### Powdered Gum
- Tragacanth Type M-3 NF Premium
- Tragacanth Gum Ribbon No. 1 NF FCC
- Tragacanth (Astragalus gummifer) gum
- Tragacanth Gum Ribbon

### Ropufa® '10' n-3 INF Powder
- Powder

### Sammi Gelatine

### Spray Dried Fish Gelatin

### Spray Dried Hydrolysed Fish Gelatin

### Vee Gee Pharmaceutical Gelatins
- Vitamin A Acetate/D2 500/50
- Vitamin A Acetate/D3
- Vitamin A Palmitate 500
- Vitamin D2 850
- Vitamin D3 100
- Vitamin D3 100 HP
- Vitamin D3 850

### Casein
- CMP-I®

### Milk protein

### Amylase
- Diastase J-P

### 9000-71-9
- Catalase

### 9000-92-4
- Urease

### 9001-05-2
- Urease

### 9001-37-0
- Urease

### Glucose oxidase

### 9001-62-1
- ChiroCLEC™-CR Lipase

### Lipase
- Lipase 8
- Lipase 16
- Lipase 24
- Lipase 30
- Lipase AP6
- Lipase AP12

### Newlase

### 9001-73-4
- Papain

### 9001-75-6
- Pepsin

### Pepsin 1:3000 Powder
- Pepsin 1:6000
- Pepsin 1:10,000 Powd. or Gran.
- Pepsin 1:15,000 Powd.

### 9001-98-3
- Maxiren® Rennet

### 9002-01-1
- Streptokinase

### Streptokinase
- Streptodornase

### 9002-07-7
- Trypsin 1:75
- Trypsin 1:150

### 9002-13-5
- Urease

### 9002-18-0

# Inactive Ingredient Guide

**Chemicals in Compliance with Pharmaceutical Standards:**
Inactive Ingredient Approved Products  

The Inactive Ingredient Guide contains all inactive ingredients present in approved drug products or conditionally approved drug products currently marketed for human use. The ingredients from this guide along with their route of administration are listed here. This is the most current guide presently available from FDA/Center for Drug Evaluation and Research.

*See also:* Permanently Listed Color Additives

Inactive Ingredient Guide: Approved Products

Polyethylene glycol 8000
  Ophthalmic, oral, rectal, topical, vaginal
Polyethylene glycol 20,000
  Oral
Polyethylene oxide
  Oral
Polyoxyethylene-polyoxypropylene 1800
  Ophthalmic, topical
Polyethylene T
  Oral
Polyethylene terephthalates
  Transdermal
Polyglyclatin
  Dental, implantation, IM, subcut.
Polyglyceryl-3 oleate
  Oral, vaginal
Polyglyceryl-4 oleate
  Vaginal
Polyglyceryl-10 oleate
  Oral
Polyglyceryl-10 tetraenoleate
  Oral
Polyhydroxylethyl methacrylate
  Topical
Polyisobutylene
  Transdermal
Polyisobutylene 35,000
  Transdermal
Polyisobutylene 1,200,000
  Transdermal
Polylactide
  IM, periodontal
Polylols
  Dental
Polyoxyethylene alcohols
  Topical
Polyoxyethylene fatty acid esters
  IM-IV-SC, IM-SC, topical
Polyoxyethylene-polyoxypropylene 1800
  Ophthalmic, topical
Polyoxyethylene propylene
  Topical
Polyoxy 35 castor oil
  Intravesical, IV, ophthalmic, oral
Polyoxy 40 castor oil
  IV
Polyoxy 60 castor oil
  IV
Polyoxy 15 cocaine
  Topical
Polyoxy 4 dilaurate
  Topical
Polyoxy distearate
  Topical
Polyoxy 150 distearate
  Topical
Polyoxyethylene isononylphenyl ester
  Oral
Polyoxy 100 glyceryl stearate
  Topical, vaginal
Polyoxy glyceryl stearate
  Topical
Polyoxy 40 hydrogenated castor oil
  Dental, ophthalmic, oral, topical
Polyoxy 60 hydrogenated castor oil
  Topical
Polyoxy lanolin
  Topical
Polyoxy 75 lanolin
  Topical
Polyoxy 6 and polyoxy 32 palmitostearate
  Topical
Polyoxy palmitate
  Vaginal
Polyoxy 8 stearate
  Oral, topical
Polyoxy 40 stearate
  Dental, ophthalmic, oral, otic, topical
Polyoxy 400 stearate
  Topical
Polyoxy 50 stearate
  Topical
Polyoxy 100 stearate
  Topical, vaginal
Polypropylene
  Intrauterine, topical, transdermal
Polypropylene glycol
  IM-IV, ophthalmic, oral
Propylene glycol alginate
  Oral
Propylene glycol diacetate
  Otic, topical
Propylene glycol dicaprylate
  Topical
Propylene glycol-lecithin
  Buccal, oral
Propylene glycol monolaurate
  Transdermal
Propylene glycol monostearate
  Topical
Propylene glycol ricinoleate
  Topical
Polysaccharides
  Oral
Polysaccharides soy
  Oral
Polysiloxane
  IV, oral
Polysorbate 20
  IM, IM-SC, IV, nasal, ophthalmic, oral, otic, subcut., topical, vaginal
Polysorbate 40
  IM, IM-IV, oral, topical
Polysorbate 60
  Ophthalmic, oral, rectal, topical, vaginal
Polysorbate 65
  Topical
Polysorbate 80
  Intra-articular, intrabursal, intradermal, intralesional, IM, intrasynovial, IV, nasal, ophthalmic, oral, otic, rectal, soft tissue, subcut., sublingual, topical, vaginal
Polyvinylacetel
  Oral
Polyvinyl acetate
  Oral, transdermal

### EP Compliant Chemicals

Chemicals in Compliance with Pharmaceutical Standards:
The following chemicals that appear in this reference are listed in the **European Pharmacopoeia (2005)**

<table>
<thead>
<tr>
<th>Acacia</th>
<th>Benzyl alcohol</th>
<th>Cetylpyridinium chloride</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acesulfame potassium</td>
<td>Benzyl benzoate</td>
<td>Chamomile (Anthemis nobilis) extract</td>
</tr>
<tr>
<td>Acetic acid, glacial</td>
<td>BHA</td>
<td>Charcoal, activated</td>
</tr>
<tr>
<td>Acetone</td>
<td>BHT</td>
<td>Chlorhexidine diacetate</td>
</tr>
<tr>
<td>Acetylcysteine</td>
<td>d-Biotin</td>
<td>Chlorhexidine digluconate</td>
</tr>
<tr>
<td>Acetyltirosine</td>
<td>Bismuth subcarbonate</td>
<td>Chlorhexidine dihydrochloride</td>
</tr>
<tr>
<td>Adipic acid</td>
<td>Bismuth subgallate</td>
<td>Chlorobutanol</td>
</tr>
<tr>
<td>Agar</td>
<td>Bismuth subnitrate</td>
<td>Chlorobutanol hemihydrate</td>
</tr>
<tr>
<td>Alcohol</td>
<td>Bismuth subsalicylate</td>
<td>p-Chloro-m-cresol</td>
</tr>
<tr>
<td>Algin</td>
<td>Boric acid</td>
<td>Cholecalciferol</td>
</tr>
<tr>
<td>Alginic acid</td>
<td>Caffeine</td>
<td>Cholesterol</td>
</tr>
<tr>
<td>Allantoin</td>
<td>Calcium acetate</td>
<td>Cinnamon (Cinnamomum cassia) oil</td>
</tr>
<tr>
<td>Aloe barbadensis leaf juice</td>
<td>Calcium ascorbate</td>
<td>Citric acid</td>
</tr>
<tr>
<td>Aluminum chloride</td>
<td>Calcium carbonate</td>
<td>Citronella (Cymbopogon nardus) oil</td>
</tr>
<tr>
<td>hexahydrate</td>

Handbook of Pharmaceutical Additives, Third Edition 2977
Glossary

absorbent. A substance that can 'take up' another substance by capillary, osmotic, chemical, or solvent action.

acetylated. Any organic compound that has been heated with acetic anhydride or acetyl chloride to remove its water. Acetylated lanolins are used in hand creams and lotions.

acid. A compound that may be either organic or inorganic and is characterized by the following properties: gives up (donates) protons to other substances; has a hydrogen ion as its positive radical in solution; contains hydrogen atoms that are replaceable by positive components; reacts with a base to form a salt and water; has a pH of less than 7.0.

acidity regulator. A substance that stabilizes the acidity of pharmaceuticals.

acidulant. Any of a number of acids added to pharmaceuticals to aid in preservation, to chelate metals, and to modify taste.

active pharmaceutical ingredient (API). Any component that is intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body of man or other animals. The term includes those components that may undergo chemical change in the manufacture of the drug product and are present in the drug product in a modified form intended to furnish the specified activity or effect.

adhesive. Any substance, organic or inorganic, natural or synthetic, that is capable of bonding other substances together by attachment.

adjuvant. Subsidiary ingredient or additive in a mixture that contributes to the effectiveness of the primary ingredient.

adsorbent. A solid or liquid that can 'take up' on its surface, by chemical or physical forces, the molecules of gases, liquids, or dissolved substances when it is in contact with these molecules.

adverse reaction. A response to a drug which is noxious and unintended, and which occurs at doses normally used in man for the prophylaxis, diagnosis, or therapy of disease, or for the modification of physiological function.

aerobic. Living in air.

aerobic bacteria. Bacteria capable of growing in the presence of oxygen.

aerosol. A suspension of ultramicroscopic solid or liquid particles in air or gas.

agglomerate. Suspended solids clustered together to form larger clumps or masses that are easier to remove by filtration or settling.

albuminoid. Resembling albumin, a simple protein present in horny and cartilaginous tissues; insoluble in neutral solvents, e.g., keratin, elastin, and collagen are albuminoids.

alkali. One of a class of soluble chemical compounds that combines with acids to form salts. In water solution, alkalies are bitter; turn litmus blue, and have a pH above 7.0.

alkaloid. A vegetable substance with an organic nitrogen base capable of combining with acids to form crystalline salts. Chemical alkaloids end in 'ine', such as betaine from beets, caffeine from coffee beans, and cocaine from the leaves of the coca plant.

alkyl. Meaning 'from alcohol', usually derived from alkane. Any of a series of saturated hydrocarbons, e.g., methane. The introduction of one or more alkyls into a compound makes the product more soluble.

allergen. A substance that induces allergy, by acting in the manner of an antigen upon coming into contact with body tissues by inhalation, ingestion, or skin adsorption. The allergen causes a specific reagin to be formed in the bloodstream.

allergic contact dermatitis. Skin rash caused by direct contact with a substance to which the skin is sensitive. Symptoms include a red rash, swelling, and intense itching.

allergic reaction. An adverse immune response following repeated contact with otherwise harmless substances such as pollens, molds, foods, cosmetics, and drugs.
allergy. Hypersensitivity to particular substances, often resulting in cough, sneezing, headaches, rashes, or nausea.

ambient. The normal environment conditions such as temperature, relative humidity, or room pressure of a particular area under consideration.

amino acid. Any of a group of twenty hydrocarbon molecules (containing the radical group NH₂) linked together in various combinations to form proteins in living things.

amphoteric. A material that can display both acid and basic properties.

analgesic. A substance that soothes, calms, or allays pain.

anaphylaxis. A hypersensitive reaction to an allergen, (as to foreign proteins or drugs) that is marked by a tendency to intense systemic reaction and that results from specific sensitization following one or more usually parenteral contacts with a sensitizing agent.

anaerobe. A microorganism that thrives best or only when deprived of oxygen.

angioedema. A condition characterized by patches of swelling on the skin, mucous membranes, and sometimes viscera, and believed to be an expression of an allergy.

anhydride. A residue resulting from water being removed from a compound.

anhydrous. A substance containing no water.

antacid. A substance that counteracts acidity.

anthelmintic. A substance that expels or destroys parasitic worms.

antibiotic. An organic substance of microbial origin that is either toxic or growth-inhibiting for other organisms, e.g., penicillin, tetracycline, and erythromycin.

antibody. Produced by the immune system in response to exposure to a foreign substance, it is the body's protective mechanism against infection and disease; it is characterized by a structure complementary to the foreign substance, the antigen, that provoked its formation, and is thus capable of binding specifically to the foreign substance to neutralize it.

anticaking agent. An additive used to prevent or inhibit the clumping together of dry material and thus to maintain a free-flowing condition; often used in food and pharmaceutical products that tend to be hygroscopic.

anticoagulant. A substance that hinders the clotting of blood.

antidandruff agent. A substance that is used to mitigate the formation of white or grayish greasy scales on skin surfaces, especially of the scalp.

antifoam. A substance used to reduce or prevent foaming due to proteins, gases, or nitrogenous materials that interfere with the manufacture of the product.

antigen. Any of various foreign substances such as bacteria, viruses, endotoxins, exotoxins, foreign proteins, pollen, and vaccines, whose entry into an organism induces an immune response (antibody production) directed specifically against that molecule. The response can be an increased reaction, such as hypersensitivity or a circulating antibody that reacts with the antigen.

anti-inflammatory agent. A substance used to prevent redness, heat, and swelling that has resulted from an infection or injury.

antimicrobial agent. A substance that acts to destroy or inhibit the activity of microorganisms.

antioxidant. A substance that retards oxidation, deterioration, rancidity, and gum formation in organic substances.

anaphylaxis. A substance that expels or destroys parasitic worms.

antipruritic. A substance used to counteract itching.

antiseptic. A substance that prevents or arrests the growth or action of microorganisms on living tissue.

antispasmodic. A substance used to prevent or relieve spasms or convulsions.

antitackifier. A substance used to prevent stickiness.

antitoxin. An antibody that is capable of neutralizing the specific toxin that stimulated its production in the body.

antiurolitic. Preventive for urinary calculus (stones).

API. See Active Pharmaceutical Ingredient.

aromatic. A fragrant, usually pleasant, spicy, slightly pungent.

asepsis. A condition in which living pathogenic organisms are absent.

assay. A technique (test) for measuring a biological response or for determining characteristics such as composition, purity, activity, and weight.

astringent. A clear liquid containing mostly alcohol, but with small amounts of other ingredients such as boric acid, alum, menthol,
Glossary

and/or camphor; provides a refreshed skin-feel and a cooling feeling from the evaporation of the ingredients.

azo dyes. Broad series of synthetic dyes having double-bonded nitrogens as the chromophore group. The following are examples of azo dyes: Tartrazine, Yellow 2G, Sunset Yellow FCF, Carmoisine, Amaranth, Ponceau 4R, Red 2G, Brown FK, Chocolate Brown HT, Black PN, Pigment rubine.

background contamination. Contamination introduced accidentally in reagents, dilution water, solvents, rinse water, etc., which can be confused with constituents in samples being analyzed.

bactericide. An agent that kills bacteria.

bacteriophage. A virus that exclusively infects bacteria.

bacteriostat. An agent that inhibits the growth of bacterial organisms without necessarily killing them or their spores.

bacterium. Any of a large group of microscopic organisms having round, rod-shaped, spiral, or filamentous unicellular or noncellular bodies that are often aggregated into colonies, are enclosed by a cell wall or membrane, and lack fully differentiated nuclei. Bacteria range in size from 0.4μm to 2.0μm. Some are disease producing, but most perform necessary functions such as digestion, fermentation, and nitrification.

balm. A soothing ointment or application.

balsam. The natural exudate from a tree or plant.

base. An electropositive element or radical that unites with an acid to form a salt; a substance that when dissolved in water, dissociates to produce one or more hydroxyl ions (OH-); the usually inactive ingredient of a preparation serving as the vehicle for the active medicinal principle as in the fatty base of an ointment.

batch. A specific quantity of material produced in a process or series of processes so that it is expected to be homogeneous within specified limits. In the case of continuous production a batch may correspond to a defined fraction of the production, characterized by its intended homogeneity. The batch size may be defined either by fixed quantity or the amount produced in a fixed time interval.

binder. A substance that gives a mixture uniform adhesion, solidification, and consistency; absorbs moisture at high temperatures; e.g., acacia, crospovidone, glucose, glycerin, methyl cellulose, sodium alginate, sorbitol, tragacanth.

bioactivity. A protein’s ability to function correctly after it has been delivered to the active site of the body (in vivo).

bioassay. The determination of the biological activity of a substance (e.g. a drug) by observing its effect on an organism (or organ) compared to a standard preparation.

bioavailability. Amount of a drug that is absorbed from an administered dosage form at a certain rate by the body.

biochemical oxygen demand (BOD). The amount of oxygen required to oxidize the dissolved organic matter in a water sample by aerobic (bacterial) decay; measure of the oxygen depletion that would result from discharging organic impurities into a waterway.

biocide. An agent that can kill all pathogenic and nonpathogenic living organisms, including spores. More general than bactericide, a biocide includes insecticides and any compound toxic to any living thing.

biodegradable. Material that can be broken down by biological action.

bioequivalence. Two pharmaceutical products are bioequivalent if they are pharmaceutically equivalent and their bioavailabilities (rate and extent of availability), after administration in the same molar dose, are similar to such a degree that their effects can be expected to be essentially the same.

bioequivocality. A scientific basis on which generic and brand name drugs are compared with one another.

biological oxygen demand (BOD). The oxygen used in meeting the metabolic needs of aerobic organisms in water containing organic compounds.

biopharmaceuticals. Biotechnologically produced proteins and peptides for pharmaceutical applications.

biopharmaceutics. The science and study of the ways in which the pharmaceutical formulation of administered agents can influence their pharmacodynamic and pharmacokinetic behavior. Differences in pharmaceutical properties can cause substantial differences in the biologic properties and therapeutic usefulness of preparations which are identical with respect to their content of active ingredient. Pharmaceutical properties known to influence the therapeutic efficacy of drugs include: appearance and taste of the dosage
Glossary

form, solubility of the drug form used in the preparation, the nature of "fillers", binders, or menstrua in the dosage form, particle size, stability of the active ingredient, age of the preparation, thickness and type of coating of a dosage form for oral administration, the presence of impurities, etc.

bitter. An alcoholic solution of bitter and often aromatic plant products used in preparing a mild tonic.

bodying agent. A viscosity or consistency-giving substance.

broad spectrum. Over a wide range; a broad-spectrum disinfectant is effective against a wide range of microorganisms including bacterial spores, mycobacteria, nonlipid and lipid viruses, fungi, and vegetative bacteria.

buccal. By mouth.

buffer. A mixture of compounds that, when added to a solution, protects it from any substantial change in pH. Such mixtures are usually in solution form and contain either a weak acid and its related salt or a mixture of two acid salts.

bulking agent. Any innocuous, inert substance used to increase mass.

bulk pharmaceutical chemical (BPC). A pharmaceutical product derived by chemical synthesis, in bulk form, for later dispensing, formulation or compounding, and filling in a pharmaceutical finishing facility.

capsule. A gelatin or gelatin-like container used for enclosing medicine.

capsules, hard. Hollow capsules of various sizes made of pure gelatin with or without the addition of dye. They comprise an upper and lower part; these are joined together once filling is completed.

capsules, soft. Elastic capsule made of gelatin for filling with active ingredient/excipient mixture. Can be produced with different wall thicknesses and either with or without a seam.

carbohydrates. A large class of carbon-hydrogen-oxygen compounds that includes the sugars and their polymers (mainly starch, glycogen and cellulose).

carcinogen. Cancer-causing agent; any substance that causes the development of cancerous growths in living tissues.

carminative. A substance that expels gas from the alimentary canal.

carrier. A usually inactive substance used in association with an active substance especially in aiding the application of the active substance.

catalyst. Any substance that notably affects the rate of chemical reaction without being consumed or undergoing change.

cathartic. A substance used to cleanse the bowels.

characterization. Precisely deciphering and describing all the characteristics of a drug substance that affect its efficacy and its purity; the chemical, physical, and sometimes biological properties that are attributes of a specific drug substance.

chelating agent. Organic compounds that can withdraw ions from solution, forming insoluble complexes.

clarifier. A substance that aids in the removal of small particles that cloud liquids.

coagulant. A substance that is capable of removing colloidal material. Coagulants are used in precipitating solids or semisolids from solution, e.g., casein from milk.

coating. Protects tablet ingredients from deterioration by moisture in the air and makes large tablets easier to swallow. For most coated tablets, a cellulose (plant fiber) film coating is used which is free of sugar and potential allergy-causing substances. Occasionally, other coating materials are used such as corn protein (zein) or an extraction from trees (pharmaceutical glaze).

Code of Federal Register (CFR). A codification of the general and permanent rules published in the Federal Register by the executive department and agencies of the U.S. Federal Government. U.S. regulations that directly apply to pharmaceutical development are contained in Title 21 parts 58 (Good Laboratory Practice for Nonclinical Laboratory Studies), 210 (Current Good Manufacturing Practice in Manufacturing, Processing, Packing, or Holding of Drugs; General), 211 (Current Good Manufacturing Practice for Finished Pharmaceuticals), and 600 (Biological Products: General). Parts 50 (Protection of Human Subjects), 56 (Institutional Review Boards), and 312 (Investigational New Drugs) apply to critical trials.
Glossary

coenzyme. A nonpolypeptide molecule required for the action of certain enzymes; often contains a vitamin as a component.

cofactor. Small molecular weight, heat stable inorganic or organic substance required for the action of an enzyme.

colloid. A special type of liquid mixture or suspension in which the particles of suspended liquid or solid are present in a very finely divided form (i.e., particle size from about 1 to 500 millimicrons in diameter). The colloidal suspension of liquids in liquids is an emulsion.

color additive. Any dye, pigment, or substance that can impart color when added or applied to a food, drug, cosmetic, or to the human body.

colorant. Any substance that imparts color to another material or mixture; broadly classified as either pigments or dyes.

color, certified. Synthetic colorants certified by the FDA for safety and purity for use in foods and pharmaceuticals. May be either a dye (soluble) or a lake (insoluble).

color, natural. Any of several colors that occur naturally in plant and animal tissues.

colors, certifiable. Encompasses three categories of 'certifiable' colors: FD&C for application in foods, drugs, or cosmetics; D&C, for applications in drugs or cosmetics; and External D&C, for application in externally applied drugs and externally applied cosmetics.

commingling. The blending of carry-over material from one grade of an excipient with another, usually due to a continuous process.

compatibilizer. A substance that will allow other substances to exist in close and permanent proximity to each other for an indefinite time.

complexing agent. A molecule, atom, or ion that is attached to the central atom of a coordination compound, chelate, or other complex.

condensate. Distillate just after it has been cooled from steam into the liquid state.

conditioner. A substance added to a material or other product that improves its physical state.

consistency regulator. A substance that regulates the degree of firmness, density, viscosity, or resistance to movement or separation of constituent particles.

contamination. The undesired introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or onto a raw material, intermediate, or API during production, sampling, packaging or repackaging, storage, or transport.

control group. The group of subjects in a controlled study that receives no treatment, receives a standard treatment, or receives a placebo.

corrosive. A chemical that causes visible destruction or irreversible alterations in living tissue by chemical action at the site of contact.

counter-irritant. An agent applied locally to produce superficial inflammation with the object of removing inflammation in deeper adjacent parts of the body.

cream. A thick emulsion of oil and water.

critical. A material, process step, process condition, test requirement, or any other relevant parameter is considered critical when noncompliance with predetermined criteria directly influences the quality attributes of the API in a detrimental manner.

current Good Manufacturing Practices (cGMPs). Current accepted standards of design, operation, practice, and sanitization. In the United States, the FDA is empowered to inspect drug-manufacturing plants in which drugs are processed, manufactured, packaged, and stored for compliance with these standards.

cytolysis. The dissolution of cells particularly by destruction of their cell membrane.

cytopathic. Damaging to cells.

cytotoxic. Poisonous to cells.

cytoplasm. The protoplasmic contents of the cell outside the nucleus in which the cell’s organelles are suspended.

cytostatic agents. Therapeutics that inhibit cell division and growth.

cystotoxic. Poisonous to cells.

D&C Colors, dyes, and pigments considered safe in drugs and cosmetics when applied locally to mucous membranes or when given orally.

decolorizing agent. Any material that removes color by a physical or chemical reaction.

defoamer. A substance that reduces or inhibits foam formation due to proteins, gases, or nitrogenous materials that may interfere with processing.

dehydrating agent. A substance that removes chemically combined water or water of hydration.

Delaney amendment. Part of a 1958 law requested by the Food and Drug Administration and written by Congressman James Delaney. The law stated that food and
Glossary

chemical manufacturers had to test additives before marketing them and submit results to the FDA. The amendment specifically states that ‘no additive may be permitted in any amount if the tests show that it produces cancer when fed to man or animals or by other appropriate tests.

delayed hypersensitivity. Manifested primarily as contact dermatitis due to drugs.
demulcent. A substance usually of mucilaginous or oily character capable of soothing an inflamed or abraded mucous membrane or protecting it from irritation, e.g., tragacanth, acacia, flaxseed.
denaturant. A poisonous or unpleasant substance added to alcoholic products to make them undrinkable; also a substance that changes another substance's natural qualities or characteristics.
dental. Of or relating to teeth.
dentifrice. A powder, paste, or liquid for cleaning the teeth.
depilatory. An agent for removing hair, wool, or bristles.
dermis. The inner layer of the skin. The dermis is protected by the epidermis and is made up of tissues, muscles, and nerves. Collagen is found in the dermis layer.
desiccant. A hygroscopic substance such as activated alumina, calcium chloride, silica gel, or zinc chloride that adsorbs water vapor from the air and can be used to maintain a dry atmosphere in drug containers.
diaphoretic. A substance that increases perspiration.
diluent. Inert material added to tablets to increase their bulk in order to make them a practical size for compression.
direct compression. Process by which ingredients are blended and compressed directly into the tablet without a granulating process.
disaccharide. Carbohydrates that are formed when monosaccharide units condense, with the elimination of water.
disaggregation. The breaking up of granules or aggregates into fine particles in aqueous fluid.
disinfection. Process by which viable microbiological agents or cells are reduced to a level unlikely to produce disease in healthy people, plants, or animals. These processes may use chemical agents, heat, ultraviolet light, etc., to destroy most (but not necessarily all) of the harmful or objectionable microorganisms, pathogens, and potential pathogens. Disinfection does not necessarily result in sterilization.
disintegrant. A substance, such as plant cellulose, that expands when wet causing the tablet to break apart in the digestive tract releasing the nutrients for absorption.
dispersant. A surface active agent added to a suspending medium to provide uniform and maximum separation of extremely fine, solid particles, often of colloidal size.
dispersion. A two-phase system where one phase (disperse or internal phase) consists of finely divided particles (often in the colloidal size range) distributed throughout a bulk substance which is the continuous or external phase.
dissolution. The breaking down of fine particles into molecules or ions homogeneously dispersed in aqueous fluid.
distillate. The volatile material recovered by condensing the vapors of an extract or press.
distilled oil. An essential oil obtained by the distillation of the portion of a botanical material, e.g. peel, leaves, stem, containing the essential oil.
diuretic. A substance that promotes water elimination from the body via kidney function; any substance that increases or stimulates the flow of urine, e.g., beer, coffee.
dosage form. The form of the completed pharmaceutical product, e.g. tablet, capsule, injection, elixir, suppository.
dose. The amount of drug administered to a patient or test subject at a single time.
drug. Article intended for use in diagnosis, cure, mitigation, treatment, or prevention of disease in man or other animals and article (other than food) intended to affect the structure or any function of the body of man or other animals.
drug master file. A drug master file (DMF) is a master file that provides a full set of data on an API. In some countries, the term may also comprise data on an excipient or a component of a product such as a container.
drug product. A finished dosage form, for example, tablet, capsule, solution, etc., that generally contains one or more APIs in association with inactive ingredients. The term also includes a finished dosage form, which does not contain an API but is intended to be used as a placebo.
dry granulation. Process by which ingredients are blended and compressed on tablet presses.
drying agent. A substance with the ability to absorb moisture.
Glossary

**efficacy**. The ability of a drug to produce a therapeutic effect.

**electrolyte**. Any compound which in solution conducts a current of electricity and is decomposed by it.

**elixir**. A sweetened, aromatic preparation that contains variable percentages of alcohol and are used either for their medicinal ingredients or in their prescriptions for their flavoring quality.

**emollient**. A thick, creamy material used to soothe or soften the skin, usually made from oil, water, and wax.

**emulsifier**. A substance that prevents the separation of immiscible substances in an emulsion; helps to distribute evenly one substance in another; used to improve texture, homogeneity, consistency, and stability.

**emulsion**. A system (such as fat in milk) consisting of a liquid dispersed, with or without an emulsifier, in an immiscible liquid usually in droplets of larger than colloidal size.

**encapsulant**. That which surrounds, encases, or protects, such as a capsule.

**enhancer**. A substance used to increase, intensify or heighten; a flavor enhancer increases the flavor of a food without contributing any taste of its own.

**enteric coating**. To make the tablet not break up within the stomach but instead to break apart within the intestines.

**enzyme**. Any of numerous proteins or conjugated proteins produced by living organisms and functioning as complex biochemical catalysts; it promotes reactions and functions as a regulator, making sure the organism does not produce too much or too little of any chemical substance.

**epidural**. Situated upon or administered outside the dura mater.

**escharotic**. Caustic substance producing an eschar, a hard crust, or scab.

**essential oil**. The active flavoring principles of certain botanicals such as roots, stems, leaves, and buds of spices and herbs, seeds, flowers, citrus fruit skins, and barks of certain trees. The oil is found in small sacs that are distributed throughout the plant structure.

**ethic pharmaceutical**. A controlled substance for the diagnosis or treatment of disease.

**etiologic agent**. A disease-causing organism or toxin.

**European Pharmacopoeia (EP)**. Documented standards and regulations for European community on the quality of the active ingredients and excipients of pharmaceuticals.

**European Union (EU)**. A federation of European countries, formerly known as the European Economic Community (EEC), organized to promote economic growth and trade; member countries are Belgium, Denmark, France, Germany, Great Britain, Greece, Ireland, Italy, Luxembourg, The Netherlands, Portugal, and Spain.

**excipient**. A substance used in the pharmaceutical industry, other than the active ingredient, which has been appropriately evaluated for safety and is included in a drug delivery system to: aid in the processing of the drug delivery system during its manufacture; protect, support, or enhance stability, bioavailability, or patient acceptability; assist in product identification; or enhance any other attribute of the overall safety and effectiveness of the drug during storage or use.

**expiration date (expiry date)**. The date placed on the container/labels of an API designating the time during which the API is expected to remain within established shelf-life specifications if stored under defined conditions, and after which it should not be used.

**Ext. D&C**. Colorants not certifiable for use in oral products but considered safe for use in externally applied products; specifically excludes colorants that may have oral toxicity.

**extender**. A substance added to a product in the capacity of a diluent or modifier.

**extract (flavoring)**. An alcohol or alcohol-water solution containing a flavoring ingredient; less potent than essential oils.

**extract-solid**. A viscous or semisolid material obtained by first extracting the botanical material with a water-ethanol solvent and then removing the solvent almost completely. This is a liquid extract that has been concentrated.

**FD&C**. Colors certifiable for use in coloring foods, drugs, and cosmetics.

**febrifuge**. A substance that mitigates or removes fever.

**fermentation**. The biochemical synthesis of organic compounds by microorganisms.

**fiber**. A fundamental form of solid characterized by relatively high tenacity and an extremely high ratio of length to diameter.

**filler**. A substance added to another substance to increase bulk or weight; a material used for filling out the size and shape of a tablet or
Glossary

capsule making it practical to produce and convenient for the consumer to use.

**final bulk product.** The final drug product after chemical or biological processing and purification, ready for concentration, drying, and filling into containers prior to dispensing and final filling.

**finished product.** A medicinal product that has undergone all stages of production, including packaging in its final container.

**fixative.** A substance used to reduce the overall volatility of flavoring agents.

**flavor.** A substance added to food or pharmaceuticals to give it a specific taste; an extract or essence that imparts its flavor to food.

**flavor adjuncts.** Substances that are added to a flavor but are not an essential part of it; e.g., antioxidants, carriers, emulsifiers, and solvents.

**flavor, artificial.** A flavor not found in nature.

**flavor enhancer.** A substance that will magnify, modify, or supplement the natural or original flavor, taste, or aroma of a pharmaceutical without the substance contributing significantly to that flavor.

**flavor, natural.** A flavor derived from a natural animal or plant product.

**foam builder.** A substance that increases the amount of air in a product.

**foam inhibitor.** An additive that prevents the formation of foam during processing.

**Food and Drug Administration (FDA).** The U.S. Federal Agency responsible for enforcement of the Federal Food, Drug, and Cosmetic Act.

**formulation.** The composition of a dosage form, including the characteristics of its raw materials and the operations required to process it.

**fungicide.** Any substance that kills or inhibits the growth of fungi.

**gellant.** A substance that forms stiff gels when added to water; used in food and pharmaceutical products for its thickening and water-binding properties.

**generally regarded as safe (GRAS).** An U.S. FDA term for a group of chemicals that by current knowledge are safe to use in food and pharmaceuticals.

**generic drug.** A drug produced and marketed under its chemical or "generic" name, e.g., acetaminophen as opposed to "Tylenol", a brand name for the former produced by Johnson & Johnson. A generic drug can be sold only after a proprietary drug goes off patent (i.e. when the patent runs out after 17 years). There are numerous generic drug manufacturers. While generic drugs are cheaper for consumers, they still must meet the standards of GMPs as set out by governmental agencies.

**germicide.** An agent that destroys microorganisms, especially pathogenic microorganisms; a germicide can be a sterilizer, disinfectant, or antiseptics.

**granuloma.** An inflammatory tumor or growth composed of granulation tissue.

**gum.** A sticky substance issuing from certain trees; this substance is used for stiffening or adhesive purposes.

**haloenzyme.** An enzymes that contain proteins. The protein part of this type of enzyme is termed an apoenzyme and the non-amino acid part is termed a coenzyme.

**hazardous substance.** A substance which by reason of being explosive, flammable, toxic, poisonous, corrosive, oxidizing, irritant or otherwise harmful, is likely to cause injury.

**health hazard.** Classification of a chemical for which there is statistically significant evidence based on at least one study conducted in accordance with established scientific principles that acute or chronic health effects may occur in exposed persons. This classification applies to chemicals that are carcinogens, toxic or highly toxic agents, reproductive toxins, irritants, corrosives, sensitizers, hepatotoxins, nephrotoxins, neurotoxins, agents that act on the hematopoietic system, and agents that damage the lungs, skin, eyes, or mucous membranes.

**hematopoietic.** An organic system of the body consisting of the blood and the structures that function in its production.

**humectant.** A substance that is used to preserve the moisture content of materials; commonly used humectants include: glycerin, propylene glycol, sorbitol, hexylene glycol, butylene glycol.

**hydrate.** A crystalline product made up of salts and closely associated water molecules.

**hydrogenation.** A chemical reaction that adds hydrogen atoms to an unsaturated fat thus saturating it and making it solid at room temperature.

**hydrolyzed.** Made into water-soluble form.

**hydrophilic.** Having a strong affinity for water.
Glossary

**hydrophobic.** Nonwetting; water repelling.

**hygroscopic.** Descriptive of a liquid or solid material that picks up atmospheric water vapor and thus acts as a drying agent.

**IDLH (Immediately Dangerous to Life and Health).** A concentration of airborne contaminants, normally expressed in parts per million (ppm) or milligrams per cubic meter, which represents the maximum level from which one could escape within 30 minutes without any escape-impairing symptoms or irreversible health effects. This level is established by the United States' National Institute of Occupational Safety and Health (NIOSH).

**immediate release dosage form.** A dosage form that is intended to release all the active ingredient on administration with no enhanced, delayed, or extended release effect.

**immune response.** The production of antibodies or particular types of cytotoxic lymphoid cells resulting from the presence of an antigen.

**immunity.** The state of an organism in which protection from many infectious diseases is afforded by prior exposure to the infectious agents.

**immunogen.** A substance that is capable of causing antibody formation.

**implant.** Something placed inside of tissue such as a graft, a small container, or a radioactive material for treatment, or a pellet containing hormones to be gradually absorbed.

**impurity.** Any component of the drug product that is not the chemical entity defined as the drug substance or an excipient in the drug product.

**impurity profile.** A description of the identified and unidentified impurities present in a typical batch of API produced by a specific controlled production process. It includes the identity or some qualitative analytical designation (e.g., retention time), the range of each impurity observed, and type of each identified impurity. For each API there should be an impurity profile describing the identified and unidentified impurities present in a typical batch. The impurity profile is normally dependent upon the process or origin of the API.

**inactivation.** Any process that destroys the ability of a specific microbiological agent or eukaryotic cell to self-replicate.

**inert.** Does not dissolve in water or react chemically with other substances.

**inert ingredients.** Other ingredients that make up the composition of formulated drugs, besides the active, therapeutic agents. The variety of dosage forms essentially define the functional roles of inert ingredients, and inert ingredients are critical to delivering drug actives.

**infectious.** Able to cause disease in a susceptible host.

**inhalation.** The act of drawing air into the lungs.

**injection.** A preparation intended for parenteral administration and/or constituting or diluting a parenteral article prior to administration. The introduction of parenterals may be into the subcutaneous cellular tissue (subcutaneous or hypodermic), or the muscular tissue (intramuscular).

**intermediate.** A chemical or material used during the manufacturing process that is not the drug product but for which manufacture is critical to the successful production of the drug product.

**intra-articular.** Within the joints.

**intrabursal.** Inside the sacs enclosing viscid fluid located in the tendons and bony prominences.

**intradermal.** Being between the layers of the skin.

**intramuscular (IM).** The route of administration for certain parenteral drugs into muscle tissue. The procedure is called an injection.

**intraperitoneal (IP).** Within the peritoneal cavity.

**intrastitial.** Within the tissue.

**intrasynovial.** Within the connective tissue.

**intra-uterine.** Within the uterus.

**intravascular.** Administered by entry into a blood vessel.

**intravenous (IV).** The route of administration of certain parenteral drugs into veins. The procedure is called an infusion.

**in vitro.** In isolation from the living organism in an experimental, artificial environment, e.g., cells in tissue culture).

**in vivo.** Occurring within a living system, plant, or animal.

**iodophor.** An "iodine-carrying" compound. An iodophor is a combination of iodine and a solubilizing surface active agent, or carrier.

**irritant.** A chemical that is not corrosive but that causes a reversible inflammatory effect on living tissue by chemical action at the site of contact.

**irritation.** Condition in which redness, soreness, inflammation, some swelling appears on the skin or other bodily part. In severe cases some blistering may be seen.

**isolate.** An aromatic compound consisting of one ingredient isolated from a natural raw material such as menthol from peppermint oil or citral from lemongrass oil.
Glossary

**labile**. Unstable or unsteady; not fixed; characterized by adaptability to alteration or modification, i.e., relatively easily changed, as in cleavage of a molecule or molecular rearrangement in a compound or complex chemical material.

**lake**. Any of a large group of organic pigments that are composed essentially of a soluble dye rendered insoluble by the absorption on or chemical combination with an inorganic carrier.

**laxative**. A substance that encourages or induces a bowel movement.

**leavening agent**. A substance that is added to food or pharmaceuticals in order to produce or stimulate the production of carbon dioxide, i.e., to cause fermentation.

**Lethal Dose Fifty (LD50)**. A calculated dose of a material that is expected to cause the death of 50% of an entire defined experimental animal population. It is determined from the exposure to the material by any route other than inhalation of a significant number from that population.

**liniment**. A liquid or semiliquid preparation that is applied to the skin as an anodyne or a counter-irritant.

**lipids**. Hydrophobic biological compound (fat and fat-like material) that is insoluble in water, but soluble in nonpolar solvents such as benzene, chloroform, and ether. The major components in most lipids are fatty acids.

**liposome**. An artificial phospholipid vesicle. Liposomes can be useful for the enclosure of macromolecules such as nucleic acids or, after loading with an appropriate drug. They may be used therapeutically to achieve slow release of the drug into circulation.

**lipotropic**. Tending to prevent abnormal deposition of fats.

**lot**. A batch, or a specific identified portion of a batch, having uniform character and quality within specified limits or, in the case of a drug product, produced by continuous process, a specific identified amount that is produced in a unit of time or quantity in a manner that assures its having uniform character and quality within specified limits.

**lubricant**. A material used in topicals or tablets that adds slipperiness and reduces friction, thus making it easier to apply to the skin or swallow.

**lymphadenopathy**. Chronically swollen lymph nodes.

**masking agent**. A substance that is added to a pharmaceutical formulation in order to eliminate an unpleasant taste or smell of an active ingredient and thereby make the active ingredient more easy to consume.

**medicinal product**. Any substance or combination of substances presented for treating or preventing disease in human beings or animals; a substance or combination of substances that may be administered to human beings or animals with a view to making a medical diagnosis or to restoring, correcting, or modifying physiological functions.

**metabolize**. To undergo change by physical and chemical processes.

**microencapsulated**. Surrounded by a thin, protective layer of biodegradable substance referred to as microsphere.

**micron (micrometer)**. A unit of length equal to one millionth of a meter (µm) or thousandth of a millimeter (25µm are approximately 0.001 inch.). Bacteria range in size from 0.5µm to 20µm.

**microorganism**. A microscopic plant or animal, such as a bacterium, protozoan, yeast, virus, or algae.

**moiety**. A part or portion of a molecule, generally complex, having a characteristic chemical or pharmacological property.

**monosaccharide**. The simplest carbohydrate consisting of one unit of water per carbon atom; monosaccharides have the general formula C₆H₁₂O₆, e.g., glucose.

**mother liquor**. The residual liquid that remains after the crystallization or isolation processes. A mother liquor may contain unrecovered products (i.e., unreacted starting materials, intermediates, levels of the API and/or impurities); it may then be used for further processing.

**mutagen**. A chemical or physical agent that interacts with DNA and causes a mutation.

**mutation**. A sudden, random, permanent, genetic change; a genetic change within cells that changes its characteristics.

**nasal**. Of or relating to the nose.

**National Formulary (NF)**. A compendium of purity and testing criteria for chemicals that function...
Glossary

as excipients in pharmaceutical products; usually used in combination with the USP.
nebulizer. To reduce a medicinal solution to a fine spray.
neutralizer. A substance that changes the acid-alkaline balance.
nutritional supplements. Vitamins and minerals that are most commonly sold over the counter and are often combined with OTC active substances, e.g., cold and flu remedies contain vitamin C and paracetamol.
ointment. A formulation containing fats or oils, but no water; it does not blend with the skin but forms a separate layer over it. Ointments are semisolid preparations for external application to the body. Ointment preparations contain an oleaginous base, such as lard, vaseline, lanolin.
oleoresin. The solid, semisolid, or heavy viscous fluid or residue obtained by solvent extraction or percolation of plant matter; it consists of an essential oil and a resin. Oleoresins can be used as flavoring agents in pharmaceuticals.
ophthalmic. Pertaining to the eyes.
ophthalmics. Pertaining to products for the eyes.
oral. Of or relating to the mouth.
oral product. A pharmaceutical product meant to be introduced through the mouth in the form of a tablet, capsule, or suspension.
oral solid dosage drug. Formulated in a solid or powder form for a patient to ingest orally.
organoleptic. Evaluating a product by sense perception (hearing, sight, smell, taste, or touch).
organs of elimination. Describes the kidneys, liver, and gastrointestinal tract.
oral drug. In the United States, the FDA can grant ‘Orphan Drug status’ to one company for a drug that is believed to substantially increase the life expectancy of the treated patient for a particular disease. This excludes other companies from receiving an FDA license to produce a similar drug for a finite period of time (usually 7 years), thereby allowing the company producing the drug to recuperate their R&D expenses.
osmosis. The diffusion of a solvent through a semipermeable membrane from a solution of higher concentration to one of lower concentration until there are equal concentrations of fluid on both sides of the membrane.
otic. Pertaining to the ear.

over-the-counter (OTC) medicine. Drug formulations that over time become recognized as safe for self-medication, e.g., Tagamet and aspirin. Not all countries recognize the same drugs as safe for such usage.
oxidizing agent. An agent that causes removal of electrons; an element that gains electrons and is reduced.
packaging. All operations, including filling and labeling, which a bulk product has to undergo in order to become a finished product.
packaging material. Any material intended to protect an intermediate or API during storage and transport.
parenteral. Injected or for injection subcutaneously, intramuscularly, or intravenously, or introduced other than by way of the intestines.
parenteral drug. A drug intended for injection through the skin or other external boundary tissue, rather than through the alimentary canal, so that the active substances it contains are administered, using gravity or force, directly into a blood vessel, organ, tissue, or lesion. It is infused when administered intravenously (IV), or injected when administered intramuscularly (IM), or subcutaneously into the human body.
pathogenic. Causing or capable of causing disease.
periarticular. About or surrounding a joint.
peritoneal. Relating to the smooth, transparent serous membrane that lines the cavity of the abdomen.
pH. Symbol for the negative logarithm of the effective hydrogen-ion concentration or hydrogen-ion activity in gram equivalents per liter and used for convenience in expressing both acidity and alkalinity in a scale of 0 to 14 (acidity to alkalinity) with 7 representing neutrality as in pure water.
pharmaceutical. A broad term that includes not only all types of drugs and medicinal and curative products but also ancillary products such as tonics, dietary supplements, vitamins, and deodorants.
pharmaceutical additive, direct (intentional). Any substance added purposely to a drug or pharmaceutical for technological purposes such as preserving the pharmaceutical from bacterial deterioration, protecting it from oxidative changes, and improving its organoleptic characteristics, or texture.
Glossary

**pharmaceutical additive, unintentional**  Chemical substances found in pharmaceuticals as a result of environmental or accidental contamination.

**pharmaceuticals, classical**  Small-molecule, nonbiotech drugs produced by chemical synthesis.

**pharmacokinetics**  The discipline that deals with the rates of absorption, distribution, metabolism, and excretion of drugs.

**pigment**  A natural or synthetic inorganic or organic substance that imparts a color (including black or white) to other materials.

**plasticizer**  A chemical substance added to a resin to impart flexibility, workability, or distensibility; used in soft gelatin capsules.

**poison**  Any substance which when taken into the body in a single dose of 1.0 gm. or less, is injurious to health or dangerous to life.

**potentiator**  A substance that imparts flavor to a much greater extent than an enhancer. The most important of these are the 5´-nucleotides, that are approved by the FDA. Potentiators do not add any taste of their own, but intensify the taste response to substances already present in the substance.

**precipitate**  An insoluble reaction product; when a solution reaches saturation, the solute separates out of the solution.

**preservative**  A substance, either natural or synthetic, that protects pharmaceuticals against spoilage, discoloration, or decay; used to retard or prevent microbial or chemical spoilage.

**processing aid**  Material, excluding solvents, used as an aid in the manufacture of an intermediate or API (Active Pharmaceutical Ingredient) which itself does not participate in a chemical or biological reaction (e.g. filter aid, activated carbon, etc.).

**propellant**  A liquefied gas with a vapor pressure greater than 14.7 lb/sq. in. at 105 F.

**prophylaxis**  The prevention of, or protective treatment for disease.

**pulmonary**  Of or affecting the lungs.

**pulse therapy**  Intervals of low levels between 'spikes' of high levels of a drug in the bloodstream.

**pungent**  Describes an astringent or acrid, sharp odor or flavor.

**purgative**  A substance that is used to cleanse or wash away impurities.

**quality assurance (QA)**  The sum total of the organized arrangements made to ensure that all APIs are of the quality required for their intended use and that quality systems are maintained.

**quality control (QC)**  Checking or testing that specifications are met, or that the regulatory process, through which the industry measures actual quality performance, compares with standards, and acts on any differences.

**rancid**  Having a rank smell; smelling or tasting like stale fat.

**raw material**  A general term used to denote starting materials, reagents, intermediates, processing aids, and solvents intended for use in the production of intermediates or APIs.

**reagent**  A substance other than a starting material or solvent, which is used in the manufacture of a new drug substance.

**rectal**  Of or relating to the rectum.

**reducing agent**  A substance that loses electrons and is oxidized.

**regulatory affairs**  Drug companies must show that their products consistently meet standards set by government agencies. Regulatory affairs departments document those activities, submit proposals, and follow those proposals through completion or approval.

**release controlling excipient (critical compositional variable)**  An inactive ingredient in the final dosage form that functions primarily to extend the release of the active drug substance from the dosage form.

**rheology control agent**  A substance that affects the flow of a liquid.

**rubefacient**  A substance for external application that produces redness of the skin.

**salve**  An unctuous adhesive substance for application to wounds or sores.

**scale-up**  To take a biopharmaceutical manufacturing process from the laboratory scale to a scale at which it is commercially feasible.

**sedative**  A drug that allays irritability, nervousness, or excitement.

**sensitizer**  A chemical that causes a substantial proportion of exposed people or animals to develop an allergic reaction in normal tissue after repeated exposure to the chemical.

**sepsis**  The presence of various pus-forming and other pathogenic organisms or their toxins in the blood or tissues.

**sequestrant**  A substance that absorbs ions and prevents changes that would affect flavor, texture, and color of the food or pharmaceutical.
Glossary

**shelf life.** Length of time during which the product exhibits stability.

**side effect.** Any unintended effect of a pharmaceutical product occurring in people when normal doses are administered.

**solubilizer.** Agent that increases the amount of a substance that will dissolve in another substance.

**solute.** The substance that dissolves to form ions in solution.

**solvent.** A substance capable of dissolving another substance (solute) to form a uniformly dispersed mixture (solution) at the molecular or ionic size level; a solvent is either polar or nonpolar.

**sorbet.** That which can absorb or adsorb, or a combination of the two.

**spheroidization.** The process by which particles are shaped into uniform spheres to be more effectively used in the production of: controlled release pharmaceuticals, enzymes, catalysts, etc.

**stability.** The ability of an active ingredient or a drug product to retain its properties within specified limits throughout its shelf-life.

**stabilizer.** A pharmaceutical additive that thickens, prevents separation, prevents flavor deterioration, retards oxidation by increasing the viscosity, or gives a smoother product.

**steady-state blood level.** Maintaining a constant level of a drug in the blood stream during therapy.

**sterilizing agent.** A substance that destroys bacteria and other infectious organisms.

**stiffener.** A substance that aids in the hardening or thickening of another substance.

**stimulant.** Any agent or drug that temporarily increases action of any organ of the body.

**stomachic.** A substance that excites action in the stomach.

**styptic.** A substance that acts as an astringent or inhibits the oozing of blood.

**subcutaneous.** Beneath the skin; injected beneath the skin.

**sublingual.** Situated or occurring under the tongue.

**substrate.** The substance on which an agent acts.

**suppository.** Semirigid plastic designed to deliver a unit dose to a body cavity; it either melts at body temperature or dissolves in the fluids of the body cavity into which they are inserted.

**surfactant.** Any compound that reduces surface tension when dissolved in water or a water solution, or reduces interfacial tension between two liquids or between a liquid and a solid.

**suspended solids.** Undissolved solids that can be removed by filtration.

**suspending agent.** A substance that causes particles to mix, but remain undissolved in a liquid or solid.

**suspension.** A specific category of pharmaceutical products that must be in a colloidal dispersion for proper action, e.g., kaolin/pectin works as an adsorbent because it has a high surface area when in suspension.

**sweetener.** A sweet tasting substance used in foods and pharmaceuticals; may be either natural or synthetic; usually having much greater sweetness intensity than sugar (sucrose), but without the caloric value, e.g., saccharin, aspartame.

**symbiosis.** The phenomenon of two entities performing a joint function that neither entity can perform alone.

**synergist.** A substance which when used with another substance produces an effect that is more than additive.

**synovitis.** Inflammation of a synovial membrane, usually with pain and swelling of the body's joints.

**synthesis.** Creating products through chemical and enzymatic reactions.

**syrup.** An aqueous solution of sugar, usually sucrose, commonly used as a vehicle due to its taste and favorable viscosity properties.

**systemic.** Capable of spreading through the entire body.

**teratogen.** A substance that affects normal development, often causing developmental anomalies; ionizing radiation may have this effect.

**therapeutic index.** The ratio of the toxic dose to the minimally effective dose of a drug.

**thickener.** A substance used to impart body, improve the consistency, or texture of a pharmaceutical, or to stabilize an emulsion; works by absorbing water.

**tincture.** Alcoholic solutions of medications.

**titer.** A measured sample - the strength of a solution or the concentration of a substance (as an antibody) in solution as determined by titration.

**titration.** Volumetric analysis by means of the addition of definite amounts of a test solution to a solution of a known amount of the substance analyzed.
Glossary

tocopherols. The group of compounds (alpha, beta, delta, epsilon, eta, gamma, and zeta) that make vitamin E; obtained through vacuum distillation of edible vegetable oils.
tolerance. The state in which the quantity of drug required to produce a specific biological effect in a particular individual has increased.
tonicity agent. A substance which invigorates, restores, freshens, or stimulates.
topical product. A pharmaceutical product meant to be applied to the skin or soft tissue in the form of liquid, cream, or ointment.
toxic. Pertaining to a substance that is harmful.
toxicity. The quality or condition of being poisonous, harmful, or destructive.
toxicology. A science that deals with poisons, their effects, and the problems involved.
toxin. Any poisonous agent, produced by one living organism that is poisonous to other organisms. A toxins is usually unstable, notably toxic when introduced into the tissues, and typically capable of inducing antibody formation.
transdermal. Relating to, being, or supplying a medication in a form for absorption through the skin into the bloodstream.
triglycerides. Fatty substances in the blood.
troche. A medicinal tablet or lozenge usually of circular or oval form, e.g., one used as a demulcent for soreness or irritation of the throat.
urticaria. A transient skin eruption characterized by itching red or pale smooth, slightly raised patches and caused by irritation of the gastrointestinal, pulmonary, or urinary mucous membranes or from contact with an external agent and found in individuals with a specific sensitivity.
uv absorber. A substance which absorbs radiant energy.
vaccine. A preparation of killed microorganisms, living attenuated organisms, or live, fully virulent organisms that is administered to produce or artificially increase immunity to a particular disease.
vaginal. Of or relating to the vagina, the canal that leads out from the uterus.
validation. A documented program that provides a high degree of assurance that a specific process, method, or system will consistently produce a result meeting predetermined acceptance criteria.
vector. An agent, such as an insect, that can carry a disease-producing organism from one host to another.
vehicle. An inert substance such as a liquid or syrup in a medicinal compound through which an active agent is administered or by which other ingredients are held together.
verification. The act of reviewing, inspecting, testing, checking, auditing, or otherwise establishing and documenting whether items, processes, services, or documents conform to specified requirements.
veterinary. Referring to pharmaceuticals or biologicals intended for animal use.
virucide. An agent that destroys or inactivates viruses.
virulence. The disease-producing power of a microorganism.
virus. A simple, noncellular parasite that can reproduce only inside living cells. The simple structure of viruses is their most important characteristic. Most of them consist only of a genetic material, either DNA or RNA, and a protein coating. Some also have membranous envelopes. Viruses are 'alive' in that they can reproduce themselves, although only by taking over a cell's synthetic machinery; but they have none of the other characteristics of living organisms. Viruses cause a large variety of significant diseases in plants and animals, including humans.
viscosity control agent. A substance that controls the internal resistance to flow exhibited by a fluid.
vitamin. Represents one of a group of organic substances, some of which are of unknown composition, present in minute amounts in natural foodstuffs which are essential to normal metabolism. A lack of a vitamin in the diet causes deficiency diseases. Vitamins are commonly classified into two groups, the fat-soluble, and the water-soluble. Vitamins A, D, E, and K are fat-soluble; Vitamin C and members of the vitamin B complex group are water-soluble. In general, vitamins play catalytic and regulatory roles in the body's metabolism.
volatile oil. A substance that will evaporate quickly; responsible for the aroma, odor, and flavor found in the aqueous distillation of organic compounds of flavorings or pure spices.
Glossary

**wet granulation.** Process by which a powdered drug and a diluent are blended with a dispersion of a binder excipient.

**xenobiotics.** Industrial chemicals that have a chemical structure not found in natural compounds that may resist degradation by microorganisms.

**yeast.** Unicellular fungus belonging mainly to the Ascomycetes that usually multiply by budding. Its commercial significance lies in its ability to secrete enzymes, e.g., a source of vitamins and proteins, also used in the brewing and baking industries. They can also be used as excipients in rDNA technology.

**yield, expected.** The quantity of material or the percentage of theoretical yield anticipated at any appropriate phase of production based on previous laboratory, pilot scale, or manufacturing data.

**yield, theoretical.** The quantity that would be produced at any appropriate phase of manufacture, processing, or packing of a particular API or intermediate, based upon the quantity of components to be used, in the absence of any loss or error in actual production.
