notable locations of mass rallies. These areas hosted government buildings, offices, restaurants, stores, and religious centers which drew huge crowds throughout the day. Downtown Seoul was at the nexus of busy boulevards (e.g., six lanes in each direction), on which major demonstrations often took place. College campuses and their neighborhoods were typical epicenters of protests whereas residential and factory areas were mostly quiet in June.

Protests intensified around lunchtime and peaked during the evening traffic hours when many people were on the streets. Protesters tried to hold big rallies at major places like churches or college campuses, but they almost always faced riot police who came to disperse them and they were forced out onto the street. Major confrontations usually occurred in the evening, lasting to late at night. This pattern of

protests was repeated daily throughout June on weekdays and eventually weekends as well.

The riot police’s indiscriminate use of tear gas and aggression against citizens made just about everybody on the street furious against a regime which already lacked legitimacy. Facing police brutality, some student activists adopted militant tactics such as throwing rocks and Molotov cocktails, but, overall, protesters tried to avoid violence and radical slogans. Demonstrators took over major boulevards so the impact of the protest could be felt throughout cities. Activists shouted slogans such as “Allow constitutional debate!” and sang popular songs, children’s songs, and even the national anthem together with the citizens. Countless citizens participated in the movement by applauding, honking, and sending donations and supportive messages to protesters while booing at police and hiding activists from them. Protesters often organized political discussion on the street with citizens when the situation permitted. Off the street, professional associations, one after another, issued statements criticizing the regime while expressing support for the movement.

The student activists were the vanguard of the pro-democracy movement during the 1980s. They were the ones who trained organizers and spread political consciousness to the rest of the society. Some of them continued their activities after leaving college. During the uprising, their self-sacrificing protests under police violence impressed other citizens, and eventually led to mass participation. The visible participation of white-collar office workers and professionals was a shock to the regime, because they symbolically represented the secure middle-class citizenry. Even the media deviated from the government guideline and reported the movement favorably. The support of religious leaders was a final blow to the dictatorship since they morally certified the movement. The Catholic cathedral in downtown Seoul was one of the most important protest places during the uprising, and the church officials actively protected student protesters by refusing police searches.

In December, a direct presidential election was held under the new constitution. While two opposition parties failed to field a single coalition candidate, the ruling party’s candidate, Roh Tae-woo, who had helped Chun’s military coup in 1979, won the election with 36 per cent of the vote. The election of a former coup leader as the new president was disturbing to many people and slowed down the democratization process. Nevertheless, the fact that the people stood up against the regime and successfully pressured it to make concessions marked a historical turning point that significantly changed the context of political development in the coming decades.

Pro-life/pro-choice movements
DEANA A. ROHLINGER and MIRIAM SESSIONS

The contemporary pro-life and pro-choice movements disagree about the status of legal abortion in the US. The pro-life movement opposes elective abortion on ethical and moral grounds. Pro-life advocates argue that an “unborn child” has a right to life and they strive to get these rights legally recognized. The pro-choice movement contends that women have a constitutionally protected right to abortion and work to keep abortion safe and legal. While contention over abortion has a long history, it did not always center on issues of rights. Initially, abortion was a medical concern and physicians were the arbiters of its administration. This was the result of a campaign by physicians to professionalize medicine. Throughout most of the nineteenth century, there were no licensing laws regulating who could practice medicine. This, coupled with the lack of a traditional guild structure, meant that trained physicians had to compete directly with other medical sects (such as homeopaths) for patients. Physicians saw abortion as an issue through which they could distinguish themselves from other practitioners and push for industry regulation. They claimed that their scientific training gave them superior knowledge regarding if and when a woman should have an abortion. The campaign was a success; all but “therapeutic” abortions were outlawed and licensed professionals were charged with deciding whether an abortion was performed (Mohr 1978; Luker 1984).

In the late 1940s and early 1950s, physicians, social movement organizations and clergy pushed state legislators to repeal abortion laws and expand the circumstances in which physicians could administer abortions, including in cases of rape, incest, and fetal deformity. These efforts to change policy were quite successful and largely uncontroversial. Scholars attribute this lack of controversy to how the abortion issue was framed. Advocates argued that the state should expand physicians’ authority regarding the medical circumstances in which a therapeutic abortion could be administered, an approach that focused on medical practice rather than women’s rights (Staggenborg 1991; Burns 2005). However, the framework for understanding legal abortion changed in the 1960s as a result of two controversies that focused public attention on women’s roles in reproductive decisions. The first case involved Sherri Finkbine, who sought an abortion in 1962 after learning that she had ingested a drug known to cause fetal deformity early in her pregnancy. To raise public awareness, Finkbine notified the press of her situation. The publicity resulted in her hospital refusing to give her an abortion. Finkbine traveled to Sweden for the procedure, where her physician informed her that the fetus was severely deformed and would not have survived outside of the womb (Luker 1984). The rubella measles epidemic in the US also served as a lightning rod for abortion controversy. When contracted by a pregnant woman, the disease could cause fetal malformations. Thousands of pregnant women who contracted the disease sought abortions. Since hospitals limited the number of abortions they performed and physicians were unclear regarding their legality, many women were unable to obtain the procedure. In addition to providing a new framework for understanding the abortion issue – a woman’s right to choose whether she had an abortion – these controversies spurred the growth of the pro-choice movement. For example, the National Association for the Repeal of Abortion Laws (now known as NARAL Pro-Choice America) formed in 1969 and began organizing repeal campaigns.
countrywide. Likewise, dozens of grassroots groups emerged and used direct action tactics and street theatre to raise awareness regarding the importance of safe and legal abortion to women’s health (Staggenborg 1988). The controversies also illustrated how great the differences of opinion regarding legalized abortion were in the US. The stage for the contemporary battle over legal abortion was set with two Supreme Court decisions handed down on January 22, 1973. In *Roe v. Wade* the Court ruled that a woman has a constitutionally protected right to an abortion and that the state could not prohibit abortion during the first trimester or before viability. Viability was defined as the potential for a fetus to live outside of the womb in *Doe v. Bolton*.

**THE CONTEMPORARY BATTLE OVER ABORTION**

Pro-choice supporters initially believed that the Supreme Court decisions resolved the abortion issue. In fact, the composition of the pro-choice movement changed dramatically in the following decade. Radical groups found sustainability difficult in this new political environment. With abortion legal, there was limited need for direct action tactics and many of the organizations became defunct (Staggenborg 1991). The pro-life movement changed as well. Before 1973, the movement was largely spearheaded by the Catholic church and pro-life groups that emerged locally in opposition to liberalizing abortion laws (Burns 2005). However, in the wake of the decisions, pro-life advocates quickly mobilized inside and outside of government and began to challenge the new status quo. As a result, the pro-choice movement has often found itself on the defensive and responding to the pro-life movement’s tactics and campaigns. Here, we focus on three targets of the movements – state legislatures, Congress, and abortion clinics – and briefly discuss the strategies, successes, and failures of the movements in each.

**Restricting abortion access: state legislatures and the Supreme Court**

After the Supreme Court decisions, the pro-life movement quickly introduced legislation that would restrict abortion access in states across the US. A driving force behind these challenges was the National Right to Life Committee (NRLC). Founded as an information clearinghouse in 1971, the NRLC coordinated the efforts of the largest pro-life groups in each state to restrict legal abortion. Specifically, NRLC constructed model legislation that could be introduced in state legislatures across the country (Rohlinger 2006). The pro-choice movement was not nearly as organized as their opponents at the state level and found it difficult to stave off pro-life legislation. Therefore, after a state passed legislation restricting abortion, pro-choice groups challenged the constitutionality of the law in the judicial system. We highlight three strategies employed by the pro-life movement to restrict abortion access and the decisions from subsequent Supreme Court decisions.

First, the pro-life movement pushed state legislatures to recognize the rights of spouses and minors’ parents in abortion decisions. Since *Roe v. Wade* made abortion a privacy issue, claims regarding fetal rights and morality were less resonant particularly in terms of connecting discourse to policy change. As such, pro-lifers framed abortion restrictions in ways that were consistent with dominant institutional discourse and advocated that the rights of other parties be protected as well. For instance, pro-lifers reasoned that parents had a right to be involved in a minor’s decision to have an abortion. The pro-life movement found that this line of argumentation had a great deal of public support and political legs. Several states passed parental involvement requirements, which have been affirmed by the Supreme Court. In *Planned Parenthood of Kansas City v. Ashcroft* (1983) the Court upheld a Missouri provision that required minors to obtain consent from a parent before obtaining an abortion. The Missouri law permitted
a judicial bypass in instances that a parent’s permission could not be obtained. The ability of the state to restrict access to abortion was situated in a broader set of legal principles in Planned Parenthood of Southeastern Pennsylvania v. Casey (1992). The Supreme Court ruled that regulating abortion was constitutional as long as the requirements did not place an “undue burden” on a woman’s ability to obtain an abortion. Currently, 34 states require parental involvement in a minor’s abortion decision. Pro-lifers also argued that excluding a husband from the decision-making process discriminated against him on the basis of sex, impaired his right of procreation, and denied him equal protection under the law, and they introduced spousal notification and consent legislation to protect these rights. While pro-life advocates passed legislation in eight states, the Supreme Court overturned these laws in Planned Parenthood of Central Missouri v. Danforth (1976) arguing that spousal notification and consent requirements put an “undue burden” on women. Some pro-life advocates continue to push for fathers’ rights in reproductive decisions.

Second, and related, the pro-life movement introduced legal requirements that were designed to discourage women from getting abortions. While some of these procedures focused on making sure women seeking abortions understood the procedure and fetal development, others were designed to make access to abortion more difficult. These TRAP (Targeted Regulation of Abortion Providers) laws include mandatory waiting periods, ultrasounds, and restrictions regarding where the abortion procedure may be performed (e.g., a hospital rather than a physician’s office) as well as who conducts it. Many of these provisions have withstood the scrutiny of the courts. Currently, 44 states and the District of Columbia have TRAP laws.

Finally, pro-life advocates shifted some of the legislative emphasis away from women’s rights to those of the fetus. Initially, pro-lifers focused on passing fetal viability testing requirements before a woman could obtain an abortion. The state of Missouri, for example, passed a law declaring that life began at conception and that unborn children have “protectable interests.” The statute, among other things, prohibited government-employed doctors from aborting a fetus that they believed viable and required fetal viability testing after the 20th week of pregnancy. The Supreme Court upheld the provision noting that the state had the right to protect “potential life.” This spurred other states to pass viability legislation as well and, to date, 24 states have laws that prohibit abortion if the fetus is viable, except in cases of life or health endangerment of the woman.

The battle on Capitol Hill

Since the abortion issue largely divides along party lines (with Democrats favoring legal abortion and Republicans opposing it), the makeup of Congress affects the number of allies a given bill has and, ultimately, whether it comes to fruition. Additionally, although activists and legislators often work together crafting policy proposals, the political arena has a limited carrying capacity, which means that a relatively small number of bills get congressional attention and an up-down vote. Here, we outline some of the most significant policy proposals advanced by pro-life and pro-choice advocates since Roe.

After the Roe and Doe decisions, the pro-life movement initiated two attacks on abortion. First, they questioned the use of tax dollars to pay for a procedure that many citizens vehemently opposed. Despite pro-choice arguments that such restrictions discriminated against poor women and women of color (Sillman et al. 2004), this line of attack proved successful. In 1976, the Hyde amendment, which prohibited the use of federal funds for the abortion procedure, passed. In 1979, funding restrictions were extended to military health care coverage and banned the use of federal funds for abortion services at overseas military hospitals. In 1995, pro-lifers passed a Department of Defense appropriations bill that prohibited women from obtaining privately funded abortion services at overseas
military facilities except in cases of rape or incest. Second, pro-lifers tried to overturn the Roe decision. However, there was not a consensus among groups regarding whether pro-life proposals should include an exception to save the life of the woman. NRLC argued that such an exception was necessary and supported the passage of the Human Life Amendment, which would reverse Roe, prevent states from making abortion legal at a later date and allow abortions that would protect the health and life of the woman. Other organizations, such as the American Life League, regarded the abortion exception an unacceptable compromise and supported the Paramount Life Amendment, which recognized the right to life of each human being from the moment of fertilization without exception. Other pro-lifers argued that the passage of a constitutional amendment was unlikely and advocated for the Human Life Bill, which declared that unborn humans were legal persons and restricted the power of lower federal courts to interfere with laws restricting abortion passed by the state. All of these efforts ultimately failed (Rohlinger 2006).

The watershed of the pro-life movement has been the debate over “partial-birth” abortion (PBA), which refers to a particular abortion procedure (medically known as the intact dilation and extraction procedure) performed late in a woman’s pregnancy. Although pro-lifers learned about the procedure in the early 1990s, it was commonly referred to as “brain suction abortion.” In 1995, the legislative director of NRLC coined the term, “partial-birth” abortion, which tested well in focus groups. NRLC launched a national media campaign and initiated state legislation in Ohio banning the procedure. Within months, debate over the “partial birth” abortion procedure dominated abortion discourse (Rohlinger 2006). Congress passed three bans on the procedure. The first two were vetoed by President Clinton, who refused to sign the bill since it did not include an exception to protect a woman’s health, in 1996 and 1997. President Bush, Jr, however, signed the ban (called the Federal Abortion Ban) into law in 2003. The Supreme Court upheld the law in Gonzales v. Carhart (2006), ruling that an exception to protect women’s health was not necessary since there were other medical procedures available.

The pro-choice movement has also introduced its share of legislation. Once it became clear that the Supreme Court would permit restrictions on abortion access, pro-choice advocates pushed for the passage of the Freedom of Choice Act (FOCA), which gave every woman the right to choose to terminate a pregnancy before viability and after viability if it is necessary to protect her life or health. FOCA, in short, would codify Roe v. Wade and nullify existing state laws restricting abortion. The bill was introduced in 1989, 1993, and 2004, but languished in Congress. Pro-choice politicians, with the support of NARAL, Planned Parenthood, and the National Abortion Federation, introduced FOCA again in Congress the day after the Gonzales decision. To date there has been no progress on the bill. Pro-choicers, however, have been successful at passing legislation that protects reproductive health clinics and their clients. Most notably, they passed the Freedom to Access Clinic Entrances Bill (FACE), which makes it a federal crime to use force, the threat of force, or physical obstruction to prevent individuals from obtaining or providing reproductive health care services. FACE was a response to rising clinic blockades and violence in the 1980s and 1990s (discussed below).

While Congress is charged with creating public policy, the president plays an important role in abortion politics for four reasons. First, the president frames how abortion fits into a larger administrative agenda, if at all. For example, passing a universal health care bill was at the top of President Obama’s agenda when he took office in 2009. The abortion issue was part of that agenda insofar as his included abortion coverage in his plan. Second, the president helps decide who will hold important positions in government; and some of these offices can directly affect abortion policy. President Reagan gave well-known pro-lifers prominent positions in his administration, all of whom
supported his efforts to make legal abortion less available. For instance, he appointed pro-life activists to the Office of Population Affairs where appointees slashed funding to Title X clinics and instituted the “gag rule,” which prohibited personnel working in Title X funded clinics from discussing abortion with clients. Third, the president provides nominees for the Supreme Court. As indicated in the above discussion, the Supreme Court has played an important role in abortion policy. Finally, the president has the ability to veto legislation and overturn (or reinstate) existing executive orders. President Clinton rescinded several pro-life policies put in place by presidents Reagan and Bush Sr, including the ban on fetal tissue for medical research and the importation of emergency contraception. President Bush, Jr, however, put these bans back in place after he took office.

The clinic as a battlefield

In the 1980s, pro-life activists, who felt that President Reagan had done little more than give lip-service to movement goals, decided to stop abortion by counseling women regarding other options, disrupting clinic operations, and using violence to close clinics. These pro-life activists share a moral abhorrence to abortion and regard the clinic as a location where they can effectively end the practice. However, direct action pro-life groups differ in terms of whether they believe violence against clinic facilities and personnel is a justified and useful tactic. Those opposed to violence argue that sidewalk counseling outside of clinics is the best way to provide women the support and information necessary to prevent abortion. Those that use violence regard it as a legitimate way to defend the life of the unborn. In the last 30 years, dozens of clinics have been vandalized and destroyed, one abortion provider kidnapped, and four abortion providers murdered. Some pro-life activists tacitly encouraged violence against abortion providers. In 1995, the American Coalition of Life distributed “wanted”-style posters which listed the names, addresses and phone numbers of 12 abortion providers labeled the “Deadly Dozen” and offered a $5000 reward for “information leading to arrest, conviction and revocation of license to practice medicine.”

Likewise, in January 1997, Neal Horsley created the Nuremberg Files web site that compiled information on providers and noted which were active, which had been injured, and which had been killed by pro-lifers. The web site had to change this format after the Ninth Circuit Court of Appeals Decision determined it constituted a true threat to those listed on the web site. Again, not all direct action groups advocate the use of violence. Two of the most visible direct action groups, Operation Rescue and Pro Life Action League, understand why pro-lifers resort to such desperate measures but argue that violence serves the interests of the pro-choice movement because it makes it easier for pro-choicers to pass legislation that restricts pro-life efforts to curtail abortion at clinics (Blanchard 1995; Risen & Thomas 1998).

The pro-choice movement responded to efforts to close clinics in three ways. First, pro-choicers engaged in clinic defense and mobilized volunteers to escort women into abortion clinics. In fact, new direct action pro-choice groups formed in an effort to ensure that women had access to clinic services. Second, pro-choice organizations publicly called on the president and Department of Justice to intervene in the battle on the street and to curb clinic violence. Pro-choicers contended that violence at clinics was not isolated incidents, but part of a larger campaign intended to reduce women’s access to the abortion procedure. This line of argumentation fell on deaf ears until Clinton took office and asked Attorney General Janet Reno to investigate clinic violence. Finally, the National Organization for Women (NOW) along with two clinics sued pro-life activists under federal antitrust laws and charged the defendants with a “nationwide criminal conspiracy to close women’s health clinics.” After more than a decade in court, NOW and clinics won the suit and a judge issued the first nationwide injunction, prohibiting the codefendants from interfering
with clinic services and women’s right to obtain them. The nationwide injunction and application of federal antitrust laws to pro-life threats was overturned by the Supreme Court (2003, 2006), which ruled that noneconomic violence was not covered by antitrust laws.

THE POTENTIAL FOR COMPROMISE?

One criticism of both movements is their seeming inability to compromise on the abortion issue. While compromise does seem unlikely in the political arena, some activists do look for “common ground” on the abortion issue. Founded in 1994, the Common Ground organization encourages dialogue among pro-life and pro-choice activists and looks for solutions that protect the health and well-being of women and children (Ginsburg 1998). For example, if a young woman is dropped off by a parent to obtain an abortion she clearly does not want, clinic personnel work with local pro-lifers to find other solutions. While common ground efforts have emerged in cities where the battle over abortion is the most divisive, it is not clear whether these efforts will influence political debate and policy processes. Given the entrenchment of the abortion issue and social movement organizations in American politics, it seems unlikely that political compromise is forthcoming.

Quebec nationalist movement (Canada)
KENNETH MCROBERTS

Quebec nationalism is rooted in the French-speaking population of Quebec, Canada’s largest province by territory and second largest by population. Within Canada as a whole, French-speakers (or Francophones) have long been in the minority; they now constitute 21.4 percent of the Canadian population (based on language used at home). However, in Quebec Francophones have always been in the majority, currently constituting 81.8 percent of the province’s population.

Among Quebec’s Francophones there has been a strong sense of collective identity, going back to the establishment of the French colony of New France. Ultimately, the conquest of New France by Great Britain led to the emergence of a distinct sense of nationality. However, the very definition of this nationality, let alone the strategy for seeking autonomy, has taken different forms in different historical periods. These historical shifts in the definitions of national identity, and the associated nationalism, reflected both changes in Quebec’s political economy, as the French and then British colonial relationships were replaced by integration in North America, and changes in the configurations of social forces within Francophone society itself. As a result, there have been very distinct phases in the social and political movements that have mobilized nationalist support among Quebec’s Francophones.

NEW FRANCE: DEVELOPMENT OF A DISTINCT IDENTITY

Founded in 1608, New France remained a French colony until 1759 when, after the Battle of the Plains of Abraham, it passed into British hands. During that time, the colonial population grew to about 70,000 and, in the process, developed a certain sense of collective identity. Beyond enduring struggles with aboriginal populations and the British, as well as the challenges of a harsh climate, the colonists tended to resent the relative neglect of their French metropole. Indeed, there was periodic resentment of the monopoly that Frenchmen held over positions of authority in the colony. Thus, they began to call themselves Canadiens or habitants to distinguish themselves from the metropolitan French.

AFTER THE CONQUEST: THE EMERGENCE OF FRENCH-CANADIAN NATIONALISM

With the British conquest, leadership within Canadien society fell clearly into the hands of the Catholic clergy and a group of seigneurs. By and large, they were prepared to seek a modus vivendi with the new British authorities who, for their part, soon abandoned assimilationist ambitions. In 1774, this resulted in the Quebec Act, which accommodated the Canadien leadership by recognizing the church’s right to collect a tithe and restoring seigniorial rights, as well as reestablishing French civil law. Under such conditions, there was no space left for any Canadien challenge to British rule.

Nonetheless, by the early 1800s, two new social forces emerged within Quebec that would challenge this state of affairs. Through these struggles, the first coherent nationalist movement was formed. First, while remaining very much a minority, a growing number of Britishers settled in Quebec and spawned a commercial class with ambitious plans to develop the colony’s economy through trade with Great Britain. Having secured a legislative assembly in 1791, they enjoyed disproportionate power over the assembly and sought to use it to
promote their commercial projects as well as their hopes of assimilating the Canadien population. Second, Canadien society spawned a new class of liberal professionals and small merchants who used the colonial assembly to resist such pressures. At the same time, they began to challenge the role of the clergy within Canadien society.

This protracted conflict resulted in the emergence of a Canadien nationalist movement, the Patriotes, who championed an autonomous political status for Quebec. The Patriotes led an armed uprising in 1837 but were quickly defeated by the British authorities who, for good measure, had the active support of the Canadien clergy. Nonetheless, the Patriotes and their Parti canadien represented the first instance of a coherent nationalist movement among Francophones in Quebec.

1850–1960: NATIONALISM AS A SOCIAL MOVEMENT

With the defeat of the Patriote leadership, the Catholic church secured the upper hand within Canadien society. As such, it shifted Canadien nationalism away from the secular and autonomist ambitions of the Patriotes and articulated a vision of the nation in which the Catholic faith was pre-eminent and political institutions were decidedly suspect. Rather than political action, this religiously rooted nationalism contended that the advancement of the Canadien nation would come through cultural and social affirmation, largely through the institutions of the church.

In negotiations that led up to the creation of a new Canadian political structure, which joined Quebec with three other British colonies, Canadien leaders united in their demand that the new structure must be federal in nature. But the terms of the new federation, which was proclaimed in 1867, closely followed the concerns of the church in focusing provincial jurisdiction on areas that were central to the prerogatives of the church and its institutions (health, welfare, education, and the solemnization of marriage).

Over the decades, some nationalist movements did succeed in mobilizing electoral support. In the 1880s, le Parti national emerged in response to the federal government’s execution of Louis Riel, leader of a rebellion in western Canada. The economic crisis of the 1930s spawned Action libérale nationale. During World War II, opposition to conscription produced the Bloc populaire canadien. But these movements were short lived and ultimately absorbed within the mainstream political parties. During the post-World War II period, the Quebec government was held by the Union nationale which, while avowedly nationalist in its defense of the autonomy of Quebec within the Canadian federation, tended to defer to clerical elites and to avoid any major attempt to expand Quebec’s autonomy.

QUIET REVOLUTION: EMERGENCE OF QUEBEC NATIONALISM

By the early 1900s, Quebec was well on the way to becoming an urban, industrial society. By the 1950s, there had emerged within French-Canadian society a substantial new middle class of intellectuals, administrators, engineers, and other professionals who began to challenge the clergy’s pre-eminence, cultural and social, as well as the clergy’s restricted vision of government. They contended that as an urban, industrial society, Quebec could no longer rely on the church to oversee its educational and social needs. Only public institutions, under government leadership, could do the job. By the same token, the new middle class began to challenge the historical dominance by English-speakers of the ownership and management of Quebec’s economy. Here too there was a need for government intervention to create opportunities for Francophones.

These arguments for state intervention necessarily focused on the government of Quebec. As a provincial government, it held the crucial jurisdictions of health, education, and social services. Moreover, it was the logical
instrument for opening the upper levels of the Quebec economy to Francophones, since it was responsible to an overwhelmingly Francophone electorate. The federal government, accountable to Canada’s English-speaking majority, could not be expected to take this on. Indeed, its public service was overwhelmingly dominated by Anglophones, and by the English language.

Out of these processes emerged a markedly new form of nationalism focused upon social and economic intervention by the Quebec government. Only in this way could Francophone society become fully modern and assume economic ownership and control. Only in this way could Francophones become *maître chez nous* or “masters in their own house.” In effect, the Quebec government had to become a “national” government and, within this nationalist vision, the nation could no longer be “French Canada”; it had to be “Quebec.”

The primary bearer of the new Quebec nationalism was the Quebec Liberal Party, which took power in 1960 and held it until 1966. This period has been dubbed Quebec’s “Quiet Revolution.” Under the Liberals, the functions and structures of the Quebec government were rapidly expanded, assuming direct responsibility for education and health and social services and displacing the church and its related institutions. The Liberals nationalized Quebec’s privately owned hydroelectric companies and established a network of state enterprises. Much of this was legitimized in terms of the new Quebec nationalism. In effect, rather than a political movement, Quebec nationalism had become the leitmotif of the provincial government.

Coupled with assertion of a new role for the Quebec government was a nationalist challenge to the place of Quebec within the Canadian federation. The jurisdictions of the provincial government would have to be expanded if it were to assume its responsibilities to the Quebec nation. Indeed, it would have to be afforded the status of a “national” state. These nationalist demands fed a constitutional struggle that dominated much of Canadian politics for the rest of the twentieth century.

**CANADA WITHIN QUEBEC: THE STRUGGLE FOR AUTONOMY**

During the 1960s, a variety of political movements sought to take the logic of Quebec nationalism one step further, calling outright for the political independence or sovereignty of Quebec. In 1968, they coalesced around a new political party, the Parti québécois, led by René Lévesque. It soon became the primary opposition party and, in 1976, was elected to power. As such, it was confronted with all the challenges that face a movement which assumes power within the very structures it is seeking to transform. Guided by a broadly social democratic agenda, it undertook a variety of social and economic reforms. In addition, it passed legislation enshrining the primacy of the French language within Quebec. But its 1980 referendum on Quebec sovereignty was defeated by a wide margin, at least in part because, as a government, it had addressed some of the nationalist grievances that initially had given rise to the movement.

Also contributing to the referendum defeat was the opposition to Quebec sovereignty led by federal prime minister Pierre Elliot Trudeau, himself from Quebec. Trudeau contended that Quebec Francophones should embrace Canada as whole rather than being contained by a narrow Quebec-based nationalism. To that end, he strengthened the presence of Francophones, and the French language, within the federal government itself and sought to strengthen French-language rights across the country. In the wake of the referendum, Trudeau spearheaded a revision to the Canadian constitution which, among other things, entrenched across Canada the right to French-language schools. Nonetheless, the Quebec government and legislative assembly opposed the measure and refused to endorse it, since it diminished rather than enhanced the powers of the Quebec government.

In the late 1980s, a new federal prime minister, also from Quebec, Brian Mulroney, spearheaded an effort at constitutional reform geared to securing Quebec’s consent. This
effort failed to secure the constitutionally required unanimous agreement of the provincial governments. But behind this failure was a movement of public opinion outside Quebec, heavily influenced by Trudeau himself, against the constitutional package and against the accommodation of Quebec and Quebec nationalism that it represented. The failure of the initiative, in June 1990, led to a remarkable surge in nationalist sentiment among Quebec Francophones. But, in 1995, a second referendum on Quebec sovereignty, staged once again by a Parti québécois government, was defeated by a razor-thin margin.

CONCLUSION: AN UNCERTAIN FUTURE

Fifteen years later, the forces in favor of Quebec sovereignty have yet to recover from their second referendum defeat. Indeed, the political parties favoring sovereignty are in considerable disarray. The Quebec sovereignty movement faces several challenges. To a considerable extent, issues that in the 1960s gave rise to the new Quebec nationalism have been addressed through government intervention. Key has been the entrenchment of the French language in Quebec. In addition, Quebec has undergone critical demographic changes: an aging population has heightened the need for Quebec to attract immigrants and this, in turn, has raised the challenge of integrating newcomers within Francophone society. Finally, given the failures of the past, there is deep reluctance within the Quebec Francophone population, and even more so in the rest of Canada, to address once again Quebec’s status as a nation and its place within Canada.

Yet, by all indications, Quebec’s Francophones continue to bear a strong sense of membership in a distinct collectivity that is largely, if not entirely, contained within Quebec. Moreover, many of them, if not most, continue to see Quebec as a nation, even if it is not clear what political and constitutional implications may stem from that status. Thus, the challenges to Quebec and to Canada that were first raised by Quebec nationalism in the 1960s remain unresolved.

Red Brigades (Italy)
LORENZO BOSI

The origins of the Red Brigades (Brigate Rosse in Italian; hereafter BR), which emerged in October 1970, are to be found in the Collettivo Politico Metropolitano (CPM), formed in Milan in September 1969 with the support of various local workers’ and students’ committees. Among other left-wing armed groups operating in Italy since the early 1970s the BR was the largest, the leading organization in terms of degree of political violence deployed, claiming 145 killings, and most long-lived, lasting, despite splitting up into various groups and wings, until the end of the 1980s. It was strictly organized into city columns: Milan and Turin were the first, which were subdivided into brigades with three- to five-member “cells.” Over time the city columns expanded into Rome, Genoa, Naples, and Venice. Over the 1970s and the 1980s it was estimated as being composed of over 400 full-time members, plus an unknown number of supporters.

Italian left-wing political violence originated out of the increasing fear that a possible coup d’état was just around the corner and from the conviction that the state was part of a conspiratory anticommunist “strategy of tension,” facilitated by the Italian secret service, parts of the army, and the American CIA. This influenced the collective decision of some extraparliamentary left-wing groups to resort to violence as a weapon of political competition (della Porta 1995). They saw an armed response as the only way to oppose the total domination of the Italian working class, which was seen to have been “abandoned” by the Italian Communist Party (PCI), unwilling to serve any longer in the vanguard of the struggle for the proletariat in its drive to become a credible democratic force. An opportunity existed for a champion of revolution to emerge on the left of the PCI, and the BR identified themselves completely with this role (Melucci 1981).

Marxist-Leninist in its ideology and organizational structure, the BR aimed to perpetuate and even radicalize the 1969 labor conflict, providing armed support to striking workers. Capitalist society, controlled nationally by the Christian Democrat (DC) establishment and globally by American imperialism, was, in its leaders’ view (among others, Renato Curcio, Alberto Franceschini, Mara Cagol, and Mario Moretti) a monster preparing to demolish the world, against which the use of force to undermine the status quo was legitimate in order to bring a communist upheaval led by a “revolutionary proletariat.” Acts of physical violence soon followed their bellicose rhetoric. Initially the group’s main activities were fairly low level. They did not go beyond damaging company properties, setting fire to numerous automobiles owned by business executives, security staff, and heads of sections, or the brief kidnapping of industrial managers and right-wing trade unionists. In those factories where they were present (Sit Siemens, Alfa Romeo, Magneti Marelli, Pirelli, and FIAT) members of the BR carried out what they termed counterinformation: the “exposure” of the hidden maneuvering of capitalist power.

The development of the BR towards the adoption of more specifically radical repertoires came about gradually. The “new” task of the organization, by the mid 1970s, was that of attacking and destroying capitalist power by “striking against the heart of the Italian state,” seen as the imperialist collection of multinational corporations (Stato Imperialista delle Multinazionali, SIM). Violent action shifted from the factory to more directly political objectives, the DC. In 1976 the BR killing of General Public Prosecutor of Genoa, Francesco Coco, and two members of his bodyguard, marked an ominous change in its tactics. The declining social protest movement
in Italy during the 1960s and early 1970s; activists’ everyday conflicts with the police; the beginning of the historic compromise between the DC and PCI that caused widespread indignation in the extraparliamentary Left; and the competition within this same milieu with other left-wing armed groups, like the Front Line and the Fighting Communist Front (for recruits, financial support, and attention), were all important factors in the further radicalization of the BR repertoire (della Porta 1995). The most famous and emblematic crime of the BR was the kidnapping in 1978 and subsequent murder of Aldo Moro (with five bodyguards killed), who had twice served as prime minister and was one of the most important leaders of the DC.

The sociopolitical conditions of the late 1970s and the new repressive “emergency” measures, which constrained organizational resources and recruitment capacities, brought a further radicalization of the BR, leading to a sort of encapsulation from the outside world, in order to survive, keeping its organizational integrity, but at the cost of becoming more and more out of touch with political reality (della Porta 1995). The increasing brutality of its actions ended up disgusting not only the broader public, but also its own constituency. Public disapproval of the killing of Moro and other extreme crimes gave the state the opportunity to regain its legitimacy. The trade unions and the PCI engaging in proactive campaigns against left-wing underground groups; internal conflict over strategy; state antiterrorist measures of heavy military repression; and the onset of penitence or active collaboration (“repentance” law of 1980) by a number of captured militants from early 1980, were all factors which progressively drove the BR to its end: a process that took almost a decade to complete, from the end of the 1970s to the end of the 1980s. The organization never announced a complete cessation of its military activities, but essentially folded due to a lack of armed activists, given that most of them were either dead, in prison, or had decided to quit (Bosi & della Porta forthcoming).

A “new” group with few links with the BR performed the last violent attacks, in 1999 killing Massimo D’Antona, and in 2002 Marco Biagi, both labor advisors to the Italian government. This armed group, the BR-Partito Comunista Combattente, deserves a totally separate analysis, despite its claim to links with the old organization.

Red shirt anticorruption movement (Taiwan)
MAU-KUEI CHANG

The Red shirt anticorruption movement emerged in mid-2006 in Taiwan, with mass rallies and mobilizations in September and early October of that year. However, enthusiasm languished very quickly. It was originally called the “one-million people down Bian movement.” The word Bian stands for the then president of the country, Chen Shui-bian, the first pro-Taiwan independence president representing the Democratic Progressive Party (the DPP). Chen was first elected in 2000, and reelected in 2004. Because of his consecutive victories, the Chinese Nationalist Party (the Kuomintang, or KMT), which had ruled Taiwan for over 50 years, was forced to yield administrative power to the DPP.

The movement was directly triggered by government mismanagement and a series of high-profile scandals, with members of the first family implicated. The primary goal was to force Chen to step down one-and-half years before his term ended. To frame the core issue of the movement, the organizers called their campaigns “anticorruption and down with Bian actions.” By focusing on “anticorruption,” the organizers tried to appeal to a broader spectrum of citizens, and to prevent the movement sliding into ugly dogfights between DPP and the KMT supporters. During their campaigns, citizens were urged to wear red in expressing their support and solidarity. Red shirts, caps, or scarves soon became identifiers for the participants. “Red-shirt Army” was the most used expression of the movement as the result.

The iconic leader of the movement was Shi Ming-teh (1941—). Shi had had a long career as the most stubborn political dissident during the authoritarian era. He had spent about 26 years in jail before being released, and was then elected as the party chairman of the young DPP (1994–1996). Shi inspired followers and bystanders to join the protests by openly criticizing Chen for behaving disgracefully toward the political opposition movement.

In retrospect, the Red-shirt Army’s campaign was one of the many battles springing from enduring and partisan conflicts over nationalistic and identity issues and politics. Ethnonationalistic conflicts in Taiwan have intensified since the early 1990s. Tensions have peaked corresponding to the openings of various significant posts through popular elections. This was especially so with the beginning, in 1996, of presidential elections every four years.

In an optimistic moment for Taiwan’s new democracy, the Chen-led DPP won the presidency in 2000 by a relatively large majority. And yet Chen and his minority government appear to have split the country more than united it in his first term precisely because of ethnonationalistic antagonism. His second victory in 2004 was highly disputed. Not only was his winning margin so minimal (only 0.22%, or 29,518 votes) that it required a total recount, but the fairness of the election was also clouded by the way the DPP and the government handled a shooting incident directed at Chen and his partner just hours before voters went to the polls. Seemingly never-ending conflicts, escalating resentments, the unsolvable shooting conspiracy, and the questionable winning of the presidency all deepened the divide in the general public prior to the outbreak of the movement. When Shi began to challenge the public to join him to “Down Bian” to preserve the core values of the young democracy, the widespread pre-existing discontents crystallized and energized the movement very quickly.

Postcampaign studies have confirmed the schism between the pro-KMT and the pro-DPP camps. For instance, the majority of “Down Bian” supporters were pro-KMT (Blue), while
the pro-DPP voters (Green) were much less likely to support the campaign even if they were sympathetic toward the anticorruption cause. Today some critics think that 2006–2008 was actually the most polarized period in Taiwan’s new democracy.

In the end, the vibrant rallies and sit-ins combined did not succeed in bringing Chen down. The “Reds” left the scene after their last and greatest rally on the Double Tenth Day (October 10), or the nation-state’s birthday, which commemorated the armed uprising of the early KMT in 1911 in mainland China. Today some movement participants fault their own leaders for being too “soft” in choosing their strategies, or being self-limiting in setting their political objectives and hence missing opportunities. But the real reason may lie in the fact that the pre-existing political divide was just too deep to be bridged by any civil campaigns. And for all stakeholders, especially political elites, the options were always clear, even if they felt sympathetic toward the campaign. That is, the only justifiable victory for them or for their parties must be won through the system of popular election. To them, and many citizens likewise, the bigger conflict can only be fought in election campaigns, regardless of the result of this particular battlefield.

Though Chen was able to finish his presidential term, the damage to the DPP caused by his low popularity was so serious that the party went on to lose the following two major elections, allowing the KMT to return to power by big wins in both the legislative and the administrative bodies of the government in 2008. Chen himself, with protest at his human rights being violated, was put on trial for embezzlement in 2008 after his term ended.

REFERENCES AND SUGGESTED READINGS
Regionalist movements
LORENZO BOSI

Research on regionalist social movements lies at the intersection of two fields: studies of ethnic conflicts and studies of social movements. The term “regionalist movements” is used, in a broadly defined sense, to encompass a large spectrum of sociopolitical movements which share the claiming of sovereignty over a particular territory. They include activities that range from small-scale, sporadic events to well-developed campaigns that demand territorial rearrangements such as home rule, devolution, separatism, diaspora settlements, independence and/or secession. Cases in point, just to mention a few, are the Basques and the Catalans in Spain, the Welsh, the Scots, and the Northern Irish in Great Britain, the Corsicans and Bretons in France. One of the distinctive characteristics of the regionalist movement family is its internal diversity in relation not only to its goals, but also to its identity, ideology, organizational forms, and the repertoires used (Olzak 2004). Ethnic identity, for example, is not a requirement for regionalist mobilization. Nevertheless, it is usually instrumentally constructed and organized in the process of collective action as it helps to overcome the seemingly natural resistance of individuals to get involved in movement activities (Calhoun 1993; Johnston 1994). Thus many regionalist movements invoke ascribed characteristics such as culture and language, as well as histories of ethnic discrimination and systemic subordination from political and/or economic participation, which can be real or only perceived as such.

In seeking to challenge existing boundaries for economic, political, and social governance regionalist movements such as separatists or secessionists can provoke repressive reactions by state authorities that escalate into further mobilization and eventually justify even violent campaigns by the movements, so transforming their struggles into national liberation ones (Brubaker & Laitin 1998). In countries where there are dense social networks embedded in anti-systemic subcultures, repression functions as a catalyst for further protest. It raises the community’s political consciousness so as to mobilize further collective action by those individuals who were not previously involved. State violence against peaceful protesters has the power, in the view of anti-systemic groups, such as ethnonationalist minorities, to delegitimize the regime as non-democratic, and ultimately, to reveal its hidden malign nature so much so as to justify further protest and even violence. (Bosi 2007: 39)

Regionalist movements are not always anti-systemic and peripheral; they can also be institutionalized in political parties and become mainstream political players, pushing their agenda even from inside government. This depends very much on the openness of the regime.

Transnational forces (for example the EU) shape the emergence and trajectories of regionalist movements. But the literature so far has preferred to focus on domestic factors rather than on international ones. This despite the fact that the post-cold war era has seen regionalist movements growing in importance both in stable democracies and unstable political regimes. Most studies tend to magnify internal causes that seem most directly relevant to the emergence of regionalist mobilization. While these certainly play important roles, the existing literature does not fully explain why different types of regimes experience much the same increase in regionalist mobilization. The post-cold war era increase suggests that regionalist movements should be understood by integrating an international dimension to mobilization. In recent years there has also been a further and increasingly important resurgence of regionalist movements focusing on an opposition to
globalization by anchoring their communities to territories.

While in recent literature on social movements spatial aspects have become important explanatory dimensions in the understanding of the emergence, development, and demise of collective action, the specifically territorial aspects have been less well explored. The concept of territoriosity, understood as “a primary geographical expression of social power” (Sack 1986: 5), can provide a powerful analytical tool for understanding regionalist movements. It can become an essential concept for clarifying the way in which the dynamics of mobilization are related to external international boundaries, an issue of particular importance in societies with weakly naturalized and actively contested outer boundaries (O’Doghartaigh & Bosi, forthcoming).

Republican Revolution of 1911 (China)
GENG TIAN

The 1911 Republican Revolution ended over 2000 years of imperial rule in China. The revolution came to an end with the abdication of the Qing emperor and the rise of Yuan Shikai as the first president of the Republic of China. Traditional Chinese historiographies tended to highlight the leadership of the republicans in the revolution. However, the fall of the Qing Empire had its deeper roots not in the diffusion of republicanism but in changes upon three political actors: the Qing court, the provincial elites, and the New Armies modeled upon the modern German army after 1895. The 1911 revolution added a decisive blow to a falling empire.

Provincial governors and the gentry gained greater power by their active involvement in the repression of the Taiping Rebellion. Till the end of the Qing dynasty, the empowered provincial governorship remained a potential threat to the imperial rule. After the mid-nineteenth century, the gentry began to move into cities where they merged with urban reformists who were lobbying for provincial development, local self-governance, and constitutionalism. With the onset of the twentieth century, such local reforms turned into urgent demands for the constitutional rights of the provincial assemblies. The reformers believed that the provincial assemblies should enjoy greater autonomy from both central and local governments and that only the assemblymen knew what their people wanted and could bring real benefits to local communities. Overall, both provincial governors and gentries became increasingly difficult to subjugate by the Qing court after the mid-nineteenth century.

Continuous military pressures, from the Taiping Rebellion to the 1894 Sino-Japanese War led to the ascendency of both provincial governors and the gentry in imperial politics. In 1901, the Qing embraced reforms, in part to regain its control over the local powers. The court not only sought to squeeze more resources from the provinces, but also postponed the promised opening of the national assembly. Not surprisingly, these policies were resented and resisted by the provincial elites. The provincial elites had reasons to doubt that the court wanted to empower the royal rule in the name of installing constitutional monarchy.

After the Qing court appointed nine imperial nobles in a 13-seat cabinet in 1905, the lingering faith in the Qing court was shattered.

The triggering event of the 1911 revolution happened in Sichuan province. The Qing court attempted to nationalize railway construction, but was unable to repay the investment that the Sichuan gentry had made in the construction of local railways. They immediately organized a protest, which was later joined by local merchants, students, and members of secret societies. As the protest became more violent, the Governor-General of Sichuan pled for military support from other provinces. In late September, half of the 8th Division of the New Army stationed in Hubei was dispatched to Sichuan to aid the repression.

Many low-ranking New Army officers accessed reform or revolutionary ideals when they studied in Japan or in Chinese military schools. Many of them secretly joined the revolutionary cause. Before 1911, revolutionary soldiers in the New Armies had already unsuccessfully revolted twice in south China. Informed of the revolutionary activities in the 8th Division, the Qing court wanted to reduce the risk of mutiny by dividing the division.

Yet, the revolutionaries in the remaining troops in Wuhan, capital of Hubei, decided to stage a mutiny. However, on October 10, one revolutionary leader accidentally injured himself when he and some others were making
bombs in a house in the Russian Concession. Three of them were arrested and executed by the Russian police. To prevent further repression by the government, the revolutionaries mutinied immediately. On the same day, the 8th Battalion fired the first salvo of the revolution. Soon afterwards, the transportation units, supply units, and artillery units forced their way into Wuchang city and occupied the forts. Over the night of October 11, armies in Hanyang, another borough of Wuhan, revolted successfully, occupied the arsenal and the iron-works and secured large amounts of ammunition. After the initial success, the mutineers demanded Li Yuanhong, head of the 21st Mixed Brigade at Wuchang, as military governor. In the following weeks, more and more provinces, under the leadership of the provincial elites and local military men, declared independence from the Qing court. The revolution spread.

To repress the revolution, the Qing court installed Yuan Shikai as Governor-General of Hubei-Hunan, in the hope that he could command the armies to suppress the revolution. Yuan was the founder and high commander of the New Army in northern China but had been discharged from his position in 1908 by the court. Thereafter his loyalty to the Qing court wavered. When he resumed the commandship of the northern New Army in 1911, Yuan used his firm control over the New Armies of north China to facilitate his dealings with both the Qing and the revolutionaries. As a result, his personal authority increased after the outbreak of the Revolution. At the same time, Sun Yat-sen, founder of Chinese republicanism and a revolutionary pioneer, was elected as the provisional president of the Republic of China in Nanjing. Under Yuan’s military threat, however, the republican government compromised and agreed that Yuan would be the new president if he could end the monarchy. On February 15, three days after Emperor Puyi abdicated, Yuan became the Republic of China’s first president, thus ending the violent phase of the 1911 revolution.

The 1911 revolution terminated China’s millennium-long imperial tradition but did not bring the more powerful China the revolutionaries had hoped for. China was as weak as before, plagued internally by the warlords and externally by Japanese imperialism. To save the new nation, those Chinese inspired by the 1911 revolution spirit staged more radical social movements and revolutions such as the 1919 May Fourth Movement, the 1926 Northern Expedition, and finally the communist revolution. The 1911 revolution thus ushered in a century of revolution in China with repercussions lasting till today.

Right-wing movements
SIVAN HIRSCH-HOEFLER and CAS MUDDE

While social movements are defined as “collectivities acting with some degree of organization and continuity outside of institutional or organizational channels for the purpose of challenging or defending extant authority, whether it is institutionally based or culturally based in the group, society, culture, or world order of which it is a part” (Snow, Soule, & Kriesi 2004: 11), many authors exclusively focus on movements that “promote” change, or even more narrowly, change toward a more egalitarian society. Indeed, some scholars explicitly define social movements as those challenging the status quo (Tarrow 2011: 9), which is their implicit justification for focusing only on left-wing or “progressive” movements.

Others, like Rory McVeigh (2009: 32), define right-wing movements in political (i.e., power) terms, as acting “on behalf of relatively advantaged groups with the goal of preserving and expanding the rights and privileges of its members” (our emphasis). This definition, according to him, distinguishes right-wing movements from progressive movements, which mobilize on behalf of relatively disadvantaged groups. As most social movement scholars are primarily interested in change-oriented movements, rather than the maintenance of stability, right-wing movements have remained at the margins of their interest.

We prefer a more neutral conception over a more political functionalist definition; hence defining “right-wing” in the terms of Italian philosopher Norberto Bobbio (1994), as antiegalitarian, and thus focus in particular on extreme and radical right movements. Extreme right movements are both antiegalitarian and antidemocratic; they reject popular sovereignty and majority rule. Radical right movements are antiegalitarian and antiliberal democratic; they accept democracy, but oppose pluralism and minority rights (Mudde 2007).

Even when we exclude the mainstream right, and focus exclusively on extreme and radical right movements, we are dealing with a very broad and highly diverse group. Rather than developing a strict typology of mutually exclusive and not overlapping categories, we will discuss some of the most important types of right-wing movements that exist today. While most of our examples are drawn from established democracies, we cover not just Western Europe and North America, but also Asia, Eastern Europe, and the Middle East.

NATIVIST RIGHT-WING MOVEMENTS

Nativist right-wing movements are the quintessential “radical right” movement today, particularly in Europe. The radical right is mostly organized through political parties and there is some scholarly debate about whether we can actually speak of a radical right social movement (e.g., Hellmann 1996). At the ideological heart of these movements is nativism, the idea that states should be inhabited exclusively by members of the native group (“the nation”) and that nonnative elements (persons and ideas) are fundamentally threatening to the homogeneous nation-states (Mudde 2007: 19). The main targets of these parties’ actions and propaganda are immigrants and indigenous ethnic minorities, but also natives who enable or support multiculturalism, most notably cultural and political “elites.”

In most Western democracies the nativist right-wing is mostly organized in so-called populist radical right parties, such as the Australian One Nation Party of Pauline Hanson, the Austrian Freedom Party (FPO) of Heinz-Christian Strache (and earlier the late Jörg Haider), and the French National Front (FN) of Jean-Marie and now Marine Le Pen. Populist radical right parties have gained electoral successes since...
the mid-1980s and combine a core ideology of nativism, authoritarianism, and populism (Mudde 2007). They are currently represented in the parliaments of roughly one-quarter of all European countries, but are part of only a couple of national governments. While the successful parties are often part of broader nativist subcultures, notably in Austria or Slovakia, there are few nativist right-wing movements. Among the most visible street movements are the English Defense League (EDL) and the Russian Movement against Illegal Immigration (DPNI).

The DPNI was founded in 2002, by a former member of the notorious nativist right-wing organization Pamyat (Memory). While distinctly Russian in origins and targets, the movement differs from traditional Russian radical right movements in its virtual lack of anti-Semitism and anti-Americanism, as well as its amorphous organizational structure (Zuev 2010). Its manifesto, “How Many Russians Are There Left in Moscow,” reads like a copy of the anti-immigration points of West European populist radical right parties. According to the manifesto “migrants from the Caucasus states and from Central and South-Eastern Asia are the first part of the foreign expansion.” While its membership is estimated at around 5000, spread over some 30 branches, the DPNI gained notoriety for organizing mass demonstrations throughout Russia, which at times turned into violent attacks on migrants and clashes with the police. The movement was officially banned by Moscow City Court in April 2011, under the new draconian “antiextremism law,” but it has not been enforced yet as the DPNI has appealed the ban.

The EDL is probably the most active and visible nativist right-wing movement in Europe today. According to its website, the English Defense League is a “human rights organization that was founded in the wake of the shocking actions of a small group of Muslim extremists who, at a homecoming parade in Luton, openly mocked the sacrifices of our service personnel without any fear of censure.” The organization continues the well-established English radical right tradition of violent street protests, attracting mostly white working-class men, including many from the football hooligan subculture. However, ideologically the group provides a more modern and moderate program than more traditional nativist parties like the British National Party (BNP), breaking with overt anti-Semitism, homophobia, and racism, and predominantly targeting Muslim immigrants and fighting the alleged “Islamization” of Britain and Europe. This has enabled it to attract a much more diverse support base among the “native” English population (e.g., Bartlett and Littler 2011), and even to make modest inroads into groups traditionally targeted by English nativists, such as Jews and Sikhs. The EDL has an official “Jewish Division,” as well as “Gay” and “LGBT” divisions, while one of its (three) official leaders is Guramit Singh, a Sikh. It has received vocal support from right-wing activists and organizations abroad, including the Jewish Defense League in Canada and American “counter-jihadists” like blogger Pamela Geller and talk show host Michael Savage (see below). In late 2011 the EDL announced that it would run candidates for elections on lists of the tiny British Freedom Party, an offshoot of the struggling BNP, but also vowed to remain predominantly a street movement.

RELIGIOUS RIGHT-WING MOVEMENTS

Religion has played a role in social movements of both the left and right throughout history. For example, many US populists have been deeply religious, while many of the leaders of the civil rights movement were part of the clergy. Today, some of the strongest right-wing movements have a significant religious identity. We will briefly describe three of the most influential right-wing religious movements: the Christian Right in the US, the settler movement in Israel, and the Hindutva movement in India.

The American Christian Right is perhaps the best known and most widely studied right-wing social movement in the world. Also known
as the Religious Right, it emerged as a significant political force in the US in the late 1970s, and has since influenced the Republican Party’s platforms and nominations, especially in the South and the West, in part because of its ability to provide potent activist resources and access to a significant voting bloc (Green, Rozell, & Wilcox 2003). From a social movement perspective, the Christian Right may be defined as a set of activists dedicated to mobilizing an aggrieved but previously inactive group of citizens into mainstream politics by tapping slack resources and deploying them to its best advantage (Green, Rozell, & Wilcox 2003). The contemporary Christian Right is an informal coalition of numerous groups, with a majority of Evangelicals and Catholics. Over the past five decades the CRM has become increasingly politically organized (Rozell 2011) and engaged in various battles to restore (pro-life and pro-family) Christian values to American life by promoting conservative legislation, national campaign efforts, partisan and electoral activity, and using national organizations. Through such organizations as the Christian Voice, Moral Majority, Focus on the Family, and the Christian Coalition, the CRM has promoted a conservative right-wing domestic political agenda in the media and schools, and a hawkish foreign policy, most notably in its unconditional support for the state of Israel (Spector 2009).

The roots of the contemporary Israeli settlement movement are found in Gush Emunim (Bloc of Faithful), which evolved in the wake of the 1967 and 1973 wars from a group of activists from the youth faction of the National-Religious Party (NRP), and has developed into a major political force on the Israeli scene. Even though the Jewish settlers constitute a small minority of the Israeli population, less than 1 percent, they have significantly influenced central processes of decision-making by all Israeli governments. The movement has, over the years, taken a broad range of actions, including unconventional illegal activities. The uniqueness of the Israeli settlement movement is in its prime activity: the act of settlement or creating “facts on the ground” (Sprinzak 1991). Its activists do not just protest for their cause, but actually serve as a fulfillment of their ideology or religious commandment (mitzvah), “to settle the country and make it flourish.” Yet the contemporary Israeli settlement movement is complex and diverse. It represents various types of settlers in terms of religiosity (e.g., secular, religious, national-orthodox, and ultra-orthodox), motives for settlement (ideology versus pragmatism), socioeconomic status (upper middle class versus lower class), and types of settlement (towns, cities, outposts). What characterizes the settlement movement, aside from the consensual features shared by all social movements (see the definition above), is a combination of two more traits: the active achievement of national-territorial goals (through the act of settlement) and an ideological core of nativism and exclusionism (Yiftachel 1998). The settlement movement may be characterized as a form of ethnic-religious nationalism wherein the nation is defined in terms of both ethnicity and religion. The movement struggle highlights the tensions between commitment to the state, its institutions, and the Jewish people of Israel (also known as Mamlakhtiyut), and the commitment to the Jewish law (Halakha) (Alimi 2010: 13), often expressed in valuing religious principles over the state’s legal system (Sprinzak 1991). Through the years, members of the movement became representatives of a variety of right-wing political parties, from the Likud and NRP to the extreme right-wing National Unity Party. After some setbacks, the settler movement reorganized around a more institutionalized group, the Council of Jewish Settlements in Judea, Samaria, and Gaza (Moetzet Yeshut), which became the new official roof organization for the settlement movement. Alongside the Council are a variety of organized (as well as informal) groups of settlers, sharing a similar goal, maintaining and expanding the settlement enterprise. However, there is a significant difference in their methods of action and in their activist members (Hirsch-Hoefer 2008).
The Indian Hindutva movement can also best be described as ethnoreligious nationalism, in which the Indian nation is homogenized in both cultural and religious terms. Dating back to the beginning of the twentieth century, during the colonial period, its most powerful voice today is in the Indian People’s Party (BJP), which was in government between 1998 and 2004. However, the movement is much broader and includes nonparty organizations like the World Hindu Council (VHP) and the more radical National Patriotic Movement (RSS); collectively called Sangh Parivaar (Chowdhry 2000). The BJP program (1996) stresses a broad nationalist agenda based upon four key values: good governance (surajya), economic nationalism (swadeshi), defense of the territorial integrity of India (suraksha), and empowerment (samrasata). The religious nature of Hindutva is fiercely contested. The movement itself argues that Hindutva is a “unifying force” to create a national identity and ensure national cohesion, downplaying the Hindu character of that nation. This interpretation is upheld by rulings of the Indian Supreme Court in 1992 and 1996, which ruled that “‘Hindutva’ by itself does not invariably mean Hindu” (quoted in Chowdhry 2000: 104). This notwithstanding, the (then) president of the BJP, Lal Krishan Advani, left little doubt when he stated: “Call it Hindu or call it Bhartiya (Indian). If nationalism is stripped from its Hinduness, it will lose dynamism” (quoted in Malik & Singh 1994: 41). This Hindutva movement has often targeted non-Hindu Indians in demonstrations and propaganda, most notably the sizable Muslim minority, and has been at the heart of various violent clashes in the country. Among the most deadly have been the demolition of the Babri Masjid Mosque in 1992, which led to months of rioting in which over 2000 people died, and the anti-Christian riots in Orissa of 2008, killing hundreds and displacing tens of thousands. Today the Hindutva movement remains a diverse and powerful political force in India, despite the unexpected electoral defeat of the BJP in the 2009 parliamentary elections.

Right-wing movements are often associated with strong, even authoritarian leaders, but this is not always the case. Within the European extreme right, for example, there are some national-anarchist groupuscules (particularly in France and Italy), while the US has a long tradition of leaderless movement, dating back to at least the US populist movement of the late nineteenth century. We highlight two leaderless movements, which represent the two boundaries of the radical right in terms of their relationship to the mainstream: the recent Tea Party movement in the US, on the one hand, and the (almost) global neo-Nazi movement, on the other.

The Tea Party movement emerged almost directly after the 2008 presidential election, which not only gave the Democratic Party control of all three branches of government (i.e., House of Representatives, Senate, and Presidency), but also delivered the first black president of the US, Barack Hussein Obama. The specific name, referring to the famous Boston Tea Party of 1773, came from a rant by conservative CNBC reporter Rick Santelli, who invited American “capitalists” to a “Chicago Tea Party” to fight a mortgage plan proposed by the Obama administration (e.g., Williamson, Skocpol, & Coggin 2011). Within weeks Tea Party groups sprang up all over the country, often gathering small groups of local conservative activists worried about “big government,” “socialism,” and the alleged attack on the US Constitution. They gathered at local “town meetings” at which well-orchestrated challenges were organized against members of Congress who supported health care reform and other despised examples of “government take-over” (Tarrow 2011). The movement gained national momentum through extensive favorable coverage by the conservative media, most notably Fox News and talk radio hosts like Rush Limbaugh. Obama’s proposed health care bill provided the ultimate opportunity to mobilize nationally; heavily supported by then Fox News presenter Glenn Beck (Tarrow
more than 300,000 Tea Party supporters demonstrated against the Obama administration outside the Capitol in Washington in September 2009. While the Tea Party originated as a true grassroots movement, counting over 650 groups nationwide in October 2010, it has increasingly been overtaken by so-called Astroturf organizations like FreedomWorks, run by former House Majority Leader Dick Armey. Today the Tea Party movement has lost much of its independent thunder, having largely exchanged its public demonstrations for internal pressure within the Republican Party. Tea Party activists and candidates played a major role within the 2010 Congressional elections and have been highly influential in the Republican primaries for the 2012 presidential elections as well.

The neo-Nazi movement is a diverse collection of mostly small and violent groups, often partly overlapping with similarly amorphous subcultures like white supremacists and (racist) skinheads (e.g., Kaplan 2000). Ideologically neo-Nazis subscribe to different varieties of German National Socialism, centered on anti-Semitism, the leadership principle (Führerprinzip) and racism, often mixed with specific national fascist issues and traditions. The heartland of the neo-Nazi movement is, of course, Germany, which according to its intelligence service (BVS) counted some 5600 neo-Nazis in 2010. However, because of the particularly repressive legal and political system in Germany, much of their activities take place abroad. For example, neo-Nazi concerts and demonstrations often take place in neighboring countries such as Belgium, Denmark, the Netherlands, and Poland. Similarly, much neo-Nazi propaganda is traditionally hosted in websites or printed by publishers in Russia and the US. Despite the leadership principle, the neo-Nazi movement is bitterly divided, both nationally and internationally, and violence among neo-Nazis is not uncommon. The largest groups of neo-Nazis can be found in Germany, Russia, and the United States, but neo-Nazi groupuscules can be found from Mongolia to Israel. Few organizations have the capacity to organize demonstrations of more than a few hundred people, most are in the mere tens, particularly now that some of the leading organizations have been banned or succumbed to internal division after their leaders died (such as the German Action Front of National Socialists of the late Michael Kühnen, or the US American National Alliance of the late William Pierce). This notwithstanding, the neo-Nazi movement is one of the most deadly right-wing movements in the Western world. Moreover, several neo-Nazi organizations, like Blood & Honour or Resistance Records, make a lot of money selling “white power music” (or white noise music) and organizing concerts with bands like Bound for Glory and Macht und Ehre (power and honor), which reach thousands of mostly young people around the globe.

INTELLECTUAL MOVEMENTS

While many right-wing movements are quite anti-intellectual, and action-oriented, there are also some right-wing movements that believe in the power of ideas over actions. These so-called “Gramscians of the Right” fight their battle in magazines and on the Internet, some with significant political success.

The French Nouvelle Droite (New Right, ND) is probably the most influential intellectual radical right movement of postwar Europe. Founded in 1968, by French philosopher Alain de Benoist and others, it calls for the preservation of organic, homogeneous pan-European or Western identities. It insists on the necessity of inequalities between people and is opposed to formal, juridical equality in the context of a liberal, multicultural society. Specifically, the movement’s notion of a strong, unified, homogeneous, pan-European empire regenerated in defense against the dominant “materialist” ideologies such as liberalism, conservatism, social democracy, socialism, capitalism, and communism (Bar-On 2008: 327). The ND organized itself through groups like the Research
right-wing movements and Study Group for European Civilization (GRECE) and the Club de l’Horloge in France, with offshoots like the Belgian Texts, Commentaries and Studies (TEKOS) or the German Thule-Seminar in other parts of Europe. It was instrumental in ideologically separating the radical right from European fascism, despite some similarities, replacing the belief in hereditary and hierarchical racial differences of traditional racism with the ideology of “different but equal” cultures of “ethnopluralism.” While this central idea was popularized among European radical right parties through the French FN, the new right movement has mostly had a strained relationship with radical right parties. Today the new right has split into several subsects and no longer plays a prominent role within the European or North American radical right.

One of the exceptions is the Russian Eurasianists, who have many different sources of inspiration, dating back at least to the 1920s, but the contemporary (neo-) Eurasianists can to a certain extent be seen as the Russian new right. The original Eurasians rejected European tradition and culture, particularly European-style nationalism, and saw the Russian Revolution as an opportunity for Russia-Eurasia (Rossiia-Evraziia) to break away from Europe. Their contemporaries have created a complex and often contradictory worldview, heavily influenced by some ideas of the European new right, yet at the same time often anti-Western and pro-Asian. Eurasianism can be best seen as a specific trend within the Russian nationalist or patriotic movement: it sees in the Eurasianist “empire” a solution for contemporary Russia, differing from more nativist right-wing movements like the DPNI, which would prefer a Russian great power without imperial colonies (Laruelle 2008). It is mostly a movement made up of tiny groupuscules, with at the heart the International Eurasian Movement of Alexandr Dugin, the unofficial leader of the contemporary Eurasianists. While Dugin emerged within the extreme right circles of the infamous National Bolshevik Party of Eduard Limonov, he has since become an influential thinker in democratic Russia with close ties to important political leaders, including President Putin’s circle (e.g., Shlapentokh 2007).

More recently a growing group of Islamophic authors and bloggers have come together to fight the alleged global threat of Islam(ism). While these so-called “counterjihadists” also have some organizations, like Stop the Islamization of America (SIOA), also known as the American Freedom Defense Initiative (AFDI), it is mainly active and influential through books and blogs. Websites like Pamela Geller’s Atlas Shrugs and Robert Spencer’s Jihad Watch, both associated with SIOA, are only the most prominent tips of the counterjihadist Internet iceberg. Like the books by authors such as Bruce Bawer, Christopher Caldwell, and Bat Ye’or, with ominous titles like While Europe Slept: How Radical Islam is Destroying the West from Within, the influence of these websites reaches deeply into the American conservative movement and Republican Party (Ali et al. 2011). While counterjihadists are also active within Europe, among others through Stop the Islamization of Europe (SIOE), they are more closely linked to traditional radical right parties, most notably the Belgian Flemish Interest (VB), the Danish People’s Party (DFP), and the Dutch Party for Freedom (PVV) of Geert Wilders.

CONCLUSION

Right-wing movements come in many shapes and sizes, differing in types of actions, ideology, organization, and strategies. This diversity makes right-wing movements a potential goldmine for theoretical advances in social movement studies, particularly as scholars in the field have so far largely ignored these movements (for exceptions, see Diamond 1995; McVeigh 2009). We hereby provide some first insights on the basis of a cursory study of right-wing movements.

First, and perhaps most crucial, is that this kind of study brings back the (need for a) concept of a “social movement family,” defined as
“a set of coexisting movements that, regardless of their specific goals, have similar basic values and organizational overlaps, and sometimes even join for common campaigns” (della Porta & Rucht 1995: 232). The focus on such specific types of movements as nationalist, racial, ethnic, or religious, and the fact that the right-wing scene is at least as splintered as the left-wing movement scene, calls for fuller collaboration between researchers, which emphasizes ideological proximity without necessarily stressing the organizational dimension (Rucht 2004).

Contemporary nationalist, ethnic, and religious movements have invoked similar themes and should be viewed as (instrumental) creatures of right-wing movements.

Second, while internally divided, most contemporary (far) right-wing movements combine a core ideology of nativism and exclusionism. This type of ideology can adhere to the formalistic requirements of democracy, but its defining exclusionary and anti-egalitarian features are opposed to the essence of liberal democracy, most notably pluralism and (constitutional protection of) minority rights. These ideas and movements can be found in developing democracies as well as in advanced democracies. However, they might interact differently with their political contexts, in part depending on how (il)liberal the national democracy is.

Third, and related, right-wing movements deserve much more attention from social movement scholars, as in many countries they are much more relevant than the new social movements that dominate the field. For example, the Tea Party has provided a social movement challenge not seen in decades in the US. Moreover, while right-wing movements might not be “progressive,” they are not always merely “defending extant authority” either. In fact, in many advanced liberal democracies the new social movements often defend extant authority, while right-wing movements challenge them. But even in less liberal democracies right-wing movements can constitute the main challenge to authority. For example, in Israel the right-wing settler movement is not only much more powerful than the crippled peace movement, it also constitutes the most powerful and serious challenge to state authority.

Fourth, and last, the study of right-wing movements could provide new insights into the complex relationships between social movements and political parties. Our cursory overview seems to indicate that these relationships are closer on the right than on the left, and that political parties are more dominant within the right than left social movements. In fact, in several prominent cases the right-wing movement is largely co-opted by the party – such as in the case of the Nouvelle Droite and the National Front and the Christian Right and the Republican Party; an exception is the right-wing settler movement in Israel, which profits from the fact that various right-wing parties are vying for its support, which gives it the power of choice.

In conclusion, the right-wing social movement family offers an extremely diverse and fertile, yet so far largely untapped, area of research for social movement scholars. At the same time, social movement theory provides an important additional theoretical framework to better understand the recent rise of right-wing politics throughout the democratic world.

Russian Revolution
YEVGENYI MOSCHELKOV and OLEG GUBIN

In search of new approaches, this entry analyzes the Russian Revolution in terms of grassroots mass mobilization, which – in one year – smashed samoderzhavia (the Russian czarist regime), then attempted to create a representative liberal democracy, but culminated in the Bolshevik power seizure. In 1917, the revolutionary social movement took a quite different turn than during the barricade militant uprising and civic unrests of 1905, which advanced Russia towards constitutional monarchy and were followed by economic expansion. World War I disrupted both processes and became a catalyst for the Russian Revolution. The hard core of the Russian Revolution constituted the causal chain of collective actions and events in the year of 1917, from the fall of samoderzhavia to the emergence and then Bolshevization of the soviets, to the power duality, and further on to the construction and failure of the liberal democracy, destroyed in the Bolshevik armed rebellion. Our approach differs from conceptualizations of the Russian Revolution as a prolonged process from 1917 to the end of civil war in 1924 (the official Soviet version) and even further on to the mid-1930s (Fitzpatrick 2008). Also, we break with the idea, perpetuated in Soviet and Western scholarship, of three Russian revolutions: the 1905 Revolution, the February Bourgeoisie-Democrat Revolution, and the October Socialist Revolution. The Russian Revolution began in February 1917, with the overthrow of samoderzhavia, and ended in January 1918, with the dissolution of the Constituent Assembly.

RISE OF THE SOVIETS, EMERGENCE OF THE PROVISIONAL GOVERNMENT, AND END OF SAMODERZHAVIA

In early 1917, the deteriorating political, military, and economic crisis, largely caused by the Russian Army losses in World War I on the one hand, and by hyperinflation combined with increasing food shortages, on the other, led to worker unrest in the capital of the Russian Empire, Petrograd, and other industrial centers. At the end of February 1917, the unrest turned into a general strike in Petrograd, which brought together hundreds of thousands of industrial workers, clerks, students, and soldiers from military units located in the city. The anguished demonstrators demanded “Bread, give us bread.” The number of factories and plants where workers went on strike grew exponentially from 49 on February 23, to 224 on February 24, to 433 on February 25, with worker-striker numbers reaching 300,000, constituting 80 percent of Petrograd workers (ktq, thjd 1979: 189). On 27 February, the strike escalated into armed rebellion. Thousands of soldiers, over 10,000 in the morning, around 26,000 in the afternoon, and almost 67,000 in the evening, united with the revolutionary workers (Nbnfhtyrj 1986: 185). On February 28, the number of soldiers rebelling reached 128,000, and grew to 170,000 by March 1. The rebels released political prisoners, who then joined the protest movement and further radicalized its activities.

During the unrest, workers began spontaneously assembling self-governing bodies at the factories and plants: the soviets. As Lenin put it, “In February the masses created the soviets even before any party had managed to proclaim this slogan. It was the great creative spirit of the people, which had passed through the bitter experience of 1905 and had been
made wise by it, that gave rise to this form of proletariat power” (Lenin 1975). Workers, soldiers, and peasants began assembling their soviets too. In February–March 1917, over 600 soviets emerged, 12 times more than during the year of 1905. By October 1917, the number of soviets exceeded 1400. By June 1917, the workers had also formed the Central Factory-Plants Committee aimed at establishing worker control over the means of production. By October 1917, factory-plants committees had emerged in 50 industrial centers. The soviets and workers’ committees directed worker protests and framed their collective political demands (1986: 290–291). The avalanche of events composed a broader revolutionary situation in Russia, with increased deprivation and rapidly deteriorating living conditions for the lower classes as well as the inability of the ruling monarchical institutions to manage the overarching crisis.

The revolutionary situation created multiple opportunities for contending political forces. The right-liberal and center-right political parties of Octyabrists, Progressives, and Kadets (Party of Constitutional Democrats), united into the Progressive Block in the 4th State Duma (the highest representative body, operating in Russia since 1906), strove to pursue a liberal democratization of Russia, with greater control by the representative assemblies over policymaking processes. The pro-peasant Party of Socialist Revolutionaries (also known as Essers) and the Mensheviks, the moderate Russian social democrats, came close to achieving their strategic goals of the abolition of samoderzhavia, gradual transformation of Russia into a social democracy, and economic, especially agrarian, reforms. The Bolsheviks, the left wing of the Russian social democracy, whose leader Lenin considered Russia to be the weakest link in the global capitalist system (Lenin 1977), vowed a radical transformation of the post-monarchical regime into a socialist state under the dictatorship of the proletariat.

On February 27, in the wake of the revolutionary situation, the policymakers of the Progressive Block created the Interim Committee of the State Duma, which then formed the center-right Provisional Government. However, in the rapidly changing political landscape, leftist deputies of the State Duma crafted an alternate power structure, the Petrograd Soviet of Workers’ and Soldiers’ Deputies (Petrosoviet). The Petrosoviet was reminiscent of the Paris Commune and workers’ soviets of the 1905 militant social unrest. Hundreds of thousands of workers and soldiers participated in the election of deputies to the Petrosoviet and its analogy in Moscow, the Mossoviet (Титаренко 1986: 216). The Petrosoviet and Mossoviet, as well as other soviets in major industrial centers, in the Russian Army, and in peasant communities, marked the institutionalization of the workers-soldiers-peasants democracy – the democracy of the exploited and have-nots. The latter excluded the rich – the “haves” – and exploiters, that is, the monarchists, capitalists, landowners, top military commanders, entrepreneurs, and top managers. Unlike the inclusionary democracy of the Progressive Block, the leftists gave birth to exclusionary democracy, which Lenin mentioned in State and Revolution (Lenin 1975). The exclusionary democracy, as the revolution would soon unveil, led to the exclusion not only of the rich but also of Mensheviks and Essers.

However, at the beginning of the Russian Revolution, Mensheviks and Essers dominated in the Petrosoviet and its leadership. It was under their influence that the Petrosoviet gave general consent to the formation of the first Provisional Government. The Bolsheviks, although active in the Petrosoviet and persistent in their demand for the abolition of samoderzhavia, stayed – at this stage of the Revolution – in the shadow of the power shifts. The Bolsheviks did not support or participate in the Essers-Mensheviks’ political maneuvers with the Progressive Block and the Provisional Government. They focused, instead, on the methodical construction of their strongholds in the grassroots working-class communities and soldiers’ committees of the Baltic Fleet and army. Thus, the Bolsheviks formed, just within
the army, about 160 groups of supporters during the period 1916–1917 (Фои́н 1967: 73). Moreover they formed the military commission, Voenka, that played a crucial role in the Revolution. It was through the lower level soviets and soldiers’ committees that the Bolsheviks gradually expanded their influence, participation, and presence in the soviet movement, including the Petrosovet and Mossoviet, and then began to challenge the Mensheviks-Essers leadership in them and the broader working-class and soldiers’ movement.

Unlike the 4th State Duma, which was elected in 1912 and had already lost its legitimacy due to its support of Russia’s unpopular participation in World War I and its association with the ancien régime, the formation of the Petrosovet and other soviets was a fresh political innovation of the grassroots workers, soldiers, and peasant mobilization into an organized sociopolitical movement of the have-nots. Given the fact that the majority of soldiers were of peasant origin, one could argue that the Petrosovet had become a representative assembly of a workers-soldiers-peasants democracy. It is noteworthy that the Interim Committee and the Provisional Government, on the one side, and the Petrosovet, on the other, confronting and power-balancing each other from the start, declared themselves to be the highest state authority in the country, even though the monarchy still formally existed.

With the emergence of the Provisional Government and the Petrosovet, the pressure on the monarchy to step down reached its apogee. The abolition of the monarchy had become the collective demand not only of the have-nots but also of the bourgeoisie and, most importantly, the army officers’ corps (Лысако́в 1967). Finally, on March 2, the embattled Czar Nicholas II, who de facto lost power and was pressured by the functionaries of the Progressive Block to step down de jure, signed his renunciation of the throne in favor of his brother Michael, who also abdicated in less than 24 hours.

**POWER DUALITY AND COMPETING STRATEGIES OF REBUILDING POSTMONARCHICAL RUSSIA**

Russia – during the four days of February 27 to March 2, 1917 – eliminated the three-hundred-year old monarchical system of government. And March 3, 1917 marks the beginning of the postmonarchical history of Russia. At the start of the new history, the Provisional Government was immediately confronted with a disintegrating state, Russia’s unpopular participation in World War I, and accelerating economic crisis. It was also confronted with rising opposition from the Petrosovet and a growing number of workers’ and soldiers’ committees that were falling under Bolshevik influence. No wonder that the new period of Russian history began with an acute struggle between different political and ideological forces: one based on supporting the Provisional Government, and another on supporting the Petrosovet, thus creating a situation which went down in history under the name “duality of power.” Despite this power duality, there had been an overarching objective for the majority of the revolutionary political forces: that is, holding the Constituent Assembly, which should have determined the constitutional form of government in Russia, its national statehood, system of land ownership, and other important social and political issues. However, it was these very issues that led to uncompromising political struggle and became stumbling barriers in the way of the Constituent Assembly.

In order to avoid a power vacuum and further fall into anarchy, the Provisional Government, during its first weeks of existence, reorganized the state institutional structure under the proclaimed principles of “governance continuity” and “continuity of law.” Accordingly, virtually all articles of the 1906 Basic Laws of Empire remained in place, with the exception of the formal abolition of a few articles on the institutionalization of the czar’s authority. The State Duma and the State Council, although having formally lost their
power, stayed afloat. The Senate and Synod (highest church administrative body in Russia) were formally resubordinated to the Provisional Government but maintained much of their former state functions.

While the Provisional Government was involved in legalistic-bureaucratic reorganizations of the old power structure, the protest movement of the have-nots grew daily, with the active participation of the Bolsheviks. The Bolsheviks began assembling the party’s military units, the Red Guard, composed of small and medium-sized mobile units of armed workers and soldiers subordinated to the district party committees. From June 16–23, the Bolsheviks held the All-Russian Conference of the Party’s Military Organizations, in which 167 delegates represented 25,000 party members, serving in the Russian Army (Корольев 1986).

The growing grassroots social movement of the have-nots closely monitored the Provisional Government and was prepared to respond to any of its policies that were contrary to the soviets’ demands. The movement escalated in April. The unpopular Provisional Government’s statements on Russia’s commitments to the Entente’s strategic objectives in World War I, which basically justified Russia’s suicidal commitment to the war until victory, led to new waves of civic unrest and the April Crisis. The unrest prompted the establishment of the first coalitional Provisional Government, in which Essers and Mensheviks received six government posts. The Crisis was also marked by Lenin’s arrival in Petrograd and by his The April Theses. The April Theses openly called for socialist radicalization by the grassroots worker and soldier communities towards full state authority transfer to the soviets and launched public critique of the Essers-Mensheviks leadership in the Petrosoviet and their politics of agreement, negotiations with, and participation in, the Provisional Government (Lenin 1972). The Bolsheviks charged that the Mensheviks and Essers continued, through participation in the Provisional Government, to mingle with the czarist heritage instead of breaking away from that heritage and launching reforms in the interest of the have-nots. In the new propaganda turn, directed to mobilize peasant support and consolidate support among soldiers, most of whom were of peasant origin, the Bolsheviks articulated the slogan “Land to the peasants.”

The left trend in the revolutionary movement underwent substantial enhancement and institutionalization at the Congress of Peasants’ Deputies and the Congress of Workers’ and Soldiers’ Deputies held in May-June in Petrograd. At the latter, Lenin vocalized the Bolshevik claim for power. He interrupted the Menshevik leader, who made an assertion that there was no political party that would say, “Give us power; leave, and we will take your place,” with the call: “There is such a party!” Of course, “he meant the Bolshevik Party, which had a total of 105 delegates out of more than a thousand at the Congress of Soviets” (Medvedev 1979: 28). The congresses ignored Lenin’s gesture and elected executive committees dominated by Essers and Mensheviks. The important political outcome of the congresses was the integration of the three most numerous strata – peasants, workers, and soldiers – into the political process and the creation of their governing bodies at all levels of Russian society.

While mass mobilization and social movements of the have-nots continued to gain strength and institutional structures, the coalitional Provisional Government was losing legitimacy, as it failed to calm the revolutionary situation in the country. Overall, the “ministerial changes helped the regime little” (Riasanovsky 1993: 459). The economic problems that worsened in the summer of 1917, especially with the lack of a stable food supply, were further aggravated by the Russian army’s failures and separatist processes on the outskirts of the former Russian Empire (Hickey 2011: 266–270). These problems further undermined trust in the Provisional Government and, most importantly, negatively affected the positions of the Mensheviks and Essers in the workers’ and soldiers’ movement – positions which had already been shaken by their denials of Bolshevik
demands for immediate withdrawal from the war and power transfer to the soviets. With the diminishing influence of the moderate socialists, the Bolsheviks were rapidly gaining popularity in the working-class soviets in major industrial centers and in soldiers’ committees of the Western and Northern Armies and the Baltic Fleet.

The rising popularity of the Bolsheviks had become evident in the formidable armed demonstrations of July 3–4, led and organized by the Military Organization of Bolsheviks. The demonstration included such slogans as “All power to the Soviets,” “Down with ministers-capitalists,” and “Bread, peace, and freedom.” All political forces, including moderate socialists, interpreted the July uprising as a clear attempt by the Bolsheviks to seize power. The attempt failed. However, the methodical grassroots mobilization that the Bolsheviks had been nurturing in local workers’ and soldiers’ communities and committees came to fruition. A few days in July transformed the Bolsheviks from contenders to the front runners of the revolutionary movement. Moreover, the July demonstration delineated two opposing tendencies in resolving the revolutionary situation. The Provisional Government, with the participation of right-liberal and moderate socialists sought to get out of the crisis by synchronous replacement of the ancien régime with a democratic republic. For that purpose they pushed for gradual transformation of monarchical institutions into a liberal-democratic social structure, with consequent representation and reconciliation within it for the interests of all classes of the Russian society. The Bolshevik strategy was not “power and law continuity” – claimed by the Progressive Block and supported by moderate socialists – but rather revolutionary power discontinuity and creation of entirely new, notably socialist, social organization of the have-nots on the basis of the soviets. More specifically, the Bolsheviks demanded, in the vital interests of the have-nots, Russia’s immediate withdrawal from the war; the establishment of worker control of factories and plants, with eight-hour working days; and provision of land for the peasants, especially the poorest. While the Mensheviks and Essers primarily saw in the soviets an expressive-educational representative body of the have-nots and the vehicle of participation in, and control of, the Provisional Government, the Bolsheviks were determined to turn the soviets into a new system of socialist government of the have-nots that would eventually replace not only the Provisional Government but refurbish the entire Russian power structure.

In response to the July military uprising, the Provisional Government outlawed the Bolsheviks, ordered the arrest of their leaders, and dissolved the military units that participated in the demonstrations. However, it “never carried out any serious punitive actions against the Bolsheviks for the July putsch,” as it “deprived the Military Staff of the authority to arrest Bolsheviks,” “forbade it to confiscate weapons found in their possession,” and “looked the other way as the Bolsheviks held their Sixth Party Congress in Petrograd” (Pipes 1990: 465). Instead, the Provisional Government focused on reshaping itself. The second coalition Provisional Government included seven moderate socialists and was now headed by one of their own representatives, Kerensky. These political changes ultimately put right-liberals and moderate socialist parties into one camp and the Bolsheviks in the other.

The second coalitional Provisional Government vigorously attempted to remedy the situation both at home and on the military front. On August 12–15, 1917, it held a state conference in Moscow attended by representatives of all political forces, industry, military, and clergy. While the Bolsheviks boycotted the conference (Hickey 2011: 325–327), the Mensheviks pushed for the creation of a unified democratic front. The conference generally supported their “United Democracy Platform” but, besides that, “produced no tangible results” (Riasanovsky 1993: 459), especially for the Provisional Government. Moreover, in a blow to Kerensky, the charismatic new commander-in-chief of the Russian Army,
General Kornilov, used the conference to outline a political platform of the military that was quite contrary to the Provisional Government. His speech grabbed the headlines and overshadowed the Mensheviks’ maneuvers on transferring the unified democratic front from paper to reality. And the reality demonstrated that the Provisional Government policies did not produce improvements in the country, in which workers demanded bread, peasants land, and soldiers peace – exactly what the Bolsheviks promised them.

KORNILOV MUTINY, RISE OF THE BOLSHEVIKS, AND BOLSHEVIZATION OF THE SOVIETS

In these circumstances, the Provisional Government faced another challenge, now on the right. On August 23, General Kornilov – whose popularity was on the rise after his flamboyant speech at the Moscow conference – demanded that the Provisional Government give more state authority to the military. The latent, if not primary, objective was to overcome the Provisional Government’s indecisiveness towards the soviets and Bolsheviks and rout them from the political process (Членов 1959: 431; Pipes 1990: 463–464; Алексеев 1991: iv). The threat of military dictatorship forced Kerensky to seek the support of the worker’s and soldiers’ soviets and form a “quasi-alliance” (Медведев 1979: 29) with the Bolsheviks. The Bolsheviks mobilized the Red Guard and their military organization and, with Kerensky’s support, armed workers and withstood military mutiny (Pipes 1990: 466–467). Also, the Bolshevik agitators and soviet’s representatives worked hard among military units adjacent to Kornilov (Алексеев 1991: ix). The standoff came to an end without even a shot (Катков 1980). However, “The ‘Kornilov affair’ remains something of a mystery . . . Only the Bolsheviks really gained from this episode . . . Their leaders were let out of jail, and their followers were armed to defend Petrograd. After the Kornilov threat collapsed, they retained the preponderance of military strength in the capital, winning ever more adherents among the increasingly radical masses” (Ряшинов 1993: 460).

After that victory, Alexander Kerensky became not only the commander-in-chief, but the head of the Directory (“Council of Five”), a compact government, which included Prime Minister Kerensky and the four most powerful ministers. On September 1, the Directory, without waiting for the Constituent Assembly, declared Russia a republic. Kerensky’s act was twofold: on the one hand, he associated himself with left and left-centrist definition of Russia’s future in terms of republican ideas; on the other, Kerensky’s government became the government of the Russian Republic rather than an amorphous remnant of the overthrown monarchical assemblage. However, the triumphant Kerensky underscored the new turn in the revolutionary movement, the rise in number and political influence of the Bolsheviks and their Red Guard and military organization. Kornilov’s mutiny had become a “training ground” for the strengthening Bolsheviks’ military squad, which would soon play a decisive role in the 1917 Bolshevik rebellion.

In order to stop the Bolsheviks, the All-Russian Executive Committees of workers’, soldiers’, and peasants’ soviets, dominated by Mensheviks and Essers, summoned the All-Russian Democratic Meeting. Over 1500 delegates – representing a broad spectrum of social forces including workers’ and peasant soviets, soldiers’ committees, leftist parties, trade unions, local representative assemblies and self-governing bodies, and ethnic organizations – gathered in Petrograd at that meeting, held on September 14–22. No parties from the Progressive Block were invited, as they were largely seen as pro-capitalist and corrupted by either support of, or sympathy for, the Kornilov mutiny. The meeting sought, but without success, to form a government on a broad socialist and democratic basis. Perhaps it was the missed last chance for a peaceful exit of the revolutionary situation. The meeting managed to agree only on one issue: it formed, in place of the State Duma,
russian revo lu tion
a new representative body – the Temporary
Council of the Russian Republic, which aimed
to control the Provisional Government and
draft basic documents for the upcoming Constituent Assembly. The Temporary Council
was comprised of representatives of the left
parties, with the exception of the Bolsheviks,
who boycotted the Council.
The Bolsheviks saw in the Democratic Meeting and the Temporary Council a substitute
for the soviets, in which they, after the defeat
of the Kornilov mutiny, were rapidly gaining
the upper hand – the process known as the
bolshevization of the Soviets. On September
17, Bolshevik Nogin was elected chairman of
the Mossoviet, and on September 24 Bolshevik
Trotsky became chairman of the Petrosoviet. By
September-October, the Bolsheviks occupied
90 percent of the seats in the Petrosoviet and 60
percent of the seats in the Mossoviet. Soldiers
of the Baltic Fleet and the Petrograd garrison
declared their support of the Bolsheviks. The
methodical Bolshevik grassroots antiwar propaganda and promises to soldiers of peasant
origin to bring not only peace but give them
land paid off with their support. It was no wonder, then, that the Bolsheviks also boycotted
the so-called Pre-Parliament that was called for
by the Temporary Council. After September
25, the Pre-Parliament expanded from 313 to
555 members, as it opened its doors – in order
to become a representative body of all walks of
the Russian society – to the Kadets Party representing middle-class professionals, chambers
of commerce for entrepreneurs and business
people, and various public associations and
unions. Upon reorganization, the Mensheviks, Essers, and other moderate socialists held
255 seats (about 46%) in the Pre-Parliament.
Whereas the Pre-Parliament became a representative body of all walks of the Russian society
(Helytdf 2006), the soviets represented only the
lower layers and have-nots. However, the latter
constituted the vast majority of the Russian
population.
The major problem, however, was that neither the Pre-Parliament nor numerous reorganizations of the Provisional Government

7

were able to overcome the widening socioeconomic crisis and its further aggravation
of the revolutionary situation in the fall of
1917. Compared with 1916, gross industrial
production decreased by almost 40 percent,
hundreds of industrial enterprises were closed,
the train service, which at the time was the most
important transportation and communication
system, virtually shut down. The steadily rising
food and consumer products prices, accompanied by the reduction of real wages by 40–50
percent, caused further massive strikes and
social unrest, now with the demand of regime
change. In September–October 1917, about
2.5 million workers went on strike in Petrograd
and other industrial centers (Nbnfhtyrj 1986:
289). The scope of peasant unrest significantly
expanded: the peasants began appropriation
and redistribution of the landlords’ parcels of
land. The military losses on the German front
continued and the army became heavily demoralized, with many soldiers abandoning their
duties and returning home. And finally, the
police and other law enforcement agencies were
paralyzed in the wake of the workers’ and peasants’ unrest and protest. In this situation, the
impoverished lower classes and the exhausted
and demoralized soldiers and sailors lent their
support to the Bolsheviks and their policies of a
regime change. The Bolsheviks, a highly organized and determined force, grew rapidly: during the period February–October 1917, they
augmented their membership almost 15 times,
to 350 000 members, including 60 000 in Petrograd and the surrounding provinces and 70 000
in Moscow and the adjacent Central Industrial
Region (Rigby 1968; Fitzpatrick 2008: 52). In
sum, the Bolsheviks – both numerically and
organizationally – were prepared to take over
the failed Russian state.
THE BOLSHEVIKS’ POWER SEIZURE,
REFORMS IN FAVOR OF THE
HAVE-NOTS, AND DISSOLUTION OF THE
CONSTITUENT ASSEMBLY
The Bolsheviks’ resolute and charismatic leader
Lenin was able to overcome uncertainties


among party leaders about the power takeover, and to direct the party members toward forceful power acquisition. In August 1917, the 6th Party Congress passed a resolution on the armed uprising, set up special committees and staff, and outlined specific targets for the various aspects of the rebellion. On October 12, the Petrosoviet, which since September had been led by another charismatic Bolshevik, Trotsky, established the Military Revolutionary Committee for that purpose (Rabinowitch 2004: 233–241). The government of Kerensky had attempted to resist the efforts of the Bolsheviks, but the events were already irreversible, as the masses leaned towards the Bolsheviks. Aware of this situation, the Bolsheviks pursued an armed seizure of power. On the night of October 24, 1917, the Red Guard took control of the post office, telegraph, railroads, bridges, and other strategic infrastructures in Petrograd. In the morning of October 25, the city was covered with flyers and leaflets proclaiming removal of the Provisional Government and authority transfer to the Petrosoviets Military Revolutionary Committee. The Red Guard, people’s militia, and soldiers also dissolved the Pre-Parliament. In the late evening, the Bolsheviks, with the active participation of workers and soldiers, opened the Second All-Russian Congress of Soviets. During the Congress, which was cut off at night, the Bolshevik Red Guard took over, almost without resistance, the Winter Palace, the symbol of Russian statehood.

The legitimacy of the Provisional Government was so low and its inability to govern was so obvious, that no social or political force rose to defend it. It happened exactly as Kerensky’s former minister of war had predicted on October 20: “In Petrograd itself not one hand will be raised to protect the Provisional Government.” It could be argued that the Bolsheviks virtually grabbed state authority and, in the absence of other able political forces, saved the country from chaos and anarchy (Berdyaev 1960).

On the morning of October 26, Lenin announced at the Congress of Soviets that the socialist revolution had concluded victoriously and the Provisional Government was abolished. In response, the Mensheviks and Socialist Revolutionaries accused the Bolsheviks of usurpation, denounced the Bolshevik takeover, and most of them left the Congress in protest (Wade & Cummins 1991: 1–2). The Congress continued working under the full control of the Bolsheviks and declared itself the only legal authority in Russia. On October 26–27, it adopted two fundamental documents: the Decree on Peace and the Decree on Land (Wade & Cummins 1991: 6–11). In the Decree on Peace, Congress appealed to all warring countries for an immediate truce and peace negotiation without annexations and contributions. The Decree on Land proclaimed the nationalization of the landlords’ land, with transfer of that land to local peasant committees and boards for further distribution to peasants. Both decrees were enthusiastically received by the masses exhausted by the protracted “destructive war” (Berdyaev 1960) and the misery of peasant life. The next critical decision of the Congress was on the formation of a new government, with the establishment of the Council of People’s Commissars (Sovnarkom) and the appointment of Lenin as its chairman (Wade & Cummins 1991: 11). The new revolutionary government at first included only Bolsheviks. The Congress also elected the Executive Committee (VTSIK), dominated by the Bolsheviks.

During the few months after the Congress, the Bolsheviks managed to consolidate their power. First, the Sovnarkom announced a ban on right-wing and center-right parties and organizations, closed their media, and established censorship (Wade & Cummins 1991: 12, 53–58). On the other side, the left-wing Essers joined the Sovnarkom, making it a multiparty. Also, the Bolsheviks created VChK – the All-Russian Extraordinary Commission for Combating Counterrevolution and Sabotage (Wade & Cummins 1991: 62–64). Second, the “victorious march of the Soviets” began all over the former Russian Empire. The soviets assumed
power in Petrograd, Moscow, major industrial centers, and in Ukraine, the Don region, and the Transcaucasus. In 69 out of the 84 largest cities, power transfer to the Soviets happened peacefully. Third, the Bolsheviks adopted new legislation, culminating in the 1918 Constitution that laid the foundations of the new socialist order. In the name of social justice, the Bolsheviks abolished estates, ranks, and noble titles (Wade & Cummins 1991: 47). In November 1917, they unveiled the “Declaration of the Rights of the Peoples of Russia” that established equality among all people and gave people, including national minorities, rights of self-determination (Wade & Cummins 1991: 24–26). Private property was abolished too; only public and individual properties were allowed. The Bolsheviks established workers’ control in industry with the eight-hour workday (Wade & Cummins 1991: 19–21, 47–48). Fourth, in December 1917, the Bolsheviks signed a truce with Germany and its allies. Again, Lenin was able to overcome uncertainty among the Bolsheviks and push for the peace treaty. The left-wing Essers rebelled. However, their mutiny lacked “street support” and led to their expulsion from the government. According to the peace treaty, Soviet Russia suffered huge territorial losses to Germany, later regained by the Red Army. Overall, Lenin and the Bolsheviks emerged victorious from World War I and further consolidated their power.

The only challenge to the Bolshevik dictatorship could have come from the Constituent Assembly, elections to which occurred on November 12. The socialist parties received a strong majority of the votes, the Essers receiving about 59 percent, the Bolsheviks about 25 percent, and the Mensheviks about 3 percent. The Bolsheviks prevailed in Petrograd, Moscow, industrial centers, the Baltic Fleet, and the Western and Northern Armies (Fitzpatrick 2008: 66). The high vote for the Essers was predetermined by the fact that Russia was predominantly a peasant country and the Bolsheviks had introduced the Essers’ program of land reform. The Constituent Assembly opened on January 5, 1918 with 410 deputies out of 715 elected attending, and the Essers’ leader was elected its chairman. The Bolsheviks, emboldened by decisive victories among the strategic constituents, demanded, in an ultimatum form, unconditional recognition of their government and issued decrees by the Congress of Soviets and Sovnarkom (Wade & Cummins 1991: 64–67). After the dismissal of their requests, the Bolsheviks left the Assembly. In the small hours of the morning, “the sailor leader A.G. Zheleznyakov announced ‘the guard is getting tired’ and put an end to its proceedings forever” (Smith 2006: 138). Like the fall of the Provisional Government, no social or political force protested the dissolution of the Constituent Assembly, which, according to many scholars, should have been convened much earlier in order to prevent the Bolshevik victory. On January 6, 1918, the Bolsheviks’ VTsIK adopted a decree dissolving the Constituent Assembly (Wade & Cummins 1991: 82–83). This act symbolized the completion of the Russian Revolution (Hickley 2011: 458). Further developments can be seen as a process of construction of the new Soviet regime under the aegis of the dictatorship of the proletariat.

AFTERWORD

The Bolshevik movement emerged victorious in the Russian Revolution. It was – at that moment of Russian history – a successful revolutionary social movement. Its success can be attributed to the following seven factors. First, the Bolsheviks developed an efficient social movement organization led by professional cadres-revolutionaries. Second, their strategy of grassroots mobilization of workers and soldiers through alternative authority structures, the soviets, emerged superior to the bureaucratic reorganizations of the old government by their opponents. Third, the Bolsheviks seized the moment, that is, the economic, political, and military crisis and revolutionary situation of 1917. Fourth, the Red Guard and military organizations of the Bolsheviks were strategically designed and organized. Fifth, their
...propaganda slogans, collective action frames, lexicon, and keynoting were sharp and targeted at the right opponents and reflected the deep interests of the workers, peasants, and soldiers. Sixth, they acted strategically and masterfully emphasized the unpopular deeds of their opponents. And, finally, their opponents, from samoderzhavia to the Provisional Government, were too lenient with them, allowing them to thrive, grow, and finally seize victory.

However, from the long-term historical perspective—as perestroika, glasnost, and the rapid collapse of Bolshevism worldwide in 1980–1990s unveiled—the success of Bolshevism appears dubious. The soviets, the cornerstone of the Russian Revolution, are gone. The name of the highest representative body of the new post-Bolshevik Russia is the State Duma, in which communists represent the minority fraction comparable in size and influence to that of the 1st Congress of Workers’ and Soldier’s Deputies, at which Lenin shouted: “There is such a party!”

A NOTE ON DATES

All dates are given in the “old style” (Julian Calendar), which operated in Russia until February 1918. To convert to “new style” (Gregorian Calendar) add 13 days.

San Salvador Atenco farmers’ movement (Mexico)

CARLA BEATRIZ ZAMORA LOMELÍ

Atenco represents one of the most important contemporary social movements in Mexico, not only because of its historical importance in defense of the collective ownership of the land, but because of the actions that followed this territorial defense. These included conflict with the state, including state repression, growing alliances at regional, national, and international levels, and variation in the structure of political opportunities. The Atenco farmers are defined as collective actors, because of the social and historical particularity of their community, with high social density and communitarian relations in which collective identity is built up, with the land as the axis of the farmers’ identity.

San Salvador Atenco is a community located at the eastern boundary of the metropolitan zone of Mexico City. Historically, it has remained outside the great urban expansion, with the farmers of Atenco allocating nearly 40 per cent of the land to agricultural production in the saline soil on Lake Texcoco that the producers work year after year, working to reduce the salinity and producing maize, beans, and vegetables for local consumption. At the same time, Atenco’s location intersects with a diversified economy where agriculture combines with salaried work and with regional commerce. These means provide the subsistence of the community’s population of 42,739.

However, the Atenco residents were presented with a challenge to their way of life when, on October 22, 2001, the federal government published expropriation decrees of 5,000,393 hectares of cooperative and communal lands of the municipalities of the Texcoco, Chimalhuacán, and Atenco areas for the construction of a new international airport for Mexico City, one of the most ambitious projects of the federal administration of Vicente Fox. The decrees, coupled with the unacceptable offer of only a half dollar for each square meter of land, not only aggrieved the residents but prompted them to mobilize and act collectively in defense of their land.

The mobilization for the defense of the land and against construction of the airport manifested itself most strongly from October 2001 to July 2002. During this period the People’s Front in Defense of the Land (FPDT) was born as an organization that integrated social mobilization activities, drawing repeatedly on the learned repertoire of collective action in other contexts, such as road blockades and barricades. At the same time, the structure of political opportunities, coupled with social mobilization and associated legal strategies, facilitated the derogation of the decrees and the cancellation of the airport project.

Although there were several moments of violence between the collective actors of the FPDT and the government’s social control agents, the conflicts were solved essentially through political dialogue, as shown by the negotiation meetings between the FPDT and representatives of the federal and state governments installed in August 2003. In the subsequent stage to the airport conflict, the FPDT was recognized as a political interlocutor taking regional demands to the negotiation meetings with governmental representatives. However, the structure of political opportunities stopped favoring the FPDT with changes in the state government, that resulted in a decreasing interest in negotiating with the collective actors.

The definitive rupture of the negotiations occurred in April 2006, and with this rupture another stage in the history of the Atenco movement began. In May of the same year, the alliance of various groups with diversified regional interests and demands prompted the FPDT to support the demands of a group of...
flower vendors in the municipality of Texcoco. Given the absence of dialogue between government and demonstrators, collective protest actions escalated and met with violent confrontation when the federal and state governments unleashed its social control agents, resulting in various human rights violations: illegal searches, unlawful entry, arbitrary detention of over 200 people, sexual abuse of detained women, and the killing of two young boys by the police.

In summary, the Atenco farmers’ movement has experienced two different periods of contestation, each of which associated with different outcomes: during the first conflict (2001–2002) there was political negotiation which resulted in a successful outcome for the social movement. However, in the second conflict (2006–2010), due in large part to the closing of political opportunities and the criminalization of social protest as a governmental strategy, the movement failed to achieve any substantial gains, including the failure to achieve the release of imprisoned movement participants. After four years, the Supreme Court of Justice of the Nation released the detainees; the ministers determined that, in this case, the government used illegal evidence to accuse them of a crime they did not commit.

Satyagraha
SEAN CHABOT

Satyagraha literally means tenacity in the pursuit of truth, with the purpose of activating our capacity for moral compassion and love of humanity in struggles for personal and social liberation. Mohandas Gandhi, India’s famous leader, coined the concept as an alternative to passive submission and violent extremism in the face of oppression. It implies a nonviolent yet forceful approach to resolving conflict that addresses structural causes of suffering, benefits oppressed people, and creates favorable conditions for peace and social justice. This entry reviews satyagraha’s principles and methods, compares it to other forms of nonviolent action, illustrates its application during the Indian independence movement, and considers its historical and global relevance.

Satyagraha is unique in stressing unity between truth as end and nonviolence as means. Gandhi’s end (“truth”) was a just and peaceful society—a society where people did not face the exploitation, alienation, lack of autonomy, and violence associated with oppressive structures like British imperialism and Hindu untouchability. But since human beings do not have access to absolute truth, practitioners of satyagraha (“satyagrahis”) focus on experimenting with nonviolent methods in private and public life, inspired and guided by relative glimpses of truth.

The methods of satyagraha at first sight appear similar to other methods of nonviolent action. They include preparatory strategies like pledges, prayers, and fasts, which publicly demonstrate the worthiness and commitment of participants. They include familiar forms of direct action like boycotts, strikes, and rallies that increase pressure on political authorities and power elites. They include examples of civil disobedience such as picketing, mass marches, tax evasion, and legal defiance aimed at opposing oppressive structures and liberating individuals and society. And they include grassroots efforts (like Gandhi’s constructive program), which seek to develop the “people power” that fuels social and political movements.

But there are significant differences between satyagraha and other methods of nonviolent action. Unlike passive resistance, satyagraha is not a weapon of the weak. It relies on the strength and courage of participants, who abstain from violence out of choice rather than necessity. It calls on participants to suffer the violence of others and avoid retaliating with their own violence. Such self-suffering minimizes total loss of life, dramatizes unjust conditions, shows commitment to the common good, and ensures that mistakes do not cause suffering by others. While passive resisters internalize their hatred for opponents and express it nonviolently, satyagrahis are motivated by love of all human beings—especially opponents—in word and deed. Whereas passive resistance can set the stage for armed resistance, satyagraha attempts to avoid violent force under all circumstances. In short, satyagraha is more principled and revolutionary than most unarmed protest. It is not purely pragmatic about achieving its goals and seeks enduring transformation of oppressive structures, not just legal victories or political reforms.

Satyagraha’s principles and methods shaped all of the Indian independence movement’s major campaigns, with mixed results. But the Salt March campaign of 1930–1931 was the pinnacle of satyagraha in action. Gandhi decided to focus on the Salt Acts, because they involved taxation of a basic human need for the most oppressed people in India and obstructed national autonomy. On March 12, 1930, Gandhi and 80 satyagrahis started the 200-mile march to the coast of Dandi. Soon thousands of Indians joined the marchers, while millions more engaged in civil
disobedience or constructive work throughout the country, all dressed in white homespun cotton. Following satyagraha’s strategic steps, they had first investigated the situation, negotiated with rulers, taken the satyagraha pledge, participated in training, publicized demands, and issued an ultimatum before applying more confrontational methods. On April 5, the marchers reached the sea and Gandhi broke the law by picking up salt. When government authorities later imprisoned Gandhi and other leaders, the satyagraha campaign continued despite severe police repression, especially during raids on the Dharasana Salt Depot. In the end, Gandhi signed a settlement with British rulers that met most movement demands and signified that Indian independence was merely a matter of time.

The Salt March campaign came closer to fulfilling satyagraha’s requirements than any other campaign before or since. It demonstrated to the world that masses of ordinary people, and not just exceptional individuals, were capable of self-suffering without loss of discipline and violent retaliation. By voluntarily complying with reasonable laws and policies, satyagrahis earned the right to disobey the immoral Salt Act. And by focusing on national autonomy and reconciliation with rulers, they showed that the Indian independence movement promoted the common good, not just self-interest.

The Salt March campaign became a global media event, as journalists wrote vivid descriptions of courageous marchers and brutal police officers, and Gandhi appeared on radio programs throughout the world. It dramatically shifted domestic power relations in favor of Indian nationalists, leading to Indian independence in 1947, and has inspired activists outside of India ever since. African-Americans, for example, started paying attention to the Indian independence movement around 1920, but did not seriously consider satyagraha’s practical relevance until the Salt March campaign. Afterward, numerous African-American leaders traveled to India, talked with Gandhi and other Indian nationalists, and promoted reinvention of satyagraha to fight racial segregation at home. The African-American version of satyagraha guided the US civil rights movement of the 1950s and 1960s and brought fame to Martin Luther King, Jr, the “American Gandhi.”

Satyagraha has continued to influence social movements and activists ever since. In the United States, it guided the farm workers, peace, and feminist movements, for example. Elsewhere in the world, it empowered participants in South Africa’s antiapartheid and Poland’s Solidarity movement, among others. Today, radical intellectuals like Vandana Shiva and George Lakey urge members of global justice movements in the South and North to recognize the contemporary relevance of Gandhi’s concept. Clearly, satyagraha is still an important subject for scholars and activists in the field of social and political movements. What feminist-pacifist Barbara Deming observed in 1960 remains true today: “Experiment with revolutionary nonviolence has barely begun.”

Science and social movements
KELLY MOORE and MATTHEW HOFFMANN

Scientific knowledge has been a growing subject for organized political movements primarily since World War II. Science developed as a distinctive form of social activity in the seventeenth century, and refers to the collectivities of knowledge, tools, practices, and people who create verifiable, reliable knowledge about the natural world. Scientific knowledge may be in the form of words or formulas, or it may be represented in material things, such as a weapon or a drug. The growth of movements that challenge aspects of science parallel the immense government investments in science research post-World War II, particularly in the areas of weapons development, agriculture, health and medicine, and industrial processes. As governments have used measurable standards to characterize more aspects of their citizens’ lives – race, population, crime rates – social movements have come to challenge what Jürgen Habermas in his influential work *Theory and Practice* (1973) called interference in the “life world” of citizens. Today, many active social movements in the US, including Creationism, the pro-life movement, health social movements, and environmental movements and their critics, use science to frame their claims. Ironically, although scientific claims are ubiquitous in political debates, they are often highly contested and therefore have less power than they once did.

The increased role of science in many parts of social life poses distinct political hurdles for social movements. Theoretically, in liberal democratic governance all public governance forums are open to citizens, and rules and laws govern the conditions under which citizens can influence these systems. Despite the ubiquity of science in everyday life, it is often difficult for citizens to affect its production and use. Science is produced in places that are not easily accessed by outsiders, such as government or private laboratories. Scientific knowledge is complex, and uses highly specialized language. When activists suspect that scientific products or processes have caused harm, such effects are not always visible or immediate. It is often costly and difficult to generate counterevidence, particularly when opponents have more access to the tools to make knowledge. This problem can be characterized as the problem of “undone science” (Frickel et al. 2010). Finally, science carries a cultural authority based on specialized training and legal rules that makes bystanders, publics, scientists, and legal adjudicators skeptical of nonscientists’ claims.

Social movements that target science have addressed these issues in six major ways: building alliances with scientists; generating new rules and laws for adjudicating science-related issues; learning the science behind a problem or simply deploying it in claim making, thereby gaining credibility; engaging in “popular science” by measuring effects using rules and practices set by ordinary people rather than scientists; and by drawing attention to the political nature of some knowledge claims.

Social movements that engage science are not always critical of it. Technophilic movements appropriate scientific knowledge in the service of other goals, such as personal liberation or democratization through technological “connectedness.” These movement actors often use science in novel ways, mixing it with mysticism and other forms of personal experience that are usually thought to be antithetical to science. They are often led by gurus of various kinds who have some training in science.
HOW SCIENCE CAME TO BE A TARGET OF SOCIAL MOVEMENTS

Social movements have rarely targeted science until the early twentieth century, and not in a widespread fashion until after World War II when its role in human life increased dramatically. Since the 1920s, chemicals, weapons, consumer goods, and medical technologies have developed more quickly than ever before, affecting the natural environment, the human body, and the border between them. Proponents of these developments assumed that science automatically led to progress for all, and that scientific practices were a model of democracy. Other proponents have been enthusiastic about the possibilities for individuals to use science to transform themselves. Yet many social movement groups argue that scientific developments have unanticipated material and psychological consequences, and that science is an elite, antidemocratic practice.

The earliest sustained movement challenge resulted from the development of a standing army and concomitant buildup of nuclear and chemical weapons stocks shortly after World War II. Such weapons were created in secret, and required risky secret tests to understand their effects. Peace and antimilitarist groups opposed their testing, deployment, and development, which activists suspected of causing long-term illnesses (though they could not prove this), in addition causing blast destruction (Wittner 1997).

Since the 1950s, it has been more common for social movement groups to work with scientists in some way, even as they challenge some aspect of science. The next section explains some of the main ways that movements use science to make political claims.

HOW MOVEMENTS USE SCIENCE TO MAKE POLITICAL CLAIMS

Scientist–movement alliances

One strategy to overcome knowledge deficits and a lack of credibility is for activists to ally with scientists. Beginning in the 1950s groups began to raise new questions that made deeper inroads into challenging the uses of science, challenging the very content of scientific claims. Consumer groups, often with a small group of scientists or even a single scientist as an ally, contested government and industry’s claims that new kinds of chemicals developed for health, agriculture, or consumer products were safe. Because the harms caused by new chemicals were not obvious, scientists who understood what was known and unknown about them served as important allies and interlocutors for nonscientists. Controversies such as the safety of pesticide use, air and water pollution, and the fluoridation of public drinking water, published in works such as Rachel Carson’s Silent Spring (1962), Murray Bookchin’s Our Synthetic Environment (1962), and Barry Commoner’s Science of Survival (1966) instigated the deployment of counterclaims, pitting expert versus expert (Egan 2009). It was during this period that scientists themselves came to be important critics of the idea that science was always a force for progress and to offer their knowledge to other challengers. Ironically, by doing so, they undermined one of the key bases of their political authority, which is the idea that science is untainted by values. By participating in these movements, scientists helped to show that the choices to study, develop, and deploy knowledge are deeply political.

These early challenges relied on ad hoc assistance from scientists, but they had important longer-term effects as they helped inspire legal changes that resulted in the institutionalization of scientific expertise in public policy. In 1969 Congress passed the National Environmental Protection Act (NEPA), requiring federal agencies to collect scientific data documenting the environmental effects of proposed federal law. It called for experts, both for and against proposed federal laws, to submit claims based on scientific data. As a result, social movement organizations and civil society organizations such as the Natural Resources Defense Council (1970) and the Center for Science in the Public Interest (1971) employed scientists to conduct
research and carry out politics. These were among the first science-based public interest groups, and were followed by the formation of thousands of others over the next decades. They continue to be important sources of evidence and expertise for groups who wish to use science to contest political issues. These professionally staffed organizations provide scientific ideas and legitimacy to social movements.

In the 1970s, a new kind of alliance between scientists and activists took hold. *Stable alliances* between professionals and nonprofessionals developed, with groups working together to develop new knowledge, rather than having scientists develop knowledge and deliver it to movement groups. In Love Canal, New York, lay people and journalists documented widespread illness in the community, eventually finding that the community had been built on a toxic waste dump. Projects such as the National Women’s Health Network collectively documented hazards and abuses women had faced in health care as patients and as research subjects. Feminist scientists and other government bureaucrats were able to institutionalize solutions to some of the problems that women had identified (Kline 2010).

Collaborative relations between activists and industries have been influenced by the convergence of nonprofit organizations (NPOs) and the for-profit sector which began in the 1980s. One result is that contemporary social movement targets have expanded to include markets and industry. Industrial opposition movements, such as the movements against genetically modified foods and mountaintop removal mining, seek to alter corporate practices. This opposition tends to spur “alternative industrial movements” such as those surrounding organic foods and renewable energy/clean technology. These movements are characterized by the collaboration between the state, industry, and citizens groups and have been referred to as “alternative pathways” (Hess 2007) and “interpenetrated social movements” in the case of the breast cancer movement (Klawiter 2008).

**Gaining credibility**

AIDS activists used a slightly different strategy, gaining *credibility* by learning the science of AIDS transmission through working with a handful of scientists. Drawing on their authority as people at risk of or with AIDS, activists helped generate their own science. Recent scholarship has examined embodied health movements that conceptualize the body as a site of contestation and deemphasize the state as a primary target. AIDS-related movements in the late 1980s and early 1990s challenged the paternalism of standard practices of diagnosis and treatment, eventually influencing the creation of participatory models of disease research. This provided patients and advocates with the opportunity to influence the research agendas of pharmaceutical companies, most notably the design of medical trials (Epstein 1998).

**Generating new rules and laws that legitimate activist claims about science**

In the 1950s, there were no laws or bureaucratic rules that legitimated activists’ participation in legal or political deliberations about science. As suggested earlier, one major change since that time is that new laws and rules have been institutionalized to give citizens the right to participate in decisions about environmental issues. Changes in how research on human subjects is carried out have also provided activists with more leverage. Slowly building through the 1950s, major changes in the treatment of research subjects lessened scientific researchers’ power, and gave research subjects new formal rights of informed consent. Activists have used these new rules to call for even greater participation in how research is carried out. Some legal rulings, however, have had the effect of giving scientists and activists less power. The *Kuhmo Tire vs. Carmichael* decision (1999) elaborated the rights of judges to decide what constituted “junk” or “good” science in the courtroom. This lessens the benefit of allying with scientists.
Popular science/popular epidemiology

Alliances, changing rules, and learning to use scientists’ tools and language are not always possible or effective for activists. As a result, some movement groups collect their own scientific evidence, engaging in what Brown (2007) calls “popular epidemiology.” They may or may not work closely with scientists, but, in every case, they define problems differently than scientists usually do, developing their own techniques, standards, and solutions. Phadke (2005) documents this phenomenon in the successful resistance to the Indian government’s proposed Uchangi dam, as affected village residents used participatory resource mapping to record local ecological characteristics and land-use patterns and developed alternative irrigation plans with the assistance of nongovernmental engineers. Other groups collect data in response to scientific uncertainty or indeterminacy and may advocate taking precautionary measures, as in the case of office workers’ efforts to legitimize sick building syndrome (Murphy 2006). As Brown has demonstrated, this type of movement engagement is among the most powerful, for it often challenges traditional understandings of the relationship between scientists and nonscientists and leads to novel solutions to problems.

The ability of social movements to collect and analyze data is in part shaped by broader trends such as higher levels of education, the accessibility of computer software systems, and the electronic availability of scientific studies. It is also the result of the availability of inexpensive and easy to use testing technologies such as those used by “bucket brigades” or citizen groups that collect and analyze data on environmental pollutants (Ottinger 2010).

Drawing attention to the political nature of knowledge claims

Science derives some of its political power from the belief that scientific knowledge is adjudicated only by nature, not by the political interests and beliefs of sponsors and practitioners. Social movement groups have disrupted the presumption of value-neutrality and thereby minimized a distinct source of science’s political power.

Political theorists have been critical of the idea of the neutrality of science since the 1950s. Some writers in the 1960s, such as Herbert Marcuse in One Dimensional Man, asserted that the uncritical acceptance of instrumental rationality as a basis for organizing contemporary life had created “one-dimensional” people, in which the sublime and creative aspects of humans were pushed aside (Marcuse 1964). Religious groups have made similar kinds of challenges to science. Creationists, for example, have asserted that scientists, far from being value-neutral, have failed to look at evidence for evolution fairly. Whether these claimants are correct is less relevant than their ability to dispute the idea that science is separate from other forms of social life.

More recently, activists around the world have challenged the supposedly neutral scientific safety standards for foods, chemicals, and for what counts as “healthy.” States and suprastate groups, such as the European Union and the World Bank, embed these standards into national and local policies. Citizens have a difficult time challenging the originating agencies, since citizens have minimal or no legal standing with them. Instead, many social movement groups use courts to draw attention to the ways that moral and political values of governments and industry are masked by supposedly neutral standards.

TECHNOPHILIC MOVEMENTS

Social movements sometimes enthusiastically embrace science as a form of liberation from the body, the planet, from place, or from the mind. In the 1970s new movements advocated using science and technology to escape from the cultural strictures, including religion, that were supposed to have twisted and damaged emotional, sexual, and physical life. These technophilic countercultures advocated a form of what Binkley (2007) calls a “loosening,”
that was promulgated through magazines such as CoEvolution Quarterly and how-to manuals such as The Joy of Sex. Each provided, often via the authority of a guru, technical instructions and goods, ironically, to be used to become more “natural” and relaxed. The apotheosis of this cultural movement was what came to be known as the Human Potential Movement (HPM), a secular answer to spiritual quests inspired by psychologists Abraham Maslow, Carl Rogers, and Rollo May. The HPM saw endless potential in human beings for creativity and self-expression, after their basic needs were met, and encouraged people to use quasi-scientific principles to improve their lives.

Other groups and leaders expressed technocratic ideals by calling for the simultaneous reorganization of large-scale social and technological systems in order to promote self-actualization, democracy, and sustainability. In the 1970s, Stewart Brand, one of the founders of The Whole Earth Catalog, helped to turn the Internet, then a tool of the military, into a civilian communication system that he and others hoped would allow citizens to express their political interests and creative selves free from government control (Turner 2008). Anti-nuclear activists similarly sought to decentralize power relations by changing how technology was organized (Epstein 1991). These impulses can be seen today in open-source technology movements.

CONTEMPORARY MARKETS AND ECONOMY

As a relatively autonomous field, science has always been contested. The study of science and social movements reveals the changing nature of that contestation from disputes over the use of science, to the questioning of the content of science, to the eventual institutionalization of these challenges in contemporary deliberative knowledge-producing practices. Because of the established connections between scientists and ordinary people, some writers have asked whether we are seeing a widespread shift in the general form of social movements, or whether scientist–nonscientist alliances are a form of co-optation.

Self-help movements
ROBERTA G. LESSOR

Self-help groups are a distinctive feature of social life in the US and elsewhere that emerged on the scale of a social movement during the last four decades of the twentieth century. The term “self-help” applies to a wide variety of groups in which members mutually aid one another, seek personal changes, and in some cases, seek to challenge existing institutions that are not meeting their needs. Self-help groups can generally be characterized as “lay” versus “professional,” as formed in respect to members’ discontent with institutionalized means of dealing with a variety of human physical and mental problems, and as proposing new practices to address these problems. The proposed strategies include the promotion of personal, individual growth and, in some cases, the betterment or improvement of the health or well-being of an entire affected group. The rapid expansion of self-help in the 1960s and 1970s coincides with larger human rights movements of the time (the civil rights movement, the women’s movement, the women’s health movement). “Self-help” continues to evolve in the twenty-first century, albeit in new forms and with different emphases.

WHY SELF-HELP?

Social scientists in the mid-1970s began studying the expansiveness of self-help, which was estimated at the time to constitute half a million small support groups. They emphasized the groups functioning as a shelter from the alienation and dehumanization of a technologized society (Katz & Bender 1976). Such groups, it was asserted, provided face-to-face connections among people who felt powerless to confront their problems alone in mass society. The individual member could draw on the power of the group itself to sustain him or herself through a variety of life challenges. In the 1960s and 1970s, self-help groups emerged and/or grew markedly in every imaginable arena, helping members negotiate every point of both anticipated or unexpected change in the life cycle (new nursing mothers in La Leche League; single mothers or fathers in Parents Without Partners); to cope with all manner of human pain or stress (grief recovery groups, family members of suicide victims); to cope with stigmatization (Little People of America); with health issues (International Association of Laryngectomees, United Ostomy Association); to aid in recovery from addictions (Recovery, Inc., Alcoholics Anonymous, Overeaters Anonymous); and to offer acceptance and advocate for change (Committee for the Rights of the Disabled, the Boston Women’s Health Book Collective, and dozens of feminist women’s health collectives throughout the country) to name only a few out of thousands emerging or growing in this period.

EVOLUTION OF SELF-HELP GROUPS AND THE STUDY OF SELF-HELP

The minimal number of self-help groups prior to the 1960s is evidenced by the paucity of studies of self-help and self-help groups. Bales’ 1944 sociological study of the therapeutic function of Alcoholics Anonymous (AA) stands out as an early investigation of self-help groups, the AA of that time having grown from a group of less than 100 members beginning in 1936 to the establishment of groups in most sizable US cities. The growth of AA is a marker of self-help group growth in that the organization currently reports over 63,000 groups and 1.4 million members in the US and Canada (data provided by Alcoholics Anonymous General Services Office, NY).
The rapid growth of self-help groups soon made even categorization a challenge (Killilea 1976). Early research on self-help appeared mainly in the disciplines of social service, clinical psychology, and education, rather than sociology. However, social scientists recognized the key importance of self-help organizations as a form of social institution and as a “natural laboratory for investigating social structure, social relationships, and issues of policy” (Katz 1981: 135). Studies appeared on groups themselves and on a range of social processes that could be understood through field research and participant observation in such groups, for example, socialization (Lofland & Lejeune 1960), consciousness raising (Lessor 1985), and community building (Wuthnow 1996). Not all sociologists in the early years of the self-help movement recognized self-help groups as particularly significant, however, Goffman (1963) referring to them as “huddle-together” groups.

If AA represented the epitome of the lay group with no professional leaders, the other extreme was the incorporation of self-help into professional practice. Recognizing the popularity and apparent power of group members to help one another in solving human problems, mental health professionals soon launched groups as a useful accompaniment to individual therapy or as a therapeutic modality in itself. The difference in the newly emerging encounter groups, T-groups, and sensitivity training in psychotherapy (Back 1972) was their mediation by a trained leader. The rise in such groups is further evidence of the recognition of the profound impact of the self-help movement. Therapists attested to the therapeutic value of the input of a small group helping its members and literally changed the way that much of therapy was conducted (see for example, Back’s 1972 recounting of the evolution of the work of the psychotherapist Kurt Lewin).

SELF-HELP GROUPS AIMED AT CHANGE AND THEIR CONSEQUENCES

The women’s health movement (WHM) offers an excellent example of the rise of a self-help movement that changes both individual practice and social policy. It further illustrates the process of mainstreaming that occurs when a movement is successful. The early days of the WHM were marked by the formation of small groups of women who were determined to overcome what they identified as women’s exclusion from medicine as both patients and providers. They pointed out the lack of information available to women about their own bodies, health, and sexuality and the way in which such knowledge was seen as the sole province of a then male-dominated medical establishment. Working together in small groups, women took matters into their own hands, learned from their own bodies and each other, and disseminated their newly acquired knowledge and skills such as self-examination and menstrual extraction. They communicated about normal processes in menstruation, menopause, and women’s sexuality and about recognition of diseases affecting women. From such self-help group work, participants wrote and distributed self-help materials. What originated as a sheaf of shared mimeographed materials generated in groups known as The Boston Women’s Health Book Collective became the astoundingly successful book, Our Bodies Ourselves. The book has now been issued in multiple updated editions in its 35-year history and been widely adopted, translated, and read by millions.

Women’s health groups were also deeply concerned over the nearly complete lack of research on women’s health and the exclusion of women from large federally funded panel studies. The WHM provides a prime example of a self-help movement that viewed political change as an important element of support. Similarly, self-help groups formed by gays, lesbians, people of color, and people with disabled were established because participants saw their voices as not being sufficiently heard in legislative, medical, educational, or workplace institutions.

If the purpose of a politically active self-help group movement is to change existing
institutions that were formerly unresponsive to members’ concerns, the WHM’s successful efforts once again offer a case in point. Among other gains, research on women’s health markedly increased (e.g., the establishment of the Nurses’ Health Study in 1976, the Women’s Health Initiative in 1991), women’s reproductive freedom increased (the 1973 Supreme Court Roe v. Wade decision legalizing abortion), and the number of women in medicine dramatically increased (from 3% prior to the WHM to the nearly 50% of women now entering medical school classes and the 70% who occupy obstetrical/gynecological residencies). That is, many of the concerns made their way into the mainstream of women’s health care. Being “mainstreamed” marks recognition of the movement’s concerns yet at the same time signals transformation as the rallying cries of the lay self-help group are incorporated into formal institutions. For example, almost every hospital medical complex now has a designated “women’s health center,” but one that in its professionalization necessarily looks quite different from the early women’s centers that challenged existing institutions through asserting women’s control over their bodies and reproductive lives. Further, many of the health issues that the WHM groups sought to highlight and educate themselves about are now the focus of disease-specific advocacy groups. Initiatives concerning breast cancer, uterine cancer, autoimmune diseases, and heart disease compete for attention and funding. And perhaps the ultimate consequence of the movement’s “success” is that some hard-fought WHM issues now have corporate sponsors, as in cosmetic companies such as Avon sponsoring run/walks for breast cancer (Ruzak & Becker 2004).

THE WIDESPREAD DISSEMINATION AND DIFFUSION OF SELF-HELP

The women’s health movement exemplifies the rise of a self-help movement, its activism, success, and eventual demise as it is incorporated into professional help. The recovery movement, however, demonstrates professionalization as well as a further step (no pun intended) of the self-help recovery movement into marketing and entertainment. Self-help group members of the 1960s could have had little or no awareness of how huge a societal phenomenon self-help would become, or the ways in which it would be institutionalized, an ironic twist to the very term “self-help.” Similarly, few observers could have foreseen the enormity of the recovery movement, although much has been written on it more recently. What began as the Alcoholics Anonymous (AA) 12 Step Recovery program with alcoholics sharing “experience, strength and hope” with other alcoholics “for fun and for free” as they sought sobriety together, led ultimately to a multibillion dollar recovery industry. The AA self-help program remained essentially the same, a no-cost, leaderless, lay self-help group, yet its success led ironically to the development of an entire recovery industry. And the recovery industry netted enormous profits using as its main therapeutic offering the transport of its clients to free AA self-help groups.

The recovery industry grew around AA and the multitude of other anonymous self-help groups spawned by its 12-step model: Narcotics Anonymous, Cocaine Anonymous, Overeaters Anonymous, Sex Addicts Anonymous, and Adult Children of Alcoholics. These and numerous other groups employed the concept of “addiction” or its corresponding identifier, “codependency,” both terms that were widely introduced into everyday jargon as the movement grew. By the 1990s, 4 in 10 Americans had joined a self-help group, most oriented toward recovery or self-improvement (Wuthnow 1996).

The self-help movement and self-help industry has not been without its analysts and critics. The book A Disease of One’s Own (Rice 1996), illustrates the popularity of self-help seeking in recovery groups by examining the impulse felt by many who don’t have an addictive disease to examine whether they may well be affected by someone else’s as a “codependent,” thereby qualifying for their own self-help group.
and recovery identity. In The Culture of Recovery (Rapping 1996), women’s current self-help participation and reading of self-help books aimed at “fixing” the person is contrasted to the earlier efforts of participants in the women’s health movement. The earlier self-helpers sought to feel better by also changing society, the later by changing the self, an analysis casting the self-help “recovery” movement as conservative or even counterrevolutionary. While it could be argued that reading self-help books may not contribute to making social change, a more positive assessment is offered in Women and Self-Help Culture: Reading Between the Lines, where it is asserted that such advice books validate “caring” (Simons 1992). On the other hand, one biting critique of self-help books warns of the “totalitarian” nature of a movement that sees pathology everywhere and personal change as mandatory (Kaminar 1992).

The incorporation of self-help/recovery into daily life is nowhere more evident than in the self-help book industry, a category of books taking up substantial space in the chain bookstores. And while advice books have undoubtedly been around since the printing press was invented, their growth in recent years has been so explosive that they now occupy their own category in the New York Review of Books, outsell most other types of books, and, with their authors, occupy center stage for discussion on the most popular television talk shows. Through televised discussion, the subject of a self-help book can be known without the need to read it. In addition to talk shows dealing with self-help efforts, an ever more personal scrutiny of self-help efforts is offered in currently popular televised reality shows. Such prime-time fare chronicles recovery groups and personal improvements of all types, as exemplified by the weight loss show, “The Biggest Loser,” where self-help becomes not just entertainment but competition. In reviewing the self-help efforts that now blanket the social landscape, a sociological analysis places self-help in an even larger social and historical framework, showing that Americans have always cheered recovery and reform and the creation of a new and better self (McGee 2005). This does not explain the late twentieth-century explosion in self-help, however. Such a qualitative increase, it is argued, is accounted for by the inclusion of women alongside men in the workforce and the development in the US of an increasingly “beleaguered self” in search of relief (McGee 2005).

CONCLUSION

The self-help movement in the past 50 years can be characterized as growing in size yet weakening in social impact, as the self-helper read the book or watch the television show, or visit an online web site to learn how to cope or to post comments that focus on themselves. The bulk of such efforts appear less oriented to social change and more oriented to personal change (cf. Rapping 1996; McGee 2005). The increasing embeddedness of self-help groups in churches further assures their increasingly conservative nature. A recent study of the “mega churches” that are now in the foreground of American religious life observed that perhaps the churches most distinguishing feature is the great number and varied range of self-help groups that they offer (Snow et al. 2010). Wuthnow’s extensive study of small support groups in the US found that two-thirds of such groups are linked to religious faith in some way. He points out that such groups reflect the fluidity of American lives and also the latest “realignment” in adapting American religion to the main currents of secular culture. That is, group members are seeking both community and spiritual growth as they pursue an improved “self,” yet the creation of either in such groups is unlikely. In a “come if you feel like it” and “learn if you want to” environment that has come to characterize self-help groups, participants are neither held to account for their participation as a community nor is doctrinal knowledge pursued (Wuthnow 1996: 6–8). The churches, in giving people a comforting setting in which to focus on personal troubles or to develop an improved self, have chosen an popular emphasis but one that is oddly unlikely
to build a doctrinally inspired organization. Despite their pervasiveness, self-help groups don’t focus on social and political change as many did in the 1960s and 1970s. Further, it could be argued that their exclusively inward focus and voluntary norms may also preclude building the institutions in which they are housed.

Separatist movements

DEVASHREE GUPTA

Separatist movements advocate for greater sovereignty for their members, who are often part of a common ethnic, religious, or territorial group, and who resist further incorporation into the larger polity, believing instead that they should exercise more control over their political, economic, or cultural affairs than the national states in which they live. While some separatist movements may attempt to achieve their goals within the confines of existing state boundaries, seeking to increase group autonomy or gain more power in local governance structures, such movements can also challenge existing state boundaries and call for the formation of entirely new or reconstituted territorial units. Since World War II, separatist movements in Europe, Asia, and Africa have nearly quadrupled the number of independent countries in the international system and increased the number of United Nations members from 51 at its founding to 192 members today. By some counts, there are over 70 current separatist movements around the world, mostly concentrated in Europe and Asia. Not all of these involve ongoing, active mobilization, and fewer still feature violent resistance, though the violence that such movements engender can be particularly intense and intractable.

At the heart of almost all separatist movements is the principle of self-determination – the idea that individuals are entitled to determine, freely and without compulsion, how and by whom they will be governed. Self-determination was a guiding principle of the Treaty of Versailles, which sought to create new states, largely along ethnonational lines after World War I. Though this initial use of the self-determination principle was limited to Europe, the rise of anticolonial movements in the wake of World War II broadened the scope of application to other parts of the world while enshrining the principle as a legal right in a host of international treaties and accords. The International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights, for example, both maintain that “all peoples have the right of self-determination. By virtue of that right they freely determine their political status and freely pursue their economic, social and cultural development.”

The right of self-determination, however, does not entitle groups to demand their own, independent states, as it does not come with a concomitant right of unilateral secession – a limitation that reflects the right of states to maintain their own territorial integrity. Indeed, these two principles, both of which are protected in international norms and legal instruments, exist in fundamental tension, and complicate the choices of other states that may wish to assist separatist movements because of perceived human rights abuses or co-ethnic ties, but that also do not wish to see the principle of state sovereignty weakened or the creation of new, unstable state actors (Horowitz 2003). Instead of independence, separatist movements that claim a right of self-determination may pursue a variety of other goals, including some form of accommodation within existing political boundaries, such as regional autonomy, consociationalism, or explicit protections for minority rights. However, such limited outcomes may not suffice for some separatist groups, particularly in cases where historic grievances are deeply felt, or where the state is unwilling to lessen its control over certain populations or territories. In such cases, separatist movements are both unlikely to reach some kind of accord that respects state sovereignty and to want anything short of full independence. It is in these difficult cases – like the Tamils in Sri Lanka, the Moros in the Philippines, or the Tibetans in
China—that violence, both by the separatists and the state, is most likely to occur.

Because separatist movements can vary considerably in their characteristics, including where they occur, the intensity and scale of their mobilization, and their use of violence, considerable scholarly effort has been devoted to better understanding why such movements occur when and where they do. Early explanations maintained, for example, that separatist movements are more likely to emerge in places where states themselves are multiethnic and where central political authorities are unable to hold centrifugal forces at bay. Such states, common particularly in Africa and Asia where the artificial boundaries drawn during the decolonization process rarely reflected ethnolinguistic settlement patterns on the ground, can lack a unifying national identity that can hold a country’s heterogeneous communities together (Furnivall 1948). When such states are helmed by strong central authorities, these polities can appear stable and united. However, if that political center weakens, as happened in Yugoslavia and the Soviet Union after the collapse of communism, or in Somalia in the early 1990s, different regions and identity groups are more likely to seize the opportunity presented to demand greater autonomy and local control. Thus, multiethnic states need not be inherently more likely to dissolve into separatist fractiousness, but that demographic quality, combined with weak control by the political center, creates a climate in which separatist movements can thrive.

A rival state-centric explanation argues that state strength, not weakness, is a precipitating factor in separatist pressures. In this line of reasoning, as the modern state has developed, it has extended its reach, both in terms of exerting territorial authority to more areas as well as in regulating and controlling an increasing number of activities in the lives of its citizens. When the state penetrates areas that previously have not been subject to regulation and control, especially if this extension of its power is perceived as excessive, unnecessary, or arbitrary, it risks sparking a separatist backlash by those actors unwilling to submit to this new authority (Gellner 1983). When that backlash is concentrated among territorially contiguous populations or particular ethnonationalist groups, it can form as a separatist movement. Many of the regional nationalist movements in Western Europe, such as the Basques and Catalans in Spain, or the Bretons in France, are the products of central state authority being extended to regions that have strong substate identities and prior experience of autonomy, or even independence, and that accordingly reject the central state’s authority in favor of more localized control over their affairs.

In contrast to the above state-centric explanations, a third body of work emphasizes unequal relations between economic centers and peripheries as an important factor in separatist movement formation. Michael Hechter (1975), for example, argues that uneven economic development can reduce certain areas within a state to the status of an internal colony, systematically exploited for its resources without receiving commensurate political or economic benefits, thus placing it in a perpetual relationship of dependency and subservience to the political and economic center. Moreover, such internal colonies are frequently distinct, ethnically and culturally, from the rest of society, such that economic differentiation between the center and periphery is also reproduced as a cultural differentiation of labor. If such regions are able to organize themselves and create movement structures, as the Scottish have been able to do, these economic grievances, coupled with ethnic differences, can become a potent source of inspiration for separatist claims.

Center–periphery cleavages, and grievances more generally are usually not sufficient, in themselves, to spark separatist mobilization. There are numerous examples of underdeveloped and deprived regions around the world that have little or no separatist ambition, and many ethnic groups that can claim grievances against the state but that fail to organize themselves around demands for greater
separatist movements. Rather, such conditions merely provide tinder for movements; what is needed is the spark. Here, a number of scholars who focus on the microfoundations of mobilization examine the role of ethnic entrepreneurs in generating sustained separatist pressures. Such entrepreneurs are typically members of regional or local elites who use their position and influence within minority ethnic groups to increase their power vis-à-vis central political authorities. Ethnic entrepreneurs play a crucial role in framing grievances and crystallizing potential separatist tendencies in a way that is understandable to the public and that serves as a focal point for organizing. Just as movements do not “just happen,” and are instead the result of individuals working to organize, sustain, recruit, and deploy supporters in strategic ways, explanations that look at ethnic entrepreneurs attempt to expand on prior arguments about where and when separatist movements take place by looking at the agency of the actors that are involved (Smith 1981).

Finally, a vigorous debate has unfolded in recent years about the impact that globalization and regional integration have had on separatist tendencies. One group of scholars has argued that globalization and integration have increased separatist pressures because they have reduced the salience of state borders and thus weakened the once inviolable principle of territorial integrity – previously held to be an obstacle to many separatist demands. Further, for separatist groups that lack sufficient critical mass to be viable autonomous or independent political entities in their own right, participation in a regional integration project, such as the European Union, can offset the disadvantages of small size, as such groups can more easily conceive of engaging in a variety of economic and political relations that bypass the traditional state (Jones & Keating 1995). On the other hand, globalization and regional integration may also defuse more extreme separatist pressures because many of the traditional advantages of being an independent, sovereign state are no longer linked to having state status. In the European Union, for instance, regions can interact economically with other regions, and local actors can access development funds with minimal interference from national political authorities (Lynch 1996).

Once separatist movements emerge, states can respond in a variety of ways to their demands, including ignoring movements, negotiating with them, or repressing them. What states choose to do, and the outcomes of this interaction, are other rich areas for research that in a number of crucial features and hypotheses intersects the broader literature on state responses to social movements, policing, and violence. For example, a number of the variables that scholars highlight to explain how and why states grant some separatist demands and not others include whether they are democratic (and therefore more likely in principle to respond to self-determination claims) and their governance structures. Nancy Bermeo (2002) argues, for example, that federal systems are better equipped to accommodate regional autonomy demands than centralized systems. Barbara Walter (2006), moreover, posits that one of the most salient factors determining whether a state will negotiate with separatist forces is future reputational effects – whether concessions will adversely affect other potential separatist demands from other groups. Thus, states facing multiple separatist movements, like China, will be far less likely than states with limited movements to concede ground for fear of setting a precedent that other groups can invoke in the future. Of the concessions that states may grant, formal secession is quite an uncommon event, occurring in only a handful of cases. Since 1990, for example, just over two dozen new countries have emerged from separatist movements, most from the collapse of the Soviet Union and Yugoslavia; elsewhere, the number of successful secessionist claims is sharply limited and includes rarities like East Timor and Eritrea. Instead, and as with social movements more broadly, separatist movements can achieve more limited success such as local autonomy, or recognition of
minority rights – outcomes that may fall short of a movement’s stated goals but that satisfy all but the most zealous activists.

Slow Food movement
SOPHIE BOSSY

“Slow Food is a global, grassroots organization with supporters in 150 countries around the world who are linking the pleasure of good food with a commitment to their community and the environment. A non-profit member-supported association, Slow Food was founded in 1989 to counter the rise of fast food and fast life, the disappearance of local food traditions and people’s dwindling interest in the food they eat, where it comes from, how it tastes and how our food choices affect the rest of the world” (Slow Food 2012).

Slow Food was born from a protest issued against the building of a McDonald’s at the Spanish Steps in Rome in 1986 and was formally created in 1989 during a meeting in Paris where the founders of the organization adopted a manifesto stating as their mission the defence of “sensual pleasure and slow, long-lasting enjoyment” that food can represent against the “Fast Life” of our societies.

Today, there are around 85,000 members located all around the world in over 1000 “convivia.” The headquarters is in Bra, Italy. The missions of the organization include the defence of biodiversity, taste education, and encouragement of the linkage between producers and consumers (or, as they sometimes call them, “co-producers”). These missions are concretely translated into actions with the Slow Food Foundation for Biodiversity, the Ark of Taste, and Terra Madre for the defence of biodiversity; the organization of taste workshops, school initiatives, and the creation of the University of Gastronomic Science with a multidisciplinary academic program for taste education; and the organization of fairs and markets such as the Salone del Gusto, Aux Origines du Goût, A Taste of Slow, or Eurogusto. The organization is composed of local chapters called convivia, grouping, at least partly, local producers, people working in the food-processing sector, and foodies or amateurs of good cuisine. These convivia are variously oriented because they usually stem from local initiatives. Italy has the biggest contingent of convivia but the growth of Slow Food is important in many other countries.

Its president until the date of writing, Carlo Petrini, has been its main charismatic leader and contributor to the theorization of the philosophical and political background of the organization (Petrini 2003, 2007). The core philosophy of Slow Food is summed up in the concept of “eco-gastronomy” that attempts to link the ideas of pleasure and of responsibility with concern for the environment in order to enjoy food that is “good, clean and fair.” For Slow Food members, an eco-gastronome is thus someone who seeks an “educated pleasure,” that is, an enjoyment coming from the knowledge of how and by whom the food was produced and by supporting those who do it well from an environmental, social, and ethical point of view (Andrews 2008: 72). This eco-gastronomy is also a promotion of a “moderate hedonism” (Humphery 2010: 69) that can be expressed with the phrase “mangiare meno e mangiare meglio” (eat less and eat better) that distances itself from the traditional views of gastronomy associated with fancy food and a form of elitism: Slow Food promotes simple food and family run restaurant more than “haute cuisine.” Through the Ark of Taste, the Slow Food Foundation for Biodiversity, and the network of Presidia, it also attempts to save endangered crops, traditional recipes, or dishes from disappearing under the assault of globalization.

If Slow Food has emerged from a struggle against McDonald’s, its main target is not fast food but, more generally, “Fast Life,” which is seen as a more systematic world order that imposes its pace of time, ideologies, and values on every aspect of life. In that sense, Slow
Food is a member – and certainly one of the main promoters – of the Slow Movement in that the organization attempts to contribute to the spread of different way of life: “slow living” (Honoré 2004; Parkins & Craig 2006). With the snail as their symbol, these “time rebels” attempt to promote an art of slowing down against the cult of speed that is so present in our societies: by respecting the timing of seasonality, by taking the time to cook, and taking the time to sit down and enjoy the food that has been prepared, people can rediscover lost pleasures and give meaning to their actions. Slow Food does not give miracle recipes to slow down and many of its members admit they struggle to slow down in their – often very busy – daily lives but this philosophy is nonetheless at the core of the principles of Slow Food and its little brother Città Slow: an organization whose members, small cities, implement reforms in urban planning that are designed to improve the quality of life: reduction of traffic, improvement of public transportation, banning of neon signs, restoration of old buildings, and so on.

With its attempt to increase consumer awareness, Slow Food is strongly involved in the political consumerism movement, the network of actors who criticize traditional consumerism by politicizing the act of buying in order to search and promote other types of consumption. However, what sets Slow Food apart from other organizations in this movement is its emphasis on pleasure and conviviality and its support of small producers around the world. Nonetheless, as many political consumerists, Slow Food is not only an organization that fights against a certain system but a network of people who dream of how things could be different and attempt to create alternative ways of living with the belief that it can start with a good meal.

REFERENCES AND SUGGESTED READINGS

The first World Social Forum (WSF) was organized by a group of Brazilian and French activists in Porto Alegre, Brazil, in January 2001, coinciding with the meeting of the World Economic Forum, and challenged neoliberal globalization under the slogan “Another World is Possible.” Organized under a set of principles outlined in its charter, the WSF was intended to be an “open meeting place” for civil society actors to commit to “reflective thinking, democratic debate of ideas, formulation of proposals and free exchange of experiences” (World Social Forum 2002). While explicitly critiquing neoliberal globalization the gatherings were also meant to be a “permanent process of seeking and building alternatives” and “open to pluralism and diversity.” Politically, social forum activism is characterized by more radical versus mainstream approaches to social change and is focused mainly on social justice and human rights concerns regarding models of development; gender, indigenous, labor, and environmental issues; and the forces of globalization writ large.

On the surface, social forums are large gatherings where organizations facilitate working sessions, testimonials, cultural events, large panels and speeches, but organizations, movements, and activists engage each other on many different levels before, during, and after the event itself. The notion of WSFs as a “process” signals the idea that the meetings themselves are not the main purpose. Instead, the goal of most organizers is to facilitate the exchange of ideas, to expand and deepen activist networks, and to provide new spaces in which people can reflect on and help realize alternatives to neoliberal globalization. They create ongoing opportunities for activists to come together to strengthen their alliances, foster shared identities and goals, build trust, develop plans for cooperation, and disseminate ideas about strategies for advancing more sustainable and just social and economic policies. They generate reflection and learning through multiple and diverse forms of interaction (Byrd 2005; Juris 2008).

Since its inception, the WSF has expanded to hundreds of regional, domestic, and community forums facilitated by decentralized organizing coalitions and organizations throughout the world (Smythe & Smith 2010). In addition, WSF gatherings grow in size and change in terms of organizing processes and priorities. Each WSF proves to be very much a political reflection of the time and place in which it occurs. The first three WSFs, from 2001 to 2003, were held in Porto Alegre, Brazil, with over 80,000 activists attending the 2003 WSF, which served as a planning space for the largest global protests ever held, against the Iraq War on February 15, 2003. In 2004 the WSF moved to Mumbai, India, to focus on issues related to Asia, and in 2006 WSFs were held simultaneously in Mali, Pakistan, and Venezuela. More recently the WSF has taken place in Nairobi, Kenya, in 2007 and in Belém, Brazil, in 2009. In 2011 it returned to Africa as Dakar, Senegal, was host. While the US has held two domestic social forums: the first in Atlanta, Georgia, in 2007 and the second in Detroit, Michigan, in 2010, Italy has seen literally hundreds of domestic, local, thematic, and community forums throughout the last decade. In each instance the location choice is deliberate and intended to highlight key concerns or issues as well as stimulate and develop regional and local networks. In Latin America the forums have played a role in helping elect more progressive leaders, especially in Brazil and Bolivia, and have, in general, lent political support to the “pink tide,” which has signaled a more progressive political shift overall in the region.

THE WORLD SOCIAL FORUMS’ ANTECEDENTS

Although the World Social Forum may at first appear as an anomaly in the global arena, the gathering represents the convergence of several transnational protest traditions and a continuity of transformative events contending the global economic and political order. Smith et al. (2007) trace the origins through a web of transnational associations and movement networks that developed out of activist streams of the 1980s and 1990s. This web facilitated cooperation and exchange across national boundaries. These networks included transnational movements targeting human rights, labor, trade liberalization, antiwar, and environmental issues. The earliest resistance to the global economic order began in the global South around the issues of International Monetary Fund (IMF)-imposed structural adjustment policies. Organizations in Canada, Mexico, and the US. started focusing on trade liberalization during negotiations around the North American Free Trade Agreement. As a result of these struggles, the annual World Bank/IMF meetings became sites of protest rallies in the late 1980s, continuing throughout the 1990s.

Other authors point to the genesis of the WSF in the depths of the Chiapas jungles where many observers cite the First Intercontinental Encounter for Humanity Against Neo-liberalism, held in Chiapas, Mexico, in the summer of 1996 at the initiative of the Zapatista Army of National Liberation, as the first step in building the international movement against neoliberal globalization (Seoane & Taddei 2002). A few months after the first Zapatista encounter in early 1997, the first drafts of the Multilateral Investment Agreement began to circulate, especially at the initiative of the Global Trade Watch organization in the US. The trade agreement served to mobilize not only organizations from the south but also groups from the US and Europe. These mobilizations lead up to the event that transformed the antiglobalization movement: the “Battle for Seattle.” This event, in November 1999, mobilized approximately 30,000 activists on the streets of Seattle to protest the meeting of the World Trade Organization (Smith 2008). These campaigns marked a turning point in economic globalization by demonstrating a capacity for mass challenges to international trade agreements and high levels of concern for global human rights, labor rights, and environmental protection. The Seattle protests challenged our understanding of state–social movement relations because they demonstrated how global-level politics affect a wide range of local and national actors.

In response to the impact of those protests, the idea of a World Social Forum to be held at the same time as the World Economic Forum, which meets in Davos, Switzerland, began to take shape early in the spring of 2000. The city of Porto Alegre, Brazil, was chosen for its 12-year experience of democratic initiatives expressed in the unprecedented participatory budget applied by the left-wing municipal government led by the Brazilian Workers’ Party. The first World Social Forum, held in January 2001, brought together all the different currents of thought that have come to comprise this rich and heterogeneous movement now taking shape at the international level, and which has become highly visible since the mass protests against the World Trade Organization (WTO) in Seattle.

The period from 1999 is a new epoch in which worker’s struggles, the “new social movements” of the north, and a new group of young activists (anarchists, antisweatshop, antibiotech, peace, and human rights movements) came together via an interrelated set of efforts. The Zapatista uprising in Chiapas in 1994, the protests in Seattle against the WTO in 1999, the subsequent demonstrations against the perceived agents of corporate globalization in Washington DC, Melbourne, Prague, Gothenburg, Quebec City, and Genoa, and the creation of the World Social Forum, coalesced to create a new diaspora of contention against the global neoliberal model (Fisher & Ponniah 2003).
FORUM ORGANIZING DYNAMICS AND DEBATE

The WSF organizational environment focuses on exchange and diffusion of ideas and tactics as a primary driving force connecting the various participants within the spaces created. Forums achieve this objective by promoting an antihierarchical organizing logic, variously termed "horizontalism," "autonomous space," or "self-organization" by Forum organizers and founders (Juris 2008; Wood 2010). The discursive fields and mobilizing structures created by the WSF organizers work to allow participant organizations and movements to find commonality in their grievances, as well as to discover differences in their strategies and tactics in order to ultimately build larger networks of contention, which are culturally and conceptually diverse (della Porta et al. 2006). Consequently, innovative methods for diverse inclusion and democratic collaboration across borders have paved the way for movements to integrate their struggles and reflect on collaborative projects in an openly deliberative space. But at the same time, such lofty objectives have brought about adversity and tensions among participants and Forum organizers concerning representation and the move away from more radical "Seattle"-styled encounters.

From the beginning the WSF emerged as not only a countermeeting to the World Economic Forum, but was also meant to be a countersymbol to globalized capitalism. In building this process the organizers were keenly aware of the failed attempts in the past, such as the socialist internationals, to organize movements transnationally around a diverse set of issues. One specific concern was to create a space for exchange that had little hierarchical intervention and was simply a reflection of the diversity of movements in the Global Justice Movement. Thus, to democratize the space, participants sought to eliminate hierarchical organizing tendencies within WSF process (Smith et al. 2007). A common diagnosis of the Global Justice Movement promoted by Forum participants highlighted the danger in organizing transnationally in a fashion that could reproduce the hierarchical structure endemic to global neoliberal capitalism.

Globalizing processes aimed at expanding global capitalism and consolidating and protecting capitalist elites have a long history, and these processes have been met with fierce opposition from popular groups, including indigenous peoples, peasants, and workers. The current expansion is no different. The WSFs have clearly provided a focal point, a center of gravity, for diverse streams of activism to come together across national and other boundaries in order to counter the power of global capitalist elites and their supporters in governments. It reflects the need to link local action with global politics as well as activists’ desire to shift their energies from mass street protests toward the articulation of alternatives to the current global political economy. But the expansion of the WSFs has been uneven and reflects variation in organizing capacities across locales and a variety of network dynamics that affect the diffusion of the WSF process (Smythe & Smith 2010). In other words, there have been many more local and domestic social forums held in Europe and North America with rich activist traditions and well-funded organizations than in developing countries; the exception being Brazil.

Writers and researchers have provided assessments that are both positive (social forums as a space where oppressed groups, such as laborers, women, and indigenous populations, can gain visibility and support for their liberation struggles) and negative (as when groups from developing countries are co-opted within the forum process itself by larger well-funded organizations from Europe and North America) (Smith et al. 2011). In fact, the WSF itself has become, at times, a bitterly contested space where organizations and activists disagree and find common ground on both issues and tactics. Thus, debates rage at the social forums concerning promoting radical vs. reformist tactics; saving the environment vs. the economy; endorsing human rights vs. protectionism; embracing
a universality of values vs. indigenous and local knowledge; and locating geographies of dissent – whether focus and resources should be placed on the local, domestic, or global arenas. Forum organizers argue that these debates and the discussions they incubate are part of the beauty of the WSFs as a learning space, enriching the experience of forum participants, and providing a platform for activists to refine their arguments and alternative visions for a more just, sustainable, and equitable world.

Social movements in India
DEBAL K. SINGHAROY

Indian society has long been a breeding ground for a range of tribal, caste, peasant, worker’s, women’s, ethnic, regional, environmental, human rights, gay rights, and animal rights movements, and many other social movements under the auspices of varied ideologies and organizations. This entry outlines the emergence and dynamics of some of these movements in the context of societal transitions in contemporary India.

BACKGROUND

Ideationally, India is epitomized as a country with a heritage of ancient civilizations with a spirit of accommodation, peace, and non-violence. In reality, however, India is laden with a host of contradictions between tradition and modernity, prosperity and poverty, enlightenment and ignorance, vice and virtue, globalization and localization. Though India has achieved the status of a fast-growing economy, with its average annual economic growth rate above 7.5 percent per annum in the last decade, her socioeconomic realities have remained embedded in a declining land–person ratio; sustained poverty with more than two-fifths of the population living below the poverty line, more than four-fifths earning less than $2 per day (World Bank 2010); one-fifth of the population remaining undernourished (Schöniger 2007); protracted ignorance with one-fourth remaining illiterate; environmental degradation with fast declining forest coverage and phenomenal increases in carbon emission; corruption in high places; increasing social divides and inequalities, and a lack of political commitment for social justice. In recent years these contradictions have been accentuated and the people who have been the victims of historical neglect and injustice have suffered the brunt of these various deprivations, all of which have paved the way for the emergence of varieties of social movements both within and outside the democratic framework of the society. Major facets of these movements are delineated below.

SELECTED MOVEMENTS IN INDIA

Tribal movements

The tribes of India (744 communities are recognized as scheduled tribes (ST) in the constitution to get the benefits of protective discrimination), with over 90 million people, constitute 8.5 percent of the population of the country. Around 98 percent of them live in rural areas, including in forest, mountain, islands, and geographically isolated areas, and traditionally enjoy a good deal of autonomy and practice a distinctive cultural way of life. However, their contacts with the outside world have seldom done much to improve their social and economic life. Rather, these contacts often victimized them economically by taking away their land and traditional livelihood, subordinated them politically by encroaching on their autonomy and connection with the environment, and marginalized them culturally by imputing constructed stigmatized identities, such as being backward and uncivilized. The early resistance and revolts of tribes began during the colonial period when the British extended their hegemony into the tribal areas. This caused an array of radical revolts of the Oraon, Bhumij, and Kol in 1830–1832, Santal in 1855–1857, Munda in 1874–1901, and the Kherwar in 1877–1880 in eastern India against oppression and infringement on their lives and culture by government officials, moneylenders, Christian missionaries, and businessmen. The tribes’ love for autonomy was also reflected in the movements of the Kuki in Manipur in 1917–1919,
the Santal, Oraon, Munda Bhumi, and other tribes of Jharkhand in 1940–1995, the Naga in the 1920s, Mizo in 1960 (Singh 1983), the Bodo since 1987 in northeast India, and the Gorkha in West Bengal, since 1980 struggling for separate statehood.

The forest is an inseparable part of the lives and livelihood of the tribes in India. Through collective mobilization of the Kharwar of Bihar in the 1930s and 1970s, the Saora of Andhra Pradesh, and the Adivasis of Deng in Gujarat in 1980–1990, there were attempts to resist the oppressive actions of forest officials and demands that their rights over land and forest be acknowledged (Shah 2005). The tribes also participated in the nationalist movement, in radical peasant movements like Tebhaga (1946–1947), Telangana (1948–1952), and Naxalite (1967–1971), and in environmental movements to protect their autonomy and identity. Tribal movements in India have mostly remained localized and violent and their mediating ideology is grounded in these movements’ connection to the land, the forest, and nature, except for their participation in peasant, environmental, and regional autonomy movements to protect their autonomy and identity. Tribal movements in India have mostly remained localized and violent and their mediating ideology is grounded in these movements’ connection to the land, the forest, and nature, except for their participation in peasant, environmental, and regional autonomy movements linked to broader ideological and organizational frameworks. Contemporary India has been experiencing extremist Maoist movements in 13 states, covering one-third of the country. Guided principally by radical Marxists, these movements mostly thrive in areas with significant concentrations of tribal people and high incidences of poverty and unemployment. The recent trends show that though there has been a proliferation of tribal movements based on localized issues, with increasing interconnectivity and emergence of an educated middle class, an increasing number of the tribes are becoming more connected to the wider society through rejuvenation of their primordial ethnic identity, demanding redress of their neglect through democratic political means.

Dalit movement

Historically the Dalits (meaning broken or crushed) are the Antaja – the outcastes and untouchables who have been rendered such by their birth in the Hindu social order. They have been the victims of social oppression and exclusion, being prohibited from fetching water from community wells or tanks, entering temples, sending children to school, speaking in public gatherings, touching the upper caste, wearing new cloth, using umbrellas, and riding bicycles in front of higher caste people. Furthermore, any act of disobedience has led to violent reactions by the higher castes, including beating, death, and house burnings. Additionally, the outcastes have been economically exploited, as bonded labor, getting low or no wage for their work, and being politically subjugated, as reflected by their absence from political decision-making bodies.

The early voices against such practices were raised in the ninth-century Alvar and twelfth-century Veerashaiva movements in South India, and in the fifteenth- and sixteenth-century Bhakti and Sufi movements in North India, which preached egalitarianism and humanity through devotion to God, and questioned the practice of untouchability and caste inequality. The nineteenth-century social reform movements of Arya Samaj, Brahmo Samaj, and the Ram Krishna Mission strongly opposed caste prejudice and conservatism among the Hindus. In the late nineteenth and early twentieth centuries, anti-Brahmin movements of the Dalits arose in several parts of the country under the auspices of the Satyashodhak Samaj and the Self-Respect movements in Maharashtra and Tamil Nadu, the Adi-Dharma in Bengal and Adi-Hindu movements of untouchables in Uttar Pradesh that propounded dignified existence of the untouchables (Shah 2005).

The anti-untouchability movements received significant attention during the independence struggle. Mahatma Gandhi called them the Harijans (children of God) and regarded untouchability as a curse on humanity. He worked to improve heir status by undertaking constructive societal reform. Ambedkar, the celebrated Dalit leader who spearheaded the anti-untouchability movement, pleaded for their mass conversion to Buddhism, and social
and political empowerment through separate elections and a state policy of protective discrimination. The government of India has recognized 1108 groups of Dalits as scheduled castes, who make up 16 percent of the country's population today, and provides them with economic, educational, and political benefits through protective discrimination. However, despite such provisions, the overwhelming majority of Dalits live in poverty, are unemployed, or work in demeaning low-paid occupations. Dalit movements have created the space to voice their grievances against the injustice and exploitation they suffer both at the grassroots and at the regional and the national levels by forming organization and political parties like Republican Party in 1956, the Dalit Panther Party in 1972 in Maharashtra, the Bahujan Samaj Party in 1984 in Uttar Pradesh, the Kamptapuri Political Party in 1990 in Rajbansis, West Bengal, and many others. Significantly, the Bahujan Samaj Party, under the leadership of Ms. Mayawati, the present chief minister of Uttar Pradesh, has wielded considerable influence in both regional and national politics.

India is now experiencing the resurgence of numerous Dalit movements at the grassroots to claim some measure of dignity, a greater share of economic and political power, and to redress the historical injustice inflicted on them for centuries. These grassroots movements have also become better connected locally, regionally, and nationally to various organizations, in order to help influence decision-making processes of the state and civil society to activate institutional mechanisms for their empowerment.

Backward class movement
The other backward class (OBC), which forms 52 percent of the country's population, belongs to the Shudra caste, the lowest rung in the Varna hierarchy of Hindu social order, and historically has been the victim of educational and economic backwardness, deprived of opportunities for upward mobility even though they are not untouchables by birth. Significantly, there have been contradictory processes: On the one hand, castes like the Mahars of Maharashtra state and the Lingayats of Karnataka state have claimed the status of upper castes through Sanskritization (a process of acquiring the lifestyle of an upper caste); while, on the other hand, many castes like the Reddis, Vokkaligas, and Kammas of South Indian states contested the domination of the upper castes, especially of the Brahmins, through organized movements. Tamil Nadu experienced an anti-Brahmin movement in the 1920s. Political organizations like the Justice Party (1916) and Dravida Kazhagham (1944) were formed to provide separate states for the non-Brahmins (Rao 1979). These caste groups have also participated in peasant movements manifested during the 1940s to 1970s in the agriculturally backward regions, and also in the farmers' movements in the agriculturally developed regions during 1970 and the 1990s. The OBC movements gained momentum in 1980s with the submission of the Mandal Commission Report to parliament and acceptance of its recommendation for a 27 percent reservation for them in government jobs and admission to educational institutions. Significantly the OBC has used the strategy of strong protest and sustained agitation to make their presence felt in regional and national politics. Caste associations of OBC like the Jat Mahasbha, Jadav Mahasabha, Kasyastha Mahabha, and Gujjar Mahabha play important roles to consolidate their interests. The OBC like the Yadavs and Jats has emerged as a viable social and political force in contemporary India by projecting their collective interests and identities and developing alliances with Dalits and religious minority groups through political parties like Rashtriya Janta Dal, Janta Dal in Bihar, and the Samajwadi Party in Uttar Pradesh, which are ideologically affiliated to socialism.

Women's movement
Women in India remain victims of traditional practices and institutional arrangements. Though tribal and peasant women participated in tribal and peasant movements and many in
the independent movements, a self-conscious women’s movement took shape only in the 1960s and thereafter. (See entry on Women’s movement in India for further discussion.)

**Peasant movements**

India has historically been a land of villages and agriculture and has witnessed a series of violent and nonviolent peasant movements. (See entry on Peasant movements for further discussion.)

**Working-class movement**

In India, the working class consists of workers both from the industrial and the service sectors. The emergence of India’s modern industrial working class began in the mid-nineteenth century concurrently with the growth of urban industrialization, with the working-class movement following in the early twentieth century when, with the support of Mahatma Gandhi, the Ahmedabad Textile Labour Association formed in 1917. It was followed by the formation of the Madras Labour Union in the Buckingham and Carnatic Mills in Madras in 1918, the All India Trade Union Congress in 1920, the Bombay Textile Labour Union in 1926, and many other unions. However, the trade union movement experienced a temporary setback in the late 1920s and 1930s when trade union leaders were implicated in conspiracy cases by the colonial rulers (Bhowmik 2010). These movements regained momentum in the 1940s and thereafter, with the nullification of these cases and subsequent engagement of left-wing organizations and the Indian National Congress with trade unionism. In postindependence India, trade unions have been part of larger political processes and remained integrated with political parties, for instance the Indian National Trade Union Congress (INTUC) is affiliated with the Indian National Congress, the Centre of India Trade Unions (CITU) with the Communist Party of India (Marxist), the All India Trade Union Congress (AITUC) with the Communist Party of India, and the Bharatiya Mazdoor Sangh (BMS) with the Bharatiya Janata Party. Until the late 1970s the working-class movement sustained its significance in the social movement sector arena of society with both the left and the nationalists remaining firm on the issues of safety, security, good pay and working conditions for the working class. The workers’ strength and unity was depicted in the historic 20-day Indian Railway Workers Strike in 1974 under the aegis of the United Council of the Trade Unions (ICTU), with the participation of workers from across ideological and organizational strands coming together to make the government accept their demands. However, the increasing dependence of Indian governments on international financial institutions for funding since the 1980s, and introduction of the structural adjustment program for economic liberalization since the 1990s, imposed restrictions on trade union activism. But the promulgation of the National Security Act and the Essential Services Maintenance Act has helped to make the working-class movement resilient in the post-economic reform period.

In contemporary India, 455.7 million workers, constituting 49.8 percent of the total workforce of the country, are employed in industrial and service sectors, and 92.3 percent of them belong to the informal sectors that suffer from the problems of employment security, low wages, and a lack of legal and social security protection. Established trade unions seldom step in to help. Even the big multinational companies employ workers on hire and fire basis, positing them awkwardly in relation to their bargaining strength vis-à-vis the management. The Maruti Suzuki Motors workers’ movement against poor wages, authoritarian management, and victimization of workers was ruthlessly crushed in Gurgaon in 2000 and in Manesar Haryana in 2011, as workers were killed by brutal police action and many workers suffered suspensions. Significantly, the Congress-led government of Haryana took a pro-management view and persuaded the workers, by signing a “good conduct agreement,” to return to their jobs, but the national trade unions have remained noncommittal to
the cause of the striking workers. Indeed, the political economy of economic liberalization in India seldom privileges workers’ mobilization for their rights over the investment-friendly environment for the multinational corporation.

Environmental movements

Against the backdrop of the declining land/person ratio to 0.29 hectare per household, declining forest coverage to 23 percent of the land mass, phenomenal air pollution with 93 percent increase in carbon emission (597 metric tons in 1990 to 1149 in 2005; World Bank 2010), involuntary displacement and loss of sustainable livelihoods, threat of climate change, chaotic industrialization and urbanization, overexploitation of natural resources, and continued, rabid population growth, India has been experiencing the proliferation of a multifaceted environmental movement in various parts of the country, dating back to at least the early 1970s. This general movement can be broken down into a number of more specific movements that vary in part in terms of focus.

One set of more specific environmental movements are those that focus on the forest and water. Examples include the Chipko (hugging the tree) movement which emerged in Uttrakhand (1973) to protect the forest from destruction by government officials and forest contractors; the Appico movement in Karnataka (1983) that sought to protect and conserve the forest for the forest dwellers; and the Chilka Bachao Andolan in Orissa (1990), which protested against the joint project of the Orissa government and the Tata Iron and Steel Company for commercial shrimp cultivation, posing an ecological threat and loss of the livelihood of the traditional fishermen of the Chilka lake area.

A second set of environmental movements protest against hydro and thermal projects and dams. Examples include the Silent Valley movement in Kerala (1974), which mobilized against the massive hydroelectric project and the likely destruction of the valley’s unique ecological foundation as a result of the submersion of a vast area of the valley under water; the anti-Tehri dam movement (1978) in Uttarakhand state, against the construction of a big dam for a hydroelectric project in an ecologically fragile area that threatened the displacement of approximately 50,000 people; the Narmada Bachao Andolan movement (1980 onward) against the construction of large, multipurpose dams in Gujarat and Madhya Pradesh on the Narmada River, threatening displacement of hundreds of thousands of people from around 230 villages; the Enron Virodhi Andolan movement in Maharashtra (1999–2002) against the US-based Dabhol Power Company and the Maharashtra government for forcible occupation of land, resulting in the displacement of the villagers and endangering an environmentally sensitive area.

Another set of environmental movements includes those against nuclear and defense projects. Among these movements was the anti-missiles base movement in Baliapal (1985–1986) in Orissa which was opposed to the forceful eviction of villagers and the loss of their traditional livelihood; the antinuclear power project in Haripur, West Bengal, against the Russian-supported nuclear power plant, which was exposing the vast area and its people to nuclear hazards; and the movements against the French-sponsored Jaitapur nuclear power project (2010) in the Ratnagiri district of the Konkan region Maharashtra, for its forcible land acquisition displacing thousands of farmers and bringing nuclear and environmental hazards.

Antimining and industry movements constitute the final set of environmental movements. Examples include the anti-POSCO-India agitation (2011) in Jagatsinghpur, Orissa, against forceful acquisition of land for a Korean steel company by the government of Orissa to set up a mega-steel project in this area; and the antibauxite mining movement in the Deomali Hill of Koraput district of Orissa (2008–2009).

Environmental movements in India have acquired added support from international NGOs like Greenpeace and the World Wildlife
Fund, and national NGOs like the Centre for Science and Environment and Centre for Environment and Education. These NGOs have been particularly vocal about articulating environmental concerns, and pressuring the state to take pro-environment measures concerning water, forest, wild, and marine life, climate change and sustainable development, through institutionalized means. Though the environmentalists have predominantly followed the Gandhian principle of nonviolence, in recent years there has been a good deal of engagement of left-wing politicians and some extremist groups. Environmental movements have also contributed to the formation of predominantly tribal states like Jharkhand, Uttarakhand, and the Chhattisgarh, and have emerged as part of democratic politics at the grassroots. Their ideological and strategic differences notwithstanding, these movements have received support from wider civil society activists, students, women, tribal and human rights activists, peasants, farmers, and intellectual activist groups. They have been successful in drawing public attention to a range of issues of concerning the environment.

New farmers’ movement

The introduction of advanced technology in agriculture has led to impressive agricultural development and the emergence of commercial farmers, mostly in Punjab, Haryana, Western Uttar Pradesh, Maharashtra, and Tamil Nadu. These farmers are concerned about a range of issues, including subsidies for agriculture, free and uninterrupted supply of electricity, higher prices for agricultural produce, deferment of loan recovery, crop and cattle insurance, and abolition of agricultural income tax. Since the early 1970s protests have been organized by localized farmers’ organizations like Shetkari Sanghatana in Maharashtra, Bharatiya Kisan Union (BKU) in Uttar Pradesh, Haryana, Punjab Khetibari Zamindara Union (KZU) in Punjab, which was later merged with the BKU, Bharatiya Kisan Sangh in Gujarat; the Tamil Nadu Agriculturalists’ Association (TNVS) in Tamil Nadu, and the Karnataka State Farmers in Karnataka (Brass 1994). These movements wielded influence in local, regional, and national politics in India in the 1970s and 1980s by increasing their representation both in the state legislatures and Union Parliament, and created and reinforced the significance of primordial institutions and the identity of peasant castes, like the Jats of northern India who demanded the creation of a new Harit Pradesh (Green Province) in the Western part of Uttar Pradesh.

Movements against corruption

Over the decades India has been widely known for its corruption. In 2010, for example, India acquired the dubious distinction of occupying the 87th position among the 178 countries of the world in the corruption index of Transparency International. Twenty-eight percent of the members of parliament (MPs) had criminal cases pending against them; several ministers, MPs, and bureaucrats were behind bars; and judges of upper courts and chief officials of investigative agencies were facing corruption charges. More than 30 million cases were pending for disposal in the judiciary (Developed Nation 2012). The ordinary person has been the major victim of this corruption, as social justice and welfare was and is elusive. Against this backdrop, India has witnessed the proliferation of right to information movements that began in the rural areas in early 1990 under the leadership of civil society activists to compel central and state governments to enact a Right to Information Act, empowering citizens to ask for information on the functioning, planning, and expenditure on any issues of governance, to be provided within 30 days of submission of the application. Again, a nationwide movement against rising corruption, and the government’s apathy and inaction to stop corruption by MPs, ministers, and bureaucrats, moved through the whole country in 2011 under the leadership of Anna Hazare, a Gandhian civil society activist. This movement reached most parts of the country, compelling the government to include civil society representatives to draft the Lokpal Bill and to call for a special parliamentary

discussion of the bill and its expeditious enactment in hopes that would be an effective deterrent to corruption among the public servants. This movement has renewed people’s faith in the Gandhian philosophy of nonviolence and people’s capacity to question the functioning of their elected representatives.

Other contemporary movements

In addition to the movements discussed above, contemporary India has been a hot spot for agriculturalist, religious, human rights, gay rights, and animal rights, ethnic, caste, regional autonomy, and extremist movements. An outline is provided in the table.

CONCLUSION

As the contradictions between economic prosperity and livelihood insecurity, legal enactment and political commitment, culture of inclusion and politics of subordination, worldly vice and spiritual virtue, continue to reign in India, making the marginalized insecure and vulnerable, social movements have remained an inseparable part of social progression to create space for contestation against these contradictions in one form or the other. Many of these social movements are not only mobilizations to address these contradictions, but form cross-cutting alliances or coalitions, for example, participants in regional autonomy movements are also participants in environmental, ethnic, human rights, and women’s movements and vice versa. As the state’s legitimacy has suffered as a provider of social and economic security, and of opportunities for upward mobility, eco-sustainability, and climate justice, a culture of social movements has been inculcated by civil society actors to develop struggles of various forms against the functioning of the state, integrating varieties of interests and identities for collective actions. Through sustained mobilization Indian society has taken the form of a social movement society – an interconnected collectivity regularly mobilized with the interplay of multiple social movements on the principle of fragmentation at one end and unification on the other, and in a process of continuous renewal and rejuvenation. Thus, social movements have achieved the state of “recurrently organized and sustained mobilizations of interactive civil actors to have access to and control over the cultural, social, and economic and the political resources to enable them for upward social mobility, to demolish the structure of domination and reorient their collective identities for self expression and fulfilment” (SinghaRoy 2010: 179). While the state has provided the liberal democratic framework to articulate issues, interests, and identities for collective mobilizations and cooption of these movements on the one hand, people’s protest at the grassroots has also created space for their self-assertion and social recognition on the other.

In India there have been rich intellectual efforts of applying various sociological theories and social movement theories to a variety of collective contestations and mobilizations. There have also been efforts to use comparative and analytical perspectives to examine social movements cross-culturally. However, there is an added methodological need to investigate the intersectionality among social movements in contemporary India by formulating a dynamic holistic perspective that accommodates social movement mobilizations as an integral part of society, taking shape due to unequal access to resources and conditions for capacity building and social mobility, and to create new space for inculcation of critical thought, ideas, and actions for the progression and sustenance of social structure.

Solidarity (Poland)
GRZEGORZ PIOTROWSKI

Solidarity (Solidarność in Polish) is a social movement, based on a trade union, that emerged in Poland in 1980. It was not only the biggest social mobilization in history (it is estimated that approximately 9–10 million people became members of Solidarity in a country of 38 million), but many commentators stress its leading role in overthrowing the communist regime in Poland and also in the rest of Eastern Europe.

The genealogy of the Polish pro-democratic opposition and anticommunist resistance starts with the “thaw” in 1956, when the Communist Party, after an uprising in Poznań in June 1956, decided to liberalize its politics and reduced censorship. The next wave of contention was the events of 1968, which began with student strikes in March in Warsaw that were directed against cancellation of a theater play and later spread countrywide. It was also the beginning of an anti-Semitic campaign launched by hard-core activists within the Communist Party. The hard line the Communist Party took after these events triggered further social discontent, which resulted in strikes in 1970, brutally pacified by the militia and the army in December 1970.

The direct predecessor of Solidarity was the Workers’ Defense Committee (Komitet Obrony Robotników, KOR), established in 1976 after the violent suppression of strikes in Ursus and Radom to defend the leaders of these protests. Most of the founders of KOR were later at the core of the Solidarity movement. KOR introduced two trends that were at the foundation of the opposition of the 1980s: they tried to link the intellectuals with the workers, and they opposed the regime openly, without disguising their names. KOR was established as a group providing legal aid for oppressed workers using the tools that were given by the communist legal framework, especially by the constitution.

The movement developed from independent strike committees (gathered in an umbrella organization, Międzyzakładowy Komitet Strajkowy), which mushroomed in the summer of 1980 after the government’s decision to increase food prices. Massive strikes, especially those in August of 1980, brought the communist state’s economy to a halt, resulting in its signing the August Agreements (Porozumienia Sierpniowe) between August 10 and September 11, 1980. One of the claims of the workers was an independent trade union confederation, which was formed on September 17, 1980, and confirmed on November 10, 1980, when the Solidarity trade union was registered in a court in Warsaw. The workers also demanded wage rises, better working conditions, amnesty for their colleagues, and less censorship.

On September 19, 1980, an independent student’s union (Niezależne Zrzeszenie Studentów, NZS) was formed; it was registered by the authorities on February 17, 1981. On May 12, 1981, the farmers’ section of the union was registered in a court as the Niezależny Samorządny Związek Zawodowy Rolników Indywidualnych Solidarność. These organizations broadened the reach and impact of the Solidarity movement into other parts of society.

Solidarity, formally a trade union, had a hierarchical structure, with its charismatic leader and chairperson Lech Wałęsa (later president), at the top. Its structure included regional divisions as well as chapters referring to particular industry branches, which allowed greater flexibility. The movement’s leaders were both intellectuals and the workers themselves, the most prominent among them including: Bronisław Geremek, Tadeusz Mazowiecki, Bogdan Lis, Władysław Frasyniuk, Adam Michnik, Jacek Kuroń, Andrzej Gwiazda, Anna Walentynowicz, and Zbigniew Bujak.
The months between the first strikes, legalization of the Solidarity trade union, and the establishment of martial law in Poland, are called “Carnival of Solidarity,” and were characterized by massive participation in the union (reaching 10 million members, quarter of Poland’s population according to some estimates) and a historical compromise with the authorities. The Communist Party was initially reluctant to use force against the workers and activists, and agreed to some of the claims of the movement, mostly because of its fear of its potential (almost all working people in Poland took part in a four-hour warning strike on March 27, 1980). The demands of the strikes in summer 1980 and the August Agreements became the basis for establishing a legal opposition in the form of Solidarity.

The introduction of martial law in Poland on December 13, 1981, ended the Carnival of Solidarity. The military regained control of the streets, a curfew was introduced, and strikes were broken, sometimes with the use of firearms, as in the Wujek coal mine where nine miners were shot by the police. It is estimated that some 56 people lost their lives during the coup. The martial law, described by Davis (1998: 1181) as “the most perfect coup d’etat in the history of modern Europe,” resulted in the delegalization of Solidarity and the incarceration of around 10,000 activists. With increasing repression against the dissidents (increased censorship, expulsions from workplaces, curfews, infiltration by the secret police, random arrests, house searches, occasional beatings, and a few killings), Solidarity activists moved underground, formed the Temporary Coordination Committee (Tymczasowa Komisja Koordynacyjna), and began operating surreptitiously. Some of their clandestine actions included graffiti, underground stamp production, underground radio broadcasting, and, most significant of all, an illegal “second cycle of publishing” to avoid censorship, similar to the samizdat in the USSR. During this phase of the movement’s career, several splinter groups emerged, such as Solidarność Walcząca, established in June 1982 in Wrocław by Kornel Morawiecki, which differed in its attitude toward compromise with the authorities and was focused on underground publishing and intelligence and counterintelligence actions aimed at the secret police.

Solidarity leaders played the key role in negotiations with the communist government at the round table negotiations and the first (partially) free elections of June 4, 1989, when citizens’ electoral committees (Obywatelskie Komitety Wyborcze) won all 160 seats in the first round of the elections. The electoral committees were established in December 1988 and were transformed into a series of political parties soon after the elections. The elections were part of the agreements of the round table negotiations that took place from February to April 1989, between the communist leaders, the pro-democratic dissidents, and Catholic church officials. After the electoral victory, Tadeusz Mazowiecki was nominated as the first noncommunist prime minister on August 24, 1989, and his government initiated a series of changes that dismantled the communist regime. Partisan pluralism was introduced and the capitalist economy replaced the centrally steered socialist one. These reforms became known as the “Balcerowicz plan” (named after minister for finance Leszek Balcerowicz) or “shock therapy.”

Following the 1989 victory, Solidarity changed its purpose and became a legal trade union again. All of this presumably contributed to the context that fostered a series of right-wing parties, which formed an electoral committee Electoral Action Solidarność (Akcja Wyborcza Solidarność, AWS) that spearheaded 1997 parliamentary election victories, including the nomination of Jerzy Buzek as prime minister. At the same time, the importance of the trade union was declining, with approximately 500,000 members as of 2010.

Over the years many controversies swirled around the Solidarity movement. They include accusations from the Right of the political spectrum over the nature of the compromise reached at the negotiations (and occasionally of betrayal of Solidarność ideals or of its leaders’
cooperation with the secret police), to the agreement on introduction and support of neoliberal economic reforms (Ost 2005). Some of these issues were raised in the late 1980s, but most surfaced after 1989 at the behest of mostly right-wing-oriented politicians and commentators. Other controversies were linked to the turn within the Solidarity movement that took place after martial law in Poland, when the Catholic church began playing a more important role and was grouping the different currents within the opposition. The shift toward more conservative positions (especially after the killing of Solidarity’s chaplain, Jerzy Popiełuszko, in 1984), together with the support of Pope John Paul II, resulted in the emergence of many small youth-based groups that were critical of the communist authorities and the pro-democratic dissidents. One of the best-known groups of this kind was the Orange Alternative (Pomarańczowa Alternatywa) that was established in Wrocław (Kenney 2002). Also, for many young activists, the actions of Solidarity were too moderate and some issues were ignored (especially compulsory military service and environmental issues, particularly visible after the Chernobyl catastrophe in 1986, and the prospect of building a nuclear power plant in Poland).

Solidarity became a symbol of pro-democratic movements behind the Iron Curtain and for a peaceful systemic transformation, which was confirmed by the award of the Nobel Peace Prize to Lech Wałęsa in 1983. For many observers, the “Carnival of Solidarity” and the massive participation of Poles in the union spelled the beginning of the end for communist regimes in Eastern Europe. The Solidarity movement is often presented as an example of a successful social movement operating through nonviolent means and taking power in a peaceful and successful process of democratization. The actions of Solidarity were also a blueprint for other dissident movements in Eastern Europe, offering not only ideological inspiration, but also a model for direct cooperation before and after 1989.

REFERENCES AND SUGGESTED READINGS

The Southern Christian Leadership Conference (SCLC) grew out of the Montgomery bus boycott to become one of the leading organizations of the civil rights movement in the US. On December 1, 1955, Rosa Parks was arrested in Montgomery, Alabama, for refusing to relinquish her seat on a public bus to a white person. Local black clergy, activists, and the women’s political council called a bus boycott. The boycott organization elected Reverend Dr Martin Luther King, Jr as its president. Tens of thousands participated in the nonviolent campaign, drawing violent reprisals from white supremacists and crippling Montgomery’s bus system until they succeeded in integrating it in December 1956. Bayard Rustin wrote a series of working papers proposing a permanent organization to carry the movement to other cities. In January 1957, King, Rustin, Ella Baker, and 60 young black ministers met at Ebenezer Baptist Church in Atlanta to form the SCLC. Coupling Christian ethics with activism, their goal was to “redeem the soul of America” through nonviolent resistance to Jim Crow. SCLC intentionally cultivated a principled but pragmatic image of King as a leader, capable of appealing to a wide range of interests. An association of organizations, with no individual members, the SCLC emphasized networking between black churches, supporting local action, and spreading civil rights struggle.

Through the late 1950s, the civil rights movement developed slowly. But then, on February 1, 1960, four black students sat-in at the “whites only” Woolworth’s lunch counter in Greensboro, North Carolina, prompting the manager to close the store for the day. Within two months the sit-in tactic spread to 125 cities in nine states. White supremacists spat on, beat, and arrested the young nonviolent activists for violating Jim Crow, eliciting broad public outrage and drawing national support to the movement. Followed by the Freedom Rides and other campaigns to integrate public spaces, the civil rights movement spread like wildfire through the South. Ella Baker and SCLC played an important supportive role.

In December 1961, SCLC committed to the wholesale desegregation of Albany, Georgia. Laurie Pritchett, the shrewd chief of police, trained his officers to conduct themselves cordially and arrest masses of protesters without violence. After a year of protests, police had arrested more than 1000 activists – Dr King three times. But the campaign encountered little violence, failed to capture national attention, won few gains, and soon petered out. Theorizing the failure of the campaign, Rustin surmised that “protest becomes an effective tactic to the degree that it elicits brutality and oppression from the power structure.”

With these lessons in mind, SCLC initiated a campaign in Birmingham, Alabama, in 1963, intent on holding highly visible public demonstrations, eliciting police brutality, and projecting the movement onto a national stage. As one activist remarked, SCLC “calculated for the stupidity of Bull Connor,” the sheriff of Birmingham with a disreputable history of enforcing segregation through violent means. In April, after breaking a court injunction barring further protest, King, in jail, composed his famous “Letter from Birmingham Jail.” “Instead of submitting to surreptitious cruelty in thousands of dark jail cells on countless shadowed street corners,” wrote King, the Southern black “would force his oppressor to commit his brutality openly – in the light of day – with the rest of the world looking on.” In May, in response to the “Children’s Crusade” organized by SCLC’s James Bevel, Connor’s police repeatedly assaulted nonviolent young
schoolchildren with dogs, clubs, and high pressure hoses, provoking a national outcry. President Kennedy sent Assistant Attorney General Burke Marshall to intervene, and introduced legislation to Congress, culminating in the Civil Rights Act of 1964. President Kennedy told Martin Luther King, Jr: “Our judgment of Bull Connor should not be too harsh. After all, in his way, he has done a good deal for civil-rights legislation this year.”

As SCLC and the civil rights movement made substantial progress toward ending legal segregation in the South, it shifted its focus toward eliminating the de facto disenfranchisement of vast swaths of the black population. SCLC targeted Selma, Alabama, since whites represented 99 percent of the electorate but constituted less than 50 percent of the population, and because of the notorious brutality of Sheriff Clark. On “Bloody Sunday,” March 7, Clark’s police dispersed nonviolent marchers with clubs and teargas, garnering national coverage. During February and March, white supremacists murdered three nonviolent protestors – Jimmy Lee Jackson, James Reeb, and Viola Liuzzo. Responding to the broad public outcry, President Johnson dispatched 2000 soldiers and 1900 national guardsmen to protect the insurgents. On March 15, Johnson told the nation “Their cause must be our cause too.” Two days later, he introduced the Voting Rights Act to Congress.

By 1966, the civil rights movement had effectively dismantled many legal barriers to civil and political integration. SCLC expanded its efforts to address persistent economic inequality and de facto segregation through the Chicago Campaign and the national “Poor People’s Campaign.” But these efforts made little headway in challenging poverty or informal segregation. Civil rights practices were particularly suited to challenging local authorities who sought to preserve Jim Crow; as Jim Crow waned, the civil rights movement ran out of targets. Determined to win economic and political equality, a new generation of young black activists rejected civil rights politics and called for “Black Power!”

Even while the civil rights movement flagged, King’s stature kept the SCLC alive. His mere presence at rallies attracted supporters, and captured a national audience. After King was assassinated on April 4, 1968 in Memphis, where he supported striking sanitation workers, the SCLC all but collapsed.

SCLC played a unique ambassadorial role for the civil rights movement, helping pioneer and proliferate civil rights practices, and linking local black churches with young activists and Federal officials. SCLC will always be remembered for its contribution to overcoming legal segregation and the de facto disenfranchisement of black people in the US.

Squatters’ movements
LYNN OWENS

To squat is to occupy a space otherwise not in use, without the owner’s permission. Squatting takes many forms, from building shantytowns on the outskirts of the megalopolises of the developing world, to claiming unused rural land for food production, to occupying vacant buildings in the city center. Squatting addresses unmet spatial needs, either indirectly, as a protest to draw attention to the vacancy and viability of alternative spaces and force authorities to intervene, or, more directly, by procuring space for the squatters themselves. Boundaries between squatting and squatters’ movements are messy. They overlap, but are not the same. While all squatting is at least somewhat political – challenging property regimes and the elites benefiting from them – to squat is not necessarily to participate in a squatters’ movement. The vast majority of the world’s squatters do not actively take part in squatters’ movements; conversely, these movements do not limit themselves simply to housing concerns, and their participants are not necessarily always squatters. When researchers study squatters’ movements, these are both narrower and broader than merely squatting. Such movements are almost invariably urban, and usually in Europe. The history of these movements dates from the 1960s, peaking into the 1980s, and continuing in a smaller form to this day. The Netherlands, once numbering over 20,000 active squatters, had the largest and most influential of these movements, but other countries also experienced noteworthy squatting activity, including the UK, Germany, Italy, Switzerland, Denmark, and Spain. Squatters’ movements promote a do-it-yourself (DIY) ethic in defending space and lifestyles against the influence of capital and state. Housing issues establish only the stating point for these movements.

CONCEPTUAL FRAMEWORKS

Typology
Pruijt (2004) suggests six different types of squatting. The first, deprivation-based squatting, consists of poor people who lack other housing options. Although probably the most widespread form of squatting, it is least likely to figure in most contemporary squatters’ movements, despite remaining a central movement framing trope. The second type is squatting as an alternative housing strategy. This includes a broader group of actors, not only the very poor, and a wider set of goals, such as creating alternative living arrangements. Next, entrepreneurial squatting exploits the opportunity to start projects with few resources and free of bureaucratic demands, leading to a proliferation of squatted social centers, restaurants, theaters, bars, infoshops, and more. Conservationist squatting seeks to protect buildings from destruction, often occupying spaces made vacant during processes of development. Fifth is tourist squatting, where travelers temporarily reside in vacant buildings. Finally, political squatting takes squatting, with its rejection of dominant laws and mores regarding property, as the baseline for a broader form of antisystemic politics and extraparliamentary activism. While this list provides a useful structure for distinguishing ideal types of squatting, studies of actual squatters’ movements reveal that they frequently contain all of these forms. In practice it can be hard to differentiate clearly the intentions and usage of squatted buildings. Squatters’ movements can be understood through how they bring these differences together and seek to manage and exploit their tensions.

Local and transnational
Squatting is ostensibly a highly localized phenomenon, but this localism often provides a springboard for transversing national borders.
Squatting opportunities vary widely depending on national and municipal laws, as well as the specific conditions of cities, neighborhoods, and buildings. Therefore, even when squatters’ movements share cultural and legal frameworks of a shared nationality, one often finds wide variation between squatters’ movements across cities. Primarily urban, their tactical and narrative focus is on the immediate conditions of urban social space; they privilege defending and defining the local. Concurrently, many squatters also seek to expand the boundaries of their neighborhood and city, rejecting the parochialism of some forms of localism by building larger networks of squatters and squats across borders (Owens 2008). For example, squatting in New York City has a long history, but the city’s squatters’ movement was sparked by an influx of European activists (Pruijt 2003). Facilitated by shared information and the mobility of squatters between locations, these intensely local movements simultaneously construct a shared movement culture and identity across national and local contexts. Squatters’ movements underscore the complex interaction generated when local politics connects across geographic boundaries, and how spatial relationships are remade through activism.

Radical and conservative

By challenging the integrity of private property, squatting appears inherently radical. This radicalism, however, is often tempered by conservative impulses, such as preserving old buildings, threatened neighborhoods, and lost community. Many squatters practice radical politics, marked by frequent ideological and organizational overlaps with autonomists and anarchists (Katsiaficas 2006). Even outwardly apolitical squatting takes a radical edge, its DIY ethic encouraging people to solve their own housing problems outside of market and state influence. Moreover, squatting can radicalize its practitioners, either through the self-empowerment experienced by the act itself or, frequently, through the intense repression that such threats to property tend to provoke (Owens 2009). Nevertheless, squatting often draws on a conservationist, and even conservative, streak. Sometimes this is explicit, such as when squatters occupy buildings in order to keep them from being demolished. More often, though, squatters’ movements frame their actions beyond questions of housing deprivation, producing narratives of lost community and alienated individuals, calling for the protection of vacant buildings and abandoned neighborhoods with historical or community significance. The squatters’ movement in Berlin, for example, began as a conservationist action (Pruijt 2004). Squatters push forward their radical actions grounded in preserving a certain ideal of the past. Squatters’ movements thus resist simple ideological categorizations. Even at their most radical, they depend on protecting not only old buildings, but also traditional values of community and communality.

Independent and connected

Squatting provides the essential resources of space and shelter, increasing squatters’ self-sufficiency, but all activists value space, which ensures that connections will be forged across other movements. Squatted spaces create new opportunities and resources. Most movements are comprised of loose networks of squatted buildings spread across cities and regions, but more developed movements display the capacity to create their own self-contained environments. At their peaks, neighborhoods in Amsterdam and Berlin had the population and density of squatters to allow many activists to live inside the movement, literally and figuratively. Squatting provided not only dwellings, but also workshops, daycare centers, stores, restaurants, movie theaters, and more; homes, work, and leisure all in one place. These examples are relatively rare, yet the aim of using squatting to provide as many services as possible is exemplified in the successes of squatted social centers. Social centers are most highly developed in Italy (Mudu 2004), but can be found in many locations with active squatters’ movements. They concentrate services, providing space not just for squatters, but also other activists. Further, they operate
as an access point for nonactivists and local residents to connect with movement activities, as well as important social services (Membretti 2007). Users need not be explicitly political, as the performance, practice, and atelier spaces of social centers also attract artists and cultural activists. This fluid border, both open and closed, facilitates cross-fertilization between movements and activists, offering them stable and safe free spaces. For example, Spanish and Italian social centers act as central nodes of networks of alternative globalization activists (Mudu 2004; Martinez 2007). Squatting builds allies through offering space for their work and needs; allies build squatting through offering their own skills and legitimacy.

**Action and identity**

Squatting is both a means and an end; not simply an action, it is also a mode of being. Squatters’ movements must mediate the relationships between squatting as an action and squatter as an identity. Squatting can be used as a form of direct action or a protest tactic, providing an effective means for disenfranchised groups, who may lack other options. This is seen most clearly in the case of deprivation squatting: people squat because they have to. Their goal is to secure stable housing and end their time as squatters as quickly as possible. Alternately, housing organizations occupy buildings to draw attention to homelessness, like Home Not Jails in the US (Corr 1999), seeking to compel authorities to increase their assistance. In both cases, squatting is simply a means; if a better one becomes available, it can be replaced. This facilitates legalization of housing and co-optation of movements (Pruijt 2003). However, squatting can also be an end goal; shelter is less important than squatted shelter. This distinction is significant in understanding squatters’ movements. Many movements may employ squatting as a tactic, but only squatters’ movements privilege it as an end in itself. This commitment to squatting protects movements from forces of co-optation, but also makes success less likely in the long term. In the end, a squatted building is nearly always either legalized or evicted. A possible exception can be found in Amsterdam. Through a process of flexible institutionalization, as described in Pruijt (2003), squatters negotiated concessions from authorities, maintaining some autonomy over buildings without completely compromising their squatter identities. Conflicts between action and identity frequently emerge as differences over whether squatting is primarily a political movement or a cultural one. As with the other tensions, squatters’ movements are often most robust when refusing to privilege one exclusively over the other. Yet, this is not always possible, especially during hard times. For example, as their movement declined, Amsterdam squatters fought over the essence of the squatting and its politics (Owens 2009).

**UNANSWERED QUESTIONS**

Squatters’ movements have a unique and coherent character. This is partially a result of the similar contexts and information flows between and within these movements. But it is also due to the nature of how the movement is defined, which limits it to a very specific form of squatting and politics. Yet squatting is a vast phenomenon, used by many political actors across the world. More work needs to be done researching squatting politics in the developing world, such as Brazil’s rural Landless Workers Movement (Wright & Wolford 2003). While Corr (1999) tries to integrate squatters’ movements across rural and urban, developed and developing countries, this project remains underdeveloped.

There is still much work to do comparing movements across national contexts, particularly as they change over time. Pruijt (2003), comparing New York City and Amsterdam, explains weaker US squatters’ movements by stricter US property laws, which limited New York City squatters to government-owned, buildings, thus those in the poorest condition, restricting the movement’s growth. Such constraints were even stronger in other US cities, further limiting political squatting. However, opportunities change with time. With the
housing crisis beginning in 2008, vacancies and homelessness have greatly increased, bringing with them a marked increase in squatting. Conversely, the Dutch government made squatting illegal in 2010. Although squatting and squatters’ movements continue, they do so under very different circumstances.

State-sponsored social movements

YANG SU

A state-sponsored social movement refers to a popular movement initiated and endorsed by the central leadership of the state and organized by the government’s apparatuses. Collective action events are peopled by citizens in their capacity as nonstate actors, but the main source of claims, leadership, and organizational resources is from within the state itself, and state actors, in their official capacities, serve as the main organizers. Examples range from a daily ritual that the government calls for its citizens to perform (such as a pledge of allegiance) to a campaign of persecutions against its minorities (such as genocide). Oft-cited historical events such as the Nazi persecution of Jews in Hitler’s Germany and the Cultural Revolution in Mao’s China, are considered to be state-sponsored movements. Other less extreme examples also belong to the category, as will become clear when the concept is further clarified.

As a concept to describe the state’s role in social movements, state sponsorship shares similarities with the commonly known concept of political opportunity structure, but it is also qualitatively different from that concept. They both belong to the group of conditions that facilitate the emergence and operation of a social movement. A movement is thought to be more likely to emerge, develop, and succeed if the system is open, the state’s repression capacity is low, the elites are in conflict, and/or some elite members are supportive. For political opportunity structure scholars, a movement is seen as outside the realm of the state, and favorable conditions as constituting a facilitative environment.

The boundaries between the state and movement, however, all but disappear in the situation of a state-sponsored movement. There are three distinct features in the interaction between the state and movement. First, the top leadership, or at least the prevailing faction of the leadership, is calling for the movement. This is in contrast to a movement that is initiated by forces within society. Second, the government provides the organizational resources – funds, personnel, office, for the movement. In comparison, in other movements state leaders and bureaucrats may be restricted by law from openly participating in their official capacities, and government resources from being used in partisan mobilizations. Third, leadership and activism are often rewarded with career opportunities by the government, while they may be met with the government’s indifference, harassment, or even imprisonment if involved in other movements.

As such, given their close relationship with the state, should we just treat state-sponsored rituals and campaigns as part of institutional politics? To do so would be to miss what social movement scholarship has to offer. Like other social movements, not only do the campaigns of state-sponsored movements take the form of collective events, but they also draw their participants from among the ordinary masses. Once started, the movement may involve initiatives that quickly deviate from the state’s blueprint. In other words, the state’s initiation opens up the floodgates of other mass actions, albeit under the cover of the original goal. More often than not the state cannot police the movement into the shape originally designed. The result more resembles a social movement – with unexpected twists and turns in its course and newly constituted identities among the participants – than the prescribed routines associated with institutional politics.

While state sponsorship of social movements is common wherever there is a state, the character and volume of such movements
state-sponsored social movements vary through history and across different types of political systems. Before the separation of church and state, the religion of a country sponsored by the government might be understood as a state-sponsored social movement. But large waves of change in the past several centuries generated political regimes built on the claims of the “people,” as opposed to the traditional sovereignty claims based on the “king.” These newer regimes possess institutional affinity with the populace, and are therefore prone to mobilizing popular movements in their state-building projects and the maintenance of legitimacy. Among the popular-based governments, there is a marked difference between democratic and authoritarian regimes, however. In the former, election resolves a large part of the legitimacy issue; hence fewer state-sponsored movements. In the latter, the occurrence and volume of such movements are higher. Among the democratic regimes, transitional democracies witness more state-sponsored movements than more stable and mature democracies.

Given all the powers enjoyed through its bureaucratic and legal channels, why would a government mobilize popular movements? First, state-building is always a work in progress; this is particularly the case for a nascent government established through a popular movement such as revolution. In the course of transitioning from a revolutionary movement to a bureaucratic and legalistic state, mass campaigns become a routine and permanent feature of political life. Second, in authoritarian as well as democratic countries, the state monopoly of authority is by no means complete. Many authorities—church, scientific, commercial, educational, and medical, for example—reside outside the control of the state, in varying degrees. When the state attempts to compel them to serve the regime or to give up authority, citizen groups may be prompted to challenge such authorities. Third, the state may find its organizational resources to be in short supply, which is almost always the case, and voluntarism among the citizenry to be a volcanic source of power to tap.

Conceptually state-sponsored social movements can be classified into two types: promotional and persecutory. Promotional state-sponsored social movements center on ceremony and collective action that proclaim and rehearse certain values such as racial purity, patriotism, class conflict, and egalitarianism. These include public rituals in public squares in communist countries such as Cuba, China, Soviet Union Russia, and North Korea. These rituals are seemingly joyous and victim-free. In democratic countries, state-sponsored rituals also exist, as illustrated by Robert Bellah’s (1991) concept of “civic religion in America.”

Persecutory state-sponsored social movements are mobilized to remove undesired elements of the population, and too often take the form of state-organized purges of “class enemies,” ethnic cleansing, and genocide. The state promotes hatred and discrimination among the citizens, pitting one group against the other. In extreme cases, the state also promotes elimination of certain segments of the population as a solution of the “problem.” Examples include the Holocaust, recurrent political campaigns in communist societies, and the contemporary genocidal events in Bosnia and Rwanda.

Most often, a state-sponsored social movement is a combination of these two types, with one feature being more pronounced than the other. On the one hand, a state’s promotion of a value is rarely victimless, even in the most seemingly innocuous cases. For example, certain versions of patriotism are bound to differentiate a hierarchy of ethnic order, and to enhance hostility toward immigrants and foreigners. On the other hand, persecution is conducted in the name of a value, an ideology, and hence rehearsed repeatedly, as occurred with both Nazism and communism.

The tradition of studying state-sponsored movements dates back to World War II, when the world witnessed the rise of totalitarianism. The research peaked in the postwar decades, and the field of collective behavior studies, the predecessor of the social movement studies, was heavily built on the analysis of this type of movement. On the nature of regimes
and character of societies, scholars proposed concepts such as totalitarianism and mass society. On the micro level of participation, psychologists engaged in psychiatric analysis and proposed concepts such as alienation and authoritarian personalities.

Since the 1970s, for a considerable period research has shifted away from these movements to only study “good” or “popular” social movements such as civil rights movements, women’s movements, and environmental movements. The new paradigms in the social movement field rightly reject some notions drawn from earlier studies of state-sponsored movements, such as irrationality of participants and the totalitarianism imagery of the society. But in the meantime, movement studies suffered a problem of a different kind: theories were too narrowly drawn from only those episodes in contemporary America and other Western democracies.

Two recent developments may herald a new boom of studying state-sponsored movements. On the theoretical front, some proponents of the current paradigms have made a forceful call to study “contentious politics,” a concept that encompasses a wide variety of episodes. Empirically, many historic-comparative scholars now dismantle the boundaries between social movement scholarship and cases of contention which in the past may not have been counted as social movements. For example, the Red Guard movements in Beijing in 1966–1967 may be seen as prototypical state-sponsored movements. In them researchers have uncovered features commonly observed in “good” movements such as grassroots initiation, rebellion, factionalism, and tactical innovation. For another example, genocide has been seen as a campaign driven by genocidal state policies. In some instances, the nonstate actors in those killings can be seen as participating in state-sponsored movements. But recent scholarship has challenged the state-policy model and contends that perpetrators act sometimes more on their self-constituted identities than on their prescribed institutional roles. To the extent they are community actors, killing events can be seen as collective action events, and social movement theories may thus have a lot to offer in understanding such events, even though they have not been traditionally considered as social movements.

Stonewall riots (United States)

ELIZABETH A. ARMSTRONG and SUZANNA M. CRAGE

Around 1:20 a.m., early on Saturday, June 28, 1969, police raided the Stonewall Inn, a homosexual bar on Christopher Street in Greenwich Village in New York City. Customers included homeless teens, drag queens, and others unwelcome elsewhere. Patrons initiated a riot that lasted into the night and resumed the next day. The Stonewall riots are often viewed as the spark of the gay liberation movement (Duberman 1993; Teal 1995; Carter 2004). This is not historically accurate: gay liberation was already well underway. The riots were not the first time gays fought back against police, nor were they the first raid to generate political organizing (D’Emilio 1983; Stryker & Van Buskirk 1996; Epstein 1999; Armstrong 2002; Bernstein 2002; Silverman & Stryker 2005; Stryker 2005).

The Stonewall riots are of interest because of their symbolic importance to gay movements in the US and around the globe. The processes through which the riots acquired this salience provide insight into the creation of collective memory within social movements.

GAY LIBERATION AND THE STONEWALL RIOTS

The gay liberation movement was active by fall 1968, and likely before (Stryker & Van Buskirk 1996; Armstrong 2002; Carter 2004). Gay periodicals used the language of “gay power,” and small radical organizations existed. Gay liberation was particularly vibrant in New York. In 1969, Greenwich Village was home to some of the most skilled and visionary gay activists in the country. When the police raided the Stonewall Inn, a crowd gathered (Carter 2004; Duberman 2004). People started throwing things, and after further escalation riot police arrived to disperse them. Rioters blocked the street and taunted police. Activists happened upon the riot in process and immediately began constructing it as significant. One helped escalate it (Carter 2004); another called contacts at New York newspapers. The event received unprecedented coverage on Saturday morning, including reports of nearly a thousand rioters and several hundred police. That day, people gathered to see the bar. That evening, riot police returned and another riot followed (Duberman 2004).

On Sunday, activists distributed flyers calling the riots “the first time that thousands of Homosexual men and women went out into the streets to protest” in New York City (Teal 1995). Another account labeled the riots “The Hairpin Drop Heard around the World.” These assertions became self-fulfilling prophecies. (See Armstrong and Crage 2006, particularly the online supplement, for a list of primary documents on the event and its aftermath.)

THE MAKING OF THE MYTH

The Stonewall riots acquired lasting significance not simply because of what happened, but because of how activists used them – starting when they were still in progress – to advance social movement goals. Stonewall was not the first time homosexuals stood up to the police – they did so earlier in both San Francisco and Los Angeles (Silverman & Stryker 2005; Stryker 2005; Armstrong & Crage 2006) – but it was the first time they did so in front of activists with the capacity to commemorate this defiance. That fall, New York activists drew on an existing annual protest and began planning a Christopher Street Liberation Day parade to commemorate the riots’ first anniversary. They encouraged other cities to participate, and in 1970 New York, Los Angeles, and
Chicago held successful events. New York activists immediately began planning the second parade, and in 1971 seven cities hosted events. Approximately 200,000–250,000 people attended San Francisco’s tenth-anniversary parade. The parade was an ideal commemorative form: It fit the Stonewall story, affirmed gay collective identity, produced feelings of pride (Taylor & Whittier 1995), and forced cities to accommodate public gay existence.

REPRODUCING THE MYTH

The Stonewall story is better understood as an achievement of gay liberation rather than an account of its origins. Historians of sexuality have tried to debunk the Stonewall myth, but it retains its hold among activists and scholars (Kissack 1995; Silverman & Stryker 2005). The political utility of the myth is obvious – it continues to serve the movement well. It is not only rehearsed annually in freedom day parades around the globe, but is employed by activists in countless ways. For example, Rupp and Taylor (2003) observed vivid retellings of the Stonewall story by drag queens in their stage performances. Scholars reproduce the story for at least three reasons. First, people politically invested in the elaboration of the gay, lesbian, bisexual, transgender, and queer (GLBTQ) political and cultural project – particularly journalists and public historians – share movement interests in preserving and extending this powerful story. Second, referring to events as occurring “before Stonewall” or “after Stonewall” is easier than referring to events as occurring before or after the complex set of historical and cultural processes that transformed gay life during the 1960s and 1970s. Finally, sociologists studying contemporary GLBTQ movement politics sometimes reproduce the myth in overly simplified movement histories. Historically inaccurate accounts threaten the credibility of sociological work on GLBTQ movements, as well as our understanding of the role of events in the development of movements. Naturalizing the Stonewall story also makes it difficult to see its globalization as a political accomplishment in need of explanation.

Strategies of the Chinese communist revolution
SHIZHENG FENG

The victory of a revolutionary struggle depends on the effectiveness of the strategies. Mao Zedong argued that the success of the Chinese communist revolution relied on the three grand strategies that the Chinese Communist Party (CCP) had adopted—party building, armed struggle, and the united front. Mao praised them as the CCP’s three magic weapons. Yet, between 1921 and 1935, the CCP was most of the time under the strong influence of the Communist International (Comintern), and its strategy was rather incoherent, to say the least. It was only after 1935, and especially after the 1940s when Mao ascended to become the CCP’s paramount leader, that these grand strategies became the guiding principles of the revolution.

PARTY BUILDING

Of the three grand strategies, party building was primary. According to Mao, whether or not the CCP could successfully carry out the other two grand strategies depended on the CCP leadership’s capacity to maintain an effective organization. The CCP’s organizational building strategy had three major components: (1) the maintenance of CCP’s solid leadership in the revolution, (2) a stress on “thought construction” in party building, and (3) an emphasis of “mass line” as CCP’s basic organizational principle. Each is discussed in turn.

During the revolution, the CCP leadership strove to have absolute control over all affairs, especially military matters. Before 1927, when the CCP did not have its own army, it was only able to establish party branches at the regiment level within some Kuomintang armies over which it had a strong influence. Soon after 1927, the CCP began establishing party organs at all levels of its own army: party groups at the level of squad and platoon, party branches at the company level, and party committees above the company level. A military unit above the level of the company also installed a CCP representative, assumed by the secretary of the CCP organization at the same level. Moreover, the entire army was under the control of the CCP “Front Committee.” The party decided major issues ranging from army deployment to officer promotion. This absolute CCP leadership over the military has lasted till today.

Second, within the party, decision-making power was held at the center, largely in the hands of a few top CCP leaders. To maintain the authority of the party and the central leadership, the CCP constitution had the following regulation: “the individual party members are subordinate to the party organization, the minority to the majority, the lower level to the higher level, all the constituent organizations and members to the center.” In fact, the leadership question had posed a serious problem for the CCP ever since its establishment. In the early years, the CCP leadership was most of the time dominated by those who had Soviet Union background and were trusted by the Comintern. After the CCP’s Zunyi Conference in 1935, however, Mao’s influence in the CCP rose quickly. After the early 1940s and the Yan’an Rectification Campaign, Mao rose to become the CCP’s paramount leader and the Comintern faction lost its influence in the party. Mao remained the CCP’s ultimate arbiter on all aspects of decision making till his death in 1976.

To strengthen internal cohesion, the CCP had made great efforts to educate its members. This strategy, known as “thought construction,” is another basic example of party building. The CCP demanded its members be well versed in Marxism, Leninism, and Mao Zedong thought. To achieve and

maintain party cohesion, the CCP often launched thought struggles or line struggles, during which members who held views deviating from the party center were criticized or even purged. The Yan’an Rectification Campaign, from 1941 to 1945, was the most well-known line struggle. Through the campaign Mao gained absolute domination within the party.

The third feature of party building was the adoption of “mass line” as the party’s fundamental organizational principle. The CCP claimed that the party was the vanguard of the proletariat and should serve the people’s heart and soul. It urged CCP members to mobilize the people by raising their class consciousness without considering themselves as saviors of the people. The party maintained that the revolution could achieve major success only when the poor became enlightened to fight for their own liberation. Therefore, the CCP leadership demanded their members understand the masses and learn from them, to understand people’s interests and knowledge and theorize them, and to construct general policies and strategies to guide the revolutionary struggle. The principle of “from the mass, to the mass” refers to forming policies on the basis of opinions collected from the people, and using the policies to guide the people. It must be noted that the actual workings of communist mobilization never precisely followed this standard model. On the other hand, the mass line ideal did lead the CCP to organize many large-scale mass movements before and after the success of the revolution. This is an important feature that distinguishes the Chinese communist revolution from most other revolutions.

ARMED STRUGGLE

The second grand strategy of the Chinese communist revolution was armed struggle. Because the CCP at first did not have its own armed forces, it was easy for the Kuomintang to purge CCP members in 1927. Learning from this lesson, armed struggle was promoted as one of the CCP’s central strategies. Thus we have Mao’s famous quote: “political power grows out of the barrel of a gun.” In response to the Kuomintang purges and killings, the CCP instigated numerous armed uprisings during and after the summer of 1927. Although all the uprisings failed, the survivors of the rebellion forces were able to retreat to mountainous regions in various parts of China and stage guerrilla warfare.

The CCP’s military strategy was initially incoherent. After Mao reached domination within the party, his military thinking became the guidelines for the communist revolution. Mao’s military strategy had three main components, namely, establishing communist-controlled local governments, encircling the cities from the countryside, and sustaining guerrilla warfare.

The CCP used its military power to seize a territory and establish a government on that territory. It then implemented land reform and other policies to win the support of poor peasants and recruited them to the armies that defended the territory. Since most of the Kuomintang armies were located in and near big cities and the Kuomintang forces were much more powerful, Mao promoted the strategy of encirclement of the cities from the countryside, that is, establishing military bases in poor and backwoods areas or border regions, and expanding the bases to close in on the cities. Mao insisted that the CCP army should start capturing big cities, even the entire country, only after it gained enough power. Many rural communist bases were established, the most famous one being the Central Soviet Area in the Jinggang Mountains in Jiangxi, and the Shaanxi-Gansu-Ningxia Border Region. During the time that it faced more powerful enemies, the CCP adopted guerrilla warfare as the main form of armed struggle. It was not until 1947, when the military strength of the CCP army in many ways surpassed the Kuomintang army, that the CCP started to stage large-scale military campaigns. Within two years, it had defeated the seemingly mighty Kuomintang forces.
UNITED FRONT

The third grand strategy of the Chinese communist revolution was the united front. The essence of the united front ideal is that the party needs to exhibit great flexibility in order to unite with possible allies and defeat its archenemy. The idea of the united front was originally introduced to China by the Comintern, but was greatly enriched through the practice of the CCP and eventually promoted by Mao as the party’s pivotal strategy.

During the course of the Chinese communist revolution, the united front policy went through four main shifts, the first being the establishment of the National Revolutionary United Front, 1924–1927, which was the premier alliance between the Kuomintang and the CCP. The chief purpose of this united front was to oppose the northern warlords or, in the CCP’s language, those who represented the power of imperialism, colonialism, and feudalism.

In 1927, after Chiang Kai-shek’s purge of the CCP, the surviving members of the CCP reached the conclusion that the landlords and bureaucratic capitalists as well as their representatives were their archenemies. Accordingly, they promoted the idea of the second united front, or the Democratic United Front of Workers and Peasants. The CCP implemented radical land reform policies and killed many landlords in its controlled territories. In some places, the radical policies went so far that even many well-to-do peasants were slain.

During the Long March, grasping the opportunity of the increasingly pressing Japanese aggression, the CCP propagated the idea of another united front with the Kuomintang, that is, to unite with all the patriotic forces in China in order to resist the Japanese invasion. The CCP’s new call gained some sympathy among the Kuomintang elite and generals. The ensuing historical dynamics ended with the Xi’an Incident on December 12, 1936, during which Chiang Kai-shek was placed under house arrest by two of his generals and forced to agree to form a united front with the CCP to fight against the Japanese. With the full-scale Japanese invasion of China in 1937, this new united front between the Kuomintang and the CCP became a reality. In this period, to obtain the support of all Chinese (rich and poor) in the Japanese-occupied rural areas, the CCP no longer implemented its radical land reform policies. Instead, it promoted a policy of “reducing rent, reducing interest.” It even tried to incorporate local landlords in the government apparatus in areas under its control.

The new CCP policies widened the mass support for their causes and greatly helped the CCP army to resist the increasingly ferocious Japanese attacks between 1940 and 1943.

The CCP identified the Kuomintang as its archenemy after the defeat of Japan in 1945. Accordingly, it improvised a new united front that included all the Chinese – workers, peasants, intellectuals, and businessmen – except the landlords and the Kuomintang as their allies. This is the so-called People’s Democratic United Front. This united front had its theoretical and practical aspects, both of which had a huge impact on modern Chinese history. The way the CCP regarded Chinese businessmen and intellectuals as one-time friends shaped many CCP policies after it took power. Yet, at the practical level, it was the support of the peasants in rural areas (as a result of the CCP’s new land reform policy) and the intellectuals and students in urban areas (as a result of the successful communist propaganda and mobilization strategies as well as the effect of the Kuomintang-controlled areas) that was most crucial for the CCP’s success during the civil war.

The essence of the united front strategy was “alliance for the purpose of struggle,” that is, to shift CCP’s alliance strategies in time to get more people on its side and to more easily defeat its identified archenemy. According to the CCP theory, in order to bring success to the revolution, the CCP could not forfeit its leadership in the united front. This required the CCP to have a strong party apparatus and strong coercive forces under its control. In other words,
in CCP’s theory and practice, the three great magic weapons were an integrated whole.

Strikes in US history

JUDITH STEPAN-NORRIS and BEN LIND

Strikes occur when activists temporarily and collectively withhold their participation from some crucial activity in order to convey a grievance or to enforce demands. These include food strikes, rent strikes, hunger strikes, culture strikes, prison strikes, student strikes, and labor strikes. By far the most prevalent of these, the focus here, are the latter, also known as walkouts or work stoppages, which occur when workers withhold their labor. The strike is potentially the most injurious action to firms, since production and therefore profits are reduced or stopped altogether (Rubin 1986).

Strikes are a vital component of labor union activities that qualify unions as social movements, even while they have other features that reinforce their institutional characteristics. Strikes require worker solidarity, mobilization, and collective action that put workers at risk for serious consequences (reduced income and job loss). Strike leaders oftentimes solicit community support, form alliances, and engage in relations with the public and the media. While labor unions are important actors in the initiation of strikes – they often call strikes in attempts to obtain union recognition and to enforce collective bargaining demands – their orientations to strikes differ greatly. In addition, strikes may be initiated by union actors who are working outside of their unions (as in wildcat strikes).

THE DETERMINANTS OF STRIKES IN THE US

The US has the most violent and militant labor history (Taft & Ross 1969), yet its labor movement is less progressive than most others. This is known as “American exceptionalism.” Further, US strike patterns are distinct in that although their frequency and participation rates are moderately high compared to other industrial nations, their most distinguishing characteristic is their long duration. To better understand strike activity, scholars have investigated bargaining logic and strategies, macroeconomic forces (including business cycles, unemployment, and wages), the role of organizational influence (union density and leader ideology), as well as legal and political contexts. They have also investigated interindustry differences (Kerr & Siegel 1964) and workers’ positional power (Wallace, Griffen, & Rubin 1989).

ECONOMIC BARGAINING APPROACHES

Early works examining strikes attributed their outbreak to imperfect market knowledge. This argument emphasizes misunderstandings in negotiation over worker remuneration, including pay and benefits, such that a strike occurs when either management or (especially) labor is unaware of the other’s concession range (Hicks 1932). If both parties have perfect knowledge of what remuneration terms the other party would accept, negotiations would quickly reach an apparent optimal compromise. Strikes therefore occur when either party overestimates the concessions the other will find acceptable.

Ashenfelter and Johnson (1969) improve this model by introducing a third negotiating party – union leadership. Their model assumes the union’s leadership, like management, is better informed than the workers they represent. Despite sufficient bargaining knowledge, the union leadership is accountable to the interests of the rank and file, interests which are often difficult to satisfy given the range of concessions management is willing to make. When the best attainable concessions from management falls short of expressed worker interests, the union...
leadership may either sign a contract that risks rank and file disappointment and objection or they may call a strike. Accordingly, calling a strike ensures union leadership support and is often done despite union leadership’s knowledge of its inevitable failure.

Both the amount and the characteristic of information available to the parties involved vary as do their particular strike histories and contexts (Cousineau & Lacroix 1986). Sources of quality information include a reduction in economic uncertainty, such as noninflationary settings (Kaufman 1981), prior negotiations and contracts (Reder & Neumann 1980), and a firm’s past experiences with strikes (Tracy 1987). Viewed relationally, asymmetric knowledge disparities between bargaining parties also increase the duration of bargaining and the likelihood of strikes (Tracy 1987).

MACROECONOMIC CAUSES

In contrast to the attention scholars give to firm-level bargaining processes, others cite macroeconomic conditions, such as the business cycle, as a motivator for strike outbreak. The macroeconomic hypothesis states that economic prosperity has a positive relationship with strike frequency, such that strikes will occur more frequently during times of economic expansion and less frequently during economic recession.

An assumed worker risk assessment motivates the macroeconomic hypothesis. Striking poses a risk of unemployment to participating workers and this risk becomes more salient if alternative venues of employment are unattainable. Should the strike fail and the workplace either refuses to rehire the strikers or closes its doors completely, workers must find employment elsewhere and draw upon savings during the strike. Knowing that high unemployment rates suggest greater market competition for available jobs, workers are less likely to strike in these conditions given the relatively heightened cost of unemployment. Furthermore, during periods of high unemployment, employers draw upon a relatively larger pool of replacement workers (Rees 1952).

Empirical tests of this hypothesis offer some support. Analyzing US quarterly data from 1952 through 1968, one study finds a strong negative relationship between unemployment and strike frequency and a strong positive relationship between gross national product and all strike measurements (Skeels 1971). However, one must be wary of the direction of causality here. Strike activity may consequently lead to an economic slowdown (Flaherty 1987) or decline in industry stock value (Dinardo & Hallock 2002).

However, the strength and role of these macroeconomic effects may be particular to certain national and historical circumstances (Snyder 1975, 1977; Edwards 1981). Skeptical of using these economic indicators without scrutiny, one study shows that economic prosperity led to an increase in strikes in the US prior to 1910 and again after 1947, yet the effect did not hold up between 1910 and 1947 (Edwards 1981). Beyond the period effects, the study finds that, during the most prosperous times, strikes tended to occur within economically disadvantaged sectors. While both improvements in real wages and low unemployment increase the number of strikes in the US and Canada (Snyder 1977), earlier work (Snyder 1975) finds that for Italy and France economic factors affect neither the number of strikes, nor the number of strikers. These findings have not gone uncontested; one study argues that high unemployment rates led to a decrease in strike frequency in Italy following World War II (Franzosi 1995) and another describes economic effects as “surprisingly vigorous” in US strikes (Skeels 1982) as compared to the analysis of Italy and France.

ORGANIZATIONAL CONSIDERATIONS

As the organized unit negotiating on the behalf of workers, labor unions play an immense role in strike activity. The advent of resource
mobilization theory directed greater academic attention to this role. When rank and file workers pay union dues and elect union leaders, they maintain an organized vehicle to pursue their interests at minimal personal cost. Should a strike occur at a workplace, unions are better equipped to engage rank and file participation than a nonorganized workforce.

The US labor federations since the late 1800s have approached the strike differently. The Knights of Labor (1869–1900, substantively) emphasized education, cooperation, and arbitration. Although it rose to prominence by means of a series of successful strikes, in general, its leadership did not support them. Ironically, it was a series of unsuccessful strikes that brought the Knights to ruin. The American Federation of Labor (AFL, 1886–1955), formed to protect and improve craft workers’ positions, was more reliant on strikes to accomplish its ends, as was the merged American Federation of Labor-Congress of Industrial Organizations (AFL-CIO, 1955–present), which incorporated less skilled industrial workers.

Marx argued that strikes were training grounds for workers, and necessary as a precursor to revolution. US revolutionary unions have seen the strike in a similar way, but there were vast differences in their use of the strike and their adherence to this principle. The Industrial Workers of the World (IWW, in substantive existence from 1905 to about 1924), organized around anarcho-syndicalist principles, invoked its ideological precepts in its highly visible and spectacular use of the strike. It aided grassroots worker struggles by providing organizers and personnel to help organize strikes, while it scorned collective bargaining (it refused to sign collective bargaining agreements), paid officers, high union dues, and strike funds. The IWW sought to organize the unorganized mainly by supplying leadership where spontaneous strikes occurred. It was very successful in its leadership, but less successful in leaving lasting organization: concessions workers won in these strikes oftentimes weathered away. The Trade Union Unity League (TUUL, 1929–1934) was a communist trade union federation organized out of the Trade Union Educational League (TUEL), which “bored-from-within” the AFL. Both organizations attempted to move the AFL’s apolitical stance and mild militancy in a more political and confrontational direction.

Both organizations attempted to move the AFL’s apolitical stance and mild militancy in a more political and confrontational direction.

The Congress of Industrial Organizations (CIO, 1938–1955) was a progressive (but not revolutionary) union that organized workers by industry. Its strength was in its ability to organize all workers, regardless of skill, gender, race, or national origin, and it is known for its widespread and successful implementation of the sit-down strike.

Marx argued that strikes were training grounds for workers, and necessary as a precursor to revolution. US revolutionary unions have seen the strike in a similar way, but there were vast differences in their use of the strike and their adherence to this principle. The Industrial Workers of the World (IWW, in substantive existence from 1905 to about 1924), organized around anarcho-syndicalist principles, invoked its ideological precepts in its highly visible and spectacular use of the strike. Both organizations attempted to move the AFL’s apolitical stance and mild militancy in a more political and confrontational direction.

While some contend that it engaged in strikes for political reasons (attempts to help the Soviet Union accomplish some end), TUUL strikes were mainly conducted for economic reasons and to further trade union demands (Devinatz 2005).

The Congress of Industrial Organizations (CIO, 1938–1955) was a progressive (but not revolutionary) union that organized workers by industry. Its strength was in its ability to organize all workers, regardless of skill, gender, race, or national origin, and it is known for its widespread and successful implementation of the sit-down strike.

Communists were involved in the CIO’s organization and leadership. Unions aligned with the communists were also accused of engaging in political strikes. Communist-led unions also vigorously pursued workers’ control on the shop floor as well as their ordinary grievances (Stepan-Norris & Zeitlin 2003).

Studies generally use union density to gauge labor’s organizational capacity. “Union density” refers to the percent of a population’s workforce belonging to a labor union. A great deal of evidence supports the hypothesis of a positive relationship between union density and strike activity, as measured by both the frequency of strikes and the quantity of strikers (Snyder 1975, 1977; Skeels 1982).

While these studies failed to show a relationship between union density and strike activity after World War II, one study attributes this nonresult to the allowable conditions and characteristics of strikes that were elaborated in postwar collective bargaining agreements (Morris 2003). Unions either completely cede their right to strike during the term of the agreement, they agree to specified conditions under which strikes may occur, or they maintain their right to strike. Collective bargaining agreements, which became widespread beginning
in the late 1930s, initially had considerable diversity on strike clauses. But after the communist unions were expelled from the CIO, and the CIO merged with the AFL in 1955, more unions negotiated contracts that gave away their right to strike during the contract’s term. This tendency made the timing of strikes predictable and eliminated unexpected and costly conflicts. While this development didn’t eliminate strikes, it did render the union an enforcer of class harmony in that unions are required to ensure their members adhere to the terms of the contracts they sign. After accounting for contract lifespan of approximately two years and lagging union density accordingly, the study indeed finds a positive relationship between union density and strike activity in the postwar era (Morris 2003).

Though there is little doubt the involvement of established unions result in more predictable strike activity, scholars should proceed with some historical caution. Before 1900, strikes frequently emerged without the assistance of formal organizations. Though in many instances at the time, workers formed organizations during a strike, these organizations often disbanded afterwards. Beyond the limited role of unions in these early strikes, the matter of union recognition as a reason to strike should raise some alarm and suggest the possibility of reverse causality (Franzosi 1989: 356).

Additionally, some scholars question how militant labor unions actually are with regard to strikes (Fantasia 1988; Brecher 1997). In line with Michels’ 1915 “iron law of oligarchy” (Michels 1949) these scholars see organizations formalizing relations, making deals, and assuring peace. They suggest that when organizations are involved, employers withhold concessions or withdraw concessions they have already granted. In this view, it is only workers’ continual disruption of production that accomplishes working class progress. One such scholar, for instance, states that due to the professional and bureaucratic nature of unions, union leadership often tries to prevent strikes and mass upheaval (Brecher 1997). Likewise, the formation of unions and collective bargaining agreements lead to fewer strikes due to their recognition of management as a legitimate form of authority (Brecher 1997). The nature of unions as an adequate embodiment of worker solidarity has served as another line of inquiry. One seminal work addressing this topic claims that all bureaucratic institutions – not excluding labor unions – inevitably individualize workers and reduce their sense of solidarity, and consequently diminish their potential for collective action (Fantasia 1988).

POLITICAL AND LEGAL CONTEXT

Once legal restrictions encumber the strike’s initiation and manifestation or when business unions lead them, strikes tend to be more rational, strategic, and disciplined. The US political and legal environment has changed, and has thereby had a tremendous effect on the use of the strike and its prevalence. Following is a list of the US major labor laws affecting the use of the strike (Roberts 1971).

The Sherman Antitrust Act of 1890 prohibited actions in restraint of free trade and competition. Even though corporate abuse was its original intended target, it was often used by employers against labor unions. Injunctions, which are prohibitory writs issued by courts to restrain individuals or groups from committing inequitable acts, were many times granted to employers to end picketing and/or boycotts. The Clayton Act of 1914 unsuccessfully attempted to make unions exempt from the Sherman Antitrust Act and from injunctions. The 1932 Norris-LaGuardia Act succeeded in restricting the use of injunctions. The Railway Labor Act (1926, extended to airlines in 1934) required mediation and voluntary arbitration in railroad (and airline) disputes. A very important part of the New Deal legislation was the National Industrial Recovery Act (Section 7a) of 1933, which gave workers the right to organize, to be free from interference or coercion of employers in their attempts to organize, and prevented
the requirement that workers join company unions. The National Labor Relations Act (Wagner Act) of 1935 was passed one month after the Supreme Court ruled NIRA Section 7a unconstitutional. It established workers’ right to organize and set up machinery (National Labor Relations Board) for holding elections. This act established unfair labor practices prohibiting discrimination against workers due to union membership, prohibited company unions, and required employers to bargain with unions that are the lawful representative of its employees.

During World War II, the tripartite National War Labor Board (1942) settled disputes. This followed the AFL’s and CIO’s commitment to a no strike pledge during the duration of the war in exchange for employers’ promise to freeze prices. However prices were not kept constant, and though the no strike pledge was (largely) honored for the first two years, strikes then became more prevalent than before the war.

The Labor Management Relations Act (Taft-Hartley Act) of 1947 represents a major retreat from labor protections. Taft-Hartley was passed in the aftermath of the post-war strike wave and attempted to equalize bargaining power by providing a series of union unfair labor practices. It limited union security provisions (outlawing the closed shop and automatic check-off of union dues), established procedures for handling national emergency disputes (including the use of an 80-day injunction during fact finding), made collective agreements enforceable by the courts, set up conciliation and mediation services, required union leaders to sign non-communist affidavits as a leadership requirement, mandated unions file financial statements, and outlawed certain types of strikes (e.g., secondary boycotts, sympathy strikes). The Taft-Hartley Act also made the unions more susceptible to injunctions. The Public Employees’ Fair Employment Act (Taylor Law) of 1967 is one of over 30 state laws that cover public employment relations. It prohibits public employees from striking and assesses penalties for violations against the union and employees involved.

As a form of collective action, strikes also develop with respect to broad, encompassing political structures according to political opportunity theory. Beyond the legislation discussed above which directly enabled (or impeded) the ability of workers and unions to call strikes, when analyzing strikes in the US, scholars often use the number of Democratic Party office holders to gauge labor’s access to the political system, as the Democratic Party is more pro-labor than the Republican Party. During the first half of the twentieth century, this relationship did indeed hold, as times with more democrats in Congress also featured more frequent strike occurrence (Snyder 1975, 1977). Likewise, other studies conclude that a Democratic president in the White House yields an increase in strike activity (Skeels 1971, 1982; Snyder 1977).

TYPES OF STRIKES

Sit-down strikes are actions that involve workers sitting down at their workstations and refusing to leave their places of work. This prevents the need for and the dangers around picketing, because replacement workers are not easily utilized. For employers to defeat sit-down strikes, they would have to employ replacement workers who were willing to engage in face-to-face confrontations at every workstation.

Wildcat strikes are work stoppages called by union employees that do not have union authorization or approval. Normally, it is assumed that these are evidence of a lack of authority of the union (i.e., the union is not able to control its members), but they may also have the informal support of local and/or shop level union representatives.

General strikes are large-scale and coordinated actions by unions that stop all production and commercial activity (with exceptions of necessary supplies) within a given industrial, geographical, or political boundary. They span
multiple unions and firms, and sometimes have revolutionary aims.

REFERENCES AND SUGGESTED READINGS

Students for a Democratic Society (SDS) (United States)
RICHARD FLACKS

Students for a Democratic Society (SDS) was the leading national organization in the white student movement of the 1960s. SDS originated as the Student League for Industrial Democracy (SLID), whose roots were in the Intercollegiate Socialist Society, founded in 1905. The latter group, founded by such notables as Jack London, Upton Sinclair, and Walter Lippmann, became the League for Industrial Democracy in 1921. SLID was its youth wing, and was part of the burgeoning student Left of the 1930s; it declined in membership and visibility through the 1950s. The mobilization of black students beginning in 1960, and the stirrings then of political interest on the part of some grouplets of white students, provided opportunity for a revitalized organized student Left. Al Haber, seeing that the SLID was an organizational shell with some resources, led an effort to change its name to Students for a Democratic Society, and actively recruited a number of student activist leaders to construct an ideological center for the emerging student movement. One of those he recruited, Tom Hayden, editor of the University of Michigan Daily agreed to draft a manifesto for SDS and the wider movement. This draft was debated and adopted, along with a new constitution, at the founding convention of the newly constituted SDS in June 1962, at a United Auto Workers conference center in Port Huron, Michigan. The conference was attended by several dozen students from campuses in the northeast and Midwest. Many of these, like Hayden, were student government leaders and campus activists; a number of leaders of the Student Nonviolent Coordinating Committee (SNCC) came to the Port Huron meeting (Miller 1994; Hayden & Flacks 2002; Hayden 2005).

Although SDS’ founding was inspired by the courage and social impact of the Southern student movement, its founders identified with emerging ideological currents in the European and American left – currents which in Great Britain were identifying as the “New Left.” “New Left” refers to a deliberate break with both the communist and social democratic traditions of the “old left” – a stated desire to transcend the terms of the cold war, and the languages of orthodox Marxism. Clues to a new language were found in the writings of such radical intellectuals as C. Wright Mills, Paul Goodman, and Albert Camus. The Port Huron Statement defined the New Left vision in terms of “participatory democracy” (rather than “socialism”). As a social vision, “participatory democracy” privileged action through social movement and decentralized communities; as an organizational model, it suggested rotating leadership, local autonomy, consensus decision making (Miller 1994).

Although SDS was born out of the strongly anticommunist wing of the social democratic left, it deliberately transgressed the latter’s rules of engagement with those labeled “Stalinist” and “Stalinoid.” The Port Huron Statement criticized the politics of anticommunism as well as communism, and at the convention a “noncommunist” membership requirement was eliminated (Sales 1974; Gitlin 1993).

SDS’ perspectives on the cold war, anticommunism, and the need for a new left proved influential and prophetic even though strongly criticized by LID leaders, who tried to strangle the organization in its cradle. Several revered elders, particularly Norman Thomas and A.J. Muste, stopped the infanticide; eventually SDS split from its “adult” sponsor (Sales 1974).

For a couple of years after its 1962 convention, SDS appeared destined to be a think tank for a new generation of left-wing activists,
providing a bridge between campus and community social action. In 1964, a grant from the United Auto Workers initially was intended to help SDS organize campus support for labor movement and progressive economic issues. After much debate, however, the Economic Research and Action Project (ERAP) instead focused on establishing collectives in a variety of northern cities, aimed at organizing on economic issues in primarily white working-class neighborhoods. This effort was, again, inspired by SNCC, who had urged that their white supporters work with poor whites in parallel with SNCC’s southern black organizing work (rather than seeking to “come South” where their presence was increasingly tense). ERAP projects in such cities as Newark, Cleveland, and Chicago became nuclei of ongoing “community unions” that presaged community organizing projects encouraged by federal war on poverty programs. SDS was increasingly identifying itself as a center for youthful activism (mostly off campus), rather than serving as an intellectual center.

SDS’ early founders took it for granted that a majority of college students would be apathetic and largely conservative and didn’t at first envision catalyzing a mass student movement. In the fall of 1964, the Berkeley Free Speech Movement’s character as a mass uprising began to suggest that there might be some potential for an American student movement. At the same time, American participation in the Vietnam War was rapidly escalating. SDS’ most organizationally fateful decision, made in December 1964, was to call for a national student march on Washington demanding US withdrawal from Vietnam scheduled for April 1965.

This call was rather prophetic. President Johnson initiated attacks on North Vietnam in early 1965, and draftees were sent as ground troops that spring. In March, in Ann Arbor, a number of faculty (many close to SDS) initiated a “teach-in” on the war. The teach-in was a kind of reverse strike in which concerned faculty and students met after classes and through the night for a marathon set of discussions, debates, forums, and lectures concerning the war. Thousands participated in the March 25 Ann Arbor teach-in; the form rapidly diffused across campuses, and eventually national teach-ins using a telephone hookup took place.

Antiwar feeling quickly grew among students and faculty; the SDS March in April drew at least 25,000 participants. These events were widely covered in weekly magazines; SDS suddenly was highly visible as the main national organization mobilizing protest against the war. By 1966, as the threat of the draft increased, SDS chapters were leading on-campus protests against military encroachments on campus life: use of class standing for deciding student deferments, use of campus facilities by recruiters for weapons manufacturers, on-campus military research centers and the like. These protests typically involved acts of civil disobedience, followed by police quelling of resistant protesters, mass arrests, and roughing up of protesters, culminating often in large-scale student strikes and rallies to protest treatment of the protests. Hundreds of such episodes, often led by SDS chapters, occurred on campuses across the country. During the same period, SDS initiated or endorsed some national marches and rallies against the war (though increasingly it emphasized local on-campus action and criticized national mobilizations), and encouraged draft resistance and direct action against selective service. A feature of SDS’ organizational life in the second half of the 1960s was that the national organization was often unable to achieve agreement on specific strategies of protest, but local chapters were free to mobilize on their own (Sales 1974; Gitlin 1980, 1993).

SDS’ practice of rotating leadership, combined with the inevitable fluidity of a student membership base, resulted in considerable turnover in national leadership. At the same time the organization’s membership growth far outstripped the capacity of the national office to service local chapters. To a considerable extent, SDS became a symbol of radical identity, rather than a strategically or ideologically coherent national organization. As a result, it was invaded by the Maoist
Progressive Labor Party, which defined SDS as a mass organization (rather than an ideological rival) ripe for takeover. To overcome the challenge, SDS leaders began employing a “more revolutionary than thou” rhetoric; national meetings were characterized by bitter conflict among competing factions. And all the while, SDS was increasingly a target of deliberate efforts to disrupt it by the FBI’s COINTELPRO (Cunningham 2005).

In 1969, the organization split asunder. The “weather” faction, including many national leaders, declared themselves a revolutionary underground and abandoned belief in the revolutionary potential of its bourgeois student base; other factions vied for primacy as true representatives of Maoism (Varon 2004). The demise of SDS as a national organization ironically preceded the largest mass mobilization in American history as 4–5 million students struck and rallied in the aftermath of the Kent State and Jackson State massacres (Gitlin 1993).

SDS, like other movement organizations founded in the 1960s, had a brief existence. Some have interpreted its history as a story of failure or frustration – and many SDS veterans have written memoirs trying to understand its trajectory (e.g., Flacks 1988; Gitlin 1993; Pardun 2001; Oglesby 2008; Rudd 2009; there are many others).

SDS was, however, a crucible for much of the political and cultural change associated with the 1960s. It fostered the vision of “participatory democracy” as a cognitive practice for the Left; catalyzed a mass student movement unprecedented in size and militancy in US history; helped invent the role of “community organizer”; sparked feminist consciousness among activist women rebelling against their marginalization in SDS leadership (Echols 1989); deeply challenged US imperial policy and the legitimacy of conscription. Like student movements through history and around the world, SDS was a training ground for a large number of political actors and intellectuals who continued as change agents in many social arenas. The literature about SDS is vast; many puzzles concerning its dynamics and social impact remain.

Student Nonviolent Coordinating Committee (SNCC) (United States)
FRANCESCA POLLETTA

The Student Nonviolent Coordinating Committee (SNCC) was formed in the spring of 1960 to support the student sit-ins against segregation that were sweeping the south. By 1962, the group had metamorphosed into a cadre of activists who combined direct action with political organizing in the most repressive areas of Mississippi and southwest Georgia. Never a membership organization, SNCC (pronounced “Snick”) had 160 staffers at its largest. It lasted only eight years and it could take credit for no landmark civil rights legislation or policy. Yet, then and now, SNCC’s influence far outstripped its size, longevity, or easily measurable accomplishments.

Young, smart, radical, and seemingly fearless, SNCC workers were famous for their willingness to confront Southern apartheid at its starkest, often singing as they were carted off to jail. But their influence came also from their innovative strategies, and these were a result of SNCC’s position at the intersection of two very different activist traditions. SNCC’s founders were tutored in nonviolent direct action by the Gandhian pacifist James Lawson. In campaigns such as the 1961 Freedom Rides, they drew on techniques of passive resistance that had long been used by pacifists, but they stripped direct action of its sober religiosity and made it radical, spontaneous, urgently moral, and effective.

A different tradition came to bear as SNCC moved from direct action to community organizing in 1961–1962. Ella Baker, a former Southern Christian Leadership Conference official, with roots in labor organizing and the cooperative movement, encouraged SNCC activists to work closely with local black activists. SNCC staffer Bob Moses collaborated with longtime Mississippi activist Amzie Moore to launch voter registration projects in the most repressive areas in the state. The plan was to force the Justice Department to intervene to protect black voting. But just as important, SNCC workers saw their task as helping to build enduring black political organizations.

In 1964, frustrated with the government’s unwillingness to act, a coalition of civil rights groups including SNCC brought upward of 800 mainly white students to the state for the summer to help with voter registration efforts and staff alternative schools. After a white volunteer and two other civil rights workers were abducted and killed, the summer project operated within a glare of national publicity. That publicity continued as the SNCC-created Mississippi Freedom Democratic Party (MFDP) challenged the National Democratic Party to seat its delegates, rather than the segregationist regular state party, at the national convention.

The Party refused, granting the MFDP only two symbolic seats. Still, the challenge solidified SNCC’s place among the Big Five of the civil rights organizations. Funding and support were now pouring in, yet the organization found itself in turmoil. Disillusionment with self-professed liberal allies and burnout from the rigors of the summer combined with a sense that the influx of white workers was transforming what had been a predominately black organization into something else. Diverse cleavages crystallized in a battle over organizational structure. At a time when northern New Leftists were celebrating SNCC’s consensus-based decision making, many SNCC activists were castigating participatory democracy as ineffectual and self-indulgent.

By the time the battles over organizational form ended, many SNCC workers had left the south altogether and others had shifted their focus from Mississippi to Alabama. There
SNCC workers helped to form an all-black independent county-level party, the Loundes County Freedom Organization (nicknamed the Black Panther Party). It was in Loundes County that SNCC’s new chair Stokely Carmichael called for “Black Power” on the Meredith March in June 1966. Carmichael’s call came after long and contentious discussions within SNCC about the need to focus on black consciousness, organize separately from whites, and renounce nonviolence. However, few within SNCC had a clear sense of what Black Power should involve programmatically. While some staffers championed the publicity that SNCC spokespeople were increasingly garnering on an international stage, others bemoaned the fact that the organization had all but abandoned grassroots organizing for speechmaking. At the same time, increased government surveillance and the loss of funding led many to drift away from the organization. By 1969, when chair H. Rap Brown changed the group’s name to the Student National Coordinating Committee, it had little national presence and by 1971 it had stopped operating.

For a small organization with a short lifespan, SNCC’s political influence was outsize. It made popular tactics of direct action and community organizing; created, in the MFDP, an organization that would remain central in efforts to gain black electoral representation; inspired a generation’s enthusiasm for consensus-based decision making; produced an early salvo in the rise of second wave feminism; and developed influential black cultural projects such as the Free Southern Theater and the Freedom Singers.

SNCC has figured in numerous theories of movement dynamics: in McAdam’s theory of recruitment to high risk activism and in his analysis of the biographical consequences of movement participation; in Morris’s theory of the organizational basis of mobilization; in Robnett’s account of “bridge leadership” in which women perform essential, if often unrecognized, leadership tasks; in Polletta’s analysis of participatory democracy’s strengths and weaknesses; and in Evans and Boyte’s theory of the role of “free spaces” in spurring protest.

Suffrage movement, international
REBECCA J. MEAD

Voting is considered an inherent right of citizenship in modern democracies, an idea originating in Enlightenment ideology but not automatically achieved in practice. In the past, proposals to expand the franchise to include nonproperty-holding white men were quite controversial, so the concept of suffrage for women and people of color was an even more radical suggestion given their putative lack of rational capacities. Dominant gender roles confined women to the domestic sphere while husbands or other male kinfolk represented their political interests, and challenging these ideas was difficult. Even when women gained voting rights, these were frequently partial (allowing participation in some elections but not others), restricted by marital status, education, property qualifications, and race, and did not automatically grant other civil rights. Winning full suffrage required hard work by determined women – it was never a "gift" – and success was the result of multiple factors. These include: (1) educational advances; (2) the growing presence of women in the workforce and trade unions; (3) the increasing political sophistication and mobilization of women in clubs and reform organizations; (4) affiliations between suffragists and progressive reform movements; (5) fluid political environments in territories, provinces, and colonies; (6) the adoption of direct action techniques; and (7) transnational activism, although these relationships could be problematic.

Traditionally, suffrage studies have focused on the achievement of national suffrage by privileged women in the industrializing countries of North America and Europe, but more recent scholarship examines exclusionary as well as inclusionary factors, cross-class, race, and gender coalitions, transnational connections, areas that lacked established national boundaries and independent democratic political systems, and the partial and sequential nature of the process as it moved from the peripheries to the centers of power. In particular, the international nature of suffrage activism is a flourishing area of current research that transcends the boundaries of nationalistic histories and addresses the dynamics of imperialism. Women’s rights activism has always been a transnational phenomenon, providing invaluable encouragement to isolated women through letters, visits, publications, conferences, and formal organizations. In the 1830s, utopian socialism and abolitionism linked women in America and Europe and catalyzed their efforts to achieve equal rights. Between 1848 and 1852 the revolutionary movements that swept Europe stimulated an explosion of feminist enthusiasm and organization which inspired the first American women’s rights convention at Seneca Falls. When reactionary forces crushed the democratic insurgencies and ruthlessly suppressed political organizing for decades, European women took heart from the vivacity of the American movement.

In 1888, American leaders established the International Council of Women (ICW) hoping to promote international suffrage activism, but they were disappointed because the organization avoided controversial issues (like suffrage) and most of its constituents were preoccupied with moral reform campaigns, especially temperance and prostitution. This emphasis did not prevent the Women’s Christian Temperance Union (WCTU) from playing a vital role in early transnational suffrage organizing, however. In the early twentieth century a resurgence of feminism transformed suffrage activism into a mass movement in many countries and created new organizations at all levels. Between 1890 and
1915 a powerful international feminist socialist movement developed, often in open hostility to and in competition with “bourgeois” women, but with a shared concern for female economic independence and the rights of the growing numbers of wage-earning women. In 1904, the International Woman Suffrage Alliance (IWSA) was established by suffragists frustrated by the broad program and conservatism of the ICW. The organization continued to expand into the 1920s, incorporating chapters from regions outside the Anglo-European core and providing suffragists in those areas with support in their struggles for enfranchisement. Nationalism and imperialism could and did affect many suffrage struggles and limit transnational cooperation. For example, many US suffragists who resented their own lack of political autonomy nevertheless advocated the imposition of woman suffrage on colonial peoples in violation of their rights to self-determination. Nevertheless, the constant efforts of woman suffragists to overcome national, class, racial, religious, and logistical barriers in order to create and sustain international ties clearly indicates the importance of these networks of friendship, collegiality, and organizational authority.

Prior to the radical political shifts catalyzed by the Enlightenment, male suffrage was heavily restricted by property ownership, but some women in medieval Europe and colonial America could vote if they were taxpayers, property owners, or independent heads of households. Revolutionary democratic movements did not automatically guarantee equal citizenship rights, although they did provide powerful philosophical arguments useful in future struggles. In 1776, New Jersey women could vote if they met the property qualifications (which few did, since married women could not own property independently), but they were disfranchised in 1807. During the French Revolution, philosopher Antoine Condorcet and feminist Olympe de Gouges argued for women’s rights, but in 1793 the Jacobin-controlled Assembly rejected their arguments, passed measures prohibiting female political activity, and sent de Gouges to the guillotine and Condorcet to prison, where he died mysteriously. The political exclusion of many working-class or racial-ethnic men necessitated long struggles for universal male suffrage. Although woman suffragists often developed crucial alliances with labor, socialist, or civil rights activists, these men generally considered universal male suffrage a prerequisite for female enfranchisement and rejected partial measures that would disproportionately benefit elite women. Indeed, woman suffragists sometimes argued that their votes could undermine the political influence of radical groups, used racist or nativist arguments, and supported exclusionary measures.

In the US, gender discrimination within the abolitionist movement eventually led to the foundational 1848 Seneca Falls women’s rights convention, but the suffrage movement split after the American Civil War. When the Fifteenth Amendment proposed to prohibit voting discrimination because of race, but said nothing about sex, some prominent suffragists accepted this compromise as the best deal possible under the circumstances, but Elizabeth Cady Stanton and Susan B. Anthony disagreed and demanded immediate universal suffrage. This controversy resulted in the establishment of two separate suffrage organizations in 1869: Stanton and Anthony organized the National Woman Suffrage Association while Lucy Stone, Henry Blackwell, and others created the American Woman Suffrage Association. Until they merged to become the National American Woman Suffrage Association (NAWSA) in 1890, these two groups pursued different strategies. The AWSA tried to win suffrage at the state and territorial level, while the NWSA pushed for a federal amendment and tried to gain the vote through creative interpretation of the Fourteenth Amendment. This “New Departure” strategy argued that voting was a right of citizenship and since women were citizens they should be able to vote. Women who went to the polls to test this theory (including Anthony) were usually unsuccessful. In 1875, the US Supreme Court rejected this argument when it
ruled that voting was a privilege, not a right of citizenship (Minor v. Happersett).

By necessity, US suffragists turned to territorial and state campaigns which generally failed. Early suffragists were politically inexperienced and handicapped by criticisms that they violated prescriptive gender norms. Over time they developed an array of organizational skills, arguments, and tactics and learned to maneuver through the political system, but they experienced many defeats and disappointments in the process. They had some success in convincing small territorial legislatures to grant woman suffrage – in Wyoming (1869), Utah (1870), and Washington (1884; disfranchised in 1887) – but usually state legislatures would not accept responsibility for directly enfranchising women. At best, they would authorize a referendum which required suffragists to conduct statewide public campaigns. Reviewing the record in 1916, NAWSA president Carrie Chapman Catt counted 480 state legislative campaigns and 41 state referenda resulting in only nine state or territorial victories, all in the western US. These successes were significant in establishing important precedents and creating a body of four million western women voters by 1915, as well as many veteran activists. These western connections have received inadequate historical attention, as studies of the US movement generally focus on the East Coast, the militancy of Alice Paul and the National Woman’s Party (NWP), and the final push for the federal amendment.

In the early twentieth century, the US suffrage struggle became a mass movement reinvigorated by a new generation of activists who renewed the effort to win a federal amendment. Like Paul, some learned confrontational methods from their experiences with British suffragettes. The NWP activists picketed the White House, suffered arrests and forced feeding, and infuriated President Wilson and the mainstream NAWSA leadership, but they made it clear that they would persevere until successful. Eventually the Nineteenth Amendment squeaked through Congress, but the ratification process almost failed due to implacable opposition in the South. Since the 1890s, some suffragists had been willing to compromise with racism and segregation in order to gain southern support, but this “Southern strategy” had no success. Finally, in 1920 the Tennessee state legislature ratified the amendment – by one vote – when a young representative changed his position at his mother’s request. Enfranchisement within a segregated polity did not guarantee other civil rights, however, especially for African-American women.

Like the US, Canada and Australia were settled rapidly by Anglo-Europeans and a decentralized political system allowed provinces to determine their suffrage requirements. By 1900, municipal female suffrage was widespread, and beginning in 1916 several western Canadian provinces granted provincial suffrage. In 1917 Canadian women gained limited federal suffrage, with full enfranchisement in 1918. Nevertheless, several provinces subsequently lagged in granting provincial suffrage – the last was Québec in 1940. In New Zealand, efforts to enfranchise women narrowly failed in 1878, 1879, and 1887. After full male suffrage was established in 1889, an innovative Liberal-Labor government passed woman suffrage in 1893. South Australia enfranchised women in 1894, Western Australia in 1899, and New South Wales in 1902. These victories were due to cross-class coalitions of woman suffragists and Labor-Liberal politicians supported by the WCTU. In 1902, the constitution of the new Australian Commonwealth enfranchised white women to maintain consistency with the areas that had already granted female suffrage. To settle the “race question,” the constitution disfranchised all Aboriginal peoples, a provision which was not rescinded until 1966.

In northern Europe, the earliest successes were in Scandinavia. In 1906, relative political autonomy from Russia, universal male suffrage, and a strong socialist movement allowed Finnish women to become the first in the world who could both vote and stand for office. As a result, 19 women became members of parliament in 1907, inaugurating a long tradition
of female participation in national politics. Norwegian women who met certain property requirements could vote in 1907, additional reforms allowed most women to vote in local elections in 1910, and the Norwegian parliament passed full female suffrage in 1913. In Sweden, some women taxpayers were allowed to vote in the mid-1700s, but these rights were abolished in 1771. In 1862, tax-paying women who were unmarried or widowed regained the local franchise. Parliament rejected full suffrage for women in 1906, but allowed married women to vote in municipal elections, and in 1909 women won the right to stand for local election. Despite the election of many women to municipal councils and female involvement in trade unions and social democratic politics, Swedish women did not gain national suffrage until 1919. In Denmark women were allowed to participate in municipal elections in 1909, but could not vote for the national legislature until 1915.

In Great Britain, the publication of Mary Wollstonecraft’s book, *Vindication of the Rights of Women* (1792), is considered the beginning of the women’s rights movement, but it became a political movement in association with efforts to expand the franchise for British men. In 1867, John Stuart Mill introduced a woman suffrage amendment to the proposed Reform Bill, followed by his famous article, “The Subjection of Women,” in 1869, the same year women taxpayers won the municipal vote. In 1897, 17 suffrage organizations consolidated as National Union of Women’s Suffrage Societies (NUWSS) under the leadership of Millicent Garrett Fawcett, the wife of a member of parliament. Without universal suffrage, however, even the most progressive male politicians resisted the enfranchisement of women.

In 1903, the most famous British suffrage organization, the Women’s Social and Political Union (WSPU), was founded in Manchester by members of the Pankhurst family and others who were dissatisfied with the lack of progress. Manchester had a vigorous early suffrage movement which involved many working-class women who borrowed militant tactics from the labor movement. Initially the WSPU worked with the Labour Party to support a variety of social reforms, but after 1905, the Pankhurs dropped this commitment, focused solely on woman suffrage, shifted their attention to middle-class women, and moved to London. They began to attack whichever political party was in power and to oppose to all legislation that did not address their demands. Through public meetings, confrontations, and disruptive tactics that led to arrests and imprisonment, the suffragettes gained much publicity and some sympathy. Their efforts seemed to produce results when Parliament considered a measure that would enfranchise female “householders,” but when the bill stalled, a WPSU delegation stormed the House of Commons on “Black Friday” (November 18, 1910). They were assaulted by the police and over a hundred women were arrested, creating a public relations disaster for the government. Subsequently WPSU violence escalated to include arson, bombings, and other attacks on persons and property. In 1913, Emily Davison became a suffrage martyr when she died after throwing herself in front of the king’s horse at the Epsom Derby. Imprisoned WPSU militants began hunger strikes and publicized the brutality of force-feeding, which won them public sympathy and seriously embarrassed the government.

These actions made it clear that the suffragettes were willing to die for their cause, but World War I interrupted further progress. Under the strict control of the Pankhursts, the WPSU adopted a patriotic pro-war stance and stopped campaigning, alienating antiwar members and causing organizational splits. The issue of home rule in Ireland also complicated the British movement. Irish Unionist women suffragists had been active since the 1860s, and in 1900 Republican women began forming their own groups. The program of the failed 1916 Easter Uprising promised universal suffrage and equal rights to all citizens, reflecting the participation of many women in Irish nationalist politics. In 1918, Parliament granted the vote to women in Great Britain who were over
the age of 30, householders, the wives of householders, or graduates of British universities, but full suffrage was not achieved until 1928.

The argument that women’s contributions to national war efforts earned the gratitude of politicians and resulted in female enfranchisement has enjoyed broad popularity because it is a nationalist narrative that emphasizes the generosity of men rather than the continuing struggles of women. Suffragists always insisted that the vote was a basic right of citizenship, not something that could be earned. In fact, the impact of World War I on the movement was frequently problematic. Organizations split over support or opposition to the war, energies were diverted into war-related activities, and many victories were partial. In the Netherlands, women won the right to run for national office in 1917, but full suffrage was delayed until 1919. Belgian women could vote locally after 1921, but they had to wait until 1948 for full enfranchisement.

Postwar geopolitical reorganization and revolutionary instability profoundly affected the suffrage movement. After the overthrow of the czar in February 1917, Russia granted universal suffrage which was reconfirmed by the Bolsheviks when they seized power. Under Soviet influence, Latvia and Estonia granted women the right to vote in 1918, followed by Belarus and Ukraine in 1919. Free of foreign domination for the first time in over a century, Poland granted full woman suffrage in 1918. In Austria, universal male suffrage was not fully established until 1907, but female enfranchisement was not achieved until after the collapse of the Austro-Hungarian Empire and the formulation of a new constitution in 1918. In the 1920s, other new nations emerging from the ruins of the Austro-Hungarian and Ottoman Empires granted women suffrage: Czechoslovakia (1918); Albania (1920); Armenia, Azerbaijan, Georgia, Lithuania (1921); Kazakhstan, Mongolia, Tajikistan (1924); Turkmenistan (1927); Romania (1929); and Turkey (1930).

In Germany, the replacement of monarchy by democracy also resulted in female enfranchisement. In the late 1800s, universal male suffrage and female political participation was limited by the regime of Chancellor Bismarck. Middle-class women established various feminist organizations by the 1900s, but the main force in the German suffrage movement was socialist women. Despite government repression, German socialists built the most powerful movement in Europe by the early 1900s, and Clara Zetkin became the principal German socialist suffrage leader. Zetkin advocated suffrage to strengthen working-class power but reinforced the essentialism of women as as wives and mothers, perhaps to allay concerns that socialists would radically disrupt traditional family and gender roles. Zetkin actively participated in international socialist women’s activities but scorned collaboration with middle-class suffragists because she considered reformism and feminism as distractions from the revolutionary class struggle. There was also a significant German movement advocating expanded mother’s rights, including greater sexual and reproductive freedom and broader government maternal support policies. By November 1918, Germany was in crisis. The Social Democrats took control, signed the armistice, and announced many reforms, including universal suffrage. Although the radical revolutionaries were forcefully defeated in their efforts to implement a communist government, the 1919 constitution of the Weimar Republic confirmed full suffrage.

In France, woman suffrage was consistently linked to revolutionary activism. Given the chronic instability of the French state, equality for women was perceived by some as a threat to social stability, public order, and the family, while radical anticlerical politicians argued that women would be conservative, pro-family and pro-church voters. In 1848, the provisional French Republic proclaimed universal suffrage as a basic right – except for women, who were legally forbidden to attend political meetings on the grounds that their proper place was in the home. When two persistent French suffragists, Jeanne Deroin and Pauline Roland, formed a women’s rights association they were arrested and given six-month
prison terms. After the collapse of the Second Republic, the Commune, and the founding of the Third Republic in 1871, the tension between anticlerical republicans and Catholic monarchists polarized French political life, but both resisted equal rights for women. For many years, the suffrage movement was led most notably by Hubertine Auclert (who coined the term féminisme), but it was internally fragmented and centered in Paris. Despite a vigorous public debate on women’s rights issues and some legislative support for granting municipal suffrage, the measure failed in the early 1900s.

French suffragists resumed their efforts after World War I, but the country’s terrible wartime losses led to pro-natalist policies which emphasized female domestic and reproductive functions at the expense of their individual rights. Female enfranchisement by communists also reinforced fears that gender equality would undermine traditional French society. In the interwar years, suffragists remained active and the debate continued, but progress was limited. Although the Chamber of Deputies passed enfranchisement measures in 1919, 1925, 1932, and 1935, the Senate consistently rejected them. Finally, in June 1942, while the country was under Nazi occupation, Charles de Gaulle promised that “all our women” could vote in the next National Assembly election. In 1944, the provisional government confirmed this right and French women participated in the assembly elections in 1945. While technically French citizens, Muslim women in Algeria were not enfranchised until 1958.

Suffragists experienced similar difficulties in other countries with unstable democratic institutions and strong Catholic traditions. In early twentieth-century Spain, suffragists organized a Supreme Feminist Council and petitioned Parliament. In 1931, the constitution and legislation of the new Spanish Republic granted women the vote, full legal status, and many other rights. In the 1933 elections, however, a conservative victory seemed to confirm fears that women influenced by the Catholic church would vote for reactionary candidates and thus endanger the Republic. After the Spanish Civil War, Francisco Franco rescinded earlier women’s rights legislation. Although female heads of households were allowed to vote in referenda, political participation meant little under his dictatorship. After Franco’s death, the 1978 constitution restored democratic principles and established equal rights for women.

Portuguese women gained expanded rights when a republic was established in 1910, excluding the right to vote. After a fascist coup in 1926, Portuguese women were allowed to vote in 1931, but only if they met certain educational requirements which did not apply to men. In 1933, the constitution stated they everyone was equal under the law “except for women, the differences resulting from their nature and for the good of the family.” After another coup in 1974, women were granted full political rights. Greece passed limited female suffrage in the 1930s, but only in municipal elections to women who were both literate and 30 years or older. Full suffrage was achieved in 1952.

As in many other countries, feminism emerged as a social force in Latin America late in the nineteenth century as a consequence of modernization. Progressives argued that improvements in the status of women were necessary for social, political, and economic development, while urban elite and middle-class professional women protested their limited educational and vocational opportunities. Throughout the hemisphere, they expanded their professional associations through a series of women’s congresses encouraged and supported by the ICW, and they established several pan-American women’s associations. Latin American women relied upon these international connections because of the weak condition of democratic politics in their home countries. Universal male suffrage for Latin American men was rare until the 1910s and 1920s, and political circumstances frequently interfered with the exercise of this right.

As in Europe, debates about female suffrage often centered on the conservative influence of the Catholic church, and even many women’s
rights activists worried that enfranchising women would endanger other progressive reforms. Although Ecuador was the first Latin American country to grant women the vote in 1929, it was passed by conservative politicians who were confident of female support and limited to literate women. Thus many Latin American women’s rights activists initially prioritized education and other reforms and developed strongly maternalist arguments for suffrage that emphasized female difference, economic vulnerability, and contributions to social reforms. The Brazilian Federation for the Emancipation of Women (FBPF), formed in 1920 under the leadership of Bertha Lutz, articulated a broad program demanding civil rights and protective labor legislation for women. In addition to suffrage organization and publicity, female enfranchise in the small state of Rio Grande do Norte in 1927 established an important precedent, and a new electoral code enfranchising women under the same conditions as men was implemented in 1932.

The growing involvement of working-class women and socialists in populist political movements broadened public support for suffrage but did not guarantee women the vote. The 1917 Mexican Constitution granted major improvements in the rights of women and extended voting rights to all citizens, but women were excluded from that category. A counterrevolutionary coup in 1924 terminated a socialist experiment with woman suffrage in the state of Mérida. Encouraged by the election of Lázaro Cárdenas in 1934, Mexican suffragists renewed their efforts. With his support, an amendment passed both houses of the Mexican Congress in 1938, but stalled during the ratification process. Mexican women were not enfranchised until 1953. In Peru in the 1920s, women’s rights activists associated with the revolutionary Alianza Popular Revolucionaria Americana (APRA) coalition repressed their demands in favor of political solidarity with their male comrades. Expressing concern about Peruvian women’s dependence upon men, their general lack of education, and the influence of the Catholic church, they expressed only qualified support for limited female suffrage. The measure finally passed in 1955.

In contrast, influential Argentinian suffragists denounced the exclusion of women from political life and rejected the idea of restricted suffrage. The differences reflected conditions in the respective countries. The nations of the Southern Cone (Chile, Argentina, and Uruguay) had vigorous progressive movements and democratic traditions that supported women’s rights activism, but Peru and Colombia generally lacked these foundations. Although the small Colombian state of Vélez enfranchised women in 1927, the national supreme court annulled this action and subsequent constitutional reforms explicitly excluded women from voting. After 1948 a violent civil war delayed further progress until the Colombiant dictator, Gustavo Rojas Pinilla, granted female citizenship in 1954. Argentine men gained universal suffrage in 1912, and the state of San Juan enfranchised women in 1927 but the national government ended that experiment in 1930 and the senate continued to block woman suffrage bills. In 1947, the populist president, Juan Péron, and his wife, Eva, mobilized female support for the peronista cause, leading to the enfranchisement of Argentine women. Uruguay adopted universal male suffrage and other constitutional reforms in 1916. Uruguayan feminists stressed female difference, not gender equality, and the obligation of the state to protect vulnerable women. Their nonthreatening position gained the support of conservatives and the Catholic church, and in 1932 the senate approved woman suffrage without discussion. In 1920, Chilean men received universal suffrage and a supportive populist president was elected, stimulating the growth of middle-class women’s feminist and suffrage organizations. Literate Chilean women received municipal suffrage in 1934, but continuing political instability and conservative resistance delayed full suffrage until 1948.
In Asia, woman suffrage was also associated with progressive political movements. During the Japanese Meiji Restoration, the government’s rapid push for modernization led to greater opportunities for female education and vigorous public debate about democratic reforms, including woman suffrage. Women began to participate in political meetings and in a few towns they exercised the right to vote. Alarmed by this enthusiasm, the government granted limited suffrage to men and prohibited political activities by various groups, including women. Additional laws codified women’s proper role as a wife and mother with no legal rights independent of husbands. Efforts to contest these laws were encouraged by the Japanese WCTU (established in Tokyo in 1886), but the organization’s moral reform program challenged traditional values and generated controversy.

In 1921, the Japanese Women’s Suffrage Association was organized within the WCTU, but religious and political differences hampered coalitional efforts until 1924, when the Women’s Suffrage League was formed. In 1925, Japan authorized universal male suffrage, eliciting protests from Japanese women who were excluded. In 1930, a bill to grant women local suffrage passed the House of Representatives but was blocked by the conservative House of Peers. Larger political developments soon engulfed the movement: by 1931, Japan was at war with China and male support for suffrage was designed to win women’s patriotic cooperation in imperial expansionism. Many suffragists did not comply, adopting convention resolutions against fascism (1932) and reduced military spending (1933). After 1937, they stopped holding annual conventions, and the League disbanded in 1940. After the war, suffragists regrouped and successfully requested that the government support woman suffrage. Their demand was confirmed by General Douglas MacArthur and additional constitutional revisions in 1946 eliminated other gender inequities. Thus it would be misleading to conclude that Japanese women were “given” the vote by the American occupational regime without acknowledging their long struggle and quick action to gain their rights in the new political order.

As in Japan, a small number of educated, progressive Chinese women were intensely involved in the revolution that established the Republic of China in 1911. When the 1912 constitution excluded women from political participation, they immediately began lobbying, parading, and protesting, including attacks on parliament buildings in direct emulation of the British suffragettes. Their efforts ended when repressive new laws banned many democratic political activities and groups, including the Women’s Suffrage Alliance. As China descended into political chaos in the 1920s, suffragists focused on provinces that declared independence from the central government and implemented democratic reforms resulting in four provincial constitutions that guaranteed women equal political rights. In 1936, the draft constitution of the national government proposed “universal, equal, and direct suffrage,” but war intervened and the document did not become official until 1947. After the communists took over in 1949, they co-opted the narrative of women’s liberation, celebrating the achievements of communist women and eliminating the contributions of noncommunist suffragists from official histories.

After World War II, many nations passed voting rights for women, especially after the United Nations adopted the Universal Declaration of Human Rights in 1948. Oddly, Switzerland instituted universal male suffrage in 1848, but did not enfranchise women nationally until 1971 due to the decentralized nature of the Swiss canton system and deep conservatism in isolated areas. Suffrage activism began in the late nineteenth century, but sustained pressure by women’s groups, the Social Democratic party, and the trade unions was fruitless. After World War II, referenda failed repeatedly in most cantons. The 1971 referendum passed nationally with 66 percent of the vote, but several cantons still rejected it. Finally, in 1990 the federal supreme court ordered the last
hold-out (the canton of Appenzell) to comply with the federal constitution which guarantees equal rights to men and women.

In other areas, equal enfranchisement sometimes resulted from colonial rule but it was usually part of the decolonization process. Indian women gained suffrage under the Government of India Act of 1935, and this right was reaffirmed following independence by the 1949 Indian constitution. Universal suffrage generally accompanied decolonization in Africa. Technically, many Middle Eastern countries granted suffrage after World War II, but electoral participation is often limited. For example, in 2004 Saudi Arabia banned women from voting in the first national elections and their future inclusion remains uncertain. Factors that have worked in the past to disfranchise many people – including political instability, lack of commitment to or rejection of democratic principles, and racial and gender prejudices – are still powerful. Indigenous peoples, in particular, continue to struggle for inclusion in their national political systems despite policies and practices intended to marginalize them. Much current research on suffrage examines these exclusions, often within analyses of larger conceptions about the meaning of citizenship, because these remain highly significant and contested issues in the contemporary world.

Sendero Luminoso/Shining Path (Peru)
CYNTHIA MCCLINTOCK

Sendero Luminoso or “Shining Path” was an unforgiving Maoist rebellion that emerged in Peru’s remote, impoverished southern highlands and began violent attacks in 1980. Led by Abimael Guzmán, a former philosophy professor in the southern highlands town of Ayacucho, the Shining Path expanded across vast swathes of Peru and by the late 1980s and early 1990s was active in the capital, Lima. The conflict between the Shining Path and Peru’s security forces was the most violent in the country’s twentieth-century history; it was estimated that, by 2000, 69,200 people had been killed; 75 percent of the victims spoke the indigenous language, Quechua (CVR 2004).

The Shining Path was very different from other Latin American insurgencies. First, it was brutal; it was the perpetrator of the majority of the killings, 54 percent, versus the military’s 30 percent (CVR 2004). Sendero’s targets included not only soldiers and police but agronomists, journalists, teachers, nuns, priests, and even militants of left-wing and grassroots groups. Second, whereas most Latin American insurgencies were political movements with diverse factions, the Shining Path resembled a religious cult, whose deity was Guzmán. Also, most Latin American insurgencies were formed out of rage at repressive dictatorial regimes; but in 1980 Peru had just returned to elected civilian government. Further, support for the Shining Path from foreign countries was insignificant; its funds were derived from the drug trade.

For scholars, the puzzling question was: How could such a sectarian, savage movement have posed a threat to the Peruvian state? How did it gain 25,000 militants and the support of roughly 15 percent of Peruvians (McClintock 1998)? All analysts agreed that Peru’s society was deeply divided and that Peru’s indigenous peoples had long been excluded and impoverished; Peru’s truth and reconciliation commission emphasized these points. But why did Sendero emerge in the 1980s?

Challenging in particular the work of Theda Skocpol, Peru’s foremost analysts advanced a voluntarist explanation; they highlighted the importance of Guzmán’s leadership and the character of the revolutionary organization itself (Degregori 1994; Gorriti 1999). Gorriti emphasized Guzmán’s image as a brilliant intellectual; dubbing himself the “Fourth Sword of Marxism” (the first three being Marx, Lenin, and Mao), Guzmán appeared to be a “philosopher-king” and, in a country whose indigenous peoples traditionally revered the sun, the “Puka Inti” (“Red Sun”) (Gorriti 1999). Degregori emphasized that the teachers and students in Peru’s southern highlands were at this time painfully distancing themselves from their traditional peasant communities and were yet excluded from “modern” Peru; in the Shining Path’s rigid ideology and strictly hierarchical organization they found solace (Degregori 1994).

As Sendero expanded into more prosperous regions of Peru, scholars began to emphasize the interplay between economic and political factors (McClintock 1998; Taylor 2006). With respect to the scholarly debate between Theda Skocpol and James Scott about the significance of economic factors to peasant rebellion, McClintock and Taylor sided with Scott: a real threat to peasants’ subsistence and a dramatic erosion of Peruvian living standards were catalysts to Peru’s rebellion (McClintock 1998; Taylor 2006). In turn, the economic devastation eroded state legitimacy and created opportunities for a shrewd revolutionary organization; Sendero’s actions provoked human rights abuses, which further delegitimated the state (Taylor 1996; McClintock 1998).
In 1992, Guzmán was captured at his Lima hideout by a specially-formed elite police-intelligence squad. Although Alberto Fujimori was president at the time and took credit for the capture, the successful police intelligence squad had been formed by his predecessor, Alan García. Scholars concur that his capture was pivotal to turning the tide of the war. Immediately, Guzmán’s charismatic image was punctured; behind bars, he was revealed not as a deity but a paunchy middle-aged man with a ragged beard and thick glasses. Scholars also agree that, by this time, Sendero was losing support in the highlands; its brutality was alienating peasants at the same time that the security forces’ human rights violations were reduced. In part as a result, many peasants were inclined to join government-sponsored armed self-defense patrols, called rondas campesinas, and these were also important to Sendero’s defeat. Much more controversial was the draconian antiterrorist legislation and repression, especially in universities, under the Fujimori government (1990–2000).

By the mid-1990s, Sendero was decimated. In the new millennium, remnants of Sendero continued to operate, but virtually exclusively in Peru’s coca-producing areas. The raison d’être for these Senderista groups was not ideology but cash from the drug trade.

For highland Peruvians and for scholars, the most important questions in the new millennium were whether or not the community members on different sides in the war could reconcile and whether or not victims’ families could be compensated in a meaningful way. At the same time that these questions loomed, the vast majority of Peruvians were tremendously relieved that “the time of fear” had ended.

Symbolic crusades
SHAUNA A. MORIMOTO and STEVEN WORDEN

Looking back from today’s diverse and fluid society, American theorists in the first half of the twentieth century appear to have been unduly narrow in their collective action theorizing. Early studies addressed primarily instrumentally oriented forms of collective action. Specifically, research focused on those that sought mainly to advance or defend the tangible economic or political interests of their adherents. Analysts dismissed noneconomic or nonclass-related struggles as trivial, epiphenomenal, or expressions of personal pathologies. Thus, theorists offered few frameworks equipped to analyze struggles to reform or ban noneconomic practices and preferences, especially those that did not appear to directly affect the activists themselves.

Yet the question remained unasked: Why would people form movements aimed at abolishing or drastically altering certain practices, especially when participants personally seemed to have little or nothing to lose by the persistence of the targeted practices? Such neglect was peculiar especially in light of America’s rich history of general reform movements: the abolitionist movement, the temperance movement, antipornography movements, various public education reform movements, sundry health fads, and the long tradition of anti-animal cruelty movements.

In the mid-1950s, Joseph Gusfield began redress this neglect with his initial theorizing of the “symbolic crusade.” According to Gusfield (1963) symbolic crusades are movements that do not seek utilitarian or instrumental outcomes, but instead focus on reforming or restricting behavior for the symbolic purposes of enhancing activists’ status or prestige. Although Gusfield’s formulation has been critiqued, theorizing the symbolic aspects of collective action represented an important shift in understanding social movements.

ROOTS OF THE THEORY

In his early research on the Women’s Christian Temperance Union, Gusfield documented the organizational effects of a slide in the prestige formerly enjoyed by advocates of abstinence, as they went from being admired as bold humanitarian reformers to being regarded as figures of ridicule. Gusfield further elaborated this theme of loss of status group prestige in the context of social change in his seminal work, Symbolic Crusade: Status Politics and the American Temperance Movement. In this work, he most fully formulated a theory of disinterested, noneconomically instrumental movements.

BASICS OF THE THEORY

Drawing upon Max Weber’s concept of social status, Gusfield argued that just as social class exists in a stratified system, social status is similarly stratified and allocated. Status groups exist as they set themselves apart from other status groups on the basis of common values, moral standards, and consumption patterns such as housing, transportation, and leisure activities. But, as Gusfield pointed out, whereas class is manifested in control and power, prestige is communicated through the giving and receiving of acts of deference on the basis of a way of life. Thus, status groups establish themselves in a hierarchy as deference is accorded to the distinctive values, customs, and habits associated with status groups. Such customs, habits, and styles of life, in turn, also serve to identify membership within a status group. But as society changes, members of a status group may find themselves not sufficiently respected for their way of life.
When one group’s “status discontents,” as Gusfield termed them, perceive that another group is withholding the respect, admiration, and approval that they believe is their group’s due, they may attempt to assert their position in the hierarchy through ceremonies of symbolic defense. Status discontents may contend with other status groups in the political arena, competing over the allocation of prestige through the legislative or judicial process. In such instances, one status group may struggle to formally institutionalize their own values over others, through the passage of legislation. Gusfield terms such activities “status politics.” Understandably, the political arena is an especially valuable resource for status discontents’ negotiating of social status. Indeed, laws help us determine what is culturally acceptable and shape values.

Symbolic crusade theorists would cite instances of status politics as actions by status discontents to increase the allocation of approval and admiration that they feel their status groups’ values deserve. Thus, Gusfield would consider these results as status movements’ successes undertaken on behalf of status communities or status collectivities.

Gusfield’s contribution to social movement theorizing was to see these efforts in their full dramatictistic significance as they were performed in the highly visible theater of state politics. On that stage, symbolic acts take place that confer legitimacy and prestige on selected status communities and correspondingly lower the prestige of others. Situating his perspective in the dramatistic perspective of Kenneth Burke, Susanne Langer, Clifford Geertz, Erving Goffman, Murray Edelman, and Hugh D. Duncan, Gusfield identified the state as the crucial venue in which status communities carry out the performance of dominance and recognition. As he noted: “Issues which seem foolish or impractical items are often important for what they symbolize about the style or culture which is being recognized or derogated. Being acts of deference or degradation, the individual finds in governmental action that his own perceptions of his status in the society are confirmed or rejected” (Gusfield 1963: 11).

Prior to Gusfield’s work, theorists simplistically dismissed the entry of status movements into the political sphere as anomalous expressions of irrational or paranoid fringe groups or of neurotic individuals caught up in overly emotional expressive movements. Such was especially the case when the groups were religiously affiliated, or culturally and politically conservative (Hofstader 1964).

APPLICATIONS OF SYMBOLIC CRUSADE THEORY

In the case of the temperance movement, Gusfield traced its origins to the decline in prestige and influence of the lifestyle of rural American Protestants vis-à-vis other emerging groups, namely the urban Catholic “indulgent” working class. In response, many adherents of the threatened status group fought to reassert the dominance of their lifestyle by pressing for adherence to its values regarding alcohol consumption. But the movement’s antialcohol orientation was not simply a statement of preferences regarding beverages; more importantly, it provided the symbolic means for proclaiming one’s membership in a status group that valued self-control and industriousness. Furthermore, the fact that Prohibition was essentially unenforceable was of small consequence to the crusaders. What was important was that other rival status groups had to modify their drinking habits according to “our” law. Gusfield thus saw the goal of the temperance movement as being more symbolic than instrumental or utilitarian.

Other social movements, such as anti-pornography crusades in the US and nuclear disarmament campaigns in the UK, have been studied as symbolic crusades (Parkin 1968; Zurcher & Kirkpatrick 1976). Zurcher and Kirkpatrick (1976), for example, argue that working-class antipornography activists had achieved high status by generating high incomes. Because their occupational status
was inconsistent with their pay rates, they turned their attention to antipornography as a symbolic crusade to maintain their high economic rewards despite their lower status work. Importantly, this crusade propelled antipornography activists to a moral high ground, and demonstrated the righteousness of their social status.

CRITIQUES OF SYMBOLIC CRUSADES

There have been significant critiques of Gusfield’s work on symbolic crusades, and the framing of social movements based on the idea of maintaining status and prestige (Wal- lis 1977). One concern is with the ideological underpinnings of the theory. Because the theory is applied to moral crusades that reinforce the status quo, symbolic crusaders are thought to have “ulterior” motives which the theory seeks to expose. Conversely, the instrumental goals of progressive movements are accepted and understood. However, because reform is central to symbolic crusades, the theory may well be applicable only to more conservative movements.

Other critiques focus more squarely on the formulation of status, on the one hand, and symbolic goals on the other. With regard to status concerns, critics point out that such movements may be more focused on maintaining culture, lifestyle, or values rather than status (Wood & Hughes 1984). For example, the temperance movement has also been interpreted as a way for business and religious leaders to deal with the social problem of drunkenness in the developing Americas (Rorabaugh 1979; Tyrell 1979). Wood and Hughes (1984) argue that culture, ideology, and beliefs drive moral movements directly, rather than these being secondary to the overarching concern of the loss of group status.

In a related critique, some have suggested that symbolic goals cannot be easily disaggregated from instrumental objectives. Beisel (1990), for example, points out that Gusfield, and others working within the framework of symbolic crusades, separate class from status. This, however, overlooks the important ways that class and culture are linked, and not just to material gains. Indeed, Beisel (1990) argues that the strength of urban antivice movements in the late 1800s varied by levels of class cohesion. She finds that crusades over moral reform were a way that elite social classes struggled to uphold their lifestyle and transmit culture to younger generations, hence connecting symbolic, status, and economic concerns.

SYMBOLIC CRUSADES IN CURRENT CONTEXTS

These critiques notwithstanding, or even perhaps because of them, Gusfield’s work continues to have an enduring influence. First, by theorizing symbolic meanings, Gusfield offered an alternative way to view fervor behind collective action. Instead of being merely concerned with economic or political gains, status and symbolic meanings are important to social movement actors. This has influenced how sociologists understand phenomena such as moral panics against groups that pose threats to society (Cohen 1972). Examination of moral panics has been particularly significant in examinations of youth culture, including analysis of comic books, music, and video games (Binder 1993; McRobbie & Thornton 1995; Lopes 2006). Further, lifestyle and cultural concerns have advanced understanding of social movements that combine political, economic, and cultural concerns. Luker (1984), for example, argues that the ongoing conflict between pro-life and pro-choice activists is driven by concerns over gender, class, and lifestyle. While middle-class women see motherhood and career as choices and support legalized abortion, working-class women view motherhood as a master status and hence wish to repeal abortion rights. From the perspective of social movement research, Luker’s analysis shows how both instrumental and symbolic concerns are central to moral reform movements.
Second, being attentive to the symbolic meanings of collective action offers greater insight into the contingent and contested nature of social movements. Thus social movements are not just viewed linearly, but as an emergent and changing process that varies with social actors and depends on the changing social environment. This is particularly useful when examining the success of social movements, and whether or not countermovements arise in response to organized social action (Meyer & Staggenborg 1996).

Third, stressing the importance of collective action for symbolic gains led researchers to consider issues such as social movement framing and dramatization. By recognizing the emotionally charged nature of reform movements, scholars are now especially attentive to the ways discursive practices influence culture, social norms, and values. How social movements are framed, dramatized, and represent collective social values has implications for the ultimate success in garnering support for social movements. Thus, in the US, rural interests oppose urbanites and government in concerns over logging, while Canadians celebrate “timber culture” to oppose environmentalists (Meyer & Staggenborg, 1996). Beyond simply theorizing framing, scholars are also now attentive to the media and discursive strategies of social movement organizations.

Tepper (2009) argues that symbolic crusades remain central to understanding both regulation and the movements of oppositional culture. Rather than being dramatic, emotional, and highly visible “crusades,” however, reform of “immoral” lifestyle choices has morphed into “quiet regulation.” In studying raves in Chicago, he argues that regulation in the contemporary era relies on the discourse of danger (particularly to youth) through bureaucratic channels. While no less concerned about upholding the status quo against moral threats, reform has shifted to administering laws and ordinances instead of garnering broad-based concern or moral outrage. Importantly, being out of the limelight allows this type of symbolic crusade to undermine the potential for groups to organize in opposition to the reform. Tepper (2009) suggests that it is important to remain attentive to symbolic crusades, especially in their quiet and regulatory form.

CONCLUSION

Today we see a plethora of political acts taken that result in days or streets being formally designated to honor status groups’ heroes, months honoring particular groups’ histories, and festivals commemorating specific groups’ contributions to the national heritage. Activists get laws passed to save old growth timber, prevent drilling in Alaska, censor art and music, and outlaw cockfighting, flag-burning, and the hunting of baby seals. In effect, laws come to define the culturally acceptable.

The concept of symbolic crusades thus remains important in understanding the dynamics of social movements and collective action. Indeed, being attentive to symbolic meanings, dramatization, and status pointed scholars to new ways to look at social regulation, reform, and social change. Such considerations offered insight into social movements as much more complex and nuanced than analyses that focused exclusively on the political and material gains of adherents. Whether one finds Gusfield’s theory fully applicable to contemporary analysis, there is little question but that examination of the symbolic and cultural meaning of social movements remains a fruitful and even necessary area of sociological investigation.

Taiping Rebellion (China)
YANG ZHANG

Lasting from 1850 to 1864, the Taiping Rebellion was the biggest social rebellion of China’s imperial era and probably the most violent rebellion in world history, measured by the number of casualties. Led by Christian convert Hong Xiuquan, the rebels uprose in Guangxi province, next to Canton, established the Taiping Heavenly Kingdom (“Heavenly Kingdom of Great Peace”), and controlled large parts of southern China. The rebellion swept across most parts of the Qing Empire’s 18 inner provinces, involved around 5 million troops, and killed more than 20 million people (Cao 2001: 553). The Taiping Rebellion is also well known for its charismatic leadership, Christian ideology, anti-Manchu nationalism, and radical social reform. Despite its final failure, the rebellion directly influenced the Qing Empire’s military, administrative, and fiscal structure and central–regional relationship.

The Taiping Rebellion was rooted in the social disruption and rebellious turbulence which had developed since the late 1840s, which was triggered by several social-structural factors including both long-term changes and abrupt social dislocations. Above all, population grew steadily from 160 million in 1680 to 430 million in 1850 (Cao 2001: 703–704, 706–707), and thus overstretched the Qing Empire’s agrarian economy and caused serious land annexation and elite competition. Second, the Qing Empire’s annual revenue had not increased since 1750 and its silver stock accumulated in its golden age during the eighteenth century had been exhausted by the Lotus Rebellion between 1796 and 1804. This fiscal distress could not sustain the empire’s operation. Third, due to the increasing opium trade, especially from the late 1820s, Chinese society incurred serious silver shortages each year until 1852 and witnessed economic recession from the late 1830s to 1850. Almost 200 million silver dollars flew out of China and drove silver inflation alongside deep copper devaluation and price deflation. This worsened the livelihood of peasants, small landlords, and artisans since they earned in copper, yet paid taxes and bought production means in silver. Millions of peasants and artisans were bankrupted. Several natural disasters during the 1840s further drove the poor to become a floating population, and some became bandits. Last, Chinese secret societies combined folk religion and anti-Manchu nationalism, developed translocal networks and organizations, spread over south China, and drove the Qing Empire to scatter its troops and fiscal resources.

In this specific Chinese social disruption, the Taiping uprising was further facilitated by its social-spatial environment. In both Guangdong and Guangxi, there were continuing conflicts between the “natives” and the “guest settlers” who migrated from north China. In the nineteenth century, tensions were sharpened since the guest settlers took up Christianity and attacked the natives for their superstition, while Confucian bureaucrats and natives despised guest settlers’ foreign faith. Hong Xiuquan, a guest-settler yeoman’s son, after repeatedly failing civil service examinations between 1827 and 1843, accepted Christianity, claimed himself as the younger brother of Jesus, and recruited several Taiping leaders, such as Feng Yunshan. They preached to other guest settlers in mountainous areas of Guangxi and attracted thousands of believers until 1847.

Triggered by several conflicts between the Christians and local Confucian gentries, especially during Feng’s detention between December 1847 and June 1848, Taiping leaders began to plan armed rebellion. At that time, Guangxi’s standard army paid most of their attention to other rebellions inspired by folk religions, and so did not notice the mobilization of Taiping
organizations. Between November 1850 and January 1851, about 20,000 followers from different parts of Guangxi and Guangdong region arrived at Jintian, Guangxi to join the uprising and the founding of the Heavenly Kingdom on January 11, 1851.

The Taiping rebels began to fight with the Qing troops and local militias organized by Confucian gentries in Guangxi, and then marched into Hunan and Hubei provinces along the Yangtze River between June 1852 and January 1853. In January 1853, they captured Wuchang, the capital of Hubei province, and developed a troop of 500,000 soldiers by affiliating with other traditional rebels and enlisting poor peasants and artisans. They marched quickly east along the Yangtze and occupied Nanjing, a very important city of populous, prosperous southern China, in March 1853. They then made Nanjing the Heavenly capital, territorialized its regime, and controlled several areas in the Yangtze Delta.

From March 1853 to the fall of Nanjing in 1864, there were numerous, large-scale, and fierce military conflicts. After defeating Taiping’s northern and western expeditions in 1853–1856, the Qing Empire reorganized its army, largely by creating local gentry-led self-defense militias in all warring provinces to replace the failed standing army (Kuhn 1967). While the Qing had to rely on them to fight the Taiping rebels and thus decentralize its military, fiscal, and administrative structure, the Chinese gentries also had very strong incentives to annihilate Taiping for its anti-Confucian ideology. On the other side, Taiping was weakened by its brutal internal factional conflicts in Nanjing in 1856. After several wars between Taiping and provincial militias as well as foreign mercenaries between 1857 and 1864, Nanjing finally fell and Taiping was suppressed in July 1864.

Taiping was important for its revolutionary yet ambiguous ideologies and institutions. It combined Christian religion, anti-Manchu nationalism, and radical socioeconomic thoughts, and claimed to build an equitable society (Jen 1973), yet also made use of Chou-li, an ancient Confucian moral creed (Shih 1966). Taiping Heavenly Kingdom announced social reforms, including land reform, prohibition of private trade, a ban on opium smoking, the abolition of foot binding, and strict separation of the sexes, but few of them were effectively carried out even in its urban bases. Claiming equality in the beginning, Taiping nevertheless established a theocratic, and highly bureaucratic, militarized rule over land in its control (Michael 1970).

Its political ideal was further damaged by extensive corruption, brutal factional conflicts among its leaders, and clientelism within its military and administration.

Despite its final collapse, Taiping facilitated several other great rebellions (especially the Nien and Moslem Rebellions) between the 1850s and 1870s, since the Qing Empire paid most attention to Taiping. Those rebellions cost the Qing almost 1 billion tael silver (20 times its annual revenue), resulted in the disintegration of its governmental structure and the rise of Han bureaucrats’ political power, and finally led to the rise of provincial warlords in 1890s and contributed to the downfall of the Qing Empire in 1911. Owing to its anti-Manchu nationalism and radical socioeconomic claims, the Taiping Rebellion has also been broadly seen as the forerunner of the later Nationalist Revolution of 1911 and the Communist Revolution.

Kuhn, P.A. (1970) Rebellion and Its Enemies in Late Imperial China: Militarization and Social

Taiwan Independent Movement
FU-CHANG WANG

The Taiwan Independent Movement (TIM) refers to collective, organized efforts to establish a sovereign Taiwan independent of China. Since the seventeenth century, Taiwan has been closely related to China. The western part of Taiwan became part of Chinese territory in 1684 after Qing troops defeated Koxinga, a Ming dynasty loyalist who drove away the Dutch colonialists in 1662 and used Taiwan as a base for his military campaign against Qing dynasty rulers. Taiwan was ceded to Japan in 1895 by the Qing dynasty in the Treaty of Shimonoseki that followed the 1894 Sino-Japanese War and was returned to Chinese rule again in 1945 after World War II. Since the seventeenth century, many Chinese Han migrants have settled in Taiwan, constituting more than 95 percent of the island’s population by 1905, according to the Japanese census. Advocates of TIM, however, claimed that after 51 years of Japanese rule the Taiwanese had evolved into a nation different from China. The TIM claim was contested by the Chinese Communist Party (CCP) regime and the Kuomintang (KMT, literally “Nationalist Party”) regime, which relocated to Taiwan after the former took over the Chinese mainland in 1949. Both the CCP and the KMT claimed that Taiwan had been a part of China since ancient times.

Although the idea of a unique Taiwan nation was first conceived in the 1920s, a political movement to advocate for an independent Taiwan did not emerge until 1947, when the new Chinese rulers’ actions resulted in an island-wide protest in the so-called “February 28th Incident” (Kerr 1965; Lai, Myers, & Wei 1991). Before 1990, however, TIM was strictly prohibited in Taiwan and advocated openly only abroad, especially in Japan and the US. The first notable TIM organization emerged when Thomas Liao (Liao Wen-yi 廖文毅) announced the establishment of the Provisional Government of Republic of Formosa on the ninth anniversary of the February 28 Incident in Tokyo in 1956 (Chang, Hu, & Tseng 2000). Liao served as president of the exile government and openly promoted the TIM within the international community, but met with little success. After the KMT regime coerced Liao to return to Taiwan on May 1965 and forced him to publicly denounce the movement, TIM’s major base moved to the US. In June 1966, the United Formosans in America for Independence (UFAI) was formed in Philadelphia. In January 1970, the most important umbrella TIM organization overseas, the World United Formosans for Independence (WUFI), was established in New York by collaborating among the TIM organizations in Japan, the US, Europe, and Canada. The WUFI began to use conventional measures, including lobbying and demonstrations, and radical measures, including attempted assassination and bombing, to promote its cause (Chen 2006: 204–212). The WUFI moved back to Taiwan in 1991 after legal restrictions on TIM’s public campaign were abolished.

Given the KMT regime’s strict regulations and repression, no organization openly promoted the TIM inside Taiwan until the Presbyterian Church of Taiwan made a public announcement in 1977 to demand that a new and independent nation be formed, though some underground TIM activities did take place in the 1950s and 1960s. For instance, Ming-min Peng and his students prepared a manifesto titled “A Declaration of Formosan Self-Salvation,” but were arrested before they could distribute it (Peng 1972: 121–131). The Democratic Progressive Party (DPP), a champion for Taiwan’s democratic movement, was the first political party to offer public support for TIM, in 1987, in the name of freedom of
speech. The DPP later included the demands of Taiwan Independence in its party outline in 1991. Given the public controversy surrounding TIM, however, the DPP did not rank the TIM agenda as a high priority in its platform. In 1996, some radical members left the DPP and established the Taiwan Independence Party (TIP 建國黨) out of their disappointment over the DPP’s pragmatic turn on the TIM issue. Even after the DPP won the presidential election in 2000, it still did not actively pursue the TIM agenda; instead, it claimed that Taiwan was already in a de facto state of independence, and hence there was no need to declare de jure independence, for both internal and external reasons.

The domestic dispute over TIM has several causes. First, because most Han Taiwanese have Chinese ancestors, TIM advocates had difficulty convincing people that the Taiwanese had become a different nation. What’s more, early TIM activists’ concept of the Taiwan nation did not include the Chinese mainlanders who migrated to Taiwan after 1945. Rather, TIM supporters regarded the 1.2 million mainlanders (14–15% of Taiwan’s population during the 1950s) as members of the Chinese nation and Taiwan’s oppressors. After the 1970s, such an exclusionary concept of the Taiwanese nation became problematic as more second-generation mainlanders began to identify with Taiwan, especially after they were treated like strangers in their supposed fatherland when they were allowed to visit China after 1987. A multiethnic nationalism claiming that all ethnic groups in Taiwan, including mainlanders, are part of the Taiwanese nation emerged to replace the previous ethnic nationalism after 1990 (Schubert 1999; Chang 2000; Wong 2001). Most mainlanders, and some Taiwanese of different ethnic backgrounds, however, still could not accept TIM.

The external factor played an even more significant role. After 1990, TIM supporters began to regard the CCP regime as the Taiwanese nation’s new oppressor, as China has threatened to use military means to prevent Taiwan from declaring independence. The threat is quite real, as China still deploys over 1000 missiles targeting Taiwan along the coast. The TIM thus receives mixed support from the Taiwanese people, as they were, and still are, quite divided over interpretations of Taiwan’s historical connection with China, their familial relations with China, perceptions of Taiwan’s de facto status, and their preferred pattern of future relations with China.

Temperance movements
SHARON S. OSELIN

The temperance movement in the US encompassed a long and tumultuous historical period spanning from the 1820s to the passing of National Prohibition in 1919, and, some argue, has reemerged more recently. In studying this movement, scholars are able to examine how a confluence of political and social goals fuels and sustains mobilization. The temperance movement was a morality-based movement, focused on issues of vice among the American population, which activists felt were indicative of the demise of a collective moral fiber. Wagner (1997) proposed that this perspective underscored a national ideology that was embedded within a specific cultural and political context. Those who comprised this movement were largely upper and middle class Protestants, with a strong base in the Midwest and New England (Gusfield 1986). Through the social construction of actions that constitute vice activities, seen as a “social problem,” powerful groups also designated a target population for the many social ills assumed to be connected to these behaviors. The growing numbers of immigrants – Irish, Germans, and Italians – were held particularly responsible for the pervasiveness of vice practices. They were also groups who were slow to support temperance movement agendas, which further demonized them.

The temperance and vice movement, however, not only focused on the consumption of alcohol, as many people assume, but cast a wider net to target additional forms of vice – such as prostitution, smoking, venereal disease – that in turn spawned multiple overlapping social movements. These movements include the vice and vigilance movement, the antipornography movement, the hygiene movement, and antismoking movement. All of these movements shared the similar objectives of changing individual behaviors with the intention to bring about societal transformation.

While the central goal of the temperance movement was to change individual behaviors through the enactment and passing of laws that enforced these restrictions, its goals also served to carry out other social and cultural functions, such as reinforcing differences between categories of people along ethnic, class, and immigrant lines and securing status among particular groups. It was this intense scrutiny of behavior which helped differentiate status among citizens; thus abstinence from a myriad of social practices served as status markers that were particularly heralded and enforced by the middle-class communities. Indeed, those who complied were thought to embody esteemed auxiliary traits, such as self-control and industriousness (Gusfield 1986). Conversely, individuals who were unable or refused to conform to these behavioral performances and corresponding ideology were “lowlifes” who constituted an undesirable low status group. Prohibitions against “vice” activities became socially constructed and maintained among powerful groups in society, and the most significant accomplishment of this movement was evident in the passing of National Prohibition in 1921.

The propelling force behind this movement was a well-defined sense of morality among American Protestants. Thus, it is not surprising that the practice of denouncing moral “inferiors” and heralding those who complied with moral virtues produced widespread moral crusades against drinking alcohol as well as other vice activities (Morone 2003). Stemming from ideas about salvation and repentance based in Puritanical beliefs, the adherents of the temperance movement viewed individual actions as a reflection on the wider community. Accordingly, supporters of this cause proposed that personal practices of vice in turn diminished

their community. A “good” society provides instructions and discipline regulating behaviors of vice. The demarcation of the populations assumed to be responsible for vice was especially effected by the law and demonized by its supporters. Not only were these groups considered less refined but they were also largely situated within the lower class strata of society.

Middle-class white women, thought to be paragons of virtue and morality, performed a central role in mobilization and the use of tactics in the latter part of the nineteenth century for the temperance and vice movement. Indeed, it was these women who comprised the Women’s Christian Temperance Union (WCTU) and engaged in a myriad of public tactics and strategies in order to elicit awareness and garner public support for their cause. For example, some of their acts included street demonstrations and visits to local saloons armed with bibles as they sang hymns. When they were turned out of these businesses, this small group of women in Ohio in 1873 dramatically knelt in the snow and prayed for the sinners inside (Morone 2003). More importantly, the WCTU helped launch the massive women’s movement that took up a variety of causes beyond prohibition in the nineteenth and twentieth centuries that directly influenced women, including women’s suffrage, good hygiene, daycare for children, and sexual purity.

The issue of sexual purity was of paramount concern for the women’s movement in the early twentieth century. As a result, sexual chastity was emphasized while prostitution and pornography were identified as temptations that threatened the moral fiber of upstanding citizens and many middle-class marriages. These Victorian-based notions sustained perceptions about the dangers of rampant lust and women’s virtue within American society. In fact, it was expected that women’s roles revolve around motherhood and domesticity as these private spheres were thought to keep women pure. The women who did not embrace this role were stigmatized and held responsible for promoting social ills.

At the height of the temperance movement, prostitutes were especially demonized for their direct assault against feminine virtues. Indeed, many of these same notions still linger today surrounding women’s sexual practices, and therefore their behaviors are continually scrutinized according to these codes of conduct. Weitzer (2007) argues that moral crusades against prostitution are still ongoing in the twenty-first century, which not only promote expectations of virtue surrounding women’s sexual behaviors but also actively mobilize groups of citizens to shape and influence relevant laws. These laws (and social opinion) therefore inform police interactions with sex workers, which ultimately uphold containment strategies where street prostitutes are punished for their noncompliance with prevalent gender codes of conduct.

In one scholarly endeavor, Reckless (1933) analyzed the transformations of vice in Chicago during the early part of the twentieth century. As a result of the temperance and vice movements during this time, he found that many of the “redlight” district activities and establishments were closed. Yet, interestingly, he notes an upsurge in the number of clandestine businesses throughout the city, such as cabarets, roadhouses, and taxi-dance halls. His findings suggest laws did not greatly dampen acts of prostitution in terms of numbers but rather simply encouraged different forms of prostitution (indoor sex work) to blossom.

In a related vein, pornography was also tapped as a threat to sexual purity. Like the purity movement, the antipornography movement comprised its own movement but was also subsumed within the broader vice and temperance movement. The movement adherents deem the viewing of pornography as a social problem largely due to the challenges these acts present to the status quo (Zurcher & Kirkpatrick 1976). In fact, supporters perceived such “illicit” practices posed threats to the middle-class status and way of life, beliefs which led to the mobilization of the antivice movement generally.
The hygiene movement stemmed from the purity movement in that the two eventually became synonymous due to having very similar agendas – to create social and legal change in order to uphold a particular set of morals and to stop the spread of venereal diseases. The movement also had a secondary agenda to protect girls and women from sexual exploitation, which was exacerbated by rampant fears of sex slavery (Pivar 2002).

Although these campaigns were often at least temporarily successful in the increased prosecution of prostitutes and pornography (although there was variation by state), the degree to which the practices decreased remains unknown as they often occurred clandestinely. In contrast, the temperance and vice movement can be considered a success in that it accomplished one tangible goal – to enact laws that made drinking alcohol a crime and consequently altered social practices. And even while Prohibition ended in 1933, some argue it had long-term effects on American culture. For example, Americans did not return to their pre-Prohibition drinking levels until 1971 (Burnham 1968).

Some scholars make the case that there is a new temperance movement which emerged in response to the 1960s, a time period laden with “behavioral crises,” filled with sex, drugs, and challenges to authority (Wagner 1997). Indeed, it was during the 1960s and 1970s that many in the American middle class perceived this breakdown in norms and morality as indicative of a serious cultural and societal problem. Yet, it is also arguable that it was the middle-class fear of slipping into downward mobility that bolstered their commitment to this particular ideology, which upheld class differentiation. The practices of drinking, drug use, and sexual promiscuity posed a threat to their way of life, and the reassertion of abstinence and outward rejection of these “licentious” behaviors underscored middle-class status cues. For example, Zurcher and Kirkpatrick (1976) note that the revival of the antipornography movement in the late 1960s, which surfaced across the US, was fueled by these very principles and beliefs.

From this vantage point, it can be argued that there is a new temperance movement among the middle class, which functions as before to protect and preserve their cultural, social, and economic position. Overall, the reiteration of this ideology not only demarcates appropriate behaviors surrounding issues of “vice” but also underscores the power, resiliency, and commitment of the American Protestant middle class to extant norms which uphold their status.

REFERENCES AND SUGGESTED READINGS

Terrorism has been a hotly contested phenomenon for centuries. The term first came to be used to describe the Terror of the French Revolutionary government of the late eighteenth century, although the principle of spreading terror through violence for political ends is much older. Since then, the term has come to focus on nonstate actors, from the anarchist militants of the late nineteenth century, through the nationalist anticolonial movements of the mid-twentieth, to the leftist, rightist, religio-nationalist, and religious groups of the late twentieth and early twenty-first centuries. Since the September 11 attacks on the World Trade Centre and the Pentagon in New York and Washington DC, the term has become particularly ubiquitous. From media coverage to literary and film subgenres and academe, terrorism, terrorists, and terrorist movements fascinate as much as they appall. Why do individuals, movements, or states turn to terrorism? Under what circumstances do they move away from it? Are they driven by ideology? By political or economic exclusion?

CONCEPTUALIZATION

Before discussing “terrorist movements,” it is important to unpack the term “terrorism.” In traditional terrorism studies, terrorism is considered a brute fact, an objective phenomenon, independent from the person describing it. While there has been a heated (and as yet unresolved) debate over how exactly to define terrorism, and while it is recognized in these circles that who or what is labeled “terrorist” is influenced by political agendas, traditional terrorism scholars take for granted that there are certain actions and actors which are inherently “terrorist,” and can be unproblematically labeled thus. Amongst critical scholars, by contrast, “terrorism” is considered a social construct, a phenomenon that derives its meaning in large part from its description as “terrorist.” This is not to deny the brutality and suffering that such violence causes; far from it. Rather, it is to underline the intensely political nature of the term “terrorism” and the way it is used to legitimize the violence carried out by (usually) states and their allies, and delegitimize the violence (and much else) carried out by their opponents (Jackson et al. 2011; for a critique see Horgan & Boyle 2007).

To illustrate the subjectivity of the term, one has only to look at the heated debates over who is labeled a terrorist in the Middle East, with Israel and the West labeling groups such as Hamas and Hezbollah “terrorist,” while Hamas, Hezbollah, and many ordinary Arabs return the compliment by tar-ring what Israel and the US-led coalitions in Iraq and Afghanistan do with the same brush. One can, of course, counter that this is mere political point-scoring, and that the task of academics is to apply an agreed-upon definition objectively and systematically across the board (cf. Ganor n.d.).

There are, however, a number of problems with the term “terrorism” (Jackson et al. 2011). First, it has become profoundly pejorative and normatively laden. “Terrorism,” as Richardson (2006: 19) observed, “is something the bad guys do.” This inhibits neutral analysis, and led Schmid and Jongman (1988: 182) to lament in the 1980s that terrorism studies are “counterinsurgency masquerading as political science” – although the field has since improved. Second, precisely because of its pejorative effect, the term has been so overstretched to condemn such a variety of actors that it has become almost meaningless. What, after all, do Greenpeace (“ecoterrorists”) and al-Qaeda have in common? Third, and more fundamentally, the term is “ontologically unstable,” as
it is not only subjective but also contextually contingent, in other words “subject to historical and political trends . . . and the perceptions, beliefs and values of the person defining it” (Jackson et al. 2011: 103–104). Terrorism, as we have seen, has evolved with the times from describing acts of state violence during the French Revolution to describing violence carried out primarily by nonstate actors. It draws heavily on particular, historically bound conceptions of the state and its relationship with society, and would lose much of its force without the (modern) concept of noncombatant immunity. The decision of which groups to include in (academic) “terrorist” databases is profoundly affected by the political and legal climate of the day. Once a group is labeled “terrorist,” all its (violent) actions are included in the database, regardless of whether they are strictly “terroristic” – think of a Hamas attack on an Israeli tank in combat inside the Gaza Strip, or an IRA skirmish with British soldiers in Northern Ireland, both of which can be described as guerrilla tactics in an asymmetric war. Liberal states and their allies are usually excluded from such databases, even if they have been involved in, or sponsored, acts that could be described as terrorist. Sowing terror in a wider audience beyond the immediate victims for political goals – one of the key ingredients in most terrorism definitions – is not confined to what is conventionally called “terrorism,” but is widely practiced in warfare and politically minded criminal circles, for instance, yet convention usually stops us from labeling it thus.

Even if the term is more precisely defined and used as neutrally as humanly possible, the way “terrorism” is used is problematic for two further reasons. By grouping together movements or individuals simply on the ground that they share a set of tactics at a particular point in time, one creates an illusion of homogeneity where none exists (Toros & Gunning 2009). What, after all, do the Allied Forces bombing Dresden (a coalition of state armed forces), the Tamil Tigers (a nationalist, mass-based guerrilla group), al-Qaeda (a loose transnational network of small cells) and the Unabomber (a lone individual) have in common, beyond using broadly similar tactics? Would it not make more sense to compare the Tamil Tigers to other mass-based insurgent groups, regardless of whether they used tactics that can be described as “terrorist”? The exclusive focus on a tactic thus has the effect of downplaying historical and social context, and conflating phenomena that may otherwise have little in common. Second, because “terrorism” is used not simply to describe acts but to label individuals, groups, or movements, once an entity has committed an act described as “terrorist,” all its actions are tainted by the label, regardless of whether they actually fit the definition. Yet the actions of groups like Hamas or the IRA range far more widely, from violence that is not strictly speaking terrorist, through provision of welfare and security, to engagement in the political process (Toros & Gunning 2009).

With these caveats in mind, I will use the term “terrorist” to describe acts of (threatened) violence against targets that are considered illegitimate by the target audience, with the purpose of affecting the attitudes and behavior of a wider audience than the immediate victims of the violence through the spread of fear. I will not use it to describe individuals, groups, or movements to avoid essentializing what they do and reducing their complexity to one single set of tactics (for a critical theory-inspired discussion of this position, see Toros & Gunning 2009).

**TERRORISM, SOCIAL MOVEMENTS, AND SOCIAL MOVEMENT THEORY**

For most of the 1970s and 1980s, terrorism studies dominated the study of political violence by movements such as the Algerian National Liberation Front, the Provisional Irish Republican Army, and the German Baader-Meinhof Group. Although a few scholars of that period used social movement theory to study political violence, the majority of social
movement scholars focused on largely nonviolent social movements such as the US civil rights movement or the antinuclear movement, despite the fact that the violence carried out by, say, the Italian Red Brigades or the Algerian NLF could be seen as part of wider social movements (cf. Crenshaw 1995). It was only in the 1990s and 2000s that social movement theory began to be more frequently used to study “terrorist” violence (e.g., della Porta 1992, 1995; Hafez 2003; Bergesen et al. 2007; Gunning 2007). However, within terrorism studies, social movement theory is still a minority concern; for instance, by 2008, still only 7 out of over 1500 articles in what were then considered to be the two core “terrorism studies” journals explicitly employed a social movement theory framework (Gunning 2009).

A social movement perspective is particularly useful for studying terrorist violence because it squarely places the violence in its political and social context – something which has often been downplayed in traditional terrorism studies. Social movement theory does so by focusing not just on the (often small) organizations carrying out the attacks but the wider social movements and societies out of which they typically grow. It helps to locate “terrorists” socially, as embedded social actors, with multiple identities and social roles, whose relationship with “terrorism” is often far more ambiguous than traditional “terrorism studies” allows (see for example Toros’ discussion of Philippino farmers drifting in and out of militias, depending on who dominates the area; Toros 2008). It also helps to locate “terrorism” temporally, seeing it not as a static phenomenon but as a fluid, constantly changing form of protest, which usually grew out of – and often evolves back into – largely nonviolent protests, and, as such, part of a larger “protest cycle” (Toros & Gunning 2009).

Through its tripartite focus on opportunity structure, mobilizing, structures and frames, social movement theory helps to bring into focus the relationship between the organizations carrying out terrorism, wider society (including its belief systems), and political structures. Through this dynamic model, social movement theory helps to bridge both the structuralist-interpretivist and the structure-agency divides in the social sciences by focusing attention on the interplay between structures, agents, and interpretations.

Where traditional terrorism studies tend to focus either on broad structural explanations or on narrow ideological or organizational explanations, social movement theory encourages us to look at the interaction between structure, organization, and ideas (della Porta 1995; Gunning 2009). How, for instance, do political exclusion or state repression affect oppositional organizations and the way they, and the societies they claim to represent, frame their grievances? How do broader belief systems feed into the frames militant groups use, and how are they impacted by organizational and broader political dynamics? An example of this is the effect of state repression on oppositional organizations, which, depending on the precise circumstances, can either serve to drive them underground, creating a “spiral of encapsulation” which isolates them from wider society and facilitates the development of increasingly radical frames (della Porta 1995; Hafez 2003), or can encourage the creation of an “insurgent society” which comes to accept radical tactics as the norm (Araj 2008).

Where traditional terrorism studies focus overly on ideological justifications and grievances, social movement theory encourages scholars to look beyond ideology and grievance to the availability of resources and opportunities. Grievances and, to a lesser extent, justifications for violence, are ubiquitous; terrorism is not. To explain why only some groups resort to terrorism at certain times (and forewear terrorist tactics at others), one needs to include an analysis of the relative availability of networks, highly motivated and skilled volunteers, weapons, weapon expertise, popular support, safe places, and third-party support (e.g., a neighbouring state elite), among other things.
EXPLAINING AND UNDERSTANDING “TERRORISM”

Although much of the literature on terrorism focuses on structural conditions, structural explanations in themselves are insufficient to explain the occurrence of (nonstate) terrorism. Democracy, for instance, has been found by some to feed terrorism by providing both the motivation for those who feel marginalized by majority rule and the opportunities to mobilize and organize. Others, however, have found the opposite, namely that greater levels of democracy decrease the chance of terrorism occurring by providing political avenues for redressing grievances (Lia 2005). Repression has similarly been found both to cause terrorism and to prevent it. Structural conditions alone cannot explain these divergent trajectories.

An exclusive focus on ideology or organizational characteristics is equally unsatisfactory (della Porta 1995: 6; Gunning forthcoming). Most ideologies contain justifications for violence. Yet many adherents do not actually turn to violence. Groups often act against their own ideological pronouncements, and most groups are ideologically more diverse than their opponents present them as. Individuals often join for wholly nonideological reasons, whether in search of safety against rival groups or the police, or in search of identity or status or simply to follow their friends.

A more persuasive explanation lies in an analysis of the interaction between broader political and socioeconomic conditions, organizational and resource dynamics, and the framing of grievances, identities, and action repertoires. State repression, for instance, has been found to be particularly conducive to political violence if it is seen as indiscriminate and excessive by those the opposition movements claim to represent, and if it is reactionary—in other words, when oppositional organizations are already well developed, with the skills, loyalties, and motivation to maintain what they have (Hafez & Wiktorowicz 2004: 67–71). Whether the response becomes specifically “terrorist” (as opposed to more broadly violent), depends on a number of factors, including the relative strength of the organization carrying out the violence, the (perceived) responsiveness of the political system to opposition, the place in the protest cycle where the violence occurs, and the way the grievances, the state, the immediate victims of the attack, and the responses are framed by both the activist and the broader society they claim to represent. This in turn is influenced by organizational dynamics (for instance, whether it concerns a broad-based insurgency movement or a vanguardist, underground organization).

A good example is the case of the Italian Red Brigades, which began as a small self-help defence force for the Italian Left’s protest movement of the early 1970s, against the attacks of right-wing groups and police forces (della Porta 1995). The Brigades grew out of the mass protests of students and workers that engulfed Europe in the late 1960s, and many of its members had become socialized into politics by the organizations of the New Left. Violence intensified in response to policing becoming more indiscriminate and repressive, driving hitherto nonviolent activists into the arms of the Red Brigades. When mass protests began to wane, the Brigades also began to use violence (and the counterviolence it provoked) to reignite the masses. Violence initially peaked when most of the Brigades’ members were imprisoned. However, the violence of the early 1970s, and in particular the violent response by the police and its endorsement by the establishment, had socialized a new generation into violent politics, and when the official organs of the Left, the Communist Party and the Trade Unions, struck a “historic compromise” with the Centre Right, this second generation embarked on a more destructive wave of violence, reinvigorating the Red Brigades in a spiral of competition and one-upmanship.

This second wave of violence was facilitated by the structural conditions of Italy’s political system (and in particular the perception that there were no effective political avenues left for addressing youth grievances), by the passing on of organizational underground expertise and a
by now established ideological framework for glorifying violence as part of a global struggle against capitalism, and by personal loyalty to fallen or imprisoned comrades (many of those who joined these groups had already been close friends before they joined). Ideology played a role, as did structural conditions of social and political exclusion and repression. But it is in the interplay between structural conditions, ideology, and organizational dynamics that the explanation lies for the evolution of this particular cycle of violence. Justifications for violence, for instance, had been prominent in both left- and right-wing ideologies in 1960s Italy. Yet it took the particular dynamics of protests, police violence, economic uncertainty, and political marginalization to bring these justifications to the fore and translate them into actual violence – and then only those socialized in the (isolated) hothouse of the New Left’s underground organizations heeded the call to violence. The vast majority of supporters of Italy’s Left did not resort to violence.

Another example is that of Palestinian Hamas’ turn to suicide bombing against civilians in the mid-1990s. Hamas was founded at the start of the Intifada in 1987–1988, as an offshoot of the Palestinian Muslim Brotherhood, a large social organization focused on the re-Islamization of Palestinian society. The Brotherhood’s main emphasis had been on providing social welfare and education and it had eschewed the resistance efforts of its main rival, the Palestine Liberation Organization (PLO). When the uprising broke out against Israeli occupation in 1987, its younger members decided that, faced with a resurgent PLO, they did not want to be marginalized by events and founded the Islamic Resistance Movement (acronym: “HAMAS”). Suicide bombing had been spectacularly used in both the Iran–Iraq war of the 1980s and in Hezbollah’s fight against Israel’s occupation of Lebanon. Yet Hamas did not turn to suicide bombing until 1993, and only embarked on sustained campaigns against civilians from 1994 onwards.

One explanation for this is that, until 1993, Hamas lacked both the ideological and organizational tools to carry out suicide bombing and the context to give it the motivation to do so (Gunning 2007). To compete successfully for popular support in the Palestinian uprising, Hamas initially just had to copy the tactics developed by the PLO. When the PLO’s exiled leadership agreed, controversially, to participate in the ill-fated Madrid Peace Process, Hamas reaped the benefits locally, by portraying itself as the true champion of Palestinian rights. Hamas was further strengthened by the PLO’s siding with Saddam Hussein against Kuwait, resulting in the withholding of funding from the rich Gulf countries. By early 1993, Hamas was beating Fatah, the PLO’s main faction, in most student union elections, one of the chief barometers of grassroots support in the Palestinian Territories at the time.

This situation changed dramatically over the course of 1993. In September, the Oslo Peace Accords were announced, catapulting Fatah back to center-stage and seriously weakening Hamas’ position. The Intifada had already all but ground to a halt and popular support for the uprising had been on the wane for some time – much as support for the 1960s protests had waned in Italy by the early 1970s. The main political player, Fatah, had made a compromise with the status quo – not unlike the Communist Party in Italy – and those opposed to the compromise were fearful of marginalization, particularly as the Peace Accords included an agreement to cooperate with Israel on the suppression of opposition groups. Israeli troops were scheduled to withdraw from Palestinian city centers in 1994, calling for a tactical revision of how to carry on the resistance. By early 1994, therefore, Hamas had the motivation to find a new way of attacking the enemy, to reclaim its position as a key player in Palestinian politics and to reignite the uprising through spectacular acts of resistance.

The ideological and organizational tools were provided courtesy of Israel’s decision to send over four hundred Hamas and Islamic
Jihad leaders into exile to Lebanon in December 1992. In the no-man’s-land between Israel and Lebanon, where the exiles languished for months, the organization which helped to look after the Palestinians was Hezbollah, the pioneer of suicide bombing in the Levant. It is thus no coincidence that the first suicide bombing claimed by Hamas was carried out in April 1993 (against soldiers, in the West Bank). When Baruch Goldstein, an Israeli settler living on the West Bank, killed some 30 worshippers in the Ibrahimi Mosque in Hebron in February 1994, Hamas was ready to respond with a bloody suicide bombing campaign against civilians inside Israel. Ideological justifications, organizational know-how and a changed opportunity structure came together to create the conditions for a radical change in tactics.

That suicide bombing targeting civilians was chosen over other tactics was a function of both the close links developed with Hezbollah and the fact that occupation by a well-armed democracy appears to be particularly conducive to the adoption of suicide tactics when resistance groups lack the means to win a direct battle with their better-armed opponents (Pape 2005; for a critique of Pape’s methodology, see Ashworth et al. 2008). In a democracy, so the argument goes, the general population has a direct influence on the government, as well as a claim on the government’s protection. Suicide attacks against civilians are thus a cost-effective tactic with the potential to both sway public opinion and undermine the government’s legitimacy. However, contrary to Pape’s study, which links suicide bombing with occupations by democracies in an almost mechanistic manner, a social movement perspective is able to explain why suicide bombing was only embarked on in 1993–1994, more than 25 years after Israeli occupation of the West Bank and Gaza began. As with the Red Brigades, ideology played a role by providing religious and nationalist justifications for suicide bombing. Yet it took the particular dynamics of uprising, controversial counterinsurgency tactics, political marginalization, and exile to bring these justifications to the fore and translate them into actual violence.

REFERENCES AND SUGGESTED READINGS

The Tiananmen student movement was triggered by the death of Hu Yaobang on April 15, 1989. Hu was the former general secretary of the Chinese Communist Party (CCP), but was pressured to resign from the position in 1987 in part because of his lenient attitude toward the student protests in 1986. Hu became a widely respected figure among students and intellectuals after his resignation. Hu’s death, however, was just a triggering event. By the late 1980s, most Chinese no longer believed in the communist ideology upheld by the Chinese government. A limited number of people even started to criticize the government for the tragedies it had brought to the Chinese during the Mao era (1949–1976) and advocated political reform and democratization. A general crisis of faith occurred among the Chinese, especially the educated population. Moreover, in the late 1980s, China’s higher education had overproduced students who were unable to get jobs with respectable earnings after graduation. Finally, rumors about official corruption spread and inflation soared in 1988 as the Chinese economy underwent a downturn. Ever since 1986, student protests of different scales had never really stopped on college campuses.

The 1989 student movement in Beijing lasted for seven weeks between April 15 and June 4. It ended in a military crackdown during which hundreds of civilians, students, and soldiers were killed. The movement’s dynamics can be captured by the following chain of events. First, the death of Hu Yaobang allowed students to frame the protests as mourning activities. Since Hu was then still a CCP politburo member, and mourning a top CCP leader was a legitimate action, the nature of the protest delayed the government response and gave the movement an early boost. By April 23, that is, the day after Hu’s state funeral, the students had staged a city-wide class boycott and established university- and city-level movement organizations. A few major claims of the movement centering on free press, free association, and pro-democratic reforms also emerged in this period. While Beijing students and residents were involved in the movement for numerous different reasons, the above claims did become the movement’s master frame. Second, alarmed by the scale of protests, the Chinese government published a *People’s Daily* editorial entitled “It Is Necessary to Take a Clear-Cut Stand against Turmoil,” which labeled the movement as antigovernment and called on the people to stand up and oppose it. The outmoded Maoist language of the editorial, however, upset most Beijing students and triggered the April 27 demonstration staged by some 100,000 students.

Third, the government started to make concessions after the April 27 demonstration. Several dialogues were held between government officials and students and a student dialogue delegation was established. The concessive mode of the Chinese government reached a peak when the government-controlled media published the May 4 speech that Zhao Ziyang (then the CCP’s general secretary) made in his meeting with the delegates of the 22nd Asian Development Bank Meeting. In that speech, Zhao stated that the majority of students were “by no means opposing our basic system” because their basic slogans were “Support the Communist Party!,” “Uphold the reforms!,” “Push forward democracy!,” and “Oppose corruption!,” all also on the government’s agenda, and that “China will not have large-scale turmoil.” The government concession satisfied the majority of the students and the movement declined in early May as a result. Fourth, compelled by...
the movement’s decline, around 300 students, most of them from Beijing University, staged a hunger strike in Tiananmen Square on May 13. Negotiations and dialogue immediately took place between the government officials and student movement leaders with the hope of ending the hunger strike and Tiananmen Square occupation before May 15, the first day of Mikhail Gorbachev’s state visit to China. The negotiations brought no result and the hunger strike and occupation continued. On May 15, the hunger-striker population swelled to over 3000 students and more and more supporters arrived in the square. When the ambulances for collapsed hunger-strikers shuttled across the Beijing streets, the sirens became a mobilization call. After May 16, huge numbers of sympathizers and supporters came to the square daily, and more and more people from all over China arrived in Beijing. The hunger strike was a great success in terms of movement mobilization. Nevertheless, it disrupted several major events of Gorbachev’s China visit and disheartened those top state officials who had once supported Zhao Ziyang’s concessive approach to the movement. Most top state officials except for Zhao Ziyang started to support a more hardline approach. Fifth, the government declared martial law and about 100,000 soldiers were brought to Beijing on May 20. The troops, however, were blocked by the students and Beijing residents and the Tiananmen Square occupation continued. Finally, on the evening of June 3, a new wave of martial law troops forced their way into Beijing. Hundreds of civilians, students, and soldiers died in street battles that night, making it one of the greatest tragedies of twentieth-century China.

During the movement, some student leaders, intellectuals, and top government officials tried very hard to find ways to bring the movement to a better ending. The tragic outcome was not entirely inevitable. Yet, three related structural forces did make other possible endings of the movement less likely. First, the government habitually used outdated Maoist rhetoric to criticize the movement and those who participated in the movement. Such action only heightened resentment because most Chinese of the 1980s had bitter memories of the Maoist Cultural Revolution, and thus no longer believed in the communist ideology. Second, the authoritarian nature of the Chinese regime had given little space to the development of organizational forces beyond state control. Thus, the organizations that led the movement were all newly established, the leaders of different student organizations did not know how to work together, and the students had little respect for those who led the movement. This made it very hard for the government to negotiate with the movement organizers and almost impossible for the movement organizers and activists to steer the direction of the movement in a strategic manner. Third, the government’s lack of ideological legitimacy and the poorly organized nature of the movement greatly raised the importance of rumors. The first major success of student mobilization in Beijing on the morning of April 20 was facilitated by a rumor about police brutality and arrest at Xinhua Gate, where the CCP Central Committee and State Council are located. The first city-wide class boycott was made possible largely because the students believed in a rumor that premier Li Peng had agreed to meet with the students after Hu’s state funeral but then broke his promise. After martial law was enacted, numerous rumors of the factionalism in the government and the army gave people the courage and hope to resist the martial law troops. While almost all of the rumors were later proved to be unfounded, people believed them because they did not trust, even hated, the government. This kind of state–society relationship made the Tiananmen student movement more like a prolonged riot, which greatly reduced the chances of reaching a compromise between state and students and contributed to the tragic ending of the movement.

The 1989 movement has shaped Chinese politics in many ways. On the positive side, top Chinese officials became more clearly aware that dogmatic communist ideology was not going to work. They thus resolutely
ventured into market-oriented reform and have increasingly relied on good performance as the basis of state legitimacy. This performance-based state legitimacy has made Chinese officials more susceptible to public pressure and led them to work harder, which has been a major reason behind China’s economic success. Nevertheless, after the military crackdown, Zhao Ziyang stepped down from the CCP general secretary post and many of China’s pro-democracy intellectuals fled to the West. Although the new CCP leaderships after Zhao were by no means conservative, they all became overcautious in dealing with the issue of political reform for fear of creating opportunities for another large-scale antigovernment movement like that of 1989. Political stability thus became the main goal of the new generations of Chinese leaders. Yet, overly relying on good performance as the basis of state legitimation led to new problems. Most importantly, no government has the ability to lead a country to economic success without setbacks. Even though the current Chinese state has performed very well in terms of its ability to maintain a successful economy, this success has raised the Chinese people’s expectations and encouraged populism. In short, the current Chinese government’s craving for political stability has a tendency to cover up rather than solve social problems, and to demoralize society. Moreover, every year during the June 4 anniversary, dissidents in China and abroad have found different ways to commemorate the movement and to push for political reform in China, which makes the regime very nervous. The spirit of the 1989 movement is still widely alive, and its historical meaning has not yet crystallized.

Transnational Zapatism
THOMAS OLESEN

The Zapatista uprising on January 1, 1994, in the Mexican state of Chiapas, immediately posed a challenge to observers of Mexican politics. The impact of the uprising, however, quickly spread beyond Mexico’s borders. The transnational interest generated by the Zapatistas is matched by no other comparable movement in the post-cold war period. Despite the obvious physical, social, and cultural obstacles, an extraordinarily large number of civil society actors, mainly in Europe and the US, have initiated solidarity efforts in support of the Zapatistas, leading to the formation of a transnational Zapatista solidarity network. The network was at its most active in the latter half of the 1990s when dramatic events in Chiapas—such as the Mexican army’s invasion of Zapatista territory in 1995 and the paramilitary massacre in the village of Acteal in 1997—garnered massive attention abroad. Yet the Zapatistas continue to be a source of inspiration for activists outside of Mexico to this day—as testified by an ongoing scholarly interest in the transnational dimension of the movement (e.g., Bob 2005; Olesen 2005; McDonald 2006; Reitan 2007; Juris 2008; Khasnabish 2010).

The Zapatistas emerged on the scene in the post-cold war historical setting. This was a period of redefinition and identity crisis on the Left. The movement contributed to this process in several ways. In 1996 they staged a so-called Intercontinental Encounter for Humanity and against Neoliberalism, which drew thousands of non-Mexican activists to settings deep in the Lacandon Forest of Chiapas. The Zapatistas were quick to embrace the concept of neoliberalism, which had become a descriptor of the political processes initiated by Reagan and Thatcher in the early 1980s—favoring welfare state retrenchment and capitalist development strategies. The Zapatistas focused on neoliberalism in Mexico, but at the same time linked this to a global process of capitalist domination over society, culture, and nature. By illuminating a common source of social and political injustice the Zapatistas successfully located their own local and national struggles in a wider context that made it easier for outside persons and organizations to mirror their own struggles and concerns in those of the Zapatistas (Olesen 2005).

The 1996 meeting was not conceived as a political rally with the Zapatistas in the leading role. The Zapatistas viewed it as an extended and open workshop and went to great lengths to emphasize how social and political change must occur through dialogue and from the grassroots. While clearly locating themselves on the political Left, the Zapatistas thus dissociated themselves from the traditional vanguardist conceptions of revolutionary change that had dominated the radical political scene in Latin America during the 1950s–1980s. In taking this approach the Zapatistas apparently drew considerable inspiration from the indigenous roots of the movement. Indigenous communities have a long tradition of deliberation as the basis of political decision making. The Chiapas encounter in 1996 became a major source of inspiration for the development of the so-called social forums that have been a key feature of transnational activism since the 1990s. Meetings modeled on the Chiapas encounter were held in Spain in 1997 and Brazil in 1999 and were important catalysts for the protests at the WTO meeting in 1999, widely seen as the birth of the so-called Global Justice and Solidarity Movement (Olesen 2005).

The transnational Zapatista solidarity network is notable for the broad array of activists engaged in it. Three broad and sometimes interrelated trends may be discerned: first, organizations with a focus on human rights,
and especially indigenous rights, are centrally involved in the network; second, a number of organizations relate to the Zapatistas via different projects (e.g., schools) intended to improve social development in Chiapas; third, the Zapatistas attract different types of organizations on the Left, especially those with a radical, anarchist, and autonomous outlook. This variety can be partly explained by the Zapatistas’ communication or framing activities. The Zapatistas, and in particular their primary spokesperson and communicator, Subcommandante Marcos, have located their struggle in a democratic framework.

This focus makes the movement and its political projects appealing to a broader sector of organizations than would have been the case with a more narrowly defined radical/revolutionary project. Further, the Zapatistas have constantly invited activists around the world to use them as a mirror. Subcommandante Marcos, aided by an intellectual and literary style of writing that goes down well with the well-educated middle classes of Europe and the US, has successfully portrayed the Zapatistas as a symbol of struggles against injustice everywhere. This interpretation has been widely adopted and is reflected in slogans such as “we are all Marcos” popularized during protests against the International Monetary Fund, World Trade Organization, and G8 in the early 2000s (Olesen 2005).

Unemployment movements
MATTHIAS REISS

From the nineteenth century onward, movements of the unemployed have played a significant role in constituting the workless as a distinct social group in modern societies and have helped shape the emerging welfare state. Unemployed protest – or the prospect of it – has fostered the introduction of measures to help the workless and served as a corrective to the tendency of decision-makers to stigmatize and marginalize them.

Conflicting interpretations of whether unemployment was “a problem of industry” (as in the title of an influential book by British economist and social reformer William H. Beveridge in 1910) or the result of individual shortcomings have always marked it as a site of contentious actions. Unemployment movements have gone to great lengths to stress the respectability of their constituents and frame their demands as entitlements earned through previous (or, in the case of youth unemployed, future) services rendered in industry, the armed forces, or society (especially the family). Membership in specific national or ethnic communities has also been used as a basis for claim making. Unemployment movements have also offered the workless a chance to overcome the negative psychological effects of involuntary idleness and provided them with a sense of agency. Any discussion of the outcome of unemployment movements therefore has to take into account not only the tangible benefits won by them but also the impact they had on their participants and supporters, their deterring effect on decision-makers, and the way they shaped the discussion about unemployment and the unemployed in the public arena.

Unemployment movements are a relatively new field of research which emerged with the return of mass unemployment in Western societies during the 1970s. Previous works, such as the famous study of the unemployed in the Austrian village of Marienthal (Jahoda, Lazarsfeld, & Zeisel 1933), had denied the ability of the workless to organize and act collectively, or dismissed their movements as insignificant, ineffective, or dominated by outsider groups or agitators. Recent research has overturned the thesis of the politically apathetic and socially isolated unemployed and broadened the framework of analysis to unemployment movements in developing countries, such as Argentina, and the transnational protest against the causes of unemployment.

One of the remarkable features of unemployment movements is their wide repertoire of action. With few resources and limited or no access to the media or political institutions, the unemployed have adapted and further developed established forms of protest action as well as invented a number of new ones, such as national protest marches, church parades, occupations of buildings, sit-down strikes, mock funerals, visits to restaurants without paying, roadblocks, or “boss-napping.”

Unemployment movements have frequently tried to overcome their lack of resources through cooperation with other groups. These movements are usually short lived unless they are supported by external partners, although the latter often experience the unemployed as hard to control and unpredictable. Cooperation with extreme groups can also lead to stigmatization and loss of legitimacy.

Socialist and communist parties have provided not only funds, organizational skills, dedicated cadres and leadership, but also a master frame which offered a nonindividual explanation for unemployment (capitalism), a remedy (socialism/communism) and a way to achieve it (social or political revolution). Conservatives and groups of the extreme right offered similar explanations but different remedies (paternalism/protectionism/cooperative state).
Trade union movements and the political parties affiliated with them command great legitimacy and substantial resources and for that reason have been important allies of unemployment movements over the years. However, trade unions are organizations of the employed and often had – and still have – an ambivalent relationship with those who were out of work. The interests of the unemployed differ from those who are still employed, and mass unemployment weakens the positions of trade unions vis-à-vis employers. Unemployment organizations were also perceived as rivals for the representation of the working class, front organizations of radical groups, or associations of potential strike breakers. Nevertheless, some trade unions supported unemployment movements and provided forums for the workless to bind them to the labor movement.

Mobilization of the unemployed has proven to be difficult even at the best of times. Being out of work does not create a stable and positive social identity around which people can be easily mobilized but is a status which most try to shed as soon as possible. On the other hand, involuntary idleness has freed individuals to build movements of the unemployed, especially if they already had organizing experience, while anger and feelings of victimization have provided powerful incentives for collective actions – often in cooperation with those who were still in paid employment but concerned about the effects of unemployment on a community, region, or the nation at large.

As long as unemployment affected mainly blue-collar workers, working-class communities offered a variety of networks for mobilization. The initial practices of controlling the unemployed and administering benefits also facilitated the building of networks at labor exchanges or relief work projects and offered a clearly identifiable target for protest activities in the form of local or regional authorities. These favorable preconditions for mass mobilization have now largely disappeared, although e-mail and Internet forums offer new ways for exchanging information and building networks.

Urban movements
ELEONORA PASOTTI

WHAT ARE URBAN MOVEMENTS?

The definition of urban movement is contested and has changed over time. Urban movements were and continue to be often referred to as urban social movements. The reasons are not explicitly articulated, but can be attributed to the emphasis on noninstitutional politics and protest rather than associations, which was privileged by early path-setting work in this field.

In one such contribution, Castells (1977: 360–375) defined urban movements by their outcomes. He distinguished between participation, protest, and urban social movements, attributing only to the latter category the ability to bring about social change. Subsequently, he and others abandoned this strategy, and focused on potential rather than actual outcomes and on the specifically territorial focus of urban movements. Castells defined urban social movements as movements that consider themselves related to a specific spatial community, are territorially defined, and usually mobilize around three goals: collective consumption, cultural identity, and political self-management (Castells 1983: 328).

Other definitions put more weight on the political context within which urban movements operate. Here, urban movements are a type of social movement rooted in “collectivities with a communal base and/or with the local state as their target of action” (Fainstein & Fainstein 1985: 189). As in Castells, participants can share a communal base because they relate to the same housing complex, neighborhood, or city. However, this approach underscores that economic and sociodemographic changes condition but do not determine the trajectories of urban social movements and emphasizes the target of protest. Most often action is directed towards local authorities as they “act to service, police, and redevelop urban communities” (Fainstein & Fainstein 1985: 189). Yet, the local state is not necessarily the target of action, which can also be directed to private agents or towards self-help initiatives.

A further unresolved issue is the form of urban movements. A focus on protest and resistance and skepticism about nonconfrontational forms of civil society engagement (Mayer 2003) led some scholars to privilege informal groups over associations and nongovernmental organizations. Yet, other scholars see urban movements as taking a variety of forms, “from counter-cultural squatters to middle-class-neighborhood associations and shanty town defense groups” (Castells 1983: 328), with strategies that vary tremendously, including lobbying, protesting, rent strikes, squatting, reappropriation, and other forms of subversive reclaiming.

COMMUNITY AND CLASS

A recurrent theme in the study of urban movements is the challenge of combining community identity (primarily around place and ethnicity) with class identity. The lack of this integration is often taken as a reason for movement failure. For instance, Castells (1983) argued that only urban movements that combined all three goals of collective consumption, cultural identity, and political self-management could succeed in bringing about social change and avoid disempowerment through co-optation and integration into existing institutions. However, he argued that even that change was limited in scope, precisely because, due to their emphasis on locality and their inability to integrate class, urban social movements are only the expression of
the inability to find systemic solutions to the problems afflicting the oppressed: “the source of urban movements in our societies is the absence of effective channels for social change” (Castells 1983: 326). Thus ultimately urban social movements can only aspire to have local effects, not systemic effects.

The inability of urban movements in the US to combine class and community has been isolated as a core reason for their weakness and ultimate inefficacy in political science as well. In *City Trenches*, Ira Katznelson argues that US workers in major industrial cities act on the basis of class solidarity at work but on ethnic and territorial identities at home (Katznelson 1981). This sharply divided consciousness between the politics of work and the politics of community protected the core arrangements of capitalism from political challenge. The effect in the US has been a predominance of community politics in the critical period of the 1960s and 1970s. Then, in some cases, claims went beyond self-government and collective consumption and extended to employment. However, coalitions were fragile and movements were co-opted by municipal governments through moderate and piecemeal reforms and decentralization.

Much analysis on urban movements sets them in the context of macroeconomic shifts. In the latter part of the twentieth century, capital reacted to deindustrialization by investing its surplus in cities with a strategy of “accumulation by dispossession” (Harvey 2008), in which poor residents in high-value areas were displaced to make place for profitable urban redevelopment. The state acted as a facilitator of business in the 1960s and 1970s. With the spread of neoliberal policies in the 1980s, city governments took the leading role in initiating extensive urban redevelopment, which is combined with retrenchment in social spending and privatization of service provision in the effort to compete with other cities (Smith 1996).

Yet, urban movements also reflect the political system in which they are “channeled and contained” (Katznelson 1981; Fainstein & Fainstein 1985). The openness or vulnerability of the political system and the fragmentation of the elites are key factors in the emergence of urban movements and shape targets and strategies. Hence, current work conceptualizes urban movements as part of the urban system and even of global networks.

**CURRENT AND FUTURE EMPHASES**

There continues to be a significant isolation of writings about urban movements from scholarship on other types of social movements (Pickvance 2003: 104). Yet, the spatial dimension of the urban context and its effect on mobilization is ripe for analysis – thanks also to new geomapping data which allows for a better link between space and protest strategy. A promising area in which social movements and urban movements come together is the study of the urban dimension of democratization protests. Despite having national (and even global) audiences, the main actors in these protests are urban movements, based in the capital and sometimes a few other cities. Vivid examples have been offered by the toppling of the Milošević regime in Yugoslavia, by the Color Revolutions in the post-Soviet zone, and by uprisings in North Africa and the Middle East in 2011.

Beyond cases of regime transformation, the challenge to integrate workplace and community identities remains key to urban movements. The translation of *Right to the City* (Lefebvre 1996) launched a new wave of scholarly interest and activism aiming to combine community and workplace consciousness into forms of resistance against capitalism and in particular against neoliberalism. Since the original version of the book, on the eve of the 1968 Paris revolts, the main tools for organization at the disposal of the working class have lost significant sway. Political parties suffered steep declines in voters’ loyalty and electoral turnouts. Unions witnessed dramatic falls in membership, in both the private and public sectors, and lost their claim to representativeness following the rise of flexible work in advanced
economies, and of informal work in developing economies. The weakening of organized forms of popular resistance lessened the ability of the disadvantaged to mobilize. Research on political participation, protest, and associationalism shows that socioeconomic status continues to be the most significant predictor of political activity, and that the waning of unions further undermines involvement by popular sectors (Collier & Handlin 2009).

Yet, a new wave of resistance is taking place in cities worldwide, in industrial and developing economies, as well as in democracies and authoritarian regimes. Urban movements continue to mobilize around a great variety of issues—such as their struggle against urban redevelopment and gentrification; for environmental justice, including public transportation, waste management, pollution, and urban agriculture; for improved social services, community empowerment, and employment opportunities. Over the last decade, these goals manifest themselves not in isolation, but rather as components of a wider agenda of social justice, as urban movements mobilize people and “new urban meanings” (Castells 1983). The approach evokes the campaigns of the 1960s and 1970s. However, movements today are much better able to scale horizontally and vertically, thanks to the use of digital technologies.

The Right to the City Alliance, founded in 2007, is an important illustration of such urban movements. With chapters in eight regions/cities across the US, the movement presents a coalition of several dozen organizations building grassroots resistance in “low-income, working class communities of color to strategically challenge neoliberal economic policies.” Formal and informal linkages under the header of Right to the City are growing across the world, deploying digital communication to achieve coherence in ideology, to share tactical and strategic tools, and to support one another (Brenner, Marcuse, & Mayer forthcoming).

In parallel, new approaches to negotiation are emerging between community coalitions, local governments, and capital investors. Two prominent examples in the US are community benefit agreements and living wage campaigns. Both efforts rely on urban movements in which community groups and organized labor come together. Organized labor contributes by emphasizing the class dimension of the conflict, and bringing resources and organizational skills. Community groups deliver transversal mobilization and the legitimacy that derives from broad representation. The actor that is still missing is formal politics. Political parties do not take on a leading role in the protests, and serve a moderating and co-opting function now as they did 40 years ago. Scholarship suggests that the strength and resilience of class–community coalitions is key to these movements’ results, yet the conditions under which these coalitions succeed are not yet explored. Thus, issues in the field of urban studies for future research are (1) the conditions under which labor and community organizations can collaborate successfully and sustainably, with a focus on issues of democratic governance and scaling mechanisms; (2) how digital activism changes the scope and effect of urban movements, as well as their mobilization, organization, and framing; and (3) the interaction between urban movements and the processes of formal politics.

REFERENCES AND SUGGESTED READINGS

Since the start of the new millennium there have been four major instances of urban "rioting" in Europe, each of which has given rise to prolonged academic and/or public theoretical speculation regarding the underlying political origins and motives of such action. The term “rioting” is often rejected as inappropriate by academic and political commentators, on the grounds that it often used to suggest “wanton criminality” or, oppositely, to imply a degree of political awareness and ambition that is actually lacking among participants. Here we shall be employing the more neutral descriptor of “disorders” in referring to such events.

The first of these disorders occurred in the spring and early summer of 2001 in a handful of northern British towns and cities (Burnley and Oldham in Lancashire, and Bradford in West Yorkshire), all once famous for textile manufacturing. Each event involved violent clashes between Muslim youths of Pakistani and Bangladeshi heritage and police officers, following initial altercations between the former and white neofascists on the outskirts of major Asian residential areas.

The next major example, the French disorders of October/November 2005, were sparked off by an ostensibly innocuous encounter in the Parisian suburb (or banlieue) of Clichy-sous-Bois in which three male teenagers of North African descent were approached by a handful of police officers seeking proof of their identities. This quickly developed into a chase, during which the youths tried to avoid capture by entering an electricity generating station. There, however, two of them were fatally electrocuted while the third incurred severe burns. Rumors that the police had pursued the teenagers without good reason became the pretext for five successive nights of confrontation. Disorder then extended into numerous other Paris banlieues before proliferating outward across the entire nation.

The Greek disorders of December 2008 were precipitated by the death of a 15-year-old male high school pupil, Alexis Grigoropoulos, who was shot down by a police officer in the Exarcheia area of central Athens while out socializing with friends. The tightly policed location in which the incident occurred is synonymous with the “koukouloforoi” anarchist group, who are notorious for covering their heads and faces with hoods in an apparent attempt to avoid identification and incrimination. Soon afterwards, hundreds of youths gathered outside the nearby polytechnic school, a symbolic location of resistance since 1973 when it was the scene of rebellious activity against the military dictatorship of the day. The youths began shouting antipolice slogans and threw stones and petrol bombs at officers before protesting throughout the city center, where they vandalized scores of banks and multinational commercial and retail premises.

The last of the four examples – the nationwide disorders in the UK in August 2011 – initially broke out on the Broadwater Farm estate in Tottenham, north London, the scene of similar violence in 1985. Here the fatal police shooting of a male black resident, reputedly belonging to a local gang, became the focus of unchecked rumor asserting that he had been fired upon while unarmed or even wearing handcuffs at the time. Forty-eight hours after the shooting had occurred a crowd of 200 gathered outside the local police station, demanding to know precisely what had happened and why. The protest was initially good-natured. However, as the crowd grew increasingly impatient in the face of police unresponsiveness, confrontation was sparked off when a 16-year-old
woman demanding answers from the officers present was allegedly bundled to the ground.

Details of this incident and the associated violence were quickly circulated on YouTube and various forms of social media. Within an hour, there were running battles between police and residents on nearby streets while hundreds of local shops were looted. In the next three days, the looting and disorder spread, first to other parts of London, and thereafter to pockets of other major cities like Birmingham and Manchester. Those involved in the disorders were primarily young and male, but not confined to any particular ethnic category.

In all three countries, violence was condemned by the national media and political authorities in ways which reflected long-standing academic “theories” of “riot” causality. Thus, the British and French disorders were each denounced as evidence of the inherent criminality of those involved (the so-called riff-raff hypothesis), of the rabble-rousing influence of “political or religious fundamentalist trouble-makers” (the agitator theory), or of the “copycat” effect of mass media – or, in the case of the more recent UK riots, social media – coverage (the contagion effect). The Greek disorders were similarly attributed to the sinister influence of the koukouloforoi and the equally criminally minded or poorly socialized immigrant groups supposedly overrepresented in these events. However, closer academic inspection of all four cases makes it possible to identify clear underlying political motives for such behavior.

Relevant research into the French and 2001 British disorders, for example, has highlighted several common antecedent causal conditions, most notably: relatively high levels of social segregation and stigmatization; severe industrial decline and correspondingly high unemployment (impacting on ethnic minority youth in particular); complaints of poor schooling and educational and employment discrimination; and lack of political representation. These factors have evidently encouraged forms of cultural adaptation involving assertively antisocial attitudes predicated on toughness and territorialism, petty criminality, and drug use.

Research further reveals how, in Britain, feelings of disaffection among working-class youths of Asian heritage had been intensified by the renascence of neofascism, as reflected in vastly increased shares of local electoral voting. Here, the growing tendency for ethnic youth to organize responsively in defence of community was misconstrued by right-wing parties, the police, and local media as “antiwhite racism,” characterized by the creation of “no-go areas” supposedly heaving with lawlessness and under the sinister influence of “Muslim fundamentalism.” Far Right opposition rose correspondingly, and it was in response to perceptions of enhanced right-wing provocation and allegations of police indifference to the plight of local Asian populations that youth resistance was ultimately expressed through violence.

Similar forms of cultural adaptation exhibited by French ethnic minority youth were likewise condemned by political and media commentators apt to perceive the banlieues as hotbeds of Islamic militancy and delinquency. The resulting abandonment of “community policing” programmes in favor of a general crackdown on “quality of life crimes” (like hanging around entrances to public housing and defrauding public transport), the tightening up of immigration laws and a greater emphasis on identity checks, helped produce the drastic deterioration of police–community relations in which the disorders eventually occurred.

Academic theorists have emphasized how the Greek disorders differed from their British and French counterparts to the extent that they involved a far broader coalition of working- and middle-class youth, all variously affected by an economically ailing and politically corrupt society in which the unemployment rate for people aged 15 to 24 was approaching 25 percent, employment rights were being nullified, and completion of a highly expensive university degree offered no guarantee of a secure job. It was against such conditions of
hopelessness and demoralization, and amidst perceptions that the police were responding repressively to mounting popular dissent, that the reaction to the killing of Alexis Grigoropoulos occurred—and was, perhaps, all the more incendiary due to the political significance of the location where the fatal shot was fired and the neighboring polytechnic school.

The pivotal Tottenham disorder of 2011 occurred in a context of high unemployment and educational underachievement, compounded by recent cuts in the funding of youth club provision. Widespread police application of “stop-and-search” and other specially targeted operations instigated in response to rising street theft, burglaries, and gang-related activity were said to have blurred the distinction between innocent and guilty. If collective indignation surrounding the police shooting and the more precipitous treatment of the teenage girl was symptomatic of endemic community alienation and resentment, it is also possible that disorders occurring elsewhere in London, and thereafter nationwide, were driven by sympathetic undercurrents in areas also experiencing problematic police-community relations. Even the widespread looting of retail outlets (which was more characteristic of these disorders than the above precedents) may have contained an underlying political motive. While lacking the political ambition of (say) the hunger or bread “riots” of earlier centuries, the UK disturbances represented, in the words of sociologist Zygmunt Bauman (Duarte 2011), “a mutiny of defective and disqualified consumers, people offended and humiliated by the display of riches to which they had been denied access.”

There is therefore little doubt that the most prominent examples of “European rioting” occurring in the past two decades have been relatively unfocused and inchoate, lacking either obvious goals or explicit demands for political empowerment. Though unquestionably driven by profound political grievance, they did not constitute the type of “insurrection,” “uprising,” or “upheaval” that is generally more synonymous with enduring, bona fide social movements.

Velvet Revolution of 1989
DON KALB

It was the massive and peaceful civic eruption in Czechoslovakia in November 1989 which first generated the name “Velvet Revolution”: an accelerating wave of demonstrations and strikes, initially led by a handful of young students in the performing arts, which led within three weeks to the fall of the supposedly “hard-line” socialist regime in Prague. Subsequently, the name “Velvet Revolution” was extended to include the whole sequence of peaceful (except for Romania) revolutions in 1989 that initiated the fall of state socialism in Europe.

The protest sequence was driven by developments in Poland, Hungary, and the Soviet Union. Its first phase culminated with the Gorbachev approved Polish Round Table of February–April 1989, which produced the partially free parliamentary elections in June and then a Solidarity-led government in August. The Polish negotiations were a response to a new cycle of ferocious labor protest in Poland that started in the late spring of 1988. In Hungary it was the gradual fragmentation of the Hungarian Socialist Workers’ Party since 1985 and the emergence of open political competition, first within and then outside the party, leading to the opening of the Iron Curtain in July 1989 and subsequent free elections. In the Soviet Union it was the arrival of Gorbachev in 1985 that allowed discussion of the stagnation of “really existing socialism,” an endorsement of “reform,” and a sober calculation of the costs and benefits of its Central European empire.

By the summer of 1989, opposition forces, underground youth, peace, and environmentalist groups in Central and Eastern Europe, empowered by a diffusion of news and civil society networks connecting East and West Europe, were emboldened to come out and press claims for free elections and the end of socialist party rule. Even where such dissent had not openly existed before, such as in the German Democratic Republic (GDR) or Romania, this swiftly led to mass movements. These movements were of a different nature from country to country, and were represented by different sorts of leadership, focusing on partly different concrete issues, and employing partly distinct framings. But they reinforced each other, shared in the claim for democracy and civil society, and produced nothing less than the fall of the Berlin Wall on November 9, 1989, and the end of state socialism. The heavily militarized division of Europe, with stockpiles of nuclear weapons that could have destroyed the world ten times over, was swiftly unmade by peaceful protests in less than a year.

The subsequent full victory of liberal capitalism over state socialism in the cold war led Western commentators, from Francois Furet to Francis Fukuyama, to announce varieties of the famous “end of history” thesis, extolling the end of the ideological antagonisms that had riveted modern Europe and the world since the French Revolution. It has continued to frame the character of dominant political narratives to this day. We are still in the post-1989 period.

As in the classical revolutions (England, the US, France, Russia, China), intellectuals of diverse sorts (dissidents, pastors, actors, writers) were substantially involved in 1989. But instead of claiming the victory of an arising class and capturing the command centers of the state to impose it, they walked peacefully under the banners of “civil society,” “decency,” “normalcy,” basic civic freedoms, and a “return to Europe.” Their ideas were framed in universal notions of human rights as revitalized by the “Helsinki process” (1975). These were merged with recent and older local traditions of antipolitics and what the writer Milan Kundera had called “the republic of the mind,” traditions
that rejected centralized power over people's lives.

Except in Poland and Hungary, however, such intellectuals had been thoroughly marginalized by the party states and their security apparatuses in the 1980s. In countries with strong police states like Czechoslovakia, the GDR, and Romania, even a few weeks before the actual revolutions dissident groups had been tiny and ostensibly irrelevant. They found themselves lifted at once into positions of responsibility as representatives of “the people” – with the exception of the dissidents of the GDR, who were swiftly marginalized by “reunification” with the Federal Republic of Germany, and Romania, where “the revolution” was manipulated by sections within the security apparatus itself. “This was not an explosion,” the Polish philosopher Leszek Kolakowski later wrote about the revolutions, “it was like the breaking of an egg from inside the shell” (1999).

The Velvet Revolution of 1989 is one of those enigmatic recent world-shaping events that the experts did not foresee, like the financial crisis of 2008 or the Middle Eastern and north African rebellions of early 2011. Nineteen eighty-nine, in fact, called for new perspectives in the social sciences. There is a recent consensus that this unexpected cycle of region-wide peaceful revolutions can only be explained in a complex multiscalar narrative that proceeds on several temporal planes simultaneously, going beyond the usual modernist focus on separate nation states and intrastate social movements. The protest wave was the crystallization of a set of diffuse structural processes within the socialist bloc that were only weakly perceived in their full dimensions by contemporary participants and commentators. We need to (1) analyze the whole empirical sequence of public contentious events in the countries of Central and Eastern Europe; (2) link processes in CEE with developments within the Kremlin; (3) understand these events against the background of the basic contradictions within “really existing socialism” as they were unfolding over time; and (4) place these dynamics in the socialist world within the transformations of encompassing world capitalism since 1945 as a whole.

Stalinism was designed to turn backward agricultural societies into urban industrial societies within a uniquely compressed period of time enabled by forceful methods. East Central Europe in 1948 was overwhelmingly rural, with anywhere between 50 and 80 percent of the population living off the land (except in the GDR and the Czech lands). By 1980 these agricultural populations had been largely transformed into modern literate urban working classes and white-collar workers. After the initial high-speed social transformation a seemingly stable “socialist mode of production and consumption” had developed. Against its self-image, however, that mode of production was not well planned and had its own irrationalities, among others a heavy bias toward capital and military goods controlled by the party-state, and a massively underperforming agricultural sector. After 1970 it also became ever more dependent on Western loans. While it did produce the basics for a modern way of life, it did not live up to Khrushchev’s famous promise of 1961; it never surpassed the West. Growth began stagnating around 1970 and remained in a low-level equilibrium ever since. Overtaking the West, however, had always been part of its proclaimed raison d’être. By the 1980s the “capitalist” other, that had been stuck in deep crisis in the 1930s and was associated with Nazism and war, had been thoroughly transformed into a wealthy space of social democracy and individual freedom. Life in socialism seemed bleak in comparison. Socialism produced a modern public with modern desires, but characteristically left the desires suspended and therefore politicized, feeding a civic disavowal that deepened over time as Western lifestyles were increasingly showcased over the socialist region. This was one aspect of what was growing inside Kolakowski’s “shell of an egg.”

Just as important and more politically momentous, the socialist mode of production left a large measure of control over production
to its lower level managers and workers. It penetrated much less forcefully into the sphere of production than capitalism did. This lack of control by the center amounted to a partial denial of the Western idea of socialist authoritarianism and totalitarianism; it controlled the sphere of political discussion but not quite the sphere of work. Workers’ control had been a recurrent idea in the antisoviet revolts in Poznan 1953, Budapest 1956, Prague 1968, and of course in Poland under Solidarity, and was one aspect of the claim for “socialism with a human face.” But in fact quite a bit of control from below on the workshop floor existed. This was part of the bargain to get sodalities of workers, who could not be fired nor incentivized by high wages, to commit themselves to the plan under the conditions of shortage and obsolete technology. The more complex the socialist economy became, the less the party-state seemed capable of securing the central appropriation of surplus from workers and firms.

Workers were also aware that they were ruled in their own name and they had learned to use this to their own advantage. Although independent labor unions were outlawed, workers did not go easy on the party state if it raised food prices. Worker unrest and local rebellions would recurrently break out in protest against imposed raises, in the price of meat in particular. In Poland in 1971, 1976, 1979, 1980, and 1988, massive worker unrest, increasingly coordinated, emerged precisely around this issue, with cumulative political consequences. Paradoxically, socialism unraveled among others as a consequence of workers demanding workers’ rights. Poland was the prime example.

One response to stagnation, pioneered in Hungary since 1968, was “reform.” It was an effort to decentralize control and responsibility to lower levels of execution in firms and the bureaucracy. It empowered the technocrats vis-à-vis the central planners and the party leadership. Such experts would then subsequently claim further “reform.” In the daily running of socialist societies after 1970 therefore, technocrats, increasingly with university credentials, pushed back party ideologists and became a force both within and outside the parties, further hollowing out party rule. Hungary was the classic case.

This shift in leadership downward and outward from the party center was accelerated as socialist countries, from the mid-1970s, were given access to Western loans as part of the “Helsinki” deal with the West (“human rights for loans”). In the 1980s, indebted socialist countries desperately tried to export their way out of their newly acquired servitude. Their products, however, were hardly competitive in the West. The energy bill to be paid to the Kremlin kept rising too. International loans were also used to buy off rebellious workers, in particular in Poland after 1973. By 1989 Hungary, Poland, Romania, Yugoslavia, the GDR, and Russia had run up some 90 billion of dollar debt to the West. Instead of defaulting, as Mexico did, the state socialist economies desperately tried to integrate further into the Western markets. Hungary became the first Comecon nation to become a member of the International Monetary Fund in 1982. The Soviet Union rejected an invasion into Poland in 1981 because the politburo feared a Western economic blockade. In the process, “reform” was accelerated while the party was losing its ability to buy off the workers in whose name it ruled. Socialist parties in the 1980s became increasingly bent on exacting higher productivity and a larger surplus from them. In the process, Ceaucescu’s Romania imposed a new homebred Stalinism and in fact paid off its debts by 1989.

Poland, for various reasons, one of them being its strong Catholic church, had always enjoyed a more open political scene than other Warsaw pact countries. From the mid-1970s, young critical intellectuals, in particular Jacek Kuron, began seeking alliances with an increasingly restless working class, resulting in the creation of the Workers Defense Committee (KOR) in 1976, to support workers in their legal fights against punishment. The KOR was
of signal importance in turning a new bout of isolated worker protests in the shipyards of the Baltic Coast in 1980 into the making and then the legalization of an independent nationwide labor union, Solidarity, with the electrician Lech Walesa at its head. The collective spirit that percolated after the new Polish pope, Karol Wojtyla, had brought the nation together in massive public rituals in 1979, was now increasingly turned into defiance against the party state. The alliance between intellectuals, workers, and the Catholic church fractured and delegitimized the party. With a membership of 8 million by late 1980, and openly demanding worker self-management and a pluralist civic sphere, this was the end of state-socialism as we knew it. Solidarity was not just a blue-collar union; the new middle classes of technocrats were substantially part of it, including a good million party members. On December 13, 1981, General Jaruzelski’s martial law destroyed the public side of the union in a few weeks, and incarcerated thousands of its activists. But it did not defeat for good the spirit of defiance in the factories, nor could militarization be a durable solution for the accumulating problems of socialism. In 1985 an amnesty was announced. In April 1988, in response to price hikes of meat, several mines in the south and various factories along the Baltic coast were once again occupied by workers, now led by a new generation of young and even more radical worker leaders. Dada-like street performances by students, mocking the regime, were also spreading again in the cities, such as, famously, the “Orange Alternative.”

The coming of Gorbachev as General Secretary of the Communist Party of the Soviet Union in 1985 signaled the start of a rejuvenation of the aging Kremlin leadership. Glasnost (openness) and perestroika (restructuring) were the symbols under which the new politburo set about tackling social and economic stagnation. In talks with the Polish generals following the renewed strikes and occupations in Poland in the spring of 1988, the Kremlin accepted that the Polish generals would negotiate with opposition individuals. The idea of the Round Table was born. The intention of the party was to acquire acceptance of “economic reform” (including price rises) in exchange for political pluralism and the strengthening of its own legitimacy. Gorbachev and even the Polish party leadership did not fully sense that the legitimacy of the party in Poland was beyond repair, and elsewhere soon too. Poland started its Round Table in January 1989, ushering in partly free elections in June that the regime was confident to win. They would not, and against everyone’s expectations Solidarity would form a government in September.

In Hungary, oppositional youth groups had been forming since the late 1970s around colleges and in independent democratic networks. Within the Socialist Party the “reform socialist” faction had become hegemonic in the early 1980s. In 1985 independent representatives were allowed to register for elections and became a strong oppositional nucleus in the party and the parliament. Increasing competition among leaders within the party gradually led to the formation of political movements, including Fidesz, the youth league of the Socialist Party, and the Hungarian Democratic Forum, which united a faction of reformists around Imre Pozsgay with “populist” intellectuals in the provinces. Political competition was spilling over into the street from the summer of 1988 onwards. The Hungarian Democratic Forum was allowed to organize a huge demonstration against the treatment of Hungarian minorities in Transylvania under Ceaucescu’s “systematization policy.” Large-scale environmental protests emerged against plans to dam the Danube. Janos Kadar, who had led the Hungarian Socialist Workers Party since 1956, was forced out in the summer of 1988. The party was now pressed to acknowledge that 1956 had in fact been a “popular rebellion” rather than a “counterrevolution.” The party was forced to face the legality of its actions in the aftermath of the Budapest uprising, including the killing of Imre Nagy and others. This process of legal and historical questioning
finally resulted in the public reburial of Imre Nagy in Budapest in June 1989, where Victor Orban of Fidesz openly demanded the departure of the Russian army and sovereignty and democracy for Hungarians. Youth groups were now campaigning in the form of “pan-European picnics” for the opening of the Iron Curtain. GDR tourists, holidaying in Hungary, were not returning home, hoping to get to Austria through the weakening Curtain and then on to West Germany. This was made possible officially in August 1989, after Gorbachev told the Hungarian government that it was a bilateral issue between Budapest and the East German government. Tellingly, Hungary received an extra incentive to lift the Curtain from the West German Christian Democrats in the form of a one billion Deutschmark loan. Hungary, like Poland, was becoming a parliamentary republic and the Iron Curtain was falling.

This in its turn had repercussions for the GDR as the number of refugees through the Hungarian route exploded. The GDR first refused travel to Hungary. But GDR citizens fled in large numbers to the German and US embassies in Prague. When a trainload of refugees was finally allowed to travel from Prague to the Federal Republic through GDR territory, protests within the GDR itself began mounting. A small church-based group in Leipzig had been doing quasi-oppositional religious processions on Mondays, but from September on attendance began to grow exponentially, turning the processions into the famous Monday demonstrations, with tens of thousands of participants claiming democracy, and later demanding reunification. Gorbachev, visiting Berlin in October for commemorations, rejected violence and urged the replacement of Erich Honecker. With huge demonstrations now spreading to East Berlin, the new leadership was shaken. On November 9, in the confusion, a government speaker giving improvised answers on television to journalists uttered, mistakenly, that the new free travel regime to West Berlin could start immediately that same night. Large crowds began gathering at once before the checkpoints in the Wall. Local officers, who could not get through to the central committee, which was meeting behind closed doors, finally opened a checkpoint. Shortly, excited and incredulous people were flowing into the streets of West Berlin and crowds soon started tearing down the Wall. The overwhelmed GDR leadership felt incapable of stopping the crowds and meekly began discussing reunification on Western terms, to which Gorbachev, seeking further economic ties with the West, had no objections.

With the Iron Curtain and the Berlin Wall crumbling, all the other socialist regimes in Eastern and Central Europe were on the line. Thodor Zhivkov, the Socialist Party leader in Bulgaria, declared, as soon as November 10, that Bulgaria would have free elections. The hard line socialist regimes in Czechoslovakia and Romania did not choose that route. The Czechoslovak regime cracked down on a big demonstration in Prague on November 17, but was soon overwhelmed by a new wave of even more massive demonstrations of hundreds of thousands of people in Prague and elsewhere, which were set in motion by networks of young actors in the country who used their schools and theaters as organizational nodes. Oppositional thinkers such as Vaclav Havel were catapulted into positions as “representatives of the people” and into national leadership. Before the end of November the regime was negotiating a date for elections.

The Romanian revolution was even more convulsive and indeed violent. Here it was not the democratic voice of a sudden opposition but the violent fractures within its own repressive apparatus that ultimately produced the end of the Ceaucescu regime and one-party rule. A Hungarian-speaking protestant pastor, Laszlo Tokes, in the border city of Timisoara, had been criticizing the discrimination of (Hungarian) Protestants. The Ceaucescu regime had already decided it would crack down on any open dissent, following the example of the Chinese
Communist Party at Tiananmen Square on June 4, and it proceeded to remove him from his church. A few dozen parishioners were protecting him. In the local escalation that followed, the army commander who was sent in to besiege Timisoara refused, after an initial assault, to shoot common people who were clearly not the bloodthirsty counterrevolutionaries denounced by official rhetoric. Put under pressure by Ceaucescu to use the army, the minister of defense committed suicide in Bucharest on December 22. Top networks within the Romanian security apparatus, unwilling to fight the nation, decided that it was time for the “conducator” to go. They used the unrest that emerged at a public address by Ceaucescu in Bucharest later that day to highjack the dictator and his wife, shoot them without legal process, and impose control over Bucharest and the armed groups. And, following the regional examples, they swiftly announced elections.

By December 31, 1989, Kolakowski’s “eggshell” had been broken, ostensibly by an assortment of mutually reinforcing civic movements of highly variable persuasions, composition, and power. They had done so in different ways, along different crack-lines, reflecting different histories of different states. The deeper unity and direction of the process was driven by the unfolding inner contradictions of “really existing socialism” within a world increasingly dominated by Western capitalism.

Victim movements

STÉPHANE LATTE

Over the last three decades, “victims” have become in most Western democracies one of the central figures in the field of social movements. While, in order to make their voices heard, increasing numbers of activist groups claim to be “victims,” the number of books and articles which either celebrate or denounce the advent of a “nation of victims” has been growing. Yet few sociological studies have taken the political uses of this category seriously. After briefly tracing the genealogy of victim movements, I will then identify the originality of this new contentious repertoire. Then, I will show how the study of this emerging form of protest has shed light on three blind spots of the sociology of collective action: the emotions of protest, the role of the traumatic event in the activist recruitment, and the gendered dimensions of social movements.

THE GENESIS OF THE “VICTIM MOVEMENT”

Since the mid-1970s, the identification of “victims” as a population with specific characteristics and problems has developed in Europe and the US along with an administrative, social, and academic mobilization. Launched by various governments, the “victim” category has been adopted by social movements and integrated into scientific knowledge.

Interest in “victims” first arose from a bureaucratic concern for the crime issue. While in the late 1970s the problem of crime control competed with social-economic issues at the top of the political agenda, governments sought to promote victim assistance and compensation programs. The influences behind these policies are quite varied. In the US, these initiatives were inspired by the law-and-order campaign as they primarily aimed at encouraging victims and witnesses of crimes to cooperate with law enforcement authorities so as to reduce crime. In France and Canada, victim assistance was rather a symbolic counterpart to a penal policy aimed at the rehabilitation of offenders. Victim relief should help defuse the “fear of crime” and promote social acceptance of measures for offender reintegration. In both cases, these policies led to the institutionalization of the administrative category of “victims.” Symbolic measures focused public attention on victim-related issues such as the proclamation of the National Crime Victims Rights Week by Ronald Reagan (1981) or the convening of committees in charge of stimulating victim reforms (the Task Force on Victims of Crime in the US and the Milliez Commission in France). National organizations were also created to coordinate the implementation of grassroots victim assistance programs run by volunteers: the National Organization for Victim Assistance in the US (1979), Victim Support in Britain (1979), the Institut National d’Aide aux Victimes in France (1986). Finally, the “victims” category has received institutional consecration with the founding of the Office for Victims of Crimes in the US Department of Justice (1984) and, more recently, with the launching in France of the first department entirely devoted to victims’ rights (2004).

This unprecedented public concern subsequently encountered the nascent victim activism. The first victims’ groups were created in the late 1970s in the US (Parents of Murdered Children in 1978, Protect the Innocent in 1979, Mothers Against Drunk Driving in 1980) and Canada (Citizens United for Safety and Justice in 1981, Victims of Violence in 1984). However, the relationship between the mobilization of victims and the state varies depending on national configurations. Thus, in the US, there is a strong convergence...
between public assistance programs looking for legitimization and protest entrepreneurs looking for institutional support (Elias 1993; Weed 1995). Victim activists work closely together with officials in charge of public policies: each identify themselves with the same category of “victim movement” and they conduct joint campaigns for constitutional amendments for victim rights. In Canada, officials of the ministry in charge of victim issues have faced difficulties in co-opting activist networks that do not describe themselves with this label and they have failed to generate a belief in the existence of a “social demand of victims” (Rock 1986). Finally, in France and the UK, victim assistance leaders, who have mostly come from the movements for prisoner rehabilitation, refuse to play the role of spokesperson for the “victims” and explicitly reject the characterization of “victim movement.” They derogatorily call self-help groups “angry victims” and suspect them of being driven by irrational reactions, vengeful aims, and punitive spirit. In both countries, it was not until the late 1990s that victims’ organizations were recognized by government officials as legitimate representatives (Rock 1998).

An academic field – victimology – has played a role in the reification and institutionalization of the “victims” category. Following the First International Symposium on Victimology, held in 1973, scholars, policymakers, and victim advocate group leaders founded the World Society of Victimology (1979). This scientific society functions as a transnational pressure group, coordinating a lobbying campaign at the United Nations that led to the vote for the “Declaration of Basic Principles of Justice for Victims of Crimes and Abuse of Power” in 1985. But above all, this academic movement for victims has helped forge and circulate encompassing concepts defining the “victims” category as a homogeneous entity. Thus, the “discovery” of post-traumatic stress disorder (PTSD) in 1980 led to the identification of a psychiatric syndrome supposedly shared by victims of crime, natural disaster, or road crash. Now all victims, regardless of their origin, receive the same treatment and care.

WHAT IS A “VICTIM”? THE LABELING PROCESS AND THE SOCIAL CONSTRUCTION OF THE “VICTIM” ROLE

In some countries, like the US, the expression “victim movement” is now commonly used and refers to a coalition of well-defined self-help groups, lawyers, and victim assistance professionals who campaign for the recognition of victims’ rights. In other countries, the term is not a stable reference, so it may be risky to give a sociological definition to a victims’ mobilization. Indeed, an overly broad view of this term leads to including eclectic social movements which do not necessarily have common characteristics. Today, almost all collective action requires the identification of a group defined as a victim (of injustice or inequality) and the public display of suffering persons is one of the strategies commonly used by many protest movements, such as feminist mobilizations and those of the unemployed, AIDS activists, or undocumented immigrants. Therefore, what sociological characteristics specifically distinguish victim mobilizations from more conventional social movements?

Victim movements might first be defined in a tautological sense in that they consist primarily of “victims” and that these “victims” lead the movement. The direct commitment of individuals facing a dramatic event is the first criterion of differentiation that allows us to distinguish victims’ organizations from other forms of assembly such as trade unions, humanitarian agencies, or charities. For example, the main French group of victims of terrorism chose a slogan – “created by victims for victims” – which clearly differentiates it from victim assistance networks involving legal experts and psychologists.

But having been the victim of a tragic event is not in itself an objective property. It is rather the result of a social process of labeling. In some cases such as aviation or road accidents,
the relatives of deceased persons rather than the survivors are socially designated as victims. In contrast, in France, associations of terrorism victims are usually run by the survivors of terrorist attacks while the bereaved families occupy a secondary role in the mobilization. The designation as “victim” is the result of a hierarchy within the victims’ organizations.

Moreover, the term “victim” is not always claimed by individuals who have had a personal tragedy. The word still has a negative connotation among social movements because it is associated with passivity or helplessness. Thus, feminist movements against domestic violence or child abuse prefer the label of “survivor” which implies agency (Dunn 2005). The leaders of the first French association of struggle against HIV refuse the characterization of “AIDS victims” and call their members “sick social reformers” or “citizen experts.” In South America, the associations of parents of disappeared persons replace “victim” with the term of “fighter” or “hero” or “resistant” which more correctly corresponds to the political nature of their struggle. To understand the endorsement or rejection of victim status, it is thus necessary to analyze the construction of collective identity by activist groups.

Finally, not all dramatic events necessarily give rise to the public designation of victims. For example, work accidents have historically been seen as victimless crimes, a fatality, or a socially acceptable risk. Therefore, without the resources needed to engage in lawsuits, workers who have had work accidents struggle to perceive themselves, to mobilize, and to be recognized as victims.

A NEW CONTENTIOUS REPERTOIRE?

Rather than trying to define who is and who is not a “victim,” it is in fact more important to observe what constitutes the specificity of the protest activities subsumed under the label of “victim movements.” To this end, we will define as a victim repertoire a new register of collective action characterized by four properties:

1. This repertoire presupposes the use of a limited range of self-designation, all of which refer to a position in a tragedy: “victims,” “bereaved families,” “survivors,” etc.
2. This register is then characterized by a particular emotional tone. Victimization entrepreneurs often portray a range of public emotions—pain, grief and suffering—which, unlike anger or pride, are usually considered outside the realm of political struggle.
3. This repertoire is also defined by a special form of organization—the victims’ association—led by actors whose public legitimacy is based on their direct victimization experience.
4. Victim groups rely primarily but not exclusively, on four modes of protest. First they employ individual public testimony (press releases, participation in talk shows, autobiographical publications) as a way of publicizing their grievances. They then use lawsuits to obtain compensation and the conviction of those responsible for their suffering or to transform their trials into a court of public opinion. In addition, these organizations frequently mobilize therapeutic practices and medical language, either to strengthen ties within the group (support group) or to authenticate their damages and legitimize the merits of their complaints (public use of diagnosis categories such as PTSD) (Latté & Rechtman 2006). Finally, they regularly organize commemorative events (silent marches, public funerals, memorial services, and vigils) to get a hearing for their case and get media attention. Thus, victims’ organizations have specific strategies that are usually associated with the treatment of individual misfortune rather than with collective action.

This victim repertoire is currently spreading far beyond the limited framework of the victim movement. It tends to become a master frame invested by eclectic fractions of social
movements. For example, antipsychiatry movements in Britain, which previously were based on class struggle rhetoric and trade union models, have, since the 1980s, adopted the style of victimhood protests by creating associations of survivors (Survivors Speak Out), organizing support groups and public commemorations (Crossley 2006). Similarly, since the 1980s, part of the American feminist movement has left the field of political action to engage in self-help groups of survivors of patriarchal violence (Whittier 2009). More recently, labor unions have also converted to the victim repertoire by attempting, for example, to mobilize the victims of harassment at work or asbestos victims. The success of this contentious repertoire should probably be related to broader trends: the growing importance of media constraints on social movements, the judicialization of collective action and the depoliticization of protest activity. However, more detailed studies could help identify which contexts and actors promote or prevent the introduction of this register into the various sectors of protest activity.

VICTIM ACTIVISM: A “NEW EMOTIONAL MOVEMENT”?  

The development of victim activism provided an opportunity to reopen several fields of research on social movements, the first of which is the study of the role of emotions in collective action. Walgrave and Verlhust thus propose to add a new case in the typology of social movements to designate certain mobilizations of victims: the Movement against Senseless Violence in The Netherlands or the Belgian White Movement against pedophilia, for instance (Walgrave & Verlhust 2006). These authors characterize these demonstrations as “new emotional movements” (NEM) for which they consider the affective variables predominant in participation. These NEM indeed contradict some of the results of resource mobilization theory. First, no traditional protest organizations (trade unions or political parties) take part in the mobilization process. Moreover, usual social networks (friendship, church, or professional circles) remain largely inactive in activist recruitment. Finally, protest actions are organized only by small, loosely structured groups often led by inexperienced activists. Similarly, contrary to the principles of framing analysis, these victim mobilizations do not rely on the classical frames of collective action. They do not refer to major transformative ideologies and their claims are usually imprecise and weakly formalized. Finally, none of the socio-demographic variables – age, educational level, and income – seems to predict the recruitment of these movements. The authors conclude that the logic of adherence to these movements is mainly emotional: the grief, compassion, fear, or identification with the figure of the victim outweigh the absence of organizational support and social predisposition to a political commitment.

However, identifying victim movements with NEM presents a number of difficulties. First, the lack of socioeconomic data concerning the mobilization of victims makes it difficult to test the generalized hypothesis that the weight of the social determinants of activist participation fades as an emotional logic becomes dominant. Some empirical studies even tend to invalidate this. Thus, during the mobilization of the victims of industrial disasters (Latt 2009) or road fatalities, cultural capital, economic resources, and activist know-how appear essential to explain why some victims join support groups and why others remain apathetic. These organizations “tend to be run by activists who have been victimized rather than victims who have become activists” (Weed 1990: 469).

Moreover, even in the most dramatic circumstances, material benefits and economic incentives are not necessarily absent. Indeed, victim organizations form loose collectives that cannot rely on community pressure to encourage their members to participate. Creating financial incentives for mobilization (around issues of pecuniary
compensation, in particular) therefore contributes to strengthening an emotional tie which otherwise remains vague.

Finally, the “emotionality” attributed to victim activism should not be viewed as an inherent property of this type of movement, but as a “folk construct” (Groves 2001). Thus, the attribution of emotions is a common form of disqualification, in both the public as well as the judicial arena. Victim groups are thus stigmatized as “irrational” movements based on a sense of mourning, a desire for revenge, or a traumatic shock rather than reasoned claims. This is why many victim spokespersons try to repress the public expression of their emotions (Whittier 2001) while others explicitly reject the emotional dimension of their protest. As a recent press release issued by a French association of disaster victims put it: “We are not part of an emotional demonstration; we refuse to be confined to that role” (Latté 2008: 692, 2009).

A fruitful direction is to leave aside the study of mobilizing emotions and to emphasize the analysis of mobilized emotions. The victim movements are perhaps distinctive less because of their (“emotional”) motives than because of the affective role they play in public and the emotional work to which they are obligated by the cultural expectations attached to the social victim’s role (Stanbridge & Kenney 2009).

ARE VICTIMS MOBILIZED “ACCIDENTALLY”?  

In line with this reflection on emotions in protest activities, victim activism also offers the opportunity to clarify the role played by sudden events in collective action. For 30 years, social movement scholars have made efforts to identify the effects of dramatic events on mobilization processes. The concepts of “suddenly imposed grievances” (Walsh 1981), “moral shock” (Jasper 1997), and “quotidian disruption” (Snow et al. 1998) aim at highlighting the catalytic effect of certain events on the onset of collective action. These tools have been forged in part from case studies of victim movements (the protest of residents from the area of the Three Mile Island nuclear power plant, in particular). In fact, these collective actions arise chronologically subsequent to a brutal event that disrupts the routines of ordinary life. Moreover, the self-presentation of these movements is built on the dramatization of an accident solidarity that binds individuals who did not know each other prior to the accident and who only share the traumatic experience. Thus, Lemieux and Vilain characterize victim organizations as “circumstantial groups,” that is, as organizations which, unlike ordinary social movements, are not based on “a priori solidarity” (friendship networks, family ties, political affinities, social proximity), but on “a posteriori solidarity” (the fact of having been together at the “wrong place at the wrong time”) (Vilain & Lemieux 1998).

The role of the event in the process of mobilization cannot, however, be overestimated. The event effectively functions as a screen that sometimes obscures the fact that many victim groups are in fact based on deeply rooted social identities and preexisting organizational networks. For example, in France, the associations of cult victims are based on the religious affinities of their members while the movement of Polynesian nuclear test victims finds its support in the networks of the Protestant church and the Independence Party. The groups of asbestos victims are based on the labor unions, and the mobilization of “Gulf War syndrome” victims on the solidarity of veterans. From this point of view, the victims are not only captives of the event, but they take hold of the event as an opportunity for collective action. The event reorients activist commitments, but it does not create them.

DO VICTIMS HAVE A GENDER?  

The analysis of the gendered dimensions of victim activism is a final field which deserves to be opened. Compared to most social movements, victim organizations have atypical patterns of gender composition. These are
most often mixed movements not directly focused on gender-related issues. However, the visibility of women in victim activism contrasts with the often-noted invisibility of women activists in the area of social movements. The cause of victims has historically been championed by spokeswomen: Candy Lightner, the founder of Mothers Against Drunk Driving, or Françoise Rudetzki, the leader of SOS-Terrorism in France. Quantitative studies also reveal an overrepresentation of women in the membership of such organizations (Weed 1990). Moreover, the names of some of these movements are explicitly related to collective identities linked to motherhood or wifehood: Mothers Against Drunk Driving, Mothers of the Plaza de Mayo in Argentina, the “crazy women of Algiers” (a movement against forced disappearances) or the “asbestos widows” in France. Finally, victim groups frequently face disqualification full of gendered meanings. For example, media representations of the “victim” are based on the stereotype of the “weeping woman”: “the quintessential disaster victim is emotional, beleaguered, overwhelmed, passive – in a word, female” (Enarson & Meyreles 2004). Similarly, critics of the development of victim movements denounce this activism as a “personal” (rather than “political”) commitment, as a claim for a “passive” status (rather than an “active” citizenship), as a “private” (rather than a public) problem, as an “emotional” reaction (rather than as a “rational” position). In short, victims’ characteristics are routinely related to properties culturally associated with femininity. Therefore victim activism is a particularly promising field to explore how these gendered meanings are used by activists and their opponents to classify and prioritize social movements.

War crime movements in Japan
JENNIFER CHAN

Various nongovernmental advocacy efforts concerning Japanese war crimes have arisen in the past six decades since the conclusion of the International Military Tribunal for the Far East (hereafter referred to as the Tokyo Tribunal) and the trials at other sites throughout the Pacific. One can group these movements broadly into three periods: (1) the parole for war criminals movement (1952–1958); (2) the post-Tokyo Tribunal war crime movements (1958–1998); and (3) the nongovernmental coalition for the International Criminal Court movement (1998–present). In this essay, the scope of war crime movements encompasses those concerning war crimes, crimes against peace, and crimes against humanity, as defined in the relevant international conventions such as the Hague Conventions, the Geneva Conventions, and the Statute of the International Criminal Court.

When the San Francisco Peace Treaty came into effect in 1952 at the end of the Allied Occupation of Japan, the parole for war criminals movement emerged out of popular Japanese sentiments that the Tokyo trials represented victors’ justice. The conviction of Japanese war criminals (28 top military and government leaders for Class A crimes against peace and 5700 individuals for Class B and C war crimes and crimes against humanity) was considered unfair (Totani 2008). The war victim narrative put forward by this right-wing nationalist movement, demanding the release of all Class B and C criminals, quickly garnered widespread support. In particular, movement leaders rallied around the dissenting opinion of Indian Justice Radhabinod Pal that the Hague Convention of 1907 was not legally binding on Japan and that crimes against peace were not punishable under international law up until World War II (Totani 2008). By 1958, all war criminals were released from prison, marking a temporary and artificial closure to war crimes issues in Japan.

In the second period, spanning the four decades between 1958 and 1998, several factors facilitated the emergence of a range of war crime movements in Japan and Asia. First, an intellectual movement led by Japanese historians, philosophers, and political theorists, such as Oda Makoto, pushed beyond the predominant victim consciousness to look at the complicity of the Japanese nation as war aggressors (Avenell 2010). Second, new evidence unveiled by historical and feminist researchers, notably in South Korea and Japan, since the 1970s, reopened issues of Japanese war crime responsibility that were omitted by the Tokyo Tribunal, such as military sexual slavery. Third, the death of Emperor Hirohito in 1989 removed one of the last obstacles for various national and regional social movements (Dudden 2006). Fourth, the emergence of international human rights discourses and movements since the 1990s has lent considerable normative as well as organizational weight to various war crime social movements in Japan and the Asia-Pacific region (Tsutsui 2009). This period is characterized by domestic, regional, and international activism on a range of differentiated issues from forced slave labor to military sexual slavery in an increasingly institutionalized human rights frame.

Two prime examples of war crime movements of this period are the history textbook movement and the “comfort women” redress movement. Support groups against Japanese history textbook censorship, centered on the famous lawsuits of historian and Professor Saburo Ienaga, have developed since the 1960s (see, for example, Children and Textbooks Japan Net 21 1998 (consisting of 110 groups)). These in turn are countered by a nationalist
historical revisionist movement made up of groups such as the Japanese Society for History Textbook Reform (founded in 1996). The redress movement for “comfort women” (the majority of whom were Korean) best illustrates the gender and racial biases of international law, the UN human rights system, and social movements. Though rape was clearly defined as a war crime in international conventions, the “comfort women” issue was largely dropped in the Tokyo Tribunal with the exception of the prosecution of a few cases (Totani 2008). It took concerted mobilization efforts by regional and transnational social movements (led by the nongovernmental Korean Council for the Women Drafted for Sexual Slavery by Japan, the Violence Against Women—Network Japan, and the Center for Research and Documentation on Japan’s War Responsibility) to obtain a public apology by the Japanese prime minister in 1992 and UN recognition of military sexual slavery (Chan-Tiberghien 2004). In July 1995, a private Asian Women’s Fund to provide support and atonement money for the “comfort women” was established with donations from the Japanese public. The Fund was controversial, as it was not financed by the Japanese government. It divided the “comfort women” as well as the advocacy groups into pro- and anti-Asian Women’s Fund camps. In 2000, a coalition of national, regional, and international nongovernmental networks including the Violence Against Women—Network Japan, Korean Council for the Military Sexual Slavery by Japan, Asian Center for Women’s Human Rights, Women’s Caucus for Gender Justice (US) organized a people’s tribunal, the Women’s International War Crimes Tribunal on Japan’s Military Sexual Slavery, which for the first time found the emperor guilty of war crimes (Hayashi 2000; Violence Against Women in War—Network Japan 2000).

The last period of Japanese war crime movements coincided with an international movement for the establishment of the International Criminal Court (ICC). In 1995, several nongovernmental groups met in New York and formed the Coalition for the ICC, which played an instrumental role in the lead-up to the signing of the Rome Statute in 1998. In Japan, two networks – the Japan Network for the ICC and the International Human Rights NGO Network – started to educate the public as well as legal professionals about the ICC. Advocacy for Japan’s signature of the Rome Statute was tricky, as some legal scholars believed that talking about war crimes in the context of the ICC might slip into supporting Japanese emergency measures in dispatching Japanese Special Defense Forces overseas and, worst of all, the revision of Article 9 of the Constitution. The ICC movement in Japan, however, used the opportunity to connect contemporary war crimes to Japanese war crime responsibility during World War II (Chan 2008). Japan acceded to the Rome Statute in 2007.

As many issues were left out of the scope of the Tokyo Tribunal – the emperor’s criminal responsibility, issues of the treatment of colonial subjects as well as nationals (notably the atrocities committed against Okinawans in the last months of the war), and military sexual slavery – Japanese war crime movements have lasted for over six decades and seem unlikely to subside in the near future.

Weatherman (United States)

PEPPER G. GLASS

Weatherman (also known as Weathermen, The Weather Underground, and The Weather Underground Organization) was a revolutionary organization that staged violent and dramatic events, especially bombings, across the US. The group formed in the late 1960s, continuing into the 1980s when it disbanded as members became increasingly isolated and smaller in number.

Weatherman originally emerged from the Students for a Democratic Society (SDS), a central force in “New Left” protests in the US during the 1960s. As the SDS faced internal schism in the spring and summer of 1969, a militant faction – the Revolutionary Youth Movement – wrote and distributed a document. The statement, “You Don’t Need a Weatherman to Know Which Way the Wind Blows” (a quote from a Bob Dylan song), called for the student movement to become revolutionaries by organizing a base of white, lower-class youth. “In every case, our aim is to raise anti-imperialist and anti-racist consciousness and tie the struggles of working-class youth (and all working people) to the struggles of Third World people, rather than merely joining fights to improve material conditions, even though these fights are certainly justified” (Ashley et al. 1970: 75). The paper also expanded SDS practices by advocating violence as well as moving the settings of protest beyond college campuses.

Following the lead of foreign guerrilla movements, Weatherman established small groups in major cities, including a central “Weather Bureau” in Chicago. There they organized demonstrations from October 8 through 11 1969 – the “Days of Rage.” This was a protest “not only to bring ‘peace to Vietnam,’ but beginning to establish another front against imperialism right here in America – to ‘bring the war home’” (Students for a Democratic Society 1970: 168). Hundreds attended the Days of Rage, many armed with football helmets, gas masks, sticks, and pipes. On both October 8 and 11, they broke through police lines to damage property in wealthy downtown neighborhoods. These events ended in injuries to protesters and police, as well as mass arrests – including most of the organizers of the event.

Within months of the Days of Rage, the members of Weatherman decided to operate clandestinely, becoming the Weather Underground Organization. This move “underground” greatly shrank their numbers. Over the next several years, the group set off bombs in various settings, including Chicago police cars, the home of a judge in New York City, the National Guard Association in Washington, DC, the Presidio Army base in San Francisco, the US Capitol building, the Pentagon, and Gulf Oil’s headquarters in Pittsburgh. Statements explaining their reasons, as well as warnings beforehand in order to avoid harming people, accompanied the bombings. Still, there were several injuries and deaths, including for Weatherman itself. On March 6, 1970, three members died when a bomb that they were building exploded. These deaths led the organization to reconsider its view on human victims, deciding to only target property. The group also participated in a prison escape of counterculture icon Timothy Leary on September 15, 1970.

Weatherman were highly critical of “imperialist” interventions by the US, especially the war in Vietnam, and they were influenced by international communist and guerilla campaigns. Some visited Cuba, and they met with North Vietnamese representatives. In protests, members cheered “Ho, Ho, Ho Chi Minh” and “Mao, Mao, Mao Tse-tung.” Named after a
quote from Mao’s *Little Red Book*, their book *Prairie Fire* (Weather Underground Organization 1974) was “the first manual devoted specifically to urban guerrilla warfare in the United States” (Short 1975: 25). As a group wishing to organize white, working-class youth, as well as early challengers of “white privilege” (Berger 2006), Weatherman also saw themselves as corollaries to the Black Panthers. Yet the Panthers did not necessarily approve of their practices, as Fred Hampton said of the Days of Rage, “We oppose the anarchistic, adventuristic, chauvinistic, individualistic, masochistic, and Custeristic Weathermen” (Rudd 2009: 173).

The activities of Weatherman also found the scorn of law enforcement. The FBI placed multiple members on its Ten Most Wanted list during the 1970s. Yet by the mid- to late-1970s, most members had surrendered themselves, especially after 1973, when the government dropped criminal charges because of its use of illegal wiretap surveillance. Still, the FBI hunted Weatherman well into the 1980s. One of the final activities of members was an attempted Brinks truck heist in 1981, when fugitives killed two police officers and a Brinks guard, as well as injuring numerous others. “By 1986, with most suspects captured, the ‘armed struggle’ movement originating in the 1960s had come to a virtual end” (Varon 2004: 299).

Industrial Workers of the World (IWW)

ANDREW MARTIN

The way in which social movement groups organize themselves has considerable, and often unforeseen, ramifications. Among movement scholars, much of the debate regarding the degree of formalization centers on issues of tactics, with bureaucratic movement organizations charged by critics as too conservative. Yet there the implications for adopting a less formalized structure may play out in other ways as well. During the late nineteenth and early twentieth century, opposition by business elites and their allies in the state to unionization efforts, particularly among unskilled workers, often took the form of extreme repression, and bloodshed was not uncommon during this period. Nowhere was this more evident than in the case of the Industrial Workers of the World, whose radical goals and loose organizational structure provided considerable opportunities for repression.

Of course, it is important to recognize that the “Wobblies,” as they are fondly recalled, demonstrated, for the briefest period of American history, that a radical labor movement could indeed prosper in the United States. Although only viable for 20 years, the movement produced some of the most notable figures in American labor history: “Big” Bill Haywood, Joe Hill, Eugene Debs, “Mother” Jones, and the “Rebel Girl,” Elizabeth Gurley Flynn.

Like many progressive labor organizations in America, the Wobblies began in opposition to the more conservative American Federation of Labor, a rivalry that would define much of the IWW’s life-course. This was not the first time the AFL, primarily comprised of highly skilled native workers, was challenged from the left. In the late 1800s the Knights of Labor, advocating a broad agenda of labor reform, sought to include all types of workers. It was, however, not until the IWW that a labor organization consciously strove to organize all laborers, regardless of occupation, national origin, or race, into “One Big Union.”

The union was formed in 1905 in Chicago by a collection of labor activists, as well as leaders of the Western Miners Foundation, a militant union that had already experienced substantial repression in its efforts to organize miners in the Western United States. Maintaining that the American political system was structured to ignore the needs of the working class, the Industrial Workers of the World adopted an anarcho-syndicalist philosophy. As such, all of the efforts of the union were focused on creating disruption at the point of production, rather than seeking to win new gains at the ballot box. Bill Haywood, one of the most famous leaders of the IWW, famously pronounced that all workers needed only to fold their arms (stop working) and they would be successful. Within the context of the economic strategy, the union advocated a number of militant tactics, including strikes, boycotts, and even sabotage. Reflecting its anarchist bent, the union’s organizational structure was comprised less of formal positions than a network of loosely connected allies and organizers. In fact, the organization resisted in signing formal binding contracts with employers, preferring instead to use the threat of a work stoppage to enforce its demands.

One of the reasons why the IWW, despite its short life, is still so well known today is the fact that it was involved in a number of notable labor disputes. True to its eclectic organizational roots, these strikes occurred across a diverse range of industries. One of its most notable triumphs was the textile workers strike in Lawrence, Massachusetts, in 1912. Like many other disputes it was involved in, the
conflict actually began prior to the arrival the IWW. Nevertheless, it was able to snatch victory from the jaws of failure; IWW organizers were successfully able to unite an ethnically diverse group of workers. In a tactical stroke of genius, the union used children of striking workers to solicit support from elites in New York City. The union also had some successes elsewhere, including among loggers in the Pacific Northwest and the South, as well as in the mines throughout the country. It was also one of the first unions to take seriously the plight of farmworkers through its Agricultural Workers Association.

Not surprisingly, given the radical goals and tactics espoused by the union, it was almost inevitable that it would elicit strong repression, not only by the state and businesses elites, but also by the AFL. This union often got involved in Wobblies disputes, promising the employer a “safe” alternative to the IWW. Obviously the ability of such unions to ensure more stable labor relations than the IWW was also critical. And while violence by police and businesses was common in many of the strikes organized by the IWW (Joe Hill, for example, was lynched, as were other supporters), it was the Wobblies’ opposition to what they deemed to be a capitalist conflict, World War I, that finally afforded the state the opportunity to crush the union once and for all. The government raided a number of IWW offices across the country and successfully convicted a number of leaders for their opposition to the war, including Bill Haywood, who fled to the Soviet Union, where he lived for the rest of his life.

The fact that the union lacked a clear structure and bureaucratic resources only made it more vulnerable to attacks by the state. Indeed, the union was often beset by internal squabbles. Moreover, individual actors within the union pursued their own organizing agenda, which spread the limited resources of the union thinner and made it even more vulnerable to external opposition. Not surprisingly, the severe repression eroded the strength of the organization considerably, and while it does exist in the United States and other countries today, it is a shadow of the organization that led successful labor disputes in the mills and mines of early twentieth-century America.

While the tangible gains made by the IWW were fleeting, its impact on the labor movement and beyond is considerable. Along with the Knights of Labor, it played an important role in organizing the growing masses of factory workers and the eventual success of the Congress of Industrial Organizations in forging industrial unions like the United Autoworker. Many members of the IWW, such as Joe Hill, also recognized the importance of music in organizing workers, and, as such, the IWW has generated a number of famous labor songs, including “Solidarity Forever,” many of which can be found in its “Little Red Songbook.” Perhaps less well known, but as important, was the IWW’s impact on freedom of speech laws. In various cities throughout the country efforts by the police and business interests were made to silence IWW agitators, but the union won a number of free speech cases. The IWW demonstrated that the melding of working-class concerns with issues of social justice was a powerful formula for change. Of course, its radical claims and rather weak organizational structure made it particularly susceptible to state repression, and it is no surprise that the more formalized Congress of Industrial Organizations would eventually become the primary union to mobilize the unskilled workers of American factories.

Women’s movements
ALISON DAHL CROSSLEY and HEATHER MCKEE HURWITZ

Women have organized throughout the course of modern history and in all parts of the world. Women’s movements are broadly defined as “all organizing of women explicitly as women to make any sort of social change” (Ferree & Mueller 2007: 577). Mobilizations of women arise out of gendered structures of oppression and opportunity, and women’s movements have been among the most enduring and consequential movements in modern history. Participants in women’s movements frequently use gender to form a collective identity on the basis of their social position as women. While many women’s movements embrace a feminist identity and seek to advance the social position of women, it is not always the case. Women also mobilize around claims that are unrelated to or in opposition to feminism.

CONTEXT FOR WOMEN’S MOBILIZATION

Women have always had sufficient grievances to mobilize, and women’s collective action abounds throughout history. However, collective activity on the part of women directed toward improving their own status has flourished primarily in periods of generalized social upheaval, when sensitivity to injustice, discrimination, and social inequalities has been widespread in the society as a whole.

Modern women’s movements have been widely conceptualized in waves of mobilization. While the wave framework correctly identifies time periods of heightened collective action, scholars of women’s movements challenge the idea that there are distinct waves of the women’s movement because it obscures the persistence of feminism in different political, social, and cultural climates. Instead of disappearing between waves, the women’s movement is best understood as going into a holding pattern, which Verta Taylor (1989) termed abeyance in order to survive in hostile political climates; such was the case in the US in the 1950s (Rupp & Taylor 1987). In abeyance, movement activists from an earlier phase of mobilization struggle to maintain the ideology and structural base of the movement in the absence of mass support. A movement in abeyance is primarily oriented toward maintaining itself rather than confronting the established order directly. Focusing on building an alternative culture, for example, is a means of survival when the political structure is not receptive to challenge. The concept of abeyance has since been used to analyze contemporary women’s movements in numerous countries and national contexts, including Britain, Australia, South Korea, and Japan (Grey & Sawer 2008).

Despite temporal and geographical differences in women’s movements, scholars identify certain basic structural conditions that have contributed to the emergence of women’s protest in most parts of the Western world. Broad societal changes in the patterns of women’s participation in the paid labor force, increases in women’s formal educational attainment, shifts in marriage, women’s fertility rates, and reproductive roles disrupt traditional social arrangements, setting the stage for women’s movements. As industrialization and urbanization bring greater education for women, expanding public roles create role and status conflicts for middle-class women, who then develop the discontent and gender consciousness necessary for political action. For example, declines in women’s childbearing can improve women’s educational attainment and participation in the paid labor force which, in turn, may raise their gender consciousness.
Women’s movements in the global South also arise out of structural conditions related to globalization and structural adjustment policies. Although these movements may not be labeled feminist movements, women around the global South have mobilized against the ramifications of globalization such as poverty, militarism, and environmental degradation. For example, women maquiladora workers in Mexico are fighting for better work conditions and higher wages, domestic workers in Uruguay gained legal standing comparable to the country’s formal workforce, women in India built an environmentally sound dam and continue to organize for land and water rights, and women in Okinawa are leading antimilitarism mobilization (Naples & Desai 2002).

The structural preconditions underlying the emergence and endurance of women’s collective mobilization are perpetually evolving. Demographic, economic, and cultural processes that spur women’s movements vary by national and regional context. Even within a specific country, political and cultural variations in women’s movements are reflected in differences in the ways women define their collective interests, whether by regional, cultural, racial and ethnic, religious, age, caste, or community identities, or a combination of these intersecting identities.

RANGE AND TYPES OF WOMEN’S MOVEMENTS

Women mobilize in all parts of the world and in response to a broad variety of grievances and social inequalities. Participants in women’s movements use their identities as women to address social problems that face women in particular or that affect women disproportionately to men. They also use their bonds as women to further their networks and communities as a base for mobilization. The range of women’s movements includes feminist movements, hybrid movements, transnational movements, and antifeminist movements.

Feminist movements seek to advance the status of women and are informed by feminist ideologies. However, the term feminist is contested not only because it has been historically associated with Western women’s movements, but also because the meanings ascribed to feminism have changed over time. One approach to categorize feminist movements by historian Karen Offen has been to distinguish between individualist and relational feminism. In this comparative historical model, individualist feminism emphasizes women’s rights as human rights based on ideologies of personal autonomy, while relational feminism bases women’s equality on their traditional contributions to family and childrearing. In the 1960s and 1970s, feminist movements were often classified as liberal, radical, or socialist. Liberal feminist ideology argues that women lack power because they are not, as women, allowed equal opportunity to compete and succeed in the male-dominated economic and political arenas but, instead, are relegated to the subordinate world of home, domestic labor, motherhood, and family. The major strategy for change is to gain legal and economic equalities and to obtain access to elite positions in the workplace and politics. Examples of liberal feminist movements include campaigns to increase the number of women in political office or to invest in education programs that teach girls to be leaders in underrepresented fields. In contrast, radical feminist ideology dates to Simone de Beauvoir’s early 1950s theory of “sex class,” which was developed further in the late 1960s among small groups of radical women within the New Left. The radical approach recognizes women’s identity and subordination as a “sex class,” emphasizes women’s fundamental difference from men, and recasts relations between women and men in political terms. To unravel the complex structure on which gender inequality rests, requires, from a radical feminist perspective, a fundamental transformation of all institutions in society. To meet this challenge, radical feminists formulated influential critiques of the family, marriage, love, motherhood, heterosexuality, capitalism, and more. Socialist feminism, which has been the dominant form
of feminism in some countries, shares with radical feminism the intent to transform society in fundamental ways but focuses on a class analysis of the ways that capitalism oppresses women. Since the 1970s, varieties of feminism have expanded to include lesbian feminism, Islamic feminism, environmental feminism, to name just a few.

Hybrid women’s movements use elements of feminist movements as a frame for other causes or claims. Women’s movements have shaped the ideologies and tactics of a wide variety of social movements, and were instrumental in the formations of gay and lesbian and peace movements, among others. The effects women’s movements have on other movements are classified by Nancy Whittier as generative or spillover. Generative effects are those that change the fields of protest or influence future stages of protest. An example of the generative effect of women’s movements is the mobilization against childhood sexual abuse, which was originally framed in feminist terms but has since created numerous networks and communities of activists that do not necessarily adhere to feminist ideologies. Spillover effects of women’s movements include the spread of tactics, structures, and cultures to other movements. For example, the feminist framing of health care has influenced other women’s health movements such as breast cancer activism. Some women’s self-help movements emerged from combining a feminist frame of postpartum depression with a medical frame, illustrating the hybridity of women’s movements (Taylor 1996).

Transnational women’s movements have long been in existence, despite the heightened attention devoted to them as a result of globalization. From the late nineteenth century through World War II, women created alliances and coalitions to improve the position of women. Transnational organizations such as the International Council of Women, the International Alliance of Women, and Women’s International League for Peace and Freedom mobilized around suffrage, citizenship, and world politics. In the aftermath of World War II, the Women’s International Democratic Federation, founded by left-wing women, challenged the existing transnational women’s organizations and met great success organizing throughout the third world. These organizations provided the foundation for a transnational feminist community that would successfully incorporate women’s concerns in global politics (Rupp 1997). Since the 1970s, transnational women’s movements have continued to create and sustain networks of women, although the grievances have evolved to address issues such as the feminization of poverty, environmental justice, and the agency of women in development. Transnational women’s movements also situate local interests within a global stage set by governmental organizations, nongovernmental organizations (NGOs), and international funders.

Antifeminist movements that mobilize against women’s equality have existed since the earliest feminist movements. Elite white women mobilized against woman suffrage, concerned that women’s political participation would undermine the family structure and women’s caretaker role. Contemporary antifeminist movements include participants who hold a variety of perspectives, including in the US those of the religious Right who assert that traditional gender roles and the heteronormative nuclear family should be the foundation of society. On the other end of the antifeminist spectrum are those who are not necessarily religious, but whose antifeminist beliefs are informed by their view of the rational self-interested individual as the foundation of society. Other antifeminists seek to curtail women’s reproductive freedom, and they continue to escalate their tactics, including harassing women at abortion clinics and killing physicians who are abortion providers. The prevalence of antifeminist resistance throughout history highlights the significance of the family, sexuality, reproduction, and traditional gendered arrangements for the maintenance of the dominant social order.
DYNAMICS OF WOMEN’S MOVEMENTS

Historical, cultural, and structural contexts influence the dynamics of women’s movements. Social movements also develop in response to political and cultural opportunities and the availability or scarcity of resources. Women’s movements mobilize not only to make claims against the state and the government, but they also target other institutional and cultural arenas (Staggenborg & Taylor 2005). An examination of movement dynamics reveals the varieties of mobilizing structures and tactical repertoires significant to women’s movements across the globe.

Mobilizing structures

Women’s movement organizations may be independent or form networks and coalitions with other women’s movement organizations. They address a variety of grievances, from raising women’s unequal status with men in the home, labor, or political spheres, to organizing against the war in Iraq, toxic plants, or mega-dams. Whether they are local, national, and/or international in scope, they adapt their mobilizing structures to their social and political contexts and their targets. For example, women’s movements in Calcutta and Bombay have divergent ideologies and organizational structures as a result of the differing political cultures and distributions of power within each city (Ray 1999).

Women’s movements have complex relationships with the state, which inevitably influences the development of movement organizations and strategies. In India, women’s movement organizations rely on the state for legal protection while simultaneously acknowledging its role as oppressor. In contrast, contemporary Korean and Australian women’s movement organizations focus on developing strong connections with the state, which both advance gender equality and hinder development of feminist political cultures (Grey & Sawer 2008). In addition to negotiating relationships with the state, international women’s movement organizations must also reconcile differing perspectives about the relationship between nationalism and internationalism.

Women’s movement organizations develop a range of mobilizing structures to achieve their goals. Bureaucratically structured women’s organizations have hierarchical leadership and primarily target mainstream arenas. They may work for women’s rights in the public sphere, such as improving women’s political representation and legal protection. In contrast, collective organizations use nonhierarchical leadership and decision-making processes, and often place importance on women’s culture and personal experiences. Collective organizations grew from radical feminists’ attempts to structure relations among members, processes of decision making, and group leadership in a way that prefigured the values and goals of the movement.

Women’s grassroots organizing responds to traditional male-dominated political avenues of change, or top-down bureaucratic structures. Grassroots organizations value local knowledge and experiences, as well as the inclusion of women from a variety of social backgrounds. Grassroots organizations may preserve women’s political participation in states undergoing postsocialist transition when neoliberal or capitalist policies may undermine the roles that women once held. In other political settings, grassroots women’s movement organizations may organize workers in the informal sector to protect their communities from environmental degradation or provide microloans to poor working women.

Strategies and tactics

Participants in women’s movements use a wide variety of strategies and tactics to challenge gender inequality in multiple arenas, including at the institutional, cultural, and interactional levels of society. A social movement’s tactical repertoire is not only influenced by internal movement dynamics, but by external macro historical processes. At the cultural and interactional levels, women frequently form self-help groups that challenge gender inequality and seek to change power
imbalances between men and women. Some women’s movements emerge out of separatist women’s and lesbian communities that seek to challenge dominant systems of power. Young women activists form study circles and reading groups to educate themselves about global issues and social problems, using informal social gatherings to develop a critical consciousness that informs their activism. The cultures of solidarity that arise out of women’s movements not only promote individual participants’ politicization of everyday life, but also simultaneously collectively challenge traditional gender expectations of women and girls.

At the structural level, women’s organizations may employ legal reform strategies, legislative campaigns, and policy advocacy related to gender inequality. Women’s movements create networks of elected officials, lawyers, and women’s political parties. Legislative campaigns for equal pay or maternity leave policies disrupt the essentialist practices of institutions that value the contributions of men over those of women. Women’s movements have contributed to other types of institutional change through participation in union organizing and religious and military institutions.

Tactical repertoires of women’s movements also include protests, rallies, marches, pickets, and petitions. One of the most successful uses of petitions in recent women’s movement mobilization was the One Million Signature Campaign, the first mass feminist mobilization to protest gender inequality in mudawwana, or Moroccan family law. The campaign also mobilized women outside of North Africa, sparking women’s movement organizing throughout the Islamic world (Salime 2011). Women in the same movement also employed cultural strategies such as sharing their experiences in the family by publishing their stories in newspapers and magazines. In fact, women’s movements in many parts of the world combine tactics to address both cultural and institutional change, such as participating in consciousness-raising groups as well as in acts of civil disobedience.

The Internet

In order to fully recognize the numerous forms of contemporary women’s movements, we must also expand our understandings to include online activities. Since the mid-1990s, feminists across the world, of all ages and backgrounds, have used the Internet to circulate news and information related to women and feminism, to connect feminists across the world, to create and sustain feminist communities, to empower women through sharing gendered experiences, to promote particular goals and agendas, and to broaden the scope of organizations that operate primarily offline. Scholars point to the vibrant feminist communities on the Internet as evidence that feminism is flourishing and not in abeyance (Grey & Sawer 2008).

Much of the power of feminism online lies in its global dissemination of feminist information and resources, which would have been virtually impossible before the widespread use of the Internet. The Internet has shifted both the potential and trajectory of contemporary feminism through the creation and sustenance of transnational feminist networks (Moghadam 2005). The success of transnational women’s movements projects and campaigns, such as a web-based feminist analysis of the global crisis and their offline international forums, relies on the connections and speed that Internet technology affords.

While feminism on the Internet may seem starkly different from offline feminism, it does reconfigure elements of traditional feminist modes such as self-help and consciousness raising. For example, feminist websites and blogs develop communities of readers who get to know each other by posting comments on a regular basis or by participating in a discussion board. While consciousness-raising groups required face-to-face connections between feminists in the same geographical area, online communities may be established across a variety of boundaries. Although differences between offline and online relationships may be vast, similar issues are discussed in both
contexts, including sharing experiences of and reactions to sexism in everyday life.

GLOBAL WOMEN’S MOVEMENTS

Throughout modern history, women in all regions of the world have organized collectively against the injustice and oppression in their lives and communities. International women’s organizations date back to the closing decades of the nineteenth century, but since the 1970s there has been a phenomenal growth in regional, subregional, interregional, international, and transnational networking among women’s organizations. The global stage of feminism has changed dramatically in recent history, exhibited by greater numbers of transnational networks and international conferences. Each of these changes has led to a significant shift in the context of women’s movements in the global sphere and has also brought women’s lives and experiences to discussions about globalization and transnational politics.

The United Nations has spearheaded numerous campaigns for women and has created and dramatically shifted global women’s networks and organizing. UN efforts include International Women’s Year (1975), the Decade for Women (1975–1985), and the fourth world conference on women (1995). Each has fostered global feminist dialogues and stimulated local and transnational feminist activities. Although these conferences have been sites of considerable debate and conflict over the meaning of “women’s issues,” the definition of feminism, the use of terminology such as “first world” and “third world,” and inequalities between feminists of the global and economic North and South, their forums facilitated the development of networks and strategies that positioned the language of gender equality and human rights at the forefront of the UN.

The institutional landscape of global feminism was forever altered by the policies and actions of the UN, but these changes happened alongside other feminist efforts, including NGOs, transnational networks, and grassroots organizing (Moghadam 2005). Grassroots feminist organizing effectively incorporated voices and experiences of women from a variety of communities, educational backgrounds, and socioeconomic statuses. The Huairou Commission, a network of grassroots partnerships, was formed in 1995 in response to the absence of grassroots women organizers at the UN conferences.

Women from governmental organizations, NGOs, and those not associated with formal organizations are actively working to eradicate sexism and other interrelated forms of inequality on local, regional, and global scales. Although these networks are not without struggles over difference and power inequalities, they also highlight the commonalities between women from different parts of the world.

THE IMPACT OF WOMEN’S MOVEMENTS

Women’s movements have been influential in democratization throughout the world, and they have also shaped other social movements in significant ways through their discourse, collective identities, organizational structures, and decision-making processes, and their embrace of culture and everyday activism as tactical repertoires. The study of women’s movements has also led to new lines of theorizing in social movements by calling attention to a wider range of claims-making that targets institutions beyond the state, focusing on tactics that emphasize culture and community, discovering processes of movement “spillover,” and informing larger questions related to movement trajectories, continuity, and change.

Women’s movements in Africa
AILI MARI TRIPP

African women’s movements became especially visible after the 1990s. Women’s organizations were increasingly characterized by their associational autonomy from the government and from the dominant political party. In contrast to the first three decades after independence, they began to acquire their own resources, select their own leadership, and forge their own women’s rights agendas in ways that were no longer dictated by the ruling party or government. Although the movements had new agendas, leaders, and funding sources, they sometimes drew on precolonial ideologies (e.g., of political motherhood) and older protest tactics (e.g., shaming authorities and grieving). They also drew on experiences of women during the independence movements and armed liberation movements and built on the experiences of women’s mobilization during the earlier single-party era.

During the first three decades after independence, women’s organizations were generally tied to the patronage politics of the single-party state. Their activities were monitored and directed to ensure that they would support various party/government initiatives. This meant that women’s organizations tended to be focused around religious associations, welfare, and domestic concerns and espoused a discourse of “developmentalism.” At the grassroots level producing handicrafts, promoting literacy, farming, income-generating projects, assisting AIDS orphans and fighting AIDS, and cultural expression dominated women’s associational life.

This changed in the 1990s, with growing feminist international influences and the diffusion of norms and strategies across Africa regarding women’s rights. Women’s movements were influenced by women’s rights agendas that were being promoted by international women’s organizations as well as the United Nations, African Union, Southern African Development Community, and other subregional organizations. New women’s networks and conferences organized around female education, violence against women, peace, the environment, reproductive rights, and women’s rights more generally were the main vectors in spreading these norms.

The 1985 UN Conference on Women held in Nairobi and later the 1995 UN Conference on Women in Beijing, in particular, served as catalysts for many organizations and activists. International donors, weary of state corruption and waste, began to shift resources towards nongovernmental organizations, including women’s associations, which now had new resources at their disposal, independent of the state and party patronage. Women activists had fought for greater democracy and in turn, the new democratizing trends opened up political space for women’s mobilization along with activism of environmentalists, human rights, indigenous peoples, party activists, and many other groups. In the 1990s, single-party regimes transformed themselves into multiple-party systems; military dictatorships dissolved into civilian rule; while freedom of press, association, and assembly expanded. The decline of conflict in Africa, especially after 2000, speeded up the push for women’s rights, especially in postconflict countries. The end of a significant number of conflicts after the mid-1980s created important political opportunities for women’s movements, especially where women’s peace movements overlapped with women’s movements. All of these changes—the diffusion of international norms regarding gender equality, new donor strategies, democratization and political liberalization, and the decline of conflict—created conditions which allowed new women’s
movements to emerge and have the impact they did.

A wide variety of new women’s organizations emerged in most African countries, even countries that still exhibited semi-authoritarian and authoritarian tendencies. However, in countries where the ruling party loosened its grip, the new organizations began promoting a women’s rights agenda to push for constitutional and legislative changes regarding gender equality. They began to introduce new agendas ranging from issues of reproductive rights, to violence against women, expansion of credit facilities for businesswomen and women farmers, access to land, women’s inheritance rights, media representation of women, women’s political representation, and many other concerns.

Reforms that had at one time met with active resistance from more conservative and religious forces, including clan leaders and traditional authorities, were encountering less resistance from them, and in some instances they even became advocates for changes in women’s status. These included issues such as domestic violence, land inheritance by women, female genital cutting, child marriage, and forced marriage. Issues that pertained to family and clan, or family law and customary law, generally met the most resistance, compared with legislative changes that affected gender equality in markets or in state institutions like the civil service or schools. Thus legislative quotas for women, maternity leave, employment practices, and other such concerns have been much less controversial than reforms in family law.

Although the older welfare-oriented and developmental agendas persisted after the 1990s, a new emphasis on political participation and advocacy emerged. New women’s organizations formed to improve leadership skills, encourage women’s political involvement, promote women’s political leadership, press for legislative changes, and conduct civic education.

The 1990s thus were marked not only with greater political liberalization in much of Africa but also by the rise of new women’s activism, which continued into the following decade. The movements saw gains in legislative and constitutional reforms regarding women’s rights. There were significant increases in female representation, with some of the highest rates of representation globally found in Africa (e.g., Rwandan women hold 56% of their national legislative seats). Norms and attitudes also began to change rapidly regarding girls, education, women’s right to political leadership, women’s need for access to resources, and even cultural practices such as female genital cutting. While activists within women’s movements generally believe there is a long way to go before gender equality becomes a reality, if one contrasts the beliefs and practices of the 2010s with those of two decades ago, significant gains have in fact been made in the areas of education, health, and, increasingly, in the area of political representation.

In many ways, the women’s movement in Australia might be understood as a diffusion of women’s movements elsewhere in the West. Both the so-called “first wave” of the movement, with its focus on the struggle for the franchise, and the “second wave” of mobilization in the 1970s, bore close resemblance to similar waves of mobilization in the UK and the US. Even the more recent phenomenon of a “generation war” among feminists centered on the contested notion of an emerging “third wave” of feminist activists seemed to have its genesis in struggles far away (Maddison 2008). Such a comparison, however, misses the unique contribution that the Australian women’s movement has made to both feminist repertoire generally, and, more specifically, to research and reflection on the relationship between women, feminist movements, and the state.

The handful of published histories of the Australian women’s movement (see, e.g., Kaplan 1996; Lake 1999) recall the arrival of women’s liberation in Australia in 1969 and its rapid development through the spread of collectives and consciousness-raising groups. In 1972, women with a more instrumental focus, and who specifically wanted to influence the 1972 federal election, created the reformist organization the Women’s Electoral Lobby. With the election of a reforming social democrat Labor government, feminists successfully rapidly entered the state, an innovative – indeed world-leading – model of women’s policy machinery was developed, and a period of rapid policy advancement ensued. The Australian women’s movement forged a unique and highly interconnected relationship with the state that relied upon an informal alliance between the women’s movement outside the state and feminist activists within the bureaucracy. Since this time there has been much justified praise for the innovative “wheel” model of women’s policy machinery that developed through this relationship and which gave the rest of the world the “femocrat,” the name for feminists appointed to positions in the bureaucracy with a specific directive to improve policy outcomes for women (see Sawer 2003).

In the years since the 1970s a great deal has been written about the Australian women’s movement’s relationship with the state in Australia and the consequences of that relationship (see, e.g, Dowse 1982; Franzway, Court, & Connell 1989; Sawer 1990; Maddison & Partridge 2007; Maddison & Jung 2008). This state focus certainly produced some extraordinary outcomes, not the least of which was an acceptance (that lasted several decades) that feminist-informed gender analysis had a legitimate place at the heart of government policymaking. While this issue remains highly contested there is little doubt that the establishment of a women’s machinery of government in Australia and the accompanying gains in policy, legislation, and funding for essential women’s services such as refuges, child care, and health centers are very tangible, if insecure, feminist achievements.

With hindsight, however, there is also the view that perhaps the construction of a model that relied, at least in part, on a sympathetic and reformist government and on external pressure from the women’s movement, was somewhat short-sighted (Maddison & Jung 2008). The pressure required under this model needed to come from a visible, united, and highly mobilized movement; the sort of movement that history shows is only ever in episodic existence over longer cycles of movement continuity (Rupp & Taylor 1987; Taylor 1989).

Since the mid-1990s Australia has seen the almost total demise of a feminist presence...
within government. Dramatic changes in the Australian political context during this period, including the growing hegemony of neoliberalism and a long period of conservative, antifeminist government, certainly contributed to this decline. However, it is also probable that the dominant state focus added to the wider invisibility of the movement, particularly as movement organizations became partially co-opted by their funding relationship with government. The paradox for feminists was that the price of policy success inside government was an increasing lack of influence and access for activists outside the bureaucracy (Eisenstein 1996).

The entry into government also profoundly challenged the feminist commitment to nonhierarchical organizational forms and the type of interpersonal connections that were possible in these contexts. The loss of these personal connections may partially account for the subsequent loss of visibility for the movement as personal commitments to organizing and attending public protests waned. Feminist cultural events that promoted movement visibility and were essential to defining an ongoing collectivity have also declined in both frequency and number of participants. The net effect is a feminist movement that appears to have entered a period of abeyance with no obvious end in sight. It is likely that the strong state focus of the movement – although innovative and undoubtedly successful at the time – has contributed to this decline.

Women’s movements in Europe
LAURE BERENI

Women’s movements in Europe appeared during the second half of the nineteenth century, a time of nation-state building and slow progress towards the realization of democratic principles. Women were excluded from the political realm, but they could increasingly organize on behalf of their (constrained) identities as women. Among the various emerging women’s organizations, mostly dedicated to philanthropic and social reform work, some sought to challenge women’s subordination to men. By the first decades of the twentieth century, a number of these organizations began to identify as “feminist,” after the term coined by French suffragist Hubertine Auclert. While not all women’s movements overtly struggled against gender hierarchy and saw themselves as feminist, all addressed women as a constituency and devoted a large part of their energies to work for women.

Facing comparable legal situations throughout Europe, women’s movements converged on the same issues, such as the disadvantaged status of married women, unequal pay in the workplace, the situation of poor single mothers, organized prostitution, barriers to education and professions, and suffrage, which would become the principal concern of the “first wave” of feminism. Organized women acted mostly by legal and respectable means, publishing papers, launching manifestos, organizing public conferences, or lobbying political actors. From the outset, efforts were made to link women’s activities across national boundaries. A series of women’s rights congresses were held in European cities from the late 1870s on, and a variety of international organizations appeared in the wake of the International Council of Women, founded in 1888 in Washington.

Alongside national differences, European women’s movements were divided along cross-national lines of debate. Historian Karen Offen (2000) distinguishes between an “individualistic” tradition of feminism, which emphasized abstract individual rights and women’s personal independence, and a “relational” tradition, which rooted women’s emancipation in the revaluation of their gendered identities, crucially defined by motherhood. Another important source of division among women’s movements appeared with the rapid development of Marxist-Socialist parties in most European countries from the 1880s on. Feminist socialists, such as Clara Zetkin in Germany and Alexandra Kollontai in Russia, insisted that the situation of women workers was specific, called for the proletarian revolution as the prerequisite of women’s emancipation, and distanced themselves from what they called “bourgeois feminism.”

During the interwar period, women’s movements experienced a variety of difficulties: first, they lacked a major common goal after suffrage had been granted to women in several European countries; second, their transnational efforts were increasingly weakened by international divisions, with a communist regime being established in Russia and antagonist chauvinisms emerging throughout the continent; third, by the mid-1930s, the fascist or authoritarian regimes established in Germany, Italy, and other European countries brutally dismantled autonomous women’s movements.

In the aftermath of World War II, European women’s movements suffered the direct consequences of the cold war; in the West, they stood in the shadow of dominant political forces, and feminist mobilization entered a phase of quiescence, despite the publication of such writings as Simone de Beauvoir’s The Second
Sex in 1949; in the East, women’s organizations were gradually absorbed by the socialist states.

In most West European countries, the second wave of women’s movements emerged in the late 1960s, following the birth of the “women’s liberation movement” in the US. Arising in the wake of radical student protests, the new women’s movements saw themselves as departing from past feminism. Rallying to the new motto “the personal is political,” they advocated free contraception and abortion, railed against the dominant definition of women’s roles as mothers and spouses, and denounced all forms of male violence against women, including in intimate relationships. Organizationally, sexual separatism became a central norm, and small, loosely interconnected groups were favored over conventional hierarchical organizations. Innovative militant practices were developed, such as consciousness raising and self-help. Throughout Western Europe, second-wave women’s movements were divided into three dominant currents: liberal (or reformist) feminists called for a gradual improvement of women’s rights, mostly through institutional lobbying; radical feminists sought to combat patriarchy through a profound challenge of existing social structures; socialist feminists, finally, called for an inseparable fight against patriarchy and capitalism. In the 1970s, radical thinking gained an unprecedented influence among European women’s movements.

By the end of the 1970s most women’s movements had entered a period of diminishing activism and declining political visibility. A new era began, marked by three main evolutions. First, women’s movements underwent a process of institutionalization. By the turn of the 1980s, women’s policy agencies, often referred to as “state feminism,” were established to improve gender equality in many European countries, as well as at the European Union level. Women’s organizations, therefore, became less confrontational and more professionalized. Second, new forms of international cooperation were developed: after the collapse of the socialist regimes in the early 1990s, women’s movements reflourished in Eastern Europe, and new solidarities were built between organized women across the continent. The European Women’s Lobby, founded in the late 1980s, gathered hundreds of women’s organizations around a common gender equality agenda that included equality in the workplace, dismantling trafficking in women, and combating violence against women. Finally, feminist protest gained new momentum during the 1990s. On the one hand, new groups formed with younger generations of activists, who emphasized the intersectionality of power relations (gender, race, class, sexuality), and often called themselves the “third wave.” On the other hand, many European women’s organizations engaged in campaigns for equal political representation in government, through electoral gender quotas or “parity.” As they have gained new political visibility, women’s movements in Europe have remained divided along political and generational lines, as evidenced by the fierce controversies over the Muslim headscarf and prostitution.

Women’s movements in India
MANISHA DESAI

India has a long history of dynamic and varied women’s movements beginning in the late nineteenth and early twentieth centuries. Scholar activists (e.g., Gandhi & Shah 1992; Kumar 2002) normally identify two major waves: the first wave from around 1920 to 1945, which coincided with India’s independence struggle and whose major aim was suffrage and education for women and later addressing legal inequities in family laws; and the second wave, also called the “autonomous” women’s movement, from the early 1970s to the 1990s and whose main focus was violence against women. I identify a third wave, namely the transnational women’s movement which, beginning in the mid to late 1990s, has organized across national and regional borders around issues of neoliberal globalization and religious fundamentalism, among others. Each wave consisted of many strands that were often in conversation with each other. And while each period had a main focus, there were many issues and strategies in each wave.

The first wave, or the nationalist women’s movement, emerged during India’s independence struggle against British colonial rule. The roots of this movement were laid by elite social reformers in the mid- and late nineteenth century such as Raja Ram Mohan Roy, who sought improvement in upper-caste women’s status, namely abolishing sati (the murder of women on the funeral pyres of their dead husbands), allowing widow remarriage, raising the age of marriage, and opening educational opportunities for women. Dalit (meaning “oppressed” – the identity chosen by the ex-untouchable castes) reformers such as Jyoti Phule, by contrast, focused more specifically on the unequal patriarchal relationships among upper-caste Hindus and linked it to the unjust colonial relationship with Britain. As a result of these reform movements, by the late nineteenth and early twentieth century a class of educated, upper-caste, Hindu, Muslim, and Parsi women had become active in the nationalist movement. It was through their activism in the nationalist movement that many women began to create women’s organizations to work on “uplifting” women and demand suffrage. During the late nineteenth century most of the women’s organizations were local, mostly urban, and regional, focusing on social reform within Hinduism, women’s education, and as forums for discussion among educated women. National level organizations began to emerge between 1910 and 1920. The first of its kind was the Mahila Parishad (Ladies’ Congress) and in 1917 the Women’s India Association was formed, in 1930 joining with others to form the All India Women’s Conference, which continues to exist. These organizations combined the issues of national freedom and women’s suffrage with issues including education, health, and later wages and benefits for women workers.

As a result of their struggles, at independence in 1947 women were granted suffrage and the constitution guaranteed equal social, political, and economic rights for women. Among the rights that the constitution did not address and which continue to be an issue today is that of personal laws or laws relating to marriage, divorce, child custody, and inheritance. Given the religious diversity of India and the violent partition that led to the formation of India and Pakistan, the nationalist leaders did not support a uniform civil code. Instead, women are governed by the laws of their respective religions, most of which are not gender just. The expectation was that each religion would seek reform of its own practices.
Following independence, some women’s activists focused on reforming personal laws in their respective religions, while others organized poor urban and rural women workers through the various Left parties. By the late 1960s the promises of independence had failed to address issues of poverty, landlessness, and violence against the poor. And it was around these issues that a new generation of activists became involved in landless peasants’ movements, antiprice rise movements, and worker and student movements, in all of which poor women participated in large numbers. Left parties or radical “nonparty political formations” organized most of these movements. It was through their activism in these movements that many urban, middle-class women experienced the subordination of gender issues to caste and class issues and began to discuss this in “autonomous” women’s groups. These groups were galvanized into a highly visible protest movement throughout the country around the rape of a 14-year-old girl while in police custody. Throughout the 1970s and 1980s the autonomous movements focused on violence against women, ranging from “dowry-deaths” (murder of women by in-laws for not bringing an adequate dowry) to wife-battering and female foeticide or sex-selective abortions.

The movements sought and succeeded in getting numerous legal changes to combat the various forms of violence against women. In addition to legal reform, activists also undertook consciousness raising or conscientization and provided support services to women. This period was marked with a focus on oppression common to all women across class, caste, and religion. Many research and documentation centers also emerged and women’s studies programs were established in universities across the country.

This period of active mobilization coincided with the UN-sponsored International Women’s Decade, 1975–1985, which provided both resources and opportunities for activists in India to travel and interact with activists in the region as well as at the global level. This led to the current period of what I have called the transnational women’s movements. This period is marked by an increasing diversity of movement groups, issues, and strategies, such as dalit women’s movement, gay and lesbian groups, hijras or transgender groups, and women’s antinuclear and peace groups. Many see this plurality as a fragmentation of the movement, some see it as the institutionalization and depoliticization of the movements. The movements, however, are active on a lot of fronts, chief among them neoliberal globalization and religious fundamentalism as well as taking advantage of the 33 percent reservation for women in local government. Given the commonality of these issues across borders, Indian feminists have also been at the forefront of transnational organizing, as evident by their involvement in organizing the 2004 World Social Forum in Mumbai. The diversity of Indian women’s movements points to their vitality and they have become key players in forging south–south and north–south collaborations and shaping transnational feminist movements.

The extent to which this vitality will make a difference in the lives of ordinary men and women in India will be determined by its ability to form meaningful coalitions with other movements to challenge the domination of the market-driven reforms that have widened social, economic, and political inequalities since their inception in 1991.

Women’s movement in Japan
KOSUKE NIKAIDO

The telltale signs of the remarkable level of success that the discourse of feminism and the accompanying politico-social movement of women’s liberation have had on the society and culture in Japan are quite visible, in spite of the country’s reputation as a rather patriarchal and traditional society. For instance, the Equal Employment Opportunity Act, first instituted in 1985 and considered largely symbolic and toothless then, has nevertheless been strengthened repeatedly through a number of reforms. In the twenty-first century, the principles of egalitarianism and gender neutrality with respect to hiring, promotion and so on, are widely accepted and deeply entrenched, at least at the level of the ideal, if not always at the level of practice. The relatively small but dedicated and tireless group of attorneys, feminist activists, academics, and lawmakers who have done the lion’s share of the work of prodding and pressuring the government can also in large part take credit for some other notable accomplishments, like the Domestic Violence Prevention Act of 2001 and 2004 (see, for instance, Gelb 2003, for details on the specific strategies adopted by Japanese activists to press for these policy changes).

Also, in the sphere of public opinion as measured by survey polls, we may observe that there are some conspicuous changes with regard to attitudes toward gender roles. In general, it seems the case that a sizeable majority of women in Japan feel that the social and political conditions for women have improved significantly over the last several decades or so. However, the difficult question – from the standpoint of a study of the feminist movement – has to do with whether these generally progressive changes can be attributed mainly, or even partly, to the work and influence of the movement activists themselves. The feminist movement in Japan has always been quite small compared with its counterparts in most other advanced industrial countries, and many, if certainly not all, activists have traditionally evinced some aversion toward direct involvement in politics. In turn, the generally conservative and corporatist Japanese state has often been insulated from pressure by lay activists and citizens’ groups. It is quite understandable, then, that many observers of Japanese society have been dismissive or downright unaware of the contribution, or even existence, of the surprisingly vibrant feminist movement there. For instance, in the preface to the book Broken Silence: Voices of Japanese Feminism – a highly useful anthology that introduces the arguments and ideas of some of the most paramount activists in Japan to the English-speaking world – Sandra Buckley (1997) laments that so many Western academics assume there is no feminist movement in Japan. However, any concrete historical change in social order must be instigated, in a broad sense, by an empirically existing individual or group, and upon a closer look the contributions made by the feminist movement are considerable.

Within that scope, it is generally agreed that the most vigorous periods of activity for the movement came during two stages in the twentieth century. The first “wave” occurred mainly in the teens and early 1920s following World War I; it was initially spearheaded by literary critics and writers – most notably Raicho Hiratsuka, famed founder of the progressive-minded journal Seito (Bluestocking) – who retrospectively ended up being precursors to the more identity-oriented activists of the “second wave.” It was not long before the budding movement began to broaden into an ideologically and politically wide-ranging entity that grew more audacious in making concrete political demands. For instance, following the
international trend, suffrage was among the paramount issues, and the remarkably adept and resilient Fusae Ichikawa – whose tenure as an active leader in the movement for women’s rights was to last into the 1970s – began her activist career as a founder of the suffragist organization the Women’s Suffrage League in 1925. Socialist feminism also developed considerable intellectual vigor around this time, led by luminaries like Kikue Yamakawa. Yet, as is well known in modern Japanese history, many of these progressive efforts were totally scuttled by Japan’s turn toward wartime mobilization, and suffrage was not achieved until the Allied Occupation Forces introduced it following the military regime’s defeat.

Meanwhile, “second wave feminism” in Japan corresponds more or less with the worldwide mobilization of the similarly labeled movement following the highly activist and energetic decade of the 1960s. So, from the late 1960s to the early 1970s a number of grassroots groups dedicated to the cause of women’s liberation sprouted up in urban areas, at times in concert with, but often independently of, the New Left or student movements. A few of these groups were able to conduct activities that led to considerable exposure and visibility in spite of their ragtag start and relative organizational inexperience. In particular, groups of young women in Tokyo that coalesced around the Lib Shinjuku Center vigorously published leaflets and journals, staged demonstrations, and continuously organized study sessions on issues as diverse as reproductive rights, women’s education, immigration policy, and Japanese corporations’ exploitation of women in the developing world. In the meantime, a group of somewhat older and more established women began to contest more specific policy issues focused on gender equality – their often long monikers, such as the Group to Promote Coeducational Home Economics and the United Nations International Year of Women Action Group, seem to directly embody the goal and substance of their arguments and concerns.

Thereafter, it is not uncommon to hear the argument that the feminist movement quickly expended its energy and dissipated, thus reinforcing the notion that such a movement would have little or no cultural viability in Japan. However, while it is true that most of the grassroots “women’s liberation-inspired” groups did demobilize sometime after the late 1970s, at the same time the impact they left behind on the nature of the discourse on gender politics in Japan must be properly remembered. The more holistic and identity-focused discourse of the women’s liberation movement left a deep imprint on the consciousness of a number of more organized and professional activists working as academics, writers, attorneys, and so on. Such cultural influence, in turn, enabled the latter group of women to take up issues such as equal employment opportunity and domestic violence prevention in a more comprehensive and reflective manner after the 1980s, when organized feminism in Japan gradually became more professionalized and compartmentalized.

In the twenty-first century, as is the case in many advanced Western countries, there has been considerable talk of the so-called “postfeminism generation” in both the popular and academic media in Japan. Such a newly developing trend has yet to receive any systemic consideration and analysis in the English-language scholarship, however. Probably this is because most concerned intellectuals – both Japanese and foreign – are still very much playing “catch-up” in the sense of introducing the very existence and accomplishments of the movement to begin with.

Zapatista movement
(Mexico)
MARCO ESTRADA-SAAVEDRA

The National Liberation Zapatista Army (Ejército Zapatista de Liberación Nacional, EZLN) was formed in 1983 from the National Liberation Forces (Fuerzas de Liberación Nacional, FLN), a subversive organization formed in the late 1960s in northern Mexico, inspired by the Cuban revolution. FLN set up a guerrilla movement whose aim was the spread of socialism in Mexico. However, FLN was virtually wiped out by the federal Government in the early 1970s. Former members of the FLN managed to regroup and settle in the southeastern state of Chiapas in 1983, mainly along the hilly region of Los Altos, in the northern area of the state in the Lacandon jungle, where they pursued similar goals to those of the late FLN and created EZLN, a grassroots-based organization. With this organizational base, EZLN was able to expand its ranks and lead the 1994 armed rebellion.

The FLN was formed by a politburo, whereas the EZLN originated in rural areas, with insurgent cells made up of “fighting students and workers” in cities. The EZLN’s command is structured as follows: General Command, Subcommand, General Staff – a council of military commanders – and the Revolutionary Indigenous Clandestine Committee (Comité Clandestino Revolucionario Indígena, CCRI). The military command positions of EZLN are: general commander, subcommander (subcomandante), commanders, lieutenant colonels, majors, captains, lieutenants, sublieutenants, and insurgent troops. The EZLN’s insurgent troops have subdivisions: sections, platoons, companies, battalions, and regiments. In addition, there are Zapatista militias formed by civilians trained by the EZLN; they are not part of the insurgent army but are on call to support the guerrillas in regular warfare actions.

The CCRI is formed by indigenous commanders and plays merely a political role within communities. Most commanders have no military training; they are mostly influential political leaders in their communities and regions and they receive instructions from the EZLN’s General Command and General Staff communicated by Subcomandante Marcos. They share such commands with those responsible in each community. They also inform the military chiefs about the state of affairs in their communities and about the activities of outsiders inside the jungle.

The Zapatista grassroots include communities and indigenous groups who decide to take part in the revolutionary project. The guerrilla insurgents may be assisted in five major ways: (1) by maintaining the anonymity of insurgents, (2) by recruiting new combatants, (3) by ensuring food and supplies to sustain the guerrillas, (4) by taking part in demonstrations and public protests, and (5) by involvement in collective efforts of infrastructure development and setting up (inter)community services. These activities help strengthen (inter)community bonds of solidarity, increase social integration, and foster and sustain Zapatista collective identity.

In a Zapatista community health and education sponsors play a special role in collective life in terms of the preservation of the Zapatista identity and the continuance of resistance. In each community the number of health and education sponsors may vary from four to six men and women – appointed by the community – who take part in health and education sponsoring activities. In view of the deficiencies in local medical services, the health sponsor is chiefly responsible for disease prevention and health care. The education sponsors teach Zapatista children how to read.
and write and basic math. Sponsors also educate children on history, life, and environment, and community integration. The shaping of children’s minds into a Zapatista identity is a form of political propaganda that builds commitment to the movement.

**Colectivos** – cooperatives providing products and services intended for the exclusive benefit and enjoyment of insurgent farmers – run the Zapatista community services. Colectivos are formed by working groups, which are also called colectivos. The larger colectivo is led by a representative, whereas the internal working groups are headed by a coordinator. The duties at the Zapatista colectivos are assigned by the community responsible, which organizes tasks based on the regional commanders’ instructions. The community responsible oversees the colectivo’s work and provides the materials and resources required for any voluntary work conducted in the community. Such resources are, in turn, provided by the political-military organization of the Zapatistas.

The EZLN’s subsystems and grassroots are linked to one another via the community and region responsible people who are the top civil and military authorities at local and regional level. The community responsible person organizes local meetings, collects the resources to be sent to insurgent camps, runs the colectivos and monitors and manages the community to ensure its cohesion. All community responsible persons report to the Regional Military Command.

The Regional Military Command and all community responsible persons in a region make up a Clandestine Regional Committee. The Committee’s duties are chiefly political: organizing the resistance, recruiting militia, and conducting ideological and propaganda activities. The community responsible persons meet once a month at the Clandestine Regional
Committee’s headquarters to discuss issues and requests from communities and try to find ways for the EZLN’s military commanders to address them.

To ensure grassroots cohesion, control, and coordination and fulfill core demands included in the EZLN’s political strategy since the 1994 uprising, new regional political organization structures were required to set up a de facto autonomy in the territories controlled by the insurgents. To this end, the Rebel Zapatista Autonomous Municipalities (Municipios Autónomos Rebeldes Zapatistas, MAREZ) were created, followed by the Good Government Boards (Juntas de Buen Goberno, JBG).

The first MAREZ were formally established in December 1994; they would take on the duties of a formal government. The MAREZ’s authorities are appointed civilians supervised jointly by the CCRI-EZLN and the Council of Communitarian Representatives. The top authority at each municipality under the MAREZ government is the superintendent (presidente), followed by a secretary and treasurer. Just below these three offices there is the Social Participation Council, in charge of four aspects: justice, agrarian affairs, public services, and the civil registrars. By the end of 1999 regional education and health plans were developed at the Zapatista civic-political centers or aguascalientes (literally “hot waters”), later given the name of caracoles (literally “snails”). The work of insurgent municipal authorities is unpaid as is customary in indigenous communities. Projects are conducted through collective or communitarian work with resources donated by domestic and international pro-Zapatista groups.

Just after the efforts to reestablish dialogue between the federal government and the rebels failed and the 2001 Indigenous Rights and Culture Act was passed in 2003, the Zapatistas announced the creation of resistance caracoles and five JBGs in insurgent territories. The goal behind such actions was to demilitarize Zapatista areas with civil authorities and make progress in establishing autonomy as well as to obtain recognition for indigenous rights and culture.

The presiding members of the boards are the highest authorities in their respective regions. The number of authorities at each JBG varies according to the number of autonomous municipalities represented. In every case, each MAREZ has two town councilors, who are members of the autonomous municipal council, as part of the authorities. Their term of office is three years. During each term, the authorities of the JBG are turned over every 15 days. Candidates for the posts are selected by means of collective deliberation under the tutelage of the EZLN’s military authorities. There is a parallel body to that of the JBG that has no official recognition, the Surveillance Committee, formed by members of the regional CCRI who actually make the most important political decisions. In this sense, the process of forming the JBGs entails a partial demilitarization of Zapatism.

The creation of the JBGs places regional Zapatism under a supracommunitarian civil authority and is a redefinition of the relation of Zapatism and communities, farmers, political organizations, and the state government. By means of the JBGs, neo-Zapatism hopes to mitigate the attritional effects of resistance, such as shortage of resources, and diminish the development gap among insurgent communities. This process of administrative control seeks to lessen the discretionary and conflicting nature of governmental roles by providing the grassroots with access to a higher instance to deal with prevarication and abuse by local authorities and the Autonomous Council. However, this leads to a centralization of power in the JBGs.

The redefinition of Zapatista relations through the JBGs involves certain steps for a state-creation strategy: (1) geographical demarcation of Zapatista territories; (2) sovereignty over law-making, regulations, and authorizations; (3) tax collection and resource distribution among Zapatista communities; (4) authority to rule, prosecute, and punish in disputes among Zapatistas and between...
Zapatistas and other jungle inhabitants; and (5) authority to perform the executive and administrative duties of a civil government for the Zapatista population. However, the operational powers of the JBGs are limited by the access to symbolic, material, and human resources supplied by pro-Zapatista groups.

Culture and social movements
RHYO H. WILLIAMS

Culture encompasses the symbolic and expressive dimensions of social life. Culture includes sets of symbols such as language, intangible, abstract “mental products” such as ideas, beliefs, values, and identity, and the meanings given to material objects such as clothing, decorations, art objects, buildings, and the like. A long tradition in sociological theory conveys culture as a distinct dimension of social life, and embodied primarily in social institutions such as religion or the family. More recent theorizing, however, understands culture as analytically embedded in all aspects of human society. When institutionalized in organizational routines and social networks culture is tightly enmeshed in social structures, even as it can be kept analytically distinct.

Social movements are sustained, more-or-less organized attempts at change. They may try to change individuals, group behaviors, government policies, or society’s cultural understandings. Social movements are generally thought to last longer and be more organized than a mob or a crowd, but are not as established or institutionalized as a political party or lobbying group. Further, unlike parties or lobbying groups they may have goals and targets well beyond the state or realms of institutional policies (Snow 2004).

Sociologists have studied culture and socialmovements with three basic sets of questions. First, many accounts of social movement emergence posit their basic causes as cultural. Second, when studying the processes and dynamics that allow social movements to function and maintain themselves, analysts have focused on cultural factors such as collective identity, ideological claims, emotions, and internal group norms, rituals, and practices. Third, scholars who study the impact that movements have on society have often focused on the cultural changes that are their goals for action.

MOVEMENT EMERGENCE

Most of the sociological study of social movements since the end of World War II has sought to ascertain “why do social movements emerge?” One way to categorize the answers is whether they put the basic cause of movement emergence in the social structural dimensions of society, or in societal and group culture. Social structural causes include changing economic fortunes of particular classes, the formal political systems of society, or the resources (such as money, members, and organizations) that a group can mobilize in order to mount collective action. Cultural answers to the question of movement emergence have generally fallen within one of two categories: changes in the national or societal culture; or changes in group subculture among those people involved in a social movement.

For example, traditional strain theorists argued that movements develop because large-scale social and cultural changes result in a collective social-psychological anomie or alienation among people experiencing these changes. Various types of cultural “strain,” such as the development of “mass society,” or widespread changes in normative values, lead to breakdowns in normal routines and result in disruptive and innovative collective actions. More recently, European-based “new social movements” of the 1970s and 1980s, such as the Greens, were theorized by Melucci (1989) as the cultural response to late capitalism’s elevation of “life-style” concerns over re-distributive economic politics. Middle-class cultural movements have replaced labor as central collective actors of the period in the post-industrial West. A more specific analysis of the role of
group culture was Gusfield's (1986) thesis that the US prohibition movement was led by people concerned about their declining social status. Their movement was a “symbolic crusade” to restore their cultural prestige.

At a more micro-level perspective, scholars have focused on the language and “framing” work done by movement leaders. Analysts argue that many groups have the potential for collective action, but it takes the articulation of an ideology or a set of grievances, and a sense of collective identity, for this potential to turn into an actual movement. Movements are thus “constructed” by the frames of movement leaders, who convince people to engage in collective action. Collective action frames interpret people’s life situations, including such emotions as the anger and fear they may feel, by articulating them as grievances against an unjust system or enemy. Frames also tell people how they might change such situations, and try to convince them their own involvement will make a difference (see Benford & Snow 2000).

In all of these examples, it is something in culture – changes in the culture of a particular group, changes in the larger culture, or the use of cultural objects such as rhetoric, ideology, and identity – that contribute significantly to a social movement’s emergence.

MOVEMENT DYNAMICS

Once a social movement has emerged, it needs to sustain collective action through mobilizing people repeatedly to action, whether street protests, letter-writing campaigns, financial contributions, or the like. The capacity to sustain action involves both cultural objects and processes that work cognitively, emotionally, and morally. Movement ideology is composed of ideas, language, and nontextual symbols directed at both movement members and publics in the society that the movement is trying to persuade. Other dimensions of culture, such as collective identity, group practices, and shared emotions and narratives, help people who are mobilized stay committed to their movement and their cause.

Social movements use ideological claims and symbolic messages to make their case for social change (Platt & Williams 2002). Sometimes ideology is a straightforward articulation of the ideas that motivate the movement and include the visions of how society might be different. For example, the Students for the Democratic Society drafted the “Port Huron Statement” that articulated their rationale for action; similarly, Marx and Engel’s *The Communist Manifesto* was the ideological base for the international communist movement’s calls for social change, including a diagnosis of the injustices of capitalist society and a vision of a more equitable socialist social order.

Movements create or adapt ideologies for change, but they also experience some limitations in the ideological claims they can make (Williams 1995). While activists are free to formulate any argument they choose, many claims will not be effective in particular contexts. There is a “cultural repertoire” that puts boundaries on what a given society or historical period will consider legitimate ideas. These repertoires develop through the interaction of challenger claims and the reigning hegemonic ideology within a society (Steinberg 1995).

Some movements use the memories of historical figures to legitimate their movement goals (Jansen 2007). But these associations require “memory work” and are bounded by the “reputational trajectories” of the historical figures. Thus, movements face the challenge of articulating innovative calls for change, while using ideological claims and symbolic messages that are largely within the boundaries of the existing legitimate culture.

Movements’ ideological messages are often reduced to easily remembered slogans, such as “Make Love, Not War,” “God is Pro-Life,” or “No Blood for Oil.” These slogans are a shorthand that is only effective when the movement’s fuller ideology is well enough known that audiences can fill in the potential ambiguity in content (e.g., a San Francisco bumper sticker, “I own a dog and I vote” only makes sense if one
understands current land-use issues regarding beaches in the Bay Area).

Another method of communicating the content of movement claims is to reduce them further to pictures or nontextual figures. The pro-choice movement consistently uses a drawing of a coat hanger with a line through it to symbolize the dangers of illegal abortions. Christian Right organizations distribute bumper stickers with the word “vote” in which the ‘t’ is elongated into a cross. Communist movements have used red stars historically, while white supremacist groups in the United States and Europe resurrect the Nazi swastika. Nontextual symbols provide even less information about specific issues, and yet make even broader political and social claims. They are often ambiguous enough that multiple groups use them, as in the Vietnam War era in the United States when counterculture protesters stitched American flags on to the backs of their blue-jean jackets at the same time that pro-war blue-collar workers were putting American flag decals on their hard hats. In such cases, the ideological message was not readable directly from the symbol used, but could only be understood within the context of the wearer’s general presentation of self. And the political battle was in part over which movement would control the potent cultural symbol itself, with its attendant legitimacy and positive associations.

Movements must create and sustain a collective identity as part of maintaining collective action (e.g., Polletta & Jasper 2001). That is, people must feel that they share important characteristics with others in the movement, and that this identity is important enough to promote or protect through movement involvement. So, while slogans and nontextual symbols articulate a social movement’s ideas, the individuals and groups who display them are also making a statement about their personal and social identity. Symbolic displays mark those using them as part of a particular movement, and encapsulate their basic attitudes and values.

The creation and nurturance of a shared collective identity produces a sense of “we-ness,” in such a way that it can become the basis for action. People may identify themselves as the victims of an injustice based on their identity or social location, experience anger or determination as a result of this, and organize to combat the injustice. Other times, the “we” becomes people who hold a certain set of values or interests (such as preserving wilderness areas) and feel both motivated and obligated to act. Sometimes the “we” seems obvious, as when it is built on a longstanding ethnic or religious identity.

Collective identity helps mobilize and sustain a movement (Nepstad 2004). People must be willing to continue to contribute time, energy, and perhaps withstand risk, through both victories and setbacks. Spirits must be kept up, shared identities must be reaffirmed, and group solidarity must be cultivated. Slogans, a particularized vocabulary, items of clothing or grooming, flags or pennants, all can contribute to this process – letting fellow movement members know who one is, and distinguishing movement “members” from others. Particular songs, or a style of music, can be a powerful force in galvanizing emotions, providing opportunities for shared action in collective performance or singing, and cementing a collective identity through shared knowledge or words or the like (see Roscigno & Danaher 2004). Narratives and stories allow group members to frame a shared history and align their experiences, motives, emotions, and identities (Davis 2002).

Another dimension of movement culture is the discourse and practices used among movement members in the processes of internal debate, decision-making, and interpersonal interaction. “Backstage” arguments among movement members are connected to the public ideology movements articulate, but they are often not identical (Kubal 1998). They may be dress rehearsals for later public positions, they may be quarrels among factions vying for control of the group’s message (Benford 1993), and they may be jokes, rationales, or beliefs purposely kept from public view. Movement members develop norms of etiquette (Polletta 2002) or styles of discourse (Hart 2001) that
govern what types of arguments are allowed within group meetings, what types of relationships are considered the model for action, and what types of people movement members should want to try to be. These are cultural rules of action that help shape movement ideological claims, group strategic decisions, and public collective identity. Alternatively, one can think of movement culture as a “group style” that entails both standards for intra-group behavior and relationships, as well as modes of communicating and establishing shared meanings (Eliasoph & Lichterman 2003).

Group style and other dimensions of movement culture are contexts within which collective action must be imagined and manifested. They facilitate as well as constrain some types of action and not others – affecting the strategies and tactics that groups use in their efforts at collective action. While rational and instrumental calculation often helps a group make strategic and tactical choices, they are not the entire picture. For example, Moore (2008) demonstrated that three different groups of scientists, in three different eras, had different rationales, collective identities, and integrative principles for their protests against defense and military spending in science. These different styles, or modes, of protest, rested on different assumptions about science and society, and different assumptions about what constituted appropriate action. Klawiter (2008) calls similar formulations “cultures of action” and shows how they constitute the meaning of breast cancer for different groups of people and activists. Conceptually, these considerations bridge between the “internal” dynamics of movement maintenance, to help shape the “external” impact the groups had on the wider social environment.

MOVEMENT IMPACT

Almost all social movements have a variety of goals. Many want to change laws, or enact policy changes within institutions such as schools, churches, or hospitals. Some movements seem primarily intent on blocking the goals and efforts of other movements (Fetner 2008). But many movements also seek changes in their wider societal culture (d’Anjou 1996). For example, the gay and lesbian liberation movement wants policy changes that will end discrimination against gays and lesbians, but it also wants to change the cultural values associated with homosexual orientations and identity. Similarly, the women’s movement in the United States and globally has worked at combating stereotypes about women, while the vegetarian movement has tried to change people’s ideas (as well as habits) about food and nonhuman animals (Maurer 2002). In all cases, movements are arrayed against a sense of “authority,” whether that authority is institutionalized in the state and organizations or more generally within the culture (Snow 2004).

Most movements shift fairly easily between attempts at institutional change and cultural, although one type of target or strategy often comes to dominate the movement’s public identity. For example, Christian Right groups have sometimes been interested almost exclusively in symbolic change, as when they advocate putting the Ten Commandments in government buildings. Other movement groups are often particularly interested in creating “activists”; that is, the change in which they are most interested is in the set of personal and collective identities found within groups of people (Lichterman 1996). Helping to transform individuals and groups into people who continue to agitate for sociocultural change is itself a form of cultural impact.

Diffusion and scale shift
SARAH A. SOULE

DIFFUSION OF SOCIAL MOVEMENTS

Social scientists use the term diffusion to refer to the spread or flow of an innovation across actors in a social system (Rogers 1995). When we speak of diffusion of social movements, we mean that some element of a social movement (e.g., tactic, frame, ideology, protest, repertoire, campaign) is spreading across some set of actors (e.g., organizations, networks, groups, people, communities, states) in a social system either through direct or indirect networks of communication (Soule 2004; Givan, Roberts, & Soule 2010).

There are four different types of actors in the diffusion process and it is worth offering some discussion of how each relates to the diffusion of social movements. First, there are innovators, who are the very first to adopt some movement innovation and are usually adventurous and willing to take risks. These may be thought of as “early risers” or “initiators” when thinking about the way in which some movements seem to spawn others in a cycle of protest (Tarrow 1998), but we might also consider the generators of a particular frame or the developers of a new protest tactic to be innovators. Second, there are the early adopters of an innovation who are important because, by adopting the innovation, they help to legitimate it by demonstrating its effectiveness to others. Early adopters do not usually invent new tactics or frames, but they are quick to jump on the bandwagon once these become available. Third, there are the later adopters of an innovation who choose to adopt it once it has become somewhat legitimate and/or it has been proven to be useful. A given protest tactic may be costly and risky, thus many observers may wish to wait and see if the tactic is efficacious before they adopt. Finally, there are the non-adopters who have not (and presumably will not) adopt the innovation. In the case of social movements, non-adopters may be groups or organizations that do not have the resources to adopt a given tactical innovation or they may be groups or organizations for which an innovative frame simply does not resonate.

Early treatments of diffusion by social movement scholars were framed by an interest in psychology and micro-level processes and they viewed diffusion as an outgrowth of contagion between individuals in groups or crowds (Soule 2004). In this body of work, collective gatherings were something to be feared because impulses toward aggression were thought to spread between people. Observers of race riots, lynching, Nazism, fascism, McCarthyism, and Stalinism viewed individuals as susceptible to such aggressive impulses.

With the development of the resource mobilization and political process traditions, scholars focused instead on the connections between different movement organizations, movement actors, and their wider, political environment. Thus, more recent treatments of diffusion recognize that the boundaries between movements and movement organizations often overlap, leading to a web of connections (both real and imagined) between actors and social movement organizations. This web of connections helps us to account for the wave-like character of protest cycles and other types of social mobilization (Tarrow 1998). It also helps us to account for the spillover of ideas and personnel between different movements and movement organizations (Meyer & Whittier 1996).

MECHANISMS OF DIFFUSION

Observers and scholars of social movements have long been intrigued by how social movements seem to spread or diffuse from one site to another. Recent work has tried to specify
the *mechanisms* by which this happens. This work focuses on the importance of two different mechanisms: *direct network ties* and *indirect network ties*.

Direct ties are those that facilitate diffusion via point-to-point contact between people via communication. Some scholars are able to measure such ties directly, such as when interpersonal communication is linked to the spread of riots (Singer 1970), protest tactics (Morris 1981), frames (Givan, Roberts, & Soule 2010) and tactical repertoires (Givan, Roberts, & Soule 2010). Other recent work focuses on technological innovations and the use of the Internet, which facilitate direct communication between activists and between activists and potential activists and thus impact the diffusion of protest (Ayres 1999; Givan, Roberts, & Soule 2010). However, other scholars infer that communication between people has happened. For example, some argue that transportation, trade, and travel routes facilitate diffusion of information about rebellions and other forms of mobilization, presumably because these bring people together (e.g., Hedstrom, Sandell, & Stern 2000). Related, scholars argue that physical proximity leads to the diffusion of mobilization (e.g., Gould 1991). And, others infer that interpersonal communication occurs via shared organizational memberships (Morris 1981).

Indirect ties are those ties that are not forged via direct person-to-person contact. Some of the scholarship on indirect ties focuses on how shared cultural understandings and identification of similarity to others can lead activists to imitate the actions of others to whom they are not directly connected, but to whom they feel connected for some reason (McAdam & Rucht 1993; Soule 1997). For example, Soule (1997) argues that innovative protest tactics spread between activist groups who define themselves as similar to others. Other work on indirect networks focuses on how the mass media can also serve as an indirect channel of diffusion via broadcasting information about a movement or some element thereof (e.g., Walgrave & Manssens 2000; Andrews & Biggs 2006; Givan, Roberts, & Soule 2010). Finally, other work focuses on structural equivalence (Soule 1997), or the way in which actors who are not connected, but who are both mutually connected to a third actor, come to resemble one another (Givan, Roberts, & Soule 2010).

**SCALE SHIFT**

Scale shift is the “change in the number and level of coordinated contentious actions to a different focal point, involving a new range of actors, different objects, and broadened claims” (McAdam, Tarrow, & Tilly 2001: 331). Like diffusion, scale shift implies the transfer of some element of a social movement from an origin to other destinations. In short, scale shift is the process by which issues that are important to certain localities resonate with, and are adopted by, others in places situated either above or below the origin. Scale shift, as such, can be thought of as vertical diffusion, such as when an issue or tactic or frame emerges at a local level, but is adopted by actors at the supra-local (for example, the federal or transnational) level. While the examples of scale shift provided by McAdam, Tarrow, and Tilly (2001) and Tarrow and McAdam (2005) tend to focus on “upward” scale shift (that is, on examples of contentious politics that expand outward and upward from the local level to the state, federal, or transnational level), Tarrow (2005: 121) elaborates also on the idea of “downward” scale shift, or when a practice is adopted at a lower level.

Scale shift is thus a specific kind of diffusion; it is vertical rather than horizontal. As such, it implies a radical difference in the targets of social movements as activists move from one level to another. For example, when movements shift scales from targeting a community or a city council to targeting the European Union or a transnational agreement, such as NAFTA, that which is the object or target of the activism is quite different. This difference might produce radically different outcomes, different probabilities of repression,
and may suggest radically different strategies and tactics, as what works at one level may fail miserably at another (Soule 2009). For example, activists associated with the Free Burma Coalition began by targeting corporations, such as Pepsi, which had investments in Burma. Eventually, these activists began to target cities, and eventually states, to encourage the passage of selective purchasing agreements. This shift in the object or target of the movement led to different opportunities for the movement and necessitated different strategies (Soule 2009).

MECHANISMS OF SCALE SHIFT

Like the literature on the diffusion of social movements, scholarship on scale shift describes the way in which established lines of communication and interaction facilitate the spread of ideas and information necessary for a movement or campaign to spread from the local level to some other level (i.e., direct ties). But, scholars who describe scale shift also emphasize the importance of brokerage or when information is transferred between two or more previously unconnected sites, as was the case when Southern student groups such as SNCC and CORE visited Northern campuses during the civil rights movement in an effort to connect (or broker) relations amongst campuses (McAdam, Tarrow, & Tilly 2001).

Also important to the process of scale shift are attribution of similarity and emulation. The core idea of scale shift is that local collective action inspires broader collective action when information reaches a distant (either culturally or geographically) group and when this information resonates with the distant group. The distant group defines itself as similar to the initial, local group via the mechanism of attribution of similarity. This is similar to what diffusion scholars mean when they talk about the importance of culturally constructed similarity to diffusion via indirect ties (Strang & Meyer 1993). The attribution of similarity leads the distant group to imitate the original group, or to the process of emulation (McAdam, Tarrow, & Tilly 2001).

UNRESOLVED ISSUES

There are several issues worthy of further consideration and deliberation in this area of scholarship. First, scholarship on both diffusion and scale shift should specify in a more precise manner what exactly is being diffused or is shifting scales. All too often scholars speak vaguely of the diffusion of social movements without specifying exactly what element of the movement is spreading. And, when scholars speak of scale shift, they speak vaguely about “contention” moving upward and outward. But, is this a behavior (e.g., tactics and tactical repertoires) or an idea (e.g., frames and ideology) or a campaign? Are the mechanisms and processes of diffusion and scale shift the same with both ideational and behavioral innovations? Are these innovations being transplanted whole cloth or are they borrowed with some degree of adaptation?

Second, much of the empirical work on diffusion and scale shift has not adequately conceptualized which actors are truly at risk for adopting an innovation. Scholars should specify precisely which units are at risk for adopting a given innovation; for example, while all organizations or groups may technically be at risk of adopting a new protest tactic, in actuality many of these would not really be at risk because they may not have the resources to deploy the new tactic or their own particular identity may preclude using some kinds of tactics. The attention to attribution of similarity by those discussing scale shift moves us in the right direction, at least with respect to the need for adopters to define themselves as similar to transmitters as a basic requirement for being at risk. This is even more complicated when talking about cross-national diffusion (Snow & Benford 1999) because cultural differences may inhibit the attribution of similarity.
Third, scholarship should pay careful attention to the impact of diffusion, especially by exploring the ways in which the varying levels of contention described by work on scale shift also represent both the targets of contention and the opportunity structures within which contention happens (Soule 2009). Activism may start at one level by targeting this level (e.g., protest in a community to prevent the building of a “Big Box Store”), but as it begins to shift scale, so too does its target shift (e.g., rather than targeting a local city zoning board, the target may shift to a multinational corporation). As the contention shifts scales, it encounters different opportunity structures (e.g., the city-level opportunity structure likely differs from the corporate opportunity structure of the multinational corporation). And, finally, scholars should begin to unpack how the opportunity structure at one level may drive scale shift (e.g., if activists are thwarted at one level, they may strategically move to another level). Soule (2009) begins to explore these issues, but there is room for further unpacking the dynamic relationship between scale shift, targets of social movements, and the levels of opportunity, all of which affect the impact of diffusion.

Fourth, scholarship on diffusion and scale shift should move away from the imagery of mechanical transference of some innovation across different social actors and, instead, consider the way in which diffusion is a creative, agentic, and strategic process (Snow & Benford 1999; Chabot 2000). Diffusion and scale shift follow an uneven process whereby groups experiment with innovations, which are then adopted in a piecemeal and variegated fashion. Scholarship should recognize the processual and contested nature of the diffusion process and move beyond more mechanistic accounts (Schneiberg & Soule 2005; Givan, Roberts, & Soule 2010).

Finally, thus far scholarship on the diffusion of protest has not compared the relative effectiveness of indirect and direct models of diffusion for spreading elements of social movements. There is an often overlooked distinction between communication and influence (Soule 2004), both of which transfer information and both of which have potential to alter the actions of other people. But, communication may be less likely than influence to change opinions. To what extent is communication analogous to indirect ties and influence analogous to direct ties? If these are analogous, we might expect direct ties to be more effective diffusion channels than are indirect ties. Scholars of social movements might begin to explore the differences in effectiveness between these mechanisms of diffusion and scale shift.

Direct action
KELLY MOORE and BENJAMIN SHEPARD

Direct action is strategic political activity in which users seek redress by targeting the people, institutions, and practices that they wish to change. In contrast, indirect political action uses intermediaries, such as elected representatives, to effect change. Direct action is not only an instrument to force others to change. Participants in direct action often see themselves as enacting the values that are important to them, such as fellowship and nonhierarchical relations. It is used by revolutionaries, religious groups, and many others. Groups on the left, right, and center of the political spectrum have used direct action. Direct action is most common among groups that are prohibited from or have limited access to legal participation in institutionalized politics. These include, for example, prisoners, members of ethnic, sexual, and religious minorities, women in some places and times, and students and other young people.

Examples of direct action include blockades, encampments, occupations, vigils, and street theater, refusal to pay taxes or salute officials and royalty, and violence against people and property. A distinguishing quality of direct action is that it is often reinvented rather than being routinized for long periods of time. It is distinct from retreatism and from immediate, unplanned actions such as spontaneous riots. Direct action can have immediate effects on power relations, force a rethinking of those relations, and symbolize and express new kinds of relationships.

TYPES OF DIRECT ACTION

One of the hallmarks of direct action is that it is often specific to a time, place, and problem. While some forms of direct action are modular, spreading from place to place and across different contexts and users, many forms of direct action are quickly defeated by opponents. Activists engage in what McAdam (1983) calls tactical innovation, or efforts to develop new techniques that opponents cannot quickly counter. Yet direct action can be categorized in some general but overlapping categories, including occupations and blockades, sabotage and slow-downs, play and mockery, witnessing, and violence against people and material things.

Occupations and blockades encompass the use of spaces for purposes other than for what they were intended in order to disrupt routine practices and draw attention to their immorality. Examples include sailing into nuclear testing zones, sit-ins, human chains, marches, flashmobs, parades, land occupations, and attaching people to objects using locks and other tools. Sabotage and slow-downs include actions that make routine action more difficult by making it costly and time-consuming to continue in a routine manner. Tree spiking, changing images on advertisements such as billboards, pouring blood on draft card files, hacking or disrupting computer systems, destroying or hobbling machinery, and working at a very slow pace are some important examples of sabotage and slow downs. Not all forms of direct action are confrontational or angry. Play and mockery are often filled with humor that can encourage participants and audiences to rethink what kinds of social and political relations are possible, and give participants a feeling of power. Effigies, clowning, guerrilla theater, street parties, and humor used in sight of targets are examples of this type of direct action. Witnessing is the sharing of one’s moral convictions. While often associated with religious groups, especially Christians, witnessing is the act of publicly identifying one’s moral commitments, particularly in the face of arrest or repression, as a means of convincing others of one’s seriousness and intentions. Vigils, hunger strikes, refusal to
pay taxes, self-immolation, and accepting arrest or beatings are examples of witnessing. Finally, violence against people and things can destroy what participants see as the causes or visible representations of the power relationships they wish to end. Violence can take the form of assassinations, bombings, kidnapping, arson, hijacking, torture, and prison breaks that are organized by individuals or by groups such as militias.

IMPORTANT HISTORICAL SOURCES OF DIRECT ACTION

Direct action is perhaps one of the oldest and most universal forms of political action. It is not specific to any form of government, appearing in totalitarian systems, liberal democracies, feudal systems, and nearly every other form of governance. One early example is described in Aristophanes’ play Lysistrata (c. 411 BCE) in which Greek women, who were not by law Greek citizens and could not vote, withheld sex to force their husbands to end the Peloponnesian War. Other early forms of direct action include medieval peasants’ refusal to plow fields or tender what they owed to their rulers unless their demands were met; soldiers in nearly every country and time period who collectively refuse to fight; and public mockery of officials. Some forms of direct action are modular, that is, they move from place to place and time period to time period. Other forms, such as the eighteenth- and nineteenth-century English tradition of “rough music,” or the practice of publicly humiliating community wrongdoers through boisterous, noisy, theatrical processions using musical instruments, bones, effigies, and other props in front of the target’s home or business, are shorter-lived.

Although ubiquitous, direct action was not self-consciously theorized and codified as a form of political action until the late nineteenth century. Labor activists and revolutionaries, especially anarchists in Western Europe, Russia, and the United States, called for the use of “direct action” rather than the ballot box to challenge the state. Anarchists rejected the moral legitimacy and utility of the state, and advocated the organization of individuals into self-governing groups and federations. Important theorists of direct action include the Russian Peter Kropotkin (1842–1921), and the Americans Emma Goldman (1869–1940) and Voltairine De Cleyre (1866–1912). All three advocated that workers refuse to participate in exploitative labor. De Cleyre and Goldman called for strikes, for work slowdowns, and violence against property, as well as advocating for an end to marriage, which they saw as a form of economic oppression.

Another important source of direct action is religion. Many religious traditions have strict injunctions against certain forms of action and require others. These injunctions have served as the basis for resistance to political, social, and economic rules. In the West, Christian Anabaptist traditions have served as a basis for resistance to slavery and warfare; Hinduism, Catholicism, Islam, and Buddhism have also served as theological bases for direct action. Indian political leader Mohandas K. Gandhi (1869–1948) joined religious practices with anarchist calls for refusal to participate in unjust systems. His method, called Satyagraha, or “the way of truth,” greatly influenced other uses of direct action in the twentieth and twenty-first centuries. Satyagraha was inspired by the writings of Leo Tolstoy (1828–1910) and John Ruskin (1819–1900) and by Gandhi’s Hindu religious beliefs. The core principle of Satyagraha was the appeal to the moral goodness of opponents, accepting the consequences – including violence and incarceration – of refusing to participate in unjust systems (Diwakar 1948). Users of Satyagraha were required to make sacrifices, such as fasting, and to morally prepare themselves for disobeying unjust systems. Between 1904 and 1913, Gandhi worked for equal rights for Indians in South Africa. Thousands of people went to jail for refusing to pay an annual tax levied on former indentured servants, and for refusing to carry identification papers that the government required of Indians. He later used
this same method to help Indians in India to
win freedom from British rule in 1947.

Gandhi’s methods inspired religiously based
peace and civil rights activists in the United
States in the 1940s, 1950s, and 1960s. Men
who refused to fight during World War II
were given “conscientious objector” status, and
assigned to work camps. At the end of the
war, some conscientious objectors helped to
generate direct actions against the cold war
weapons buildup occurring in Europe, the
United States, and in the Soviet Union. These
actions included peace marches, boats sailed
into nuclear test zones, and refusal to partici-
pate in civil defense drills. Civil rights activists
in the United States, including the Reverend
Martin Luther King Jr, Rosa Parks, James Bevel,
Septima Clark, and Myles Horton, learned and
taught about Satyagraha-based civil disobedi-
ence techniques. These were used in a series
of campaigns to end segregation in the Southern
United States between 1954 and 1965 that
included sit-ins, freedom rides, and mass arrest.

Direct action took a more carnival-like and
celebratory form when it was used by antiwar
and counterculture activists. The French Situa-
tionists International, inspired by Dadaism and
surrealism were a major influence on this kind
of direct action. The Situationists advocated
the overthrow of capitalism by undermining its
key means of reproduction, including adver-
tising. The Situationists and other anarchistic
art community groups in the United States,
such as the Diggers, the Yippies, and the San
Francisco Mime Troupe, used carnivalesque
forms of action, including distributing free
food, putting on street theater, and mocking
traditional culture through new styles of dress.

In the late 1960s and early 1970s, violent
direct action reemerged as the mass-based
political movements of the previous decade
dissolved. In the United States, Japan, Ger-
many, Italy, and other countries, small, armed,
underground clandestine groups such as the
Weather Underground, the Republic of New
Africa, and the Red Army Faction used rob-
bery, kidnapping, and murder to try to start a
revolution. In the southwestern United States
and in Great Britain, “monkey wrenching,” or
the destruction of machinery and other equip-
ment, was used by ecological activists.

Throughout the 1970s and 1980s, antinu-
clear activists followed their Christian faith
to oppose the creation of nuclear weapons.
Renowned campaigns targeted the Lawrence
Livermore National Laboratory in Livermore,
California, and Pacific Gas and Electric’s Dia-
blo Canyon energy plant near San Luis Obispo,
California. Here, a diverse group of activists
used a wide range of tactics to block the con-
struction of the plants, creating carnivals as
well as experiments in direct democracy, to
both prefigure a better world and to persuade
others to abandon nuclear technologies (Epton

Among the more important recent devel-
opments are the combination of celebratory
and confrontational action used across places
and times in quasi-modular forms. Global jus-
tice groups such as the People’s Global Action,
for example, use festivity as well as more seri-
ous demonstrations to draw attention to their
claims and to build solidarity among them-

WHY USE DIRECT ACTION?

A major reason for the use of direct action
is that groups believe that targets hold power
illegitimately, so routine means of influence,
such as voting to influence governments, will
not address their grievances. Anarchists, for
example, believe that states are illegitimate, and
therefore use political tools outside the state’s
control to achieve their goal of small-group,
relatively autonomous governance. Similarly,
groups use direct action to change the practices
or existence of universities, police forces, reli-
gious hierarchies, or prisons. They may view
the existence of these institutions, not just their
policies, as detrimental.

Direct action is also used by groups who
dem a problem in need of immediate remedy.
Like a firefighter who must destroy property
in order to save a life, some activists see direct
action not as a choice, but a moral necessity to prevent greater and significant harm from being done. AIDS activists have looked to this logic in passing out syringes to drug users to prevent disease transmission, and urban gardening activists have built gardens in roads while existing community gardens were being destroyed. In these cases, groups use direct action to prevent imminent harm.

Yet, some groups, such as Operation Rescue, turned away from a commitment to nonviolence. Here, American anti-abortion activists sought to prevent what they saw as imminent harm in blockading abortion clinics or shooting abortion providers (Lovell 2009). In 1991, Operation Rescue started the Summer of Mercy, a wave of direct actions to block access to an abortion clinic in Wichita, Kansas. They rejected Gandhi’s principles of nonviolence and, 18 years later, Dr. George Tiller, a doctor who was the target of this direct action, was shot and killed by a man in contact with Operation Rescue.

Some groups use direct action because the other political and cultural tools available to them, such as violence, petitioning, or voting, are themselves morally objectionable or are seen as futile. Direct action is, for many users, an expression of who they are and what kind of relationships they have with co-participants and targets and want to have with them in the future. Actions such as street parties, vigils, and humor are expressions of emotional, moral, and social ties as much as means to an end.

Particularly in highly repressive systems where there are limited or no formal ways of affecting groups who are in power, challengers have little choice but to use direct action to acquire new benefits. People who are imprisoned or enslaved, for example, may use work slow downs or “strategic incompetence” to force opponents to concede in some way. The less power groups have, the more likely they are to face serious repression for using subterfuge to gain power.

Finally, direct action exemplifies new ways of living. Playful actions, such as clowning and wearing costumes, dancing and playing music, for example, exemplify a celebratory and joyful life. Refusing to participate in an activity, such as conscription or degrading or dangerous work and accepting the consequences can exemplify a moral commitment to living a just and humane life.

In practice, many motivations are often blended together, and not all motivations are equally salient for all users of direct action.

STUDYING DIRECT ACTION

Direct action is studied using a variety of methods. There are many studies of individual groups and techniques, which are also widely available in electronic form on blogs and websites. Systematic studies of direct action typically use field observation and interviews, surveys of actions, users, and consequences of actions, and historical comparisons. Evidence often comes from newspapers and other mass media, personal and organizational correspondence and records, images, police reports, and interviews. The goals of most research studies are to understand the meanings of direct action for participants and observers, to understand its effectiveness in changing relations of power among users and targets, to understand its moral and political sources, and to understand how repression shapes the development and effectiveness of direct action. Exemplary studies include Gamson’s (1975) study of the relationship between tactics, organizational character, and outcomes. In a study of direct action in the United States between World War II and 1968, Tracy (1996) showed that users considered direct action to be politically important not only because of its instrumental value, but because it revealed the power of users’ beliefs. Zwerman and Steinhoff (2005) studied armed underground, clandestine groups in the United States and Japan and showed that such groups were likely to develop at the end of cycles of mass-based protest and attendant increases in repression. Earl (2006) and McAdam (1983) also document the effects of repression. Shepard (2011) documents the origins and meanings of ludic, or playful direct action.

Emergent norm theory
MIKAILA MARIEL LEMONIK ARTHUR

Emergent norm theory hypothesizes that non-traditional behavior (such as that associated with collective action) develops in crowds as a result of the emergence of new behavioral norms in response to a precipitating crisis. For proponents of emergent norm theory, collective action includes all types of social behavior in which the conventional norms stop functioning as guides to social action and instead people collectively overturn or go beyond the normal institutional practices and frameworks of society (Turner & Killian 1987), and therefore new conventions must form as part of the collective action. The basic suppositions of emergent norm theory are that collective action is rational, that collective action is a response to an ambiguous precipitating event, and that new norms of behavior appropriate to the collective action situation emerge through group processes without prior coordination and planning. Originally proposed by Turner and Killian (1972), emergent norm theory has grown out of two main traditions. First, the Le Bonian tradition of thinking of crowds as normless entities and collective action as irrational behavior led Turner and Killian to think about how norms are instituted in crowds. Second, symbolic interactionist perspectives and small-group analysis contributed a model of norms as developing through interaction.

Emergent norm theory suggests that crowds come together because a crisis occurs that forces people to abandon prior conceptions of appropriate behavior and find new ways of acting. When a crowd forms, there is no particular norm governing crowd behavior and no leader exists. But the crowd focuses in on those who act in a distinctive manner, and this distinction is taken on as the new norm for crowd behavior. As this new norm begins to be institutionalized within the crowd, pressures for conformity and against deviance within the crowd develop, and discontent is silenced. This silencing of alternative views contributes to the illusion of unanimity within the crowd.

The norms that develop within crowds are not strict rules for behavior. Rather, they are more like overarching frameworks for behavior that set limits on what is appropriate (Turner & Killian 1987: 9–11). These norms develop through either emergent or pre-existing social relationships. Turner and Killian suggest that anything which facilitates communication among crowd participants facilitates the emergence of norms, and they call this process “milling.” In addition, though the emergent norm theory perspective does contest the notion that crowd behavior is particularly irrational, it suggests that many crowd participants are suggestible and that this suggestibility contributes to the spread of emergent norms.

There are two main avenues of criticism that have faced emergent norm theory. The first, proposed by Reicher (1987) suggests that when crowds come together, they bring norms with them. Therefore, new norms do not have to emerge. These norms are different depending on the group making up the crowd – for instance, an angry crowd gathering after the arrest of a community member will exhibit different norms than a group of suburban teenagers at a rock concert. These differences reflect the different ways that crowds behave, but are norms nonetheless.

The second line of criticism suggests, first, that all social behavior results in the renegotiation of social norms, and second, that the creativity in norm creation and behavior that has come to be seen as “norm emergence” are usually not created through interaction but rather through long-term rational planning processes or through reliance on small
changes to established repertoires (Tilly 1993). Couch (1968), while writing before the development of emergent norm theory, is often cited to support this criticism. An additional area of criticism suggested by some researchers is that there are significant methodological difficulties in tracing the emergence of a norm in a crowd setting.

While emergent norm theory was originally applied to a variety of forms of collective behavior, it is most commonly relied on to help understand the behavior of large groups, or crowds. In particular, emergent norm theory has gained a strong foothold in disaster research, as it is used to understand the behavior of groups who experience a precipitating crisis (a disaster) and then are forced to find new ways to respond that will help to ensure the safety and survival of as many people as possible. Dynes and Tierney (1994), for instance, have used emergent norm theory to help understand the civilian-initiated evacuation of the World Trade Center on September 11, 2001. Other researchers, such as Johnson (1987) have suggested that emergent norm theory can explain not just orderly civilian-initiated evacuation but also the aggressive and selfish behavior sometimes seen in mass panics. Johnson believes that in certain situations the breakdown of social order leads to these types of behavior as rational responses to the new social circumstances.

Emotion and social movements
DEBORAH B. GOULD

Etymologically, emotion and movements (in the sense of protest) are related. According to the Oxford English Dictionary, emotion, meaning “a physical moving, stirring, agitation,” comes from the Old French emouvoir, meaning “stir up,” and from the Latin emovere, meaning “move out, remove, agitate,” from ex-meaning “out” and movere meaning “to move.” Movement comes from the post-classical Latin movementum, meaning “motion,” and earlier, movimentum, meaning “emotion,” “rebellion,” or “uprising.” The verb “to move” – which means “to affect with emotion” and “to prompt or impel toward some action” – links emotion and movements and suggests a frequent accompaniment. We might expect, then, that studies of social movements and other forms of protest politics would foreground the role of emotion in mobilization. History shows, however, that scholars of protest have been and continue to be ambivalent about emotion.

THE PLACE OF EMOTION IN PROTEST AND IN STUDIES OF PROTEST

Early scholars of protest in the “collective behavior” tradition were strongly influenced by nineteenth-century French social psychologist and sociologist, Gustave Le Bon. In his famous book The Crowd: A Study of the Popular Mind (1895), Le Bon revealed deep concern about the growing power of “the masses” who, he argued, were determined “to destroy utterly society as it now exists” (1960: 16). Although he noted that crowds could be virtuous and heroic (19), his overriding concern was their negative qualities, especially with regard to one variant of the “crowd,” mass movements. Like many thinkers of his age, Le Bon pitted emotion against reason, and crowds, in his view, were dangerously under the sway of emotion. The feelings exhibited by a crowd, he asserted, were “very simple and very exaggerated” (50). Even more, in a crowd feelings were transmissible from one individual to another: indeed, sentiments in crowds possessed “a contagious power as intense as that of microbes” (126). Driven by instincts and unconscious motives, and infected by the unruly passions of those around him, the individual in a crowd was likely to become irrational, “induced to commit acts contrary to his most obvious interests” (32). Crowds, Le Bon asserted, displayed “extreme mental inferiority” as well as an “incapacity to reason, the absence of judgment and of the critical spirit,” and an “exaggeration of the sentiments” (4, 35–36).

Through the middle of the twentieth century, scholars of collective behavior echoed Le Bon’s psychological theory of mass political action, reducing contentious politics to the instinct-driven, unconscious, irrational, and destructive behavior of unruly mobs. Scholars in this tradition placed emotion, typically understood as natural impulses that interfered with reason—emotion as irrationality, in other words—at the heart of their explanations. Protest emerged when a structural strain—for example, massive unemployment or an economic depression—disrupted the normative order and ostensibly excited “feelings of anxiety, fantasy, hostility” among individuals (Smelser 1995: 11; as cited in McAdam 1960: 9); emotionally and psychologically distraught, individuals turned toward rash, impetuous, frenzied, disruptive group behavior. Individuals engaged in protest, then, not because they had political grievances but because social changes made them psychologically unstable and emotionally overwrought, leading them toward irrational behavior. Scholars in this
literature bought into and upheld a normative split between the psychological and the political, relegating all things psychological to the private realm; they thus understood protest as a dangerous seepage of the psychic into the political realm where rational deliberation should reign. In contrast to legitimate actors in the polity, protesters violated the public/private split and were, in different versions of this literature, self-evidently alienated from society and unfulfilled in their personal lives; narcissistic and arrested in their development; perhaps even latently homosexual (see, for example, Lasswell 1959: 125; and Kornhauser 1998: 163, as cited in McAdam 1960: 17–18).

Scholars in this early collective behavior literature, in short, tended to pathologize those who engage in contentious politics, viewing collective protest not as struggles over power but rather as the emotionally driven working out of participants’ psychic distress. Regardless of its political content, protest was simply a form of acting out, an expression of unbalanced individuals’ unconscious psychic agonies and needs, the actions of a frustrated, overwrought, wild, and dangerous mob. The psychic, in this rendering, is always pathological and passion always seems to interfere with and preclude reason. Protest is an aberration, engaged in by aberrant people.

These scholars’ disparaging portrayals of protest and protesters, and the prominence of affect and emotion in their depictions, were precisely what energized critics of the collective behavior literature and sparked the emergence of a new sociological field – social movement studies – in the 1970s. Social movement scholars responded to the collective behavior literature by adopting paradigms that assumed, even if implicitly, the rationality of protesters. (The intellectual climate influenced these scholars as well: in that moment, rational actor models were migrating from economics departments into other social science disciplines like sociology and political science.) For example, resource mobilization and political process models posit that participants in collective action are ordinary actors in the polity who, blocked from engaging in routine interest group politics, unite and prudently turn to extra-institutional politics to press their demands. Protest, here, is understood as normal political behavior, and protesters are construed as rational actors in the sense that they engage in reasonable, thoughtful, strategic behavior designed to achieve their sensible political goals.

Still dominant today, these rational-actor models usefully countered the classical paradigms’ depictions of protesters as impulsive, irrational deviants motivated by psychological problems and unruly passions rather than reason. But, as Goodwin, Jasper, and Polletta (2001) have noted, they simultaneously entailed an evacuation of emotion from research into contentious politics. In light of prevailing understandings that oppose emotion to reason, acknowledging that protesters might be motivated by feelings risked painting activists as irrational, so scholars in this new field expelled emotion, replacing the unthinking and irrational psychological misfit with the dispassionate and calculating rational actor. Whereas in the classical models we had protesters who felt their grievances deeply but never cognitively assessed them, in the now-dominant models we have rational actors who coolly calculate their grievances and pursue a strategic course of action, all the while apparently devoid of anger, fear, joy, pride, shame, hope, or any other emotion.

**THE EMOTIONAL TURN AND ITS CONTRIBUTIONS**

This is the terrain on which an emotional turn in the study of social movements has occurred. Over the last 15 years, in an effort to offer a corrective to the assumption of rational actors in the reigning political process model but without resurrecting the problems presented by the classical collective behavior models, a number of social movement scholars have begun to explore the emotional dimensions
of mobilization and demobilization (Groves 2009; Morgen 1982; Taylor 1962, 1996; Taylor & Whittier 1996; Goodwin 2005; Jasper 1995, 1998; Goodwin, Jasper, & Polletta 2001, 2001; Aminzade & McAdam 2001). Where the earlier collective behavior literature coded institutional politics as the realm of reason and maligned protest as driven by emotion and thus unreason, and where, in response, the next generation of scholars assumed movement actors’ rationality and wrote emotion out of their accounts, scholars in the emotional turn offer a multifaceted picture of human beingness that, without denying the reasoning capabilities of movement actors, posits emotion as a ubiquitous and vital feature of social life. Drawing from a wealth of research across the arts and sciences which challenges the pitting of emotion against reason, scholars in the emotional turn posit emotion as a motivational force and an important means by which human beings come to know and understand ourselves and our contexts, our interests and commitments, our needs and our options in securing those needs. Accordingly, we cannot ignore emotion or relegate it to one arena (e.g., protest) which can then be disparaged and dismissed.

This turn toward emotion in the study of protest not only challenges the rationalist ontology which prevails in much of the literature, but it also enhances our understanding of the workings of key concepts in the field. The factors that movement scholars deem important for mobilization have force precisely because of the feelings that they elicit, stir up, amplify, dampen (Goodwin & Pfaff 1997: 283): opening political opportunities, for example, might be an important factor in the emergence of a social movement but only to the extent that an emotional charge attaches to those openings; a collective action frame successfully mobilizes only when emotionally resonant. Even more than improving existing models, in foregrounding emotion this research points us toward a largely unexplored arena for analyzing crucial sources of activism, and blockages as well. Political opportunities might be tightly closed, but indignation and desperation might combine to encourage mobilization, or the sheer pleasure of engaging in contentious politics might generate a willingness to protest despite the small odds of success. Conversely, political opportunities might be opening, but fear, a paralyzing sense of hopelessness, or an overriding numbness might impede mobilization.

A focus on emotion also provides insight into why participants continue their involvement in activist formations when they could easily take the proverbial “free ride” and rely on others to do the work. As sites where world-making occurs, activist contexts generate strong feelings among participants – for example, marvel at being part of a collectivity, euphoria and camaraderie from being in an action together, feelings of fulfillment that derive from taking part in something larger than oneself, a sense of freedom to become the self you want to be. Once experienced, the desire to feel those feelings again may be strong, helping to sustain participation. As well, activist contexts are crucial sites of meaning-production in the realm of emotion: they not only offer a language for people’s often amorphous, inchoate, nontransparent affective states, they also provide an emotional pedagogy of sorts, a guide for what and how to feel and for what to do in light of those feelings. Analyses of women’s consciousness-raising groups show that feminists challenged individualized understandings of what many women were experiencing as depression and, pointing to the social origins of that feeling state, renamed it anger. In similar fashion, direct-action AIDS activists in ACT UP linked the pervasive grief in lesbian and gay communities to anger, and both feelings to militant and confrontational political activism (Gould 2001). Both examples illustrate that social movements’ interpretive emotion work encourages people to understand themselves and their situations in new ways and indeed to feel differently, all of which can have significant political consequences.
Attention to emotion may also illuminate aspects of movement decline. To understand why internal conflicts sometimes fracture movements, for example, we may need to explore their emotional undercurrents. The often unstated and unacknowledged, but nevertheless forceful, feeling states that often shape the texture, tonality, intensity, velocity—the very content and character—of such conflicts. Internal conflicts do not always destroy movements but they can become extremely difficult to navigate when feelings such as betrayal, nonrecognition, resentment, and mistrust are in play. Feelings like the allure of normativity and social acceptance, discouragement and a sense of political inefficacy, or boredom might also play a role in the decline of social movements.

In short, then, foregrounding emotion enhances our understanding of the emergence, sustainability, and decline of activist formations.

OPEN QUESTIONS

Renewed interest in emotion spans the disciplines and, as a result, definitions have proliferated. An open question for scholars in the field of social movements is thus how to characterize emotion. Rather than decide definitively whether to view emotion as hardwired physiological event, social norm, or some combination, we might better serve by developing a working concept that speaks to what emotion does. Such a working definition might begin by noting that emotion references bodily sensations or feelings, of greater or lesser intensity, in response to a situation. Arising as we come into contact with the world, emotion helps us to make sense of that world, and prepares us to act.

A key unresolved question for those studying social movements and other forms of protest politics is the relationship between emotion and reason. Haunted by the earlier collective behavior literature which often equated emotionality with irrationality, scholars in the emotional turn sometimes have tamed emotion conceptually, strongly linking it to cognition and rationality. Assertions that tether political feelings and action to people’s cognitive processing of the facts of a situation undoubtedly fend off the specter of irrationality that often accompanies discussions of political emotion. And it certainly is true that political feelings and action sometimes flow unambiguously and predictably from one’s cognitive processing; we can easily imagine how plans to construct a toxic waste dump near a school, for example, might generate outrage and consequent mobilization. But assertions of thought-emotion continuity mask the ways that feelings—political and otherwise—frequently diverge from our reasoning selves and do not always result in understandable and thus “reasonable” political behavior. Consider the following example. We might know that our government has authorized torture of prisoners, and that knowledge might give rise to an understandable, even “rational,” outrage, but other feelings, perhaps more indistinct and inchoate and less tied to one’s cognitive reasoning, might be what most shape our responses, or nonresponses, to this knowledge: overwhelmedness in the face of this information, anxiety about engaging in activism, or a desire to block out the world’s problems.

As cultural theorist Lauren Berlant notes, nonrationality is at the heart of the political (2005b). Nonrationality differs from irrationality: the nonrational is not within conscious, cognitive sense-making but rather to the side of such processes; the term irrational, in contrast, usually means that which is contrary to such processes, connoting that which goes against one’s interests as well as that which is (therefore) illogical, crazy, senseless, unfounded, and unreasonable. In the hurry to refute the problematic equation of emotion with irrationality, some scholars in the emotional turn have elided the difference between the irrational and the nonrational and have disavowed the nonrational aspects of emotion. But political feelings are often less
emotion and social movements

Emotion and Social Movements

Framing and social movements
DAVID A. SNOW

Framing, within the context of social movements, refers to the signifying work or meaning construction engaged in by movement adherents (e.g., leaders, activists, and rank-and-file participants) and other actors (e.g., adversaries, institutional elites, media, social control agents, countermovements) relevant to the interests of movements and the challenges they mount in pursuit of those interests. The concept of framing is borrowed from Erving Goffman’s Frame Analysis (1974) and is rooted in the symbolic interactionist and constructionist principle that meanings do not naturally or automatically attach themselves to the objects, events, or experiences we encounter, but arise, instead, through interpretive processes mediated by culture. Frames contribute to this interpretive work by performing three core functions. First, like picture frames, they focus attention by punctuating or bracketing what in our sensual field is relevant and what is irrelevant, what is “in-frame” and what is “out-of-frame,” in relation to the object of orientation. Second, they function as articulation mechanisms in the sense of tying together the various punctuated elements of the scene so that one set of meanings rather than another is conveyed, or, in the language of narrativity, one story rather than another is told. And third, frames often perform a transformative function by reconstituting the way in which some objects of attention are seen or understood as relating to each other or to the actor. Examples of this transformative function in the context of social movements are illustrated by the transformation of routine grievances or misfortunes into injustices or mobilizing grievances, and by the reconfiguration of aspects of one’s biography as commonly occurs in both political and religious conversion. Given the focusing, articulation, and transformative functions of frames, it is arguable that how we see, what we make of, and how we act toward the various objects of orientation that populate our daily lives depends, in no small part, on how they are framed. Applied to social movements, the idea of framing problematizes the meanings associated with relevant events, activities, places, and actors, suggesting that those meanings are typically contestable and negotiable and thus open to debate and differential interpretation. From this vantage point, mobilizing grievances are seen neither as naturally occurring sentiments nor as arising automatically from specifiable material conditions, but as the result of interactively based interpretation or signifying work. The verb framing conceptualizes this signifying work, which is one of the activities that social movement leaders and participants, as well as their adversaries, do on a regular basis.

DEVELOPMENT OF A FRAMING PERSPECTIVE ON SOCIAL MOVEMENTS

The link between framing and social movements was first noted in a 1982 experimental study of the conditions under which authority is defined as unjust and challenged (Gamson, Fireman, & Rytina 1982) and then developed more fully in a 1986 conceptualization and elaboration of “frame alignment processes” (Snow et al. 1986). Since then there has been an almost meteoric rise in research on framing and social movements, with much of the work congealing into what is now called the framing perspective on social movements (Benford & Snow 2000; Snow 2004). The analytic appeal and utility of this perspective is based largely on the conjunction of three factors. The first is the neglect of the relationship between meaning and mobilization, and the role of interpretative processes in mediating that relationship, by the
dominant perspectives on social movements that emerged in the 1970s; the second is the rediscovery of culture and the so-called discursive turn that occurred during the 1980s; and the third is the development of a framing conceptual architecture or scaffolding which has facilitated more systematic theorization and empirical assessment of framing processes and effects.

CONCEPTUAL ARCHITECTURE

Among the interconnected concepts and processes that have surfaced as the framing literature has expanded, there are at least nine that can be thought of as cornerstone concepts and processes in that they provide a conceptual architecture that has stimulated much of the research exploring the relevance of framing to mobilization both empirically and theoretically. These key concepts or processes include: collective action frames, master frames, core framing tasks, frame alignment processes, frame resonance, framing hazards, discursive processes, and discursive opportunity structures and discursive fields.

Collective action frames are the resultant products of framing activity within the social movement arena. They are relatively coherent sets of action-oriented beliefs and meanings that legitimate and inspire social movement campaigns and activities. Like everyday interpretive frames, collective action frames focus attention by specifying what is “in” and “out of frame”; articulate and elaborate the punctuated elements within the frame so that a particular meaning or set of meanings is conveyed; and, as a result, often transform the meanings associated with the objects of attention, such that some situation, activity, or category of individuals is seen in a strikingly different way than before, as when everyday misfortunes are reframed as injustices or status groups like the homeless and cigarette smokers are framed as legitimate targets for social movement protest. But collective action frames differ from everyday interactional frames in terms of their primary mobilization functions: to mobilize or activate movement adherents so that they move, metaphorically, from the balcony to the barricades (action mobilization); to convert bystanders into adherents, thus broadening the movement’s base (consensus mobilization); and to neutralize or demobilize adversaries (counter-mobilization). Much of the research on framing and social movements has focused on the empirical identification of collective action frames and specification of their functions with respect to the movements in question. In the case of the environmental movement, for example, numerous frames have been identified, such as “an environmental justice frame,” a “runaway technology frame,” a “conservation frame,” and a “landscape frame.”

Although most collective action frames are movement-specific, sometimes those that emerge early in a cycle of protest come to function like master algorithms in the sense that they color and constrain the orientations and activities of other movements within the cycle, such that subsequent collective action frames within the cycle are derivative (Snow & Benford 1992). When the ideational and interpretive scope and influence of a collective action frame expands in this way, it can be thought of as a master frame. Examples of master frames in recent history include the civil rights frame in relation to the resurgence of the women’s movement and the flowering of movements accenting the rights of the aged, the disabled, the American Indians and other ethnic groups; the nuclear freeze frame in relation to the peace movement of the 1980s; and the environment justice frame in relation to various environmental movements (Snow & Benford 1992; Benford & Snow 2000).

The relative success of collective action frames in performing their mobilization functions is partly contingent on the extent to which they attend to the three core framing tasks or challenges of “diagnostic framing,” “prognostic framing,” and “motivational framing” (Snow & Benford 1988). Diagnostic framing entails two aspects: a diagnosis of some event or aspect of social life or system
of government as problematic and in need of repair or change; and the attribution of blame or responsibility for the problematized state of affairs. Diagnostic framing provides answers to the questions of “What is or went wrong?” and “Who or what is to blame?” Much research examining the substance of collective action frames suggests that diagnostic framing typically defines or redefines an event or situation as an “injustice” (Gamson 1992; Benford & Snow 2000: 615), but it is not clear that all collective action frames include an injustice component. Prognostic framing involves the articulation of a proposed solution to the problem, including a plan of attack and the frame-consistent tactics for carrying it out, and often a refutation of opponent’s current or proposed solutions. Such framing, simply put, addresses the Leninesque question of “what needs to be done.” Research has shown that both diagnostic and prognostic framing can generate considerable debate resulting in “frame disputes” within movements (Benford 1993a). The final core framing task, motivational framing, involves elaboration of a call to arms or rationale for action that goes beyond the diagnosis and prognosis. Motivational framing entails the construction of “vocabularies of motive” that provide prods to action by, among other things, overcoming the fear of risks often associated with collective action and the so-called “free-rider” problem (e.g., why contribute to the attainment of some large goal when that goal constitutes a “public good” in the sense of being an indivisible and nonexcludable benefit?). Motivational framing attends to these impediments to action by accenting and highlighting the severity of the problem, the urgency of taking action now rather than later, the probable efficacy of joining others in the cause, the moral priority of doing so, and enhancement or elevation of one’s status (Benford 1993b), as when some suicide bombers are promised various divine favors for their “righteous” deeds (Snow & Byrd 2007). Understandably, motivational framing has been referred to as the “agency” component of collective action frames (Gamson 1992).

Frame alignment processes encompass the strategic efforts of social movement actors and organizations to link their interests and goals with those of prospective adherents and resource providers so that they will contribute in some fashion to movement campaigns and activities. Four basic alignment processes have been identified (Snow et al. 1986). They include “frame bridging,” which involves the linkage of two or more ideologically congruent but structurally disconnected frames regarding a particular issue; “frame amplification,” which entails the embellishment, crystallization, and invigoration of existing values and beliefs; “frame extension,” which depicts movement interests and framings as extending beyond the movement’s initial constituency to include issues thought to be of relevance to bystander groups or potential adherents; and “frame transformation,” which involves changing prior understandings and perspectives, among individuals or collectivities, so that things are seen differently than before, as is commonplace with conversions and so graphically illustrated by the opening and closing refrain of “Amazing Grace”: “Amazing Grace, how sweet the sound, That saved a wretch like me. I once was lost but now am found, Was blind, but now I see.” Research on these alignment processes has been quite extensive and has firmly established their importance in relation to mobilization (Benford & Snow 2000; Snow 2004).

The ultimate measure of the effectiveness of proffered collective action frames and the corresponding alignment strategies is whether they resonate with targeted audiences. Those for which frame resonance is established facilitate mobilization; those that are nonresonant fall on deaf ears, thus failing to inspire or influence the direction of social movement activity. Two sets of interacting factors have been postulated to account for variation in frame resonance. One is the “credibility” of the proffered frame, which is affected by the consistency between claims and actions, the relative empirical credibility of claims and events, and the credibility of the frame articulators, as determined by status and knowledge considerations. The second
set of factors affecting frame resonance is the “salience” of the framing to the targets of mobilization, as determined by the centrality of the beliefs and claims to the lives of the targets of mobilization, the extent to which the framing is experientially commensurable with the past or present lives of the targets, and the extent to which the framings have narrative fidelity, such that they are resonant with cultural narrations and myths (Snow & Benford 1988; Benford & Snow 2000: 619–622).

Affecting both sets of factors are various framing hazards or vulnerabilities that undermine the prospect of resonance and/or frame alignment. There are at least three sets of such framing hazards: ambiguous events or ailments, as when there is uncertainty about the correct application of two alternative framings (Goffman 1974); framing errors or misframings, as when a diagnostic frame is inappropriately applied or just wrong, or a frame is overextended (Snow & Corrigall-Brown 2005); and frame disputes, as when movement actors disagree and debate about appropriate diagnostic, prognostic, and motivational framings (Benford 1993a). Inasmuch as concerted problem-solving is contingent, in part, on interpretive alignment regarding the diagnosis and prognosis of some problem, then framing hazards constitute impediments to concerted collective action.

The generation and modification of collective action frames occur primarily through the discursive processes of frame articulation and elaboration. Frame articulation involves the discursive connection and coordination of events, experiences, and strands of one or more ideologies so that they hang together in a relatively integrated and meaningful fashion. Frame elaboration involves accenting and highlighting some events, issues, and beliefs or ideas more than others, such that they become more salient in an array of movement-relevant issues (Snow 2004). Historically renowned movement leaders, such as Gandhi and Martin Luther King, were masters at frame articulation and elaboration. Gandhi’s principles of “satyagraha” and “ahimsa” were based, in part, on his articulation of beliefs derived from Hinduism, Buddhism, and Christianity, and Martin Luther King’s potent civil rights frame derived, in part, from his articulation and elaboration of strands of Christianity, democratic theory, and Gandhi’s philosophy of nonviolence.

The processes of frame articulation and elaboration occur during the course of conversations, meetings, and written communications among movement leaders and members within broader enveloping cultural and structural contexts variously called discursive fields (Steinberg 1999) or discursive opportunity structures, which have been found to facilitate and constrain framing efforts (Ferree et al. 2002; Ferree 2003; McCammon et al. 2007). Discursive fields evolve during the course of debate about contested issues and events, and encompass cultural materials (e.g., beliefs, values, ideologies, myths) of potential relevance and various sets of actors (e.g., targeted authorities, social control agents, countermovements, media) whose interests are aligned, albeit differently, with the contested issues or events, and who thus have a stake in what is done or not done about those events and issues. The discursive processes of frame articulation and elaboration draw selectively upon these cultural materials and are conducted in relation to the various sets of actors that constitute the discursive field. This suggests that the development of collective action frames is facilitated and/or constrained by the cultural and structural elements of the discursive field and discursive opportunity structure in which the evolving frame is embedded. This further suggests that collective action frames constitute innovative articulations and elaborations of existing ideologies or sets of beliefs and ideas, and thus function as extensions or antidotes of them. From this vantage point, social movements are viewed not as carriers of pre-configured, tightly coupled beliefs and meanings, traditionally conceptualized as ideologies, but as signifying agents actively engaged in the production and maintenance of meanings that are intended to mobilize adherents and constituents, garner bystander support, and demobilize antagonists.
UNRESOLVED ISSUES

Although the connection between framing and social movements has generated considerable theorization and empirical research, there are a number of issues that have not been adequately addressed. One cluster concerns issues specific to framing processes and their consequences. Much research has identified movement-specific collective action frames, but comparatively little research has examined systematically the discursive processes through which frames evolve, develop, and change. The conceptual cluster of frame articulation and elaboration and the theorized discussion of the discursive fields in which these processes are embedded provide the conceptual edifice for research on frame discursive processes, but to date the actual occurrence of systematic research on framing processes (see Gamson 1992; Ferree et al. 2002; Snow et al. 2007) has not kept pace with the calls for such research (Steinberg 1999; Johnston 2002; Snow 2004).

A second cluster of issues that have not been sufficiently explored concerns the relationship between collective action frames and framing processes and relevant cultural and social psychological factors such as narrative, ideology, collective identity, and emotion. Clearly these are overlapping concepts that interact in ways not yet fully understood.

And last, our understanding of social movements will be advanced if more attention is devoted, both theoretically and empirically, to how framing intersects with the issues and processes examined via the theoretical lens of resource mobilization, political opportunity, and cultural perspectives. These perspectives should be seen not so much as competing but as shedding light on different aspects of the character and dynamics of social movements. The framing perspective emerged not as an alternative to other perspectives on social movements, but to investigate and illuminate what these other perspectives glossed over, namely the matter of the production of mobilizing and countermobilizing meanings and ideas.

Gender and social movements
NANCY WHITTIER

Social movements are shaped by gender systems and they also are a source of social change in gender. Some social movements directly attempt to change gender relations; these movements, particularly women’s movements, have been the focus of considerable scholarship. Increasingly, scholars also recognize the gendered nature of other social movements and the impact of systemic inequalities of gender on the opportunities, constraints, and forms of social movements in general.

RESEARCH ON GENDER AND SOCIAL MOVEMENTS

Research on gender and social movements has proceeded through several stages. Initial works focused on documenting women’s movements, including feminist and non-feminist movements, and explaining their emergence and development. A second phase of work began to analyze gender in social movements more broadly, including masculinity, and to analyze the intersections between gender, race, class, and nationality in social movements. Most recently, numerous scholars have begun to examine the ways that movements are gendered in their origins, collective identities, frames and discourses, organizational structures, tactics, and political and cultural opportunities. In doing so, they contribute to a rethinking of the basic concepts of the field of social movements. These phases are similar to those for scholarship on gender more broadly, which initially focused on documenting women’s experiences and remedying male bias, next on gender as an institution and the intersections between gender and other major forms of social inequality, and lastly on reformulating basic sociological knowledge and theory based on a perspective that makes gender central. Sociological work on gender and social movements thus reflects the influence of the feminist movement on the academy.

OVERVIEW OF GENDERED MOVEMENTS

Many social movements have targeted the social structures, culture, and interactional norms around gender. These include feminist movements, which in many countries focused first on gaining basic political rights such as the vote and the right to own property, and then progressed in later waves to addressing other forms of inequality between women and men ranging from responsibility for child-raising and household labor, discrimination in paid employment, sexuality, reproductive rights, and healthcare, to stereotyping in the arts and popular culture, election to public office, violence against women and children, and so on. Parallel to these movements are antifeminist movements, which tend to emerge in response to feminist movements, and also target gender directly in an attempt to forestall or roll back changes.

Other movements have been organized around gender, without taking gender as a central or explicit target. For example, women’s temperance and social reform movements in the United States in the late 1800s and early 1900s organized women based on their social responsibilities for morality, child-rearing, and the promulgation of religious values. Women have organized in “mother’s movements” to challenge governmental killings and disappearances of their children (such as the Madres de la Plaza de Mayo in Argentina), or to fight against environmental degradation or for better public education. Such “maternalist
politics” can uphold traditional definitions of women’s place while simultaneously expanding those definitions, bringing women into the public sphere and often changing activists’ own family relations and identities. Men’s movements also organize men around some traditional definitions of masculinity while simultaneously stretching those definitions by, for example, encouraging men to express emotions more freely (Newton 2004).

Further, movements do not have to be oriented around gender to be shaped by it. Because gender is a central feature of social structure, culture, and daily life, all movements are gendered. The major elements of social movements are their emergence and recruitment, collective identities, frames or discourses, organizations, tactics or actions, external contexts or political opportunities, and outcomes. Each of these elements is gendered. Because gender intersects with race, class, sexuality, nationality, and other forms of inequality, social movements are gendered in multiple ways.

EMERGENCE

First, movements’ emergence and processes of recruitment are gendered because the status of women and men shapes their differential ability and willingness to organize on their own behalf. Gendered factors such as family structures and responsibilities, access to higher education, paid employment, and fertility rate, all affect recruitment and participation in activism. These factors all vary according to race, class, and nationality as well as gender, and also change over time; such variations account for some of the differences in the level and form of women’s mobilization cross-culturally and historically. Further, social movements emerge along gendered lines because they emerge from gendered pre-existing organizations and networks (Taylor 1999). For example, feminist organizing during the late 1960s in the United States emerged partially from the civil rights movement, in which women gained organizing experience and an ideology opposing inequality, but also faced gender barriers to full participation. However, grievances and networks based on race and class cross-cut those based on gender. For African-American and Latina women during the same era, their connections to mixed-sex movements around race mitigated their interest in a mixed-race movement around gender. Instead, many advocated for women’s interests within mixed-sex movements (Roth 2004; Springer 2005). Similarly, international women’s conferences sponsored by the United Nations have illustrated how women in third world countries define their interests quite differently from those in the highly industrialized global North.

COLLECTIVE IDENTITIES

Second, movements’ collective identities, or group definitions, are gendered. Some social movements directly try to change the definition associated with their group, as feminist movements, for example, try to change what it means to be a woman. Beyond this, movement participants bring with them a gender consciousness that affects the collective identities they construct, and they draw on ideas about gender from both dominant and oppositional cultures. For example, environmental or peace activists may define themselves as mothers concerned about the well-being of children and future generations, and participants in antiglobalization protests may draw on masculinity to define themselves as warriors standing up to the police, or they may draw on feminist and queer politics to define themselves as rejecting the dominant gender order along with capitalism.

FRAMES

Third, social movements construct interpretive frames to explain their grievances and issues, addressing their causes and calling for action. In doing so, they draw on mainstream discourses and also challenge and extend those
discourses. Mainstream frames and discourses are built around particular definitions of the nature, roles, and responsibilities of women and men, and social movements include elements of these mainstream frames and discourses even as they construct alternatives. For example, movements for women’s suffrage, like other maternalist movements, drew on women’s special place as mothers to argue for a greater influence by women on national affairs.

ORGANIZATIONAL STRUCTURE

Fourth, social movements’ organizational structures are gendered. For example, the American civil rights movement assigned formal leadership to men while assigning women to more informal leadership roles (Robnett 1997). Recognizing these differences entails not only recognizing discrimination within the movement and bringing to light the previously unacknowledged role of women, but also redefining theories of leadership to include the ways that women exercised influence outside of official leadership positions. Beyond leadership, women and men may take on different tasks within movement organizations, with women taking more responsibility for activities such as providing food for events or monitoring the emotional climate at meetings, and men undertaking more public speaking, drafting of position papers, or providing “peacekeeping” at public demonstrations. Gendered divisions of labor within movements vary considerably across time, space, and among movements, of course. In movements that explicitly challenge the gendered status quo, such differences may be much less marked or even at times inverted; while in movements that seek to restore traditional gender roles, they may be exaggerated.

TACTICS AND STRATEGIES

Fifth, tactics and strategies are affected by gender. Women and men may draw on established social activities in order to work for change, as in men’s use of violent intimidation compared with women’s reliance on boycotts and vicious gossip in the US racist movement of the 1920s (Blee 1991). Here, too, incorporating tactics grounded in traditionally feminine activities into social movement theory suggests a broader definition of tactics and strategies that includes actions previously not seen as part of social movements.

OPPORTUNITIES AND CONSTRAINTS

Sixth, gendered external social structures and mainstream culture delimit the opportunities and constraints for social movements. Because gender varies by race and class, these opportunities and constraints differ substantially as well. Political opportunities are affected by gender because women and men have differential access to the state both as elected officials and as outside activists. On a more subtle level, the state and other major social institutions operate through gendered structures, procedures, and discourses (sometimes termed gender regimes). When activists target or enter institutions, therefore, they face particular opportunities or barriers depending both on their actual gender and on the way their movement engages with or challenges existing notions of gender. For example, in working to change discourses about gender in the Catholic Church, women were able to draw on the institutional base of female religious orders but were limited by their structural subordination. As a result, they focused on discursive rather than structural change (Katzenstein 1998). Mainstream culture affects how movements’ claims are received, as well, with activists who challenge accepted notions of gender being more likely to be marginalized. Men who openly display affection toward each other and lobby for an expansion in the definition of masculinity, for example, are the subject of considerable ridicule (Schwalbe 1996), while women who lobbied for restrictions on hunting were viewed as hysterical females treading into waters where they did not belong (Einwohner 1999).
OUTCOMES

Finally, in addition to being shaped by gender, social movements are an important force in changing gender systems. Feminist movements in the United States and Western Europe have produced considerable change in cultural beliefs, the structure of paid employment, women’s access to higher education, and basic rights such as the vote, credit, and property ownership. In many countries, women’s activism has produced constitutional guarantees for women’s minimum representation in elected office. Further, social movements have contributed to changes in the cultural codes and interactional norms that define gender. At the same time, these changes have been contested by antifeminist movements. Social movements also produce unintended outcomes for gender. For example, women’s involvement in environmental activism can change their positions at home and in their communities. Social movements also have gendered consequences for subsequent social movements, through the changes they produce in political opportunities, mainstream culture, and other institutions.

FUTURE DIRECTIONS

Several lines of research are promising. First, more analyses of the gendered dimensions of men’s and mixed-sex movements will augment the extensive work on women’s movements. Second, work on cases outside the United States and Western Europe is examining the gender dimensions of a variety of movements (Davis 2007; Fallon 2008). Because gender systems vary comparatively, this work promises to expand theorizing on the topic. Third, efforts to reconceptualize social movement theory based on this work have begun, and promise to produce a richer and more inclusive theoretical model.

Moral shocks/outrage
MIKAILA MARIEL LEMONIK ARTHUR

Many analysts of social movements are interested in how it is that people come to participate in social movement activity. The decision to participate is not a simple one – social movement participants may face significant risks and personal costs, such as arrest or violence, if they become involved. In addition, individuals often perceive social movements as being able to obtain desired goals without their own personal action, a dilemma that has come to be known as the “free-rider” problem (Chong 1991). Some popular explanations for individuals’ decisions to join social movements have included biographical availability and mobilization through preexisting social networks (Snow, Zurcher, & Ekland-Olson 1980). However, there are individuals who participate in social movements without being connected to any existing networks or being in any significant way biographically available. The moral shocks perspective shows how these individuals, often ignored in research about participation in social movements, can recruit themselves into social movement activity due to their experience of a moral shock.

The term “moral shock” refers to the experience of a sudden and deeply emotional stimulus that causes an individual to come to terms with a reality that is quite opposed to the values and morals already held by that individual. Moral shocks can take a variety of forms. They often emerge as suddenly imposed grievances (McAdam, Tarrow, & Tilly 2001), but can also arise as a result of rhetorical appeals on the part of movement leaders or through shocking personal experiences (Jasper & Poulsen 1995). Some research on moral shocks and self-recruitment looks at the framing strategies that movement leaders use to create a sense of shock in potential recruits, in particular the use of extreme graphics in public or through direct mail campaigns. Those moral shocks which are related to powerful and well-known symbols are most influential in generating self-recruitment on the part of potential social movement participants. Research using the moral shocks perspective has focused on social movements around environmental or nuclear hazards, abortion, animal rights, religious values, healthcare, and other matters where individuals have strong personal and moral reactions to the issues at hand while not necessarily being part of networks which have a preexisting commitment to these issues.

Once potential recruits have experienced a moral shock, they are galvanized to participate in social movement activity. The “self-recruitment” portion of the moral shocks and self-recruitment model then suggests that rather than waiting for an appropriate social movement organization to seek them out, potential recruits who have experienced a moral shock are likely to seek out social movement participation on their own. These individuals will search for a social movement organization that shares their personal, moral, and value-based commitments to the issue that they believe in, and they will then join without much prompting from the social movement organization. As noted above, social movement organizations can take advantage of the self-recruitment process by designing recruitment campaigns relying on moral shocks which cause individuals to believe that they are joining the social movement organization on their own out of a sense of moral duty.

Criticisms of the moral shock and self-recruitment model of mobilization have tended to be rooted in the hypothesis that the majority of social movement participants are recruited through preexisting social networks like friendship groups or church memberships, and that therefore even if moral shock sometimes drives potential social movement participants to seek out and join...
social movement organizations, moral shocks are not very significant overall in explaining why people participate in social movements. In particular, those who study recruitment to high-risk activism highlight the necessity of networks to fulfill the function of convincing people to participate (McAdam 1986), since merely coming to care deeply about an issue will not make an individual willing to take significant risks of arrest or physical harm in pursuit of social movement goals.

One of the most well-known works that uses the moral shocks and self-recruitment perspective to explain why people join social movements is Kristen Luker’s *Abortion and the Politics of Motherhood* (1984). Luker explains how women who had never previously been active in social movements or in any kind of politics became mobilized as part of the anti-abortion movement because of a variety of moral shocks. In particular, Luker outlines two main varieties of moral shocks that these potential recruits experienced: those surrounding their own reproductive decisions or options, and those concerning the ways in which they first heard about the *Roe v. Wade* court decision.

Music and social movements
ASHLEY R. GROMIS and WILLIAM G. ROY

Recent scholarship has increasingly addressed the ways that social movements creatively use cultural products and themselves act as sources of cultural creativity. Because of its temporal synchronicity and its expression in lyrics, music has been an especially powerful form of cultural expression. It is music’s dual nature as a set of cultural objects and an activity fostering solidarity that explains its effectiveness for social movements. Music not only serves as an important resource for social movements, but is also something they actively “do.”

A RICH HISTORY

Music has been widely used for many purposes by many movements (Eyerman & Jamison 1998; Mattern 1998; Turino 2008; Rosenthal & Flacks 2010). The civil rights movement has been well studied as the archetypical musical movement. It not only utilized folk music as part of its collective action, but also made a significant impact on the national consciousness as reflected in contemporary popular music (Garofalo 1992; Eyerman & Jamison 1998; Roy 2010). Elements of the Black Nationalist movement continue to be present in both rap and hip hop music and their broader culture (Zook 1992). In Hawaii, music is a vital part of the movement by native Hawaiians to reclaim their traditional heritage (Lewis 1992). The punk-inspired English “Rock Against Racism” campaign formed in 1976 in hopes of organizing youth to fight racism both in music and British society (Frith & Street 1992). Marginalized youth have widely found their voice in and advocated for social change through popular music in such disparate places as socialist Hungary, post-Cultural Revolution China, Hong Kong, Cuba, Chile, and Argentina. Students protesting the Milošević regime in Serbia made extensive use of popular music in the creation of collective identity, framing of the opposition, and mobilizing youth for elections. Playing rock music, particularly popular Western songs, became a staple at protest events (Steinberg 2004). African traditional and popular music throughout the continent has fortified the fight against cultural imperialism. Popular musicians have effectively indigenized their music, many drawing from existing models of “black music” from across the world (Collins 1992).

As the frequent presence of music in social movements might suggest, there is no systematic relationship between music and the content of social movement goals. Music can be used equally effectively to empower reactionary and progressive movements. Through the exaltation of German classical musicians over their foreign or Jewish counterparts and the creation of participatory music programs for both children and adults, leaders in Nazi Germany were successful in securing support and loyalty from the larger German population (Turino 2008). During approximately the same period, the Italian fascist regime effectively used theater performance and its music as a vehicle to convey fascist ideology to the broader society (Berezin 1994). And the American White Power movement has developed a highly sophisticated infrastructure for the production and distribution of hate music (Futrell, Simi, & Gottschalk 2006).

The association between music and social movements extends far into the past as well. Songs used for protest and propaganda, or “songs of persuasion,” can be traced as far back as political and religious movements following the Protestant Reformation in Europe (Denisoff 1983). By the end of the nineteenth century, topical songs were already present in the American labor and abolitionist
movements, and, as early as 1900, the Socialist Party began publishing workers’ songbooks (Cohen & Samuelson 1996). Beginning in the 1920s, folk music formed a deep and lasting connection with the political left in the US. Music was an important aspect of the early mass mobilization of textile workers in the American South between 1929 and 1934, where the use and transmission of oppositional, mill-specific songs was facilitated by the advent of new technology, such as radio, records, and broadcasts of live performances (Roscigno & Danaher 2004).

CULTURAL SOCIOLOGY AND THE SOCIOLOGY OF CULTURE

Scholarship on music and social movements reflects the general theoretical cleavage between “cultural sociology” and the “sociology of culture.” “Cultural sociology” examines all social life through the lens of culture, which is defined in the anthropological sense of how people make sense of social life. “Sociology of culture” focuses instead on the institutions that specialize in artistic expression including art, music, literature, architecture, etcetera, emphasizing the intersection of organizational, economic, aesthetic, and cultural variables.

The cultural sociology perspective unpacks the meaning of music for participants and in relation to the larger culture. Three kinds of meanings are emphasized: what social movements believe, who they are, and what they want. What social movements believe is analyzed in terms of social values and ideologies. Music is seen as doing the work of persuasion—either of or by social movement activists. Like stories, songs have identifiable structures and are often open to interpretation, which allows them to be appropriated by movements to garner attention and empathy from individuals and help them relate to the message articulated by the movement (Polletta 2006). What participants are is a matter of identity. Popular music and musicians who embody their musical messages can be instrumental in launching identity movements and creating a medium through which protesters can construct collective identity and discourses of opposition (Eyerman & Jamison 1998; Steinberg 2004). Music has a remarkable ability to reinforce and undermine social boundaries such as race, gender, class, and nationality (Roy 2010). For participants of marginalized movements especially, music can be an important medium through which commitment to the movement is articulated and reaffirmed while the contrast with the mainstream culture is reinforced (Turino 2008). What social movements want is matter of goals. Music can express political and transcendent aspirations, captured most vividly in the universal hymn of social movements “We Shall Overcome.”

Some scholars explain how movements express meaning to the broader culture, rather than their internal dynamics. As cultural actors, social movements reflect and reinterpret established and shared frameworks of meaning from common cultures. They are also open spaces in which movement-specific cultures, such as rituals, traditions, and forms of artistic expression, can be injected into the dominant culture (Rosenthal & Flacks 2010). Sometimes people in or associated with the movement are analyzed; at other times, nonparticipants are treated as the voice of the movement. For the latter, analysis is sometimes little different from cultural analysis of the mass media. For example, in the 1960s, American singers of soul music were sometimes treated as the voice of the civil rights movement. In some instances, including African-American and American folk music or Swedish progressive music, social movements can help develop distinct musical genres and influence the dominant popular culture (Eyerman & Jamison 1998). The most common form of analyzing expression to the broader culture is political analysis of lyrics. Protest songs put emphasis on the verbal or intellectual aspect by framing something as “wrong” and in need of alteration (Denisoff 1983).

Turning now to the sociology of culture, four perspectives within this paradigm will be
discussed to examine the relationship between music and social movements – why and when social movements use music, art worlds and the production of culture, the effect on collectivity itself, and the emphasis placed on activities and relationships.

In examining why and when social movements use music, the movement use of music is treated as a variable that needs to be explained. Explanations are given in terms of characteristics of the movements, characteristics of the social bases on which those movements draw, and characteristics of the broader social context in which movements arise. Music can serve many different purposes within a movement, including providing those already active in a movement with an opportunity to reaffirm their commitment, educating those who are not familiar with movement issues, recruiting of new participants, and mobilizing those who identify with the movement to action (Rosenthal & Flacks 2010).

Drawing on the literatures about art worlds and the production of culture, movements can also be analyzed in terms of the organizational and institutional characteristics of the movement and their contexts. The hierarchical structure of the American Communist Party was reflected in the social form of its use of music as propaganda. Their strong organizational experience was used to create an impressive musical infrastructure. In contrast, the embeddedness of the civil rights movement in the black community facilitated a more participatory form of music by which music became part of collective action itself (Roy 2010).

Music may serve a movement as a whole by expressing and reinforcing ideology and agreements that help to bind a group together (Rosenthal & Flacks 2010). The act of sharing music on the community level may be meaningful to a movement in and of itself, and can foster interpersonal connection and community acknowledgement and celebration.

Finally, the use of music in movements can be examined through an emphasis on activities and relationships. In this approach, movements are treated as more than the sum of individual motivations. Some analysts focus on activities such as collective actions, or rituals. In the case of the American Southern labor movement and the textile strikes, the use of music that was already familiar to the workers utilized musical expression as a resource that was already rooted in rituals and collective activity that could easily be integrated into the movement (Roscigno & Danaher 2004). Music is set within dyadic and higher order relationships with attention to such features as hierarchy, division of labor, and solidarity. The division of labor in a movement can inform how music is experienced within the movement. The adoption of the conventional performer/audience model in the Old Left hindered the development of a participatory, “singing” movement, whereas the disintegration of this distinction in the civil rights movement allowed for music to become an activity that everyone participated in together in the movement (Roy 2010).

Music and social movements is currently a lively field of study. We can anticipate new themes to include the effect of new technologies on musical activities in social movements, a broader global focus, including both global movements and comparisons of nationally based movements, more comparisons or contrasts with other forms of creative arts in social movements, and greater attention to musical activities.

Networks and social movements
MARIO DIANI

Since the interest in social movements started to develop in the 1960s, the relation between networks and movements has been analyzed from two perspectives. By far the most popular one has treated networks as important facilitators of individuals’ decisions to become – and remain – involved in collective action (e.g., McAdam 1988; Kitts 2000). This reflected, on the one hand, the need to stress the social embeddedness of movement participants, in contrast to their earlier characterizations as marginal and disorderly personalities (McAdam 2003: 281–284), on the other, the interest in identifying the mechanisms behind people’s commitment to collective causes, contributing to the debate inspired by Mancur Olson’s seminal work on *The Logic of Collective Action*. At the same time, analysts have looked at social movement networks as the structure of the links between the multiplicity of organizations and individual activists, committed to a certain cause. From this perspective, movement networks have been treated as the consequence, rather than the precondition, of collective action, a specific instance of the broader processes through which actors modify social structures through agency. More specifically, looking at the configuration of movement networks has provided observers with a clue to grasp the logics by which movement actors choose their partners, thus generating broader and complex organizational fields (e.g., Diani 1995).

In their most basic sense, social networks consist of sets of nodes, linked by some form of relationship, and delimited by some specific criteria. Analysts of social movement networks have mostly used as nodes either the individuals mobilizing or sympathizing with a certain cause, or subscribing to certain alternative lifestyles, or the organizations, promoting collective action on such issues and/or encouraging alternative cultural practices. They have looked at both direct and indirect ties. Direct ties are present when two nodes are directly linked in explicit interaction and interdependence, for example, two activists who know each other personally, or two organizations that jointly promote a rally. Indirect ties are assumed to exist between two nodes when they share some relevant trait or orientation – for example, interest in certain issues or in the same campaigns – yet without any face-to-face interaction.

Defining the boundaries of a social movement – classifying certain actors or events as part of a social movement dynamic or not – has proved most problematic. Many social movement analysts associate with a given movement all organizations sharing an interest in certain issues (for example, the environment, or women’s rights) or all organizations willing to adopt disruptive tactics, regardless of whether they are actually linked to each other or not (e.g., Andrews & Edwards 2005). Others include in a movement only those nodes actually connected by some kind of relation. In particular, social movements have been conceived as the processes through which informal networks between a multiplicity of actors, sharing a collective identity, and engaged in social and/or political conflict, are built and reproduced (Diani 1992). Identity plays a crucial role here as it connects actors to longer-term collective projects, thus making their relation different from that between actors engaged in purely instrumental coalitions. While some movement identities may be very exclusive, thus leading to the consolidation of very self-referential and tightly bounded networks, most movement identities are fairly inclusive, and allow for activists’ multiple involvements.
in different types of collective experiences (Carroll & Ratner 1996).

In the beginning, social movement analysts mostly focused on the role of social networks as predictors of individual participation in collective action. Even in the early 1970s, many still regarded movement participants as individuals lacking a proper social integration, following the disruption of routine social arrangements brought about by radical processes of change and modernization (McAdam 2003). Interest in the link between social networks and movement participation developed precisely to challenge that assumption. By the 1980s, the notion that social movement participants are usually well integrated in dense systems of social relationships, that prior social ties operate as a basis for movement recruitment, and that established social settings are the locus of movement emergence, had become one of the most established findings in social movement research (Kitts 2000; McAdam 2003).

Social movement activists and sympathizers are usually linked through both “private” and “public” ties well before collective action develops. Personal friends, relatives, colleagues, neighbors, may all affect individual decisions to become involved in a movement; so may people who share with prospective participants some kind of collective engagement, such as previous or current participation in other movement activities, political or social organizations, or public bodies. Individuals may also be linked through indirect ties, generated by their joint involvement in specific activities and/or events, yet without any face-to-face interaction. These may range from participation in the same political or social activities and/or organizations, to involvement in the same subcultures or countercultures (Whittier 1995; Melucci 1996).

The impact of individual networks on individual participation has been tested in reference to different dependent variables. These have included presence or absence of participation; participation in specific types of activities, for example, in conservation or political ecology groups; the continuation of participation over time; the levels of risk associated with participation. Networks may provide opportunities for action through the circulation of information about ongoing activities, existing organizations, people to contact, and a reduction of the practical costs attached to participation. They may be the source of social pressure on prospective participants (“if you go, I will go too”), although cross-pressures are also possible, and so are people participating precisely because they expect others not to do anything. Networks may facilitate the development of cognitive skills and competences, and/or provide the context for the socialization of individuals to specific sets of values. They may also represent the locus for the development of strong emotional feelings (Gould 2003; Passy 2003).

It is disputed whether direct or indirect ties should operate differently, although in general social pressure is more likely to be exerted through direct links, while socialization to values or cognitive skills may also originate from involvement in similar organizational settings, regardless of strong involvement with specific individuals. Whether strong or weak ties should matter most is also a matter of debate: one would expect strong ties to matter more in the case of high-risk activities but weak ties may facilitate the contacts between a movement organization and a constituency with more moderate or at least diversified orientations, and/or the diffusion or the spread of a movement campaign.

While many analyses treat network location mainly as an individual attribute, a structural account of participation requires analysts to look at how individual ties combine into more complex network patterns. These questions have been addressed through both formal modeling and empirical case studies. For example, Marwell and Oliver (1993) have challenged Olson’s conclusions by emphasizing the crucial role of a critical mass of people (“organizers”), prepared to face the costs of starting collective action, regardless of the size of the group taken as a whole. They have also suggested that in highly heterogeneous networks, selective mobilization attempts, targeting specific
subgroups of a population, can be more effective than in homogeneous networks (Marwell & Oliver 1993: 130–156).

Attention has also been paid to the relation between collective performance and the network structure of a given population or territory. Gould (1995) showed that levels of collective action by different Parisian neighborhoods in the Commune uprising of 1871 were accounted for by organizational and informal relations between neighborhoods as well as by nonrelational properties. Hedström and his associates (Hedström 1994; Hedström, Sandell, & Stern 2000) also stressed the link between territorial units and mobilization processes, yet with an emphasis on diffusion processes rather than levels of participation. They found spatial proximity, and the resulting increased likelihood of personal acquaintances, to significantly influence the spread of trade union and social democratic party organizations in Sweden from 1890 to 1940.

Yet another important illustration of the networks–movements connection is the view of movements as complex fields of interactions between multiple actors. This had already been noticed in the 1970s by scholars interested in subcultural and countercultural dynamics as well as in interorganizational relationships (e.g., Gerlach 1971). However, this perspective has gained momentum since the 1980s, in parallel with the growing success of the network concept as a key to make sense of contemporary society, beyond classic dichotomies such as that between bureaucracy and markets, and with the renewed interest in agency in social theory. The spread of transnational contention and coalition building has further emphasized the interest in movement networks. All this has translated into growing attention to both interorganizational fields and subcultural and countercultural communities.

Looking at interorganizational fields (Ansell 2003) reflects the fact that it is actually very difficult to think of movements as consisting of one organization. When this happens, as in the instances of the Bolshevik party in Russia or the National Socialist party in Germany, it usually means that the transition from movement to bureaucracy is complete. Movements indeed consist of multiple instances of interorganizational collaboration on campaigns of different intensity and scope. Direct ties between movement organizations include most prominently the exchange of information and the pooling of mobilization resources; indirect ties cover a broad range of possibilities, from shared personnel to joint participation in specific actions and/or events, from exposure to the same media, especially computer-mediated ones, to shared linkages to third parties (whether private or public organizations).

Sometimes, relationships between groups and organizations are recurrent to the point that one can think, for a given social movement, of a distinctive “alliance structure” and “oppositional structure”; other times this does not happen and ad hoc shifting coalition networks prevail. It is important to recognize the difference between a pure coalition, driven by instrumental principles, and a movement network (Diani & Bison 2004). In both cases, networks facilitate the mobilization and allocation of resources across an organizational field, the negotiation of agreed goals, the production and circulation of information. However, it is the presence of a shared identity which qualifies a movement network vis-à-vis a coalition network, and helps make its boundaries somehow neater – better, less blurred. As identity is not a given trait but is the product of incessant negotiations between social actors, which often involve ideological conflicts, movement boundaries are rarely stable. Their instability is also reflected in movement networks’ internal segmentation, even though this may also derive from principles of division of labor or the diversity in issue agendas between different organizations (Diani 1995).

At the same time, social movements, especially but not exclusively those challenging moral values and dominant cultural codes, also have a strong subcultural and countercultural dimension (Whittier 1995; Melucci 1996). Individual networks represent the backbone of
broader social movement communities, where interpersonal ties involve the sharing of distinctive lifestyles or of broader cultural models. While social movement scholars have studied them mostly in reference to “new” social movements (e.g., gay and lesbian subcultures, alternative scenes, radical intellectual milieus), working-class communities continue to attract considerable attention from social historians and historical sociologists. To say the least, communitarian ties strengthen identity and solidarity among movement activists and sympathizers. At the same time, though, they provide the specific locus of social conflict in those cases where the challenge is eminently on the symbolic side, where, in other words, at stake is mainly the definition of identities and the preservation of opportunities for the enactment of alternative lifestyles.

Since the 1990s, research on networks and movements has increasingly explored the impact of technological innovation, in particular information technology, on collective action processes. According to analysts, the spread of computer-mediated communication has affected social movements in several ways (van de Donk et al. 2004; della Porta & Mosca 2005; Earl 2010). First, it has increased their efficiency and effectiveness by facilitating the pooling of ideas and resources, increasing movement activists’ capacity to coordinate actions on a larger scale than previously conceivable, and speeding up diffusion processes. Second, it has introduced a new arena of contention and created new targets for activist campaigns, for example, in the form of movement activists and sympathizers overloading the websites of movement opponents with messages in order to block their operations. Third, it has contributed to the strengthening of specific collective identities and solidarities between people committed to a given cause. Finally, it has also contributed to the emergence of new types of public sphere by offering alternative sources of information to the public, or at the very least, to those sectors of the public sharing similar worldviews and values that are hardly given a voice by mainstream media. At the same time, questions have been raised regarding the ultimate impact of computer-mediated communication on mobilization processes. In particular, it is disputable whether “virtual,” computer-mediated ties may replace “real” ties, based on face-to-face, “local” interaction. Without denying the importance of the practical opportunities for collective action offered by new technologies, it remains to be seen whether they can also generate the shared understandings and – most important – the mutual trust, which have consistently been identified as important facilitators of collective action (Diani 2000).

Thinking on networks and movements is likely to evolve along quite diverse, if compatible, lines. First, we may expect attempts to explore the “black box” of the relation between networks and participation to continue, as advocated by proponents of the “analytic turn” in social movement research (McAdam 2003). In particular, increasing attention is likely to be paid to the relation between networks and culture. It is indeed impossible to disentangle the two, as social ties – and hence networks – only exist inasmuch as they are recognized as such, and this necessarily happens through a process of interpretation and symbolic construction (Mische 2008).

Second, more consistently with the so far dominant, realist view of networks, social scientists need to extend their conception of nodes in movement networks to objects other than individuals or organizations. In particular, a network perspective could contribute substantively to our understanding of protest cycles and protest campaigns. The whole idea of protest cycle presupposes interdependence between events, and so do the techniques of event history analysis increasingly used in this area of inquiry. Events might be treated as network nodes, linked through different mechanisms. For example, organizations operate as ties by promoting and/or participating in multiple events; individual activists operate in the same way; events may also be linked through symbolic means, for example, by narratives that underline continuity between what
would otherwise be largely independent and disconnected episodes of social conflict. The application of a network perspective could generate important insights on how events become linked into a social movement process.

The time dimension should also be introduced more explicitly into the analysis of movement networks. Most studies of networks are based on data collected at a single point in time (see, however, Osa 2003; Mische 2008). More information is needed on how movement networks evolve over time, and how those changes affect patterns of collective action at large. Unfortunately, the data necessary to those analyses are hard to locate, as systematic archives of social movement activity are rare. Nonetheless, some remarkable studies have indeed drawn upon archival records. Court records are another important source of network data, and have been used to account for recruitment to contemporary terrorist groups as well as for the traits of historical examples of contention. Newspaper reports offer a possible alternative, which has not been extensively explored yet (but see Rootes 2003). If data obtained in this way were confirmed to be a valid measure of actual ties, this would represent a major step forward towards network analysis of movements over long time spans.

Nonviolence/nonviolent action
KURT SCHOCK

NONVIOLENCE

Nonviolence is an evolving theory and practice of personal and social transformation that rejects the use of coercion and violence in everyday life and in promoting social change (Texeira 1999). Nonviolence may entail a holistic approach, which opposes all forms of violence, including social, economic, cultural, and ecological, or it may apply specifically to prosecuting an acute conflict without resorting to violence or coercion.

Diverse traditions and faiths have promoted nonviolence throughout history, including those of many indigenous cultures, and religions such as Hinduism, Jainism, and Buddhism. Traditions within Judaism, Islam, and Christianity have also emphasized nonviolence. Christian peace churches such as the Brethren, Mennonites, and Quakers, for example, embrace pacifism and view violence as incompatible with their understanding of the divine.

There is also a tradition of nonviolence engaged in by individuals outside of religious practice. Henry David Thoreau, for example, was an exemplar of individual civil disobedience: the open violation of unjust laws or policies on the grounds of individual conscience. Thoreau refused to pay poll taxes to the state of Massachusetts because it supported slavery and the war against Mexico. In Resistance to Civil Government he encouraged others to engage in civil disobedience, arguing that when the government is unjust it is the duty of conscientious citizens to do so (Thoreau 1996).

With individual and moral nonviolence, there is an implicit social causality that individual actions will promote a better society; if enough individuals adopt nonviolent beliefs and behaviors, then macrosocial change will result. Nevertheless the primary motivation is individual morality or conscience, and social transformation is not prioritized. By contrast there is an explicit social causality in deliberate and organized collective campaigns of nonviolence to promote social change (Vogele 2010).

Mass-based campaigns of nonviolent resistance aimed at achieving a variety of social and political objectives became a significant force in the late nineteenth and early twentieth centuries. Nonviolent resistance was used increasingly as a means of struggle against injustice, oppression, and foreign domination where in the past violent rebellion or war would have seemed the only option. Nonviolent resistance, to an extent, was increasingly used as a functional equivalent of violent rebellion and war (Randle 1994).

Some examples from this era include Hungarian resistance to Austrian rule from 1849 to 1867, Finnish resistance to Russian rule from 1899 to 1906, the 1905 campaign of noncooperation in czarist Russia, the Egyptian general strike against British occupation in 1919, the Kapp putsch that thwarted a coup in Germany in 1920, and general strikes – which became a weapon of working class protest – in Italy in 1904 and Britain in 1926 (Randle 1994).

Inspired by religious traditions, individual nonviolence, and historical instances of collective mass defiance, Mohandas Gandhi was influential in bridging individual morality and transformation with collective social and political transformation through campaigns of nonviolent resistance. Based on his experience struggling for the rights of Indians in South Africa in the late nineteenth and early twentieth century, he developed satyagraha, which he applied to the struggle for Indian Independence as well as to struggles for justice within
Indian society upon his return to India in 1915. Satyagraha – or the force of truth – involved both individual and social transformation through nonviolence. Gandhi was significant in developing the first comprehensive theory and practice of nonviolence in the modern era and in challenging the long-held and still dominant assumption that violence is the final arbiter in politics.

Proponents of nonviolent struggle, such as Gandhi and Martin Luther King, do not view conflict as something to be avoided or suppressed. Instead conflict is viewed positively as an opportunity to transform society and oneself. Moreover, Gandhi and King were adept at incorporating both moral and strategic aspects into their campaigns. Whether inspired by Gandhian nonviolence or not, nonviolent resistance increased over the course of the twentieth century so that, by the twenty-first century, nonviolence had become a global and modular method for prosecuting struggles against oppression and injustice (see below).

NONVIOLENT ACTION

Nonviolence, as a strategy of social transformation, occurs through the collective, organized, and sustained use of methods of nonviolent action. Typically those adopting nonviolent action are members of marginalized or oppressed groups without access to institutional power. Methods of nonviolent action occur outside of conventional politics and do not involve violence or the threat of violence. Nonviolent action may occur through acts of omission, whereby people refuse to perform acts expected by norms, custom, law, or decree, or acts of commission, whereby people perform acts which they do not usually perform, are not expected by norms or customs to perform, or are forbidden by law or decree to perform (Sharp 2005). Nonviolent action differs from rhetoric, institutional politics, political violence, and everyday forms of resistance; however, its boundaries are context-dependent and may not always be clear cut. Of course, empirical campaigns of resistance may involve various forms of action and those implementing nonviolent action may be met with violence. In fact violent repression is to be expected when elite interests are seriously challenged.

Although differences between nonviolent and violent action are obvious, they share some commonalities relative to conventional politics. Both are “extrainsitutional” or “unconventional” forms of direct action that involve physical and coercive force and the fear of bodily harm. Nonviolent action, by contrast, instead of physically coercing or eliminating the opponent, works through social power and the human mind by use of appeals, manipulation, and nonviolent coercion (Bond 1994).

Methods of nonviolent action fall into three descriptive classes: protest and persuasion, noncooperation, and nonviolent intervention (Sharp 2005). Methods of protest and persuasion are symbolic expressions with communicative content intended to persuade the opponent, expose the opponent’s illegitimacy, provide social visibility to unjust relations, illustrate the extent of dissatisfaction, educate the public and third parties or catalyze their support, and overcome fear and acquiescence. These methods are often the crucibles in which frames are elaborated and disseminated, solidarity is forged, and people are mobilized to participate in other methods of nonviolent action. These methods do not consist of the use of reason, discussion, or persuasion exclusive of direct contentious action. They include actions such as protest demonstrations, marches,
rallies, public speeches, symbolic public acts, and vigils.

Methods of noncooperation involve the deliberate withdrawal, restriction, or defiance of expected participation or cooperation. While these methods may have symbolic significance, they are also intended to disrupt the status quo and undermine the opponent’s power, resources, and legitimacy. These methods may be social, economic, or political. Social noncooperation involves the refusal to carry out normal social relations, such as social boycotts, social ostracism, student strikes, and stayaways. Economic noncooperation involves the suspension of existing economic relationships or the refusal to initiate new ones, such as labor strikes or slowdowns, economic boycotts, refusal to pay rent, debts, interest, or taxes, and the collective withdrawal of bank deposits. Political noncooperation involves the refusal to continue usual forms of political participation or obedience, such as election boycotts and disobeying political authorities.

Methods of nonviolent intervention are acts of interposition intended to directly disrupt social relations or develop alternatives to oppressive relations. Examples range from sit-ins, pickets, nonviolent obstructions, nonviolent sabotage, land occupations, and paralyzing transportation, to developing alternative markets and creating parallel institutions during the course of a struggle. These methods can be subdivided into two types. Disruptive nonviolent intervention upsets or destroys normal or established social relations. Creative nonviolent intervention forges new social relations (Burrowes 1996). Creative nonviolent intervention is significant, because in struggles against oppression it is not only necessary to withdraw participation from oppressive relations, it is also necessary to engage in positive action to build alternatives. The two types of nonviolent intervention are mutually supporting and reinforcing: while disruptive nonviolent intervention (and noncooperation) drains power from the oppressors, creative nonviolent intervention generates power among the oppressed.

NONVIOLENT SOCIAL MOVEMENTS

Major episodes of nonviolent resistance from the second half of the twentieth century onward include the civil rights movement led by Martin Luther King that challenged racial segregation and discrimination in the American South (1955–1968); numerous protest movements in more developed countries in the late 1960s—exemplified by the student and anti-Vietnam War movements in the US and Australia, and the student-led insurrection in France in 1968; and a wave of pro-democracy movements from the 1980s into the twenty-first century that challenged dozens of nondemocratic regimes throughout the world. Notable successes include the Philippines in 1986, Chile in 1989, Poland in 1989, Serbia in 2000, and Tunisia in 2011.

Various issue-related social movements have been almost exclusively nonviolent. Women’s movements have advocated nonviolent methods and social relations, adopting nonviolent action as both a tactical choice and a framing element, and cultivating a social critique of violence—from domestic violence to militarization and war making. Labor movements have historically depended on methods of noncooperation, especially the strike, to force concessions from capitalists and the state. “New social movements” that emerged in Western industrialized countries after World War II, such as the environmental and peace movements, have been almost exclusively nonviolent. Many indigenous people’s movements have also been primarily nonviolent. In recent years powerful land rights movements throughout the global South have adopted nonviolent resistance to prevent land alienation and promote land reform.

By the beginning of the twenty-first century, social movements implementing nonviolent action had become a modular and global phenomenon. Some factors contributing to the increasing use of nonviolent resistance over the course of the twentieth century include an increasing disparity in the means of violence between rulers and the ruled in most
countries, diffusion of methods of nonviolent action across countries, processes of learning and the transfer of generic knowledge about nonviolent action, and an increasing recognition of the effectiveness of nonviolent resistance and the relationship between means and ends.

Conceptual distinctions can be made between social movements that implement nonviolent action as a matter of principle and those that implement it for pragmatic reasons, although empirically there is probably a mix. Participants in principled nonviolent social movements view nonviolence as a way of life and usually hold religious or ethical beliefs that prohibit using violence against others in most or all situations. In contrast, participants in pragmatic nonviolent social movements perceive nonviolent action as the most expedient method for promoting change. Nonviolence is viewed as a means for prosecuting conflicts and not necessarily as a lifestyle (Burrowes 1996).

Distinctions can also be made between reformist and revolutionary nonviolent social movements. In the former, particular policies are perceived as the cause of or the solution for social problems. Movements of this type tend to implement short- to medium-term campaigns aimed at changing public policies within the existing political framework. Moreover, these movements do not usually involve constructive programs. In contrast, revolutionary nonviolent social movements are guided by a structural analysis, and aim to change the basic structures of society. Particular campaigns, which may have a short- to medium-term time frame, are conducted within the context of a long-term revolutionary vision and involve the implementation of constructive programs to build a better society (Burrowes 1996).

The cross-classification of the principled–pragmatic dimension with the reformist–revolutionary dimension provides four types of nonviolent social movements: pragmatic-reform, principled-reform, pragmatic-revolutionary, and principled-revolutionary. These categories are broadly descriptive rather than definitive and are not mutually exclusive. Examples of pragmatic-reform movements include antinuclear and environmental movements in developed countries that target government and corporate policies. An example of a principled-reform movement is the American civil rights movement led by Martin Luther King that incorporated a religious perspective in its challenge to particular policies that upheld racial segregation and political exclusion. Examples of pragmatic-revolutionary movements include the political revolutions in Eastern Europe in 1989 and the first Palestinian Intifada (1987–1993) that used nonviolent methods against Israeli occupation. An example of a principled-revolutionary movement was Gandhi’s struggle in India directed at liberation from British rule along with the development of constructive programs aimed at fundamentally transform social and economic relations within India (Burrowes 1996).

DYNAMICS AND CONSEQUENCES

One way to proceed with the analysis of nonviolence is to examine it as an ideology or to examine the beliefs, attitudes, goals, values, and lifestyles of activists that inform their selection of strategy and tactics. Another way is to examine the dynamics and consequences of implementing methods of nonviolent action regardless of the motivation for their use. The second approach may be more useful in uncovering the distinctive nature of nonviolent resistance (Bond 1994). Some important findings from the latter approach are discussed below.

Dependence relations

A common perspective concerning the outcome of struggles prosecuted through nonviolent action is that as long as the opponent lacks the will or capacity to violently repress, then nonviolent resistance has a chance of succeeding. However, if the opponent does not, then nonviolent resistance will be crushed by
violent repression. An alternative, and more accurate, perspective suggests that the crucial variable in determining the outcome of nonviolent struggle is not repression, but rather the presence or absence of dependency relationships between the oppressor and the oppressed (Summy 1994).

One form of dependence, moral dependence, concerns the social distance between the oppressor and the oppressed. The shorter the social distance, the more likely that nonviolent action will succeed; the greater the social distance, the less likely the success. Social distance may increase or decrease through processes of dehumanization and rehumanization. If social distance between oppressor and oppressed is large, then intermediary parties that connect the antagonists must intervene in the conflict for nonviolent resistance to succeed. The oppressor and oppressed may be concatenated through third parties through the “great chain of nonviolence.” In the case of Indian Independence, for example, liberal and socialist Britons and higher caste Indians bridged the social distance between British imperialists and impoverished Indians. This intercession provided leverage to the struggle for national liberation (Galtung 1989).

Other forms of dependence are political and economic. Political authority, for example, depends critically on the strength of a government’s claim to legitimacy. A government’s ability to command obedience is reduced if it is widely perceived as acting in an unjust, corrupt, or unconstitutional manner. Government power will also be severely undermined if any essential group of administrators, police, military, or workers in key sectors such as energy or transportation refuse or threaten to refuse to carry out their duties and competent replacements are not readily available (Summy 1994).

Economic resources of a government must also be constantly replenished. If workers withdraw their labor, people refuse to pay taxes, or third parties, such as important international trading partners, impose economic sanctions on a government, then its power will be undermined. Thus, governments depend on the cooperation of their own citizens, but also on other states, and, increasingly, transnational institutions and organizations. In order for nonviolent struggles to succeed, there must be some sort of dependence relation that can be leveraged by the challengers, either directly or indirectly through third parties (Summy 1994; Schock 2005).

**Backfire**

A dynamic that is crucial to many struggles waged through nonviolent action is backfire: the reduction of the power and legitimacy of an authority that uses violent repression against activists engaged in nonviolent protest. For a repressive event to generate backfire information about the event needs to be communicated to receptive audiences, receptive audiences must perceive the event to be unjust and they must be outraged by it, and authorities must take their outrage into consideration (Martin 2007). For example, the outrage generated by the violent repression of civil rights activists in the American South, which contributed to the intervention of federal forces, was critical to the success of the civil rights movement. The backfire dynamic may be crucial in winning over neutral or uninvolved third parties that serve to concatenate the oppressors with the oppressed.

**Consequences**

From a strategic perspective, there is evidence that nonviolent resistance may be a more effective strategy than violent resistance. Chenoweth and Stephan (2011), for example, compared the effectiveness of hundreds of major campaigns of collective action with maximalist objectives, such as regime change or secession, which occurred from 1900 to 2006. They found that nonviolent resistance movements were more likely to succeed than violent resistance movements. This was in part due to the ability of nonviolent resistance movements to attract more widespread support than violent ones and the increased likelihood that the backfire dynamic will be invoked.
Karatnycky and Ackerman (2005) examined 67 democratic transitions that occurred from the 1970s through the 1990s. They found that the prospects for a democratic transition increased when challengers refrain from using violence. Moreover, the occurrence of mass-based nonviolent resistance was a significant factor in most democratic transitions and countries with strong and cohesive nonviolent civic coalitions were more likely to be more democratic in the post-transition era. Thus, beyond the effectiveness in promoting regime change, the nature of the post-transition regime was shaped by the form of the transition. Countries where the transition was propelled by mass-based nonviolent resistance movements were more democratic several years after the transition compared to transitions propelled by violent resistance or top-down elite-driven reform. Violent social movements, when successful, tend to be related to the centralization of power, which in turn promotes power differentials between ruling and subordinate groups. By contrast, successful nonviolent resistance movements tend to be related to a diffusion of power throughout society.

In a general comparison of various ways of promoting social change, Martin (2006) argues that nonviolent resistance is more successful than conventional politics and violent resistance in terms of its historical track record, degree of popular participation, compatibility of means and ends, and lower levels of suffering. In conclusion, social scientists are increasingly recognizing the power of campaigns of nonviolent resistance to transform acute conflicts and the relationship between means and ends.

Organizations and movements
ELIZABETH A. ARMSTRONG and TIM BARTLEY

Social movements organize people, resources, and ideas for social change. Many do this through formal organizations—often called social movement organizations (SMOs). The concept of a social movement organization is trickier than it may initially seem, since it depends on defining a “social movement” and specifying its relevant set of organizations. Though scholars have defined social movements in a variety of ways, we draw on Snow (2004) to provisionally define social movements as collectivities seeking social change at least partly outside of institutionalized politics. Similarly, though various definitions of organizations have been offered, we view organizations as goal-directed, boundary-maintaining groups, typically with some degree of formal structure.

Many social movement groups, past and present, are clearly identifiable as SMOs—for example, the Student Nonviolent Coordinating Committee (SNCC), War Resisters League, Greenpeace, the National Gay and Lesbian Task Force, and many others. In other cases, it is unclear whether groups are sufficiently organized or change-oriented to be considered SMOs. For instance, Gay Liberation Fronts existed in many US cities in the early 1970s, but it is unclear if they were formal organizations. In contrast, the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) is formally organized, but it has at some points been too closely tied to “normal politics” to clearly qualify as an SMO. Sociologists have not developed clear decision rules for identifying groups as SMOs. Instead, they have often drawn on lay Understandings—treating a group as a SMO if its participants see themselves as building an organization that participates in a movement. Alternatively, some scholars focus on the broader category of “advocacy organizations” and view differences in structures, goals, and tactics as continuous rather than discrete (Andrews & Edwards 2004).

Organizations have not always been central to social movement research. Early theories saw mass activity as rooted in social disorganization. Studies of crowd behavior and mid-century “mass society” theories treated collective action as the result of alienation, social isolation, and authoritarian tendencies (see Mass society theory). Similarly, “strain theory” argued that social movements were caused by structural shifts that produced social disintegration and the breakdown of existing organizational and institutional structures (see Strain and breakdown theories).

The civil rights movement had a profound impact on the study of social movements. Sociologists’ sympathies with the movement contributed to the rise of theories that treated activism as rational political activity requiring resources and organization instead of irrational, spontaneous collective behavior. This moved SMOs to the center of the analysis, carried by two influential theories: resource mobilization and political process. Resource mobilization theory developed in part as a response to the professionalization of social movements in the later years of the civil rights movement. McCarthy and Zald (1977) argued that the rise and fall of movements is best explained by the resources available for building and maintaining organizations, not by grievances, which were seen as relatively constant. The resource mobilization paradigm in particular put the structure and strength of SMOs at the center of the analysis. Political process theory also drew attention to organizations, viewing social movements as “politics by other means” for those excluded from the formal polity (McAdam 1982). Researchers
in this tradition have shown not only that political opportunities shape mobilization, but also that grassroots organizational infrastructures are critical, as illustrated by the role of black churches and colleges in the civil rights movement (Morris 1981).

Syntheses of resource mobilization and political process approaches solidified the SMO as a key focus of research. While the SMO was a novel focus in the early days of resource mobilization theory, it now occupies a central place in the sociology of movements.

STRATEGY AND STRUCTURE IN SMOS

One key set of questions has to do with how SMOs make decisions, strategize, and manage participation. Most research in this area engages with one of two strong theories of voluntary organizations. One strand responds to Olson’s (1965) influential statement on the problem of “free riding” in voluntary organizations. Olson argued that since self-interested individuals will tend to free ride on the efforts of others, large voluntary organizations are doomed to failure unless they can provide excludable benefits (selective incentives) to their members. Other work has shown that incentives for participation can take the form of “purposive” and “solidary” incentives (Zald & Ash 1966). Furthermore, as shown by Snow, Zurcher, and Ekland-Olson (1980) and others, recruitment to SMOs occurs largely through social networks, which can mitigate the tendency toward free riding. Social movement scholars have also developed alternatives to Olson’s model by emphasizing how expectations about others’ participation and the emergence of a “critical mass” can foster participation. Studies have shed light on the determinants of movement participation, and have reminded social movement scholars that organization is a problem and a process, not merely a structure to be taken as given.

A second strand of research focuses on Michels’ 1911 “iron law of oligarchy” (Michels 1962), which argues that organizations inevitably evolve from democratic governance toward control by elites, from radical goals toward moderate ones, and from broad agendas for social change toward narrow dictates of organizational maintenance. Michels’ critique of oligarchy inspired some New Left and feminist activists in the 1960s to experiment with informal and antibureaucratic organizational forms (Breines 1989), but these experiments often created new organizational problems. Freeman (1972) warned against a “tyranny of structurelessness” in which power coalesces in the hands of the few even in groups with little formal structure.

Michels’ theory also inspired debates about the efficiency of formal organization – particularly hierarchical and bureaucratic organization – and its effects on movement outcomes. While Piven and Cloward (1979) suggested that formal organization depresses mass mobilization, Gamson (1975) argued that bureaucracy can help movements achieve their goals. Yet it has become clear that this debate posed the question in a limited way: Only two organizational forms were considered (bureaucracy vs. no bureaucracy) and it was assumed that organizational forms were simply vehicles for achieving particular goals (Clemens & Minkoff 2004). Some research has moved past these limitations. Polletta (2002) argues that participatory democracy within SMOs is politically effective under particular conditions. Since its main benefits are to build group solidarity, enhance tactical innovation, and develop leadership skills, participatory democracy works best when costs of participation are high, the environment is uncertain, or when there are few people with developed leadership skills. Clemens (1993) argues that some marginalized groups may be relatively immune to the “iron law” and capable of utilizing bureaucratic structures with a lower risk of co-optation. Furthermore, scholars are increasingly looking more closely at how the internal structures of organizations can facilitate strategic capacity, mass participation, and a resistance to oligarchy (Ganz 2000; Voss and Sherman 2000).
ENVIROMENTS AND FIELDS OF SMOs

SMOs are embedded in and depend on broader environments. Early statements of resource mobilization and political process theories gained power by showing that the emergence and success of social movements could be explained largely by fluctuations in SMOs’ environments (Jenkins & Perrow 1977). For resource mobilization theorists, organizational environments shape SMOs largely through the flow of resources, including funding, space, staff, expertise, and technology. Political process scholars have focused on how the structure of political opportunities shapes the formation, growth, survival, and success of SMOs. Specifically, they have shown that the state enables and constrains SMOs by providing positive opportunities for some kinds of organizations and establishing legal prohibitions against other kinds. By legally recognizing and providing benefits (i.e., tax exemption) to some types of organizations, the state effectively “channels” SMOs, potentially making them more bureaucratic (McCarthy, Britt, & Wolfson 1991). Institutional theory provides a third way to think about the relationship between SMOs and environments. Neo-institutionalists argue that SMOs, like other kinds of organizations, tend to adopt organizational forms that are culturally legitimate and taken for granted as appropriate (Clemens 1993; Polletta 2002).

Scholars have also expanded the analysis from particular SMOs to larger “fields” or “populations” of SMOs. Early statements of social movements as “multiorganizational” fields (Curtis & Zurcher 1973) have been expanded greatly in more recent work. Influenced by population ecology theory, some social movement scholars have analyzed the interacting forces that cause populations of SMOs to grow or decline. Minkoff (1999) shows how SMOs constitute the environment for one another, such that the fate and impact of a particular SMO depends partially on its position within an organizational population. SMOs in a field may compete for resources, cooperate on social movement actions, develop a division of labor, or provide resources and other forms of support to each other. Yet the conditions under which cooperation or competition prevails are not yet fully understood. Armstrong (2002) demonstrates that activist views about whether it is appropriate for a movement to be represented by one organization or many can influence SMOs’ ability to develop cooperative relationships.

Examination of the structure and evolution of movement fields has also shed light on the consequences of movement diversification. It has often been assumed that ideological differences in a social movement field reflect a lack of unity and thus indicate movement weakness. Yet some research suggests that ideological and functional diversity may enable movements to appeal to a larger constituency and to respond effectively to complex and rapidly changing political environments (Armstrong 2002). Diversity in social movement fields also enables movements to benefit from “radical flank effects” and may even generate useful strategic innovation.

BEYOND THE SMO

Research organized around the concept of the SMO has generated insight into how actors coordinate collective action. However, scholars have also found that the process of organizing a social movement is not fully captured by a focus on SMOs. The study of SMOs (as a noun) is only a part of the larger project of understanding social movement organization (as a process). Several strands of scholarship shift the SMO out of the center of the analysis.

A cultural turn in social movement scholarship has reinvigorated interest in why people organize. While resource mobilization and political process approaches treated grievances as relatively unproblematic, cultural approaches argue that movements cannot be understood without attention to discourse, framing, and the crystallization of collective identities. This perspective views movements as processes of building collective identities
and framing grievances—and SMOs as one (but not the only) site of this cultural work. The move beyond SMOs is also informed by the recognition that social movement activity is sometimes coordinated through networks, rather than, or in addition to, organizations. What we recognize as social movements may sometimes be extensive advocacy networks, featuring SMOs as well as professionalized advocacy organizations, governmental or inter-governmental actors, and individual policy entrepreneurs. The concept of a “transnational advocacy network” has become especially prominent in studies of global contention (Keck & Sikkink 1998). Furthermore, some activists have adopted decentralized networks as an organizing principle, eschewing more traditional organizational vehicles. In the environmental movement, for instance, groups like EarthFirst! have adopted radically decentralized network forms.

Finally, scholars beyond the subfield of social movements have realized that the processes identified and described by social movement scholars are evident in other arenas of social life. Thus, the study of social movement organizations is increasingly being replaced by the study of “social movements and organizations” (Davis et al. 2005). Under this rubric, scholars have primarily focused on three kinds of tasks. First, they have refocused attention on social movements that press for change in the policies and practices of organizations beyond the state, including corporations, universities, and nonprofits (e.g., Raeburn 2004). Second, they have argued that social movements are key sites of innovation and diversity in industries and organizational forms (e.g., Schneiberg, King, & Smith 2008). Third, scholars have used theories of social movements to explain the behavior of other types of organizations, with particular attention to “social movement-like” processes among firms (e.g., Swaminathan & Wade 2001).

REFERENCES AND SUGGESTED READINGS

Outcomes, political
EDWIN AMENTA and NEAL CAREN

Scholars have increasingly turned their attention to the political or state-related consequences of social movements. The years 2001 through 2009 alone have seen an acceleration of publications, including 45 articles, 38 in the top four general sociology journals and seven articles in Mobilization (see Amenta et al. 2010). In comparison to mobilizing supporters, fashioning identities among them, and choosing strategies, most macropolitical consequences of challengers are not as directly related to the efforts expended by challengers and not directly implemented by them. Although most studies demonstrate the influence of the largest movements, this research has not addressed how much movements matter. As for the conditions under which movements matter, scholars have been revising their initial hypotheses that the strategies, organizational forms, and political contexts that aid mobilization will also aid in gaining and exerting political influence. Scholars are exploring alternative arguments about the productivity of different actions and characteristics of movements and movement organizations in the varied political contexts and institutional settings they face.

HOW MIGHT MOVEMENTS MATTER IN POLITICS?

Scholars of the political impacts of movements have moved away from addressing whether movements or organizations are “successful” in gaining new benefits or acceptance (Gamson 1990) and have turned to examining the causal influence of movements on political outcomes and processes (Andrews 2004) drawn from political sociology literature. Many scholars focus on political collective goods, or group-wise advantages or disadvantages from which nonparticipants in a challenge cannot be easily excluded (Olson 1965). Collective goods can be material, such as categorical social spending programs, but can also be less tangible, such as new ways to refer to members of a group. Social movement organizations (SMOs) almost invariably claim to represent a group extending beyond the leaders and adherents of the organization and most make demands that would provide collective benefits to that larger group (Tilly 1999). According to the collective benefit standard, a challenger can have considerable impact even when it fails to achieve what it is seeking, but also negative consequences or negligible ones, such as achieving a program that did not benefit constituents. Scholars working from this standard tend to refer to consequences or impacts of social movements rather than successes or failures. From this perspective, the greatest sort of impact is the one that provides a group continuing leverage over political processes. These sorts of gains are usually at a structural or systemic level of state processes and are a kind of metacollective benefit, as they increase the productivity of all future collective action of the group. Gains in the democratization of state processes are perhaps the most important that social movements can influence.

Most collective action, however, is aimed at a more medium level—major changes in policy and the bureaucratic enforcement and implementation of policy. Once enacted and enforced with bureaucratic means, categorical social spending programs, notably, provide rights of entitlement to the benefits, and legal changes and bureaucratic reinforcement of such laws help to ensure the routine maintenance of such collective benefits. Under these circumstances, the issue is privileged in politics, and the political system becomes biased in favor of the group. Regulatory bureaucracies that are products of challenger mobilizations may push on their own to advance mandates in the
absence of new legislation, as in the case of state labor commissions or in affirmative action. Through their policies states can also ratify or attempt to undermine potential collective identities or help to create new ones. Dividing the process of creating new laws containing collective benefits into the agenda setting, legislative content, passage, and implementation of legislation simplifies analyses.

Democratic states generally recognize challenging organizations, and so Gamson’s (1990) “acceptance” is less useful than a modified version of “inclusion,” or challengers gaining state positions through election or appointment, which can lead to collective benefits. Important intermediate influence can come through elections and political parties, as the willingness of officials to aid the constituents of social movements often turns on electoral considerations (Amenta 2006). The connections can be direct and tight, as when movements form their own political parties, which can take office (usually in coalitions) and act on their platforms, as with some Left-libertarian or Green parties in Europe. In polities with direct democratic devices, movements may win or influence policy changes through referendums (Kriesi 2004).

**HOW MUCH DO MOVEMENTS MATTER AND UNDER WHICH CONDITIONS DO MOVEMENTS MATTER IN POLITICS?**

Some scholars view social movements aside from labor as relatively lacking in political influence in comparison to other political actors and institutions (e.g., Skocpol 2003). Others tend to evaluate movements as highly influential (e.g., Baumgartner & Mahoney 2005; see review in Amenta et al. 2010). The global questions have not been addressed systematically, however, largely due to the high data barriers and the general trade-off between the size of the question and the ability of scholars conclusively to answer it. Ascertaining the degree to which movements have mattered politically would require analyses over long periods of time across many different movements, issue areas, and countries and involve demonstrations that movements were at least as causally influential as various political institutions, conditions, and actors previously found to affect policy – a tall order. Although abundant research now indicates that various individual movements, especially the larger ones often the focus of study, and their activities have influenced specific policies, it remains difficult to pinpoint how much even the larger movements have mattered in comparison to other actors and structures in relation to specific outcomes of interest. Also, some types of issues and situations seem relatively impervious to movement influence. In addition, researchers often find that movement influence is often contingent on favorable political or other circumstances (see Amenta et al. 2010).

Far more scholarly effort has been expended on the conditions under which movements are influential. The initial hypotheses about the political impacts of movements were similar to the hypothesized determinants of mobilization. Scholars focused on a movement’s mobilizing structures, framing and other strategies, and political contexts favorable to mobilization. These arguments hold that what promotes challengers’ mobilization will also promote their political influence; in short, specific forms of challenger organization, strategies, including framing strategies and protest types, and political opportunities will result in both mobilization and political influence and benefits for mobilized challengers. Although scholars still address the roles of mobilizing structures, strategies, and political contexts, results indicate that the conditions producing mobilization sometimes make it difficult to achieve influence at stages in the policy process beyond agenda setting. Finally, political mediation arguments reject the search for “magic bullets,” or specific organizational forms, strategies, or political contexts that will always help challengers and argue instead that specific forms of organization and strategies will be more productive in some political contexts rather than others.
The first argument is that whatever aids a group’s mobilization will lead to its making gains. The ability to mobilize different sorts of resources is central to movements (McCarthy & Zald 2002) and mobilization of resources and membership has been shown to influence some state-related consequences in different research. Although research suggests that the largest are most influential, mobilization seems to be only a necessary condition to have political influence (see Amenta et al. 2010). Debates also address which forms of organization are likely to produce political gains. SMOs with greater strategic resources are deemed likely to prevail over others in the field, notably resourceful movement infrastructures, including diverse leaders, complex leadership structures, multiple organizations, informal ties, and resources coming substantially from members (Andrews 2004). Yet organizations designed to mobilize people and resources behind a cause may not be best suited to engage in the tasks of political influence, persuasion, or litigation.

Second, specific strategies and goals of collective action and forms of challenger organization are more likely to produce influence. Cress and Snow (2000) argue that for a challenger to have an impact it must employ resonant “prognostic” and “diagnostic” frames to identify problems and pose credible solutions to them. For movements to be influential research suggests that their frames need to be minimally plausible, and culturally resonant, but their value likely varies by setting. Amenta (2006) finds that the Townsend Plan’s frames did not change much, but its influence varied greatly over time. More important, frames that help mobilize supporters may be counterproductive in trying to influence policymakers (McVeigh, Myers, & Sikkink 2004) or courts (Pedriana 2006). Working from the hypothesis that specific strategies will work differently at individual phases of the policy cycle, recent scholarship has focused on the impact of protest, for which the response of political authorities to collective action is expected to be rapid, on the agenda-setting stage of the policy process. Olzak and Soule (2009) find that institutional environmental protest events influenced congressional hearings, which are associated with policy action (Baumgartner & Mahoney 2005).

There has not been nearly as much work, however, on the strategies that work through slow-moving processes. This is a major gap, as this includes most movement collective action addressing political institutions and electoral politics, as well as legal challenges. Although scholars tend to view movement action addressing institutional politics as “assimilative” and likely to be less influential than protest, electoral strategies, such as supporting favored candidates and opposing disfavored ones, are often far more assertive and influential in politics (Amenta, Caren, & Olasky 2005). Political actors seek to gain reelection and to act on party principles and personal values, and are typically much less afraid of movements threatening, say, to occupy their offices, than to drive them out of office. The finding that movements are less influential in later parts of the policy process may mean that the forms of organization, frames, and strategies applicable to mobilization are unhelpful at best in later stages of the policy process, or that protest has great limits as a movement strategy. Beyond protest, social movements seek to have influence over politics through electoral activity, seeking sustained leverage and not simply a quick reaction (see Amenta et al. 2010 for examples).

A third argument is that once a challenger is mobilized the main thing influencing its impact is the political context or “opportunity structure.” Early claims that in “open” states with “strong” administrative capacities challengers will achieve policy gains (see Kriesi 2004) have been criticized on the grounds that within any country movement influence has varied over time and a state’s bureaucratic capacities vary by issue. The “open” and “strong” specifications have been superseded by more fine-grained conceptual developments in political sociology (see
Amenta et al. 2010). These arguments hold that long-standing characteristics of states and political institutions—the polity structure, the democratization of state institutions, electoral rules and procedures, and existing state policies—influence the prospects of challenges. The centralization and division of power between each branch of government mean both multiple points of access and veto. The level of democratization influences mobilization, and the bases for exclusion from democratic processes increase the likelihood that groups will mobilize along these lines, such as African American civil rights in the US context and workers in the European one. Electoral rules such as winner-take-all systems discourage the formation of new political parties. Equally important, however, the political contexts that promote mobilization, especially those in which a movement’s constituency is threatened, do not always increase the productivity of collective action by challengers (Meyer & Minkoff 2004).

Finally, many scholars have developed different political mediation models, which build on arguments concerning strategy, organizational form, and political contexts (Amenta, Caren, & Olasky 2005; Amenta 2006). The basic point of this argument is that the collective action of challengers is politically mediated. In a democratic political system, mobilizing relatively large numbers of committed people is probably necessary to winning new collective benefits for those otherwise underrepresented in politics. So, too, is making plausible claims regarding the worthiness of the group and the usefulness of its program. Yet challengers’ action is more likely to produce results when institutional political actors see benefit in aiding the group the challenger represents. To secure new benefits, challengers will typically need help or complementary action from like-minded state actors, including elected officials, appointed officials, or state civil servants. And so challengers need to engage in collective action that changes the calculations of relevant institutional political actors, and to adopt organizational forms that fit political circumstances.

Political mediation arguments do not identify individual organizational forms, strategies, or long-term or short-term political contexts that will always or usually help challengers to win collective benefits. Instead the idea is that certain organizational forms and collective action strategies will be more productive in some political contexts rather than others. Challengers need to moderate strategies and forms to address political circumstances. The standard distinction between disruptive and assimilative strategies is dropped in favor of addressing variations in assertiveness of action (Amenta 2006), with assertiveness meaning the use of increasingly strong sanctions. Sanctions in assertive institutional collective action threaten to increase or decrease the likelihood of gaining or keeping something valuable to political actors—often positions—or to take over their functions or prerogatives and usually involves some sort of institutional action. The institutional collective action of challengers works best by mobilizing large numbers of people behind a course of activity, often one with electoral implications. This collective action may be designed to convince the general public of the justice of the cause and influence elected and appointed officials in that manner, but may also demonstrate to these officials that a large segment of the electorate is willing to vote or engage in other political activity mainly on the basis of a single key issue. If the political regime is supportive and the domestic bureaucrats are professionalized and supportive, limited protest based mainly on the evidence of mobilization is likely to be sufficient to provide increased collective benefits. By contrast, achieving collective benefits through public policy is likely to be more difficult if neither a supportive regime nor an administrative authority exists, and the sorts of limited protest listed above are likely to be ignored or have a limited effect. As political circumstances become more difficult, more assertive or bolder collective action is required to produce collective benefits.
FURTHER RESEARCH

Much work remains to be done. Scholars need to address theoretically the problems that the organizational forms, framing and other strategies, and political contexts that promote mobilization pose for achieving political influence beyond protest. Similarly, more thought is needed regarding the political process beyond agenda setting and the impact of movement action aside from protest. Scholars need to explore further movement action aimed at electoral politics (Amenta, Caren & Olasky 2005; Amenta 2006).

In the quantitative case studies prominent in recent research scholars should prioritize the most consequential policies to challengers and try to pinpoint how much movements have mattered in comparison with other determinants of outcomes. Structural changes such as winning democratic rights and major policy transformations should be at the top of the list. Quantitative case studies can also exploit the advantages of fuzzy set/Qualitative Comparative Analysis software, which can address both the interactions specified by political mediation arguments and the more unusual situation of major changes induced by movements. Also, instead of theorizing about their cases as if they were typical – expecting that broad explanatory claims and findings should apply to all movements (cf. McAdam & Su 2002; Giugni 2007) – scholars should think more about different types of movements and make comparisons with findings regarding similar movements. Also, it would be valuable to address less prominent cases, as most recent research has been about the African American civil rights, feminist, and environmental movements. It is also important to address the fact that movements are not always attempting to create new policies, but sometimes fight to alter or replace entrenched unfavorable policies or defend favorable ones (Baumgartner & Mahoney 2005). Similarly, scholars have paid only scant attention to bids for influence through the courts (Skrentny 2006). Less prominent in case studies have been deep historical analyses to address major institutional changes and to appraise the mechanisms and time-order aspects of theoretical arguments. These analyses can more easily address the impact of movements on electoral politics and from there to policies and other political outcomes. Qualitative studies can address the big questions about major structural shifts in politics related to movements: Did the African American civil rights movement bring about civil and voting rights? Did the women’s suffrage movement cause women to gain suffrage? Is the labor movement responsible for legislation regarding worker organization? Although there remains the standard trade-off between the size of the question and the ability of research to provide conclusive answers, current research has tilted toward the more easily answered questions. More generally, scholars may want to train their attention on the main political outcomes of interest to movements, such as civil and voting rights for the African American civil rights movement, old-age pensions for the old-age pension movement, or abortion policy for the abortion rights and antiabortion movements. In these analyses scholars can address whether and how much and for what reasons movements mattered in key episodes of political change. To address the degree to which movements have mattered and to test complex arguments about the mediation of influence, however, will require research designs that compare across several movements and over long stretches of time.

REFERENCES AND SUGGESTED READINGS

Participatory democracy refers to an organizational form in which decision making is decentralized, nonhierarchical, and consensus oriented. It can be contrasted with bureaucracy, in which decision making is centralized, hierarchical, and based on a formal division of labor, as well as with majority vote. Participatory democratic organizations have been a prominent feature of many progressive movements, including radical pacifism, the civil rights movement, the New Left, feminism, environmentalism, antinuclear activism, gay and lesbian movements, and the global justice movement.

Participatory democratic organizations today claim a diverse lineage, with precursors in ancient Athenian democracy, the New England town hall, Quaker meetings, and Spanish civil war affinity groups. The term itself was popularized in 1962 by the New Left group, Students for a Democratic Society (SDS). SDS activists took the term from philosopher Arnold Kaufman to refer to a polity in which citizens were regularly involved in public policymaking. They intended the term to describe a political system, not a mode of organizational decision making. However, at the time, decision making within SDS itself was collectivist and consensus oriented, this despite the group’s formal reliance on parliamentary procedure. The same was true of the militant civil rights group, the Student Nonviolent Coordinating Committee (SNCC). For thousands of activists in the New Left, antiwar, and radical feminist movements, participatory democracy soon became an organizational ethos (Ferree & Martin 1995; Polletta 2002). By the end of the decade, many young activists perceived the political system as intransient, and they turned to building alternative schools, health centers, food coops, and publishing guilds, thus contributing to an enduring cooperative movement (Rothschild & Whitt 1986).

For sociologists writing about the surge of collectivist organizations during this period, the participatory democratic impulse reflected a youthful repudiation of authority that was at odds with the demands of effective political reform. Participatory democratic organizations were conceptualized as “expressive” or “redemptive” in contrast to their “instrumental” and “adversary” bureaucratic counterparts (see discussions in Breines 1989 and Polletta 2002). Since then, many scholars have instead adopted Breines’s (1989) view of participatory democracy as animated by a prefigurative impulse. By enacting within the movement itself values of radical equality, freedom, and community, activists have sought to bring into being a society marked by those values. Far from being antipolitical, participatory democracy has been an attempt to transform what counts as politics.

Still, most scholars have seen participatory democracies as fragile. And indeed, some of the most famous participatory democratic movement groups, such as SDS, numerous feminist collectives, and the antinuclear Clamshell Alliance, collapsed after explosive internal battles about organizational structure. One common explanation for participatory democracy’s fragility is its inefficiency (see discussions in Breines 1989; Polletta 2002). Consensus decision making takes time, decentralized administration creates problems of coordination, and a minimal division of labor sacrifices the benefits of expertise. These inefficiencies are manageable in an organization that is small or has little opportunity for political impact. But when participatory democratic groups grow in size or political stature and face new demands for coordination and funding, such inefficiencies become intolerable. The result is often a battle
between political pragmatists, who are willing to adopt a more centralized and hierarchical organizational structure, and purists who refuse such reforms. Ultimately, either groups bureaucratize or they collapse.

Yet the battles that have wracked participatory democratic groups have usually centered not on the inefficiency of the form but on the group’s failure to live up to its professed egalitarianism. In line with this insight, some scholars have argued that participatory democracy’s vulnerability is its inequity rather than its inefficiency. Michels (1958) maintained that democratic organizations inevitably developed oligarchical structures as those occupying positions based on their expertise developed a stake in retaining their positions. Participatory democrats refuse those imperatives and privilege democracy over expertise. That only means that the hierarchies are informal, scholars in this vein argue. The result is what Freeman (1973) calls the “tyranny of structurelessness” in which the elimination of formal structures of authority only makes it easier for informal cliques to rule freely. When members shut out of decision making protest their marginalization, an organizational crisis is likely, since participatory democracy provides no mechanisms for holding leaders formally accountable.

A third perspective holds that as long as members’ interests are fundamentally congruent, they are unlikely to object to disparities in informal influence (Mansbridge 1982). But when members’ interests conflict, which is likely to occur in all but the most homogeneous of groups, the consensus-based decision making characteristic of participatory democratic organizations offers no way of adjudicating those conflicts. If minorities are not coerced to agree with the majority, then a stalemate is likely. After a series of such stalemates, an organizational crisis may ensue.

Although these explanations have been advanced separately, case studies have shown that two or even three of these dynamics have often operated at the same time. Moreover, the fact that groups have found strategic benefit in participatory democratic organization and that they have done so in groups that are striking in their diversity casts doubt on the inevitability of participatory democracy’s failure. It invites more attention to the conditions in which the form’s potential inefficiency, inequity, and inability to reconcile competing interests become insuperable problems. Perhaps even more important, though, several trends have transformed the ways in which contemporary activists practice participatory democracy, as well as the challenges they face. One trend, especially evident in the women’s movement, is the growth of hybrid organizational forms. In the 1970s and 1980s, activists running rape crisis centers and battered women’s clinics found themselves pressed to adopt more conventional organizational structures by federal funding agencies. Activists discovered, however, that they could combine organizational forms: capitalizing on participatory democracy’s capacity to foster tactical innovation and solidarity and bureaucracy’s capacity to maximize expertise (Matthews 1994). For example, groups combined a hierarchy of offices with informal consultation across levels, divided decisions into those requiring consensus and those not requiring it, and so on (Ferree and Martin 1995). Indeed, scholars say that hybrid organizations have become the norm, in the women’s movement and more broadly (Chen 2009).

That said, many activists remain committed to participatory democracy as a true alternative to bureaucracy. Indeed, the rise of the global justice movement has been accompanied by a resurgence of interest in radically “horizontal” forms. Here, though, a second trend is striking: the formalization of participatory democratic practices. If the creation of hybrid organizational forms responded to the tendency of participatory democracy to produce inefficiencies, the formalization of participatory democratic practices is intended to counter the inequalities that it has often generated. In meetings, roles of facilitator, timekeeper, and “vibes watcher” are intended to minimize unacknowledged exercises of influence. Networks and coalitions are favored over organizations...
as a way to preserve groups’ autonomy. The World Social Forum and associated regional forums encourage participants to share experiences, analyses, and strategies for opposing neoliberalism, and to undertake collaborative projects. However, participants are formally barred from adopting unified positions. Given the diversity of agendas and groups involved in the Forum, and the disparities of power among them, Forum organizers say, any joint positions would require a coercive, and inevitably false, unity.

A third trend is also evident in the global justice movement. The Internet has provided not only a new means of communication, but also new models of action and interaction (Juris 2008). Building on the possibility for collaborative problem solving associated with the Internet, along with its capacity to foster ties of diverse kinds, activists have sought to create movements in which autonomous spheres or publics are linked in multiple ways along the lines of a virtual network. At the same time, contention around corporate access to personal online information and open source software, as well as campaigns for do-it-yourself online copyright agreements, are intended not only to prefigure a more participatory society within the movement but to gain for people outside the movement control of the decisions that affect them. In this sense, the Internet has helped to make central once again the more macropolitical dimensions of participatory democracy that were central to the New Leftists who introduced the term.

Whether and how new digital technologies are transforming the practice of participatory democracy are questions that merit further research. Another important question concerns the impacts of participatory democratic organizational forms. During historical periods or institutional arenas in which participatory democratic organizations are prominent, do they make inroads into the repertoire of institutionalized organizational forms? For example, Rothschild (2000) argues that widespread public support for workplace democracy reflects the popular valorization of terms such as “voice” and “empowerment” by the social justice movements of the 1960s and 1970s. What are the conditions in which particular versions of participatory democracy diffuse across movements? Some evidence suggests that a popular perception of participatory democracy as white and middle class may make it less appealing to activists of color and working-class activists (Polletta 2005). Finally, we know little about whether participatory democratic organizations exist in conservative movements. If they do exist, and are animated by prefigurative goals, then that suggests that radical democracy is a more politically capacious concept than we usually think. If such groups are not animated by prefigurative goals, then we may learn about additional rationales for movement groups to operate as participatory democracies.

Racist social movements
KATHLEEN BLEE

Racist movements are organized, collective efforts to create, preserve, or extend racial hierarchies of power and privilege. Such movements explicitly espouse the ideologies of white supremacism and/or anti-Semitism (anti-Judaism or hatred of Muslims or Arabs) that were consolidated in the Western world in the eighteenth and nineteenth centuries. Manifestations of intergroup antagonism in earlier times, even conflicts that cross what later would be regarded as racial lines, generally are not considered racial movements because these are not based in modern ideas of race as an essential, biological, polarized, and unchanging attribute of social groups. Denoting as racist only social movements that take place in Western societies is a common practice in sociological research, as most scholars regard white supremacism and anti-Semitism as the legacy of ideologies by which European colonists sought to exonerate their brutal conquests and occupations (Frederickson 2002). However, this restriction has been challenged by studies that use the concept racist (or racial) movements to describe subnational intergroup antagonisms in a number of non-Western societies, including China, India, Indonesia, and Russia.

Racist movements take a variety of forms over time and in different places. Some arise in response to political opportunities for asserting enhanced racial superiority; others as countermovements organized to oppose perceived gains by other racial groups. Some recruit sizable proportions of the population, whereby accruing significant influence over state policy or even the ability to elect candidates to political office (Brustein 1996; Berezin 2009). Such large racist movements often are linked, overtly or covertly, to right-wing political parties, nationalist efforts, or fascist groups (Blee 1991; Payne 2000; Rydgren 2007; McVeigh 2009). In other contexts, racist movements are small and politically marginal. These tend to shun mainstream politics, relying instead on violence or terrorist tactics to achieve racist goals (Blee 2002; Futrell & Simi 2004; Giugni et al. 2005; Futrell, Simi, & Gottschalk 2006).

Racist movements also vary in their ideologies and agendas. Some favor the creation or preservation of racially homogeneous societies, generally through exclusion, expulsion, or extermination of those they regard as racially different. Others promote racial supremacy or separatism within heterogeneous societies. Although movements that promote racial superiority or separatism such as black nationalism or black separatism in the US are sometimes referred to as racist, scholars generally reserve this term for collective efforts that promote white or Aryan dominance because these seek to bolster established racial systems of subordination and superordination. White supremacist, Nazi and neo-Nazi, White Power skinhead, Aryan supremacist, and white/Aryan separatist movements are types of modern racist movements (Barkun 1997).

The ideologies of racist movements typically are quite complex. All have a core belief in racial supremacism or racial separatism, but this may coexist with philosophies that seem quite antithetical, such as environmentalism, women’s rights, atheism, or anticolonialism. The ability to embrace beliefs from widely differing ideologies and social contexts while retaining racism as a central agenda is described as the “scavenger” aspect of modern racism (Mosse 1985). Racist movements are generally adept at recruiting members by presenting racial solutions to a wide range of nonracial social concerns, including anxieties about crime, the quality of children’s education, the global economy, or national pride. Such ideological flexibility is why some racist movements
with very extreme racial views manage to attract a wide base of adherents (Blee 2002; Zeskind 2009).

Until the late twentieth century, racist movements tended to be fervently nationalistic. Racist leaders identified the interests of whites or Aryans as what was best for the nation as a whole and advocated national purges of other races. In the twenty-first century, a number of racist movements have rejected narrow nationalist appeals in favor of global racist politics, what some term a movement of “pan-Aryanism.” The waning of nationalism in these racist movements is due to a variety of factors. Opportunities to spread the influence of racist movements through transnational venues such as the Internet have proven attractive. Also compelling is the global circulation of racist mercenaries and terrorists, as well as a global trade in armaments and other contraband that presents the possibility for enhanced funding of racist movements. Equally important has been the declining support for national governments by racist movements. Many racist movements in the US, Canada, and Europe embrace extreme anti-Jewish philosophies, often based on variants of Christian Identity, a racist philosophy that regards Jews as the powerful and literal descendants of the devil. These movements describe western governments as under the control of a Jewish elite, or, in racist terminology, as “Zionist Occupied Governments (ZOG)” and thus as obstacles to racist agendas (Blee 2002; Durham 2007; Zeskind 2009).

The penchant for secrecy about strategies and future plans that is characteristic of virtually all modern racist movements makes it difficult to predict their future course, but it is likely that they will be small and very violent. In the aftermath of the atrocities of World War II, particularly the extermination of millions of European Jews through deliberate policies of racial supremacy, overt racist appeals became less legitimate in many parts of the Western world. Also, racial hierarchies of privilege and subordination were sufficiently institutionalized in much of the West in the postwar period that there was little impetus for mass racist mobilization to challenge existing arrangements. Racist movements that mobilized in the latter half of the twentieth and early twenty-first centuries thus tended to be small groupings of White Power advocates, neo-Nazis, and Aryan supremacists. Except where they allied with political parties in some European and Southern African nations, these movements have had little direct impact on the policies of the nations in which they are located. Instead, some of the most influential racist movements have turned to strategies of violence and terrorism, seeking to disrupt the social order and provoke social chaos, a strategy they describe as instigating an apocalyptic “race war” to eradicate Jews and non-whites.

WHY DO RACIAL MOVEMENTS ARISE?

Theories of why racist movements begin and how they attract adherents generally use frustration-reaction or intergroup competition frameworks. Frustration-reaction theory is based in older scholarly understandings of racist movements as collective and irrational expressions of anger by members of one racial group toward members of another. According to this theory, racist movements might accurately target groups that are responsible for their perceived problems, but, more often, they displace anger from the antagonist to a more vulnerable group that serves as a scapegoat and target of collective aggression. The case of Nazism in Germany – especially before the Nazi seizure of state power – is an example of how racist movements emerge as a response to collective frustration. The Nazis, in this formulation, took advantage of the discontent evoked by economic turmoil and the national humiliation of Germany in World War I to build a popular movement. Jews, Roma (Gypsies), and others became scapegoats for collective anger over Germany’s national distress. When the Nazi movement took control of the German state, such sentiments made it possible to unleash a
“final solution” of racial extermination, with catastrophic consequences (Blee & Creasap 2010).

A competing and later theory regards racist movements as the product of antagonisms that stem from competition between racial groups for social, economic, cultural, or territorial advantages (Olzak 1992; Beck 2002). Competition theory has been used to explain the rise and fall of such racist movements as the Ku Klux Klan (KKK), a series of largely unconnected white supremacist movements as the first KKK emerged in the Reconstruction-era South. This Klan was a small, loosely organized grouping of rural white men who used terror to bolster Southern white male privileges and combat what they feared to be the growing strength of African Americans and Northern politicians after the Civil War. This Klan collapsed in the 1870s in the wake of federal sanctions and, perhaps more importantly, because whites perceived political or economic competition from African Americans to have waned as the result of racist legislation and renewed white control of the Southern economy. In the mid-1910s, a new Klan emerged in the South, but this KKK movement grew strongest in the cities of the Midwest, East Coast, and West Coast. Competition theory explains the shift in the Klan’s base as the result of changes in patterns of interracial rivalry. White Protestants in Northern and coastal states turned to the Klan when they felt threatened by large numbers of Catholic and Jewish immigrants and the migration of African Americans from the South. The second Klan thus used economic boycotts and electoral politics to curb competition and maintain the privileges of white native-born Protestants. After the collapse of the second Klan in the late 1920s, subsequent eruptions of the KKK were small and concentrated in the South, emerging largely in response to racial integration of schools (Blee 1991; Cunningham 2004; Durham 2007).

Competition and, less commonly, frustration-reaction theories are widely used in the study of racist movements, but there are problems with each theory. Frustration-reaction theory has been criticized for reducing social phenomena to individual psychological states, making it difficult to account for the varying appeal of racist movements in times or places in which people are likely to experience similar levels of anger or distress. Moreover, research on racist movements, even German Nazism, finds that factors other than intergroup hostility are significant in mobilizing people toward racist collective action, and that racist activists are no less logical or rational than others in a similar social context. Frustration-reaction theory can also be circular, using the presence of racist movements as evidence of antecedent collective anxiety. Competition theory is generally more robust for explaining racist movements (Blee & Creasap 2010). This theory suggests that racist movements emerge as the result of economic and political competition among racial groups. The spike in racist movements and racial violence in late twentieth-century Europe that accompanied the influx of migrants from former colonies in northern Africa and South Asia is an example, as is the racist backlash that occurred with postcommunist economic and political uncertainty in Russia and Eastern Europe. However, counterexamples suggest that competition theory might not be universally applicable. The largest racist movements in the twentieth-century US occurred in the 1910s–1920s, 1950s–1960s, and 1980s, times of relative economic prosperity for many whites in which racial competition for jobs and social benefits was relatively low; in contrast, the serious economic depression of the 1930s, with its severe competition for jobs and economic benefits, witnessed comparatively fewer racist movements. A recent variant of competition theory, the “power-devaluation model,” (McVeigh 2009) escapes some of the problems that plague frustration-reaction and competition theories. Addressing the question of what propels socially privileged groups like whites to mobilize in movements like the Ku Klux Klan, this model suggests that
right-wing movements appear when structural changes devalue the economic, political, or status power of privileged groups, provoking interpretive shifts that propel these groups to activate resources and take advantage of political opportunities to reverse their losses.

DATA AND METHODOLOGIES

Racist movements pose complicated problems for researchers. Most evident is the danger of studying groups in which violence is common and directed not only at those perceived to be enemies of the movement, but also at allies, even members. Researchers may find it difficult to avoid becoming a target of a violence that tends to suffuse organized racism. Moreover, since racist groups generally seek to avoid public scrutiny and are particularly concerned about infiltration by government authorities, researchers face danger if they are perceived as disseminating negative information about racist groups or as potential government informants (Blee 2007).

Another problem for the study of racist movements is that they tend to operate illegally or on the margins of legality. Except in the rare cases where racist movements operate in the political mainstream, visible racist activists also face sanction from family, friends, and employers. Most racist movements thus operate in ways that are difficult for authorities and researchers to trace, creating few documents and attempting to obfuscate the identities, intentions, and activities of their members (Sehgal 2009).

Concerns about researcher safety and the inaccessibility of racist groups have had a pronounced effect on the methodologies used in racist movement studies, especially by shaping the techniques of data collection. Much research on racist movements is based on information made publicly available by racist groups, such as group propaganda, speeches at rallies and protests, and interviews with racist spokespersons. These have proven useful in detailing changes over time in the ideological direction of racist groups and their ability to mobilize adherents for public events. However, the validity of such data is questionable since these reflect what racist leaders deem useful to be disseminated and reveal little about how racist groups actually operate. Such important questions as how racist movements are funded, what alliances exist among racist groups, and how organized racists formulate strategies cannot be addressed with information garnered from racist movements themselves. Moreover, such data tend to overemphasize the importance of self-designated leaders, making it difficult to understand the composition and activities of other members. Indeed, many racist movements today contain substantial numbers, even majorities, of women and teenagers who are almost never regarded internally as their leaders or spokespersons (Blee 2007).

A second source of data on racist movements is government intelligence and information from private antiracist monitoring agencies such as Searchlight (England) or the Southern Poverty Law Center (US). These agencies collect and disseminate information from the public events of racist groups, as well as information acquired through arrests and criminal and civil prosecutions of racist members and groups, and from infiltrators or defectors from the racist movement. Such data have been used effectively to analyze the strategic and tactical operations of racist movements across the world. Yet the validity of such information too can be questionable since it is often collected to meet the needs or enhance the political advantages of monitoring agencies rather than for purposes of social scientific research.

A third and much less common source of data on racist movements is ethnographic observation of the inner workings of racist groups or interviews with their members. To get access to accurate information while protecting the safety of a researcher requires lengthy and delicate negotiation with racist activists. These data have only been collected on a small number of racist groups, limited geographical areas, and subsets of racist activists such as women or
teenaged White Power skinheads. Conclusions derived from analyses of these data may have limited generalizability (Blee 2007).

GAPS IN RACIST MOVEMENT RESEARCH

There are large gaps in what is known about racist movements. The difficulty of collecting valid data on secretive and dangerous groups, as well as widespread scholarly aversion to studying loathsome social movements, has resulted in a paucity of research on racist social movements relative to social movements that advocate progressive social change. There is a need for additional research on four important aspects of racist movements.

First, there is virtually no data on global circulation of ideas, strategies, resources, or members of racist movements. It is unclear whether or how racist movements in various parts of the world have coordinated their efforts, or even how the notion of pan-Aryan unity has been received across different racist movements.

Second, scholars do not fully understand how and why people are attracted to racist ideas and movements. The theory that adherence to racist groups is a product of individual pathologies or irrational emotions is clearly inadequate, but a more robust understanding of the mechanisms and motivations of racist movement recruitment has not been formulated.

Third, there is only fragmentary evidence about the range of outcomes that are associated with different types of racist movements. It is unclear, for example, whether the adoption of Christian Identity precepts is likely to precipitate strategies of terrorist violence. It is also unknown whether small, secretive racist groups will prove to be more durable than larger racist movements.

Finally, the connections between racist movements and the social contexts in which they emerge and are sustained need additional study. It is not enough to assert that racist societies provide the social environment in which racist movements can develop, as there is considerable variation in the extent to which this occurs. Rather, researchers need to explore the mechanisms that link the extreme ideologies of racist movements with the normative and institutionalized racist practices of their societies.

Recruitment
STEVEN E. BARKAN and STEVEN F. COHN

Social movements have long been an important basis of political participation in democracies and have achieved major political, social, and cultural changes. Although the influence of social movements depends largely on their ability to recruit members, it is by no means obvious why people choose to participate in them.

This question has been termed “the free rider problem.” As Mancur Olson’s (1965) analysis indicates, people have limited time and energy and must choose to spend these resources in ways that most benefit themselves. Individuals join social movements because they believe that the movement’s goals, if implemented, would yield significant benefits to themselves and/or to the attainment of values they cherish. Although these benefits motivate participation, there is an additional problem. If a movement has few participants, people desiring these benefits might believe that the movement could not succeed unless they joined the movement. Thus, joining the movement might represent a rational investment of their time, energy, and, often, money. However, if a movement already has a large number of participants, then it is unlikely that one more person’s joining the movement would increase its chances of success. In that case, why would additional people join? If the movement is successful, they, along with the participants, would enjoy the fruits of this success; they would have gained all the benefits of participation without spending their own scarce resources of time and energy. In that case, they could use these resources to gain other benefits for themselves, while “free riding” on the efforts of those already participating.

One possible response to this free rider problem is that people who join social movements do not rationally calculate the costs and benefits of their joining. Analyses of social movements in the late nineteenth and early twentieth centuries indeed assumed that social movements were not rational enterprises and that those who joined them were, in fact, acting on the basis of irrational impulses. The most prominent proponent of this view, Gustave Le Bon (1897), a French theorist, said that people joined movements because they succumbed to crowd emotions and lost their ability to resist unconscious instincts. This general belief informed views of social movements well into the twentieth century, as these views stressed that movements represented an emotional and relatively unorganized response to a breakdown in social norms and social organization. Individuals were said to be attracted to movements because they were lonely and alienated because of weak social ties and hence sought in movements a sense of belonging they otherwise lacked.

This nonrational model of social movements has since fallen into disfavor. Social movements are now viewed as rational enterprises in pursuit of many kinds of political, social, and cultural changes, and their members are viewed as rational individuals favoring such changes. However, the success of recent efforts to demonstrate the rationality of social movement participants has re-emphasized the importance of addressing the free rider problem: if these people are rational, why do they participate at all? The contemporary literature on social movement recruitment and participation tries to answer this question.

Its dominant response derives from analogous work in complex and voluntary organizations, including labor unions. Organizations generally offer several types of resources to motivate recruitment and higher levels of participation after recruitment. These include (1) coercion; (2) utilitarian incentives such as paid income in work organizations and discounts for various goods and services in voluntary organizations; (3) normative (or purposive)
incentives that appeal to the values, concerns, and ideologies of individuals and, in social movements, lead people to identify with a movement’s goals and to believe that the movement is capable of achieving its goals; and (4) social (or solidary) incentives that make participation socially rewarding in terms of friendships and other personal contacts. Because social movement organizations (SMOs), like other voluntary organizations, typically lack the first two types of incentives, they must rely heavily on the latter two types to induce people to join them and to motivate higher levels of participation after joining. In these respects, normative and social incentives act as selective incentives to induce self-interested people to devote time and energy to participation rather than to other potentially rewarding activities. An additional category of organizational incentives that lead people to feel a sense of belonging to the movement is also thought to be important for levels of post-recruitment participation.

In contrast to many types of voluntary organizations, normative incentives in social movements depend heavily on the movement’s (or its SMO’s) political ideologies and beliefs. These cognitions include the movement’s grievances, goals, and strategies for change. Individuals whose own ideologies and beliefs are congruent with those of the movement are more likely to join it. In addition to these movement-specific ideologies, more general cognitions may also influence decisions to join. These include a liberal vs. conservative belief system, a feeling of political efficacy, and religious ideologies. Movements and organizations that are liberal tend to attract liberal individuals, while those that are conservative tend to attract conservative individuals. People who feel politically efficacious, that is, who believe that citizen participation generally, and their own particularly, can make a difference, are more likely to join than those who are politically alienated. Social movements and SMOs with a religious basis for their activities attract members whose religious beliefs coincide with those of the movement or SMO.

In all these respects, a movement’s set of ideologies is thought to be an important, necessary condition for recruiting members, but it is far from a sufficient condition. The reason for this is simple: many more people agree with a movement’s goals and other ideologies than ever participate in the movement or help it in any other way. This recognition has led the contemporary social movement literature to stress the importance of social incentives. In this view, people join movements because they have pre-existing friendship and organizational ties that induce them to join. For example, agreeing to some friends’ request to join them in a protest wins their appreciation, while declining their request may win their displeasure. In this respect, recruitment into social movements is no different from the many other activities in which social ties play an important role. Accordingly, a host of studies finds that individuals with pre-existing ties to movement members will be more likely to join a movement than those with fewer or no such ties. These ties appear to be especially important for recruitment into high-risk activism like the Freedom Rides in the US South that were a hallmark of the civil rights movement in the 1960s. By challenging the earlier, nonrational model’s assumption that social movements attract lonely and alienated individuals, the emphasis in contemporary work on friendship and organizational networks reinforces the rationality of social movement participation.

Turning to postrecruitment participation, individuals who develop friendships after joining a movement or SMO tend to exhibit higher levels of participation than those with fewer or no such friendships. In this regard, SMOs with a national membership face particular problems because their members are geographically isolated and usually have little contact with each other or with the national organization. To deal with this situation, some national organizations have developed a “federated” structure involving many local chapters. Because these chapters enable interaction and friendships among members who live near each other, they enhance commitment to the organization.
itself and promote higher levels of participation on its behalf.

Organizational incentives are the final type of resource offered by SMOs and are thought to be especially important for postrecruitment participation. These incentives take two forms, perceptions and communication. Members have various perceptions of their SMO. A first perception, *legitimacy*, involves members’ willingness to trust SMO leaders and to support their decisions, even if the members might disagree with some of these decisions. Those with higher levels of perceived legitimacy are more likely to exhibit higher levels of postrecruitment participation. A second perception involves members’ beliefs in the *effectiveness* of their SMO. Postrecruitment participation is generally higher among members who perceive stronger effectiveness. A final perception concerns members’ *commitment*, including their sense of belonging, to their SMO and movement. Members who are more committed also exhibit higher levels of postrecruitment participation. *Communication* with SMO leaders and staff also matters. In particular, members who are contacted more often by their SMO’s leaders and staff or otherwise communicate with them are also thought to exhibit higher levels of postrecruitment participation than members with less or no such communication.

Future work on recruitment should address at least three problems in the literature. The first problem concerns potential deficiencies in the studies of recruitment. An ideal study would be predictive and would study a random sample of adults, predicting which factors would lead some of them to join a particular social movement. Because only a small proportion of adults become members of any given social movement, such a study would need an extremely large sample to have any statistical validity and would be astronomically expensive. Because of this, studies of social movement recruitment are limited in scope. Some studies are retrospective, asking current participants why they initially chose to participate. Results from these studies depend upon the assumption that current participants can accurately remember and will accurately report why they started to participate, and these studies often have no adequate control group of nonparticipants. Other studies are predictive but only in a limited context: for example, they study who among a set of people in a particular locality who favor the goals of a social movement rally actually choose to participate in the rally. As these difficulties suggest, the recruitment literature would benefit from better designed studies, but, because of the nature of recruitment into social movements, such studies are difficult to devise.

A second problem in the recruitment literature concerns the many types of social movements. Many typologies of movements exist, but a common typology divides them, based on their goals, into political or social reform movements, religious movements, self-help movements, and cultural movements. Within each category there are many types of specific movements that have existed in many different nations and localities within nations and across many different decades and centuries. Although many studies of recruitment exist, they do not begin to match in number the sheer quantity of movements, and additional work on unstudied movements may shed new light on the dynamics of recruitment.

Finally, studies of recruitment obviously imply that one is being recruited into something. But what is this something? What does it mean to be a member of a social movement? If someone takes part in just one protest on behalf of a social movement, is that person a member of that movement? As this question suggests, people do not usually sign up for a movement in the way they sign up for many other activities. To compound this problem, some SMOs are organized in a very formal manner, with clear membership rolls and criteria for membership, while others are organized much more loosely, with unclear criteria for membership and only a loose understanding, if that, of who their members are. In the most informal SMOs, members may literally come and go, and it is not at all easy to identify their members. The lack of a clear understanding in movements and SMOs, and thus in
the recruitment literature, of what it means to be a member confounds efforts to achieve a comprehensive understanding of recruitment, however important such an understanding is for the study of social movements.

REFERENCES AND SUGGESTED READINGS

The relative deprivation model aims to explain individuals’ decisions to join or start social movements and is based on a certain set of psychological ideas (Gurr 1970). Relative deprivation itself refers to “the gap between what one has and what one expects” (Brush 1996), particularly in comparison to some specific reference group. The concept of relative deprivation has its roots in the early “frustration-aggression hypothesis” of John Dollard, which suggested that when individuals respond to frustration and do not receive a response that relieves their frustration, such individuals will respond with aggression. Relative deprivation has been used as the mechanism to explain where this frustration emerges from.

Analysts of relative deprivation have specified a variety of dimensions of deprivation that individuals may experience. These include aspirational deprivation, having increasing aspirations that are not realized; decremental deprivation, when expectations are stable but available resources are declining; and progressive deprivation, improvement in general social, economic, or power conditions which is followed by a sudden reversal of these trends. In general, in order to experience relative deprivation, an individual must not only experience desire, but also feel that she or he has a right to gain access to the sought-after resources. In addition, she or he must experience a perception that the likelihood of access being blocked is quite high. The contradiction between this feeling of entitlement and this feeling of stymied progress forms a type of cognitive dissonance which becomes activated through the appearance of a structural strain (McPhail 1971).

While many theorists of relative deprivation have confined their analysis to exploring when relative deprivation emerges and what form it takes, some have gone further to specify a mechanism whereby relative deprivation leads to collective action. The combination of feelings of relative deprivation with structural strain can lead individuals to come to see the sources of the blockages to their aspirations as structural blockages. Therefore, these individuals are led to seek structural solutions by working together as part of a similarly situated group – in other words, a social movement.

More sophisticated relative deprivation analyses include deprivation along with other factors, such as the balance of power between parties or resource mobilization. For instance, Korpi (1974) suggests that it is not only how deprived a group feels in terms of power resources that matters, it is also the rate of change in access to these resources relative to other groups, and that, of the three types of deprivation, only progressive deprivation is likely to lead to situations of conflict. Similarly, Tilly (1973), while not writing specifically in the relative deprivation school, notes that violent collective action is particularly likely both when a group is gaining power relative to others and when they are losing it. Miller, Bolce, and Halligan (1977) propose another instance in which the experience of relative deprivation is likely to matter: in the case of uncertainty about the future. They note that only certain disaster is more frustrating than uncertainty. More specifically, models based on the notion of relative deprivation have been used to explain when revolution does and does not occur, how religious movements or cults come into being, and the timing of urban race riots.

The empirical evidence used to demonstrate relative deprivation is usually socioeconomic in nature and collected on aggregate levels, such as census data, even though deprivation itself is an individual experience. In addition, more recent empirical research has had difficulty confirming the usefulness of relative deprivation models. For instance, relative deprivation may be able to explain some small part of the
variation in riots, but it is unable to explain why the majority of individuals who face relative deprivation do not act on this. However, even some analysts who are not fully impressed by the relative deprivation approach point to the likelihood that individual members of social movement organizations may talk about their reasons for forming or joining the movement in terms that can be conceived of as relative deprivation. Others have criticized the relative deprivation model because it cannot be tested empirically without some sort of evidence of feelings of deprivation prior to the collective action episode. The model, therefore, is less commonly employed in sociological analyses of social movements today, though it continues to prove popular among psychologists. Some contemporary scholars do utilize relative deprivation models in analyses of protest among immigrant groups (see, for instance, Grant 2008).

Repression and social movements

JENNIFER EARL

The repression of social movements refers to attempts by individuals, groups, or state actors (e.g., militaries, national police, and local police) to control, constrain, or prevent protest. Historically, this has often involved increasing the costs associated with social movement participation (e.g., through violence, arrest, etc.). Commonly studied forms of repression include police action at public protest events, such as arrests and police violence, military suppression of protest events, “disappearances” of activists, arrests and/or imprisonment of activists, infiltration of social movements by informants, covert counterintelligence programs, restrictions of free speech and assembly, assaults on human rights, and murders of social movement activists. In the digital age, repression has also blurred with censorship in states that do not allow unfettered, and/or unmonitored access to the Internet.

DISTINGUISHING BETWEEN DIFFERENT TYPES OF REPRESSION

Since the above examples represent a wide variety of ways to suppress or control protest, scholars have sought to distinguish between different types of repressive actions. Two common distinctions are between overt repression (e.g., public protest policing, see della Porta & Reiter 1998; Earl, Soule, & McCarthy 2003) and covert repression (on covert repression, see Marx 1974; Cunningham 2004) and between coercive repression (e.g., state violence, see Davenport 1995) and channeling (Oberschall 1973; McCarthy, Britt, & Wolfson 1991). Researchers make these kinds of distinctions because they suspect that the dynamics and consequences of repression may differ depending on the kind of repressive tactic deployed.

The distinction between overt and covert is based on visibility of the repressive acts (or, at least, how visible they are intended to be). For instance, the Federal Bureau of Investigation (FBI) ran a series of covert counterintelligence programs against selected social movements in the US during the 1950s through early 1970s. These programs used methods, such as tapping phone lines, examining mail, and burglarizing dwellings and offices to gather information, that were meant to affect the ability of social movements to survive and/or deploy certain tactics, without the public recognizing that the FBI was targeting these groups (Cunningham 2004). In contrast, other repressive actions are publicly visible (i.e., overt). Consider, for instance, the Chinese government’s actions at Tiananmen Square, where the government used military tanks to crush protesters and move crowds. The policing of major public protest events is a very common type of overt repression.

The distinction between coercion and channeling is also important. Coercion involves violence, harassment, and surveillance while channeling occurs when laws, policies, or actions reward protest movements for using certain kinds of tactics (typically, more institutional and/or nonviolent tactics) while discouraging others (typically, more radical, noninstitutional, or violent tactics). Coercive repression is well known: the tanks in Tiananmen Square, South American death squads, and murders of civil rights activists in the US are all examples of coercive repression. In contrast, channeling focuses on the proverbial carrots that can lure protesters towards certain tactics and/or goals as well as the proverbial sticks that push protesters away from certain tactics and/or goals. For example, McCarthy, Britt, & Wolfson (1991) argue that US tax laws on nonprofit status
encourage social movement organizations to take more institutional action and less political action and thereby “channel” dissent. If social movement organizations were to organize the use of violent tactics for political ends, for instance, their tax exempt status could be threatened. Another well-studied example of channeling involves donations to social movement organizations. Some scholars have argued that philanthropists encourage moderate protest and discourage radical protest by funding moderate social movement organizations and de-funding organizations that radicalize. Although empirical research suggests that funding can be reactive, scholars have not confirmed the extent to which de-funding, in particular, actually occurs.

A less frequently invoked distinction between different kinds of repression involves who is “doing” the repression. The bulk of research on the repression of social movements has focused on the role of state actors even though private groups (e.g., the Ku Klux Klan (KKK), White Citizens Councils, universities, and corporations) as well as philanthropists have been implicated in the repression of social movements (Earl 2004). The KKK, for example, engaged in coercive repression against civil rights activists, and corporations have employed private security agents to disrupt strikes. Further, even among state actors, there are important theoretical differences. Militaries charged with repression in authoritarian states are likely to differ from local police agencies, both with respect to how they distribute repression and the types of repressive actions they employ.

All of these distinctions are important because they bear on two fundamental questions that scholars have raised about repression: (1) how can researchers explain the level and types of repressive actions taken against different activists and social movements? and (2) how can researchers explain the consequences, or effects, of repression on activists and social movements? Given the importance of these distinctions, Earl (2003) crossed these three dimensions or distinctions – overt vs. covert, coercive vs. channeling, and distinctions amongst types of repressive actors (national state-based actors, local state-based actors, and private actors) – to produce a typology of 12 different types of repression. These categories can be used to systematize comparisons across research findings and to create hypotheses about dependencies between different styles of repression (e.g., private repression rises when overt, state-based coercion rises).

WHAT IS REPRESSION VERSUS SOCIAL CONTROL MORE BROADLY?

An emerging debate in repression research involves not just distinctions between broad types of repression (as discussed in the prior section), but a debate over what is focused enough to be meaningfully studied as repression (and, hence, comparable to other forms of repression) at all. That is, can the definition of repression be stretched so far that it blurs into general social control and becomes analytically unhelpful to social movement scholars?

One impetus for this debate is the phenomenon of quiescence. In a perfectly repressive situation, one would never see any protest and repressive mechanisms might be covert or unnoticed. Thus, a literature that studies how private and public actors “take on” protesters is already studying a situation in which full repression has failed (Oliver 2008). Thus, a thorough study of repression would need to understand the production of quiescence (Gaventa 1980).

However, as soon as one starts down the path of studying quiescence, a host of theoretical issues beset scholars. For instance, in many of the company towns that Gaventa studied, protest was unthinkable because of the multiple ways in which employees depended on employers (e.g., for company housing, for goods through the company store, for medical care, for the employment of other family members in towns with only one employer, etc.). This meant the employers could create huge costs for the slightest hint of dissent, thereby producing mass quiescence. But this
Repression and Social Movements

Quiescence results from a broad set of social controls that may or may not be designed to control dissent and protest. Whether pervasive employer controls in company towns are designed to limit labor activism or employers simply enjoy limited labor activism as a by-product of company towns designed for other reasons is an important question. It cuts to the heart of whether control measures must be designed to limit protest in order to be considered a form of repression.

Oliver (2008) suggests another case of social control that calls into question the boundaries of repression as a concept. She argues that repression researchers should be concerned with trends in mass incarceration in the US, which have resulted in a massive swelling of state control through jails, prisons, probation, and parole and has disproportionately affected people of color. Oliver asks what the civil rights movement might have looked like if it were not for mass incarceration and, in doing so, calls into question whether forms of social control that are not uniquely tied to protest, but have major implications for protest, should be studied by repression researchers. Similarly, other scholars have questioned whether the subjugation of women should be considered a form of repression. Earl (2004) suggests one alternative, arguing for a reframing of research around the social control of protest, versus repression, which would include both actions intended as repression and more general forms of social control that have demonstrable impacts on protest. Doing so would expose the consequences of analytic distinctions between intentional repression and general social control to future research. Fernandez (2008) advocates a similar approach, arguing for the study of the social control of dissent. However, it is clear that the debate over what “counts” as repression versus social control is still far from resolved.

EXPLAINING THE LEVEL OR TYPE OF REPRESSION

One of the major questions facing repression researchers involves how one explains repression. This casts repression as a dependent variable such that its level/severity, form, targeting, etcetera, become the focus of explanation. Most of this research has focused on explaining the level of particular types of repression. For instance, scholars may separately attempt to explain the number of protests at which police will be present, the number of political murders, or the severity of restrictions on free speech or free association in a country, but scholars have much less frequently examined how an increase in the severity of free speech and free association restrictions might affect the rate of political murders in the same country. However, researchers interested in explaining repression have recently considered how multiple layers of the state may work together, or in tension, in efforts to suppress a social movement.

In explaining the prevalence, level, or severity, scholars have focused on a small set of causal explanations. The most robustly supported explanation is the “threat” model of repression (Earl & Soule 2006; Davenport 2007a). This approach predicts that the more threatening a social movement, a social movement organization, or a protest activity is to the government and government elites, the more likely or severe repressive action will be. Because the emphasis is on threats to regimes, this approach has largely been used to explain repressive acts by governments or actors closely connected to the state.

Scholars working within a threat perspective have differed in whether they consider objective threats or subjective threats to be most important. Scholars who emphasize objective threats have been referred to as “rationalists” or “realists” (Davenport 2007a). Other scholars argue that governments and political elites do not always recognize existing threats, may misinterpret a nonthreat as threatening, or may otherwise exaggerate or downplay objective threats (e.g., Boudreau 2005). Scholars emphasizing the subjectivity of threats refer to the process by which states and/or political elites recognize and/or construct threats as “threat perception.”
Whether concerned with objective or subjective threats, a range of particular factors have been identified as objectively threatening, or likely to be perceived as threatening, including the mobilization of large numbers of social movement supporters and participants, the use of radical or violent protest tactics, and the embrace of radical or transformative ideologies, to list a few.

Other researchers have argued that states are opportunists. Assuming that states would prefer to suppress all challengers, scholars argue that weak challengers, who are vulnerable to repression, will be targeted. Weakness could be indicated by a range of characteristics, such as the social composition of social movement supports and/or the level of resources a social movement has available.

Still others have argued that the level or severity of repression depends on internal dynamics within the organization charged with repression. For instance, recent research on the FBI’s covert counterintelligence programs in the 1960s and 1970s suggests that the organizational structure and decision-making processes of the FBI influenced what groups were targeted for action, the tactics that were used against targeted groups, and the extent to which different groups were consistently and heavily repressed (Cunningham 2004). Others have made similar arguments about organizational and institutional characteristics of police forces in explaining police action at protest events (Earl and Soule 2006). Still others have focused on police knowledge (e.g., della Porta 1995). Ethnographic work on protest policing suggests that police agencies attempt to delicately control large protests through planning and permitting restrictions (Fernandez 2008) but that on the ground interactions between protesters and police during events are also important (Waddington 1994).

Finally, some scholars have tied the level of repressiveness to democratic process, showing, for instance, that states that allow for more citizen voice also tend to be less repressive (Davenport 2007b). This represents an important development both in understanding how repression works internationally and in understanding the implications of democratization for repression around the world.

In contrast to these approaches, which view repression as an outcome of some directional causal process, others have argued for a more emergent view of repression. Specifically, some researchers interested in processes of interaction between insurgents and authorities argue that general explanations of repression are problematic because many repressive outcomes are actually the result of situational interactions and thus cannot be predicted (e.g., police interact with protesters and out of that interaction emerges a police response to protesters).

Other scholars interested in interactions between activists and repressive agents have understood interaction to be less about situational interactions and more about the over-time relationships between authorities and insurgents. Framing the interaction between authorities and insurgents as a predator–prey situation, these students of social movements have argued that causal consistencies may exist. Methodological techniques, such as biological predator–prey statistical models, allow these researchers to statistically diagnose feedback processes between authorities and insurgents. For instance, a general version of one of these models would specify that the actions of repressive agents at Time 1 affect some movement characteristic at Time 2, which in turn affects the actions of repressive agents at Time 3. Some researchers have expanded these techniques to consider how repressive actors, movements, and countermovements interact over time and thereby affect the rate and/or severity of repression.

THE EFFECTS OF REPRESSIVE ACTION

Researchers have also examined the effects of repression on activists and social movements. Most of the research in this area focuses on the effects of repression on either the level of social
movement activity or the tactics deployed by social movements (see Earl & Soule 2010 for a review of this literature).

Before discussing theories about the effects of repression, it is important to understand how this debate is related to major theories on social movements. Some interest in the effects of repression on the level of social movement participation has been generated by the connection of repression to arguments surrounding “political opportunities.” In the political process approach to explaining social movement emergence, mobilization, and success, repression is thought to indicate closed political opportunities. Political opportunities are critical to political process theory because the theory’s fundamental proposition is that favorable political opportunities have a direct (or curvilinear, according to some) relationship with movement emergence, movement mobilization, and movement success.

One could further specify, differentiating between stable and volatile political opportunities. Stable opportunities are often defined as being structural, and hence are called political opportunity structures (POS). Repressive capacities or structural controls on repressive agents (e.g., constitutional limitations on police power) are seen by some scholars as POS. Volatile opportunities vary over time and may be less structural. The prevalence of state repression at a given moment is often referred to as being a component of volatile political opportunities.

Political process theorists argue that repression dampens social movement mobilization. Sometimes framed as increasing the costs of movement participation, the claim is that repression reduces the number of individuals willing to engage in protest. Others interested in rational choice models of collective action, but not in political process or political opportunities, have agreed with this cost-based argument, suggesting that repression raises the costs of activism and thus should reduce the overall amount of activism (Opp & Roehl 1990).

While supportive evidence of this claim has been found, evidence has also been found suggesting that repression radicalizes social movement participants (e.g., Hirsch 1990) or social movement organizations (Zwerman, Steinhoff, & della Porta 2000). Thus, instead of diminishing protest or deterring the use of particularly aggressive tactics, many scholars have argued that repression encourages further protest and the use of noninstitutional tactics.

Still other scholars have sought to reconcile these seemingly divergent empirical findings by arguing the repression has a curvilinear (or, alternatively, an inverted-U) relationship to movement participation and the use of confrontational tactics. Linden and Klandermans (2006) show that the effect of repression may also depend on how activists were recruited into activism, suggesting another way to reconcile discrepant macro findings. Stepping back from this dizzying array of arguments and findings, it is clear that repression research has yet to build a consensus on the effects of repression, or the conditions under which certain effects should be expected.

Some scholars have moved away from debates over the effects of repression on overall protest levels and instead focused on whether repression raises the costs of deploying a particular tactic and thereby reduces the number of individuals willing to use particular protest tactics. This is often referred to as tactical substitution (see Lichbach 1987). For instance, if violent protest tactics were repressed, tactical substitution would anticipate a shift toward less violent protest tactics.

Resource mobilization theory

BOB EDWARDS and PATRICK F. GILLHAM

Resource mobilization theory (RMT) developed during the 1970s as a new generation of scholars sought to understand the emergence, significance, and effects of the social movements of the 1960s (see Jenkins 1983; McAdam, McCarthy, & Zald 1988; Edwards & McCarthy 2004). Rejecting both the view held by some earlier movement scholars that social movement actors were deviant or anomic, and the pluralist assumption that all parties willing to engage in the political process have a reasonable chance that their grievances will be heard and addressed, resource mobilization scholars sought to understand how rational and often marginalized social actors mobilized effectively to pursue their desired social change goals (Freeman 1975; Gamson 1975; McCarthy & Zald 1977; Tilly 1978; McAdam 1982; Morris 1984; Zald & McCarthy 1987; Staggenborg 1988; Tarrow 1994).

ORGANIZATIONAL-ENTREPRENEURIAL TRIBUTARY OF RESOURCE MOBILIZATION THEORY

The organizational-entrepreneurial branch of resource mobilization theory (RMT) reoriented social movement analysis by taking the analytical insights of organizational sociology and extending them by analogy to social movements. More recent exemplars of this perspective include Minkoff’s (1995) analysis of women’s and race-ethnic organizations; Smith, Chattfield, and Pagnucco (1997) on transnational social movement organizations (SMOs); Andrews’ (2004) study of the impact of the civil rights movement on local communities in Mississippi; a special issue on SMOs edited by Caniglia and Carmin (2005); and Gillham and Edwards’ (2011) analysis of SMO efforts to manage legitimacy in order to preserve key resource streams or exchange relationships. From this perspective a social movement is a set of preferences for social change within a population (McCarthy & Zald 1977). Individuals who share those social change preferences are called adherents, while those who contribute resources of various kinds to help the movement mobilize are constituents. Those who watch from the sidelines are bystanders. A key analytical issue for RMT is understanding how social movements turn bystanders into adherents and subsequently adherents into constituents and ultimately mobilize constituents to active participation. Such tasks of mobilization are undertaken most often by SMOs.

In their classic formulation McCarthy and Zald (1973) identified a trend in US social movements toward the increasing significance of large, formally organized SMOs deploying professional staff to pursue the broad social change goals of their constituents. Early RMT was closely associated with the trend toward professionalization and debates over its impact were a focus of much research (Staggenborg 1988; Andrews & Edwards 2004). Yet, while many SMOs are quite large with professional staffs and substantial resources, most are small, less formally organized groups operating at the local level (Edwards & Foley 2003). At a minimum an SMO is a named group that undertakes actions to further the social change goals of the social movement.

All SMOs pursuing the goals of the movement comprise a social movement industry (SMI). SMIs vary in size, and the capacity of a movement to engage in collective action is influenced greatly by type, amount and distribution of resources within its SMI. RMT expects that the greater the mobilization capacity of an SMI, the greater its potential for achieving some of its social change goals. The broader social movement sector (SMS) is

comprised of all SMIs and their component SMOs. In leaning on organizational sociology to reorient the study of social movements, RMT holds that SMIs and SMOs differ from governmental and market-sector organizations because of watershed differences in goals, their structural location in civil society, and in the varied resources and power they wield. Nevertheless, the SMS has grown dramatically over the last 30 years and has contributed to the increasing social change potential attributed to “civil society” worldwide.

RESOURCES ACCESS

Early formulations of RMT focused on broad patterns of resource availability and paid disproportionate attention to the mobilization of material resources from external sources. By contrast, recent RMT analysts emphasize more explicitly the uneven distribution of resources in a society, and seek to understand how individual and collective actors endeavor to alter that distribution in order to direct resources to social movements. In other words, RMT is becoming more explicitly a partial theory of overcoming resource inequality. Thus, questions of general resource “availability” have shifted toward questions of specific means of resource access.

Two long-standing debates about resource access center on whether social movements obtain their support primarily from internal or external sources and the closely related question about the extent to which external supporters constrain movement goals and activities. Recent developments in RMT seek to reframe this debate in several ways. Research has made it clear that social movements and individual SMOs generally obtain their resources from a combination of internal and external sources. All but the very smallest SMOs gain access to resources by multiple means.

MECHANISMS OF RESOURCE ACCESS

Four mechanisms of resource access are particularly important: self-production; aggregation from constituents; appropriation/co-optation; and patronage (see Edwards & McCarthy 2004).

Self-production

A fundamental mechanism by which social movements gain access to resources is to produce those resources themselves through the agency of existing organizations, activists, and participants. Movements produce social-organizational resources when they launch SMOs, develop networks, and form issue coalitions. They produce human resources by socializing their children into the ways and values of the movement, or by training participants and developing leaders. Movements like those for civil and human rights have produced out of their struggle a moral authority that is a powerful resource. Social movements also produce items with movement symbolic significance like T-shirts, coffee mugs, posters, art, and even cakes and cookies for bake sales, which can be sold to raise money or used directly to promote the movement.

Aggregation

Resource aggregation refers to the ways a movement or specific SMO converts resources held by dispersed individuals into collective resources that can be allocated by movement actors. Social movements aggregate privately held resources from beneficiary and conscience constituents in order to pursue collective goals. Monetary or human resources are aggregated by soliciting donations from broadly dispersed individuals in order to fund group activities, or recruiting volunteers to help with an activity. Yet, SMOs also aggregate other types of resources as well. For example, moral resources held by others can be aggregated by compiling and publicizing lists of respected individuals and organizations that endorse group goals and actions.

Co-optation/appropriation

Social movements often utilize relationships they have with existing organizations and
groups to access resources previously produced or aggregated by those other organizations. Resource co-optation generally carries the tacit understanding that the resources will be used in mutually agreeable ways. In the US context churches and church-related organizations have probably produced resources most often co-opted by social movements from buildings, members, and staff, social networks, rituals, and discourses or moral authority.

**Patronage**

Social movements also gain access to resources through patronage. Patronage refers to the provision of resources to an SMO by an individual or organization that often specializes in patronage. Foundation grants, private donations, or government contracts are common in financial patronage. In monetary patronage relationships actors external to the movement or SMO provide a substantial amount of financial support and usually exert a degree of control over how their money can be used. Patrons may even attempt to influence an SMO’s policy decisions and day-to-day operations. Human resources can be acquired through patronage relationships as when one SMO loans staff to another for a set period of time as is common in issue campaigns or coalitions.

**RESOURCE TYPES**

Despite the obvious centrality of resources to RMT, analysts were slow to develop a clear conceptualization of resources. Analysis and often heated debate focused on a narrow range of material and human resources. Yet, resources important to social movement mobilization are more varied. In recent years RMT analysts have benefited from broader developments in social science and made considerable gains in specifying and differentiating between five distinct types of resources: moral, cultural, social-organizational, human, and material (see Edwards & McCarthy 2004).

**Moral resources**

Moral resources include legitimacy, integrity, solidarity support, sympathetic support, and celebrity. Of these, legitimacy has received the most theoretical attention, and celebrity perhaps the least. Collective actors who most closely mimic institutionally legitimated or “mainstream” expectations gain advantages over groups that fit those expectations poorly. Similarly, celebrity endorsements of an issue campaign can increase media coverage, generate public attention, and open doors to policymakers and resource providers alike. Moral resources tend to originate outside of a social movement or SMO and are generally bestowed by an external source known to possess them, as in a celebrity lending their fame, the receipt of awards like the Nobel Peace Prize by a prominent activist, or the certification by an external credentialing body like the Internal Revenue Service. Nevertheless, some movements succeed in the difficult task of creating moral resources, as was clearly the case with the US Southern civil rights movement or, more recently, the international human rights movement. Because moral resources can often be retracted, they are both less accessible and more proprietary than cultural resources.

**Cultural resources**

Cultural resources are artifacts and cultural products such as conceptual tools and specialized knowledge that have become widely, though not necessarily universally, known. These include tacit knowledge about how to accomplish specific tasks like enacting a protest event, holding a news conference, running a meeting, forming an organization, initiating a festival, or utilizing new social media. This category includes tactical repertoires, organizational templates, and technical or strategic know-how required to either mobilize, produce events, or access additional resources. Specific cultural resources are widely available in a given society, but neither evenly distributed, nor universally available. In
other words, not every member of a society or social group possesses specific competencies or knowledge that could be valuable to a social movement or SMO. This points to a key difference between cultural and moral resources. Cultural resources are more widely accessible and available for use independent of favorable judgments from those outside a movement or SMO. Cultural resources include movement- or issue-relevant productions like music, literature, magazine/newspapers, or film/videos. Such cultural products facilitate the recruitment and socialization of new adherents and help movements maintain their readiness and capacity for collective action.

**Human resources**

Human resources are both more tangible and easier to appreciate than the above resource types. This category includes resources like labor, experience, skills, expertise, and leadership. Individuals typically have control over the use of their labor and other human resources and make them accessible to social movements or SMOs through participation. Yet, not all participants offer the same mix of capabilities. SMOs often require expertise of varying kinds and having access to lawyers, web designers, social media consultants, dynamic speakers, organizers, or outside experts when the need arises can be vitally important. The use-value of expertise often depends on the situation. For example, a prominent scientist may have little more to offer than a college intern if an environmental group needs to restore its web page after a crash. Similarly, a celebrated musician participating in a blockade contributes no additional human resource to the blockade, yet, from the standpoint of the moral resources contributed by the celebrity’s presence the evaluation would be much different.

**Material resources**

The category of material resources combines what economists would call financial and physical capital including monetary resources, property, office space, equipment, and supplies. The importance of monetary resources for social movements should not be underestimated. No matter how many other resources a movement mobilizes, it will incur costs and someone has to pay the bills. Material resources have received the most analytic attention because they are generally more tangible, more proprietary, and in the case of money more fungible than other resource types (Edwards & McCarthy 2004). In other words money can be converted into other types of resources (e.g., rent for office space, hiring of picketers, purchase of opinion ads) while the opposite is less often the case.

**Social-organizational resources**

There are three general forms of social-organizational resources: infrastructures, social networks, and organizations, each varying in their degree of organizational formality. Infrastructures are the social-organizational equivalent of public goods like the postal service, roads, or the Internet that facilitate the smooth functioning of everyday life. Infrastructures are nonproprietary social resources. By contrast, access to social networks and especially groups and formal organizations can be limited by insiders. Thus, access to resources embedded in them can be hoarded by insiders and denied to outsiders (e.g., donor lists). Such differential access only intensifies existing inequalities among groups in their ability to utilize crucial resources of other kinds. SMOs often seek to overcome the problem of resource scarcity by forming coalitions with other SMOs or by co-opting resources produced by others for nonmovement purposes, like churches, schools, service organizations, occupational groups, or, more broadly, civil society. The ease of SMO access to resources available by forming coalitions or produced by others for nonmovement purposes will vary depending on the perceived compatibility of the groups involved.
EXCHANGE RELATIONSHIPS

Combining the four means of access with the five types of resources discussed above specifies twenty specific exchange relationships through which social movements or SMOs acquire the various mixes of resources they use to pursue their social change goals (Edwards & McCarthy 2004). As indicated earlier, exchange relationships can be internal or external to an SMO. In addition, they differ in the use-value they provide and are contextualized by time and place. Exchange relationships differ in the use-value of the resources they make available to an SMO, whether material, human or other. Hence, an SMO wanting to influence conservative political elites might seek out as an exchange partner a large nationally recognized religious organization with the capacity to provide legitimacy, and thousands of dollars and letter-writing members, rather than a lesser known organization with far fewer moral, material, or human resources. By contrast, an organization wishing to generate significant media attention may seek out exchange partners known for engaging in innovative and high-profile tactics. The value of exchange relationships is context dependent in time and place. For example, valuable relations with elected officials or celebrities may lose use-value when such individuals are caught up in a public scandal. Conversely, relations might increase in value when minority parties become the majority or when a celebrity wins an award.

This broad view of exchange relations problematizes the long and narrow debate among social movement analysts over the extent to which acquiring resources from external sources constrains the actions of SMOs. That debate has focused almost exclusively on a single exchange relationship—monetary patronage. Yet, as articulated here, SMOs routinely manage numerous exchange relationships providing various kinds of resources. Hence, the impact of “source constraints” or the set of expectations and obligations between exchange partners depends in part upon the specific mix of resource access and resource type (Edwards & McCarthy 2004). Thus, among two professionalized SMOs actively involved in planning a large protest event, they may differ in the source of their moral, cultural, material, human, and organizational resources, which will provide different constraints or opportunities for both SMOs. For example, a union which draws resources from a diverse and more conservative membership base and has close relations to political elites might find it difficult to justify to their resource partners the use of confrontational tactics. In contrast, an SMO reliant on self-generated revenues from speaking fees and merchandise sales and with members that favor the exercise of civil disobedience will find it much easier to justify engagement in confrontational tactics, all else being equal.

CONCLUSION

By wedding together rational actors, strategic action, and organizational theory with the perennial effort by social groups to overcome the differential availability and distribution of resources needed to pursue social change, resource mobilization theory continues to be a central and salient theory for analyzing “politics by other means” (Gamson 1975; Zald & McCarthy 2002). Promising theoretical and empirical directions to take for RMT scholars include explorations of the importance of less tangible resources, such as legitimacy and social media networks, for movement mobilization and the formation of movement coalitions. Moreover, scholars might explore further the breadth of exchange relationships on which movement activists draw, including partnerships with agents of social control and even countermovement organizations and hostile political elites. Resource demobilization or reduction of resources to SMOs also needs further investigation, as it is currently assumed that the processes for mobilizing resources are reversed when SMOs fail. Finally, additional theorizing and research might apply RMT to collective endeavors not typically considered to
be social movements. For example, the emergence of alternative or youth subcultures, the development and diffusion of lifestyle sports, emerging musical or performance genres, as well as the formation, development, and decline of corporations or competing views on global climate change.

Rights and rights movements

JOHN D. SKRENTNY and RENÉ PATNODE

The goal of many social movement organizations (SMOs) seeking political change is some kind of right. Rights-based movements have been the signature form of political movement since at least the mid-twentieth century in the West and are increasingly common in other parts of the world.

DEFINING THE SUBJECT: WHAT ARE RIGHTS?

SMOs that direct demands toward the state and seek some solution to a problem or disadvantage do not necessarily seek rights. A right is a guarantee or entitlement, that is, something that one is owed by virtue of membership in a polity or some other collective. Rights can be distinguished from benefits, charity, or public good measures, all of which may flow to an aggrieved group or everyone in society at the discretion of state actors. The distinction is captured in the titles of historian Linda Gordon’s book, Pitied but Not Entitled and Richard Scotch’s From Good Will to Civil Rights. (Of course, whether the state actually fulfills its duties in providing for rights is an open question, and some rights movements are not fighting for new rights, but that rights already in law are actually honored in practice.)

A rights movement, then, is an organized, collective effort using at least some means outside of formal institutions to effect changes that would have the state guarantee some benefit. The basis of the right is either formal membership in a polity (citizenship rights) or membership in the species (human rights).

Most rights-movement scholarship has focused on efforts to expand and deepen the meaning of citizenship. T.H. Marshall’s classic (1950) study offers a helpful roadmap for understanding the goals and trajectories of rights movements. Marshall argued that rights can be classified into three groups that developed in a historical sequence. The first group includes the civil rights. These are the classically liberal “freedoms from” government restriction or intervention. Secured in Western European states in the 1700s, civil rights include rights to due process, property rights, religious rights, press rights, and the right to work in one’s desired occupation. Political rights developed in the 1800s and include the right to vote and the right to hold office. Marshall was most interested in the 1900s development of social rights, or the welfare state rights to education, poverty relief, old-age pensions, unemployment insurance, and health insurance. His primary interest was in the relationship between Britain’s system of equality—the equality of rights bestowed by equal citizenship—and the inequality of social class.

Marshall’s interest in social rights led his attention away from the goal of many rights movements, especially in the second half of the twentieth century: the right to not be subject to public or private discrimination. For Marshall’s framework to be useful for studying rights movements, we need to also consider class hierarchies and their relationship to identity hierarchies, such as race and gender, which cut across class lines. In this view, we may highlight that the effort to bring civil, political, and social rights typically first involved expansion from the upper classes to the lower (propertyless) classes while being limited to white males. Once civil, political, and (in some polities) social rights were at least formally guaranteed to white men of all classes, much rights movement action focused on equalizing rights across the vertical cleavage lines of gender, race, national origin, etcetera.

Rights movements have clear connections to identity politics and “new social movements,”
though the overlap is not perfect. Not all identity politics are about rights; movements of identity politics may instead seek recognition or to change the view of the group held by others. For example, one issue for activists fighting for gays and lesbians related to how medical institutions, and particularly their official diagnostic manuals, defined “homosexuality.” Specifically, they sought to shift the definition to one that did not classify being gay as a psychological abnormality (Marcus 2002). That said, advocates of gay rights do also seek more rights such as recognized marriages and partner benefits. Thus rights and recognition often go hand in hand, although they are not equivalent.

CLASS-BASED RIGHTS MOVEMENTS

One established research area focusing on class-based movements attempts to explain the trajectories of labor activists seeking the right of collective bargaining (Lichtenstein 2002). There is a growing body of work that focuses on the US case and its crucial nineteenth-century period of labor organization, and situates the US comparatively with cases in Europe where labor was stronger and had greater success. For example, Voss (1993) argued that we can understand the failure of the development of a welfare state in the US in part by understanding the collapse of the Knights of Labor in the nineteenth century. Haydu (2008) presents the other side of the same struggle: Business interests created a kind of class-based movement as well, though it was focused on property and their right to manage their businesses as they saw fit.

Piven and Cloward (1977) offered an influential and broad approach to understanding class-based rights struggles. In addition to the black civil rights movement, they studied three class-based movements including the Workers’ Alliance of America, the Congress of Industrial Organizations, and the National Welfare Rights Organization. They argued the source of movement emergence and success lay primarily in society’s institutional structures, but also noted that the rights focus of their SMO cases came primarily from “early rhetorical pronouncements by liberal political leaders” which “helped to fuel the discontents of workers and blacks” and “helped to concentrate those discontents” (1977: 17).

IDENTITY-BASED RIGHTS MOVEMENTS

Many key developments in social movement theory occurred through the study of movements seeking rights based on racial and other nonclass identities, especially the black civil rights movement. In the American context, “civil rights” referred mostly to rights of nondiscrimination rather than the more generalized rights to be left alone that characterize Marshall’s use of the term, Morris (1984) built on the theory of resource mobilization by showing how the black civil rights movement was able to use its own resources and institutions (especially the black church) rather than having to rely primarily on outside help to create its movement. McAdam’s influential (1982) political process theory of social movement development, which emphasized the importance of political opportunities such as access to state elites and elite competition, used the black civil rights movement as its case for theory development.

Later studies explored the development of rights for other racial and ethnic minorities, such as Asian Americans (Wei 1993), Latinos (Gómez-Quiñones 1990) and American Indians (Cornell 1988). Still other studies have sought to understand how these rights movements impacted each other (Skrentny 2002).

Movements on behalf of women have a long tradition as rights movements in the US. The 1848 Declaration of Sentiments borrowed rights language from the Declaration of Independence to call for equality for women. There are several studies of the women’s rights movement as it grew in the 1960s and 1970s, including Mansbridge’s (1986) analysis of the failure to win passage of the Equal Rights Amendment in the US and Costain’s (1992) application of
political process theory to women’s rights in the 1970s. Skrentny (2002) showed how American women mobilized to be included in federal employment affirmative action programs and to have Title IX implemented to end sex discrimination in education. McCann developed the theory of legal mobilization in his (1994) study of wage discrimination against women. His study showed that law is not just a source of social control but provides resources to press claims for rights in what he called a “bottom-up jurisprudence.” McCann showed how statutes guaranteeing rights provided the resources to take rights claims to court and fight for equality.

By the late twentieth century, this expansion meant that the range of rights movements extended to just about any group, human or not, that could have a grievance. Scotch showed the crucial role of the state in the development of the disability rights movement. Fejes (2008) explored the origins of the gay rights movement. Kirkland (2008) analyzed the movement for fat rights and the tensions between medicalization and normalization of the identity. Jasper and Nelkin (1992) analyzed the changing views toward animals and the development of a rights frame in their study of the animal rights movement.

Rights movements may also focus on issues rather than identities. For example, Carp (1998) explored the politics of adoption and rights mobilization around family issues. A growing literature examines rights movements pressing conservative issues and identities, such as Wright’s (2007) examination of the militia movement and organization for gun rights in the US.

As Armstrong and Bernstein (2008) note, one common aspect of civil rights movements in the early part of the twentieth century was that they targeted state institutions or businesses. However, as the century progressed, and recognition became a goal in addition to rights, targets diversified and multiplied. Instead of a single target, movements would attempt to win the hearts and minds of the masses on a variety of fronts. The burgeoning popularity of the Internet spurred this development in so far as communication became significantly easier (Bennett 2005).

As previously mentioned, rights are intimately tied to questions of citizenship; thus perhaps the most defining category of rights movements going into the twenty-first century involve rights pertaining to immigrants, both “documented” and “undocumented” (Buff 2008). Within the US, there have been heated movements and counter-movements, especially in Texas and California, regarding the rights of undocumented immigrants in areas such as education or medical care. In most cases, these movements center on the rights of Mexican immigrants. Ironically, immigrant rights movements might not only clash with entrenched majorities but also with the minority groups (such as African Americans) served by earlier civil rights movements, due to fear of competition for economic and social resources. Solidarity with other groups is often crucial to the success of rights movements, but is difficult to achieve in the immigrant case (Johnson & Hing 2007).

RIGHTS MOVEMENTS IN GLOBAL PERSPECTIVE: INTERNATIONAL/DOMESTIC INTERACTIONS, GLOBAL DIFFUSION OF RIGHTS, AND GEOGRAPHIC VARIATION

Though there has been a great amount of work on rights movements in the US, rights movements have never been uniquely or even primarily an American phenomenon. In this final section, we explore some of the dynamics of rights movements in other regions of the world, and in particular interactions between states and at the global level. Due to its rising geopolitical and economic importance, we give particular attention to and use for illustration the case of China.

Rights movements have long influenced each other across borders and developments at the international level can impact domestic rights politics. For example, Gandhi’s efforts against racist oppression in India inspired and informed Martin Luther King, Jr’s fight
for racial equality in the US. Indeed, it is hardly a coincidence that many decolonization movements – fighting for the right to sovereignty against European powers, especially in Asia and Africa – occurred concurrently with the black civil rights movement, and the United Nations promulgated the first conventions and covenants for human rights, including the 1965 Convention on the Elimination of All Forms of Racial Discrimination, at roughly the same time as Congress’ monumental Civil Rights Act of 1964 and the Voting Rights Act of 1965 (Skrentny 2002).

Since the 1960s, the dynamic typically goes the other way: Rights movements in the West often devote much attention to and seek to build networks with developing countries that are often home to rights-denying authoritarian regimes. Some rights movements welcome the international ties, others may be able to go it alone. Despite the existence of a strong authoritarian regime, scholars such as Minxin Pei (2003) argue that, in China, processes such as global diffusion of information, finance, culture, and institutional practices, as well as domestic changes, provide opportunities and impetus for domestic actors to challenge the status quo. The reform and opening process has enabled a growing number of local protests and a strong push for environmental rights in particular.

Not all rights movements against authoritarian states are threats to those states. The fact that rights movements often invoke nationalistic discourse can reaffirm government control and can threaten both ethnic and ideological minorities. Authoritarian governments can co-opt movements, using them as a pressure valve of sorts, rather than promising wide-scale reforms. This is evident in the East Asian cases studied by Weller (2008). In China, allowing small-scale movements allowed space for the airing of some grievances, and the government has been moderately responsive to demands. In contrast, the authoritarian Taiwanese government’s ambiguous response led to calls for democratization, and South Korea’s lack of response to and repression of democracy rights movements led to violent protest and a sweeping regime change.

A major focus of work on the global diffusion of rights regards human rights, that is, rights that one may claim based on membership in the human race and as the basis of human dignity, rather than as part of formal membership in a particular polity. Since there is no institutional machinery for the enforcement of human rights, much of this research focuses on the ability of movements to make use of the ratification of human rights conventions or human rights discourse as resources to leverage rights-protecting action from states. For example, Keck and Sikkink’s influential (1998) study of human rights activism across borders sought to identify the conditions that allowed these groups to have an impact, identifying elements such as the nature of the issue (issues involving bodily harm were more likely to lead to productive impact). Risse, Ropp, and Sikkink (1999) sought through various case studies to develop a model for how human rights can matter at the domestic level, showing how domestic movements in oppressive states could use human rights discourse to appeal to Western powers to exert pressure onto the rights-denying domestic political elites.

Yet there is considerable scholarly debate regarding the ability of human rights organizations that target state-level entities to obtain significant change. Scholars may note the European Union’s ability to force would-be members to accept certain rights norms (the “acquis”), but in many cases implementation for new members lags far behind the promises made (Geddes 2003). Elsewhere, cases such as that of China are instructive for considering the potential weaknesses of global rights movements because they suggest a model whereby a notorious, supposed human rights “abuser” can push back, with the aid of economic power and with some degree of success, against critics. Such countries may even claim to ascribe to an alternate, but no less valid, model of rights (Pei 2003). In many of those cases, rights efforts must often target smaller subnational- or local-level politics and policies.
Several contemporary organizations (for example MoveOn.org), incorporated to address global issues, nonetheless may recruit domestic actors in many different countries to focus on relevant local projects or to bring existing projects into the fold. These international nongovernmental organizations, “INGOs,” then serve in part as federated communities in which the actors can network and share information, strategies, and resources (Bennett 2005). However, the efforts of even the most modest of nongovernmental organizations (NGOs) may be frustrated by local governments and at the very least must accept some degree of government oversight. Recently, scholars have developed the term “GONGO” (for “government-organized NGO”) to apply to those cases where boundaries between independent activity and government control are blurred. Lastly, grassroots rights efforts can be frustrated by similarly grassroots reactive movements. The protests surrounding the Olympic torch run prior to the 2008 Olympics in Beijing are just one example; in that case, spurred by Tibetan protests earlier in the year, non-Chinese around the world used the occasion of the torch’s presence in their own cities to protest China’s handling of Tibet and to mobilize for Tibet’s right to sovereignty but were met by equally vociferous Chinese counterprotests (Economy & Segal 2008). Increased contention on both sides of a rights issue can be a key side effect of the globalization of these movements.

Riots
DANIEL J. MYERS

A riot is an unruly collective act of violence that is temporary, discontinuous from everyday routines, and results in damage to persons or property of either the participants or targets of the collective actor. Although most social scientists have an intuitive sense of what constitutes a riot, the edges of the definition are fuzzy and it can be difficult to determine whether or not some events are actually "riots." For example, it is agreed that a riot is a collective act. That is, more than one individual must be involved and at least minimally coordinate action in order for a riot to occur. Two people acting together, however, would not constitute a riot, even though it is a collective act of violence. Thus, the lower limit for participation, damage, and duration to define a riot is difficult to establish and has led many sociologists to analyze events more ambiguously referred to as "civil disorders" or "collective violence." For most, however, unless there are at least 30–50 people involved, the events last more than a few moments, and there is action that could result in property damage or injury requiring medical attention, a riot has not occurred.

Even those events that consensus would label as riots are a diverse lot. The American sociologist’s vision of rioting is heavily influenced by the race-related urban riots that occurred in the 1960s, including the infamous Watts 1965, Newark 1967, Detroit 1967, and Washington DC 1968 riots. These riots were typically ignited by a confrontation between police and African American citizens and, although injuries occurred, the activity in the riots was dominated by attacks on property and looting (Abu-Lughod 2007). Injuries most typically resulted from attempts by police and military officials to prevent damage and contain or extinguish the riot. These kinds of riots have been echoed in other urban environments over the years, including riots in Britain in the early 1980s, in Los Angeles following the Rodney King verdict, in Cincinnati, Ohio following accusations of police brutality, and most recently in the Parisian suburbs of France, as immigrants from northern Africa took to the streets and burned thousands of cars in protest at perceived police brutality and poverty.

While these kinds of events are important, there are many other kinds of collective events that have been treated as riots, including food riots, machine breaking raids, murderous ethnic purges, lynching, brawls at sporting events, and even victory celebrations. Horowitz (2001), for example, documents what he calls the deadly ethnic riot, which is a collective lethal attack of one ethnic group on another and includes events ranging across the globe from Hindu attacks on Muslims in India, anti-Catholic violence in Northern Ireland, and attacks on Ibo citizens of Nigeria. In practice, these different types of riots are not completely distinct. Rather, riots are usually complex events in which different kinds of people with different motivations participate in a variety of ways in the larger riot, each overlapping with the other in some ways, but not in others. For example, the celebration riots that followed the string of National Basketball Association Championships in Chicago, and later in Los Angeles, took on many of the characteristics of the urban street riots of the 1960s.

Concern with riots, and crowd behavior more generally, has a long history in sociology, reaching back to the founding moments of the discipline when thinkers such as Gustave Le Bon and Sigmund Freud produced a view of crowds as unanimous, crazed, criminal, anonymous masses whose constituent individuals had ceded control of themselves over to the mob and/or a hypnotically suggestive leader. Although subsequently debunked in...
sociological scholarship, this view of the crowd and of rioters lives on in the popular mind, in journalistic accounts of riots, and even in introductory sociology and social psychology textbooks. Empirical research on crowds, however, indicates that riot participants are certainly not of unanimous mind and in fact their participation and behaviors reveal diverse motivations, actions, and experiences of the event. Furthermore, individuals in crowds are not anonymous, as they typically attend the event in small groups made up of friends and family members. These small groups remain intact throughout the event, move through the larger crowd together, and are the fundamental unit in which decisions about what to do are made. Nor do individuals in crowds become hypnotized by the situation or cede control of themselves to crazed irrationality. In fact, even when engaging in some of the most extreme and heinous atrocities (such as genocidal purges), riot participants retain an extraordinary level of rationality, going to great lengths, for example, to ensure they are killing the right kind of person (Horowitz 2001). Rioters, for example, may stop rioting to actually interrogate those suspected of being on the wrong side. Horowitz relates one such instance in which Sinhalese rioters in Sri Lanka questioned a man once, held him as a prisoner while they proceeded to kill other Tamils, later questioned him further, and eventually (mistakenly, since he was a Tamil) released him.

Because of the unfortunate early history of thinking about riots and crowds, scholars also developed expectations about what kinds of persons would be more likely to participate in a riot. Criminals, socially marginalized, isolated, unemployed, and uneducated were all stereotypes portrayed in earlier writing on riots. As has been the case with mob psychology notions more generally, these ideas have been proven false by empirical research. When the characteristics of riot participants have been compared to nonparticipants (particularly to those living in geographic proximity to riots), few differences have been detected (Mason & Murtagh 1985). Even though, for example, unemployment in a city predicts rioting, the unemployed are not disproportionately represented among the actual rioters – their rates of participation are virtually identical to those who are employed. Nor do rioters tend to be more psychologically frustrated with their circumstances or feel more deprived than nonparticipants. Thus, rioters do not fit the image of marginalized societal refuse held by early crowd theorists.

What, then, is true about those who riot? First, as with most violence, riot participants are considerably more likely to be men than women. Second, rioters tend to be younger than the average person living in the area where a riot occurs, although rioting is clearly not just an activity of the young. More important, however, is simple biographical availability, which in part accounts for the presence of the young at riots. Those who happen to be spatially close
riots to a riot are more likely to join in. Those who are not at work, watching children, or attending classes are more likely to be able to break free from their routines and become part of the crowd. There is, for example, a clear daily pattern of riot activity that peaks after usual work hours and then dies down when people have to return to their jobs and schools (McPhail 1994). Finally, rioters tend to have higher senses of personal efficacy than those who do not participate. They are more likely than those who stay at home to believe that their actions matter and will make some kind of a difference (Snow & Oliver 1995).

ECONOMIC HARDSHIP AND RIOTING

Sociological research and theorizing about riots has focused on the causes of rioting. What conditions contribute to its emergence? Many factors have been posited as important contributors to, or preconditions for, rioting. Economic factors such as unemployment and poverty have been cast as both absolute and relative deprivation conditions that produce what is essentially a violent protest about these conditions. This theoretical argument seemed more than plausible and the emergence of so much rioting in poor, urban areas disproportionately involving racial and ethnic minorities buoyed the notion. The research, however, has been less than definitive. Research attempting to explain the variation among cities in riot frequency and riot severity based on relative and absolute deprivation measures as well as other indicators of social and economic well-being has been hard pressed to find any consistent relationship supporting the basic theoretical notions (Spilerman 1970, 1976). Related concepts, such as the pressure that rapid changes in population place on the provision of social services and the notion that poor political representation prevents the opportunity to redress grievances through conventional means, have not fared any better.

More recently, competition theory has been used somewhat more successfully to predict rioting. Here, analysts propose that battles over economic, labor market, and, to a lesser degree, residential turf escalate into collective violence as one group attempts to improve its position or maintain relative advantage over another advancing group. After all this research though, economic factors, however they may have been cast, still remain a fairly weak predictor of rioting. Economic hardship is too ubiquitous and rioting is too rare for economic conditions to directly produce rioting. Thus, economic conditions may be seen as providing fertile ground for rioting and other collective violence, but are not, by themselves, a sufficient explanation for the emergence of violence.

SOCIAL CONTROL AGENTS

The role of state authorities, especially local police, in producing, escalating, and quelling riots has been a major topic of research not only because interaction between police and citizens so often seem to ignite rioting, but also because state authorities have a responsibility to maintain order and therefore are expected to wield repressive forces to bring riots under control, to return the social environment to a state of calm, and to protect the persons and property that might be targeted by rioters.

These two dynamics have produced different hypotheses about the roles of police in riots. On one hand, if confrontations with citizens and heavy-handed policing tactics provide the sparks that set off riots, then increases in police presence ought to increase rioting. Likewise, if police engage rioters with escalated engagement as they attempt to quell the riot, they may inflame, rather than extinguish the riots. On the other hand, repression can actually stop or slow rioting, and although police intervention can lead to more discontent and grievances, police presence, especially if early and formidable, can prevent or reduce rioting by raising the anticipated costs of participation.

The quantitative empirical evidence on the role of policing has been inconsistent. Some scholars have found that larger police forces
are related to more and more severe riots while others have found no relationship or just the opposite. Qualitative and historical studies, however, have demonstrated that it is not just the strength of the police in terms of number and firepower that matter, but rather, how they wield their power and what kinds of relationships exist between the police and the community that matters most. Those communities that have a history of antagonism between the police and some segment of the citizenry seem much more likely to erupt after a publicized instance of heavy-handed police behavior.

DIFFUSION, MASS MEDIA, AND EFFECTIVENESS

The mass media is another key player in understanding the origins and trajectory of rioting, particularly as rioting spreads and becomes a wave of unrest rather than a single event or a few isolated ones. When the National Advisory Commission on Civil Disorders published its report on the US riots of the summer of 1967, it put substantial responsibility for the spread of riots on the mass media and how it handled reports of the riots, as had the McCone Commission’s report on the Watts riot of 1965. Since then, scholars and politicians have routinely criticized mass media for their conduct during and after riots. The mass media contribute to riots in two main ways. First, they can fan the flames of a riot while it is happening by live broadcasts of the action on the streets. These reports immediately draw the attention of potential participants who can be drawn out into the street and increase the size of the crowd, the complexity of the situation, and the chances for further inflammatory confrontations as police try to control the situation. The pressure for immediacy can also contribute to inaccurate and inflammatory reporting as reporters rely on hearsay and rumors as they quickly attempt to piece together a story. Second, media reports of riots spread information about riots and their outcomes and seem to suggest rioting as a behavioral tactic to potential actors in other locations. Thus, in modern times, mass media distribution has become the key network structure that provides a conduit for the diffusion of collective violence.

Rather than the mindless imitation posited by early crowd theorists, however, modern takes on the diffusion of collective violence are inherently rationalist. These approaches to diffusion understand the imitation process as involving transmission of information about the actions of rioters, the reactions by social control agents, and the outcomes of the riot to other potential rioters in other locations. The potential rioters then evaluate the outcomes of the prior act and then, individually and collectively, make decisions about whether they will be likely to adopt the behavior, should the opportunity arise. When an opportunity does arise, such as when a crowd gathers around to observe an arrest, rioting is then more likely to develop.

Because media distribution areas and the cultural salience of actors are both geographically concentrated, information flows that could inform further rioting are geographically concentrated as well. In addition, the salience of past events wanes quickly as the riots become old news, and thus the chance of imitations are concentrated in brief periods, thereby inducing short-lived bursts of action or mini-waves of rioting reflected in the relatively jagged pattern of rioting most often observed in riot waves.

The rationalist logic requires that riots are observed and evaluated positively in order for the evaluation to lead to imitation. A negative appraisal would presumably dissuade diffusion. Contrary to what might be expected by an outsider viewing the sometimes devastating effects of riots on neighborhoods and businesses, surveys conducted by social scientists after urban riots in the 1960s repeatedly demonstrated that many African Americans viewed the riots positively. Even in the very neighborhoods where the riots caused the most damage, the residents often believed that the riots were necessary to call attention to the problems of the area and would ultimately do more good than harm (Feagin & Hahn, 1974). Many of those who
participated in the riots and later testified before the Congressional committee expressed a sense of pride and efficacy for both their own actions and of others they observed (US Senate 1967–1970). Likewise, in 2005, many French Muslims expressed supportive attitudes toward the actions of rioters, believing that these destructive protests were finally calling attention to the problems of a population that had been systematically neglected by French policymakers. These positive evaluations of rioting are consistent with, and lend support, to rationalist, diffusion-based explanations for the spread of rioting.

Whether riots actually do produce positive outcomes is an open question. There is little doubt that riots draw attention to the community in which they occur and invite speculation about the causes of the riots and what might be done to correct them. Government commissions are formed and legislative bodies investigate and sometimes introduce policy and allocate resources to address the posited problems. Because riots seem to appear in relatively impoverished areas, for example, policy interventions have been targeted toward improving the economic conditions in these areas. The Model Cities program in the late 1960s US was one key federal program that was developed at least in part as a response to the riots of the era (Gale 1996). Thus, riots can definitely produce attention to problems in a community, as rioters often seem to expect. Whether this attention and the resulting programs ultimately have any positive effect is a different question and one that has been harder to demonstrate. Often, the programs are underfunded or dismantled before any effect has been felt. Furthermore, the long-term effects on the economies of riot-stricken areas are difficult to overcome – some areas never seem to recover from the devastation (Collins & Margo 2004).

Animal rights movement
C. Traini

In the English-speaking world, the expression “animal rights movement” is used to designate activist organizations that, since the late 1970s, have denounced the exploitation of animals. By then, however, the history of social movements for the protection of animals was already more than 150 years old. Indeed, since the start of the nineteenth century, activists appalled at the human treatment of animals have mobilized against the brutality of our customary behavior. The initial concern was with the treatment of cattle and it is only through a gradual sociological process that animal protection extended to pets and then, much later still, to wild species and to their natural environment. This long history of mobilization for the protection of animals is inevitably linked to the evolution, not merely of socially acceptable emotions, but also of the threshold of tolerance of uncontrolled violence (Elias & Dunning 1986). Methodologically, historical analysis has proven essential in reconstructing the genesis of the variety of emotional gratifications thanks to which animal advocacy can still today mobilize activists of widely varying sociological profiles.

In 1824, the Society for the Prevention of Cruelty to Animals was the first activist organization ever founded to reform the ways in which human beings treat animals. In 1840, it became the Royal Society for the Prevention of Cruelty to Animals (RSPCA) thanks to the patronage of Queen Victoria, and attracted reputable members of the establishment. In other countries, similar groups were created by various parts of the elite. Members of these activist organizations were concerned about the sad spectacles which involved handling cattle and draft animals. However, they focused not so much on animal suffering than on the uncouth practices of those handling the animals. In fact, members of the first organizations to protect animals thought of themselves as educators whose role was to develop standards and to educate the masses. They focused on pedagogy. These early campaigning organizations promoted moral standards based on their aversion to brutality, injuries, and blood, on their respect for self-control and temperance, and on an interest in economic returns. Animal advocacy was considered one of the most effective means of reducing the violence of the lower classes – a concern particularly acute in France where there was the fear that it could trigger riots or even revolution (Agulhon 1981).

During the last third of the nineteenth century, moral protests and mobilization against the mistreatment of animals were characterized by a number of interdependent developments. First, pets, and especially dogs, were adopted in an increasing number of homes and contributed to glorify the intimacy and privacy of a domestic sphere to which middle-class women were henceforth confined (Kathleen 1994). Scandalized by the fate of abandoned dogs and in the name of protecting the weak – part of their private role, women flocked to organizations for the protection of animals that offered them the possibility of participating in the public sphere, from which they were usually excluded. The first dog shelters were created in Great Britain in 1860 and in France in the 1880s. They later became the main activity of animal protection organizations, as is still the case today. The institutionalization of shelters contributed to make a growing proportion of activists think of themselves as succorers, whose mission was to relieve the suffering of well-loved and loving creatures.

Moreover, Great Britain, soon followed by other countries, witnessed considerable outrage about the development of vivisection (French 1975). In 1875, Frances Power Cobbe founded the Society for the Protection of Animals Liable to Vivisection in London. A mere year later, the RSPCA counted no less than ten
British antivivisection associations. According to the *Bulletin de la Société française contre la vivisection*, there were 26 European antivivisectionist societies in 1885: fifteen in Great Britain, three in Switzerland, two in Germany, and two in France. These organizations were initially founded by traditional elites, concerned by the rise of a scientific and medical bourgeoisie but they found considerable support amongst women, shocked at the idea that dogs could be vivisected (Lansbury 1985). Mobilization against vivisection arose at a time when the history of animal protection was reaching a critical turning point. On the one hand, concern with the fate of animals was part of the leveling of compassion that developed in the wake of both Romanticism and democratic egalitarianism. Described as weak victims of powerful torturers, the suffering animal became the focus of a new type of activists, determined to act as *vindicatores*. Animal protection then assumed a critical, even subversive dimension, to the extent that it allowed outsiders to identify with the animal victim, and to protest such an abuse of power (Traïni 2011).

Nonetheless, the description of vivisectors as despicable torturers also aroused the indignation of the scientific community, who rapidly organized a devastating counterattack against the opponents of vivisection. In 1882, British scientists founded the Association for the Advancement of Medicine by Research. In 1884, the French psychiatrist Valentin Magnan likened the protection of animals to a form of madness caused by hereditary degeneration. In 1909, in the United States, Charles Loomis Dana, President of the American Neurological Society, described the protectors of animals as sick individuals suffering from zoophilpsychosis (Buettinger 1993). Scientism and sexism thus encouraged the diffusion of a stereotype attributing activism on behalf of animals to an excess of emotions, characteristic of pathologies to which the feminine nature was particularly subject.

Thus, after being defended by the most prestigious elites of a number of countries, animal protection became increasingly seen as the product of excessive sentimentality and therefore an inappropriate emotion in the public sphere. However, since the second half of the twentieth century, several distinct developments have helped to restore the prestige of animal advocacy. First, attachment to pets has become much more widespread across the social classes than in the previous century. The
socialization of children in developed countries is increasingly characterized by emotional and imaginary bonds with pets, stuffed animals, and animal characters in comic strips or cartoons. Second, the discovery of such concepts as biocenoses, the ecosystem, climax, and biodiversity have contributed to the slow emergence of a science, ecology, that provides compelling justifications for the protection of wild species and their natural environment. Specialists in the natural sciences founded organizations to campaign for the protection of wild species threatened with extinction. Thus, in 1961, for example, Sir Julian Huxley and three British ornithologists founded the World Wildlife Fund (WWF) which, 30 years later, claimed 4,700,000 members. The widespread interest in wild species also owes much to those in television and the cinema who, following in the footsteps of Jacques-Yves Cousteau, have contributed to making fauna, previously distant and unknown, into a more familiar televisual presence. Through a child’s eyes, the lines separating pets, stuffed animals, and wild or domestic species seen in TV documentaries or cartoons, have blurred. This evolution appears even more significant since it challenges the distinction between “useful” animals and “harmful” animals that nineteenth-century protectors of animals had promoted. This profound change in the depiction of animality has favored the broadening of the vocations of succorer and vindicator – originally exclusively oriented toward pets – to also include wild species and cattle. Thus, in 1963, British activists from the Hunt Saboteurs Association attracted attention by using their own bodies as barricades. Despite the risks involved, they successfully disrupted fox hunts. The same group of people founded the Band of Mercy in 1972 and the Animal Liberation Front (ALF) in 1976. They then launched commando operations against industrial livestock farming and laboratories to liberate the largest number of animals exploited by human beings. ALF activists assumed the role of liberators, determined to defy the law and face danger as long as the direct action undertaken could save the life of an animal perceived as worthy of compassion. In March 1979, the dramatic military tactics of the British ALF were imported by activists who liberated animals from the New York University Medical Center. In few years, ALF has completed over 100 clandestine operations in North American labs. The targets of its direct actions include ranches, meat markets, butchers, taxidermists, fur retailers, and so on. The California Attorney General declared it a terrorist organization in 1986 (Jasper & Nelkin 1992). Since then, activists of ALF have made direct actions in order to liberate animals in almost 40 countries.

Moreover, between 1970 and 1978, a group of Oxford-based academics decided to re-examine issues of moral philosophy and animal ethics. Richard Ryder, Peter Singer, Tom Regan, and others have fueled debates around the notion of anti-speciesism, that is, the desire to challenge discrimination against members of different species. Some of the activists involved in this philosophical debate organized protest campaigns against animal experimentation, such as Henry Spira in Manhattan in 1976. However, these activists intended to be educators rather than liberators, thereby renewing the original role adopted by supporters of the cause and in contrast with the more recent ALF (Singer 1998). Regardless, anti-speciesist philosophical arguments have, along with green theory, contributed to restore the legitimacy of animal protection. The sophisticated controversies of animal ethics and the university degrees collected by a new cohort of activists challenge the image of an involvement supposedly stemming from mindless sentimentality. In fact, the expression “animal rights movement” does not merely describe a new series of protest activities, but enhances the work of legitimization initiated by one of the most recent generations of animal protection activists. The use of this expression contributes to a motivational framing (Snow & Benford 1988), which aims to locate involvement in the protection animal in a symbolically powerful genealogy. Indeed, in English-speaking countries, “rights talk”...
makes claim to a two-fold legitimacy, linked to its grounding in philosophy and its connection with movements as significant as the civil rights movement.

The preliminary historic analysis is very useful when examining the most recent developments and transformations of the animal protectionist movements. In France, for example, according to the data produced by the Conseil national de la vie associative, 510 new associations “friends or specialists of animals” were created on average every year between 2000 and 2005, that is 2.5 times more than 30 years before. The great majority of these organizations are dedicated to strengthening the tradition of the succorers by offering multiple refuges and care to suffering pets. A smaller number of associations of vindicators were created both to denounce the systematic exploitation of animals by humans and to promote anti-specist theses or vegetarian and vegan diets. The members of these few associations often liken their mission to one of education and work to renew the debates about the necessity of animal protection. They organize happenings to protest against animal experiments, circuses, and cattle transport; they attempt to draw the attention of the media and they mobilize Internet resources to make the public more aware of animal suffering. This new generation of activists – in France as in many other countries – probably contribute to the modification of the most discursive dimension of animal protection. However, there are so far no studies that would allow us to assess how and to what extent they have succeeded in altering not only the discourses but also, and more importantly, the practices of an activist base, which remains heterogeneous.

Civil rights movement
(United States)
KENNETH T. ANDREWS

The civil rights movement emerged in the 1950s as a massive challenge to US racial inequality. The movement relied on diverse tactics including litigation, community organizing, and direct action to pursue political empowerment, expanding economic opportunities, desegregating major institutions, altering social relations, and transforming the broader culture. The movement remains one of the central cases in the study of social movements, and it had enduring impacts on American society and politics. This entry focuses on the movement’s origins, organizations and leadership, dynamics, decline, and legacy.

OVERVIEW

The civil rights movement was the sustained challenge to racial inequality from the mid-1950s through the mid-1960s. Most scholars understand this period as part of a much larger black freedom struggle that had origins well before the 1950s and extends up to the present. As a distinct and important phase of this struggle, two key events marked the onset of the civil rights movements: the 1954 Brown v. Board of Education and the 1955 Montgomery Bus Boycott. Both events showed the efficacy of collective challenges to racial inequality. The Montgomery Bus Boycott was launched after Rosa Parks was arrested for violating the city’s segregation policies on public buses on December 5, 1955. Although Parks’ resistance is sometimes characterized as a spontaneous act of defiance, she was a life-long activist and connected to a network of local civil rights leaders and organizations (Morris 1984). The boycott was supported by the newly formed Montgomery Improvement Association led by a young minister, Martin Luther King Jr. The boycott itself was sustained for over one year until courts ruled that the segregation laws were unconstitutional. The Montgomery Boycott was significant in demonstrating the viability of mass protest and civil disobedience in the Deep South. Building on the boycott’s success, King and other activist ministers founded the Southern Christian Leadership Conference (SCLC), an organization that brought together activist ministers from across the South and spearheaded many of the movement’s most important and successful campaigns (Fairclough 1987).

The Brown decision was the culmination of a protracted legal campaign waged by the NAACP Legal Defense Fund. The most immediate impact of the Brown decision was the rise in “massive resistance” by white Southerners to challenge civil rights initiatives (Klarman 1994). Within two months of the Brown decision, White leaders gathered in Indianola, Mississippi to found the White Citizens’ Council, an organization that led efforts to resist the movement and federal support for civil rights (McMillen 1971). The conflict over school desegregation came to a head in Little Rock, Arkansas in 1957, as the local NAACP branch sought to desegregate local schools. Ultimately, President Eisenhower ordered the National Guard to Arkansas to enforce the successful desegregation of Little Rock Central High School by the Little Rock Nine. Through the late 1950s and 1960s minimal change occurred in patterns of school segregation. Thus, despite the high drama of the Little Rock conflict, there was little school desegregation until the late 1960s when the federal courts and the Department of Health, Education, and Welfare compelled local school districts to act on the Brown ruling (Rosenberg 1991).

The Montgomery Bus Boycott and its forerunners demonstrated the viability of
organizing a mass movement to challenge segregation in the Deep South, but there were few protest campaigns between 1956 and the beginning of the Greensboro sit-ins on February 1, 1960. This changed quickly as college students throughout the South became involved in direct action protest. The sit-in campaigns targeted segregated lunch counters and other public accommodations in the US South. The tactic had been developed by Congress of Racial Equality (CORE) activists in the 1940s and used sporadically in the 1950s, most often by high school students outside the core Southern states (Meier & Rudwick 1975; Morris 1981). The initiating event in 1960 occurred when four students at Greensboro’s North Carolina A&T began their protest on February 1. Following Greensboro, protest spread to nearby cities with large numbers of black college students. By mid-April sit-in campaigns had been launched in more than 60 cities in every Southern state except Mississippi (Andrews & Biggs 2006). The 1960 sit-ins escalated the Southern civil rights struggle, politicized college students, and pioneered the use of novel protest tactics. Moreover, the sit-ins led to the formation of the Student Nonviolent Coordinating Committee (SNCC) that played a critical role in shaping the civil rights movement.

In 1961, CORE launched Freedom Rides that challenged segregation in interstate travel. On May 4, two interracial teams boarded busses in Washington, DC, traveling through the South to New Orleans to arrive on May 17. Freedom Riders faced some harassment in the early days, but the most extensive violence occurred in Alabama. With the foreknowledge of the FBI, Justice Department, and local law enforcement, Ku Klux Klan leaders executed a coordinated assault on the Freedom Riders in Anniston and Birmingham. Students from Nashville traveled to Montgomery to participate in the Freedom Rides and another bloody assault took place further heightening pressure on the Kennedy administration for a quick and nonviolent resolution. Ultimately, Kennedy secured guarantees from Mississippi’s Governor Ross Barnett for safe passage to Jackson where activists were arrested for breach of the peace and violating local segregation laws. Civil rights leaders established training centers to send further Freedom Rides through the South as they too were arrested with little fanfare. Most Freedom Riders refused bail and were ultimately sentenced to Mississippi’s infamous Parchman Penitentiary taking them out of the newspapers and the public eye (Arsenault 2005).

The spring of 1963 witnessed the next major wave of demonstrations. Events in Birmingham, Alabama captured center stage when Martin Luther King’s SCLC launched a massive campaign (Eskew 1997). The campaign targeted business leaders focusing on the primary goals of desegregating downtown establishments, instituting fair hiring practices, and establishing a biracial committee to implement school desegregation. While under arrest, King wrote his famous “Letter from a Birmingham Jail” that provided a powerful and widely disseminated justification for using civil disobedience and direct action protest grounded in religious, historical, and political context. The SCLC’s strategy in Birmingham was shaped by its unsuccessful campaign the previous year in Albany, Georgia. In Birmingham, protesters used diverse tactics that were designed to divide the elite (Morris 1993). Sustained protest, including the “Children’s Crusade” in which hundreds of children protested and were attacked by Eugene “Bull” Conner’s police force, generated a crisis among local elites and brought massive national and international attention to the conflict. At the same time, civil rights campaigns occurred in dozens of Southern cities through the spring and summer. The summer ended with the 1963 March on Washington for Jobs and Freedom that brought civil rights supporters to Washington, DC, for one of the movement’s most iconic moments on the steps of the Lincoln Memorial.

In the early 1960s the SNCC attempted to organize the most dangerous parts of the rural South with a strategy of building organizational capacity among the most powerless segments of the black community (Payne 1995). This
marked a shift away from prior organizing and protest that occurred in major cities like Nashville, Atlanta, and Tallahassee. Between 1961 and 1963, the SNCC initiated projects in southwest Georgia and in Mississippi. In 1964, an umbrella organization in Mississippi that included the SNCC, CORE, and the local NAACP recruited college students from around the country to work in Mississippi’s civil rights projects. Voter registration was the major focus of local organizing although organizers established Freedom Schools to provide courses on citizenship, literacy, history, and so forth. The Freedom Summer project mobilized support for an independent political party—the Mississippi Freedom Democratic Party—that challenged the traditional, all-white delegation of Democrats to the Democratic Party Convention in Atlantic City. Led by local leaders such as Aaron Henry and Fannie Lou Hamer, the challenge was unsuccessful although it brought considerable attention to voter discrimination in Mississippi and helped build support for the 1964 Civil Rights Act and the 1965 Voting Rights Act. Organizers and participants in Freedom Summer went on to play leading roles in other movements including the Black Power, antiwar, and women’s liberation movements (McAdam 1988). The Freedom Summer campaign also built a foundation of local leaders and organizations that had an enduring impact on local political and policy in Mississippi (Andrews 2004).

The following spring witnessed what is often considered the last major battles of the Southern civil rights movement in Selma, Alabama. The campaign focused on voter participation and is credited with consolidating support for the 1965 Voting Rights Act (Garrow 1978). Like Freedom Summer, the Selma campaign had roots in community organizing by SNCC activists. However, the SCLC played the leading role during the demonstrations and marches that occurred in 1965. The most well-known events occurred during a planned march from Selma to the state capitol in Montgomery. On March 7, the protest ended with demonstrators being beaten by state troopers while attempting to leave Selma by crossing the Edmund Pettus Bridge. The events were labeled “Bloody Sunday” and received extensive national and international attention. A second planned march was canceled by Martin Luther King Jr following a court injunction. Finally, following a favorable decision by a federal judge, a third march from Selma to Montgomery began on March 21 led by King and accompanied by an estimated 25,000 protesters, including major civil rights leaders and celebrities.

Although there was significant continuity in black protest after 1965, the period of intensive mobilizing subsided in the late 1960s. In the South, many activists shifted their attention toward electoral politics and others toward pursuing economic changes through various initiatives including the War on Poverty. The shift toward Black Power had its origins in the Southern civil rights movement. For example, SNCC activists introduced and popularized the term during a 1966 march in Mississippi, and organizers working in the rural South had been questioning the strategic value of nonviolence for several years (Payne 1995). Nevertheless, the Black Power movement gained much greater traction outside the South. The growth of other social movements, including the student, women’s, and antiwar movements, may have further undercut support for the civil rights movement. The attention of political authorities and the mass media shifted away from civil rights as well and toward the Vietnam War, urban riots, and emerging social movements. The legislative gains in the mid-1960s may have accelerated the movement’s decline by exacerbating internal tensions in the movement between moderate and radical activists (Piven & Cloward 1977).

ORIGINS AND EMERGENCE

The civil rights movement’s emergence was shaped by important social, economic, and political forces. These include the collapse of the cotton economy, the urbanization of
black Southerners, growing levels of college enrollment, and a strengthening of civic and religious organizations in black communities.

Race relations in the post-Reconstruction South rested on an institutionalized system of economic, political, and social control of African-Americans. The economic foundation relied on sharecropping that left black farmers destitute, and discriminatory practices throughout other sectors. The sharecropping system was undermined by the mechanization of agriculture and the increasing economic opportunities for black workers in cities. Political domination was established through disfranchisement including poll taxes, discriminatory voter registration procedures, intimidation, and violence. Through white political domination whites funneled a disproportionate share of resources into “whites only” schools and other public facilities. Socially, Southern race relations were governed by a system of Jim Crow laws and practices that relegated blacks to inferior facilities and degrading patterns of interaction.

Changes in the national and international political context facilitated the movement’s emergence in the 1950s. In domestic politics, increasingly favorable court decisions and federal attention to civil rights may have emboldened civil rights leaders and blacks more broadly about the prospects for challenging racial inequalities (McAdam 1982). International politics mattered too. For example, military service during World War II was formative for many civil rights leaders (Payne 1995). The heightened attention to democracy and reactions to the Holocaust may have fueled demands for addressing racism in the United States. Moreover, the cold war played a pivotal role in shaping the emergence of the civil rights movement. America’s system of racial apartheid became a major vulnerability in diplomatic relations thereby providing the movement with an important source of leverage. At the same time, the cold war and McCarthy era anticommunism channeled the movement away from strong alliances with the Left, toward a rights frame, and elevated the significance of congregations and religiously based frames and ideology (Hall 2005).

Major changes occurred within black communities leading up to the civil rights movement. Increasing urbanization provided a context within which black-owned businesses emerged and stronger religious and civic associations flourished. While rural churches had few resources and might share a minister across multiple congregations, urban churches provided the movement’s mass base with its elaborate leadership structure, communication channels, and powerful shared symbols and rituals (Morris 1984). Black colleges and universities expanded in the years leading up to the civil rights movement, especially following World War II (McAdam 1982).

These changes in black institutions were reflected in the growth in civil rights organizations and leadership networks. The NAACP, the largest civil organization, was founded in 1909, and the organization had a federated system of local and state chapters with local leadership. The NAACP also had separate youth and college organizations that played important roles in some of the early civil rights campaigns. The NAACP’s Legal Defense Fund was established as a separate organization in 1939 and led the major legal challenges to segregated schools. CORE was founded in 1942 by an interracial group of pacifists with connections to the Fellowship of Reconciliation. In the 1940s CORE pioneered the use of sit-in tactics and launched integrated bus trips through the South in 1947 to challenge segregation laws. CORE had few local organizations in the South in the 1950s but took on an increasingly important role during and following the 1960 sit-ins. The other two major civil rights organizations – the SCLC and SNCC – were formed during the movement itself. The SCLC was formed in the wake of the Montgomery Bus Boycott as a network of affiliated ministers and congregations. The SNCC emerged from the 1960 sit-ins as an organization of student activists (Biggs & Andrews 2010).
Civil rights campaigns and protest were typically supported by “local movement centers” including leaders and local organizational affiliates from the major civil rights organizations (Morris 1984). However, movement support went beyond formal movement organization and included sympathetic congregations, labor organizations and leaders, and so forth. Although men occupied many of the formal leadership positions, especially in the churches and NAACP, women played pivotal roles as leaders such as Ella Baker, Septima Clark, and Fannie Lou Hamer and as the movement’s rank-and-file support.

MOVEMENT IMPACT AND LEGACY

The impact and legacy of the civil rights movement was broad and complex. Many facets of American society were touched by the movement, including politics, social interactions, workplaces and the economy, culture and popular beliefs, and subsequent social movements. These outcomes were, of course, partial and uneven and faced substantial and ongoing resistance.

The movement dismantled the system of Jim Crow segregation that circumscribed the lives of black Southerners for many decades. Although this consequence is sometimes overlooked, it remains one of the movement’s most significant accomplishments. In the political arena, the movement helped make civil rights a central focus of federal legislation and policymaking through the 1960s. The 1964 Civil Rights Act and the 1965 Voting Rights Act are the most widely celebrated victories. Other political impacts include the transformation of the Southern political party system and advancing legislation in other areas including housing and affirmative action. Economic consequences include the desegregation of labor markets and workplaces leading to some economic gains for blacks (Wright 1999). However, significant economic inequality persists, and some scholars point to increases in incarceration as a form of political backlash following the civil rights and Black Power movements.

One of the most important and overlooked consequences of movements is their impact on subsequent social movements. The civil rights movement contributed in fundamental ways to the formation of the Black Power, women’s liberation, farm workers, student/New Left, and anti-Vietnam War movements. Key leaders for each of these movements had formative experiences in the civil rights struggle and adopted major strategies and collective action frames from strands of the civil rights movement (McAdam 1988). Beyond these direct connections, the civil rights movement was and continues to serve as a major source of inspiration and learning for social movement leaders and participants. For example, the civil rights movement aided the revitalization of the US labor movement (Isaac & Christiansen 2002). Undoubtedly, the civil rights movement shaped many countermovements that have sought to undermine or reverse the movement’s accomplishments from the 1950s to the present.

Labor movement
RICK FANTASIA, KIM VOSS, and BARRY EIDLIN

The labor movement is a broad, multidimensional social formation that is generated from the social structures of work and industry in a society. It may comprise both legally recognized and formally sanctioned institutions (like trade unions, political parties, and works councils) as well as less formal groupings of workers and their allies (industrial actions, organizations of strike supporters, workers centers, dissident movements within unions, cultural forms, etc.). Labor movements operate at the intersection of economic practice, civil society, and the state. They are more or less firmly institutionalized in any given society in any given historical period, and can be partly characterized by the extent to which extra-institutional practices are permitted and have been incorporated into the routine operations of industrial and labor relations. The social and organizational composition of a labor movement, as well as the degree to which its practices have been institutionalized, are thus two important analytical axes through which the social logic of a labor movement can be discerned.

Given this inherently relational character of labor movements, we find tremendous historical and cross-national variation both across and within individual labor movements, depending upon the broader sociopolitical context in which the labor movement in question is situated. Indeed, it is only by situating labor movements within these concrete historical and political contexts that we can properly discern and analyze them. As such, this entry will primarily focus on the specific case of the US labor movement and its development over time, while making broader statements about general trends and characteristics where appropriate.

The US case is often considered an exception to broader labor movement trends in the other advanced capitalist democracies. If the structures and dynamics of the US labor movement are distinctive in significant ways, and we think that they are, our analysis will also show similarities with other national cases, and especially in the formative years. The distinctions that have emerged since then as the exceptional qualities of the US case have to do with the exceptional power of US corporations to shape the terrain upon which the labor movement operates. In other words, if there has been a US exceptionalism with regard to labor, it is because it has been relationally constituted by the exceptional position of capital in the US context. Therefore, to the extent that the US labor movement’s historical development has been made to be exceptional compared to other countries through its relations with an exceptionally powerful corporate sector in the US, then it is also true that corporate structures and practices internationally have begun to mimic elements of the US model in ways that have affected labor movements across the advanced capitalist democracies. Thus, while it is important not to generalize too much from the specificities of the US case, it nevertheless offers a useful analytic vantage point from which to develop a broader understanding of the ways in which particular institutional and political configurations work to shape labor movements more broadly.

Having been born in and by the industrial order, the labor movements of the most developed capitalist societies generally took on their characteristic appearance over the course of the nineteenth century, with political parties and trade unions being the most prevalent organizational forms. Contrary to conventional wisdom, in its formative decades the US labor movement was not a particularly exceptional case relative to other industrial societies, although the arc of its trajectory would become increasingly distinctive later on. Thus, just as in England and France, two
countries whose socioeconomic development was roughly comparable to the United States, for much of the nineteenth century the American labor movement was composed of skilled craftworkers whose cultures and practices had been constructed to protect traditional skills and craft prerogatives in the face of machine technologies and standardized work practices that employers had specifically designed and implemented to erode them. By the last quarter of the nineteenth century, however, the character of the American labor movement began to take an “exceptional” form, although not at all in the manner in which conventional wisdom has often held. The labor movement in the US was becoming militant and class conscious in ways similar to that which Karl Marx had envisaged in his analyses of the development of capitalist society, most notably expressed in the explosive growth of the Knights of Labor. The Knights were a remarkably egalitarian organization of workers and artisans that, by its height in 1886, had mobilized almost 10 percent of the US working class, across skill level, nationality, race, and gender, into militant local assemblies spread out across the entire country.

In contrast to perspectives in sociology and historical studies that have viewed the US labor movement as intrinsically and exceptionally weak, or conservative, or lacking in collective solidarity (variously attributed to affluence, or the possibilities for upward social mobility, or the spatial expansiveness of the American frontier, or early universal male suffrage, among other factors) the existence of the Knights of Labor in the late nineteenth century suggests the need for an alternative interpretation. A consideration of the dynamics of both their rise and their fall provide us with the lessons for such a reinterpretation. Ironically, it was the rapid and widespread mobilization of workers into the Knights that provoked a powerful mobilization of employers to counter them, with the ferocity of the reaction leading to their equally rapid downfall, as well as to a general weakening of the US labor movement for at least another generation. Unlike in England and France, where the state often intervened to encourage or demand employer concessions in labor disputes, the US government at the time did little to constrain the actions of employers, allowing them free rein to destroy the Knights of Labor. Considered altogether, this suggests that (1) the US labor movement was not intrinsically weak and, if anything, at one time was perhaps more militant and class conscious than its counterparts; (2) the reaction by employers to the militancy of the Knights reshaped the legal, political, and social terrain in ways that made militant worker organizations much more difficult to mobilize and sustain, thus demonstrating the “exceptional” power enjoyed by employers in the US context. One outgrowth of the defeat of the militant Knights was the ascendency of a more pragmatic, conservative, craft-based unionism, embodied by the American Federation of Labor (AFL), which became the overwhelmingly dominant institutional force within the US labor movement well into the twentieth century.

What this brief example illustrates is that labor movements can never be properly understood without considering them in their mutually constituting relationship to the corporate employers of labor (capital). Moreover, the nature of this relationship will strongly affect the role of the state in the society. In the case of the US, the state has not been as strong a force for regulation as it has been in other societies and this has meant that large corporations have been relatively free to operate. With such freedom, large corporations have become firmly ensconced as the dominant institutional player in US society, thus ensuring a relatively weak labor movement. In most other capitalist societies the state has tended to foster more balance in this relationship, by limiting (or regulating) the power of large corporations. It is important to recognize at the same time, however, that, because the society is not a static one, the power and position of the labor movement in US society has not always been consistently weak.

Moreover, the labor movement has never been monolithic and has always combined various competing tendencies. For example, by the turn of the twentieth century, a
massive increase in European immigration was underway, with millions of relatively unskilled workers pouring into the US, attracted to the huge factory complexes where assembly lines and other mass-production techniques were fast becoming the basis for most forms of manufacture. A craft-based capitalism was giving way to highly industrialized forms, thereby paving the way for a new form of unionism. The American Federation of Labor (AFL) which, as we’ve seen, had openly rejected the militant social unionism of the Knights of Labor, was made up of organizations largely shaped by the prerogatives of their own members, native-born skilled craftsmen concerned with protecting their own relatively privileged status within the working class more than with opening their ranks to the unskilled immigrants whom they often looked upon with contempt. Not until the 1930s was a widespread effort undertaken to organize the unskilled workers from the mass-production industries into industry-wide unions. It meant bringing into the same organizations men and women of all races and ethnic backgrounds, regardless of skill level, and these industrial unions formed together under the overall banner of the Congress of Industrial Organizations (CIO). The attempts to form the CIO unions were met with ferocious resistance by the large corporations, often including organized violence and thereby necessitating a more militant stance and a more combative political framework on the part of the new unions. Politically, CIO leaders abandoned efforts to form independent labor parties in favor of an alliance with the Democratic Party. In the workplace, unions traded organizational stability and legitimacy in the form of “dues checkoff” (where union dues are automatically deducted from workers’ paychecks) and “union security” (where union members covered by a contract are obligated to remain union members for the duration of the contract) in exchange for assisting management in quelling shop floor unrest and ensuring more predictable, stable industrial relations. The result was a dramatic growth of union membership in the immediate postwar decades, but at the cost of undermining unions’ mobilizing capacity at the shop floor level.

Many scholars and labor leaders have looked upon the 30 years following the close of World War II as a “golden age” for the US labor movement, characterized by a “labor–management compact” whereby unions and employers worked together to ensure steady increases in workers’ wages and benefits in exchange for steady increases in worker productivity. But a closer look at the historical record shows that the idea of a “labor–management compact” is illusory in important respects. Although weakened by the crisis of the Great Depression, large corporations quickly moved in the immediate postwar period to reassert and consolidate their power within US society by seeking to curtail the militancy and radicalism of the CIO. An important step in this renewed employer counteroffensive was the passage of the Taft-Hartley Act in 1947, a broad set
of statutes drafted by corporate lawyers to essentially repeal the Wagner Act that had earlier encouraged industrial unionism. The Taft-Hartley Act achieved a number of the long-standing goals of American corporate employers, including weakening union security in a variety of ways; forbidding the most effective forms of industrial action; imposing a stifling regime of bureaucratic governance over labor relations practice, as well as on the practices of union leaders; while purging communists and radicals from the ranks of the union leadership, thereby removing the clearest and strongest voices for social change from positions of authority in the unions.

The passage of the Taft-Hartley Act illustrated the contradictory position in which US unions now found themselves. Their alliance with the Democratic Party and the passage of the Wagner Act had won for labor greater organizational stability and institutional legitimacy than they had ever previously enjoyed. This allowed unions to secure unprecedented increases in living standards for their members. But that stability and legitimacy came at a price. In a pattern that would recur over time, the Democratic Party proved to be an unreliable political ally when it came to defending labor’s gains. In the case of Taft-Hartley, conservative Southern Democrats allied with Republicans to pass the bill over President Truman’s veto. Furthermore, unions’ reduced level of shop floor organization, combined with renewed employer aggressiveness, hemmed in labor’s broader social agenda. Rather than continue to fight for universal social benefits, such as a national health care system and more extensive pensions, unions settled for the creation of a private system of employer-provided “fringe benefits” that unions negotiated separately with each company.

By the mid 1950s the AFL and the CIO had merged, while largely adopting the political visage of the AFL. It was a period characterized by rapid postwar economic growth, rising American military intervention throughout the less developed world, and a profound ideological conformity imposed under the name of McCarthyism. The corporate-imposed domestication of the US labor movement noted above was often misinterpreted by social scientists as a kind of “natural” outgrowth of institutional maturation that was thought to characterize labor relations in all developed societies. A related version of the same theme saw the “end of ideology” as the inevitable accompaniment to modern socioeconomic development, whereby societies would simply discard any need for radical criticism or ideological debate with regard to the future.

However, underneath such obvious signs of approval that were stamped on the social order by conservative social scientists or the bureaucratic practices that had been imposed on labor relations in the process of domesticating it, there were important countertendencies apparent to the few who took notice. These took the form of dissident movements of workers, often radicalized by their experiences in the largest unions, who fought against the sorts of things that the Taft-Hartley Act had imposed (i.e., they struggled to replace union leaders who were insufficiently militant, overly bureaucratic, or undemocratic, and to wield militant forms of protest and collective action, such as wildcat strikes). In other words, the actions of employers to constrain the labor movement had generated new forms of organization and new forms of action from deep within the labor movement itself.

By the beginning of the 1970s, facing strong competitive pressures from European and Japanese firms, US manufacturing corporations began to squeeze more from their domestic operations by forcing down wages and by mounting a formidable and wide-ranging assault on union organization. Drawing upon a legal arsenal that had been put in place by the Taft-Hartley Act and assisted by a burgeoning industry of management consultants specializing in both union avoidance (slowing the creation of new unions in those sectors of the economy where unions had not had traditional roots, like health care and much of the services) and in breaking unions in the traditional sectors of labor
strength (food processing, meat packing, newspapers, airlines, etc.). While the assault against unionism reached its peak during the decade of the 1980s, it continued through the 1990s and up to the present, with union density rates falling from a high point of 35 percent in the mid 1950s to approximately 12 percent and falling in 2010 (where in the private sector it is less than 7 percent).

Some groups of workers sought to resist the employer assault in this period, mounting impressive campaigns against corporations such as Pittston Coal, Ravenswood Aluminum, Los Angeles property services companies, and more. But, overall, the US labor leadership’s response to the attack was conservative and unimaginative. Many labor leaders embraced a renewed focus on “labor–management partnership,” even as management expressed a preference for eliminating unions altogether rather than partnering with them. Meanwhile, union leaders called for labor law reform as a means of righting the tilt toward management in labor relations. But again, Democratic Party politicians proved themselves to be unreliable political allies, as the labor-backed Democratic presidential administrations of Carter, and later Clinton, failed to deliver on promises of labor law reform.

In the mid-1990s, faced with the demise of its institutions and its position in society, the leadership of the US labor movement began to forge a process of internal change in an attempt to reverse its fortunes. The change began with a “palace coup” within the top ranks of the AFL-CIO, that replaced a conservative, bureaucratic leadership with a reform leadership group drawn from some of the more militant and dynamic unions. Once in place, the new leadership group began a campaign to encourage, cajole, and coerce the leadership of the approximately 60 unions in the Federation to turn more of their efforts and budgets toward organizing new members, rather than servicing the needs of existing union members. They encouraged new, more militant union organizing tactics, including circumventing the bureaucratic system of union representation elections in favor of collective action and disruption; developing “corporate campaigns” to pressure institutional shareholders to protest corporate antiunionism; and seeking to envelop labor struggles within a wider circle of community solidarity, narrowing the distinction between the labor movement and other social movements.

While these reform and revitalization efforts made some headway in slowing the pace of union decline, they did not reverse it. By the mid-2000s, some prominent US labor leaders began to express frustration publicly with what they charged was an insufficient attention to new organizing within the AFL-CIO. In 2005, these leaders formed a coalition of some of the largest US unions that left the AFL-CIO to form the rival Change to Win Federation (CTW). Although the split did not lead to much interfederation conflict, as some had feared, it also did little to revitalize the labor movement as a whole. Within a few years some of the original CTW unions had returned to the AFL-CIO fold, and several CTW unions found themselves riven by internal conflicts.

One casualty of the resurgence of intraunion conflict was the most recent effort at enacting labor law reform. Although President Obama publicly backed the reform legislation, known as the Employee Free Choice Act (EFCA), as a candidate, he emulated his Democratic Party predecessors in showing little enthusiasm for labor law reform as president. Meanwhile, unions that had played key roles in backing and advancing EFCA, such as the Service Employees International Union (SEIU) and UNITE HERE, diverted resources from mobilizing around EFCA toward fighting internal battles. At the same time, most other union leaders continued their patterns from previous reform efforts of relying on labor-backed Democratic Party politicians to advocate for EFCA within Congress. But with large numbers of newly elected, conservative-leaning Democratic legislators expressing lukewarm support for the bill, and little backing from President Obama, the EFCA legislation stalled in the Senate, where it died before coming to a vote.
Despite the US labor movement’s numerical decline and failure to achieve legislative gains for itself, it remains a powerful and respected political force. While corporations routinely outspend labor in election campaigns by vast margins, few other organizations are able to mobilize the number of voters that unions can. This is especially the case for unions representing workers in the public sector, where union membership has remained strong at more than one-third of the workforce. Since unions’ political mobilizing efforts are usually deployed in the service of electing liberal, usually Democratic Party, politicians, many conservative lawmakers, political action committees, foundations, and wealthy individuals have advanced strategies and policies to limit unions’ ability to participate in the political process. In recent years this has taken the form of increasing attacks on public sector unions, in some cases going as far as attempting to deny collective bargaining rights entirely to public sector workers. These attacks have in turn sparked some of the largest labor mobilizations in decades. The long-term outcome of these mobilizations remains uncertain, but their existence, and the generally positive public response to them, speaks to the continuing importance of unions, and challenges popular notions that unions are somehow outdated in the twenty-first century.

Corporate mobilization against the US labor movement has been particularly aggressive and particularly successful in weakening the conditions of workers and their organizations in recent decades, but the position of labor has become increasingly precarious elsewhere as well. The labor movements in the most advanced economies of Western Europe are still a good deal stronger politically, and more firmly rooted institutionally than are US unions. Indeed, the practice of “social partnership” has, for decades, characterized the relationship between large corporations and the labor movement in much of Western Europe, and is still intact. What this has generally meant is a more consultative, and less openly combative, relationship than in the US, represented by the active existence of works councils in many of the largest enterprises and trade associations that afford labor a voice in corporate planning. However, the deregulation of global markets and the imposition of many neoliberal reforms across Europe (often pioneered in the US, where labor has not been able to offer firm resistance) has shown that societies are now faced with some very similar competitive pressures (to privatize public services, to deregulate markets, to treat short-term shareholder value as a guide in economic policy, etc.). The tendency to cheapen the cost of labor is therefore increasingly an international effort, so that there is a drive to eliminate the differences between national labor movements by weakening them all. Ironically then, faced with the competitive pressures from US corporations in many world markets (given that the impetus and rationale for wage cuts and union busting in the US in the 1970s were blamed on competitive pressures from the other direction!) European societies have seen corporate intransigence increase and union power decline in recent years, expressed most explicitly in the erosion of a host of state social welfare policies. Across Europe a debate rages between the labor movement and allied social forces seeking to defend a European model of social solidarity, and those who would subordinate social and labor policies to corporate power and the exigencies of the market alone.

Student movements
CHRISTOPHER ROOTES

Movements for social and political change are typically “youth movements” insofar as it is usually young people who are first to demand changes in or of regimes that appear unable to satisfy popular aspirations to basic human rights, personal freedom, economic well-being, and political democracy. To some extent this reflects intergenerational inequities leading to a “conflict of generations” (Feuer 1969) as the young are especially likely to suffer high rates of unemployment and to harbour aspirations stimulated by contact with or awareness of conditions in states that are socially and politically liberal as well as more affluent. But it also reflects the fact that young people are relatively less likely than their elders to be constrained, by obligations of work and family, to conformity with the dominant regime.

Many of what are indiscriminately called “youth movements,” especially in their initial stages, consist of or are led by students. This has become increasingly true as the proportion of successive age cohorts who experience higher education has risen to the point where, even in many less economically developed countries, around half of all people aged under 25 are or have been students in universities or post-secondary colleges. Mobilizations that begin among university students frequently extend to other young people, especially secondary school students, but it is usually university students who remain at the core of activism.

Although students have been prominent in many revolutions and revolutionary movements, as well as other forms of contentious politics, student movements – social movements comprised wholly or mainly of students – are a distinctively modern phenomenon. Their emergence is predicated upon the existence in a society of a critical mass of students.

Student movements have emerged in all manner of modern and modernizing societies, often as agents of change, sometimes in reaction against change, but usually as challengers of regimes perceived to lack legitimacy or moral authority. They have appeared in authoritarian states in Europe, Asia, Africa, and Latin America, as well as in the liberal democratic states of the industrialized world.

Student movements have an important place in the development of social movement theory. In the United States, it was dissatisfaction with the reductionist psycho-social explanations of student protest (see, e.g., Feuer 1969) that stimulated explanations that took social movements seriously as forms of political action (e.g., Keniston 1968; Habermas 1971). In Europe, theories of “post-industrial” society and “new social movements” were developed by Touraine (1971) and others as explanations of the student protest that confounded orthodox Marxist theories.

Sociological interest in student movements was excited principally by the eruption during the 1960s of student protest in the United States and in many states in Europe and the Pacific. Protests against the United States’ prosecution of the war in Vietnam were central to the student movements of the 1960s, but they also had other and deeper causes.

In the United States, the student movement emerged in the early 1960s out of the campaign for civil rights for African-Americans in the South as well as the socialist Student League for Industrial Democracy, which became Students for a Democratic Society in 1960. It came to prominence with the student revolt, in the name of freedom of speech, at the University of California, Berkeley, in 1964, the Berkeley events inspiring new scholarly interest in student movements as well as student mobilizations on other campuses across the United States and beyond. The US student movement, fuelled by increasing opposition to
the Vietnam War, spread nationwide before reaching a crescendo in the spring of 1970. In Western Europe, student movements developed in most countries and, most spectacularly, brought normal life to a halt in much of France in May 1968 when students appeared to put revolution back on the political agenda of liberal democratic states. However, student movements also challenged regimes and/or contested government policies in Australia, East Asia, and Communist-ruled Eastern Europe.

Student movements emerged in the advanced industrialized societies toward the end of a period of doubling, even trebling, of enrolments in higher education. As a result, students were everywhere unprecedentedly numerous, both relatively and absolutely. The expansion of higher education had various sources. One was demographic pressure – the swelling, consequent upon the postwar “baby boom,” of the age cohorts from which most students were drawn. But everywhere the main pressures for expansion were political – from governments influenced by human capital theorists to invest in more highly qualified workforces in the hope of improving economic competitiveness, and from newly affluent parents concerned to ensure the career prospects of their offspring. As socio-technical change sketched in the outlines of the “knowledge economy” and began to transform occupational structures, so demand for and the supply of higher education grew dramatically. At the same time, increasing affluence made it possible for unprecedentedly large numbers of young people to enjoy a moratorium upon adult obligation. Youth as a distinct stage of life was born, and the university was its ideal locus.

The numbers of students expanded just at the time that demographic and socioeconomic changes combined to enhance the status and visibility of youth. The entry of this generation produced strains within universities that, in many countries, were elitist and traditionalist. Inadequate facilities, unreformed curricula, and antiquated rules generated conflicts between students who considered themselves adults, and authorities who regarded themselves as acting in loco parentis. These local conflicts with university authorities were, however, symptomatic of wider strains in society.

These were not, however, simply the self-interested complaints of the materially deprived. Everywhere, students were drawn disproportionately from the relatively privileged strata of societies. Actual or anticipated graduate unemployment, sometimes proffered as an explanation of the rise of student radicalism, played little or no part. This was before the peak of the long postwar economic boom and, even in Italy, where the mismatch between output and labor market was legendary, the peak years of the student revolt coincided with historic lows in the frequency of graduate unemployment (Rootes 1995). If there were grievances about employment prospects, they were less about the lack of jobs than about demands for “jobs worth doing.”

Social, demographic, and educational changes provided the actors for student movements, and local difficulties that raised civil libertarian issues often generated the first sparks, but it was events in the wider political arena that accounted for the spread of protest and cross- and intra-national variation in its incidence. Students’ local grievances generally highlighted political rigidities at state level as university authorities found themselves powerless to respond in ways that might defuse protest, as in France where university rectors had no power even to modify dormitory regulations. However, the general political condition that stimulated the development of student movements was an effective vacuum of political opposition to government policies within mainstream political arena.

In the United States, where only a few legislators voiced opposition to the Vietnam War, the draft compelled students to think seriously about the issues, and student opposition expanded to fill the space available. In Western Europe, the sclerotic politics of states frozen by the communist/anticommunist divide were similarly conducive. In West Germany, the absence of opposition was almost
literal, as student socialists had been expelled from the Social Democratic Party and a “grand coalition” government of Social and Christian Democrats overwhelmingly dominated the parliament. The vacuum of opposition was often reproduced at local level. In Europe, the student movements of the 1960s usually began not at campuses such as the Sorbonne, Heidelberg, Munich, or Rome where the institutionalized Left was strong, but at those, such as Nanterre, Berlin, Frankfurt, Trento, and Turin, where the Left was weak or absent. The most propitious condition for the development of the utopian student movements that so captured the imagination of observers was their political and social isolation (Statera 1975:119).

The subsequent development of student movements was the product of interaction between the movements, their environments, and their internal social and political dynamics. Mass media coverage generalized student movements, but raised the stakes and contributed to internal dynamics that were divisive and ultimately destructive (Gitlin 1980). Media attention amplified recruitment but, once the movement had peaked, a “reverse bandwagon” effect exaggerated its decline. By focusing upon the outspoken and the outrageous, media coverage created “leaders” without authority or political acumen, encouraged spectacular and provocative actions, and amplified the incidence of violence. This deepened the movement’s political isolation and encouraged political adventurism, with the result that in several countries, including Italy, Germany, and the United States, small minorities of student activists drifted into terrorism. More generally, frustrated by the limitations of their student constituencies, they rediscovered Marxism and embarked upon mostly fruitless missions to revolutionize the proletariat. Secular processes may have dictated the inevitable demobilization of student movements, but the turn to sectarian theorizing and Leninist organization, because they were antithetical to the civil libertarian and moral protests that had inspired student mobilization in the first place, everywhere hastened the process (Rootes 1980).

Although encounters with apparently unjust authority were crucial to the mobilization of student movements, it was crucial to their survival that official repression should remain moderate and unsystematic. Nowhere in the West did the level of repression of student protest reach the levels usual in Eastern Europe, Asia, or Latin America. Student movements were thus able to develop in the free spaces of liberal democracies aided by the intermittent stimuli of erratic police action. On those few occasions where repression was extreme—as with the 1970 shooting of four students at Ohio’s Kent State University—the immediate reaction was indignant protest, but the longer-term effect was demoralizing and demobilizing. Generally, however, the repression of student movements was mild compared with that of striking workers. State responses were more generally reformist than simply repressive.

In most countries, student movements simply declined, but in the United States and France they collapsed suddenly. In the United States, the invasion of Cambodia demonstrated the impotence of the movement, and the shoot- ings at Kent State raised the stakes. Most students returned to their books, but the most radicalized minority, such as the Weather Underground, resorted to clandestine political violence. In France, the student movement was overwhelmed by the political crisis it unleashed, and outmaneuvered by President de Gaulle’s appeal to the electorate. Thus disconcerted, the libertarians in the movement were no match for the Marxist sects who, emboldened by the crisis, sought to hegemonize a chimerical worker–student alliance. The student movement’s rediscovery of the proletariat occurred almost everywhere and guaranteed the extinction of student movements as activists’ mobilizing efforts were directed off-campus. Only in Germany was the student movement so completely isolated from the working class that, in forming an extra-parliamentary opposition, it looked to broader sections of society, thereby
By 1971, student movements had burned themselves out almost everywhere. The turn to Marxism meant that, in the rare cases where issues stimulated renewed protests by students, they did not generally produce student movements. In 1976, the longest and most widespread student strike in French history paralysed the universities, but it found little wider resonance, both because the political context had changed and because the prominence of leftist groups determined to portray the protests as anticapitalist obscured the elements of cultural critique that had made the 1968 revolt so iconic. Because most protesting students rejected leadership of any kind, the presence of the sectarian left was less an aid to more effective mobilization than an obstacle to it, and the collapse of the protests left no significant legacy (Rootes 1982).

The direct impact of the 1960s student movements upon political structure was extremely limited. Their one nearly universal legacy – the extension of the franchise to 18-year-olds – has made little impact. Nowhere in the West did student movements succeed in overthrowing elected governments. Even in France, the demise of de Gaulle in 1969 was less a delayed result of the student revolt than of his own political miscalculation. Nor did student protests influence elections in the ways they hoped. The election that ended the French student revolt produced a decisive shift to the right. If student protest persuaded Lyndon Johnson not to seek re-election, the outcome was the election not of a liberal antiwar candidate, but of Richard Nixon. Student movements’ impacts upon policy were probably more positive. Student protest certainly raised the salience of the Vietnam War and probably hastened US withdrawal. But the greatest impacts were in higher education where both curricula and governance underwent reform.

The wider political impacts of student movements were diffuse. Graduates of the “generation of ’68” contributed to the radicalization of Labor parties in Britain and Australia, and the secularization of communist parties in Italy and Spain, but their most important legacies were in the other social movements they inspired, the women’s and personal liberation movements chief among them. “Movement entrepreneurs” who learned their skills in the student movement moved on to organize workers and the poor as well as to the environmental and antinuclear movements that emerged in the 1970s. By these means, student movements contributed to the legitimation of protest and the “participatory revolution” in liberal democracies whose effects continue, especially in Western Europe.

In and since the 1980s, observers, especially in the United States, claimed to detect in various campus-based campaigns – from disinvestment in South Africa under the apartheid regime to that against sweatshop labor in developing countries – the makings of a new student movement comparable to that of the late 1960s. But although students were indeed among the early activists in such campaigns and in the antiglobalization/global justice and climate change movements, none developed as a fully fledged student movement. The principal reason is that, in all these cases, students either rapidly found allies in other, more powerful social or political actors, or because their activism quickly sparked mobilizations of much broader cross-sections of society.

The precipitate decline of Western student movements is readily explicable. The conditions of student life and the rapid turnover of student generations scarcely favor a politics of the long-haul. The student movements of the 1960s arose out of an extraordinary conjunction of demography and social change, sustained rises in living standards, the expansion of higher education in response to technological change and changes in occupational structures, and an effective vacuum of political opposition. It is possible that some of these conditions will recur; it is improbable that they will again occur in such conjunction. The 1960s now appear as a transitional stage in the development of industrialized societies in two respects. First, they
marked the point at which youth emerged as a distinct stage of life and was accorded the liberties and rights of adulthood. Second, the 1960s was the crucial decade in the transformation of the university from an elite institution at one remove from society into a site of mass education increasingly integrated with the demands of the market for highly skilled labor.

The transformation of higher education amounts in many places to its dilution. Not only are studies increasingly vocational, but students themselves are less likely to be 18-year-olds straight from school. Students are increasingly obliged to work at least part-time, and policies favoring late entry and recurrent education have encouraged universities to enrol more older students. The status of “student” has, in consequence, become less determinate as students are increasingly integrated into the social and economic mainstream. Cultural and moral concerns have not disappeared from student politics, but they have, with the proliferation of the “new” social movements, become more widespread in non-student politics. Distinctively student politics have, as a result, come more closely to resemble the politics of other sectional interest groups. Thus prolonged student protests in France in 2009–2010 were against proposed reforms of the university curriculum designed better to integrate higher education with the demands of the economy. British students have intermittently protested against the introduction of and increase in tuition fees since they were first introduced in 1998. Nevertheless, when a proposed trebling of fees produced dramatic but short-lived protests in 2010–2011, even in the context of unprecedented cuts to the public sector and welfare provision, students failed to make durable connections with other affected interest groups other than secondary school students who will bear the brunt of the changes. It is, moreover, problematic to designate as a “movement” a campaign and succession of protest events that lasted barely two months.

If student movements have all but disappeared from the liberal democratic states of the advanced industrialized societies, they have continued intermittently to play important roles in authoritarian states. In the 1970s, student movements played critical roles in the democratization of Spain and Greece during years of military dictatorship, in Spain because the universities enjoyed a degree of political immunity and so provided space for political discussion and organization not enjoyed by other groups in society, and in Greece because students dared to challenge an increasingly unpopular regime. In Hungary, Poland, and Czechoslovakia, student movements repeatedly challenged communist regimes from the 1950s to the 1980s. Sometimes their protests were bloodily repressed – as in Hungary in 1956 – but student movements kept alive democratic aspirations and so contributed to the eventual collapse of those regimes.

The role of student movements in the democratization of Asian societies is even clearer. In Thailand, South Korea, Taiwan, and Indonesia, despite often savage repression, student movements provoked political crises in authoritarian regimes that ultimately contributed to the expansion of civil liberties and democratic rights. Student protests against more closed and systematically repressive regimes have had less fortunate results. The student movement in Burma has been aggressively repressed, but perhaps the best-known example, both for the hopes it raised and the brutal way in which they were dashed, was the Chinese movement that focused upon Beijing’s Tiananmen Square in 1989.

In Iran student protests have been the leading edge of protest against the repressive governments both of Shah Reza Pahlevi and of his postrevolutionary successors. The pro-democracy Iranian Green movement of 2009 is often referred to as the inspiration for the Arab Spring that began in 2011 with the successful mobilizations against authoritarian and gerontocratic regimes in Tunisia and Egypt, and rapidly spread to other countries in the Arab world. None of these was primarily or exclusively a student movement but students and student organizations played prominent parts.
These, and the many other instances of student movements in authoritarian states, have in common the fact that it was generally students who first challenged oppressive regimes in the name of universalist principles of liberty, morality, and democracy. The critical conditions for the emergence and development of student movements are a suitably moralistic political grievance, an absence of effective opposition within the polity from other, more powerful political actors, and a lack of powerful allies. Chief among the conditions of their success, however, is their ability to attract allies either from reformists within governing elites or from other sections of society, and weakness or inconsistency in the state’s repressive response. Students, relatively unconstrained by the obligations of adult life, may be the least inhibited opponents of authoritarianism, but they are seldom able by themselves to achieve their objectives.

The development of student movements in modernizing societies under authoritarian regimes is common, but their development in fully democratic states in economically advanced societies is wholly exceptional.

Transnational social movements

JACKIE SMITH

Modern social movements, generally thought of as political, emerged in tandem with modern nation states, as groups of people organized to alternately resist new claims being made by national authorities (such as taxes or military conscription) or to advance their own claims that states provide a variety of public goods and services (such as education, health care, and various forms of financial assistance). Ongoing competition between authorities and citizen challengers generated new structures – including parliaments, bills of rights, and bureaucratic checks and balances – to routinize public participation in national politics and to otherwise enhance the accountability of political leaders to citizenry (see, e.g., Tilly 1984; Markoff 1996; Tarrow 1998). Today, as states increasingly turn to international political arenas to manage their economies and ecologies and other aspects of social life, social movements are becoming increasingly transnational in their structure and focus.

The same rapidly advancing technologies that have fostered the expansion of a global economy have aided the rise of transnational social movements. Relatively cheap airline tickets, more widely available telephone and Internet access, expanding use of English as a global working language, and a globalized mass media enable people from more diverse classes and geographic origins to share information and cultivate cooperative relationships across huge distances (Tarrow 2005; Smith 2008). While transnational social movements were active in the nineteenth and early twentieth centuries, promoting international peace, an end to slavery, and women’s suffrage, activists in these movements were by and large from privileged backgrounds (Rupp 1997). Today’s transnational activism, which has expanded rapidly since the 1970s and 1980s, involves those of far more modest means. That said, it is still true that many transnational (and other) movements are disproportionately middle class, since people with more and better education as well as time, skills, and resources are the most able to be involved in social movements. But social movement politics by its nature attempts to lower barriers and costs to popular political participation, and many activists seek to confront the inequities they find in their own structures and operations.

Transnational social movements are best seen as networks of actors that are organized at local, national, and international levels. Many include formal organizations that have constitutions, staff members, bank accounts, and boards of directors. Others are neighborhood or friendship groups that meet informally and irregularly and who support each other’s work to promote social change. Individuals are also key players in all social movements, and in transnational movements, we often find members of government delegations to the United Nations playing key roles in social movements. For instance, governments like Mexico have long been supportive of international disarmament efforts, and its delegates have helped peace movement activists get access to information and to increase their influence on official disarmament negotiations.

United Nations officials, such as those in the United Nations Human Rights Commission, are also frequently involved in supporting the work of the transnational human rights movement. Journalists and academics are also part of many movements, helping to popularize debates or to advance new analyses that can assist social movements. Webs of interpersonal and interorganizational connections help expand the flow of information to different actors within movements. Transnational
events like United Nations conferences or transnational meetings of civil society groups have helped increase the strength and density of these network ties, and the increased frequency of these events in recent decades helps account for the rise of transnational movements.

Transnational movements have adopted a number of strategies to promote global change. They can work to advance new international agreements, such as the Convention to Ban Landmines or the International Criminal Court, or to block agreements such as those of the World Trade Organization. They can work to press individual governments to abide by international norms or to ratify treaties. And they can appeal to global institutions or norms in order to strengthen their leverage in national conflicts. Margaret Keck and Kathryn Sikkink (1998) refer to the latter of these strategies as the “boomerang effect.” They argue that when national political systems are repressive or restrictive, appeals to international norms or alliances can bring international pressure to bear on states, thereby altering the balance of power in national political contests. So when Argentine human rights activists mobilized their transnational networks, they introduced an additional cost (US military aid) to the government if it persisted in flouting international law. In short, transnational movements can and do affect both national and international political processes. Moreover, by shaping international treaties and by working with international institutions, they help define the institutional arrangements of our global political system.

The major distinction of transnational movements is that they mobilize people across national boundaries around a shared aim. They help people define their interests and identities in ways that go beyond the traditional nation-state borders. By facilitating routine communication between people from vastly different regions and cultures, they help enhance understanding and mutual trust while making international friendships more feasible and likely. A member of Amnesty International (AI), for instance, will share more common interests and perspectives with AI members outside her or his own country than she or he will with many of her compatriots. Organizations generate their own internal cultures and identities. And because they generally oppose predominant cultural systems, social movement organizations have a particular need for creating supportive identities that can bind members together and support collective action even in the face of repression (see, e.g., Rupp 1997).

As they attempt to define new activist identities, transnational movements must overcome the considerable influence of the national state in defining people’s primary allegiances and motivations. However, just as the processes of global economic integration help generate the technologies and other infrastructures that support transnational organizing, here too global processes help break down the monopolies states have on their citizens’ loyalties. The globalization of the economy has meant that people’s educational backgrounds are more similar, as are their professional lives and working conditions. Moreover, there are increasingly obvious connections between global forces, such as transnational corporations or international trade laws, and one’s daily experiences and interests, and these provide important foundations for the creation of shared understandings and meanings outside the framework of traditional state boundaries. Indeed, overcoming differences in national perspectives may be far easier than overcoming other differences within movements (Moody 1997). In other words, we can see important foundations for the globalization of civil society to parallel the globalization of economic and political institutions.

Like all movements, transnational social movements seek to enhance their political influence by cultivating alliances with other groups. A long-standing divide exists between social movements organized around issues such as the environment or civil rights and those organized to promote the interests of labor (Waterman 2005). In many contexts,
corporate interests seek to undermine alliance building by framing environmental struggles as contests between jobs or development and environmental conservation. Divisions between richer and poorer activists persist in many movements, as economic class shapes the day-to-day experiences and perspectives of people in important ways. Sometimes, however, transnational movements can help overcome class or caste divisions by providing a broader perspective on the divisions that might exist within a single country. Activists in transnational environmental groups, for instance, are motivated out of a concern for a particular policy, and they will work with any groups they think can help secure their aims. In contrast, within countries we often find that urban–rural divisions or even anti-indigenous prejudices can impede alliance formation within nations.

The World Social Forum is a contemporary focal point for transnational social movements. It began in 2001 as an effort to mobilize against the global neoliberal capitalist order and around the slogan “Another World is Possible.” It consists of a biannual global meeting, accompanied by national, regional, and local social forums that are linked through overlapping networks of participants and through internet sites and other forms of communication. Activists refer to it as a “process,” since it aims to foster ongoing dialogue and learning across time and space. It has mobilized many hundreds of thousands of activists and remains a core site of innovation and activity for the contemporary global justice movement (Santos 2006; Smith et al. 2007).

While social movements address any number of different issues, many work more or less self-consciously to affect the formal means by which citizens can both participate in policy debates and hold their elected leaders accountable for policy decisions. So movements for racial equality have generated laws to protect minority voting rights, and demonstrators protesting against military arms races have helped to advance new legal protections for all forms of public speech. In short, in the course of mobilizing around particular issues, movements help shape the laws and institutions of our democracies. This is exactly what has taken place in the international political arena. As groups mobilized to advocate for human rights or to limit the use of military force, they have found themselves involved in the process of helping define the role of citizens in institutions that were established by states.

Global political institutions such as the European Union and United Nations were formally organized by governments with little desire to see much in the way of citizen participation. International diplomacy was seen as “high politics” that needed to be removed from the pressures of what were seen as poorly informed and passionate citizenries. But because a government’s participation in any international organization generally required that their national legislature approve of the arrangement, governments were forced to yield some space for citizens’ involvement in these bodies. And since the establishment of both these institutions, we have seen efforts by movements to further expand citizen participation in global politics.

Nevertheless, a substantial “democratic deficit” remains, and many national delegates to international institutions are unelected and largely unaccountable to citizens. There are no political parties organizing constituencies beyond the national level. Many international negotiations remain secretive, and even national legislators are denied access to official meetings and documents. Because global institutions have an increasing impact on the policy decisions that affect us, this global democratic deficit has undermined the quality of democracy within nations as well. Some analysts speak of a “hollowing out” of national democracy in recent years as states delegate more of their authority to supranational institutions, privatize more of their services to the corporate sector, and delegate more distributional decisions to local authorities (see Markoff 2004). Thus, after years of growing transnational activism aimed at promoting international agreements for human rights, more equitable
development, and environmental protections, more transnational movement groups are demanding global democracy as the twenty-first century unfolds (Smith 2008).

Another key emphasis of contemporary transnational movements is a call for a more balanced approach to global integration than policymakers have pursued thus far. Since the late 1970s, key players in global politics have emphasized the development of global markets, and they encouraged all countries to reduce tariffs and other measures that limit the flow of goods and services across national borders. Increased global trade was thought to bring economic growth that would benefit all. Unfortunately (but not unexpectedly), for many reasons this simple economic logic has not proved true, and along with unprecedented increases in global trade we find unprecedented concentrations of wealth amid persistent poverty and environmental degradation.

Beginning in the 1990s, many groups began working transnationally to challenge this predominant neoliberal model of economic globalization. They argued that many decisions should not be left to the “free” market, because markets respond only to those with wealth. And many social goods – such as a clean environment or public health – are not readily reduced to simple cost–benefit calculations. These decisions, activists argue, require informed public debate and consultation. At the World Trade Organization Ministerial in Seattle in 1999, transnational movements came together with national and local organizers to demand more accountable and less market-oriented international policies. Activists demanded a greater say in decisions about how national and local economies (and polities) are organized, as they were finding that global institutions were squeezing out possibilities for citizen input into decisions about what kinds of industries operate in local communities, what protections states can (and more often cannot) enact to preserve their natural environments, and how educational, health, and other services are managed. These protests, coupled with declining economic growth and global financial crisis, which began around 2007, helped slow the progress of trade globalization, and opened space for more critical perspectives on the global economy to emerge.

In sum, attention to transnational social movements helps us understand the political processes behind globalization. Because movements are working to connect localized citizens with global political processes, they provide the connective tissue that helps integrate our global polity by mobilizing local communities around global policy debates. They are also part of complex processes of contestation that help define the structure of global institutions and the character of local, national, and global polities. By helping shape institutions, policies, and systems of meaning, they are important actors in the global system. By insisting that the global system be made more open and accountable, transnational movements are essential for the preservation of democracy.

Studying transnational movements is difficult. One needs to have expertise in the politics and cultures of different countries, as well as an understanding of the global political system – which constitutes a unique “area study” of its own. Because of these complexities, most studies to date are case studies of how transnational activism affects a particular national context or of particular transnational campaigns or events. The Global Civil Society Yearbook, published annually since 2001, has sought to trace the evolution of globally organized social change efforts, and it provides useful information about trends in global organization and activism. Electronic newspaper records have allowed for large-scale, comparative analyses of media coverage of movements. Key questions that emerge from analyses of transnational movements are: How have globalizing trends affected the ways people engage in politics? How do transnational forms of activism compare with national ones? How does participation in transnational activism vary across different countries? And, perhaps most importantly, what impacts do
transnational movements have on global political and cultural change?

Al-Qaeda
FAISAL DEVJI

Emerging as it did from the cold war’s final proxy war, the anti-Soviet jihad in Afghanistan, the militant network known as Al-Qaeda was a global phenomenon well before the spectacular 9/11 attacks that made its reputation worldwide. Yet despite its planetary vision of Muslim suffering at the hands of Western enemies, or its equally dispersed recruits who possess no determinable sociological profile, both this project and the movement to which it gave rise are often defined in traditional terms. So Al-Qaeda is either seen to constitute some new and purely internal variation within the closed genealogy of Islamic radicalism, or as representing the updated version of an older European ideology like nihilism, anarchism, or even fascism. These backward-looking visions, however, cannot provide an adequate measure of the phenomenon as a future-oriented social movement.

Al-Qaeda’s life as a movement lies in its remarkable fluctuation and flexibility as an organization. Indeed it is precisely because the movement can no longer be tied to some traditional form of political organization, ideology, or even purpose that its influence can spread so rapidly across a global terrain. For Al-Qaeda operates as a set of services linked to a brand name that is franchised globally. But for this to happen its founding organization, established to fight the cold war’s last battle in Afghanistan, is compelled to shrink to a symbolic point. Similar is the fate of Al-Qaeda’s anti-Soviet ideology, which Alice-like has to pass through globalization’s looking glass in miniature form, reduced to a half-dozen or so sound bites for the benefit of a do-it-yourself jihad against the West as a whole.

All this can be seen very clearly in the various bombings that followed the 9/11 attacks, which in one move established Al-Qaeda as the most potent brand name of the militant’s marketplace. Thus the official reports on the 2005 London bombings tell us that the mobilization of its perpetrators was unprecedented in its rapidity and that, unlike cults, secret societies, or radical groups in the past, these men did not have to be removed from everyday life and immersed in some special environment in order to be indoctrinated. Instead they were mobilized in public places like gyms and on rafting expeditions, their only truly private act being the concoction of explosives. All this was possible only because there existed neither an organization to discipline nor an ideology to indoctrinate them. No traditional organization or ideology can exist for a global cause that refuses to be grounded in any particular struggle. Al-Qaeda thus takes the form of a network rather than a hierarchy. And moving from a hierarchical to a networked form entails the corresponding shift from a vertical to a horizontal mode of dissemination. After all it is no longer an ideology or doctrine, other than a handful of modular sound bites and slogans, that is being transmitted here but a set of practices with instructions provided that are linked to a brand name. All that is required is to download them – or to buy into the franchise.

In this sense Al-Qaeda-inspired militancy represents the democratization of Islamic authority, since its practitioners manufacture their own legitimacy from scriptural and other fragments that circulate globally in electronic form. When authority is no longer tied to a particular society but has become a global commodity, it cannot constitute an old-fashioned hierarchy but depends completely on the purchasing decisions of individual buyers. Such an attitude toward religious authority is not unique to militants but characterizes even the most pacific of Muslim practices. In his book *Globalised Islam* (2004), Olivier Roy points out that the attempt by many Muslims to purify Islam of all
cultural particularity ends up making a global technology of it, which is to say a standardized product to be bought and used in the global arena. Militants of the Al-Qaeda type tend to pitch their practices not to local audiences as much as to global ones, so that their widely disseminated videotapes refer mostly to each other, talking to each other in a frenzy of technological communication from which real people and societies have been excluded. But divested from real people and societies, militant acts cease to have political purchase, having become gestures within a global society that has come into existence but does not yet possess political institutions of its own.

Unlike the “fundamentalist” or “Islamist” politics of a previous generation, Al-Qaeda is concerned neither with states nor ideologies, though it does not therefore seek to overturn these. Alongside environmentalists or pacifists, the men inspired by Al-Qaeda consider Muslim suffering to be a “humanitarian” cause, like climate change or nuclear proliferation, which must be addressed globally or not at all. Indeed the worldwide Muslim community of Al-Qaeda’s imagination is modeled upon and comes to represent the human race itself as a global subject, both of which lack political existence and are therefore defined only in the prose of victimization. In other words the political institutions of states either in their singular or collective forms no longer provide the conceptual framework for militant practices, which exist in a global society bereft of political institutions. Al-Qaeda achieves meaning in this institutional vacuum.

Arab Spring
DANA M. MOSS

Over the past several decades, few puzzles have captivated academic imaginations more than the persistence of authoritarianism in the Middle East. Scholars have dedicated volumes to exploring possible causal factors, including the role of oil rents, the “robustness” of coercive apparatuses, Islamist movements, civil society, elite fragmentation, and other such political processes and characteristics (Posusney & Angrist 2005). However, the eruption of what has been dubbed the “Arab Spring” in late 2010 sent shockwaves through the world, decimating myths about Arab sociopolitical gridlock. Sweeping social change in the region appeared largely “unthinkable” (Kurzman 2004) until an unprecedented series of popular movements turned streets into occupied protest zones across the region.

The term “Arab Spring” most commonly refers to the mass protests, uprisings, and revolutionary movements that began in Tunisia in December 2010, and then spread to Egypt, Yemen, Bahrain, Libya, Syria, and other countries in the Middle East and North Africa (MENA) region. It can be argued that no country has been entirely insulated from the “threat from below”; the popular chant al-sha'b yurid isqat al-nidham (the people want the fall of the regime) has been echoed across borders for over a year to date. Arab Spring movements have dethroned long-standing rulers in Tunisia, Egypt, and Libya thus far, shaken the stability of regimes in Yemen, Syria, and Bahrain, inspired hasty efforts at constitutional reforms in countries like Morocco and Jordan, and prompted ruling elites to reassure ruffled publics about economic growth measures in Saudi Arabia, Bahrain, and Oman. Even those states which have toppled their “pharaohs” have continued to see mass street protests demanding the accountability of new governments, the resignation of the old guard, and the implementation of transparent democratic structures. In other countries like Yemen and Syria, movements have continued with participation in the millions under conditions of extreme violence (including bombings, kidnappings, torture, and mass internment) and resource deprivation.

The sheer magnitude of the Arab Spring can hardly be captured in a single encyclopedic entry, not least because the events are ongoing at the time of this writing, but also because the revolutionary transitions themselves comprise an era of unsettled contention that will span years to come. The synopses below include only some of the watershed moments of the Arab Spring in some of the affected countries, as of April 2012; they are far from a comprehensive list of participating locales, events, movements, important figures, or facilitating conditions. Future scholarship is likely to tease apart these accounts and other popularly understood narratives in order to test their accuracy and their implications for social movement research. The number of actual countries that have experienced the Arab Spring is also likely to be a future subject of debate, since protesters from Israel to the United States to China have attempted with more or less success to harness a visible “occupy the streets” mobilization technique that – at least tacitly – has been influenced by the widespread tactic of street occupation used by Arab Spring participants.

TUNISIA

The Tunisian Revolution is commonly understood to have been caused by a young fruit seller, 26-year-old Mohamed Bouazizi, who set himself on fire on December 17, 2010, in the small city of Sidi Bouzid. After a confrontation with a female municipal officer, who reportedly publicly humiliated Bouazizi and confiscated his cart after demanding a
bribe, Bouazizi immolated himself with gasoline on the street in front of the governor’s office. Al Jazeera English reported this as “an act that symbolised the frustrations of poor, unemployed Tunisians and triggered the revolt that ousted veteran leader Zine El Abidine Ben Ali” (Oct. 27, 2011). Bouazizi died 18 days later, after being visited by then-President Ben Ali.

It is reported that protests in Sidi Bouzid began almost immediately in response to Bouazizi’s immolation, and these demonstrations escalated after several other youths enacted measures of self-harm. Within the next two weeks, via mechanisms that remain unspecified, save for the use of social media outlets like Facebook, Twitter, and YouTube, protests had spread to Tunis. Members of professional associations, including lawyers and teachers, also joined the protests as media outlets reported strong public reactions to instances of repression and sniper shootings that killed civilians at public gatherings, including funerals. Confrontations on the street continued through January 14 when President Ben Ali, who had been in power since 1987, fled to Saudi Arabia. However, protests against the government led by the ruling party, the Democratic Constitutional Rally (RCD), continued almost immediately, and this led to rapid turnover of government officials through the beginning of February.

Despite the flaring of protests intermittently throughout 2011, Tunisia hosted peaceful elections on October 27, 2011, electing the previously banned Islamist Al-Nahda party to the majority led by Rachid Ghannouchi. Due to new gender quotas in the proportional parliamentary elections, women will make up over 40 percent of Tunisia’s new parliament. Elections were not unproblematic, however; several thousand of Sidi Bouzid’s residents clashed with police after learning that some of their votes had been discounted. Debates over the future of Tunisia under a moderate Islamist party are ongoing.

EGYPT

The Egyptian revolution began in late January 2011, and resulted in the resignation of longtime president Hosni Mubarak on February 11. Protests were organized initially to coincide with National Police Day on January 25 in order to protest corruption, repression, economic stagnation, and other grievances, and reports cite that these protests were encouraged through social media sites. Preexisting movements, including a variety of youth groups and the April 6 Movement, distributed thousands of pamphlets encouraging protests and giving instructions on nonviolent confrontation. The main protest site throughout the demonstrations became Cairo’s Tahrir (Liberation) Square; however, protests took over other major city centers as well.

On January 26, all mobile and internet services were shut down in response to the protests and, that Friday, demonstrations swelled in number. It is reported that members of the government released inmates from prisons in an effort to promote chaos, and by January 28 the police had withdrawn from the streets. Mubarak addressed the nation, pledging reforms. The military were deployed and a curfew was imposed, but it was largely ignored. The now-famous incident of pro-government thugs riding into Tahrir Square on camels and horses, attacking protesters with weapons, occurred on February 2, and a series of rock-throwing battles between pro- and antigovernment groups that paralyzed the streets were broadcast live by Al Jazeera to audiences around the world. At 6 pm on February 11, Vice President Omar Suleiman announced in a brief statement over state television that Mubarak had stepped down.

The Supreme Council of the Armed Forces (SCAF) assumed control of government, and national (as well as international) celebrations erupted with millions of Egyptians cheering into the night. Since that time, a myriad of hallmark events have occurred, highlighting the tensions between continued demonstrations and the transitional government. These
events include (but are not limited to): the raiding of security offices by looting protesters; the passing of a constitutional referendum in March 2011; the announcement of elections to be held in a three-part series beginning at the end of November 2011; massive protests in April and May 2011 calling for Mubarak and members of his regime to be put on trial; protests demanding that SCAF follow through on implementing democratic demands; and demonstrations aimed at reasserting popular democratic demands after protests were banned at the end of March. By August 2011, Mubarak was put on public trial, though this was put on hold as of October 30, 2011 over controversies regarding the presiding judge. After the trial resumed in January 2012, arguments were concluded in February 2012; the results are being deliberated at the time of this writing and the outcome may be announced in June 2012.

In October and November of 2011, street-level violence again erupted as protests continued and demonstrators were attacked, detained, and tortured by security forces; documented instances of police beating women and tearing off their clothing mobilized demonstrations in December 2011. Popular disillusionment with the SCAF regime continues to grow, and activists accuse the government of fueling sectarian violence between Coptic Christians and Muslims. Egypt’s revolution, while far from over, has been cited as the most important catalyst for uprisings in other MENA countries, many of which witnessed a surge in popular protest after Mubarak’s resignation.

YEMEN

Despite it being the Middle East’s poorest country, Yemen continues to host the Arab world’s longest-running uprising. Protests and some armed conflict continue against President Ali Abdullah Saleh, who has been in power since 1978. The capital city of San’a first witnessed protests by independent activists in January 2011, with thousands amassing on January 27; protests were named the “Day of Rage” on February 3 and the “Friday of Anger” on February 18. Protests have taken place in all major cities in Yemen since February 2011, and continue at the time of this writing with no sign of abating. The initial protests in San’a were led by a female journalist and activist named Tawwakul Karman who, in October 2011, was awarded the Nobel Peace Prize. Thousands joined the small number of protesters in the streets to celebrate the end of Hosni Mubarak’s presidency in Egypt on February 11, but protesters were attacked and kept from occupying San’a’s own Tahrir Square. During this time, youth groups asserted their leadership role in the protests, and tents were erected at the gates of San’a University, thereafter dubbed “Taghyir (Change) Square.” This sit-in was established several days after the erecting of peaceful occupying protests in Ta’iz, which have led Yemen’s protests in number since February.

The complex and ever-shifting roles of Yemen’s tribal confederations, certain factions of the armed forces, the traditional opposition bloc, and the youth groups have resulted in (1) an escalation of fighting between Saleh’s military forces on one side and rebel military and armed tribal factions on the other, (2) the popular delegitimation of the “old” oppositional coalition, and (3) the assertion of demands by the “youth” of the Yemeni protests. One of the most notable events occurred on March 18, 2011, when snipers killed over 50 protesters in Taghyir Square and injured over 200. This resulted in dozens of resignations by Yemeni public officials and some international condemnation of Saleh’s regime. On May 23, Saleh also violated tribal law and sparked a minor war by attempting to assassinate a powerful tribal shaykh named Sadeq al-Ahmar. Saleh’s forces have bombed and shelled protest sites throughout the uprising, resulting in hundreds of casualties in many Yemeni cities and increasing Yemen’s pre-existing refugee crisis. Taghyir Square continues to be a literal tent city for protesters and residents who have lost their homes in
the fighting between antigovernment tribes or defected military units and the President’s Republican Guard and Central Security forces.

On June 3, 2011, a bomb, planted by as yet unknown parties, exploded inside the president’s palace. President Saleh suffered severe injuries and was flown to Saudi Arabia for medical treatment, where he stayed until September 23. Chronic water, food, and fuel shortages paired with constant, low-level violence against the population have brought about the gravest humanitarian crisis in the country’s history (Picard 2011). However, the massive street protests have continued – and even grown – in nearly every city and town. On any given Friday in San’a or Ta’iz, well over half a million men, women, and children in the protest squares chant for the fall of the regime. However, after Saleh’s return to San’a in late September, attacks against protesters increased, and international pressure failed to persuade Saleh to commit to a transfer of power until November 23, 2011. At this time, Saleh signed the Gulf Cooperation Council initiative initially drafted in the spring of 2011, which terminated his presidency and installed vice president Abd Rabbuh Mansur Hadi as interim president of the republic. Hadi’s presidency was confirmed by a single candidate presidential referendum in February 2012, which was also mandated by the GCC agreement. Since then, Hadi and the unity government led by Prime Minister Muhammad Basandwah have struggled to establish their legitimacy and authority in the face of continued interference by former President Saleh, his family, and expanding antigovernment operations by al-Qaeda in the Arabian Peninsula (AQAP). Street protests have continued, as many revolutionary activists insist that their demands have not yet been met. The encampments established by popular reform movements in San’a and Ta’iz continue, while throughout southern Yemen, protests in favor of Southerner rights and independence have escalated. As of April 2012, Saleh remains in Yemen after spending time in New York City for “medical treatment.” Yemen will likely provide scholars with a fascinating case of how a primarily peaceful movement can be maintained in what is considered to be the Middle East’s most “backward” and violence-prone country.

LIBYA

Libya’s revolution – also referred to as the 2011 Libyan Civil War – began on February 15, 2011, as protests in the cities of Benghazi, Bayda, and Zintan erupted. Over the next several weeks, security forces attempted to deter the protests by force, while counterdemonstrations took place in the capital city of Tripoli and other cities. February 17 was dubbed a “Day of Revolt,” as protesters inside Libya and in exile called for mass mobilization against Colonel Moammar Gadhafi, Libya’s head of state since 1969. Footage circulated in the international press of African mercenaries, who had allegedly been recruited from neighboring countries by Gadhafi to fight the protesters, and throughout this time reports of deadly attacks against protesters continued. A National Transitional Council (NTC) was formed, and it has been hotly contested precisely when and how the protests transformed into an armed rebellion. Nevertheless, the NTC rapidly recruited a volunteer army, and young and inexperienced militias comprised of college graduates, professionals, and laborers took up arms.

By the end of February many towns were reported to have “fallen” to the rebels, including the key town of Benghazi; however, Gadhafi’s troops recaptured several towns and appeared to be staging a significant military comeback by March. Foreign military intervention began on March 19 under the United Nations’ Security Council Resolution 1973, which authorized NATO to enforce a no-fly zone, target the Libyan military’s resources and movements, enforce a naval blockade, and impose an arms embargo. In June 2011, Gadhafi’s son Saif al-Islam offered to institute elections, but this
was summarily rejected by rebel forces and foreign powers. Tripoli was captured by the rebels around August 22 at the same time that the NTC issued a written roadmap to transition Libya to a constitutional democracy. On September 16, the UN General Assembly voted in favor of granting the National Council a seat in the congress. Gadhafi was captured and killed on October 20, 2011, and by the end of the month NATO announced that it would terminate its operations. Saif al-Islam, Gadhafi’s son and outspoken leader of the regime, was captured in November 2011. The death toll has been reported to be well over 30,000 people. The fall of Gadhafi appeared to give a significant morale boost to the uprisings in Syria and Yemen.

SYRIA

The Syrian uprisings are reported to have begun on January 26, 2011; several protests in support of the Libyan and Egyptian revolutions were organized throughout February, when activists tested the waters for their own targeted protests. As President Bashar al-Asad promised reforms, however, protests were suppressed by a variety of violent means. A media blackout continued in Syria, with information smuggled out of the country by activists. Protests appeared to gather steam in March, beginning in the southernmost town of Dar’a and, since that time, massive demonstrations continued on the streets of Hama, Homs, and other cities, despite widespread use of violence by the security apparatuses loyal to the al-Asad regime. The current president inherited his position from his father, Hafez al-Asad, who ruled Syria from 1971 until his death in 2000. Security forces continued to lay siege across Syria, and videos showed the use of tanks and heavy artillery against civilian gatherings, mass graves, and victims of killing and torture of all ages.

The eruption of such mass disobedience in the face of al-Asad’s police state was deemed largely impossible after the 1982 massacre in Hama, in which at least 10,000 civilians were killed in response to an Islamist uprising of a few hundred rebels. While protests have been reported to be largely nonviolent, armed resistance groups have emerged within Syria. A Syrian National Council was formed and asserted demands on behalf of the protest movements. Activists demanded the implementation of a Libyan-style no-fly zone and for the “equipping of the ‘Syrian Free Army’ – an opposition group composed of defecting soldiers,” according to Al Arabiya news. However, in October 2011, NATO refused this request. In February 2012, former United Nations Secretary-General Kofi Annan was appointed as the Joint Special Envoy of the United Nations and the League of Arab States on the Syrian crisis, and negotiated a ceasefire with the al-Asad government, as well as a plan to allow journalists and UN observers into Syria. Annan’s plan came under scathing criticism by Syrian activist factions, who claimed that its terms were overly generous to the al-Asad regime and that it allowed the military to continue their assaults. The April 12, 2012 ceasefire was not observed by the government, and Annan continued to express “alarm” (BBC News) over the violence, urging the deployment of UN observers more quickly into Syria. Reports circulated that any Syrian accused of speaking to a UN observer has been targeted with violence. The civilian population, particularly in cities such as Homs and Hama, faced siege warfare, and populations throughout the country have suffered from hunger and other resource shortages throughout the winter and spring of 2011–2012.

As the conflict continued, al-Asad became increasingly isolated in the international community, and the actions of the Syrian regime were condemned by the UN and the Arab League, though he told the UK’s Daily Telegraph in October that the “whole region would burn” were his regime to collapse. The Syrian Emergency Task Force of Los Angeles reported, as of April 2012, that over 12,000 civilians have been killed and tens of thousands have been detained and imprisoned, including hundreds of women and children.
BAHRAIN

The tiny Gulf kingdom of Bahrain, currently ruled by King Hamad bin Isa al-Khalifa, first witnessed protests in relatively small numbers during the first two weeks of February 2011. Violence against protesters occurred during this period, and by February 14 protesters marched to and occupied the iconic Pearl Roundabout in Manama, Bahrain’s capital, and erected tents in order to occupy the area. Early in the morning on February 17, police attacked the protesters camping on the roundabout; several were killed, dozens “disappeared,” and hundreds were wounded. Al Jazeera English reported that hospitals were overrun with the injured; footage during this time showed distraught nurses and doctors protesting against the king and the violence of the roundabout raid. Manama was placed under a military lockdown and a three-month emergency law was declared; the roundabout camp was destroyed and ringed with barbed wire and military guards after protesters were attacked and evicted.

While demonstrators were able to return to the roundabout by February 19, after security forces withdrew from the site, the regime used brutal force to crack down on the protests happening both inside and outside of the capital, and eventually the monument at the Pearl Roundabout was destroyed. Since that time, many incidents of protest and persecution have been reported, though Bahrain did not witness any of the mass mobilization that initially characterized its movement on February 14. Medics and doctors were prosecuted in the courts and several activists were sentenced to life in prison. Parliamentary elections were held to fill the seats left vacant by the al-Wefaq National Islamic Society – Bahrain’s majority party – after they resigned and then boycotted government following the violence in February. Freedom House reported that beginning in February 2011, approximately 1600 activists have been tried in courts, notably medical professionals accused of treating injured protesters. In November 2011, a Bahrain Independent Commission of Inquiry reported that human rights abuses did indeed take place earlier that year. After a lull in protests, mobilizations re-emerged on the street in March 2012. In response, security forces have launched assaults on protesters and targeted communities with constant tear gas attacks. Bahrain’s hosting of the Formula One Grand Prix mobilized protesters in April 2012, breathing life into a street-level movement that was considered to have been successfully crushed just months before. Protesters continue to call for the abdication of the king, chanting “Down Hamad!”

While very little research has been published to date on the 2010–2012 Arab Spring due to its extremely recent and still-developing character at the time of writing, scholars will have no shortage of existing literature to build on in the realm of social movements, revolutions, international relations, and democratic reform. While the literature has recently been dedicated to uncovering agency and resistance in the Arab world through analyses of everyday practices and interactions (e.g., Bayat 2010), the events of 2011 signal a new era in how the region will be studied. Bloggers, journalists, and scholars have already begun to theorize about the role of the youth population exploitation, rising unemployment, the use of social media, heightened senses of collective efficacy and solidarity of movements, and the frailty of “sultanistic regimes” (Goldstone 2011). Importantly, while the role of Islamist factions in the uprisings have varied and continue to be negotiated, none of the Arab Spring uprisings were Islamist insurgencies or party-led movements, at least in their inception. How this particular movement wave plays out will be the focus of exciting theoretical advances in studies aimed at exploring the sources, processes, and outcomes of significant social change.

Future scholarship should take up a number of questions of multiple strata and temporal variations, including: (1) international responses to national-level rebellions, which vary from intervention to avoidance; (2) the dismantling of the “wall of fear” and the social
importance of emotions in mobilization; (3) the role of “older” forms of political mobilization through tribes and kinship networks versus popular social movements seeking to transcend identity politics and familial ties (Mabrouk 2011); (4) the role of pre-Arab Spring movements, including unions, associations, and Islamist movements in the mobilization processes; (5) movement diffusion across regions and the globe, including nonviolent strategies; (6) strategic variation, particularly in response to different levels of state repression; (7) the critical role of women, youth, and minorities in the demonstrations; (8) temporal and ecological variations in protest emergence, especially between capital cities and peripheral regions; (9) the effects of social media and media coverage; (10) outcomes of democratic transitions, violence, state collapse, humanitarian disasters, widespread unemployment, and other factors across states; (11) an exploration of the counterfactuals, that is, the countries where mobilization was muted (e.g., Algeria, Jordan, Saudi Arabia, Oman, Morocco, the United Arab Emirates, and Iraq) or is taking different forms that may end up being no less significant over time; and (12) the Arab Spring’s effects on the Arab–Israeli conflict.

Attac
FREDRIK UGGLA

Founded in France in 1998, Attac (Association pour une taxation des transactions financiers pour l’aide aux citoyens) has been one of the most prominent groups in the so-called global justice (also known as the antiglobalization or the alter-mondialization) movement, with tens of thousands of members in its country of origin, and national chapters in dozens of other countries. The group has mixed a critique of liberal economic policies in general with a very specific demand: the introduction of a tax on financial transfers as a method to restrain financial markets and raise revenue for development projects.

Attac and its demands were born in a context of radical, extra-parliamentary political currents in France during the second half of the 1990s (Ancelovici 2002; Waters 2004). Its foundation was preceded by a December 1997 editorial by Ignacio Ramonet in Le Monde Diplomatique entitled “Désarmer les marchés” (“Disarm the Markets”). In a milieu marked by financial turmoil following the Asian crisis of 1997 and by incipient opposition to multilateral liberalization, Ramonet’s piece suggested the establishment of a tax on financial transactions. During the following months, Le Monde Diplomatique served as a hub (Waters 2004) around which a group of well-known French organizations and personalities developed Attac as a vehicle to further this demand. As the group was formally created in June 1998, the magazine’s director, Bernard Cassen, became its first president.

During its first years of existence, Attac enjoyed spectacular development. By late 2001, it claimed to have almost 30,000 members in France alone and national chapters in another 40 countries (Ancelovici 2002).

The national chapters sprung up in a more or less spontaneous fashion and maintained their independence from the original French chapter. Accordingly, Attac lacked any central institutions to give direction or exert authority over the national chapters. Thus, the group represented a case of a transnational coalition rather than a federation. This trait would lead to numerous arguments about the group representing a new, internationalist kind of social movement.

In terms of demands, Attac mixed one very concrete aspect (the introduction of a tax on financial transfers; a so-called “Tobin tax”) with criticism of economic liberalism in general. In the latter regard, demands ranged from issues related to tax havens and trade to the defense of public services and opposition to privatizations. Over time, some of the more successful national chapters appeared to focus more on local tangible demands and comparatively less on global ones. With this, they may have tried to overcome an important political limitation of the group: the absence of demands that could mobilize public opinion in general (Uggla 2006).

Operationally, the group claimed to be a “movement of popular education oriented towards action.” Seminars and summer schools were featured prominently along with more traditional forms of protest action. Several of the national chapters also set up “scientific councils” aimed at the production of analysis critical of liberal economic orthodoxy. Additionally, the group was closely associated with the world social forums that were first organized in Porto Alegre in 2001 (Kolb 2005).

Attac’s political position was buoyed by the media attention that the group attracted. While such attention may in large part have been the result of the group’s own media strategies, it is tempting to see another factor at work in this regard, namely the fact that Attac could provide journalists (as well as politicians) with a link to the incipient and unstructured movement that was developing around themes such as...
resistance to free-trade agreements, privatizations, and financial deregulation (Kolb 2005). Thus Attac often became a proxy for the entire Global Justice Movement (Kolb 2005). This served the organization well in terms of attention from the media and from the political establishment. In its native France, in particular, this soon led to political results. As politicians of all hues courted the group (which was ambivalent about such overtures), almost three-quarters of the French claimed to favor the introduction of a Tobin tax by September 2001 (Ancelovici 2002; Waters 2004).

But in other contexts the association of Attac with the broader movement for global justice would prove to be a double-edged sword. As the movement’s protests in Genoa and Gothenburg in 2001 brought widespread rioting and police repression, Attac became associated with violence in the eyes of the public in certain countries. This association, together with the challenge of finding concrete demands with which to attract support and members, eventually led to Attac’s downturn in several countries following the initial successes.

Even in France, Attac would experience a marked decline. Internal conflicts between the founding members and local groups led the group to lose influence in the broader movement. In 2006, the group’s president was forced to resign after supposed fraud in the group’s internal elections. By 2008 – ten years after its foundation – the number of fee-paying members in France had dwindled to around 10 000.

Of the international chapters, several seemed to be dormant.

Even as new protests against the dominant economic system begin to spread around the world, Attac may find it hard to retake its former position. But the group’s signature demand – taxation of financial transactions – fared better, as, during the fall of 2011, it was elevated to the highest European policy levels, and it became one of the instruments with which the leaders of the European Union proposed to respond to the financial turmoil.

Bisexual movement
CHRISTIAN KLESSE

Bisexual movements have been politically active in many parts of the world for several decades. Most historical accounts locate the roots of the modern bisexual movement in the early 1970s. In the United States, bi-identified activists have been part of the lesbian and gay civil rights or liberation movements since the mid-1960s. Distinctively bi political manifestos, social or political groups, and community structures have spread from the early 1970s onwards. These steps to bisexual self-organizations took inspiration from the women’s and the gay liberation movements. Early bi activists often advocated a sex-radical agenda which reflected the sexual liberationist ethos of countercultural politics at the time. Bisexual politics in the United States solidified in the 1980s. Local groups mushroomed throughout the country. Bisexual feminists strongly shaped this period of US bisexual politics, which resulted both in the prominence of female key activists in the wider movement and the simultaneous growth of separate organizations. Bi men later formed their own networks. Attempts were made at regional organization throughout the 1980s, with the first national bisexual conference in the United States taking place in 1990.

The organization of regional, national, and (since 1991) international conferences have been a consistent feature of global bisexual politics. Social support structures, networks, and political campaigning groups have appeared in many countries across the globe since the 1980s. In some countries, activists formed umbrella organizations on a national scale. The historical trajectories of bi organizations and politics differ significantly depending on their national, regional, or geopolitical context.

Historically, bisexual groups have often worked in close affiliation with lesbian and gay organizations. At the same time, bisexual activists have worked toward creating autonomous bisexual community structures and distinctive modes of bi analysis and politics. The following explanations are frequently given for this strategy: Bisexual activists argue that forms of anti-bi oppression are highly specific and cannot be explained through recourse to one-dimensional or universalistic theories of “homophobia.” Moreover, bisexuals are often not welcome in lesbian and gay groups and organizations, although many bi-identified people have worked alongside gay men and lesbians in many struggles against the denigration and oppression of same-sex desire, intimacy, and culture. Many bi activists had to endure the bitter experience that they were only accepted as active members of gay and lesbian groups as long they did not make their bi identity public or did not enter a primary relationship with an other-sex partner. The erasure of bisexuality (and bisexuals) from lesbian and gay activism is evidenced in the long-standing conflicts stemming from the resistance of local organizers of Stonewall memorial marches or pride parades to refer to bisexuality in the title, campaigning material, or programming. While it has become more common to refer quite generally to “LGBT” rights or movements these days, bisexuality and transgender continue to be of low concern for many local organizers.

Bisexual activists have analyzed the rejection of bisexuality not only in the heteronormative mainstream, but also in many lesbian, gay, or queer contexts, as either an effect of bi-negativity (or biphobia) (i.e., a mixture of anti-bisexual sentiment and discrimination) or monosexism (i.e., the deep-rooted belief that it is natural to desire only people of one sex). Stereotypes are an integral part of bi-negativity. Common anti-bi stereotypes
include the beliefs that bisexual people are immature, confused, indecisive, morally corrupted, over-sexed, promiscuous, disloyal to the lesbian and gay cause, or cowards who shy away from the consequences of facing the harsh realities of standing up to their allegedly true gay or lesbian identities.

For these reasons, bisexual activists have aimed at building autonomous organizations. This does not mean that many may not at the same time propagate a coalitional politics and advocate cooperation with other movements, such as the lesbian and gay, feminist, transgender, intersex, queer, polyamory, BDSM, sex worker, and other movements. In many countries, bisexual movement organizations have created their own media, including newsletters, magazines, and more recently blogs. Since the late 1980s a range of edited volumes documenting autobiographical and activist writing and research into bisexual politics have appeared in English language.

Bisexual politics tend to focus on issues and concerns around bisexuality. Like other social movements, the bisexual movement has given rise to identity-political strategies and rationalities. Bisexual identity politics are complicated by the inherent diversity of bisexual identities, intimacies, and erotic lives. Historically, the term bisexuality has been associated with manifold and quite distinct meanings. In the nineteenth century, bisexuality became central to the attempts of Western scientists and scholars to explain their core categories of sexual classification: homosexuality and heterosexuality. Western theories of sexuality tended to box human beings according to a crude dichotomic sexual orientation model, which dubbed people as either heterosexual (the majority) or homosexual (and later, when terminology had moved on, lesbian or gay) (the minority). Bisexuality became a category for those who did not fit in either of these boxes or who fell into the “middle ground” of a continuum of desire ranging from exclusively homosexual to exclusively heterosexual. Yet it differed from both in that it was denied the seriousness of a proper sexual orientation (or valid adult identity).

Today most people use the term bisexual to signify the capacity of a person for desiring people of different genders, rather than just one. At the same time, the term has kept the connotations of older meanings of androgyne (or gender ambiguity). Contemporary bisexual identities hinge on either the sexual or the gender angle (or both). Bisexuality is derived from a Western epistemology. This leads to problems in the transnational sphere of sexual politics such as, for example, in the field of international human rights politics. Bisexuality may not resonate with local linguistic practices and cultural identifications. Even if the term bisexual is used in non-Western contexts, it may coexist in symbolic tension with other local frameworks and definitions.

Bisexual movement politics have solidified in many countries over the last few decades. However, they have so far not achieved a degree of organization or institutionalization which would be comparable to the lesbian and gay movements. Bisexual activism is often dependent on sharing spaces and resources of lesbian and gay organizations. Bi spaces are usually temporary and transitory. Campaigning groups are often quite small. The pool of activists which sustains projects such as the organization of conferences and the production of media is often limited. Burnout and a high turnover are common experiences in activist circles. Some interpret these phenomena as an effect of a strong impermanence of bisexual identifications.

Bisexual activists have worked around a vast array of issues, including coming-out support, community building, education, sexual health, antibullying and antidiscrimination work, trade union politics, the repeal of repressive or discriminatory legislation, and the struggle for social, legal, or political rights (e.g., around immigration, marriage, polyamory, etc.). Like other movements, the bisexual movement has not been unified in its political strategies. It contains radical currents and more liberal ones, and bridges a schism between queer and equal rights agendas. Bi politics often oscillate between a utopian approach which exploits the
category confusion inherent to bisexuality for envisioning a world free of binary thought and a more pragmatic one which wants to establish bisexuality as a (third) recognized orientation. Despite the widespread prevalence of the myth that bisexuality comes along with an enhanced capacity for incorporating diversity, bi politics, too, have been riddled with internal conflicts regarding the social divisions of race, gender, class, age, and disability.

Citizen peacebuilding movements

DANIEL WEHREFENNING

Citizen peacebuilding movements have been around for centuries but have gone through many transformations. They have had to deal with similar issues to other social movements, such as the challenge of keeping people involved long term and sustainably changing society. However, citizen peacebuilding movements face additional challenges which other social movements may not have to deal with.

The cost and risks of joining citizen peacebuilding movements are generally very high. In particular, in their early stages, members are often cast out of their social networks, treated as traitors for interacting and cooperating with the other sides, and sometimes even violently oppressed.

The cohesiveness in citizen peacebuilding movements is also challenging. While many social movements are built around a common theme or grievance, this is often a challenge for many citizen peacebuilding movements. Peace is the vision, but the definition of what peace looks like is the challenge. As many conflicts are asymmetrical, so are the definitions and visions for peace. For example, the peace activist from the weaker group often declares justice and equality as a precondition for peace (more of a political definition of peace), while the peace activist from the stronger group focuses more on interpersonal peacebuilding (a more personal definition of peace). These differences are very challenging in the process of horizontal integration of the various peace constituencies and often hinder the building of a strong combined peace movement. Consequently, we often see separate citizen peacebuilding movements in each conflict party.

The vertical integration with the political leadership creates other difficulties. While social movements often exist as purely oppositional movements to the political process, citizen peacebuilding movements are more dependent on the political process, as the vision of peace has to have a political reality. This mix of being a social citizen movement and at the same time a political movement creates more challenges, in particular when party politics enters the picture and some parties want to absorb or co-opt the citizen peacebuilding movement.

ORIGINS OF CITIZEN PEACEBUILDING MOVEMENTS

Today’s citizen peacebuilding movements tend to be holistic projects that do not just seek an end to violence but also seek to build positive and lasting reconciliation and peace between the parties in conflict. However, historically they started out as nonviolent, antiwar movements.

Peace movements in their earlier forms have been around for centuries. For example most religious traditions have a clear nonviolence foundation. In Judaism the destruction of the Second Temple gave rise to a peace party advocating nonviolent Resistance to the Romans; the Koran reports of the nonviolent struggle of the Prophet Mohammed before the Hegira; and in the early years of Christianity (first century) we find pacifist movement adherents refusing to serve in the military or engage in violent activities, particularly during the time of the first crusades (Boulding 2000). However, these early expressions of nonviolent movements were not yet citizen peacebuilding movements but rather antiwar movements, advocating for nonviolence and pacifism instead of following the common tit-for-tat war philosophy. It wasn’t until the nineteenth century that more organized forms of mass movements toward peacebuilding began.
to appear, such as the first international Peace Congresses in the 1840s in London and Brussels (Boulding 2000). The Nobel Peace prize, the Interparliamentary Union, and the International Peace Bureau formed the first transnational infrastructures for peacebuilding. World War I was the first breaking point for peace movements, and most declined rapidly with the notable exception in the form of some Christian pacifist and some women’s movements that were still active (Boulding 2000). The postwar period then saw an increase in peace education and a rekindled interest in specifically pacifist movements. However, the beginning of World War II was a serious blow to the fragile peace movements, in particular the secular movements since many of their supporters died in the war. Just when the surviving peace groups were reorganizing around the newly founded United Nations after World War II, the cold war set in and dissuaded new waves of peace activists from joining the ranks (Boulding 2000).

What is particularly interesting about the peace movements of this time is that they became more citizen-based, in the sense of being more grassroots organized, but at the same time strayed from some of the peace education philosophies toward more antiwar movements protesting the rapid militarization of the cold war (in particular nuclear proliferation). Also, a second strand of activities developed within the traditional circles of peace movements in the form of nonviolent civil rights movements (including the women’s rights movement). However, the cold war in general was a rather bleak time for citizen peacebuilding with major power politics determining the fate of war and peace rather than citizen activism.

These impediments notwithstanding, there were two developments that were very beneficial to the evolution of citizen peacebuilding. Firstly, the actions of Mahatma Gandhi and Martin Luther King Jr introduced a new kind of nonviolent citizen activism, which is instrumental to this day and strengthened the role of citizen movements in bringing political change. Secondly, in the 1950s and 1960s, conflict resolution and peace research became very popular worldwide, which led to the creation of major formalized early peace theories (Boulding 2000). In particular, the contact hypothesis theories propounded by Allport (1954) provided theoretical support for citizen peacebuilding efforts. There were also the pioneering books in the new peace research community, which stimulated future work in this emerging field of research. In the 1980s there was another paradigm shift, at least theoretically, as interest moved from a more national security paradigm to a more common and regional security paradigm. This also brought with it a new understanding of peacebuilding, which was much more proactive than the traditional antiwar perspective (peacemaking).

The end of the cold war can then be seen as the most important change for citizen peacebuilding in recent decades. It changed world dynamics considerably by breaking the bipolar power balance between the United States and its allies and the UDSSR. This in turn gave rise to many more civil wars as well as regional and global institutions and citizen movements, two dynamics that are crucial for current citizen peacebuilding movements world wide.

THEORIES OF CITIZEN PEACEBUILDING

The end of the cold war also inspired more new theories around the emergence of active citizenship in the form of global citizenship (global civil society, see Kaldor 2003) and in intrastate peacebuilding. However, acknowledgment of the role of citizen peacebuilding is often found under different labels like second-track, multi-track, or civic diplomacy and mediation. Theories by numerous scholars (Kelman 1972; Fisher, Ury, & Patton 1983; Fisher 1997; Saunders 1999; Voorhees 2002; Galtung 2004) have focused on these issues. All of these theories focus mainly on nonstate actors (citizen) as the primary agents of change and, while still interested in finding resolutions to social and political problems and differences, they are also concerned
citizen peacebuilding movements

with reestablishing relationships between the individuals and groups of the conflict parties (peacebuilding).

Theses theories outline different levels and mechanisms through which citizen peacebuilding is or can be pursued:

**Back-channel talks.** This is one of the most important but also most secretive kinds of citizen peacebuilding, which is rarely public and thus takes place in the shadows. Participants can vary, but in most cases include important grassroots, civil society, or government actors who are either well connected and respected in their own group and/or have decision-making power themselves.

**One-and-a-half track diplomacy.** This mechanism involves interaction between officials and unofficial actors in conflicts, as distinguished from the diplomatic efforts of official actors but with more elevated political importance compared to other purely civil society or grassroots citizen peacebuilding.

**Second-track diplomacy.** Describes the strategic interaction and intervention of unofficial representatives in citizen peacebuilding. It distinguishes between two kinds of interventions, political second-track diplomacy (unofficial intervention targeted at official actors) and cross-community second-track diplomacy (unofficial interventions with unofficial actors).

**Grassroots peacebuilding.** Many grassroots citizen peacebuilding movements and activities are highly organized, like neighborhood or living-room dialogue groups and demonstrations, but some are also spontaneous. Grassroots citizen peacebuilding often involves internal dialogue within one group, especially in more segregated societies, aimed at informing and strengthening the internal capacity of moving toward peaceful solutions and to lay the foundation for future intergroup relations and peacebuilding.

Fundamentally all of these kinds of citizen peacebuilding emphasize the “bottom-up” input by citizens into the official or semi-official decision-making processes (Hemmer et al. 2006). There is also an important place for “top-down” communication and decision making. However, it is through a process of cross-pollination rather than through the traditional form of “trickle down” diplomacy. There are three main theories that describe this more holistic understanding of citizen peacebuilding (movements).

**Public peace process.** Harold Saunders (1999) conceptualizes a successful peace process as a multi-level process that develops and progresses in multiple arenas at the same time.

Different forms of citizen peacebuilding
while influencing each other. He distinguishes between four arenas: the official peace process of (would-be) peace negotiations; the quasi-official process, made up of citizens outside of the government who consult with officials on specific issues; a public peace process involving dialogue between citizens outside of government; and civil society, in particular, civil society associations and organizations (NGOs) that span various ethnic, racial, religious, economic, social, and other dividing fault lines. Each of these arenas is linked to the others and they cross-pollinate each other. This is built on the idea that dialogue and relationships between citizens outside of governments will complement, support, and energize the official peace process. While officials mainly negotiate issues and interests, citizens change the behavior and reestablish the relationships between the groups in conflict.

Multi-track diplomacy. Another key theory of citizen peacebuilding movements resides in Diamond and MacDonald’s (1996) work on multitrack diplomacy. They emphasize that peacebuilding cannot just be achieved through political negotiation with the addition of some select nongovernment groups, but needs to be a process that includes many different social actors in multiple conflict resolution processes. In their analysis, Diamond and MacDonald differentiate between different tracks and give each track a strategic importance in peaceful change. Eight of the nine tracks fall into the nonofficial category. Media, business, and religion are all different tracks with specific roles in terms of communication, dialogue, and responsibility toward peace. In this multilevel model, with its heavy reliance on unofficial actors, the different tracks work as combined movement toward peace.

Peace infrastructure. Another holistic theory is provided by John Paul Lederach’s (1997) work. He emphasizes that “an important task in the development of a framework for sustained reconciliation is to build a peace constituency within the setting” (Lederach 1997: 94). This is done by linking an active peace constituency with the official peace process through the development of what he calls “mid-range leadership,” which entails key citizens engaged in communication with the political leadership through processes called second- or one-and-a-half-track diplomacy. Lederach highlights the need for an organic and interactive peace process, connecting the whole sociopolitical body as a movement toward peace. He refined this concept in The Moral Imagination (2005), which highlights the importance of getting a small set of people centrally involved at the right places and being able to tap into resources, space, and connections to influence large-scale change. He emphasizes that it is not so much the quantity but the quality of the actors and their connection that matters. The metaphor of the critical yeast vs. the critical mass derives from this (Lederach 1997: 91), building on a web approach of change in which the challenge is to link multiple sets of interdependent processes and different sets of people together into an effective movement to bring about social change. Lederach argues that the most significant citizen peacebuilding movements are those that infuse a new quality of interaction and strategically connect a small group of people in such a way that whole societies begin to be transformed. He argues that this might be a more long-term perspective but is the only way to produce sustainable change.

Synthesizing the theoretical ideas behind the public peace process, multitrack diplomacy, and the peace infrastructure suggests some interesting conditions and strategies under which citizen peacebuilding movements are more likely to be successful. It seems that because political negotiations (first-track diplomacy) are primarily concentrated on peace-making and the political establishment of the peace process, the role of citizen peacebuilding movements is primarily a supportive one. This supporting role, however, seems to break down into two different objectives: The first is the bottom-up push to influence and support the official negotiations through channeling and integrating public opinion and leading its expert council, as well as breaking political stalemates through cross-community actions.
The second objective is to build up civil society and grassroots capacity (peace infrastructure and constituency) to implement the top-down (trickle down) political peace agreement and embed it in a broader long-term concept of citizen peacebuilding and reconciliation. In these two objectives, the various citizen peacebuilding forms (backchannel, one-and-a-half track diplomacy, second-track diplomacy, and grassroots dialogue) have different functions at different times but all work together as a movement to bring a sustainable peace.

**LESSONS TO BE LEARNED FROM ISRAEL/PALESTINE AND NORTHERN IRELAND**

Unfortunately, little empirical work has been done to test and advance the citizen peacebuilding theories of Saunders, Diamond and MacDonald, and Lederach (Broome & Jakobsson Hatay 2006), in spite of an increasing acknowledgment that citizen participation plays a critical role in conflict resolution. As a consequence little is known about functioning models. However, a comparative analysis of the citizen peacebuilding efforts in the two seemingly intractable conflicts in Israel/Palestine and Northern Ireland shows the evolution of citizen peacebuilding movements from an anti-war toward a positive peace movement over the last decades. Furthermore, it reveals that the more effective and successful use of citizen peacebuilding movements in the Northern Ireland peace process and the failure thereof in Israel/Palestine supports the above theoretical criteria for citizen peacebuilding movements (Wehrenfennig 2009).

In the 1970s and 1980s, we witnessed the early formation of peace movements as anti-war movements in both conflicts. The Peace People in Northern Ireland (1976) or the famous Shalom Akhshav/Peace Now (1978) citizen peace (building) movement are two well-known examples during this period. But despite their success in raising awareness for peace in their respective societies, the antiwar citizen movements in both conflicts did not bring sustainable change for peace. Only when various other forms of citizen peacebuilding, including back-channel talks and one-and-a-half track diplomacy approaches, joined forces with the public peace movements did the major peace process in both conflict zones start. The official peace processes of the 1990s in Northern Ireland and Israel/Palestine were inspired by citizens acting as intermediaries and laying the foundation in secret back-channel talks and early forms of one-and-a-half track diplomacy. In Northern Ireland, the secret back-channel talks were orchestrated by businessman Brandon Duddy (between the IRA and the British government), priest Harry Reid (between the Irish and British government), and pastor Patrick Magee (between the Loyalist paramilitaries and the British government). In Israel/Palestine the official negotiations were pre-meditated through the unofficial dialogues of two Israeli professors, Dr Ron Pundak and Dr Yair Hirschfeld, who connected key Israeli political actors (e.g., Yossi Beilin, who then became Deputy Minister of Foreign Affairs under Prime Minister Yitzhak Rabin) with prominent and politically connected Palestinians (e.g., Faisal Husseini, Hanan Ashrawi, Ziad Abu Zayad, and Sari Nusseibeh), which turned these informal discussions into the official peace process. This demonstrated, among other things, that relationship building through citizen involvement on all levels of society is crucial in preparing or supporting official peace negotiations (Wehrenfennig 2009).

However, the failure of the peace process in Israel/Palestine and the success of it in Northern Ireland serve as another indicator of the importance and function of citizen peacebuilding movements. With the beginning of the peace process in Northern Ireland we see not only a massive increase in citizen peacebuilding activities, but also a kind of coordination (through civil society umbrella organizations like the Community Relations Council, the Community Foundation for Northern Ireland, and the Northern Ireland Council for Voluntary Action) and demonstration of how the different levels and forms
of citizen peacebuilding activities can work together to serve the broader peace process. There has been a cross-pollination and coordination between the various types and forms of citizen peacebuilding activities, which best can be seen in the Opsahl commission in 1992 and the Yes campaign for the ratification of the official peace referendum in 1998. The Opsahl commission was a large (independent) citizen research initiative that revealed many hidden social and economic concerns about the future of Northern Ireland and the peace process that the political debates at the time were not addressing. Its findings became the blueprint for the peace talks. The 1997–1998 Yes campaign was a key citizen peacebuilding initiative connecting and mobilizing the various citizen peacebuilding constituencies to convince the critical population on both sides of the conflict that the concessions of the proposed peace agreement, which the political negotiations had worked out, were good and needed to be ratified. The Belfast Peace Agreement was ultimately approved in the 1998 referendum, with a high voter turnout and 71 percent of the population voting in favor of the peace agreement, even though the polls were pointing the other way for a long time. This success is, in large part, connected to the coordinated citizen peacebuilding efforts of the Yes campaign.

Vice versa, the failure of the peace process in Israel/Palestine is also connected to the failure of the citizen peacebuilding movement in the 1990s. While starting strong, with numerous citizen peacebuilding efforts in the early years of the Oslo peace process, the missing coordination between these citizen peacebuilding efforts created oversaturation and misuse that ultimately turned many people away and coined the negative term of “the peace industry.” Furthermore, the missing connection and cross-pollination with the official peace process created a critical distance between the citizen peacebuilding efforts on the ground and the slow-progressing official peace talks. The citizen peacebuilding movement’s failure to connect with and pressure the official negotiations by staying silent and passive rebounded on them as many people turned away from their efforts. Disillusioned by having minimal effect on the official peace process, many people stopped supporting the citizen peacebuilding initiatives on the ground and, finally, when there was some progress in the official peace negotiations, public opinion had turned so much that the citizen peacebuilding efforts did not seem to matter anymore, leading, in part, to the Second Intifada of 2000 (Wehrenfennig 2009). The failure of the citizen peacebuilding efforts in this context appeared to have a negative effect on the potential for peace, and, as a result, it has been difficult to reignite substantial citizen peacebuilding activities in Israel/Palestine.

Citizen peacebuilding movements are very important social movements and a key component for the realization of sustainable peace in most conflicts of our day. In particular, functioning to reestablish the relationship between conflict parties and to coordinate the implementation of peace on the ground, citizen peacebuilding movements appear to be an important addition to the official peace negotiations.

Collective (public) goods
PAMELA OLIVER

In economics, public or collective goods are contrasted with private goods. The enjoyment of a private good can be restricted to those who pay for it, and the consumption of a private good by one person makes it unavailable to anyone else. Markets “work” for private goods, where individuals make clear decisions about cost/benefit tradeoffs and prices are the consequences of the forces of supply and demand. By contrast, public (collective) goods are nonexcludable – shared by everybody, whether they helped pay for the good or not – and nonrival – in that one person’s “enjoyment” of the good does not affect another’s. People who share in a public good without paying for it are often called “free riders.” Because people can share in a public good if it is paid for by others, the usual assumptions of the market fail, and economists and social scientists generally argue that public goods need to be provided through taxation or other collective means. Public goods are an instance of the more general matter of externalities, in which one person’s actions or choices affect the costs or benefits to other people who did not make the choice. Within economics, there has been a great deal of elaboration of these ideas. Some goods are nonrival but excludable (e.g., satellite television), others are nonexcludable but rival (e.g., environmental resources); both excludability and rival-ness are continua rather than dichotomies. Public or collective goods vary greatly in important ways that affect the social dynamics of their provision, including their lumpiness and the linearity or nonlinearity of their production functions. Moreover, the same “good” (like clean air or a bridge) can be provided in different ways that have different production functions relating contributions to benefits. Introductory overviews of these issues may be found in the cited references.

At the core of politics is the matter of public or collective goods: How much of goods like schools and transportation systems and military defense should be provided? How should the costs of these goods be distributed across the population? Which goods should be treated as public or collective goods available to all, and which should be private goods available only to those willing and able to pay for them? Laws and customs that favor one group or discriminate against another group are also collective goods. So is the level of environmental pollution. Some things are “public bads” – that is, things that hurt people who did not create the problem. Also, even though public goods are by definition shared, this does not mean that everyone shares equally in them. The same public good may be considered beneficial by some and harmful by others, and even a good that everyone agrees is good (or bad) will generally have different effects on different people. Within the study of public or collective goods, many other distinctions are also made about the production function relating the “amount” of a collective good to the “amount” and type of payment or action that goes into providing it, including whether goods are divisible, whether there are crowding effects, whether it is physically possible to exclude people from “enjoying” the good, whether there are alternatives to the good, and so forth.

The terms “collective action” and “cooperation” are often used in this tradition of theory and research to refer specifically to the act of making contributions to the provision of collective goods, even when those contributions are made by individuals acting alone. In this context, “collective action theory” refers to theories of the conditions under which individuals or groups are willing and able to make contributions to collective goods.

In the world of collective goods and the larger world of externalities, people have “regulatory interests” (Heckathorn 1988), that is, interests

in what other people do or do not contribute to collective goods. People may expend their own resources to motivate or coerce other people to make contributions to a collective good (Oliver 1980). Environmentalists expend effort and resources to win legislation that uses the power of government to force industries to pay the price of reducing the pollution from their factories. Workers may expend effort to persuade or coerce other workers either to cooperate with management or to resist management. Neighbors may use social pressure to affect how others maintain their lawns. There is what is called a “second order collective action problem” involved in deciding whether to pay the cost of actions that affect other people’s likelihood of cooperating with collective action. Third- and even fourth- or higher order collective action problems can readily be defined, as some people expend resources to motivate other people to expend resources to motivate still other people to contribute to collective goods. These chains of nested relations clearly exist empirically and can create many complex strategic patterns and relationships (Heckathorn 1996). The result is that there is no simple single principle for the dynamics of public goods provision. Scholars thus either focus on one class of problems or focus on identifying the differences between classes of problems.

Social movements are generally “about” public or collective goods, in the sense that they seek legislation, policies, or programs that affect people outside the social movement. Social movements also can be considered public or collective goods in themselves, in that the existence and actions of the social movement affect everyone, not just the people who contribute to it. Ideas from collective action theory often illuminate patterns in social movements (e.g., Chong 1991). Research on participant motives regularly finds that the subjective value attached to the collective good itself is a stronger predictor of movement participation (e.g., Muller & Opp 1986) than individual benefits.

One important class of collective good is the prevention of environmental degradation or erosion of common resources. People create environmental degradation (the collective bad) when the harm to the environment they personally experience from their own resource use or pollution-generation is lower than the benefit they receive from their action. A great deal of applied collective action theory addresses the conditions under which environmental degradation can be avoided (e.g., Ostrom 1999). Work on “social dilemmas” in social psychology similarly focuses on behavior in mixed-motive situations and the contexts that make cooperation possible in the face of incentives to defect for personal benefit.

Consciousness, conscience, and social movements
DAVID A. SNOW and ROBERTA G. LESSOR

Few concepts and/or processes have so intrigued and perplexed philosophers, theologians, social scientists, and, more recently, neuroscientists, as that of consciousness (Ornstein 1973; Jaynes 1976; Velmans & Schneider 2007). At its core, “consciousness” translates into awareness, both internal awareness of self and external awareness of context. “Conscience,” on the other hand, can be regarded as the moral component or value-laden dimension of consciousness. Conscience constitutes the core of the “superego” of the Freudian triadic structure of the self (Freud 1962), and the “me” of the Meadian dyadic structure of the self (Mead 1962). In both cases, conscience can be construed as the socially or culturally constraining part of self, and thus inextricably linked to consciousness. Both consciousness and conscience figure prominently in theorizing and analyzing social movements.

CONSCIOUSNESS AND SOCIAL MOVEMENTS

The concept of consciousness has long been woven into many discussions of social movements, both descriptive and analytic, dating back at least to the writings of Karl Marx and Fredrik Engels. However, the concept intersects most significantly with the cognate concepts of class and oppositional consciousness, false consciousness, consciousness raising, and consciousness transformation.

Class and oppositional consciousness

Class consciousness, as generally used, means not only awareness of one’s material economic interests, but also, and most importantly, awareness of the extent to which one’s material conditions and interests are shared with similarly situated others, and different from those whose lives are embedded in a contrasting material context within the same socioeconomic regime or hierarchy. There is thus a material, economic component to the concept, as well as a social psychological component.

These elements were clearly accented and linked by Marx and Engels, and carried forward in subsequent scholarly work on class and social movements. As discussed in other entries in the encyclopedia, Marx and Engels saw working-class mobilization, among other forms of mobilization, as being partially contingent on the working class developing a “class consciousness,” a consciousness that signaled the transformation of the working class from a “class-in-itself” into a “class-for-itself.” The former refers to the objective situation of a class without an implication of members’ understanding of their situation in relation to the economic system as a whole and to each other. A class-for-itself, on the other hand, arises when members of a class-for-itself become conscious that their fates are joined, that they are the objects of exploitation and oppression, that they share a common enemy, and that any significant change in their objective situation requires dramatic alteration of the social system (see, in particular, Marx’s discussion of the “small-holding peasants” in The 18th Brumaire (1963: 123–125)). Marx did not clearly specify how or under what conditions this transformative process would occur. Consequently, debate ensued as to whether the emergence of working-class consciousness would occur spontaneously when the social conditions reached a certain unspecified but intolerable threshold, or whether it had to be organizationally molded and facilitated as V.I Lenin pondered and concluded affirmatively in What Is To Be Done? Never in dispute,
however, was the significance of consciousness to the movement.

The flow of history in more than a century since the writings of Marx and Engels set in motion ongoing debate among Marxist scholars (e.g., Lukács). One neo-Marxist challenge has been the presumption of a direct, automatic linkage between class antagonisms and the formation of grievances of sufficient magnitude to mobilize working-class revolt. There have been labor movements and strikes and other outcroppings of working-class unrest (Fantasia 1988; Fantasia & Stepan-Norris 2004), but for a variety of reasons the prophesied proletarian revolution never materialized in advanced capitalist societies. Not only did Marx fail to anticipate the evolution and growth of the middle, managerial class, but the immiseration of the working class failed to reach the level of wretchedness that Marx and others envisioned. Additionally, the development of strident working-class consciousness has been neutralized by multiple, cross-cutting associations and identities rooted in ethnicity, race, religion, and gender; by the existence of national, mythic narratives that highlight, as in the United States, shared belief in the prospect of upward mobility; and by the non-class character of many public issues and conflicts, such as those over crime control, abortion, birth control, school prayer, and evolution versus creationism. These and other conflictual issues have generated different oppositional consciousnesses (Mansbridge & Morris 2001), but they have been based on cleavages other than class.

False consciousness

The concept of false consciousness is generally used to denote an individual’s or social category’s misunderstanding of the character of their life situation and the conditions underlying it. The charge of false consciousness points to a presumably erroneous understanding of the relationship between one’s interests, usually material, and the way one thinks about and acts toward those interests. It implies a cognitive disjunction between perception and reality. Presumably those individuals whose interpretations and actions are encumbered and blinded by their false consciousness would think and act differently if they had a “correct” understanding of their situation.

This conceptualization of false consciousness derives from Marxist theory (see, in particular, Engels 1968) and has long been invoked to explain why the working class, as well as other subordinate classes or oppressed social categories, do not recognize the basis of their oppression and therefore fail to act in accord with their “true” interests. Theoretically, the problem is that the working class or oppressed are unable grasp the causes of their oppression because they are blinded by the dominant, hegemonic cultural and/or political ideology, which they have presumably adopted, albeit unwittingly (see Gramsci 1971).

A number of troublesome issues and questions have dogged the notion of false consciousness and its application for some time (see, e.g., Gabel 1975, and Lukács 1971). Perhaps most troublesome is the issue of interpretive elitism and associated questions such as the following: Who designates social classes or categories as being false consciousness? Is it social movement activists or ideologues, philosophers or social scientists, theologians or politicians, or the media? And what gives those who attribute the label the specialized insight or knowledge to legitimate their attributions? Second, doesn’t attribution of the concept demean the cognitive/interpretive abilities and agency of those so designated? And third, does not the use of the concept ignore the fact that people act toward objects for a variety of reasons – some are instrumental, others affective or emotional, and still other reasons are moral/normative – which can vary in their relative salience to the actor. Thus, the puzzlement of some political observers and pundits notwithstanding, one of the reasons working-class folks in the United States and elsewhere often do not act in accordance with their observed material interests, and their presumed class identity, is due to the greater salience of moral and lifestyle considerations
and their associated identities. The point is that factors other than material class interests can motivate action or inaction, and, as a consequence, determining what is in an actor’s best interest can be a very tricky matter.

For all of these considerations, perhaps it is best to avoid the false consciousness attribution and recognize that there is considerable interpretive variability in how events, lifestyles, and material conditions are understood and rationalized. However, whether invoking the false consciousness attribution or not, the obdurate fact still remains that social movement participation is often contingent on some degree and form of consciousness raising or transformation.

Consciousness raising and transformation

Since both consciousness raising and consciousness transformation imply some degree of change in political awareness or interpretive understanding of the reasons for repression, oppression, inequality, injustice, and the like, the two processes are often used interchangeably. However, it is arguable that there are fined-tuned differences between them, with consciousness transformation involving more wholesale cognitive change as occurs in some conversions, as illustrated by Arthur Koestler’s discussion of his conversion to communism in 1931. As he wrote in The God That Failed (Crossman 1952): “By the time I had finished with Feuerbach and the State and Revolution, something had clicked in my brain which shook me like a mental explosion. ... The whole universe [fell] into pattern like the stray pieces of a jigsaw puzzle assembled by magic at one stroke. There [was] now an answer to every question, doubts and conflicts [were] a matter of the tortured past.”

Such seemingly dramatic and sweeping cognitive changes aside, both consciousness raising and consciousness transformation involve the adoption of a diagnostic frame and corollary attribution scheme in which a problem, or set of problems, and its locus of blame or causality are simultaneously sharpened and generalized. In the case of self-help and some religious movements, the change in locus of blame is usually in the direction of self-internalization and responsibility, whereas in the case of more politically oriented groups and movements the change involves a shift from an internal to an external locus of control – that is, from self blaming to structural blaming, from victim blaming to system blaming.

The feminist/women’s movement in the United States in the late 1960s and 1970s provides ample illustration, as students of the movement noted that the mobilization of women during this period was contingent on the realization that their grievances and problems were not personal and idiosyncratic but systemic and thus political (Bird 1969; Evans 1979). Thus, changing the locus of blame was one of the key functions of women’s consciousness raising groups during this period. A major objective of these groups, as observers noted, was to get women “to recognize the political nature of complaints that [were] conventionally dismissed as personal” (Bird 1969: 216), whether in intimate relationships (Friedan 1997) or in the workplace (Lessor 1984).

Although consciousness raising and transformation typically occur in group contexts, interactional mechanisms or processes are also involved. A major set of such mechanisms include the frame alignment processes of amplification, extension, and transformation (Snow et al. 1986). Amplification and extension function primarily as mechanisms through which consciousness raising is affected. Frame amplification entails the embellishment, crystallization, and invigoration of existing values, beliefs, and understandings so that they are more salient and dominant; frame extension depicts movement interests and framings as extending beyond the movement’s initial constituency or concerns to include issues thought to be of relevance to bystander groups or potential adherents. Such amplification and extension can be accomplished by movement leaders and it can also be done by adherents who come to recognize their situation in the movement’s framing. Frame transformation,
on the other hand, involves changing prior understandings and perspectives, among individuals or collectivities, so that things are seen as strikingly differently than before, as is commonplace with conversions and is illustrated by the Koestler case above.

CONSCIENCE AND SOCIAL MOVEMENTS

If conscience is the moral or value-laden component of consciousness, then clearly conscience plays an important role in social movements. The role of conscience within the context of social movements can be seen most prominently in three interrelated concepts: moral convictions and incentives; prisoners of conscience; and conscience constituents.

Moral conviction and incentives

It is widely understood that movement participants are motivated not only by instrumental and solidary (affective) incentives, but also, and often most importantly, by moral incentives. Calls and rationales for participation are often framed, both individually and organizationally, in terms of the moral propriety, obligation, and urgency of taking action. Additionally, some events or situations may be seen as so morally objectionable and provocative that those individuals so affected may feel morally obligated to take up the sword. This is the “moral shock” argument that the observation of, or direct experience with, some events may be so morally reprehensible and emotionally moving that individuals will be inclined to join the cause irrespective of the presence or absence of ties to movement members (Jasper 1997). Accordingly, the moral shock value of some events or happenings is not lost on movement strategists, as with the strategic use of photographs of aborted fetuses by antiabortion activists and of visualizations of animals used in scientific laboratories by PETA (People for the Ethical Treatment of Animals) to mobilize prospective participants. Whether moral appeals are expressed in terms of moral proprieties and obligations or moral shocks, the salience of moral convictions and incentives, and thus conscience, in relation to participant mobilization is indisputable. Indeed, it is moral conviction that accounts in large part for the “iron in the soul,” which Barrington Moore (1978: 89–91) suggests is key to understanding the persistence of many social movements in the face of repression and resistance.

Prisoners of conscience

It is precisely the “iron in the soul” that gets at the core of prisoners of conscience, a term which is used generally to refer to those individuals who are, or have been, imprisoned because of their nonnegotiable moral beliefs and convictions. The concept appears to have been originally defined, and perhaps coined, by Peter Benenson, who defined a prisoner of conscience as “any person who is physically restrained, by imprisonment or otherwise, from expressing (in any form of words or symbols) an opinion which (s)he honestly holds and which does not advocate or condone personal violence.” Some human rights and nongovernmental organizations, such as Amnesty International, have fought vigorously for the rights of prisoners of conscience, and have played a key role in facilitating the release of hundreds of prisoners of conscience worldwide. For example, according to Amnesty International’s 2011 human rights facts and figures, the nonprofit organization was calling for the release of prisoners of conscience in 48 countries. While most of these countries tend to be skewed politically in the direction of authoritarian regimes, from time to time prisoners of conscience can also be found in democratic countries, especially when the state is embroiled in conflict with social movement protestors contesting states’ policies and practices. Illustrative was the imprisonment of Daniel and Phillip Berrigan – both Catholic priests known popularly as the Berrigan brothers – for their leadership in the antiwar and antidraft movements in the United States during the Vietnam War years. Among the protest events they led or engaged in, the one that led most directly to their imprisonment involved
burning the records of a Maryland draftboard in May 1968.

Conscience constituents

In addition to morally inspired adherents or participants and the prisoners of conscience, a third set of conscience-based movement actors include those that McCarthy and Zald (1977) call “conscience constituents.” They include individuals, groups, and organizations that support movement campaigns and activities without benefitting directly from the attainment of its objectives. Conscience constituents function primarily as resource providers. They provide not only financial support, but often spaces to organize and meet, experiential expertise, legitimacy, and even moral support. They do so primarily because the movements they support are morally resonant; they see the movements as warranted and just on moral grounds. Examples of such conscience constituents are abundant in the annals of social movements, including some whites in the case of the black civil rights movement, the Catholic Worker organization in the case of movements for the homeless and the impoverished, and heterosexuals in the case of the gay and lesbian movement.

CONCLUSION

It is well-nigh impossible to reach a reasonable understanding of the dynamics of movement mobilization without consideration of the concepts of consciousness and conscience. This entry has provided an overview of key dimensions of the concepts, and an introduction to the scholarly arguments over their conceptualization and functioning. It is hoped that the entry invites further exploration of the concepts and their multifarious connections to social movement mobilization and participation.

Crowds (gatherings) and collective behavior (action)

DAVID A. SNOW and PETER B. OWENS

Crowds, or temporary gatherings as some scholars prefer (McPhail 1991), are a ubiquitous feature of everyday life. People have long assembled to observe, to celebrate, and to protest various happenings in their everyday lives. The historical record is replete with examples of crowds functioning as important textual markers, helping to shape and define a particular event, as well as strategic precipitants and carriers of the events themselves. The storming of the Bastille on July 14, 1789, which is considered one of the precipitating events of the French Revolution, and the sit-ins and marches associated with the civil rights movement in the United States in the second half of the twentieth century, constitute two well-chronicled historical examples of contentious crowds or collective action. Not all such gatherings function so emblematically, of course. Most are mere sideshows to the flow of history. Nonetheless, the assemblages or gatherings more commonly called crowds are ongoing features of the social world and, as a consequence, have long been the object of theorizing and inquiry, ranging from the psychologistic renderings of Gustav Le Bon (1960) and Sigmund Freud (1921), to the more sociological accounts of Neil Smelser (1963) and Ralph Turner and Lewis Killian (1987), to the highly systematic and empirically grounded observations of Clark McPhail and his associates (McPhail & Wohlstein 1983; McPhail 1991; Schweingruber & McPhail 1999).

Crowds have traditionally been analyzed as a variant of the broader category of social phenomena called collective behavior. Broadly conceived, collective behavior refers to group problem-solving behavior that encompasses crowds, mass phenomena, issue-specific publics, and social movements (Turner & Killian 1987). Today few social movement scholars use the term collective behavior, as it fell out of fashion in the late 1970s because of some of the questionable imagery and theorizing associated with it. Supplanting it is the apparently more palatable term “collective action,” which is conceptualized concretely as “two or more persons engaged in one or more behaviors (e.g., orientation, locomotion, gesticulation, tactile manipulation, and/or vocalization) that can be judged common or convergent on one or more directions (e.g., direction, velocity tempo, and/or substantive content)” (McPhail 1991: 159). Implicit in the collective behavior conception is a continuum on which the collectivity can vary in terms of the extent to which its participants are in close proximity or diffused in time and space. Instances of collective behavior in which participants are in close proximity, such that they can monitor one another by being visible to, or within earshot of, one another, are constitutive of crowds or temporary gatherings. Examples include protest demonstrations, victory celebrations, riots, and the dispersal processes associated with the flight from burning buildings. In contrast are forms of collective behavior or action that occur among individuals who are not physically proximate but who still share a common focus of attention and engage in some parallel or common behaviors without developing the debate characteristic of the public or the organization of social movements, and who are linked together by social networks, the media, or both. Examples of this form of collective behavior, referred to as diffuse collective behavior (Turner & Killian 1987) or the mass (Lofland 1981), include fads and crazes, deviant epidemics, mass hysteria, and collective blaming. Although crowds or temporary gatherings and diffuse...
collective behavior are not mutually exclusive phenomena, they are analytically distinct and
generate somewhat different literatures.

Understanding crowds or gatherings requires consideration of five overlapping
questions: (1) How do they differ from the gatherings typically associated with everyday
behavior, such as audiences and queues? (2) What are the distinctive features of crowds or
temporary gatherings as forms of collective behavior or action? (3) What are the condi-
tions underlying their emergence? (4) What accounts for the coordination of behavior
in crowds or temporary gatherings? and (5) What are the correlates and/or predictors of
individual participation?

DISTINGUISHING BETWEEN THE
CROWDS OF COLLECTIVE
BEHAVIOR/ACTION AND EVERYDAY
BEHAVIOR

Collective behavior and more routine, conven-
tionalized behavior are not discrete, mutually
exclusive phenomena. Yet the existence of col-
lective behavior traditionally conceived rests
in part on the assumption of significant dif-
fferences between collective behavior and more
taken-for-granted, institutionalized behavior.
In the case of crowds or gatherings associ-
ated with the latter, such as at sports events
and holiday parades, they tend to be highly
conventionalized in several ways. First, they
are recurrent affairs that are scheduled for
a definite place at a definite time; they are
calendarized both temporally and spatially.
Second, associated behaviors and emotional
states are typically routinized in the sense that
they are normatively regularized and antici-
pated. And third, they tend to be sponsored
and orchestrated by the state, a community,
or a societal institution, as in the case of
most holiday parades and electoral political
rallies. Accordingly, they are typically socially
approved gatherings that function to reaffirm
rather than challenge some event, institutional
arrangement, or the larger social order itself.

In contrast, the crowds or gatherings associ-
ated with collective behavior or action, such as
protest demonstrations, victory celebrations,
and riots, usually challenge or disrupt the
existing order. This is due in part to the
fact that these crowds are neither tempo-
really nor spatially routinized. Instead, they are
more likely to be unscheduled and staged in
spatial areas (streets, parks, malls) or physi-
cal structures (office buildings, theaters, lunch
counters) that were designed for institutional-
ized, everyday behavior rather than contentious
or celebratory crowds. Such gatherings have
long been described as “extraordinary” in the
sense that their occurrence indicates that some-
thing unusual is happening. Precisely what it is
that gives rise to the sense that something “out-
side the ordinary” is occurring is rarely specified
unambiguously, however. Lofland (1981) sug-
gests that it is increased levels of emotional
arousal, but such arousal is not peculiar to
crowd episodes. The conceptualization offered
here suggests another possibility: It is the
appropriation and use of spatial areas, physical
structures, or social networks and relations for
purposes other than those for which they were
intended or designed that indicates a break with
routine and that perhaps something outside the
ordinary is happening.

THE CHARACTERISTIC FEATURES OF
CROWDS

Crowds have been portrayed historically
and journalistically as if they are monolithic
entities characterized by participant and
behavioral homogeneity. Turner and Killian
(1987: 26) called this image into question,
referring to it as “the illusion of unanimity,”
but not until the turn toward more systematic
empirical examinations of crowds was it firmly
established that crowd behaviors are typically
quite varied and highly differentiated, and that
crowd participants are generally quite hetero-
geneous in terms of orientation and behavior
(McPhail 1991; Schweingruber & McPhail
1999).
Variation in crowd behaviors. Based on field research of crowds, Wright 1978 differentiated between two broad categories of crowd behaviors: crowd activities and task activities. “Crowd activities” refer to the redundant behavior seemingly common to all incidents of crowds, such as assemblage, milling, and divergence. In their overview of empirical research on behavior within what they call collective action gatherings, McPhail and Wohlstein (1983) identified collective locomotion, collective orientation, collective gesticulation, and collective vocalization among the types of crowd behaviors “repeatedly observed across a variety of gatherings, demonstrations, and some riots” (595).

Based on these observations and subsequent overlapping work, the following “crowd activities” (Wright 1978) or “elementary forms of collective action” (Schweingruber & McPhail 1999) have been identified: facing (e.g., common or convergent gaze, focus, or attention); voicing (e.g., common or convergent chanting, singing,booing, cheering, shouting); manipulating (e.g., common or convergent signaling, gesturing); and locomotion (e.g., common or convergent movement, marching, dancing). Given the recurrent and seemingly universal character of these basic crowd behaviors, it is arguable that they do not distinguish between types of gatherings, such as between demonstrations, celebrations, and riots.

To get at the variation in types of crowds, attention must be turned to what Wright conceptualized as “task activities” (1978). These refer to joint activities that are particular to and necessary for the attainment of a specific goal or the resolution of a specific problem. It is these goal-directed and problem-oriented activities that constitute the primary object of attention and thus help give meaning to the larger collective episode. Examples of task activities include parading or mass marching, mass assembly with speechmaking, picketing, proselytizing, temporary occupations of premises, lynching, taunting and harassment, property destruction, looting, and sniping.

Several caveats should be kept in mind with respect to crowd task activities. First, any listing of task activities is unlikely to be exhaustive, because they vary historically and culturally. Tilly’s (1978) concept of “repertoires of collective action” underscores this variation. Tilly stressed that while there are innumerable ways in which people could pursue collective ends, alternatives are in fact limited by sociohistorical forces. His research suggests, for example, that the massed march, mass assembly, and temporary occupation of premises are all collective task activities specific to the twentieth century.

Second, crowd and task activities are not mutually exclusive but are typically combined in an interactive fashion during the history of a crowd episode. The mass assembly, for example, is often preceded by the massed march, and property destruction and looting often occur together. Indeed, whether a crowd episode is constitutive of a protest demonstration, a celebration, or a riot depends, in part, on the particular configuration of task activities and, in part, on who or what is the object of protest, celebration, or violence.

A final caveat follows. The task activities associated with any given crowd episode vary in the degree to which they are the focus of attention. Not all are equally attended to by spectators, social control agents, or the media. Consequently, task activities can be classified according to the amount of attention they receive (Snow, Zurcher, & Peters 1981). One that is the major focus of attention and thus provides the phenomenal basis for defining the episode constitutes “the main task activity,” whereas those subordinate to the main task activity are “subordinate or side activities.” The main task activity is on center stage and typically is the focus of media attention, as illustrated by the extensive media coverage of property vandalism and looting associated with some riots. In contrast, the remaining activities are sideshows, occasioned by and often parasitic to the focal task activity. Examples of subordinate task activity in the case of property or community riots, or both, include spectating or observing, informal, unofficial attempts at
social control, and even the work of the media (Snow, Zurcher, & Peters 1981).

Variation in participating units. Just as empirical research on crowds has discerned considerable heterogeneity in behavior, so there is corresponding variation in terms of participants. Some are engaged in various task activities, some are observing, and still others are involved in the containment and control of the other participants and their interactions. Indeed, most of the individuals who make up a crowd fall into at least one of three categories of actors: task performers, spectators or bystanders, and social control agents. Task performers include the individuals performing both main and subordinate tasks. In the case of an antiwar march, for example, the main task performers would include the protesting marchers, with counterdemonstrators, peace marshals, and the press or media constituting the subordinate task performers.

Spectators or bystanders, who constitute the second set of actors relevant to most instances of crowd behavior, have been differentiated into proximal and distal groupings according to proximity to the collective encounter and the nature of their response. Proximal spectators, who are physically co-present and can thus monitor firsthand the activities of task performers, have generally been treated as relatively passive and nonessential elements of crowd behavior. However, research on a series of victory celebrations shows that some spectators do not merely respond passively to the main task performance and accept the activity as given, but can actively influence the character of the activity as well (Snow, Zurcher, & Peters 1981). Accordingly, proximal spectators can vary in terms of whether they are passive or animated and aggressive. “Distal spectators” refer to individuals who take note of episodes of crowd behavior even though they are not physically present during the episodes themselves. Also referred to as “bystander publics” (Turner & Killian 1987), they indirectly monitor an instance of crowd behavior and respond to it, either favorably or unfavorably, by registering their respective views with the media and community officials. Although distal spectators may not affect the course of a single episode of crowd behavior, they can clearly have an impact on the career and character of a series of interconnected crowd episodes.

Social control agents, consisting primarily of police officers and military personnel, constitute the final set of participants relevant to most instances of crowd behavior. Since they are the guardians of public order, their primary aim with respect to crowds is to maintain that order by controlling crowd behavior both spatially and temporally or by suppressing its occurrence. Given this aim, social control agents can clearly have a significant impact on the course and character of crowd behavior.

The foregoing observations indicate that behavioral and participant heterogeneity are characteristic features of most crowd episodes or temporary focused gatherings. In turn, the research on which these observations are based lays to rest the traditional image of crowds as monolithic entities composed of like-minded people engaged in undifferentiated behavior.

CONDITIONS OF EMERGENCE

Under what conditions do individuals come together collectively to engage in collective task activities constitutive of protest or celebration? Three sets of interacting conditions are discernible in the literature: (1) conditions of conduciveness; (2) precipitating ambiguities or grievances; and (3) conditions for mobilization.

Conditions of conduciveness. The concept of conduciveness directs attention to structural and cultural factors that make crowd behavior physically and socially possible (Smelser 1963). Conditions of conduciveness constitute the raw material for crowd behavior and include three sets of factors: ecological, technological, and social control. Ecological factors affect the arrangement and distribution of people in space so as to facilitate interaction and communication. One such factor found to be particularly conducive is the existence of large, spatially concentrated populations. The vast
majority of campus protest demonstrations in the 1960s occurred at large universities, for example. Similarly, the urban riots of the 1960s typically occurred in densely populated residential areas, where there were large, easily mobilizable black populations (Spilerman 1976).

The heightened prospect of interpersonal interaction and communication associated with population concentration can also be facilitated by the diffusion of communication technology, namely telephone, radio, television, and Internet access. But neither the diffusion of such technology nor population density guarantee the emergence of crowds or temporary gatherings engaging in collective behavior in the absence of a system of social control that allows for freedom of assembly and speech. Political opportunity scholars have argued theoretically and empirically that incidence of public protest against the state diminishes considerably in political systems that prohibit and deal harshly with such crowd behavior, whereas the development of a more permissive attitude toward public protest and a corresponding relaxation of measures of social control is frequently conducive to the development of protest behavior.

**Precipitating events and conditions.** However conducive conditions might be for instances of crowd behavior, it will not occur in the absence of some precipitating event or condition. Although the specific precipitants underlying the emergence of crowd behavior may be quite varied, most are variants of two generic conditions: (1) ambiguity; and (2) grievances against corporate entities, typically the state or some governmental, administrative unit, or against communal or status groups such as ethnic, racial, and religious groups.

Ambiguity is generated by the disruption or breakdown of everyday routines or expectancies, and has long been linked theoretically to the emergence of crowd behavior (Turner & Killian 1987; Johnson & Feinburg 1990). Evidence of its empirical linkage to the emergence of crowd behavior is abundant, as with the materialization of crowds of onlookers at the scenes of accidents and fires; the celebrations that sometimes follow high-stakes, unanticipated athletic victories or defeats; the collective revelry sometimes associated with the disruption of interdependent networks of institutionalized roles, as in the case of power blackouts and police strikes; and prison riots that frequently follow on the heels of unanticipated change in administrative personnel, procedures, and control (Useem & Kimball 1989).

The existence of grievances against the state or some governmental, administrative unit, or against communal or status groups, can be equally facilitative of protest gatherings. Grievances against the state or other corporate actors are typically associated with the existence of economic and political inequities that are perceived as unjust or political decisions and policies that are seen as morally bankrupt or advantaging some interests to the exclusion of others. Examples of protest crowds triggered in part by grievances include the hostile gatherings of hungry citizens and displaced workers in industrializing Europe; the striking crowds of workers associated with the labor movement; and the mass demonstrations (marching, rallying, picketing, vigiling) associated with the civil rights, student, antiwar, and women’s movements of the 1960s and 1970s.

**Conditions for mobilization.** A precipitating condition coupled with a high degree of conduciveness is rarely sufficient to produce an instance of crowd behavior. In addition, people have to be assembled or brought into contact with one another, and attention must be focused on the accomplishment of some task. On some occasions in everyday life the condition of assemblage is already met, as in the case of the pedestrian crowd and conventional audience. More often than not, however, protest crowds, large-scale victory celebrations, and riots do not grow out of conventional gatherings but require the rapid convergence of people in time and space. Research reveals that the assembling process (McPhail & Miller 1973) is contingent on the receipt of assembling instructions, which ordinarily includes specification of time and place and solicitation of
participation, which has been found to be the strongest predictor of participation (Schussman & Soule 2005); availability (relatively free or discretionary time); and ready access, either by foot or by other transportation, to the scene of the action. And the focusing of attention typically occurs through some “keynoting” or “framing” process whereby the interpretive gesture or utterance of one or more individuals provides a resonant account or stimulus for action. It can occur spontaneously, as when someone yells “Cops!” or “Fire!”; it can be an unintended consequence of media broadcasts; or it can be the product of prior planning, thus implying the operation of a social movement.

COORDINATION OF CROWD BEHAVIOR

Examination of protest demonstrations, celebratory crowds, and riots reveals in each case that the behaviors in question are patterned and collective rather than random and individualistic. Identification of the sources of coordination has thus been one of the central tasks confronting students of crowd behavior.

Earlier theorists attributed the coordination either to the rapid spread of emotional states and behavior in a contagion-like manner due to the presumably heightened suggestibility of crowd members (Blumer 1951; Le Bon 1960) or to the convergence of individuals who are predisposed to behave in a similar fashion due to common dispositions or background characteristics (Allport 1924). Both views are empirically off the mark. They assume a uniformity of action that glosses the existence of various categories of actors, variation in their behaviors, ongoing interaction among them, and the role this interaction plays in determining the direction and character of crowd behavior. These oversights are primarily due to the perceptual trap of taking the behaviors of the most conspicuous elements of the episode – the main task performers – as typifying all categories of actors, thus giving rise to the previously mentioned “illusion of unanimity” (Turner & Killian 1987).

A more modern variant of the convergence argument attributes coordination to a rational calculus in which individuals reach parallel assessments regarding the benefits of engaging in a particular task activity (Berk 1974). Blending elements of this logic with strands of earlier theorizing, Coleman (1990) argued that crowd behavior occurs when individuals make a unilateral transfer of control over their actions. Such accounts are no less troublesome than the earlier ones in that they remain highly individualistic and psychologistic, ignoring the extent to which crowd behavior is the product of collective decision making involving the “framing” and “reframing” of probable costs and benefits and the extent to which this collective decision making frequently has a history involving prior negotiation between various sets of crowd participants, namely the main task performers and the control agents (McPhail, Schweingruber, & McCarthy 1998).

A sociologically more palatable view holds that crowd behavior is coordinated by definition of the situation that functions in normative fashion by encouraging behavior in accordance with the definition. The collective definition may be situationally emergent (Turner & Killian 1987) or pre-established by prior policing strategies or negotiation among the relevant set of actors (Waddington, Jones, & Critcher 1989; della Porta & Reiter 1998; McPhail, Schweingruber, & McCarthy 1998).

THE CORRELATES AND PREDICTORS OF PARTICIPATION

What factors make some individuals more likely than other individuals to participate in crowd episodes? It is clear that the odds of participating in some crowd episodes are greater with personal or organizational requests to participate (Schussman & Soule 2005) and increasing spatial proximity and access to those episodes, schedule congruence, and discretionary time (McPhail & Miller 1973). As well, individuals whose daily routines and expectancies have been rendered ambiguous or who
share grievances that are linked to the occurrence of a crowd episode would appear to be more likely candidates for participation. But both of these sets of conditions typically hold for a far greater number of individuals than those who end up participating in a crowd episode or protest gathering in some capacity other than a social control agent or media representative. So what can be said about the personal and interpersonal correlates or predictors of participation?

There is no simple answer to this question or standard formula for predicting crowd participation. However, research on this question suggests at least four general, sensitizing observations, particularly with respect to participation in protest crowds. The first general observation is that commonsensical psychological indicators of protest event participation, such as intense frustration or strong feelings of deprivation, have not been found to be valid or reliable predictors. For example, studies of individual riot participation, which have been numerous, have failed to find consistently significant empirical correlations between measures of frustration or deprivation and participation (McPhail 1994). This is not to suggest that riot or protest participants may not sometimes feel deeply frustrated or deprived as compared to others, but that these psychological states do not reliably explain their participation or differentiate them from nonparticipants. Such findings are consistent with the second general observation: There are a diversity of motivations for participating in crowd episodes, ranging from curiosity to exploitation of the situation for personal gain (e.g., fun, material goods) to sympathy with the issue for which the episode is a marker or carrier to embracement of and identification with the cause from either a self-interested or altruistic standpoint (Turner & Killian 1987).

That neither a distinctive psychological state or deficit nor a dominant motive have been found to be associated with crowd and protest participation does not mean that psychological or personality factors are without relevance to the issue. To the contrary, one such factor that appears to be consistently associated with participation as a main task performer in protest crowds and riots is the existence of a sense of “personal efficacy” – the belief that one’s participation will make a difference, the confidence that one’s efforts will contribute to the larger cause (Snow & Oliver 1995). This finding, which constitutes the third general observation regarding participation correlates, makes good sense when considered in conjunction with the fourth general observation: Participants in crowd episodes – whether they are victory celebrations, protest events, or riots – seldom participate alone. Instead, rather than being isolates or loners, they are typically in the company of friends or acquaintances; they are, in other words, part of a social network (Snow & Oliver 1995). Thus, participation in crowd episodes, particularly planned ones such as protest events, tends to be embedded in social networks, which also function to nurture a greater sense of both personal and collective efficacy. When these factors are coupled with the previously mentioned conditions for assemblage, and either ambiguity or target-specific grievances, participation becomes more likely and perhaps even more predictable.

Employers’ collective action
MICHEL OFFERLÉ

Debates about employers’ collective action have remained inconclusive. Historians, sociologists, and political scientists have established that neither competition between employers, nor the secretive nature of their business practices, nor their supposed individualism, prevent them from acting together or from establishing permanent organizations of various natures. The very rich literature dealing with interest groups (including organizations representing economic interests) demonstrates this fact very convincingly. For instance, Michel Pinçon and Monique Pinçon-Charlot (2000) have shown that when it comes to its sociabilities and its reproduction, the French bourgeoisie behaves like a “collectivist” class.

COLLECTIVE AND INDIVIDUAL ACTIONS OF ECONOMIC ELITES

The idea that employers, taken as an aggregate of economic powers (whether or not they are owners of the means of production and exchange), would not need any collective organization since, in a capitalist regime, the power of the state is routinely the power of the dominant economic class, has been challenged by empirical research that underlines the autonomy of social fields and that points out that political professionals are not merely the mouthpieces of the capitalist class (Offe & Wiesenthal 1980; Traxler 1993; Schmitter & Streeck 1999). At present, the debate centers less on the existence of collective action and more on the forms and conditions of its success, which is to say on trying to learn how business acts and how and when it is that business wins (for the US context, see Vogel 1989; Smith 2001; Baumgartner et al. 2009; Offerlé 2009).

Employers’ collective action is at once simpler and more complex than that of other social groups. It is simpler because economic entrepreneurs have at their disposal many more resources than other causes and interests. They can and they have achieved their desired results by remunerating full-time employees. This kind of collective action is also more complex because their significant resources allow for a far greater number of choices, and because the demands made by actors considered as “privileged” must take on specific or acceptable modes of formulation. In fact, collective action is in no way ineluctable: big companies have enough resources to, on the one hand, act alone by remunerating public relations agents and by involving their executive management; and, on the other hand, to form specialized co-optative associations (business roundtables, business councils or Association Française des entreprises privées (French Association of Private Businesses) or associations that are not centered on the strict defense of economic interests (Club Bilderberg, Aspen Institute, Société du Mont Pèlerin) or social gatherings.

This plurality of choices at the top can also be found among the “smaller employers.” The notion of registers of resilience allows us to contextualize the tools by which an individual succeeds in naming, understanding, and protesting (against) his or her fate (Felstiner, Abel, & Sarat 1980/1981; Offerlé 2006): depending on the time in which we live and the place we occupy in society, we possess an array of individual and/or collective means to interpret the events that impact our life and to remedy them. To let her anger and her distress be known, a smaller employer can use tax evasion, undeclared work, predation, hunger strikes, and peaceful or violent demonstrations, for example. By contrast, a major employer is able to hire a lawyer to act juridically or a lobbyist to act politically. He will also
be able to act as a predator and/or call on a collective organization that will not act in the same manner or with the same means as the small entrepreneur.

As a consequence, in principle all economic entrepreneurs can “choose” between several forms of individual action and several modalities or levels of employers’ collective action: local, national – professional or inter-professional – and international. Collective action comes up against the many obstacles that sociologists of mobilizations, such as Olson (1965), have highlighted. To counteract individualistic tendencies, targeted individual incentives are offered and, in fact, historically, employers’ organizations have provided services to their members: data on markets, on the credibility of colleagues or competitors, quality standards, and the like. More or less pressing incentives to an agreement can be implemented in small groups of acquaintances. Regarding cartels or consortiums, measures have been adopted that were (or are) coercive in nature and varying in length.

Yet, these groups have very often been perceived as reactive. The literature on the subject often ascribes the employers’ drive to mobilize as threats on the part of the state (or conversely, of politicians’ desire for a coalition with entrepreneurs in a given context), or as a reaction against labor movements or other field-relevant social movements (notably, the various contemporary consumerist, environmentalist, and alter-globalist movements). But, as has been well documented by economic or business historians and social scientists, far from being uniquely reactive, these groups can also be pro-active and participate in the creation of economic institutions (Jones & Zeitlin 2008; Steiner & Vatin 2009; Coen, Grant, & Wilson 2010).

REPERTOIRE OF EMPLOYERS’ COLLECTIVE ACTION

The notion of collective action, from Tilly’s vantage point, focused on dissenting and episodic collective actions and not on daily, routine forms of resistance or ongoing actions, and it is limited to collective actions that are visible in their forms of protest. Building on this limitation and applying it to the repertoire of employers’ collective action, we can show that, for employers and management as well as for protest actors, partially routine forms exist and are used on a regular basis by both agents and organizations. The repertoire is strategic and constrained. Just like repertoires of protest, it varies widely in time and social space.

Turning more specifically to the “top” professional organizations, one can identify two modalities of repertoires that have successively developed within market economy democracies, one more confrontational, the other less so. Examples of the first modality occurred during the end of the nineteenth century and part of the beginning of the twentieth century in France when it resorted to collective modes of action against workers enrolled in the labor movement: black lists, banning of unions, anticollectivist propaganda, control of newspapers, creation of social defense leagues whose objective was to denounce first socialist and then communist doctrines and practices, creation of mutual insurance funds against the consequences of strikes, and slush funds. These forms of control that extend ownership rights and forms of paternalism are initially local. They tend to become national as the workers’ struggle increasingly adopts national symbols and demands. This class struggle was also extended to the political sphere by the massive support – local and national – provided by political parties and members of the parliament, as well as by economic pressures on governments that were considered as dangerous (withdrawal of financing, drain of capital, threats of canceling taxes or investment, subsidization of ultra-right groups and, occasionally, of anticommunist ultra-left groups). Contrary to what happened in Germany or the United States, lock-outs were quite rare in France and the massive occupation of assembly seats by business owners, companies officers, or
business lawyers (as in the United States or Switzerland) was never very common; the relative autonomization of the political profession took place quite early in France.

This militant anticollectivism could also be correlated with paternalistic forms of social support. Some small subgroups of employers were ready to adopt more open forms of mobilization: peaceful or violent demonstrations, shock tactics, and the bombing of public buildings. This is the case of the “Poujadist” movements in France from the 1950s to the 1970s. In the United States examples abound as well (scabs, antiunion brigades, detective agencies put into service, etc.)

More generally, business or professional organizations often have, particularly between the two world wars (in their support of the fascist and Nazi takeovers) and during the cold war years, secretly or openly worked to destabilize regimes considered as threats to the interests of the “free world” (see, e.g., Anglo-Iranian Petroleum in Iran (1953), United Fruit in Guatemala (1954), ITT in Chile (1973)). This often happened in collusion with the American secret service. In the cases of extended mobilizations, small business or small store owners have been able to play a crucial role (see the “bosses strike” of the Chilean truck drivers in 1972 or the mobilization of the Iranian bazaars before the fall of the Shah).

In Western democracies, this initial repertoire was very slowly replaced by a second, much less confrontational scenario that echoes the institutionalization of the labor movement, the transformation of forms of support and the shrinking of the perimeter of state intervention in state-controlled economies. The two main adversaries of organized business found themselves backpedaling. This transformation was also due to the very change in the structure of business (the partial crumbling of commerce, the development of the service economy, and the partial managerialization of business), and the marginalization of protest currents within small businesses. Employers’ associations were (and are) shifting toward the conference room.

In various countries, demonstrations can be tools used by small business and small store owners and their organizations to fight against the high cost of living (particularly in Africa) or against political power (e.g., in Belarus, Ukraine, Turkey in 2001), or against occupation (as in the Palestinian territories.) The open participation in countermobilizations in coalition with other social or political actors wishing to destabilize a government can be observed in other countries (in Venezuela against Hugo Chávez or in Bolivia against Evo Morales). This confrontational form has not totally disappeared in the United States, a country in which the defense of free enterprise and of business freedom remains strident, even though the threat of communism is not a major challenge. Hence, there are wealthy contributors who subsidize collective organizations, such as think tanks and small law offices that fight against unions. The relatively unrestricted financing of electoral campaigns has allowed for the increased participation of corporations and business organizations – particularly that of the American Chamber of Commerce – in the campaign funding of candidates and in lobbying activities oriented to affect decisions on particularly high-stakes laws (such as health insurance or union laws).

Today, economic elites’ collective action is markedly exercised on the register of expertise. Employers’ organizations and think tanks that, to variable degrees, have participated in bringing to the fore and implementing what are globally called the “neo-liberal reforms” (Denord 2007; Phillips-Fein 2009), work essentially from this register of expertise. Such expertise – fiscal, social, economic, even communicational – is marshaled by those organizations claiming that they have access to the best experts, whose credentials include academic diplomas, former employment in top administration or governmental posts, or proven success in managing businesses.
The employers’ associations’ expertise is expressed in writing memos, parliamentary amendments, memoranda, and white papers, in sitting on multiple commissions and in organizing events, and in the practice of lobbying. Lobbying is a broad concept that refers to the use of techniques of control and persuasion, performed in more or less discrete ways, as well as to applying pressure, and agenda setting in public debates. The recourse to the law is particularly developed in the United States where legal counsels of major companies and professional organizations judicialize social or environmental issues.

THE SUCCESS OF MOBILIZATIONS?

Most of the time, large business owners make a show of their unity and solidarity, which can be deployed against the state or against the unions. Nonetheless, many internal divisions do exist within employers’ national confederations, which depend first of all on the size of the enterprise. Even within the looser confederations, such as the MEDEF (French Enterprise Movement) or the Italian Confindustria, there are often conflicts between major wholesalers and the food industry, between car makers and subcontractors, between services and industry, between banks and all the other enterprises, between the garbage industry and recycling businesses, between construction professionals and construction material producers.

American political scientists have tried to measure quantitatively the effects of entrepreneurial mobilizations of specific enterprises or organizations. Mark Smith (2000) distinguishes the unifying from the global stakes that oppose numerous competing groups. On the one hand, even when positions are split, ideologized, and publicized, the “employers” can subsequently assure a common position, as in, for example, the issue of free enterprise, and of employers’ fiscal and social contributions. On the other hand, on certain issues, confrontational or competitive stakes can oppose employers’ factions: as concerns immigration laws, employers do not necessarily share the same economic interests.

Finally, certain outcomes are of concern only to particular niches of entrepreneurs and only involve a measure generated or contested by and for a specific group or a few actors. In this case, the issues tend to be dealt with in a “technical” manner without the politicization implied by a public debate, for example, an exemption, a fiscal measure concerning a group of businesses or one sector only.

In those three ideal-typical configurations, the forms and the arguments vary rather widely. A differentiation, based not only on the issues at hand but on their historical occurrence, has also been proposed, notably by Vogel (1989), who studied the temporal variability of resources by focusing on the cycles of successes enjoyed by business compared to other actors (unions or citizen groups) in American history. The same reasoning could be used for France, where protectionism alternated with free exchange.

The expertise of the employers’ collective action is present in one of the most poorly studied and least publicized aspects of their activity: their contribution to the production of the intermediary of the public sector (by auto-regulation or co-production of a body of technical and economic norms) that structures the possibilities of production and exchange. It is also present in their activities that are most visible in the old neocorporatist set-ups or in the few countries that have kept a level of national negotiation between union and employers. Negotiations or parity management of social systems have become standard modes of operation in which the employers’ organization is a “social partner,” that is, a “syndicate.” The issue now becomes the locus of the negotiation (enterprise, sector, nation, Europe) and the contents of those negotiations.

The possibility of an autonomous collective action on the part of the economic elites and its success depends, of course, on the configuration of political power. It can run up against the patrimonialization of that power (e.g., the
employers’ collective action

Tunisia of President Ben Ali) or into its control (today’s China), since in some countries professional organizations have to submit to state authority. It takes quite varied shapes in stabilize pluralist democracies depending on the form of the state, the modes of representation of interests, and the forms of professionalism of the political body, all of which generate differentiated modes of cooperation and differentiated interpenetrations between political and economic elites: from the individual recourse of a business owner, to collective campaigns of all the businesses and their organizations, not to mention all the forms of niche lobbying and all the neocorporatist transactions.

Environmental movements
CHRISTOPHER ROOTES and ROBERT BRULLE

INTRODUCTION

Environmental movements are networks of informal interactions that may include, as well as individuals and groups who have no organizational affiliation, organizations of varying degrees of formality (including even political parties, especially Green parties) that are engaged in collective action motivated by shared identity or concern about environmental issues. Such networks are generally loose and uninstitutionalized, but their forms of action and their degree of integration vary. Environmental movements are, however, identical neither with organizations nor with episodes of protest. It is only when organizations (and other, usually less formally organized actors) are networked and engaged in collective action, whether or not it involves protest, that an environmental movement exists (see Diani 1995: 5; Rootes 2004).

Such linkages are not always readily visible. Where environmental movements are well established, they may focus on less visible lobbying and “constructive engagement” with governments and corporations rather than highly visible protest. Where environmentalism has become entrenched, there are many “subterranean” linkages among groups and organizations, and the full range of movement activities is less and less adequately represented in mass media.

The methodological implications of this are that no one strategy is likely to yield a complete picture. Although studies of protest events (Rootes 2003) may represent the most visible face of the movement and escape the constraints of organizational studies that necessarily omit the less organized parts of the movement, they are unlikely to give adequate accounts of the less public—or simply less publicized—activities of the movement, including a great deal that happens locally and beneath the radar of mass media. Careful ethnographies of national organizations and local campaigns are thus a necessary complement to event-based studies.

THE RISE OF THE ENVIRONMENTAL MOVEMENT

Although concern about the environment has a long history, modern environmental movements date from the 1970s. The increasingly obvious effects of accelerating industrialization and exploitation of natural resources provided growing audiences for the alarums of conservationists and preservationists, but the radical critique of capitalist industrialism and representative democracy associated with the New left and the counterculture created the public space for the development of new social movements, as well as furnishing their tactical repertoire. Especially in the United States, environmentalism benefited by being a relatively consensual issue in a period of intense political polarization, but soon new, more radical environmental movement organizations (EMOs) that embraced nonviolent direct action arose and spread to Western Europe. Friends of the Earth (FoE) and Greenpeace arose in reaction against the apparent timidity of conservationist organizations such as the Sierra Club, and in response to the demands from a new, self-confident, and participatory generation to participate directly in activism. The internationalism of the new EMOs and their skillful exploitation of mass media to put pressure on governments and corporate decision-makers were in tune with the times, and these were the fastest growing EMOs during the 1980s.

The history of environmentalism, on both sides of the Atlantic, has been one of

successive waves of critique, innovation, and incorporation. The rise of the new EMOs encouraged innovation in the agendas and tactics of older conservation organizations and, by the end of the 1980s, networking among older and newer organizations and joint campaigns were increasingly common. By then, however, dissatisfaction with increasingly institutionalized reform environmentalism was stimulating the rise of radical ecologist groupings and the environmental justice movement (EJM).

Many organizations formed in earlier waves of environmental concern have adapted to accommodate subsequent concerns and developments in ecological consciousness. In the United States, despite observers’ doubts that established, “wilderness obsessed” EMOs are capable of accommodating the concerns of the EJM, especially since 2000, the Sierra Club and Greenpeace have taken the environmental justice agenda seriously. In Western Europe, the environmental justice frame has been increasingly adopted, especially by FoE, while established EMOs such as the World Wide Fund for Nature (WWF) and the national bird protection societies have developed a more inclusive ecological perspective and have broadened the range of their campaigns to include issues of habitat and the welfare of human populations (Rootes 2005). The rhetoric of conflict and critique may give a misleading impression of divisions within environmental movements whose existence can be demonstrated by the persistence, despite such differences, of network links of varying degrees of strength and intensity (Dalton 1994).

VALUES AND SOCIAL BASES OF ENVIRONMENTALISM

The rise of values and attitudes favorable to environmentalism is frequently explained in terms of “post-materialism” (Inglehart 1977). According to this thesis, post-materialist values that place higher priority on economic and security needs, chiefly because new, younger generations raised in relative affluence and security replace older generations who, during their formative years, more often experienced economic privation and the insecurities of war. The rise of environmentalism was counted among the consequences of this “culture shift.”

Yet Dalton and Rohrschneider (2002), examining the link between individual endorsement of post-materialist values and membership in environmental organizations, found that the correlation was modest in wealthy nations and almost nonexistent in poor nations. Post-materialism may not be as good a predictor of environmentalism as some suppose because it embraces both post-materialist aesthetic and principled concerns with environmental protection and essentially materialist concerns with safety and security. Even global environmental concern, often considered to be unproblematically post-materialist, might be portrayed as materialist.

Post-materialism is relatively weakly correlated with support for environmentalism because concerns for the environment are held both by highly educated “post-materialist” ecologists, who are not so much fearful for their own security as concerned about global environmental problems whose effects are relatively remote, as well as people, usually less well educated, who are more exercised by fear of the threats that pollution poses to their own immediate material security. Post-materialism is a better predictor of environmental activism than of environmental concern because activism, unlike concern, is highly correlated with higher education, which is itself an antecedent of most forms of political activism. The significant relationship that Dalton (2005) found between national affluence and membership in environmental organizations might simply be because affluence stimulates membership in civic groups generally.

Most research on the social backgrounds of environmental activists and members of national EMOs has concluded that they are
disproportionately highly educated, employed in teaching, creative, welfare, or caring professions, and, especially, the offspring of the highly educated (Rootes 1995). For this reason, environmentalism has sometimes been interpreted as the self-interested politics of a “new class” of traffickers in culture and symbols, opposed or indifferent to the interests of those whose labor involves the manipulation of material things. However, environmental activists are not exclusively drawn from such backgrounds, and approval of EMOs and environmental activism, as well as pro-environment attitudes, are widespread in society.

Grassroots environmental movements involve a broader cross-section of society than do major national EMOs, in part because locally unwanted land uses are more often imposed upon the poor. Women play more prominent roles in grassroots mobilizations than in national EMOs, reflecting women’s greater involvement with, and confidence in acting in, the local community than the wider public sphere. The barriers to entry to the local political sphere are also lower than in national politics. Grassroots environmental activism is thus an important means of social learning about environmental issues, a school for participation generally, and an entry point for new activists and new issues; it is a source of revitalization of the environmental movement, and makes the movement more socially representative.

VALUES AND FORMS OF ACTION

Theorists have distinguished between conservationism, environmentalism, and ecologism, but such clear philosophical distinctions are not usually precisely mirrored in divisions among movement organizations, their members, and supporters. Organizational formalizations of ideological division are more likely in the formal political sphere, where membership tends to be exclusive, than in the movement milieu, where organizations are more fluid, overlapping memberships are common, and the flexibility of the network structure is better able to accommodate differences without overt conflict.

The discursive frames adopted by environmentalists have consequences for the ways in which they campaign and the forms of organization they adopt (Brulle 2000). Yet, as Dalton (1994) discovered, whether European EMOs had originally been committed to conservationism or ecologism made surprisingly little difference to their choices of strategies, tactics, and styles of action. The apparent convergence within the broad environmental movement sector was not simply a matter of the progressive institutionalization and incorporation of more radical organizations such as FoE and Greenpeace; just as FoE and Greenpeace learned the etiquette necessary to smooth dealings with the powerful, so traditional conservationist organizations became less conflict-averse in their tactics and more skilled in the use of mass media. Although EMOs’ values do influence their strategy and tactics, greater effects are attributable to the pattern of opportunities and constraints inherent in the structures of the national political systems within which those organizations operate.

Even where they embrace direct action, environmental movements are almost wholly non-violent, but movement subcultures are not isolated from wider social and political contexts. Violent environmental protests in Italy and Spain in the 1980s were carry-overs from other, wider political ructions – in Italy, the political violence of the 1970s, and in Spain, the temporary association of militant Basque nationalism with environmentalist struggles. Similarly, confrontational environmental protest in Britain in the 1990s rode the wave of more general confrontational protest that rose with the campaign against the poll tax (Rootes 2003). National political cultures explain less than political conjunctures.

The great majority of environmental organizations are either engaged in practical conservation work or focus upon parliamentary
and educational strategies; only a small minority rely on protest, and these are distinguished by the discourses they articulate. Those that employ the discursive frames of deep ecology and environmental justice are primarily responsible for the relatively small number of environmental protests, especially in the United States (Brulle 2000: 246; Carmin & Balser 2002).

INSTITUTIONALIZATION AND ITS DISCONTENTS

As the numbers of members and supporters of conservation organizations and EMOs have grown since the 1970s, many of those organizations have become substantial operations with annual budgets in the millions, and employees numbering hundreds or thousands. They have, as a result, become increasingly internally institutionalized as formal organizations, internally bureaucratized, hierarchical, and depending upon salaried professional employees rather than enthusiastic volunteers. Although some democratic organizations exist in the environmental movement, the majority are formal oligarchies that lack formal participatory mechanisms and are governed by self-selecting boards (Brulle 2000). These “professional social movement” organizations (Zald & McCarthy 1987) have been labeled “astro turf” organizations (Cigler & Loomis 1995) or “protest businesses” (Jordan & Maloney 1997), in which professional staff dominate the organization and members are merely financial supporters. Some, like Greenpeace, are unabashed about this; others preserve a semblance of democracy in principle but are not less oligarchic in practice (Rootes 2009).

Conventionally, it has been assumed that “success” for a social movement means its institutionalization, usually as a political party. Yet although Green parties emerged from the 1970s onward, and began by the 1980s to win seats in some European legislatures, they were seldom direct products of environmental movements, but more often of antinuclear campaigns or the politically marginalized left. Moreover, they are not institutionalized vehicles of the environmental movement in the way that socialist parties were of the labor movement. Green parties have prospered, especially in northern Europe and Australasia, but their relations with environmental movements have been problematic, especially in those cases where Greens have entered government.

One reason for this is that, where conditions have favored the development of institutionalized EMOs, they have become formal organizations embedded in networks of policy advocacy and implementation, becoming a “public interest lobby” (Diani & Donati 1999) or an “advocacy community” (Bosso 2005). In order to protect their reputations with more powerful actors in government and corporations, environmental organizations that have secured access on the basis of their expertise and politically nonpartisan status, have generally been careful to keep some distance between them and those, such as Green parties, who have sought to enter the political arena directly, especially when the latter are at best minor players in formal politics.

In the United States, where political structures have discouraged the development of Green parties, charitable foundations have been a substantial source of funding for most major EMOs. However, most foundation funding goes to moderate organizations that use the traditional discourses of conservation, preservation, and liberal environmentalism, and has been concentrated on a relatively small number of large EMOs involved in political advocacy work (Brulle & Jenkins 2005). In Britain, foundation funding is less significant, but strongly favors organizations engaged in practical environmental protection and remediation rather than advocacy (Rootes 2009).

Some claim that the institutionalization of EMOs, and their dependence, notably in the United States, upon foundation funding, has robbed them of the capacity and, even of the
will, to mobilize large numbers of people in collective action, leaving them without the “veto power” – the ability to disrupt “business as usual” – that social movement scholars have usually considered to be the ultimate basis of the power of social movements (van der Heijden 1997). Interestingly, however, those organizations that claim to speak for grassroots environmental activists appear to be scarcely less oligarchic than others: most organizations associated with the EJM in the United States lack mechanisms of democratic accountability (Brulle & Essoka 2005).

Nevertheless, recent history suggests that environmental movements may have squared the circle, and that the institutionalization of EMOs has not simply entailed the deradicalization of the movement or a loss of shared identity. In Germany, a substantially institutionalized movement coexisted in the 1990s with the revival of highly confrontational, at times violent, antinuclear protest, as established EMOs gave assistance to local antinuclear groups (Rucht & Roose 2003). In Britain during the 1990s, even as EMOs grew in numbers and size as well as access and influence, reported environmental protest increased and became more rather than less confrontational (Rootes 2003).

The rise of new, more radical groupings such as Earth First! can be traced to dissatisfaction with the apparent timidity of more established EMOs, but shared identity among environmental campaigners has survived even as their tactical repertoires have varied. In Britain, even the radical “disorganizations” most committed to direct action were connected by networks of advice and support to more established organizations. The support of established EMOs for direct action groups may not have been very publicly visible, but the sense of identity among the constituent parts of the environmental movement did not dissolve as a result of the institutionalization of its more established organizations and the reactions against it, but instead grew as groups came to practice a division of labor and to realize the advantages of cooperation. Climate change has not only stimulated the rise of new forms of direct action (e.g., the Climate Camps), but has drawn members and supporters of even conservation organizations into the streets (Rootes 2010).

The European experience shows that it is possible for an environmental movement to retain many of the characteristics of an emergent movement whilst taking advantage of the opportunities presented by institutionalization. Institutionalization has not been a barrier to the mobilization of protest. Whilst some writers have referred to the “self-limiting radicalism” of Green parties, it is the “self-limiting institutionalization” of environmental movements that is the more striking and that has more profound implications for sociological theory.

The survival of environmental movements and their resistance to the deradicalizing effects of institutionalization has distinguished them from the other “new social movements.” Because pressing environmental problems are a chronic condition of an industrialized world, Northern environmental movements, although by no means universally anticapitalist, are recurrently influenced by the critical analyses of their radically anticapitalist constituents, as campaigns against genetically modified organisms and neoliberal globalization have shown.

In the global South, however, environmental campaigns are usually so bound up with campaigns for human, democratic, and economic rights that they often do not take the form of environmental movements. In East Asia, stronger states with more developed and affluent civil societies have fostered more vigorous environmental movements than in sub-Saharan Africa (Mittelman 1998). As in post-communist Central and Eastern Europe, environmental movements in East Asia were often used as cover by pro-democracy activists (Lee & So 1999). In the less industrialized states of Asia and Africa, as in recently democratized Central and Eastern Europe, environmentalists’ successes often depend upon support from
Northern EMOs and human rights organizations, with the risk that dependence on foreign assistance displaces the local agenda and diverts the energies of activists away from efforts to mobilize local people. Perhaps for this reason, environmental movements have had greatest impact where they mobilized local people and incorporated local cultural values and rituals, empowering local activists and enabling them to challenge authoritarian states (Lee & So 1999: 291).

Despite frequent references to “the” environmental movement, even to “the global environmental movement,” there remains such variation among and within local and national environmental movements that to speak of a global environmental movement is a triumph of abstraction or aspiration over experience. Obstacles include the wide diversity of material circumstances, cultures, languages, and political circumstances. National environmental movements have flourished under conditions of stable democracy in strong states; the absence of a developed democratic global polity is a major obstacle to the development of a global environmental movement.

IMPACTS

The direct impacts of social movements are always hard to distinguish from the effects of changes external to the movement. The rise of environmental movements from the late 1960s was contemporaneous with the development of legislation and state agencies designed to protect the environment, but the latter was not mainly an effect of the former. Rather, both were products of developing environmental awareness. Environmental NGOs have since sought to channel and develop that awareness, and in that they have enjoyed some success, albeit that their small and particular successes are easier to identify with confidence than their larger impacts.

Environmental activists have played major roles in preserving Californian redwood forests and the Great Barrier Reef, and Greenpeace’s campaign against the dumping at sea of the Brent Spar oil storage buoy changed not only the policies of oil companies but perceptions of the sea as a limitless waste repository. Environmental movements have stimulated and mediated the concerns of the wider public, and reflected and amplified concerns originating in scientific and policy communities. At least intermittently, they have succeeded in sensitizing mass publics and decision-makers to environmental issues that would not otherwise have been so salient. For the most part, it is EMOs that have set the agenda of environmental reform and succeeded in framing the issues as matters of global collective responsibility.

As environmental issues move up political agendas, EMOs may struggle to meet the expectations of others, and, unable to participate effectively in high politics, they may be drawn back to the grassroots. Environmental movements have been the most durable of the new social movements and so they are likely to remain.

Formal models and computer simulations

PAMELA OLIVER

A formal model is a mathematical representation of some single process, in this case a process that is believed to be common and important in at least some social movements. Closely related are computer simulation models that link multiple mathematical expressions to represent different actors or types of actors in a system. This type of modeling is different from empirical statistical modeling, in which there is a data set of cases and variables, and regression techniques are used to estimate the coefficients for predicting dependent variables from independent variables. Instead, the “data” are all internal to the model itself. However, the results of empirical studies may be used to inform the nature of the mathematical relations or the numerical parameters in the model. An important sub-type of computer simulation models is agent-based simulations in which each actor’s behavior is a function of a set of mathematical relations, the expressions determining one actor’s behavior are in part a function of other actors’ behavior, and the computer program generates the interactions among these actors over time. Some formal or computer models express determinate relations in which the same inputs will always produce the same results. Many models contain probabilistic elements, in which the mathematical expressions increase or decrease the probability that a given action will be taken; probabilistic models yield different results each time they are run, and analysis of them focuses on the distribution of possible outcomes for a given set of inputs.

Mathematical and computer simulation models seek to represent processes or relationships at an abstract and simplified level so that their dynamics can be investigated in a rigorous and systematic way. The results of these investigations sometimes prove illuminating for understanding the dynamics in real social movements. In fields such as engineering, where there is accumulated research about relatively invariant physical relationships and well-defined measures of inputs and outputs, formal models can generate reasonably accurate predictions for the behavior of specific empirical systems. There is generally insufficient empirical or theoretical base to do this in the study of social movements, but scholars are trying to move in this direction. No formal model can represent the full messy complexity of a real social movement, or even of a real protest event or campaign. However, some formal models have provided theoretical insights about movement processes and have pointed to important distinctions among types of movements. Some formal models have generated empirical predictions that have been supported. In other cases, the failure to gain support for empirical predictions has led to the refinement and improvement of formal models.

Because formal models concern abstract processes, many models concern processes that occur in social movements but not only in social movements, and there are a great many different kinds of formal models that can provide potential insight to movement dynamics. Those with the most direct ties to social movements include: (1) decision models of collective action and contributions to collective or public goods; (2) multi-actor models of strategic interaction, including both game theory and models of regime-movement interactions, as well as models of the spread of violence between groups and models of insurgencies and counter-insurgencies; (3) influence models of public opinion or ideological change; (4) models of the assembly or dispersal or crowds and gatherings, including emergency evacuations; and (5) models of contagion and diffusion of movement events or tactics. There are growing
fruitful collaborations between social scientists with deep empirical knowledge of social movement processes and systems analysts and computer programmers with the technical skills needed for writing complex dynamic simulation models. Examples of empirical problems that have been addressed using these methods include generating cooperation for improving the environment, how identities are constructed, ethnic conflict, protest-repression dynamics, and the spread of new ideas.

Genocide and mass killing are a tragic yet recurrent feature of modern human history, having occurred across a broad range of societies. This extreme form of social violence has accordingly become a major subject of interest for social scientists, who have generated a wide variety of explanatory models for why violence occurs and how it spreads over time. However, few empirical or theoretical works have explored the specific roles that social movements have played within historical cases. Genocides and other forms of mass violence often occur in contexts of highly contentious interactions between movement organizations and political institutions. These interactions potentially range from open conflict and violence between official institutions and movements, to exploitation and assimilation, and collaboration and mutual aid. Empirical evaluations of how social movements work within historical cases of genocide and mass killing would undoubtedly improve existing explanatory models for why and how such violence occurs. In order to provide impetus for such an endeavor, we first offer four examples of how movements have historically operated within cases of genocide, and then identify existing areas of social movement theory and research which we believe are useful for further analyses.

One such form of movement–state interaction occurs when successful mobilization by a political opposition movement becomes linked by official institutions with an entire social collectivity. The first critical process here is the creation of official panic. In contexts where state institutions are already weak or imperiled, such as civil war or economic collapse, engagement in contentious collective action by movements may generate a sense of grave threat within dominant political institutions. The second critical process is the linking of the threat posed by a movement and a social group. This connection may arise through claims made by movement representatives, through imputation by official institutional channels, or by members of the domestic population themselves. Genocide and mass killing are more likely to occur when these two processes culminate in a third process: the collective aggregation of the domestic population with the threat, whether real or perceived, posed by the movement.

This form of interaction was likely operative during the 1915 Armenian genocide by the Ottoman Young Turk regime. Faced with deteriorating military conditions along its border with Russia, the regime struggled to maintain the empire’s territorial and political integrity. In this context, the successful mobilization of Armenian nationalist organizations in central and eastern Anatolia was seen by the Young Turk regime as a threat to their own ethno-nationalist goals. Viewing the entire Armenian population as potential supporters of the separatist movement, the Young Turk regime quickly escalated its policies from compromise to mass deportations and executions (Mann 2005). A similar series of events precipitated the 1994 Rwandan genocide. After an invasion by the Rwandan Patriotic Front (RPF), a nationalist army based in neighboring Uganda, the Hutu Power government engaged in a strident media campaign linking the domestic Tutsi population with the threatening nationalist mobilization. Violence against the Tutsi population was thus enabled through this linkage between a threatening militant movement and a domestic population, framed as presenting a mortal threat to Rwandan society (Straus 2006).

Another form of interaction occurs when the structures of existing state institutions are threatened by movements demanding
significant social, economic, or political reforms. In order to protect existing power arrangements and deflect attempts by opposition movements to gain a political foothold, states may resort to policies of nationalist war and mass violence against a domestic or foreign population. Similar to the form of interaction above, such a pattern of action is more likely in times of political, economic, or social upheaval, when movements may present real threats to existing institutions. However, unlike the first form of interaction, the threat posed by the movement does not become generalized toward a social collectivity. Rather, state institutions attempt to rally the nation around a pre-existing social conflict, often framed in “organic” nationalistic terms (Mann 2005), and in doing so attempt to demobilize and delegitimate political opposition. Mass violence thus becomes driven, in part, by the need for official institutions to protect themselves from collective challenges to their power and legitimacy by constraining the options of social movements.

This form of interaction may have been one condition that led to genocide and ethnic cleansing in Eastern Europe during the 1990s. After the breakup of Yugoslavia, Serbian and Croatian leaders faced mounting domestic pressures from domestic movements seeking a variety of democratic and economic reforms. As conflict brewed between these nations over issues of national sovereignty and territorial rights, these opposition movements presented increasingly successful challenges through both electoral campaigns and contentious protest. Gagnon (2004) argues that the desire of political elites in Serbia and Croatia to maintain their holds on power led to a specific strategy of demobilization that incorporated, but was not driven by, pre-existing ethnic identities and distinctions. Violence, rather than arising from grassroots “ethnic” sentiments, was used by elites “to change what it means to identify as Serb or Croat and to impose an equivalence between ethnic identity and political position – in other words, a political homogeneity” (Gagnon 2004: xviii). The political construction of this equivalence constrained the options of opposition movements, framing them as potentially “traitors” to an organically Serb or Croat nation.

A third form of interaction occurs when a movement successfully exploits gaps or breakdowns in official institutional power to advance its own social or political agenda. When state power is divided or weak, movements may be able to exploit such a political vacuum by attempting to elevate their own goals and strategies to the level of officially sanctioned practice. A movement may even attempt to make a grab for state power itself, making such an elevation of goals and strategies more certain. This type of interaction contributes to the social formation of genocidal violence when insurgent claims to power and legitimacy become linked with the elimination of some foreign or domestic collectivity, often a rival movement organization. Typically, this is a collectivity that has previously engaged in contentious interaction with the successful movement, or otherwise presented itself as an obstruction to the fulfillment of the movement’s goals. Assuming the mantle of official power thus becomes linked with the elimination of political rivalry framed in terms of group membership.

This form of interaction was present in Indonesia during the 1965–1966 mass killings against known and alleged members of Indonesia’s communist party (PKI). Since 1957, Indonesian politics had balanced tensions between nationalist parties and military factions, religious organizations, and the largest communist party in Southeast Asia (PKI). However, this system was shattered by an attempted coup in 1965, which resulted in the deaths of six army generals and severely weakened central state institutions. Stepping into this power gap, a coalition of surviving military leaders and nationalist political parties, led by General Suharto, blamed the coup on the PKI. This coalition then began to incite and coordinate massive violence against known or suspected communist members throughout the country, eventually resulting
in between half a million and two million deaths (Cribb 2001). This violence was used by the new military regime to consolidate its rule, resulting in the ousting of President Sukarno and the establishment of a military dictatorship under Suharto.

A fourth type of interaction occurs when a movement collectively engages in mass violence on behalf of an official institution, but without any explicit chain of command or set of orders to account for the occurrence of mass violence. In cases such as these, violence arises collectively on the part of a social movement’s members, but only after the violence has been somehow sanctioned by official institutions as both necessary and legitimate. This is most likely to occur among state-sponsored movement organizations, but the most important aspect of such interaction is that a movement looks to official institutions for both inspiration and support for its claims and actions.

Such a form of interaction has been documented in Su’s (2011) study of collective violence in rural China during the Cultural Revolution. The Cultural Revolution itself was an extraordinary instance of political mobilization, involving appeals by Mao Zedong for collective mobilization against existing state party leaders and institutions, framed by hardcore supporters as reformist and counterrevolutionary. Focusing on the effects this call to mobilization had within various rural communities, Su finds that violence did not emerge from a specific policy or set of orders given to local movements. Rather, violence emerged collectively at the community level, as local movement participants interpreted the state’s call for a “war” against all “class enemies” as a legitimation of collective violence. This violence was directed against individuals, and their families, previously implicated as involved in exploitative practices during the Great Leap Forward. Rather than emerging from a “master plan” of the state, violence thus emerged as an indirect, collective outcome of interactions between a distant state apparatus and local movement participants.

Before proceeding, several caveats are in order. First, we must note that these four examples are neither mutually exclusive nor exhaustive. Indeed, it is certain that similar but distinct forms of interaction have occurred, and that multiple forms of interactions may coexist in many historical cases, but are too numerous to list here. It is also important to note that these kinds of interactions are never sufficient on their own to create genocidal violence. We do not argue here for a direct causal relationship between such movement–state interactions and the occurrence of genocidal violence; genocide and mass killing are complex outcomes of numerous social and political factors which are rarely sufficient on their own (Fein 1993). Rather, we point to such forms of interaction as important context-setting conditions that deserve greater analytic attention. In addition, we argue that such an exploration would provide a useful site of juncture between the study of social and political movements and social scientific explanations for genocide and mass violence.

In encouraging further study of these forms of interaction, we suggest that several existing areas of social movement theory and research provide useful “jumping-off” points. As noted above, particular social collectivities must become linked in some fashion with emergent threats or social problems in order for mass violence to be possible. Such a construction and avowal of “otherness,” assembled in opposition to a shared sense of “we-ness,” has been a defining feature of the study of collective identity (Snow 2001), particularly in its relation to social movements (Polletta & Jasper 2001). In order for such emergent and dynamic identities to become linked with plans of action that lead to mass victimization, framing processes must link these identities together by identifying a problem posed by a particular collectivity, and suggesting lines of action necessary to remedy the problem – in this case, the removal of the collectivity in some fashion (Hunt, Benford, & Snow 1994). Finally, the study of political opportunities, and their relation to mobilization and movement
outcomes, should inform further study of the processes and mechanisms underlying how and when movements and official institutions interact in specific ways (McAdam 1996).

Gray zone of politics and social movements

JAVIER AUYERO

The clandestine connections between state actors and perpetrators of collective violence define the gray zone of politics (Auyero 2007). What Tilly (2003) calls “violent specialists” – that is, actors who specialize in inflicting physical damage – play a key, though sometimes not quite discernible, role in the origins and the course of collective violence. Some of these specialists (police and soldiers, for example) are part of the state apparatus; some others (think thugs, gangs, and vigilante groups), however, enjoy important but oftentimes illicit connections with established power-holders. The notion of the gray zone of politics challenges the easy and simplistic state–society distinctions that most of literature on collective action still takes for granted (among government agents, repressive forces, challengers, polity members, etc.).

Boundaries between institutionalized and noninstitutionalized politics are oftentimes permeable and blurry (Goldstone 2003). State institutions and political parties are often deeply penetrated by social movements. Far from being separate domains, institutional politics and movement actions are deeply intertwined. Groups and individuals who engage in protest (violent or not) may also, later in time, work for political parties, run for office, or occupy government posts to pursue their goals. The very same people can be “outsiders” – sometimes engaging in illegal or violent protest – and, soon after, “insiders” – actively participating in institutional politics (the ANC in South Africa or the Workers Party in Brazil are good examples). The notion of the gray zone highlights the fact that the lines between insurgents and state agents and party activists are also dissolving in the opposite direction. Party activists, local leaders with well-oiled connections with established power-holders, and/or state agents (police) may accept (and sometimes encourage and direct) collective violence (as in the recent “food riots” in Argentina (Auyero 2007)). The gray zone blurs the lines between institutional and noninstitutionalized politics, making the latter seem simply a mode of the former.

The relationship between clandestine political connections, collective violence, and social movements has been the subject of increasing scholarly attention. For example, research on the origins and forms of communal violence in Southeast Asia has highlighted the hidden links between partisan politics and collective violence (Das 1990). Brass’s notion of “institutionalized riot systems” appositely describes these obscure connections. In these riot systems, Brass (1997: 12) points out that, “known actors specialize in the conversion of incidents between members of different communities into ethnic riots. The activities of these specialists, who operate under the loose control of party leaders, are usually required for a riot to spread from the initial incident of provocation.” Kakar’s (1996) analysis of a pehlwan, a wrestler/enforcer who works for a political boss, further illustrates this point: the genesis of many episodes of collective violence is located in the area where the actions of political actors and those specialists in violence secretly meet and enmesh.

Wilkinson’s (2004) study is perhaps the most systematic examination to date of the connections between party politics (electoral competition) and collective violence (ethnic riots). He convincingly shows that:

Ethnic riots, far from being relatively spontaneous eruptions of anger, are often planned by politicians for a clear electoral purpose. They are best thought of as a solution to the problem of how to change the salience of ethnic issues and identities
among the electorate in order to build a winning political coalition. (2004: 1)

Throughout his detailed and insightful study, Wilkinson calls attention to the instances in which political elites instigate riots in order to win elections and brings to the fore what is often the state’s complicity in failing to prevent violence. The state’s response, he argues, is very much conditioned by the “instructions” that politicians give to other state officials telling them “whether to protect or not protect minorities” (2004: 65–85). In other words, political elites and organizers often “incite” violence and prevent repressive forces from responding once riots break out.

Historical accounts of “race riots” in the United States also point to a similar dynamic between members of established political parties and the instigation (or not) of collective violence. Abu-Lughod (2007), for example, documents the attacks committed by the Ragen’s Colts – young party hacks who were financially supported by Frank Ragen, a well-known Democratic Cook County commissioner – on African-Americans during the 1919 riots in Chicago. Years later, during the 1943 riots in Detroit, whites who attacked blacks could count “on police protection and even assistance” (2007: 148).

That party leaders and/or state officials might be “behind” – rather than against – such episodes of collective violence should hardly surprise students of Latin American politics. In a detailed study of “la violencia” – the wave of political violence that killed 200,000 people in Colombia in the 1940s and 1950s – historian Roldán shows that in the state of Antioquia “partisan conflict provided the initial catalyst to violence” (2002: 22). She argues that not only did state bureaucrats “promote” the violence that shocked the region but that police and even mayors themselves actively participated in the partisan attacks. Political elites, she points out, did not simply tolerate or instigate the violence; they were its perpetrators. While party members organized attacks on places and peoples, the police acted as partisan shock troops. In words that should ring true to those studying political violence in other parts of the world, Roldán states that: “while many citizens attributed the escalation of violence to the absence of official forces, these forces were so often the perpetrators of violence between 1946 and 1949 that one wonders why anyone bothered to suggest that the presence of the authorities could have been of much help” (2002: 82). Clandestine ties, Roldán demonstrates, outlast specific episodes of violence and show durable, structure-like, properties.

Ethnographic work by Gunst (1995) in Jamaica and Arias (2006) in Brazil provide further evidence of the collusion between state actors, members of political parties, and violent entrepreneurs such as gang members who are associated with the drug trade. Finally, Luis Astorga’s (2005) historical reconstruction of the intertwining of the political field with the field of illicit drug production and trafficking in twentieth-century Mexico offers another excellent example of the (concealed and often illegal) connections between actors inside and actors outside of the official political system – relations that must be rigorously examined if we are to explain seemingly random upsurges of violence – both past and present.

What do all these cases have in common? They all portray the activation of clandestine connections among political actors well-entrenched within the polity and others located outside of it. When faced with the gray zone of politics most of the categories that we, scholars of collective action, routinely operate with (categories that are very much informed by empirical analyses carried out in the United States and Europe) proved useless, if not misleading. As much as the literature agrees that the interactions between political elites, agents of social control, and protagonists of joint action matter, these remain discrete entities. The imaginary political anthropology of social movement and collective action scholarship lives in a world in which there are clear boundaries between insurgents and authorities, dissidents or challengers and state actors, located in different regions of the social and
political space (as in the “protest side” and the “repression side”). There is an almost complete silence about the possible participation of authorities in the direct promotion of mobilization and/or the straightforward perpetration of collective violence. In part, the notion of the gray zone of clandestinity seeks to address this problem by calling attention to the existing continuities between state actions, routine politics, and extraordinary massive action.

Political analysts should do a better job at integrating “gray zone” relations into the study of “normal” politics. Inattention to these clandestine connections has analogous effects to the inattentiveness to “informal institutions” noted by political scientists Gretchen Helmke and Steven Levitsky. In both cases, political analysis “risks missing much of what drives political behavior and can hinder efforts to explain important political phenomena” (2004: 725). Rather than dismissing them as aberrant phenomena or denouncing them on moralistic grounds, the challenge for a proper social scientific analysis is to factor such usually robust relations into our standard models of political action, an analytic integration that should, in turn, allow us to better incorporate violence into the study of popular politics.

Green Movement in Iran
HAMID REZAI

Like analysts of Iran during the 1970s, current observers of Iranian politics overwhelmingly described the outbreak of massive protests in the aftermath of the controversial presidential election on June 12, 2009, known as the Green Movement, as surprising and unpredictable. Yet many actors on the ground accurately anticipated the post-election turbulence. Shortly before the election, as rumors about possible election fraud spread through text-messaging and online media, masses of supporters of Mir Hossein Mousavi and Mehdi Karrubi, two presidential candidates in the race against incumbent Mahmood Ahmadinejad, shouted slogans such as “agar taqallob besheh Iran qiamat misheh,” or “if there has been cheating [in the election], Iran will explode” (Fassihi 2009). When state officials declared Ahmadinejad as the clear winner the next day, claiming that he had received 62 percent of the votes, millions of Iranians poured into the streets shouting “r’aye man kojast?” or “where is my vote?” to express outrage over what they perceived to be electoral fraud. Since then, many protesters across Iran have been killed and thousands arrested. Several hundred activists have left the country to escape state repression.

The Green Movement is the result of intensifying elite divisions that have existed in the Iranian polity since the 1980s. While fragmentation among the elite was contained by the immediate interference of Ayatollah Ruhollah Khomeini, the unifying leader of the 1979 revolution, the absence of his charismatic authority since the 1990s has increasingly factionalized the Islamic Republic and shaped the nature of popular contention in Iran.

The political environment for collective mobilization since the 1979 revolution may be divided into the following four settings: (1) consolidation, war, and repression (1979–1988, the Khomeini era); (2) postwar reconstruction and economic liberalization (1989–1997, the tenure of President Ali Akbar Hashemi Rafsanjani); (3) reform and political opening (1997–2005, the tenure of President Seyyed Mohammad Khatami); and (4) mobilization in the context of increasingly violent repression (2005–present, the tenure of President Mahmood Ahmadinejad).

After the genocidal massacre of dissidents and the destruction of oppositional political organizations in the 1980s, civil societies and associations re-emerged gradually due to the changing political environment and emerging opportunities since the early 1990s. The available opportunities provided by the increasing fragmentation of the ruling elite and the ideological transformation of many high-ranking state officials into staunch proponents of reform generated a semi-free public sphere that led to the emergence of hundreds of associations and organizations and the publication of a plethora of critical books, journals, and dailies.

The limited electoral competition and the subsequent electoral manipulation and repression utilized by the radical Islamist faction of
the regime to exclude other competitors from the polity provided a unique opportunity for other factions within the state to mobilize the streets for their objectives. The Iranian Green Movement is the meeting point of many actors and strata of Iranian society that have been targets of repression by the Islamic state since its inception. This permissible but limited contesting space allowed women, workers, students, teachers, and secular and religious intellectuals to find allies in the elite. The ongoing elite struggle over power and the ultimate attempt of the radical Islamists to use violence to oust all other factions from the polity compelled many reformists to take to the streets as a last resort in their negotiations with the Islamic state. Regimes that use force to restrict political rights after a long and sustained period of opening risk eliciting resistance from dissidents who have already gained organizational resources to challenge the state’s violent closing (Tarrow 1998; Goldstone & Tilly 2001). As noted above, the tenures of Rafsanjani and Khatami (1989–2005) were accompanied by significant economic and political changes that led to a relative liberalization (Bayat 2007).

If the protests in the aftermath of the controversial election were predictable, they had surprising consequences for both the state and its dissidents. The state witnessed the oceanic outbreak, diffusion, and radicalization of the Green Movement. Dissidents experienced the brutality of the regime’s repressive measures against activists. Regardless of the potential long-term outcomes of state/dissident interactions in Iran, in the short term radical Islamists violently restricted the political environment for dissident activism, and protesters moved from the reformist slogans of “where is my vote?” to demanding radical changes, including the removal of the supreme leader of the Islamic Republic. As the regime increases its repressive measures against street demonstrations, activists of the green movements employ online publications, and meetings at the universities, in their homes, and other venues to reduce the cost of their struggle for change.

Hooliganism
REN VLIEGENTHART

The study of hooliganism – violence committed by sport fans – has been an isolated area of academic inquiry (Spaaij & Anderson 2010), despite the fact that scholars with varying backgrounds have studied the phenomena. Sociological (Dunning 2000), anthropological (Marsh 1978), and psychological (Armstrong 1998) explanations for the occurrence of hooliganism have been given. These explanations too often emphasize the irrational character of the violent behavior: hooligans are considered to be outrageous, emotional, and involved in a highly ritualized act. In many respects, these assumptions about violent fans resemble the psychological and “convergence” explanations made about participants in protests and riots in the 1960s. However, while social movement scholars have since considered alternative explanations for participation in protests, and even riots, such as shared mobilizing grievances, students of hooliganism have until recently not considered fan violence as inspired by such motivations. This is unfortunate, since oftentimes hooliganism could well be driven by grievances and the urge to express them.

In most cases, hooliganism involves more or less organized groups trying to initiate fights with rival groups. The aims of these fights are twofold. First, hooligans try to humiliate the competing gangs that support other club teams. Second, hooligans use violence to attract attention for their social background and to express grievances related to their social position (Dunning, Murphy, & Waddington 2002).

Interestingly, most of the research considers hooliganism as a particularist phenomenon and does not incorporate theoretical or empirical insights from studies of other types of collective violence. Additionally, most studies focus on the question why hooliganism occurs (at all), rather than on the question of how its occurrence and intensity differs across time and space. Much of the empirical work is qualitative and consists of detailed accounts of violent events, often relating to soccer matches in European countries, and mainly the United Kingdom.

Recently, several authors have explicitly argued that hooliganism should be conceptualized as a form of collective action (Tilly 2003; Collins 2008). This suggestion provides an opportunity to integrate theories that are widely applied in the study of social movements and collective action. In line with this idea, Spaaij and Anderson (2010) propose a holistic model to explain fan violence. This model includes: (1) macro-level variables, such as the political, social, economic, and cultural context; (2) meso-level variables, such as habitus and fan cultures and identities, which are argued to mediate the influence of macro-level variables on the occurrence of hooliganism; and (3) a wide set of individual and collective actor variables that moderate the relations between macro-level and meso-level phenomena and the occurrence of hooliganism. These variables include characteristics of individual participants, the responses by authorities and media, and the aggressive behavior by sport players on the pitch.

Recent empirical studies offer support for the usefulness of considering hooliganism as a form of collective action. Braun and Vliegenthart (2008), for example, find that over time variation in the occurrence of violence by Dutch soccer fans can be explained by deteriorating economic conditions, attention for hooliganism in the media, and social learning. Especially the latter explanation, focusing on the role of soccer players, turns out to be a very strong one: aggressive behavior on the pitch increases the likelihood of violent fan behavior after the match. In another study, Braun and Vliegenthart (2009) integrate these explanations in
a diffusion framework and demonstrate that, like many other types of collective action, variation in hooliganism, both over time as well as geographically, can be well explained by considering it a specific type of innovation.

Institutional theory and social movements

MARC SCHNEIBERG

During the 1990s, institutionalists studying emergence and change became dissatisfied with theories that stressed contextual sources of stability, path dependence, and conformity, and looked to overcome “excessive determinism” by integrating social movement research with institutional analysis. Bridging these two bodies of work transformed understandings of institutional processes, actors, and structures. It added contestation, collective action, framing, and mobilization for alternatives to theoretical inventories of isomorphism, legitimation, and diffusion. It juxtaposed challengers and advocates of alternatives to states and professionals as key actors. It shifted from images of isomorphic settings characterized by path dependence, conformity, and taken-for-grantedness to concepts of fields as sites of contestation, organized around multiple and competing logics (Davis & Thompson 1994; Davis et al. 2005; Hargrave & Van de Ven 2006; Schneiberg & Lounsbury 2008; King & Pierce 2010; Fligstein & McAdam 2011). This work has employed three broad analytical strategies for linking social movements and institutions to explain change.

MOVEMENTS “OUTSIDE” INSTITUTIONS: SEQUENTIAL PROCESSES

One strategy preserves a bright line between movements, contestation, and deliberate mobilization for change, on the one hand, and institutional dynamics like diffusion, legitimation, and taken-for-grantedness, on the other. It takes movements as “extra-institutional forces” that arise outside – or on the peripheries – of established fields, acting as outsider-challengers to assert new visions of order, disrupt existing arrangements, and secure policies from established authorities to realize those visions. Moreover, it understands movements and institutional dynamics as distinct forces, producing change or path creation either side by side, or as stages in a broader sequence of transformative dynamics. Mobilization, disruption, and asserting new visions evoke contestation within fields over competing logics, public hearings, and debates, and political settlements in the form of new policies and institutions, followed or paralleled by conventional institutional processes of theorization, endorsement by professions, and diffusion (Schneiberg & Soule 2005; Hargrave & Van de Ven 2006).

Such a strategy illuminates whole classes of cases (Schneiberg & Lounsbury 2008). As they mobilized for alternatives to corporate capitalism in the United States, agrarians and independent producers won antitrust policies that disrupted existing market institutions and sparked struggles over market governance, fueling new strategies and regulatory settlements that became codified as best practices, diffused across firms and states, and stabilized new market orders. Civil rights activists fought for equality, securing antidiscrimination laws that created profound uncertainty for employers, prompting theorizing and claims-making by legal and human resource professionals, the codification and diffusion of compliance strategies, and their endorsement by the courts. Waves of environmental mobilization evoked scandal, struggles over competing institutions and legislative activity, prompting shifts in discourse, theorization, and new forms of conventional conflicts among nonprofits, state agencies, and firms. Nor are mobilization-disruption-institutionalization sequences confined to the state. Shareholder activists, anti-corporate groups, and others have mobilized boycotts, takeover threats, and other disruptive tactics against corporations and universities, fueling the development and diffusion of “lean and mean” corporation, black studies
program, and more (Davis & Thompson 1994; Rojas 2006; King 2008).

Understanding how movements mobilize outside fields to contest existing institutions opens up the black boxes of canonical punctuated equilibrium or two-stage models of change. It sheds important light on the sources and dynamics of “pre-institutional” events – shocks, the appearance of innovations – that spark conventional institutional processes of diffusion, endorsement, and legitimation. It also supports a view of institutions as settlements of political contests over the nature and boundaries of fields (Armstrong 2005) – settlements which reflect challenger mobilization for alternatives, and which themselves often combine conflicting logics and contradictions in uneasy truces, laying structural foundations for subsequent mobilization.

MOVEMENTS WITHIN INSTITUTIONS/MOVEMENTS AS INSTITUTIONAL FORCES

A second strategy draws parallels rather than bright lines between movements and institutional processes (Campbell 2005), focusing on how movements mobilize for change within – and with – existing channels, institutions, and power structures. Movements mobilize outside systems to directly oppose existing orders, create legitimacy crises, and disrupt institutions. But they also work to change systems incrementally from within by engaging in conventional institutional processes, by reconstructing the classification, regulatory, and organizational pillars of institutions, and by drawing on existing institutions and taken-for-granted understandings to theorize, articulate, and combine new alternatives with prevailing systems. Here, movements themselves become vehicles for theorization, recombination, and other institutional processes inside fields and organizations (Zald & Berger 1978), often bypassing states and conventional politics entirely.

Scholars highlight four ways movements serve as institutional forces within fields. First, movements mobilize in the system as agents of theorization, classification, and diffusion (Lounsbury, Ventresca, & Hirsch 2003; Rao, Monin, & Durand 2003; Weber, Heinz, & DeSoucey 2008). By entering policy debates, theorizing waste as commodity, and working in universities to provide students and managers arguments for recycling, environmental activists transformed cultural beliefs and industry discourse about waste, enabling the diffusion of recycling. Similarly, by developing new codes and classifications, insider-champions of nouvelle cuisine and grass-fed beef and dairy, respectively, helped reconstitute the field of gastronomy from within, fostering the spread of new cuisines, and carved out new market niches within the organic foods industry. In effect, movements worked as insiders to reconstruct the “cognitive pillars” of fields through cultural practices familiar to framing scholars.

Second, movements foster change by exploiting the presence of multiple logics and contradictions, working inside fields or organizations as agents of recombination, assembly, and transposition (Clemens 1997; Creed, Scully, & Austin 2002). GLBT activists, for example, gained leverage for reform as firm insiders by simultaneously coming out and fitting in. They articulated domestic partner benefits with civil rights frames, values of fairness, corporate social responsibility, and concerns with competitiveness, while weaving casual mentions of everyday lives and experiences with same-sexed partners into conversations with colleagues to normalize difference and activate listeners’ identities as unprejudiced persons.

Third, movements promote reform by forging, participating in, and becoming part of private regulatory systems, rating, and ranking, and certification schemes (Bartley 2007; King & Pierce 2010). Environmental and anti-sweatshop activists were pivotal in creating certification schemes for sustainable agriculture in forestry and fair labor practices in apparel, reconstructing the normative and regulative pillars of these fields, and mobilizing
those pillars to reshape market forces. Such schemes are increasingly common in transnational settings.

Fourth, movements reconstitute fields from within as “organization generating organizations” that re-populate settings with economic and political forms that embody new logics (Clemens 1997; Rao, Morrill, & Zald 2000; Schneiberg, King, & Smith 2008; Hiatt, Sine, & Tolbert 2009). Movements do this directly, by creating new organizations and providing them with resources, templates, and technical expertise, and indirectly, by promoting favorable regulation and normative environments. Through these means, movements have fostered new forms of political representation, independent power producers, systems of cooperative, mutual, and public alternatives to corporations, and new classes of food producers, breweries, and restaurants.

Scholars recognize that movements can couple conventional institutional efforts within fields with extra-institutional tactics of disruption and polarization, creating separate organizations for each approach. Yet mobilizing as outsiders to disrupt institutions is not all movements do. Some even eschew open confrontation entirely to pursue change incrementally from within, sometimes quite effectively, prompting a rethinking of how movements and institutions relate and this second broad strategy for analyzing how they produce change.

MOVEMENTS, INSTITUTIONS, INTERACTION EFFECTS

A third strategy addresses how mobilization and institutions interact to produce change. It takes institutions as contexts for movements, enhancing or weakening movement effects on change. It also takes movements as contexts for institutional processes, supporting or undermining theorization and the diffusion of alternatives.

The first line of work extends political opportunity structure arguments about elite allies and the like to consider how other features of institutional contexts enhance or dampen movement effects (Davis & Thompson 1994; Soule & Olzak 2004; King 2008; Hiatt, Sine, & Tolbert 2009). Movements may be more effective – better able to translate numbers, resources, or actions into changes in policy or organization – depending on prevailing discourse, public opinion or norms, the stages of policy processes, how far changes have diffused in nearby regions or fields, and whether authority structures are multilevel or fragmented. Institutions are conditions for social movements.

The second line of work inverts this imagery to consider how movements are political conditions for institutional processes like diffusion (Briscoe & Safford 2008; Schneiberg & Lounsberry 2008). Incumbents often contest new forms. Under these conditions, new forms will spread slowly, if at all, and diffusion effects will be absent, unless movements for change mobilize to support those forms. Mobilization provides political cover for alternatives, rendering firms and states more receptive to others’ examples, while increasing the broadcast strength of early adopters (Strang & Soule 1998). Movements thus enable diffusion and the institutionalization of alternatives that would otherwise be stillborn.

CONCLUSION

The engagement between social movement and institutional theory has been a productive one. It has yielded new imageries of change – imageries of movements working inside and outside states, organizations, and established fields that seem particularly suited for increasingly transnational worlds and reconfigured relations between states and societies. It has evoked some provocative new ways of linking structure, agency, and action. And it has given a lie to worries about the lack of empirical research on movement outcomes by documenting how movements effect change, whether in a sequence with institutional dynamics, as institutional forces
themselves, or in interaction with institutional processes.

REFERENCES AND SUGGESTED READINGS

The study of Muslim women is one of the most challenging and contentious topics of inquiry in political and social movement studies. Muslim women have long been stereotyped as oppressed, passive recipients of patriarchy, religion, and politics, rather than as active figures in their own right. Motivated by the overwhelming absence of women as subjects in the literature, the last two decades have witnessed an upsurge in critical scholarship exploring women’s roles as organizers of and participants in movement activity in various locales across the globe.

The term “Islamic women’s movements” (IWMs) may incorporate a large spectrum of Muslim women’s groups, including (but not limited to) Islamist women’s movements (those who perceive Islam to be a total social, political, and economic system meant to inform all aspects of society), Muslim or Islamic feminist movements (those who view Islam as fully supportive of women’s rights, and who prioritize gender in their movement goals), and secular Muslim women’s movements (those whose members self-identify as Muslims but whose activities are not necessarily framed by religion). Analyses of women’s collective action in both “formal” and “informal” contexts have raised issues of how political activity may be construed in “unusual places” (Peshkova 2009), and have seriously challenged underlying notions about politics being conceived as what only men do in formally recognized institutional settings. IWMs may organize through charitable societies, government-sponsored committees, religious study groups, nongovernmental organizations (NGOs), human rights and development organizations, and women-only branches or affiliates of male-run organizations. The issues that IWMs tackle include reforming personal status laws based on sharia, or Islamic law, which govern the terms of marriage, divorce, child custody, mediation, inheritance, and alimony. IWMs tend not to challenge the existence of sharia as a framework for law; rather, groups focus on reforming it to be “correct and more authentic” (Warrick 2009). IWMs also address political corruption, poverty alleviation, democratization, education, social services, women’s access to mosques, violence, and many other topics.

Women’s dress has also become a focal point of protest, especially during periods of forced hair- and face-covering or uncovering by the state or Islamist groups. Because Islam is readily used as an excuse for gender inequities in the status quo, IWMs of all kinds strategically locate their missions and activities within a religiously viable discourse and engage in Islamic interpretation, or *ijtihad*. Uncovering the contexts and meanings of the Koran and hadiths (narrations describing the words and deeds of the Prophet) are at the core of women’s epistemological struggle to legitimize their desired sociopolitical reforms. This project involves critical examinations of the sources of religious knowledge and authority, and the manner in which texts have been used to bolster practices that women deem to be unjust, discriminatory, and contradictory to Islam. These new gender hermeneutics have resulted in a gendered historicization of Islam, a critique of hegemonic Islamic discourses, and their applications to law and culture. This does not necessarily involve a rejection of “tradition” outright, but rather a recognition that “new orthodoxies emerge through changing relations of power” (Moll 2009), and that – in the postmodernist vein – “tradition” is actually a series of *traditions* having different implications for women. Gendered readings of the Koran and hadiths also use the Prophet’s wives...
and female descendants as examples of women leading in business, politics, and piety. As some interpretations note, mothers have had a privileged status in the Koran, which has led some IWMs to emphasize the protection of mothers (and potential mothers) through improved education, health services, and rights as being originally intended by the faith. In this way, Islamic feminists directly challenge patriarchal frameworks and strategically use religious discourse to argue for reforms also in agreement with tenets of secular liberalism. In order to bolster their positions, IWMs assert that their interpretation of Islam – one that typically lends itself to an improvement in women’s status – is the most authentic, valid, and indigenous manifestation of their religion.

IWMs have organized and created formal associations, organized public protests, and produced printed publications since the turn of the twentieth century. While popular movements occasionally arose in response to massive political crises, these associations were typically made up of urban, upper-class women tackling issues of social welfare, suffrage, and restrictions on elite women’s dress. The relationship between IWM mobilization and nationalist struggles – referred to as the “honorable door” for women to engage in public activism and to “earn” emancipation (Fleischmann 1999) – has been complex. Nationalist movements throughout the formerly colonized world have always recruited women to their cause, relying on them as foot soldiers in liberation efforts. Both sides have recognized that women’s status lies at the heart of defining what kind of nation theirs should become. Women’s grievances about their treatment under colonialism and apartheid inspired many to form their own women-specific branches of the nationalist struggle. However, in most cases, male-dominated nationalist movements pressured women to address national liberation first, and to leave the issue of women’s rights for after the revolution. Any acknowledgment by IWMs of existing patriarchy in nationalist platforms resulted in accusations of betrayal. As in the case of Algeria, women have typically seen a swift reversal of their hard-won rights in postcolonial regimes. However, engagement in nationalist struggles (which, for some groups, continues at the time of this writing) has created numerous political opportunities for women to merge ideas of gender equality with the national project, and to demand, sometimes successfully, that women’s status be addressed in nationalist charters.

Islamist women have also been prominent in supporting the activities of male-dominated Islamist organizations since the founding of these oppositional movements critical of nationalist, capitalist, and socialist projects. For example, during the World War II period, the Muslim Sisterhood and the Society of Muslim Women played a vital role in sustaining the Muslim Brotherhood of Egypt during periods of state crackdown. IWMs engaged in resistance activities by relaying messages to imprisoned members, opening their homes to Islamist organizers, and spreading outlawed literature. Scholars have noted that when under threat, male Islamists have forsaken ideals of gender segregation and heavily relied on women to sustain their movements. Interestingly, the stated goals of women Islamist leaders themselves did not address gender liberation per se, but rather the preference that women lead in the home and family – the “private sphere” – instead of in public politics. In recent decades, postcolonial democratic and nondemocratic states, powerful Islamists, members of the ‘ulama (community of religious scholars), and politicians have been under increasing pressure to heed the calls of women’s movements, due in part to increasing literacy rates, educational attainments and, in some cases, raised political consciousnesses spurred by the presence of NGOs in poor rural areas (such as in Bangladesh). Male-centered Islamist organizations have responded to women’s grassroots mobilization by revising their founding statements about gender roles and stressing women’s importance as individuals with rights in public political life.
Islamic women’s movements

and work (though women and men are still conceived of as having separate and disparate roles).

Relationships of power and domination between the “East” and “West” or “first world” versus “third world” polities have had numerous effects on women’s activities and the study of their movements. Muslim women’s NGOs, for example, necessarily confront a variety of fundamentalisms in many of the areas in which they operate. While not all fundamentalisms are violent or inherently pose the same challenges, the presence of fundamentalist groups necessitates that women’s NGOs respond to the fear that their organizations are neo-imperialistic and anti-Islam. Many IWMs distance themselves from Western feminist organizations, either as a conscious strategy or because of inherent distrust. It should be noted that while some IWMs do self-identify as feminist (nisa’iyah in Arabic), scholars also sometimes impose the term on organizations that do not. Gender-specific issues are not always prioritized or explicitly stated in Muslim women’s movement activity for a variety of reasons, including the desire to avoid crackdowns by the state for engaging in controversial activities. Responses to Western stereotypes also impact movement goals and the research process itself; Jafar (2007) states that women in Pakistan worry about cementing negative stereotypes of their country when addressing violence against women, and may be hesitant to address such issues, particularly in front of foreign observers.

However, IWMs also publically criticize discrimination and brutality justified by Islam; in India, Pakistan, Jordan, Yemen, and elsewhere, IWMs have utilized the press in order to publicize crimes of rape or child marriage, using individual cases as an impetus for wider legal reform. Researchers submit that Islamic feminisms have been more effective than secular feminist movements in pushing for personal status law reforms because of their privileged “insider” positions within the faith itself (Moll 2009). Of course, not all Muslim women’s movements shun affiliation with the West; as discussed by Ahmadi (2006) the post-Islamic revolution activities of many Iranian women’s organizations have embraced trans-Atlantic ties with Western-affiliated activists. So while distancing one’s organization from non-indigenous influences has become a strategy of survival for many IWMs, it is important to note that this is not the only preferred or successful option for women’s movements. In addition to bridging the gap between various forms of feminism, some IWMs have addressed class and religious barriers by arguing for the right of nonelite men and women and nonbelievers to study and interpret Islam (Shehabuddin 2008).

The divide between activism and scholarship has been nonexistent in the case of many prominent Islamic scholars; for example, Amina Wadud has given many controversial public sermons in Malaysia, the United States, South Africa, and elsewhere that have sparked heated debates about women’s leadership roles in Islam. Her efforts, dubbed a “gender jihad,” have challenged tenets that ban women from praying in mosques and from becoming imams, or prayer leaders (Wadud 2006). Other activist-scholars include (but are hardly limited to) Omaima Abou-Bakr, Asma Afsarrudin, Zainah Anwar, Asma Barlas, Riffat Hassan, and Afsaneh Najmabadi. Such scholarship and activism continues to explore the effects of Islamic women’s movements on political outcomes and social change, as well as to challenge conventional notions about what constitutes feminism, political action, resistance, and agency.

Israeli social movements
ROTTEM SAGI

Since the founding of the state of Israel, Israeli social movements have paralleled those of Western democracies, but with a concentration of movements that have pressed for national security and religion. In 1948, Israel was established as a Jewish state and was born out of a contested, transnational movement started in 1870, known as Zionism. As a result of its roots in Zionism, the early stages of Israeli government co-opted social movement organizations for the purposes of state building. This created a political system that allowed social movement organizations (SMOs) easy access to the Israeli polity.

EARLY ISRAEL

Israel is governed by a parliamentary system, which gives citizens 18 years and older the right to vote. The 120 available assembly (Knesset) seats are filled through public election and proportional representation. The threshold for proportional representation, currently at 2 percent, has always been low. When no single party has a majority, they must build coalitions to form a government. This highly democratic system of governance is a product of Israel’s social movement beginnings. Not only was the state a product of the Zionism, but it also relied on SMOs to assist in early state-building. Because SMOs were heavily intertwined with the formation of the Israeli government, SMO leaders were often co-opted by the parties and appointed to leadership roles within the government.

Two iconic examples include the farmers’ association and the Histadrut organization. Israeli farmers received privileged status as a result of the belief that their work was a calling, rather than a job. Farmers were viewed as settlers returning to Israel to care for the land. Histadrut, Israel’s oldest labor organization, went beyond the goals of trade unionists and proposed to help build the necessary political and economic institutions in order to develop a sovereign state. The labor federation became deeply intertwined with the political parties. Following the first election, the Labor Party won 57 of the 120 assembly seats revealing the strength of labor movement. The Labor Party was able to hold onto its majority in the Knesset until 1977.

LATER ISRAEL

Following the Six Day War of 1967, Israel experienced massive economic growth and changes in its political environment. An increased sense of security allowed movements flourishing in other parts of the world, such as environmental and feminist movements, to begin airing grievances in Israel. Some of these SMOs relied on the language used by previous social movements, claiming they were not challenging authority, but encouraging Israeli nationalism. The environmental movement organization, Protection for Nature, attempted to foster a love of the country through infusing patriotism into nature activities. However, these SMOs were not able to get the same privileges awarded to previous organizations. For example, feminist organizations originally associated with various political parties, which provided vocational training and day-care services in exchange for political support, detached themselves from the Knesset in the early 1970s when they sought to question male dominance in Israeli society. They attempted to do so using patriotic rhetoric, but began challenging the broader social structure of society.

Over time, it became increasingly difficult for the newer SMOs to realize their goals in the
same way older organizations had. The government began disentangling itself from SMOs, leading to the 1982 Law of Associations, which regulated interest groups by issuing rules for appropriate conduct and requiring all interest groups to register. Although legally citizens were free to form associations, requests could be denied if organizations acted illegally or undermined Israel’s democratic nature.

ISRAELI SOCIAL MOVEMENTS AND THE ARAB CONFLICT

Israel’s unique foundation as a small, contested secular Jewish state surrounded by Arab nations has produced powerful SMOs concerned with national security and the role of religion in government. Prior to Israel’s founding, movements pressed for both more pacific and more aggressive approaches to the Arab world. Two-state solution

Though there were always organizations within the state opposing military action against its Arab neighbors, social movements criticizing Israel’s security practices became more prominent after the Six Day War. In 1942, Ihud was founded as a pacifist organization that supported a bi-national solution to the Jewish–Arab struggle. They fought against the creation of Israel as a solely Jewish state and decried military actions against Arabs by Israel, but failed to affect any change and eventually disappeared from the Israeli political scene shortly after the Sinai Campaign in 1956.

After the post-1967 economic boom, the Israeli polity began to change. The Yom Kippur War of 1973 marked a change within Israeli culture. Citizens began to criticize the government for its failings during this surprise attack. The long-standing, liberal-leaning government, led by the Labor Party, began to lose control of the majority of assembly seats and was replaced by the more conservative, right-leaning Likud party. Mustafa and Ghanem (2010) suggest that the rising percentage of Mizrahi (Jews originating from the Middle East or northern Africa) and ultra-Orthodox Jews, who traditionally voted for right-leaning political parties, contributed to the political shift in 1977. Other theorists credit this shift to the changing economic conditions in Israel, the surprise attack in 1973, and the resignation of Prime Minister Golda Meir (Yishai 1998).

Demographic, economic, and security changes contributed to electoral volatility and led to more contested SMO politics. During the 1982 Lebanon War, bereaved parents of fallen soldiers began speaking out about the war. Within the first week of the war, several families of fallen soldiers killed in a battle to conquer the Beaufort Post in Lebanon formed a group known as “Beaufort Family.” They claimed the battle was an unnecessary operation and blamed the government for their sons’ deaths. As the war evolved into a long-term attempt to reshape Lebanese politics, activists staged frequent protests. This was unique in that previously such deaths were seen as a justifiable sacrifice but now families began to blame the government. The Soldiers Against Silence, a group of reserve soldiers, and Peace Now joined the Beaufort Family in voicing dissent. Outside of Prime Minister Begin’s home beginning in April 1983 they displayed long lists with names of the casualties and a fatality count. Within three months, the Labor Party, who initially supported the war, called for a withdrawal from Lebanon. After the Israeli Defense Force (IDF) withdrew from Lebanon in 1985, the war became known as the “war of choice” distinguishing it from previous wars of necessity (Levy 2010).

Other leftist movements concerned with the Israeli–Arab conflict became increasingly popular over the years. Women in Black (Nashim BeShachor) is one of the more well known examples. Originating in Jerusalem in 1988, this movement was entirely composed of women who sought to end Israeli occupation of the West Bank and Gaza Strip. These women met every Friday between 1 p.m. and 2 p.m. in designated locations around the country and held silent protests. They dressed entirely in black to symbolize the tragedy of Israelis and
Palestinians. These women held up signs: black octagons that read “Stop the Occupation” (Helman & Rapoport 1997).

**Religious, right-wing, and settlers’ movements**

During the Six Day War, Israel captured a number of neighboring territories with the intention of exchanging them for peace with its neighbors. The settlers’ movement, composed primarily of right-wing religious organizations, viewed the newly captured territories as part of the “entire Land of Israel,” as outlined in the Bible, and was opposed to returning them. One such SMO, “Land of Israel Movement,” was adamantly opposed to a two-state solution and felt the Jews had claim to the “entire Land of Israel.” This organization was predominantly populated by religious leaders and the underground terrorist groups Irgun and Lechi. After failing to convince politicians by directly approaching them, movement members took action by illegally settling in Hebron, a city located in the occupied territories. After increasing pressure on the Israeli government, the settlers’ movement achieved victory with the establishment of Hebron as a Jewish city. In 1969, movement members created their own political party, the Land of Israel Party, and ran in the upcoming elections, but were unable to win a single Knesset seat (Issac 1976).

Kach, a right-wing political organization led by Rabbi Meir Kahane, is another example of the influence of religious right on Israeli politics. Kahane began taking action against the Arabs in 1972 when he and his followers distributed fliers in the city of Hebron, summoning their mayor, Muhamad Ali Jaabari, to a public trial in an attempt to incite conflict. In addition to symbolic actions, Kahane and his followers also used acts of terror to remove Arabs from occupied territories. In 1982, the members of Kach barricaded themselves in the Sinai Peninsula and, in front of the world media, threatened to commit suicide if Israel returned the land to Egypt as part of the Israel–Egypt peace treaty. The Israeli government rushed Kahane to the scene, and the rabbi was able to publicly negotiate with his followers not to commit suicide. This led to his controversial win of a Knesset seat in 1984 as a member of the Kach Party. In 1988 revised Knesset laws banned parties that incited racism and prevented Kach from running in the elections of that year. Kahane was assassinated in 1990 leading the Kach Party to split into two separate political parties, both of which were banned from the 1992 elections because of their original ties to Kach. By 1994 both organizations had been banished from Israel’s political landscape under 1948 antiterrorism laws (Sprinzak 1986).

Not all religious-based political actions are related to the settlers’ movement. Because Israel lacks a constitution, the role of religion in the public sphere is ambiguous and religious organizations have been successful in some areas. Several dimensions of public life are dictated by religious law. For example, secular Jews are legally required to use services provided by state-sanctioned orthodox rabbinate for marriage, divorce, and burial. In order to gain the majority, religious movements often form coalitions with the right-wing parties. In 2006, the rightist bloc won 50 of the 120 assembly seats with a coalition consisting of the ultra-orthodox Shas and United Torah Judaism party in addition to other extreme right-wing groups.

The diverse spectrum of social movements in Israel continues to be studied in a number of disciplines. Anthropologists, political scientists, and sociologists have all tried to understand the field of social movements in Israel and its relationship with the government and the citizenry. While the majority of scholars have focused on the security-based social movements, research has also been done to understand the impact of religion on the Israeli polity, Israel’s constant state of uncertainty with regard to security and easy access to political representation allows for continued scholarship with regard to movement outcomes, social change, and countermovements.

Mass society theory
STEVEN M. BUECHLER

Mass society theory is a complex, multifaceted perspective. As applied to social movements, however, the basic idea is that people who are socially isolated are especially vulnerable to the appeals of extremist movements. The theory resonated with fears of fascist and communist movements in the 1930s and 1940s and reached its apogee in the late 1950s.

Ideologically, the concept of mass society has been used by conservative thinkers to express dismay about the leveling tendencies of industrial society and the declining influence of family and community (Swingewood 1977). It has also been used by radical thinkers to bemoan the manner in which large bureaucratic institutions (especially in the guise of mass culture) can pacify populations and reinforce the status quo (Marcuse 1964).

An important sociological predecessor is Emile Durkheim’s analysis of modern society and the rise of individualism. With increasing size and complexity, social integration became problematic in two ways. Anomie involves insufficient regulation of behavior while egoism involves excessive individuation of people. Both signify weakened social integration and loosened social controls that contribute to dysfunctional outcomes, including suicide (Durkheim 1897). The same logic applies to many types of unconventional behavior.

The mass was one type of collective behavior subsequently identified by the Chicago School of Sociology (Blumer 1951). Alongside crowds, publics, and social movements, masses are distinguished by their large size, anonymous nature, loose organization, and infrequent interaction. As such, the concept of a mass connotes a group ripe for manipulation and control.

C. Wright Mills (1956) recognized these dangers in his analysis of the power elite. It gained power in part because of the transformation of publics enjoying democratic dialogue and political influence into masses with neither. With the transformation of publics into masses, “at the end of the road there is totalitarianism, as in Nazi Germany or in Communist Russia” (Mills 1956: 304).

It was in this context that William Kornhauser – trained in Chicago School sociology – wrote The Politics of Mass Society (1959). It remains one of the most explicit statements of the alleged links between mass society and social movements. Written in the shadow of aforementioned totalitarian tendencies, mass society theory sought to explain the rise of extremism abroad and the dangers to democracy at home. Recalling Durkheim’s analysis of egoism and anomie, mass society emerges when small local groups and networks decline, leaving powerful elites and massive bureaucracies on one side and isolated individuals on the other. As Kornhauser wrote: “Mass society is objectively the atomized society, and subjectively the alienated population. Therefore, mass society is a system in which there is high availability of a population for mobilization by elites . . . [p]eople who are atomized readily become mobilized” (Kornhauser 1959: 33, emphasis in original). Put slightly differently, mass society is one where “both elites and non-elites lack social insulation; that is, when elites are accessible to direct intervention by non-elites, and when non-elites are available for direct mobilization by elites” (Kornhauser 1959: 43, emphasis in original).

In a healthy pluralist democracy, both elites and non-elites are partially insulated, intermediate groups are strong, and normal channels of influence are robust. In mass society, both groups lose this insulation, intermediate social buffers erode, normal channels are ineffective or bypassed, and extremism becomes more likely.
Mass movements pursue remote, extreme objectives and mobilize uprooted, atomized people (Kornhauser 1959: 47). Thus, “[m]ass movements mobilize people who are alienated from the going system, who do not believe in the legitimacy of the established order, and who therefore are ready to engage in efforts to destroy it. The greatest number of people available to mass movements will be found in those sections of society that have the fewest ties to the social order . . . ” (212).

This description of mass movements reflects the collective behavior depiction of mass behavior with a remote focus of attention, a declining sense of reality and responsibility, and a highly unstable, shifting focus of attention and intensity of response (Kornhauser 1959: 43–46). This depiction thus links the politics of collective behavior with unreasoning and extremist threats to social order.

Subsequent analysis and research have led many to conclude that the idea that the most socially isolated are most likely to engage in mass politics “is almost certainly false” (Rule 1988: 109). Those who are socially isolated are actually less likely to join while those who are embedded in preexisting social ties are disproportionately likely to do so (Oberschall 1973). Chicago School sociologists Turner and Killian (1987: 390) themselves note that “[s]ubsequent study of totalitarian movements has raised serious questions about the applicability of Kornhauser’s concept of mass movement.”

Other researchers concur that “[v]irtually all of the major claims of the theory have been controverted by an overwhelming body of evidence” (Hamilton 2001: 12). Despite its largely discredited status among academics, literary and journalistic proponents of this perspective enjoy a much wider and perhaps more credulous audience. As a result, “mass society theory proves well-nigh indestructible” (Hamilton 2001: 12) despite its logical flaws and empirical shortcomings.

Media framing and social movements

RENS VLEEGENTHART

In their study of media content, mass communication scholars commonly rely on Entman’s (1993: 52) definition of framing: “[selecting] some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation.”

Much of the study of media framing of political issues centers around three questions: (1) How is the issue framed; (2) How can we explain variation in framing – both over time and cross-sectionally; and (3) What are the effects of media framing on public opinion and policymaking? These questions are also of clear relevance to the study of social movements (see also Snow 2008).

EARLY STUDIES

While both media content and framing processes are central concepts for social movement scholars, media framing does not receive that much attention. This is all the more remarkable, since several of the most influential studies that pertain to the causes and consequences of media coverage – and that are widely cited by students of social movements and media scholars alike – deal precisely with that issue. Gitlin (1980), for example, uses the framing concept to assess the interaction between mass media and the US New Left movement in the 1960s. He documents how the media and their initial favorable framing of the movement and its issues helped it to gain broader support. However, the requirements for the movement and its events to remain newsworthy – and thus to contain characteristics such as drama, conflict, and personalization – made the movement’s main leaders increasingly focus on media strategies. Intensive coverage of internal struggles and anomalies within the movement ultimately resulted in erosion of its public support. Tuchman (1978), in her study of the coverage of the US women’s movement, finds that organizational and institutional arrangements, as well as routines in the news gathering process, constrained journalists in their capacity to frame issues independently. Both studies demonstrate the inherent problematic nature of the relationship between movement activists and journalists and the limited capacity of movements to influence mass media content.

On the one hand, social movements, maybe more than any other political actor, need the media to convert bystanders and mobilize supporters in order to attain the changes sought, whatever the institutional arena. On the other hand, journalists need social movements to stage events and “make news.” However, in most instances, their interests do not coincide. While movements are interested in getting favorable coverage for their claims, journalists are interested in conflict and confrontational events that fit their standard news format.

Focusing on the consequences of media content for a social movement, Gamson and Wolfsfeld (1993) suggest three possibilities. First, media coverage can affect on the prospect of participation among movement sympathizers. This is labeled the mobilizing function of mass media. Second, coverage legitimizes the existence of the movement and its claims, contributing to its political relevance and its capacities to influence politicians and policymakers. This is called the validation function. Third, they identify scope enlargement. By getting extensive and favorable coverage, the movement draws attention to the conflict from actors that were not previously involved and might get involved as allies. The most relevant actor here
might well be the general public. A favorable opinion from an involved public is one of the key legitimizing sources for the movements' claims and an important tool to exert political influence. Focusing in more detail on the latter, Gamson (1992) describes how media framing can impact individuals' frames for a whole range of contested issues. He distinguishes between three types of frame formation: cultural, personal, and integrated. For the first one, there is a heavy reliance on media discourse and common wisdom, the second one relies on personal experiences, while the last one integrates the two.

CURRENT FOCUS

While these early studies seem to provide fertile ground for developing a media framing perspective toward social movements, more recent work has to a considerable extent neglected this connection. The coverage of movements and their events have received considerable attention, but studies have mainly focused on why – and not how – certain protest events (Smith et al. 2001) and movements (Amenta et al. 2009) get covered, discussing issues such as selection and description bias. In addition, when considering the consequences of media coverage, attention has focused on the effect of the visibility, legitimacy, and resonance of the movements' claims (the discursive opportunity structure) on support for the movement (Koopmans & Olzak 2004).

Several exceptions exist, however. On the question how movements can affect media framing, Rohlinger (2002) has investigated the role of several pro-life and pro-choice movements in the US abortion debate. Her findings demonstrate that movements can indeed be successful in influencing media framing about the issue of concern. More concretely, journalists are more likely to incorporate the movement's framing when they apply frames that resonate with the wider societal debate and when they develop an organizational structure that fosters an efficient interaction with journalists. Furthermore, Rohlinger's findings show that the media strategy movements choose for their interaction with journalists depends on the political context. When access to political elites exists and they lend a willing ear to the movement's claims, movement organizations are more inclined to remain silent and circumvent any political discussions in order to maximize political gains. If access to political elites is absent, organizations deliberately look for media coverage, often in cooperation with other organizations that pursue similar claims (Rohlinger 2006). In their study on the framing of the 2005 French riots, Snow, Vliegenthart, and Corrigall-Brown (2007) investigate the variation in media framing in diagnostic and prognostic terms across countries, outlets, actors, and time. They show that time in particular is of major importance, and that noteworthy changes in framing take place when the conflict over an issue evolves. Snow (2008) suggests considering media coverage of a certain event or issue as an example of a discursive field. This discursive field can be classified based on the level of its stability in terms of the relations between (collective) actors, as well as on the degree of agreement among those actors regarding the focal event or issue. Variation on those continua might well account for variation in framing.

Turning to the effects of framing, there are several studies dealing with consequences of media coverage for social movements, focusing especially on scope enlargement and how framing affects individuals' attitudes and opinions regarding the issues of concern. In many instances, they use an experimental design. Terkildsen and Schnell (1997) combine experimentation with media content analysis, which nowadays is a commonly used strategy to assess media effects. Based on a content analysis of mass media framing of the abortion debate, they discerned five frames and used those frames in an experiment to investigate whether they had an impact on both the saliency and direction of respondents'
attitudes toward women’s rights. The study revealed that the media’s framing of the issue affected public perceptions about the issue—a “political rights” frame, for example, had a positive impact, while an “antifeminism” frame had negative consequences. Another example with a similar methodology is McLeod and Detenber’s (1999) study of the attitudes toward protest and protesters as the main dependent variables. Their findings suggest that differences in coverage not only lead to differences in identification with the protesters, but, more generally, also to varying levels of support for the right of people to protest. Coverage that is framed in terms of support for the “status quo” results in less sympathy toward the protesters and their right to protest.

AGENDA FOR FUTURE RESEARCH

Although existing studies have suggested the usefulness of a framing perspective in understanding the interaction between social movements and the media, this relationship has received only limited attention by social movement scholars until now. Questions regarding the extent to which, how, and in what situations social movements can influence media framing are only partially answered. The same goes for the question of how movement participants and other citizens are affected by framing in the media. Some research suggests that media can have a strong impact on mobilization and even supersede the role movement organizations play (Walgrave & Manssens 2000). But when this happens, or does not, is not yet well understood empirically.

Finally, the moderating role of media framing in the processes by which social movements try to affect politicians and policymakers is largely unexplored. In these instances, a systematic frame analysis of movement communications, media coverage, and political documents could be illuminating. Evidence on the influence of media framing on policy outcomes exists (Baumgartner, De Boef, & Boydstun 2008), but the role of movements in the process has received only limited attention.

Meetings
CHRISTOPH HAUß

A meeting is a gathering of three or more participants who maintain a single focus of cognitive and visual attention while engaging in multiparty talk that is ostensibly related to some common business of the participants (cf. Schwartzman 1989: 7, 61, 274–275); it has clearly marked boundaries in time (beginning and end are officially announced) and space (a spatial environment of mutual monitoring possibilities). These boundaries partially suspend the social structures of the meeting’s environment, thus creating a relatively autonomous unit of social life. The meeting develops its own structures which both enable and constrain the interactions of the participants. These structures include the sequential organization of meeting talk (turn-taking) and topics (agenda), the need to be relevant with regard to the current topic, procedural rules, as well as a number of functional roles related to the maintenance of the meeting itself, usually including the role of a facilitator. These structures are culturally contingent and social movements often develop their own specific meeting culture which – consciously or unconsciously – reflects much of the movement’s identity and the goals for which it strives.

Social movement meetings constitute “free spaces” or “subaltern counterpublics” in which oppositional consciousness and collective identities as well as collective action frames and strategies are developed and contested. Frame disputes are therefore a common feature of such meetings, but the majority of the meeting time tends to be used for information sharing, reporting, and storytelling as well as mundane practicalities such as negotiating time and place of the next meeting, division of labor between various meetings and individuals, devising the nitty-gritty of a particular protest activity, and other everyday routines related to the maintenance of the social movement infrastructure (Glass 2010). Whether or not such issues are treated as “technical” or “political” depends on the micropolitics of the particular meeting as well as the movement culture more broadly (see below) and the dividing line is often subject to contestation.

Despite their capacity to foster opposition to dominant social structures, meetings in social movements are not free from domination themselves. Feminists (as well scholars like Bourdieu and Foucault) have shown how public speech is always disciplined by symbolic orders and the codes of conduct of the social situation, even if these orders are proclaimed as “emancipatory.”

We can distinguish meetings within and between organizations/groups. Interorganizational meetings are of particular importance in – if not constitutive of – social movements because they foster and sustain the informal networks of organizations, groups, and individuals which compose the movement. Although recently social media have made single protest events possible without any prior face-to-face meeting, it is still safe to say that more durable attempts to mobilize for or against social change inevitably include a series of such mesomobilization meetings aimed at maximizing the support from and participation of various social groups and social movement organizations based on the terms (master frames, identities, narratives, strategies, action repertoires etc.) negotiated in these meetings. In that sense, face-to-face meetings constitute a social movement infrastructure behind the scenes of public protest events and preceding such events by months and years (Haug 2013).

In contrast to most meetings in work organizations, participation in social movement meetings is voluntary and activists tend to emphasize the openness of their meetings in the sense that – at least in principle – anyone is
meetings

welcome to attend (though repressive regimes seriously limit the possibility to hold open meetings). Nevertheless, within a particular movement or protest mobilization, the openness and accessibility of meetings often remains subject to contestation because the norm of openness can be countervailed in practice by the politics of time and place (i.e., the dilemma that any scheduled meeting time and place inevitably privileges some potential participants at the cost of others) as well as by opaque channels of information, explicitly closed meetings among influential friends, and other elements of “the tyranny of structurelessness.”

Research has also shown that meetings often function as sites for status contests and provide opportunities for participants to validate their role and status in the larger context of the movement or organization (e.g., Schwartzman 1989: 41f., 70–72). Status is expressed both verbally (style and quantity of speech) and nonverbally, for example, through gestures and one’s positioning in the room (head of the table or back row). Egalitarian activists therefore try to avoid spatial arrangements that provide such positions indicating status and queuing mechanisms are often used to organize turn-taking, thereby avoiding struggles over “airtime.”

Email lists have become a common instrument to facilitate communication among participants before and after the meeting and sometimes to include others who are not able to participate (e.g., circulation of minutes). Apart from extending the scope of meeting communication in time and space, email lists afford divergence, diversity, and individual autonomy, thus balancing the inherent tendency of face-to-face meetings to foster convergence, unity, and the affirmation of the collective (Kavada 2010). While the capacity of meetings to facilitate a sense of collective identity and interpersonal trust is evidently a crucial resource for collective action, a strong urge for harmony and conformity also tends to underpin groupthink and informal hierarchies. To avoid this trap of conflict avoidance, some activists have developed a “fight culture” in their meetings that encourages participants “to challenge each other’s domineering behavior when it happens or to voice unpopular and dissenting opinions when they have them,” thus keeping hierarchies in check and preventing entrenched oligarchies (Leach 2009: 1059). In meetings where a fight culture does not exist, radical activists have nevertheless managed to challenge the hegemony of elitist organizers by encouraging “more empathetic listening habits” among these informal leaders and by training them in a more attentive and inclusive facilitation style (Doerr 2011: 527). Thus, meetings are key for sustaining and challenging the informal leadership common in social movements as well as for establishing good leadership practice.

Contrary to the public impression that movements rely mainly on charismatic leaders, a look at backstage meetings reveals a more differentiated picture. Common leadership roles in contemporary social movements include veterans (have participated in many or all meetings in a particular meeting arena), brokers (have participated in many other relevant meetings), experts (have relevant knowledge about relevant policy fields, the logic of public discourses, or actor constellations), representatives (can speak for and report back to a relevant constituency), mobilizers (are actively involved in mobilizing people to act), organizers (convene meetings, prepare agendas, arrange facilitation, organize a venue, collect participants’ email addresses, and attend to logistical problems), and facilitators (officially in charge of managing the progress of the meeting). The distribution of these roles often varies between topics and sessions, bringing about the kind of amorphous and distributed leadership characteristic of social movements.

Since the end of the cold war, there has been a global proliferation of larger activist conferences comprising a host of different meetings, seminars, and workshops whose primary aim is not to devise an overall coordinated strategy in the sense of a central committee that aims to steer a larger movement, but to nourish “the strength of weak ties”, to share experiences, and
to facilitate cross-fertilization across issues, ideologies, and national boundaries (della Porta & Mosca 2007), not least through the inclusion of indigenous movements. Well-known examples are the Social Forums, the Inter-galactic Meetings called by the Zapatistas, or the conferences of People’s Global Action. Although these conferences have also brought about various campaigns and protest mobilizations, many observers have argued that their core significance is their form, which essentially propagates and searches for alternative forms of governance and reflects the aim to democratize liberal democracy (Maeckelbergh 2009). The global Occupy movement which emerged in 2011 vividly illustrates this when it refused to formulate a list of demands, insisting instead on the importance of its public meetings and the diverse collaborations they bring about. The meeting is the message, as it were, and this message is expressed through a variety of cultures and practices.

MEETING CULTURES AND PRACTICES

Especially in currents engaged in prefigurative politics and radical democratic practices, the process of the meeting and its governing principles are seen as a crucial element of the movement’s identity. The idea of turning the ends (a society without domination) into the means (a meeting without domination) clearly show in the roles and rules of procedure that these activists have institutionalized in order to make their meetings as inclusive and egalitarian as possible without rendering them ineffective: the facilitator is not chairing the meeting but facilitates the progress by asking questions and regularly summarizing the state of the discussion; the timekeeper checks the time assigned to each agenda item; the vibes watcher monitors group dynamics; a minute-taker (or scribe) records important points – often visibly on the board – and helps to keep the discussion focused; and a stacker keeps a list of speakers, possibly applying a 50 percent quota of women speakers or prioritizing those who have not previously spoken (cf. e.g., Graeber 2009: ch. 7).

More hierarchical meeting cultures, which are often associated with the institutionalized labor movement, do not attribute as much importance to the meeting process and focus more on the outcomes. As a result, meeting chairs sometimes impose preordained decisions merely to be rubber-stamped by the meeting. Many fights and factions in contemporary movements are related to diverging ideas about the ground rules of the meeting rather than incommensurable goals per se. A prominent example of such meeting-related rifts took place during the preparatory process for the European Social Forum 2004 (cf. Maeckelbergh 2009: 39–65; Kavada 2010).

Other, more subtle tensions related to different meeting cultures concern the relative importance assigned to the actual meeting in relation to the coffee breaks and pre- and after-meeting talk; the level of politeness required to maintain face and hence the level of contestation possible during the meeting; the degree of authority that can be claimed by any participant (most notably the chair); the role of precoordination of meeting structures and hence the degree of autonomy of the meeting; the permeability of the meeting to its physical environment; the admissibility of emotions as officially part of the meeting; the role of formal turn-taking rules; the disposition to break up into smaller working groups as opposed to maintaining a single plenary session throughout the meeting; and the relative importance of the individual participant to the collectivity and hence the amount and type of dissent necessary to veto a decision.

There are a myriad of manuals, handbooks, and bylaws that attempt to formalize some of these contested dimensions of meeting culture, the oldest and most widespread in the US being Robert’s Rules of Order for “deliberative assemblies,” first published in 1876. Not surprisingly, activists try to establish their own standards with handbooks for consensus decision making and meeting facilitation. Yet, the codification of meeting rules cannot solve the
principal dilemmas posed by the competing choices of meeting procedures.

Moral economy theory and peasant movements in Latin America

DOLORES TREVIZO

Eric Wolf (1969), Joel S. Migdal (1974), and James C. Scott (1976) offered compatible explanations about agrarian revolts and revolutions in the developing world that continue to resonate for Latin America. Before presenting their “moral economy” theory, along with important criticisms of that work, I first define some terms. This is followed by an application of moral economy arguments to exemplary cases of recent peasant and indigenous-peasant movements in Latin America.

In much of the region, people who work the land, whether as smallholders, renters, or sharecroppers, or even as agricultural wage workers, are called campesinos. This loosely translates as “peasants,” even though, in the strictest sense of the term, peasants cultivate their own parcels primarily with family labor for the household’s subsistence. In Latin America, both the recently dispossessed as well as the long-term landless may see themselves as campesinos and thus participate in “land invasions” by squatting on private or public property to get the land redistributed to them. Further, most indigenous people who live in the countryside and either work the land, or want to work the land, also identify as campesinos. This means that indigenous movements that mobilize for land (or other agricultural inputs) are simultaneously peasant movements.

MORAL ECONOMY THEORY

Like Barrington Moore (1966) before them, Wolf, Migdal, and Scott argued that the expansion of capitalism and the concomitant rise of centralized states explain various kinds of peasant revolts. While agreeing with Marx (1867) that penetrating markets privatize (“enclose”) the commons and strip (“dispossess”) peasants of their lands, “moral economy” theorists moved in a decidedly cultural direction. They did so by focusing on intra-village solidarity as well as on how peasants constructed a culturally salient set of rights and obligations in relation to landowning patrons. Such rights and obligations functioned as a moral economy to the degree that wealthier patrons were normatively obligated to help peasants by ensuring their subsistence during inevitable production crises. In Wolf’s (1969: 279) words, before the onset of capitalism, “social equilibrium depended on a balance of transfers of peasant surpluses to the rulers and the provision of a minimal security for the cultivator. . . . Reliance on ties with powerful patrons were recurrent ways in which peasants strove to reduce risks and to improve their stability.”

In sum, moral economists not only hold that the expansion of capitalism turns land, forests, natural resources, and labor into commodities, but that the cultural change that results exposes peasants to greater forms of human suffering. Cultural shifts unglue the social relationships that historically functioned as social insurance. When this happens, sudden and widespread subsistence threats may fuel moral outrage amongst peasants because they expect patrons to help them in the way that they had helped their forbears. In other words, it is not merely their sudden material deprivation but also their moral shock at the unresponsiveness of former patrons that ignites peasant protests.

Moral economists were critiqued by those who explained peasant rebellions either by emphasizing rational peasants (Popkin 1979), interclass conflict (Paige 1983), declining state power, and/or the role of outsider political entrepreneurs (Skocpol 1982). Jeffrey Paige, for example, argued that moral economy theory overemphasized subsistence crises as well as
exaggerated the moral bonds purportedly tying patrons and clients in pre-capitalist economies. Samuel Popkin agreed, adding that penetrating markets do not explain protests because he found that peasants from the noncommercial areas of Vietnam were more likely than those from the commercialized areas to support outside revolutionaries (Popkin 1979: 245–246). Popkin further argued that village communities are themselves internally stratified, and differential privileges and power are, as always, the source of individual and intergroup conflict. As such he concluded that peasants are no more communal or solidaristic than anyone else. Rather, they are self-interested, utility-maximizing, rational actors who will join movements when the benefits of doing so outweigh the costs. In other words, peasants overcome the “free rider problem” to join collective action when credible political entrepreneurs offer them individual incentives that will personally benefit them or their families (1979: 251–253).

APPLICATIONS TO LATIN AMERICA

These criticisms notwithstanding, moral economy theory offers some insights that help to explain recent cases of rural protest in Latin America. To begin with, evidence that peasants work with outside movements to invade lands, reclaim water, or even to overthrow states does not invalidate moral economy theory. Both Wolf and Migdal were explicit that the havoc caused by commercialization makes peasants open to political mobilization by, or with, others. Far from being random “incentives,” land and other natural resources are culturally meaningful. Whether because of their recent ties to it, or the nature of their displacement from it, rural folk frequently feel morally entitled to idle land, even when owned by others. Further, water and forests tend to be defended for communal – not individual – use.

Perhaps because Wolf directly influenced the field, Mexican rural studies lends empirical support to many moral economy claims. For example, in exploring nearly 200 years of agrarian violence from 1750 to 1940, John Tutino (1986) finds that subsistence insecurity is an important determinant of peasant revolts in Mexico. Independent evidence about a large cycle of peasant protests in Mexico during the 1970s shows that peasant land invasions were a reaction to the expansion of capitalist agriculture after World War II. As the theory predicts, the penetration of markets into the countryside slowly commodified land and did so while the population saw dramatic growth. In addition, the mechanization of agriculture in the 1970s resulted in rampant unemployment. Both processes led to widespread landlessness and near landlessness which, in turn, explain why peasants mobilized with outsiders to invade lands in nearly every state of Mexico during the 1970s (Trevizo 2011). They did so, moreover, despite the high cost of significant political repression. More recently, the armed indigenous-peasant Zapatistas (EZLN) won land reform concessions in Chiapas despite the fact that the Mexican government had, in 1992, ended land reform.

Though similar dynamics were at work throughout Latin America in the twentieth century, moral economy theory illuminates some aspects of the recent upsurge in rural protests in the region. This is so because agrarian capitalism (including agro-industry) continues to develop, if cyclically, given the growing demand for agro-crops internationally since World War II, as well as the greater demand for foodstuffs in local urban markets. As was the case in Mexico, the expansion in markets for land displaced peasants from their plots, while the mechanization of agriculture in the 1970s displaced rural workers. As tight urban labor markets are especially impenetrable to rural folk, who generally have lower levels of education than urban dwellers, mass rural landlessness and unemployment resulted. In Honduras, Peru, Bolivia, and Colombia, such people were, indeed, more open to outsiders who helped them to invade lands in the 1960s–1970s.
Since then, recently dispossessed small farmers as well as landless rural workers in Guatemala, Ecuador, Brazil, and Paraguay, have invaded land, both private and public, in the hopes of getting the government to redistribute it to them. The Brazilian case, the Landless Workers Movement (MST), is currently the largest social movement in Latin America. There, too, the mechanization of agriculture in the 1970s disemployed many rural workers from sugarcane plantations in northern Brazil. Further, the commercialization of rural property dispossessed smallholders from their plots at the very moment that sharecroppers and renters were pushed off the land by landlords. These trends resulted in a sharp increase in the number of landless families as well as widespread unemployment. As many large proprietors are absentee landowners with idle estates, rural folk justify squatting on the grounds that land “belongs to those who work it” (Wolford 2006: 163).

But while some recently displaced peasants participate in land invasions to provoke land reform, others, as noted, join revolutionary movements. This was the case in Central America during the 1980s. There the expansion of agro-industrial exports during the 1970s contributed to the emergence of revolutionary movements in the next decade. As elsewhere, Central American economies responded to the increasing demand for agricultural products by adding cotton, sugar, and beef to their coffee exports. The expansion of agricultural exports beyond coffee further commercialized the land and quickly introduced labor-displacing machinery into agricultural production. Both processes displaced smallholders from their lands, cleared renters and squatters and, in Guatemala, cleared colonos (serfs). Agricultural workers, too, were suddenly unemployed and urban labor markets could not absorb the sudden increase in people looking for work. The displaced masses formed a significant part of the social bases fueling revolutionary conflicts in Central America during the 1980s (Paige 1997).

Although land invasions are prototypical forms of peasant struggles in Latin America, rural folk have increasingly fought the privatization of water and other natural resources. Indigenous peasants in Bolivia, for example, won their “water war” when peri-urban residents and others joined them in 2000 to fight the privatization of water. This, along with the rising cost of water, provoked moral outrage among many in and near Cochabamba. They argued that because water falls from the sky, it is a gift from God and, therefore, belongs to the people. As such, it should be respected as a collective good and managed according to indigenous traditions, called usos y costumbres, that date back to pre-Inca times. They won when the government rescinded the contract with Aguas del Tunari, operated by a transnational consortium (Bechtel) based in San Francisco (Spronk & Webber 2008).

Similarly, indigenous and mestizo groups in Ecuador have not only engaged in a series of land invasions demanding land (1970s–1980s), they have actively resisted capitalist expansion in the countryside by usurping their government’s plans in the 1990s to promote export crops, as well as by fighting the shrimp, cattle, and exotic tree-farming industries. Remarkably, in 1997 rural folk from Junín, an agrarian community with a history of land invasions, successfully chased out a mining company owned by Mitsubishi which had begun copper exploration along with an Ecuadorian state-owned company. The World Bank, as well as the British, Swedish, and Japanese governments, had invested over US$22 million in this failed project. One informant explained that a small number of people shut down the mine that their government assumed would create long-term development because “We love our homes and we love our land . . . we are organized to protect our community” (quoted in Kuecker 2008: 103). As their agrarianism and subsistence ethic aligns easily with environmental stewardship ideas, peasants increasingly employ ecological frames when they work with
Catholic priests to fight for land and other natural resources.

Perhaps because of their many twentieth-century struggles against the commodification of their land, peasant and indigenous-peasant movements in Latin America have been leaders in recent antineoliberal campaigns, such as those taken up by the Via Campesina (Peasant Way). Originally founded in the early 1990s by 47 peasant organizations from all over Latin America and the Caribbean (the CLOC, Coordinadora Latinoamericana de Organizaciones del Campo), the Via Campesina is now a transnational network of peasant groups. Member organizations represent rural folk in Mexico, Guatemala, Honduras, Ecuador, Brazil, Peru, and Paraguay. Peasants from Southeast and South Asia, Europe, and Africa have joined Latin Americans to demand, among other things, land reform, “food sovereignty,” protection from dumping, “just prices” for agricultural products, and the right to sustainable development.

Representing an estimated 300 million rural families worldwide, Via Campesina peasants fight to protect land and other natural resources, such as water, seeds, and forests, against the privatizing impulse of “neoliberal capitalism.” Via Campesina’s demand for “food sovereignty” (soberanía alimentaria) echoes the “subsistence ethic” described by moral economists to the degree that peasants assert that “food is our right,” one that ensures both individual survival and a “dignified life” in the pueblos. Edelman (2005) offers a similar interpretation, noting that their demand for just prices is comparable to a moral economy claim, differing only in that the appeal is to global, rather than local, norms.

These cases offer support for the moral economy claim that capitalist expansion strips peasants of their lands, water, forests, and other natural resources. Whether they mobilize with the help of outsiders or not, peasants are cognizant that commercialization exposes them to risks that threaten their subsistence. Dispossession and subsistence crises, or the mere threat of such crises, have clearly motivated both unarmed peasant revolts for land and water and, in some cases, the peasants’ participation in armed guerrilla movements (as in Central America and Peru in the 1980s).

But not all moral economy propositions find such strong empirical support. The research on whether the erosion of patron obligations to peasants fuels protests is inconclusive. About Mexico, for example, Tutino (1986: 31) argued that it is not a subversion of traditional patron–client bonds that fuels peasant unrest but, rather, the widespread perception that elites are responsible for their subsistence crisis. Franz J. Schryer (1990: 177), in contrast, argued that the breakdown of the normative obligations that once tied patrons and clients is key to explaining local land invasions in Hidalgo, Mexico, in the early 1970s. According to him, within one generation of greater commercialization, the cultural system of the old subsistence ethic broke down, including among many Nahua. Landed elites no longer understood Nahuatl, the language of local indigenous peasants, and eventually stopped helping them during economic crises, refusing to lend or rent land, offer pay advances, or even employment.

Both archival and historical ethnography would illuminate the context behind recent findings indicating intra-village conflict due to “individualist” attitudes, economic exploitation, and/or gender oppression. A better understanding of how vertical and horizontal mechanisms of rural solidarity change over time would avoid anachronistic generalizations. After all, moral economists did not argue that the bonds between patrons and clients or among villagers were without conflict. Rather, they argued that the old subsistence ethic comprised normative obligations intended to ensure survival during crises and that such norms are distinct from the quid pro quo exchanges typical of market relations. As several cooperative labor practices – such as the Andean minga or the Oaxacan tequio (collective work) – have survived into the twenty-first century, historical ethnography could explore whether
their subversion by labor markets contributes to protests. How do peasants respond when some refuse to participate in a minga or serve their community through tequio in times of need? While broader examples of various solidarity systems – like the fictitious kin relations known as compadrazco – have existed for centuries in Latin America, the empirical question that remains unanswered is whether the disintegration of solidarity bonds by market relations fuels political unrest.

In sum, recent peasant and indigenous-peasant movements in Latin America lend support to those moral economy claims that hold that peasants fight to preserve their livelihoods when capitalist expansion strips them of their land, or in any way threatens their subsistence by privatizing or polluting other natural resources. However, more research is still needed to illuminate whether the expansion of markets undoes the moral ties that normatively obligate better-off patrons to help poorer peasants in times of need and, if so, the degree to which such broken bonds fuel peasant protests.

Nationalist movements

HANK JOHNSTON

Nationalist movements are a subtype of social movement that make political, economic, and cultural claims based on definitions of a national group or “nation.” Like other movements, they can include individuals, small groups, formal organizations, and sometimes political parties, depending on their breadth of support and the kind of state in which they occur. Contemporary examples are numerous: the Quebecois nationalist movement against English Canadian governance, Scottish nationalist challenges in the UK, Irish nationalism in Northern Ireland, Palestinian nationalism in the West Bank and Gaza, Basque and Catalan nationalist parties in Spain, Tibetan and Uighur nationalism in China, and the numerous nationalist fronts – Estonian, Lithuanian, Armenian, Chechen, to name just a few – that challenged Russian dominance and contributed to the fall of the Soviet Union in the late 1980s and early 1990s. Nationalist movements can mobilize politically, culturally, and/or militarily in both democratic and nondemocratic states to challenge prevailing patterns of sovereignty, political representation, economic opportunities, civil rights, and resource distribution. A defining characteristic of most nationalist movements is a link between a collective national identity and claims of territorial sovereignty (Hechter 2000).

BASIC DEFINITIONS

Although the definitions of nationalism, a nationalist movement, an ethnic movement, and a national state are debated, it is generally accepted in the social sciences that “nation” does not refer to a state, as in member states of the United Nations, but rather to a large community of people with a common identity, of which a shared language, cultural patterns, and religion are usually the most basic elements. Other elements of a nation include attachment to a territory or region, common history, shared traditions, rituals, myths, and unifying symbols such as flags, anthems, and images. As such, nations refer to a people or an ethnic group, and are to be distinguished from states, which refer to the institutional political order (Smith 1976). Thus, the common term “nation-state” is technically incorrect in most instances because the vast majority of modern states are composed of several distinct ethnic-national groups. In many contemporary states, it is common that one ethnic-national group dominates political and economic institutions, which relegates other national groups to minority status (Connor 1972), raising the specter of interethnic conflict, which can sometimes be violent, and nationalist movements, which are embedded in contentious politics.

When one finds political and economic discrimination by the majority, strong cultural and linguistic patterns that congeal minority-national identity, plus perceived opportunities for making challenges against the state, the basic ingredients of nationalist mobilization are present. Structural and competition-based explanations of nationalist movements propose that the combination of economic, political, and – to a lesser extent – cultural grievances with national identity drives movement mobilization (Olzak 1992). In contrast, a “primordial” perspective holds that there is a social-psychological depth in ethnic-national identity and therefore it can be an especially potent basis of mobilization. Although social scientists recognize that many characteristics of national groupings are socially constructed or “imagined” (Anderson 1991), primary socialization by family, friends, and local communities with distinct cultural and linguistic traditions imparts elements of identity that are not easily foregone or forgotten, and can
be activated by leaders as political contexts open. Extreme formulations of the primordial perspective may draw upon vague biological and racial references, but these are widely rejected by the social sciences. Nevertheless, social-psychological research suggests that elements of ethnocentrism, cognition, conformity, and stereotyping help construct, confirm, and intensify national identification, making it plausible that there is a fundamental quality in national identification that needs to be part of the explanatory equation. Moreover, recent theoretical developments in the field of protest studies that stress emotional factors in mobilization further indicate this perspective.

NATIONALIST IDENTITY

While structural factors such as economic discrimination and lack of political access are often severe and long standing, and while there is good evidence of constructivist processes in national ideologies, a singular trait of nationalist movements is the passion associated with their mobilization. These strong emotions are partly based on social-psychological tendencies of ethnocentrism and stereotyping. Ethnocentrism contributes to high valuation of one’s own group and characteristics (Tajfel 1981). Also, there is a large body of research showing how the tendency to stereotype out-groups is a product of basic cognitive processes whereby complex realities are grouped and categorized to make them understandable, even when perception is faulty, unreliable, or limited. These are fundamental processes to how people think, define themselves, and define the groups they belong to. Thus, it is not uncommon that nationalist movements tap emotional responses among members, and may lead to violence. While interethnic violence often occurs outside the context of nationalist movements, many of the same emotions are present within them. The genocide in Rwanda was not part of a nationalist movement, but the ethnic cleansing in Sarajevo was. In a related vein, the genocide in Darfur represents a case where the state mobilized nationalist sentiments of the Arab majority in the north to oppose a regional ethnic-national minority’s claims of political autonomy in the south. Because modern states claim a monopoly on the means of violence, when they invoke majority national identities as justifications for mobilization, it is common that contention takes a violent turn. Regional nationalist movements must often take up arms to defend themselves. The volatility of nationalist identity and the emotions they invoke also make them susceptible to demagoguery and manipulation by leaders.

Examples of the strength of support and destabilizing influence that national movements can mobilize are numerous. The Soviet Union was torn apart by nationalist movements in its non-Russian republics. A nationalist movement split the state of Czechoslovakia in two. Native African nationalism in South Africa defeated apartheid. Nationalist movements in Serbia, Croatia, Slovenia, Bosnia, Kosovo, and Macedonia all chipped away at the former state of Yugoslavia with devastating results. Extreme Basque nationalism has motivated terrorist attacks in Spain for almost a half century. However, the emotions that drive the strength and intensity of these movements must be understood in terms of how they are channeled by structural factors such as political institutions and levels of repression, and by cultural factors, such as ideologies of nationalism, which vary in how they celebrate the in-group, condemn the out-group, and in how they emphasize and articulate claims and grievances.

NATIONALIST IDEOLOGIES

In cultural terms, nationalist movements are animated by ideologies of nationalism, which can occur either at the state level or at a regional level among members of ethnic minority groups. Nationalism is an ideology that appeared in the early nineteenth century as the modern, bureaucratic, and centralized
state began to take shape in Europe. Earlier, the inhabitants of Europe’s loosely federated states and empires had identities that were regional or local. State-building processes in the nineteenth century defined a broader national identity based on a common majority language and symbols that were crucial to waging war with national armies, centralizing state administrations, and legitimating the state’s increasing influence in local affairs. Because the emerging national states of nineteenth-century Europe were rarely ethnically homogeneous, creating a broad-based national identity that transcended regional and linguistic ones always held the potential of stimulating reactive minority-national identities. In this way, the development of nationalism at the state level paradoxically gave rise to ethnic nationalisms at the regional level, which often challenged the cultural, linguistic, and religious hegemony of the national majority group. It is not by chance, therefore, that shortly after new visions of the centralized national state diffused throughout Europe, encouraged by the French Revolution and the Napoleonic Wars, that the first wave of nationalist movements mobilized in 1848 against more traditional state forms such as the Hapsburg empire (Hroch 1985).

Reasons for this were that the anciens régimes did not reflect the national identities of the people within their borders. State elites were, in a sense, foreign rulers who demanded taxes but limited the rights and representation of minority-national groups. Also, regional national identities were encouraged by local cultural and political elites as a means to pursue their own interests. Similar processes were at work one hundred years later as indigenous elites animated anticolonial movements in Asia and Africa against foreign rule (Strang 1992).

OPPORTUNITIES AND THREATS

In structural terms, the openness of state institutions – for example, when minorities enjoy legal protections and access to channels of political representation – influences the trajectory and strategies of nationalist movements. In democratic states, it is common that nationalist movements pursue political party mobilization, plebiscites about regional autonomy, and cultural promotion. Movements here are composed of party organizations, nongovernmental organizations (NGOs), and citizen groups that freely operate. National identification may be strong among many citizens, but the availability of civil liberties and institutional political channels tends to undercut the attractiveness of nationalist movements as the main vehicle of interest articulation, paralleling a political opportunity explanation of protest (Eisinger 1973). In democracies, citizens balance a complex array of interests, claims, and grievances, as the pluralist model of crosscutting political allegiances would predict. Because of this, nationalist movements in the US are few and relatively weak. There were strands of Black, Chicano, and Indian nationalism in the 1960s and 1970s, but these were represented by relatively small groups pursuing cultural and/or extreme political demands within broader ethnic-based movements for civil rights and economic opportunities. In other developed democracies of the West, nationalist movements may become potent political forces, such as in Quebec, Scotland, Catalonia, and Euzkadi. State responsiveness to less extreme demands, as exemplified by widespread linguistic accommodation or the creation of regional political institutions, means that more extreme groups pursuing full political independence, are marginalized, rejected by most citizens in favor of the benefits of remaining within the existing state. Smaller nationalist movements in Western democracies, such as Welsh, Breton, Lombard, South Tyrolean, Corsican, and Sami, are weak for several reasons. Citizens with strong and animating national identities are few. The benefits that derive from state membership, especially when its policies encourage ethnic pluralism and affirmative action, may be considerable. Also, overall levels of ethnic discrimination may be relatively low,
nationalist movements – while perhaps not abundant – may be available within the existing state.

In nondemocratic states, it is common that institutional channels for expressing minority-national grievances are underdeveloped or nonexistent. Authoritarian regimes often attempt to preempt minority nationalism through policies intended to shift national expression into less threatening activities, and by repressing any attempt to mobilize outside of what is permitted. This was the case in the Soviet Union, where numerous ethnic-national republics were incorporated into a repressive political and economic system that was dominated by ethnic Russians. Russian citizens were encouraged to immigrate to other regions and were often favored in employment at the expense of the national minorities. These patterns have been called “internal colonialism” insofar as the dominant national group exploits the other national groups within state territory, paralleling the domination by colonial powers of foreign peoples (Hechter 1975). In the USSR, the communists attempted to placate nationalist demands by permitting the limited use of national languages and folkloric expressions of national identity, with “nationalist in form, socialist in content” as the guiding principle. The party recruited minority-national loyalists – often educated in Moscow – for top positions in the minority republics’ state and party structures. Combined with a police surveillance to stifle political opposition, nationalist movements were suppressed in the Soviet Union for much of its history, and only began to appear in the late 1980s when the communist regime began to liberalize and when economic crisis aggravated dissatisfaction with the center (Beisinger (2002)).

Research shows that when state repression is great, nationalist movements do not so much disappear as take other, less public forms – a development that can be said to reflect the depth of national identity. When it is strong, national identification can persist under the most adverse conditions, as in the cases of Tibet under the Chinese communists or Catalonia and the Basque region under the repressive Franco regime. Widespread use of a minority language seems to fortify national identity under repressive conditions, especially when state policy seeks to impose the dominant tongue, as in protests in Tibet in late 2010. Moreover, when national identity is strong, state repression and linguistic discrimination can drive nationalist movements underground and force nationalist expression to assume diffuse and duplicitous forms that escape police surveillance. Under repressive conditions, subtle acts of resistance, clandestine actions, and symbolic affirmations of identity keep nationalist resistance alive (Johnston 2006).

**NATIONALIST SECESSION**

Nationalist movements often seek to break away from the ruling state system and establish new, independent states based on the minority national identity. This is a secessionist form of nationalism. Secessionist goals are common where the minority nationalist community is large, regionally concentrated, and the state is seen as politically unresponsive and repressive of minority national rights (such as linguistic rights, as in Quebec). Also, the illegitimacy and vulnerability of the majority state are important factors in the opening of political opportunities for the mobilization of secessionist movements. Where states are weak, secessionist movements are more likely to be successful.

As mentioned, state boundaries fluctuate with wars and treaties, sometimes carving up a territory such that a national minority is ceded to an adjacent state made up of a different national group. When this occurs, especially when there is a strong historical memory of territory lost, irredentism (or revanchism, a synonym) is a common subtype of secessionist ideology. The national minority seeks to reattach to the old state, often aided by the neighboring state, or by groups and organizations within it, as in the case of support from the Republic of Ireland flowing to Sinn Féin in
Finally, movements for independence by colonized nations parallel secessionist movements in that they too seek separation from an ethnically (and racially) distinct state. Anti-colonial nationalist movements were common in the postwar period of the twentieth century as European powers, weakened by World War II, were challenged by national liberation fronts in Asia and Africa. Although colonial societies in Africa and Asia were often segmented and/or tribal, anticolonial nationalism was a powerful unifying ideology. As nationalist liberation movements gathered strength, they could sometimes gain the peaceful acquiescence of the colonial power to withdraw and grant independence. In other instances, long wars of independence had to be fought, as in Indochina, Algeria, and Angola.

The nationalist movements in the former Soviet republics were secessionist, although most started as movements demanding more democratic freedoms. While the Tibetan nationalist movement currently assumes a diffuse and clandestine form that only occasionally breaks the surface of public life, as mentioned above, many of its proponents do not seek to accommodate to Chinese rule but rather to resist it and ultimately secede from it. Because secessionist movements threaten the integrity of the state and the depletion of its territory and resources, they are almost always violently opposed by the state. For example, China is made up of 25 large ethnonational groups (having populations of over 500,000) and many more small ones. The communist regime has crushed Tibetan and Uighur nationalist protests when they occurred, unwilling to entertain any challenges to Han Chinese ethnic dominance. Folkloric expressions such as dance and music festivals may be permitted, but political mobilization is not.

The same logic operates in Russia, which is a patchwork of over a hundred national minorities, of which six have populations over a million. One of these, the Chechens, began to mobilize a strong nationalist movement in the early 1990s, which Russia deemed as a threat to its territorial integrity (Johnston 2008). Russia invaded Chechen territory to squelch secessionist claims, and, for years, the Chechens fought vastly superior Russian forces to a stalemate, twice forcing Russian withdrawals and winning de facto independence. Yet allowing one rebellion to succeed established an unwanted precedent and was a road on which Moscow was unwilling to travel. Ultimately, the Russian army crushed the Chechen insurgency and reincorporated the war-torn region into the Russian federation. Although estimates vary, a conservative figure for civilian deaths in the two Chechen wars is 200,000. Secessionist wars have been among the great tragedies of the last century (Gurr 2000). The nationalist claims of the Ibo people of Nigeria in great part precipitated the Nigerian civil war, 1967–1970, which claimed over two million lives. The secessionist war of East Pakistan in 1971 led to the creation of Bangladesh and caused the death of an estimated three million. In 1992–1995, the Bosnian war fueled the ethnic cleansing and genocide in which close to 100,000 are thought to have died, and over two million forced to flee from their homes.

GLOBAL PATTERNS

Recently, interest has grown in how nationalist movements develop in a globalizing context. Nationalist movements mobilize in state systems, which in turn are embedded in the expanding system of global economic integration and international regimes of human rights, indigenous rights, and rights of self-determination (Olzak 2006). The effects of globalization on nationalist movements occur in three interrelated patterns. First, the global diffusion of claims for national self-determination is fueled by the mobilization of other nationalist movements. This is
encouraged today by global communications technology, although the spread and clustering of nationalist claims were seen historically, first in the nationalist revolutions of 1848, and later, in Woodrow Wilson’s Fourteen Points in 1918 and the creation of new states in Eastern Europe. Second, globalization spreads a world culture that values human rights and civil liberties that encourage nationalist claims. These ideals are fostered by networks of activists in NGOs that promote the discourse of minority-national self-determination and justice. The availability of global-level channels of claim-making through NGO pressure on states opens political opportunities and encourages nationalist movements, not only in developed states but also less developed ones. There also seems to be a tendency of the global human rights regime to reduce violence in less democratic states (Olzak 2006). Finally, a trend in the late twentieth century has been the involvement of international multilateral institutions such as the UN, NATO, and the International Court of Justice (ICJ) in nationalist conflicts. For example, in 2008 Serbia called upon both the ICJ and the General Assembly of the UN to render Kosovo’s declaration of independence illegal. For their part, the Assembly of Kosovo referred to global regimes of human rights and self-determination as justification for its claim of secession from Serbia.

Occupy Wall Street movement
HEATHER GAUTNEY

Occupy Wall Street is an ongoing series of protests, initiated on September 17, 2011 in lower Manhattan’s financial district, against alarming trends in social inequality, high rates of home foreclosure and unemployment, and the excessive influence of corporate and financial interests on government. The protests attracted large numbers of participants and gained widespread international attention due to the movement’s broad appeal, to “the 99 percent,” and tenacious use of nonviolent protest against variably heavy-handed police response.

Occupy Wall Street began with roughly one hundred activists camped on a small stretch of concrete in downtown Manhattan known as Zuccotti Park. They chose the Park because of its unusual status as a privately held space, owned by Brookfield Office Properties. Unlike city parks, which have curfews, Zuccotti was available 24 hours a day to the general public as part of an exchange for increased air rights for a development project.

Within weeks of the initial occupation, “Occupy” camps emerged in nearly every major city in the US and abroad, then in small towns, universities, and other social institutions, spawning a massive “Occupy Together” network. These local manifestations were bound by a common theme: “The one thing we all have in common is that we are the 99% that will no longer tolerate the greed and corruption of the 1%.” The slogan is based on a well-known, yet staggering statistic, that a wealthy 1 percent of people in the US own roughly 40 percent of its wealth. Other markers of social inequality cited by the movement include: severe income disparities, education and health care inequality, uneven taxation, runaway debt, and downward trends in social mobility. The movement also associates the US debt crisis and recession with corporate irresponsibility and government deregulation, which enabled subprime lending and the US housing market crash. It is also critical of the government’s use of taxpayer funds to bail out the financial sector, which they see as greedy and corrupt.

The Occupy movement emerged amidst a wave of protest activity worldwide. In early 2011 millions converged in Egypt’s Tahrir Square, and throughout the Arab world, to fight political corruption and bring democracy to the region. In European cities, like Athens, Rome and London, rioting and violent forms of protest signaled widespread outrage over the loss of pensions, jobs, and social services, and a generalized crisis of legitimacy among their political leadership. In Spain, “May 15” or “15 m” protesters took to the streets against political corruption, unemployment, and austerity, calling themselves “the indignants.”

Prefiguring the US Occupy movement, 15 m activists established a giant campsite in Madrid’s Puerta del Sol in Madrid, which disbanded after two short months due to problems with police and local businesses.

Early that summer, small protest encampments appeared in the US, including “Walkerville” in Wisconsin, named after the “Hooverville” shantytowns of the Great Depression. Walkerville activists protested Governor Scott Walker’s Budget Repair Bill, which reduced social benefits like pensions and health insurance, and stripped public employees of their collective bargaining rights. Weeks later, New Yorkers Against Budget Cuts established a small camp called “Bloombergville” to protest Mayor Bloomberg’s proposed budget cuts and public employee layoffs, including 6000 teaching jobs. Shortly after the camp disbanded, a Vancouver-based magazine/activist network named “Adbusters” issued a call on
the Internet for a “Tahrir moment” in the financial district, urging activists to “set up tents, kitchens, peaceful barricades and occupy Wall Street.”

Days after the first tents appeared in Zuccotti, clashes between police and protesters drew massive media attention. Horrifying video of the NYPD pepper-spraying screaming young girls at point-blank range aired primetime on TV stations around the globe, inciting outrage and disgust. Bad turned worse when protesters marched across the Brooklyn Bridge, and a record-breaking 700 of them were trapped and arrested halfway.

Within weeks, Occupy Wall Street proliferated into a national phenomenon, as local Occupys emerged throughout the country, the largest in New York, Denver, and Los Angeles. On October 15, the movement officially went global, organizing a “Global Day of Rage” in which hundreds of thousands rallied in some 900 cities around the world, including 20,000 in New York’s Times Square. As local officials throughout the country attempted to clear the camps, violent confrontations ensued, including a major standoff in the city of Oakland in late October, in which police used projectiles and rubber bullets, critically injuring Iraq war veteran Scott Olsen. Days later, a citywide general strike brought some 30,000 protesters to the streets, and they effectively shut down the Port of Oakland.

A national wave of evictions followed in November, in which police cleared most Occupy camps, including the original site at Zuccotti Park. By then, Zuccotti had mushroomed into a booming tent city housing hundreds of people, with its own newspaper, the Occupy Wall Street Gazette, and a functional kitchen, media center, security apparatus, and “People’s Library.” Tens, perhaps even hundreds, of thousands visited the park, including celebrities like Katy Perry and Kanye West, among many others. The camp also hosted live concerts by David Crosby and Graham Nash, and, later, Jackson Browne. Tourist buses added Zuccotti to their regular routes, and large media conglomerates maintained a constant presence around the perimeter of the park.

During the evictions, thousands of nonviolent activists nationwide were arrested, totaling 5000 by early December. In many cases, including in New York, local officials authorized media blackouts and use of extreme force in clearing the camps. The People’s Library in Zuccotti, which consisted of over 5000 titles, was dumped in the trash by police.

Since the clearing of the camps, the movement has focused on more targeted and localized forms of occupation. Occupy Colleges, Occupy the Department of Education, Occupy our Homes, are just some examples of the countless places, institutions, people, and organizations the movement has tried to claim. Occupy Colleges made headlines in late November when police pepper-sprayed young college students sitting-in at the University of California at Davis. After video of the event was broadcast worldwide, a meme of the infamous “pepper-spray cop” went viral over the Internet and mainstream media, in which the image of Officer John Pike is seen dousing everything from the Constitution to Lady Liberty in pepper spray.

Social media, like Facebook and Twitter, helped elevate the UC Davis protests, and were crucial to the development of the Occupy movement overall. The cyberlife of the movement most likely involves an exponentially larger number of constituents than has been seen in the camps and demonstrations. Membership on the Occupy Wall Street Facebook page grew from a few hundred to hundreds of thousands within the first two months, in addition to the hundreds, if not thousands, of local “Occupy” Facebook pages that have surfaced. In addition to Facebook, Twitter is widely used for sharing news and events, among a vast network of millions of users. Mobile computer devices like the iPhone have enabled activists to virtually attend organizing meetings, regardless of their location, and coordinate street actions in real time.

The organization of the movement itself could be said to parallel the structure of
social media, in which umpteen users constitute a complex web of news, video, and personal communication. The “leaderless” or “horizontal” organization of Occupy has enabled groups from diverse kinds of organizations, like trade unions, third parties, and student groups, to participate in the movement without sacrificing their autonomy. It has also allowed for local specificity. Local Occupys organize rallies, demonstrations, and camp communities in their immediate locales, but remain linked by a common commitment to grassroots organizing, through the mechanism of the General Assembly.

The General Assembly, or “GA,” is the decision-making apparatus of the Occupy movement, open to all interested parties, and led by facilitators who rotate on a regular basis. Specific issues, such as media, outreach, people of color, direct action, and others were handled by working groups—also open and inclusive—that periodically reported back to the GA. Each Occupy has its own GA and set of working groups. Because of the large number of participants in New York, activists formed an additional assembly of working group delegates, called a spokescouncil, based on the grassroots organizational structures of the Global Justice Movement in the late 1990s.

Also deriving from Global Justice activism is the use of consensus process by spokescouncils and general assembly. All meeting participants are invited to join in decision-making processes and build consensus among the group for their ideas. Proposers must first explain and justify their ideas, then field questions and engage in a large-scale group discussion. Votes are cast via a system of hand signals and proposals are revised until a nine-tenths majority approves. Days after the first camp emerged in Zuccotti Park, a pamphlet on consensus process was made widely available in print and online. The movement argues that its grassroots processes can serve as a model for democratizing other social and political institutions.

One of the more controversial aspects of the Occupy movement regards its refusal to issue formal sets of demands. Various policy-related issues have been raised by different parts of the movement, including, but not limited to education, housing, and health care reform; environmental protection; and the development of alternative energy sources. The refusal to issue formal demands, however, is based on the movement’s belief that mainstream electoral channels have been corrupted by money and corporate interests. The term Occupy, or act of occupation, in part refers to processes in which people and groups take back, or take over, what they believe should be commonly held. This “do-it-yourself” form of activism involves circumventing mainstream political channels, which the movement believes are closed to them, and realizing their claims through direct action. Occupation also involves the long march of reform, but wants to transform existing institutions, like those in education or health care, into collectively managed apparatuses that can serve the interests of all stakeholders.

REFERENCES AND SUGGESTED READINGS

The Plowshares movement began in September 1980 when eight religious activists entered a General Electric (GE) plant outside Philadelphia, armed with hammers and bottles of blood. Inside the plant, they located the nuclear weapons that General Electric was developing. They hammered upon the weapons, poured blood, kneeled in prayer, and waited for security officers. When they were taken into custody, they released a press statement declaring “We commit civil disobedience at General Electric because this genocidal entity is the fifth leading producer of weaponry in the U.S. . . . In confronting GE, we choose to obey God’s law of life, rather than a corporate summons to death. Our beating of swords into plowshares is a way to enflesh this biblical call” (Berrigan 1987: 55, 65).

MOVEMENT STRATEGY

The GE Plowshares action was an expressive act of moral witness, reflecting the prophet Isaiah’s vision: “Nations shall beat their swords into plowshares and their spears into pruning hooks; one nation shall not raise the sword against another, nor shall they train for war again” (Isaiah 2:4). Yet there was also a strategic element to this campaign since the activists knew they would be arrested; this provided an opportunity to argue in court that nuclear weapons violate international laws that prohibit preparations for genocide. When their court date arrived, all eight stated that they were not guilty on two grounds. First, they were upholding the Nuremberg principle, which states that citizens have an obligation to resist their government if it is committing crimes against humanity. Second, they based their innocence on the “necessity defense,” which allows citizens to break a law when imminent danger is present and all normal channels of addressing the threat have proven ineffective. The jury was not persuaded by their defense and the judge imposed prison sentences ranging from 18 months to 10 years (Laffin 2003).

These long prison sentences were designed to deter others from following the activists’ example. But it did not work. Within months, more Plowshares actions had occurred. Within a few years, the movement expanded overseas. Between 1980 and 2006, roughly 50 Plowshares campaigns took place in the United States and dozens more have happened in Great Britain, Germany, the Netherlands, Sweden, the Republic of Ireland, and Australia (Nepstad 2008).

MOVEMENT BACKGROUND AND INFLUENCES

The Plowshares movement was deeply influenced by earlier Catholic movements against war, particularly the Catholic Worker movement. Under the leadership of Dorothy Day and Peter Maurin, Catholic Workers combined direct action campaigns with traditional works of mercy – such as providing food and shelter for the destitute. During the Vietnam War, numerous Catholic Workers were imprisoned for burning their draft cards. Subsequently, a group of radical Catholics plotted ways to shift the antiwar movement from protest to resistance. One of these Catholics was Philip Berrigan, a Josephite priest. He called upon activists to obstruct the US government’s capacity to wage war. Toward that end, in October 1967, he and three others entered Baltimore’s Selective Service office, grabbed conscription files, and doused them with blood. While they awaited trial, they planned another draft board raid. This time, Philip Berrigan was joined by his brother, Jesuit priest Daniel Berrigan, and seven others. Over the next several years, dozens
of draft board raids occurred throughout the United States.

After the Berrigans served prison terms for the draft board raids, they wanted to apply the same dramatic tactics to the escalating arms race. Yet they knew that few could survive the consequences of such high-cost activism without a support system that could provide moral encouragement and assistance with family responsibilities. Hence they began building faith-based communities devoted to war resistance. Philip Berrigan and fellow activist Elizabeth McAlister established a commune in Baltimore in 1973 named Jonah House. One Jonah House resident, John Schuchert, proposed the idea of a plowshares action after attending vigils at the Philadelphia-area GE plant. Convinced that they had to obstruct the production of genocidal weaponry, he realized that activists could enter the GE plant with small hammers concealed in their coat pockets. Such an action would symbolize the prophecy of beating swords into plowshares. Eventually, eight individuals – including Philip and Daniel Berrigan – decided to implement Schuchert’s idea, thereby launching the Plowshares movement (Nepstad 2008).

MOVEMENT LONGEVITY

Over time, leaders devised various techniques to sustain the Plowshares movement. One way that they have successfully recruited and retained activists has been through the development of a theology of resistance that justifies these tactics as part of the biblical prophetic tradition. A second technique has been to provide a strong commune-based support system that offers assistance with emotional, material, and family needs, thereby enabling individuals to overcome the obstacles to high-risk activism. Thus, despite the serious costs associated with Plowshares activism – including prison sentences as long as 18 years – the movement has shown remarkable longevity, persisting for more than three decades.

Politics of grief and grieving “mothers” movements

HELENA FLAM

Recently social movement research has opened to the idea that emotions are important to collective action. Social movements challenge emotions, such as loyalty, gratitude, or love, that cement society, and reinforce the established institutions and relations of domination. They also redirect (empathy, anger, loyalty), weaken (fear, in-group animosities), convert (shame into anger) or intensify (anger with the opponent, in-group solidarity) the emotions of their members to sustain the momentum, help win over accidental onlookers and deal with movement opponents (Flam & King 2005). An entire spectrum of emotions in various constellations plays a role in social movement mobilization, internal dynamics, and demise. Of these solidarity, shame, anger, pride, and fear receive most attention.

Grief – whether contemporaneous and real, remembered or anticipated/imagined – should also be acknowledged as an emotion mobilizing for collective action, even though this mobilization may be apolitical. The grieving mothers’ movements are energized by grief. They make an issue of the disappeared or murdered political activists, or – potential or real – victimized military recruits, endangered deserters, missing, maimed, or killed soldiers.

Grief is a composite, “flip-flop emotion” or an emotion with typical derivatives – either way it is complex. Individual mothers when on their own strongly differ in how they react to the death, “disappearance,” or maltreatment of their children: (1) they may experience shock, disorientation, or panic; (2) their grief may be combined with a number of feelings such as pain, despair, guilt, anger, helplessness, melancholy, insecurity, anxiety, fear, hope; (3) in terms of actual conduct, they may become either paralyzed and depressed or overactive, either withdrawn or outgoing, either extremely anxious or calm.

Grief can mobilize for politicized collective action. In the early 1980s the German Democratic Republic (GDR) introduced the unisex military draft. It was anticipated or imagined past grief that led a few young East German female dissidents to dress in black and attempt to cross a central square in East Berlin to post their protest letter to the GDR leaders. They were brutally arrested, but once freed they established Women for Peace. The Israeli Women in Black, who since 1988 have held weekly vigils against the Israeli occupation of the Palestine territories, have also either imagined or experienced in person the grief of women losing “their men” in war. Their vigils sometimes include Palestinian women, and they sympathize with their losses as well. Mobilized Latin American mothers said they were grieving not only their losses but also “the insecurity and future of [their] children and grandchildren” (Schirmer 1989: 21).

Grief does not guarantee politicized collective action. The apolitical commemorative practices of some rural Russian grieving mothers just like those of their Nicaraguan or Chilean counterparts underline this point. Mothers who come together in recognition of their mutual grief may wish to quietly remember their disappeared or fallen sons or act on grief’s energizing elements/derivatives such as defiance, anger, hate, and/or hope in relationship to their opponent(s). If – as Western experts claim – grief indeed involves denial of the loss, the wish to reverse it, and find somebody to blame, then these particular grief-particles show elective affinity with politicized collective action.

Grieving mothers themselves stress that as a shared emotion grief can be said to evoke immediate mutual understanding/empathy and accelerated bonding among those affected.
politics of grief and grieving “mothers” movements

by it (Vidal in Schirmer 1989: 18; Shatan in Schirmer 1989: 23; Oushakine 2009: 222, 254–258; Jagudina 2009: 35–47). It helps to underwrite a long-term commitment to each other, shared collective pain, thoughts, actions, and goals. It thus creates a stability necessary but insufficient to reconfigure the world. The extent of reconfiguration or reframing seems predicated mainly upon internal group dynamics, although the type of losses suffered, the national myths, and the changing legal-political context also play a role.

Grief is not a just a matter of rhetoric. The politics of grief – that is, the conflicting discourses that aim to define whether or not it is legitimate and to set down the when-who-how of grief as well as its intensity and duration – do have an emotion as an ultimate experiential basis.

Mothers’ movements make a bid for respect, if their societies bestow it on the figure of a mother. Catholicism elevates the mother of Jesus, Mary, to a saint, and – in the Pietà – glorifies her devotion and pensive commiseration with the sacrifice of his life for mankind in the name of/for his father. Nationalism venerates mothers, claiming both woman’s reproductive powers and her sacrifice of her son(s) for the national collective in wars. Both reduce woman to the sacrificial, apolitical, and asexual mother role. In exchange for acquiescence these ideologies offer veneration. Authoritarian regimes often rely both on intensified nationalism and religion for legitimation – they valorize motherhood and traditional family values (Schirmer 1989: 4–5, 25–26). Grieving mothers play on this venerated, sacred mother figure for greater legitimacy.

The case of the pioneering Las Madres de Plaza de Mayo in Buenos Aires, Argentina – the first 14 mothers marched on April 13, 1977 – cautions against equating claim to an elevated and protected status with its automatic acquisition. The authoritarian Argentinian junta and bystanders initially dismissed the “grieving mothers” as “las locas” (the crazy ones). (Most power-holders at first ridicule mother-activists; in Israel Knesset members referred to Mothers against Silence as “the merry women of Dizengoff St” or “hysterical women.”) Civic courage, shown by mothers’ decision to stage public collective action in repressive regimes, their long-term commitment and perseverance despite arrests, killings, and disappearances decimating their own as yet modest ranks, their growing numbers, and Western support are among the factors necessary to insure their elevated and protected status.

SOLDIERS’ MOTHERS

Women’s antiwar protest can take sexualized forms. In Aristophanes’ Lysistrata, women grieving over many “sons of Athens” lost in the Peloponnesian War, were moved by their remembered or anticipated grief (“we bear sons who go off to fight far away” and “instead of enjoying the pleasures of love and making the best of our youth and beauty, we are left to languish far from our husbands, who are all with the army… our girls growing old in lonely grief”) to go on a sex strike against the war. A recent antiwar sex strike took place in Kenya in May of 2009.

Rather than mobilizing women as sexual beings, in 1870 American writer and philosopher Julia Ward Howe tried to establish a mothers’ day as a day of protest against the war. She wrote “Mother’s Day Proclamation” as a wife and mother, evoking women’s grief, condemning war-related bestialization of men, and calling for an international women’s congress to establish peace. Her Austrian counterpart Bertha von Suttner wrote a very influential book, Lay Down Your Arms, in 1889 in which she showed war caused pain and suffering from a women’s perspective. She became a major pacifist animating many peace groups and congresses.

Although women pacifists had their own organizations within the American, British, and German women’s movements, they did not play a central role, as shown by their modest
numbers but also the fact that only a minority did not give up their antiwar stand when their countries engaged in World War I.

It is unclear to what extent contemporary non-Western movements are aware of these predecessors. The Russian and Nicaraguan soldiers’ mothers movements illustrate their vastly differing activities and typical cleavage lines dividing such movements: apolitical and politicized, urban and rural, dissenting and collaborating groups or activity phases.

Generation after generation of Nicaraguan women have been losing their sons and husbands in (civil) wars. The first Nicaraguan mothers’ organization was formed out of concern for welfare issues but also as a response to Anastasio Somoza Debayle’s strategy of using disappearances of young activists to unsettle and terrorize Nicaraguan society. When the Sandinistas came to power, the organization changed its name to the Mothers of Heroes and Martyrs (Bayard de Volo 2004). These mothers’ grief was encouraged, honoured, and harnessed to the Sandinista cause. When the Sandinistas came to power, the organization changed its name to the Mothers of Heroes and Martyrs (Bayard de Volo 2004). These mothers’ grief was encouraged, honoured, and harnessed to the Sandinista cause. When the Sandinistas began sending out military draft commissions across the country, in one town mothers actually staged a mass blockade which rendered recruiters powerless. From 1980 to 1984 Mothers Against the Draft mobilized to boycott such recruitment efforts. Anticipating that the real grief of mothers whose sons died while in the Sandinista army would turn into hatred of the Sandinista regime, the Mothers of Heroes and Martyrs visited newly bereaved mothers – either ahead of or with their bodies – to stand by them, but also to turn their grief, resentment, and anger against Somoza and the Contras rather than the Sandinista regime. A decade later, in the reconciliation phase, the Association of Mothers and Relatives of the Kidnapped and Disappeared gathered mothers whose grief about their disappeared children had been marginalized and forgotten (Tully 1995).

In the Soviet Union and, later, Russia, women have been pushed into the roles of the asexual Soviet worker, patriotic-militaristic, self-sacrificing Mother Russia, primitive apolitical “baba,” or sweet and caring “babushka.” Encouraged in the early 1980s by the pro-reform military upset about skyrocketing peacetime suicides related to extreme hazing, women who refused to be pushed into these acquiescent roles cooperated with draft commissions to abolish the worst abuses. Similarly, highly educated students’ mothers from big cities mobilized against unfair and corrupt draft practices no longer exempting students. They petitioned, lobbied, and staged vigils and demonstrations for reforms. The first soldiers’ mothers organization, the Committee of Soldiers’ Mothers (CSM), was set up in 1989; by early 2000 it claimed 300 regional committees and 2500 activists (Jagudina 2009: 163–180). These provided legal counsel and practical help to deserters, young men trying to avoid conscription, new recruits trying to escape life-threatening dangers of peer harassment and premature battle. In the late 1980s and early 1990s dissenting urban mothers broke the silence about the secret draft criteria, the hazing system, corruption, cruelty, and mass starvation leading to desertion, suicides, and non-combat deaths among soldiers. They also supported reformers pushing for a voluntary army and sat on an investigative presidential commission.

In 1989 the Soviet troops withdrew from Afghanistan. In 1994 they invaded Chechnya. That year CSM was the first Russian organization to issue an antiwar statement. Mobilized mothers protested against the war, organizing marches to find missing soldiers and reclaim their sons. In 1995 300 women walked from Moscow to Grozny in a March of Maternal Compassion. The activists also picketed the Duma (lower house of the Russian parliament), went on hunger strike, and wrote 110 appeals to grant amnesty to runaways, evaders, and captive soldiers. In 1998–1999 they mobilized for amnesty and in 1999–2000, when the Russian army invaded Chechnya again, they mobilized against the war. After terrorist bombings in Russian cities, nationalism and militarism intensified, compelling
soldiers’ mothers to invest in organizational consolidation and networking, while pressing for lists of the wounded, dead, and disappeared as well as for respectful treatment of their bodies. CSM claim to represent 4 million soldiers and sailors, and 8 million parents. In 2004 they infuriated Russian authorities when they initiated peace talks with exiled Chechen fighters. In the same year the United People’s Party of Soldiers’ Mothers was established with the aim of pushing through military reforms.

Rural soldiers’ mothers sometimes assisted in the daily work of the draft boards and military administration, and helped the impoverished parents of fallen soldiers to claim their rights to financial compensation, medical care, and discounts on state-provided utilities, but they have remained apolitical and poor, focused on initiating, co-shaping, and carrying out commemorative – more or less public – actions (Jagudina 2009; Oushakine 2009: 212–218). While the urban soldiers’ mothers cheered when in 1988 Gorbachev condemned the war in Afghanistan as a grave mistake, rural mothers reeled at this turnabout which deprived the deaths of their sons of any sense or dignity – their concern was to ensure that they would be remembered as heroes, while their own “unnoticed grief and ignored pain” (Oushakine 2009: 219) would resurface in personal narratives, social networks, and public space (Jagudina 2009: 172; Oushakine 2009: 208, 211). For most this was the only way to claim social and symbolic significance.

The Palestinian mothers of “martyrs” constitute a contrasting case. They are under massive lay and religious pressure to seem euphoric upon hearing that their children – as suicide bombers, terrorists killed in action, or children accidentally killed by a roaming bomb – turned “heroes” upon their deaths. While they are in a state of shock and despair, they are denied the right to cry openly. Instead they are urged to “ululate” in celebration as well as to prepare a joyful feast (Shalhoub-Kevorkian 2003: 392). In a society in which religious, patriarchal, and political pressures combine with the low veneration of mothers, it is unrealistic to expect either individual or collective expressions of grief.

Mothers of the disappeared

“Forced disappearance” may include abduction, torture, secret imprisonment and murder. It became the primary instrument of the governments in Guatemala, beginning in 1966; Chile beginning in late 1973; and Argentina after March 1976. . . .over 90,000 people have disappeared in Latin America [by the end of the 1980s]. . . .secret and anonymous disappearances give no evidence and provide no identification of either the victim or the perpetrator. . . .victims or relatives. . . .are meant to suffer silently. . . .alone. The victim is denied martyrdom; those left behind are prohibited the final ritual of bereavement. . . .(Amnesty International in Schirmer 1989: 5)

Because it is not absolutely certain that the people who have been arrested or kidnapped are dead, there remains hope, with many relatives translating . . . uncertainty into . . . protest . . . publicly . . . chronic mourners. . . . refuse to allow themselves and their relatives to be forgotten. (Schirmer 1989: 25, emphasis added.)

In several Latin American countries mainly female, mostly apolitical, relatives of the disappeared entered the public arena to break the silence about the disappearances employed by the authoritarian states as a means of political repression. They demanded information about the fate of the disappeared, countered open defamation of the victims as terrorists, subversives, or traitors and pressed for “the truth” about those responsible for state terror. Later they also tried to debunk the derisive and accusing statements attributing blame for disappearances and killings to mothers and wives (Schirmer 1989: 20, 25). They usually started as just a few, and in a few years were joined by thousands of demonstrators and activists. While demonstrating, they carried photos or placards of their relatives, flowers, or lit candles, wore white scarves or t-shirts with their names, blocked traffic, made noise with musical instruments, spread leaflets, went on hunger strikes (e.g., the Long Hunger Strike in Chile in 1978)
or chained themselves to or entered government buildings, and travelled to Western organizations and selected Latin American countries to testify. They continued their rounds of police stations, hospitals, prisons, detention centers, morgues, and cemeteries, but also petitioned governments, asked police for information, and politicians for interviews, and presented writs of habeas corpus to the national supreme courts. They also started documenting cases of disappearance based on the testimonies of relatives and witnesses, and turned into experts on human rights. When the first mass graves were discovered, they – as was the case in Chile in 1979 – staged long marches to hold masses there, and/or responded like the Argentinian mothers, leaving no doubt about their priorities: “we don’t want a tomb to cry at, we want to know who was responsible and we want them in prison” (Fischer in Howe 2006: 46).

Even when repressive authoritarian regimes later acknowledged the women’s right to feel pain about the disappearance or murder of their relatives, they demanded its individual and private, not public, expression. After trying silencing by repression, several tried to buy silence with laws offering financial compensation or benefits. Typically, once the authoritarian regime was replaced by a democratic one or put on democratic feathers, even when freshly uncovered mass graves turned the pain of uncertainty into grief over losses brought about by certain politically motivated killings, political leaders still refused to acknowledge and take responsibility for state terror. They dismissed disappearances as cases of personal deviance or domestic problems for which they blamed mothers and wives. Even when they recognized disappearances and killings as political, they approved or applied amnesties. Governments either outright refused to or procrastinated in setting up investigative commissions and prosecuting the guilty, leaving the military and security forces unscathed. Under the pressure of grieving mothers and other human rights organizations, with great reluctance some finally gave in, but half-heartedly or falsifying evidence, adding insult to injury and injustice. Just like the previous authoritarian leaders, their more democratic successors wanted to silence the mobilized women. With time, hope turned into “disappointment and growing cynicism with the legal apparatus” (Schirmer 1989: 20).

Even when forced to recognize the extent of political killings, the new political leaders called for forgetting the past and urged moving on in the name of reconciliation and national unity. Those mobilized mothers who refused to heed these calls, although accused of hindering the democratic processes, continue until today what they had done all along: “present themselves to the public as . . . chronic mourners who refuse to allow themselves and their relatives to be forgotten” (Schirmer 1989: 25).

Official discourses and rituals of reconciliation frame and privilege modes of bereavement desired by the state, the military, and the media, while they negate the experiences of the tens of thousands of people who endured or opposed human rights abuses. They close public spaces to the calls for justice and the justified expressions of rage.

Against the official forgetting the Madres de Plaza de Mayo continue their weekly marches, which remind anybody willing to look that 30,000 persons are still unaccounted for. They have been at it for 33 years. They still wear white headscarves and move silently around. Their headscarves symbolize both their solidarity and diapers. Some mothers stitched into their scarves the names of their disappeared children and the date when they disappeared. Others carry their pictures. Many need a stick to be able to walk.

In Chile, set against the military pretense of having always stood the guardian of the nation, the constrained state commemorations, investigations, and official memory sites, aggravated by the alienating media spectacle of remembering, both apolitical and politicized collective gatherings serve to “[r]eclaim . . . discursive and symbolic space for individual and collective mourning” (Grunebaum 2002: 309). Although they do not involve just mothers, perhaps because these are now freed from the
pressure to act on their own, they convey a clear message: not all, but some “orphans of regime transition” do not allow the official politics of mourning to make them relinquish their rage, their sense of betrayal, and their painful memories of the past. Their commemorative ceremonies may be a private event during which a few family members and ex-fellow-prisoners first circle a crypt of a young man, who first “disappeared” and was later found dead, then listen to a quiet mass (Frazier 1999: 105, 110–112). Alternatively they may entail human rights activists returning to the now empty mass grave in a prison camp, praying or crying for justice, and honouring the dead. The subversion of official memory may take yet another form – of an energetic, politicized funeral procession complete with politicians, human rights activists, and journalists, banners and signs, chanting and marching, and determination not to forget that there were mass killings and no “war” during the junta regime.

All the examples cited here show that grieving mothers and (post-)authoritarian political regimes as a rule engage in conflicts about the general legitimacy of expressing grief and the particular forms its expression should take. The activists, local authorities, politicians, and the media fight or negotiate with each other over: (1) the proper sphere (private or public) for expressing; (2) the intensity and medium of expressing (quiet dignified through loud to ridiculously bombastic); (3) the site for expressing (central, peripheral; city square, special walls, halls, monuments etc., mass grave, cemetery, community rooms, own apartment); (4) the form of expressing (private vs. collective vs. state rituals, monuments, museums, archives); and (5) the symbols for expressing grief (personalized, such as photos; collective, such as black dresses, logo T-shirts, white scarves, or self-made photo and recollection albums; or politicized, top-down regime-signifiers such as war monuments). Conflicts and negotiations, and even evasion, also determine (6) the caretaker responsibilities, that is, who is in charge of expressing grief.

Postcommunism and social movements
ONDŘEJ CÍSAR

Social movements in the postcommunist world are generally believed to be underdeveloped and weak. Given that various social movements and their organizations form a standard group of collective political actors in the established democracies nowadays, one might even wonder whether the extant regimes in postcommunist East Central Europe can at all claim to be real democracies. In terms of political mobilization, they seem to be miles away from the Western social movement societies, defined by the presence of capable, institutionalized, and professionalized activist organizations (Meyer & Tarrow 1998). Going beyond the East/West dichotomy, this entry presents a more complex picture of postcommunist social movement activism.

Although communist regimes were based on a particular form of forced and ritualized collective action, such as May 1 marches, through which the citizens periodically manifested their support for the regimes, independent and officially recognized social movements did not exist in nondemocratic settings. In order to demonstrate their loyalty, citizens participated in official state-controlled organizations, which were sometimes able to provide those involved with a limited room for quasi-independent activity at their margins (Fagan 2004).

Although some individuals took part in antiregime dissident collective action, with the notable exception of Poland (the Solidarity movement), it never became a mass-based phenomenon in communist regimes. Generally, collective action and social movement activity were expropriated by the communist regimes, which ideologically identified their origins in the working class movement of the nineteenth and early twentieth centuries. Rhetorically, communist regimes even supported some of the Western-based new social movements, such as peace and feminist movements, since they claimed the movements’ goals were consistent with the official communist regimes’ anticapitalist and anti-imperialist agenda.

The conditions for the independent existence of social movements were created only after the fall of the communist regimes in 1989. In a nutshell, as part of the precarious democratization process the new regimes opened up and sometimes unwittingly provided a wide range of social movement organizations with opportunities for political action. However, despite the opening opportunities, the overall level of citizen engagement and participation in social movements remained very low in postcommunist Europe (Howard 2003). There are at least two reasons for this low level of engagement.

First, since the old regimes identified with and were based on a ritualized version of political mobilization and activism, collective action continued to be viewed as part of communism even after its fall. And although antiregime collective mobilization was understood as a legitimate way of political expression when it was aimed at the nondemocratic regimes, it suddenly started to be seen as illegitimate after the old regimes had successfully been toppled. In general, collective action and protest did not belong to the democratic polity, which was supposed to be based on regular elections only. To put it bluntly, the “specter of Joseph Schumpeter” has been haunting postcommunist Europe since then: while protest is the way to face the nondemocratic regime, it is no way to address political problems under the conditions of democracy. According to this understanding, protest is the indication of a nondemocratic problem, not a part of a standard democratic solution (see also Saxonberg 2003).

Second, as many commentators point out, political freedoms acquired in the new
democratic regimes were not viewed as an opportunity to finally express genuine social needs, but as an opportunity not to participate at all. For postcommunist citizens, freedom literally meant the liberal notion of “freedom from politics,” not a republican concept of freedom to “take part in politics.” The result was general nonparticipation and social movements weakness, which according to Western observers equals to political apathy, cynicism, and alienation from politics on the part of postcommunist citizenry.

FOUR TYPES OF POSTCOMMUNIST ACTIVISM

However, there is at least one exception to this rule, namely trade unions, which enjoyed mass participation under communism, and maintained their relatively participatory character even after its fall. Hence, although political activism in postcommunist Europe is generally defined by low levels of individual participation, this activist type is mostly based on membership organizations, albeit their membership has steadily declined since 1989. Their functioning logic is path-dependent, since these organizations inherited mass membership from the pre-1989 period, either in the form of officially existing regime-controlled organizations or in the form of mass movement against the communist regime (the Solidarity movement in Poland). This participatory activism can be seen as the first type of postcommunist social movement activism.

Compared to other types of social movement activism (see below), the participatory one organizes fewer collective action events, since it relies on formalized and conventional interaction with the political system. Trade unions are integrated in the policy process through institutionalized channels such as tripartite institutions, which were emulated in postcommunist Europe after the West European model. However, according to some researchers, they failed to incorporate genuine working-class interests and only helped the postcommunist political elite to tame trade unions. According to this diagnosis, unions were thus effectively disabled in their effort to advocate the needs of employees severely affected by postcommunist transformation hardships (Ost 2000).

This trade union participatory activism is based on relatively broad membership. The union organizations are thus able to mobilize many people in protest activities in the streets once they opt for protest strategies. In terms of action repertoire, this activist form is characterized by a reliance on a limited number of standard nonviolent strategies such as the petition, demonstration, and strike, which is particularly important for this type. New “cultural” strategies associated primarily with the new social movements, such as performances or happenings, are not utilized very often. The dominant category of demands for this activist form constitutes economic claims and demands concerned with public policies. Participatory activism is clearly materialist in its orientation (Ekiert & Kubik 2001). Drawing on their inherited membership base, trade unions mostly rely on membership contributions: the prevailing mechanism of resource access is individual aggregation. Among other postcommunist social movements, they are a notable exception in this respect, which is due to their roots in pre-1989 organizations.

While most existing studies equate generally low postcommunist participation with weak civil societies and nonexistent social movements, a small, yet growing, body of literature challenges the skeptical account by pointing out a peculiar nonparticipatory activist type, so-called transactional activism, apparently characteristic of postcommunist countries, which is overlooked by those who focus on individual participation only (Petрова & Tarrow 2007; Cisař 2010). Transactional activism, based predominantly on small advocacy organizations in sectors such as the environment and women’s and human rights, is foreign-assistance driven. Transactional activist organizations have derived their resources mainly from external agencies, via patronage.
In the first half of the 1990s, these organizations were supported by American and European state and nonstate actors; since the end of the 1990s European Union (EU) funds have become the most important source of funding. Among the most active supporters of civil society in postcommunist Europe were US-based private foundations, such as the Rockefeller Brothers Fund, Charles Stewart Mott Foundation, Andrew W. Mellon Foundation, Atlantic Philanthropies, Catherine T. MacArthur Foundation, and, most important among them, the network of Soros’s Open Society Fund. Apart from private foundations, projects funded by USAID and individual European states were in operation in the region in the 1990s. Also, one of the important sources of funding was the EC/EU program Phare. The Phare program was originally designed to assist postcommunist countries with economic transformation and political reforms; later on the mission changed to helping the accession countries to get ready for EU membership (Mendelson & Glenn 2002). With the EU membership of postcommunist countries approaching (postcommunist countries of East Central Europe became full EU members in 2004), EU funds assumed a much greater role.

Put more concretely, “Americanization” of postcommunist social movement organizations (SMOs) was replaced by “Europeanization,” which further deepened the trends already introduced in the early 1990s, namely their institutionalization, organization capacity building, bureaucratization, and professionalization (Fagan 2005; Čísař & Vrábková 2010). Most environmental and women’s and human rights organizations and movements presently receive some form of international, often EU, funding. And the dependence on international funding has made it possible for these organizations to survive organizationally, even without the need to mobilize resources from individual members and/or supporters, which would be a nearly impossible task in the postcommunist situation of politically rather disinterested populations. In other words, international funding created the conditions for the model previously labeled in the context of US politics as “advocates without members” (Skocpol 2004) to develop in postcommunist Europe as well.

When defining transactional activism, Petrova and Tarrow (2007: 79) underscore the capacity of this activist type to network and establish “ties—enduring and temporary—among organized nonstate actors and between them and political parties, power holders, and other institutions.” The presence of this type among postcommunist organizations demonstrates that even though the local organizations generally display low levels of organizational membership, they are able to engage in advocacy-based activism and interorganizational networking. In fact, they substitute for their lack of mobilization capacity by transactional capacity building.

Although data is not available for all postcommunist countries, this activist type seems to account for most of the protest events sponsored by SMOs. As for the size of membership and collective action, transactional SMOs are unable to mobilize a wide following. Their organizations are often based on a couple of dedicated activists and their protests are attended by dozens or hundreds of individuals at the most. In terms of action repertoire, transactional activists employ a somewhat wider portfolio of strategies than the previous category. While they very often resort to nonviolent demonstration and petitioning, they also utilize “cultural” strategies, such as performance, exhibition, and festival.

Issues associated with ecology and the environment, animal rights, and human and civic rights and freedoms are usually the basis of the transactional activists’ political demands. Transactional activists do not articulate economic demands; on the contrary, they display clearly postmaterialist orientation in the structure of their claims. Importantly, in some postcommunist countries these demands surpassed their materialist counterparts. While
Ekiert & Kubik (2001) found, in the beginning of the 1990s, almost no “postmaterialist” demands commonly associated with the new social movements in Poland, these demands, counted as the sum of environmental and human-rights-related claims, constituted one-third of all demands in the Czech Republic, 1993–2005 (see Císař 2010).

Radicalism is a third type of social movement activism that has developed in postcommunist Europe. While the mainstream SMOs display a clearly diversified portfolio of strategies, which indicates that they do not rely on extra-institutional direct action only, radicals engage almost exclusively in demonstrations and direct action. In other words, this difference makes it obvious that radicals remain an extra-institutional political force. Both radical Left movements, which are interested in radical change of the capitalist economy, and radical Right and nationalist organizations, which attack the fundamentals of the present liberal state such as minority rights (e.g., homosexuals in Poland; Roma in Slovakia, Czech Republic, and Hungary), fall into this category of activism. This activist form is based on decentralized activist networks and organizational efforts of individual activists. Radical activists mobilize even fewer individuals than transactional activists, since their demands usually fall outside what is generally regarded as socially acceptable. In postcommunist settings, this concerns especially radical Left organizations, which are unable to get any resonance for their anticapitalist demands discredited by the former communist regimes. On the other hand, radical Right associations, especially racist and nationalist ones, seem to have greater resonance in the postcommunist world (e.g., Hungary, Poland, but also other states).

Compared to the other activist types, the radical strategic repertoire includes a relatively large number of violent direct actions. Radical activist demands often concern issues of national security (radical Right) and foreign policy (radical Left). Both radical Left and Right convene on the criticism of international institutions, especially the EU. However, the two ideologically different camps usually clash in conflicts over other issues. These groups strive to maintain their independence by being dependent on sources generated by their own means. These are, most notably, volunteering, individual contributions, revenues from journal sales, and benefit performances. In other words, they derive their sources via self-production.

For radicals, more than for other activist types, it is not only availability, but also perceived il/legitimacy that determines what counts as a resource. A particular funding method is not understood instrumentally so much as it is seen as an important part of their political expression. From this vantage point, the collective identity of a group is not only defined by its program and demands but also by how the group supports itself. Its collective identity is defined not only by what the group wants to get, but also by how it wants to get it. In the words of a radical Left activist, “independent thinking requires independent money.” As a result, radical activists’ budgets remain comparatively very small.

Civic self-organization, consisting of collective action mobilized without the involvement of an organization or a group, constitutes the fourth type of activism in postcommunist societies. This type seems a somewhat surprising form of collective action capacity among postcommunist citizens and partially questions the skeptical diagnoses of the state of postcommunist civil society based on individual level data on nonparticipation. The important presence of this seemingly organization-independent and often episodic collective action has been demonstrated in the Czech Republic, Slovakia, and Bulgaria. Collective mobilizations of this type tend to be numerous and at the same time small in size. The action repertoire seems to be dominated by petition and nonviolent demonstration, and the portfolio of self-organizations’ claims is quite varied.

As the events in this category take place without direct involvement of organizations and platforms, financial start-up costs are limited.
These costs typically can be derived from the pockets of those directly involved in the action. Dedicated individuals, probably experienced in social and/or political organizing, are a condition for this type of activism to take place. On the other hand, organizers might be individuals temporarily mobilized by some “precipitating event” who would suddenly find themselves in a position to (co-)organize some type of protest.

Social movement and citizen activism in postcommunist Europe cannot be fully captured by a single concept, such as a nonparticipatory or advocacy activism, alone. The pattern of political activism is diverse, including at least four different ways by which political activists organize and express their grievances. At the same time, available research demonstrates the relative importance of transactional activism among other activist forms. This particular type of activism shows that although large numbers of individuals do not politically participate in the postcommunist countries, a stratum of relatively effective policy advocates has nevertheless developed in the region after the fall of communism. Even if there is no individual participation on the micro level, there is a lot of action on the organizational level. In this respect, postcommunist social movements seem to resemble their contemporary counterparts in established democracies, which no longer seem to rely on mass-based contentious action either, more than one might expect (see Meyer & Tarrow 1998; Sampson et al. 2005).

QCA and fuzzy set applications to social movement research

CHARLES C. RAGIN and ALESIA ALEXANDROVNA SEDZIAKA

Much of social life is routine and highly repetitive. Social actors appear to be either constrained by norms or driven by the pursuit of mundane self-interest. For this reason, many social scientists are drawn to the study of non-routine events, especially those that are large scale and collective in nature. Of special interest are events that are culturally, historically, or politically significant in some way – big events that stand out as qualitative departures from the stream of everyday social life. The extreme case of departure from routine is the social revolution, where there is a concerted, collective effort not only to topple an existing state but also to reshape the social order. Of course, social revolutions are rare, as are “mere” political revolutions. Fortunately, however, many of the analytic attractions of revolutions are also present in the study of social movements and other forms of collective action. In many respects, such phenomena provide the opportunity to study large-scale social change in embryonic form.

It is not only their qualitative nature – the fact that they represent significant departures from and challenges to routine social life – that draws the attention of social scientists to social movements and related phenomena. Another feature that makes them an important object of inquiry is that the conditions for their realization are often topographical in nature. That is, for these phenomena to occur at all, a number of conditions typically must be met or satisfied in some way. It is useful to think of these conjunctions of conditions as “causal recipes.” If any one of the essential ingredients is lacking, then the outcome (e.g., collective action of some sort) may not occur or may fail in some other way. To complicate matters a bit, there are often multiple recipes – different combinations of conditions – linked to the same general outcome. A central goal of research on social movements and collective action is to unravel the relevant causal recipes and to specify their various ingredients.

This interest in studying the “causal recipes” linked to “qualitative outcomes” dovetails with key features of qualitative comparative analysis (QCA), an analytic technique first introduced in the late 1980s (Ragin 1987, 2000, 2008). QCA builds on the logic of qualitative, case-oriented research as it is practiced in comparative sociology and comparative politics. Typically, scholars in these fields examine only a few cases at a time, but their analyses are both intensive – addressing many aspects of cases – and integrative – examining how the different parts of each case fit together, both contextually and historically. By formalizing the logic of this type of analysis, QCA makes it possible to bring some of the empirical intensity of qualitative approaches to studies that embrace more than a handful of cases. QCA uses set-theoretic methods of comparison, representing each case as a combination of causal and outcome conditions. These combinations can be compared with each other as configurations and then logically simplified through a bottom-up process of paired comparison. Computer algorithms developed by electrical engineers in the 1950s provide techniques for simplifying this type of evidence. The data matrix is reformulated as a “truth table” and then logically simplified. These procedures mimic case-oriented comparative methods but accomplish the most cognitively demanding task – making multiple comparisons of case configurations – through computer algorithms. The goal of QCA is to summarize – in a logical, shorthand manner – the information in a truth table regarding the
different combinations of conditions linked to a specific outcome.

The affinity between QCA and the study of social movements is apparent in the fact that many of the first applications of QCA involved phenomena related to social movements. In The Comparative Method (1987), for example, Ragin offers two such applications: the comparative study of ethnic political mobilization among linguistic minorities in Western Europe and a reanalysis of Stein Rokkan’s study of the conditions linked to schisms in working-class movements. Fuzzy-Set Social Science (Ragin 2000) presents a detailed set-theoretic analysis of the condition linked to mass protest against austerity measures demanded of debtor countries by the International Monetary Fund. Another example: Ragin (1995) reanalyzes data from William Gamson’s The Strategy of Social Protest, focusing on the different causal recipes linked to the success of challenging groups in their efforts to secure new advantages for their constituents.

QCA has been adopted by a variety of social movement researchers and applied to a wide array of social movement topics. The remainder of this entry highlights a few of these efforts.

Amenta, Carruthers, and Zylan (1992), for example, use QCA to identify the conditions that allow social movements to win positive outcomes for their constituents. They examine the implications of the Townsend Movement for old-age policies and movement acceptance in the US and argue that political context mediates the influence of organization and strategic action on movement success. They suggest that undemocratic political systems and patronage-based political parties, bureaucracies, and political coalitions as well as movement organization and action all interact in various ways, culminating in different outcomes across states. Their findings indicate that political structures in the form of extensive voting rights and open parties are essential conditions for achieving higher public pensions and that these conditions combine with organization and allies in different ways across the states. In a subsequent publication, Amenta, Caren, and Olasky (2005) elaborate political mediation theory showing that movement strategies are effective in some contexts, but not in others. For example, radical policy change requires favorable political conditions in combination with mobilization and assertive action. The authors use QCA to examine the role of movement mobilization and strategy in the generosity of old-age assistance programs across states. They find that little other than mobilization is needed for success in open polities, while assertive strategies must be used when circumstances are less favorable.

Cress and Snow (1996, 2000) use QCA to study the viability and outcomes of 15 social movement organizations for the homeless in eight US cities. Their analysis demonstrates the ways in which organizational, tactical, political mediation and framing factors combine to produce different outcomes (representation, resources, rights, and relief for the homeless). The study of successful SMOs highlights the importance of how well organizations articulate problems and targets of blame as well as courses of action. Cress and Snow (2000) find that viable organizations and well-articulated frames are essential conditions for SMO impact and that they produce significant outcomes in conjunction with disruptive tactics and sympathetic allies or the absence of disruption in responsive cities. In another study of SMOs for the homeless, Cress and Snow (1996) use QCA to assess the role of resources for organizational viability. They show that combinations of specific types of resources (leadership, information, and space for meeting) may be more important than their quantity and that external resources are essential for the mobilization of poor people’s movements.

McAdam et al. (2010) use fuzzy sets and QCA to study the mobilization of opposition against large infrastructure projects in developing countries. They identify combinations of causal conditions (including measures of threat, opportunity, resources, prior conflict, and host country compensation) that are linked to differences in community opposition to 11
oil and gas pipeline projects in 16 countries. They find that, among communities at risk for mobilization, environmental and social threats posed by a project are sufficient to trigger conflict. However, Western funding of projects and public consultation serve as necessary political opportunities that grant opponents access to projects and encourage high levels of contention. Interestingly, determined groups and individuals were able to organize without significant resources or prior movement activity. The authors suggest that threat and opportunity consistently work together to shape resistance to infrastructure projects.

Fuzzy-set QCA has also been applied to the study of the emergence and persistence of activism (Hagan & Hansford-Bowles 2005). The authors examine activism among the youth who moved to Canada in opposition to the Vietnam War and formed antiwar resistance. They are interested in multiple paths leading to initial activism and also to further movement involvement. The comparative analysis facilitates an examination of a diverse respondent-driven sample (as opposed to a random sample) and the analysis of individual cases as wholes. The findings indicate that the causal processes differ for initial and persistent activism, and that they also differ by gender. Pre-existing activist networks do not appear important in decisions about migration, but figure prominently in subsequent movement involvement. The experience of mutual help is an essential and transformative condition that accounts for the change from individual to collectively organized antiwar resistance. Women’s involvement in later activism is greater due to continuing ties to resisters and preimmigration experiences, while men’s activism is conditioned by leftist political attitudes and postimmigration activities.

Applications of QCA are also found in the study of unions, the labor movement, and resistance. Dixon, Roscigno, and Hodson (2004) explore the joint effect of union organization and worker solidarity on strike action. They find that the independent presence of either unions or solidarity does not lead to collective action. Rather, it is the combination of these conditions that produces outcomes – unions facilitate strikes where workers are already interconnected. QCA allows researchers to directly address this combinatorial argument. Brown and Boswell (1995) examine patterns of interracial strikebreaking and solidarity in the Great Steel Strike of 1919. They apply QCA to 16 cities involved in the strike and find that a split labor market was a necessary but not sufficient condition for black strikebreaking. The influx of minority migrants was mediated by government repressiveness and union strength. These findings support the authors’ call for the consideration of political context in accounts of racial conflict.

Wickham-Crowley applies QCA in his work on guerrillas and revolution in Latin America to suggest that multiple conditions advanced by competing theories may be responsible for the success and failure of revolutions (1993: ch. 12). He shows that guerrilla movements secured sustained peasant support under a variety of circumstances. He then suggests that multiple theories of revolutions can be integrated. Ultimately, guerrilla uprisings, peasant and worker support for guerrilla movements, guerrilla military strength, and loss of support from the US combined to produce revolutions while several paths led to failures. These conditions appear to be interrelated in that peasant support is, for example, dependent on the presence of guerrilla uprisings, while US aid to a regime is dependent on internal political dynamics.

The common thread running through these diverse applications of QCA is their concern for causal complexity. With QCA it is possible to address causal complexity even when the number of cases is modest. The key is that QCA applies techniques of configurational comparison that mimic the logic of case-oriented comparative investigation. This emphasis on identifying configurations of conditions facilitates the linking of cross-case comparative analysis with case narratives.

This selective review of applications of QCA in the study of social movements highlights
only a few studies. For other applications to social movements including such topics as union growth, strikes, human rights movements, environmental conflict and others, consult the bibliography of QCA applications at the web site Compass (2012).

REFERENCES AND SUGGESTED READINGS

The Red Army Faction (RAF) was a terrorist group that was active in the Federal Republic of Germany from 1970 until its dissolution in 1998. It saw itself as an urban guerilla group. But, following Walter Laqueur’s distinction between guerillas and terrorism (1977a, 1977b), it is better characterized as a terrorist organization.

The RAF came into being in 1970, in parallel with communist groups that were offspring of the Extra-Parliamentary Opposition (Ausser-parlamentarische Opposition or APO). The group did not garner appreciable support among the German public. The group’s ideology may be characterized as anti-imperialist, anti-Zionist, and nationalist-revolutionary. Without assistance from the German Democratic Republic’s Ministry for State Security (the MfS or “Stasi”), the RAF would not have lasted as long as 1998.

Following the death of Benno Ohnesorg, a student who was killed by a policeman in West Berlin on June 2, 1967, and after April 11, 1968, when a laborer fired shots at Rudi Dutschke, the best-known spokesman for the student movement, different circles within the APO began talking about armed struggle. Rudi Dutschke himself had introduced the concept of the urban guerilla into radical discussions in 1967. Later he came to regard the notion as no-win and reactionary.

In 1969 a group centered around Dieter Kunzelmann traveled to Jordan for military training. This grouping gave birth in 1972 to the June 2 Movement. In 1970 a group centered around Horst Mahler, Ulrike Meinhof, Gudrun Ensslin, and Andreas Baader traveled to Jordan, where it also went through military training. This group called itself the RAF. The Revolutionary Cells (Revolutionären Zellen or RZ) emerged out of a group centered around the former chair of the Frankfurt SDS (Sozialistischer Deutscher Studentenbund or Socialist German Student Union), Karl-Dietrich Wolff. In 1973 the RZ cells began to call attention to themselves with violent assaults. Karl-Dietrich Wolff remained in publishing.

All three groups attempted to ward each other off, even as they exchanged ideas and members with each other. They all saw themselves as anti-imperialist, and they maintained ties (still not well analyzed) to international terrorism. There is still no integrated history of all three groupings, but scholarly research today is at work piecing together previously existing accounts.

Thus far, researchers have distinguished three generations of the RAF. The group centered around Baader, Meinhof, and Ensslin got its bearings from the 1969 *Minimanual of the Urban Guerilla* by Carlos Marighella, and built up an infrastructure using money and weapons that were obtained in holdups. In the summer of 1972 this group launched a wave of attacks on American military installations, German police stations, and the Springer publishing conglomerate. Shortly afterward, most members of this group were captured and incarcerated.

From inside prison, the members of the RAF attempted to use an information system, supported by some of their lawyers, to construct a successor group for the purpose of demanding and obtaining their release from jail. They even succeeded in building this network through a 145-day hunger strike, from mid-September 1974 through the beginning of March 1975, and an accompanying publicity campaign against their terms of imprisonment, which they characterized as “isolation torture.” The accusation of torture, which was largely erroneous, elicited widespread sympathy in
liberal circles and Western Europe. One of the founding members of the RAF, Holger Meins, starved himself to death. He died on November 9, 1974 and his death became a beacon to the second generation. Different infrastructures for this successor generation emerged, though some were destroyed in their incipient stages.

Under new leadership, initially of the RAF attorney Siegfried Haag and later of Brigitte Mohnhaupt (who had already been imprisoned for several years owing to her support for the RAF, and who was able to confer with Baader and Ensslin in jail before she herself was released), the RAF now attempted using different assaults as a means of extortion to spring their figureheads from the group’s first generation out of jail. In 1977 one of the group’s commandos kidnapped Hanns-Martin Schleyer, and, in order to intensify the pressure, a commando from the Popular Front for the Liberation of Palestine (PFLP) hijacked a Lufthansa passenger airplane. The hostage takers demanded the release of their jailed companions.

The federal government did not negotiate. A special commando of the Federal Border Guard liberated the passengers on the Lufthansa airline. Andreas Baader, Gudrun Ensslin, and Jan-Carl Raspe killed themselves when they recognized that the effort to extort their release had failed. Irmgard Möller wounded herself critically in a suicide attempt but survived. Baader, Ensslin, and Raspe made their suicides look like murder so that the state would be unmasked as fascistic.

Many details of the history of the RAF and of left-wing terrorism in Germany remain unexplained, since the terrorists who were subsequently jailed and indicted did nothing to help clarify the story. The justice system was dependent on circumstantial evidence and not infrequently content with having the accused sentenced because they were members or supporters of a criminal organization. Intelligence reports on the history and structure of international terrorism are frequently not accessible. So far the most profound investigations have come from journalists.

The RAF did not disband until 1998. The June 2 Movement had merged with the RAF in 1980. Little is known about the third generation of the RAF. Members of the RZ, who were active as weapons procurers for the RAF before the establishment of the Revolutionary Cells as an independent group, acted within this network more or less as hired killers for the PFLP and for the terrorist Carlos the Jackal.

Above and beyond the many unexplained substantive historical details concerning left-wing terrorist groups, how they are assessed remains highly controversial among political scientists and sociologists. Thus, for example, Jan Phillip Reemtsma (2007) has provided a good deal of solid evidence allowing him to raise the question of whether left-wing terrorist groups in the Federal Republic should even be regarded as a political phenomenon, or whether they are better characterized as something closer to gangs of failed criminals of the kind described in Dostoyevsky’s 1873 novel *Demons*. Undoubtedly the most ambitious attempt at a sociological interpretation was advanced by Norbert Elias (1997). He argues that left-wing terrorism in Japan, Italy, and Germany should be seen as a delayed outcome of the history of the former Axis powers, countries in which the ideas of civilization and of the state’s monopoly on the legitimate use of force were traditionally highly contested. The history and structure of the RAF, the June 2 Movement, and the RZ are also subject to controversy because their founders were activists during the sociocultural upheaval of the 1960s. To this day in the Federal Republic, the emancipatory or retrograde elements of this upheaval are evaluated in highly different ways. Some scholars regard the RAF as the logical result of the ideas of 1968. For others it merely seems the result of decomposition in the many different motifs of this predominantly youthful upheaval.

Religion and social movements
GENE BURNS and FRED KNISS

This entry summarizes some of the central foci in the literature on religion’s role in social movements. These include the study of social movements that found new religions; social movements within existing religious organizations (here organizations are broadly defined to include organized religious traditions); and the state context of religious movements, focusing especially on religion–state relationships. (The more common term is “church–state” relationships, but “religion–state” avoids using a specifically Christian term for a concept that applies to multiple religious traditions.) The entry concludes with a discussion of some of the theoretical questions that emerge from an overview of these different issues.

SOCIAL MOVEMENTS THAT FOUND NEW RELIGIONS

Most of what we now recognize as major “world religions” began as social movements, though not necessarily political movements. Certainly early Christianity and the Protestant Reformation are two prime examples.

The US seems to have been especially fertile ground for religious innovation. An influential explanation uses an economic metaphor: Immigration patterns combined with the constitutional disestablishment of religion in the US produced a vibrant “free market” for religious movements (Warner 1993). Innovative “producers” attempt to appeal successfully to “consumers” and “market niches,” some of which involve social spaces for groups and activities that might be unpopular in the larger society. However, there is some debate about whether the resulting voluntarism in American religion ultimately supports or threatens the social status quo (Warner 1993; Emerson & Smith 2000).

Much as the social movements of the 1960s spurred the development of resource mobilization and a rejection of Durkheimian approaches, a parallel process occurred within the sociology of religion in response to countercultural and utopian experiments of the time that took a more explicitly spiritual or religious turn. The study of “new religious movements” (NRMs), an alternative term to the pejorative label of “cults,” became a recognized literature in its own right. Stark and Bainbridge offered a rational action-based theory of the motivations, commitment, and organization involved in NRMs that shaped much of the ensuing work (Snow & Phillips 1980; Stark & Bainbridge 1985).

SOCIAL MOVEMENTS WITHIN RELIGIOUS ORGANIZATIONS

Historically schisms, especially common within Protestantism, have been a central source of change within religious organizations. However, more recent sociological research has emphasized the diversity and conflict that occurs within denominations and other religious groups as a normal matter of course.

A given religious tradition can host quite diverse political possibilities. In the US, white Evangelical Protestantism, currently associated with sexual and political conservatism, has in other contexts fueled populist activism for social and political equality. White Evangelicals were, for instance, a prime base of support for economic populist and antiimperialist William Jennings Bryan, the presidential candidate of the Democratic Party in 1896, 1900, and 1908. Indeed, until the 1980s, white Evangelicals were a solid voting bloc for the Democratic Party, but they now lean heavily Republican (due to both changing racial and religious politics).
Given that religious groups’ internal cleavages often parallel external controversies, it is not surprising that contemporary analyses of intrareligious movements find issues of identity politics central to debates within religious traditions. For example, the place of women in the public realm (Chaves 1997) and the moral status of sexual orientation has to a great extent been argued within the churches. There is division within the US population as a whole, so that antigay political organizations have become important even as American public opinion slowly liberalizes in its tolerance of homosexuality. A similar, indeed wider, gulf has grown between the American Catholic population and the Roman hierarchy. The laity is also much more liberal on abortion than is the Catholic hierarchy (Dillon 1999). Sexual issues have also been divisive in Protestant denominations, such as the Southern Baptists. Struggles over the legitimacy of tolerance of homosexuality and abortion within Baptist theology, for instance, have remade the Southern Baptists in the wake of an intense organizational struggle over such issues (Ammerman 1990).

But religious opinion at times leads rather than follows public opinion as a whole. The US pro-life movement began as an almost entirely Catholic movement even though it is not the case that the average American Catholic is reliably pro-life. The movement took on a new dimension, however, with the rise of the Christian Right, including such right-wing organizations as the Moral Majority, the Christian Coalition, and Focus on the Family. These have drawn particular strength from white conservative evangelicals, especially in the South (Wilcox & Larson 2006).

While many American social movements have had a strong religious component, most religious adherents in the US typically do not connect their religion with political causes. Even when they do, sitting in the same congregation may be one person who interprets the faith in a right-wing direction, and another in a left-wing direction (e.g., Dillon 1999). In contemporary America, while levels of religious participation do correlate with levels of sexual conservatism, for the most part religious behavior and religious affiliation do not predict political ideology well (Williams 1997).

Thus, for instance, the Metropolitan Community Church is a pro-gay rights church founded about 40 years ago by a Southern charismatic minister within Pentecostal Protestantism, a religious tradition that has usually been antigay (Warner 1995). While the church is now more theologically diverse and arguably has achieved mainstream status, similar studies of gender politics have shown that even apparently very traditional, patriarchal religious ideology can be used by some women in incipiently feminist directions.

Not necessarily political in the standard sense, religious innovation within immigrant groups has been of increasing interest in the US. The 1965 overhaul of US immigration law, ending strict quotas that heavily favored European immigration, has dramatically increased the quantity and quality of religious and ethnic diversity especially in urban areas, but increasingly in small-town and rural areas as well. Latin America and Asia have become the primary sources of US immigration; these immigrants are probably more religious and more Christian than are the populations of their countries of origin. They also bring with them a different cultural context for religion than that of Americans of European and African origins. Once transplanted, even otherwise conservative religious ideas and organizations can easily become the basis for mobilization in defense of cultural identities or in promoting religious/cultural/ethnic revitalization. Various case studies of immigrant religion have documented this movement-like quality of transplanted religion (Warner & Wittner 1998). In some European Muslim communities, adoption of explicitly Muslim cultural markers, especially the headscarf for women, has been a defensive reaction against hostility to immigrants and especially Muslim immigrants. While many secular Europeans see the headscarf as a stubborn refusal to assimilate and leave traditional religion behind,
some women in immigrant communities have adopted the headscarf only after arriving in Europe.

A particularly complex set of religious phenomena has been labeled “fundamentalism,” an umbrella term encompassing a variety of religious ideas and movements. Usually “fundamentalism” (Marty & Appleby 1994–2004) is applied to groups with an explicit emphasis on patriarchal gender roles and on a political agenda involving the uncompromising application of religious morality in a way that more established, mainstream groups find objectionable. The term has been applied disparately to the Christian Right in the US, Islamic political movements that are involved in international conflicts (such as al-Qaeda, Hezbollah, and Hamas), puritanical Islamic theological movements (such as Wahhabism), Hindu nationalism in India, and some orthodox Jewish groups, among other religious communities and movements. Those within the movements frequently claim to be guarding the true faith, but they typically are selective in their emphases and interpretations of religious tradition and include political causes that reflect contemporary agendas (Snow & Byrd 2007). The idea, for instance, that Islam required theocracy was hardly a long-standing position within Iranian Shia Islam before the Iranian Revolution of 1979; similarly, the Christian Right’s support for low taxes or for Israeli military policy have hardly been traditional positions among its main constituency, white Evangelical Christians. It is important to remember that tradition is often invented.

The examples listed above include groups (such as the Christian Right and al-Qaeda) that would see each other very much as enemies. The term “fundamentalism” is broadly enough applied that it includes, for instance, the dominant form of Islam in Saudi Arabia (Wahhabism), favored by a ruling regime that sees itself as an adversary of some anti-Western Islamic fundamentalist movements. The term, “fundamentalism,” then, is used widely and at times a bit vaguely. Scholars have sometimes too easily accepted the rhetoric of their subjects that all such movements really are a return to some long-held religious “fundamentals.”

Still, the discussion of “fundamentalism” has been an important attempt to understand the apparent power of politicized religion in recent decades. To lay as well as scholarly observers, it was striking indeed that the Christian Right and the Iranian Revolution burst upon the scene within a few years of each other. While these were hardly twin phenomena, it may well be that the so-called “new religious right” and other fundamentalist movements around the world were responding to the same globalization processes and socioeconomic strains of late capitalism that were engendering the various new religious movements. Wuthnow (1983) suggests that the political activists of the religious right walked through a door that had been opened by the countercultural left and its new religious movements. That is, the new left and the counterculture had re-legitimized the role of moral discourse in the public arena. Many of the criticisms of racial inequality and the Vietnam War during the 1960s (and, later, the Watergate scandals) were expressed in religious or moral language. And the Democrats, after all, were the first to elect a “born again” president, Jimmy Carter.

A comparison of class dynamics of different religious movements suggests that the term “fundamentalism,” while too vaguely and broadly applied, might still capture something real about a phenomenon that crosses borders. Many of those attracted to new religious movements (discussed above) are from middle- and upper-class backgrounds, and are often well-educated members of the “new class” of information and service professionals characteristic of late capitalism (Snow & Machalek 1984). Both NRMs and fundamentalist movements blur the boundary between public and private; fundamentalist movements, however, are more likely to appeal to classes that are underprivileged in the new global political economy. This may be less true of US Protestant fundamentalists, who as a group have been upwardly mobile economically since their beginning in the early twentieth century. But,
in general, they continue to come from less educated backgrounds (Wuthnow 1988), and thus are less likely to benefit from the growing dominance of the “new class.” There are also other exceptions, as sociologists have noted that fundamentalism sometimes has appeal for highly educated immigrants.

Similarly, the worldwide spread of Pentecostalism suggests that religious growth is correlated with class dynamics but in complex ways that vary from country to country. Pentecostalism is spirit-filled Christianity, involving, for instance, faith healing and speaking in tongues. In some countries, Pentecostalism appeals primarily to the middle class, while in others it appeals primarily to underprivileged classes. Among the reasons Pentecostalism may be appealing is that it builds a sense of trust among its adherents by enforcing a strict moral code and by providing a shared, intense religious experience. When popular among business people, trustworthiness may encourage commercial relationships; when popular in shantytowns, residents may be better prepared to act collectively to meet basic needs and challenge criminal elements or unresponsive governments.

RELIGION AS A FACILITATOR FOR OTHER SOCIAL MOVEMENTS

One common approach to the relationship between religious organizational dynamics and broader social movements assumes that there is not much distinctive about religious versus other motivations for social movement participation because religion can be a source of organizational resources in the same way that professional or political organizations, or social networks, can provide organizational resources. Morris’s (1984) study of the role of Southern black churches in the civil rights movement is a now-classic work in this tradition. Another prominent example is Christian Smith’s (1991) account of liberation theology in Latin America. Particularly Catholic ideas did matter (much as religious charisma mattered in Morris’s discussion of black churches), but more significant in the growth of liberation theology was that a minority of left-wing bishops effectively utilized the organizational possibilities within the Catholic Church. Similarly, in a study of the US Central American peace movement, Smith (1996) emphasizes the organizational resources provided by religion and its usefulness for framing tasks and maintaining commitment in the course of the movement.

While religious organizational resources can be central to building a social or political movement, in other cases, religious identities can be important because they include a sense of trust and loyalty, as well as provide a sense of “us” vs. “them.” For instance, Ian Paisley built a hard-line Protestant political movement in Northern Ireland after first building a new Evangelical denomination, the Free Presbyterians. He also contrasted his religious and political beliefs to those of more moderate Protestants who wanted partly to accommodate Catholics. Paisley convinced his followers that such moderates would secularize Northern Irish society, so that Protestant religious identity would no longer be a defining feature of Northern Ireland (Bruce 2007). The organizational resources of the Free Presbyterian Church mattered, as did the fact that its followers were disproportionately rural and far from prosperous. But the denomination was highly decentralized, so that resources could not be marshaled easily for political causes. It was instead the social solidarity of religious loyalties that mattered most.

A typical “commonsense” view of religion, appearing often in journalistic accounts of religious politics, suggests that a given religion has a certain set of beliefs that all its members share, and that members try to shape the world in the direction that their beliefs mandate. Such a view regularly informs news media accounts of the role of religion in politics, when, for instance, journalists assume that Catholics are particularly opposed to abortion. It also informs many academic analyses, especially outside sociology, such as Huntington’s (1996) “clash of civilizations” argument. Huntington
argued that, with the fall of Soviet-dominated communism in the late 1980s, world conflict would increasingly take the form of clashes among parts of the world with different cultural heritages, rooted primarily in religious differences. And so Huntington speaks of a Western civilization rooted in Protestantism and Roman Catholicism, an Orthodox civilization where Orthodox Christianity has been the dominant religion (a region overlapping considerably with the Soviet Union and its satellite states), an Islamic civilization in North Africa and the Middle East, and so forth. Proponents of Huntington’s argument would, for example, point to conflicts between the West and Muslim fundamentalist movements. But from such a perspective it is difficult to understand internal conflict within a purported civilization, for instance, the fact that such Muslim movements are often at odds with their own states, and the fact that the Iraq War was quite unpopular in the West. Nor does the perspective help us understand much about why religious movements – from NRMs to religious battles over sexual morality to battles over the religious or secular identity of states – are so prevalent. This cultural consensus approach has trouble explaining religious change and internal diversity in general. To take one example from Huntington’s own work, he asserts that the world went from 22 such monolithic cultures to 6 in about a century but offers no explanation of how or why such autonomous cultures can merge, change, or disappear.

A more subtle twist on this approach is Hunter’s (1991) culture wars thesis, which has been the basis of extended debate and critique (Williams 1997). Unlike Huntington, Hunter emphasizes cultural conflict within societies, but like Huntington he sees religious cultures as central. Explicitly citing Durkheim, he argues that the US has two large, mostly internally consistent cultures driving debate over many contemporary social issues. One is based more on traditional religious moral objectivism and the other moral relativism and situationalism, in both religious and secular forms. Hunter’s argument is more sophisticated than Huntington’s in that it specifically builds upon an understanding of religious change and innovation, drawing upon Wuthnow’s (1988) discussion of the breakdown of denominational identities. In Hunter’s view, the weakening of denominational division allows for cross-denominational alliances based on shared religious worldview and values that transcend religious particularities. It is not accidental that the term “culture war,” far from being a merely academic concept, has been invoked by American politicians and journalists in discussing debates over abortion, homosexuality, secularism, and religion–state relations.

In contrast to such cultural consensus perspectives, framing arguments take religious ideas seriously but focus on the way that particular religious interpretations are relevant to a particular historical context and a particular set of political opportunities. Such arguments usually build upon resource mobilization and political process models to understand how religion becomes part of a movement but see religious frames as essential to the nature and potential effectiveness of social movements in inspiring activists and connecting to a larger base of support (Smith 1991, 1996; Burns 2005).

THE CONTEXT OF RELIGION–STATE RELATIONSHIPS

Although often not made explicit, the question of religion–state relationships is central to understanding religion’s impact on other social movements. As noted earlier, what is often dubbed the “new paradigm” (Warner 1993) in the study of US religion, in contrast to the European secularization paradigm, assumes that the constitutional disestablishment of religion has been central to the diverse paths US religion has taken. That secularization paradigm (e.g., Bruce 2002) also assumes that the religion–state relationship is central but expects disestablishment to lead, in the long run, to the weakening of religious fervor.
Religion and Social Movements

The importance of religion-state relationships becomes especially clear in a comparative context. There are numerous examples of social revolutions or social and political movements, most notably in France and Mexico, with strong anticlerical components directed against an established Catholic Church, or, in the case of Turkey, established Islam. However, in cases where the old regime is perceived to be an enemy of popular religion, as in Iran, revolutionary movements can build upon religious sympathies. But even in a liberal state, there is variety in how much the regime controls religion, from largely forcing it out of public affairs—as has been more true in France—to giving religion a high degree of autonomy, as has been more true in the US.

Theoretical Directions

As implied earlier, the dominant approach in US sociology of religion is skeptical of assumptions that people sharing a religious affiliation mostly share the same beliefs and values. The dominant approach is amenable to Swidler’s (1986) view of culture as a “tool kit” rather than an overarching and internally consistent system of meaning. Thus a given religious tradition includes various ideas that can be used, like tools, to build and adjust multiple social projects.

But among the trickier questions in this “tool kit” approach is how and why a group reaches for one tool rather than another in a particular situation. Further, under what circumstances are new tools acquired, and when are longstanding tools abandoned? The answer surely lies in looking at how religion and culture interact with other social influences and constraints, but developing a systematic understanding of those interactions is no small matter. Framing studies, discussed above, have been one attempt to understand these interactions.

From a different perspective, Beckford (1985) has argued that NRMs involve new identity constructions in response to the decline of old national, ethnic, or religious identities under late capitalism and globalization. The new social movements research, though developed mostly separately from the sociology of religion, includes similar emphases. For instance, research on new social movements in Europe highlights their dependence on informal networks of people who share common countercultural values in opposition to previously dominant forms of identity (such as nation or race) (Kriesi 1988).

Emerson and Smith’s (2000) discussion of how white Evangelicals face race relations in the US is an interesting case of the difficulty in understanding why one “tool” rather than another is popular with a particular group at a particular time. Emerson and Smith argue that there have been genuine attempts by white Evangelicals to reach across the racial divide and address racial injustice, but the theological emphasis on one’s individual relationship to Jesus has channeled the white Evangelical antiracist mobilization away from consideration of systemic or structural racism. And so they plausibly argue that some interaction between race and religion must explain the curious empirical reality that black and white Evangelicals diverge more sharply in their attitudes on racial justice than do blacks and whites as a whole.

And yet it remains unclear why evangelical beliefs per se would have this effect, as they assert: Why would the same evangelical beliefs push blacks towards a more structural view and whites toward a version of “laissez-faire racism” (Tranby & Hartmann 2008)? Here we refer to the view that racial inequality is not an important policy concern but is at most a matter for individuals to address by making race irrelevant, rather than figuring out whether there might be structural reasons racial inequality persists.

Taking a quite different approach to understanding how and when people translate religious commitments into support for political and social movements, Munson (2008) focuses on a different level of analysis, that of individual biography. He argues that his ethnographic data demonstrate that involvement in
The pro-life movement often begins not upon any prior ideological commitment but upon whether individuals come into contact with the movement during “turning points” in their lives when they become “biographically available” for movement activity, initiated through personal contacts that can even be somewhat accidental. Such turning points would include going to college or suddenly having an empty nest. Munson argues that becoming clearly involved in a pro-life religious community often follows, rather than precedes, becoming active in the movement.

Kubik’s (1994) and Zubrzycki’s (2006) studies of the role of Catholics in the politics and national identity of Poland, much like Smith’s (1991) study of Latin American liberation theology, emphasize the context of changing religion–state relationships and the organizational autonomy of Catholicism. While mostly avoiding overt conflict with whatever regime that is in power, the Catholic hierarchy has in many countries an organizational presence that few denominations can match. And so, its independence of the communist state allowed it to be a central actor when Solidarity challenged the hegemony of the Polish United Worker’s Party, as well as a central actor in post-Communist Poland. But Kubik and Zubrzycki are interesting not just because of their discussion of religion–state relations but for their emphasis on the ritual and symbolism that allowed Catholicism to give new meaning to Polish identity and Polish independence. They approach the question of religion’s distinct contribution to social movements by emphasizing such symbolic meaning and religious identity rather than the specific content of beliefs and values. As in Dillon’s (1999) discussion of progressive American Catholics, religious symbolism can provide motivation and meaning that cannot be found within secular political ideologies.

Rumor in collective behavior and social movements
GARY ALAN FINE

At the heart of collective action is the desire for secure information. When people gather together, definitive knowledge is often in short supply and the desire is great. Uncertainty produces fear and as a consequence there is an insistent desire to know, placing oneself and one’s community on a firmer footing. Whereas formal institutional actors (states, economic institutions, agencies of social control) generate forms of official knowledge, communities without legitimated information gathering processes depend on uncertain knowledge (or what has been termed “truth claims”). Access to secure information reflects the political structure, and, within movements and collective behavior, rumor plays a vital role.

Rumor is defined as information that is spread without “secure standards of evidence.” It is a form of knowledge whose truth value or predictive value is uncertain, both in its origins and in its accuracy, and, as psychologists Gordon Allport and Leo Postman (1947) argued, it is most likely to appear in circumstances that are characterized by importance and ambiguity. Of course, what constitutes unsecured knowledge is a matter of judgment. Some suggest that official pronouncements are secure by virtue of the standing of their sponsors, while others suggest that the motivation to deceive makes even official pronouncements uncertain; others suggest that outsider institutions may have access to secure knowledge through their connections.

Rumor has often been tightly linked to the analysis of collective action, and is sometimes treated as a form of collective behavior. Rumor is often found in situations of panic, crowd behavior, collective gathering, and the like. We lack comprehensive evidence on the frequency of rumor in periods of stress, but the literature on responses to disasters or political uprisings suggests that rumors are often prevalent. The major theorist of rumor as a form of collective behavior was the symbolic interactionist Tamotsu Shibutani, whose book Improvised News: A Sociological Study of Rumor (1966) is a well-deserved classic. Shibutani became assertions about events in the past or present (“The United States Government was aware of the attacks on September 11 and decided not to stop them”) or claims about the future (“the Euro will be discontinued as a transnational currency”). Judgments about the accuracy or usability of rumor have been described by Gary Alan Fine and Bill Ellis (2010) as linked to the “politics of plausibility” (does the rumor claim fit in with widely held beliefs?) and the “politics of credibility” (is the source of the information judged to be an honest broker, not shaped by an interest to deceive?).

Rumor is to be distinguished from both contemporary legends and from gossip, two related discursive forms that sometimes overlap with rumor. Contemporary legends (sometimes referred to as “urban legends” or “solidified rumors”) typically involve longer, more complex narratives of belief that involve traditional, folkloric themes or motifs. Rumors typically are shorter, nonnarrative claims, more likely to be statements of belief than stories. Gossip is an evaluative – or moral – information claim that is presented about a known, but absent, third party (either a personal acquaintance or a figure of general repute, such as a celebrity or political leader). Unlike rumor, some forms of gossip may be certain and secure knowledge, entirely accurate and known directly.

interested in the dynamics of rumor after spending time in Japanese-American internment camps during World War II, where information seeking was prevalent. Through a set of widely dispersed case studies, Shibutani argued that moments of collective action or behavior are frequently characterized by a strong need for information, whereas participants have access to only ambiguous, uncertain knowledge. Ralph Turner suggested that rumor is a form of “intensified information seeking.” At such times people search for whatever information they can glean from others who are often as uncertain and confused as they. Imagined circumstances are believed as they are spread. Shibutani suggested that rumor constituted a form of improvised news as people communicate without means to ascertain the truth of what they hear, attempting to build confidence about the ambiguous events that swirl around them. The Shibutani model is also applicable to other theoretical treatments of collective behavior, such as that of Ralph Turner and Lewis Killian (1987) who suggest that a central goal of those who gather collectively is to discover the proper norms and expectations for behavior, and, as result, social actors are judging appropriate action often by means of information that they believe they can trust. These models have proved particularly influential in the examination of riots, as folklorist Janet Langlois (1983) demonstrated in her examination of rumors in the 1943 Belle Isle racial riots in Detroit. Langlois notes that similar rumors were spread in black and in white communities with the race of the actors switched, a common occurrence as Gary Alan Fine and Patricia Turner (2001) noted in their analysis of racial rumors. Misleading information, suggesting hostile actions on the part of an outsider group, can produce violence in a social “tinderbox.” In the official analysis of the riots in the 1960s, the Kerner Commission (National Advisory Commission on Civil Disorders 1968) found that “rumors significantly agitated tensions and disorder in more than 65 percent of the disorders studied.” While riots develop from real grievances, beliefs are also important stimulants for violence. As a result, during periods of institutional threat and collective disorder, governments or civic groups establish rumor control centers, designed to present “accurate” information. Whether these agencies provide true information as opposed to misleading or anodyne claims, designed to dampen hostilities, whether these claims are trusted by angry and frightened residents, and whether they actually decrease the amount of violence are all open to question. However, it is believed that control of information is one means by which civil disturbances can be prevented or shortened.

Because of their unofficial nature, outside of the control of authorities or elites, rumors often suggest the power of conspiratorial groups. The classic study by French sociologist Edgar Morin, Rumor in Orleans (1971), examines a rumor complex which alleged that Jewish dress shop owners were drugging young French women and selling them into forced prostitution (“white slavery”). Whereas once the sources of conspiracy were outsider groups, today, as Veronique Campion-Vincent (2005) argues, there is an increasing emphasis on elites as sources of conspiracy, a set of beliefs that links rumor diffusion to collective action and social movements.

While less attention has been paid to the connection of social movements and rumor, members of movements also search for secure information, and this is particularly evident when social movements are sponsoring collective action. Participants in social movements must evaluate the plausibility of uncertain information as they often lack a direct pipeline to official claims or a means of judging those claims. Scholars of social movements are less prone to examine rumors than those who focus upon collective behavior, but those who focus on the evolution of movements, such as Francesca Polletta’s analysis of the dynamics of movement diffusion, It Was Like a Fever (2006), recognize that informal networks, compelling narratives, and emotional engagement shape movement activity and the commitment of members in the
face of social costs. Movements often depend on narratives to create affiliation, and these narratives may be grounded on contemporary legends or may incorporate rumor. While many social movement organizations are relatively stable and develop their own sources of information, participants often—and understandably—mistrust the information that is provided by official sources that oppose the goals of the movement. As a result, social movements often create their own knowledge networks, which, by virtue of established credibility of the sources of the claims, are treated as accurate and the basis of action. Again conspiracies play into the acceptance of rumor. Those movements that allege the existence of conspiratorial action exemplify this need, as these groups operate explicitly on the claim that “secure knowledge” is false information. Movement organizations that question the official outlines of the attacks on September 11 (9/11 Truther Groups) serve as particularly powerful examples of how alternative knowledge sources are crucial.

While rumor is found throughout society, it is often particularly and dramatically evident in moments of uncertainty and of change, and these are moments at which collective behavior and social movements are present as well.

Slave rebellions

DAVID K. PETERSON

Slavery has existed in various places and times throughout human history. So too have slave rebellions. Some of the most well-known and compelling stories of all time have depicted these rebellions. Moses led a revolt against the enslavement of Hebrews in ancient Egypt, demanding of Pharaoh to “Let my people go!” This episode is important, if not central, to the Abrahamic spiritual traditions – Christianity, Judaism, Islam, and others. Spartacus, during the Third Servile War in the first century, led a rebellion of slaves against their Roman captors. The tale of this revolt is especially beloved in the Western political tradition. In ninth-century Iraq more than 500,000 East African slaves rose up against their Arab masters in what is known as the Zanj Rebellion. Rebellions have occurred in other places and times and have similarly become the stuff of legend. Because slave rebellions emerge from the site of the most extreme dispossession, in the face of the most terrifying odds, they are paradigm cases of resistance to oppressive power; they represent, in the words of Herbert Aptheker (1943: 3), the preeminent historian on the subject, “the highest form of protest.”

Though slavery and slave rebellions have existed throughout human history, they are uniquely significant in the modern era, particularly in the Americas. In the modern world slavery takes on, according to W.E.B. Du Bois (2003: 67), “a scale and an elaborateness of detail of which no former world ever dreamed.” It is the “imperial width of the thing,” he argued, “the heaven-defying audacity” that makes its modern newness. Slavery was central to the economic development of the European powers and thus also to the bourgeois revolutions that would transform the Old World into the modern world. Modern slavery was also significant in that this most extreme form of human domination emerged alongside unprecedented pronouncements of human equality and conceptions of human agency and freedom. According to Orlando Patterson (1982), the existence of slavery in a given society does not simply contradict notions of human freedom; the existence of slavery produces and gives meaning to the concept of freedom. Slave rebellions held the potential, not to make everyone free, but rather to destroy the concept of freedom itself. For this reason, slave rebellions were extremely threatening both to economic stability and to the coherence of the general principles upon which the modern world was founded; they threatened the ruling system of production as well as the ruling episteme.

Slaves were not considered political subjects by the institutions of the societies in which they were enslaved, not even subordinate ones, and thus could not petition for the redress of their grievances or engage in the repertoire of collective action that typically falls under the category of “social movements.” Slaves resisted, to be sure, and this resistance was constant and took a variety of forms: working slowly, breaking tools, running away, and poisoning the master, for example. Slave rebellions, however, sought nothing less than the total uprooting of the whole system of slavery in a given territory. In all cases, slave rebellions were bloody and violent. In most cases slave conspiracies were discovered before they could reach fruition. In many cases rebellions were short-lived uprisings that may have taken the life of a master and his family or the lives of a few members of the slaveholding class before they were quickly and viciously repressed. In a few cases slave rebellions reached the level of prolonged warfare that stretched out over months and sometimes years. In just one case, in all of human history, the Haitian Revolution, did a rebellion of slaves lead to the total abolition of slavery and the establishment of a republic by the self-liberated slaves.
Though the motivation for rebellion was ever present there are several variables across space and time that impacted upon the likelihood and magnitude of rebellion. These include: the existence and strength of maroon societies, the demographic ratio of enslaved to nonenslaved, economic conditions of production, levels of urbanization, the knowledge and rumor of rebellion elsewhere, discourses of freedom and liberty among free populations, external forces at battle with the slaveocracy. The most important precipitant of revolt was revolt itself; rebellion was contagious despite the effort of those interested in the maintenance of slavery to frame the outbreak rebellion as sparse, deviant, and isolated (Aptheker 1943).

One of the most important ways in which the enslaved resisted their bondage was to “steal away,” or escape the plantation and form “maroon societies.” Maroon societies existed throughout the western hemisphere and not only provided spaces of refuge from the degradation of slavery, they also provided bases from which the institution could be attacked. The largest and most enduring of such societies, known as Palmares, was formed in the mountains of Brazil. Palmares had an estimated population of more than 10,000 people and survived for nearly a hundred years between 1600 and 1700. Maroon societies often joined with and were aided by indigenous people. The largest maroon society in North America was formed by the Black Seminoles, an amalgamation of the Seminole Indians of the southeastern US and escaped African slaves. Maroon societies were particularly prominent and powerful on the island colony of Jamaica. Between the years 1730 and 1739, Jamaican maroons launched the “First Maroon War” under the leadership of an escaped slave named Cudjoe. The British, unable to defeat the rebellious runaway slaves, struck a deal that allowed them to occupy a series of towns under British supervision. This “peace” was broken with the “Second Maroon War” launched by the maroons against the British colonial authorities in 1795. Jamaica is a unique case that highlights the threat posed by maroons to the institution of slavery. Though war waged by maroons was not typically prolonged, maroon societies throughout the New World played a central role in the outbreak of slave rebellions.

It was a maroon named Dutty Boukman who, on August 14, 1791, initiated the great Haitian revolt, which would become the only known successful slave rebellion in history. Within weeks the revolt was joined by more than 100,000 slaves who, in a great and righteous fury, burned hundreds of plantations. Maroons had attacked the plantation society of the French island colony of San Domingo (now Haiti) several times in the centuries leading up to what is known as the Haitian Revolution. Though the initial fury of the revolt was initiated by maroons, it was a self-educated slave, Toussaint L’Ouverture, who would lead the rebellion to defeat the British, Spanish, and French invasions and establish Haiti, the first Black republic in the western hemisphere and the first nation in the modern world to abolish slavery. The usurpation of this most profitable colony drastically altered the geopolitical map of the modern world. It shattered the imperial ambitions of Napoleon Bonaparte and left France with little choice but to sell the Louisiana Territory, a move that doubled the size of the US and enabled its expansion westward. The significance of the Haitian rebellion is thus difficult to overstate.

Whereas social revolutions often occur during moments of political or economic crisis, the Haitian Revolution occurred after a decade of sustained and stable economic growth. San Domingo was not only the most valuable French colony but, at the time, it was the most valuable colony in the world. On the eve of the rebellion San Domingo produced 40 percent of Europe’s sugar, 60 percent of Europe’s coffee, and accounted for two-thirds of France’s overseas trade. This value was extracted through the most horrific and brutal exploitation of the enslaved, which, as on the other “sugar colonies” of the Caribbean, eventually facilitated rebellion. Unlike the post-“cotton kingdom” system of plantation slavery that prevailed in the US, the plan for Africans
imported to San Domingo was for them to be worked to death and then replaced. For this reason the Haitian slaves truly had nothing to lose but their chains.

Brutality alone, however, does not explain the emergence and scope of the Haitian Revolution. The climate that fostered such exceptional agricultural productivity in San Domingo was conducive to the spread of disease which regularly claimed the lives of the enslaved. It is estimated that annual death rates of the enslaved were regularly 10 to 15 percent. The unforgiving climate and the commonness of death on San Domingo discouraged European settlement of the colony, resulting in a unique demographic imbalance between the enslaved and the nonenslaved. It is estimated that whites on San Domingo numbered 30,000 compared to 500,000 slaves and 40,000 “free” blacks and “mulattoes.” Only the most extreme brutality could maintain such a situation, making San Domingo a veritable powder keg waiting to explode, and explode it did (James 1963).

The Haitian Revolution sent shockwaves throughout the world, striking fear in the hearts of slave masters everywhere and stoking the fires of hope and yearning in the hearts of the enslaved. The very existence of slave rebellion and conspiracies to rebel troubled the stereotypes of African inferiority and docility employed by slaveholders to justify the institution of slavery. These stereotypes were not just troubled by the Haitian revolt, they were obliterated. Toussaint’s army of slaves-turned-soldiers not only bested the greatest military leaders of the day, including the great Napoleon Bonaparte, they established and maintained a system of political organization. Correspondence between Toussaint and various European and American leaders indicate that he was widely considered, even by his enemies, to be a great statesman. Poems were written about Toussaint by some of the greatest poets of the day, including William Wordsworth, and were widely circulated throughout Europe. His bold example meant that slavery anywhere could only continue through an ever more brutal tightening of the institution everywhere (James 1963).

Certainly the discourse of freedom that was shaking up and transforming the monarchical regimes in Europe and the colonial regimes in the New World was a powerful precipitant of rebellion. It was not that such discourses gave the enslaved an understanding of the value of freedom. On the contrary, nobody understood the value of freedom and desired it more than the enslaved. The existence of such discourses did, however, embolden the slaves by giving them the idea that they might find supporters among those raising the banner of freedom elsewhere. Toussaint took the slogans of the French Revolution – Liberty, Equality, and Fraternity – seriously and assumed he would find support among those pronouncing them. Similarly, Gabriel Prosser planned a revolt in 1800 in the Richmond, Virginia, area which he hoped would be supported by revolutionary France. Gabriel Prosser’s plan exempted Quakers and Methodists from retribution, due to their endorsement of notions of universal equality and their advocacy of emancipation. Though Prosser’s plans were leaked before the rebellion came to fruition, the slaveholding class in the US was stricken with fear that they might face the type of retribution being sought in Haiti at the time. The knowledge of any revolutionary activity emboldened the slaves and increased the likelihood of revolt, but no event had a greater impact than the great Haitian Revolution.

Conditions in the “sugar islands” and in South American regions like Brazil were vastly different than those that prevailed in the US. Cotton, rice, and tobacco, rather than sugar and coffee, were the primary agricultural products in the US. The climate was somewhat more forgiving in North America and so the slave populations grew even after the last captive African was imported. Despite this population growth, the enslaved were far outnumbered by the whites, making the possibility of a successful rebellion highly unlikely. Indeed, most rebellions in the US were either short lived or discovered before they could come to fruition.
The audacity to plan slave rebellions and the courage to carry them out was often strengthened during times in which conflict between a given slaveocracy and an external force was imminent. Such conflicts were viewed as providing both an opportunity to revolt, due to the diversion of repressive force, and also a potential friend in the external force. The largest slave revolt in US history, known as the German Coast Uprising, erupted on the eve of the War of 1812. The rebellion was led by Charles Deslondes, a free black who worked as an overseer on a Louisiana plantation. Deslondes and his associates, in concert with local maroons, overpowered the master (and his son), of the plantation on which Deslondes was employed, seized weapons—guns, cane knives, farming tools and clubs—and began a march to New Orleans, amassing an estimated 200 to 500 slaves and burning several plantations along the way. The rebellious band was reported to have been singing chants of “Liberty or Death!” Deslondes, in anticipation of John Brown’s great plot, planned to seize the armory in New Orleans, liberate the city, and turn it into a refuge for fugitive slaves from across the Americas. Like so many before and after him, despite his initial and unprecedented successes, Deslondes’s liberation army was suppressed by the superior might of state militia in concert with federal troops.

Slaves were sometimes armed by their enslavers in order to fight against opposing forces. For example, the French armed a significant number of slaves in early eighteenth-century Louisiana in order to help combat the Chonaches Indians. Upon realizing the slaves had a friend in the Indians they, instead, turned their arms against their enslavers. It is also well known that the British promised freedom to slaves willing to fight against the revolutionary effort of the colonists. Several of the “Black Loyalists,” upon the defeat of the British, sought refuge in Nova Scotia. W.E.B. Du Bois, in his classic historical text Black Reconstruction in America (1998), attributes the efforts of the slaves against their Southern captors as the decisive factor enabling Northern victory in the Civil War. During the Mexican War in the middle of the nineteenth century whites in Texas attempted to rally their fellow citizens to the cause of the war by spreading the rumor that the Mexicans aimed to arm the black slaves and enlist them in a fight to liquidate the whites. This emboldened the slaves and was the major cause of a few planned and actual revolts. There is evidence that the enslaved planned their revolt to commence as soon as enough whites had left the area to join the war effort against the Mexicans (Aptheker 1943). The slaves took every opportunity to exploit the weakness of those holding them in bondage. Their loyalty was to freedom rather than to the cause of any of the warring parties.

The “conspiracy” of Denmark Vesey highlights the importance of urbanization to the precipitation of rebellion. Urbanization made the monitoring of slaves more difficult and thus enabled greater lines of communication between free and enslaved blacks. This provided the slaves a window to the world, albeit a narrow one, that was closed to those held captive on rural plantations. Upon purchasing his freedom with money he won in a game of chance, Vesey embarked upon an audacious plan for a rebellion that would have been the largest in American history had it not been betrayed by a fellow slave. The scope of the plot was truly incredible, incorporating estimates of up to 2000 slaves in and around Charleston. That such a plot was not leaked sooner is truly remarkable. Like other foiled rebellion plots, the Vesey conspiracy was followed by a trial and the eventual mass hanging of the alleged conspirators. The impact of the discourse on human freedom can be seen here as the rebellion was planned to commence on July 14, Bastille Day, in 1822. Also, the lasting impact of the Haitian Revolution can be seen in Vesey’s plot, which included plans to kill as many whites as was necessary, burn the plantations, sail to the black republic of Haiti, and seek refuge there. Vesey’s conspiracy can be contrasted with that of Nat Turner’s 1831 revolt, probably the most well-known revolt in US history, which involved only a few conspirators,
but which erupted with ferocity, resulting in the killing of 60 whites and, ultimately, the mass killing by whites of approximately a hundred blacks.

The conditions of slavery demanded that measures be taken to keep the enslaved ignorant of the happenings of the outside world. Still, certain information about social and political developments inevitably reached the consciousness of the enslaved and had a stirring effect. The slaves had little ability to distinguish between rumor and fact; so the rumor of various happenings, rather than their actuality, was sufficient to precipitate rebellion. For example, in the early to mid-nineteenth century, debates took place in the various legislative halls of the US concerning the expansion of slavery to the western states, in which those opposed to expansion might frame their opposition in a general denunciation of the institution. Upon hearing rumors of such denunciations slaves were in many instances prompted to suspect that slavery had been abolished but that their masters were simply refusing to comply. Similarly, many slaves believed that the election of Abraham Lincoln meant that slavery had been abolished. So limited was the information available to the enslaved that rumors had a tremendous effect (Aptheker 1943). It was not only rumors of antislavery discourse on the part of whites that precipitated revolt. In 1829, a free black from Boston named David Walker published the scathing "Appeal to the Coloured Citizens of the World," rumors of which (most slaves were forcibly illiterate) emboldened slaves to rise up against the injustice of their captivity.

Slave rebellions were typically the exclusive efforts of the enslaved themselves and rarely involved the participation of free blacks (excluding maroons). However, slaveholders often attributed the cause of rebellion to activity among the "free" blacks as part of a general effort to contain and constrict them. To accept that the rebellion could be organized and emerge among the slaves was dangerous to the maintenance of racist ideologies which held that the enslaved were docile, cowardly, and incompetent.

The participation of whites in slave revolts was virtually nonexistent with the exception of the decade prior to the American Civil War. The most well-known and influential example of such participation is represented in John Brown’s brazen effort in 1859 to seize the armory at Harper’s Ferry as a first step in the precipitation of nationwide revolt. John Brown is a truly unique and significant historical figure who was committed, with the whole of his being, to the cause of abolition by any means necessary. Prior to the Harper’s Ferry attack, John Brown’s armed band played a role similar to that played by maroons in other times and places by attacking small plantations in various parts of the country and liberating small holdings of slaves. The Harper’s Ferry plot was in the works for 20 years before it was carried out and was based on a very careful study of guerilla warfare. The failure of the revolt was not a foregone conclusion like that of so many rebellions that preceded it. Were it not for a few unexpected mishaps it could very well have succeeded and drastically altered the course of US history. The very fact of the actuality and possibility of rebellion being organized by and finding support among whites, in many ways indicated the unsustainability of the institution of slavery and foreshadowed the Civil War (Du Bois 2001).

Slave rebellions had a tremendous impact on abolitionist movements in a variety of ways. While the horror of rebellions often made whites sensitive to the plight of the enslaved, this was not always the case. The outbreak of slave rebellions often turned the most ardent haters of the enslaved into abolitionists, not because of a softening of attitudes toward the enslaved but rather because of an acknowledgement of the explosive potential of slave rebellion which, as Napoleon Bonaparte painfully learned, could unleash irrepressible rage with the capacity to shatter the economic foundations and expansion hopes of entire nations. With little to no warning, slave rebellions could turn a seemingly stable social
and economic order upside down overnight. Even though slavery was often extremely profitable, the ever-present threat of rebellion could engender calls for abolition. While support for abolitionism is often attributed to recognition of the humanity of the enslaved on the part of the abolitionists, in many cases abolitionist sentiments can be attributed to the fear of the consequences of the righteous fury of the enslaved (Du Bois 2001).

James Baldwin, speaking of the US civil rights and Black Power movements of the post-World War II period, referred to himself as “a survivor of and witness to the latest slave rebellion.” The function of slavery in the US, to facilitate the simultaneous ostracization and exploitation of blacks, was not eliminated with the emancipation proclamation and the passage of the 13th, 14th, and 15th amendments to the US constitution, but rather survived in the post-emancipation institutional configurations of Jim Crow racism, the “dark ghetto,” and the prison industrial complex (Wacquant 2002). Accordingly, social movements to combat these institutional configurations have often attempted to frame their efforts as slave rebellions. The use of the slave rebellion frame has been particularly prominent in the US prisoner movement. This is due to the overwhelming racial disparities in incarceration along with the fact that the 13th Amendment to the US constitution outlawed slavery “except as a punishment for crime whereof the party shall have been duly convicted.” The 1972 Attica Prison uprising was framed as a slave rebellion by the rebels and was eerily reminiscent of past slave rebellions. The uprising involved the seizure of the prison by 1000 inmates, mostly black, and culminated in the death of 29 inmates and 10 correctional officers and civilians. To successfully frame a movement effort as a slave rebellion in the contemporary moment, given the virtually universal acknowledgement of the absolute wrongness of the institution of slavery, is to authorize any means of pursuing movement goals and all haste in the pursuit. Thus, slavery and resistance to slavery may well represent the ultimate social movement “master frame,” pun intended.

Social media
BETH GHARRITY GARDNER

The implications of social media for social change are fueling incredible debate at the time of this writing. This is being driven by the unprecedented diffusion of social media technologies and services, such as text messaging, e-mail, blogs, YouTube, Facebook, and the like, over the first decade of this century. For movement scholars, more important than the new digital technologies themselves are their consequences for social movements and protest. To be sure, there is no shortage of fodder for theoretical and empirical questioning. Not only has social media been ascribed a pivotal role in the coordination of rapid, massive, and – in some cases – revolutionary mobilizations in geopolitical contexts as diverse as Iran, Moldova, and Tunisia, but they lend new meaning to the iconic phrase the whole world is watching as actors broadcast events in real time to international audiences. Through the variety of available, easy to use designs, social media enable novel forms of one-to-many and many-to-many communication that reveal surprising contours of an evolving “virtual public sphere” (Langman 2005). By altering the communication landscape these technologies are changing the terrains of contentious politics. They broadly call into question long-standing assumptions about social movements.

Scholars disagree on whether these technologies have truly transformative political potential or if they merely amplify familiar contentious politics. These diverging views tend to hinge on the documented ease of both political- and consumption-oriented uses of social media; the inequality in access to different digital mobilizing tools; and the use of these same tools by power holders to suppress challengers (Hindman 2011; Shirky 2011). While theoretical debates were simplistically divided into optimists versus pessimists, current scholarship has given way to more nuanced approaches for tracking new media. Against this backdrop, three major dimensions for studying the impact of social media on the fates of social movements are noteworthy: the means and motivations for collective action, movement relations to professional news media, and state–civil society dynamics.

A few things movement scholars seem to agree on are that social media tools are providing both new forms of organizing and protest as well as lowering barriers to participation. Affecting the supply-side of conditions for protest, to use Klandermans’ term (2004: 360), are new tactics and organizational forms that are increasing the pace, ease, and reach of activism. Face-to-face contact may not be necessary for the diffusion of practices, but less clear is whether it is necessary for motivating and sustaining protest. Thus still contested is how social media are reshaping the repertoires for movement activism, which, in addition to tactics, carry mobilizing identities and issues. One explanation for differing claims is the dearth of research on the ways in which these technologies may be creating new demands for protest, new issues and stakes, such as when hacker groups built censorship circumvention software to help activists get around state firewalls in Tunisia. Another explanation is the lack of consistency in the methods and objects of study. To assess these differing claims and issues, scholars are examining variation in the uses of these technologies for different ends (Earl & Kimport 2009, 2011).

As these technologies are being used for information access, public speech, and social networking, they appear to be recasting movement relations with the traditional news media. The mainstream media coverage of movement messages has conventionally been viewed as a crucial route to political influence by swaying public opinion, authorities, and elites.
media tools add to this new opportunities and challenges for activists as they have a greater ability to produce and control their own media messages – directly linking participants as well as members of their audience to information, ideas, and other individuals. In conjunction with the ability of movement actors to sidestep media institutions, journalists are curating news from institutional outsiders who can provide immediate accounts for breaking news (Robinson 2010). Social media coverage of recent mass mobilizations provide numerous examples of what can be seen as a leveling of activist and journalist roles, like when US National Public Radio’s senior strategist open-sourced his Twitter feed at the onset of the Tunisian uprising by aggregating and filtering the tweets of fellow users on the ground. Despite trends toward more bottom-up newsgathering, social media also reinforce mainstream news dominance in terms of status and wide distribution. Research shows that professional and citizen communicators frequently continue to link to traditional news outlets (Hindman 2011). How social media are modifying journalistic norms and how movement messages are conveyed internally and to broader publics remain open questions.

The potential for social media to invigorate democratic politics by buttressing civil society and the public sphere is generating yet another path of inquiry. Two recent mobilizations – the Arab Spring and the Occupy movements – are highlighting possible repercussions of social media for accountability in both authoritarian and democratic regimes. In the case of the former, scholars are questioning the role of social media in undermining government monopolies on public communication during the wave of pro-democracy demonstrations that spread throughout North Africa and the Middle East. By tracking the conversations taking place on websites, blogs, and social networking services like Twitter, Howard and colleagues (2011: 13) show that activists used social media to create a viral “freedom meme” that mobilized debate as well as action to put pressure on governments throughout the region. Their findings illustrate features of these technologies that may strengthen the public sphere: the sheer number of participants and the ability of online debates to spread across national borders and precede on-the-ground actions. Other scholars document not only the state’s power to surveil and repress political actors and movements using digital technologies, but the lack of transparency and control for users over the companies providing their social media services (Mozorov 2011; Shirky 2011). However, state efforts to stifle social media have backfired in many cases, as when Egyptian police killed blogger Khaled Said in 2011 for posting incriminating videos of fellow officers and unwittingly galvanized his martyrdom via a Facebook-sparked campaign against police brutality. The implications of social media for state–society relations remain open for further research.

From politics-as-usual to radical transfers of power, new idioms are emerging that reflect the perception of social media’s impact on the means and motivations for political participation. The digital tools that political activists have begun to deploy are often portrayed in mainstream media discourse as the central catalysts of contention (e.g., the “Twitter,” “Facebook,” or “Wikileaks” revolutions). Meanwhile, scholarly concepts are still being charted to anchor evaluations of protests spanning the boundaries of online and offline activism. Undoubtedly social media are providing mobilizing and coordinating tools for social movements the world over, but more questions about their effects on social movement processes continue to arise in the wake of rapid changes in these technologies, and people’s uses of them.

REFERENCES AND SUGGESTED READINGS

The nature of social movements in Singapore needs to be understood against this historical background and, in particular, the social composition of a diverse population almost entirely (the exception being some of the original Malay/Indonesian population) of migrant origin, with no roots in the new country and often with social, religious, and political allegiances and links to their country of origin, and to the immediate political and economic circumstances of the first years of independence. The new postcolonial government found itself with a small country divided by language, ethnicity, religion, and culture, heavily dependent economically on the now withdrawing British military bases and with virtually slum-like housing for many of its inhabitants, and with a strong left-wing, mainly Chinese, opposition. The government, under the direction of its ultimately long-serving prime minister, Lee Kuan Yew, immediately set about a major program of what was known in Singapore as “nation building” including a massive public housing project designed both to create a good physical infrastructure and to bind the immigrant population to the new country through property ownership; stimulation of rapid industrialization; vigorous suppression of the Left and of the Chinese “chauvinism” that was seen as being its roots; and the creation of numerous symbolic forms of attachment to the new country through such means as a new national anthem, the celebration of National Day as a major public event, the recognition of four official languages (Malay, Mandarin, English, and Tamil) while Malay remained as the national language despite its minority status, and the encouragement of identification with the new state through education, propaganda, the creation of a nationwide network of community centers, and close censorship and monitoring of the media (Clammer 1998).

The result of all this activity was a political culture what some commentators have
termed “soft authoritarianism,” a culture that included retention of the colonial era Internal Security Act allowing arrest and detention of oppositionists, suppression of any independent media, total government control of education, control of voluntary societies and charities through the Registrar of Societies, the introduction of compulsory military service for men, an almost complete government monopoly of housing through the Housing Development Board (HDB) and the Housing Urban Development Corporation (HUDC), in which well over 80 percent of the population lived in government-controlled dwellings, and close surveillance of the population through the extensive secret police and its large network of informers. The result, both in the early days of independence and subsequently, has been the suppression of any forms of social movements other than those created or directed by the state itself (Clammer 2011). The Singapore state has indeed been active in this sphere, having at various times attempted to create the above-mentioned community centers, residents’ committees in the public housing blocks, citizens’ consultative committees, a civil defense organization, a movement to promote Confucianism as a kind of national value system to offset the very materialism and commercial mindset that the government had itself created, campaigns to encourage the speaking of Mandarin amongst the linguistically diverse Chinese population, and the ill-fated attempt to create a national ideology based on supposedly shared “Asian values” somewhat parallel to the official national ideologies of neighboring Indonesia and Malaysia.

The result has been a society that is noteworthy for the absence of independent social movements, which raises a challenge for conventional social movement theory. What we see in Singapore in fact is a situation closer to that which might be expected in a socialist society: state dominance and control or cooption of any emergent movements, and the parallel attempt by the state itself to substitute for spontaneous movement emergence a set of artificial “movements” of its own. But this of course is not to argue that social tensions do not exist in Singapore, as indeed they do. What is sociologically and politically interesting is their deflection by the state through the mechanisms of management, co-option, control of public resources such as housing, supervision of voluntary and charitable organizations, close surveillance of religious institutions and movements, vigorous promotion of a consumer society as the highest good, socialization into national (i.e., government) values through education and military service, and, where these means fail, through direct suppression, including the arrest, and certainly in the recent past, torture of “dissidents,” meaning mainly simply critics and social activists opposed to or promoting alternatives to the government’s hegemonic position. The same party, the Peoples’ Action Party (PAP), has been in office since independence and the organization of the electoral system, government control of the media, and the use of lawsuits against political opponents has ensured that very few opposition candidates have ever been elected to the single-chamber parliament.

But beneath this apparent hegemony opposition does exist, even if it is prevented from taking an institutionalized form. In coffee shops, in the small but significant underground economy, in elite cultural organizations, and most certainly in religious circles, alternative views are voiced. The latter organizations in fact represent one of the most interesting aspects of Singapore society. Paradoxically, in a deeply materialistic society, religion flourishes, both as a marker of ethnic and cultural identity (as with Islam for the Malays, and for the Pakistani and Bangladeshi communities, Hinduism for many Indians, Roman Catholicism for the Eurasians, and Judaism for the small but vigorous and long-established Sephardic Jewish population), and as a sign and source of upward social mobility, as with Protestant Christianity and with newer forms of activist Buddhism such as the Japanese origin Soka Gakkai movement, very popular amongst lower middle class and upwardly mobile blue-collar
Chinese speakers. While religious activity is itself controlled through the Maintenance of Religious Harmony Act and while socially critical forms of Christian theology and practice such as liberation theology are actively discouraged, and those movements which support it such as the Christian Conference of Asia (CCA) or the Student Christian Movement (SCM) have been suppressed or expelled, nevertheless religion in Singapore provides one of the few channels, never fully controllable by the state, in which social activism can to some extent occur and in which alternative value systems to the officially promoted materialistic and consumer-oriented ones can be voiced, even though the dominant form of Protestant Christianity has proved to be a pietistic and Evangelical rather than socially engaged one.

The very absence of social movements in Singapore other than state-authorized ones or nonpolitical elite organizations, such as the Malayan Nature Society, make Singapore a very interesting “negative” case study for students of social movements. Singapore represents what might be called the modernist project still alive and well in Southeast Asia: a concern with “nation building,” social order, control and cohesion, and the hegemony of a particular state-centered ideology and conception of identity. While this has led to a lack of social creativity, an unwillingness of many Singaporeans to engage in civic life and the absence of opportunity structures for new movements to appear, there are signs of cracks in this seemingly monolithic system. These include influences and pressures coming from economic and media globalization, the rise of fundamentalism amongst some religious communities both within Singapore and in its near neighbors, new pressures that are arising from global resource depletion (Singapore is one of Asia’s biggest oil refinery centers), the rise of the new middle class with their demands for mobility, freedom in education, and access to media and information and the expansion of the Internet. Singapore is one of the most “wired” societies in the world, its small size and good infrastructure making this easy to accomplish (more than 75% of all households have Internet access). But while the Internet allows state-controlled information to be disseminated in new electronic forms, it also allows the average citizen access to a much larger world and to forms of communication and information sharing with many other Singaporeans. Perhaps more than anything else IT will change the political culture of Singapore in more liberal directions.

South Korean transnational fatherhood movement

ALLEN J. KIM

The South Korean transnational fatherhood movement, popularly known as “Father School” (FS), addresses men’s role and identity as contemporary fathers. In 1995, Duranno Christian Publishing established a Father School in Seoul, South Korea, in response to the growing national epidemic of abusive, ineffective, and absentee fathers. Worldwide, new social expectations for fathering are thought to encourage greater balance between work and family roles and focus on emotional involvement. Having celebrated its 15th anniversary in 2010, political notables, including President Lee Myung Bak, and news outlets internationally have recognized the organization’s effort in emphasizing the important role men play in children’s lives. Men participate in conference seminars that challenge them to become more expressive, nurturing, and responsible fathers in contrast with traditional Korean patriarchy shaped by Confucianism. From their evangelical optic, “a healthy family begins with the father.”

BACKGROUND

Since its inception, this nonprofit organization has graduated 200,000 participants worldwide in 230 cities in 45 countries. At the time of writing, 3000 sessions of the FS program have targeted men of diverse backgrounds in settings such as the church, prison, military, corporation, mental hospital, school, and immigrant contexts. The seminal idea for educating Korean fathers came through Do Eun Mi’s vision (wife of family minister Hwang Eun Chul) who experienced a distant, stoic, and abusive patriarchal father. Under Confucianism, which historically shaped familial and state philosophy, extreme patriarchy, filial piety, rigid family hierarchy, and strict gender differentiation were doctrines guiding daily life. These principles continue to influence Korean parenting culture today. The Father School program was formally developed at Duranno Bible College in Seoul, South Korea, by the guidance of elder Kim Sung Mook, who is the organization’s head figure and movement representative.

An essential feature of Korean patriarchy is the “salaryman” stereotype: the East Asian ideal of a white collar, breadwinning, salaried husband and father. Long work hours, stress, after work drinking culture, and South Korea’s high educational costs and academic achievement pressures are thought to be contributing factors to men’s focus on work and absence from the family. Traditional Korean cultural values such as “chae-myun,” referring to the unspoken code of honor and pride steeped in Confucian morality, prevent men from seeking outside therapeutic assistance where the norm of saving face pervades social relationships. The popularity of the movement peaked following the economic crisis of the late 1990s, when many South Korean men lost their jobs overnight along with the breadwinner role central to men’s identities. For some men, new conditions prompted men to reconsider their familial roles and their relationships, or lack thereof, with family members. Participants of FS typically come to attend through the recommendation of former members, the urging of family members, church announcements, or as a result of public outreach marketing campaigns in local communities by the organization.

ORGANIZATION

Fathers’ School International Headquarters (FSIH) in South Korea functions as the central management and administration base for
its domestic and international programs. Domestically, FSIH is responsible for FS South Korea, FS for Special Ministry (seminars for prisons, army camps, high school youth, companies, rural fathers married to foreign spouses, single-parent households, homeless, and government agencies) and Mothers’ School (a complementary program helping women discover their role and identity as spouses and mothers). Regional headquarters, located in North America, Europe, Oceania, and in select countries within Asia, are self-operated and funded.

For their international operations, the headquarters provide resources and manpower supporting stand-alone seminars abroad. The organization adopts and modifies its message of involved fathering in ways that are sensitive to local cultural contexts and seeks to have the “local” brothers or volunteers operate the program independently. Within South Korea, transforming failed patriarchy involves stitching together gendered ideologies stemming from Confucianism, Christianity, and mainstream cultures from both East and West. Membership is not exclusive as both religiously informed and nonreligious programs (called “Open Father” programs) are offered to men of all backgrounds and ages.

FATHERHOOD EDUCATION

FS enlists Christian clergy, professors, government officials, and former members to conduct a 4–5 week program instructing fathers on their identity and role as the head of the family. Conference seminars are composed of small groups of participants with emphasis on personal disclosure, camaraderie, and openness of feelings. Men engage upon a collective journey to explore and remedy obstacles associated with distant Korean patriarchy and its attendant focus on breadwinning and selfishness. The organization assists men to recover their identity and valuable role as fathers seeking to reunify the family through a more nurturing, expressive, and moral fathering role. Their “social campaign” to build strong and healthy families is achieved through a fourfold aim:

1. Recovering the identity of the father.
2. Creation of a new and healthy family culture.
3. Developing strong leadership in the workplace and in society.
4. Establishing new support groups for social service.

Toward this goal each week addresses themes pertaining to the father’s influence: father’s manhood; father’s mission; father’s spirituality; and father and his family. Seminar features include embodied activities such as hugging, letter-writing, singing, family dates, a foot-washing ceremony, purity vows, and other rituals that promote positive fatherhood involvement. FS does not attempt to preserve the traditional family, but rather modernize it in ways that appear consistent with the “New Father” ideal in Western family ideology. Sharing similarities with the Promise Keepers Movement in the US, FS functions as a larger evangelical effort to turn the hearts of men toward their families. However, the movement is distinctive in its effort to prepare immigrant and nonimmigrant men to become a better fit in their contemporary families.

MOVEMENT FUTURE

Non-Western men are undergoing dramatic social changes, and organized international responses such as FS reveal the changing nature of fatherhood. The nuclear family is seen as the core of South Korean society, and this movement’s persuasive efforts are directed at reviving values that champion involved and emotionally expressive dads. Father School faces challenges and opportunities pertaining to its future and mission to reconstitute fatherhood globally. China, India, Japan, and North American contexts have been identified as recent growth areas. While participation has leveled off domestically, the organization’s
shift in reaching unmarried men through their “pre-Father School” program reflects their priority in reaching future dads earlier. Finally, obstacles associated with volunteer burnout, new member recruitment, and funding are viewed as ongoing organizational challenges.

Strikes within the European context

ANDREW J. RICHARDS

Labor unions have always been, and remain, the principal agents of strike mobilization and organization. However, any assessment of strikes in contemporary Europe has to be placed in the context of the general decline of union power since the 1980s. During the last two decades of the twentieth century, the proportion of workers belonging to unions (or union density) fell across Europe, and continued to do so into the twenty-first century, albeit more slowly. While long-standing cross-national differences in union density remained entrenched, the general trend everywhere was downward (table 1).

Yet the relationship between union density, as a measure of union power, and union capacity to wage strikes is complicated. Union density obviously captures those workers who belong to unions and who are therefore, presumably, more mobilizable than nonunionized workers. But other factors affect, positively or negatively, the power and influence of unions regardless of density rates per se (Western 1997; Piazza 2010). For example, institutional supports such as state funding (in France) or works councils (in Spain) enable unions to retain influence and organizational strength, and to represent more workers through collective agreements, than their otherwise low density rates would suggest. Conversely, union density in Britain stands in the middle of the European range, yet few union movements outside the US operate in a less hospitable environment for the organization of workers, let alone the waging of strikes.

In fact, the effects of union power on strike levels are important, but not obvious. Strikes incur considerable costs for unions and their members, thereby begging the question of whether they manifest strength or, rather, weakness. Powerful unions, by definition, can absorb the costs of striking, and mobilize workers on a large scale, but such power should also enable them to achieve their goals without resorting to such potentially costly action. Hence in Scandinavia, where unions remain powerful, levels of industrial conflict are relatively low (see below). Conversely, the monumental British miners’ strike of 1984–1985 – the last truly epic strike of the twentieth century anywhere in Europe – was, on one level, an astonishing demonstration of union mobilization. Yet in reality, it represented the desperate rearguard action of an increasingly vulnerable union, whose defeat heralded a long period of union quiescence and antiunion legislation (Richards 1997). This makes the analysis of cross-national trends in strikes inherently complicated. Low levels of industrial conflict may be associated with cases of both union strength and weakness, while high levels of industrial conflict may take place in contexts of apparent union weakness (for example, Spain).

In a valuable overview, Carley (2010: 2, 3, 9) notes that “industrial action is an area where international comparisons are notoriously difficult.” Given that data sources, definitions of industrial action, and criteria for determining whether incidents are recorded all differ across countries, considerable care is needed in analyzing trends in industrial conflict. Nevertheless, some conclusions may be drawn. Within individual European countries, it is difficult to discern any consistent trend, with strike levels fluctuating from year to year and following no particular pattern. However, cross-national comparison shows that some countries are more strike prone than others. Given the varying sizes of national workforces, absolute figures for strikes are invalid for cross-national comparison. Carley (2010: 9, 12, 13) therefore uses a relative measure...

from European Industrial Relations Observatory (EIRO) data – the number of working days lost through industrial action per 1000 employees – to compare 24 European Union (EU) countries plus Norway over the 2005–2009 period. Denmark emerges as the most strike-prone country in Europe, with an average of 159.4, followed by France (132), Belgium (78.8), Finland (72.9) and Spain (60.4).

In contrast, there were averages of only 11.3 for Portugal, 6.2 for both Germany and Sweden, and 5.7 for the Netherlands. Nonetheless, these figures cover a very short time frame, and that for Denmark is heavily inflated by a major and unusual two-month strike in 2008.

In table 2, I use a slightly different comparative measure – the number of workers involved in strikes and lockouts (from International Labor Organization (ILO) data) as a percentage of civilian employment (from OECD data) – for a longer period (2000–2008).

These findings broadly conform to those of Carley, with Sweden, Germany, and the Netherlands again at the lower end of the spectrum, and Spain at the higher end. But this time, the average for Denmark is much lower, and that for Italy much higher. These discrepancies are a function of the data and measurements used and time frame adopted. Clearly, any reasonable analysis of cycles of strike action depends on the availability of adequate time series data. For example, a “rough comparison” over time may be made for all EU countries as a whole using statistics from Eurostat, the ILO, and OECD. These data show that the average number of working days lost per 1000 workers across the EU fell from 39 for the entire 1997–2006 period to 30.6 for
Piazza (2010: 290) also demonstrates a generally downward trend in strike levels, and for an even longer time period. Using ILO data on the number of days lost to strikes per worker for the 1952–1999 period in 12 European countries plus Australia, Canada, and Japan, he shows that average levels of industrial conflict peaked significantly in the 1970s, fell but remained high in the 1980s, before dropping drastically in the 1990s.

Strikes are seldom spread uniformly throughout the economy. In most European countries between 2005 and 2009, they were concentrated above all in manufacturing, followed closely by the public sector and transport and communication. Conflict over pay remains the most important cause of strikes in nearly every European country, followed by working conditions and hours; job losses, dismissals, and redundancies; and, occasionally, political opposition to specific government policies on social security, labor law reform, public sector pay and jobs, and privatization (Carley 2010: 15–16).

Paralleling the perennial issues over which strikes are fought are long-standing academic debates on why levels of strike action ebb and flow. Research on labor conflict straddles several disciplines, and no firm consensus exists (Brandl & Traxler 2010: 519). Many analysts (and not just economists) stress the role of economic factors in determining strike patterns. For example, the decline of heavy industry, involving the demise of traditionally cohesive working-class communities, has undermined the structural foundations for the generation of collective action (Richards 1995). The dampening effect on industrial conflict of high and rising unemployment is a well established finding (Brandl & Traxler 2010: 532). Increasing attention is now being paid to the effects of globalization, with its pressures for economic competitiveness and labor discipline, in also reducing industrial conflict (Piazza 2010).

Nonetheless, other analysts — particularly political scientists, sociologists, and labor relations specialists — emphasize the role of labor market institutions and union power in mediating the effects of macroeconomic change (Western 1997). Thus, while globalization reduces strike rates, national union density plays an important intermediary role in determining the exact extent of labor quiescence (Piazza 2010: 289). Other authors also emphasize the importance of union power in mediating the effects of economic change on strike levels, though not necessarily reaching the same conclusions. Tsebelis and Lange (1995) found that strikes increased in those countries where organized labor had been traditionally strong but was becoming less powerful. However, Brandl and Traxler (2010: 519, 532–533) conclude that trends toward “social peace” (that is, reduced industrial conflict) follow from the weakening of unions relative to employers’ and business interests. Yet they also point out that those economic processes which have undermined unions and enhanced the power of employers could, in severe economic crisis, intensify national distributional struggles, thereby promoting the possible future resurgence of industrial conflict.

Either way, the national context — changing union power, the particular configuration of labor market institutions, and the persistence or not of corporatist structures of decision making — remains the key arena for researchers studying strike patterns within and across European countries. In a sense, the British case illustrates the importance of the national institutional context. No European country demonstrates better how adverse economic and political changes, unhindered by any institutional protection for organized labor, had a devastating impact on trade unionism itself, and, consequently, on strike activity. Union membership, after reaching a postwar peak in 1979, declined sharply thereafter, as did strike activity from the mid 1980s onwards. The average number of days lost to strikes per worker in Britain fell from 3074 in 1980–1989 to only 261 in 1990–1999 (Piazza 2010: 290).

The study of strikes remains multifaceted, but, ultimately, the strike, in contemporary
Europe, speaks to the continuing capacity of unions to promote collective action, and even solidarity, amongst increasingly fragmented national workforces. With the structural basis for workers’ collective action now weakened severely, retaining that capacity may depend increasingly on unions’ ability and willingness to join forces, when the need arises, with other, nonlabor-based, movements (Baccaro, Hamann, & Turner 2003).

Syndicalism
ROBERT MACPHERSON

Syndicalism encompasses both a method of labor movement organization and a revolutionary political philosophy growing out of the anarchist tradition. It has also been known as “anarcho-syndicalism” and “revolutionary syndicalism,” with broad definitions including the American and British movements known as “industrial unionism.” Syndicalist practice combines revolutionary anticapitalism, a commitment to workers’ control through democratic unions, and a rejection of both the state and political parties. From the mid-1890s until well into the 1920s a wave of syndicalist mobilization swept across the world, with mass organizations forming in the industrialized core of Europe and the US as well as throughout the colonial world. Some regions, notably Spain, but also many colonial areas, saw large syndicalist organizations active past this period. Recent research into syndicalism has shown it to be an early transnational social movement, nurtured by a network of migrant radicals and forming a more theoretically coherent structure than much traditional labor historiography had supposed.

REVOLUTIONARY GOALS AND ORGANIZATIONAL LOGIC

An emphasis on direct action tactics and a combative stance toward capital and the state were core tendencies in all syndicalist organizations. Many syndicalist organizations have espoused explicitly libertarian socialist goals, whether stated in the form of “socialism” or “anarchocommunism.” Syndicalists thus often reject any formalization of the worker–management relation in an attempt to avoid undermining their revolutionary orientation. However, they also emphasize the importance of daily labor struggles and the winning of concessions from employers and the state provided these are accomplished through the workers’ own efforts. In addition to such solidarity-building struggles, a significant tactical focus has been the “general strike” involving all workers.

Syndicalism’s most defining feature, however, is a prefigurative politics which sought to “build the new world in the shell of the old” by forming democratic union structures which would grow to become the main governance organs of a postcapitalist society. This emphasis on workers’ control of production, eschewing mediation by the both the state and radical parties, has been the major determinant of syndicalist organizational logic. A dual structure is sometimes created by combining industry- or craft-organized unions with a geographically based council system. A federated structure, combining nested sets of democratic assemblies and recallable delegates, is used in order to preserve as much autonomy as possible for local sections while allowing for large-scale coordination. The tactical emphasis on the general strike shows its true importance in light of these organizational forms; a cataclysmic general strike is hoped to lead to the revolutionary overcoming of capitalism and the state in a way that will then allow syndicalist structures to reconstruct society (Rocker 2004).
organizations in Spain in 1868 and Italy in 1869) and the Swiss Jura Federation. The characteristic political and organizational practices of syndicalism made some of their earliest appearances within these groups (Schmidt & van der Walt 2009).

Anarchist-syndicalist links were evident throughout the post-1890 period of mass mobilization. For example, the formation and spread of the General Confederation of Labor (CGT) after 1895 involved a coterie of prominent anarchists including Fernand Pelloutier and Emile Pouget. This was an oft-repeated pattern, with anarchists at the activist core of many unions. Even syndicalist strains that rarely used the language of anarchism had fairly direct ties, such as the role of Chicago anarchists in the founding of the Industrial Workers of the World (IWW).

HISTORICAL TRAJECTORY

Until recently, most historical research has focused on syndicalism in the global core during the period of the early twentieth-century wave. The French CGT grew to almost two million members and precipitated a blizzard of strikes and direct action attacks. In Spain a welter of early syndicalist organizations led to the National Confederation of Labor (CNT) in 1910, an organization which would be well over one million strong at its peak. In the 1930s the CNT became integral to both the battle against Franco as well as the collectivization campaign that took place during the Spanish Civil War. In the US the IWW permanently altered labor tactics with its direct action methods (using the sit-down as early as 1906) and gained an influence well beyond that expected by its peak membership of 100,000 (Darlington 2010).

However, the internationalist orientation and novel tactics of syndicalism suited it just as well to colonial and newly industrialized peripheries; Argentina, Cuba, South Africa, Mexico, Egypt, and East Asia were just some of the areas that saw syndicalist activity. In many areas of Latin America these syndicalist unions, such as the Argentinean Regional Worker’s Federation (FORA), would dominate the union movement for a decade or more, leading combative working classes and often combining urban/rural and skilled/unskilled labor. In China sizable syndicalist movements grew throughout the 1910s, linking up with syndicalist and anarchist radicals in Korea, Japan, and Paris. By the 1930s this transnational wave declined under a combination of state repression, the economic dislocations of the interwar years, and the growing influence of Bolshevik-inspired party models (Hirsch & van der Walt 2010). Despite this, many new syndicalist organizations are currently active worldwide (as well as older organizations like the CNT) and have formed global networks such as the International Workers Association to link up local federations.

System exiting and social movements
AMBER C. TIERNEY

As has been well documented in the social movement literature, movements can take multiple forms. Accordingly, analyses of coordinated challenge tend to array social movements along a spectrum of variable dimensions. Snow and Soule (2010) suggest that social movements can be relegated to one of two general types of challenge, such that the challenge is either direct (including various forms of specifically targeted protest) or indirect (including movements that exit from or divest in authority). Indirect challenges—the less often examined form of collective action—relate to movements that are covert or ambiguous with respect to the action they employ; that may endeavor to actualize broad-based change through individual conversion; and finally, that bypass authority structures by literally “exiting” or withdrawing from undesirable systems or relations (Snow & Soule 2010).

The concept of system exiting draws from Hirschman’s (1970) microeconomic theory of “exit” and “voice” as alternate responses to organizational decline. Hirschman argued that under a democratic competitive-market system, actors (consumers) could seek redress for grievances (e.g., declining product quality or—in the case of social movements—dissatisfaction with the state) through one of two means: exit or voice. “Exit” refers to the process by which, an actor elects to withdraw from a system or relationship (direct protest), whereas “voice” refers to the process whereby an actor directly communicates their demands (direct protest). In his earliest articulation of the theory (1970), exit and voice were conceived of as two contrapositive “see-sawing” forces. In this light, the execution or engagement of one mode of protest—the “dominant strategy”—limited the degree to which the “subsidiary” mode could be simultaneously employed.

However, later analyses of system exiting reformulated the exit—voice interplay (i.e., “dominant” vs. “subsidiary” calculus) to make sense of Hirschman’s foundational schema within the context of “mono-organizational” regimes (e.g., authoritarian), where market-like conditions are absent (Hirschman 1993; Pfaff & Kim 2003). Though they draw differing conclusions, many of these analyses on system exiting in nondemocratic regimes look to the case of the 1989 revolution against the Leninist German Democratic Republic (GDR) as an archetypal case to examine system exiting (Hirschman 1993; Mueller 1999; Pfaff & Kim 2003; Pfaff 2006). In subsequent work, Hirschman (1993) augmented his earlier thesis, to suggest that both exit (out-migration from East Germany) and voice (protest demonstrations in the GDR) functioned, in tandem, to bring about Die Wende, ultimately culminating in German reunification.

In a similar vein, Pfaff and Kim (2003) advance a sociological theory of exit—voice dynamics that takes social embeddedness into account and thereby delineates the ways in which system exiting has social implications for voice. First, mass exiting functions as a “signaling” device to publicly amplify and reveal grievances against the state. Additionally, a “network erosion effect” can occur where exiting options may siphon off the “resourceful” and “alert” individuals who would be more likely to mobilize, thereby undercutting the potentiality of direct collective action (see Hirschman 1970). Comparably, Pfaff (2006) finds that channels for voice are often blocked by the regime and where opportunities for clandestine emigration arise, exiting becomes increasingly desirable (Mueller 1999; Pfaff 2006). Pfaff (2006) finds evidence to suggest that a positive relationship between mobilization and emigration existed in the
context of the 1989 revolution. Maintaining that emigration from the GDR operated as a signifier of regime vulnerability, Pfaff reasons that exiting served to trigger collective action. However, Pfaff cautions that at a certain point, a critical threshold is reached and exit runs the risk of stifling voice by removing actors from social networks that initiate and drive mobilization (Pfaff 2006: 29).

Alternatively, Mueller (1999) focuses solely on exiting systems, arguing that contextual circumstances constrain exiting dynamics in social movements. Under authoritarian rule, contextual constraints and opportunities, resources, collective identities, and previous histories of struggle engender “hybridized-exiting profiles.” Mueller cites multiple examples of exiting movements – ranging from the flight of the Dalai Lama and his government to the mass exiting of Cubans to Florida – to delineate how contextual factors shape the multiple forms of exiting profiles.

Other studies examine exiting strategies in the context of religious sectarian movements. Johnson (1974) and Wilson (1974) analyze organizational forms of religious groups, including the development of the religious “sect” as an oppositional or “contracultural” social organization that has exited from the traditional church (Johnson 1974: 248). Johnson argues that the religious sect is at variance, theologically, with the mainstream, and as such, elects to exit from the main of the church and create an alternate offshoot “sect” stemming from the original denomination.

Notable works on system exiting amongst communal groups underscore the ways in which intentionally imposed social processes and organizational structures reinforce the rejection of the wider social order. For example, Berger’s (1981) study on a pastoralist commune in Northern California known as “The Ranch,” emphasizes the ways in which “ideological work” maintains the commune by reinforcing quintessential counterculture beliefs through ritual. Kanter (1972) finds that the most enduring communes were those that had the strongest boundaries, were the most centralized and had charismatic leaders who upheld an articulated cultural system of rituals and symbols to maintain commitment. Alternatively, Hall (1978) uses a phenomenological approach to develop a typology of six ideal utopian types (based on two modes: “time” and “social enactment”), that serve as a heuristic to better understand communal life and the ways in which “myth” encourages group formation.

Snow and Soule (2010: 16) point to a host of additional studies that further illustrate system exiting in the context of social movements, including: terrorist groups, separatist and secessionist movements, religious cultic movements, and finally, mass suicide movements, where death becomes the absolute expression of exit (see Hall 1987 for a discussion of the “Jonestown” mass suicide and Balch 1995 for a discussion of the Heaven’s Gate suicides).

As this review demonstrates, traditional and contemporary accounts of collective action require an expanded conceptual window, one that counts system exiting as an alternative form of collective contention in which aggrieved populations can challenge the relevant authority structures through coordinated systems of exiting.

Tea Party movement
(United States)
AMANDA PULLUM

The Tea Party is a conservative movement in the US that surfaced in early 2009. Broadly defined, the Tea Party consists of a loose coalition of allied collective efforts aimed at reducing taxation, reining in the federal government’s spending (e.g., bailout and stimulus monies), and opposing government involvement in health care and related social activities. However, many Tea Partiers have mobilized around additional conservative concerns, and it is difficult to provide a more precise goal or mission of the Tea Party because national and local Tea Party organizations differ considerably in their stated purposes. There are multiple national organizations, but no group is clearly dominant, and each of the local groups may have weak or no ties to the national organizations.

The origins of the Tea Party are the subject of some debate within the movement, but most agree that the Tea Party began in February 2009 with multiple protests opposing the Obama administration’s recently passed economic stimulus package, the American Recovery and Reinvestment Act (Bennett 2010). Although the Tea Party often bills itself as a grassroots campaign, several Tea Party organizations receive considerable funding from large, national organizations, with the most notable being FreedomWorks and Americans For Prosperity (Mayer 2010). Opponents of the Tea Party have accused these organizations of “astroturfing,” or funding a political project that is disguised as a “grassroots” movement.

The organization Tea Party Patriots states, “The impetus for the Tea Party movement is excessive government spending and taxation.” This national group lists its core values as “fiscal responsibility, constitutionally limited government, and free markets.” Tea Partiers also include opposition to the Obama administration’s health care reform, opposition to cap and trade legislation, excessive government spending, and opposition to illegal immigration as reasons for joining the movement. Furthermore, many Tea Partiers are also members of the Christian Right, leading to some overlap between these movements (Jones & Cox 2010); Tea Parties also attract some Libertarians as well. As of 2010, polls showed that Tea Partiers tended to be white, over the age of 45, and both wealthier and better educated than the general public (Quinnipiac University 2010; New York Times/CBS News 2010).

Some Tea Party organizations identify themselves as part of “The 9–12 Project.” In March 2009, Fox News commentator Glenn Beck issued a call to “bring us all back to the place we were on September 12, 2001. The day after America was attacked we were not obsessed with Red States, Blue States or political parties. We were united as Americans, standing together to protect the greatest nation ever created” (9–12 Project 2009). Beck encouraged viewers to hold meetings in their homes or communities, and created a list of 9 principles and 12 values with which 9–12 Project members agree. “We Surround Them” – Beck’s assertion that his supporters were numerous, while those currently holding political power were few – quickly became a rallying cry for 9–12 Project groups.

The stated goals of 9–12 Project groups are much broader than those of the larger Tea Party movement. The 9 Principles reflect a concern with nationalism, religion, and family-related issues, and an opposition to affirmative action and social welfare programs; these issues are not clearly noted in other Tea Party organizations’ mission statements. However, due to the movement’s overlap with the Christian Right, many rank-and-file Tea Partiers do express a desire for religion to play a stronger role in
politics (Campbell & Putnam 2011). Nearly all Tea Party groups wish to reduce taxation, limit government spending, and limit the size and scope of the government.

The Tea Party has also attracted members of other conservative movements, such as anti-immigration activists and “birthers.” (Birthers claim that Barack Obama was not born in the US, making him ineligible to be president; some also believe, despite his claims to the contrary, that Obama is a Muslim.) Though not all Tea Partiers support these views, Campbell and Putnam’s data show that Tea Party members have “a low regard for immigrants and blacks” compared to other white Republicans. The presence of these viewpoints has led observers and the Tea Party’s opponents to accuse the movement of racism, an accusation that many Tea Partiers have fiercely contested. The Tea Party appears to be the latest in a series of right-wing and nativist movements in the US; Lipset and Raab (1970) argue that such movements arise when formerly dominant groups are displaced from power. For many Tea Partiers, the election of the first African American president may represent such displacement.

We can summarize the Tea Party as a loosely connected coalition of national and local conservative organizations, holding differing values and goals but agreeing on support of fiscal conservatism, small government, and strict construction of the Constitution. Tea Partiers often identify as Republicans or Libertarians, and Tea Party candidates generally run for office as Republicans. Yet, Tea Partiers argue that the Republican Party is not conservative enough and that Republican politicians, while more responsive than Democrats, do not take into account Tea Partiers’ concerns. Most Tea Partiers, then, might best be seen as conservative Republicans who feel alienated from the party.

The Tea Party has achieved some important electoral victories. With considerable Tea Party support, Scott Brown won the Senate seat previously held by the late Massachusetts senator Ted Kennedy. At the time of this writing, in late 2011, Representative Michele Bachmann served as chair of the Tea Party Caucus, which boasted 62 members from the House of Representatives and four from the Senate. Further, it is reasonable to anticipate that the Tea Party will be an important consideration for the Republican presidential candidate for the 2012 election, and that Tea Party support (or lack thereof) may play a substantial role in the race. Along with CNN, Tea Party Express sponsored a debate in September 2011 in which eight Republican presidential candidates participated before an audience of Tea Party members, and Tea Partiers nationwide posed questions via video. It remains to be seen, however, whether the Tea Party will continue to gain power in conservative American politics.

Transgender movement

AMY L. STONE

The transgender movement in the US has been growing since its start in the late 1960s, focusing on issues such as violence, legal recognition, employment discrimination, media coverage, and poverty. “Transgenderist” was a term first used by transvestite pioneer Virginia Prince in 1978 to describe individuals who, like her, lived as a different gender without hormones or surgery (Valentine 2007). Since the late 1980s, “transgender” has come into common use as an umbrella term that includes individuals who identify as a gender other than the one they were assigned at birth or who otherwise vary from culturally conventional gender roles.

Historian Joanne Meyerowitz (2002) traces the start of the transgender movement to transsexual support groups and organizations in the late 1960s and early 1970s. These early groups included the creation of COG in 1967, the first formal organization of self-identified transsexuals, and the Street Transvestites Action Revolutionaries (STAR), founded by activist Sylvia Rivera and African American drag queen Marsha Johnson in 1970 in New York City. Early protests included the Compton Cafeteria Riots in 1966 in the San Francisco Tenderloin, a riot that preceded the infamous New York Stonewall riots by a few years (Stryker 2008). Other important early organizations included a support group for female-to-male (FTM) transsexuals in the San Francisco Bay Area founded by Louis Sullivan in 1986, which grew into FTM International. These early groups were different than transsexual advocacy groups, which were led by doctors. Creating organizations independent of the medical profession and building community among transsexuals was a critical part of the early transgender movement.

The transgender movement moved from delocalized small groups to a national presence in the 1990s. During this time “transgender” was claimed as a political and social identity within communities. Transgender organizations grew, including direct action groups such as the Transsexual Menace (1993). Legal groups such as the Sylvia Rivera Law Project (2002) and the Transgender Law Center (2002) began to address important legal cases about marriage, name changes, and criminal justice that affect the lives of transgender persons. National organizations such as the National Center for Transgender Equality (2003) and Gender Public Advocacy Coalition (1995) advocated for federal transgender-supportive legislation and policies. This national presence was supported by a growing positive coverage of transgender lives and issues in the media, including mainstream movies such as Boys Don’t Cry and Trans America. These movies were frequently criticized for their use of nontransgender actors; additional criticisms of transgender media coverage include the fixation on individuals such as Thomas Beattie “the pregnant man” rather than coverage of transgender movement issues.

The transgender movement has made legislative and movement gains in the arenas of hate crimes and nondiscrimination laws. In the US, this has led to the establishment of the Transgender Day of Remembrance, held every year on November 20, which was started in 1998 to honor the death of a transgender woman. It has also led to support and passage of the Matthew Shepard and James Byrd, Jr Hate Crimes Prevention Act in 2009, which includes coverage of gender identity. This was the first federal law to extend protections to transgender persons. The transgender movement has made progress on state and municipal laws that protect transgender persons from discrimination based on gender, gender identity, or gender expression. As of 2011, the National Gay and Lesbian Task Force reported that 44 percent of the US population was covered by transgender-inclusive nondiscrimination laws.
either at the state level (in 15 states and the District of Columbia) or the city level (in 143 cities and counties across the US). In addition, as of 2011, over 400 colleges and 200 of the Fortune 500 companies also prohibit discrimination based on gender identity and/or expression. Passing a transgender-inclusive federal nondiscrimination law has been more complicated and politically fraught. Transgender advocacy organizations have long struggled to get transgender-inclusive language in the proposed federal bill, the Employment Non-Discrimination Act (ENDA), which was initially proposed to protect just sexual orientation. Within the gay and lesbian movement, there has been criticism of organizations, such as the Human Rights Campaign, that have been willing to support ENDA without the inclusion of transgender people. There have also been increasing numbers of federal policies that are supportive of transgender citizens and legal challenges that have worked to establish the right to marriage, changing sex, and changing name on legal documents, criminal justice, immigration, asylum, and medical deduction for health care.

Other transgender movement goals have focused on the medical diagnosis and procedures for transitioning from one sex to another. These goals have included altering the inclusion of gender identity disorder in the Diagnostic and Statistical Manual of Mental Disorders (DSM). This goal is controversial among transgender activists and advocates. On the one hand, the inclusion of gender identity disorder in the DSM allows transgender patients to access medical insurance in some cases and deduct medical care. On the other hand, many transgender activists argue that gender identity disorder as a mental health diagnosis stigmatizes transgender persons. The inclusion of the gender identity disorder of childhood as a mental health diagnosis is particularly controversial. The transgender movement has been more successful at changing the standards of care for transgender patients. The World Professional Association for Transgender Health (WPATH), formerly the Harry Benjamin International Gender Dysphoria Association, establishes the medical standard of care for access to surgery and hormone use. Earlier standards of care were criticized by many transgender activists and organizations as relying too heavily on cisgender (nontransgendered) gatekeepers, primarily mental health practitioners, for transgender access to medical care.

The transgender movement has also successfully pushed for inclusion in the larger lesbian, gay, bisexual, transgender, and queer (LGBTQ) movement. Although transgender and transsexual individuals have participated in the lesbian and gay movement since its start, there was a consolidation of their inclusion in the movement in the mid-1990s. Early gay activists in the homophile, lesbian separatist, and gay liberation movements had conflicting attitudes about including transsexual and other gender variant participants. Homophile activists excluded anyone who was gender variant, particularly transvestites and transsexuals. In the early radical years of gay liberation, activists initially embraced crossdressers, drag queens, and transsexuals as part of the cause of gay liberation, along with oppression based on race, class, and gender. Early lesbian feminism had a series of disputes about the inclusion of both butches and transsexuals, for example the appropriateness of Sandy Stone, a transwoman, working for the lesbian recording company Olivia Records. Burgeoning transgender activism in New York City and San Francisco altered the strategy of the transgender movement in the early 1990s by pushing for inclusion in both local and national lesbian and gay events and organizations.

Two national events that actively excluded transgender individuals or issues – the Michigan Womyn’s Music Festival in 1991 and the 1993 March on Washington for Gay, Lesbian and Bisexual Rights – drew the attention of activists across the country to transgender inclusion. Transgender women had covertly participated in the lesbian-focused festival for many years. However, in 1991 festival security guards expelled Nancy Jean Burkholder, a transwoman, for not being a “womyn-born womyn,” the technical policy for admission.
Debates raged in LGBT newspapers across the country as to whether or not transgender men and women should be welcome at the festival; an alternative event, Camp Trans, began across the road from the festival, an event that still continues (Gamson 1997). The March on Washington organizing committee in 1993 rejected requests to include “transgender” in the March title to the cheers of some committee members, although there was a transgender-specific caucus area and inclusion in the goals of the march. Despite these conflicts, during the early 1990s many lesbian and gay movement organizations began to “add the T” to their organizational name and mission statement.

The international transgender movement has had variable success. The European Union now has laws that forbid transgender discrimination in the workplace and includes gender identity grounds of persecution eligible for asylum. Canadian transgender military officers are allowed to serve and may receive medical care to transition while in the military, and in 2011 Australian passports could denote “X” rather than “F” or “M” for sex, creating options for intersex and transgender citizens. Most countries have some form of transgender movement organizing, although this organizing may just be small localized groups.

Existing social science research on transgender organizing has a few central foci. First, scholars in both sociology and anthropology have analyzed the taxonomical organization of the category “transgender” and the way this organization alters transgender organizing (Davidson 2007; Valentine 2007). According to Megan Davidson (2007: 61), “different constructions of the category transgender, and who it includes and excludes, are not simply negotiations of a collective identity but, more significantly, negotiations about the boundaries of a social movement and that movement’s efforts to effect social change in the United States.” This analysis includes tensions within the transgender movement between subgroups over what it means to have an authentic transgender identity (Broad 2002). Second, scholars have developed a history of transgender organizing, from Joanne Meyerowitz’s (2002) history of transsexuality to transgender scholar Susan Stryker’s (2008) critique of the erasure and appropriation of transgender history. Other scholars have also analyzed the way that transgender organizing operates in tension with LGBTQ organizing, including the history of transgender exclusion from lesbian and gay politics. Finally, scholars have analyzed transgender movement goals and victories, particularly transgender law and civil rights (Currah, Juang, & Minter 2006).

Visual analysis of social movements

NICOLE DOERR and SIMON TEUNE

Visual analysis is the development of concepts and methods to study visual elements of the mobilization, framing, diffusion, and resonance of protest and social movements. In the early 1990s, the “visual turn” in the humanities and cultural studies inspired a theoretical debate about the “power of images” in political conflict (Müller & Özcan 2007). While the visual turn resonated in international relations and media studies, especially in reaction to contentious global media events such as September 11, few social movement scholars have adjusted their focus to the visual realm. Although it is widely acknowledged that visible manifestations are a vital part of social movements and their reception in the public sphere, analysts of social movements have relied almost entirely on text-based concepts and methods.

Visual analysis extends primarily to three aspects of social movement dynamics: (1) visual manifestations as a class of expressions produced in social movements; (2) the representation of social movements in images disseminated in mediation processes; and (3) a larger societal framework granting visibility to certain groups and claims while others remain invisible. Dealing with these aspects, visual analysis speaks to canonized concepts of social movement research such as contentious repertoires, framing, collective identity, media resonance, and discursive opportunities.

In drawing attention to the performative dimension of contentious politics, movement theorists have revealed the powerful visual dimension of historical events constructed and remembered by protesters, bystanders, and opponents. Social movement scholars working in different fields have presented visual analyses primarily in the form of case studies and in an interdisciplinary spirit in order to explore the actors and strategies behind visual mobilization, the constraints upon them, their resources, and the impact of visual struggles both in collective memory and different media arenas. Sociologists and media analysts have investigated the different forms of visual framing displayed in embodied rituals of interaction as well as through distant media communication aimed at mobilizing emotions such as shame and anger (Halfmann & Young 2010), irony or pride (Mattoni 2008). Scholars have applied visual analysis to the relationship between the visual and political mobilization in the context of the prolife movement (Pollack Petchesky 1987), radical environmental movements (Routledge 1997; Delicath & DeLuca 2003), global summit protests (Teune forthcoming), and mobilizations on social precarity (Mattoni 2008) and immigration (Doerr 2010).

A first field of inquiry addressed by visual analysis includes framing processes and the dynamics of political conflict in media discourse. Images are, like texts, a key medium used by protesters to communicate a message. Given the complex and contentious reception of culturally coded images in pluralist publics, these attempts are likely to have varied and potentially ambiguous effects. Moreover, due to the characteristic openness of visual forms (Müller & Özcan 2007), images require a particularly careful and hence challenging reading by movement analysts. Visual theorists in media studies and art history agree that images are associated with a complex stock of cultural knowledge and experiences, frames and identifications, while they are also interpreted, framed and reframed by political actors. In their use of images, social movements tap into the collectively memorized experiences and emotions connected to past political events, and they, in turn, become part of a collective memory via photography, film, and other visual
representations (Romano & Raiford 2006). Because the resonance of social movements is essentially tied to their image in public and commercial mass media, visual representations of protest in these arenas constitute another concern of visual analysis.

It has mainly been media scholars that have shown the impact of images on the reception of contentious actors (Arpan et al. 2006), their role in attracting media attention (Routledge 1997), and mainstreaming social movement claims (Delicath & DeLuca 2003). An open question regards the cognitive and emotional resonance of older iconographic traditions and popular images used by protesters in marches, while also being imitated, copied, or destroyed by countermovements in turn.

Second, visual analysis offers a set of new questions to the study of political discourse and practices of discussion and democracy inside and outside social movements. Social movement theorists have discussed the role of narratives and symbols which help activists create visibility for the perspective and experiences of disadvantaged groups in mainstream arenas of political talk (Polletta 2006). In this vein, empirical studies that combine visual and discursive methods indicate that actual visual images or symbolic texts displayed within group discussion and brainstorming may be a source or constraint for including disadvantaged groups and fostering the diffusion of new ideas (Doerr 2010). Another open question regards the relationship between visual images and political framing as diagnostic, prognostic, and action oriented. In comparison to cognitive linguistic “arguments” exchanged within political discourse, visual theorists have argued that images construct new political meaning mimetically and/or through association with existing symbolic forms and by reimagining older traditions (Müller & Özcan 2007). At the same time, linguistic signs are symbolic forms built on images, metonymies, and metaphors (Delicath & DeLuca 2003). A much deeper analysis of the cultural and cognitive sources, practices of memorization, transposition, and diffusion of ideas is necessary to understand social change and continuity in dialogues between visual and verbal, symbolic, and textual forms of framing.

Third, there is a growing need for research on the visual conditions of diffusion of social movements in increasingly globalized yet culturally diverse societies. Regarding the popularization of new media, it is surprising that few movement scholars have explored visual images as triggers for transnational protest events. While much work has focused on the reception of global icons of protest in mass media, we know little about the place-specific production and strategic mobilization of images by resource-poor local activist groups (Mattoni 2008) and the reframing of protest images by mass media and the police (Teune forthcoming) as well as state actors. Through Internet-based diffusion, images are represented globally in real time. Could visual framing strategies under these circumstances be more effective in diffusing new ideas, and empower transnational movements for social change? In empirical terms, it seems that the number of global images diffused via ICT has not, in fact, changed familiar visual representations in media reporting on protest portraying political conflict (Halfmann & Young 2010). By combining framing approaches with visual analysis we should be in a better position for understanding pathways of diffusion of slogans, images, and visual objects that spread ongoing revolutionary and pro-democracy movements across countries? Successful visual diffusion practices are key for understanding diffusion across cultural and linguistic contexts. It would be enlightening, for example, to see which linguistic and visual frames diffused across different Arabic- and English-speaking audiences, and which new images, texts, and strategies emerged through cross-cultural, cross-linguistic contact.

Visual analysis of political mobilization has three main contributions to offer to the field of social movement studies. First, it enlarges our understanding of existing concepts of social movement studies – framing, identity, and political discourse as well as strategy and resources. Each of these is created not only
by cognitive linguistic mechanisms but also through visual struggle. Second, the study of images in social movements helps understand the resonance and impact of political protest in varying cultural contexts. Third, and more broadly, a systematic inclusion of visual materials and methods will help understand the capacities of and constraints for contentious actors to formulate, diffuse, and popularize criticism and alternatives. How influential are images relative to other factors in accounting, in particular, for why movements emerge when they do and for how successful they are in realizing their goals? Studying the production conditions of visual images, the popular resonance of a particular visual frame, and the constraints imposed by mainstream media may help us to understand how activists reach out more broadly to people outside the movement. By combining different visual methods such as iconography, media analysis, and framing (Müller & Özcan 2007), future research needs to pinpoint the cultural sources and political success of visual mobilization strategies in different local contexts, their reception and diffusion to various environments and the reframing of contested symbols in contentious politics.

Women’s movement in Spain

MONICA THRELFALL

The Spanish women’s movement displays a number of features that clearly place it in the “family” of European women’s movements, yet it also differs in significant ways.

It was a “latecomer” to European feminism, mainly due to the fact that Spain was governed by an autocratic dictatorship until the elections of 1977. It is common to date its “arrival” to 1975, because the UN’s celebration of International Women’s Year gave all the legal, tolerated, and banned women’s organizations the chance to speak out under cover of the international focus on women’s rights, whether by joining in the dictatorship’s formal events or by vociferously boycotting them. The peculiar feature was that there long existed a protofascist women’s organization with countrywide branches, run by the sister of the dictator General Franco. It had originally been set up during the civil war (1936–1939) to galvanize support for the military insurgency, and survived the intervening decades by running an obligatory social service for women devoted to reinforcing feminine stereotypes of wifely and motherly duties. In this traditional, paternalistic, and Catholic climate, women were allowed to legally set up Housewives Associations. In the late 1960s and early 1970s these associations were infiltrated, or secretly set up, by women’s rights advocates from the underground left-wing parties, particularly from the active and influential Communist Party of Spain. The latter also dominated the legal and illegal arms of the trade union movement and addressed some of the women workers’ problems. In this paradoxical context, most of the independent women’s groups, ranging from cultural promotion to women’s liberation, were identified with and involved in the fight for democracy. Thus, a politicized form of socialist feminism emerged quickly into semi- and then full legality as part of the democratic opposition. Two feminists were elected to the first elected parliament of 1977–1979, which was charged with drafting the new constitution, and, after pressure from women’s organizations, it duly included bans on sex discrimination in law and at work and ensuing parliaments passed laws to implement them.

Second-wave Spanish feminism was not only molded by opposition to a vindictive long-ruling dictator but was also vitalized by the memory of the democracy he had crushed. The parliaments of 1931–1936 had granted women the right to vote, to custody over children, some equality at work, divorce by mutual consent, and a groundbreaking abortion law – all revoked after the civil war. So instead of looking back to an era of (virtually nonexistent) liberal feminism, it was a radical and bloodied first-wave that was the second’s precedent. But it had shown how much a handful of determined women engaging with institutional struggles could achieve. As soon as democratic institutions returned, feminists operating inside the elected parties’ power centers, such as local governments, used them to set up policy committees, advice bureaus, and services for women. Unusually the Spanish Socialist Party openly launched a women’s birth control center it had financed, while the Communist Party had backed a previous underground one.

When the Socialist Party won the 1982 elections it had promised little for women, nevertheless the women’s movement campaigns to defend doctors and nurses arrested for performing illegal terminations forced the party to introduce an abortion law as one of its first measures in 1983. Socialist feminists also convinced the government to set up an official Institute for Women which took the sex equality campaign forward on many fronts, supporting the spread of women’s organizations throughout
the country through institutional recognition and subsidies for their activities. Even when conservatives were returned to power in 1996, the women’s movement had become sufficiently established for them not to abolish the Institute or the women’s rights centers across the country, even when several of them focused on issues of male violence against women. By then the worldwide campaign for granting women political power had taken root in Spain, with several women promoted to prominent positions, at one point holding the posts of president in both houses of parliament under a conservative administration (2000–2002) – a first in Europe. When the Socialist Party returned to power in 2004, it did so committed to full “gender parity” for all elective posts (a long-standing demand of its feminist wing that all public bodies should achieve a composition of no more than 60% and no less than 40% of either sex). The prime minister duly appointed a gender-balanced government, a first in Europe after the groundbreaking case of Norway in 1980. Far from window-dressing, this was followed up by several new equality laws aimed at eradicating violence and alleviating women’s burden of care for the young and the elderly (Valiente 2007, 2008).

Thus the Spanish women’s movement is distinguished by the strength of socialist-feminism among its ranks, and in particular by the latter’s, as well as by liberal feminism’s, institutional orientation. In this sense, Spain has seen its share of “state feminism” (Stetson & Mazur 1995) while also demonstrating that individual parties at local, regional, and national levels have been the ones to institute change following instigation by women’s organizations and policy advocates (Threlfall, Cousins, & Valiente 2005). Law reform, policy innovation, and the establishment of services to bolster equality have been feminism’s overriding focus, at the expense of conceptual or theoretical innovation. Nonetheless, feminist academic research, mainly among historians, sociologists, lawyers, and political scientists, has flourished. While the lesbian wing of the movement did not achieve a high profile in the first decades of democracy, it did achieve registration of civil partnerships in some regions, starting with Catalonia in 1998, as part of the wider lesbian and gay and transgender movement. The legality of same-sex marriage was recognized in 2005, making Spain part of an advance group of ten countries of the world, and 4500 couples married in the first year of the law.

Zionist movement

Zionism means different things to different people depending on their ethnic, religious, and national identities, but it is defined most succinctly as, “a movement seeking to create for the Jewish people a home in Palestine secured by public law” (Engel 2009: 1). The term Zionism comes from the word “Zion,” a biblical name for Jerusalem. In August 1897, over two hundred Jews met in Basel, Switzerland, to establish the World Zionist Congress and founded the Zionist Organization (ZO). This event marked the formal establishment of the Zionist movement. From its inception this transnational movement has worked to establish a sovereign state the Jewish people could call home. It finally achieved its primary goal on May 14, 1948 when the state of Israel was established as a sovereign Jewish homeland.

THE FOUNDING OF A MOVEMENT

Theodor Herzl is credited as founder of the political Zionist movement. He grew up in Vienna and initially identified more closely with German rather than Jewish culture. In 1891, Herzl moved to Paris as a correspondent for a Vienna newspaper, *Neue Freie Presse*. Like many other Western European Jews at the time, Herzl initially felt that the best way to end anti-Semitism would be to convince all the Jews to convert to Christianity. However, a series of anti-Semitic events all across Europe and Russia during the late nineteenth and early twentieth centuries caused him to question this solution. For example, the openly anti-Semitic politician Karl Lueger was elected by popular vote and was eventually appointed mayor of Vienna in 1895. Prussian law restricted non-baptized individuals from joining the army. Under Romanian law, an individual could not be considered both Jewish and Romanian. In Russia, the assassination of Czar Alexander II sparked a series of large-scale anti-Jewish riots, known as “pogroms,” blaming the Jews for the czar’s death. These riots sought to expel Jews from the region and resulted in many deaths. For Herzl, the Dreyfus affair in France was the final straw that propelled him into the Zionist movement. Captain Alfred Dreyfus was a Jewish officer in the French military who was convicted of treason in 1894. Two years after he was placed in solitary confinement, new evidence proved that Major Ferdinand Walsin Esterhazy was the true perpetrator. However, this evidence was suppressed by high-ranking military officials, Esterhazy was acquitted, and falsified documents brought new accusations against Dreyfus. News of the military’s cover-up began to spread, and in 1899 activists pressured the government to bring Dreyfus back to Paris for a new trial. Herzl, who was covering these events as a correspondent, began to question if Jews’ religious beliefs were the real reason behind these conflicts. In response to these events, he became increasingly concerned with the increasing amounts of anti-Semitism and the future of Jews. This was a concern for many Jewish intellectuals in Europe and Russia at the time. Prior to Herzl’s Zionist movement, a number of Jewish thinkers, such as Perez Smolenskin and Leo Pinkser, called for the mass migration of Jews to Jerusalem. However, it was Herzl who sought political and financial support for such a large-scale migration.

Herzl had unknowingly come to the same conclusion as other Jewish thinkers of the time. Similar to the ideas set forth by authors such as Leo Pinkser, Herzl concluded that Jews would always be perceived as alien in European society because they were a minority of the population wherever they lived. The solution was for Jews to be “granted sovereignty over a portion of the globe large enough to satisfy the rightful requirements of a nation” (Herzl 1896: 24).
A key difference existed between Herzl’s political Zionism and other plans for mass Jewish migration: Herzl felt that government approval was the only way to achieve sovereignty. In order to be successful, the Jews needed to obtain government approval before resettling in a new land and calling it their home.

In pursuit of his goals, Herzl attempted to solicit the support of Baron de Hirsch, a multimillionaire who had already founded the Jewish Colonization Association. This organization encouraged mass Jewish migration by financially supporting agricultural settlements in Argentina for persecuted Russian Jews. However, de Hirsch disagreed with a political approach and only supported philanthropic efforts to relocate persecuted Jewish communities. After failing to solicit support from a number of other philanthropic organizations, Herzl took his message to the Jewish public and published Der Judenstaat (The Jewish State) in 1896. There were a number of critics, especially among the highly religious community. Orthodox Jews distanced themselves from early Zionism. In fact, most participants viewed Zionism as a secular movement. Finally, Herzl found a firm basis of support among student organizations, such as Kadimah. In order to discuss his revolutionary ideas, Herzl brought together the first ever congress of representatives of the Jewish people. The Zionist Congress lasted three days and consisted of 204 delegates from all around the world. It was at the congress that the ZO was established. Herzl proclaimed the movement a success because it was able to bring together elements of the Jewish community.

FINDING SPACE FOR A JEWISH HOMELAND

In Basel, the ZO established a plan of action to obtain a legal Jewish home in Palestine: promote the settlement of Jewish agriculturalists and skilled laborers in Palestine, organize Jews at the local level, create a sense of Jewish nationalism, and begin gaining government approval. Following the first congress, Herzl was elected as president of the ZO and local federations were established all over the world. Anyone who paid a small annual fee of one shekel, or its equivalent, was considered a Zionist and was granted the right to vote for a delegate in congress. In addition to expanding the movement and establishing the organizational structure, the early work of Herzl and the ZO focused on meeting with officials, such as Sultan Abdul Hamid of Turkey, in order to gain a charter for an autonomous settlement. The first major fragmentation in the movement occurred when the ZO received its first formal offer from the British government for an autonomous settlement in East Africa. A large faction of the community opposed any land outside of Palestine. In light of worsening conditions in Russia and failed negotiations in Istanbul, Herzl urged Zionists to consider the offer a temporary shelter until they could legally secure a home in Palestine. Herzl died of a heart condition in 1904 before the ZO finished evaluating the area. The investigation determined that the land was unsuitable for agriculture and the ZO Congress rejected the offer. A number of delegates in favor of the British offer seceded from the ZO and formed the Jewish Territorial Organization (JTO), which searched for an autonomous settlement in any part of the world. This was the first of many divisions within the Zionist movement. Though it conducted negotiations with various governments, the JTO never succeeded in finding a suitable home and was eventually disbanded shortly after World War I by the leader and original founder, Israel Zangwill.

David Wolffsohn was elected as head of the ZO in 1904, following Herzl’s death. This marked a change from a political focus to a practical focus within the Zionist movement. A combination of slow-moving diplomatic efforts and the failed Russian revolution in 1905 forced the Zionists to seek alternative approaches to mass migration. The ZO established the Jewish National Fund (JNF) in order to raise money for the purchase of land in Palestine. Though they did not have the
government approval to create an autonomous state, they still attempted to use legal means of obtaining land for their new settlement. The majority of this land was owned by merchants who often lived outside of Palestine and paid taxes on the land in exchange for holding the land titles. Though they were technically tenants, the peasant families who worked these plots for generations thought of the land as theirs because they rarely, if ever, came into contact with the landowners. Roughly 80 percent of the land purchased by the JNF before World War II was purchased from these landowners. Thus, much of the land that was purchased was already inhabited by local Arab communities. Zionists assumed that the local Arab communities would welcome the Jewish settlements because they would also benefit from the newly built infrastructure and the increased capital that came with these settlements. They thought that the local residents would support Palestine as a Jewish homeland and prefer a Zionist-led government over the Ottoman rule. However, as more Zionists immigrated to Palestine, many of the local Arabs were displaced, and they began to resent the Jewish settlers.

POPULATING PALESTINE WITH JEWS

Zionists were not the first Jews to arrive in Palestine. Though the harsh living conditions deterred most Jewish immigrants from seeking refuge there, a few settled in the holy cities of Jerusalem, Hebron, Tiberias, and Safed, forming the “Old Yeshuv.” These individuals felt it was their religious duty to move to Israel. Their goals differed greatly from those of early Zionism. They primarily lived off halukka, which was money that had been collected from Jews in the Diaspora. Jews considered giving halukka a duty because it was a religious commandment for Jews to settle in the Holy Land. However, this idea was rejected by the “New Yeshuv,” those individuals who immigrated to Palestine as part of the Zionist movement. The New Yeshuv wanted to realize the utopian vision set forth by Herzl’s (1902) book, Altneuland (Old New Land). Herzl imagined a liberal, egalitarian society that resembled the welfare state. He rejected the class system and imagined a society that encouraged private entrepreneurship, but was built on agricultural cooperatives and welfare. In this model, land and natural resources would be publicly owned. Thus, the Zionists focused on creating a self-sustaining settlement that did not require outside funding and was supported by agricultural collectives. Initially, only those Jews who could exemplify this liberal tradition and who were willing to work as part of these collectives were permitted to immigrate.

The New Yeshuv are often separated into waves of immigration referred to as aliyah, a Hebrew term that literally means “ascent” and refers to the biblical ascent of the Jews up the Judean Hills. Prior to World War I, there were two waves of immigration to Palestine associated with the Zionist movement. The composition of immigrants in each wave reflects both changes within the Zionist movement and the changing political situation in Europe and Russia. The First Aliyah was the first wave of Zionist immigration to Palestine, which occurred from 1881 to 1904. Though these immigrants rejected the goals of the Old Yeshuv, they were still heavily reliant on outside funding because they had no agricultural experience or infrastructure. The First Aliyah was a symbolic representation of the start of a future nation. They created the first agricultural cooperatives and established the use of Hebrew as their primary language. In contrast to the First Aliyah, the Second Aliyah was predominantly composed of young, well-educated Jews (writers, historians, journalists) who opposed the use of local Arab labor to work the land. The majority of these immigrants were born in Russia or Ukraine. Though they were raised in the traditions of socialism, they were open to democracy and an open party system of governance. When they first arrived in Palestine, they became agricultural workers. Many, like Ben Gurion, would eventually become political leaders of the established state of Israel. The
first two waves of Zionist immigrants laid out the structure, but they lacked numbers. This would change following World War I.

With each progressive wave of immigration, tensions rose between the non-Jewish locals and the Zionists. As new settlements arose, more locals were displaced. As a result, unemployment rates rose among non-Jews living in Palestine. As the Zionist movement grew, so too did the idea that whenever possible Jewish farms should be worked by Jewish labor, referred to as “Hebrew labor.” This increased unemployment rates among the non-Jewish population and added to their resentment of the Zionist movement. This economic competition eventually led to the formation of the “Arab nation,” which opposed the Zionist movement and the idea of an autonomous Jewish homeland in Palestine. Many Zionists believed that either these tensions would resolve as economic conditions improved or two separate but parallel economies would arise: a Jewish and a non-Jewish system where members would compete within their own communities but not against each other.

THE BRITISH OCCUPATION OF THE PALESTINE MANDATE

World War I brought about a number of changes to the burgeoning Zionist movement. When Turkey entered the war, the governing body in Palestine began instituting a number of laws which limited the power of the Jewish settlers. The Turkish government forced the Jews, who were subjects of the Allied Powers, to either become Ottoman citizens and serve in the army or leave the country. As a result, many of the Jews were expelled from Palestine or fled. This caused a major depletion in the already small population struggling to survive in Palestine. Finally, the Ottoman Empire fell, and the British took control of Palestine. In 1920, Britain installed a local regime to govern the country until the League of Nations could determine its future. By 1922, the League of Nations ratified Britain’s right to govern Palestine. This gave Zionists hope because, unlike the Ottomans, the British government endorsed the Zionist movement. In 1917, the British government issued the Balfour Declaration which endorsed the establishment of a national Jewish homeland in Palestine. This newfound hope caused the membership rate of the ZO to swell to six times its prewar count. However, this success was short lived because after Britain took control of Palestine, the growing countermovement in the region caused Britain to question its allegiance to the Zionist movement.

The countermovement declared that the Arab nation had a right to Palestine and wished to create an “Arab state.” The tension between the Zionist movement and the Arab nation often escalated into violence in Palestine. As a result, the British placed military forces in the region to police the area until an agreement could be reached. However, these forces were expensive to maintain, and Britain had not initially planned to act as peacekeepers in a querulous region.

Meanwhile, Eastern Europe was becoming an increasingly dangerous place for Jewish communities. Roughly 60,000 Jews were killed in pogroms between 1918 and 1920. At the same time, other countries began restricting the number of immigrants they accepted into their countries. As a result, hundreds of thousands of Jews wanted to escape to Palestine. The prospect of so many Jews immigrating to Palestine worried the British, Arabs, and Zionists alike. The British required that the ZO guarantee a year’s financial support for each new Jewish immigrant who entered the country. Almost 650 new immigrants entered Palestine each month during the Third Aliyah (1919–1923), increasing the number of Jews seeking employment by 50 percent. This aliyah was primarily composed of socialist Jews who were trained in agriculture and who were motivated by the Zionist Workers’ Movement. Luckily, the British instituted ambitious public works projects in order to build infrastructure. This helped absorb the new additions to the labor force and improved the absorptive capacity of the local economy. The composition of the Fourth Aliyah was quite different
from the third in that the majority of these immigrants were motivated by personal reasons; most of these Jews were from lower-middle-class communities and were looking for economic opportunities available in Palestine. Differences between Third and Fourth Aliyah immigrants revealed deeper disagreements within the movement regarding the fundamental goals of the Zionist movement.

Up until the mid-1920s, the Zionist movement experienced little fragmentation, but as immigration into Palestine increased, divisions developed within the movement. The increased desire to immigrate coupled with the British immigration restrictions led to disagreements concerning which Jews should be allowed into Palestine. Some, known as “General Zionists,” focused on the economic goals of the Zionist movement and were content to sacrifice political autonomy in exchange for economic security for the Jewish people in Palestine. The General Zionists thought that focusing on economic gains over political gains would ease the tension with the Arab community. Others, known as “Revisionists,” focused on the political goals of the Zionist movement and wanted to challenge the British immigration restrictions, lack of funding for Zionist projects, and restrictions on Jewish settlements in Transjordan. The Revisionists wanted immediate mass migration to Palestine and assumed the Arab community would reject any plan set forth by the Zionists. Some of these differences, such as the role of Arabs, would continue to divide political parties even after Israel gained statehood.

The British became more involved as peacekeepers in the region following a dispute over a sacred site in Jerusalem in 1929. Though the religious Jews living in Jerusalem rejected the goals of the Zionist movement, the ZO felt it was their responsibility to defend all Jews living in Palestine. Disagreement over who had the right to worship at this site escalated into violence, and in one week 133 Jews and 116 Arabs lost their lives. The worldwide economic depression and increased violence in Palestine worried the British, who were hesitant to spend any more money to maintain the region. They sent a representative to find out the source of the violence. The Shaw Commission concluded that the growing violence was a result of the threat felt by the Arabs and recommended limitations on the expansion of the Jewish community. As a result, the British severely limited Jewish immigration and land purchase.

The Arab countermovement saw this as an opportunity to advance its claims and gain autonomous control over Palestine. To get London’s attention the Arabs began boycotting British goods and a small, radical faction began endorsing violence against the Jews. The Arabs decided to continue demonstrating until their demands were met. They called for a ban on Jewish immigration to Palestine, a ban on land transfers from Arabs to Jews, and an Arab-controlled government. In 1936 the Palestinian Arabs threatened to attack both the British and Jews if their demands were not met by May 15 of that year. The Arab revolts that broke out required Britain to send more resources to the region in order to keep the peace. When the British finally suppressed the uprising in 1938, they had sent over 17,000 army troops and two airforce squadrons. This was a steep price to pay at a time when Europe was becoming an increasingly hostile place. Britain created the Peel Commission to solve their problems in Palestine so they could focus on other areas of the world. The commission called for a partitioning of the region. The Arabs rejected this offer and continued to revolt. Britain sent Colonial Secretary MacDonald to assess the situation and devise a solution. He asserted that the Zionists were at the heart of the unrest and proposed a severe limitation on Jewish immigration and a immediate halt to land transfers from Arabs to Jews. Though the Arabs still rejected this plan because it did not guarantee them sovereignty over the region, Britain endorsed it, and in 1939 it became known as the White Paper. The increased restrictions on the Zionist movement signaled a shift in Britain’s allegiance.

During the Holocaust, the Zionist movement’s attention was split between actively
pursuing the creation of a Jewish homeland and rescuing Jews from Germany and Eastern Europe. The General Zionists favored a more political approach and wanted to make deals with the Arab community so the British would increase their immigration quota. The Revisionists favored a more militaristic approach in which the ZO would work to get a Jewish majority in the region and declare all of Palestine a Jewish homeland. As World War II progressed, Zionists became increasingly focused on rescuing Jews. Many Zionist organizations, such as the New Zionist Organization and Histadrut, coordinated clandestine operations to bring Jews to Palestine outside of the British immigration quota. The ZO knew that, compared to the Arabs, they had little bargaining power. By 1942, the ZO became more assertive and stated that their goals were to create a Jewish commonwealth where the Zionists had complete control over immigration. This declaration signaled a change from a gradual development of the region to a push for complete Jewish sovereignty over the entire region and all who lived there, including the Arabs.

THE CREATION OF THE STATE OF ISRAEL

The end of the war brought with it a significant number of displaced persons and new hope for the Zionist movement. Many of the Holocaust survivors were unable to return to their homeland and were referred to as “displaced persons.” They demanded resettlement. In an effort to maintain its own strict immigration quotas, the US urged Britain to repeal the White Papers and allow these Jews into Palestine. Britain did not wish to further antagonize the Arabs and declined to lift immigration restrictions in Palestine. As a result, the Zionists took to a more militaristic approach. They had developed a security force, Haganah, during the first waves of immigration to protect the agricultural collectives. When the White Papers signaled that chances of achieving a sovereign state were slim, the Zionists expanded their security forces. Along with many Revisionist Zionists and Jewish soldiers who fought in the British Army during the war, Haganah began attacking British installations and bringing illegal Jewish immigrants into the region. Their goal was to establish a Jewish majority in order to gain statehood. The British deported those Jews who were caught attempting to immigrate illegally into Palestine and sent them to detention camps in Cyprus. The sight of Jewish Holocaust survivors being detained behind barbed wire in Cyprus outraged many, including US president Harry S. Truman. The damage to the prestige and property of the British was too much for them to handle after being devastated by World War II. They returned control of the Palestine Mandate to the United Nations, who formed a special commission (UNSCOP) to assess the region and its future. UNSCOP proposed a partition in which 55 percent of the region would become an independent Arab state, 45 percent of the region would become a sovereign Jewish state, and Jerusalem would be governed by an international regime. Though the Arabs and British were adamantly opposed to the agreement, the Soviet Union, US, and Zionists were more than happy with the partition plan. On May 14, 1948 the Zionists realized their initial objective, and Ben Gurion declared the new sovereign Jewish homeland the state of Israel.

Though many define Zionism as a movement seeking to establish a sovereign Jewish state, not everyone agrees with this definition. In 1975, the UN passed Resolution 3379, which determined that Zionism was a form of racism. By a vote of 72 to 35, the resolution was passed as an effort to eliminate all forms of racial discrimination. Though the resolution was revoked in 1991, many still view Zionism as a racist movement infringing the rights of the local Arab community. Others view Zionism within a religious context. According to Sizer (2004: 20), “Christian Zionism is born out of the conviction that God has continuing special relationship with, and covenant purpose for, the Jewish people, apart from the church, and that the Jewish people have a divine right to possess the land of Palestine.” Definitions of
Zionism can vary widely based on an individual’s religious, ethnic, or national identity.

When the Zionist movement succeeded in creating a sovereign Jewish homeland, their goals began to shift. Many of the organizations created by the Zionists became the foundational structures of the newly formed state of Israel. Many of the early political leaders in Israel were active members of the ZO. The initial goal of the movement was to create a sovereign Jewish state that all Jews living in the Diaspora would eventually migrate to. However, many Jews had found new homes in other areas, such as the US, and were content to support the cause without immigrating to Israel. Today, the Zionist movement is a highly institutionalized, transnational movement that is significantly more diffuse than it once was. Though many Zionists today still feel all Jews should immigrate to Israel, others hold the belief that the goal of the Zionist movement is to support Israel as the Jewish homeland and assist Jews living in Diaspora all over the world.
