Most retained lead accumulates in bone, where it resides for years. But in all cells, lead has multiple effects. It binds to enzymes, particularly those with available sulfhydryl groups, changing the contour and diminishing function. For example, 3 of the 8 enzymes in the ubiquitously distributed heme pathway are susceptible to lead inhibitory effects. The accumulation of excess amounts of heme precursors also is toxic. The last enzyme in this pathway, ferrochelatase, enables protoporphyrin to chelate iron, thus forming heme. Erythrocyte protoporphyrin (EP) levels higher than 35 µg/dL (laboratory dependent) are abnormal and are consistent with lead poisoning, iron deficiency, or recent inflammatory disease. Measurement of the EP level is thus a useful tool for
monitoring biochemical lead toxicity. EP levels begin to rise several weeks after BLLs have reached 20 µg/dL in a susceptible portion of the population and are elevated in nearly all children with BLLs higher than 50 µg/dL. A drop in EP levels also lags behind a decline in BLLs by several weeks because it depends on both cell turnover and cessation of further overproduction by marrow red blood cell precursors. The test can be ordered either as the free EP or the zinc protoporphyrin. The latter is generally not corrected for hematocrit.

A second mechanism of lead toxicity works via its competition with calcium. Many calcium-binding proteins have a higher affinity for lead than for calcium. Lead bound to these proteins may alter function, resulting in abnormal intracellular and intercellular signaling. Neurotransmitter release is, in part, a calcium-dependent process that is adversely affected by lead.

Although these 2 mechanisms of toxicity may be reversible, a third mechanism prevents the development of the normal tertiary brain structure. In immature mammals the normal neuronal pruning process that results in elimination of multiple intercellular brain connections is affected by lead. Failure to construct the appropriate tertiary brain structure during infancy and childhood may result in a permanent abnormality. It is tempting to extrapolate from these anatomic findings to the clinical correlate of attention-deficit/hyperactivity disorder observed in lead-poisoned children.

Clinical Effects

The BLL is the best-studied measure of the lead burden in children. Although subclinical and clinical findings correlate with BLLs in populations, there is considerable interindividual variability in this relationship. Lead encephalopathy is more likely to be observed in children with BLLs higher than 100 µg/dL; however, one child with a BLL of 300 µg/dL may have no symptoms, whereas another with the same level may be comatose. Susceptibility may be associated with polymorphisms in genes coding for lead-binding proteins, such as Δ-aminolevulinic acid dehydratase, an enzyme in the heme pathway.

Several subclinical effects of lead have been demonstrated in cross-sectional epidemiologic studies. Hearing and height are inversely related to BLLs in children; in neither case, however, does the lead effect reach a level that would bring an individual child to medical attention. As BLLs increase in the study populations, more sound (at all frequencies) is needed to reach the hearing
threshold. Children with higher BLLs are shorter than those with lower levels; for every 10 µg increase in the BLL, the children are 1 cm shorter. Chronic lead exposure also may delay puberty.

Several longitudinal studies have followed cohorts of children from birth for as long as 20 yr and examined the relationship between BLLs and cognitive test scores over time. In general, there is agreement that BLLs, expressed either as levels obtained concurrently with cognitive testing or as a measure that integrates multiple BLLs drawn from subjects over time, are inversely related to cognitive test scores. From these studies, no BLL above 0 µg/dL appears safe. On average, for each 1 µg/dL elevation in BLL, the cognitive score is approximately 0.25-0.50 points lower, though the relationship is not linear across the BLL spectrum. Because the BLLs from early childhood are predictors of the cognitive test results performed years later, this finding implies that the effects of lead can be permanent.

The effect of in utero lead exposure is less clear. Scores on the Bayley Scale of Mental Development were obtained repeatedly every 6 mo for the 1st 2 yr of life in a cohort of infants born to middle-class families. Results correlated inversely with cord BLLs, a measure of in utero exposure. However, after 2 yr of age, all other cognitive tests performed on the cohort over the next 10 yr correlated with the BLLs at age 2 yr but not with cord BLLs, indicating that the effects of prenatal lead exposure on brain function were superseded by early childhood events and later BLLs. Later studies, performed in cohorts of Mexican children monitored from the prenatal period, confirm the association between in utero lead exposure and later cognitive outcomes. In these studies, maternal plasma Pb levels obtained, especially during the 1st trimester, were more strongly associated with cognitive scores in the offspring than in maternal BLLs.

Behavior also is adversely affected by lead exposure. Hyperactivity is noted in young school-age children with histories of lead poisoning or with concurrent elevations in BLL. Older children with higher bone lead content are more likely to be aggressive and to have behaviors that are predictive of later juvenile delinquency. One report supports the concept of long-term effects of early lead exposure. In this longitudinal study, the mothers of a cohort were enrolled during their pregnancies. BLLs were obtained early in pregnancy, at birth, and then multiple times in the offspring during the 1st 6 yr. The investigators report that the relative rate of arrests, especially for violent crimes, increased significantly in relationship to the presence of these BLLs early in life. For every 5 µg/dL increase in BLL, the adjusted arrest rate was 1.40 for prenatal BLLs and 1.27 for
6 yr BLLs. Epidemiologic data support the findings in this observational study. In an analysis that combined two national datasets, total annual leaded gasoline use (U.S. Geological Survey), and total reported violent criminal acts (U.S. Department of Justice), the amount of leaded gasoline used yearly was found to be strongly associated with violent criminal behavior with a lag time of 23 yr—that is, early exposure was followed 2 decades later by violent behavior rising and falling in close tandem. A similar association was found, this time between urban air lead levels and later violent crime, with a similar best-fit model employing a lag of approximately 22 yr.

An intervention study, in which children with moderate lead poisoning and initial BLLs of 20-55 µg/dL were aggressively managed over 6 mo, addressed the issue of the effects of treatment on cognitive development. Components of treatment included education regarding sources of lead and its abatement, nutritional guidance, multiple home and clinic visits, and for a subset, chelation therapy. Average BLLs declined, and cognitive scores were inversely related to the change in BLLs. For every 1 µg/dL fall in BLLs, cognitive scores were 0.25 point higher. A randomized placebo-controlled treatment study of 2 yr old children with initial BLLs of 20-44 µg/dL that employed the chelating agent succimer administered over 6 mo found no difference in mean cognitive scores at age 4 yr. However, as in the earlier treatment study, regression analysis did find an inverse relation between change scores—that is, a change in BLLs was associated with a change in cognitive scores.

Whether the behavioral effects of lead are reversible is unclear. In one small, short-term study, 7 yr old hyperactive children with BLLs in the 20s were randomly allocated to receive a chelating agent (penicillamine), methylphenidate, or placebo. Teacher and parent ratings of behavior improved for the first two groups but not the placebo group. BLLs declined only in the chelated group. Two yr old lead-poisoned children enrolled in a placebo-controlled trial of the chelating agent succimer showed no mean difference in behavior at 4 or 7 yr of age. However, mean BLLs were also not different in the 2 groups at those ages.

These studies support the concept that early exposure to lead can result in long-term deficits in cognition and behavior; they also hold out the possibility that reductions in lead burden may be associated with improvement in cognitive test scores.
Clinical Symptoms

**Gastrointestinal** symptoms of lead poisoning include anorexia, abdominal pain, vomiting, and constipation, often occurring and recurring over a period of weeks. Children with BLLs higher than 20 µg/dL are twice as likely to have gastrointestinal complaints as those with lower BLLs. **Central nervous system** symptoms are related to worsening cerebral edema and increased intracranial pressure. Headaches, change in mentation, lethargy, papilledema, seizures, and coma leading to death are rarely seen at levels lower than 100 µg/dL but have been reported in children with a BLL as low as 70 µg/dL. The last-reported death directly attributable to lead toxicity in the United States was in 2006 in a child with a BLL of 180 µg/dL. There is no clear cutoff BLL value for the appearance of hyperactivity, but it is more likely to be observed in children who have levels higher than 20 µg/dL.

**Other organs** also may be affected by lead toxicity, but symptoms usually are not apparent in children. At high levels (>100 µg/dL), renal tubular dysfunction is observed. Lead may induce a reversible Fanconi syndrome (see Chapter 547.1). In addition, at high BLLs, red blood cell survival is shortened, possibly contributing to a hemolytic anemia, although most cases of anemia in lead-poisoned children are a result of other factors, such as iron deficiency and hemoglobinopathies. Older patients may develop a peripheral neuropathy leading to wrist drop and footdrop, as well as hypertension.

Diagnosis

Screening

It is estimated that 99% of lead-poisoned children are identified by screening procedures rather than through clinical recognition of lead-related symptoms. Until 1997, universal screening by blood lead testing of all children at ages 12 and 24 mo was the standard in the United States. Given the national decline in the prevalence of lead poisoning, the recommendations have been revised to target blood lead testing of high-risk populations. High risk is based on an evaluation of the likelihood of lead exposure. Departments of health are responsible for determining the local prevalence of lead poisoning, as well as the percentage of housing built before 1950, the period of peak leaded paint use. When this information is available, informed screening guidelines for
practitioners can be issued. For instance, in New York State, where a large percentage of housing was built before 1950, the Department of Health mandates that all children be tested for lead poisoning via blood analyses. *In the absence of such data, the practitioner should continue to test all children at both 12 and 24 mo.* In areas where the prevalence of lead poisoning and old housing is low, targeted screening may be performed on the basis of a risk assessment. Three questions form the basis of most published questionnaires (Table 739.3), and items that are pertinent to the locale or individual may be added. If there is a lead-based industry in the child's neighborhood, the child is a recent immigrant from a country that still permits use of leaded gasoline, or the child has pica or developmental delay, blood lead testing would be appropriate. All Medicaid-eligible children should be screened by blood lead testing. Venous sampling is preferred to capillary sampling because the chances of false-positive and false-negative results are less with the former.

**Table 739.3**

**Minimum Personal Risk Questionnaire**

1. Does the child live in or visit regularly a house that was built before 1950? (Include settings such as daycare, babysitter's or relative's home.)
2. Does the child live in or regularly visit a house built before 1978 with recent (past 6 mo) or ongoing renovations or remodeling?
3. Does the child have a sibling or playmate who has or did have lead poisoning?

From Screening young children for lead poisoning: guidance for state and local public health officials, Atlanta, 1997, Centers for Disease Control and Prevention.

The threshold for lead effects and the reference level for risk management purposes are not the same. Laboratory issues make the interpretation of values between 0 and 5 µg/dL more difficult. Some labs certified as proficient by the CDC or other testing programs can accurately measure BLLs to 2 µg/dL; others only to 5 µg/dL. A screening value at or above 5 µg/dL is consistent with exposure and requires a second round of testing for a diagnosis and to determine the appropriate intervention. The timing for the “repeat” evaluation depends on the initial value (Table 739.4). If the diagnostic (second) test confirms that the
BLL is elevated, then further testing is required by the recommended schedule (Table 739.5). A confirmed venous BLL of 45 µg/dL or higher requires prompt chelation therapy.

**NOT RECOMMENDED AT ANY BLOOD LEAD CONCENTRATION**

- Searching for gingival lead lines
- Testing of hair, teeth, or fingernails for lead
Other Tools for Assessment

BLL determinations remain the gold standard for evaluating children because of ready availability and its correlation with health outcomes in populations. Techniques are available to measure lead in other tissues and body fluids. Experimentally, the method of x-ray fluorescence (XRF) allows direct and noninvasive assessment of bone lead stores. XRF methodology was used to evaluate a population that had long-term exposure to lead from a polluting battery-recycling factory. The study found that the school-aged children had elevated lead levels in bone but not in venous blood, a finding that is consistent with our understanding of the slow turnover of lead in bone, which is measurable in years, in contrast to that in blood, which is measurable in weeks. It also indicates that children may have substantial lead in their bodies that is not detected by routine blood lead testing. This stored lead may be released to toxic levels if bone resorption rates suddenly increase, as occurs with prolonged immobilization of longer than a week and during pregnancy. Thus children with histories of elevated BLLs are potentially at risk for recrudescence of lead toxicity long after ingestion has stopped and may pass this lead to the next generation. XRF methodology is not available for clinical use in children.

Lead also can be measured in urine. Spontaneous excretion, even in children with high BLLs, is usually low. Lead excretion may be stimulated by treatment with chelating agents, and this property of these drugs forms the basis of their use as a component of lead treatment. It also has been used to develop a test that differentiates children with lead burdens responsive to chelation therapy, the lead mobilization test. In this test, a timed urine collection follows one or two doses of chelating agent and the lead content is determined. However, this test is no longer recommended.

Lead in hair, nails, and saliva also is measurable but has problems of contamination and interpretability. Further research is required before indications for testing these materials are established. Other tests are used as indirect assessments of lead exposure and accumulation. Radiographs of long bones may
show dense bands at the metaphyses, which may be difficult to distinguish from growth arrest lines but, if caused by lead, are indicative of months to years of exposure. For children with acute symptoms, when a BLL result is not immediately available, a kidneys-ureters-bladder (KUB) radiograph may reveal radiopaque flecks in the intestinal tract, a finding that is consistent with recent ingestion of lead-containing plaster or paint chips. The absence of radiographic findings does not rule out lead poisoning, however.

Because BLLs reflect recent ingestion or redistribution from other tissues but do not necessarily correlate with the body burden of lead or lead toxicity in an individual child, tests of lead effects also may be useful. After several weeks of lead accumulation and a BLL higher than 20 µg/dL, increases in EP values to more than 35 µg/dL may occur. An elevated EP value that cannot be attributed to iron deficiency or recent inflammatory illness is both an indicator of lead effect and a useful means of assessing the success of the treatment; the EP level will begin to fall a few weeks after successful interventions that reduce lead ingestion and increase lead excretion. Since EP is light sensitive, whole blood samples should be covered in aluminum foil (or equivalent) until analyzed.

**Treatment**

Once lead is in bone, it is released slowly and is difficult to remove even with chelating agents. Because the cognitive/behavioral effects of lead may be irreversible, the main effort in treating lead poisoning is to prevent it from occurring and to prevent further ingestion by already-poisoned children. The main components in the effort to eliminate lead poisoning are universally applicable to all children (and adults) and are as follows: (1) identification and elimination of environmental sources of lead exposure, (2) behavioral modification to reduce nonnutritive hand-to-mouth activity, and (3) dietary counseling to ensure sufficient intake of the essential elements calcium and iron. For the small minority of children with more-severe lead poisoning, drug treatment is available that enhances lead excretion.

During health maintenance visits a limited risk assessment is warranted, which includes questions pertaining to the most common sources of lead exposure: the condition of old paint, secondary occupational exposure via an adult living in the home, and/or proximity to an industrial source of pollution. If such a source is identified, its elimination usually requires the assistance of public health and housing agencies as well as education for the parents. The
family should move out of a lead-contaminated apartment until repairs are completed. During repairs, repeated washes of surfaces and the use of high-efficiency particle accumulator (HEPA) vacuum cleaners help reduce exposure to lead-containing dust. Careful selection of a contractor who is certified to perform lead abatement work is necessary. Sloppy work can cause dissemination of lead-containing dust and chips throughout a home or building and result in further elevation of a child's BLL. After the work is completed, dust wipe samples should be collected from floors and windowsills or wells to verify that the risk from lead has abated.

A single case of lead poisoning is often discovered in a household with multiple affected family members, including other young children, even in a household with a common source of exposure such as peeling lead-based paint. The mere presence of lead in an environment does not produce lead poisoning. Parental efforts at reducing the hand-to-mouth activity of the affected child are necessary to reduce the risk of lead ingestion. Handwashing effectively removes lead, but in a home with lead-containing dust, lead rapidly begins to reaccumulate on the child's hands after washing. Therefore, handwashing is best limited to the period immediately before nutritive hand-to-mouth activity occurs.

Because there is competition between lead and essential minerals, it is reasonable to promote a healthy diet that is sufficient in calcium and iron. The recommended daily intakes of these metals vary somewhat with age. In general, for children 1 yr of age and up, a calcium intake of about 1 g/day is sufficient and convenient to remember (roughly the calcium content of a quart of milk [≈1,200 mg/qt] or calcium-fortified orange juice). Calcium absorption is vitamin D dependent; milk is fortified with vitamin D, but other nutritional sources of calcium often are not. A multivitamin containing vitamin D may be prescribed for children who do not drink sufficient milk or who have inadequate sunlight exposure. Iron requirements also vary with age, ranging from 6 mg/day for infants to 12 mg/day for adolescents. For children identified biochemically as being iron deficient, therapeutic iron at a daily dose of 5-6 mg/kg for 3 mo is appropriate. Iron absorption is enhanced when iron is ingested with ascorbic acid (citrus juices). Giving additional calcium or iron above the recommended daily intakes to mineral-sufficient children has not been shown to be of therapeutic benefit in the treatment of lead poisoning.

**Drug treatment** to remove lead is lifesaving for children with lead encephalopathy. In nonencephalopathic children, it prevents symptom progression and further toxicity. Guidelines for chelation are based on the BLL.
A child with a venous BLL of 45 μg/dL or higher should be treated. Four drugs are available in the United States: 2,3-dimercaptosuccinic acid (DMSA [succimer]), CaNa₂ EDTA (versenate), British antilewisite (BAL [dimercaprol]), and penicillamine. DMSA and penicillamine can be given orally, whereas CaNa₂ EDTA and BAL can be administered only parenterally. The choice of agent is guided by the severity of the lead poisoning, the effectiveness of the drug, and the ease of administration (Table 739.6). Children with BLLs of 44-70 μg/dL may be treated with a single drug, preferably DMSA. Those with BLLs of 70 μg/dL or greater require two-drug treatment: CaNa₂ EDTA in combination with either DMSA or BAL for those without evidence of encephalopathy, or CaNa₂ EDTA and BAL for those with encephalopathy. Published data on the combined treatment with CaNa₂ EDTA and DMSA for children with BLLs higher than 100 μg/dL are very limited. However, anecdotal information derived from the treatment of hundreds of severely lead poisoned children in northern Nigeria indicates that single-drug treatment with DMSA is lifesaving, although the degree of residual damage in survivors has not been reported.

Drug-related toxicities are minor and reversible. These include gastrointestinal distress, transient elevations in transaminases, active urinary sediment, and
neutropenia. These types of events are least common for CaNa$_2$ EDTA and DMSA, and more common for BAL and penicillamine. All of the drugs are effective in reducing BLLs when given in sufficient doses and for the prescribed time. These drugs also may increase lead absorption from the gut and should be administered to children in lead-free environments. Some authorities also recommend the administration of a cathartic immediately prior to or concomitant with the initiation of chelation to eliminate any lead already in the gut.

None of these agents removes all lead from the body. Within days to weeks after completion of a course of therapy, the BLL rises, even in the absence of new lead ingestion. The source of this rebound in the BLL is believed to be bone. Serial examinations of bone lead content have shown that chelation with CaNa$_2$ EDTA is associated with a decline in bone lead levels but that residual bone lead remains detectable even after multiple courses of treatment.

Repeat chelation is indicated if the BLL rebounds to 45 µg/dL or higher. Children with initial BLLs higher than 70 µg/dL are likely to require more than one course. A minimum of 3 days between courses is recommended to prevent treatment-related toxicities, especially in the kidney.

The indication for chelation therapy for children with BLLs <45 µg/dL is less clear. Although use of these drugs in children with BLLs from 20 to 45 µg/dL will result in transient lowered BLLs, and in some cases reversal of lead-induced enzyme inhibition, few such children increase their excretion of lead significantly during chelation, raising the question of whether any long-term benefit is achieved. A study of 2 yr old children with BLLs of 20-44 µg/dL who were randomized to receive either DMSA or placebo found that the drop in BLLs was greater in the 1st 6 mo after enrollment in the DMSA-treated group, but the levels converged by 1 yr of follow-up. Mean cognitive test scores obtained at 4 and 7 yr of age were not statistically different between the groups. Chelation with DMSA (and CaNa$_2$ EDTA) is not recommended for all children with BLLs <45 µg/dL. Further work needs to be done to determine whether there are subgroups of children with BLLs lower than 45 µg/dL who might benefit from chelation. For example, if children are selected for chelation after demonstrating responsiveness to a test dose of a chelating agent with an enhanced lead diuresis—an indication that the drug is effective at removing lead permanently from the body—will there be better clinical/subclinical outcomes? It also remains to be demonstrated whether other chelating agents available in the United States or elsewhere are effective at either substantially reducing body stores (bone) of lead or reversing the cognitive deficits attributable to lead at
these BLLs.

With successful intervention, BLLs decline, with the greatest fall in BLL occurring in the 1st 2 mo after therapy is initiated. Subsequently, the rate of change in BLL declines slowly, so that by 6-12 mo after identification, the BLL of the average child with moderate lead poisoning (BLL >20 µg/dL) will be 50% lower. Children with more markedly elevated BLLs may take years to reach the current CDC reference level, 5 µg/dL, even if all sources of lead exposure have been eliminated, behavior has been modified, and nutrition has been maximized. Early screening remains the best way of avoiding and therefore obviating the need for the treatment of lead poisoning.

Mushrooms are an ideal food. They are low in calories, fat free, and high in protein, making them a great source of nutrition. Unfortunately, some are highly toxic if ingested. Picking (foraging) and consumption of wild mushrooms are increasingly popular in the United States. This rise in popularity has led to increased reports of severe and fatal mushroom poisonings.

The clinical syndromes produced by mushroom poisoning are divided according to the rapidity of onset of symptoms and the predominant system involved (Table 740.1). The symptoms are caused by the principal toxin present in the ingested mushrooms. The 8 major toxins produced by mushrooms are categorized as cyclopeptides, monomethylhydrazine, muscarine, hallucinogenic indoles, isoxazole, coprine (disulfiram-like reaction), orellanine, and gastrointestinal tract–specific irritants. The edible wild mushroom *Tricholoma*
equestre is associated with delayed rhabdomyolysis, and *Clitocybe amoenolens* and *Clitocybe acromelalga* have been reported to cause erythromelalgia. The toxins responsible for these effects are unknown, and diagnostic testing methods are limited.

| Cholinergic syndrome                               | 30 min to 2 hr after ingestion: bradycardia, bronchorrhea, bronchospasm, salivation, perspiration, lacrimation, convulsions, coma | Muscarine                              | *Boletus* species, *Clitocybe* species, *Inocybe* species, *Amanita* species            |
| Disulfiram-like reaction with ethanol              | 30 min after drinking ethanol (may occur up to 1 wk after eating coprine-containing mushrooms): flushing of skin of face and trunk, hypotension, tachycardia, chest pain, dyspnea, nausea, vomiting, extreme apprehension | Coprine                               | *Coprinus atramentarius*                                                                 |
| Hallucinations                                     | 30 min to 3 hr after ingestion: hallucinations, euphoria, drowsiness, compulsive behavior, agitation | Psilocybin and psilocin                | *Psilocybe* species                                                                       |
| Delayed gastritis and renal failure                | Abdominal pain, anorexia, vomiting starting over 30 hr after ingestion, followed by progressive renal failure 3-14 days later | Orelline, orellanine                   | *Cortinarius* species                                                                     |
| Immune-mediated hemolytic anemia                   | Syncope, gastroenteritis, oliguria, hemoglobinuria, back pain, hemolysis        | Immunoglobulin mediated                | *Paxillus involutus*                                                                      |
| General gastrointestinal irritants                  | 30 min to 2 hr after ingestion: nausea, vomiting, abdominal cramping, diarrhea; may recover without treatment | Unidentified, probably multiple        | *Chlorophyllum molybdites*, backyard mushrooms (“little brown mushroom”)                  |
Symptoms after eating mushrooms may not be the direct effect of a toxin but may be an allergic reaction or a toxic effect of pesticides or other contaminants. In addition, all who ate the same mushroom may not become sick, or if they do, they may become sick at different intervals. Table 740.2 lists general principles of management.

**Table 740.2**

**General Management of Mushroom Ingestion**

1. Determine history of ingestion: how many types of mushrooms ingested, what time, if anyone else ate them, and what symptoms are present.
2. Attempt to determine which of the possible syndromes (see Table 740.1) the patient may have. For example, gastrointestinal symptoms occurring more than 6 hr after ingestion strongly suggest cyclopeptide, gyromitrin, or *Cortinarius* poisoning.
3. Administer activated charcoal. If the patient has diarrhea, do not give a cathartic. If a cathartic is used, give it only with the first dose of activated charcoal. Use repeated doses of activated charcoal for suspected amatoxin poisonings.
4. If feasible and when indicated, send gastric aspirate or emesis, along with any remaining mushrooms, to a mycologist for identification.
5. Try to perform a preliminary identification of mushroom and spores. Start to develop a spore print as soon as possible.
6. Maintain supportive measures, including airway support, intravenous fluids, and vasopressors (if needed). Monitor volume status.
7. Avoid antispasmodics for gastrointestinal symptoms.
8. Anticipate the clinical course.
Gastrointestinal: Delayed Onset

Amanita Poisoning

Poisonings by species of *Amanita* (death cap mushroom) and *Galerina* account for 95% of the fatalities from mushroom intoxication; the mortality rate for this group is 5–10%. Most species produce two classes of cyclopeptide toxins: (1) phallotoxins, which are heptapeptides believed to be responsible for the early symptoms of *Amanita* poisoning, and (2) amatoxins, octapeptides that inhibit nuclear RNA polymerase II and subsequent production of messenger RNA leading to impaired protein synthesis and cell death. Cells with high turnover rates, such as those in the gastrointestinal mucosa, kidneys, and liver, are the most severely affected. Other suggested toxin effects are induction of apoptosis, glutathione depletion in the liver, and oxygen free radical formation. Acute yellow atrophy of the liver and necrosis of the proximal renal tubules are found in lethal cases.

The clinical course of poisoning with *Amanita* or *Galerina* species is biphasic. Nausea, vomiting, and severe abdominal pain ensue 6-24 hr after ingestion. Profuse watery diarrhea follows shortly thereafter and may last for 12-24 hr or longer. During this time, patients become severely dehydrated. From 24 to 48 hr after poisoning, jaundice, hypertransaminasemia (peaking at 72-96 hr), renal failure, and coma occur. Death occurs 4-7 days after the ingestion. A prothrombin time less than 10% of control is a poor prognostic factor.

**Treatment**

Treatment for *Amanita* poisoning is both supportive and specific. Fluid loss from severe diarrhea during the early course of the illness is profound, requiring aggressive correction of fluid loss, electrolytes, and acid–base disturbances. In the late phase of the disease, management of renal and hepatic failure is also necessary.

Specific therapy for *Amanita* poisoning is designed to remove the toxin rapidly and to block binding at its target site. Oral activated charcoal is recommended as part of the initial treatment for children with *Amanita* poisoning. For significant ingestions, consider silibinin (5 mg/kg IV over 1 hr followed by a continuous intravenous infusion of 20 mg/kg/24 hr) for 3 days postingestion. If silibinin is not available, intravenous penicillin G (400,000 units/kg/24 hr) may be used. Silibinin and penicillin G inhibit binding of both
toxins, interrupt enterohepatic recirculation of amatoxin, and protect the liver from further injury, although their effectiveness is controversial. Acetylcysteine should be given for hepatoprotective effect. Hemodialysis and hemoperfusion are also recommended as part of the initial treatment for intoxicated children. Orthotopic liver transplantation may be required for children with severe hepatic failure.

**Monomethylhydrazine Intoxication**

Species of *Gyromitra* contain gyromitrin, which decomposes in the stomach to form monomethylhydrazine (CH$_3$NHNH$_2$) and inhibits central nervous system (CNS) enzymatic production of γ-aminobutyric acid. Monomethylhydrazine also oxidizes iron in hemoglobin, resulting in methemoglobinemia. Children with *Gyromitra* poisoning experience vomiting, diarrhea, hematochezia, and abdominal pain within 6-24 hr of ingestion of the toxin. CNS symptoms such as vertigo, diplopia, headache, ataxia, and seizures develop later in the clinical course. Hemolysis and methemoglobinemia (see Chapter 489.6) are rare but potential life-threatening complications of gyromitrin poisoning.

**Treatment**

Hypovolemia from gastrointestinal fluid losses and seizures require supportive intervention. Pyridoxal phosphate, the coenzyme that catalyzes the production of γ-aminobutyric acid, can reverse the effects of monomethylhydrazine when administered in high doses. Pyridoxine hydrochloride (25 mg/kg infused over 30 min) is given at a frequency that is dependent on clinical improvement. Diazepam is given for persistent seizures. Parenteral administration of methylene blue is indicated if the methemoglobin concentration exceeds 30%. Blood transfusions may be required for significant hemolysis.

**Renal: Delayed Onset**

**Orellanine Poisoning**

Species of *Cortinarius* contain the heat-stable toxin bipyridyl orellanine, which causes severe nonglomerular renal injury characterized by interstitial fibrosis and acute tubular necrosis. Although the exact mechanism of injury is not fully understood, a metabolite of orellanine is thought to inhibit renal protein
synthesis. *Cortinarius* poisoning is characterized by nausea, vomiting, and diarrhea that manifest 36-48 hr after ingestion. Although the initial symptoms may be trivial, more serious renal toxicity occurs in several days. Acute renal failure occurs in 30–50% of those affected, beginning with polyuria and progressing to renal failure (see Chapter 550).

**Treatment**

Treatment for orellanine poisoning is supportive. Early presentation, within 4-6 hr after ingestion, can be treated with activated charcoal and gastric lavage. Hemodialysis may be needed in patients suffering from renal failure. Most patients recover within 1 mo, but chronic renal insufficiency develops in one third to one half of patients, who subsequently require renal transplantation.

**Autonomic Nervous System: Rapid Onset**

**Muscarine Poisoning**

Mushrooms of the genera *Inocybe* and, to a lesser degree, *Clitocybe* contain muscarine or muscarine-related compounds. These quaternary ammonium derivatives bind to postsynaptic receptors, producing an exaggerated cholinergic response.

The onset of symptoms is rapid (30 min to 2 hr after consumption), and intoxication is characterized by symptoms of cholinergic excess: diaphoresis, excessive lacrimation, salivation, miosis, bradycardia, hypotension, urinary and fecal incontinence, and vomiting. Respiratory distress caused by bronchospasm and increased bronchopulmonary secretions is the most serious complication. The symptoms subside spontaneously within 6-24 hr.

**Treatment**

Atropine sulfate, the specific antidote, is administered intravenously (0.01 mg/kg; maximum: 2 mg). This is repeated until the pulmonary symptoms resolve or the patient becomes overtly tachycardic.

**Coprine Ingestion**
Coprinus atramentarius and Clitocybe clavipes contain coprine. Like disulfiram (Antabuse; Odyssey Pharmaceuticals, Inc.), coprine inhibits the metabolism of acetaldehyde after ethanol ingestion. The clinical manifestations result from accumulation of acetaldehyde.

Coprine intoxication becomes apparent after ethanol ingestion and may occur up to 5 days after consumption of the mushroom. Hyperemia of the face and trunk, tingling of the hands, metallic taste, tachycardia, and vomiting occur acutely. Hypotension may result from intense peripheral vasodilation.

The syndrome typically is self-limited and lasts only several hours. No specific antidote is available. If hypotension is severe, vascular reexpansion with isotonic parenteral solutions may be required. Small oral doses of propranolol have also been suggested.

Central Nervous System: Rapid Onset

Isoxazole Intoxication

Although Amanita muscaria and Amanita pantherina may contain muscarine, the toxins responsible for the CNS symptoms after ingestion of these mushrooms are primarily muscimol and ibotenic acid, the heat-stable derivatives of the isoxazoles. Muscimol, a hallucinogen, and ibotenic acid, an insecticide, act as γ-aminobutyric acid agonists. From 30 min to 3 hr after ingestion, CNS symptoms appear: obtundation, alternating lethargy and agitation, and occasionally seizures. Nausea and vomiting are uncommon. If large amounts of muscarine are contained in the mushroom, symptoms of cholinergic crisis also may occur.

Specific therapy must be carefully selected. If an exaggerated cholinergic response is observed, atropine should be administered. Conversely, because ingestions of A. muscaria or A. pantherina may cause anticholinergic findings, the acetylcholinesterase inhibitor physostigmine can be used to reverse the delirium and coma. Benzodiazepines also are used for the agitation and delirium. Seizures can be controlled with diazepam. In most cases, however, early supportive care and close observation are all that is required.

Indole Intoxication

Mushrooms belonging to the genus Psilocybe (“magic mushrooms”) contain psilocybin and psilocin, 2 psychotropic compounds. Within 30 min after
ingestion, patients experience euphoria and hallucinations, often accompanied by tachycardia and mydriasis. Fever and seizures have also been observed in children with psilocybin poisoning. These symptoms are short-lived, usually lasting for 6 hr after consumption of the mushroom. Treatment consists of rest and observation in a quiet environment. Severely agitated patients may respond to diazepam.

**Gastrointestinal: Rapid Onset**

Many mushrooms from various genera produce local gastrointestinal manifestations. The causative toxins are diverse and largely unknown. Within 1 hr of ingestion, patients experience acute abdominal pain, nausea, vomiting, and diarrhea. Symptoms may last from hours to days, depending on the species of mushroom.

Treatment is mainly supportive. Children with large fluid losses may require parenteral fluid therapy. It is imperative to differentiate ingestion of mushrooms of this class from ingestion of *Amanita* and *Galerina* species containing cyclopeptide toxins.

### Solanine Poisoning

*Diane P. Calello*

#### Keywords

solanine
Solanaceae
poisoning

Solanine is an alkaloid found in plants of the nightshade family (Solanaceae), specifically tomatoes, eggplant, and most significantly, potatoes. The majority of solanine poisoning reported has arisen from the ingestion of greened potatoes. When exposed to light and allowed to turn green and/or sprout, potatoes produce
a number of alkaloid glycosides containing the cholesterol derivative solanidine. Two of these glycosides, α-solanine and α-chaconine, are found in highest concentration in the peels and sprouts. Some solanine can be removed by boiling but not by baking. The major effect of α-solanine and α-chaconine is the reversible inhibition of cholinesterase. Cardiotoxic and teratogenic effects have also been reported.

Clinical manifestations of solanine and chaconine poisoning intoxication occur within 7-19 hr after ingestion. The most common symptoms are vomiting, abdominal pain, and diarrhea; in more severe instances of poisoning, neurologic symptoms, including drowsiness, apathy, confusion, weakness, and vision disturbances, are rarely followed by coma or death.

Treatment of solanine poisoning is largely supportive. In the most severe cases, symptoms resolve within 1-2 wk.

Seafood Poisoning

Diane P. Calello

Keywords

seafood
Ciguatera Fish Poisoning

The most frequently reported seafood-toxin illness in the world, ciguatera fish poisoning, has been reported in Florida, Hawaii, French Polynesia, the Marshall Islands, Caribbean and South Pacific Islands, and the Virgin Islands. With modern methods of transportation, the illness now occurs worldwide. Grouper is the most commonly identified source of the toxin, followed by snapper, kingfish, amberjack, dolphin, eel, and barracuda. Poisoning has also been associated with farm-raised salmon.

The dinoflagellate *Gambierdiscus toxicus*, a microscopic unicellular organism found along coral reefs, produces high concentrations of ciguatoxin and maitotoxin. The toxins are passed along the food chain from small herbivorous fish that consume the dinoflagellate to larger predatory fish and then to humans. These toxins are harmless in fish but produce distinct clinical symptoms in humans.

Ciguatoxins are odorless, colorless, and tasteless, and are not destroyed by cooking or freezing. Ciguatoxins increase the sodium ion permeability of excitable membranes and depolarize nerve cells, actions that are inhibited by calcium and tetrodotoxin.

Between 2 and 30 hr after ingestion, ciguatera fish poisoning typically produces a biphasic illness. The initial symptoms are nonspecific and are of gastrointestinal origin (diarrhea, vomiting, nausea, and abdominal pain). The second phase occurs within a few days of ingestion and consists of intense itching, anxiety, myalgias, painful intercourse, feeling of loose teeth, and rash on palms and soles; the neurologic symptoms of circumoral dysesthesias and cold allodynia (reversal of hot and cold sensation) are characteristic of this disease and may last for months. Tachycardia, bradycardia, hypotension, and death occur very infrequently. Eating fish organs, roe, or viscera is associated with greater
symptom severity. The diagnosis of ciguatera fish poisoning is based on clinical presentation and a compatible epidemiologic history; the diagnosis is confirmed by testing the ingested fish for toxin. There is no human biomarker to confirm ciguatera fish poisoning.

**Treatment**

Treatment of ciguatera fish poisoning is supportive. Intravenous fluids may be required for severe diarrhea, and parenteral administration of calcium can be used to treat hypotension. Once adequate hydration is established, mannitol (0.5-1.0 g/kg, IV over 30-45 min), given within 48-72 hr of the toxic fish ingestion, is recommended for reduction of acute symptoms (especially neurologic symptoms) and possible prevention of chronic neurologic symptoms. Various other medications and herbal remedies have been tried, with variable results. Most cases are self-limited with a favorable prognosis.

**Scombroid (Pseudoallergic) Fish Poisoning**

Ingestion of members of the Scombridae families, including albacore, mackerel, tuna, bonita, and kingfish, have been linked to major outbreaks of pseudoallergic fish poisoning. Nonscombroid fish and marine mammals, such as mahi-mahi (dolphin fish), swordfish, and bluefish, also are associated with poisoning.

The bacterial transformation of histidine to histamine is responsible for the clinical syndrome. Histidine is found in high concentrations in the flesh of scombroid fish; if refrigeration is inadequate, the action of bacterial decarboxylases during putrefaction converts histidine to histamine. Fish containing more than 20 mg of histamine per 100 g of flesh are toxic. In patients receiving isoniazid, a potent histaminase blocker, ingestion of fish flesh containing a lower concentration of histamine may be toxic.

The onset of clinical manifestations is acute and occurs within 10 min to 2 hr of ingestion. The most common symptoms and signs are diarrhea, erythema, sweating, flushing, diaphoresis, urticaria, nausea, and headache (Fig. 740.1). Abdominal pain, tachycardia, oral burning or numbness, dizziness, respiratory distress, hives, and facial swelling also occur. The illness is usually self-limited, terminating within 8-24 hr.
Treatment

Treatment is mainly supportive. With severe diarrhea, fluid replacement may be necessary. Antihistamines and antiemetics have been variably successful.

Paralytic Shellfish Poisoning

Mussels, clams, oysters, scallops, and other filter-feeding mollusks may become contaminated during dinoflagellate blooms or “red tides.” During periods of contamination, water in coastal areas can be colored red by the algae; this sign is the origin of the term red tide. (Such discoloration does not necessarily indicate the presence of toxin, and toxin may be present in high quantities without discoloration. Nonetheless, discolored water should be regarded with suspicion.) The dinoflagellates *Alexandrium* spp. and *Gymnodinium catenatum* often are responsible for these red tides and contain several potent neurotoxins. Paralytic shellfish poisoning is a distinctive neurologic illness caused by 20 closely related heat-stable paralytic shellfish toxins, generally referred to as saxitoxins. These compounds prevent nerve conduction by inhibiting the sodium–potassium pump.
Consumption of bivalves, such as mussels, scallops, and clams, is the usual pathway of intoxication, although crustaceans and fish have been implicated as well.

The onset of clinical manifestations of paralytic shellfish poisoning occurs rapidly, 30 min to 2 hr after ingestion. Abdominal pain and nausea are common. Paresthesias are common and occur circumorally or in a stocking–glove distribution, or both. Perioral numbness or tingling, diplopia, ataxia, dysarthria, and the sensation of floating are seen less commonly. In severe cases, respiratory failure from diaphragmatic paralysis may result. Swimming in the water during a red tide episode does not appear to have neurologic sequelae, although skin or mucosal irritation may result.

**Treatment**

No antidote for paralytic shellfish poisoning is known. Supportive care, including mechanical ventilation, may be needed. Although the symptoms are usually self-limited and short-lived, weakness and malaise may persist for weeks after ingestion.

**Neurotoxic Shellfish Poisoning**

Neurotoxic shellfish poisoning is a rare disease that occurs after consumption of molluscan shellfish contaminated with brevetoxins. Shellfish harvested along the Gulf of Mexico during or right after a red tide are at risk of contamination with brevetoxins produced by the dinoflagellate *Karenia brevis*. There has also been recent evidence of brevetoxin production by raphidophytes (*Chattonella* spp.). Brevetoxins are a group of more than 10 lipid-soluble neurotoxins that activate sodium ion channels, causing nerve membrane depolarization. Shellfish are not affected by the brevetoxins. Rinsing, cleaning, cooking, and freezing do not destroy the toxins, which also cannot be detected by taste or smell.

The onset of clinical manifestations of neurotoxic shellfish poisoning occurs from within a few min up to 18 hr after consumption. Most symptoms are gastrointestinal (nausea, vomiting, and diarrhea) or neurologic (numbness and tingling of the lips, mouth, face, and extremities, ataxia, partial limb paralysis, reversal of hot and cold sensation, slurred speech, headache, and fatigue). Neurotoxic shellfish poisoning is similar to a mild case of paralytic shellfish poisoning.
Treatment

There are no specific antidotes for brevetoxins. Treatment involves mostly supportive care. Brevenal, a natural antagonist of brevetoxin produced by *K. brevis*, may be used as a form of treatment in the future.

Diarrhetic Shellfish Poisoning

Several outbreaks of diarrhetic shellfish poisoning have been reported in Europe after consumption of mussels, cockles, and other shellfish. The dinoflagellates *Dinophysis* and *Prorocentrum* produce okadaic acid and its derivatives, the dinophysistoxins. These compounds inhibit protein phosphatases. The intracellular accumulation of phosphorylated proteins causes increased fluid secretion by gut cells via calcium influx, which is mediated by cyclic adenosine monophosphate and prostaglandins.

Patients have severe diarrhea. Care is supportive and directed at rehydration. The illness is self-limited, and recovery occurs in 3-4 days; few patients require hospitalization.

Amnesic Shellfish Poisoning

Amnesic shellfish poisoning was first reported in 1987 in Canada when a group of people demonstrated severe gastroenteritis as well as neurologic symptoms, including memory loss, after eating mussels from Prince Edward Island. Subsequent cases have been identified after consumption of shellfish from the United States, Spain, and the United Kingdom. The responsible toxin, domoic acid, comes from a diatom, *Pseudonitzschia multiseries*, and is a potent glutamate agonist, disrupting neurochemical transmission in the brain. It also binds to glutamate receptors, which increase calcium influx, producing neuronal swelling in the hippocampal area of the brain and death.

The initial clinical manifestations are gastrointestinal. Memory loss is closely related to advanced age. Those patients <40 yr are more likely to suffer only from diarrhea, whereas those >50 yr suffer from memory loss lasting months to years.

Pufferfish Poisoning
The consumption of pufferfish (blowfish) in certain geographic areas such as Japan and the Indo-Pacific Ocean is associated with a lethal neurotoxic illness due to tetrodotoxin. Fugu, a Japanese delicacy, is sought after in part because of the subtle neurotoxic effects experienced upon eating, including perioral paresthesias and a dissociative feeling. While a trained fugu chef will remove the most toxic parts of the fish, the toxin is still found in varying degrees.

Tetrodotoxin, which is also found in the blue-ringed octopus, causes a paralytic illness due to the blockade of voltage-dependent sodium channels. Early symptoms include paresthesias, nausea, and dizziness, which progresses to weakness, numbness, and incoordination. Autonomic compromise may also occur with bradycardia and hypotension. In the most severe of cases, respiratory compromise requires assisted ventilation.

There is no specific antidote for tetrodotoxin pufferfish poisoning.

**Azaspiracid Poisoning**

The azaspiracids are a class of algal toxins associated with harmful algal blooms (HAB). Azaspiracid poisoning results from ingestion of contaminated bivalve shellfish, especially mussels. Azaspiracid toxins are distributed throughout the muscle tissue in the shellfish. Azaspiracid is cytotoxic to cells and an inhibitor of Ca$^{2+}$ channels in plasma membranes. Symptoms start 6-18 hr after ingestion and include nausea, vomiting, severe stomach cramps, and diarrhea, which often persist up to 5 days.

Cyanobacteria (blue-green algae) also produce HAB; exposure is usually during recreational water sports and may be cutaneous or gastrointestinal. Symptoms include rash, cough, abdominal pain, diarrhea, nausea, emesis, muscle aches, watery eyes, weakness, or sore throat.

**Scombroid Fish Poisoning**

**Shellfish Poisoning**

**Fish Poisoning**
Melamine (1,3,5-triazine-2,4,6-triamine, or C$_3$H$_6$N$_6$), a compound developed in the 1830s, is found in many plastics, adhesives, laminated products, cement, cleansers, fire retardant paint, and more. Melamine poisoning from food products was unheard of until 2007, when melamine-tainted pet food caused the death of many dogs and cats in the United States. In 2008, feeding of melamine-tainted infant formula to more than 300,000 children resulted in kidney injuries, 50,000 hospitalizations, and 6 deaths in China. This was the first reported
epidemic of melamine-tainted milk products.

Melamine contains 66% nitrogen by mass. The illegal addition of melamine to infant formula can give the formula a milky appearance and falsely raise the protein content as measured by nitrogen testing. Melamine, combined with cyanuric acid, forms cyanurate crystals in the kidneys. Along with protein, uric acid, and phosphate, melamine forms renal calculi.

Clinical manifestations are initially subtle and nonspecific. The severity is dose related. The first symptoms in affected infants are unexplained crying (especially when urinating), vomiting, and discolored urine caused by the formation of stones and gravel in the urinary tract. Urinary obstruction and acute renal failure follow. In the absence of a specific diagnosis, death from renal failure may occur. Whether children with melamine-induced renal failure will have chronic sequelae is currently unknown. Animal studies have shown that melamine may cause cognitive impairment, but further investigation is needed.

The melamine stones and gravel can be treated with hydration, alkalinization, or lithotripsy. Acute renal failure requires supportive care and dialysis if needed.

In April of 2017, an attack on the town of Khan Shaykhun in Syria employed a poisonous “nerve agent” (likely Sarin) and resulted in the deaths of at least 92 civilians, many of them young children. The attack intentionally targeted civilian neighborhoods at the time children were getting ready for school—strong evidence that its purpose was terror, not warfare. Terrorist actions targeting children are not novel. Brought to the forefront of American consciousness by Timothy McVeigh's references to child fatalities as “collateral damage” during the Oklahoma City bombing in April 1995, the intentional targeting of children became firmly ensconced as a global reality with the attack upon a school in Beslan, Russia, in September 2004. The attack, which left 334 (including 186 children) dead, presaged additional attacks specifically directed against children at an Amish school in Pennsylvania in 2006, at a camp for teenagers in Utoya, Norway, in 2011, and at Sandy Hook Elementary School in Connecticut in 2012, among others.

Paralleling the targeting of children is an apparent trend toward the use of “unconventional” weapons of terror. In 1984, members of the Rajneeshee cult employed Salmonella typhi in a wave of intentional poisonings that affected 751 persons, including 142 teenage patrons of a popular pizza parlor. In 1995, the Aum Shinrikyo cult killed 12 and sickened thousands by intentionally releasing sarin nerve agent in the Tokyo subway system. A disgruntled scientist allegedly deployed anthrax spores via the U.S. mail in October 2001, killing 5 and injuring 17 in an attack upon a nation already reeling in the wake of the 9/11 attacks.

These developments remind us that terrorists can strike at any time, utilizing any number of unconventional weapons, including biologic and chemical agents. Children will not be spared in these attacks on civilians, and indeed schools and daycare sites may be the targets of these actions.
**Etiology**

Terrorists may choose to use weapons of opportunity, agents that for some reason are readily available to some member of the terrorist group. The motives of terrorists often are obscure and difficult to predict. Prevention and response strategies should thus concentrate not on those agents most likely to be used but, rather, on those agents that, if used, would constitute the gravest potential threats to public health and security.

Biologic threat agents, including pathogens and toxins, have been divided by the Centers for Disease Control and Prevention into three categories, with category A including diseases caused by those six agents posing the greatest threat: anthrax, plague (see Chapter 230.3), tularemia (see Chapter 233), smallpox, botulism (see Chapter 237), and the viral hemorrhagic fevers (see Chapter 297).

Terrorists could also procure and release a vast array of potentially harmful chemicals. Tank cars full of flammable industrial gases and liquids, corrosive industrial acids and bases, poisonous compounds such as cyanides and nitrites, pesticides, dioxins, and explosives traverse our railways and roads daily. Four classes of “military-grade” chemicals with a history of use in warfare or manufactured specifically for use as weapons include the organophosphate-based nerve agents, vesicants, cyanides (misleadingly referred to as “blood agents”), and certain pulmonary irritants or “choking agents.”

**Epidemiology and Pediatric-Specific Concerns**

Large-scale attacks on civilian targets will likely involve pediatric victims, and children may be more susceptible than adults to the effects of certain biologic and chemical agents (see Chapter 737). A thinner and less-keratinized epidermis makes dermally active agents, such as mustard or trichothecene mycotoxins, a greater risk to children than adults. A larger surface area per unit volume further increases the problem. A small relative blood volume makes children more susceptible to the volume losses associated with enteric infections such as cholera and to gastrointestinal intoxications such as might be seen with exposure to the staphylococcal enterotoxins. Children's high minute ventilation, compared with that of adults, increases the threat of agents delivered via the inhalational
route. The fact that children live “closer to the ground” compounds this effect when heavier-than-air chemicals are involved. An immature blood-brain barrier may heighten the risk of central nervous system toxicity from nerve agents. Developmental considerations make it less likely that a child would readily flee an area of danger, thereby increasing exposure to these various adverse effects. Moreover, children are more likely to be terrified at the sight of responders in personal protective ensembles.

Children appear to have a unique susceptibility to certain potential agents that might be used by terrorists. Although adults generally suffer only a brief, self-limited incapacitating illness after infection with Venezuelan equine encephalitis virus, young children are more likely to experience seizures, permanent neurologic sequelae, and death. In the case of smallpox, waning herd immunity may disproportionately affect children. Vaccine-induced immunity to smallpox probably diminishes significantly after ages 3-10 yr. Although most adults are considered susceptible to smallpox, given that routine civilian immunization ceased in the early 1970s, older adults may have some residual protection from death, if not from the development of disease. Today's children are among the first to grow up in a world without any individual or herd immunity to smallpox.

Children also may experience unique disease manifestations not seen in adults. Suppurative parotitis is a common characteristic finding among children with melioidosis but is not generally seen in adults with *Burkholderia pseudomallei* infection (see Chapter 232.2). Seizures, often the presenting symptom of cyanide or nerve agent poisoning, may clinically be much harder to recognize in children than in adults, looking more like unresponsiveness or change in mental status than tonic-clonic phenomena.

Pediatricians are likely to experience unique problems in managing childhood victims of biologic or chemical attack. Many of the drugs useful in treating such casualties are unfamiliar to pediatricians or have relative contraindications in childhood. The fluoroquinolones and tetracyclines are commonly cited as agents of choice in the treatment and prophylaxis of anthrax, plague, tularemia, brucellosis, and Q fever. Both drug classes are often avoided in children, although the risk of morbidity and mortality from diseases induced by agents of bioterrorism far outweighs the minor risk associated with short-term use of these agents. Ciprofloxacin received, as its first licensed pediatric indication, FDA approval for use in the prophylaxis of anthrax after inhalational exposure during a terrorist attack. Doxycycline and levofloxacin are licensed specifically in children for the same indication, and levofloxacin is also licensed for
postexposure prophylaxis of children against plague. Immunizations potentially useful in preventing biologic agent–induced diseases are often not approved for use in pediatric patients. The available anthrax vaccine is licensed only for those between 18 and 65 yr. The plague vaccine, currently out of production and probably ineffective against inhalational exposures, was approved only for individuals ages 18-61 yr. The smallpox vaccine, a live vaccine employing vaccinia virus, can cause fetal demise when given to pregnant women.

Many otherwise useful pharmaceutical agents are not available in pediatric dosing regimens. The military distributes nerve agent antidote kits consisting of prefilled autoinjectors designed for the rapid administration of atropine and pralidoxime. Many emergency departments and some ambulances stock these kits. The doses of agents contained in the nerve agent antidote kit are calculated for soldiers and thus are excessive of those appropriate for young children, and pediatric pralidoxime autoinjectors are not yet available. Atropine autoinjectors specifically formulated for children are approved by the FDA and are available. Even though these products exist, children smaller than 15 pounds are too small for safe use of the autoinjectors, and obtaining venous access via cutdown will not only be time-consuming but extremely difficult in a contaminated environment.

Although physical protective measures and devices (e.g., “gas masks”) are likely to be of little utility in a civilian terrorism setting, such commercially available devices are not often available in pediatric sizes. The Israeli experience during the first Gulf War suggests that frightened parents may improperly use such masks on their children, resulting in inadvertent suffocation.

In the event of a large-scale terrorist attack, there may be an insufficient number of pediatric hospital beds. In any large disaster, excess bed capacity might potentially be provided at civilian and veterans hospitals under the auspices of the National Disaster Medical System, but that system makes no specific provision for pediatric beds. The situation is even more dire regarding burn unit beds, which may be needed in an attack with vesicants like sulfur mustard.

Clinical Manifestations

Should a terrorist attack occur, clinicians may be called on to make prompt diagnoses and render rapid lifesaving treatments before the results of confirmatory diagnostic tests are available. Although each potential agent of
terrorism produces its own unique clinical manifestations, it is useful to consider their effects in terms of a limited number of distinct clinical syndromes. This approach helps clinicians make prompt, rational decisions regarding empirical therapy. Casualties resulting from a terrorist attack would either experience symptoms immediately upon exposure to an agent (or within the first several hours after exposure) or, alternatively, would see their symptoms develop slowly over a period of days to weeks. In the former case, the sinister nature of the event is often obvious and the etiology more likely to be conventional or chemical in nature.

Biologic agents differ from conventional, chemical (see Chapter 737 ), and nuclear (see Chapter 736 ) weapons in that they have inherent incubation periods. Consequently, patients are likely to present distant in time and place from the point of an unannounced and unnoticed exposure to a biologic agent. Whereas traditional first responders, such as firefighters and paramedics, may be at the forefront of a conventional or chemical terrorism response, the primary care physician or emergency room is likely to constitute the first line of defense against the effects of a biologic agent.

Casualties can thus be categorized as either immediate or delayed in presentation. Within each of these categories, patients can be further classified as having primarily respiratory, neuromuscular, or dermatologic manifestations (Table 741.1 ). A limited number of agents may cause each particular syndrome, permitting institution of empiric therapy targeted at a short list of potential etiologies. The viral hemorrhagic fevers might manifest as fever and a bleeding diathesis; these agents are considered separately in Chapter 297 . In most cases, supportive care is the mainstay of hemorrhagic fever treatment.

Sudden-Onset Neuromuscular Syndrome: Nerve Agents

The very rapid onset of neuromuscular symptoms after an exposure should lead the clinician to consider nerve agent intoxication. The nerve agents (tabun, sarin, soman, and VX) are organophosphate analogs of common pesticides that act as potent inhibitors of the enzyme acetylcholinesterase. They are hazardous via ingestion, inhalation, or cutaneous absorption (see Chapter 77).

The inhibition of cholinesterase by these compounds results in the accumulation of acetylcholine at neural and neuromuscular junctions, causing excess stimulation. The resultant cholinergic syndrome involves central, nicotinic, and muscarinic effects. Central effects are both muscarinically and nicotinically mediated, and include altered mental status progressing rapidly to lethargy and coma, as well as ataxia, convulsions, and central respiratory depression. Studies on pesticide exposure suggest that children may be more prone to central neurologic dysfunction with organophosphate toxicity than adults. The most lethal effects are respiratory, which result not only from central effects but also from direct paralysis of the diaphragm and other respiratory muscles (nicotinic effects), as well as bronchospasm and bronchorrhea (muscarinic effects). Nicotinic effects include muscle fasciculations and twitching, followed by weakness, which can progress to flaccid paralysis as muscles fatigue. Importantly, flaccid paralysis is not present initially, as in a patient with botulinum toxin poisoning; in botulinum toxin poisoning, neurotransmitter cannot be released from the presynaptic terminal, whereas in nerve agent poisoning, excess neurotransmitter accumulates because acetylcholinesterase, the enzyme that turns off the transmitter, is inhibited. Muscarinic effects include miosis (the clinical hallmark of a patient who has suffered a non-life-threatening nerve agent challenge), visual blurring, profuse lacrimation, and watery rhinorrhea. Bronchospasm and increased bronchial secretions lead to cough, wheezing, dyspnea, and cyanosis. Cardiovascular manifestations include bradycardia, hypotension, and atrioventricular block. Flushing, sweating, salivation, nausea, vomiting, diarrhea, abdominal cramps, and urinary incontinence are also seen. In the absence of prompt intervention, death can quickly result from a combination of central effects and respiratory muscle paralysis.
The classic neuromuscular syndrome of extremely acute symptoms most commonly results from an aerosol or vapor challenge, the most likely route in a terrorist attack. But nerve agents are liquids at standard temperature and pressure, and do not cause immediate irritation to skin, so liquid nerve agent can be contagious person-to-person, pass through the skin, and cause the cholinergic crisis syndrome that way. This is often delayed by minutes to hours, depending upon dose and body site. In children, because the stratum corneum of the skin forms only gradually, skin transit time will be reduced. The most important clinical pearl is that miosis may be a late development. *If the clinician suspects that the child may have been exposed to nerve agent via the skin route, she or he should immediately treat, even if miosis has not yet developed.*

**Cyanide poisoning** is a major differential diagnosis of nerve agent poisoning in an attack scenario. Cyanide poisons cytochrome a3 in the mitochondrial electron transport chain and can cause an almost immediate and rather similar syndrome of loss of consciousness, immediate rapid breathing, status epilepticus, and rapid progression to cardiac arrest. Important clinical differential points include miosis, which is usually absent in cyanide poisoning, and the usual lack of cyanosis (ironically) due to the tissues’ inability to use oxygen from the blood, causing venous blood to retain oxygen and remain red. In a real emergency, it may be necessary to treat for both nerve agent and cyanide poisoning until the cause is definitively identified.

### Delayed-Onset Neuromuscular Syndrome: Botulism

The delayed onset (hours to days after exposure) of neuromuscular symptoms is characteristic of botulism. Botulism occurs after exposure to 1 of 7 related neurotoxins produced by certain strains of *Clostridium botulinum*, a strictly anaerobic, spore-forming, Gram-positive bacillus commonly found in soil. Naturally occurring botulism (see Chapter 237) usually follows ingestion of preformed toxin (food poisoning) or results from intestinal toxin production (infantile botulism). An aerosol exposure would likely result in a case of clinical botulism indistinguishable from that caused by natural exposures.

Following exposure to botulinum toxin, clinical manifestations typically begin with bulbar palsies, causing patients to complain of ptosis, photophobia, and blurred vision resulting from difficulty in accommodation. Symptoms can progress to include dysarthria, dysphonia, and dysphagia, and finally, a
descending symmetric paralysis. Sensation and sensorium are typically not affected. In the absence of intervention, death often results from respiratory muscle failure. The mechanism of action of botulinum toxin is almost the exact opposite of that of nerve agent. Seizures, loss of consciousness, and peripheral twitching and fasciculations, typical of nerve agent poisoning, are not seen in botulism.

**Sudden-Onset Respiratory Syndrome: Chlorine, Phosgene, and Cyanide**

The acute onset of respiratory symptoms shortly after exposure should prompt the clinician to consider a range of potential chemical agents. Of note, nerve agents, discussed previously, may affect respiration via massive bronchial hypersecretion, bronchospasm, and respiratory muscle paresis. However, the nerve agent casualty will likely have generalized muscle involvement and central nervous system manifestations. In contrast, the toxic inhalants chlorine and phosgene produce respiratory distress without neuromuscular involvement.

**Chlorine** is a dense, acrid, yellow-green gas that is heavier than air. After mild to moderate exposure, ocular and nasal irritation occurs, followed by cough, a choking sensation, bronchospasm, and substernal chest tightness. Pulmonary edema, mediated by hydrochloric acid and free oxygen radical generation, follows moderate to severe exposures within 30 min to several hours. Hypoxemia and hypovolemia secondary to pulmonary edema are the factors responsible for death when it occurs.

**Phosgene**, like chlorine, is a common industrial compound that was used as a weapon on the battlefields of World War I. Its odor has been described as similar to “new-mown hay.” Like chlorine, phosgene also is thought to result in the generation of hydrochloric acid, contributing particularly to upper airway, nasal, and conjunctival irritation. Acylation reactions caused by the effects of phosgene on the pulmonary alveolar-capillary membrane lead to pulmonary edema. Phosgene lung injury also may be mediated, in part, by an inflammatory reaction associated with leukotriene production. Patients with mild to moderate exposures to phosgene may be asymptomatic, a fact that may cause victims to remain in a contaminated area. Noncardiogenic pulmonary edema or “dry land drowning” occurs 4-24 hr after exposure and is dose dependent, with heavier exposures causing earlier symptoms. Dyspnea may precede radiologic findings. In severe exposures, pulmonary edema may be so marked as to result in hypovolemia and
hypotension. As in the case of chlorine, death results from hypoxemia and asphyxia.

Cyanide is a cellular poison, with protean clinical manifestations. Initially, cyanide toxicity is most likely to manifest as tachypnea and hyperpnea, progressing rapidly to apnea in cases with significant exposure (see Chapter 77). The efficacy of cyanide as a chemical terrorism agent is limited by its volatility in open air and relatively low lethality in comparison with nerve agents. Released in a closed room, however, cyanide could have devastating effects, as evidenced by its use in the Nazi gas chambers during World War II. Cyanide inhibits cytochrome a₃, interfering with normal mitochondrial oxidative metabolism and leading to cellular anoxia and lactic acidosis. In addition to respiratory distress, early findings among cyanide victims include tachycardia, flushing, dizziness, headache, diaphoresis, nausea, and vomiting. With greater exposure, seizures, coma, apnea, and cardiac arrest may follow within minutes. An elevated anion gap metabolic acidosis is typically present, and decreased peripheral oxygen utilization leads to an elevated mixed venous oxygen saturation value.

Delayed-Onset Respiratory Syndrome: Anthrax, Plague, Tularemia, and Ricin

A delayed onset of respiratory symptoms (days after exposure) is characteristic of several infectious diseases and 1 toxin that might be adapted for sinister purposes by terrorists. Among the most threatening and problematic of these are anthrax, plague, tularemia, and ricin, the latter having garnered considerable media attention in recent years.

Anthrax is caused by infection with the Gram-positive spore-forming rod Bacillus anthracis. Its ability to form a spore enables the anthrax bacillus to survive for long periods in the environment and enhances its potential as a weapon.

The vast majority of naturally occurring anthrax cases are cutaneous, acquired by close contact with the hides, wool, bone, and other by-products of infected ruminants (principally cattle, sheep, and goats). Cutaneous anthrax is amenable to therapy with a variety of antibiotics and is readily recognizable to experienced clinicians in endemic areas; consequently, it is rarely fatal. Although it is common in parts of Asia and sub-Saharan Africa, only two cases of cutaneous anthrax had occurred in the United States in the 9 yr that preceded the attacks of
2001 (when 11 cutaneous cases were seen). Gastrointestinal anthrax has been described only once in the United States, in a drum circle participant whose drum heads were made from imported animal hides. In general, however, it occurs after the ingestion of contaminated meat. In the past, inhalational anthrax, or **woolsorters’ disease**, was an occupational hazard of abattoir and textile workers. Now eliminated as a naturally occurring disease in the United States, it is this inhalational form of anthrax that poses the greatest terror threat. Following an inadvertent release in 1979 from a bioweapons facility at Sverdlovsk in the former Soviet Union, 66 of 77 (86%) known adult victims of inhalational anthrax died. In the 2001 attacks involving contaminated mail in the United States, 5 of 11 (46%) patients with inhalational anthrax died. Whether better intensive care modalities, changes in antibiotic therapy, or earlier recognition accounted for this improved mortality rate remains unknown.

Symptomatic inhalational anthrax typically begins 1-6 days after exposure, although incubation periods of up to several weeks have been reported. The disease begins as a flulike illness, characterized by fever, myalgia, headache, and cough. A brief intervening period of improvement sometimes follows, but rapid deterioration then ensues; high fever, dyspnea, cyanosis, and shock mark this second phase. Hemorrhagic meningitis occurs in up to 50% of cases. Chest radiographs obtained late in the course of illness may reveal a widened mediastinum or prominent mediastinal lymphadenopathy; pleural effusions also may be seen. Bacteremia is often so profound that Gram stains of peripheral blood may demonstrate the organism at this stage. Prompt treatment is imperative; death occurs in as many as 95% of inhalational anthrax cases if such treatment is begun more than 48 hr after the onset of symptoms.

Whereas inhalational anthrax is a disease primarily of mediastinal lymphatic tissue, exposure to aerosolized plague bacilli typically leads to a primary pneumonia. Endemic **plague** is usually transmitted via the bites of fleas and is discussed in Chapter 230.3. The causative organism of all forms of human plague, **Yersinia pestis**, is a bipolar-staining, Gram-negative facultative intracellular bacillus. An ability to survive within the macrophage aids its dissemination to distant sites following inoculation or inhalation. “Buboes,” markedly swollen, tender regional lymph nodes in the distribution of a bite, are the hallmark feature of bubonic plague. Fever and malaise are typically present, and septicemia often develops as bacteria gain access to the circulation. Petechiae, purpura, and overwhelming disseminated intravascular coagulopathy commonly occur, and 80% of bubonic plague victims ultimately have positive
blood culture results. Plague is extremely infective and lethal, as illustrated by the fact that the “Black Death” eliminated one third of the population of Europe during the Middle Ages.

Intentional aerosol dissemination of *Y. pestis* would likely result in a preponderance of pneumonic plague cases. Pneumonic plague may also arise secondarily after seeding of the lungs of septicemic patients. Symptoms include fever, chills, malaise, headache, and cough. Chest radiographs may reveal a patchy consolidation, and the classic clinical finding is blood-streaked sputum. Disseminated intravascular coagulation and overwhelming sepsis typically develop as the disease progresses. Untreated pneumatic plague has a fatality rate approaching 100%.

**Tularemia** is a highly infectious disease caused by the Gram-negative coccobacillus *Francisella tularensis*. Naturally occurring tularemia is discussed in Chapter 233. The high degree of infectivity of *F. tularensis* (<10 organisms are thought to be necessary to produce infection via inhalation), as well as its survivability in the environment, contributes to its inclusion on the list of agents of concern. Several clinical forms of endemic tularemia are known, but inhalational exposure resulting from a terrorist attack would likely lead to a plague-like primary pneumonia or to typhoidal tularemia, manifesting as a variety of nonspecific symptoms, including fever, malaise, and abdominal pain.

**Ricin** is a protein toxin derived from the castor bean plant (*Ricinus communis*) that inhibits ribosomal protein synthesis. It is highly toxic in animal studies when inhaled, and may result in the delayed onset of respiratory distress, pulmonary edema, and acute respiratory failure. One case series of 8 persons from the 1940s described a febrile respiratory illness after inhalational exposure. If injected, it may cause a sepsis-like syndrome that may progress to multiorgan system failure; ingestion can lead to severe gastroenteritis. Ricin-containing letters were mailed to a U.S. Senate office building in 2004, and again to President Obama and New York City Mayor Bloomberg in 2013, although no persons were sickened in either attack.

**Intermediate-Onset Dermatologic Syndrome:**

**Mustard and Lewisite**

The development of skin lesions within hours to days of exposure is characteristic of the chemical vesicants. These compounds, often referred to as **blistering agents**, are cellular poisons and include the alkylating agent mustard
and the organic arsenical agent lewisite. Tissue injury to rapidly reproducing cells begins within minutes of contact with these agents. Clinical effects typically become evident several hours after exposure to mustard, whereas patients exposed to lewisite feel immediate pain. Both mustard and lewisite affect the eyes and respiratory tract, and their inadvertent ingestion may produce significant gastrointestinal symptoms. Mustard exposure may lead several days later to bone marrow suppression. With a large challenge, mustard may also cause an acute respiratory syndrome, particularly affecting the upper airway and presenting with laryngospasm and stridor.

**Delayed-Onset Dermatologic Syndrome: Smallpox**

The appearance of an exanthem days to weeks after exposure is likely to be a presenting feature of smallpox. Caused by infection with variola virus, a member of the orthopoxvirus family, smallpox has an incubation period of 7-17 days. This would likely permit the wide dispersal of asymptomatic exposed persons, thus contributing to the spread of an outbreak. During the incubation period, the virus replicates in the upper respiratory tract. A primary viremia ensues, during which time seeding of the liver and spleen occurs. A secondary viremia then develops, the skin is seeded, and the classic exanthem of smallpox appears.

Symptoms of smallpox begin abruptly during the phase of secondary viremia and include fever, rigors, vomiting, headache, backache, and extreme malaise. Within 2-4 days, macules appear on the face and extremities and then progress in synchronous fashion to papules, pustules, and finally scabs. As the scabs separate, survivors often are left with disfiguring, depigmented scars. The synchronous nature of the rash and its centrifugal distribution distinguish smallpox from chickenpox, which has a centripetal distribution. Historically, smallpox had a 30% mortality rate, with death typically resulting from visceral organ involvement.

**Diagnosis**

In some cases, the terrorist nature of a chemical or biologic attack may be obvious—for example, a chemical attack in which victims succumb in close temporal and geographic proximity to a dispersal device or terrorists announce
their attack. In other instances, the clinician may need to rely on epidemiologic clues to suspect an intentional release of chemical or biologic agents. The presence of large numbers of victims clustered in time and space should raise the index of suspicion, as should cases of unexpected death or unexpectedly severe disease. Diseases unusual in a given locale, in a given age group, or during a certain season likewise may warrant further investigation. Simultaneous outbreaks of a disease in noncontiguous areas should cause one to consider an intentional release (as in the 2001 mail-borne anthrax attacks), as should outbreaks of multiple diseases in the same area. Even a single case of a rare disorder such as anthrax or certain viral hemorrhagic fevers would be suspicious, and a single case of smallpox would almost certainly be the result of an intentional dissemination. Large numbers of dying animals might provide evidence of an unnatural aerosol release, as would evidence of disparate attack rates between those known to be indoors and outdoors at a given time.

In a mass casualty setting, diagnoses may be made largely on clinical grounds. The diagnosis of nerve agent intoxication is based primarily on clinical recognition and patient response to antidotal therapy. Several simple rapid detection devices developed for military use can detect the presence of nerve agents in the environment. Some of these are now commercially available and are stocked in certain emergency departments and public safety vehicles. Measurements of acetylcholinesterase in plasma or erythrocytes of nerve agent victims may be helpful in long-term prognostication, but the correlation between cholinesterase levels and clinical effects is often poor, and the test rarely is available on an emergency basis.

**Botulism** should be suspected clinically among patients presenting with a symmetric, descending, flaccid paralysis. Although the differential diagnosis of botulism includes other uncommon neurologic disorders, such as myasthenia gravis and the Guillain-Barré syndrome, the presence of multiple casualties with similar symptoms should aid in the determination of a botulism outbreak. Electromyography is useful in supporting the diagnosis.

Initially the diagnosis of **cyanide poisoning** also will likely be made on clinical grounds in the presence of the appropriate toxidrome. An unusually high anion gap metabolic acidosis with elevated serum lactate and an oxygen concentration greater than expected in mixed venous blood lend support to the clinical diagnosis. Elevated blood cyanide concentrations can confirm the clinical suspicion.

Of all the chemical and biological agents, the only ones for which immediate
therapy without waiting for definitive diagnosis is potentially life-saving and mandatory are nerve agents and cyanide poisoning. If these are suspected, they should be treated before waiting for further diagnostic certainty, since they can kill so quickly.

**Anthrax** should be suspected upon finding Gram-positive bacilli in skin biopsy material (in the case of cutaneous disease), blood smears, pleural fluid, or spinal fluid. Chest radiographs demonstrating a widened mediastinum in the context of fever and constitutional signs and, in the absence of another obvious explanation (e.g., blunt trauma or postsurgical infection), should also lead one to consider the diagnosis. Confirmation can be obtained by blood culture.

A diagnosis of **plague** can be suspected on finding bipolar “safety-pin”–staining bacilli in Gram or Wayson stains of sputum or aspirated lymph node material; confirmation is obtained by culturing *Y. pestis* from blood, sputum, or lymph node aspirate. The organism grows on standard blood or MacConkey TRA agars, but it is often misidentified by automated systems. *F. tularensis*, the causative agent of tularemia, grows poorly on standard media; its growth is enhanced on media containing cysteine. Because of its extreme infectivity, however, many laboratories prefer to make a diagnosis via polymerase chain reaction or serologically using an enzyme-linked immunosorbent assay or serum agglutination assay.

**Smallpox** should be suspected on clinical grounds and can be confirmed by culture or electron microscopy of scabs or vesicular fluid, although the manipulation of clinical material from suspected smallpox victims should be attempted only at public health laboratories able to employ maximum biocontainment (Biosafety Level 4) precautions. Similar caution should be exercised with specimens from patients with various viral hemorrhagic fevers.

**Prevention**

Preventive measures can be considered in both a preexposure and a postexposure context. **Preexposure protection** against a chemical or biologic attack may consist of physical, chemical, or immunologic measures. **Physical protection** against primary attack often involves gas masks and protective suits; such equipment is used by the military and by certain hazardous materials response teams, but it is unlikely to be available to civilians at the precise moment that a release occurs. Medical personnel need to understand the principles of physical protection as they apply to infection control and the spread of contamination.
Pneumonic plague is spread through respiratory droplets. Droplet precautions, including the use of simple surgical masks, are thus warranted for providers caring for patients with plague. Smallpox is transmitted by droplet nuclei. Airborne precautions, including (ideally) a high-efficiency particulate air filter mask, are thus warranted with smallpox victims. Patients with certain viral hemorrhagic fevers, such as those caused by filoviruses (Ebola, Marburg) and arenaviruses, should be managed using a combination of droplet and contact precautions, ideally in a specialized biocontainment unit. Most other biologic agent victims can be safely cared for with the use of standard precautions. In the case of chemical agents, residual mustard or nerve agent on the skin or clothing of victims might potentially pose a hazard to medical personnel. For such victims, whenever possible, clothing should be removed, and the patients decontaminated using copious amounts of water before extensive medical care is rendered. Most other chemical agents are volatile enough that spread of an agent among patients or from patient to caregiver is unlikely.

Preexposure chemical prophylaxis might be used on the basis of credible intelligence reports. Should officials deem that the threatened release of a specific biologic agent appears imminent, antibiotics might be distributed to a population prior to exposure. Opportunities to employ such a strategy are likely to be limited, although federal and state officials are examining various mechanisms for such employment. In military settings, pyridostigmine is FDA-approved as pretreatment against expected nerve agent attack. It is not approved for use in children, and it is not likely to be recommended in civilian settings.

Although licensed vaccines (preexposure immunologic measures) against anthrax and smallpox have been developed, widespread use of either vaccine is likely to be problematic, especially in children. The anthrax vaccine is licensed only for those persons age 18 yr and older, is given as a five-dose series over 18 mo, and requires annual booster doses. These considerations make civilian employment of the current anthrax vaccine on a large scale unlikely, although a new recombinant anthrax vaccine is in development and being studied as a three-dose series.

Significant obstacles to the widespread employment of smallpox vaccine also exist, although public health officials have contemplated the resumption of a smallpox vaccination campaign. Whereas in the past smallpox vaccine (prepared from vaccinia virus, an orthopoxvirus related to variola) was used safely and successfully in young infants, it has a relatively high rate of serious complications in certain patients. Fetal vaccinia and demise can occur when
pregnant women are vaccinated. *Vaccinia gangrenosa*, an often fatal complication, can occur when immunocompromised persons are vaccinated. *Eczema vaccinatum* occurs in those with preexisting dermatoses (atopic dermatitis). Severe vaccine-related encephalitis was well known during the era of widespread vaccination; because it occurs only in primary vaccines, it would disproportionately affect pediatric patients. Autoinoculation can occur when the virus present at the site of vaccination is manually transferred to other areas of skin or to the eye. Young children would presumably be at greater risk for such inadvertent transmission. Myocarditis has been reported following vaccinations of military recruits.

To manage these complications, vaccinia immune globulin should be available when one is undertaking a vaccination campaign. Vaccinia immune globulin (0.6 mg/kg IM) may be given to vaccine recipients who experience severe complications or to significantly immunocompromised individuals exposed to smallpox and in whom vaccination would be unsafe. A compound, tecovirimat, has been used successfully under an Investigational New Drug permit to treat persons (including children) experiencing severe complications from vaccine. The current cell-culture–derived vaccine (ACAM2000), as well as vaccinia immune globulin and tecovirimat, can be obtained as needed upon consultation with officials at the Centers for Disease Control and Prevention. In addition to a potential role in preexposure prophylaxis, vaccination may be effective in postexposure prophylaxis if given within the 1st 4 days or so after exposure.

Anthrax vaccine might similarly be employed in a postexposure setting. Some authorities recommend three doses of this vaccine as an adjunct to postexposure chemoprophylaxis after documented exposure to aerosolized anthrax spores. Nonetheless, postexposure administration of oral antibiotics constitutes the mainstay of management for asymptomatic victims believed to have been exposed to anthrax as well as to other bacterial agents such as plague and tularemia. Table 741.2 lists appropriate prophylactic regimens for various biologic exposures.

Tentative diagnoses of the above named conditions are: nerve palsies, symptoms but is unlikely to reverse them.

| Viral hemorrhagic fevers | Febrile prodrome with rapid progression to shock, purpura, and bleeding diatheses | 4-21 | Contact (consider airborne in cases of massive hemorrhage) | Supportive care; ribavirin may be beneficial in treating Lassa fever, and perhaps other arenaviral hemorrhagic fevers | Ribavirin has been shown to be efficacious in the postexposure prophylaxis of Lassa fever |

† Preferred drugs are shown in bold font.
‡ Penicillin and amoxicillin should only be used when the strain of Bacillus anthracis is known to be susceptible.

Treatment

Tables 741.2, 741.3, and 741.4 provide recommended therapies for overt diseases caused by various chemical and biologic agents. It is likely that the clinician attending to victims will need to make therapeutic decisions before the results of confirmatory diagnostic tests are available and in situations in which the diagnosis is not known with certainty. In particular, decontamination by hospital personnel in appropriate personal protective equipment is required for patients exposed to chemical agents who have not been adequately decontaminated in the prehospital setting (see Table 741.4). In such cases, it is useful to note that many diseases and symptoms caused by chemical and biologic agents will resolve spontaneously, with only supportive care required. Most cases of chlorine or phosgene exposure can be successfully managed by providing meticulous attention to oxygenation and fluid balance. Mustard victims may require intensive multisystem support, but no specific antidote or therapy is available. Many viral diseases, such as smallpox, most viral hemorrhagic fevers, and the equine encephalitides, are also managed supportively.

* Decontamination, especially for patients with significant nerve agent or vesicant exposure, should be performed by healthcare providers garbed in adequate personal protective equipment. For emergency department staff, this equipment consists of a nonencapsulated, chemically resistant body suit, boots, and gloves with a full-face air-purifier mask/hood.

† Intraosseous route is likely equivalent to intravenous.

‡ Atropine might have some benefit via endotracheal tube or inhalation, as might aerosolized ipratropium. See also Table 741.5.

§ Pralidoxime is reconstituted to 50 mg/mL (1 g in 20 mL water) for IV administration, and the total dose infused over 30 min, or may be given by continuous infusion (loading dose 25 mg/kg over 30 min, and then 10 mg/kg/hr). For IM use, it might be diluted to a concentration of 300 mg/mL (1 g added to 3 mL water—by analogy to the U.S. Army's Mark 1 autoinjector concentration), to effect a reasonable volume for injection. See also Table 741.5.

ABCs, Airway, breathing, and circulatory support; max, maximum; min, minimum; prn, as needed. Adapted from Henretig FH, Cieslak TJ, Eitzen EM: Biological and chemical terrorism. *J Pediatr* 141:311–326, 2002.

In addition to ensuring adequate oxygenation, ventilation, and hydration, the clinician may need to provide specific empiric therapies on an urgent basis. Patients suffering from the sudden onset of severe neuromuscular symptoms may have nerve agent intoxication and should be given atropine (0.05 mg/kg) promptly for its antimuscarinic effects. Although atropine relieves bronchospasm and bradycardia, reduces bronchial secretions, and ameliorates the gastrointestinal effects of nausea, vomiting, and diarrhea, it does not improve
skeletal muscle paralysis. Pralidoxime (also known as 2-PAM) cleaves the organophosphate moiety from cholinesterase and regenerates intact enzyme if “aging” has not occurred. The effect is most prominent at the neuromuscular junction and leads to improved muscle strength. Its prompt use (at a dose of 25 mg/kg) as an adjunct to atropine is recommended in all serious cases.

Ideally, both atropine and pralidoxime should be administered intravenously in severe cases, although the intraosseous route may be acceptable. Some experts recommend that atropine be given intramuscularly in the presence of hypoxia to avoid arrhythmias associated with intravenous administration. Many emergency management services stock military-style autoinjector kits consisting of atropine and 2-PAM for intramuscular injection. Pediatric atropine autoinjectors are licensed, although kits intended for adults (with 2 mg of atropine and 600 mg of pralidoxime) might be used in children >2-3 yr (Table 741.5). Autoinjectors cannot easily be used in the smallest infants.

* Consider adult pralidoxime autoinjector use for severely affected mass casualties when IV access or more precise mg/kg IM dosing is logistically impractical. The initial dose using atropine autoinjectors is 1 autoinjector of each recommended size. The initial dose using pralidoxime autoinjectors is the recommended number of (adult-intended, 600 mg) autoinjectors. These latter may also be injected into an empty sterile vile; the contents redrawn through a filter needle into a small syringe may then provide a ready source of concentrated (300 mg/mL) pralidoxime solution for IM injection to infants. Autoinjectors may become available that provide adult doses of both atropine and pralidoxime in 1 injector; these could be used in children ≥3 yr in lieu of 2 individual injectors and dosed as noted previously for pralidoxime alone.

Animal studies support the routine prophylactic administration of
anticonvulsant doses of benzodiazepines, even in the absence of observable convulsive activity. At present, the approved benzodiazepine is diazepam, but FDA approval of midazolam, which shows superior activity against nerve agent-induced seizures in multiple animal models, is anticipated within the next few years.

**Delayed neuromuscular symptoms** in the setting of terrorism might be due to botulism. Supportive care, with meticulous attention to ventilatory support, is the mainstay of botulism treatment. Such support may be necessary for several months, making the management of a large-scale botulism outbreak especially problematic in terms of medical resources. A licensed heptavalent antitoxin (types A-G) is available through the Centers for Disease Control (1-800-232-4636). Administration of this antitoxin is unlikely to reverse disease in symptomatic patients but may prevent further progression. In addition, a pentavalent (containing antibody against toxin types A to E, but licensed only for treatment of type A or B intoxication) product, Botulism Immune Globulin Intravenous (Human), BabyBIG, is available through the California Department of Health Services (1-916-327-1400) specifically for the treatment of infant botulism.

The **rapid onset of respiratory symptoms** may signal an exposure to chlorine, phosgene, cyanide, or a number of other toxic industrial chemicals. Although the mainstay of therapy in virtually all of these exposures consists of removal to fresh air and intensive supportive care, cyanide intoxication often requires the administration of specific antidotes.

The classic **cyanide antidote** utilizes a nitrite along with sodium thiosulfate and is given in 2 stages. The methemoglobin-forming agent (e.g., sodium nitrite) is administered first, because methemoglobin has a high affinity for cyanide and causes it to dissociate from cytochrome oxidase. Nitrite dosing in children should be based on body weight to avoid excessive methemoglobin formation and nitrite-induced hypotension. For the same reasons, nitrites should be infused slowly over 5-10 min. A sulfur donor, such as sodium thiosulfate, is given next. This compound is used as a substrate by the hepatic enzyme rhodanese, which converts cyanide to thiocyanate, a less toxic compound excreted in the urine. Thiosulfate treatment itself is efficacious and relatively benign, and may be used alone for mild to moderate cases. Sodium nitrite and sodium thiosulfate are packaged together in standard antidote kits, along with amyl nitrite, a sodium nitrite substitute that can be inhaled in prehospital settings in which intravenous access is not available.
Another antidote available in the United States is hydroxocobalamin, which exchanges its hydroxy group for cyanide, forming harmless cyanocobalamin (vitamin B₁₂), which is subsequently excreted by the kidneys. Hydroxocobalamin use is not complicated by the potential for nitrite-induced hypotension or methemoglobinemia, and it has low toxicity. The recommended dose is 5 g in adults or 70 mg/kg in children, administered IV over 15 min. A second dose (2.5-5 g in adults; 35-70 mg/kg in children) may be repeated in severely affected patients. Side effects include modest hypertension and reddening of skin, mucous membranes, and urine that may last several days. Although no human controlled trials are currently available to compare hydroxocobalamin with nitrite/thiosulfate-based therapies, many authorities believe that hydroxocobalamin's efficacy and safety profile favor it as the cyanide antidote of choice, especially for children in the mass casualty context. To use hydroxocobalamin, however, the solution must be mixed immediately before use, so first responders need to be properly trained to employ it.

Animal research suggests a modest benefit of steroid therapy in mitigating lung injury after chlorine inhalation, and thus steroids may be considered for patients with chlorine exposure, especially as an adjunct to bronchodilators in those manifesting bronchospasm and/or a history of asthma. Further, symptomatic relief has also been reported following chlorine exposure with nebulized 3.75% sodium bicarbonate therapy, though the impact of this regimen on pulmonary damage is unknown. Animal models have also suggested a benefit from antiinflammatory agents, including ibuprofen and N-acetylcysteine, which appear to ameliorate phosgene-induced pulmonary edema, as well as the utilization of low tidal volume ventilation (protective ventilation), although the results of such interventions have not yet been reported in clinical trials.

In cases in which the delayed onset of respiratory symptoms may be the result of a terrorist attack, consideration should be given to the empirical administration of an antibiotic effective against anthrax, plague, and tularemia. Ciprofloxacin (10-15 mg/kg IV q12h), levofloxacin (8 mg/kg IV q12h), or doxycycline (2.2 mg/kg IV q12h) is a reasonable choice. Although naturally occurring strains of \( B. \text{anthracis} \) usually are quite sensitive to penicillin G, these agents are chosen because penicillin-resistant strains of \( B. \text{anthracis} \) exist. Moreover, ciprofloxacin and doxycycline are effective against almost all known strains of \( Y. \text{pestis} \) and \( F. \text{tularensis} \). Concerns about inducible \( \beta \)-lactamases in \( B. \text{anthracis} \) have led experts to recommend 1 or 2 additional antibiotics in patients
with inhalational anthrax. Rifampin, vancomycin, penicillin or ampicillin, clindamycin, imipenem, and clarithromycin are reasonable choices based on in vitro sensitivity data. Because B. anthracis relies on the production of 2 protein toxins, edema toxin and lethal toxin, for its virulence, drugs that act at the ribosome to disrupt protein synthesis (e.g., clindamycin, the macrolides) provide a theoretical advantage. Frequent meningeal involvement among inhalational anthrax victims makes agents with superior central nervous system penetration desirable. The treatment of anthrax is detailed in Table 741.3.

Raxibacumab, a monoclonal antibody that inhibits anthrax antigen binding to cell receptors, thus preventing toxins from entering cells, is approved for the treatment of inhalation anthrax in combination with antibiotics, as is obiltoxaximab, which neutralizes anthrax toxins. The adult dose of raxibacumab is 40 mg/kg given IV over 2 hr and 15 min. The dose for children is weight based; ≤15 kg: 80 mg/kg; >15-50 kg: 60 mg/kg; >50 kg: 40 mg/kg. Premedication with diphenhydramine IV or PO is recommended 1 hr before the infusion.

In patients in whom a diagnosis of plague or tularemia is established, streptomycin (15 mg/kg IM q12h) has historically been considered the drug of choice. Because this drug is generally unavailable, many experts consider gentamicin (2.5 mg/kg IV/IM q8h) the preferred choice for therapy. In addition to ciprofloxacin, levofloxacin, or doxycycline, chloramphenicol (25 mg/kg IV q6h) should be employed in the 6% of pneumatic plague cases with concomitant meningitis. To be effective, therapy for pneumatic plague must be initiated within 24 hr of the onset of symptoms. There is little clinical experience with ricin-induced pulmonary injury. The mainstay of therapy is expected to be supportive care.

The management of vesicant-induced injury is similar to that for burn victims and is largely symptomatic (see Chapter 92). The major difference between thermal burns and vesicant burns is that vesicant casualties do not need the large volumes of fluid required by thermal burn victims, as their epidermis remains intact. These patients risk overhydration if treated using thermal burn protocols. Mustard victims will benefit from the application of soothing skin lotions such as calamine and the administration of analgesics. Early intubation of severely exposed patients is warranted to guard against edematous airway compromise. Oxygen and mechanical ventilation may be needed, and meticulous attention to hydration is of paramount importance. Ongoing research suggests a role for oral N-acetylcysteine in mitigating chronic pulmonary effects due to
mustard injury. Lewisite victims can be managed in much the same manner as mustard victims. In addition, dimercaprol (British antilewisite) in peanut oil, given intramuscularly, may help ameliorate the systemic effects of lewisite.

The management of symptomatic smallpox victims also is largely supportive, with attention to pain control, hydration status, and respiratory sufficiency again of primary importance. The parenteral antiviral compound cidofovir, licensed for the treatment of cytomegalovirus retinitis in HIV-infected patients, has in vitro efficacy against variola and other orthopoxviruses. Its utility in treating smallpox victims is untested. Moreover, in the face of a large outbreak of disease, wide parenteral use of this drug would be problematic. Tecovirimat, mentioned previously, demonstrates excellent in vitro activity against orthopoxviruses, but its utility in treating patients with smallpox is likewise untested.

In all chemical casualties, but especially if a liquid agent such as VX or mustard is suspected, decontamination is crucial and should be considered a primary medical intervention. While this has been part of casualty doctrine in the civilian and military environments for decades, only recently has information become available to quantify its value. In recent unpublished work funded by the U.S. government and carried out by Public Health England and the University of Hertfordshire, disrobing eliminated 90% of contamination in normal volunteers, and following this with showering using water or soap and water eliminated 99% of contamination. This has huge implications for the hospital management of possibly contaminated casualties, including children, and hospitals must plan to execute the decontamination mission at all levels.

A useful planning tool for clinicians faced with an acute chemical emergency is the National Library of Medicine's website, Chemical Emergency Medical Management (http://chemm.nlm.nih.gov), which contains a quick tool assisting the clinician in quick syndromic identification similar to that used in this chapter.

*This chapter borrows from material by Frederick M. Henretig, published in previous editions of this textbook. The views expressed herein are those of the authors and do not necessarily reflect the position of the University of Nebraska or its component entities.
Mass psychogenic illness refers to the rapid spread of illness signs and symptoms affecting members of a cohesive group, originating from a nervous system disturbance involving excitation, loss, or alteration of function, whereby physical complaints that are exhibited unconsciously have no corresponding organic etiology. Mass psychogenic illness shares features in common with conversion disorder (Chapter 35) in that the symptoms are not consciously produced and are typically sensorimotor in nature. The physical symptoms are associated with significant distress and impairment; they commonly interfere with function at school or home and affect peer relationships. Mass psychogenic illness has also been called “mass hysteria” in the past, although most of the medical community has moved away from the term “hysteria.” Some experts have argued that “functional” is a better used term than “psychogenic” because it does not imply etiology and does not reinforce dualist thinking about the mind being separate from the brain. Nonetheless, mass psychogenic illness is the term in widest use today.

Much less is known about the biological underpinnings and clinical features of mass psychogenic illness than is known about conversion disorder and other somatic symptom disorders. However, there are some important features in common with conversion disorder. These include sudden abrupt onset, inconsistency with known anatomy and physiology, atypical features, and inconsistency of symptoms over time. Specific features of mass psychogenic illness are the occurrence of these symptoms in a cohesive group; the presence of increased anxiety; spread of symptoms via sight, sound, or oral communication (including social media); and a high female: male ratio.
Clinical Features and Diagnosis

There are many examples of mass psychogenic illness throughout history. The best known is perhaps that of the Salem “witches.” Most widely reported examples of mass psychogenic illness are in adults, but there are several reports in children too. For example, in 2004, 10 teenage girls from a school in rural North Carolina developed paroxysmal episodes resembling epilepsy or syncope. These girls were from a cohesive social group (school-age students in a small school) and had similar symptoms. The symptoms were shown not to be consistent with either syncope or epilepsy and they eventually resolved after a 2-wk holiday break from school. Another episode in Le Roy, NY, was an outbreak of a “tic-like” illness among high school students. The symptoms were atypical for tics because they were not preceded by a premonitory urge and could not be suppressed with effort. In addition, the symptoms were remarkably similar across the affected patients. Symptoms resolved over time. In the Le Roy example, there was likely an exacerbating role of both social media and mass media, which amplified the cohesiveness of the group.

In a study of 280 environmental chemical incidents in the United Kingdom between 2007 and 2008, 7% were classified as mass psychogenic illness according to 5 diagnostic criteria: (1) presence of somatic (bodily) symptoms; (2) preexisting social connection between two or more of the affected people; (3) epidemic spread of symptoms; (4) attribution of symptoms by affected individuals (or by their parents or caregivers) to a threatening external agent of a physical (usually chemical, biologic, or radiologic) or spiritual nature; and (5) symptoms and signs that are not compatible with the environmental exposure specified by the affected individuals nor with any other environmental exposure that could reasonably be expected to have been present at the time of (or shortly before) the onset of symptoms.

One study has examined experimentally induced mass psychogenic illness. In a randomized controlled experiment, participants were assigned to one of three groups to study the effects of a simulated biologic threat and elements of social contagion. The three groups were (1) no-intervention control group, (2) psychogenic illness induction group, and (3) psychogenic illness induction plus media group. Groups 2 and 3 were told that the purpose of the study was to test the side effects of a carrier compound for an antiinfluenza medication. They were told that the compound did not produce serious side effects but was being evaluated with regard to mild side effects. In groups 2 and 3, professional actors
were placed among the participants to feign illness during the study with symptoms of nausea, dizziness, and headache. Group 3 was also shown a documentary about the 1918 flu pandemic. The video contained interviews with survivors and vivid images of death and illness. The two psychogenic induction groups had 11 times more symptoms than did the control group. If a subject had a lifetime history of a traumatic event of depression, he or she was more likely to have symptoms. The documentary viewing was not associated with a higher rate of symptoms. This study confirmed the role of “social contagion” in mass psychogenic illness and provided a model for future studies of factors leading to such contagion.

**Treatment Strategies**

Mass psychogenic illness is usually self-limited, but treatment requires careful reassurance and communication between physician and patient. Explanation models should be communicated in a sensitive manner so as not to appear dismissive of symptoms. When doctors and patients do not agree on the “reality” of the illness, the prognosis is worse. Thus, media attention, medical and scientific disagreement, and legal proceedings must be managed in a way that does not exacerbate the symptoms or the illness.

In the Le Roy illness described earlier, treatment varied across individuals. The treatment strategies included cognitive behavioral therapy, supportive psychotherapy, education, pharmacotherapy for co-existing anxiety, and alteration of social setting. Many of the patients sought multiple medical opinions. There were frequent discussions among public health and other medical officials and the local media outlets. Reduced media attention seemed to lead to more rapid improvement of symptoms in some patients.

It is helpful for healthcare providers to avoid the dichotomy of approaching illness using a medical model in which diseases are considered as being either physically or psychologically based. In contrast, a biobehavioral continuum of disease better characterizes illness as occurring across a spectrum ranging from a predominantly biologic etiology on one end to a predominantly psychosocial etiology on the other. It is beneficial to the patient for the treating physician to try to shift the emphasis from understanding the etiology to a path toward recovery.
Bibliography

CHAPTER 743

Animal and Human Bites

David A. Hunstad

Many animals besides domestic and stray dogs and cats inflict bites on humans. The profile of such bites varies by country and region, based on living conditions, indigenous species, and opportunity for encounter.

Epidemiology

Worldwide there are tens of millions of dog bites, resulting in approximately 55,000 deaths annually from rabies (see Chapter 300). Dog bites represent approximately 80–90% of all bites in the United States; 5–15% are from cats, 2–5% from rodents, and the remainder from rabbits, ferrets, farm animals, monkeys, and reptiles. An estimated 4.5 million persons in the United States are bitten by dogs annually; approximately 885,000 of those bitten seek medical care. Bites from dogs are also most common in Bangladesh, India, Pakistan, and Myanmar, whereas in Nepal cattle and buffalo account for more than half of bites, followed by dogs, pigs, and horses. Approximately 1% of dog bite wounds and 6% of cat bite wounds in the United States require hospitalization. During the past 3 decades, there have been approximately 20 deaths per year in the United States from dog-inflicted injuries; 65% of these occurred in children under 11 years of age. The breed of dog involved in attacks on children varies; Table 743.1 depicts the risk index of fatal dog bites by breed. Compared with other breeds, bites by pit bulls account for higher rates of hospital admission, lower Glasgow scores at admission, and an increased risk of death. Unaltered male dogs account for approximately 75% of attacks; nursing dams often inflict injury to humans when children attempt to handle their puppies.

* Data are presented only for dog breeds for which registration information is available from the American Kennel Club (AKC). The AKC does not register the Perro de Presa Canario, Wolf Hybrids, or dogs of unknown mixed breed.

† Data for Labrador Retrievers and Labrador mix are combined. Relative risk is normalized to Labrador Retriever and Labrador mix.

‡ The term pit bull refers to dogs from the following breeds: American Pit Bull Terrier, American Staffordshire Terrier, and Staffordshire Bull Terrier.

AKC, American Kennel Club.

From Bini JK, Cohn SM, Acosta SM, McFarland MJ, Muir MT, Michalek JE; TRISAT Clinical Trials:
The majority of dog attacks on children in the United States occur between the ages of 6 and 11 years, with a slight predominance of males. Approximately 65% of attacks occur around the home, 75% of biting animals are known by the children, and almost 50% of attacks are said to be unprovoked. Similar statistics apply in Canada, where 70% of all bites reported in one study were sustained by children aged 2-14 years; 65% of dogs involved in biting were part of the family or extended family.

Of the approximately 450,000 reported cat bites per year occurring in the United States, nearly all are inflicted by known household animals. Because rodent bites (rat, mouse, gerbil) do not represent reportable conditions, little is known about the epidemiology of these injuries or the incidence of infection after rodent-inflicted bites or scratches.

Few data exist on the incidence and demographics of human bite injuries in pediatric patients; however, preschool and early school-age children appear to be at greatest risk of sustaining an injury from a human bite, often in daycare or preschool settings. In some series, the proportion of human bites is highest among adolescents, an age group in which fist-to-tooth injuries (so-called fight bites) become more common.

**Clinical Manifestations**

Dog bite–related injuries can be divided into three categories of almost equal incidence: abrasions, puncture wounds, and lacerations with or without an associated avulsion of tissue. Dog bites may also involve crush injury to tissues. In contrast, the most common type of injury from cat and rat bites is a puncture wound. Cat bites often penetrate to deep tissue. Human bite injuries are of two types: an occlusion injury that is incurred when the upper and lower teeth come together on a body part or a clenched-fist injury that occurs when the injured fist, usually on the dominant hand, strikes the teeth of another individual.

**Diagnosis**

Management of the bite victim should begin with a thorough history and physical examination. Careful attention should be paid to the circumstances surrounding the bite event (e.g., species and number of animals, type of animal
[domestic or wild], whether the attack was provoked or unprovoked, location of the attack); a history of drug allergies; and the immunization status of the child (tetanus) and animal (rabies). During physical examination, meticulous attention should be paid to the type, size, and depth of the injury; the presence of any foreign material in the wound; the status of underlying structures; and, when the bite is on an extremity, the exact location of the injury, an assessment of possibly involved structures, and the range of motion of the affected area. A diagram of the injury should be recorded in the patient's medical record. Radiographs of the affected part should be considered if it is likely that a bone or joint was penetrated or fractured or if foreign material is present in the wound. The possibility of a fracture or penetrating injury of the skull should particularly be considered in infants who have sustained dog bite injuries to the face or head.

**Complications**

**Infection** is the most common complication of bite injuries regardless of the species of biting animal. The decision to obtain material for culture from a wound depends on the species of the biting animal, the length of time that has elapsed since the injury, the depth of the wound, the presence of foreign material contaminating the wound, and whether there is clinical evidence of infection. Although potentially pathogenic bacteria have been isolated from up to 80% of dog bite wounds that are brought to medical attention within 8 hr of the bite, the infection rate for wounds receiving medical attention in <8 hr is relatively low (2.5–20%). If the dog bite(s) is (are) not deep and/or extensive, wounds that are <8 hr old do not require cultures unless there are early signs of infection or the patient is immunocompromised. *Capnocytophaga canimorsus* is isolated from approximately 5% of infected wounds in immunocompromised patients and can cause serious systemic infection in these individuals. The infection rate in cat bite wounds, even those that receive prompt medical attention, is >50%; therefore it is prudent to obtain material for culture from all but the most trivial cat-bite wounds. Cultures should be taken from all other animal bite wounds regardless of species that are not brought to medical attention within 8 hr.

The rate of infection after rodent bite injuries is not known. Most of the oral flora of rats is similar to that of other mammals; however, approximately 50% and 25% of rats harbor strains of *Streptobacillus moniliformis* and *Spirillum minus*, respectively, both of which cause rat bite fever (see Chapter 744).

All human bite wounds, regardless of the mechanism of injury, should be
considered to carry a high risk for infection and should be cultured. Because of the high incidence of anaerobic infection after bite wounds, it is important to obtain material for anaerobic as well as aerobic cultures.

Table 743.2 lists common causes of soft tissue bacterial infections after dog, cat, or other animal bites. Bites of humans or cats, those in which treatment is delayed, those in immunocompromised patients, and those associated with deep puncture wounds or significant crush injury carry a higher risk for infection. An elevated risk for infection is also present if the bite is to certain anatomic regions (e.g., hand, foot, or genitals) or there is penetration of bone or tendons.

**Table 743.2**

**Microorganisms Associated With Bites**

**Dog Bites**

- *Staphylococcus* species
- *Streptococcus* species
- *Eikenella* species
- *Pasteurella* species
- *Proteus* species
- *Klebsiella* species
- *Haemophilus* species
- *Enterobacter* species
- *Capnocytophaga canimorsus*
- *Bacteroides* species
- *Moraxella* species
- *Corynebacterium* species
- *Neisseria* species
- *Fusobacterium* species
- *Prevotella* species
- *Porphyromonas* species

**Cat Bites**

- *Pasteurella* species
- *Actinomyces* species
- *Propionibacterium* species
Bacteroides species
Fusobacterium species
Clostridium species
Wolinella species
Peptostreptococcus species
Streptococcus species
Staphylococcus species

Herbivore Bites

Actinobacillus lignieresii
Actinobacillus suis
Pasteurella multocida
Pasteurella caballi
Staphylococcus hyicus subsp. hyicus

Swine Bites

Pasteurella aerogenes
Pasteurella multocida
Bacteroides species
Proteus species
Actinobacillus suis
Streptococcus species
Flavobacterium species
Mycoplasma species

Rodent Bites—Rat Bite Fever

Streptobacillus moniliformis
Spirillum minus

Primate Bites

Bacteroides species
Fusobacterium species
Eikenella corrodens
Streptococcus species
Enterococcus species
Staphylococcus species
Enterobacteriaceae
Simian herpesvirus

Large Reptile (Crocodile, Alligator) Bites

Aeromonas hydrophila
Pseudomonas pseudomallei
Pseudomonas aeruginosa
Proteus species
Enterococcus species
Clostridium species

Treatment

Table 743.3 describes the prophylactic management of human or animal bite wounds to prevent infection.

Table 743.3
Management of Bite Wounds

| History | Animal bite: Ascertain the type of animal, whether the bite was provoked or unprovoked, and the situation/environment in which the bite occurred. Follow rabies guidelines for details on management of bites that carry a risk of rabies.
| Patient: Obtain information on antimicrobial allergies, current medications, splenectomy, liver disease, or immunosuppressive conditions. |
| Physical Examination | If possible, record a diagram of the wound with the location, type, and approximate depth of injury; range of motion; possibility of joint penetration; presence of edema or crush injury; nerve and tendon function; signs of infection; and odor of exudate. |
### Culture
Aerobic and anaerobic cultures should be taken from infected wounds.

### Irrigation
Copious amounts of normal saline should be used for irrigation.

### Débridement
Devitalized or necrotic tissue should be cautiously débrided.

### Radiographs
Plain radiographs should be obtained if bony penetration is possible and to provide a baseline for future evaluation of osteomyelitis.

### Wound Closure
Primary wound closure is not usually advocated. Wound closure may be necessary for selected, fresh, uninfect ed wounds, especially large facial wounds. For larger wounds, edges may be approximated with adhesive strips in selected cases.

### Antimicrobial Therapy

#### Early presenting (uninfected) wounds:
- provide antimicrobial therapy for (1) moderate-to-severe injuries less than 8 hours old, especially if edema or significant crush injury is present; (2) bone or joint space penetration; (3) deep hand wounds; (4) immunocompromised patients (including those with mastectomy, advanced liver disease, asplenia, or chronic steroid therapy); (5) wounds adjacent to a prosthetic joint; and (6) wounds in close proximity to the genital area. In most cases, coverage should include *Pasteurella (Eikenella in human bites)*, *Staphylococcus*, *Streptococcus*, and anaerobes including *Fusobacterium*, *Porphyromonas*, *Prevotella*, and *Bacteroides* spp.

#### Infected wounds: Cover *Pasteurella (Eikenella in human bites)*, *Staphylococcus*, *Streptococcus*, and anaerobes including *Fusobacterium*, *Porphyromonas*, *Prevotella*, and *Bacteroides* spp. The following antimicrobials can be considered for most terrestrial animal and human bites. **DOSAGES ARE FOR ADULTS.**

- **First choice:** Amoxicillin/clavulanic acid
- **Penicillin allergy:** No alternative treatment for animal bites has been established for penicillin-allergic patients. The following regimens can be considered.
  - Clindamycin 300 mg PO qid plus either ciprofloxacin 500 mg PO bid or levofloxacin 500 mg PO daily or trimethoprimsulfamethoxazole one double-strength tablet PO bid
  - Doxycycline 100 mg PO bid
  - Moxifloxacin 400 mg PO daily
- In highly penicillin-allergic pregnant patients, macrolides have been used, but because of poor antimicrobial coverage against anaerobic pathogens, the wounds must be closely followed.
- In cases where intravenous antibiotics are deemed necessary, single antimicrobial choices can include ampicillin/sulbactam, cefoxitin, ertapenem, or moxifloxacin.
- Empirical regimens for marine- and freshwater-acquired infection should also cover *Vibrio* and *Aeromonas* spp. respectively, with agents such as third-generation cephalosporins (e.g., cefotaxime) and fluoroquinolones.

### Hospitalization
Indications include signs and symptoms of systemic toxicity and worsening infection.

### Immunizations
Provide tetanus and rabies immunization, if indicated.

### Elevation
Elevation may be required if any edema is present. Lack of elevation is a common cause of therapeutic failure.

### Immobilization
For significant injuries, immobilize the extremity, especially the hands, with a splint.

### Follow-up
Patients should be reminded to follow up within 48 hours or sooner for worsening or unresolved infections and continuous pain.

### Reporting
Reporting the incident to a local health department may be required.

---

bid, two times a day; PO, orally; qid, four times a day; tid, three times a day.

---

From Goldstein EJC, Abrahamian FM: Bites. IN Bennett JE, Dolin R, Blaswer MJ, editors: Mandell, Douglas, and Bennett’s principles and practice of infectious diseases, ed 8, Philadelphia,
After appropriate material has been obtained for culture, the wound should be anesthetized, cleaned, and vigorously irrigated with copious amounts of sterile saline. Irrigation with antibiotic-containing solutions provides no advantage over irrigation with saline alone and may cause local irritation of the tissues. Puncture wounds should be thoroughly cleansed and gently irrigated with a catheter or blunt-tipped needle; high-pressure irrigation should not be employed. Avulsed or devitalized tissue should be debrided and any fluctuant areas incised and drained.

Insufficient data exist to settle questions of whether bite wounds should undergo primary closure, delayed primary closure (3-5 days), or healing by secondary intention. Factors to be considered are the type, size, and depth of the wound; the anatomic location; the presence of infection; the time since the injury; and the potential for cosmetic disfigurement. Appropriate surgical consultation (e.g., general pediatric surgery; plastic, hand, or orthopedic surgery) should be obtained for all patients with deep or extensive wounds; wounds involving the hands, face, or bones and joints; and infected wounds that require open drainage. Although there is general agreement that visibly infected wounds and those that are more than 24 hr old should not be sutured, there is variation in practice regarding the efficacy and safety of closing wounds <8 hr old with no evidence of infection. Because all hand wounds are at high risk for infection, particularly if there has been disruption of the tendons or penetration of the bones, surgical consultation is almost always indicated, and delayed primary closure is recommended for many bite wounds of the hands. Facial lacerations are at smaller risk for secondary infection because of the more luxuriant blood supply to this region. Given this fact and cosmetic considerations, many plastic surgeons advocate primary closure of facial bite wounds that have been brought to medical attention within 6 hr and after thorough irrigation and debridement.

Similarly, there are few studies addressing the efficacy and selection of antimicrobial agents for prophylaxis of bite injuries. The bacteriology of bite wound infections is primarily a reflection of the oral flora of the biting animal more than the skin flora of the victim (see Table 743.2 ). Because many of the aerobic and anaerobic bacterial species colonizing the oral cavity of the biting animal have the potential to invade local tissue, multiply, and cause tissue destruction, most bite wound infections are polymicrobial.

Despite the large degree of homology in the bacterial flora of the oral cavity among humans, dogs, and cats, important differences exist between the biting
species, and they are reflected in the type of wound infections that occur. The predominant bacterial species isolated from infected dog bite wounds are *Staphylococcus aureus* (20–30%), *Pasteurella multocida* (20–30%), *Staphylococcus intermedius* (25%), and *C. canimorsus*; approximately one-half of dog bite wound infections also contain mixed anaerobes. Similar species are isolated from infected cat bite wounds; however, *P. multocida* is the predominant species in at least 50% of cat bite wound infections. At least 50% of rats harbor strains of *S. moniliformis* in the oropharynx, and approximately 25% harbor *Spirillum minor*, an aerobic Gram-negative organism. In human bite wounds, nontypable strains of *Haemophilus influenzae*, *Eikenella corrodens*, *S. aureus*, α-hemolytic streptococci, and β-lactamase–producing aerobes (~50%) are the predominant species. Clenched-fist injuries are particularly prone to infection by *Eikenella* spp. (25%) and anaerobic bacteria (50%).

The choice between oral and parenteral antimicrobial agents should be based on the severity of the wound, the presence and degree of overt infection, signs of systemic toxicity, and the patient's immune status. Amoxicillin–clavulanate is an excellent choice for empirical oral therapy for human and animal bite wounds because of its activity against most bacteria that have been isolated from infected bites. Similarly, piperacillin-tazobactam or ampicillin-sulbactam is preferred for patients who require empirical parenteral therapy. Penicillin G remains the drug of choice for prophylaxis and treatment of rat-inflicted injuries, as this agent has excellent activity against *S. moniliformis* and *S. minor*. Because first-generation cephalosporins have limited activity against *P. multocida* and *E. corrodens*, they should not be used for prophylaxis or empirical initial therapy of bite wound infections. Therapeutic alternatives for penicillin-allergic patients are limited because the traditional alternative agents are generally inactive against one or more of the multiple pathogens that cause bite wound infections. Clindamycin plus trimethoprim-sulfamethoxazole is the most commonly suggested regimen for these patients. Tetracycline is the drug of choice for penicillin-allergic patients who have sustained rat bite injuries.

Although tetanus occurs only rarely after human or animal bite injuries, it is important to obtain a careful immunization history and to provide tetanus toxoid to all patients who are incompletely immunized or who have gone longer than 5 years since their last tetanus immunization. The need for postexposure rabies vaccination in victims of dog and cat bites depends on whether the biting animal is known to have been vaccinated and, most importantly, on local experience with rabid animals in the community. Bites from bats, foxes, skunks, and
raccoons should be considered to carry a high risk of rabies, and postexposure prophylaxis is indicated. For dogs, cats, and other animals that are known or can be captured, observation for 7-10 days by the local animal control department is indicated. If a biting dog or cat has escaped, a decision about rabies prophylaxis can be based on the circumstances surrounding the bite and advice from local infectious diseases specialists and/or health department officials. Annually worldwide, animal bites and contacts result in more than 10 million postexposure courses. Postexposure prophylaxis for hepatitis B should be considered in the rare instance in which a susceptible individual has sustained a human bite from an individual who is at high risk for hepatitis B.

Prevention

It is possible to reduce the risk of animal bite injury with anticipatory guidance (Table 743.4). Parents should be routinely counseled during prenatal visits and routine health maintenance examinations about the risks of having potentially biting pets in the household. All patients should be cautioned against harboring exotic animals for pets. Additionally, parents should be made aware of the proclivity of certain breeds of dogs to inflict serious injuries and the protective instincts of nursing dams. All young children should be closely supervised, particularly when in the presence of animals, and from a very early age should be taught to respect animals and to be aware of their potential to inflict injury. Reduction of the rate of human bite injuries, particularly in daycare centers and schools, can be achieved by good surveillance of the children and adequate teacher-to-child ratios.

Table 743.4

Measures for Preventing Dog Bites

- Realistically evaluate environment and lifestyle and consult with a professional (e.g., veterinarian, animal behaviorist, or responsible breeder) to determine suitable breeds of dogs for consideration.
- Dogs with histories of aggression are inappropriate in households with children.
- Be sensitive to cues that a child is fearful or apprehensive about a dog and if so, delay acquiring a dog.
• Spend time with a dog before buying or adopting it. Use caution when bringing a dog or puppy into the home of an infant or toddler.
• Spay/neuter virtually all dogs (this frequently reduces aggressive tendencies).
• Never leave an infant or young child alone with any dog.
• Properly socialize and train any dog entering the household. Teach the dog submissive behaviors (e.g., rolling over to expose abdomen and relinquishing food without growling).
• Immediately seek professional advice (e.g., from veterinarians, animal behaviorists, or responsible breeders) if the dog develops aggressive or undesirable behaviors.
• Do not play aggressive games with your dog (e.g., wrestling).
• Teach children basic safety around dogs and review regularly:
  • Never approach an unfamiliar dog.
  • Never run from a dog and scream.
  • Remain motionless when approached by an unfamiliar dog (e.g., “be still like a tree”).
  • If knocked over by a dog, roll into a ball and lie still (e.g., “be still like a log”).
  • Never allow a child to play with a dog unless supervised by an adult.
  • Immediately report stray dogs or dogs displaying unusual behavior to an appropriate person.
  • Avoid direct eye contact with a dog.
  • Do not disturb a dog who is sleeping, eating, or caring for puppies.
  • Do not pet a dog without allowing it to see and sniff you first.
  • If bitten, immediately report the bite to an adult.

CHAPTER 744

Rat Bite Fever

David A. Hunstad

Etiology

*Rat bite fever* is a generic term that has been applied to at least two distinct clinical syndromes, each caused by a different microbial agent. Rat bite fever caused by *Streptobacillus moniliformis* is most commonly reported in the United States as well as in Brazil, Canada, Mexico, Paraguay, Great Britain, and France; it has been identified elsewhere in Europe and in Australia. *S. moniliformis* is a Gram-negative bacillus that is present in the nasopharyngeal flora of many laboratory and wild rats. Infection with *S. moniliformis* most commonly occurs following the bite of a rat; however, infection has also been reported in individuals who have been scratched by rats, in those who have handled dead rats, and in those who have ingested milk contaminated with the bacterium (termed *Haverhill fever*). Rat bite fever may also be transmitted by bites from wild mice. Rat bite fever caused by *Spirillum minus*, called *sodoku*, is most commonly reported in Asia. *S. minus* is a small, spiral, aerobic Gram-negative organism. Reports of rat bite fever from Africa are rare, suggesting underrecognition rather than absence of the disease.

Clinical Course

The incubation period for the streptobacillary form of rat bite fever is variable, ranging from 3 to 10 days. The illness is characterized by an *abrupt* onset of fever up to 41°C (105.8°F) (fever occurring in more than 90% of reported cases), severe throbbing headache, intense myalgia, chills, and vomiting. In virtually all instances, the lesion at the cutaneous inoculation site has healed by the time the systemic systems first appear. Shortly after the onset of the fever, a
polymorphous rash occurs in up to 75% of patients. In most patients, the rash consists of blotchy red maculopapular lesions that often have a petechial component; the distribution of the rash is variable, but it is typically most dense on the extremities (Fig. 744.1A and B). Hemorrhagic vesicles may develop on the hands and feet and are very tender to palpation (Fig. 744.2).

**FIG. 744.1** Morbilliform rash on the hands/palms (A) and feet (B) of a patient with rat bite fever. (From Vetter NM, Feder Jr HM, Ratzan RM: Rat bite fever caused by a kiss, *Am J Emer Med* 34(6):1190.e3–1190.e4, 2015. Figs. 1 and 3.)
Approximately 50% of patients have arthritis, which first manifests toward the end of the 1st week of disease; early on, the arthritis may be migratory. If untreated, fever, rash, and arthritis last from 14 to 21 days, often with a biphasic pattern to the fever and arthritis. A wide range of complications are reported in patients with rat bite fever, the most common being pneumonia, persistent arthritis, brain and soft tissue abscesses, and, less commonly, myocarditis or endocarditis. The mortality rate due to untreated rat bite fever is estimated to be approximately 13%.

The incubation period of sodoku is longer (14-21 days) than that of the streptobacillary form of disease. The hallmark of *Spirillum*-induced disease is fever associated with an indurated, often suppurative, nonhealing lesion at the bite site. Lymphadenitis and lymphadenopathy are invariably present in the regional nodes that drain the inoculation site, and many patients have a generalized macular rash most prominent when fever is present. In untreated patients, sodoku has a relapsing and remitting course; symptoms abate after 5-7 days of chills and fever but recur 7-10 days later. There may be multiple cycles if the disease is not recognized and treated.
Diagnosis

Diagnosis of the streptobacillary form of rat bite fever is difficult because the disease is uncommon and can be confused with Rocky Mountain spotted fever or (less commonly) meningococcemia. Furthermore, *S. moniliformis* is difficult both to isolate and to identify with classic bacteriologic techniques. The organism is fastidious, requires enriched media for growth, and is inhibited by sodium polyanethol sulfonate, an additive present in many commercial blood culture bottles. A definitive diagnosis is made when the organism is recovered from blood or joint fluid or is identified in human samples with molecular technology such as polymerase chain reaction analysis, which has been used successfully in humans and laboratory animals.

Diagnosis of sodoku is made on clinical grounds because there are no diagnostic serologic tests and *S. minus* has not been cultured on artificial media. Rarely, the organism may be identified in Gram-stained smears of pus from the inoculation site. Approximately 50% have a false positive VDRL.

Treatment

Penicillin is the drug of choice for both forms of rat bite fever. Intravenous penicillin G or intramuscular penicillin G procaine is recommended for 7-10 days; a regimen of IV penicillin G for 5-7 days followed by oral penicillin V for an additional 7 days has also been used. Doxycycline, gentamicin, or streptomycin represent effective alternatives for penicillin-allergic patients. Patients with endocarditis caused by *S. moniliformis* require high-dose penicillin G for 4 weeks; the addition of streptomycin or gentamicin might be helpful.

Bibliography

CHAPTER 745

Monkeypox

David A. Hunstad

Etiology

Since the eradication of smallpox (variola), monkeypox virus, causing the disease monkeypox, has, for humans, become the most important member of the genus Orthopoxvirus. Monkeys are the predominant host for the virus; however, it may be endemic in African rainforest squirrels and is present in African rats, mice, domestic pigs, hedgehogs, and opossums. It has also been identified in and transmitted by prairie dogs in the United States and has affected elephants in zoos. Severity of infection varies by viral strain and by host; for example, disease is relatively mild in cynomolgus monkeys but severe in orangutans.

Monkeypox virus was first observed in humans from West and Central Africa in the 1970s at the time that smallpox had been eradicated from the area. In the 1970s, the secondary attack rate was around 3% (a stark comparison to the 80% seen in unvaccinated smallpox contacts). Few cases were observed over the next 2 decades; however, during a subsequent outbreak in the 1990s, when immunity to smallpox was no longer prevalent in the population, the secondary attack rate exceeded 75%. Monkeypox outbreaks have also been reported in the Sudan. Monkeypox was inadvertently introduced into the United States in 2003, presumably through rodents from Ghana that infected prairie dogs that were subsequently distributed as pets; this outbreak affected more than 70 persons. Primary transmission of the disease from infected animal to human is by bite or by human contact with an infected animal's blood, wound discharge, or other body fluids. Human-to-human transmission of infection is uncommon but is believed to have been an important source for the transmission of new cases during the U.S. outbreak.
Clinical Course

The clinical signs, symptoms, and course of monkeypox are similar to those of smallpox, although typically milder. After an incubation period of 10-14 days, during which the virus replicates in lymphoid tissues, humans experience an abrupt onset of malaise, fever, myalgia, headache, and severe backache. Nonproductive cough, nausea, vomiting, and abdominal pain may be present. Generalized lymphadenopathy, a finding unusual in smallpox, is invariably present during the acute stages of monkeypox illness. After a prodrome of 2-4 days, an exanthem appears in cephalad-to-caudal progression. As the rash progresses, fevers begin to abate. The rash is initially macular but transforms within hours to firm papules that rapidly vesiculate and become pustular over 2-3 days. Unlike smallpox lesions but similar to chickenpox lesions, the lesions of monkeypox tend to occur in crops (Fig. 745.1). Late into the second week of illness, the lesions begin to desiccate, crust, scab, and fall off.

![FIG. 745.1 A, Legs and feet of a monkeypox patient. B, Legs and feet of a smallpox patient at an analogous stage of rash (pustular). (A, courtesy Joseph M. Harvey, MD. B, courtesy J. Nobel, Jr, MD, Centers for Disease Control and Prevention.)](image)

Monkeypox should be suspected in any child who has the characteristic prodrome associated with an atypical form of chickenpox and a history of contact with prairie dogs or exotic mammals such as Gambian rats and rope
squirrels. Diagnosis is by isolation of monkeypox virus in culture, demonstration by polymerase chain reaction of viral DNA in a clinical specimen, or microscopic demonstration of an orthopoxvirus in a clinical specimen in the absence of other orthopoxvirus exposure.

**Treatment**

There is no proven effective therapy for monkeypox. Despite evidence that preexposure administration of smallpox vaccine is 85% effective in preventing or attenuating monkeypox disease, the rarity of monkeypox infection does not warrant universal vaccination. In instances of known exposure or in outbreak situations, there may be an indication for administering smallpox vaccine. Consideration should be given to vaccinating close family contacts and healthcare workers who provide care to infected individuals. Vaccine is said to be preventive if given within 2 wk of exposure. Individuals with a compromised immune system and those with life-threatening allergies to latex or to smallpox vaccine or any of its components (polymyxin B, streptomycin, tetracycline, neomycin) also should not receive smallpox vaccine.

Although there are data indicating that cidofovir has in vitro activity against monkeypox virus and has been effective in preventing monkeypox infection in animals, there are no data to support its effectiveness in humans. Careful attention should be paid to skin hygiene, maintenance of adequate nutrition and hydration, and prompt implementation of local or systemic therapy for secondary bacterial infection that may occur. For prevention of human-to-human spread of disease, a combination of contact, droplet, and airborne infection control procedures should be implemented.

**Bibliography**

Parker S, Handley L, Buller RM. Therapeutic and prophylactic drugs to treat orthopoxvirus infections. *Future Virol*. 

Envenomations due to snakes, spiders, scorpions, and other venomous animals can cause significant morbidity and mortality, although the majority cause only localized pain and swelling. In the 2014 report of the American Association of Poison Control Centers, approximately 55,000 out of 2.3 million phone consultations were related to bites and stings of various creatures, with approximately 18,000 involving children <19 yr of age. There were six fatalities, one pediatric fatality from a crotalid envenomation, four adult fatalities from crotalid envenomations, and one adult fatality from a hymenoptera sting.

Not every bite from a venomous creature is harmful. In many cases no venom is injected; these are so-called dry bites. A dry bite may occur for many reasons, including failure of the venom delivery mechanism and depletion of venom. Up to 20% of pit viper, 80% of coral snake, and approximately 50% of all venomous snake bites are dry.

General Approach to the Envenomated Child

Children may be bitten or stung as they play and explore their environment. The evaluation may be hampered by an unclear history of the circumstances and the possible offending organism, particularly with preverbal children. The overall effects of some venomous bites and stings may be relatively more severe in children than in adults because children generally receive a similar venom load from the offending animal yet have less circulating blood volume to dilute its effects.
General Management

The majority of envenomations require local wound care, pain control, and reassurance. However, the severely envenomated child may require advanced life support interventions including endotracheal intubation and mechanical ventilation. Intravenous access should be obtained in an unaffected extremity if possible (see Chapters 69 and 70 ) to provide intravenous fluids and vasopressors as needed. Early hypotension is usually due to vasodilation and should be treated with volume expansion using appropriate infusion of intravenous crystalloid solution (normal saline boluses of 20 mL/kg; repeated as needed up to 3 times). Shock unresponsive to volume repletion may require addition of a vasopressive agent such as epinephrine or norepinephrine (in addition to antivenom administration if appropriate). If the presentation is suspicious for an anaphylactic reaction to venom, treatment (including epinephrine) should be initiated as soon as possible (see Chapter 174 ) along with the appropriate antivenom.

The affected body part should be immobilized in a position of function and any areas of edema should be marked, measured, and monitored. If antivenom is available for the envenomation, efforts should be initiated to locate and secure an adequate amount to treat the patient. In the United States, regional poison control centers are available via the national phone number 1-800-222-1222 to facilitate this effort, especially if the species is exotic. Guidance in dosing the antivenom should be obtained from experienced toxicologists via the regional poison center.

General Wound Care

Bites and stings require basic wound care, including copious tap water or normal saline irrigation under pressure when possible. For small puncture wounds, this is impractical, but the skin should still be thoroughly cleansed with soap and water. Tetanus immunization should be updated as needed. Intact bullae should be left to act as a natural sterile dressing to prevent infection, whereas ruptured bullae should be debrided. Exposed tissue should be covered with wet to dry dressings. Necrotic wounds, as seen in some snake and spider bites, should be judiciously debrided, with removal of only clearly necrotic tissue. Reconstructive surgery with skin grafts or muscle/tendon grafts may be necessary at a later date. Prophylactic antibiotics are usually not necessary because venom is bacteriostatic. Antibiotics should generally be reserved for
Signs of established secondary infection.

**Snake Bites**

Most snake bites are inflicted by nonvenomous species and are of no more consequence than a potentially contaminated puncture wound (Fig. 746.1). Medically important venomous snakes in the United States belong to two families—Crotalinae and Elapidae (Table 746.1). Most snakebites occur from April through September, when snakes are at their most active. Males sustain 75% of bites and children <5 yr of age account for 10–15%. Bites are usually located on extremities, although other parts of the body have been reported. In the United States, approximately 98% of venomous snake bites are inflicted by pit vipers (Crotalinae). A small fraction of bites is caused by coral snakes (Elapidae) in the southern and southwestern states and by pet exotic snakes that have been imported.

### Table 746.1
**Important Venomous Snake Families in the United States**

<table>
<thead>
<tr>
<th>FAMILY</th>
<th>EXAMPLES</th>
<th>TOXIN EFFECTS/OTHER COMMENTS</th>
<th>ANTIVENOM</th>
</tr>
</thead>
</table>
| Crotalinae   | Rattlesnakes (*Crotalus* and *Sistrurus* spp.), cottonmouths and copperheads (*Agkistrodon* spp.) | Heat-sensing “pit” between each eye and nostril  
Toxins cause tissue damage, coagulopathy, cardiovascular collapse  
Exception: Mojave rattlesnake (*Crotalus scutulatus*) – neurotoxic venom | *Crotalinae* polyvalent immune Fab |
| Elapidae     | Coral snakes (*Micrurus* spp.)                                           | Venom is neurotoxic                                                                          | *Antivenin* (*Micrurus fulvius*) |

### Venoms and Effects

Snake venoms are complex mixtures of proteins including enzymes that cause local tissue destruction and other enzymes that have potentially lethal systemic effects including coagulopathy and neurotoxicity. The symptoms and severity of an envenomation vary according to the type of snake, the amount of venom injected, and the location of the bite. About 25% of snakebites are “dry bites,” where the patient has fang marks and puncture wounds but no pain, swelling, or systemic effects as no venom was injected. Most pit viper bites cause significant local pain, swelling, and ecchymosis and may result in necrosis of the affected extremity (Fig. 746.2). Pain and swelling typically begin quickly after the bite and may progress over hours to days. Serious envenomation may result in a consumptive coagulopathy, hypotension, and respiratory distress. In contrast, venom from the Elapidae is neurotoxic with little or no local tissue damage. These bites cause variable local pain, and the onset of systemic effects can be delayed for hours. Manifestations of neurotoxicity generally are caused by curare-like blockade at the neuromuscular junction. Symptoms usually begin with cranial nerve palsies such as ptosis, dysarthria, and dysphagia and may progress to respiratory failure and complete paralysis. Some pit vipers, including the Southern Pacific rattlesnake (*Crotalus oreganus helleri*), western diamondback rattlesnake (*Crotalus atrox*), timber rattlesnake (*Crotalus horridus*)
horridus), and Mojave rattlesnake (*Crotalus scutulatus*), can also cause significant neurotoxicity, like the Elapidae. Regional poison control centers and toxicologists should be consulted early in the course of treatment.

**FIG. 746.2** Southern Pacific rattlesnake bite (*Crotalus oreganus helleri*) in a 2 yr old boy. Note the fang marks, swelling, and bruising of the tissues (photograph taken 2 hr following the bite). (Courtesy Sean Bush, MD.)

**Management**

Prehospital care should focus on rapid transport to the emergency department while providing supportive care. Constrictive clothing, jewelry, and watches should be removed, and the injured body part should be immobilized in a position of function at the level of the heart. Many popularized field treatments for snake bites—such as tourniquets, ice, electric shock, incision, and suction—have proven ineffective or deleterious.

At the hospital, supportive care should be continued as an effort is made to identify the offending snake and secure the appropriate antivenom. In severe envenomations, advanced respiratory support may be required, including endotracheal intubation and mechanical ventilation. Intravenous access should be established in an unaffected extremity, intravenous fluids administered as needed, and standard laboratory specimens obtained, including complete blood count, coagulation studies, fibrinogen concentration, and serum chemistry analysis including total creatine kinase. Laboratory studies should initially be
repeated every 4-6 hr to monitor the patient's progress and response to therapy. If tourniquets are placed in the field, they should be cautiously removed after venous access is obtained due to possible adverse effects that may follow from a sudden release of venom into the systemic circulation. The bitten extremity should be marked with the leading edge of the erythema and edema as well as the time to monitor progression of the swelling.

Assessment of the severity of the envenomation in the field and at the hospital is essential in determining the appropriateness of antivenom therapy for the snakebite victim (Table 746.2). Antivenoms are relatively specific for the genus of snake whose venom they are designed to neutralize. If it is determined that the patient requires antivenom, appropriating the correct antivenom should begin as soon as possible by discussing the matter with the hospital pharmacy, regional poison control center, and perhaps local zoos and museums that keep captive snakes because they often stock exotic snake antivenom.

Table 746.3 lists the indications for administering antivenom. In October 2000, a Crotalinae polyvalent immune Fab antivenom (FabAV) marketed as CroFab was approved by the U.S. Food and Drug Administration (FDA) for use in crotalid envenomations. FabAV is derived from sheep (ovine) antibodies to
crotalid snake venom and replaces the previously used whole equine immunoglobulin antivenom. The most important advantage of this antivenom is fewer hypersensitivity reactions, including both immediate and delayed reactions. This is because the much smaller Fab fragment is considerably less antigenic than the entire immunoglobulin.

Table 746.3
Crotaline Fab Antivenom Dosing Guidelines

<table>
<thead>
<tr>
<th>DOSE</th>
<th>RECOMMENDATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial dose: 4-6 vials IV</td>
<td>• Reconstitute each vial of FabAV in 10 mL sterile water for injection and mix with gentle swirling. • Dilute 4-6 vials of reconstituted FabAV in 250 mL normal saline. • Infuse FabAV over 1 hr IV. • Start with slow infusion rate of 25-50 mL/hr for 10 min. • If no acute allergic reaction occurs, increase rate to 250 mL/hr to complete infusion. • The volume of the infusion may be decreased for the very small child or volume-sensitive patient. • Observe 1 hr after initial dose to assess for control of envenomation. • Repeat 4-6 vials of FabAV as needed to gain initial control.</td>
</tr>
<tr>
<td>Maintenance dose: 2 vials IV every 6 hr × 3 doses</td>
<td>• Monitor for delayed or recurrent toxicity requiring additional FabAV. • Antivenom dose requirements vary depending on the individual patient's response and clinical course. • Patients with mild envenomation may not require maintenance dosing beyond the initial dose.</td>
</tr>
</tbody>
</table>

FabAV is derived from four snakes, three from the genus *Crotalus* (the eastern diamondback rattlesnake, the western diamondback rattlesnake, and the Mojave rattlesnake) and one from the genus *Agkistrodon* (the cottonmouth or water moccasin). It is effective against the venoms of all Crotalinae snakes in the United States. There is cross-reactivity with FabAV against venom from copperhead snakes (*Agkistrodon contortrix*) . However, copperhead bites often do not require treatment with antivenom because they cause fewer systemic effects and less severe local tissue damage. Most copperhead envenomations cause only local tissue swelling, ecchymosis, and pain and generally do well with good supportive care and pain control. Any child with evidence of systemic toxicity should receive FabAV.

Initial dosing of FabAV is aimed at control of symptoms (progressive tissue swelling, thrombocytopenia, coagulopathy, neurotoxicity, or systemic toxicity). The dose is repeated until initial control of toxicity is achieved (Table 746.3 ).
Subsequent maintenance dosing may be needed to prevent or treat recurrence of venom effects because, due to its small molecular size, the half-life of FabAV is considerably shorter than that of crotalid venom constituents. Patients with significant envenomation should be followed for late hematologic abnormalities (coagulopathy) that can occur up to 2 wk after the bite. Although these tend to be mild laboratory coagulopathies without clinical bleeding, rare cases of severe delayed bleeding have been reported. Further antivenom therapy should be considered for such delayed or recurrent coagulopathy as outlined in Table 746.4.

Table 746.4

Indications for Administration of Additional Antivenom in Patients with Recurrent Coagulopathy or Thrombocytopenia After Initial Control

- Evidence of clinically significant bleeding
- Platelet count below 25,000/mm³
- International normalized ratio (INR) >3
- Activated partial thromboplastin time (aPTT) >50 sec
- Fibrinogen <50 mg/dL
- Presence of multicomponent coagulopathy
- Worsening trend in a patient with prior severe coagulopathy
- High-risk behavior for trauma
- Certain comorbid conditions (e.g., systemic vasculitis, seizure disorders, prior stroke)

Envenomation of the extremities can mimic compartment syndrome, with severe pain and swelling. It is important to treat these patients aggressively with FabAV and opioid pain control to control the severe pain and swelling. Although
fasciotomy was once advocated for the treatment of crotalid snakebites of the extremities, it is now a treatment of last resort only if aggressive FabAV treatment is unable to stop the progression of pain and swelling and true compartment syndrome is documented with measurement of intracompartmental pressure.

Antivenom (Micrurus fulvius) has been the recommended treatment for envenomation by the eastern coral snake (Micrurus fulvius) and the Texas coral snake (Micrurus tener). Indications for this antivenom are the development of any neurologic signs and symptoms of coral snake envenomation including paresthesias, slurred speech, respiratory difficulties, muscle weakness, and fasciculations. However, the antivenom may not be readily available since the manufacturer temporarily stopped production. It is not known how soon a new supply will become available. Respiratory supportive care including endotracheal intubation and mechanical ventilation for respiratory failure remains the mainstay of treatment.

**Disposition**

If, after observation for 6-8 hr, a child exhibits only fang-induced puncture marks with no local or systemic symptoms, the wounds can be considered dry bites and the child can be safely discharged home. Patients with significant toxicity and those requiring treatment with antivenom should be admitted to the hospital. Patients with a history of eastern or Texas coral snakebite should be admitted to a monitored setting for 24 hr to observe for neurologic toxicity so that respiratory support can be provided as needed. Children should be admitted to an intensive care setting if they develop severe and progressive local tissue toxicity or evidence of systemic toxicity including coagulopathy, neurotoxicity, hemodynamic instability, or respiratory difficulties.

**Spider Bites**

In the United States, 18 genera of spiders have been identified that cause clinically significant envenomation. The spiders of importance in the United States include the Latrodectus species (the widow spiders) and the Loxosceles species (the recluse spiders).
**Latrodectus Spiders**

The *Latrodectus* species are found throughout the United States and include *L. mactans* Fig. 746.3 (black widow spider), *L. hesperus* (western black widow), *L. bishop* (red widow spider), *L. variolus*, and *L. geometricus* (brown widow spider). They are indigenous to every state except Alaska. The classic hourglass-shape marking is found only in *L. mactans*. They like to live close to the ground in secluded and dimly lit areas such as barns, sheds, and garages.

![Female black widow spider](Image)

**FIG. 746.3** Female black widow spider (*Latrodectus mactans*). Note the red hourglass-shaped marking on the underside of her abdomen. (From The Centers for Disease Control and Prevention Public Health Image Library, Image #5449.)

**Venoms and Effects**

*Latrodectus* spiders possess venoms that act at neuromuscular and autonomic nervous system synapses, resulting in excessive release of neurotransmitters. All of the widow spiders possess similar venoms, with the most important neurotoxin being α-latrotoxin.

Bites by the neurotoxic spiders tend to be very painful, and the offending spider is often seen. Systemic effects may include hypertension, tachycardia, bradycardia, hypersalivation, diaphoresis, and diffuse muscle spasm. Nausea, vomiting, abdominal pain, and abdominal rigidity may mimic appendicitis or another acute abdominal emergency.
Management

The management of a neurotoxic spider envenomation centers on sound supportive care. Generous doses of opioid analgesics and benzodiazepines should be utilized to ease severe pain and muscle spasm. *Latrodectus* antivenom (Wyeth) is equine-derived and may be considered to reverse severe systemic effects of widow spider envenomation. Although effective, it is associated with anaphylaxis, serum sickness, and anaphylactoid reactions and should be reserved for high-risk patients such as pregnant women at risk of spontaneous abortion due to the severe pain. One vial is administered via intravenous infusion. Efficacy is usually noted within 1 hr of administration, with reversal of systemic toxicity and relief of pain. Occasionally a second vial is necessary. Owing to the possibility of severe or life-threatening reactions, the risks and benefits should be carefully considered and the antivenom infused slowly with continuous monitoring and preparation to treat anaphylaxis should it occur.

**Loxosceles Spiders**

**Venoms and Effects**

The spiders most notorious for their dermonecrotic potential are the recluse spiders of the genus *Loxosceles*. The best-known member of this genus is the brown recluse (*Loxosceles reclusa*; [Fig. 746.4](#)), found in the midwestern and southern regions of the United States. The venom of *Loxosceles* spiders contains a phospholipase enzyme, sphingomyelinase D, as well as hyaluronidase. Hyaluronidase is the spreading factor that enables the venom to penetrate tissues, but it does not induce tissue damage. Sphingomyelinase D causes necrosis, red blood cell hemolysis, and platelet serotonin release. The bite of this spider is generally painless and initially goes unnoticed. A few hours after the bite, the area begins to blister and bleed and become painful. Within a day or two, the site will ulcerate and develop violaceous necrosis with surrounding ecchymosis and a rim of pale ischemia (“red, white, and blue” reaction). The lesion may gradually expand over a period of days to weeks until necrotic tissue sloughs and healing begins ([Fig. 746.5](#)).
FIG. 746.4  Male recluse spider (*Loxosceles* spp.). Note the distinct violin-shaped marking on the dorsum of the cephalothorax. (Courtesy Michael Cardwell/Extreme Wildlife Photography.)

FIG. 746.5  Progression of cutaneous loxoscelism in a Brazilian patient who was bitten inside a house while putting on a shirt. Ulceration and necrosis at day 1 (A), day 9 (B), day 16 (C), and day 25 (D). (From Isbister G, Fan HW: Spider bite, *Lancet* 378:2039–2046, 2011, Fig. 3. Photographs by Ceila MS Malaque.)
Rare cases of systemic loxoscelism appear to be more common in young children. Patients present with systemic toxicity, including fever, chills, nausea, malaise, diffuse macular rash, and petechiae; they may experience hemolysis, coagulopathy, and renal failure.

In cases of necrotic dermal lesions with no identified spider as the culprit, a broad differential diagnosis must be considered to ensure appropriate management. The differential diagnosis includes skin infections (particularly methicillin-resistant *Staphylococcus aureus*; see Chapter 208), pyoderma gangrenosum, or ecthyma gangrenosum.

**Management**

The management of necrotizing spider bites includes good wound care, updating of tetanus status, and administration of antibiotics if there is secondary bacterial infection. Daily wound cleansing and splinting of the affected area should be provided until the wound has healed.

No therapy has been definitively proven effective in limiting the extent of necrosis following a recluse spider bite, including steroids, dapsone, colchicine, cyproheptadine, nitroglycerine, hyperbaric oxygen, and early excision of tissue. Meticulous wound care is the mainstay of treatment, and large lesions may require delayed secondary closure with skin grafting after clear tissue demarcation has occurred.

Patients with signs and symptoms of systemic loxoscelism should be admitted to the hospital for supportive treatment of hypovolemia, coagulopathy, hemolysis, and acute kidney injury. There is no commercially available antivenom in the United States for the management of necrotizing spider bites such as those from *Loxosceles* species.

**Disposition**

Victims with necrotic skin lesions should be monitored with frequent outpatient wound checks to determine progression of the lesion. Children with rapidly progressive dermonecrosis or systemic toxicity should be admitted to the hospital for supportive therapy, which may include intensive care admission for hemolysis, coagulopathy, renal failure, or hypotension.

**Scorpion Stings**
There are more than 650 species of scorpions worldwide, some of which are capable of causing severe or lethal envenomation. In the United States, there are two clinically significant scorpions: *Centruroides exilicauda* (the bark scorpion) and *Centruroides vittatus*. Most scorpion envenomations occur in the southwestern United States, and fatalities are rare. In other regions of the world—especially Latin America, Africa, the Middle East, and Asia—a number of scorpions regularly cause fatalities.

**Venoms and Effects**

*Centruroides* scorpion venom contains phospholipase, acetylcholinesterase, hyaluronidase, serotonin, and neurotoxins, resulting in severe pain and paresthesias as well as systemic symptoms of excessive nerve depolarization and release of acetylcholine and catecholamines. The manifestations of scorpion stings in children vary from mild to severe and can include autonomic and somatic toxicity. Autonomic toxicity includes hypertension, tachycardia, hypersalivation, emesis, diaphoresis, and bronchoconstriction, although respiratory failure is rare. Somatic motor toxicity includes ataxia, fasciculations, myoclonus, and opsoclonus. Patients are often restless or agitated, and cranial nerve dysfunction may occur.

**Management**

Most scorpion stings do not produce severe effects and require only wound care and orally administered pain medications. However, patients with more severe symptoms may require intravenous opioids for analgesia and benzodiazepines for severe muscle spasm or agitation.

In August 2011, the FDA approved a bark scorpion–specific antivenom, Anascorp (Bioclon, Mexico). This antivenom is recommended for critically ill patients with neurotoxicity or other severe symptoms, including intractable pain that is not responsive to adequate doses of opioid analgesics. Small children are more likely than adults to develop such severe symptoms. It is best to discuss antivenom therapy with the regional poison control center for guidance.

**Disposition**

Patients who have had mild scorpion stings with only local effects can be safely
discharged home with wound care instructions, analgesics, and close outpatient follow up. Patients with evolving symptoms, intractable pain, neurotoxicity, or other systemic toxicity should be admitted to the hospital, especially if scorpion antivenom is being considered. Those with severe toxicity should be admitted to an intensive care unit.

Hymenoptera Stings

The insect order Hymenoptera includes the stinging ants, bees, and wasps, which are characterized by the presence of a modified ovipositor (the “sting” or “stinger”) at the end of the abdomen through which venom is injected. Various members of the order can be found throughout the world.

Venoms and Effects

Hymenoptera venom is a complex mixture of proteins, enzymes, and vasoactive substances that result in local tissue injury and inflammation. Most stings cause only local pain, redness, and swelling followed by itching and resolution. Some patients experience a large local reaction in which swelling progresses beyond the sting site, possibly involving the entire extremity. Approximately 0.4–0.8% of children and 3% of adults are at risk for acute, life-threatening allergic reactions as a result of hymenoptera venom sensitivity. Deaths from hymenoptera envenomation due to anaphylaxis used to be a major cause of mortality; however, from 2008 to 2011 only 2 deaths due to hymenoptera envenomation were reported to poison control centers in the United States (see Chapter 171). Rare cases of delayed serum sickness can follow hymenoptera stings (see Chapter 175). Africanized honeybees (*Apis mellifera scutellata*), an aggressive hybrid of western honeybee species with African bee species, can cause massive stinging episodes resulting in systemic venom toxicity with hypotension, respiratory failure, shock, hemolysis, and renal failure.

Management

Children with typical local reactions can be treated with supportive care including analgesics and antihistamines as needed. Children with large local reactions should also receive a course of oral corticosteroids and a prescription for an epinephrine autoinjection kit including instructions in its use prior to
discharge. Patients presenting with urticaria, angioedema, wheezing, or hypotension should be treated with aggressive supportive care including standard therapy for anaphylaxis such as intramuscular epinephrine, corticosteroids, antihistamines, intravenous fluids, oxygen, and airway management as needed (see Chapter 174). Children suffering massive stinging episodes may also require critical care resuscitation.

Disposition

Children with local reactions can be discharged with continued outpatient care that may include analgesia and antihistamines. More difficult disposition decisions are involved for children with systemic manifestations. Children with only diffuse urticaria who are stable after a period of observation can be discharged home to continue a short course of antihistamines and steroids and to carry an epinephrine self-administration kit. These children are at low risk for progressing to systemic anaphylaxis with future stings. Children suffering more than simple urticaria (e.g., wheezing, evidence of laryngeal edema or cardiovascular instability) should be treated aggressively and admitted for at least 24 hr of observation. They should receive a referral to allergy/immunology to test for hymenoptera venom sensitivity and possible immunotherapy. Immunotherapy reduces the risk of systemic anaphylaxis from future stings in high-risk patients from somewhere between 30% and 60% to <5%.

Marine Envenomation

The classes of venomous marine animals that cause the most morbidity and mortality in humans are the Cnidaria (including jellyfish, the Portuguese man-of-war, Pacific blue bottle, fire coral, sea nettles, anemones, and others), Mollusca (blue-ringed octopus and cone snails), Chondrichthyes (stingrays), and members of the family Scorpaenidae (lionfish, scorpionfish, and stonefish).

Venoms and Effects

All members of the Cnidaria have unique stinging cells called nematocysts. These cells contain a highly folded tubule that discharges on contact, penetrates the skin, and injects venom. The venom is antigenic and can be dermonecrotic, hemolytic, cardiotoxic, or neuropathic, depending on the species. The Pacific
box jellyfish (*Chironex fleckeri*) of Australia, with its cardiotoxic venom, is known to cause stings that are rapidly fatal due to cardiac arrest and pulmonary edema. Although fatal anaphylaxis to jellyfish stings has been reported in coastal waters of the United States, these events are rare. For clinicians in the Americas, the primary concern with Cnidaria envenomation is localized pain that may be associated with paresthesias or pruritus. Occasionally, victims may have systemic symptoms such as nausea, vomiting, headache, and chills.

The phylum Mollusca includes octopi and cone snails (*Conus* sp.). The octopus of toxicologic significance is the *Hapalochlaena maculosa* (blue-ringed octopus), which is primarily found in Australian waters. The blue-ringed octopus secretes tetrodotoxin (the same toxin found in pufferfish) in its salivary gland. The beak of the octopus punctures the skin and delivers the tetrodotoxin. Tetrodotoxin blocks sodium channels in neurons, leading to paralysis. The venom also contains other toxins, including vasoactive agents and enzymes that cause local tissue injury. Cone snails have a hollow proboscis with a tooth that can be extended to inject venom into the victim. Venom of the *Conus* species contains conotoxins that target multiple receptors, including voltage, ligand, and G-mediated receptors. Conotoxins cause a variety of symptoms including severe pain, weakness, tissue ischemia, cyanosis, and numbness. Systemic symptoms are usually neurological and include aphonia, aphasia, weakness, paralysis, respiratory failure, cardiovascular collapse, and ultimately death.

The stingray has a sharp, retroserrated spine and associated venom gland at the base of its tail. Envenomation often occurs when the victim steps on the animal hidden in the surf and the tail is whipped around to puncture the lower extremity. Injuries involve jagged lacerations from the spine, often with retained debris (spine fragments, glandular tissue, and sand). The venom has vasoconstrictive properties that can result in tissue necrosis and poor wound healing. Stingray envenomations are noteworthy for immediate and intense pain at the site of injury that lasts 24-48 hr. Some patients experience nausea, vomiting, and muscle cramps. Rarely, hypotension or seizures occur.

The Scorpaenidae have venomous dorsal, pelvic, and anal spines that become erect when the animal is threatened. The venom glands associated with these spines contain multiple toxins, enzymes, and vasoactive substances. Envenomation causes immediate severe pain that may persist for hours or days. Victims may experience local tissue destruction, and superinfections are common. Systemic symptoms include diaphoresis, nausea, vomiting, diarrhea, abdominal pain, muscle cramping, and headache. In severe cases, paralysis,
respiratory failure, hypotension, dysrhythmias, and cardiovascular collapse have been reported.

**Management**

Treatment of Cnidaria stings should begin immediately after envenomation. Dousing the sting site with vinegar has been shown to inhibit nematocyst discharge. Visible tentacle fragments should be removed with a gloved hand or forceps, and microscopic fragments may be removed by gently shaving the affected area. Folk remedies such as rubbing the sting with sand and applying urine are not helpful and cause more irritation. Meat tenderizer is usually not effective. Antihistamines and corticosteroids are indicated for swelling and urticaria. An acute anaphylactic reaction should be treated with intramuscular epinephrine. Antibiotics are usually not necessary.

Patients who have been envenomated by Mollusca are treated supportively. There are no antivenoms available for either the blue-ringed octopus or the cone snails. Adequate pain control should be provided as needed. Cardiovascular support may be required and severe neurological toxicity such as respiratory failure should be managed via airway management and mechanical ventilation.

Treatment of stingray and Scorpaenidae stings is similar. These toxins are heat-labile, and immersion in hot water (approximately 42°C [107.6°F]) for 30-60 min denatures the protein constituents and decreases pain significantly. The wounds should be thoroughly cleansed and explored with use of local or regional anesthesia to rule out retention of spine or integument fragments. Stingray spines are radiopaque and may be seen on radiographs or identified by ultrasonography. Lacerations should be treated with delayed primary closure or allowed to heal by secondary intention. Systemic analgesia should be provided as needed. Because of the risk of secondary bacterial infection, there should be a low threshold for administering prophylactic antibiotics to cover *Staphylococcus*, *Streptococcus*, and *Vibrio* species, and wounds should be rechecked daily for a few days. An equine Fab stonefish antivenom is available for severe stonefish envenomation with systemic toxicity or intractable pain.

**Disposition**

After wound care and effective analgesia, most victims can be discharged home. If there are significant systemic effects, the patient should be admitted for
monitoring and further care as needed.

Laboratory Medicine

OUTLINE

Chapter 747 Laboratory Testing in Infants and Children
Chapter 748 Reference Intervals for Laboratory Tests and Procedures
Normal values (reference intervals) are difficult to establish within the pediatric population. Differences in genetic composition, physiologic development, environmental influences, and subclinical disease are variables that need to be considered when developing reference intervals. Other considerations for further defining reference intervals include partitioning based on sex and age. The most commonly used reference range is generally given as the mean of the reference population ±2 standard deviations (SD). This is acceptable when the distribution of results for the tested population is essentially gaussian (normal). The serum sodium concentration in children, which is tightly controlled physiologically, has a distribution that is essentially gaussian; the mean value ±2 SD gives a range very close to that actually observed in 95% of children (Table 747.1). However, not all analytes have a gaussian distribution. The serum creatine kinase level, which is subject to diverse influences and is not actively controlled, does not show a gaussian distribution, as evidenced by the lack of agreement between the range actually observed and that predicted by the mean value ±2 SD. In these cases, a reference interval defining the 2.5-97.5 percentiles is typically used.

Reference cutoffs are typically established from large studies with a large reference population. Examples of these cutoffs are illustrated by reference cutoffs established for cholesterol, lipoproteins, and neonatal bilirubin. Patient results exceeding these cutoffs have a future risk of acquiring disease. A final modification needed for reporting reference intervals is referencing the Tanner stage of sexual maturation (sexual maturity rating scale), which is most useful in assessing pituitary and gonadal function.

The establishment of common reference intervals remains an elusive target. Although some patient results are directly comparable between laboratories and methods, most are not. Careful interpretation of patient results must consider when testing was performed and what method was used. Higher-order methods, methods that are more accurate and precise, continue to be slowly developed. These will be critical to the standardization of tests and the establishment of common reference intervals.

Accuracy and Precision of Laboratory Tests

Technical accuracy, or trueness, is an important consideration in interpreting the results of a laboratory test. Because of improvements in methods of analysis and elimination of analytic interference, the accuracy of most tests is limited primarily by their precision. Accuracy is a measure of the nearness of a test result to the actual value, whereas precision is a measure of the reproducibility of a result. No test can be more accurate than it is precise. Analysis of precision by repetitive measurements of a single sample gives rise to a gaussian distribution with a mean and an SD. The estimate of precision is the coefficient of variation (CV):

\[
CV = \frac{SD}{\text{Mean}} \times 100
\]

The CV is not likely to be constant over the full range of values obtained in clinical testing, but it is approximately 5% in the normal range. The CV is generally not reported but is always known by the laboratory. It is particularly
important in assessing the significance of changes in laboratory results. For example, a common situation is the need to assess hepatotoxicity incurred because of the administration of a therapeutic drug and reflected in the serum alanine transaminase (aminotransferase) (ALT) value. If serum ALT increases from 25 units/L to 40 units/L, is the change significant? The CV for ALT is 7%. Using the value obtained ±2 × CV to express the extremes of imprecision, a value of 25 units/L is unlikely to reflect an actual concentration of >29 units/L, and a value of 40 units/L is unlikely to reflect an actual concentration of <34 units/L. Therefore, the change in the value as obtained by testing is likely to reflect a real change in circulating ALT levels. Continued monitoring of serum ALT is indicated, even though both values for ALT are within normal limits. Likely in this case is only a probability. Inherent biologic variability is such that the results of 2 successive tests may suggest a trend that will disappear on further testing.

The precision of a test may also be indicated by providing confidence limits for a given result. Usually, 95% confidence limits are used, indicating that it is 95% certain that the value obtained lies between the 2 limits reported. Confidence limits are calculated using the mean and SD of replicate determinations:

\[
95\% \text{ confidence limits} = \text{Mean} \pm t \times \text{SD}
\]

where \( t \) is a constant derived from the number of replications. In most cases, \( t = 2 \).

Accuracy is expressed by determining the difference, or bias, between results from a comparative method and a definitive or reference method. A definitive or reference method provides results with increased precision and accuracy compared to the clinical laboratory. When these methods are used, along with highly purified materials (i.e., Standard Reference Materials from the National Institute of Standards and Technology) to establish values for assay calibrators used in the clinical laboratory, the accuracy of patient results is improved. Creatinine, hemoglobin A\(_{1c}\), and neonatal bilirubin are examples in which the accuracy of these tests has been improved.

**Sensitivity, Accuracy, and Analytic**
Testing

In some circumstances, the sensitivity and accuracy of an analysis are reduced or increased as functions of clinical purpose. For example, ion exchange chromatography of plasma amino acids for the diagnosis of inborn errors of metabolism is usually performed at an analytic sensitivity that allows measurement of all the amino acids with a single set of standards. The range of values is approximately 20-800 µmol/L, and accuracy is poor at values \( \leq 20 \) µmol/L. The detection of homocysteine in this type of analysis suggests an inborn error of methionine metabolism. If the analysis is adjusted to achieve greater analytic sensitivity, it is possible to measure homocysteine accurately in normal plasma (3-12 µmol/L). This more sensitive test is used to assess cobalamin status and analyze risk factors for atherosclerotic cardiovascular disease.

Predictive Value of Laboratory Tests

Predictive value (PV) theory deals with the usefulness of tests as defined by their clinical sensitivity (ability to detect a disease) and specificity (ability to define the absence of a disease).

\[
\text{Sensitivity} = \frac{\text{Number positive by test}}{\text{Total number positive}} \times 100
\]

\[
\text{Specificity} = \frac{\text{Number negative by test}}{\text{Total number without disease}} \times 100
\]

\[
\text{PV of a positive test result} = \frac{\text{True-positive results}}{\text{Total positive results}} \times 100
\]
PV of a negative test result = \frac{\text{True-negative results}}{\text{Total negative results}} \times 100

The problems addressed by PV theory are *false-negative* and *false-positive* test results. Both are major considerations in interpreting the results of screening tests in general and neonatal screening tests in particular.

Testing for human immunodeficiency virus (HIV) seroreactivity illustrates some of these considerations. If it is assumed that approximately 1,100,000 of 284,000,000 residents of the United States are infected with HIV (prevalence = 0.39%) and that 90% of those infected demonstrate antibodies to HIV, then we can consider the usefulness of a simple test with 99% sensitivity and 99.5% specificity (see Chapter 302). If the entire population of the United States were screened, it would be possible to identify most of those infected with HIV:

\[
1,100,000 \times 0.9 \times 0.99 = 980,100 \ (89.1\%)
\]

However, there will be 119,900 false-negative test results. Even with 99.5% specificity, the number of false-positive test results would be larger than the number of true-positive results:

\[
284,000,000 \times 0.0005 = 1,420,000
\]

In addition, there will be 281,480,000 true-negative results:

\[
\text{PV of positive test result} = \frac{980,100}{(980,100 + 1,420,000)} \times 100 = 41\%
\]

\[
\text{PV of negative test result} = \frac{281,480,000}{(281,480,000 + 119,900)} \times 100 = 99.96\%
\]

Given the high cost associated with follow-up and the anguish produced by a
false-positive result, it is easy to see why universal screening for HIV seropositivity received a low priority immediately after the introduction of testing for HIV infection.

By contrast, we can consider the screening of 100,000 individuals from groups at increased risk for HIV in whom the overall prevalence of disease is 10%, with all other considerations being unchanged.

\[
\text{True-positive results} = 0.9 \times 0.99 \times 10,000 = 8,910
\]

\[
\text{False-positive results} = 0.005 \times 90,000 = 450
\]

\[
\text{False-negative results} = 10,000 - 8,910 = 1,090
\]

\[
\text{PV of positive test result} = \frac{8,910}{8,910 + 450} \times 100 = 95\%
\]

\[
\text{PV of negative test result} = \frac{89,500}{89,550 + 1,090} \times 100 = 99\%
\]

These two hypothetical testing strategies show that the diagnostic efficiency of testing depends heavily on the prevalence of the disease being tested for, even with a superior test, such as the test for HIV antibodies. Because the treatment of pregnant women infected with HIV is effective in preventing vertical transmission of the infection, screening has now been expanded to all pregnant women. The proven effectiveness of current therapy in preventing neonatal infection has intensified screening for HIV early in pregnancy.

However, because of the long time needed to test for HIV antibodies, it was difficult to screen women during labor and provide the necessary therapy. Rapid HIV antibody testing procedures using a fingerstick or venipuncture to obtain whole blood, plasma, or serum, and tests using oral fluid were approved (Table
The HIV test results are usually obtained in <20 min. The collection of oral fluid samples provides an alternative for individuals who avoid HIV testing because of their dislike of needlesticks. HIV testing using whole blood or oral fluid is classified as a waived test under the Clinical Laboratory Improvement Amendments of 1988 (CLIA), and these tests are allowed in a point-of-care setting. Waived tests are simple laboratory procedures that use methodologies that are so simple and accurate as to render the likelihood of an erroneous result by the user negligible. A positive rapid HIV test result is then confirmed by Western blot analysis or immunofluorescence assay.

According to the U.S. Centers for Disease Control and Prevention (CDC), 174 infants were born with HIV in 2014 in the United States. Rapid HIV testing during labor allows for implementation of antiretroviral therapy for HIV-infected women who have not been tested or are unaware of their HIV status. The initiation of therapy at the time of labor or within the first 12 hr of an infant’s birth significantly reduces the risk of mother-to-child transmission. In the mother–infant rapid intervention at delivery study, it was shown that the sensitivity and specificity of a rapid whole blood test for HIV during labor were 100% and 99.9%, respectively, with a positive PV of 90%. The median turnaround time for obtaining results from blood collection to patient notification was only 66 min. The performance of the rapid blood test was better than that of the standard HIV enzyme immunoassay, which had sensitivity and specificity of 100% and 99.8%, respectively, with a positive PV of 76%. In addition, the median turnaround time from blood collection to patient notification was 28 hr. As a result, rapid whole blood HIV testing is now the standard of care for women in labor with undocumented HIV status.

Rapid HIV testing can also be used in developing countries. In resource-poor settings, because of the lack of properly equipped laboratories, skilled technologists, and basic resources, such as electricity and water, these self-contained, point-of-care HIV tests are very attractive. In areas of Asia and Africa where HIV is epidemic, screening pregnant women with rapid HIV tests and offering antiretroviral therapy can significantly reduce the transmission of HIV to hundreds of thousands of infants.

**Neonatal Screening Tests**

Almost all the diseases detected in neonatal screening programs have a very low prevalence, and for the most part, the tests are *quantitative* rather than qualitative. In general, the strategy is to use the initial screening test to separate a highly suspect group of patients from normal infants (i.e., to increase the prevalence) and then to follow this suspect group aggressively. Two common strategies are used to detect congenital hypothyroidism (see Chapter 581): one
uses thyroid-stimulating hormone for the initial screen and the other uses thyroxine. In the **thyroxine** strategy for congenital hypothyroidism, which has a prevalence of 25 in 100,000 liveborn infants, the initial test performed is for thyroxine in whole blood. Infants with the lowest 10% of test results are considered suspect. If all infants with hypothyroidism were included in the suspect group, the prevalence of disease in this group would be 250 in 100,000 infants. The original samples obtained from the suspect group are retested for thyroxine and are tested for thyroid-stimulating hormone. This second round of testing results in an even more highly suspect group composed of 0.1% of the infants screened and having a prevalence of hypothyroidism of 25,000 in 100,000 individuals. This final group is aggressively pursued for further testing and treatment. Even with a 1,000-fold increase in prevalence, 75% of the aggressively tested population is euthyroid. The justifications advanced for the program are that treatment is easy and effective and that the alternative, if congenital hypothyroidism is undetected and untreated—long-term custodial care—is both unsatisfactory and expensive.

At its inception, newborn screening was driven by the selection of genetic diseases whose clinical manifestations developed postnatally, such as phenylketonuria, galactosemia, and hypothyroidism. Diseases selected for screening typically had to meet certain criteria. The prevalence of disease had to meet a minimum, typically 1 in 100,000. Disease selection required demonstrated reduction in morbidity and mortality in the neonatal period. Effective therapies needed to be available, and the cost of screening and the feasibility of laboratory testing were also considerations in this selection process.

More common diseases have also become targets for neonatal screening programs. **Sickle cell disease** (see Chapter 489.1), easily detected using liquid chromatography or isoelectric focusing, can be treated more effectively if it is diagnosed before clinical signs appear. In addition, the results of neonatal screening for **cystic fibrosis** (CF; see Chapter 432) show clear benefits associated with preclinical diagnosis, but also some inherent difficulties associated with genetic screening for complex autosomal recessive diseases that are common and are caused by a rather large number of mutations (>1,500) of a single gene. The definitive diagnostic test for CF is the measurement of concentrations of chloride in sweat, a test that is not practical during the first week of life. Neonates with CF generally have elevations in whole blood trypsinogen. This test allows the identification of a group of neonates at risk for CF. Unfortunately, trypsinogen as an initial screening test has a high false-
positive rate, an unfavorable characteristic that creates unnecessary anxiety among newborn parents and families and is costly because of the time and expense for medical follow-up. Performing DNA analysis for common mutations that cause CF reduces the size of the suspect group and identifies neonates with a higher likelihood of disease. This 2-tiered strategy identifies a manageable number of infants for whom to perform sweat tests. Problems include the following: (1) uncommon mutations are not included in the screening panel; thus cases of CF caused by these mutations can be missed; (2) common mutations that cause clinically innocent elevations of whole blood trypsinogen in heterozygous neonates cause potentially alarming false-positive findings; and (3) CF in patients with normal sweat test results is rare but is likely to be missed.

**Tandem mass spectrometry (MS/MS)** is a technically advanced method in which many compounds are initially fragmented and separated by molecular weight. Each compound is then fragmented again. Identification of compounds is based on characteristic fragments. The process requires approximately 2 min per sample and can detect 20 or more inborn errors of metabolism. The effects of prematurity, neonatal illness, and intensive neonatal management on metabolites in blood complicate the interpretation of results. The PV of a positive screening result is likely to be <10%; that is, 90% of positive results are not indicative of a genetic disorder of metabolism. Nonetheless, MS/MS permits a diagnosis to be made before clinical illness develops and has revolutionized the purpose and ability of newborn screening. MS/MS is not directed toward diseases defined as treatable, but it is directed toward all the diseases, each of which is rare, that the technique can identify.

**Electrospray MS/MS** permits the detection of rare inborn errors of metabolism and has been introduced as a newborn screening tool worldwide. Since 1998, when mass spectrometry was implemented in Australia, the rate of detection per 100,000 births has been 15.7, significantly higher than the rate of 8.6-9.5 in the six preceding 4 yr periods. Disorders of fatty acid oxidation, particularly medium-chain acyl coenzyme A dehydrogenase deficiency (see Chapter 104), accounted for the majority of increased diagnoses. Expanded newborn screening programs using MS/MS increase the detection of inherited metabolic disorders. All states in the United States use MS/MS in their neonatal screening programs; the metabolic conditions screened range from 31 to >50.

In an attempt to standardize newborn screening programs, the American College of Medical Genetics (ACMG) recommended that every baby born in the United States be screened for a core panel of 29 disorders (Table 747.3). An
additional 25 conditions were recommended as secondary targets because they may be identified while screening for the core panel disorders. The March of Dimes and the American Academy of Pediatrics also endorse the ACMG recommendations. However, expansion of the screening test menu raises several issues. The cost of implementation can be significant because many states will need multiple MS/MS systems. Staffing the laboratory with qualified technical personnel to run the MS/MS system and qualified clinical scientists to interpret the profiles can be a challenge. A number of false-positive results will also be obtained with these newborn screening programs. Many of these findings are the result of parenteral nutrition, biologic variation, or treatment and are not the result of an inborn error of metabolism. Consequently, qualified staff will be needed to ensure that patients with abnormal results are contacted and receive follow-up testing and counseling, if needed. Even with these concerns, the ACMG report is a step in the right direction toward standardizing guidelines for state newborn screening programs.

| Congenital hypothyroidism      |
| Biotinidase deficiency         |
Testing in Refining a Differential Diagnosis

The use of laboratory tests in refining a differential diagnosis satisfies PV theory because a correct differential diagnosis should result in a relatively high prevalence of the disease under consideration. An example of testing in refining a differential diagnosis is the measurement of urinary vanillylmandelic acid (VMA) for the diagnosis of neuroblastoma (see Chapter 525). A simple spot test for VMA is not useful in general screening programs because of the low prevalence of neuroblastoma (3 cases/100,000) and the low sensitivity of the test (69%). Even though the specificity of urinary VMA is 99.6%, testing of 100,000 children would produce 2 true-positive test results, 400 false-positive results, and 1 false-negative result. The PV of a positive result in this setting is 0.5%, and the PV of a negative result is 99.99%, not much different from the assumption that neuroblastoma is not present. Testing for urinary VMA in a 3 yr old child with an abdominal mass, however, gives a useful result because the prevalence of neuroblastoma is at least 50% in 3 yr old children with abdominal masses. If 100 such children are tested and the prevalence of neuroblastoma in the group is assumed to be 50%, a satisfactory PV is obtained.

\[
PV_{\text{positive test result}} = \frac{0.69 \times 50}{0.69 \times 50 + (0.004 \times 50)} \times 100 = 99\%
\]

\[
PV_{\text{negative test result}} = \frac{0.996 \times 50}{0.996 \times 50 + (0.31 \times 50)} \times 100 = 76\%
\]

Thus, in this situation, a test with low sensitivity is powerful in refining the differential diagnosis because the PV of a positive result is almost 100% in the setting of high prevalence.
Serologic Testing

Using laboratory testing to refine a differential diagnosis poses problems, as exemplified by serologic testing for Lyme disease, which is a tick-borne infection by Borrelia burgdorferi that has various manifestations in both early and late stages of infection (see Chapter 249). Direct demonstration of the organism is difficult, and serologic test results for Lyme disease are not reliably positive in young patients presenting early with erythema chronicum migrans. These results become positive after a few weeks of infection and remain positive for a number of years. In an older population being evaluated for late-stage Lyme disease, some individuals will have recovered from either clinical or subclinical Lyme disease, and some will have active Lyme disease, with both groups having true-positive serologic test results. Of individuals without Lyme disease, some will have true-negative serologic test results, but a significant percentage will have antibodies to other organisms that cross-react with B. burgdorferi antigens.

This set of circumstances gives rise to a number of problems. First, the protean nature of Lyme disease makes it difficult to ensure a high prevalence of disease in persons to be tested. Second, the most appropriate antibodies to be detected are imperfectly defined, leading to a wide variety of tests with varying false-positive and false-negative rates. Third, the natural history of the antibody response to infection and the difficulty of showing the causative organism directly combine to make laboratory diagnosis of early Lyme disease difficult. Fourth, in the diagnosis of late-stage Lyme disease in older individuals, the laboratory diagnosis is plagued by misleading positive (either false-positive or true-positive, but not clinically relevant) results, typically an enzyme-linked immunosorbent assay (ELISA) that uses whole B. burgdorferi organisms. In a review of 788 patients referred to a specialty clinic with the diagnosis of Lyme disease, the diagnosis was correct in 180 patients, 156 patients had true seropositivity without active Lyme disease, and 452 had never had Lyme disease, even though 45% of them were found to be seropositive by at least one test before referral.

A 2-step approach, similar to that used in HIV testing, is often used: a screening test that has high sensitivity (e.g., ELISA) and excellent negative PV, followed by a very specific confirmatory test for verification of positive screening test results (e.g., Western blot to detect antibodies to selected bacterial antigens). Negative screening test results and negative verification test results
are reported as negative. Positive verification test results are reported as positive. However, standardization of the testing procedures is difficult in North America, where only 1 pathogenic strain of *B. burgdorferi* is found, and is more difficult elsewhere in the Northern hemisphere, where as many as 3 pathogenic strains are present. Identification of microbial DNA in body fluids by polymerase chain reaction is definitive but invasive.

**Laboratory Screening**

Screening profiles are used as part of a complete review of systems, to establish a baseline value, or to facilitate patient care in specific circumstances, such as (1) when a patient clearly has an illness, but a specific diagnosis remains elusive; (2) when a patient requires intensive care; (3) for postmarketing surveillance and evaluation of a new drug; and (4) when a drug is used that is known to have systemic adverse effects. Laboratory screening tests should be used in a targeted manner to supplement, not supplant, a complete history and physical examination (*Table 747.4*).

In Tables 748.1 through 748.5, the reference intervals apply to infants, children, and adolescents when possible. For many analyses, separate reference intervals for children and adolescents are not well delineated. When interpreting a test result, the reference interval supplied by the laboratory performing the test should always be used, because these intervals are instrument and/or method dependent. Figs. 748.1 and 748.2 provide estimations related to dosages. Fig. 748.3 is a nomogram for risk assessment of hyperbilirubinemia.

* In preparing the reference range listings, a number of abbreviations, symbols, and codes were used (see Table 748.2).

† Reference values are shown in SI units (International System of Units) and U.S. units (Traditional Units).
FIG. 748.1  Nomogram for the estimation of surface area. The surface area is indicated where a straight line that connects the height and weight levels intersects the surface area column, or if the patient is roughly of average size, from the weight alone (enclosed area). (Nomogram modified from the data of E. Boyd by C.D. West. See also Briars GL, Bailey BJ: Surface area estimation: pocket calculator v nomogram, Arch Dis Child 70:246–247, 1994.)

FIG. 748.2  Relationships among body weight (lb), body surface area, and adult dosage. The surface area values correspond with those set forth by Crawford JD, Terry ME, Rourke GM: Simplification of drug dosage calculation by application of the surface area principle, Pediatrics 5:783–790, 1950. Note that the 100% adult dose is for a patient weighing approximately 140 lb and having a surface area of approximately 1.7 m². (From Talbot NB, Richie RH, Crawford JH: Metabolic homeostasis: a syllabus for those concerned with the care of patients, Cambridge, MA, 1959, Harvard University Press.)
FIG. 748.3  Nomogram for risk assessment of hyperbilirubinemia. (From Bhutani VK, Johnson L, Sivieri EM: Predictive ability of a predischarge hour-specific serum bilirubin for subsequent significant hyperbilirubinemia in healthy term and near-term newborns, *Pediatrics* 103:6–14, 1999, Fig 2.)

for assessing, 105
incidence and prevalence of, 99–100
medical child abuse, 110–111
outcomes of child maltreatment, 106
prevention of, 106

Abusive head trauma (AHT), 103–104, 104f, 3215

Academic disorders

diagnostic classification of, 253
neurodevelopmental dysfunction underlying, 257t
prognosis, 280–281

Acanthamoeba keratitis, drugs for, 1813t–1828t

Acanthocytosis, 2540

Acanthosis nigricans, 353f, 3509–3510

in T2DM, 3021–3022
Accelerated junctional ectopic tachycardia, 2442
Acceptable macronutrient distribution ranges (AMDRs), 303, 304t
Access, in food security, 331–332
Access to care, in developing world, 523
Accessory nerve, in neurologic examination, 3057
Accessory nipple, 2853–2854, 2854f
Accessory tragi, 3456–3457, 3457f
Accident prevention, Injury control
Accidental hypothermia, 609–610
Acclimatization, hypobaric hypoxia and, 601–602
Accommodation
  for dyslexia, 269
  for neurodevelopmental dysfunctions, 260
  ophthalmologic
    abnormalities of, 3346
    accommodative esotropia, 3354–3355, 3356f
Accreditation, childcare, 162–163
Acculturation, 70–71
Accuracy of laboratory tests, e 1
ACE, Angiotensin-converting enzyme
ACE inhibitors, 2778
  for Marfan syndrome, 3745
Aceruloplasminemia, 2526
Acetabular index, 3626–3627
Acetaminophen
  liver injury caused by, 2131
  for migraine, 3135t–3136t
  in pain management, 472–475, 474t
  toxicity
    antidotes for, 496–497
clinical course of, 499
laboratory evaluation in poisoning, 491
pathophysiology of, 498
treatment of, 499–500

for yellow fever, 1765

Acetazolamide

for acute mountain sickness, 603, 603t
adverse effects of, 3106t
dosages of, 3104t–3105t

Acetazolamide-responsive sodium channel myotonia, 3288t

Acetoacetyl coenzyme A thiolase deficiency, cytosolic, 713–714

N-Acetylglutamate synthetase deficiency, 732–733

aCGH, Array comparative genomic hybridization

Achalasia, 1932

anal, 1964
subtypes of, 1933f

Achondrogenesis type IB, 3728–3729

Achondroplasia, 2328, 3726–3728

clinical manifestations of, 2328, 3727
diagnosis of, 2328, 3727, 3727f
etiology of, 2328
gain-of-function mutation in, 638

genetics of, 3727–3728
group, 3725–3728

hypochondroplasia, 3728
thanatophoric dysplasia, 3726, 3726f

prognosis of, 2328
treatment of, 2328

Achromic nevus, 3472, 3472f

Acid

definition of, 411
excretion by collecting duct, 413
gastric, secretion of, 1932, 1969
Acid maltase deficiency, 785

Acid-base balance
clinical assessment of acid-base disorders, 414–415
metabolic acidosis, 415–419
metabolic alkalosis, 419–422
normal, 411–414
physiology of, 410–411
regulation, in tubules, 2762f
respiratory acidosis, 422–423
respiratory alkalosis, 423–425
tubular sites in, 412f

Acidemia, 414
isovaleric, 710
methylmalonic, 717–719
organic, 708–719, 708f
propionic, 715–717

Acidification
tubular function in, 2763
urinary, 2762

Acidosis, Ketoacidosis
in CKD, 2775t
lactic, 416
metabolic, Metabolic acidosis
respiratory, 414t, 422–423
with metabolic compensation, 589

Aciduria
N-carbamyl-β-amino, 825–826
L-glyceric, 722
hereditary orotic, 819, 824–825
3-hydroxy-3-methylglutaric, 714–715
3-Methylglutaconic, 712–713
methylmalonic, combined with homocystinuria, 719
mevalonic, 715, 1294t
orotic, 2521

Acinar cell, 2072

Acinus, 2072

Acne
chloracne, 3580–3581
conglobata, 3582
drug-induced, 3580, 3581f
fulminans, 3582
halogen, 3580
infantile, 3581–3582, 3582f
mid-childhood, 3582
neonatal, 3581, 3581f
PAPA syndrome, 1300–1301, 1301f
severe truncal, 1273
tropical, 3582

Acne vulgaris, 3576–3580
clinical manifestations of, 3576–3577, 3576f–3577f, 3577t
pathogenesis of, 3576
surgical therapy of, 3580
systemic therapy of, 3578–3580
topical therapy of, 3577–3578
  antibiotics, 3578, 3578b
  azelaic acid, 3578
  benzoyl peroxide, 3578
  retinoids, 3577–3578
treatment of, 3577–3580, 3578f

Acneiform drug eruptions, 3449t

Acoustic immittance testing, 3408
  acoustic reflex test, 3408
tympanometry, 3408, 3408t
  in otitis media with effusion, 3408

Acoustic reflex test, 3408
Acoustic trauma, 3436–3437

Acquaintance rape, 1078, 1078b

Acquired demyelinating syndromes
  with encephalopathy, 3185
  MR imaging red flags for the diagnosis of, 3198
d
Acquired disorders
  alveolar hypoventilation, 2335
  aplastic anemia, HSCT for, 1158
  of blood vessels, 2618
  causing cervical instability, 3649
  causing decreased production, thrombocytopenia from, 2616
c
  cystic kidney disease, 2746
  diffuse hair loss, 3540–3541
goiter, 2927–2928
  heart disease, infective endocarditis, 2451–2458
  hypermethioninemia, 706
  hypopituitarism, 2884
  hypothyroidism, 2920–2922
  inhibitors of coagulation, 2608–2609
  laryngotracheal stenosis, 2213, 2213f
  leg-length discrepancy caused by, 3613
  lymphocytic choriomeningitis virus infection, 1771
  myocardial, etiology of, 2463
  neutrophilia, 1148
  of nose, 2182–2184
      epistaxis, 2183–2184
      foreign bodies, 2183
  partial lipodystrophy, 3535
  of platelet function, 2617
  polycythemia, 2567
  pure red blood cell anemia, 2512–2513
  syphilis, 1599
  trichorrhexis nodosa, 3541
d
Acquired etiologies of primary adrenal insufficiency, 2963–2965
autoimmune Addison disease, 2963
clinical manifestations of, 2964–2965
drugs, 2963–2964
hemorrhage into adrenal glands, 2964
infection, 2963

Acquired forms
of GH deficiency, 2883
of growth hormone deficiency, 2883
of multiple pituitary hormone deficiency, 2882
of nephrogenic diabetes insipidus, 2889

Acquired heart disease, sports participation and, 3680–3683

Acquired immunodeficiencies, 1405–1410
fever and neutropenia, 1406–1407
fever without neutropenia, 1407
from infectious agents, 1405
malignancies, 1405–1406, 1406f, 1406t
transplantation, 1407–1410

Acquired long QT interval, 2449

Acquired melanocytic nevus, 3469

Acquired neutropenia
drug induced, 1143–1144, 1143t
immune mediated, 1144
infection related, 1143–1144, 1143t
lymphopenia, 1147
neutropenia secondary to
bone marrow replacement, 1144
reticuloendothelial sequestration, 1144
nutrition related, 1144

Acquired pancytopenias, 2578–2580
caused by marrow replacement, 2580
clinical manifestations, laboratory findings and differential diagnosis of, 2579
complications of, 2580
etiology and epidemiology of, 2578
pathology and pathogenesis of, 2578–2579
prognosis of, 2580
treatment of, 2579–2580

Acquired pituitary insufficiency, 2882t

Acquired stomatocytosis, 2538

Acquired toxoplasmosis
  clinical manifestations of, 1866
  serologic testing for, 1874
  treatment of, 1875

Acridine orange stain, 1336t

Acrocyanosis, 1288

Acrodermatitis enteropathica, 388, 2008, 3587–3589, 3588t

Acrodynia, 3795

Acrodysostosis, with hormone resistance, 2949–2950

Acropustulosis, infantile, 3455–3456, 3455f

ACTH-dependent Cushing syndrome, 2983

ACTH-independent Cushing syndrome, 2983–2984

Actinic prurigo, 3499–3500, 3499f

Actinomycosis, 1465–1467
  clinical manifestations of, 1466–1467
  diagnosis of, 1466
  differential diagnosis of, 1467
  etiology and epidemiology of, 1465–1466
  pathogenesis of, 1466
  prognosis of, 1467
  treatment of, 1467

Actinomycosis
  abdominal and pelvic, 1466–1467
  cerebral and other forms of, 1467
  cervicofacial, 1466, 1466f
Action myoclonus-renal failure syndrome, 3098–3099

Activated charcoal
  multiple-dose, 498
  single-dose, 497
  substances poorly adsorbed by, 497b
Activated partial thromboplastin time, 2591–2593

Activated phosphoinositide 3-kinase (PI3K) 8 syndrome, 1123

Activated protein C resistance, 2602

Activation-induced cytidine deaminase, gene mutation, 1111

Active immunophrophylaxis, for cytomegalovirus (CMV), 1722–1723

Active pericarditis, sports participation and, 3680–3683

Active tone, 3245

Active vitamin D sterols, 2777

Activins, 2992

Activities of daily living scale, in myasthenia gravis, 3307

Activity index, in pediatric ulcerative colitis, 1980

Activity restrictions, in Marfan syndrome, 3744

Acupuncture, 513
  in pain management, 484

Acute bacterial meningitis, beyond the neonatal period, 3223–3232
  antibiotic therapy for
    duration of, 3230
    initial, 3229–3230, 3230t
  clinical manifestations of, 3225
  complications of, 3231
  corticosteroids for, 3230–3231
  diagnosis of, 3225–3226
  differential diagnosis of, 3226
  epidemiology of, 3223–3224
Haemophilus influenzae type B, 3224
Neisseria meningitidis, 3224
Streptococcus pneumoniae, 3224

lumbar puncture in, 3226
pathogenesis of, 3225
pathology and pathophysiology of, 3224–3225
prevention of, 3231–3232

Haemophilus influenzae type B, 3231–3232
Neisseria meningitidis, 3231
Streptococcus pneumoniae, 3232

prognosis of, 3231
treatment of, 3226–3231

Acute bronchiolitis, 2217–2218, 2218f

Acute bronchitis, 2220–2221

Acute cellular rejection (ACR), in renal transplantation, 2783

Acute chest syndrome, of sickle cell anemia, 2546–2547, 2547b

Acute disseminated encephalomyelitis (ADEM), 3180t–3181t, 3185, 3196–3199

associated with aseptic meningitis, 3227t
clinical manifestations of, 3196
CSF findings in, 3222t–3223t
differential diagnosis of, 3198–3199
epidemiology of, 3196
laboratory findings in, 3198
and multiple sclerosis, features that may distinguish, 3199t
neuroimaging in, 3196–3198, 3198f
pathogenesis of, 3196
prognosis of, 3199
treatment of, 3199

Acute eosinophilic pneumonia, 2251, 2253t, 2254

Acute febrile ulcerative acne, 3582

Acute flaccid paralysis, 3317

differential diagnosis of, 3249t
Acute gastroenteritis, 2012–2033
  attributable incidence of pathogen-specific diarrhea in, 2021f
  burden of childhood diarrhea and, 2012–2013
  Campylobacter in, 1520–1521
  clinical manifestations of diarrhea in, 2021–2026
  diarrhea outbreaks and, 2013–2020
  differential diagnosis of, 2026–2028
  epidemiology of, 2013–2020
  food-borne transmission and, 2013, 2017t
  intestinal and extraintestinal complications of, 2026
  laboratory diagnosis of, 2028
  movement of Na\(^+\) and Cl\(^-\) ions in, 2024f
  pathogenesis of, 2012–2013, 2022t
  prevention of, 2032
  risk factors of, 2022t
  symptoms associated with dehydration, 2027t
  treatment for, 2028–2030
    antibiotic therapy as, 2030
    enteral feeding and diet selection as, 2029
    hydration as, 2028
    zinc supplementation as, 2029

Acute gastrointestinal allergy, 1238

Acute generalized exanthematous pustulosis, 3449t, 3450–3451, 3451f

Acute GVHD, 1162–1163, 1162f–1163f

Acute hemorrhagic cystitis, 2790

Acute hemorrhagic edema, 1319–1320, 1320f

Acute hepatic necrosis, liver transplantation for, 2144

Acute hepatitis, approach to, 2118–2119

Acute hydrops, 2139

Acute idiopathic pulmonary hemorrhage, of infancy, 2313

Acute infectious laryngitis, 2204

Acute infectious (suppurative) thyroiditis, 2923, 2924t
Acute intermittent porphyria, 833t, 835–839, 837t

Acute interstitial nephritis, 2770

Acute kidney injury (AKI), 429, 2769–2774
  causes of, 2770t
  clinical manifestations of, 2771
  complications of, 2772t
  drowning and, 611
  KDIGO staging of, 2770t
  laboratory findings of, 2771
  neurologic symptoms in, 2773
  pathogenesis of, 2770–2771
  prognosis of, 2774
  treatment of, 2771–2773
    dialysis, 2773–2774
    medical management, 2771–2773

Acute liver failure, 2133–2136
  in acetaminophen poisoning, 499
  clinical manifestations of, 2135
  etiology of, 2134
  in hepatitis B, 2110
  idiopathic, 2134
  laboratory findings in, 2135
  pathogenesis of, 2134–2135
  pathology of, 2134
  prognosis for, 2136
  treatment of, 2135–2136

Acute lobar nephronia (acute lobar nephritis), 2789–2790, 2793

Acute lung injury, pulmonary pressure-volume relation in, 592f

Acute lymphoblastic leukemia (ALL), 2636, 2649–2654
  cellular classification of, 2649
  clinical manifestations of, 2649–2650
  diagnosis of, 2650
  differential diagnosis of, 2650–2651
epidemiology of, 2649
etiology of, 2649
HSCT for, 1156–1157
prognosis of, 2653–2654
relapse, 2653
supportive care of, 2653
survival rates of, 4 , 2651f
treatment of, 2651–2653

Acute mastoiditis, 3429t , 3431–3434 , 3432t
  anatomy of, 3431
  clinical manifestations of, 3432
  epidemiology of, 3431
  imaging of, 3432 , 3432f–3433f
  management of, 3433–3434
  microbiology of, 3431–3432
  special situations of, 3434 , 3434f

Acute megakaryocytic leukemia, 2655

Acute meningococcal septicemia, 1472 , 1472f

Acute monocytic leukemia, 2706t

Acute mountain sickness (AMS), 602–605 , 606f
diagnosis of, 603–604
epidemiology and risk factors of, 602
management of, 604–605
medications for, 603t
pathophysiology of, 602
periodic breathing in, 604
prevention of, 602–603

Acute myelogenous leukemia, 2654–2655 , 3447
cellular classification of, 2654
clinical manifestation of, 2654
diagnosis of, 2654
epidemiology of, 2654
prognosis and treatment of, 2655
survival rate of, 2655f

Acute myeloid leukemia, HSCT for, 1158
Acute myelomonocytic leukemia, 2656
Acute necrotizing encephalopathy, 3178–3179, 3178t, 3179f
Acute necrotizing ulcerative gingivitis, 1556, 1921–1922, 3549
Acute nephritic syndrome, 2722–2723
Acute orchitis, in testicular hypofunction, 2995

Acute otitis media, 3418
  acute mastoiditis, 3429t, 3431–3434, 3432t
  antimicrobial prophylaxis for, 3426–3427
  bacterial resistance, 3425
  cholesteatoma, 3429, 3430f
  chronic suppurative, 3428
  complications of, 3428
  intracranial, 3429–3431
  intratemporal, 3428
diagnosis of, 3421
etiology of, 3419
facial paralysis, 3429
first-line antimicrobial treatment of, 3425
follow-up, 3425
immunoprophylaxis for, 3422–3423
infectious dermatitis, 3428
labyrinthitis, 3429
management of, 3423–3425, 3424f
myringotomy
  and insertion of tympanostomy tubes, 3426
  and tympanocentesis, 3426
treatment of
  duration of, 3425
  early recurrence after, 3426
  second-line, 3424r, 3425–3426
  unsatisfactory response to first-line, 3425
tube otorrhea, 3426–3427
Acute palmoplantar eczema, 3495, 3495f

Acute pancreatitis, 2074–2078
  clinical manifestations of, 2076
  complications of, 2078t
  diagnosis of, 2076
  etiology of, 2075t
  morphologic features of, 2077t
  prognosis of, 2078
  treatment of, 2076

Acute pericarditis, 2473–2475
  clinical manifestations of, 2474
  diagnosis of, 2474
  differential diagnosis of, 2474–2475
  infectious, 2474
  pathogenesis of, 2473–2474

Acute pericoronitis, 1921

Acute phobic hallucinations of childhood, 250–252
  clinical manifestations, 251–252
  diagnosis and differential diagnosis, 252
  treatment, 252

Acute poststreptococcal glomerulonephritis, 2722–2725
  clinical manifestations of, 2723
  complications of, 2724
  diagnosis of, 2723–2724, 2725f
  etiology and epidemiology of, 2723
  pathogenesis of, 2723
  pathology of, 2723, 2723f
  prevention of, 2724
  prognosis of, 2725
  treatment of, 2725

Acute primary peritonitis, 2147
  clinical manifestations of, 2147
  diagnosis and treatment of, 2147
etiology and epidemiology of, 2147

Acute promyelocytic leukemia (APL), 2654

Acute pulmonary histoplasmosis, 1650

Acute purulent conjunctivitis, 3366

Acute radiation syndrome, 3783

Acute recurrent pancreatitis, 2078–2080

Acute renal failure, in SARS-CoV, 1744

Acute respiratory distress syndrome (ARDS), 586, 586f
  drowning and, 609
  inhalational injury and, 620
  in MERS-CoV, 1744
  pediatric definition of, 587t
  volume-pressure relationship in, 594f

Acute respiratory failure, cystic fibrosis and, 2295

Acute rheumatic fever, 2200

Acute secondary peritonitis, 2147–2148
  clinical manifestations of, 2148
  localized, 2148
  treatment of, 2148

Acute serous labyrinthitis, 3435

Acute severe hypertension, 2497

Acute stress disorder, 215

Acute suppurative labyrinthitis, 3435

Acute tubular injury, endogenous and exogenous toxins causing, 2771t

Acute tubular necrosis, 2741–2742, 2770
  clinical manifestations of, 2741–2742
  diagnosis of, 2742
  pathogenesis and pathology of, 2741
  prevalent cause of
    in neonates, 2741t
in older children, 2742
treatment and prognosis of, 2742

Acute tubulointerstitial nephritis, 2737
clinical manifestations of, 2737
diagnosis of, 2737
pathogenesis and pathology of, 2737
treatment and prognosis of, 2737

Acute ureteral obstruction, 2801

Acute urticaria and angioedema, in food allergy, 1238

Acyanotic congenital heart disease
obstructive lesions, 2384–2393
aortic stenosis, 2387–2389
coarctation of the aorta, 2389–2392
infundibular pulmonary stenosis and double-chamber right ventricle, 2386–2387
peripheral pulmonary stenosis, 2387
pulmonary stenosis in combination with an intracardiac shunt, 2387
pulmonary valve stenosis with intact ventricular stenosis, 2384–2386
regurgitant lesions, 2393–2395
congenital absence of the pulmonary valve, 2393–2394
congenital mitral insufficiency, 2394, 2394t
mitral valve prolapse, 2394–2395
pulmonary valvular insufficiency, 2393–2394
tricuspid regurgitation, 2395

Acyanotic congenital heart lesions, 2372–2373
resulting in increased pressure load, 2372–2373
resulting in increased volume load, 2372

Acyclovir, 1664–1667

Acylcarnitine translocase deficiency, 744

Acyl-coenzyme A dehydrogenase deficiency, medium-chain, 740t–741t

ADA/APA consensus guidelines, 195t

Adalimumab, 1267t
for Crohn disease, 1985

Adamantanes, for influenza, 1730

Adamantinoma, 2696
Adamantinomatous CP, 2676–2677
ADAMTS-13 deficiency, TTP and, 2614 , 2614t
Adaptive behavior, significant impairment in, 283
Adaptive sports, 3716
Addison disease, 2963
Adefovir, for hepatitis B, 2113
Adenine phosphoribosyltransferase (APRT) deficiency, 819 , 821–822
Adenitis, in PFAPA, 1303–1304
Adenocarcinoma
  of colon and rectum, 2704
  complication of GERD, 1938
Adenoids, 2198–2202
  adenoidectomy, 2200
  anatomy, 2198–2199
  chronic airway obstruction, 2200–2202
  clinical manifestations, 2199
  normal function, 2199
  pathology, 2199
Adenomatous polyposis coli-associated polyposis syndromes, 2063
Adenomatous polyps, 2062t
Adenomatous tumors, 2063
Adenosine, for resuscitation and arrhythmias, 545t
Adenosine deaminase deficiency, 1125
Adenosine deaminase deficiency 2 (DADA2), 1302
Adenosine diphosphate, in hemostasis, 2589
Adenosine triphosphate-binding cassette superfamily, 442–443
S-Adenosylhomocysteine hydrolase deficiency, 706
Adenotonsillectomy, 178b
Adenoviruses, 1740–1741
  acute respiratory disease, 1740
  clinical manifestations of, 1740–1741
  complications of, 1741
  diagnosis of, 1741
  disseminated, complication of HSCT, 1167–1168
  epidemiology of, 1740
  etiology of, 1740, 1740t
  gastrointestinal infections, 1740
  hemorrhagic cystitis, 1740

    domestic, 62
genetic testing and, 635
international, 62–65
medical evaluation, 68–70
narrative, 65
pedigree symbols for, 642f
postadoption medical care, 63–65
preadoption medical record reviews, 63

Adrenal calcification, 2981–2982

Adrenal gland
    adrenal cortex
        regulation of, 2956
        zones of, 2954
    adrenal medulla, 2954, 2958–2959
    histology and embryology, 2954
    physiology, 2954–2959
    steroid biosynthesis, 2954–2956
    steroid hormone actions, 2956–2958

Adrenal hypoplasia congenita, 2960t–2961t, 2961, 2978–2979
Adrenal incidentaloma, 2981
Adrenal neoplasia, genes involved in, 2980t
Adrenal rests, testicular, 3000
Adrenal tumors, virilizing and feminizing, 2982
Adrenalectomy, for adrenocortical carcinoma, 2981
Adrenarche, 2906–2907, 2956
delayed/absent, females with, 2909–2910
α₂-Adrenergic agents, for spasticity, 3760
Adrenergic agonists, for heart failure, 2480t
β-Adrenergic agonists, for heart failure, 2481
β-Adrenergic antagonists
doses in children and adolescent, 2497t
for heart failure, 2480t
poisoning, 501–502
Adrenocortical carcinoma, 2979–2981
clinical manifestations of, 2981
differential diagnosis of, 2981
etiology of, 2979–2980
pathologic findings in, 2981
treatment of, 2981
Adrenocortical hyperfunction, etiologic classification of, 2983t
Adrenocortical insufficiency, 2959–2970
altered end-organ sensitivity to corticosteroids, 2968–2970
in critical care setting, 2967–2968
primary, 2959–2966, 2960t–2961t
secondary, 2962t, 2966–2967
tertiary, 2966–2967
Adrenocortical tumors, 2704–2705, 2979–2982
adrenal calcification in, 2981–2982
adrenal incidentaloma in, 2981
adrenocortical carcinoma in, 2979–2981
epidemiology of, 2979
Adrenocorticotropic hormone (ACTH), 2877–2879, 2954

deficiency, 2967
excess secretion, 2968
in hypoglycemia, 859

Adrenoleukodystrophy, 749–751, 3191
clinical manifestations of, 749
complications of, 750
diagnosis and differential diagnosis of, 750
epidemiology of, 749
etiology of, 749
genetic counseling and prevention, 751
laboratory and radiographic findings of, 750
impaired adrenal function, 750
neuroimaging, 750, 750f
pathogenesis of, 749
pathology of, 749
primary adrenal insufficiency and, 2961
treatment of, 750–751
bone marrow transplantation, 750
Lorenzo's oil therapy, 750–751
supportive therapy, 751

Adrenomedullary dysfunction, in 21-hydroxylase deficiency, 2974

Adult disease, modification of, 680f
Adult-onset 21-hydroxylase deficiency, 2859–2860
Adult-onset diabetes mellitus, 3021

Adults
congenital heart disease in, 2431–2436
long-term medical considerations for, 2431–2432
electrocardiogram of, 2356f
functioning, and severity of intellectual disability, 293t
GM₁ gangliosidosis in, 3189
GM₂ gangliosidosis in, 3189
with health insurance between 1998 and 2012, 1031f
hemoglobins in, 2505
metachromatic leukodystrophy in, 3190
Refsum disease, 748
shock in
  hemodynamic support and adjunctive therapy in, 580b–581b
  initial resuscitation and infection issues in, 579b–580b
T-cell leukemia/lymphoma, 1805–1806
treatment for gonococcal infections, 1482

Advance care planning, in palliative care, 52–62
Advance directives, 46
Advanced life support (ALS), 515
  BLS vs., 516
Advanced Trauma Life Support (ATLS), 525–526
Adverse childhood experiences (ACEs), 6, 6t, 124
Adverse drug reactions (ADRs), 1242–1247
  antiretroviral agents, hypersensitivity to, 1246
  biologics, 1246
  β-lactam hypersensitivity, 1244–1245, 1245t
  to chemotherapeutic agents, 1246, 2641t–2642t
  diagnosis of, 1243–1244
  drug metabolism, 1243
  drug-induced hypersensitivity syndrome, 1243t–1244t, 1246
  epidemiology of, 1242, 1243t–1244t
  hypersensitivity reactions, risk factors for, 1243
  insulin, 1246
  local anesthetics, 1246
  narcotic analgesics, 1247
  to NSAIDs, 1253
  pathogenesis and clinical manifestations, 1242–1243
  to penicillins, 1244–1245, 1426t
  perioperative agents, 1246
  in premature infants, 905t
  radiocontrast media, 1246–1247
  red man syndrome, 1246
  Stevens-Johnson syndrome, 1245–1246
sulfonamides, 1245
toxic epidermal necrolysis, 1245–1246
treatment, 1244–1247
vaccines, 1246
varicella vaccine-associated, 1715

Adverse effects
of blood transfusions, 2587
of cancer treatment, 2645–2647
of cannabis use, 1052
of cephalosporins, 1427
of GH treatment for hypopituitarism, 2886–2887
immunologic, reduced by leukoreduction, 2589

Advocacy
for child abuse and neglect, 106
for gender variance, 1022

Aeroallergens, 1175
triggering atopic dermatitis, 1216

Aerobic exercise, 355

Aeromonas, 1526–1528
diagnosis of, 1527
in enteritis, 1527
epidemiology of, 1526
etiology of, 1526
in GI infections, 1527
pathogenesis of, 1526–1527
prevention of, 1528
in septicemia, 1527
in skin and soft tissue infections, 1527
treatment of, 1527

Aerophagia, 2043

Aerosolized antibiotic therapy, for cystic fibrosis, 2292
Aerosolized saline, for bronchiolitis, 1737
Afibrinogenemia, congenital, 2598–2599
Aflatoxins, 3778
Afrezza, for T2DM, 3045
African Americans
  cultural norms, 73t–74t
  rufous albinism in, 702
  schoolgirls, traction alopecia in, 3538–3539
African tick-bite fever, 1620t
African trypanosomiasis, 1844–1846
Afterload reducers, for heart failure, 2479
Agammaglobulinemia, X-linked, 1107–1109
Aganglionic megacolon, congenital, 1961–1964
Age
  0-2 months

Allgrove syndrome, 3335

Alligator bites, microorganisms associated with, 3818b

Allogeneic HSCT, 1156, 1157b
Allograft, intestinal, 2011
assessment of, 2011
Alloimmune liver disease, gestational, 2105
Alloimmune neonatal neutropenia, 1144
Alloreactivity, donor vs. recipient NK cell, 1161–1162
Allostasis, 10
Allostatic load, 6, 10
All-terrain vehicles (ATVs), 84
All-trans -retinoic acid, 2655
Almotriptan, for migraine, 3135–3136
Aloe vera, interactions with drugs, 513
Alogliptin, for T2DM, 3045
Alopecia, 2643, 3498
  disorders associated with, 3538
  toxic, 3541
  traction, 3538–3539, 3539
  traumatic, 3538–3539
Alopecia areata, 3539–3540, 3540
Alpers syndrome, 2125, 3302
Alpha dystroglycan-related dystrophies, 3271
Alpha-adrenergic agonists, for heart failure, 2481
Alport syndrome, 2721–2722, 2781, 3404
  clinical manifestations of, 2722
  diagnosis of, 2722
  genetics of, 2721–2722
  pathology of, 2722
  prognosis and treatment of, 2722
Alternating hemiplegia of childhood, 3125, 3167
  stroke and, 3218
Alternative pathway of complement system, 1151

Altitude-associated illness, 601–607
  
  acute mountain sickness in, 602–605, 606f, Acute mountain sickness etiology of, 601
  high-altitude cerebral edema (HACE) in, 602, 605
  high-altitude pulmonary edema (HAPE) in, 605–607, 606f
  reentry, 607
  hypobaric hypoxia effects in, 601–602
  sickle trait/disease and, 607
  special considerations in, 607
  spectrum of clinical entities, 601
  travel with young infants and, 607

Aluminum salts, 1349–1351

Alveolar air equation, 2150

Alveolar alveolitis, extrinsic, 1647

Alveolar bone, 1919f

Alveolar dead space, 587

Alveolar hydatid disease, 1897

Alveolar P_{O_2} (Pa_{O_2}), 2150, 2157, 2158f

Alveolar pressure, 599–600, 600f

Alveolar rhabdomyosarcoma, 2630

Alveolar soft-part sarcoma, 2689t

Alveolar ventilation, 2150

Alveolar-arterial oxygen (A-aO_{2}), 2150–2152

Alveolitis, extrinsic alveolar, 1647

_Amanita_ poisoning, 3802

Amastia, 2853

Amatoxins, 3802
Amaurosis, 3347–3348

Ambiguous genitalia
  acute inguinal-scrotal swelling and, 2067–2069
  diagnostic approach to, 3010–3011, 3011f, 3011t–3012t
  surgical management of, 2975–2976

Amblyopia, 3346–3347

Ambulance, 517
  ground vs. air, 520

Ambulation
  in arthrogryposis, 3662
  for myelomeningocele, 3068

Ambulation assistance, 3767–3769
  assistive mobility devices, 3768, 3768f
  orthoses, 3767
  prosthesis, 3767–3768
  wheelchair, 3768–3769

Ambulatory blood pressure monitoring, 2491

Ambulatory safety, 42–43

AMDRs, Acceptable macronutrient distribution ranges

Amebiasis, 1831–1833
  clinical manifestations of, 1832
  complications of, 1832
  diagnosis and differential diagnosis of, 1832
  drugs for, 1813t–1828t, 1833t
  epidemiology of, 1831
  etiology of, 1831
  laboratory findings of, 1832
  pathogenesis of, 1831
  prevention of, 1833
  prognosis of, 1833
  treatment of, 1832–1833

Amebic (Naegleria) meningoencephalitis, CSF findings in, 3222t–3223t
Amebic colitis, 1832
Amebic liver abscess, 1832, 1832f, 2119f–2120f, 2120
Amebic meningoencephalitis
drugs for, 1813t–1828t
granulomatous, 1830, 1830f
primary, 1829–1831
Amegakaryocytic thrombocytopenia
congenital, 2576–2577, 2615
with radioulnar synostosis, 2615
Amelogenesis imperfecta, 1913, 1913f
Amenably treatable metabolic epilepsies, 3099
Amenorrhea, 1059–1060, 1060f
algorithm, 3707f
in androgen insensitivity syndromes, 3017
effect of cancer treatment on development of, 2863t
in female athletes, 3706
American Academy of Pediatrics (AAP)
   Pediatric Education for Prehospital Professionals course of, 524
   website, 519
American Association for Cancer Research (AACR), 2627
American College of Medical Genetics, core panel of neonatal screening tests, e 4t
American Society of Anesthesiologists Physical Status (ASA-PS), 459b
American Spinal Injury Association flow sheet, 3756f
American trypanosomiasis, 1847–1851
Amikacin sulfate, 1417t–1425t
Amiloride, for primary aldosteronism, 2986
Amino acid metabolism defects, 689b, 694t
   N-acetylaspartic acid (NAA), 738–739
   affecting liver, 2101t
cysteine, 706–707
genetic disorders of neurotransmitters, 726–729
glutamic acid, 724–726
glycine, 717f, 719–723
hyperammonemia, 729–735
lysine, 735–738
methionine, 703–706
phenylalanine, 695–698
proline, 723–724
serine, 723
tryptophan, 707–708
tyrosine, 699–703
urea cycle, 729–735
valine, leucine, and isoleucine, 708–719

Amino acid substitutions, 637

Amino acids
  absorption of, disorders of, 2006–2007
  branched-chain, 705f, 708
  formulas, 326
  large neutral, 697
  malabsorption of, 1988t
  sulfur-containing, 703f

γ-Aminobutyric acid (GABA)
  GABAergic medications, for spasticity, 3760
  genetic disorders of metabolism of, 728–729
  transaminase deficiency, 728

γ-Aminobutyric acid A receptor (GABA_α R) antibodies, encephalitis associated with, 3180t – 3181t, 3182–3185

Aminoglycoside-modifying enzymes, 1415t

Aminoglycosides, 1427–1428
  enterococci resistance, 1456t – 1457t
  against _M. tuberculosis_, 1562

Aminoimidazole carboxamide ribotide (AICAR) transformylase deficiency, 823
5-Aminolevulinic acid, 832, 837
δ-Aminolevulinic acid dehydratase porphyria, 834–835
5-Aminosalicylates, for Crohn disease, 1985
Aminotransferase levels, causes of elevated serum, 2089t
Amiodarone
  goiter caused by, 2928
  for resuscitation and arrhythmias, 545t
Amitriptyline
  for migraine, 3135t–3136t
  in pain management, 474t
Ammonia
  pathways of, 730f
  reference intervals, e 6t–e 13t
Amnesic shellfish poisoning, 3806
Amniocentesis, 883t, 890
Amniotic bands, 869
  constriction, 3456
  disruption sequence, 992f
Amniotic fluid
  meconium-stained, 928
  volume, conditions associated with disorders of, 880t
Amoxicillin, 1417t–1425t
  for sinusitis, 2190
Amoxicillin-clavulanate, 1417t–1425t
Amphetamines
  abused by adolescents, 1055–1056
  for ADHD, 190t–191t, 266
  as performance-enhancing aids, 3709t
  use in adolescents, 1042t–1044t
Amphibians, Salmonella transmission to humans, 1502t
Amphotericin B, 1635–1636
Amphotericin B deoxycholate, for blastomycosis, 1654
Ampicillin, 1417t –1425t
  enterococci resistance, 1456t –1457t
Ampicillin-sulbactam, 1417t –1425t
Amplitude-integrated EEG, 920
Amputation, in constriction band syndrome, 3605f
AMS, Acute mountain sickness
Amyl nitrite, inhaled, 1053b
Amylase, reference intervals, e 6t –e 13t
Amylo-1,6-glucosidase deficiency, hypoglycemia and, 860
Amyloid A (AA) amyloidosis, 1304
Amyloidosis, 1304–1306
  clinical manifestations of, 1306
  diagnosis of, 1306
  epidemiology of, 1304–1305
  etiology of, 1304
  laboratory findings of, 1306
  pathogenesis of, 1305
  prevention of, 1306
  prognosis of, 1306
  treatment of, 1306
Amylopectinosis, 782–783
Amyoplasia, 3272–3274, 3274f, 3659, 3660f
ANA, Antinuclear antibody
Anabolic-androgenic steroids, 3708–3709, 3709t
Anaerobic bacterial infection
  botulism (Clostridium botulinum), 1545–1549
  clinical manifestations of, 1556–1558, 1557t –1558t
  Clostridium difficile infection, 1552–1555
common anaerobic pathogens of, 1559–1560
diagnosis of, 1558–1559, 1558t
tetanus (Clostridium tetani), 1549–1552
treatment of, 1559

Anaerobic cocci, 1560
Anagen effluvium, 3541, 3541t
Anakinra, 1257, 1267t
Anal achalasia, 1964
Anal canal, anatomy of, 2059f
Anal fissure, 2059
Analgesia, 460, 460b
Analgesics
   for intubation, 591t
   for migraine, 3135t–3136t
   poisoning, 498–501
Analytic testing, e 1
Analyzing quality data, 35–36
Anaphase lag, 653
Anaphylactic reactions, insect allergy, 1218
Anaphylaxis, 1228–1233, 1229t, 1230f, 1352
   as cause of airway edema, 535
   clinical manifestations of, 1229–1230, 1229t
   diagnosis of, 1231, 1231b
   epidemiology of, 1229, 1231b
   etiology of, 1228–1229
   idiopathic, 1229
   laboratory findings of, 1230–1231
   pathogenesis of, 1229, 1230f
   prevention of, 1231–1233, 1234b
   symptoms and signs of, 1229t
   treatment of, 1231, 1232t, 1233f

  for pertussis, 1494–1495, 1494t
  principles of therapy, 1414–1429
    age- and risk-specific use of antibiotics, 1415–1416
    antibiotics commonly used in pediatric practice, 1416–1429
  prophylactic regimens
    for dental procedure, 2458t
    for Neisseria meningitidis infection, 1477t
  resistance, of Haemophilus influenzae, 1487
  for rheumatic fever, 1448
    topical, 3452
      for acne, 3578, 3578b
    for typhoid fever, 1506t
    for vulvovaginal infections, 2847t

Antibiotic-associated diarrhea, microbiome and, 1345

Antibodies
  antiganglioside, 3335, 3337t
  cold
    autoimmune hemolytic anemias associated with, 2564
  Epstein-Barr virus (EBV) specific, detection of, 1717, 1717f, 1717t
IgG, 1097
in induction therapy
  IL-2, 2782
  T-cell, 2782
primary defects in production of, 1107–1112
TSH receptor-blocking, 2916
warm
  autoimmune hemolytic anemias associated with, 2563–2564

Antibody deficiencies
  genetic basis of primary disorders of, 1108t
  main phenotypes of, 1110t

Antibody response, primary and secondary, 1106
Antibody-mediated rejection (ABMR), in renal transplantation, 2783–2784

Anticholinergic agents
for asthma, 1204
for nocturnal enuresis, 2821
poisoning, 496t–497t

Anticholinergic syndromes, 1047t

Anticipation, genetic, 651f

Anticipatory guidance
for children in foster care, 67t
for children with disabilities, 3769–3770
in injury prevention, 81b
in palliative care, 52–62
sickle cell disease, 2549–2550
additional screening, 2550
echocardiography, 2550
hydroxyurea, 2549
immunizations, 2549
prophylactic penicillin, 2549
pulmonary and asthma screening, 2550
red cell transfusion therapy, 2550
renal disease, 2550
retinopathy, 2550
spleen palpation, 2549
transcranial Doppler ultrasound, 2549
in well-child care, 75–78

Anticoagulants, 2605–2607
for cerebral sinovenous thrombosis, 3214
reference values for, 2592t

Anticonvulsants, for migraine, 3135t–3136t

Antideoxyribonuclease B titer, reference intervals, e 6t–e 13t

Antidepressants
for attenuated psychosis syndrome, 249
atypical
for depression and anxiety symptoms, 192t
poisoning, 505
for migraine, 3135t–3136t
for psychiatric disorders, 191–193

**Antidiuretic hormone, 2880**
reference intervals, e 6t–e 13t

**Antidopaminergic drugs, for migraine, 3136**

**Antidotes, for poisoning, 496t–497t, 498**
cyanide antidote kit, 510

**Antiepileptic drugs, 481–482**
adverse effects of, 3106t
choice of
according to seizure type and epilepsy syndrome, 3102–3103
other considerations for, 3103–3107
discontinuation of, 3110
dosages of, 3104t–3105t
hormones and, 2874
initiating and monitoring therapy in, 3107–3108
mechanisms of action of, 3102, 3102f
for migraine, 3136
for seizures, 3102, 3102f
side effects of, 3108

**Antifibrinolytics, 2601t**

**Antifungal therapy, 1007–1008, 1635–1640**
for allergic bronchopulmonary aspergillosis, 2256–2257
azoles, 1638–1639
fluconazole, 1638
isavuconazole, 1639
itraconazole, 1638
posaconazole, 1639
voriconazole, 1638–1639
in children and neonates, 1636t
echinocandins, 1639–1640
anidulafungin, 1640
caspofungin, 1640
micafungin, 1640
empirical, for invasive *Aspergillus* infections, 1650
polyenes, amphotericin B, 1635–1636
pyrimidine analogs, 5-fluorocytosine, 1636–1638
in for specific pathogens, 1637t
topical agents, 3452

Antiganglioside antibodies, 3335, 3337t

Antigen challenge, by inhalation, 2242

Antigen detection

*Coccidioides*, 1655–1656
tests, 1340

Antigen sources, associated with, hypersensitivity pneumonitis, 2240t

Antigen-presenting cells (APCs), 1106
in allergic disease, 1171–1172

Anti-glomerular basement membrane antibodies, 2717

Anti-glomerular basement membrane disease (anti-GBM disease), 2262–2263
bronchoalveolar lavage for, 2262
bronchoscopy for, 2262
chest radiography for, 2262
clinical manifestations of, 2262
laboratory for, 2262
lung biopsy for, 2262
pathophysiology of, 2262
environmental factors for, 2262
immunology factors for, 2262
pulmonary function testing for, 2262

Anti-glomerular basement membrane (anti-GBM) glomerulonephritis, 2781

Antihistamines
for atopic dermatitis, 1215
for migraine, 3135t–3136t

Antihypertensives
for children, 2496f
for migraine, 3135t–3136t

Antiinflammatory therapy
for cystic fibrosis, 2293–2294
for rheumatic fever, 1448–1449

Antimetabolites, for atopic dermatitis, 1215

Antimicrobial agents
for acne, 3579t
for brucellosis, 1538t
for cholera, 1518, 1518t
for cystic fibrosis lung infection, 2293t
for otitis media, 3426–3427
  second-line treatment, 3425–3426
  parenteral, treatment of S. aureus infection, 1433t
for pharyngitis, 2195–2196, 2195t

Antimicrobial prophylaxis, in vesicoureteral reflux, 2799

Antimicrobial resistance
  in Enterococcus, 1456–1457, 1456t–1457t
  in Neisseria gonorrhoeae, 1481–1482
  patterns of, 1414, 1414t

Antimicrobial susceptibility testing, 1338

Antimicrobial therapy
  for Mycoplasma pneumoniae, 1611
  for osteomyelitis, 3675
  for septic arthritis, 3678

Antimony, food-borne illness, 3776t–3777t

Antimony, food-borne noninfectious illnesses and, 2018t

Antimotility agents, for acute gastroenteritis, 2030

Antimüllerian hormone (AMH), 2867–2868, 2988, 2992, 2994

Antineoplastic agents, for adrenocortical carcinoma, 2981

Antineprhin antibodies, 2781

Antineutrophil cytoplasmic antibody (ANCA)-associated vasculitis, 1320b, 1324–1326

Anti-N-methyl-D-aspartase receptor (anti-NMDAR) encephalitis, 2864, 3180t–
Antinuclear antibody (ANA)
in JIA, 1261, 1262
in rheumatic disease, 1251–1252, 1252b
in SLE, 1275–1277

Antioxidant, as susceptibility factor for porphyria cutanea tarda, 842

Antiphospholipid antibodies, in SLE, 1277

Antiphospholipid antibody syndrome (APS), 2603

Antiplasmin deficiency, 2599

Antiplatelet therapy, 2607

Antipsychotics
  for aggressive behaviors, 240
  in pain management, 482
  poisoning, 505–506
  for schizophrenia, 249
  side effects of, 195

Antiquitin, 735–736

Antiretroviral therapy
  adherence to, 1799
  changing, 1799–1800
  combination, 1788–1799
  dosages of, 1799
  drug summaries, 1789–1798
  highly active, and development of IRIS, 1576
  initiation of therapy, 1799
  monitoring, 1800
  resistance to, 1800
  sites of drug action, 1780

Anti-Ro ± anti-La pregnancy, 1280

Antisecretory therapy, with pediatric dosages, 1971

Antistreptolysin-O titer, reference intervals, e 6t – e 13t
Antithrombin III deficiency, 2602, 2602t

Antithymocyte globulin, in pancytopenia, 2579

Antitoxin, for diphtheria, 1461

$\alpha_1$-Antitrypsin deficiency, 2105–2106, 3532–3533

emphysema and, 2225–2226

**Antivenom**

administration of, 3823, 3824t

*Latrodectus*, 497t

**Antiviral treatment**

common cold, 2187

for hepatitis, 1669

for herpesviruses, 1664–1668

immune globulins, 1669–1670

licensed drugs, 1665t–1666t

non-HIV clinical conditions, 1666t

for respiratory viral infections, 1668–1669

**Antley-Bixler syndrome**, 2978, 3013

**Antrochoanal polyp**, 2185f

**Anus**

assessment in newborn, 871

imperforate, 2056, 2056f, 2816

surgical conditions of, 2055–2061

**Anxiety**

in palliative care, 61

nonpharmacologic approach to, 60t

pharmacologic approach to, 57t–59t

in T1DM, 3038

**Anxiety disorders**, 210–217, 210b–211b, 210f

associated with medical conditions, 210b, 217

disparities in, 15

**Anxiety Disorders Interview Schedule for Children (ADIS-C)**, 214
Anxiolytic agents, 192t

Aorta
cocartion of, 2364f, 2389–2392, 2435
  clinical manifestations of, 2390–2391
diagnosis of, 2391
pathophysiology of, 2390
relative frequency of, 2367t
treatment of, 2391
descending
calcification of, 2488f
intravascular stent in, 2366f
surgery, in Marfan syndrome, 3744–3745

Aortic aneurysm syndromes, 3743–3744, 3743t

Aortic arch
anomalies of, 2420–2422
  double, 2421f
  right, 2420–2421
  vascular rings, 2421–2422, 2421t
development of, 2342
interrupted, coarctation with other cardiac anomalies and, 2392–2393
major branches and, 2361f

Aortic insufficiency
in rheumatic heart disease, 2460
supracristal ventricular septal defect with, 2381

Aortic stenosis, 895, 895f, 2387–2389
clinical manifestations of, 2388
laboratory findings and diagnosis for, 2388–2389
pathophysiology of, 2387–2388
prognosis of, 2389
treatment of, 2389

Aortic valve stenosis, 2435

Aortograms, 2155

Aortopulmonary translocation, 2398

Aortopulmonary window defect, 2383–2384
APCs, **Antigen-presenting cells**

Apert syndrome, in craniosynostosis, **3081–3082**

Apgar score, evaluation of newborns, **872, 872t**

Aphthous stomatitis, **3548, 3548f**
   in PFAPA, **1303–1304**

Aphthous ulcers, **1924, 1924f, 2848f**
   in HIDS, **1298f**

Apids, **1217**

Aplasia
   optic nerve, **3385**
   of parathyroid glands, **2945**
   pulmonary, **2229**
   red blood cell
      with parvovirus B19 infection, **2512–2513**
      transient erythroblastopenia, **2512, 2513t**

Aplasia cutis congenita, **3457–3458, 3458f**

Aplastic anemias, **2577, 2579t**
   HSCT for, **1158**

Aplastic crisis
   parvovirus-induced, **2532f**
   in sickle cell anemia, **2542**
   transient, in parvovirus B19 infection, **1699**

Apley compression test, **3696f**

Apnea, **526, 565**
   as delivery room emergency, **926**
   GERD and, **1938–1939**
   medical child abuse and, **110**
   neonatal, **910, 930–932**
   in pertussis, **1493**
   postoperative, **467**
   as respiratory distress, **585**
   sleep apnea, obstructive, **176–179**
that mimic seizures, 3121

Apnea test, 565

Apneustic breathing, as respiratory distress, 585

Apocrine glands, 3440

Apophysis, 3645
  in hip and pelvis, age of appearance and fusion, 3694t
  slipped vertebral, 3645–3646

Apophysitis, 3603
  calcaneal, 3688f

gastric contents, 2235–2236
hydrocarbon aspiration, 2236, 2236f

Aspiration syndromes, wheezing in infants and, 2217t

Aspirin
indications and adverse reactions, 1247
for Kawasaki disease, 1315
in pain management, 472–475, 474t
secondary peptic ulcers and, 1972

Asplenia, congenital heart disease and, 2347t–2348t

Assent, adolescent, 45

Assessment of growth, 151–157

Assist-control mode, in invasive mechanical ventilation, 596

Assisted reproductive technology symbols, 643f

Assistive mobility devices, for ambulation, 3768, 3768f

Astatic seizures, 3094–3095

Asthma
adherence to daily controller regimen, 1196
airway narrowing and, 535
childhood, 1186–1209
clinical manifestations, 1188–1189
comorbid conditions, 1198
differential diagnosis, 1189, 1190b
disparities in, 11
environmental exposure control, 1196–1198
exacerbation of, as complication of common cold, 2188
GERD and, 1938
irritant-induced, 2244
long-term controller medications, 1200–1204, 1200t
morbidity and mortality, risk factors for, 1206b
occupational and environmental, 2244
pathogenesis of, 1186f, 1188
patient education on, 1196
peak expiratory flow (PEF) monitoring, 1192
persistent, daily medication, 1199t
pharmacotherapy for, 1198–1200
pulmonary function testing, 1189–1192
radiology, 1192
referral to specialist, 1200
regular assessment and monitoring, 1192–1196
role of peak flow monitoring, 1192f
screening, in sickle cell anemia, 2550
spirometry, 1189–1191, 1191f
susceptibility, candidate genes associated with, 1177
treatment of, 1192–1209, 1193f
triggers, 1189b
    inhalation of Aspergillus conidia, 1647
    and vocal cord dysfunction, 1190b
wheezing in infants, 2217t, 2218

**Asthma exacerbations**

emergency department management of, 1208
expiratory wheezing during, 1189
home management of, 1206–1208, 1207f
hospital management of, 1208–1209
and management, 1204–1206
severity, 1190t
special management circumstances, 1209

**Asthmatic inflammation**, 1187f

**Astigmatism**, 3346
Astrocytomas, 2669–2673, 2671f
  subependymal giant cell, 3144–3145

Astroviruses, 1745–1747
  clinical manifestations of, 1746
  diagnosis of, 1746
  differential diagnosis of, 1746
  epidemiology of, 1745–1746
  etiology of, 1745
  laboratory findings of, 1746
  pathogenesis of, 1746
  prevention of, 1747
  prognosis for, 1747
  treatment of, 1746–1747
  vaccines for, 1747

Asymmetric IUGR, 906–907

Asymmetric nystagmus, 3358t

Asymmetry
  breast, 2854
  in idiopathic scoliosis, 3635f
  labial, 2872

Asymptomatic bacteriuria, 2792

Asymptomatic gonorrhea, 1480

Asymptomatic purulent otitis media, 3422

Asymptomatic viruria, polyomaviruses and, 1778

Asystole, cardiac, 2333

Ataxia, 566, 3060, 3150–3156
  autosomal-recessive cerebellar, 3153t
  causes of, 3151t
  cerebellar, in varicella, 1712
  episodic, 3125, 3154t
  hereditary spastic, 3154t
  inherited, treatable causes of, 3152t
with isolated vitamin E deficiency (AVED), 385
stroke and, 3218

Ataxia-telangiectasia, 1117–1118, 2631, 3006, 3153, 3468

Atelectasis, 2315–2316
   clinical manifestations of, 2315
cystic fibrosis and, 2294
diagnosis of, 2315, 2316f
pathophysiology of, 2315, 2315t
treatment of, 2315–2316, 2316t
of tympanic membrane, 3431

Atelectrauma, 592f, 600

Atelosteogenesis type 2, 3728–3729

Atherogenesis, blood lipids and, 751–752

Atheroma, 751–752

Atherosclerosis, 751, 752f

Athetoid cerebral palsy, 3169–3170, 3169t

Athetosis, 3150t, 3156–3161

Atlantoaxial instability, sports participation and, 3680t–3683t

Atlantoaxial rotatory displacement (AARD), 3647

Atomoxetine, for ADHD, 190t–191t, 266

Atonic seizures, 3092, 3094–3095

Atopic dermatitis, 1209–1217, 1238, 1344
   avoiding triggers, 1214b, 1216–1217
   clinical manifestations of, 1210, 1211f
   complications of, 1217
diagnosis and differential diagnosis of, 1210–1212, 1210b, 1212t–1213t
etiology of, 1209
of external ear, 3417
laboratory findings of, 1210
pathogenesis of, 1210
pathology of, 1210
prevention of, 1217
prognosis of, 1217
treatment of, 1212–1216, 1214
vulvar, 2845–2846

Atopic disease, 1170–1174
persistent atopy-associated asthma, 1188

Atopic eczema, 1209–1217

Atopic keratoconjunctivitis, 1220

Atopy, genetic basis of, 1174

Atovaquone/proguanil, 1812, 1858

Atresia

biliary
differentiation of idiopathic neonatal hepatitis from, 2098–2099
in 8 wk old male with elevated conjugated bilirubin, 2099
liver transplantation for, 2143
management of patients with suspected, 2099
neonatal cholestasis and, 2092, 2097–2099, 2097
surgical findings of, 2098
choanal, 911, 2180–2181, 2181
congenital, of external auditory canal, 3412–3413, 3413
esophageal, 1929–1931, 1929
intestinal, 1950–1953, 1952
jaundice and, 957
jejunal and ileal, 1951–1952
laryngeal, congenital, 2208–2209
pulmonary
with intact ventricular septum, 2401–2402
with tetralogy of Fallot, 2401
rectal, 2057
tracheal, 2210
tricuspid, 2402–2404, 2403
clinical manifestations of, 2403
diagnosis of, 2403, 2403
pathophysiology of, 2402–2403
treatment of, 2403–2404
urethral, 2810, 2826
vaginal, 2871

Atria
enlargement, 2356f
septation of, 2342

Atrial ectopic tachycardia, 2442
Atrial fibrillation, 2442–2443, 2442f, 2449f
Atrial natriuretic peptide, 2888
Atrial pacemaker, 2439f
Atrial septal defect, 2373, 2374f
ostium secundum defect, 2374–2376
physiology of, 2374f
relative frequency of, 2367t
sinus venosus, 2376

Atrioventricular block, 2447, 2447f

Atrioventricular canal
complete, 2433
septation of, 2342

Atrioventricular septal defects, 2376–2378
clinical manifestations of, 2377
diagnosis of, 2377–2378
electrocardiogram of, 2378f
pathophysiology of, 2377
physiology of, 2377f
prognosis of, 2378
treatment of, 2378

At-risk groups
for diarrheagenic E. coli, 1512t
for late effects of cancer and treatment, 2645t–2647t
for tuberculosis infection, 1567t

Atrophy, 3057
of cerebral hemisphere, 3147f
congenital microvillus, 1996
corticosteroid-induced, 3531
cutaneous, corticosteroid-induced, 3517–3518
macular (anetoderma), 3520
optic, 3387–3388, 3387b
peroneal muscular
  axonal type, 3327
  Charcot-Marie-Tooth disease, HMSN type IIa, 3320–3327
spinal muscular, 3246f
villous atrophy syndrome and, 2126

Atropine
  antidote for cholinesterase inhibitor poisoning, 506
  autoinjector recommendations, 3814t
  for resuscitation and arrhythmias, 545t

Atropine sulfate, 3308

Attachment, 118–119
  mother-infant
    infant's role, 130
    parental role, 128–130

Attempted suicide, 225–228

Attention, problems related to, 255

Attention-deficit/hyperactivity disorder (ADHD), 262–266, 298–299
  assessment for, 263f
  clinical manifestations for, 264–265
  developmental impacts, 264f
  diagnosis and differential diagnosis for, 263b, 265
  disparities in, 15
  DSM-5, 262b
  epidemiology of, 263–264
  etiology of, 262–263
  medication for, 2450
  medications for, 190t–191t
  pathogenesis of, 264
Attenuated familial adenomatous polyposis (AFAP), 2062t, 2704
Attenuated psychosis syndrome, 248
Attribution, errors of, 43t
Atypical absence seizures, 3097
Atypical antidepressants
  for depression and anxiety symptoms, 192t
  poisoning, 505
Atypical antipsychotics, 482
Atypical BECTS, 3096–3097
Atypical cores, 3266
Atypical genitalia, diagnostic approach to, 3010–3011, 3011f, 3011t–3012t
Atypical melanocytic nevus, 3469–3470
Atypical mole-melanoma syndrome, 3470
Atypical mycobacterial infection, 3558–3559
Atypical premature adrenarche, 2906–2907
Atypical squamous cells of undetermined significance (ASC-US), 1750
Atypical teratoid/rhabdoid tumor
  cytogenetic pattern, 2676
  relative incidence of, 2668t
Audiologic clinical evaluation
  acoustic immittance testing, 3408
  audiometry, 3407
  auditory brainstem response, 3408–3409
  behavioral observation audiometry, 3408
  otoacoustic emissions, 3409
  play audiometry, 3407
  speech-recognition threshold, 3407
visual reinforcement audiometry, 3407

Audiometry
in adolescents, 1035
behavioral observation, 3408
hearing thresholds, 3407
play, 3407
visual reinforcement, 3407

Auditory brainstem response, 3408–3409

Augmentation cystoplasty, complications of, 2815

Augmentative communication, 300

Aura
migraine with, 3132–3133
migraine without, 3128–3132, 3131r, 3132f
in unprovoked seizures, 3094

Auricular hematoma, wrestling-related, 3714

Auscultation
of acutely ill child, 529
of heart, 2352
of lung, 2150

Authoritarian parenting, 123–124

Authoritative parenting, 123–124

Autism spectrum disorder, 277, 277f, 294–302
assessment of, 299–300, 300b
comorbid conditions, 299
definition of, 294
diagnostic criteria for, 294–296, 295b
developing, maintaining, and understanding relationships, 296
restrictive and repetitive behavior, 296
social communication and social interaction, 294–296, 295b
differential diagnosis of, 298–299
disparities in, 15
DSM-5, severity levels, 296, 297t–298t
epidemiology of, 296
etiology of, 296–298
first tier, 299
hypo-/hyperreactivity to sensory input, 296
insistence on sameness, 296
management of, 300–302
complementary and alternative medicine, 301–302
co-occurring conditions, 301
educational, 300, 300b
pharmacology, 301, 301r
transition, 302
nonverbal communicative behavior, 296
outcome, 302
restricted interests, 296
screening for, 160t, 299
second tier, 299–300
social-emotional reciprocity, 295–296
stereotyped motor movements/speech, 296
symptoms of, 294–296
treatment of, 300–302

Autoantibodies
autoimmune hepatitis and, 2129
in autoimmune polyglandular syndromes, 2940t
specificity, and rheumatic disease associations, 1250t
in T1DM, 3026

Autoantigens, in autoimmune polyglandular syndromes, 2940t

Autofluorescence, 2160

Autografts, for 3rd-degree burns, 619

Autoimmune disorders
Addison disease, 2963
hypoparathyroidism, 2947
hyposplenism and, 2621t
idiopathic thrombocytopenic purpura, 2612–2614
in IPEX disorders, 1123t
myocarditis and, 2472b
neutropenia, of infancy, 1144
polyendocrinopathy, type I, 2962–2963
polyendocrinopathy-candidiasis ectodermal dysplasia, 1115
polyglandular syndromes 1 and, 2920, 2920t
respiratory signs and symptoms, 2166t
T1DM and, 3051–3052

Autoimmune encephalitis, 3091, 3179–3186, 3180t–3181t
acquired demyelinating syndromes with encephalopathy in, 3185
anti-N-methyl-D-aspartate receptor encephalitis in, 3181–3182, 3182f–3183f, 3184t
associated with epilepsy and status epilepticus, 3186
Bickerstaff encephalitis in, 3185–3186
chronic lymphocytic inflammation with pontine perivascular enhancement responsive to steroids in, 3186
CSF findings in, 3222t–3223t
Hashimoto encephalopathy in, 3185
manifesting with psychosis, 246, 246f
opsoclonus-myoclonus and other types of brainstem-cerebellar encephalitis in, 3185
types of, 3186
associated with antibodies against neuronal cell surface antigens, 3182–3185

Autoimmune enteropathy, 1997–1998
chronic diarrhea and, 2035

Autoimmune hemolytic anemias
associated with cold antibodies, 2564
associated with warm antibodies, 2563–2564

Autoimmune hepatitis, 2127–2130
acute hepatic failure and, 2134
classification of, 2128t
clinical manifestations of, 2128–2129
diagnosis of, 2129
etiology of, 2127–2128
IBD-associated, 2121
laboratory findings in, 2129
overlap syndromes of, 2130t
pathology of, 2128
prognosis of, 2130
treatment of, 2129–2130

Autoimmune limbic encephalitis, 3185
Autoimmune lymphoproliferative syndrome, 1121
Autoimmune myasthenia gravis, 3304–3305
Autoimmune ovarian failure, 3006
Autoimmune pancreatitis, 2079
Autoimmune polyendocrine syndromes, associated with T1DM, 3051–3052
Autoimmune polyendocrinopathy candidiasis-ectodermal dystrophy, 2128
Autoimmune polyendocrinopathy syndrome type 1 (APS-1), 2005, 3023
Autoimmune polyglandular syndromes, 2937–2942, 2938t–2939t
  autoantibodies in, 2940t
  chromosomal abnormalities associated with, 2941
  immune dysregulation-polyendocrinopathy-enteropathy X-linked, 2940
  monogenic, 2937
  nongenetic causes of, 2941–2942
  polygenic, 2941
  type 1, 2937–2940

Autoimmune POTS, 570

Autoimmune regulator gene
  autoimmune hepatitis and, 2127–2128
  mutations in, 2128

Autoimmune thyroid disease, in Turner syndrome, 3003
Autoimmune thyroiditis, 2923
Autoimmune type 1 diabetes mellitus, genes altering the risk of, 3023
Autoimmunity, in T1DM, 3025–3026
Autoinflammation with phospholipase Cγ2-associated antibody deficiency and
  immune dysregulation (APLAID), 1302
Autoinflammatory diseases, systemic
bone disorders, 1296t
clinical grouping by fever and skin manifestations, 1295b
diagnostic clues, 1297t
genetically complex, 1303–1304
  CRMO, 1304, 1304f
  PFAPA, 1303–1304
mendelian
  APLAID, 1302
  autoinflammation with enterocolitis, 1303
  Blau syndrome, 1302
  CANDLE, 1303
  DADA2, 1302
  DIRA, 1301–1302
  DITRA, 1303
  FCAS, 1303
  interferonopathies, 1303
  Majeed syndrome, 1303
  PAPA syndrome, 1300–1301, 1301f
  SAVI, 1303

Autoinjectors, atropine and pralidoxime, 3814t

Autologous HSCT, 1162, 1162b

Autologous keratinocytes, for 3rd-degree burns, 619

Automatisms, 3096
  motor, 910

Autonomic disorders, 3332t

Autonomic dysfunction
  genetic and metabolic disorders causing, 3334t
  symptomatic management of, 3334t

Autonomic dysreflexia, 3757b, 3758f
  management, 3755–3759

Autonomic nervous system
dysregulation
  and CCHS, 2333
  rapid-onset obesity with, 2335
  ROHHAD and, 358
genes pertinent to, 2169t
Guillain-Barré syndrome in, 3335
rapid onset
coprine ingestion, 3804
muscarine poisoning, 3804

Autonomic neuropathies, 3331–3335
Allgrove syndrome (triple A syndrome) in, 3335
congenital insensitivity to pain and anhidrosis in, 3335
familial dysautonomia in, 3331–3335
hereditary sensory and, 3332t–3333t

Autonomic storms, 3124

Autonomy, sense of, 241

Auto-PEEP, assessment of, 600

Autoresuscitation (gasp ing), SIDS and, 2174

Autosomal aneuploidy, 653t

Autosomal dominant benign familial neonatal seizures, 3113

Autosomal dominant conditions
dopa-responsive dystonia, 727–728
hyper-IgE syndrome, 1118
hypoparathyroidism, 2946
hypophosphatemic rickets, 382

Autosomal dominant inheritance, 640–642
familial form of PHHI, 856

Autosomal dominant mutations, 809

Autosomal dominant pedigree, 644f

Autosomal dominant polycystic kidney disease (ADPKD), 2138–2139 , 2747–2748
clinical presentations of, 2747 , 2748f
diagnosis of, 2748
pathogenesis of, 2747
pathology of, 2747
treatment and prognosis of, 2748
Autosomal liver phosphorylase kinase deficiency, 784
  diagnosis, 784
  treatment and prognosis, 784

Autosomal recessive conditions, 809
  cartilage-hair hypoplasia, 1117
  dopa-responsive dystonia, 727–728
  hypoparathyroidism, with dysmorphic features, 2945
  hypophosphatemic rickets, 382
  osteogenesis imperfecta, 3738
  proximal renal tubular acidosis and, 2762–2763
  Segawa syndrome, 727–728

Autosomal recessive congenital ichthyoses, 3513
  congenital ichthyosiform erythroderma, 3513
  harlequin ichthyosis, 3513
  lamellar ichthyosis, 3513
  nonbullous congenital ichthyosiform erythroderma, 3513

Autosomal recessive cutis laxa type 2, 805

Autosomal recessive hypercholesterolemia, 756

Autosomal recessive inheritance, 642–645

Autosomal recessive pedigree, 645f

Autosomal recessive polycystic kidney disease (ARPKD), 2137–2138, 2744–2747, 2747t
  clinical manifestations of, 2744–2745
  diagnosis of, 2745, 2745f
  pathogenesis of, 2744
  pathology of, 2744
  prognosis of, 2747
  treatment of, 2745

Autosomal recessively inherited congenital optic atrophy, 3387–3388

Autosomal-dominant myotonia congenita of Thomsen, 3288t

Autosomal-recessive cerebellar ataxias, 3153t
Autosomal-recessive generalized myotonia, of Becker, 3288t

Autumn crocus toxicity, 509t

Availability, in food security, 331–332

Avascular necrosis
  in developmental dysplasia of hip, 3628
  in sickle cell anemia, 2544–2545

Aversive conditioning techniques, 205

Avoidant/restrictive food intake disorder (ARFID), 230, 230b

Avulsion
  of permanent tooth, 1923
  of primary incisor, 1923f

Avulsion fractures, 3694
  hip and pelvis, 3694

Awareness, in seizures, 3086

Axial spasms, in unprovoked seizures, 3094–3095

Axillary hair, 2899

Axillary lymphadenopathy, 2625t

screening, 2491t

Blood studies, for febrile seizures, 3094

Blood tests
complete blood count, reference intervals, e6t–e13t
interferon-γ detection, 1576–1577

Blood transfusion
with HIV-infected blood, 1781
for homozygous β-thalassemia, 2555–2556
for sickle cell anemia, 2548, 2550

Blood transfusions
risks of, 2586–2589

Blood types, checked prior to renal transplantation, 2782

Blood vessels, disorders of, 2487–2490, 2618
acquired, 2618
arteriovenous fistulas, 2487–2488
Kawasaki disease, 2487, 2487f

Bloodstream infection, catheter-related, 1411–1412

Bloody discharge, from nipple, 2855

Bloom syndrome, 2631, 3501
Blount disease, 3610–3611, 3610t, 3611f–3612f
Blue diaper syndrome, 2007
Blue nevi, 3472
Blue rubber bleb nevus syndrome, 3463
Blunt injury, 556
Blunt trauma, intraabdominal injuries after, 554b
BMI-for-age, 334
Bochdalek hernia, 944, 945f
Body dysmorphic disorder, 2857

Body fluids composition
  electrolyte composition, 389–391
  fluid compartments, 389
  osmolality, 389–391
  total body water (TBW), 389

Body heat, maintenance in newborn, 872–873

Body image
  in adolescence, 1018
  perceptions of, 146

Body lice, bites, 3569t

Body mass index (BMI), 154, 334, 346, 347f

Body proportions, male, 127f

Body surface area, estimation of, for burn injuries, 617, 618f

Body temperature, during inflammatory attacks, 1295f

Body weight, TBW, ICF, and ECF as functions of, 390f

Boerhaave syndrome, 1941

Bohn nodules, 1925

Bolivian hemorrhagic fever, 1767, 1769

Bonding, parent-infant, 874–876
Bone disease

- arthritis or extremity pain caused by, 1265b
- osteomyelitis
  - chronic recurrent multifocal, 1296t, 1304, 1304f
  - DIRA, 1302f
- osteoporosis, 3750–3752
  - in myelomeningocele, 3766
- tuberculosis, 1574–1575, 1574f

Bone disorders

- autoinflammatory, 1296t
- involving defective bone resorption, 3731–3732
- osteopetrosis, 3731, 3732f
- pyknodysostosis, 3731–3732, 3732f

Bone marrow

- disorders, and risk for osteoporosis, 3751b
- infiltration, 2568
- replacement
  - neutropenia secondary to, 1144
  - pancytopenia caused by, 2580

Bone marrow aspirate

- neuroblastoma cells in, 2681f
- of patient with hemophagocytic lymphohistiocytosis, 2707f
- showing megakaryocytes, 2612f
- in work-up of malignancies, 2637t

Bone marrow failure syndromes

- inherited, 2568–2577, 2569t–2570t
- unclassified inherited, 2577, 2578t

Bone marrow transplantation, liver disease and, 2122

Bone neoplasms

- benign tumors and tumor-like processes of, 2692–2697, 2693t
  - diagnostic considerations of, 2696
  - histiocytosis, 2696
  - tibia, characteristic lesions of, 2696
- malignant tumors
  - Ewing sarcoma, 2691–2692
Bones

- abnormalities, in progeria, 827–828
- anatomic distribution of septic arthritis, 3677
- centers of ossification, 3590–3591
- formation, importance of cartilage in, 3717
- glucocorticoids effect, 2957–2958
- growth and development of, 3590, 3590t
- growth hormonal regulation, 3746–3747
- lengthening, by distraction osteogenesis, 3616
- metabolism, 2943–2945
- Staphylococcus aureus, 1431

Bony labyrinth diseases

- bacterial meningitis, 3434–3435
- labyrinthitis, 3434–3435
- osteopetrosis, 3435

Bordetella

- B. parapertussis, 1492–1496
- B. pertussis, 1492–1496

Borrelia (relapsing fever), 1603–1604, 1603f–1604f

Borrelia burgdorferi, 1604–1609

- clinical manifestations of, 1606–1607, 1606t
- congenital Lyme disease, 1607
- diagnosis of, 1607–1608
- early disseminated disease, 1606–1607, 1606f
- early localized disease, 1606, 1606f
- epidemiology of, 1604–1605, 1605f
- etiology of, 1604
- laboratory findings of, 1607
- late disease, 1607
- pathogenesis of, 1605–1606
- pathology of, 1605–1606
- prevention of, 1608–1609
- prognosis for, 1608
serology, 1607–1608
transmission of, 1605
treatment of, 1608, 1608t

Bosniak classification, renal cyst, 2788

Botryoid type, rhabdomyosarcomas, 2686

Botulinum toxin intramuscular injections
   for birth brachial plexus palsy, 3765
   for spasticity, 3762

Botulism (Clostridium botulinum), 1545–1549
   clinical manifestations of, 1546–1547, 1547f
   complications of, 1549, 1549t
   delayed-onset neuromuscular syndrome, 3808
   diagnosis of, 1547–1548, 1547t
   differential diagnosis of, 1548, 1548t
   epidemiology of, 1546
   etiology of, 1545–1546
   in neuromuscular blockade, 3310
   pathogenesis of, 1546
   prevention of, 1549
   prognosis for, 1549
   supportive care for, 1548–1549
   treatment of, 1548, 3811t–3812t

Boutonneuse fever, 1620t, 1626–1627, 1626f

Bovine spongiform encephalopathy, 1806

Bowel
   echogenic, 890t
   incontinence, after spinal cord injury, 3757
   neurogenic, in myelomeningocele, 3766–3767
   resection, short bowel syndrome and, 2002t
   whole-bowel irrigation, 498

Bowel sounds, in toxidromes, 493t

Bowen disease, 3793–3794
Bowing
- of diaphyses, in hyperphosphatasemia, 3752f
- in osteogenesis imperfecta, 3738f
- in plastic deformation, 3663f

Bowlegs, 3610b

Bowling, tibial
- anterolateral, 3613
- anteromedial, 3612
- posteromedial, 3612

Bowman’s capsule, 2715f

Boys
- adolescent, physical development, 1014
- aggressive behavior, 242
- BMI, 152f
- growth remaining charts for, 3615f
- head circumference-for-age and weight-for-length percentiles, 138f
- isosexual conditions, 2900t
- length-for-age and weight-for-age percentiles, 140f
- onset of puberty, 1016f
- peak height velocity, 1017f
- pubic hair changes, 1016f
- sexual maturity ratings, 1015t

BPD, Bronchopulmonary dysplasia

Brachial plexus, schematic of, 3764f

Brachial plexus palsy, at birth, 924–925, 924f, 3762–3765

Brachycephaly, in craniosynostosis, 3081

Brachytherapy, in retinoblastoma, 2698

Bradyarrhythmias
- medications for, 545t
- recognition of, 538–539, 539f

Bradycardia
causes of, 931t
as respiratory distress, 585

Bradypnea, 531–532
Brain
growth, in first two years of life, 131f
growth component, 127f
hemorrhage, due to untreated hypernatremia, 394
infarction, in sickle cell anemia, 2545f
irradiation, precocious puberty following of, 2904
magnetic resonance imaging of, 2498f
MRI, in neuroradiologic procedures, 3061
neural signature for dyslexia, 267f
structural development in preschool years, 143

Brain abscess, 3235–3236
clinical manifestations of, 3235
CSF findings in, 3222–3223
diagnosis of, 3235–3236, 3235f
etiology of, 3235
pathology of, 3235
prognosis of, 3236
tetralogy of Fallot and, 2399
treatment of, 3236

Brain death, 563–566
after neonatal hypoxic-ischemic encephalopathy, 923
ancillary studies for, 565–566
clinical manifestations of, 563–565
diagnosis of, 563–565
documentation of, 564f, 566
epidemiology of, 563
objections to, 566
observation periods for, 565
supportive care for, 566

Brain disease, immune-mediated inflammatory, CNS vasculitis within, 3219f

Brain injury
focal ischemic, 922f
from inflammation, infection, and medications, 915
topography, in hypoxic-ischemic encephalopathy, 919t
traumatic, 559–563
clinical manifestations of, 560
diagnosis and differential diagnosis of, 560
etiology and epidemiology of, 559, 559f
laboratory findings in, 560
pathogenesis of, 559-560
pathology of, 559
prognosis of, 563
supportive care for, 563
treatment of, 559–560, 563f

Brain iron accumulation, neurodegeneration with, 3194–3196, 3194f, 3195t

Brain lesion, precocious puberty resulting from, 2903–2904
clinical manifestations of, 2903
etiology of, 2903, 2903f–2904f
treatment of, 2903–2904

Brain malformations, 3271–3272, 3271f–3272f
in neonatal seizures, 3113

Brain tumors, in childhood, 2666–2678
astrocytomas, 2669–2673, 2671f
of brainstem, 2677–2678, 2678f
of choroid plexus, 2674
clinical manifestations of, 2666–2668
complications and long-term management, 2678
congenital and neonatal, 2667t
craniopharyngioma, 2676–2677, 2677f
diagnosis of, 2668–2669, 2669f
embryonal, 2674–2676
ependymal, 2673–2674, 2674f
epidemiology of, 2666
etiology of, 2666
familial syndromes associated with, 2667t
germ cell, 2677
histologic distribution of, 2667f
metastatic, 2678
pathogenesis of, 2666, 2668f
pineal parenchymal, 2676
of posterior fossa, 2668t
supratentorial, on neuroimaging, 2669t

Brain-adipose tissue-intestinal axis, 350f

Brainstem
auditory response, 3408–3409
disorders of, 3073, 3074f
dysfunction, that mimic seizures, 3126
glioma, 2668t
in Leigh syndrome, 3177t
reflexes, 565, 565t
tumors of, 2677–2678, 2678f

Brainstem auditory evoked responses (BAERs), 3063
Brainstem aura, migrane with, 3131t

Brainstem-cerebellar encephalitis, 3180t–3181t, 3185
Branched-chain amino acids, 705f, 708

Branchial cleft, and thyroglossal cysts and sinuses, 3457

Branching enzyme deficiency, 782–783
clinical manifestations, 783
diagnosis of, 783
treatment of, 783

Branchiootorenal syndrome, 3402

Breast, 1057–1058
abscess, 323, 2854–2855
concerns about, 2853–2857
development, 2853
abnormal, 2853–2856
evaluation, 2853
examination, annual, 2853
examination, in adolescent females, 1035
infections, 2854–2855
male disorders of, 1058
mastalgia, 2856
nipple
  discharge from, 2855
  trauma and inflammation, 2855
self-awareness, 2853
self-examination, 2853
sexual maturity ratings, 1015t, 1016f
surgery, 2857

Breast bud, 2853, 2899

Breast masses, 2856–2857
  in adolescents, 2856, 2856t
  imaging of, 2857
  malignant, 2856–2857
  peripubertal, 2856
  recommendations for daughters of women with breast cancer, 2857
  risk reduction, 2857
  screening procedures, 2857

Breast milk
  collection, 324
  and prevalence of otitis media, 3418–3419

Breastfed infant, growth of, 324

Breastfeeding, 321–322, 322b–323b, 322t–323t
  contraindications to, 875–876
  drugs and, 875
  jaundice, 324
  during nuclear medicine examination, 3785, 3785t
  nurseries and, 875–876, 875t
  of preterm infant, 904
  promotion of exclusive, for acute gastroenteritis, 2032
  SIDS risk factors and, 2171

Breastfeeding, jaundice associated with, 957

Breath-holding spells, 240–241, 2177
management of, 241
that mimic seizures, 3121–3122

Breathing
in acutely ill child, 529
assessment in newborn, 870
periodic, at altitude, 604
primary assessment of, 531–532
primary survey for, 548–550
sleep-disordered, 176
transition to pulmonary respiration, 929–930

Breech deformation sequence, 990f

Brentuximab vedotin, 2659, 2665

Brevetoxins, 3806

Brief psychotic disorder, 244

Brief resolved unexplained events (BRUE), 2176–2179
definition of, 2176–2177
epidemiology of, 2177
historical features of, 2179t
initial history of, 2177–2179
management of, 2179
physical examination of, 2177
symptom-based approach to, 2178t
testing for, 2179

Brivaracetam
adverse effects of, 3106t
dosages of, 3104t–3105t

Broad band rating scales, 186

Brodie abscess, 2694

Bromhidrosis, 3537

Bromide
adverse effects of, 3106t
dosages of, 3104–3105

Brominated flame retardants, 3789

Bronchi, obstruction of, atelectasis and, 2315

Bronchial foreign bodies, 2212, 2212f

Bronchial thermoplasty (BT), 2160

Bronchial tumors, 2216

Bronchiectasis, 2278–2280
  central, 2257f
  clinical manifestations of, 2279
  conditions predisposing to, 2278t
  diagnosis of, 2279
  pathophysiology and pathogenesis of, 2278–2279, 2279f–2280f
  prognosis of, 2280
  treatment of, 2279–2280

Bronchiolitis, 2217–2220
  acute, 2217–2218, 2218f
  airway narrowing and, 535
  clinical manifestations of, 2219–2220
  diagnostic evaluation for, 2219
  history and physical examination for, 2219–2220, 2219t
  pathophysiology of, 2217–2218
  prevention for, 2220
  prognosis for, 2220
  respiratory syncytial virus (RSV) and, 1735
  treatment of, 2219–2220

Bronchiolitis obliterans, 2226–2228, 2226t, 2260–2261, 2261f
  clinical manifestations and diagnosis of, 2227, 2227f, 2227t
  epidemiology of, 2226
  pathogenesis of, 2226–2227, 2227f
  prognosis of, 2228
  treatment of, 2227

Bronchiolitis obliterans syndrome (BOS), 2226
Bronchitis, 2220–2221
   acute, 2220–2221, 2220t
   chronic, 2221
   plastic, 2221–2222, 2221f, 2221t
      clinical manifestations of, 2222
      complications and prognosis of, 2222
      diagnosis of, 2222
      epidemiology of, 2221
      pathogenesis of, 2221–2222
      treatment of, 2222

Bronchoalveolar lavage, 2159–2160, 2314
   for hypersensitivity pneumonia, 2242
   for interstitial lung disease, 2261

Bronchodilator response, in asthma, 1191b

Bronchodilators
   for airway obstruction, 535
   for cystic fibrosis, 2293

Bronchogenic cysts, 2232, 2232f

Bronchomalacia, 2214–2215, 2336

Bronchopulmonary aspergillosis, allergic, 1647, 2255–2257

Bronchopulmonary complications, of IBD, 1975–1976t

Bronchopulmonary dysplasia, 865–867, 2324–2326
   clinical manifestations of, 2324–2325
   definitions of, 2325t
   diagnostic criteria, 938t
   in neonates with RDS, 936–940
   prognosis of, 2325–2326
   treatment of, 2325

Bronchoscopy, 2160
   in anti-glomerular basement membrane disease, 2262
   rigid, showing thick tracheal membranes, 2206f
   of vascular rings, 2421t

Bronchospasm, 464
Brown recluse spider, 3825, 3825f
Brown syndrome, 3357, 3357f
Brown-Vialetto-Van Laere syndrome, 366

**Brucella**, 1536–1538
- clinical manifestations of, 1537
- diagnosis of, 1537
- differential diagnosis of, 1537
- epidemiology of, 1536–1537
- etiology of, 1536
- pathogenesis of, 1537
- prevention of, 1538
- prognosis for, 1538
- treatment of, 1537–1538, 1538f

**Brucella abortus**, 1536
**Brucella canis**, 1536
**Brucella melitensis**, 1536
**Brucella suis**, 1536

Brucellosis, 1401t, 1536–1537
Brudzinski sign, in acute bacterial meningitis, 3225
BRUE, Brief resolved unexplained events
Brugada syndrome, 2449, 2450f
**Brugia malayi**, 1884–1885
**Brugia timori**, 1884–1885

serum, 3747

Calcium
conversion factor, 404t
deficiency, rickets caused by, 376b, 381–382
dietary reference intake, 317, 319t–320t
excessive, hypercalcemia caused by, 2952t
glucocorticoids effect, 2957–2958
reference intervals, e 6t–e 13t
tubular reabsorption of, 2762–2763
in vegetarian diet, 330

Calcium channel blockers

doses in children and adolescent, 2497t
for migraine, 3135t–3136t
poisoning, 496t–497t, 502

Calcium channel periodic paralysis, 3289t

Calcium chloride, for resuscitation and arrhythmias, 545t

Calcium homeostasis, 2943–2945, 2944f

Calcium stones, 2836t

Calcofluor white stain, 1336t

Calculi

bladder, complication of augmentation cystoplasty, 2815
renal, pathogenesis of, 2837–2838

Caliciviruses, 1745–1747

clinical manifestations of, 1746
diagnosis of, 1746
differential diagnosis of, 1746
epidemiology of, 1745–1746
Caloric supplementation, for burn injuries, 620
Caloric testing, 3057
Calyceal dilation, 2801
Calyceal diverticulum, 2788
Camelback fever, 1387
Campomelic dysplasia, 3729–3730, 3730f
Campomelic syndrome, 3014
Camptodactyly, 3655, 3655t

*Campylobacter*, 1519–1522
  in acute gastroenteritis, 1520–1521
  antibiotic therapy for, 2031t–2032t
  associated with human disease, 1520t
  in bacteremia, 1521
  complications of, 1521–1522
    Guillain-Barré syndrome, 1521–1522
    reactive arthritis, 1521
  diagnosis of, 1521
  epidemiology of, 1519
  etiology of, 1519
  in focal extraintestinal infections, 1521
  pathogenesis of, 1519–1520
  in perinatal infections, 1521
  prevention for, 1522
  prognosis for, 1522
  treatment of, 1522
*Campylobacter coli*, 1519

*Campylobacter jejuni*, 1519

bacterial gastroenteritis and, 2014

Canadian inherited marrow failure registry criteria, for unclassified inherited bone marrow failure syndromes, 2578

Canagliflozin, for T2DM, 3045

Canavan disease, 738–739, 738

Canavan spongy degeneration, 3191

Cancer

age at diagnosis, 2628

epidemiology of, 2627–2630

excess, lifetime risks of excess, 3781, 3781

five-year survival rates of, 2628

generalized incidence of, 2628

HPV squamous epithelial, 1750

impact on fertility, 2862

incidence rates of, SEER, 2629

influencing incidence of, 2630

molecular and cellular biology of, 2630–2634

principles of diagnosis, 2634–2637

age-related manifestations, 2636

eyearly detection, 2636

ensuring diagnosis, 2636–2637

physical examination in, 2634–2636

signs and symptoms of, 2634

staging, 2637

principles of treatment, 2637–2648

acute toxic effects and supportive care of, 2643–2645

age-adjusted mortality trends, 2638

chemotherapy, 2640

diagnosis and staging of, 2638–2639

discussing treatment plan with patient and family, 2640

high-risk features of, 2645t–2647t

late adverse effects of, 2645–2647

multimodal, multidisciplinary approach of, 2639–2640, 2639

oncologic emergencies in, 2644t
palliative care for, 2647–2648
radiation therapy, 2643
reduction in mortality rate, 2638f
risk-stratified shared care model for survivors, 2648f
surgery, 2640–2643
teams of providers, 2637–2638
risk factor for, 2629t
second
after HSCT, 1168–1169
relationship with primary cancer, 3783t
syndromes predisposing to, 2631
treatment effects on development of amenorrhea, 2863t

*Candida* infection, 1640–1643

cutaneous, 3564–3566
in immunocompetent children and adolescents, 1642
in immunocompromised children and adolescents, 1642–1643
maternal, affecting fetus or newborn, 879t
neonatal, 1641–1642, 1642t

Candidal diaper dermatitis, 3564–3565

Candidal granuloma, 3566

Candidiasis

intertriginous, 3565–3566
mucocutaneous, chronic, 1113
oral

in HIV, 1785
in immunocompetent patient, 1642
oropharyngeal, 1924
perianal, 3566
syndrome of APECED, 1115
vulvovaginal, 1084

Candidosisis, 3564–3566

CANDLE, *Chronic atypical neutrophilic dermatosis with lipodystrophy and elevated temperature*

Canine scabies, 3573–3574

  Rickettsia rickettsii, 1624
  signs and symptoms of, 3222
  viral meningoencephalitis as, 3232–3234

Central nervous system vasculitis, 3219–3221

Central neurogenic hyperventilation, as respiratory distress, 585

Central neurologic disease, in congenital muscular dystrophy, 3293

Central pontine myelinolysis, 394, 397, 431

Central precocious puberty, 2899–2903
  clinical manifestations of, 2899–2900
  differential diagnosis of, 2901
  laboratory findings of, 2900–2901
  treatment of, 2901–2903

Central venous catheter infection, coagulase-negative staphylococci, 1435

“Centrally mediated pain”, 469–470

Centromere position, 654

Centronuclear myopathy, 3257

Cephalexin, 1417t–1425t
Cephalic index, in deformational plagiocephaly, 3084
Cephalic tetanus, 1550
Cephalohematoma, 914, 914f
Cephalometric radiographs, 1926
Cephalosporins, 1425–1426
    adverse effects of, 1427t
    parenteral and oral, 1427t
Cephradine, 1417t –1425t
Cerebellar astrocytoma, relative incidence of, 2668t
Cerebellar disorders, 3073, 3074f
    ataxia, in varicella, 1712
Cerebellar fits, 3126
Cerebellar hypoplasia, 3271
Cerebellar vermis hypoplasia, Joubert syndrome
Cerebral blood flow, 558f
Cerebral edema, 431
    complication of hepatic encephalopathy, 2136
    drowning and, 609
    high-altitude (HACE), 602, 605
    in T1DM, 3031
Cerebral epidural abscess, CSF findings in, 3222t –3223t
Cerebral folate deficiency, 371, 3099
Cerebral gigantism, 2894–2895, 2895f
    in megalencephaly, 3079
Cerebral glucopenia, 850b
Cerebral hemisphere, atrophy of, 3147f
Cerebral herniation, 558, 558f, 563f
Cerebral malaria, 1860–1861
Cerebral manifestations, of Leigh syndrome, 3177t

Cerebral necrosis, 3783

Cerebral palsy, 3168–3173
  associated with neuropathic bladder, 2816
  classification of, major causes and, 3169t
  clinical manifestations of, 3168–3170
  diagnosis of, 3170, 3171f, 3171t–3172t
  epidemiology and etiology of, 3168
  treatment of, 3170–3173, 3173f
  white matter pathways, with spastic diplegia, 3170f

Cerebral perfusion pressure, 557–558, 558f

Cerebral salt wasting, 2892
  treatment of, 2892

Cerebral sinovenous thrombosis, 2604, 3213–3214, 3214f, 3214t

Cerebral thromboses, tetralogy of Fallot and, 2398–2399

Cerebral vasculitis, classification of, 3212t

Cerebral vasoconstriction syndrome, reversible, characteristics of, 3221t

Cerebral ventricles, dilated in fetus, 890t

Cerebro-ocular dysplasia-muscular dystrophy, 804

Cerebrospinal fluid (CSF)
  cultures, 1336–1337
  diagnostic, for malignancies, 2637t
  examination, in neurologic evaluation, 3060–3061
  findings, in central nervous system disorders, 3222t–3223t
  protein, elevated, in acute bacterial meningitis, 3225
  shunts
    associated infection, 1412–1413
    coagulase-negative staphylococci, 1436

Cerebrotendinous xanthomatosis, 761

Cerebrovascular arteriopathy, in progeria, 828

Ceroid lipofuscinoses, neuronal, 3190–3191, 3190t
Cerumen, 3398
Cervical adenopathy, 2624–2625
Cervical cap, 1073
Cervical cytology, terminology for reporting, 1748
Cervical ectopy, 1083f
Cervical lymphadenopathy, 2625t, 2634f
diphtheritic, 1460f
Cervical malignancies, 2866–2867
Cervical spine
anomalies and instabilities
22q11.2 deletion syndrome, 3650, 3650f
Down syndrome, 3649–3650, 3650f
os odontoideum, 3649–3650
radiograph of patient with JIA, 1263f
Cervical spine injuries, 3703–3704
congenital spinal stenosis, 3703
soft tissue injury, 3703
spear tackler's spine, 3703
stingers (burners), 3703
transient quadriparesis, 3703
Cervical spine trauma
primary survey for, 548
secondary survey for, 552, 552b
Cervicitis, 1084–1085
Cervicofacial actinomycosis, 1466, 1466f
Cervix
  cancer screening, 2866–2867
  inflamed, 1084f
Cesarean section, problems associated with, 880
Cetuximab, 2640t
Chagas disease, 1847–1851
clinical manifestations of, 1850
diagnosis of, 1849, 1850
epidemiology of, 1847–1848
etiology of, 1847
in immunocompromised persons, 1850
life cycle of *Trypanosoma cruzi*, 1847
pathogenesis of, 1848–1850
  acute disease, 1848
  chronic disease, 1848–1850
prevention of, 1851
treatment of, 1850–1851

**Chalazion**, 3362

**Chambers**
  developmental processes for, 2342
  transcription factors, specific for, 2340

**Chancre**
  trypanosomal, 1845
  tuberculous, 3557–3558

**Chancroid**, 1489–1490
  clinical manifestations of, 1490
  complications of, 1490
  diagnosis of, 1490
  etiology and epidemiology of, 1489–1490
  signs and symptoms, 1086
  treatment of, 1490

**Chang staging system**, 2674–2675

**Channelopathies**, 3296–3304
  cardiac, 2169
  with hypokalemic periodic paralysis, 3289
  muscle, 3296–3298, 3297
  stroke and, 3218

**Chaotic or multifocal atrial tachycardia**, 2442

**Charcot-Marie-Tooth disease**, 747
in cavus feet, 3603
HMSN type IIa, 3320–3327

CHARGE syndrome, 2180–2181, 2347t –2348t, 3404t

Charles Bonnet syndrome, 3127

Chédiak-Higashi syndrome, 702, 1134t –1135t, 2617, 3478

Cheerleading, injuries associated with, 3715

Cheilitis, 1925

Cheilosis, in riboflavin deficiency, 366–367, 366f

Chelation therapy
  for arsenic and mercury poisoning, 3796
  for iron overload, 2549, 2556
  for lead poisoning, 3801t
  for Wilson disease, 003843p0450

Chemical burns, to eye, 3396

Chemical conjunctivitis, 3367

Chemical hepatotoxicity, 2131

Chemical injury, burn in, 615

Chemical pollutants, 3786–3792
  air pollutants, 3787–3788
  asbestos, 3788
  chlorinated hydrocarbons, 3789
  endocrine disruptors, 3789
  environmental carcinogens, 3789–3790
  lead, 3788
  mercury, 3788

in newborns, incidence of, 653t

Chromosomal deletion syndromes, 995t

Chromosomal disorders

associated with congenital heart disease, 2347t –2348t

chromosome instability syndromes, 672

identification of, 633

intellectual disability caused by, 284t

Chromosomal syndromes

22q11.2 deletion syndrome, 3650, 3650f

susceptibility to malignancy and, 2632t –2633t

Chromosomal translocation, in tumors, 2631t
Chromosome analysis

aCGH, 655
banding techniques, 653
errors of cell division, 653
FISH, 654
position of centromere, 654f
SNP array, 658

Chronic arthropathy, 2597

Chronic atypical neutrophilic dermatosis with lipodystrophy and elevated temperature (CANDLE), 1303

Chronic autoimmune thrombocytopenic purpura, 2613–2614

Chronic bronchitis, 2221

Chronic bullous dermatosis of childhood, 3490–3491 , 3490f

Chronic compartment syndrome, 3698

Chronic diarrhea, 2033–2041

definition of epidemiology of, 2033
etiology of, 2034–2036 , 2034t
  carbohydrate malabsorption and, 2035
  congenital diarrheal disorders as, 2036 , 2037t
  infectious, 2034–2035
  inflammatory/immunologic, 2035
  liver and bile acids disorders in, 2035
  motility disorders in, 2035
  nonspecific diarrhea, including Toddler's diarrhea, 2036
  pancreatic deficiency and, 2035
  protein-losing enteropathy in, 2035
  short bowel syndrome and, 2035
evaluation of patients with, 2036
investigations for, 2037–2038 , 2038t
malabsorption disorders and, 1988t
from neuroendocrine tumors, 2040–2041 , 2040t
pathophysiology of, 2033–2034
prevalent agents and conditions in, 2034t
stepwise diagnostic approach to, 2039t
treatment of, 2038–2040
Chronic disease, anemia of, 2524t
Chronic eosinophilic pneumonia, 2254–2255
Chronic exertional compartment syndrome, 3715
Chronic fatigue syndrome, 1093–1096
  clinical manifestations, 1094f, 1095
  diagnosis, 1095–1096
  epidemiology, 1094
  management, 1096
  pathogenesis, 1094–1095
  prognosis, 1096
Chronic granulomatous disease, 1130, 1134t–1135t, 1404
  classification, 1139t
  clinical manifestations, 1139–1140
  genetic counseling, 1140
  genetics and pathogenesis, 1139, 1139f
  laboratory findings, 1140
  prognosis, 1140
  and risk for pulmonary aspergillosis, 1649
  treatment, 1140
Chronic growth hormone excess, 3295–3296
Chronic GVHD, 1164–1165, 1164f, 1164t
Chronic hemolytic anemias, associated with G6PD deficiency, 2562
Chronic hepatitis
  approach to, 2118–2119
  chronic liver disease, 2127
  disorders producing, 2128t
Chronic idiopathic urticaria, 1223–1226
Chronic illness
  in adolescent, 49
  children with, 7–8
Chronic infantile neurologic cutaneous and articular syndrome (CINCA), 1294t,
Chronic inflammation, bronchiectasis and, 2278–2279
Chronic inflammatory demyelinating polyradiculoneuropathy (CIDP), 3335–3337
Chronic kidney disease (CKD), 2774–2778
  causing vitamin D deficiency, 381
  clinical manifestations of, 2775
  etiology of, 2774–2775, 2774t
  laboratory findings of, 2775–2776
  pathogenesis of, 2775
  progression of, 2778
  symptoms and signs of, 2776f
  treatment and management of, 2776–2778
Chronic kidney disease mineral and bone disorder (CKD-MBD), 2776–2777, 2777f
Chronic liver disease, autoimmune hepatitis and, 2127
Chronic lower respiratory tract disease, indicators of, 2162t
Chronic lymphocytic inflammation with pontine perivascular enhancement responsive to steroids (CLIPPERS), 3180t–3181t, 3186
Chronic lymphocytic thyroiditis, 2920, 2923, 2924t, 3052
Chronic malnutrition, 2003–2004
Chronic meningococcemia, 1472, 1472f
Chronic migraine, 3131t
Chronic mucocutaneous candidiasis, 1113, 1405
Chronic myelogenous leukemia (CML), 2656
  HSCT for, 1158
Chronic nodular disease, nontuberculous mycobacteria infection and, 1588t
Chronic nonspherocytic hemolytic anemia, 2562
Chronic overlapping pain conditions, 1092–1096
  - natural history, 1092–1093
  - pathophysiology, 1093
  - predisposing factors, 1092
  - prevalence, 1092
  - psychiatric comorbidities, 1092
  - symptom/disorder overlap, 1092
  - treatment, 1093

Chronic pancreatitis, 2078–2080, 2079f
  - classification of, 2078t
  - factors contributing to etiology of, 2078t
  - IgG4-related disease and, 2080t
  - ultrasound and multidetector images in, 2079f

Chronic progressive disseminated histoplasmosis, 1651

Chronic progressive external ophthalmoplegia, 3301t, 3302
  - caused by mutations in mtDNA, 648t

Chronic pulmonary histoplasmosis, 1651

Chronic recurrent aspiration, 2237–2239, 2239f
  - diagnosis of, 2237–2239, 2238t
  - etiology of, 2237, 2237t

Chronic recurrent multifocal osteomyelitis (CRMO), 1296t, 1304, 1304f, 3674

Chronic rejection, in renal transplantation, 2784

Chronic respiratory failure, cystic fibrosis and, 2295

Chronic respiratory insufficiency, 2329–2339, 2329t
  - chronic respiratory failure, 2329–2331
  - congenital central hypoventilation syndrome, 2332–2335
  - long-term mechanical ventilation, 2329–2331

Chronic suppurative otitis media, 3428

Chronic tubulointerstitial nephritis, 2737–2740, 2739t
  - clinical manifestations of, 2740, 2740t
  - diagnosis of, 2740
pathogenesis and pathology of, 2739–2740
treatment and prognosis of, 2740

Chronic ulcerative colitis, 1976–1981
Chronic uremia, with toxic neuropathy, 3330
Chronic ureteral obstruction, 2801
Chronic urticaria
   diagnosis of, 1222, 1223–1225
   differential diagnosis of, 1225–1226

Chronic/recurrent symptoms, 2161–2166
   cough, 2161–2163
   judging seriousness of, 2161
   lung infiltrates, 2164–2165
   stridor, 2163–2164
   wheeze, 2164

Chronotherapy, 183
Chudley-McCullough syndrome, polymicrogyria and, 3070t–3071t
Churg-Strauss syndrome, 2255, 2255t
   differential diagnostic features, 1324t
Chylomicron retention disease, 1998
Chylothorax, 2323–2324
   clinical manifestations of, 2323
   complications of, 2324
   etiology of, 2323, 2323f–2324f
   treatment of, 2324

Chylous ascites, 2146–2147
Cidofovir, 1668, 3815
   for monkeypox, 3821

Cigarette smoking
   by adolescents, 1049–1050
   SIDS risk factors and, 2170
Ciguatera fish poisoning, 3804–3805
  food-borne illness, 3776t–3777t
  food-borne noninfectious illnesses and, 2018t

Cilia disorders, 2269t
  primary ciliary dyskinesia, 2298–2301

Ciliopathy, 2737–2739
  sensory and motor, childhood diseases associated with, 992t

CINCA (chronic infantile neurologic cutaneous and articular syndrome), 1294t, 1300f, 1305

Ciprofloxacin, 1345, 1417t–1425t, 3814–3815

Circadian rhythms, 172

Circulation
  in acutely ill child, 529
  fetal, 2344–2345
  neonatal, 2345
  persistent fetal, 942–944
  primary assessment of, 532
  primary survey for, 550–551, 551t
  renal, 2714f
  transitional, 2345

Circulatory collapse, complication of malaria, 1861

Circulatory death, 47–48

Circulatory dynamics, 2365f

Circumcision
  complications of, 2823, 2823f
  newborn, 874

Cirrhosis, 2085
  focal biliary, 2122
  Indian childhood, 2105
  portal hypertension caused by, 2141

Cisatracurium, 464
Cisplatin, indications and adverse reactions of, 2641t–2642t

Citalopram, for depression and anxiety, 192t

Citrin deficiency, 733–734, 2106

Citrullinemia, 733–734
  - type I, 733
  - type II, 733–734

Clarithromycin, 1417t–1425t
  - for Legionella, 1540

Clasp-knife phenomenon, 3058

Classic arthrogryposis, 3659, 3660f

Classic Bartter syndrome, 2767

Classic Ehlers-Danlos syndrome, 3527b, 3529f

Classic hemorrhagic disease of the newborn, 386

Classic 21-hydroxylase deficiency, 2971

Classic maple syrup urine disease, 708–709

Classic phenylketonuria, 695

Classical pathway of complement system, 1150–1151

Clavicular fracture, 3668, 3688
  - in delivery room, 929

Claw toe, 3605

Clean wounds, 1367–1368

Clean-contaminated wounds, 1368

Cleansing agents, for acne, 3577

Clear cell adenocarcinoma, 2866

Clear cell sarcoma, of kidney, 2685

Cleft lip and palate, 1915–1917
  - clinical manifestations of, 1916
  - dental or oral findings associated with, 1914t
incidence and epidemiology of, 1915–1916
postoperative management of, 1916
sequelae, 1916
treatment of, 1916
velopharyngeal dysfunction in, 1916–1917

Clefts
branchial, 3457
laryngotraceoesophageal, 1931 , 2210
posterior laryngeal, 2210
sternal, 2327
Clefts
Cleidocranial dysplasia, 1917–1918 , 3730 , 3730f
Climate agents, for acne, 3577
Climate change
environmental health and, 3774
global health and, 28
Clindamycin, 1417t –1425t , 1858t –1860t
enterococci resistance, 1456t
Clinic setting, productive visits for asthma, 1196b
Clinical competence, transgender care, 1027
Clinical deterioration, 41
Clinical guidelines, in developing-world EDs, 525
Clinical history, hemostatic disorders, 2591
Clinical Immunization Safety Assessment (CISA) network, 1352
Clinical Laboratory Improvement Amendments of 1988 (CLIA), e 2
Clinical pharmacokinetics, 452
Clinical spectrum, of celiac disease, 1993t
Clinical utility, of genetic testing, 628
Clinodactyly, 3655 , 3655f
Clitoral abnormalities, 2872
Clitoromegaly, in female-appearing genitalia, 3011t

Cloaca
- anomalies, 2872
- exstrophy, 2811
- persistent, 2057

Clobazam
- adverse effects of, 3106t
- dosages of, 3104t–3105t

Clofazimine
- for Hansen disease, 1585
- against Mycobacterium leprae, 1564

Clomipramine, 192t, 193

Clonal (primary) polycythemia, 2566–2567

Clonazepam
- for anxiety, 192t
- dosages of, 3104t–3105t
- for neuroirritability, 57t–59t
- for spasticity, 3760

Clonic seizures, 3092, 3111

Clonidine
- for ADHD, 266
- for neonatal abstinence syndrome, 978t
- in palliative care, 57t–59t
- poisoning, 502
- for severe hypertension in children, 2498t
- for spasticity, 3760, 3761t

Clonorchiasis, 1892–1893

Clonorchis sinensis, 1892–1893

Clonus, that mimic seizures, 3124

Closed-loop obstructions, 1965–1967

Closed-loop systems, for T1DM, 3034–3035
Clostridium, anaerobic, 1559

Clostridium botulinum, 1545–1549
- clinical manifestations of, 1546–1547, 1547f
- complications of, 1549, 1549t
- diagnosis of, 1547–1548, 1547t
- differential diagnosis of, 1548, 1548t
- epidemiology of, 1546
- etiology of, 1545–1546
- pathogenesis of, 1546
- prevention of, 1549
- prognosis for, 1549
- supportive care for, 1548–1549
- treatment of, 1548

Clostridium difficile, 2023–2026
- antibiotic therapy for, 2031t–2032t
- colitis, microbiome and, 1345
- evaluation for, 2028
- infection, 1373t–1374t, 1552–1555
  - clinical manifestations of, 1553
  - diagnosis of, 1553, 1553f
  - epidemiology of, 1553
  - etiology of, 1553
  - pathogenesis of, 1553
  - prevention of, 1554–1555
  - prognosis for, 1554
  - treatment of, 1553–1554, 1554t–1555t
- toxin, bacterial gastroenteritis and, 2014t

Clostridium difficile-associated diarrhea (CDAD), 1345

Clostridium perfringens
- etiologic cause of myonecrosis, 1559
- food poisoning, 1559
- toxins produced by, 1559
  - bacterial gastroenteritis and, 2014t

Clostridium tetani, 1549–1552

Closure, for laceration, 557
Clothing ignition, 614
Clotting cascade, 2589–2590, 2590f
Clouston syndrome, 3460–3461, 3461b
CLOVES syndrome, 3585
Cloxacillin sodium, 1417–1425
Club drugs, used recreationally, 1046
Clubbing
digital, 2150, 2152
nonpulmonary diseases associated with, 2152
of nails, 1101, 3543–3544, 3544f, 3544
Clubfoot
in arthrogryposis, 3661, 3661f
clinical manifestations of, 3598–3599, 3599f
postural, 3598
radiographic evaluation of, 3599
treatment of, 3599
CML, Chronic myelogenous leukemia
CMX001 prodrug, 1668
Coagulase-negative staphylococci (CoNS), 1435–1436
Coagulation
acquired inhibitors of, 2608–2609
activation after injury to glomerulus, 2717
Coagulation factors, 2592t
Coagulation tests, reference values for, 2592t
Coarctation
of aorta, 2364f, 2389–2392, 2392f, 2435
clinical manifestations of, 2390–2391
diagnosis of, 2391
pathophysiology of, 2390
relative frequency of, 2367f
treatment of, 2391
metamorphosis of, 2390f
Coarse facial features, 693–694
Coats disease, 3382, 3382f
Cobalamin (vitamin B$_{12}$)

- absence of transport protein, 2520–2521
- absorption of, disorders of, 2007
- biochemical action, 367t–368t
- deficiency, 372–373
- dietary reference intake, 310t–316t
- impaired absorption, 2520
- inadequate intake, 2520
- metabolic pathway, 705f
- metabolism, 372f, 2520
  inborn errors of, 2521

Cobalamin (vitamin B$_{12}$) deficiency, 2520–2521

- clinical manifestations of, 2521
- diagnosis of, 2521
- etiology of, 2520–2521
- laboratory findings of, 2521
- treatment of, 2521

Cobb angles measurements, 3635f

Cocaine

- abused by adolescents, 1055
- effect on infant, 978

*Coccidioides* spp., 1654–1657

*Coccidioidomycosis*, 1401t, 1654–1657

- clinical manifestations of, 1654–1655
- complicated pulmonary infection, 1655
- diagnosis of, 1655–1656
  - culture, histopathologic findings, and antigen detection, 1655–1656
  - imaging, 1656, 1656f
  - serology, 1656
- disseminated infection, 1655, 1655t
- epidemiology of, 1654
- etiology of, 1654
- natural history of, 1655f
- pathogenesis of, 1654
prevention of, 1657
primary, 1655, 1655f
residual pulmonary, 1655
surgical management of, 1657
treatment, 1656–1657, 1657t
diffuse pneumonia, 1657
disseminated (extrapulmonary) infection, 1657
meningitis, 1657
primary pulmonary infection, 1656–1657

Cochlear implants, components of, 3410f
Cockayne syndrome, 830t–831t, 3500
Codeine, for burn injuries, 621
Coenzyme Q10, for migraine, 3135t–3136t
Cogan syndrome, 1327t, 3371
Cognitive assessment, in language delays, 279
Cognitive behavioral therapy (CBT), 204, 235, 240
Cognitive complications, of sickle cell anemia, 2547
Cognitive development
  in adolescent, 1017–1018
  age 0-2 months, 132–133
  age 2-6 months, 135
  age 6-12 months, 135
  age 12-18 months, 137
  age 18-24 months, 142
  in middle childhood, 149–150
Cognitive distortions, suicide and, 225
Cognitive function, in T1DM, 3038
Cognitive mapping, 33, 34f
Cognitive theories, 120–121
Cognitive-behavioral disorders, after traumatic brain injury, 3754
Cognitively impaired child, measures of pain specific to, 471
Cold agglutinin disease, 2564
Cold antibodies, autoimmune hemolytic anemias associated with, 2564
Cold hemagglutinins, 1611
Cold injuries, 623–626
  chilblain (pernio) as, 626
  clinical manifestations of, 623–626
  cold-induced fat necrosis (panniculitis) in, 626
  etiology of, 623
  frostbite as, 624
  frostnip as, 623–624
  hypothermia as, 624–625
  immersion foot (trench foot) as, 624
  pathophysiology of, 623
Cold panniculitis, 3534
Cold stress, newborn, 913
Cold symptoms, caused by HCoVs, 1743–1744
Cold water injury, in drowning, 609–610
Cold water shock, 609
Cold-induced fat necrosis (panniculitis), 626
Cold-induced urticaria, hereditary diseases with, 1225t
Colesevelam, for T2DM, 3045t
Colic, 136–137
  infant, 2041–2042, 2042t
Colistin, 1417t–1425t, 1429
Colitis
  amebic, 1832
  indeterminate, 1973
  ulcerative, 3447
    chronic diarrhea and, 2035
    Crohn disease and, 1974–1975, 1974t
Collaborative care, 200
Collecting duct, secretion of hydrogen ions in, 413f
Collective violence, 1037
Collodion baby, 3501, 3510, 3510f
Colloid goiter, 2928
Colloid milium, 3499
Colloids
  therapeutic, 3451
  use for burns, 618
Coloboma
  of eyelid, 3362
  of fundus, 3384–3385
  of iris, 3349, 3349f
  optic nerve, 3385, 3385f
Colon
  adenocarcinoma of, 2704
  obstruction in, 1905t
  primary carcinoma of, 2063
  structure and function of, 1946
Colony-stimulating factors, 2501t
Color vision testing, 3343
Colorado tick fever, 1756
Colorectal cancer syndromes, general features of, 2062t
Colorectal carcinoma, 2063, 2704
Colpocephaly, in corpus callosum, 3071
Columbia Suicide Severity Rating Scale (C-SSRS) Screener, 227, 227b
Column of Morgagni, 2059f
Coma, 565
  in mushroom-associated syndromes, 3803t
Comatose drowning patients, 611

Combination therapies
  antibiotics, 1416
  antiretroviral, 1788–1799

Combined hormonal contraceptives, 1069–1070 , 1069b

Combined immunodeficiency
  ataxia-telangiectasia, 1117–1118
  cartilage-hair hypoplasia, 1117
  genetic basis of disorders, 1116
  treatment of, 1120–1121
  Wiskott-Aldrich syndrome, 1117

Combined methylmalonic aciduria and homocystinuria, 719

Combined mineral vitamin mix (CMV), 340

Combined oral contraceptives, 1065t–1066t , 1069–1070

Comedonal acne, 3576 , 3576f , 3577b

Comet tails, in HAPE ultrasound, 606

Comitant strabismus, 3354–3356

Commercial sexual exploitation of children (CSEC), 1079

Commission on Accreditation of Medical Transport Systems (CAMTS), 520–521

Common cold, 1741 , 2185–2188
  clinical manifestations of, 2186
  complications of, 2188
  conditions mimicking, 2187t
  diagnosis of, 2186
  epidemiology of, 2185–2186
  etiology of, 2185
  laboratory findings of, 2186–2187
  pathogenesis of, 2186 , 2186t
  prevention of, 2188
  treatment of, 2187–2188
antiviral, 2187
ineffective, 2188
supportive and symptomatic, 2187–2188

Common factors approach, 113–114, 115t

Common ichthyoses
ichthysis vulgaris, 3510, 3512f
X-linked, 3510–3513, 3512f

Common variable immunodeficiency disease (CVID), 1098, 1108t, 1109–1110, 2001

Commotio cordis, 2450

Communicable diseases, childcare and, 1370–1375, 1371t
antibiotic use and bacterial resistance, 1372
bloodborne pathogens, 1372
epidemiology, 1371
gastrointestinal tract infections, 1371–1372
herpesviruses, 1372
invasive organisms, 1372
prevention, 1373–1375, 1373t–1375t
respiratory tract infections, 1371
skin diseases, 1372
standards, 1375

Communicating hydrocele, 2066

Communication disorders, 273–283
clinical manifestations, 276–277
cognitive assessment, 279
DSM-5 for, 276b
epidemiology, 275
etiology, 275
and evaluation of social behaviors, 279
hearing impairment and, 278
hydrocephalus and, 278
motor speech disorders, 278
pathogenesis, 275–276
prognosis, 280–281
psychologic evaluation for, 279
treatment, 280

Communications
at age 6-12 months, 135–136
critically ill newborn, 909–910
dispatch center and, 519
in palliative care, 52–62
in postresuscitation care, 547

Community acquisition, cytomegalovirus (CMV), 1719
Community context, caring for child and youth in, 78
Community interventions, adolescent, 1019t –1020t
Community violence, 86 , 1037
Community-acquired pneumonia, 2266–2274
clinical manifestations of, 2269–2270
complications of, 2273–2274, 2273f, 2274t
diagnosis of, 2270–2271, 2270f, 2271t
epidemiology of, 2266
etiology of, 2266–2267, 2268t
pathogenesis of, 2267–2269, 2269t
prevention of, 2274
prognosis of, 2273
treatment of, 2271–2273, 2272t –2273t

Comorbidities
asthma with, 1198
chronic fatigue syndrome with, 1092
language disorders with, 281
obesity with, 350–351

Comparative genomic hybridization (CGH), 655
Comparing quality, 36–37
Compartment syndrome, chronic, 3697–3698
Compensated shock, 573–574

Compensation
  metabolic, acidosis respiratory with, 589
  respiratory, metabolic acidosis with, 588–589

Compensatory overinflation, 2222

Compensatory scoliosis, 3639–3640

Complement
  defect, in primary immunodeficiency, 1099t
  deficiency
    laboratory tests for, 1103t
    screening tests for, 1101b
    participation in host defense, 1151
  secondary disorders of, 1155
  treatment of disorders of, 1155–1156

Complement control protein deficiencies, 1154–1155

Complement system
  alternative pathway, 1151
  classical and lectin pathways, 1150–1151, 1150f
  complement cascade, 1149f
  components and pathways, 1149–1151
  constituents of, 1149b
  control mechanisms, 1151
  deficiencies of plasma, membrane, or serosal complement control proteins, 1154–1155
  evaluation of, 1152
  genetic deficiencies of complement components, 1152–1154
  initiating sequences, 2717
  membrane attack complex, 1151
  participation in host defense, 1151
  secondary disorders of complement, 1155
  treatment of complement disorders, 1155–1156

Complementary and alternative medicine, 2639–2640
  acupuncture, 513
  cannabis, 513–514
case of lead encephalopathy associated with, 3797
dietary supplements, 511
herbs, potentially toxic, 512
massage and chiropractic, 511–513
mind-body therapies, 513

Complementary feeding, 326 , 326b

Complement-mediated lysis, in PNH, 2538f

Complete androgen insensitivity syndrome (CAIS), 3017

Complete blood count, reference intervals, e 6t–e 13t

Complete fractures, 3665

Complex chronic pain problems, management of, 489–490

Complex febrile seizure, 3092

Complex regional pain syndromes, 488 , 1332 , 1332b , 3166

Complex tics, 3125

Compliance
  in equation of motion, 592
  lung, decreased, 584 , 585b
  respiratory, dynamic and static, 599–600

Complicated grief, 171

Components of asthma treatment
  control of factors contributing to asthma severity, 1196b
  patient education, 1196
  pharmacotherapy, 1198–1200
  regular assessment and monitoring, 1192–1196

Compression, cardiac, 542 , 542f–543f

Compulsions, 207t

Compulsive Valsalva-like maneuver, 3122

Computed tomography (CT)
  for appendicitis, 2051–2052 , 2052f
  chest, 2155
cranial, in neuroradiologic procedures, 3061
for cystic fibrosis, 2290f
in diagnosis, of urinary tract obstruction, 2804
in evaluation of
musculoskeletal system, 3596
osteomyelitis, 3672–3673, 3673f
septic arthritis, 3677
high-resolution, bronchiectasis, 2280f
for liver, 2091
of pancreatitis, 2077f
reducing radiation from, 3781–3782
of retropharyngeal abscess, 2197f
of temporomandibular joint in JIA, 1263f

Computed tomography angiography, of pulmonary emboli, 2311f

Concealed penis, 2824f

Concrescence, of teeth, 1913

Concussion
  of periodontal ligament, 1922
  soccer-related, 3713
  sports-related TBI, 3700–3702

Conditional essential/indispensable, 307–308

Conditioning therapy, for nocturnal enuresis, 2821

Conditions that mimic seizures, 3121–3128, 3122t
  movement disorders and other paroxysmal movements and postures in, 3124–3126
  oculomotor and visual abnormalities in, 3126–3127
  sleep-related disorders in, 3127–3128
  syncope and other generalized paroxysms in, 3121–3124

Condoms, 1065t–1066t, 1073

Conduct disorder, 236–240, 1037t
  clinical course of, 238
  differential diagnosis of, 238
  disparities in, 15
  DSM-5, 237b
epidemiology of, 238
etiology of, 238
level of care, 240
prevention of, 238–239
risk factors of, 238
screening/case finding, 239
sequelae of, 238
treatment for, 239–240

Conductive hearing loss, 3399, 3401b

Condylomata acuminata, 2866, 3567, 3567f
  vulvar, 2845–2846

Condylomata lata, 1592–1593
  perianal, 1594f

Cone snails, 3827

Conflict, global health and, 28–30

Conformal irradiation, 2643

Conformity, 1018

Congenital abnormalities
  absence of skin, 3457–3458, 3458f
  diaphragmatic hernia, 944–946, 944f, 946f
  fetal therapy for, 891t
  in folate transport and metabolism, 2518–2519
  in infants of diabetic mothers, 984
  intestinal, pseudoobstruction as, 1955–1958, 1958f
  of intestine
    duodenal obstruction as, 1950–1951
    jejunal and ileal atresia and obstruction, 1951–1952
  multiple, 989, 991f
  mydriasis, 3350
  of platelet function, 2617–2618

Congenital absence
  pulmonary valve, 2399
  vaginal, 2871
Congenital adrenal hyperplasia (CAH), **2960t–2961t, 2970–2979, 2971f**

in 46, XX DSD, **3012**

aldosterone synthase deficiency in, **2978–2979**
diagnostic and treatment of, **2972t–2973t**
glucocorticoid-suppressible hyperaldosteronism in, **2979**
by 11β-hydroxylase deficiency, **2976**
by 17-hydroxylase deficiency, **2977**
by 21-hydroxylase deficiency, **2971–2976, 2973t**
by 3β-hydroxysteroid dehydrogenase deficiency, **2976–2977**
lipoid, **2977–2978**
P450 oxidoreductase deficiency in, **2978**
screen for, **3010–3011**

**Congenital anomalies**

associated with hematuria, **2744**
clinical aspects of, **1930t**
congenital esophageal stenosis, **1931, 1931f**
esophageal atresia and tracheoesophageal fistula, **1929–1931, 1929f**
of kidney and urinary tract, **2779**
laryngotracheoesophageal clefts, **1931**
of larynx, trachea, and bronchi, **2207–2211**
life-threatening, **911t**
in neonatal period, **910**
and occurrence of otitis media, **3419**
of stomach, **1946–1950, 1948t**
  - congenital gastric outlet obstruction as, **1948–1949**
  - gastric duplication as, **1949**
  - gastric volvulus as, **1949**
  - hypertrophic gastropathy, **1949–1950**
  - hypertrophic pyloric stenosis as, **1946–1948**

**Congenital anorchia, 2993–2994**

**Congenital autosomal recessive NDI, 2889**

**Congenital central hypoventilation syndrome (CCHS), 2332–2335, 2332t**
clinical manifestations of, **2333**
differential diagnosis of, **2333, 2334t**
genetics in, **2332t**
Congenital complete AV block, 2447

Congenital condition, leg-length discrepancy caused by, 3613

Congenital contractural arachnodactyly (CCA), 3744

Congenital cranial dysinnervation disorders, 3073

Congenital deficiencies
  of membrane attack pathway components, 1152
  plasma, membrane, or serosal complement control proteins, 1154–1155
  vitamin D, 380

Congenital diaphragmatic hernia, 894–895

Congenital diarrheal disorders, chronic diarrhea and, 2036, 2037

Congenital diffuse hair loss, 3541–3542
  Menkes kinky hair syndrome, 3542
  monilethrix, 3542
  pili annulati, 3542
  pili torti, 3541–3542
  structural defects of hair shaft, 3541
  trichorrhexis invaginata, 3542
  trichorrhexis nodosa, 3541
  trichothiodystrophy, 3542
  uncombable hair syndrome, 3542
  woolly hair disease, 3542

Congenital disorders
  afibrinogenemia, 2598–2599
  amegakaryocytic thrombocytopenia, 2576–2577, 2615
  angular deformities of tibia and fibula, 3612–3613
  blindness caused by, 3347b
  causing cervical instability, 3647b, 3649–3650
  erythropoietic porphyria, 839–840, 3498
  of glycosylation, 799
  goiter, 2925–2926, 2925f
  hepatic fibrosis, syndromes associated with, 2136t
hypopituitarism, 2884, 2884f
ichthyosiform erythroderma, 3513
idiopathic motor nystagmus, 3358
kyphosis, 3642
lobar emphysema, 2223–2224, 2223f
of lung, 2229–2233
    bronchogenic cysts, 2232, 2232f
cystic malformation, 2230–2231
    lung hernia, 2233
    pulmonary agenesis and aplasia, 2229
    pulmonary hypoplasia, 2229–2230
    pulmonary lymphangiectasia, 2232–2233, 2233f
    pulmonary sequestration, 2231–2232, 2231f
Lyme disease, 1607
lymphocytic choriomeningitis virus infection, 1771–1772
muscular torticollis, 3646–3647
with nail defects, 3543f
nasolacrimal duct obstruction, 3363
of nose, 2180–2182
ocular motor apraxia, 3358
osteopetrosis, 1130
polycythemia, 2567
sensory nystagmus, 3358
thrombocytopenic syndromes, 2615–2616
tuberculosis, 1575
vertical talus, 3600, 3600f

Congenital dyserythropoietic anemias, 2515–2516
    type I, 2515–2516
    type II, 2516
    type III, 2516

Congenital esophageal stenosis, 1931, 1931f

Congenital fibrosis, of extraocular muscles, 3073

Congenital forms, of multiple pituitary hormone deficiency, 2881–2882

Congenital generalized lipodystrophy, 3050, 3050f

Congenital Guillain-Barré syndrome, 3337
Congenital heart disease (CHD), 2367–2371

acyanotic
  left-to-right shunt lesions, 2373–2384
  regurgitant lesions, 2393–2395

congenital malformation syndromes associated with coronary arteries unassociated with, 2422b
cyanotic
  decreased pulmonary blood flow, 2396–2407
  evaluation of the critically ill neonate, 2395–2396
  with increased pulmonary blood flow, 2407–2420
ductus-dependent, 911t
etiology of, 2367–2370
general principles of treatment of, 2428–2436
  in adults, 2431–2436, 2433f
  atrial septal defects, 2433
  complete atroventricular canal, 2433
  interstage management of, 2431
  left-to-right shunts, 2432–2433
  long-term management of, 2431
  patent ductus arteriosus, 2433–2434
  postoperative management of, 2430–2431
  risks in, 2432b
  survival into adulthood without surgery, 2432b
  ventricular septal defects, 2433

 genetics of
  arrhythmias, 2371t
  defects associated with syndromes, 2368t–2369t
  isolated, 2369t

 genetics screening algorithm for, 2350f

malformations, anomalies of the aortic arch, 2420–2422

next generation genome sequencing and, 2370

obstructive lesion in
  aortic stenosis, 2387–2389
  coarctation of the aorta, 2389–2392
  infundibular pulmonary stenosis and double-chamber right ventricle, 2386–2387
  peripheral pulmonary stenosis, 2387
  pulmonary stenosis in combination with an intracardiac shunt, 2387
  pulmonary valve stenosis with intact ventricular stenosis, 2384–2386

 pregnancy and, 2435

prevalence of, 2367
sports participation and, 3680–3683
sudden death and, 2448

Congenital heart lesions
acyanotic, 2372–2373
resulting in increased pressure load, 2372–2373
resulting in increased volume load, 2372
relative frequency of, 2367

Congenital hepatic fibrosis, 2138
syndromes associated with, 2136

Congenital hyperthyroidism, 2933–2934
clinical manifestations of, 2933, 2934f
etiologic classification of, 2933–2934
prognosis of, 2933
prognosis of, 2934
reason of, 2933–2934

Congenital hypogonadotropic hypogonadism, forms of, 2998

Congenital hypothyroidism, 982, 2914–2920
central (hypopituitary), 2916
clinical manifestations of, 2917–2918
epidemiology of, 2914
etiologic classification of, 2914–2916, 2915
laboratory findings of, 2918
primary, 2914–2916
prognosis of, 2920
thyroid function in preterm babies, 2916–2917
treatment of, 2918–2920

Congenital hypotonia, benign, 3273

Congenital infection syndrome, 3372

Congenital infections, 1008–1013
  clinical manifestations, 1010, 1010t
cytomegalovirus (CMV) in, 1721–1722, 1721t
diagnosis, 1010–1011
in differential diagnosis of cataracts, 3373b
general approach, 1009
infectious agents, 1011
intellectual disability caused by, 284t
other caused by, 1010t
pathogenesis, 1009–1010, 1009f, 1009t

Congenital insensitivity, to pain and anhidrosis, 3335

Congenital large hyperlucent lobe, 2223–2224

Congenital lip pits, 1926

Congenital malformations, 988t
  associated with congenital heart disease, 2347t–2348t
  of ear, 3411–3414
    cholesteatoma, 3414, 3414f
    external auditory canal, stenosis or atresia of, 3412–3413
    inner ear, 3413–3414
    middle ear, 3413
    pinna, 3411–3412, 3412f

Congenital microvillus atrophy, 1996

Congenital mitral insufficiency, 2394

Congenital mitral stenosis, 2393

Congenital muscle fiber-type disproportion (CMFTFD), 3263–3264
  clinical manifestations of, 3263–3264
diagnosis of, 3264
genetics of, 3264
laboratory findings in, 3264
pathogenesis of, 3263
treatment of, 3264

**Congenital muscular dystrophies, 3292–3294 , 3293f**
cardiac involvement in, 3260t –3261t
clinical manifestations of, 3292–3293
clinical signs of, 3258t –3259t
diagnosis of, 3293–3294 , 3294f
laboratory findings in, 3293
treatment of, 3294

**Congenital myasthenia syndromes, 3306–3307**
classification of, 3305t
clinical clues pointing to, 3307t
differential diagnosis of, 3306t
distinctive clinical and electrodiagnostic features of, 3306t

**Congenital myopathies**
clinical features of, 3263t
treatment of, 3257 , 3262f

**Congenital nephrotic syndrome, 2760 , 2781**

**Congenital omphalocele, 975–976**

**Congenital polysplenisum, 2619**

**Congenital pulmonary airway malformation, 895**

**Congenital rib anomalies, 2329**

**Congenital rubella syndrome, 1676–1680**
in T1DM, 3024

**Congenital scoliosis, 2328–2329 , 3637–3639**
associated conditions of, 3637–3638
classification of, 3638
definition of, 3637
etiology of, 3637
natural history of, 3638
thoracic insufficiency syndrome of, 3639, 3639f
treatment of, 3638–3639

Congenital sodium diarrhea, 2008

Congenital syphilis, 1596–1597
diagnosis of, 1598t
late manifestations of, 1594t
prevention of, 1599

Congenital toxoplasmosis, 1870f
clinical manifestations of, 1870, 1871t
epidemiology of, 1865
pathogenesis of, 1866
serologic testing for, 1874
treatment of, 1875, 1876f

Congenital varicella syndrome, 1710–1711, 1711f

Congenital X-linked NDI, 2889

Congenital-onset muscular dystrophy, 3258–3259f

Congestive heart failure, dosage of drugs for, 2480t

Congestive splenomegaly, 2619–2620

Conjoined twins, 899

Conjugate vaccines, 1351, 1351t

Haemophilus influenza type b, 1487t
meningococcal, 1476–1477
pneumococcal, 2274

Cortical causes of hyperhidrosis, 3536b

Cortical hyperostosis, infantile, 3735–3736, 3735f–3736f

Cortical necrosis, 2736

Corticospinal tract, HSV infection, 1706f

Corticosteroid therapy

  abrupt cessation of administration of, 2966–2967
  for acute bacterial meningitis, 3230–3231
  altered end-organ sensitivity to, 2968–2970
  antenatal, for neonatal hemorrhage, 918
  for Crohn disease, 1985
  cutaneous atrophy induced by, 3517–3518
  for Diamond-Blackfan anemia, 2511
  for drug- or toxin-induced liver injury, 2133
  fluorinated, 1279
  inhaled, for asthma, 1200r
  intranasal, 178b
  *Legionella* and, 1539
  in maintenance immunosuppression, 2783
  of minimal change nephrotic syndrome, 2758
  oral, for viral coup, 2205
  for *Pneumocystis jiroveci* pneumonia, 1663
  risk assessment for, 1202r
  of sarcoidosis, 1309
  for shock, 580b–581b
  of SLE, 1278
  synthetic, 2958
  systemic, 1202
  in testicular adrenal rest tumors, 2975
  topical, 3452–3453
    for atopic dermatitis, 1213–1214, 1214b
    for tuberculosis, 1580

Corticosteroid-binding globulin deficiency, 2963
Corticosterone methylxoxidase deficiency, 2978
Corticotropin deficiency, 2967
Corticotropinoma, 2898
Cortisol
  deficiency, in 21-hydroxylase deficiency, 2973
  excess, 2983
  reference intervals, e 6t – e 13t
  resistance, due to glucocorticoid receptor gene mutation, 3013
  secretion, 2956
    regulation, 2956
Cortisol-binding affinity, decreased, 2963
Cortisol-growth hormone deficiency, hypoglycemia in, 859
Cortisone reductase deficiency, 2969
Corynebacterium diphtheriae, 1458–1462
Coryza, in SARS-CoV, 1744
Cosmetic surgery, of breast, 2857
Costeff syndrome, 711–712
Costello syndrome, 2893
Co-trimoxazole, 1417t – 1425t
Cotton, burn injuries from, 614
Cough
  assist device, 2330
  clinical clues about, 2163t
    in common cold, 2188
  recurrent/persistent, 2161–2163
    respiratory signs and symptoms, 2166t
Cough reflex, 565t
Councilman bodies, 1765
Counseling
for children with disabilities, 3769–3770
contraceptive, 1067
for cytomegalovirus (CMV), 1723
of family of child with intellectual disability, 292
individual and family, 261
pregnancy, 1075
for seizures, 3100–3101, 3101t
stages of change and strategies for, 113t
in well-child care, 75–78

Cover tests, for strabismus, 3353–3354, 3354f

Covert toxocariasis, 1888t

Cowden syndrome, 2062t, 3475t–3476t, 3549

Cow's milk
hypersensitivity to, pulmonary hemosiderosis and, 2307
protein-based formulas, 325

Coxib drugs, in pain management, 472–475

Coxiella burnetii, 1633–1635

Crackles, 2150

Cradle cap, 3495f

CRAFFT screen, 1041, 1047b

Cramps, heat, 3705

Cranial bruits, 3055

Cranial CT angiography, in neuroradiologic procedures, 3061

Cranial disorders in newborn, 913–915

Cranial encephalocele, 3068

Cranial index, in deformational plagiocephaly, 3084

Cranial length, in deformational plagiocephaly, 3084

Cranial nerves
agenesis of, 3072–3073
in neurologic examination, 3055–3057

Cranial ultrasonography, in neuroradiologic procedures, 3061

Cranial vault asymmetry, in deformational plagiocephaly, 3084

Craniofacial anomalies, 995t
  in Diamond-Blackfan anemia, 2510t
  and incidence of otitis media, 3419

Craniopharyngiomas, 2676–2677, 2677f, 2876

Craniosynostosis, 3054–3055, 3080–3082
  clinical genetic classifications of, 3080t
  clinical manifestations and treatment of, 3080–3082
  deformational plagiocephaly and, 3083–3084, 3083t
  development and etiology of, 3080
  epidemiology and clinical characteristics of, 3081t
  genetic testing in, 3081f

Craniotabes, 375–376, 3055

Cranium bifidum, 3068

C-reactive protein (CRP), 1251b, 1251t
  increase in, appendicitis and, 2051
  reference intervals, e 6t –e 13t

Creams, 3451

Creatine
  deficiency, 722–723, 722f
  as performance-enhancing aids, 3709, 3709t

Creatine deficiency syndromes, 3099

Creatine kinase, 3246
  increased
    in muscular dystrophy, 3258t–3259t
    nonneuromuscular disorders causing, 3249t
    reference intervals, e 6t –e 13t

Creatinine
  reference intervals, e 6t –e 13t
transporter defect, 722

Crescent formation, in Bowman's space, 2717

Crescent sign, 1166

Cretinism, endemic, 2926–2927
  clinical manifestations of, 2926–2927
  etiology of, 2926
  pathogenesis of, 2927
  treatment of, 2927

Creutzfeldt-Jakob disease, 1807, 1809, 1809t–1810t

Cricopharyngeal incoordination, 1932

Crigler-Najjar syndrome
  type I, 2102
  type II, 2102–2103

Crimean-Congo hemorrhagic fever, 1766, 1768–1769

Crisaborole (Eucrisa), 1214

Critical care setting, adrenal insufficiency in, 2967–2968

Critical high airway obstruction syndrome, 928f

Critical illness myopathy, 3296

Critical opening pressure, 593–594

Critically ill children
  evaluation of, with cyanosis and respiratory distress, 2395–2396
  treatment of, 45–47

Crizotinib, 2665

CRMO, Chronic recurrent multifocal osteomyelitis

Crocodile bites, microorganisms associated with, 3818b

  behavior of, 1982f
  chronic diarrhea and, 2035
  clinical manifestations of, 1981–1982
diagnosis of, 1983–1984
Lémann score, 1981f
prognosis for, 1986
stenosis in, 1983f
stenotic, 1983f
treatment of, 1984–1986
  medical, 1984–1986
  support in, 1986
  surgery for, 1986
ulcerative colitis and, 1974–1975, 1974t
very early onset, 1986–1987

Crossed adductor response, 3059
Crossed renal ectopia, 2788f
Cross-McKusick-Breen syndrome, 3477

Crotalinae family
  bites from, 3822
  toxin effects, 3823t

Crotalinae polyvalent immune Fab antivenom, 3823, 3824t
  indication for, 3824t

Croup, 2203
  spasmodic, 2204

Crouzon syndrome, in craniosynostosis, 3081

Crown
  completion of, 1913t
  injuries to, 1923t

Crying
  during age 0-2 months, 133
  pattern, 136–137, 136f

Cryoglobulinemic vasculitis, 1327t
Cryohydrocytosis, 2538
Cryoprecipitate, 2586, 2607
Cryopyrin-associated periodic syndrome (CAPS), 1294t, 1299–1300
Cryptic microdeletion, 657f

*Cryptococcus gattii*, 1644–1646
  - clinical manifestations of, 1644–1645

Deep tendon reflexes
    in motor system, disorders of, 3246t
    in neurologic evaluation, 3059
Deep venous thrombosis (DVT), 2309, 2310t
    extremity, 2604
    in spinal cord injury, 3755–3757
Defecation disorders, functional, 2045
Deferasirox, 2549, 2556
Deferiprone, 2549, 2556
Deferoxamine, 2549, 2556
  antidote for iron toxicity, 503
Deficiency of adenosine deaminase 2 (DADA2), 1302
Deficiency of IL-1 receptor antagonist (DIRA), 1301–1302
Deficiency of interleukin-36 receptor antagonist (DITRA), 1303
Deficit therapy, 429–432
  adjusting therapy, 430, 430b
  clinical manifestation, 429, 429b
  fluid deficit, calculation of, 429
  hypernatremic dehydration, 431–432, 431b
  hyponatremic dehydration, 430–431
  laboratory findings, 429
  severe dehydration, approach to, 430, 430b
Definitive therapy, for hyperthyroidism, 2933
Deformational plagiocephaly (DP), 3082–3086
  causes of, 3082
  craniosynostosis and, 3083–3084
  epidemiology and etiology of, 3082
  history and physical examination for, 3083–3084, 3083r, 3084f–3085f
  incidence of, 3082
  lateral and posterior, 3084r
  outcomes of, 3085–3086
  prevention of, 3084–3085
  risk factors for, 3082, 3082r
  treatment of, 3084–3085
    options for, 3085, 3086r
Deformations, 986f
  of bone or joint, 3592–3594
    resulting from uterine compression, 990f
Degenerative neuromuscular syndrome, in chronic cholestasis, 2099
Degludec
for T1DM, 3032
for T2DM, 3045

Deglycosylation, congenital disorders of, 806
Degranulation abnormalities, 1134t –1135t

Dehydration, 1382
from cholera, 1516, 1517f
in heat illness, 3705
symptoms associated with, 2027t
systemic, 2890
in T1DM, 3030

Dehydroepiandrosterone (DHEA)
action of, 2955–2956
as performance-enhancing aids, 3709
secretion regulation, 2956

Dehydroepiandrosterone sulfate
action of, 2955–2956
secretion of, 2956f

Deiodination, defects in, 2916
Déjèrine-Sottas disease, 3327
Del Castillo syndrome, 2994
Delamanid, against *M. tuberculosis*, 1563

Delayed intensification, of treatment for ALL, 2652

Delayed myelopathy, 3783

Delayed sleep phase disorder, 183

Delayed-onset sensorineural, 3401b

Delayed-type hypersensitivity reaction, 1242

Deletions, 637–638, 637t, 665–667, 666t
   immunoglobulin heavy- and light-chain, 1110

Delirium
   differential diagnosis of, 248t
in mushroom-associated syndromes, 3803
in palliative care, 60

Delivery devices and inhalation technique, for asthma, 1204

Delivery room emergencies, 925–929
- abdominal wall defects, 929
- airway obstruction, 928
- failure to initiate or sustain respiration, 926
- injury during delivery, fractures, 929
- meconium, 928
- neonatal encephalopathy, 928
- neonatal resuscitation, 925–927, 926f–927f
- placental abruption, 928
- pneumothorax, 928
- respiratory distress and failure, 928

Delivery strategies, effective, 26–28, 28f

Delusions, 244

Demeclocycline, 1417t–1425t

Demographics, and high-risk infant, 898t

Demyelinating disorders, of central nervous system, 3196–3209
- acute disseminated encephalomyelitis, 3196–3199, 3198f, 3199t
- definition of, 3197t
- differential diagnosis of, 3197t
- multiple sclerosis, 3202–3207, 3202t–3206t, 3204f
- myelin oligodendrocyte glycoprotein-associated disorders, 3209
- neuromyelitis optica spectrum disorders, 3207–3209, 3208f, 3208t
- optic neuritis, 3199–3200, 3200f
- transverse myelitis, 3200–3202, 3201f, 3201t

Demyelination, stroke and, 3217

Demystification of neurodevelopmental dysfunctions, 260

Dendritic cells, 1128–1130
- abnormalities of, 1130
- activation, 1129
conventional and plasmacytoid, 1130
development, 1128–1129
functional activities, 1129–1130

Dendritic keratitis, 3370–3371, 3371f

Dengue fever, 1385, 1760–1764
clinical manifestations of, 1762
complications of, 1764
diagnosis of, 1762–1763, 1763f
differential diagnosis of, 1763
epidemiology of, 1760–1761, 1761f
etiology of, 1760–1764, 1761t
laboratory findings of, 1763
pathogenesis of, 1762
prevention of, 1764
prognosis for, 1764
treatment of, 1764

Dengue hemorrhagic fever, 1760–1764
clinical manifestations of, 1762
complications of, 1764
diagnosis of, 1762–1763, 1763f
differential diagnosis of, 1763
epidemiology of, 1761
etiology of, 1760–1764, 1761t
laboratory findings of, 1763
pathogenesis of, 1762
prevention of, 1764
prognosis for, 1764
treatment of, 1764

Dengue shock syndrome (DHF/DSS), 1762
treatment of, 1764

Dengue-like diseases, 1761

Dennie-Morgan folds, 1175, 1176f

   for airway obstruction, 535
   for HACE, 605
   indications and adverse reactions of, 2641t–2642t
   suppression test, in Cushing syndrome, 2984

Dexmedetomidine, 463
   for sedation in mechanical ventilation, 590–591

Dexmethylphenidate, for ADHD, 190t–191t

Dextroamphetamine, for ADHD, 190t–191t, 266

Dextromethorphan, abuse of, 1045t

Dextrose, in treatment of hypoglycemia, 503

DGAT1 mutation, 1998

Diabetes, cystic fibrosis and, 2287

Diabetes insipidus, 2887–2889
   central, 393, 2888
      treatment of, 2889
   central, clinical parameters of, 2890t
   nephrogenic, 393, 2766–2767, 2889
      clinical manifestations of, 2766–2767
      diagnosis of, 2767
      pathogenesis of, 2766
      treatment and prognosis of, 2767
      treatment of, 2889
      in patient with polyuria, polydipsia, and hypernatremia, 2888
      physiology of water balance, 2887–2888

Diabetes mellitus, 3019–3052
   classification of, 3019–3022, 3020t
cystic fibrosis-related, 3051
diagnostic criteria for, 3021

genetic syndromes associated with, 3051
insulin-dependent, 416
key features of, 3022
maternal, fetus affected by, 885
other etiologies of, 3022
other specific types of, 3022, 3047–3052
permanent neonatal, 3047–3048, 3048f
prediabetes and, 3022
and sports participation, 3680t–3683t
transient neonatal, 673f, 3047, 3048f
type 1, 3020–3042, 3021f
dental or oral findings associated with, 1914t
type 2, 3021–3022, 3042–3047

Diabetic ketoacidosis
   classification of, 3029t
   protocol, 3031
   treatment of, 3029, 3029t–3030t

Diabetic mothers, infants of, 852, 983–985, 984f, 984t

Diabetic nephropathy, in T1DM, 3040–3041

Diabetic neuropathy
   in T1DM, 3041

Diabetic retinopathy, 3383, 3383f
   in T1DM, 3040, 3040t

Diagnostic clues
   to anaerobic infections, 1558t
   to autoinflammatory syndromes, 1297t
   to congenital syphilis, 1598t
   historical, to hair disorders, 3538t

Diagnostic criteria
   for acute necrotizing encephalopathy of childhood, 3178t
   of bronchopulmonary dysplasia, 938t
for Guillain-Barré syndrome, 3338t
for idiopathic intracranial hypertension, 3238t
for Marfan syndrome, 3742b
for polycystic ovary syndrome, 2858t
of polycythemia vera, 2566t
of rheumatic fever
  major criteria, 1447
  minor criteria, 1448
of staphylococcal toxic shock syndrome, 1434t

Diagnostic errors, 43, 44b

Diagnostic evaluation
  of children with nephrotic syndrome, 2757
  of primary CNS vasculitis, 3220t
  of tall stature, 2895

Diagnostic imaging
  in coccidioidomycosis, 1656, 1656f
  for dysmorphic disorder, 994
  in fetal assessment, 883t
  intrauterine, of fetal disease, 889–892
  in JDM, 1282
  MRI, of hypoxic-ischemic injury, 921t
  of solid tumors, 2638
  of urinary tract obstruction, 2801–2803

Diagnostic laboratory testing, for sarcoidosis, 2249

Diagnostic microbiology
  antimicrobial susceptibility testing, 1338
  bacterial and fungal infections
     isolation and identification, 1335–1338
     microscopy, 1335
  fungal cultures, 1338
  parasitic infections, 1339
  point-of-care diagnostics, 1338–1339
  serologic diagnosis, 1339
  specimen collection, 1335
stains used for microscopic examination, 1336t
viral infections, 1339–1341
  antigen detection tests, 1340
  molecular diagnostics, 1340–1341
  specimens, 1339–1340
  viral culture, 1340

Diagnostic radiology, in dental assessment, 1926

Diagnostic testing
  of common malignancies, 2637t
  in developmental dysplasia of hip, 3626–3627
  ethics and, 634
  genetic, 627–628
  for infective endocarditis, 2454f
  for myasthenia gravis, 3308–3309
    children two years of age and older, 3308
    children younger than two years of age, 3308–3309
  of poisoning, 494–495
  in porphyrias
    first-line, 833–834
    second-line, 834
    for subclinical porphyria, 834
  psychologic, for intellectual disability, 289–291
  in tuberculosis, tuberculin skin testing, 1576 , 1576t –1577t
  viral, for HIV, 1787

Dialectical behavioral therapy (DBT), 197 , 235

Dialysis
  in acute kidney injury, 2773–2774
  peritoneal
    in acute kidney injury, 2773t , 2774
    catheters, 1413
    in ESRD, 2778–2779

Diamond-Blackfan anemia, 2510–2512
  clinical manifestations of, 2510–2511
  diagnostic criteria for, 2511t
  differential diagnosis for, 2511
  epidemiology of, 2510
etiology of, 2510, 2510f
laboratory findings for, 2511
prognosis of, 2511–2512
range of congenital anomalies observed in, 2510t
treatment for, 2511

Diaper dermatitis, 2846, 3492, 3492f
candidal, 3564
in immunocompetent patient, 1642

Diaphragm
barrier contraception, 1073
pacing, in CCHS, 2333–2334

Diaphragmatic hernia, 911t, 944–946, 944f, 946f

Diarrhea, 427–428, 428b, 432, 1904–1905
bacterial, 2022–2023
Campylobacter species associated with, 1520t
as cause of GI symptoms, 1902t
childhood, burden of, 2012
chloride-losing, 402
clinical evaluation of, 2026–2028
clinical manifestation of, 2021–2026
congenital
  chloride, 2008
  sodium, 2008
in Crohn disease, 1984t
differential diagnosis of, 1908t
endemic, acute gastroenteritis and, 2013
fluid and nutritional management of, 2029t
functional, 2039, 2042, 2042t
infectious
  antibiotic therapy for, 2031t–2032t
  clinical presentations suggestive of, 2025t
measles and, 1673
mechanisms of, 1907t
from neuroendocrine tumors, 2040–2041, 2040t
in newborn, 912
nonspecific, 2036
osmotic, 2034
pathways of, 2033f
outbreaks of, 2013–2020
in palliative care, 61
nonpharmacologic approach to, 60f
pathogens causing, exposure or condition associated with, 2017t
persistent, 2033
antimicrobial treatment for, 2039t
management of, 2030f
postinfectious, 2000
protozoal, 2026
recognition and management of, protocol for, 2027f
rotavirus and, 2023f
secretory, 2033–2034
pathways of, 2033f
Shigella infection and, 2024f
and sports participation, 3680t–3683t
syndromic, 1997
toddler’s, 1901, 2036
traveler’s, 2033
viral, 2021
while using combined oral contraceptives, 1071f

Diarrhea-associated HUS, 2732
Diarrhetic shellfish poisoning, 3806
Diastematomyelia, 3240–3241, 3240f
Diastolic murmurs, 2353
Diastrophic dysplasia, 3728, 3729f
Diazepam
dosages of, 3104t–3105t
for spasticity, 3760, 3761t
for status epilepticus, 3119t
for tetanus, 1551

Dicarboxylic aminoaciduria, 2007
Dichlorodiphenyltrichloroethane (DDT), 3789
Dichotomous trait, 677
Diclofenac sodium, in pain management, 474t
Dicloxacillin, 1417t – 1425t
DIDMOAD, 3049
Diencephalic seizures, 3124
Diencephalic syndrome, 2668
*Dientamoeba fragilis* infection, drugs for, 1813t – 1828t

Diet

for acne, 3577
for acute gastroenteritis, 2029
for cystic fibrosis, 2295–2296
for dental caries, 1921
gluten-free, 1993–1995
for heart failure, 2479
in T1DM, 3024–3025

Dietary fiber, 309

Dietary Guidelines for Americans, 303

Dietary intake

calcium and vitamin D, bone mass and, 3751
inadequate
of folate, 2518
of vitamin B_{12}, 2520

Dietary reference intake (DRI), 303

Dietary sodium restriction, 2778

Dietary supplements, 511, 511t
efficacy, 511
hepatotoxic, 2132t
interactions with drugs, 513t
safety, 511
Differentiated thyroid carcinomas (DTCs), 2703
Diffuse alveolar hemorrhage, 2306, 2306t
Diffuse anaplasia, 2685
Diffuse astrocytoma (DA), 2671–2672, 2672f
Diffuse cutaneous leishmaniasis, 1842
Diffuse cutaneous mastocytosis, 3524
Diffuse esophageal spasm, 1933
Diffuse hyperkeratosis of palms and soles, 3516
Diffuse intrinsic pontine glioma (DIPG), 2677–2678
Diffuse large B-cell lymphoma (DLBCL), 2660t–2661t, 2661–2662
  chemotherapy regimens of, 2664–2665
  incidence of, 2662f
Diffuse neonatal hemangiomatosis, 3465–3466
Diffuse persistent hyperinsulinism, 853–855
Diffuse pulmonary hemorrhage, 2314f
Diffusely adherent Escherichia coli, 1514
Diffusion, in respiratory failure, 587–588

Donor

for HSCT
- HLA-compatible sibling, 1156, 1157f
- unrelated HLA-matched, 1160

for renal transplant, characteristics of, 2780

selection
- for intestinal transplantation, 2009
- for pediatric heart transplantation, 2483–2484

vs. recipient NK cell alloreactivity, 1161–1162

Doose syndrome, 3098

L-Dopa, lifelong supplementation with, 698

Dopamine

- biosynthesis, 2959f
- for heart failure, 2480t, 2481
- for postresuscitation stabilization, 545t
- for shock, 582t

Dopamine β-hydroxylase deficiency, 728, 3122–3123

Dopamine hypothesis, in ADHD, 264

Dopamine transporter protein (DAT), 729

Dopamine-serotonin vesicular transporter disease, 729

Dopa-responsive dystonia, 3162–3163
- autosomal dominant form, 727–728
- autosomal recessive form, 727

Doppler echocardiography, 2360–2361, 2361f

Doppler imaging, for burn depth determination, 617

Doppler ultrasound, transcranial, 2546, 2549

Doripenem, 1417t–1425t

Dorsal aortae, 2343f

Dosages
- adjustment, in CKD, 2778
- of antiretroviral drugs, 1799
for constipation, 1961
for disimpaction, 1961
of drugs, for heart failure, 2480
oral antispasmodic medications, 3761

Double aortic arch, 2422
Double arch artery, 2421, 2421
Double quotidian fever, 1387

Doublecortin, 3069
Double-elevator palsy, ocular, 3357

Double-outlet right ventricle, 2367, 2404–2405, 2405
with malposition of the great arteries, 2411
without pulmonary stenosis, 2410–2411

Down syndrome, 659–662, 987, 3649–3650, 3650
aCGH in, 658
acute leukemia and transient myeloproliferative disorder and, 2655
with bone marrow failure, 2577
clinical features, 660b–661b
developmental milestones, 661
genes localized to chromosome 21, 663
down syndrome, 663
evaluation for children with, 662
self-help skills, 661

Downbeat nystagmus, 3358

Doxorubicin, indications and adverse reactions of, 2641 –2642

Doxycycline, 1417–1425
for brucellosis, 1538
for Legionella, 1540
against nontuberculous mycobacteria, 1565
for psittacosis, 1619
in treatment of malaria, 1858–1860

Dracunculiasis (Dracunculus medinensis), 1887
Dracunculus medinensis, 1887
Dravet syndrome, 3093, 3098
  treatment of, 3103

DRESS syndrome (drug rash with eosinophilia and systemic symptoms), 3448–3449, 3449t

Dressings
  for laceration, 557
  wet, 3451

Drop attack, in unprovoked seizures, 3094–3095

Droplet isolation, 1367

Drowning, 79, 607–614
  deaths, prevention of, in developing world, 523
  epidemiology of, 607–609
    in adolescents, 608
    alcohol use and, 608
    in children 1-4 yr old, 608
    in children less than 1 yr old, 607
    global impact of, 608–609
    in school-age children, 608
    sports and recreation as, 608
    underlying conditions as, 608
  etiology of, 607
  fatal, 607
  management of, 610–612
    cardiorespiratory, 611
    hospital-based evaluation and treatment in, 611
    hypothermia, 612
    initial evaluation and resuscitation in, 610
    neurologic, 611
    other issues in, 611–612
  nonfatal, 607
  pathophysiology of, 609–610
    anoxic-ischemic injury as, 609
    cold water injury as, 609–610
    pulmonary injury as, 609
  prevention of, 613–614, 613t
  prognosis in, 612–613
  unintentional, death rates from, 608f
Drug eruptions
- fixed, 3449, 3449t, 3450f
- lesional pattern and mucosal changes, 3449t

Drug induced malabsorption, 1988t

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome), 3448–3449, 3449t

Drug receptors, polymorphisms in, 445

Drug therapy
- of drug-resistant tuberculosis, 1579t
- for head lice, 3575t
- multidrug therapy (MDT), for Hansen disease, 1585
  - principles of, 445–456
    - adherence and compliance, 454
    - adverse drug interactions, 456
    - drug disposition, 446–450
    - drug interactions, 454–456, 455t
    - personalized medicine, 456
    - pharmacodynamics, ontogeny on, 450–451
    - pharmacokinetics and pharmacodynamic principles, 445–446, 446f
- of tuberculosis, 1578t

Drug transporters, 449

Drug withdrawal, in neonatal seizures, 3113

Drug-drug interactions, with isoniazid, 1561t

Drug-facilitated rape, 1078b

Drug-induced allergic reactions, heterogeneity of, 1243t

Drug-induced conditions
- abnormalities in folate metabolism, 2519
- acne, 3580, 3581f
- adrenal insufficiency, 2960t–2961t, 2963–2964
- heme negative red urine, 2718t
- hypersensitivity syndrome (DRESS), 3450f
- in immune hemolytic anemias, 2563b, 2563t
- lupus, 1276, 1277b
neutropenia, 1142t–1143t, 1143–1144
thrombocytopenia, 2614

Drug-induced dystonias, 3164–3165

Drug-induced hypersensitivity syndrome, indications and adverse reactions, 1246

Drug-induced liver injury, acute hepatic failure and, 2134

Drug-induced lupus, 3449t

Drug-induced thyroiditis, 2924–2925

Drug-related conditions, in secondary intracranial hypertension, 3237t

Drug-resistant epilepsy, with focal seizures, 3097

Drugs

absorption, 446–448
acute pancreatitis and, 2075t
adverse reactions to, 1242–1247
antiparasitic, 1813t–1828t
antithyroid, for hyperthyroidism, 2932, 2932t
associated with
aseptic meningitis, 3227t
humoral immunodeficiency, 1109t
serotonin syndrome, 505t
biotransformation, 436t, 437–441
blindness caused by, 3347b
and breastfeeding, 876t
cardiovascular, for shock, 582t
club, used recreationally, 1046t
displaying reduced metabolism or clearance in hypothermia, 624b
disposition, ontogeny on, 446–450, 447f
distribution, 447f, 448–449, 449t
formulation and administration, 453–454
parenteral drug administration, 453
parental drug administration, 453
peroral drug administration, 453
routes for drug administration, 453–454
interactions, with herbs and dietary supplements, 513t
liver injury induced by, 2130–2133
pathologic spectrum of, 2131
patterns of, 2133
treatment of, 2133
prevention of, 2133
prognosis of, 2133
metabolism, 447f, 449–450, 449t
immunity of, 904
misuse, by adolescents, 1029t
in pharmacologic therapies for vomiting episodes, 1906t
taken during pregnancy effects on fetus, 886t–887t
in toxic and metabolic neuropathies, 3331t
transfused through umbilical vein, 891t
unsafe in acute porphyrias, 835, 836t
use, during pregnancy, SIDS risk factors and, 2170
Drusen of optic nerve, 3386f
Dry bite, 3822
Dry cold, cold injuries from, 623

Electrical burns, 621–623, 622t–623t

Electrical status epilepticus in sleep (ESES), 3099

Electrical stimulation, for birth brachial plexus palsy, 3765

Electrocardiography (ECG), 2355–2358
- adult, 2356f
- anomalous origin of the left coronary artery, 2423f
- in cases of poisoning, 494, 495b, 504
- developmental changes, 2355–2356
- in diagnosis of tachyarrhythmias, 2443t
- of infant, 2356f
- of normal infant, 2355f
- P waves, 2356–2357
- P-R and Q-T intervals, 2357–2358
- premature infant, 2356f
- of premature infant, 2356f
- QRS complex, 2357
- rate and rhythm in, 2356
- ST segment and T-wave abnormalities, 2358
in tricyclic antidepressant toxicity, 504f
of a trioventricular septal defect, 2378f

Electrocerebral silence, brain death and, 566

Electroencephalography (EEG)
  amplitude-integrated, 920 , 922t
  brain death and, 566
  for febrile seizures, 3094
  in neurologic evaluation, 3063

Electrogenic secretion, 2034

Electrolytes
  absorption of, disorders of, 2008–2009
  composition, 389
  dietary reference intake, 317 , 317f , 319t –320t

Electromyography (EMG)
  diagnostic, for JDM, 1282
  in motor system, disorders of, 3246t
  for myasthenia gravis, 3307–3308
  in neuromuscular disorders, 3247

Electron photomicrograph, of cilium, 2298f

Electron transfer flavoprotein, 744–745

Electron transfer flavoprotein dehydrogenase deficiencies, 744–745

Electron transfer pathway, defects in, 744–745

Electron transport chain, 807f

Electronic cigarettes, 1050

Electronic health, adolescent, 1019t –1020t

Electrophysiologic approaches, to heart failure management, 2481

Electrospray mass spectrometry, e 3

Eletriptan, for migraine, 3135t –3136t

Elevator palsy, ocular, 3357f
Elimination
  of bed bugs, 3570b
  of toxins, 498
Elliptocytosis, hereditary, 2535–2536, 2535t
Ellis-van Creveld syndrome, 3732, 3733f
Elongation factor genes, mutations in, 2126
Eltrombopag, 2579–2580
  to stimulate thrombopoiesis, 2613–2614
Embryogenesis, disorders of, 2096–2097
Embryonal tumors, 2627, 2636, 2674–2676
Embryonic development, of kidney, 2786
Embryonic gonadal differentiation, genetic control of, 2988
Embryonic period, 126
Embryonic testicular regression syndrome, 3014–3015
Embryotoxon, posterior, 2096f
Emergence, 465
Emergence delirium, 466
Emergencies
  delivery room, 925–929
  neurologic, 557–563
    neurocritical care principles in, 557–559
    traumatic brain injury in, 559–563
  oncologic, 2644t
Emergency contraception, 1072–1073
Emergency department, 518–519
  disaster preparedness in, 518–519
  evaluation and treatment of drowning victims in, 610
  guidelines for, 518b
  risk adjustment tools in, 522–523
  visits for injuries, 80f
Emergency medical services, for children, 515–526
  - disaster preparedness in, 518–519
  - interfacility transport in, 519–521
  - outcomes and risk adjustment of, 521–523
  - pediatric prehospital care in, 516–518
  - primary care physician and office preparedness in, 515–516
  - principles applicable, 523–526
  - system of, access to, 517

Emergency Medical Services for Children (EMSC)
  - federal program of, 515
    - Innovation and Improvement Center, outcome measures, 521, 522b

Emergency medical technicians (EMTs), 517

Emergency Medical Treatment and Active Labor Act (EMTALA), 521

Emergency mental health assessment, 227

Emergency treatment, of hyponatremia, 2892

Emergency Triage Assessment and Treatment (ETAT), 525

Emery-Dreifuss muscular dystrophy, 3255t –3257t, 3285
  - cardiac involvement in, 3260t –3261t
  - clinical signs of, 3258t –3259t

Emicizumab, 2596

Emmetropia, 3344, 3345f

Emotional development
  - in adoptive children, 64
  - age 0-2 months, 133
  - age 2-6 months, 135
  - age 6-12 months, 135
  - age 12-18 months, 137
  - age 18-24 months, 142, 144
  - developmental domains and theories, 120–121
  - in middle childhood, 150
  - in preschool years, 145–146
Emotional difficulties, comorbid with language disorders, 281
Emotional health, in children with disabilities, 3770–3771
Empacho, 74t
Empagliflozin, for T2DM, 3045t
Emphysema, 2222–2225
  α1 -antitrypsin deficiency and, 2225–2226
  lobar, congenital, 2223–2224
  pulmonary interstitial, 947–948 , 948f
Empirical antireflux therapy, 1937
Empyema, 2273–2274 , 2276–2278
En coup de sabre, 1285b , 1286f
Enactors, 227
Enalapril, for heart failure, 2480t
Enalaprilat, for severe hypertension in children, 2498t
Enamel, 1919f , 1922f
Encephalitis
  autoimmune, 246 , 246f
  complication of postnatal rubella, 1678
  measles and, 1673
  in varicella, 1712
Encephalocele, 3068
Encephalomyelitis, acute disseminated, 3196–3199 , 3198f , 3199t
  CSF findings in, 3222t –3223t
Encephalomyopathy, mitochondrial neurogastrointestinal, 826 , 1958
Encephalopathies, 3168–3186
  acute necrotizing, 3178–3179 , 3178t , 3179f
  autoimmune encephalitis in, 3179–3186 , 3180t –3181t
  burn, 3178
  in cat-scratch disease, 1543
cerebral palsy in, 3168–3173
cystic leukoencephalopathy in, 3179
global hypoxic-ischemic, stroke and, 3217
glycine, 720
hepatic, 2135, 2135r
HIV, 3178
hypertensive, 3178
    stroke and, 3217–3218
hypoxic-ischemic, 918–923
lead, 3178, 3797, 3798
liver disease and, 2087–2088
mitochondrial encephalomyopathies in, 3173–3178
progressive, 293, 293b–294b
radiation, 3178
transmissible spongiform, 1806–1811
Wernicke, 365–366

Enchondroma, 2693–2694

    clinical manifestations of, 1959
    diagnosis of, 1959–1960
    treatment of, 1961

Endemic Burkitt lymphoma, 1718

Endemic cretinism, 2926–2927
    clinical manifestations of, 2926–2927
    etiology of, 2926
    pathogenesis of, 2927
    treatment of, 2927

Endemic diarrhea, acute gastroenteritis and, 2013

Endemic goiter, 2916, 2926–2927
    clinical manifestations of, 2926–2927
    etiology of, 2926
    pathogenesis of, 2927
    treatment of, 2927
Endemic relapsing fever, 1603
Endemic syphilis (T. pallidum endemicum), 1601
Endemic typhus (murine), 1629–1630
Endobronchial ultrasound, 2160
Endocardial cushions, 2342
Endocardial fibroelastosis, 2471

Endocarditis
  bacterial, tetralogy of Fallot and, 2399
  Bartonella in, 1545
  caused by
    coagulase-negative staphylococci, 1435
    Staphylococcus aureus, 1431
  culture-negative, 2452t
  infective, 2451–2458
  prophylaxis, 2435
    in Marfan syndrome, 3745
  subacute bacterial, 3384

Endocrine abnormalities
  liver disease and, 2088
  in toxoplasmosis, 1871, 1872f

Endocrine complications, of IBD, 1975t–1976t

Endocrine disease
  preventive monitoring in β-thalassemia, 2557

Endocrine disorders, Pituitary gland
  associated with, premature infants, 905t
  causing SIDS, 2168t
  fetal therapy for, 891t
  hypoglycemia associated with endocrine deficiency, 859
  multiple endocrine neoplasia (MEN) syndromes, 2942–2943, 2942t
    type 1, 2942
    type 2, 2942
    type 2A, 2703–2704, 2943
    type 2B, 2703–2704, 2943
obesity-associated comorbidities, 352t
risk for osteoporosis and, 3751b
in secondary intracranial hypertension, 3237t

Endocrine disruptors, 3789
Endocrine myopathies, 3295–3296

Endocrine system
dysfunction of, in shock, 579t
hormones of hypothalamus and pituitary, 2876–2880
late effects of cancer and treatment, 2645t–2647t
manifestations of
cancer, 2635t
celiac disease, 1992t
in newborn, 982–985
role in obesity, 349t
in SIRS differential diagnosis, 576b

Endocrine therapy, 2705
Endocrinopathies, 230 , 3051
in differential diagnosis of cataracts, 3373b

Endodermal sinus tumors, 2852 , 2864 , 2866
Endogenous Cushing syndrome, 2982
Endogenous lipids, from liver, transport of, 753–754
Endometrial ablation, 2874
Endometrial adenocarcinoma, 2866
Endometrial stromal sarcoma, 2866
Endometriomas, 2862–2865
Endometriosis, 2864
Endophthalmitis, 3365t
in Aspergillus infection, 1649
Endoplasmic reticulum, 2083
Endoscopic band ligation, for portal hypertension, 2142
Endoscopic correction, of vesicoureteral reflux, 2799f
Endoscopic retrograde cholangiopancreatography (ERCP), 2079–2080 , 2092 , 2099
Endoscopic score, for ulcerative colitis, 1977f
Endoscopy
  of esophagus, 1936–1937 , 1936f
  of foreign bodies in esophagus, 1942
Endothelial cells, injury, during glomerulonephritis, 2716f
Endothrix infections, 3560
Endotoxins, 1556
Endotracheal intubation, 536–537 , 537f
  in infectious upper airway obstruction, 2205
  in respiratory distress and failure, 590–591
End-stage renal disease (ESRD), 2778–2779
  in Alport disease, 2722
  distribution of primary cause of, 2780f
  expected remaining years of life by, 2779f
  hemodialysis in, 2779
  incident rates of, 2780t
  peritoneal dialysis in, 2778–2779
Enema
  barium
    in Hirschsprung disease, 1962f
    in severe constipation, 1960f
    in ulcerative colitis, 1978f
    with Gastrografin, 949
Energy deposition (ED), 303
Energy homeostasis, regulation of, 350f
Energy requirements, 303
Engorgement, 322–323
Enhanced physiologic tremor, 3161
Enophthalmos, 3390
Enoxaparin, 2606

*Entamoeba histolytica*, 2026
  antibiotic therapy for, 2031t–2032t
  parasitic gastroenteritis and, 2016t

Entecavir, for hepatitis B, 2113

Enteral feeding, for acute gastroenteritis, 2029

Enteral nutrition
  for chronic diarrhea, 2039
  for Crohn disease, 1985–1986
  in nursery care of premature infant, 904

Enteric adenoviruses, 1745

Enteric anendocrinosis, 1997

Enteric fever (typhoid fever), 1385, 1401t, 1502–1507
  clinical manifestations of, 1504, 1504t, 1505f
  complications of, 1504–1505, 1505t
  diagnosis of, 1505–1506
  differential diagnosis of, 1506
  epidemiology of, 1502
  etiology of, 1502
  pathogenesis, 1503–1504, 1503f
  prevention of, 1507
  prognosis for, 1507
  treatment of, 1506–1507, 1506t, 1507f

Enteric hyperoxaluria, 2838

Enteric infection
  appendicitis and, 2049
  comparison of, 2022t
  intestinal and extraintestinal complications of, 2025t

Enteric infections
  chronic diarrhea and, 2034
Enteric pathogens, detection of, 1337–1338

Enteritis
  acute, in salmonellosis, 1500
  Aeromonas in, 1527
  Campylobacter, 1519
eosinophilic, A. caninum, 1880

Enteritis necroticans, 1558

Enteroaggregative Escherichia coli, 1514
  hemorrhagic, 1514–1515

Enterobiasis, 1882–1883, 1883f

Enterobius vermicularis, 1882–1883, 1883f

Enterobius vermicularis, vulvovaginal infection, 2847t

Enterococcus, 1456–1458
  antimicrobial resistance in, 1456–1457, 1456t–1457t
  clinical manifestations of, 1457
  epidemiology of, 1456
  etiology of, 1456
  infections in older children, 1457
  neonatal infections, 1457
  pathogenesis of, 1456–1457
  prevention of, 1458
  treatment of, 1457–1458
  vancomycin-resistant enterococci in, 1457–1458

Enterocolitis
  inflammatory, differential diagnosis of, 2026t
  necrotizing, 915, 951–953, 952f

Enterocyte dysfunction, as cause of intestinal failure, 2009t

Enterocytes, differentiation and polarization of, defects in, 1996

Enterohemorrhagic Escherichia coli (EHEC), bacterial gastroenteritis and, 2014t

Enteroinvasive Escherichia coli, 1513

Enterokinase (enteropeptidase) deficiency, 2005
Enteropathogenic *Escherichia coli*, 1513

**Enteropathy**
- AIDS-associated, mimicking IBD, 1978
- autoimmune, 1997–1998
- autoimmune, chronic diarrhea and, 2035
- environmental, 2001
- gluten-sensitive, 1992
  chronic diarrhea and, 2035

**Enterotoxigenic *Escherichia coli* (ETEC), 1512–1513, 2013**
- antibiotic therapy for, 2031–2032

**Enteroviruses (nonpolio), 1690–1697**
- clinical manifestations of, 1692–1695
- complications of, 1697
- diagnosis of, 1695–1696
- differential diagnosis of, 1696, 1696
- epidemiology of, 1690–1691
- etiology of, 1690–1691, 1691

- myocarditis and pericarditis, 1693–1694
- myositis and arthritis, 1695
- neonatal infections, 1695
- neurologic manifestations of, 1694–1695
- nonspecific febrile illness, 1692
- ocular manifestations of, 1693
- pathogenesis of, 1691–1692
- prevention of, 1697
- prognosis for, 1697
- respiratory manifestations of, 1693
- roseola and, 1725
- in T1DM, 3024
in transplant recipients and patients with malignancies, 1695

treatment of, 1696–1697

in viral meningoencephalitis, 3232

Enthesitis-related arthritis, 1259t, 1269

Entropion, 3361

Entry inhibitors, 1789t–1798t

Enucleation, in retinoblastoma, 2698

Enuresis

nocturnal, 2820–2821, 2820t
clinical manifestations and diagnosis of, 2820–2821
epidemiology of, 2820
pathogenesis of, 2820
treatment of, 2821

in sickle cell anemia, 2547

Envenomations, 3822–3827

antivenom administration, 3822

general approach to envenomated child, 3822

Hymenoptera stings, 3826–3827

marine, 3827

rattlesnake, antidote, 497t

scorpion stings, 3826

snake bites, 3822–3825

spider bites, 3825–3826

wound care, 3822

Environment

obesity and, 346

physical, in evaluation for rehabilitative services, 3754–3755

sleep, of infant, SIDS risk factors and, 2170–2171

Environmental carcinogens, 3789–3790

Environmental control, primary survey and, 551

Environmental exposure

cancers explained by, 2627

contributing to asthma, 1196–1198
control of, for hypersensitivity pneumonia, 2243
food-borne diseases caused by, 3775–3778, 3776t–3777t
SLE triggered by, 1274

Environmental factors
predisposing to childhood leukemia, 2649t
suicide and, 226

Environmental factors, in anti-glomerular basement membrane disease, 2262

Environmental health
animal and human bites, 3816–3819
children and, 3774–3778
global climate change and, 3774
localized environmental hazards, 3774, 3775f, 3775t
toxins vs. toxicants, 3774

Environmental health hazards
biologic and chemical terrorism, 3806–3815
chemical pollutants, 3786–3792
food poisoning, nonbacterial, 3802–3806
heavy metal intoxication, 3792–3796
lead poisoning, 3797–3802

Environmental risk factors
of childhood injuries, 82
for schizophrenia, 246–247
for SIDS, 2170–2171
for somatization disorder, 203

Enzyme deficiencies, 2004–2005
carbohydrate malabsorption as, 2004
enterokinase (enteropeptidase) deficiency, 2005
exocrine pancreatic insufficiency as, 2005
fructose malabsorption, 2004
glucose-galactose malabsorption as, 2005
in hemolytic anemias, 2558–2562
glucose-6-phosphate dehydrogenase deficiency, 2560–2562
glycolytic enzyme deficiencies, 2560
pyruvate kinase deficiency, 2558–2560
isolated, 2073
lactase deficiency as, 2004
in mitochondrial fatty acid oxidation disorders, 740t–741t
sucrase-isomaltase deficiency, 2004–2005
trehalase deficiency as, 2005
trypsinogen deficiency as, 2005

Enzyme replacement therapy, 631
pancreatic, 2073, 2074t

Enzyme succinate dehydrogenase, in pheochromocytomas, 2986

Enzymes
aminoglycoside-modifying, 1415t
defects, of heme biosynthetic pathway, 832f
serum, in neuromuscular disorders, 3246, 3249t–3251t, 3250f, 3252f

Eosinophilia
causes of, 1132b
differential diagnosis of, 1177b
and systemic symptoms, drug rash with, 3448–3449
tropical pulmonary, 1885, 1885f

Eosinophilic cystitis, 2790

Eosinophilic enteritis, A. caninum, 1880

Eosinophilic esophagitis, 1932, 1939–1940, 1939f
in food allergy, 1238

Eosinophilic fasciitis, 1285b

Eosinophilic gastroenteritis, 1987
chronic diarrhea and, 2035

Eosinophilic granuloma, 2696
in ear, 3437

Eosinophilic granulomatosis with polyangiitis, 2255

Eosinophilic lung disease, 2251–2258
acute eosinophilic pneumonia, 2253t, 2254
allergic bronchopulmonary aspergillosis, 2255–2257
chronic eosinophilic pneumonia, 2254–2255
clinical manifestations of, 2253
eosinophilic granulomatosis with polyangiitis, 2255
etiology of, 2251–2252, 2252t
hypereosinophilic syndrome, 2257–2258
Löffler syndrome, 2253–2254
pathology and pathogenesis of, 2252–2253

Eosinophilic meningitis, 3234
Eosinophilic pustular folliculitis, 3456

Eosinophils, 1131–1133
in allergic disease, 1172–1173
in bronchoalveolar lavage, 2254f
diseases associated with eosinophilia, 1132–1133
diverse properties, 1131f

Ependymal tumors, 2673–2674, 2674f
Ependymoma, relative incidence of, 2668t

*Ephedra sinica*, potential toxicity, 512t

  in unprovoked seizures, 3094–3095

Epilepsy, 3087
  additional treatments for, 3108–3110 , 3109t
  autoimmune encephalopathies associated with, 3186
  diagnostic and classification scheme of, 3091t
  drowning risk in, 608
  drug-resistant, 3108
  pediatric, treatment of, comparison of recommendations for, 3104t
  psychosis associated with, 250
  pyridoxine-dependent, 370
  sports and special considerations for, 3101t
  surgery, 3110
  types of seizures, 3086t
Epilepsy of infancy with migrating focal seizures (EIMFS), 3097

Epilepsy syndrome, 3087–3090, 3091f, 3095
  choice of drug according to seizure type and, 3102–3103
  classification of, 3087t–3088t
  with focal seizures, 3097
  generalized seizures and, 3097–3099
  selected genes causing, 3089t–3090t

Epileptic encephalopathy, 3087–3090
  selected genes causing, 3089t–3090t

Epileptic spasms, in unprovoked seizures, 3094–3095

Epileptogenesis, in seizures, 3099–3100

Epileptogenic zone, in epilepsy surgery, 3110

Epinephrine
  for airway obstruction, 535
  for bronchiolitis, 1737
  deficiency, in hypoglycemia, 859
  for heart failure, 2480t, 2481
  nebulized racemic, 2205
  for postresuscitation stabilization, 545t
  release, features associated with, 850b
  for resuscitation and arrhythmias, 545t
  for shock, 582t

Epiphyseal fractures, 3665

Epiphysiodesis, 3615–3616

Epiploic appendagitis, 2053

Episcleritis/scleritis, 3365t

Episodic ataxias, 3125, 3154t

Episodic or induced acute hemolytic anemia, 2560–2562
  clinical manifestations of, 2561
  diagnosis of, 2562
  etiology of, 2560–2561
laboratory findings of, 2562
prevention and treatment of, 2562

Episodic tension-type headache, infrequent, 3139t

Epispradias, 2811–2812, 2812f
incontinence in girls secondary to, 2819–2820

Epistaxis, 2183–2184
anatomy, 2183
does of, 2184t
clinical manifestations, 2184
etiology, 2183
in hemophilia, 2596t
prevention, 2184
treatment, 2184
VWD and, 2599

Epitaxy, 2835–2836

Epithelial cells
   glomerular, 2715f
   injury, during glomerulonephritis, 2716f

Epithelial ovarian cancers, 2865

Epithelial tumors, 2627

Epitrochlear lymphadenopathy, 2625t

Eplerenone, for primary aldosteronism, 2986

EPODE, 358

Epsilon toxin, 1559

Epstein pearls, 1925, 3548

Epstein-Barr virus (EBV), 1715–1718, 2627, 2631
   clinical manifestations of, 1716, 1716f
   complications of, 1717–1718
   CTLs specific to, 2659, 2660f
diagnosis of, 1716–1717
differential diagnosis of, 1716–1717
epidemiology of, 1715–1716
etiology of, 1715
heterophile antibodies detection, 1717
laboratory diagnosis of, 1717
lymphoproliferation, T-cell defects characterized by, 1113
lymphoproliferative disease related, 1167
nasopharyngeal carcinoma and, 2704
oncogenesis of, 1718
  endemic Burkitt lymphoma, 1718
  Hodgkin lymphoma, 1718
  lymphoproliferative disorder, 1718
  nasopharyngeal carcinoma, 1718
pathogenesis of, 1716
prevention of, 1718
prognosis for, 1718
role in Hodgkin lymphoma, 2657
specific antibodies detection, 1717, 1717f, 1717t
treatment of, 1718
viral DNA detection, 1717
X-linked lymphoproliferative disease and, 1111

Epstein-Barr virus (EBV)-induced infection, intestinal transplantation and, 2011

Equation of motion, 592–593, 593f

Equipment
  guidelines for, in developing world, 526

  prevention of illness, 1515
  *Shiga* toxin-producing, 1513–1514
    toxin, hemolytic-uremic syndrome caused by, 2732
    treatment of, 1515

Escitalopram, for depression and anxiety, 192t

Eslicarbazepine
  adverse effects of, 3106t
  dosages of, 3104t–3105t

Esmolol, for severe hypertension in children, 2498t

Esodeviations, 3354

Esophageal atresia, 1929–1931, 1929f
  diagnosis of, 1929–1930
  management of, 1930
  outcome for, 1930–1931
  presentation of, 1929

Esophageal disorders
common clinical manifestations and diagnostic aids for, 1928–1929
dysmotility as, 1932–1933
eosinophilic esophagitis, 1939–1940, 1939f
esophageal perforation as, 1941
esophageal varices, 1941
gastroesophageal reflux disease as, 1934–1939
hiatal hernia as, 1934, 1936f
ingestions as, 1942–1945

Esophageal duplication cysts, 1932
Esophageal dysphagia, 1903, 1903t
Esophageal perforation, 1941
Esophageal stenosis, congenital, 1931, 1931f
Esophageal varices, 1941

Esophagitis
  complication of GERD, 1938
eosinophilic, 1932, 1939–1940, 1939f
erosive peptic, 1936f
infective, 1939–1940
medications commonly associated with, 1940t
pill, 1939–1940

Esophagus
  anatomy of, 1927–1929
  congenital anomalies of, 1929–1931
  embryology of, 1927–1929
  foreign bodies in, 1942–1943
  function of, 1927–1929
  obstructing and motility disorders of, 1905t, 1931–1932
    extrinsic, 1932
    intrinsic, 1932

follow-up, \textit{630}

genetic aspects of condition, \textit{630}

for hearing loss, \textit{3411}

indications for, \textit{629b}

natural history of condition, \textit{630}

for neurofibromatosis, \textit{3143–3144 , 3143f}

nondirective counseling, \textit{630–631}

prenatal diagnosis and prevention, \textit{630}

recurrence risk, \textit{630}

specific condition or conditions, \textit{630}

in spinal muscular atrophies, \textit{3316}

support groups, \textit{630}

talking to families about, \textit{629}

therapies and referral, \textit{630}

in transmissible spongiform encephalopathies, \textit{1811}

Genetic defects, of GH-IGF axis, \textit{2883t}
Genetic disorders, 2685

burden of, 632–633
causing autonomic dysfunction, 3334
commercial studies of, 683, 684

diagnostic spectrum, 686–687
in differential diagnosis of cataracts, 3373

exome sequencing, 684–686
genotype-phenotype correlations in, 639
humoral immunodeficiency and, 1109

of neurotransmitters

dopamine β-hydroxylase deficiency, 728
tetrahydrobiopterin deficiency, 727–728
tyrosine hydroxylase deficiency, 727

pediatric issues, 686
physiologic therapies, 631

of podocytes, 2753
proteinuria or nephrotic syndrome and, 2753
replacement therapies, 631–632

scope of, 683
secondary adrenocortical insufficiency caused by, 2962

sensorineural hearing loss caused by, 3402

Genetic epilepsy, 3091

Genetic forms

of GH deficiency, 2882–2883

GH1, 2882–2883
GH-releasing hormone receptor, 2882
X-linked isolated form, 2883

of limb-girdle muscular dystrophy, 3289

of multiple pituitary hormone deficiency, 2880–2881, 2881

HESX1, 2880–2881
LHX3 and LHX4, 2881
POU1F1, 2880
PROP1, 2880

of nephrogenic diabetes insipidus, 2889

Genetic heterogeneity, 683

Genetic imprinting, 649–651
Genetic issues, associated with high-risk pregnancy, 877t
Genetic load, 652f
Genetic loci, of inherited diseases of muscle, 3254–3257
Genetic markers, in neuromuscular disorders, 3246
Genetic pleiotropy, 683
Genetic polymorphisms, 433–434
Genetic risk factors
  for math disabilities, 270
  for schizophrenia, 246
Genetic role
  in ADHD, 262
  in language disorders, 275
  in susceptibility to obesity, 346, 349t
Genetic syndrome
  associated with diabetes mellitus, 3051
  intellectual disability caused by, 284t
Genetic testing, 627–632
  for breast cancer susceptibility genes, 2857
  diagnostic, 627–628
  ethics issues, 634–635
  exome sequencing, 684–686
  for fragile X syndrome, 288
  impacts of, 633
  in neurologic evaluation, 3063
  pedigree symbols of related information, 644f
  pharmacogenetic, 629
  predictive, 628–629
  predispositional, 629
  in spinal muscular atrophy, 3313t
  of young children, 48
Genetic transmission, 640–652
  digenic inheritance, 646–647
family history and pedigree notation, 640
mendelian inheritance, 640–645
multifactorial and polygenic inheritance, 651–652
nontraditional inheritance, 647–651
pseudogenetic inheritance and familial clustering, 647
X-linked inheritance, 645
Y-linked inheritance, 645

Genetic vulnerabilities, as risk factor for somatization, 203

Genetically modified organisms (GMOs), 330

Genetics, 48
approaches to study of common disorders, 676–679
basis of, combined immunodeficiency disorders, 1116
of congenital central hypoventilation syndrome, 2332–2333
of congenital heart disease, defects associated with syndromes, 2368–2369
of CVID, 1109–1110
of cystic fibrosis, 2282–2284
of hemophilia, 2595
of leukocyte adhesion deficiency, 1136–1137
in medicine, changing paradigm of, 633–634
molecular, 635–637
of skeletal dysplasias, 3718
of Wilms tumor, 2682–2683
of X-linked agammaglobulinemia, 1107–1109

Genital abnormalities, associations of, 3011

Genital culture, 1337

Genital examination
indicators for, 2842
preparation for, 2842

Genital herpes, 1704
treatment of, 1707

Genital HPV infection, 3567

Genital lesions
and ectoparasites, 1086
warts, 1750, 1750f
and herpes, 1091

Genital mutilation, female, 2874–2875

Genital mycoplasmas, 1612–1614
- clinical manifestations of, 1612–1613, 1613t
- diagnosis of, 1613–1614
  - genital tract infection, 1613
  - neonates, 1614
- epidemiology of, 1612
- etiology of, 1612
- genitourinary infections, 1613
- intrauterine and neonatal infections, 1612–1613
- nongenital infections, 1613
- pathogenesis of, 1612
- transmission of, 1612
- treatment of, 1614
  - adolescents and adults, 1614
  - neonates, 1614

Genital tract infections
- anaerobic, 1556–1558
  - Chlamydia trachomatis, 1616–1617
    - clinical manifestation of, 1616
    - complications of, 1617
    - diagnosis of, 1616
    - epidemiology of, 1616
    - prevention of, 1617
    - treatment of, 1616–1617
- mycoplasmal, 1613

Genital ulcer syndromes, 1085

Genital ulcers, vulvar, 2847–2848, 2848f

Genitalia
- ambiguous, acute inguinal-scrotal swelling and, 2067–2069
- assessment in newborn, 871
- female, prepubertal, 108f
- physical examination of, 529
Genitourinary complications, of IBD, 1975t–1976t

Genitourinary disease
and sports participation, 3680t–3683t
tuberculosis, 1575

Genitourinary tract
chronic abdominal pain and, 1909t–1910t
cystic fibrosis and, 2288
gonococcus, 1478–1484
manifestation of, enterovirus infections, 1694
mycoplasmal infections, 1613
trauma, 2833–2835
diagnosis of, 2833–2834, 2834f
etiology of, 2833
secondary survey for, 554
treatment of, 2834–2835

Genome-wide association studies (GWAS), 681, 2631
Genomic disorders, 632–633

Giant axonal neuropathy, 3328, 3329f
Giant cell arteritis, 1318t
Giant cell pneumonia, 1673
Giant congenital pigmented nevi, 3470, 3470f
Giant papillary conjunctivitis, 1220

*Giardia duodenalis*, 1833–1835
  clinical manifestations of, 1834, 1834t
  diagnosis of, 1834–1835
  epidemiology of, 1834
  etiology of, 1833–1834
  prevention of, 1835
  prognosis of, 1835
  treatment of, 1835

*Giardia intestinalis*
  antibiotic therapy for, 2031t–2032t
  parasitic gastroenteritis and, 2016t

*Giardiasis*, 1833–1836
  drugs for, 1813t–1828t, 1835t

Gigantism
  cerebral, 2894–2895, 2895f
  pituitary, excess GH secretion and, 2896–2897

Gigantomastia, 2854

Giggle incontinence, 2819

Gilbert syndrome, 2102, 2140

Gingiva
  lesions due to scurvy, 374f
  overgrowth induced by cyclosporine or phenytoin, 1921

Gingival cysts of newborn, 3548

Gingival margin, 1919f
Gingivitis, 1921
   acute necrotizing ulcerative, 1921–1922, 3549

Gingivostomatitis, 2193
   herpetic, 1703, 1703f, 1924, 1925f

Ginkgo, interactions with drugs, 513t

Girls
   adolescent
      gynecologic examination in, 2843–2844
      physical development, 1014
   African American, traction alopecia in, 3538–3539
   aggressive behavior, 242
   BMI, 152f
      growth remaining charts for, 3615f
   onset of puberty, 1017f
   prepubertal, gynecologic examination in, 2841–2843
   pubic hair changes, 1016f
   sexual maturity ratings, 1015t
   with special needs, gynecologic care for, 2872–2874

Gitelman syndrome, 402, 405, 2769
   clinical manifestations of, 2769
   diagnosis of, 2769
   pathogenesis of, 2769
   treatment of, 2769

GLA, Generalized lymphatic anomaly

Gla-containing proteins, 386

Glanders (Burkholderia mallei), 1532

Glandular disease, tularemia, 1534

Glanzmann thrombasthenia, 2617

Glargine, for T1DM, 3032

Glargine u300, for T2DM, 3045t

Glasgow Coma Scale (GCS), 533, 533t
in drowning victims, 611–612
for traumatic brain injury, 3754

**Glaucoma**

- childhood, 3388–3390
- clinical manifestations of, 3388–3389, 3388f
- diagnosis and treatment of, 3389–3390
- infantile, 3388f

**Globin genes, organization of, 2504f**
Globoid cell leukodystrophy, 3189

Globus, 1902–1903

Glomerular basement membrane (GBM), 2714–2715
   in Goodpasture disease, 2732f
   thin basement membrane disease, 2722

Glomerular capillary wall, 2751f

Glomerular disease, 2716–2717
   isolated, with recurrent gross hematuria, 2720–2728
      acute poststreptococcal glomerulonephritis, 2722–2725
   Alport syndrome, 2721–2722
   IgA nephropathy, 2720–2721
      membranoproliferative glomerulonephritis, 2726–2727
   membranous nephropathy, 2725–2726
   rapidly progressive (crescentic) glomerulonephritis, 2727–2728
   thin basement membrane disease, 2722

   pathogenesis of, 2716–2717
   pathology of, 2717

Glomerular filtration, 2715–2716

Glomerular filtration rate (GFR), 391, 2715, 2715f
   in acute kidney injury, 2770f

Glomerular proteinuria, 2749, 2751–2752

Glomerulonephritis
   acute poststreptococcal, 2722–2725
   associated with SLE, 2729–2731
      clinical manifestations of, 2729–2730
      diagnosis of, 2730
      pathogenesis and pathology of, 2729
      prognosis of, 2730–2731
      treatment of, 2730
   cellular location of injury during, 2716–2717, 2716f
   in ESRD, 2779
   membranoproliferative, 2726–2727, 2753t–2754t
   proliferation of glomerular cells in, 2717
   rapidly progressive (crescentic), 2727–2728
   symptoms of, 2718
urine chemistries in, 2770, 2772

Glomerulosclerosis, focal segmental, 2753t–2754t
  in ESRD, 2779
    primary, 2781
    recurrent, 2781

Glomerulus
  anatomy of, 2714–2715
  crescent overlying, 2728f
  filtration barrier, 2756f
  from patient with poststreptococcal glomerulonephritis, 2723f
  showing mesangial hypercellularity, 2757f

Glossitis
  benign migratory, 3548–3549
  in riboflavin deficiency, 367f

Glossopharyngeal nerve, in neurologic examination, 3057

Glucagon, antidote for β-blocker toxicity, 496t–497t, 501–502

Glucagonoma syndrome, 3447–3448

Glucocorticoid deficiency, familial, 2960t–2961t, 2961–2962

Glucocorticoid receptor gene mutation, cortisol resistance due to, 3013

Glucocorticoid-remediable aldosteronism, 420

Glucocorticoid replacement, for 21-hydroxylase deficiency, 2975

Glucocorticoids
  circulatory and renal effects, 2957
  CNS effects, 2958
  effects on skin, bone, and calcium, 2957–2958
  generalized resistance, 2968
  growth and, 2957
  immunologic effects, 2957
  metabolic effects, 2957–2958
  for rheumatic diseases, 1254t–1255t, 1256
  for Takayasu arteritis, 1320

Glucocorticoid-suppressible hyperaldosteronism, 2979
Glucocorticosteroids
for sarcoidosis, 2250
topical, potency of, 3453b

Gluconeogenesis disorders, 792–793
fructose-1,6-diphosphatase deficiency, 792, 860
phosphoenolpyruvate carboxykinase (PEPCK) disease, 792–793
type I glycogen storage disease, 792

Glucopenia, cerebral, 850b

Glucose, 308, 426–427, 777
dysregulation, in shock, 578
intolerance, in CKD, 2775t
in maintenance fluids, 425–426
postnatal glucose homeostasis screening, 985f
reference intervals, e 6t–e 13t
for resuscitation and arrhythmias, 545t

Glucose-galactose malabsorption, 2005

Glucose-lowering therapy, in organ or organ system, 3046t

Glucose tolerance test, in Cushing syndrome, 2984

Glucose-6-phosphatase (or translocase) deficiency (type I GSD), 778–781
clinical manifestations, 778–781
diagnosis of, 781
hypoglycemia and, 860
prognosis of, 781
treatment of, 781

Glucose-6-phosphate dehydrogenase (G6PD) deficiency, 1134t–1135t, 2553
in hemolytic anemias, 2560–2562, 2560f–2561f

Glucosyltransferase-1 deficiency, 803–804
clinical manifestations, 803
diagnosis of, 804
pathophysiology of, 803–804
treatment of, 804

Glucuronyl transferase deficiency, 2102
Glulisine insulin, for T1DM, 3032
GLUT-1 deficiency, 861
syndrome, 3099
GLUT-2 deficiency, 861
Glutamic acid metabolism defects, 724–726
glutathione synthetase deficiency, 725–726
glutathionemia, 726
γ-Glutamyl transpeptidase, deficiency, 726
γ-Glutamylcysteine synthetase deficiency, 726
Glutaric aciduria type 1, 736–737
Glutathione, cycle of, 725f
Glutathione synthetase deficiency, 725–726
Glutathionemia, 726
Gluten, potential sources of hidden, 1993t
Gluten-free diet, 1993–1995
Glycemic control, in T1DM, 3037, 3040–3041
Glycine metabolism defects
creatine deficiency, 722–723
glycine cleavage protein, 719
hyperglycinemia, 720
hyperoxaluria and oxalosis, 720–723
hypoglycinemia, 719
nonketotic hyperglycinemia, glycine encephalopathy, 720
sarcosinemia, 720
trimethylaminuria, 720
Glycine N-methyltransferase deficiency, 706
Glycogen, 777, 2083–2084
Glycogen storage disease (GSD), 777–788, 778f, 779t–780t, 782f, 1146
hypoglycemia and, 860
liver glycogenoses, 777–785, 779t–780t
muscle glycogenoses, 779t–780t

Glycogen synthase deficiency, hypoglycemia and, 860

Glycogenosis, 3298–3300
    type II, 2336

Glycolytic enzyme deficiencies, 2560

Glycopeptides, 1426–1427
    enterococci resistance, 1457t

Glycoprotein degradation and structure, 797–798

Glycoprotein Ib (GPIb), 2599

Glycoproteinoses, associated with neuropathy, 3329t–3330t

Glycoside-containing plants, 509t

Glycosylated hemoglobin, in T1DM, 3036–3037

Glycosylation, congenital disorders of, 798–806, 802t, 803f, 857, 3272

Glycosylphosphatidylinositols (GPIs), 798
    anchor biosynthesis, defects in, 804

Glyoxylic acid metabolism, 721f

GM₁ gangliosidoses, 770–771, 3188–3189, 3189f

GM₂ gangliosidoses, 771–772, 3189

GMOs, Genetically modified organisms

Gnathostoma spinigerum, 1887–1888

Gnathostomiasis, drugs for, 1813t–1828t

Goals of care
    palliative care, 54, 55t
    transitioning, 45–46
        advance directives, 46
        artificial hydration and nutrition, 46–47
        doctrine of double effect, 47
        withholding and withdrawing life-sustaining treatment, 46–47
Goiter, 2925–2928
  acquired, 2927–2928
  congenital, 2925–2926, 2925f
  endemic, 2916
    cretinism and, 2926–2927
  intratracheal, 2926
Goitrogens, 2927f, 2928
Goldenhar syndrome, 3404t
Goldenseal, interactions with drugs, 513t
Golfer's elbow, 3691
Golgi apparatus, 2083
Golgi homeostasis, 806
Golgi-α₁₂ mannosidase-1 deficiency, 805
Goltz-Gorlin syndrome, 3458
Gonadal dysgenesis, 2700
  with Y chromosome, diagnosis of, 3012t
Gonadal hormones, effect of total body irradiation, 1168
Gonadal neoplasms, 2698–2700
  clinical manifestation of, 2699–2700
  diagnosis of, 2699–2700
  epidemiology of, 2698–2699
  pathogenesis of, 2699
  prognosis of, 2700
  treatment of, 2700
Gonadoblastomas, 2700, 2864
  in 45,X/46,XY gonadal dysgenesis, 3005
  of ovary, 3008
  in Turner syndrome, 3003–3004
Gonadotropin-dependent/central precocious puberty, 2851–2852
Gonadotropin-independent causes, of isosexual precocious puberty, 2901
Gonadotropin-independent/peripheral precocious puberty, 2851–2852
Gonadotropins, isolated deficiency of, in hypogonadotropic hypogonadism, female, 3007
Gonads, development and function of, 2988–2993
diagnostic testing for, 2993
embryonic gonadal differentiation, genetic control of, 2988
ovaries, function of, 2992–2993
sex steroids, therapeutic use of, 2993
testes, function of, 2988–2992, 2991f
Gongylonemiasis, drugs for, 1813t –1828t
Gonococcal cervicitis, 1084f
Gonococcal urethral discharge, 1084f
Gonococcus, 1478–1484
Gonorrhea
asymptomatic, 1480
clinical manifestations of, 1480–1481
complications of, 1483
diagnosis of, 1481
disseminated gonococcal infection, 1480–1481
epidemiology of, 1479
etiology of, 1478–1479
NAAT for, 108–109
pathogenesis and pathogenesis of, 1479–1480
prevention of, 1483–1484
reported cases by age, 1082f
treatment of, 1088, 1481–1483, 1482t
uncomplicated, localized, 1480
Goodpasture disease, 2732
clinical manifestations of, 2732
diagnosis and differential diagnosis of, 2732
pathology of, 2732
prognosis and treatment of, 2732

  in setting of immunosuppression, 3448
Graft-versus-leukemia (GVL) effect, 1156
Grafts
  failure, 1165
intestinal failure of, 2012

types of, 2009–2010

kidney, survival of, 2784

for liver, 2144

Gram-negative bacterial infection

*Aeromonas*, 1526–1528

*Bartonella*, 1540–1545
  - bacillary angiomatosis, 1544
  - bacillary peliosis hepatis, 1544–1545
  - bartonellosis (*Bartonella bacilliformis*), 1543–1544
  - cat-scratch disease (*Bartonella henselae*), 1540–1543
  - trench fever (*Bartonella quintana*), 1544

*Brucella*, 1536–1538

*Campylobacter*, 1519–1522

chancroid (*Haemophilus ducreyi*), 1489–1490

cholera, 1515–1519

*Haemophilus influenza*, 1486–1489

*Kingella kingae*, 1484–1486

*Legionella*, 1538–1540

*Moraxella catarrhalis*, 1490–1491

*Neisseria gonorrhoeae* (gonococcus), 1478–1484

*Neisseria meningitidis* (meningococcus), 1469–1478

pertussis (*Bordetella pertussis* and *B. parapertussis*), 1492–1496

*Plesiomonas shigelloides*, 1528–1529

*Pseudomonas aeruginosa*, 1529–1532

*Salmonella*, 1496–1507
  - enteric fever (typhoid fever), 1502–1507
  - nontyphoidal salmonellosis, 1496–1502

*Shigella*, 1508–1511

*Stenotrophomonas*, 1533

tularemia (*Francisella tularensis*), 1533–1536

*Yersinia*, 1522–1526
  - plague (*Yersinia pestis*), 1524–1526
  - *Yersinia enterocolitica*, 1522–1524
  - *Yersinia pseudotuberculosis*, 1524

Gram-positive bacterial infections
Actinomyces, 1465–1467
diphtheria (*Corynebacterium diphtheriae*), 1458–1462

*Enterococcus*, 1456–1458
group A *Streptococcus*, 1440–1450
  rheumatic fever, 1445–1450
group B *Streptococcus*, 1450–1455

*Listeria monocytogenes*, 1462–1464

*Nocardia*, 1467–1469
non-group A or B streptococci, 1455–1456

*Staphylococcus*, 1429–1436
  coagulase-negative staphylococci, 1435–1436
  *Staphylococcus aureus*, 1430–1434
  toxic shock syndrome, 1434–1435

*Streptococcus pneumoniae* (pneumococcus), 1436–1440

cardiogenic shock and, 2481–2483
clinical manifestations of, 2477
congestive, dosage of drugs for, 2480t
diagnosis of, 2477–2478
diet for, 2479
diuretics for, 2479
etiology of, 2478b
in history, of cardiovascular system, 2346
management, electrophysiologic approaches for, 2481
pathophysiology of, 2476–2477
treatment of, 2478–2481
  alpha- and β-adrenergic agonists, 2481
  chronic treatment with β-blockers, 2481
diet for, 2479
digital glycosides for, 2479–2481
diuretics for, 2479
general measures for, 2478–2479
new therapies for, 2481
phosphodiesterase inhibitors for, 2481

Heart murmur, and sports participation, 3680t –3683t

Heart rate, fetal
  three-tier interpretation of, 885t
  variability of, 884

Heat cramps, 3705

Heat edema, 3705

Heat exhaustion, 3705

Heat illness, 3704
  in football, 3710
  spectrum of, 3705b
  and sports participation, 3680t –3683t

Heat injuries, 3704–3705

Heat stroke, 3705, 3706f

Heat syncope, 3705

Heat tetany, 3705

Heavy metals
  intoxication, 3792–3796
    arsenic, 3792–3796
    mercury, 3794–3796
  treatment of, 3796
  poisoning, 496t –497t
  in toxic neuropathies, 3330

Hectic fever, 1387
Height-for-age, 333–334
Height measurement, 151
Height velocity charts, 154, 155f
Heimlich maneuver, 535, 535f
Heinz bodies, 2620–2621
HEL² P³ mnemonic, 114, 114t

*Helicobacter pylori*
- eradication therapies for, 1971t
- on gastric mucosal surface, 1970f
- gastritis, 1970–1971
- treatment of peptic ulcer disease related to, 1973

Heliotrope rash, in JDM, 1281
Heliox, for airway obstruction, 535
Helium-oxygen mixture, for respiratory distress and failure, 590
Helmet therapy, for deformational plagiocephaly, 3085, 3086t

Helminthic diseases
- adult tapeworm infection, 1893–1895
  - *Angiostrongylus cantonensis*, 1887
  - *Angiostrongylus costaricensis*, 1887
- animal filariae, infection with, 1886
- antiparasitic drugs for, 1812–1829
- ascariasis (*Ascaris lumbricoides*), 1877–1878
- cysticercosis, 1895–1897
- dracunculiasis (*Dracunculus medinensis*), 1887
- echinococcosis (*Echinococcus granulosus* and *Echinococcus multilocularis*), 1897–1900
- enterobiasis (*Enterobius vermicularis*), 1882–1883
- flukes, 1892–1893
  - intestinal, 1893
  - liver, 1892–1893
  - lung, 1893
- *Gnathostoma spinigerum*, 1887–1888
- hookworms (*Necator americanus, Ancylostoma* spp.), 1878–1881
Löffler syndrome, 2253–2254
loiasis (Loa loa), 1886
lymphatic filariasis (Brugia malayi, Brugia timori, and Wuchereria bancrofti), 1884–1885
onchocerciasis (Onchocerca volvulus), 1885–1886
schistosomiasis (Schistosoma), 1890–1892
strongyloidiasis (Strongyloides stercoralis), 1883–1884
toxocariasis (visceral and ocular larva migrans), 1888–1889
trichinellosis (Trichinella spiralis), 1889–1890
trichuriasis (Trichuris trichiura), 1881–1882
Helminthic parasites, in eosinophilic meningitis, 3234
Hemagglutinins, cold, 1611
Hemangioendotheliomas, 2702–2703
Hemangiomas, 2687, 2702–2703, 2866, 2921
capillary, eyelid, 3362, 3362f
clinical manifestations of, 2702–2703
congenital, 3466
infantile, 3463–3465, 3464f–3465f, 3466t
orbital, 3390, 3390f
red flags associated with, 3465t
subglottic, congenital, 2209, 2209f, 2215–2216
treatment of, 2703
Hemarthrosis, 2594, 2596t
Hematocolpos, 2868, 2870–2871, 2870f
Hematocrit
concentration, 2503f
gestational levels, 962f
normal mean and lower limits of, 2506t
reference range, 963f
Hematologic and oncologic disorders, associated with hyposplenism, 2621t
Hematologic data, 2358
Hematologic diseases
in HIV, 1787
in secondary intracranial hypertension, 3237t

Hematologic issues, in palliative care, 61

Hematologic manifestations
  of cancer, 2635t
  of cat-scratch disease, 1543
  of SLE, 1275t, 1276b

Hematologic system
  arsenic effects in, 3793t
  dysfunction of
    criteria for, 574t
    in shock, 579t
  oncologic emergencies in, 2644t
  in SIRS differential diagnosis, 576b

Hematologic/oncologic complications, of IBD, 1975t–1976t

Hematoma, 2687, 2855
  auricular, wrestling-related, 3714
  epidural, 552f, 560f
  into iliopsoas muscle, 2595f
  subdural, 560f–561f
  subperiosteal, 375f

Hematometra, 2868, 2869f

Hematopoiesis, 1125
  in human embryo and fetus, 2500
  major cytokine sources and actions to promote, 2502f

Hematopoietic acclimatization, 602

Hematopoietic growth factors, 2501t

Hematopoietic stem cell transplantation (HSCT), 1138, 2511
  in acquired aplastic anemia, 1158
  in acute myeloid leukemia, 1158
  in ALL, 1156–1157
  allogeneic or autologous, 1156, 1157b
  from alternative sources and donors, 1160–1162
autologous, 1162, 1162b
in CML, 1158
donor vs. recipient NK cell alloreactivity, 1161–1162
in Fanconi anemia, 2572
haploidentical transplants, 1161
from HLA-identical sibling donor, 1156, 1157f
in homozygous β-thalassemia, 2556–2557
in immunodeficiency disorders, 1159
infectious complications, 1165–1168
in inherited bone marrow failure syndrome, 1158–1159
inherited metabolic diseases, 1160
in JMML, 1158
late effects, 1168–1169, 1169t
in myelodysplastic syndromes, 1158
in NHL and Hodgkin disease, 1158
principles and clinical indications of, 1156–1160
in sickle cell disease, 1159, 2548
in thalassemia, 1159, 1159f
umbilical cord blood transplants, 1160–1161
unrelated donor transplants, 1160

**Hematopoietic syndrome, 3783–3784**

**Hematopoietic system, development of, 2500–2505**

- fetal erythropoiesis, 2502–2505
- fetal granulocytopoiesis, 2500
- fetal thrombopoiesis, 2500–2501
- hematopoiesis in the human embryo and fetus, 2500
- red cell life span in the fetus and neonate, 2505

**Hematuria, 2596t**

- anatomic abnormalities associated with, 2744–2748
- clinical evaluation of child with, 2718–2720
- common cause of, 2719t
- confused with vaginal bleeding, 2851
- lower urinary tract causes of, 2748–2749
- multisystem disease associated with, 2728–2736
recurrent gross, glomerular diseases with, 2720–2728

tubulointerstitial disease associated with, 2737–2742

- acute tubular necrosis, 2741–2742
- papillary necrosis, 2740–2741
- pyelonephritis, 2737
- tubulointerstitial nephritis, 2737–2740

vascular diseases associated with, 2742–2744

- idiopathic hypercalciuria, 2743–2744
- nephrocalcinosis, 2744
- renal vein thrombosis, 2742–2743
- sickle cell nephropathy, 2743
- vascular abnormalities, 2742

Heme biosynthetic pathway, in porphyrias, 832

Hemiconvulsion-hemiplegia-epilepsy syndrome, 3117

Hemifacial microsomia, 1918

Hemihyperplasia, 2700–2701

Hemimelia

- fibular, 3617f
- postaxial, 3612

Hemin, in treatment of acute porphyria, 838

Hemiparesis, 3092

Hemiplegia, 3169t

- of childhood, alternating, 3125, 3167
- stroke and, 3218

Hemiplegic migraine, 3132–3133

Hemispherectomy, in epilepsy surgery, 3110

Hemlock, poison, 509t

Hemochromatosis, neonatal, 2105

Hemodialysis

- in elimination of toxins, 498
- in ESRD, 2779

Hemodynamic support, 572f–573f
Hemoglobin

abnormal
causing cyanosis, 2552
with increased oxygen affinity, 2552
adult, 2505
alterations of, by disease, 2505
C, 2551
catabolism of, 2528f
D, 2551
E, 2551
embryonic, 2504
fetal, 2504, 2505f
syndromes of hereditary persistence of, 2553
in fetus and neonate, 2504
gestational levels, 962f
normal mean and lower limits of, 2506t
reference intervals, e 6t –e 13t
reference range, 963f
tetramers, changes in, 2504f
values for non-Hispanic Whites and African Americans, 2506t

Hemoglobin disorders, 2540–2541
red blood cell morphology associated with, 2551f
unstable, 2551–2552

Hemoglobinopathies, 2540–2558
abnormal hemoglobin
causing cyanosis, 2552
with increased oxygen affinity, 2552
disorders of, 689b
hemoglobin C, 2551
hemoglobin D, 2551
hemoglobin disorders, 2540–2541
unstable, 2551–2552
hemoglobin E, 2551
hereditary methemoglobinemia, 2552
with NADH cytochrome b5 reductase deficiency, 2553
liver disease and, 2122–2123
sickle cell disease, 2541–2550
sickle cell trait, 2550–2551
thalassemia syndromes, 2554–2558

Hemoglobinuria, 2718–2719
paroxysmal cold, 2564

Hemolymphatic stage of sleeping sickness, 1845

Hemolysins, 1556

Hemolysis
- definition of, 2527–2528
- fragmentation, 2565
in G6PD deficiency, agents precipitating, 2561b

Hemolytic anemia
- acanthocytosis, 2540
- definitions and classification, 2527–2530
- enzymatic defects, 2558–2562
  - glucose-6-phosphate dehydrogenase deficiency, 2560–2562
  - glycolytic enzyme deficiencies, 2560
  - pyruvate kinase deficiency, 2558–2560
- etiology of, 2529b –2530b
- hemoglobinopathies, 2540–2558
- hereditary elliptocytosis, 2535–2536 , 2535t
- hereditary pyropoikilocytosis, 2535–2536
- hereditary spherocytosis, 2530–2534
- hereditary stomatocytosis, 2536–2538 , 2537t
- hexokinase variants associated with, 2559t
- immune, 2562–2564 , 2563b
  - in mushroom-associated syndromes, 3803t
- nonimmune, classification of, 2528t –2529t
- paroxysmal nocturnal hemoglobinuria, 2538–2540
- secondary to other extracellular factors, 2565–2566
- Wilson disease and, 2104

Hemolytic disease of newborn
- caused by blood group A and B incompatibility, 970 , 971t
- caused by Rh incompatibility, 967–970
other forms of, 970–971

Hemolytic uremic syndrome (HUS), 2612–2614, 2732–2735
- clinical manifestations of, 2733–2734
- current classification of, 2733
- diagnosis and differential diagnosis of, 2734
- etiology of, 2732–2733
- pathogenesis of, 2733
- pathology of, 2733
- prognosis and treatment of, 2734–2735

Hemophagocytic lymphohistiocytosis (HLH), 1262–1263, 2706, 2707–2708, 2709f, 2712–2713
- clinical manifestations of, 2712–2713, 2712f
- diagnostic guidelines for, 2712, 2712t
- differential diagnosis of, 2713
- physical examination in, 2712
- primary, 2706, 2713
- secondary, 2706, 2713
- treatment and prognosis of, 2713

Hemophagocytosis, 2710t

Hemophilia, 2609

Hemophilia A, 2594–2597
- chronic complications of, 2597
- clinical manifestations of, 2594, 2595f
- comprehensive care for, 2597
- differential diagnosis of, 2595
- genetics and classification of, 2595
- laboratory findings and diagnosis of, 2594–2595
- pathophysiology of, 2594
- prophylaxis in, 2596
- supportive care for, 2597
- treatment of, 2595–2596, 2596t

Hemophilia B, 2594–2597

Hemophilia C, 2594, 2597–2598
Hemoptysis

cystic fibrosis and, 2294
pulmonary, 2313–2315
respiratory signs and symptoms, 2166

Hemorrhage, 2608

acute, 2581
adrenal glands, 2964
brain, due to untreated hypernatremia, 394
diffuse alveolar, 2306, 2306t
eextracranial, 914f
gastrointestinal, 1910–1911
intraparenchymal, 561f
in newborn
hemorrhagic disease, 972–973
intracranial-intraventricular, 915–918, 917t
subconjunctival and retinal, 914–915
traumatic epidural, subdural, and subarachnoid, 915
pulmonary, 948–949, 2309–2315
retinal, 3384
birth-related, 3342
subconjunctival, 3393f
subgaleal, 914
types, in hemophilia, 2596t
from umbilical cord, 975
in yellow fever, 1765

Hemorrhagic conjunctivitis, 1693, 3366f

Hemorrhagic corpus luteum, 2863

Hemorrhagic cystitis, 2748–2749
in adenoviruses, 1740

Hemorrhagic fever

dengue, 1760–1764
with renal syndrome, 1768, 1770
viral, 1766–1771, 3811t–3812t

Hemorrhagic measles, 1673
Hemorrhagic stroke, 3215–3217, 3216f–3217f, 3216t
Hemorrhagic telangiectasia, hereditary, 3468
Hemorrhoids, 2060
  formation of, 2060f
Hemosiderin-laden macrophages (HLMs), 2306–2307, 2314
Hemosiderosis, pulmonary, 2306–2308
  clinical manifestations of, 2307
  epidemiology of, 2306
  etiology of, 2306, 2306t
  laboratory findings for, 2308
  pathology of, 2306–2307
  pathophysiology of, 2307
  prognosis of, 2308
  treatment of, 2308
Hemostasis, 2589–2594
  clinical history, 2591
  developmental, 2593–2594
  laboratory tests, 2591–2593
  mechanism of, 2590f
  pathology, 2591
  physical examination, 2591
  process of, 2589–2591

  massive, 548–550, 550t, 551b
Hemotympanum, 3436
Henderson-Hasselbalch equation, 411, 411f
Henoch-Schönlein purpura, 2307, 2618, 2831, 3446, 3446f
  clinical manifestations, 1319, 1319f
  complications, 1320
  diagnosis, 1319–1320
  differential diagnostic features, 1324f
  epidemiology, 1318–1319
laboratory findings, 1320
nephritis, 2731
pathogenesis, 1319
pathology, 1319
prognosis, 1320
treatment, 1320

Heparan sulfate degradation, 811f

Heparin
in DIC, 2609
low-molecular-weight, 2311–2312, 2606
  enoxaparin dosing, 2606
poisoning, 497t
unfractionated, 2311–2312, 2605–2606
  complications of, 2605–2606
  dosing of, 2605

Heparin-induced thrombocytopenia (HIT), 2606

Hepatic crisis, in tyrosinemia type I, 699

Hepatic disease, 195–196

Hepatic disorders, associated with hyposplenism, 2621t

Hepatic encephalopathy, 2135, 2135t

Hepatic fibrosis, 2745

Hepatic late effects, of cancer and treatment, 2645t–2647t

Hepatic lipase deficiency, 759–760

Hepatic malignancies, 2700

Hepatic methionine adenosyltransferase (MAT I/MAT III) deficiency, 706

Hepatic sickle cell crisis, 2123

Hepatic system, dysfunction of, criteria for, 574t

Hepatic tumors, causing isosexual precocious puberty, 2905

Hepatitis, 2106–2119
  autoimmune, 2127–2130
  IBD-associated, 2121
clinical approach to, 2118–2119, 2118f
infectious, and sports participation, 3680t–3683t
issues common to all forms of, 2106–2108
common biochemical profiles in the acute infectious phase, 2107–2108
differential diagnosis, 2106, 2107f
pathogenesis of, 2107
neonatal, intrahepatic cholestasis and, 2093–2094

Hepatitis A, 1347–1348, 2108–2109
clinical manifestations of, 2108
complications of, 2108
diagnosis of, 2108
epidemiology of, 2108
etiology of, 2108
immune globulin for preexposure and postexposure prophylaxis against, 2109t
prevention of, 2108–2109
immunoglobulin in, 2109
vaccine in, 2109
prognosis of, 2109
serologic course of, 2108f
treatment of, 2108

Hepatitis A vaccine (HepA), 1350t, 1357

Hepatitis A virus (HAV) infection, 1373t–1374t

Hepatitis A-hepatitis B vaccine (HepA-HepB), 1350t

Hepatitis B, 1086, 2109–2115, 2630
chronic, causes of hepatitis flares in, 2112t
clinical manifestations of, 2110–2111
complications of, 2112
diagnosis of, 2111–2112
epidemiology of, 2110
etiology of, 2109–2110
genotypes of, 2110
in immigrant children, 69
natural history of, 2111f
pathogenesis of, 2110
peginterferon or a nucleoside or nucleotide analog, 2112t
postexposure prophylaxis for, 2113–2114
prevention of, 2113
universal vaccination for, 2113
prognosis of, 2114–2115
serologic course of, 2111f
special populations in, 2114
transmission of, strategy to eliminate, 2113r
treatment of, 2112–2113
strategies for, 2112–2113
typical course of, 2115f
typical interpretation of test results for, 2111r
vaccines for
recommended doses of, 2114r
schedules for, 2114r–2115r

Hepatitis B immunoglobulin (HBIG), 1349t , 2110
Hepatitis B surface antigen (HBsAg), 2109–2110
Hepatitis B vaccine (HepB), 1350t , 1353 , 1359–1360
Hepatitis B virus, development of hepatocellular carcinoma and, 2633
Hepatitis C, 2115–2117
   acute, 2115

HUS, Hemolytic uremic syndrome
Hutchinson syndrome, 2679t
Hutchinson-Gilford progeria syndrome, 827–831, 830t–831t
  appearance, 830f
  clinical manifestations, 827–829, 828f
  diagnosis and differential diagnosis, 830
  laboratory findings, 829
  molecular pathogenesis, 829–830
  treatment and prognosis, 831
HVR, Hypoxic ventilatory response
Hyaline membrane disease, 932–936, 933f, 937f
Hyalinosis cutis et mucosae, 3520
Hybridization, array comparative genomic (aCGH), 627, 638f
Hydatid disease, 1897
Hydralazine
  for heart failure, 2480t
  for severe hypertension in children, 2498t
Hydranencephaly, 3079, 3080f
Hydration
  for acute gastroenteritis, 2028
  artificial, 46–47
  cutaneous, for atopic dermatitis, 1212–1213
  in palliative care, 60–61
Hydroa vacciniforme, 3499
Hydrocalycosis, 2805
Hydrocarbon aspiration, 2236, 2236f
Hydrocarbon poisoning, 507
Hydroceles, 2065f, 2066, 2832–2833, 2832f
  communicating, 2066
  diagnosis of, 2832
  etiology of, 2832
  treatment of, 2832–2833
Hydrocephalus, 3064, 3064f, 3076–3080
  in acute bacterial meningitis, 3224
  causes of, 3076t
  clinical manifestations of, 3077–3079, 3078f
  diagnosis and differential diagnosis of, 3079, 3079f
  genetic abnormalities associated with, 3077t
  hydranencephaly in, 3079, 3080f
  language disorders and, 278
  megalencephaly in, 3079
  pathophysiology and etiology of, 3076–3077
  physiology of, 3076
  posthemorrhagic, 917
  prognosis of, 3080
  treatment of, 3080
  with type II Chiari malformation, 3067
Hydrocortisone, in newborn, 912f
Hydrocystosis, hereditary, 2536–2537
Hydrogen cyanide poisoning, 509–510
Hydrogen ions, secretion in collecting duct, 413f
Hydrometrocolpos with polydactyly, 2868
Hydronephrosis, 2801
  antenatal, 2801, 2801t
Hydropneumothorax, loculated, 2277f
Hydrops, acute, 2139
Hydrops fetalis, 967, 974f, 2558
Hydrothorax, 2322
Hydroxocobalamin, for cyanide poisoning, 510, 3814
3β-hydroxy-Δ5-C27-steroid oxidoreductase (3β-HSD), deficiency of, 2095–2096
3-Hydroxy-3-methylglutaric aciduria, 714–715
3-Hydroxy-3-methylglutaryl CoA synthase deficiency, mitochondrial, 714
β-Hydroxy-β-methylglutaryl-CoA synthase deficiency, 745
γ-Hydroxybutyrate, as club drug, 1046t
Hydroxychloroquine
  low-dose, for porphyria cutanea tarda, 843
  for rheumatic diseases, 1254t–1255t
  in treatment of malaria, 1858t–1860t
11β-Hydroxylase deficiency, 402
  congenital adrenal hyperplasia caused by, 2972t–2973t, 2976
17-Hydroxylase deficiency, 3015
  congenital adrenal hyperplasia caused by, 2972t–2973t, 2977
21-Hydroxylase deficiency, congenital adrenal hyperplasia by, 2971–2976, 2972t–2973t
  diagnosis of, 3012t
  differential diagnosis of, 2974
  epidemiology of, 2971
  etiology of, 2971
  genetics of, 2971–2973
  genotype-phenotype correlations in, 2973t
  laboratory findings in, 2974
  newborn screening for, 2974–2975
  pathogenesis and clinical manifestations of, 2973–2974
    adrenomedullary dysfunction, 2974
    aldosterone and cortisol deficiency, 2973
    postnatal androgen excess, 2974
    prenatal androgen excess, 2973–2974
prenatal diagnosis of, 2974

treatment of, 2975–2976

ambiguous genitals, surgical management of, 2975–2976

hydorchoroid replacement for, 2975

mineralocorticoid replacement for, 2975

hydorchoroid prenatal, 2976

Hydroxymethylbilane (HMB), 835

4-Hydroxyphenylpyruvate dioxygenase, primary deficiency of, 700

17-Hydroxyprogesterone, 2974

17β-Hydroxysteroid dehydrogenase, 3016

3β-Hydroxysteroid dehydrogenase deficiency, 3015

congenital adrenal hyperplasia caused by, 2972t–2973t, 2976–2977

11β-hydroxysteroid dehydrogenase isozyme, 2969

Hydroxyurea

for β-thalassemia, 2556

for sickle cell disease, 2547–2548

Hydroxyzine, for anxiety, 192t

Hygiene, promotion of personal and domestic, for acute gastroenteritis, 2032

Hygiene hypothesis, in T1DM, 3024

Hymen, abnormalities of, 2870–2871

Hymenal membrane characteristics, 109f

Hymenolepisis, 1895

Hymenolepis , 1894t, 1895

Hymenoptera, 1217, 1218f

stings, 3826–3827

Hymens, types of, 2842f

Hyperactivity, in mushroom-associated syndromes, 3803t

Hyperacute bacterial conjunctivitis, 3365t

Hyperacute rejection, in renal transplantation, 2783
Hyperadrenergic POTS, 570

Hyperaldosteronism, 3295

Hyperammonemia, 729, 730b
  acute, treatment of, 731–732, 732b
  clinical manifestations of, 729–730
  diagnosis, 730–731
  symptomatic, 731f

Hyperammonemia-hyperornithinemia-homocitrullinemia syndrome, 735

Hyperamylasemia, differential diagnosis of, 2076t

Hyperandrogenism, 2906–2907

Hyperargininemia, 734

Hyperbilirubinemia
  conjugated, 2086
  familial nonhemolytic unconjugated, 2101–2103
  in hypertrophic pyloric stenosis, 1947
  inherited conjugated, 2103
  in newborn, 953–957, 958f
  nomogram for risk assessment of, e 14f
  unconjugated, 2086, 2087t

Hypercalcemia, 2644t
  causes of, 2951f, 2952t

Hypercalciuria, 2763, 2837–2838
  hereditary hypophosphatemic rickets with, 382–383
  idiopathic, 2743–2744
    diagnosis of, 2744
    treatment of, 2744
  renal, 2837
  therapy for urolithiasis caused by, 2839t
  in vitamin D intoxication, 384

Hypercapnia, permissive, 935

Hypercholanemia, familial, 2094–2095
Hypercholesterolemia, 754
t familial, 754
with hypertriglyceridemia, 758
polygenic, 758

Hypercoagulability, due to nephrotic syndrome, 2755–2757

Hypercyanotic attacks, paroxysmal, 2397

Hyperdiploidy, 2679

Hyperechoic rhabdomyoma, 3145f

Hyperekplexia, 3124–3125

Hypereosinophilic syndrome, 1133, 1133f, 2257–2258, 2258f

Hyperfibrinolysis, 2607

Hyperfiltration injury, 2775

Hyperglycemia, 390
fetal, 983f
in refeeding syndrome, 342f
in T1DM, 3030
in toxicologic diagnosis, 494b

Hyperglycinemia, 720
nonketotic
infantile, 720
neonatal, 720
transient, 720

Hypergonadotropic hypogonadism
female, 3002–3006
Noonan syndrome in, 3006
other ovarian defects in, 3006
Turner syndrome in, 3002–3004
45,X/46,XX gonadal dysgenesis in, 3005, 3005f
XX gonadal dysgenesis in, 3004–3005
XXX females in, 3005–3006
XXXX females in, 3006
XXXXX females in, 3006

male, 2993–2997
clinical manifestations of, 2995
Hyperhidrosis, 3536, 3536b

Hyper-IgE syndromes
   autosomal dominant, 1118
   autosomal recessive, 1134t–1135t

Hyper-IgM syndrome, 1111, 1404

Hyperimmunoglobulinemia D with periodic fever (HIDS), 715, 1294t, 1297–1298, 1298b, 1305

Hyperinsulinemia
   congenital, 856f
   fetal, 983f
   in hypoglycemia, 853t

Hyperinsulinism, in hypoglycemia, 852–859

Hyperinsulinism-hyperammononemia syndrome, 3099

Hyperkalemia, 2644t
   in CKD, 2772, 2775t
   clinical manifestations of, 400
   diagnosis of, 400
   distal nephron with, generalized abnormality of, 2765t
   electrocardiogram of, 2358f
   etiology and pathophysiology, 399–400
   in periodic paralysis, 3298t
   treatment of, 400–401

Hyperkalemic periodic paralysis, 3297t
   paramyotonia congenita with, 3289t

Hyperkalemic renal tubular acidosis, 416, 2764–2766
   clinical manifestations of, 2764
diagnostic approach to, 2764–2765
pathogenesis of, 2764
treatment and prognosis of, 2765–2766

Hyperkeratosis, epidermolytic, 3514, 3514f

Hyperkinetic disorder, 263t

Hyperkyphosis, 3641b

Hyperleukocytosis, 2644t

Hyperlexia, 278

Hyperlipidemia
  in CKD, 2775, 2775t
due to nephrotic syndrome, 2755
secondary causes of, 759b

Hyperlipoproteinemias, 754–764

Hypermagnesemia
  clinical manifestations of, 407
diagnosis of, 407
etiology and pathophysiology, 406
newborn, 913
treatment, 407

Hypermethioninemia
  acquired, 706
primary (genetic), 706

Hypermobile Ehlers-Danlos syndrome, 571, 3527–3530, 3527b, 3528t, 3529f, 3530b

Hypermobile pes planus, 3600–3601
  clinical manifestations of, 3601
  radiographic evaluation of, 3601, 3601f
  treatment of, 3601

Hypermobility, questionnaire for identifying, 3528b

Hypermyelinating (tomaculous) neuropathy, 3328–3329
Hypernatremia
  causes of, 393b, 2888–2889
  clinical manifestations of, 393–394
  diagnosis of, 394
  etiology and pathophysiology, 393
  treatment of, 394
Hypernatremic dehydration, 429, 431–432, 431b
Hyperopia, 3344, 3345f
Hyperosmolality, 395, 395b
Hyperostosis
  infantile cortical, 3735–3736, 3735f–3736f
  ulna and tibia, 364f
Hyperoxaluria
  calcium stones caused by, 2837–2838
  and oxalosis, 720–723
  primary, 2781
    type 1, 721–722
    type 2, 722
    type 3, 722
  secondary, 721
  urolithiasis caused by, 2839t
Hyperoxia test, 2395
Hyperparathyroidism, 408, 2950–2953, 3295
  causes of hypercalcemia, 2953
  clinical manifestations, 2950
  differential diagnosis, 2951
  etiology, 2950
  jaw tumor syndrome, 2950
  laboratory findings, 2950–2951
  prognosis, 2953
  treatment, 2951–2953
Hyperphenylalaninemia
caused by BH4 deficiency
  clinical manifestations, 698
diagnosis, 698
genetics and prevalence, 698
treatment, 698
neonatal screening for, 696
nonphenylketonuria, 695

Hyperphosphatasemia, 3750, 3752f

Hyperphosphatemia, 409–410, 2644t, 2775

Hyperpigmentation, 3498
  axillary, in acanthosis nigricans, 3510f
  in scleroderma, 1286f

Hyperpigmented lesions, 3474–3477
  café-au-lait spots, 3475
  disorders of pigment, 3474
  ephelides (freckles), 3474
  lentigines, 3474–3475
  macules, of tinea versicolor, 3560f
  plaques, of early morphea, 3519f
  post-inflammatory pigmentary changes, 3477

Hyperpituitarism, 2892–2898

Hyperplasia
  angiofollicular lymph node, 2626
  erythroid, 2528
  lymphoid nodular, of gastric antrum, 1970f
  nodular lymphoid, 2064
  sebaceous, 3453

Hyperplastic callus form of osteogenesis imperfecta (type V), 3738

Hyperpnea, as respiratory distress, 585

Hyperprolactinemia, 698, 2855t, 2999

Hyperprolinemia, 729
  type I, 724
  type II, 724, 736
Hyperprostaglandin E syndrome, 2767
Hyperpyrexia, 1388
Hyperreactive malarial splenomegaly (HMS), 1861
Hypersensitivity, cow's milk, pulmonary hemosiderosis, 2307
Hypersensitivity pneumonia, 2239–2243
    antigen sources of, 2240
    classification of, 2239–2241
    clinical manifestations of, 2241, 2241t
    etiology of, 2239
    laboratory for, 2241–2242
        antigen challenge, 2242
        bronchoalveolar lavage in, 2242
        lung biopsy in, 2242
        radiology in, 2241–2242, 2242f
    pathogenesis of, 2239–2241
    treatment of, 2243
Hypersensitivity pneumonitis, nontuberculous mycobacteria infection and, 1588t
Hypersensitivity syndromes, 1647
    allergic Aspergillus sinusitis, 1647
    allergic bronchopulmonary aspergillosis, 1647
    asthma, 1647
    drug-induced, 3450f
    extrinsic alveolar alveolitis, 1647
Hypersensitivity vasculitis, 1326, 1326t–1327t
Hypersplenism, 2619
Hypertelorism, 3390
Hypertension, 2775
    in acute kidney injury, 2773
    in CKD, 2775t, 2778
    clinical evaluation and, 2495t
    clinical manifestations of, 2493
    as complication of kidney transplant immunosuppression, 2784
conditions associated with, 2492b
definition of, 2490
diagnosis of, 2493–2496
etiology and pathophysiology of, 2491–2493
evaluation of, 2493f
in 11β-hydroxylase deficiency, 2976
idiopathic intracranial, 3236–3238
pediatric heart transplantation and, 2485
physical examination in, 2494t
portal, 2141–2143
clinical manifestations of, 2142
diagnosis of, 2142
in esophageal varices, 1941
etiology of, 2141
pathophysiology of, 2141
prognosis of, 2143
treatment of, 2142–2143
portal, liver disease and, 2087
portopulmonary, 2089
prevalence of, in children, 2490, 2491t
prevention of, 2496
pulmonary, 2424–2428
developmental lung disease associated with, 2425b
drugs used for, 2427t
primary pulmonary hypertension, 2424–2427
pulmonary vascular disease, 2427–2428
updated classification of, 2425b
and sports participation, 3680t–3683t
systemic, 2490–2499
in T2DM, 3047t
treatment of, 2496–2499

Hypertensive encephalopathy, 3178
stroke and, 3217–3218

Hypertensive retinopathy, 3383, 3383f

Hyperthermia, 466
in drowning, 612
malignant, 3297t, 3298
newborn, 913

Hyperthymic, 224

Hyperthyroidism, 2895, 2925, 2928
  treatment for, 2932–2933, 2932t

Hypertonic saline, for bronchiolitis, 1737

Hypertrichosis, 3538
  associated with diastematomyelia, 3239f
  causes and conditions associated with, 3538b

Hypertriglyceridemia, 758–760
  hypercholesterolemia with, 758
  risk assessment and treatment of, 762–764, 762f, 763b, 763t

Hypertrophic cardiomyopathy, 2465f, 2469–2470
  clinical manifestations of, 2469
  diagnosis of, 2469
  echocardiograms of, 2465f
  etiology and epidemiology of, 2463t, 2469
  pathogenesis of, 2469
  prognosis and management of, 2469–2470
  sudden death and, 2449

Hypertrophic gastropathy, 1949–1950

Hypertrophic osteoarthropathy, 1334
  cystic fibrosis and, 2295

Hypertrophic pyloric stenosis, 1946–1948
  clinical manifestations of, 1947
  differential diagnosis of, 1947–1948
  etiology of, 1946–1947
  treatment of, 1948

Hypertrophy, 3057
  labial, 2872

Hyperuricemia, 2644t
  in gout, 819
Hyperuricosuria, 2838, 2839
Hypervitaminosis A, 364–365
Hypervitaminosis D, 384–385, 2953
Hypervolemic hyponatremia, 395b, 396
Hyphema, 3395
   spontaneous, 3353
Hypnotherapy, in pain management, 484
Hypoaldosteronism/pseudohypoaldosteronism, 2891
Hypobaric hypoxia, 601–602
Hypobetalipoproteinemia, 2540
   homozygous, 1998
Hypocalcemia
   in acute kidney injury, 2773
   causes of, 2946
   evaluation of, 2947
   in neonatal seizures, 3113
   newborn, 913
   secondary, hypomagnesemia with, 405
   in toxicologic diagnosis, 494b
Hypocalcification, of teeth, 1914
Hypocalciuria, 2769
Hypocellular bone marrow, pancytopenia with, 2568
Hypochondroplasia, 3728
Hypocitraturia, 2763
Hypocitric aciduria, 2839
Hypocomplementemic urticarial vasculitis, 1326, 1327
Hypofunction
   of ovaries, 3001–3007, 3002
      hypergonadotropin hypergonadism in, 3002–3006
      hypogonadotropic hypogonadism in, 3006–3007
of testes, 2993–3000, 2994
    other causes of, 2995
    primary hypogonadism in, 2993–2997
    secondary hypogonadism in, 2997–3000

Hypoglossal nerve, in neurologic examination, 3057

Hypoglycemia, 848–862
    in cholera, 1516
    classification, in infants and children, 850–861
    clinical manifestations, 850, 854t, 858t
    complication of malaria, 1861
    definition, 848
    diagnosis and differential diagnosis, 861–862
    glucose homeostasis
        in newborn, 849
        in older infants and children, 849–850
    hyperinsulinism, 852–859
    in infants of diabetic mothers, 852, 983
    in neonatal seizures, 3113
    pancreatic cell and insulin secretion, 855f
    persistent or recurrent
        disorders of gluconeogenesis, 860
        endocrine deficiency, 859
        fructose intolerance, 861
        glycogen storage disease, 860
        substrate limited, 859–860
        systemic disorders, 861
    prognosis, 862
    significance and sequelae, 848–849
    stroke and, 3217
    treatment, 862

Hypoglycemic reactions, in T1DM, 3037–3038

Hypoglycemias, oral, poisoning, 503–504

Hypoglycinemia, 719

Hypoglycorrhachia, in acute bacterial meningitis, 3225

Hypogonadism
female
  hypergonadotrophic, 3002–3006
  hypogonadotrophic, 3006–3007

male
  etiologic classification of, 2994t
  primary, 2993–2997, 2994t
  secondary, 2994t, 2997–3000

Hypogonadotropic hypogonadism
  disorders associated with, 2908, 2909t
  female, 2909, 3006–3007
    diagnosis of, 3007
    etiology of, 3006–3007
  male, 2909, 2997–3000
    diagnosis of, 2999–3000
    etiology of, 2997–2999, 2998t
    treatment of, 2999–3000
    without anosmia, 2998–2999

Hypohidrotic ectodermal dysplasia, 3459–3460, 3459f, 3459t

Hypokalemia, 401–404
  causes of, 401b
  clinical manifestations of, 402–403
  diagnosis of, 403–404
  electrocardiogram of, 2358f
  etiology and pathophysiology, 401–402
  in periodic paralysis, 3298t
  in primary aldosteronism, 2985
  in refeeding syndrome, 342t
  treatment of, 404

Hypokalemic hypochloremic metabolic alkalosis, 2767

Hypokalemic paralysis, 3296
  periodic, 3297t
    channelopathies with, 3289t

Hypolactasia, primary adult-type, 2004

Hypomagnesemia, 2769
  clinical manifestations of, 406
diagnosis of, 406
etiology and pathophysiology, 405–406
in neonatal seizures, 3113
in refeeding syndrome, 342

treatment of, 406

Hypomanic episode, 222, 223b

Hypomastia, 2854

Hypomelanosis of Ito, 672, 3478–3479, 3479f

Hypomelanotic macules, 3145f

Hypomyelinating neuropathy, congenital, 3327

Hyponatremia, 2644t
in acute kidney injury, 2773
in acute porphyria, 837
causes of, 395b, 2889–2892
clinical manifestations of, 397
diagnosis, 397, 403

differential diagnosis of, 2890t
etiology and pathophysiology, 395–396
exercise-associated, 3705, 3705f
in neonatal seizures, 3113
treatment of, 397–398, 2892

Hyponatremic dehydration, 429–431, 430b

Hypoparathyroidism, 2945–2948, 2949t
aplasia or hypoplasia of parathyroid glands, 2945
associated with mitochondrial disorders, 2946–2947
autoimmune, 2947
autosomal dominant, 406, 2946
autosomal recessive, with dysmorphic features, 2945
etiology of, 2945
idiopathic, 2947–2948
and sensorineural deafness and renal anomaly syndrome, 2945–2946
suppression of neonatal parathyroid hormone secretion because of maternal hyperparathyroidism, 2946
surgical, 2947
X-linked recessive, 2945

Hypophosphatasia, 736 , 2953 , 3748–3749 , 3748f –3749f

Hypophosphatemia, 407–409
causes of, 408b
etiology of, 408–409
in refeeding syndrome, 342t

Hypophosphatemic rickets, hereditary, with hypercalciuria, 382–383

Hypophysitis, 2888

Hypopigmented lesions, 3477–3480 , 3477t
albinism, 3477–3478
melanoblast migration abnormalities, 3478–3480

Hypopituitarism, 2880–2887
clinical manifestations of, 2884
  acquired form, 2884
  congenital form, 2884
complications and adverse effects of GH treatment, 2886–2887
differential diagnosis of, 2886
GH deficiency
  acquired forms of, 2883
  genetic forms of, 2882–2883
GH insensitivity, 2883–2884
in hypogonadotropic hypogonadism, female, 3006–3007
laboratory findings of, 2884–2885
multiple pituitary hormone deficiency, 2880–2882
  acquired forms, 2882
  congenital forms, 2881–2882 , 2881f , 2881r
  genetic forms, 2880–2881 , 2881r
radiologic findings of, 2885 , 2885f
treatment of, 2886

Hypoplasia
breast, 2854
cartilage-hair, 1117 , 2577 , 3734 , 3734f
enamel, 1914t
focal dermal, 3458
optic nerve, 3385, 3385f
of parathyroid glands, 2945
pulmonary, 2229–2230
renal, 2786–2788
of teeth, 1914
thymic, 1113
urethral, 2810, 2826

Hypoplastic breast tissue, 2854
Hypoplastic left heart syndrome, 2414–2417, 2415f–2417f
Hypoplastic left ventricle, relative frequency of, 2367t
Hypoplastic right ventricle, relative frequency of, 2367t
Hypopyon, 3352–3353, 3371
Hyporegenerative anemia, 2517
Hypospadias, 2821–2822
   chordee without, 2822
   clinical manifestations of, 2821–2822
   in male-appearing genitalia, 3011t
   megameatal variant of, 2821
   treatment of, 2822
   varying forms of, 2822f

Hyposplenism, 2621
Hypotelorism, 3390
Hypotension, 526
   in newborn, 912
   orthostatic, initial, 569–571, 569f
Hypothalamic causes of hyperhidrosis, 3536b
Hypothalamic hamartomas, 2903
Hypothermia, 466, 623–625
   deep, 624–625
drugs displaying reduced metabolism or clearance in, 624b
management of, 624b
drowning, 612
newborn, 913
in pediatric drowning, 609
recommendations for, 625f
in winter sports, 624

Hypothyroidism, 387–388, 2599–2600, 2914–2922, 2925, 3295
acquired, 2920–2922
clinical manifestations of, 2921–2922, 2921f, 2922t
diagnostic studies in, 2922
epidemiology of, 2920
etiology of, 2920–2921, 2920t
treatment and prognosis of, 2922
conditions associated with, 2929t
congenital, 982, 2914–2920, 2933–2934
central (hypopituitary), 2916
clinical manifestations of, 2917–2918
epidemiology of, 2914
etiologic classification of, 2914–2916, 2915t
laboratory findings of, 2918
primary, 2914–2916
prognosis of, 2920
thyroid function in preterm babies, 2916–2917
treatment of, 2918–2920
due to total body irradiation, 1168
Graves disease, 2928–2933
precocious puberty and, 2904
primary, 2886

Hypothyroxinemia, transient, 982

Hypotonia, 3058
anatomic region of, 3247t
benign congenital, 3273
central, 3247f
combined, 3248f
infantile, differential diagnosis of, 3249t
mitochondrial disorders with, 3301t
peripheral, 3248f

Hypotrichosis, 3538

Hypouricemia, renal, 2769

Hypoventilation
  in CCHS, 2332–2333
  in newborn, 911t
  predisposing factors, 177b

Hypovolemia, urine chemistries in, 2772t

Hypovolemic hyponatremia, 395, 395b, 398

Hypovolemic POTS, 570

Hypovolemic shock, 537, 572–573, 573t, 2621–2622
  clinical manifestations of, 575–576
  hemodynamic variables in, 576t
  pathophysiology of, 574

Hypoxanthine-guanine phosphoribosyltransferase (HPRT) deficiency, 819
  clinical manifestations, 820–821
  diagnosis, 821
  genetics, 820
  pathology, 820
  treatment, 821

Hypoxia
  acute, 601–602
  hypobaric, 601–602

Hypoxia-inducible factor (HIF), 601

Hypoxic-ischemic encephalopathy, 918–923, 923f
  global, stroke and, 3217
  in neonatal seizures, 3112
  in postresuscitation care, 547

Hypoxic-ischemic injury, 609, 611

Hypoxic ventilatory response (HVR), 601–602
Hypsarrhythmia, 3098

Intracranial pressure (ICP), 557–558
  increased
    in acute bacterial meningitis, 3224
    as oncologic emergency, 2644t
    as sign of brain tumor, 2666–2668
  secondary headaches in, 3139
Intracranial tumors, causing precocious puberty, 2905
Intractable migraine, inpatient management of, 3136–3137
Intracultural variability, 70–71
Intradermal technique, 1178
Intraductal papilloma, 2855
Intradural tumor, 3242f
Intrahepatic bile ducts, cystic dilation, 2138
Intrahepatic cholestasis, 2093–2096
  disorders of transport, secretion, conjugation and biosynthesis of, 2094–2096
  neonatal hepatitis and, 2093–2094
  proposed subtypes of, 2093t
Intrahepatic portal hypertension, 2141t
Intralipid emulsion therapy, 498
Intraluminal impedance, GERD, 1937
Intramedullary tumor, 3242f
Intranasal corticosteroids, 178b
Intraoral dental radiographs, 1926
Intraosseous access, 543, 547f
Intrapartum antibiotics, 1003–1005, 1004t
Intrapulmonary right-to-left shunting, 2155
Intrapulmonary sequestration, 2232
Intrapulmonary shunting, in respiratory failure, 587
Intrarenal reflux, 2794f
Intratemporal complications, of acute otitis media, 3428
Intrathecal analgesia, in pain management, 486
Intrathecal baclofen
   for cerebral palsy, 3173
   for spasticity, 3762
Intratracheal goiter, 2926
Intrauterine device (IUD), 1065t–1066t, 1068
   copper, 1072
   progesterone, 2874
Intrauterine growth restriction (IUGR)
   definitions, 902
   factors associated with, 902t, 906t
   fetal therapy for, 891t
   incidence, 902
   small, infants, 907t
Intrauterine infections
   genital mycoplasmas, 1612–1613
   pathogenesis, 1010, 1011t
Intrauterine/maternal factors, in etiology of arthrogryposis, 3658b
Intravascular access devices, 1410–1412
catheter-associated skin and soft tissue infection, 1411
catheter-related bloodstream infection, 1411–1412
catheter types, 1410–1411
prevention of infection, 1412

Intravascular volume, regulation of, 391–392

Intravenous anesthetic agents, 462–464

Intravenous antibiotic therapy, for cystic fibrosis, 2292–2293

Intravenous immunoglobulin (IVIG)
  for fetal hemolysis, 970
  for gestational alloimmune liver disease, 2105
  for Kawasaki disease, 1315
  for kernicterus, 960–961
  for rheumatic diseases, 1254t–1255t, 1257

Intravenous solutions, 426, 426t

Intraventricular hemorrhage (IVH), 865

Intrinsic acute kidney injury, 2741

Intrinsic renal acute kidney injury, 2770

Intron mutations, 637f

Intrusions
  periodontal, 1922, 1923f
  saccadic, 3127

Intubation
  endotracheal, 536–537, 537f
    in infectious upper airway obstruction, 2205
    in respiratory distress and failure, 590–591
  medications commonly used for, 591t
  rapid sequence, 590–591

Intussusception, 1910t, 1965–1967, 1966f
  acute gastroenteritis and, 2026
  in an infant, 1967f
  clinical manifestations of, 1966
  diagnosis of, 1966
etiology and epidemiology of, 1965–1966
pathology of, 1966
treatment of, 1967

Invasive aspergillosis, 1648–1650
bone, 1649
central nervous system, 1649
cutaneous, 1649
empirical antifungal therapy, 1650
eye, 1649
heart, 1649
HSCT complication, 1166, 1167f
invasive sinonasal disease, 1649
pulmonary, 1648–1649, 1648f

Invasive diseases
GAS infection, 1442–1443
*Haemophilus influenza* in, 1489
*Neisseria meningitidis*, treatment of, 1474t

Invasive fungal infection, 1007

Invasive mechanical ventilation, 595–597
control mode in, 595–596
    assist-control mode as, 596
    intermittent mandatory ventilation mode as, 595–596
control variable in, 596
expiratory phase maneuvers in, 597
initiation of inspiration, 595–597
inspiratory phase characteristics of, 597
support modes in, 596–597
termination of inspiration (cycle) in, 597

Invasive positive pressure ventilation, 2329–2330

Invasive secretory carcinoma, 2856

Inversion stress tilt test, 3698f
Inversions, 665
Involuntary movements, 3150
in motor examination, 3058

Iodide goiter, 2927–2928

Iodide transport, defective, 2915

Iodine, 387t –388t
deficiency, 334, 387–388, 2916, 2925–2926
default goiter and cretinism, 2926–2927
goiter, 2928
exposure, congenital hypothyroidism resulting from, 2916
organification, defects of, 2915–2916
in vegetarian diet, 330

Ion transporter disorders, 3728–3729
achondrogenesis type IB and atelosteogenesis type 2, 3728–3729
autosomal recessive multiple epiphyseal dysplasia, 3728–3729
diastrophic dysplasia, 3728, 3729f

Ionizing radiation, 3778

Iota toxin, 1559

I-PASS, 41

IPD, Infantile Pompe disease

IPEX syndrome, 1121–1122, 1997
associated with T1DM, 3051
chronic diarrhea and, 2035

IPH, Idiopathic pulmonary hemosiderosis

IPNHLRC, International Pediatric Non-Hodgkin Lymphoma Response Criteria

IPNHLSS, International Pediatric Non-Hodgkin Lymphoma Staging System

IPV, Intimate partner violence

IRAK4 (IL-1R-associated kinase-4) deficiency, 1119

Iridocyclitis, 3365t, 3376, 3376t

IRIS, Immune reconstitution inflammatory syndrome

Iris
Iris disorders

- aniridia, 3349, 3349f
- basal tear of, 3393f
- coloboma, 3349, 3349f
- heterochromia, 3352
- hypopyon, 3352–3353
- lesion of juvenile xanthogranuloma, 3353
- Lisch nodules, 3352

Iritis, 3375–3377

Iron, 387t –388t

- accumulation, brain, neurodegeneration with, 3194–3196, 3194f, 3195t
- in development of porphyria cutanea tarda, 841
- dietary reference intake, 309–317, 319t –320t
- intestinal absorption of, 2008–2009
- metabolism, defects of, 2526–2527
- overload
  - in homozygous β-thalassemia, 2556
  - in sickle cell disease, 2548–2549
- poisoning, 496t –497t, 503
- reference intervals, e 6t –e 13t
- therapy, responses to, 2524t
- in vegetarian diet, 330

Iron deficiency, 241, 317

- as goitrogen, 2927t

Iron-deficiency anemia, 334, 2522–2526

- clinical manifestations of, 2522
- differential diagnosis of, 2523–2524, 2524b
- etiology of, 2522
- indicators of, 2523t
- iron-refractory, 2525–2526
- laboratory findings of, 2522–2523, 2523f
- prevention of, 2524
Iron metabolism, central role of hepcidin in, 2514f
Iron-refractory iron-deficiency anemia, 2525–2526
Iron storage disease, neonatal, 2094, 2105
Iron supplementation, 2778

Kidney biopsy, 2784

Kidney disease

autosomal dominant polycystic, 2747–2748
autosomal recessive polycystic, 2744–2747
child with hematuria, clinical evaluation of, 2718–2720
cortical necrosis, 2736
diagnosis, 2778–2779
in Alport disease, 2722
hemodialysis in, 2779
peritoneal dialysis in, 2778–2779
erythropoietin production in, 2565
glomerular, 2714–2717
with recurrent gross hematuria, 2720–2728
glomerulonephritis
  acute poststreptococcal, 2722–2725
  associated with SLE, 2729–2731
  membranoproliferative, 2726–2727
  rapidly progressive (crescentic), 2727–2728
Goodpasture disease, 2732
hematuria, lower urinary tract causes of, 2748–2749
hemolytic-uremic syndrome, 2732–2735
Henoch-Schönlein purpura nephritis, 2731
in HIV, 1786
nephropathy
  contrast-induced, 2735
  HIV-associated, 2729
  immunoglobulin A, 2720–2721, 2724t
  membranous, 2725–2726
  toxic, 2735–2736
nephrotic syndrome, 2752–2760
polycystic
  autosomal dominant, 2138–2139
  autosomal recessive, 2137–2138
premature infants, associated with, 905t
proteinuria, 2749–2750
  conditions associated, 2750–2752
rickets caused by, 376b, 379
in sickle cell anemia, 2547, 2550
Staphylococcus aureus, 1431

tubular disorders
  Bartter syndrome, 2767–2768
  Gitelman syndrome, 2769
  inherited tubular transport abnormalities, 2767–2769
  nephrogenic diabetes insipidus, 2766–2767
  renal tubular acidosis, 2761–2766
  tubular function, 2761

in type I GSD, 778

Kidney Donor Profile Index (KDPI), 2780

Kidney failure, dental or oral findings associated with, 1914t

Kidney injury, acute, 2769–2774
  causes of, 2770t
  clinical manifestations of, 2771
  complications of, 2772t
  KDIGO staging of, 2770t
  laboratory findings of, 2771
  neurologic symptoms in, 2773
  pathogenesis of, 2770–2771
  prognosis of, 2774
  treatment of, 2771–2773
    dialysis, 2773–2774
    medical management, 2771–2773

Kidney neoplasms
  clear cell sarcoma, 2685
  mesoblastic nephroma, 2685
  renal cell carcinoma, 2685
  rhabdoid tumor, 2685
  Wilms tumor, 2681–2685

Kidneys
  absence of one, and sports participation, 3680t–3683t
  anomalies in shape and position, 2788–2789
  arsenic effects in, 3793t
  associated physical findings, 2789
  congenital anomalies and dysgenesis of, 2786–2789
delayed onset, orellanine poisoning, 3803
embryonic development, 2786
excretion of water, 391
mineralocorticoid in, 2958
normal acid-base balance maintained by, 411
sodium balance determined by, 392
trauma to, 2748

Kikuchi-Fujimoto disease, 2626
Kindler syndrome, 3488
Kinetics, neutrophil, 1125–1127, 1125t

*Kingella kingae*, 1484–1486
clinical disease in, 1484–1485, 1485t
diagnosis of, 1485
endocarditis and, 1485
epidemiology of, 1484, 1484f
etiology of, 1484
occult bacteremia, 1485
osteomyelitis, 1485
pathogenesis of, 1484
prevention of, 1486
septic arthritis and, 1484–1485
in spondylodiscitis, 1485
treatment of, 1485–1486

Kinyoun stain, 1336t

Kleeblattdsädel deformity, in craniosynostosis, 3081

Kleihauer-Betke test, acid elution technique of, 964f

Klinefelter syndrome, 669–671, 2894, 2909, 2996–2997
clinical manifestations of, 2996–2997
etiology of, 2996
in gynecomastia, 3001
laboratory findings in, 2997
management of, 2997
variants, 2996–2997

Klippel-Feil syndrome, 3647–3649, 3648f
- clinical presentation of, 3648
- etiology and classification of, 3648
- physical examination of, 3648
- radiologic investigation of, 3648
- treatment of, 3648–3649

Klippel-Trenaunay syndrome, 3462–3463, 3462f

Klisis test, 3625, 3626f

Klumpke paralysis, 925

Klumpke's palsy, 3763

KMP, Kasabach-Merritt phenomenon

Knee, 3617–3623
- anatomy and range of motion of, 3617
- disorders
  - anterior cruciate ligament rupture, 3622–3623, 3623f
  - discoid lateral meniscus, 3617–3618, 3618f
  - genu valgum, 3612
  - juvenile osteochondritis dissecans, 3619–3620, 3619f
  - Osgood-Schlatter disease and Sinding-Larsen-Johansson syndrome, 3620–3621, 3620f
  - patellofemoral instability, 3621–3622
  - patellofemoral pain syndrome, 3621
  - popliteal cysts, 3618–3619
- musculoskeletal pain syndrome, 1329f
- normal coronal alignment of, 3608f
- normal development of, 3617
- problems, in arthrogryposis, 3661
- sports-related injuries, 3695–3697
  - anterior cruciate ligament, 3695
  - initial treatment of acute injuries, 3696
  - medial collateral ligament, 3695
  - meniscal tears, 3695
  - Osgood-Schlatter disease, 3697
  - patellar dislocation, 3695–3696
  - patellofemoral stress syndrome, 3696–3697
  - posterior cruciate ligament, 3695
  - in running, 3715
Sinding-Larsen-Johansson disease, 3697
in wrestling, 3714

Knee-ankle-foot orthosis, 3768
Kniest dysplasia, 3722, 3723
Knobloch syndrome, polymicrogyria and, 3070–3071
Knock-knees, 3612
Kobberling lipodystrophy, 3534
Kocher-Debré-Sémélainge syndrome, 2918
Koebner phenomenon, 3497
Kohlberg's theory of moral development, 120
Köhler disease, 3603, 3603f, 3700
Koilonychia, 3543
Konno procedure, 2389
Koplik spots, in measles, 1671, 1672
Krabbe disease, 776, 3189
KS, Kaposi sarcoma
KSS, Kearns-Sayre syndrome
Kugelberg-Welander disease, 3310, 3312
Kuru, 1807, 1809
Kwashiorkor, 1346, 3589, 3589f
Kyasanur Forest disease, 1766, 1769
Kyphoscoliosis, 2328–2329, 3530
Kyphosis
  congenital, 3642
  flexible, 3640–3641
  structural, 3641–3642, 3641f

L
La Crosse and California encephalitis, 1756

LAAHD, Lethal arthrogryposis with anterior horn cell disease

Labetalol, for severe hypertension in children, 2498t

Labial adhesions, 2819f, 2844f

Labial agglutination, 2845t–2846t, 2846–2847

Labor
  child trafficking for, 95–98
  detection of fetal compromise during, 884
  and high-risk infant, 898t

Laboratory cardiac evaluation, 2354–2366
  radiologic cardiac assessment, 2354–2355

Laboratory diagnosis, of Epstein-Barr virus (EBV), 1717

Laboratory evaluation
  of dysmorphic child, 994–996
  of hematuria, 2719f
  of jaundiced infant, 954t
  of rape victims, 1080b
  for secondary survey, 554
  of urolithiasis, 2837t

Laboratory findings
  in diagnosis of ADHD, 265
  of influenza viruses, 1729
  of neuromuscular disorders, 3246–3247
    electromyography in, 3247
    molecular genetic markers in, 3246
    nerve conduction velocity in, 3246
    serum enzymes in, 3246, 3249t–3251t, 3250f, 3252f

Laboratory screening, e 4

Laboratory testing, e 1–e 5
  accuracy and precision of tests, e 1
  for adolescents, 1035
  diagnostic
for bacterial and fungal infections, 1335–1338
for porphyrias, 833–834
for subclinical porphyria, 834
for viral infections, 1339–1341
for Von Willebrand disease, 2600, 2600t, 2601f

in disorders causing rickets, 378t, 380
in hemolytic anemia, 2530b
of hemostasis, 2591–2593
  mixing studies, 2593
  partial thromboplastin time, 2593
  platelet aggregation, 2593
  platelet count, 2591
  prothrombin time and activated partial thromboplastin time, 2591–2593
  reptilase time, 2593
  testing for thrombotic predisposition, 2593
  tests of the fibrinolytic system, 2593
  thrombin time, 2593

for hypersensitivity pneumonia, 2241–2242, 2241t
for intestinal digestive-absorptive function and inflammation, 2038t
in management of newborn readmitted for phototherapy, 960t
  neonatal screening tests, e 2–e 4
in poisoning, 491–494
  predictive value of tests, e 1–e 2
  rapid HIV antibody tests, e 2, e 3t
reference intervals, e 5–e 14
  abbreviations, 5t–6t
  key to comments section, e 6t
  prefixes denoting decimal factors, e 5t
  reference values, e 6t–e 13t
in refining differential diagnosis, e 4
  laboratory screening, e 4
  serologic testing, e 4
for rheumatic disease, 1249–1252
for sarcoidosis, 2249
  sensitivity, accuracy, and analytic testing, e 1
th ytroid function, 2919t
treponemal, 1595–1596

Laboratory values, for obesity, 353t
Labyrinthitis, 3429, 3434–3435
Lacerations
  care of, 556–557
  epidemiology of, 556
  evaluation of, 556
  eyelid margin, 3394, 3394f
  treatment of, 556–557

Lachman test, 3696f

Lacosamide
  adverse effects of, 3106t
  dosages of, 3104t–3105t
  for status epilepticus, 3119t

Lacral apparatus, 3363f

Lacrimal system
  disorders of, 3363–3364
    alacrima and dry eye, 3363–3364
    dacyrostenois, 3363
    tear film, 3363
  examination of, 3343

Lacrosse, injuries associated with, 3712

β-Lactams
  hypersensitivity, 1244–1245
  mechanisms of resistance to, 1414t

Lactase deficiency, 2004

Lactate dehydrogenase, reference intervals, e 6t–e 13t

Lactational amenorrhea method, 1073

Lactic acidosis, 416
  intermediary carbohydrate metabolism associated with, 791–796, 791b, 791f–792f

Lactobezoars, 1968–1969

Lactose intolerance, chronic diarrhea and, 2035

Lafora body disease, 3098–3099

Lagophthalmos, 1584, 3361

  critical opening pressure in, 593–594
  equation of motion in, 592–593
  functional residual capacity in, 593
  home technology dependence, 3771–3773
  invasive, Invasive mechanical ventilation
  long-term, 2329–2331, 2336–2339
adult transition in, 2331
aerodigestive and communication considerations in, 2337
airway clearance in, 2330
cardiopulmonary interactions and, 2337–2338
chest wall/thoracic configuration in, 2338
developmental considerations for, 2338
gas-exchange goals and ventilator strategies in, 2337
goals and decision-making in, 2336–2337
inhalation medications in, 2330
invasive positive pressure ventilation in, 2329–2330
modalities for respiratory support in, 2329–2330
monitoring for, 2330, 2338
mucolytics and anticholinergics in, 2330
noninvasive and transtracheal supports in, 2337
nutrition in, 2330
optimal ventilator support in, 2330
physical, occupational, speech therapy in, 2330
preparing for discharge in, 2330–2331
projected interventions and needs and, 2338
psychosocial considerations in, 2331
routine health maintenance and, 2338–2339
supplemental oxygen in, 2330
tracheal decannulation, 2339
weaning off the ventilator, 2331

monitoring respiratory mechanics in, 599–600
noninvasive, 594–595
patient-ventilator asynchrony in, 598–599
in RDS, 934–935
in respiratory distress and failure, 590–591
strategies of, in various clinical situations, 599t
time constant in, 593, 594f
ventilator-induced lung injury in, 600–601
weaning from, 600–601, 935

Mechanism of action
antibacterial medications, 1417t–1425t
antiviral drugs, 1665t–1666t
vitamin A, 362

Mechanobullous disorders, 3484–3488
dystrophic epidermolysis bullosa, 3487–3488, 3487t
epidermolysis bullosa, 3484, 3485t
epidermolysis bullosa simplex, 3484–3486, 3485t
junctional epidermolysis bullosa, 3486–3487, 3486t
Kindler syndrome, 3488

Meckel-Gruber syndrome
  in encephalocele, 3068
  polymicrogyria and, 3070t–3071t

Meconium aspiration, 941–942, 942f
Meconium ileus, 1951–1952
  in cystic fibrosis, 949–950, 950f–951f, 2296

Meconium peritonitis, 950

Meconium plugs, 949, 949f

Meconium staining
  of amniotic fluid, 928
  of infant skin, 869f

MECP2 gene region, 667t

Media violence, 86, 86b, 92

Medial collateral ligament injury, 3695

Medial elbow pain, 3690–3691

Medial epicondyle, traction apophysitis of, 3690–3691

Medial epicondylitis, 3691

Medial tibial stress syndrome, 3697, 3714–3715

Median (statistical measurement), 121

Mediastinal fibrosis, 1650–1651

Mediastinal GCTs, 2698–2699

Mediastinal granulomas, 1650–1651

Mediastinal masses, 467
  from non-Hodgkin lymphoma, 2635f
Medical air transport, 516

Medical assessment, in language and communication difficulties, 279–280

Medical care, postadoption, 63–65

Medical child abuse, 110–111
  - clinical manifestations of, 110–111
  - diagnosis of, 111
  - treatment of, 111

Medical conditions
  - associated with
    - drowning, 608
    - with hyperkyphosis, 3641b
    - increased risk of HAPE, 605b

  - in etiology of acquired methemoglobinemia, 2553b
  - genetic aspects of, 630
  - maternal
    - affecting fetus or newborn, 878t–879t
    - malformations caused by, 988t

  - of math disabilities, 270
  - psychotic disorder due to, 250b–251b

  - and sports participation, 3680t–3683t

Medical control, in emergency medical services, 517

Medical control physicians (MCPs), 519–520

Medical device-associated infection, 1366 , 1410–1413
  - antibiotics use in, 1416
  - central venous catheter, 1410 , 1435
  - CSF shunts, 1412–1413
  - intravascular access devices, 1410–1412
  - orthopedic prostheses, 1413
  - peritoneal dialysis catheters, 1413
  - urinary catheters, 1413

Medical eligibility, for contraceptive use, 1068b

Medical evaluation of the foreign-born child, 68–70

Medical history, 188
Medical home, 1035
  pediatric, for children in foster care, 67t
  psychotherapy in, 200
Medical home model, 204
Medical issues, associated with high-risk pregnancy, 877t
Medical-legal partnerships (MLPs), 9
Medical neighborhood, 8–9
Medical record, preadoption reviews, 63
Medical risk assessment, in acute mountain sickness (AMS), 603
Medication reactions
  multisystem, 3448–3451
    acute generalized exanthematous pustulosis, 3449t, 3450–3451, 3451f
    DRESS syndrome, 3448–3449
    serum sickness-like reaction, 3449, 3449t
  in setting of immunosuppression, 3448
Medicational precocity, 2907
Medication-overuse headaches (MOHs), 3139
Medications
  for acne, 3579t
  acquired methemoglobinemia and, 2553b
  for acute mountain sickness, 603t
  for ADHD, 190t–191t, 266
  for anger-driven aggressive behavior, 240
  cardiovascular, poisoning, 501–503
  for depression and anxiety symptoms, 192t
  immune-mediated hemolysis caused by, 2563t
  for intubation, 591t
  maternal, malformations caused by, 988t
  for neonatal resuscitation, 927
  for neurodevelopmental dysfunctions, 261
  oral, for spasticity, 3760–3762, 3761t
  in palliative care, 57t–59t
psychotropic, best principle, 189b

Mediterranean lymphoma, 2002

Mediterranean spotted fever, 1620t, 1626–1627, 1626f

Medium-chain acyl-coenzyme A dehydrogenase deficiency, 742–743
  clinical manifestations, 742
  laboratory findings, 742
  prognosis, 743
  treatment of, 742–743

Medroxyprogesterone acetate, intramuscular, 2873

Medulla, 2714

Medullary carcinoma
  in context of MEN2A and MEN2B, 2703
  thyroid, 2934–2935

Medullary causes of hyperhidrosis, 3536b

Medullary cystic kidney disease, 2746t

Medullary nephrocalcinosis, 2766f

Medullary sponge kidney, 2763

Medullary thyroid carcinoma, MEN2 and, 2942

Medulloblastomas, 2666, 2678
  abnormalities in, 2674–2675, 2675f
  diagnoses, with clinical correlate, 2675t
  presentation of, 2668t

Mefloquine, 1858t–1860t

MEFV, in familial Mediterranean fever, 1293

Megacolon, congenital aganglionic, 1961–1964

Megacystis-megaureter syndrome, 2796–2797

Megakaryocyte progenitors, 2501

Megakaryocytes, 2501

Megakaryopoiesis, 2609
Megalencephaly, 3079
Megalencephaly-associated macrocephaly syndromes, 3079
Megalencephaly-capillary malformation-polymicrogyria syndrome (MCAP), polymicrogyria and, 3070t–3071t
Megalencephaly-polymicrogyriapolydactyly-hydrocephalus syndrome (MPPH), polymicrogyria and, 3070t–3071t
Megaloblastic anemias, 2517–2521, 2518t
  folic acid deficiency, 2518–2519
  orotic aciduria, 2521
  thiamine-responsive, 2521
  vitamin B12 deficiency, 2520–2521
Megalocornea, 3368
Megalourethra, 2810, 2826
Megaprepuce, 2824f
Megaureter, 2807–2808, 2807t, 2808f
Megestrol acetate, for anorexia, 57t–59t
Meiosis, 653
Melamine poisoning, 3806
Melanoblast migration abnormalities, 3478–3480
  hypomelanosis of Ito, 3478–3479, 3479f
  piebaldism, 3478
  Waardenburg syndrome, 3478
Melanocytic nevus
  atypical, 3469–3470
  congenital, 3470
Melanoma, 3470–3471, 3587
Melanosis, Becker, 3473
MELAS, Mitochondrial myopathy, encephalopathy, lactic acidosis, and stroke-like episodes
Melatonin
dietary supplements, 511t
interactions with drugs, 513t

Melioidosis (*Burkholderia pseudomallei*), 1532f

Melody stent-valve, implantation of, 2366f

Membrane attack complex, 1151

Membrane complement control protein deficiencies, 1154–1155

Membranes, for wound burn management, 618t

Membranoproliferative glomerulonephritis (MPGN), 2726–2727, 2726f, 2753t–2754t
clinical manifestations of, 2727
differential diagnosis of, 2727
pathogenesis of, 2727
pathology of, 2727
prognosis and treatment of, 2727
secondary causes of, 2726t
type I, 2727, 2781
type II, 2727, 2781

Membranous conjunctivitis, 3367

Membranous nephropathy (MN), 2725–2726, 2753t–2754t, 2781
clinical manifestations of, 2726
diagnosis of, 2726
pathogenesis of, 2725–2726
pathology of, 2725
prognosis and treatment of, 2726

Membranous urethral injury, 2835

Memory, mechanisms of, 255

MEN type I, 2950

Menaquinones, 386

Menarche, 2853, 2975
onset of, 1014
Mendelian inheritance

autoinflammatory diseases, 1300–1303
autosomal dominant, 640–642
autosomal recessive, 642–645
cataracts, 3372
pseudodominant, 645
X-linked, 645

Meningitis

anaerobic, 1556
aseptic, clinical conditions and infectious agents associated with, 3227
bacterial, of inner ear, 3434
cased by Staphylococcus aureus, 1431
coccidioidal, 1657
as complication of mumps, 1682
cryptococcosis, 1644
CSF findings in, 3222–3223
eosinophilic, 3234
Haemophilus influenza in, 1487–1488
meningococcal, 1472
red flags for, 527
tuberculous, 1573, 1574

Meningocele, 3066

Meningococcal B (MenB) vaccine, 1350, 1359

Meningococcal conjugate vaccine against serogroups A, C, W135, and Y (MCV4), 1350, 1359

Meningococcal disease

clinical manifestations of, 1471–1472, 1473
complications of, 1476
diagnosis of, 1472–1474
differential diagnosis of, 1474
epidemiology of, 1469–1470, 1470
etiology of, 1469
host factors, 1471
immunity, 1471
pathogenesis and pathogenesis of, 1470–1471
prevention of, 1476–1478
prognosis of, 1476
treatment of, 1474–1476
  antibiotics, 1474–1475
  supportive care, 1475–1476
vaccination of, 1476–1478, 1478

Meningococcal meningitis, 1472
Meningococcal polysaccharide vaccine against serogroups A, C, W135, and Y (MPSV4), 1350t
Meningococcus, 1469–1478
Meningoencephalitis
  amebic
    drugs for, 1813t–1828t
    granulomatous, 1830, 1830f
    primary, 1829–1831
  as complication of mumps, 1682
  etiologies and epidemiology of, 3228t–3229t
  stage of sleeping sickness, 1845–1846
  viral, 3232–3234
Meningomyelocele, 3765–3767
  adolescence and transition to adulthood, 3767
  clinical implications of, 3766–3767
  etiology of, 3765
  prenatal screening of, 3765
  prevention of, 3765
  prognosticating in, 3766t
Meniscal tears, 3695
Menisectomy, 3618
Menkes disease, 388, 2008, 3192
Menkes kinky hair syndrome, 3542
Menorrhagia, VWD and, 2599

Menstrual activity, 2899

Menstruation
  abnormal uterine bleeding, 1060–1062, 1060b, 1061t
  amenorrhea, 1059–1060, 1060f
  dysmenorrhea, 1062–1063, 1062t–1063t
  estrogen-containing methods, in teens with disabilities, 2873
    contraceptive patch, 2873
    contraceptive ring, 2873
    oral contraceptives, 2873
    thromboembolism, 2873
  irregularities, 1058–1059
  nonhormonal methods, in teens with disabilities, 2873
  normal, 1058, 1058t
  PMS and PMDD, 1063–1064
  problems, 1058–1064
    in female athletes, 3706–3708
  progestin-only methods, in teens with disabilities, 2873–2874
    hormones and antiepileptic drugs, 2874
    implants, 2874
    intramuscular medroxyprogesterone acetate, 2873
    oral progestins, 2874
    progesterone IUD, 2874
  surgical methods, in teens with disabilities, 2874
  teens with disabilities, 2873–2874
  treatment of, in teens with disabilities, 2873

Mental disorder, preexisting, suicide and, 225

Mental health
  action signs, 186, 186b
  of GLB youth, 1025–1026
  issues, office intervention for, 77

Mental Health Rating Scales, 187t

Mental state
  altered, in acutely ill child, 527
  in neurologic examination, 3054
Mental status
   examination, 188
   in toxicdromes, 493t

Mephenytoin hydroxylase deficiency, 439
Mepolizumab (anti-IL-5 antibody), for asthma, 1204
Mercaptoacetyl triglycine (MAG-3), 2803, 2804f
6-Mercaptopurine, adverse reactions, 2641t–2642t
Mercury
   exposure, 3794–3796
      clinical manifestations of, 3795
      differential characteristics of, 3794t
      epidemiology of, 3794–3795
      food-borne illness, 3776t–3777t
      laboratory findings of, 3795–3796
      pathophysiology of, 3795
      pharmacokinetics of, 3795
      toxic levels of, 3794t
      treatment of intoxication, 3796
   food-borne noninfectious illnesses and, 2018t
Merkel cell carcinoma, 1777–1778
Merkel cell polyomavirus, 1777–1778
Meropenem, 1417t–1425t
MERRF, Myoclonic epilepsy with ragged red fibers
MERRF syndrome, 3301t, 3302
Mesangial cell disease, 2716f
Mesangial deposition, of IgA, 2721f
Mesangial matrix, glomerular, 2715f
Mesangial proliferation, 2757
Mesangium, 2714–2715
Mesenteric cysts, 2146
Mesial temporal sclerosis, 3097
Mesoblastic nephroma, 2685

Messenger RNA, 635–636

Metabolic acidosis, 427, 429
 - in acute kidney injury, 2773
 - anion gap, 494
 - in CKD, 2777
 - clinical manifestations, 417, 420–421
 - complication of augmentation cystoplasty, 2815
 - diagnosis, 417–418, 421
 - etiology and pathophysiology, 415–417, 419–420
 - with respiratory compensation, 588–589
 - treatment, 418–419, 421–422

Metabolic alkalosis, 427, 429
 - causes of, 419
 - chloride-resistant causes of, 420
 - diagnosis, 421
 - hypokalemia caused by, 401
 - maintenance phase of, 419
 - treatment, 421–422
 - and volume depletion, 391–392

Metabolic and autoimmune disorders, as cause of oropharyngeal dysphagia, 1903

Metabolic bone disease
 - bone structure, growth, and hormonal regulation, 3746–3747
 - hyperphosphatasemia, 3750, 3752
 - hypophosphatasia, 3748–3749, 3748f–3749f

Metabolic complications, of IBD, 1975t–1976t

Metabolic conditions, associated with developmental regression, 3187t

Metabolic disorders, 2127
 - acute hepatic failure and, 2134
 - associated with premature infants, 905t
 - cataracts as manifestation of, 3372–3373
causing autonomic dysfunction, 3334
causing SIDS, 2168
of dystonia, 3165–3166, 3166
fetal therapy for, 891

genetic, 688–692
inherited, associated with neuropathy, 3329–3330
language development and, 278
neutropenia and, 1145
as oncologic emergency, 2644
screening for, 634
that affect muscle, 3299–3300
in toxic and metabolic neuropathies, 3331

Metabolic disturbances
in neonatal seizures, 3113, 3114
in newborn
  fetal alcohol syndrome, 978–982, 979f, 980–981
  maternal SSRIs and neonatal behavioral syndromes, 978
  neonatal abstinence, 976–978

Metabolic evaluation, of hypercalciuria, 2837

Metabolic liver disease, 2101–2106, 2102
  α₁-antitrypsin deficiency, 2105–2106
  citrin deficiency as, 2106
  gestational alloimmune liver disease, 2105
  Indian childhood cirrhosis as, 2105
  inherited deficient conjugation of bilirubin, 2101–2103
  Wilson disease as, 2103–2105

Metabolic myopathies, 3296–3304
  glycogenoses in, 3298–3300
  lipid, 3303–3304, 3304
  malignant hyperthermia in, 3298
  mitochondrial, 3300–3303, 3301–3302
  periodic paralysis in, 3296–3298, 3298
  vitamin E deficiency, 3304

Metabolic neuropathies, 3331
Metabolic stroke, 716
Metabolic syndrome, prediabetes and, 3022
Metabolic system
dysfunction of, in shock, 579t
in SIRS differential diagnosis, 576b
Metabolic testing, in neurologic evaluation, 3063
Metabolism, errors of, 688–695, 694t, 695b
treatment of, 692–695
Metabolomics, 436–437, 1342
Metabonomics, 436–437
Metachromatic leukodystrophy, 775, 3190
Metachronous Wilms tumor, 2685
Metagenomics, 1341–1342
I-metaiodobenzylguanidine (MIBG), in pheochromocytomas, 2987
Metaiodobenzylguanidine (MIBG), 2680, 2680f
Metal metabolism disorders
iron, 2526–2527
liver and, 2101t
Metalloporphyrins, for kernicterus, 961
Metals, in toxic and metabolic neuropathies, 3331t
Metanephrine, 2705
Metaphase chromosome spreads, 653–654
Metaphyseal bone overgrowth, in IL-1-mediated diseases, 1301f
Metaphyseal chondrodysplasia-McKusick type, 3734
Metaphyseal-diaphyseal angle, 3610t, 3612f
Metaphyseal fibrous defect, 2694–2695
Metaphyseal fraying, in rickets, 378f
Metastases, periorbital, of neuroblastoma, 2680f
Metastatic tuberculous abscesses, 3558
Metastatic tumors, to brain, 2678
Metatarsal fractures, 3669
  stress fractures, 3699–3700
Metatarsus adductus, 3597–3598, 3597f, 3610
Metatranscriptomics, 1341–1342
Metatropic dysplasia, 3734, 3734f
Metformin
  in polycystic ovary syndrome, 2858f, 2861
  for T2DM, 3045t
  toxic effects, 504
Methacholine challenge, 1178
Methadone
  ingestion, 501
  treatment, 977
Methamphetamine, 1055
Methanol poisoning, 507
Methemoglobin, in respiratory distress and failure, 588
Methemoglobinemia
  acquired, 2553b
  antidote, 496t–497t
  hereditary, 2552
    with NADH cytochrome b5 reductase deficiency, 2553
  in newborn, 911t
  normal arterial blood vs ., 2553f
Methicillin-resistant Staphylococcus aureus (MRSA), 1429
  community-acquired, abscesses, 3550
Methicillin-susceptible Staphylococcus aureus (MSSA), 1432
Methionine, malabsorption of, 2007
Methionine adenosyltransferase (MAT I/MAT III) deficiency, hepatic, 706

Methionine metabolism defects
  cystathioninemia (cystathioninuria), 706
  homocystinuria, 703–706
  hypermethioninemia, 706

Methotrexate
  adverse reactions, 2641t–2642t
  for atopic dermatitis, 1215
  for Crohn disease, 1985
  poisoning, 497t
  in treatment of, rheumatic diseases, 1253–1256

Methsuximide, dosages of, 3104t–3105t

Methyl mercury
  absorption, 3795
  intoxication, 3795

Methylcobalamin formation defects, 704

3-Methylcrotonyl coenzyme A carboxylase deficiency, 711

Methylene chloride, inhaled, 1053b

Methylenedioxymethamphetamine (MDMA), 1046t, 1054
  as club drug, 1046t

Methylenetetrahydrofolate reductase deficiency, 704–706

3-Methylglutaconic aciduria, 712–713, 712t

3-Methylglutaconyl coenzyme A hydratase deficiency, 712

Methylmalonic acidemia, defects in cobalamin metabolism, 717–719

Methylphenidate, for ADHD, 190t–191t, 266

Metoclopramide
  for migraine, 3135t–3136t, 3136
  in palliative care, 57t–59t

Metoprolol, for heart failure, 2480t

Metoprolol succinate/tartrate, for postural tachycardia syndrome, 569t
Metronidazole, 1417t –1425t, 1429
   for *Clostridium difficile* infection, 1554, 1554t
   for tetanus, 1551

Mevalonate kinase deficiency, 1294t, 1297–1298
Mevalonic aciduria, 715
   systemic involvement, 1294t

Meyer-Rokitansky-Küster-Hauser syndrome, 3013

Mezlocillin sodium, 1417t –1425t

MF59, 1349–1351

MFS, Miller-Fisher syndrome

mGluR5 antibodies, encephalitis with, 3180t –3181t

MH, Malignant hyperthermia

MHC, Major histocompatibility complex

Micafungin, 1640

Michelis-Castrillo syndrome, 405

Microadenomas, 2982–2983

Microalbuminuria, 781, 2750, 3040–3041
   in T2DM, 3047t

Microangiopathies
   DIC caused by, 2609t
   thrombotic, 2565t
      classification of, 2733t

Microarray analysis
   hybridization signal in, 640f
   for intellectual disability, 287–288
   technique, 655

Microbial deprivation hypothesis, 3024

Microbiologic studies, for cystic fibrosis, 2290

Microbiology, diagnostic
antimicrobial susceptibility testing, 1338
fungal cultures, 1338
laboratory detection of parasitic infections, 1339
laboratory diagnosis
  of bacterial and fungal infections, 1335–1338
  viral infections, 1339–1341
point-of-care diagnostics, 1338–1339
serologic diagnosis, 1339
specimen collection, 1335
stains used for microscopic examination, 1336

Microbiome, and pediatric health, 1341–1347 , 1342
contributions to disease, 1344–1346
  allergic disorders, 1344–1345
  antibiotic-associated diarrhea and *Clostridium difficile* colitis, 1345
  cystic fibrosis, 1345
  inflammatory bowel disease, 1345–1346
  malnutrition, 1346
  necrotizing enterocolitis, 1344
  obesity, 1346
  premature birth, 1344

early childhood development, 1342–1343
measuring, 1341–1342

physiologic development, 1343–1344 , 1343
  inflammation, and immunity, 1343–1344
  metabolism, 1343
  microbiome-neurobiologic connections, 1344

therapeutic manipulation of, 1346–1347
  prebiotics, 1346
  probiotics, 1346–1347

Microbiota, 1341

Microcephaly, 693t –694t , 3054 , 3073–3076
  causes of, 3075t
  clinical manifestations of, 3075
  diagnosis of, 3075
  etiology of, 3073–3075
  treatment of, 3076

Microcoria, 3349–3350
Microcornea, 3368
Microcytic anemia, 2507, 2524t, 2526–2527
Microdeletion, 665, 666t–667t
cryptic, 657f
Microdontia, 1913
Microduplication syndromes, 665, 667t
Microfibrillar matrix of osteoid, 3746
Micrognathia, 1917
Micronutrient deficiencies, 334, 2003
   mineral, 387–388
Micronutrients, 309–317, 310t–316t
Microorganisms
   associated with bites, 3818b
   isolated from patients with osteomyelitis, 3671t
   isolation and identification, 1335–1338
Micropenis, 2825, 2825f
   in male-appearing genitalia, 3011t
Microsatellites, 678
Microscopic hematuria, 2792
Microscopic polyangiitis, 2307
differential diagnostic features, 1324t
Microsomia, hemifacial, 1918
Microspherocytes, hemolytic disease, 964f
Microspherophakia, 3375
Microsporidia, 1837–1838
Microsporidiosis, drugs for, 1813t–1828t
Microtia, 3411–3412
Microvillus inclusion disease, 1996, 1996f
Micro-Warburg syndrome, polymicrogyria and, 3070t – 3071t

Midazolam, 463
   for burn injuries, 621
   for status epilepticus, 3119t

Mid-childhood acne, 3582

Middle cerebral artery (MCA) Doppler study of elevated peak systolic velocity, 968f

Middle childhood
   cognitive development, 149–150, 149t
   language development, 149t
   moral development, 150
   perceptual development, 149t
   physical development, 146–149
   sleep, normal patterns, 174t
   social and emotional development, 150
   well-child care and, 77

Middle ear
   of child infected with M. abscessus, 1589f
   common conditions of, 3400f
   congenital malformations of, 3413
   trauma to, 3435–3436

Middle East respiratory syndrome coronavirus, 1744

Midgut, 1945

Midline nasal masses, congenital, 2182, 2182f

Midodrine, for postural tachycardia syndrome, 569t

Midparental height, measurement of, 154

Mid-upper arm circumference, 333–334, 334f

Midureteral obstruction, 2805

Mifepristone, for Cushing syndrome, 2985

Migraine, 3128–3138
with aura, 3132–3133
with brainstem aura, 3131t
chronic, 3131t
classification and clinical manifestations of, 3128–3133
diagnosis and differential diagnosis of, 3133–3134, 3133r
epidemiology of, 3128
stroke and, 3217
that mimic seizures, 3123
treatment of, 3134–3138, 3135t –3136t
acute, 3134
behavioral therapy for, 3138
preventive therapy for, 3137–3138
with typical aura, 3131t
vestibular, with vertigo, 3131t
without aura, 3128–3132, 3131t, 3132f

Migrant children, 169

Migration, global health and, 28–30
Migration patterns of hematopoietic stem cells, 1104f

Migratory polyarthritis, 1447

Mild acute pancreatitis, 2076

Mild hemophilia, 2595

Milia, 3454
  colloid, 3499
  scarring with, 3488f

Miliaria, 3536–3537, 3536f

Miliary tuberculosis, 1572, 3558

Military families, 169

Milium, 3582–3583

Milk
  cow, hypersensitivity, pulmonary hemosiderosis and, 2307
  human
    healthcare-associated infection, 1007
infectious agents detected in, 876t
for premature infants, 904
in infants, 326
intake, inadequate, 323–324
in toddler, 326

Millennium Development Goals (MDGs), 1, 24

Miller syndrome, 825

Miller-Dieker syndrome, lissencephaly and, 3069

Miller-Fisher syndrome (MFS), 3335, 3336f

Milrinone

for heart failure, 2480t, 2481
for postresuscitation stabilization, 545t
for shock, 582t

Minamata disease, 3795

Mind-body therapies, 513, 513t

Mindfulness meditation, in pain management, 484

Mineral supplements, for cystic fibrosis, 2296

Mineralocorticoid escape phenomenon, 420

Mineralocorticoid excess, clinical findings for, 2493t

Mineralocorticoid replacement, for 21-hydroxylase deficiency, 2975

Mineralocorticoids, 2958

altered end-organ sensitivity to, 2969
apparent excess, 2970
excess, 2983t

Minerals

absorption of, disorders of, 2008–2009
malabsorption of, 1988t
supplements, 511t

Minimal change nephrotic syndrome, 2757–2759

clinical manifestations of, 2753–2754t, 2757
Minimal residual disease (MRD), ALL, 2649
Minimum alveolar concentration (MAC), 462
Minimum personal risk questionnaire, 3799b
Minor electrical burns, 621
Minoxidil, for severe hypertension in children, 2498t
Minute volume, 2150
Mirtazapine, 193
Missense mutations, 637
Mistletoe, potential toxicity, 512t
Mitchell-Riley syndrome, 1997
Mitochondrial 3-hydroxy-3-methylglutaryl coenzyme A synthase deficiency, 714
Mitochondrial acetoacetyl coenzyme A thiolase (T_2) deficiency, 713
Mitochondrial cytopathy, 3300
Mitochondrial depletion syndrome of early infancy, 3302
Mitochondrial disease, 808–809, 810f
defects of iron utilization, 2526
diagnosis of, 807–811
diagnostic testing for, 809–810
 genetic diagnostic testing for, 649f
inheritance, 648t, 809
overview of, 807–808, 807f–808f
pedigree of, 647f
treatment principles for, 809–810
Mitochondrial diseases, 2336
associated with neuropathy, 3329t–3330t
clinical spectrum of, 3302t
expression of, 2124
hypoparathyroidism associated with, 2946–2947
with hypotonia, 3301
neonatal cholestasis and, 2093
primary, 2123

Mitochondrial DNA depletion syndrome, 809, 2125, 3177, 3177
in mitochondrial disorders, 3301

Mitochondrial dysfunction, in toxic myopathies, 3296

Mitochondrial encephalomyopathies, 3173–3178
clinical manifestations of, 3174
Kearns-Sayre syndrome in, 3176
Leber hereditary optic neuropathy in, 3175
Leigh disease in, 3176–3177, 3176f, 3177
mitochondrial DNA depletion syndrome in, 3177, 3177
mitochondrial myopathy, encephalopathy, lactic acidosis, and stroke-like episodes in, 3175
myoclonic epilepsy and ragged red fibers in, 3175
neurogastrointestinal, 826, 1958
neuropathy, ataxia, and retinitis pigmentosa (NARP) syndrome in, 3175
reversible infantile cytochrome C oxidase deficiency myopathy in, 3176
Reye syndrome in, 3178

Mitochondrial fatty acid β-oxidation, clinical manifestations, 742

Mitochondrial gene defects, in MODY, 3049–3050

Mitochondrial hepatopathies, 2123–2127
clinical manifestations of, 2124–2125
diagnostic evaluation of, 2126–2127
epidemiology of, 2124
primary, 2125–2126
secondary, 2126
tiered investigations in, 2127t
treatment of, 2127

Mitochondrial inheritance, 647

Mitochondrial myopathies, 3300–3303
investigations for, 3302–3303, 3303f
Mitochondrial myopathy, encephalopathy, lactic acidosis, and stroke-like episodes (MELAS), 3174t, 3175, 3301t, 3302
Mitochondrial neurogastrointestinal encephalomyopathy, 230, 826
Mitochondrial trifunctional protein deficiency, 743
Mitral insufficiency
   congenital, 2394
   in rheumatic heart disease, 2458–2459
Mitral stenosis, in rheumatic heart disease, 2459–2460
Mitral valve, prolapse, 2394–2395
Mixed acid-base disorder, 414, 424
Mixed connective tissue disease, 1249, 1250–1251
Mixed gonadal dysgenesis, 3005
Mixed pineal-parenchymal tumors, 2676
Mixed venous oxygen saturation, 578
Mixing studies, in laboratory tests of hemostasis, 2593
MLD, Math learning disability
MLPs, Medical-legal partnerships
M-mode echocardiography, 2359, 2359f
Mnemonic tools
   CAVE, 3598
   CRAFFT, for substance abuse in adolescents, 1047b
   FISTS, 1038b
   screening laboratory clues in toxicologic diagnosis, 494b
   STUMPED, differential diagnosis of neonatal corneal opacities, 3370t
Mobile health, adolescent, 1019t–1020t
Mobility issues
   estrogen use in teens with disabilities and, 2873
   in myelomeningocele, 3766t
Mobility loss, lumbodorsal spine, 1270f
Möbius syndrome, 3073, 3340, 3357
MOC, Maintenance of Certification
Mode (statistical measurement), 121
  as conventional ventilator settings, 598
Model for Improvement, 31–32
Moderate hemophilia, 2595
Moderately severe acute pancreatitis, 2076
Moderately severe type of osteogenesis imperfecta (type IV), 3738
Modifiable environmental risk factors, for SIDS, 2170–2171
Modified Duke criteria, infective endocarditis, 2453, 2455b
Modified Ferriman Gallwey score, 2859f
MODS, Multiple-organ dysfunction syndrome
Modular Approach to Therapy for Children (MATCH), 199–200
Modular therapy packages, 199–200
MODY, Maturity-onset diabetes of the young
MOHs, Medication-overuse headaches
Molar tooth sign, in brainstem and cerebellar disorders, 3073
Molding therapy, for deformational plagiocephaly, 3085
Molecular defects, causing liver disease, 2095t
Molecular diagnostics, 1340–1341
Molecular genetic markers, in neuromuscular disorders, 3246
Molecular genetic tests, in spinal muscular atrophy, 3313t
Molecular processing disorders, 1146
Molecularly targeted therapies, 2639–2640
Moles, rim, in scalp, 3469f
Mollicutes, 1613
Molluscum contagiosum, 3567–3568
  clinical manifestations of, 3568, 3568f
  differential diagnosis of, 3568
  etiology of, 3567–3568
  histology of, 3568
  treatment of, 3568
  vulvar, 2845t–2846t, 2850f

Molybdenum, 387t–388t

Molybdenum cofactor deficiency, 706–707, 736, 824

Mondini dysplasia, 3404f

Mongolian spots, 868, 3454, 3455f

Monilethrix, 3542

Moniliasis, 3564–3566

Monitored anesthesia care, definition of, 460b

Monitoring respiratory mechanics, 599–600
  in auto-PEEP assessment, 600
  in dead space ventilation assessment, 600
  in exhaled tidal volume, 599
  in peak inspiratory pressure, 599
  in respiratory system dynamic compliance, 599–600
  in static compliance, 599–600

Monkeypox, 3821
  clinical course, 3821, 3821f
  etiology, 3821
  treatment, 3821

Monkshood toxicity, 509t, 512t

Monoamine oxidase (MAO)
  deficiency, 726t, 728
  in tryptophan metabolism, 707f

Monoamine oxidase inhibitors (MAOIs), poisoning, 505

Monocarboxylate transporter-1 deficiency, 745
Monoclonal antibodies, in treating malignancies, 2640t

Monocular elevation deficiency, 3357, 3357f

Monocular nystagmus, 3358t

Monocytes, 1128–1130
  abnormalities of, 1130
  activation, 1129
  development, 1128–1129
  functional activities, 1129–1130

Monocytosis, 1148–1149, 1148t

Monogenic autoimmune polyglandular syndrome, 2937

Monogenic diabetes, 3022
  characteristics at presentation for, 3042t
  less common forms of, 3049
  type 1, 3023

Monomethylhydrazine intoxication, 3802–3803

Monosaccharides

Monozygotic twins, 897–898, 900f

Montelukast, for asthma, 1203

Mood disorders, 217–225
  major and other depressive disorders, 217–222, 218f

Mood stabilizers, 194t, 195, 224

Moral development
  in adolescent, 1017–1018
  in middle childhood, 150
  in preschool years, 145–146

Moral thinking, 146

Moraxella catarrhalis, 1490–1491
  acute otitis media, 1491
  bacteremia, 1491
  diagnosis of, 1491
epidemiology of, 1490
etiology of, 1490
otitis media with effusion, 1491
pathogenesis of infection, 1490–1491
prevention of, 1491
recurrent otitis media, 1491
sinusitis, 1491
treatment of, 1491

Morbidity
in childhood lupus, 1278t
new, 4–6 , 5t
of perinatal and neonatal illness, 867t
rates, fetal, 128

Morning glory disc anomaly, 3385–3386 , 3386f

Moro reflex, 3059–3060

Morphea (localized scleroderma), 1285 , 3446 , 3519–3520 , 3519f
clinical manifestations of, 1285–1286 , 3519
etiology and pathogenesis of, 3519

Morphea profunda, 1285b

Morphine, 463
adverse reactions in premature infant, 905t
for neonatal abstinence syndrome, 978t
treatment, 977

Morphine sulfate, for burn injuries, 621

Morphogenesis
cardiac, 2340
of liver and biliary system, 2081–2085

Morquio syndrome, 814

Mortality
in appendicitis, 2048–2049
excess causes of, in cancer survivors, 2666f
for injuries, 78–79
pneumonia cases, 2267f, 2267t
rates
  fetal, 128, 863
  infant, 1
  injury, 79t
  neonatal, 1, 863
  under-five, 1, 2f, 5f, 21, 21f–22f

Morulae, 1632f
Morvan syndrome, 3185
Mosaicism, 633, 659t, 672
  45,X/46,XY, 669
  generation of, 654f

Moseley straight-line graph, leg-length discrepancy, 3615f
Mosquito bites, 3569t
Mother yaw, 1600
Mother-infant attachment
  infant's role
    behavioral states, 130
    interactional abilities, 130
    modulation of arousal, 130
    mutual regulation, 130
    physical examination, 130
  parental role
    peripartum and postpartum influences, 129–130
    prenatal factors, 128

Motile cilia, 2298
Motility
  esophageal, 1927f
  ocular, 3343
  in pseudoobstruction, 1958t

Motility disorders
  cell, 1134t–1135t
  chronic diarrhea and, 2035
  in encopresis and functional constipation, 1958–1961
esophageal, 1931–1932
Hirschsprung disease and, 1961–1964
intestinal neuronal dysplasia and, 1964
superior mesenteric artery syndrome and, 1964–1965

Motion, in transport physiology, 520

Motivational interviewing (MI), 114–116, 116t, 121

Motivational therapy, for nocturnal enuresis, 2821

Motocross, injuries associated with, 3714

Motor disorders, 205–210
  coordination delays, comorbid with language disorders, 281
  stereotypic movement disorder, 209–210
    clinical course, 209
    comorbidity, 209
    definition of, 209
    differential diagnosis of, 209
    epidemiology of, 209
    etiology of, 209
    treatment of, 209
  tic disorders, 206–208, 206b
    assessment, 208
    clinical course, 206
    comorbidities, 206–207, 207f
    differential diagnosis of, 206, 207t
    epidemiology of, 206
    etiology of, 207
    screening, 208
    sequelae, 207–208
    treatment of, 208, 208b

Motor examination, in neurologic evaluation, 3057–3058

Motor function, in muscular dystrophy, 3258t–3259t

Motor neurons, disorders of, 3304–3320, 3318f
  myasthenia gravis as, 3304–3310
  spinal muscular atrophies as, 3310–3316

Motor speech disorders
  childhood apraxia of speech, 278
  dysarthria, 278
speech sound disorder, \textit{278}

Motor system, disorders of, distinguishing features of, \textit{3246t}

Motor tics, that mimic seizures, \textit{3125}

Motor vehicle injuries, \textit{78, 82–84}
\begin{itemize}
  \item all-terrain vehicles, \textit{84}
  \item occupants, \textit{79, 82–83}
  \item pedestrian, \textit{84}
  \item teenage drivers, \textit{83–84}

  septate uterus, 2869–2870
  uterine anomalies, 2869–2870
  vaginal anomalies, 2870–2872
  vulvar and various anomalies, 2872

Müllerian ducts, 2867–2868

Multibacillary leprosy, 1586t

Multicentric Castleman disease, 1726, 2626

Multichannel intraluminal impedance, 1929

Multicystic dysplastic kidney, 2786–2787, 2787f

Multicystic mass, in hemothorax, 2231f

Multifactorial and polygenic inheritance, 651–652
Multifocal infantile hemangioma, 3465–3466, 3467f

Multifocal lymphangioendotheliomatosis, 3466

Multifocal osteomyelitis
  chronic recurrent, 1304, 1304f
  nontuberculous mycobacteria infection and, 1590

Multilocular cyst, 2788

Multilocular cystic nephroma, 2788

Multiminicore disease (MmD), 3266–3268, 3268f

Multinodular goiter, 2928

Multiple café-au-lait spots, 3141t

Multiple carboxylase deficiencies, 710–711
  biotinidase deficiency, 711
  due to dietary biotin deficiency, 710
  holocarboxylase synthetase deficiency, 710–711

Multiple endocrine neoplasia
  pheochromocytomas and, 2986
  type I, 2950, 2980, 2980t
  type IIA, 2703
  type IIB, 2703, 3587

Multiple endocrine neoplasia (MEN) syndromes, 2942–2943, 2942t, 2980t
  type 1, 2942
  type 2, 2942
  type 2A, 2943
  type 2B, 2943

Multiple epiphyseal dysplasia, 3723–3724
  autosomal recessive, 3728–3729

Multiple gestation
  complications, 899
  diagnosis, 901
  etiology, 898–899
  incidence, 898
monzygotic vs. dizygotic twins, 897–898 , 899f
pedigree symbols for, 642f
prognosis, 901
treatment, 901–902

Multiple glycosylation pathways, defects in, 804–806

Multiple hamartoma syndrome, 3549

Multiple lentigines syndrome, 3474

Multiple-organ dysfunction syndrome (MODS), 572 , 578b

Multiple pituitary hormone deficiency, 2880–2882
  acquired forms, 2882
  congenital forms, 2881–2882 , 2881f , 2881t
  genetic forms, 2880–2881 , 2881t
    HESX1 , 2880–2881
    LHX3 and LHX4 , 2881
    POU1F1 , 2880
    PROP1 , 2880

Multiple sclerosis, 3202–3207
  ADEM and, features that may distinguish, 3199t
  clinical manifestations of, 3203
  diagnosis of, 3203–3204
    McDonald criteria for, 3202t
  differential diagnosis of, 3203–3204 , 3203t –3205t
  emerging therapies used in, 3205t –3206t
  epidemiology and risk factors for, 3202
  imaging and laboratory findings for, 3203 , 3204f
  prognosis of, 3207
  treatment of, 3204–3207

Multiple subpial transection, in epilepsy surgery, 3110

Multiple-sulfatase deficiency, 775–776

Multisystem disease, LCH, 2711

Multisystem medication reactions, 3448–3451
  acute generalized exanthematous pustulosis, 3449t , 3450–3451 , 3451f
  DRESS syndrome, 3448–3449 , 3449t
serum sickness-like reaction, 3449, 3449t

Mumps, 1373t–1374t, 1680–1683
clinical manifestations of, 1681, 1681f
complications of, 1682
diagnosis of, 1681–1682
differential diagnosis of, 1682
epidemiology of, 1680, 1681f
etiology of, 1680
pathogenesis of, 1680
pathology of, 1680
prevention of, 1682–1683
prognosis for, 1682
treatment of, 1682
in viral meningoencephalitis, 3232
virus, in T1DM, 3024

Munchausen syndrome by proxy, 110–111

Mupirocin, 1417t–1425t

Murine (endemic or flea-borne) typhus, 1620t, 1629–1630
clinical manifestations of, 1629
complications of, 1630
diagnosis and differential diagnosis of, 1629
epidemiology of, 1629
etiology of, 1629
laboratory findings of, 1629
pathology and pathogenesis of, 1629
prevention of, 1630
supportive care in, 1629
treatment of, 1629

Murmurs, 2353
continuous, 2353
diastolic, 2353
innocent, 2353–2354
systolic ejection, 2353

Muscarine poisoning, 3804

Muscle abscess, staphylococcal, 1431

Muscle adenosine monophosphate deaminase deficiency, 823–824

Muscle biopsy

in Duchenne muscular dystrophy, 3282, 3282f
in motor system, disorders of, 3246t
in myasthenia gravis, 3308
in neuromuscular disorders, 3253
in spinal muscular atrophies, 3310, 3313–3314, 3314f

Muscle carnitine deficiency, 3304

Muscle carnitine palmitoyltransferase (CPT) deficiency, 3304

Muscle channelopathies, 3296–3298, 3297t

Muscle development, brain malformations and, 3271–3272, 3271f–3272f

Muscle developmental disorders, 3254–3279

amyoplasia in, 3272–3273
arthrogryposis in, 3273–3279
benign congenital hypotonia in, 3273
brain malformations and muscle development in, 3271–3272, 3272f
congenital muscle fiber-type disproportion in, 3263–3264
core myopathies in, 3266–3269
muscular dysgenesis in, 3273
muscular dystrophies in
  cardiac involvement in, 3260t–3261t
  classification of, 3255t–3257t
  clinical signs of, 3258t–3259t
myofibrillar myopathies in, 3269–3271
myotubular myopathy in, 3257–3263, 3263f
nemaline rod myopathy in, 3264–3266, 3264f

Muscle glycogen synthase deficiency, 787

Muscle glycogenoses, 785–788
  Danon disease, 787
energy impairment, 788
late-onset polyglucosan body myopathy, 787
lysosomal acid α-1,4-glucosidase deficiency, 785–787
McArdle disease, 787–788
muscle glycogen synthase deficiency, 787
muscle phosphofructokinase deficiency, 788
muscle phosphorylase deficiency, 787–788
Pompe disease, 785–787
PRKAG2 deficiency, 787
Tarui disease, 788

Muscle phosphofructokinase deficiency, 788
    clinical manifestations, 788
diagnosis, 788
treatment, 788

Muscle phosphorylase deficiency, 787–788

Muscle spasm, pharmacologic approach to, 57t – 59t

Muscle weakness, in JDM, 1281–1282, 1281t

Muscle-eye-brain disease, 3255t–3257t
    in congenital muscular dystrophy, 3293
Muscle-eye-brain disease spectrum, 804

Muscles
    imaging of, in neuromuscular disorders, 3247–3253
    metabolic diseases that affect, 3299t–3300t

Muscle-specific phosphorylase kinase deficiency, 788

Muscular abnormalities, in etiology of arthrogryposis, 3659

Muscular atrophy
    peroneal
        axonal type, 3327
        Charcot-Marie-Tooth disease, HMSN type IIa, 3320–3327
    spinal, 3310–3316

Muscular dysgenesis, 3273

Muscular dystrophies, 3280–3294
Becker, 3255t–3259t, 3281–3284
cardiac involvement in, 3260t–3261t
classification of, 3255t–3257t
clinical signs of, 3258t–3259t
congenital, 3258t–3261t, 3292–3294, 3293f
Duchenne, 3255t–3261t, 3281–3284
Emery-Dreifuss, 3255t–3261t, 3285
facioscapulohumeral, 3255t–3261t, 3291–3292
limb-girdle, 3255t–3261t, 3289–3291, 3290t–3291t
myotonic, 3285–3288

Muscular torticollis, in deformational plagiocephaly, 3082
Musculoskeletal complications, of IBD, 1975t–1976t
Musculoskeletal disorders, and sports participation, 3680t–3683t
Musculoskeletal injury, management of, 3685–3700
  ankle, 3698–3699
differential diagnosis of musculoskeletal pain, 3686
  elbow, 3690–3693
  foot, 3699–3700
growth plate, 3686–3687
  hip and pelvis, 3694–3695
  imaging of, 3686
  initial evaluation of injured extremity, 3686
  knee, 3695–3697
  low back, 3693–3694
  lower leg, 3697–3698
  mechanism of injury, 3685–3686
    acute injury, 3685
    overuse injuries, 3685–3686, 3685t
  shoulder, 3688–3690
  transition from immediate management to return to play, 3686

Musculoskeletal manifestations
  of cancer, 2635t
  of electrical burns, 622t–623t
  of Henoch-Schönlein purpura, 1319
Musculoskeletal pain syndromes, 1327–1333
- benign vs. serious causes of pain, 1328t
- clinical manifestations, 1327–1328
- complex regional, 1332, 1332b
- complications and prognosis, 1329
- diagnosis and differential diagnosis, 1328
- erythromelalgia, 1332–1333
- fibromyalgia, 1330–1332, 1331b, 1331f
- growing pains, 1329–1330, 1330t
- small fiber polyneuropathy, 1330
- treatment, 1328–1329

Musculoskeletal system, management of mucopolysaccharidoses, 816t –817t

Mushroom poisoning
- autonomic nervous system: rapid onset
  - coprine ingestion, 3804
  - muscarine poisoning, 3804
- CNS: rapid onset
  - indole intoxication, 3804
  - isoxazole intoxication, 3804
- GI: delayed onset
  - *Amanita* poisoning, 3802
  - monomethylhydrazine intoxication, 3802–3803
- GI: rapid onset, 3802
- renal: delayed onset, orellanine poisoning, 3803

Mushroom toxins, 3776t –3777t
- food-borne noninfectious illnesses and, 2018t

Music therapy, in pain management, 484

Muslims
- cultural norms, 73t–74t
- disease beliefs, 74t

Mustard
- decontamination and management, 3813t
- intermediate-onset dermatologic syndrome, 3810
Mutagenesis, radiation-induced, 3780f

Mutations
   in ABCA3, disease caused by, 2303
   in CD40 ligand (hyper-IgM type 1), 1111
   of cystic fibrosis transmembrane conductance regulator (CFTR), 2283t, 2284f
   of disorders of cornification, 3511t
   gain-of-function, 638
   loss-of-function, 638
   missense or nonsynonymous, 637
   in mtDNA
      disorders caused by, 648t
      phenotypes, 648f
   in NKX2-1, disease caused by, 2303–2304
   testing, 628t

Mutilating keratoderma, 3516

Mutism, selective, 277

Myalgias, 3245

Myalgic Encephalomyelitis/Chronic Fatigue Syndrome (ME/CFS), 1093, 1095b, 1096f

Myasthenia gravis
   activities of daily living scale, 3307t
   autoimmune, 3304–3305
   clinical manifestations of, 3305
   complications of, 3309
   congenital myasthenic syndromes in, 3306–3307
   diagnostic test for, cholinesterase inhibitors as, 3308–3309
   laboratory findings and diagnosis of, 3307–3309
   neuromuscular blockade, other causes of, 3310
   prognosis of, 3309–3310
   rare other causes of, 3307
   treatment of, 3309

Myasthenic crisis, 3305

Mycetoma, 1468
Mycobacterial infections
agents against
Mycobacterium leprae, 1563–1564
Mycobacterium tuberculosis, 1560–1563
nontuberculous mycobacteria, 1564–1565, 1564t
atypical, 3558–3559
as causes of infectious pneumonia, 2268t
Hansen disease (Mycobacterium leprae), 1582–1586
nontuberculous mycobacteria, 1587–1591
tuberculosis (Mycobacterium tuberculosis), 1565–1582

Mycobacterium
M. avium, 1587, 3559
M. fortuitum, 3559
M. kansasii, 3559
M. marinum, 3558–3559
M. scrofulaceum, 3559
M. ulcerans, 1587, 3559

Mycobacterium leprae, 1582–1586
classification of, 1583, 1583f–1584f
clinical manifestations of, 1584–1585
clofazimine against, 1564
dapsone against, 1563–1564
diagnosis of, 1585
epidemiology of, 1582–1583
leprosy reactions in, 1584, 1586
long-term complications of, 1586
microbiology of, 1582
nerve involvement of, 1584, 1584f
ocular involvement of, 1584
pathogenesis of, 1583
prevention of, 1586
skin involvement of, 1584
treatment of, 1585–1586, 1585t–1586t

Mycobacterium tuberculosis, 1565–1582
associated with hemophagocytic syndrome, 2708t
commonly used agents for, 1560–1562
less commonly used agents for, 1562–1563

**Mycophenolate mofetil**
for atopic dermatitis, 1215
in maintenance immunosuppression, 2782–2783
for rheumatic diseases, 1254t–1255t, 1256

**Mycoplasma**
*Mycoplasma genitalium*, 1612–1614
*Mycoplasma hominis*, 1612–1614

**Mycoplasma pneumoniae**, 1609–1612
adjunctive therapy, 1611–1612
antimicrobial therapy, 1611
clinical manifestations of, 1609–1611
diagnosis of, 1611
epidemiology of, 1609
extrapulmonary disease, 1610–1611, 1610f
pathogenesis of, 1609
prevention of, 1612
prokaryotic organism, 1609
respiratory tract disease, 1609–1610
treatment of, 1611–1612

**Mycoplasmal infection**
causing systemic neonatal infections, 996t
genital mycoplasmas, 1612–1614

**Mycotoxins**, 3774–3775

**Mydriasis, congenital**, 3350

**Myelin oligodendrocyte glycoprotein-associated disorders**, 3209

**Myelinated nerve fibers, of retina**, 3384

**Myelodysplastic syndromes**
HSCT for, 1158
ring sideroblast in, 2526f
transition to acute leukemia, 2580
Myeloid cells, acquired disorders of, 1142t
Myeloid differentiation factor 88, 1119
Myeloid leukemia, development in Down syndrome, 2655f
Myeloid precursor cell disorders, 1145t
Myelomeningocele, 895, 895f, 3066–3068
   with Arnold-Chiari type II malformation, 2335
   clinical manifestations of, 3067, 3067f
   etiology of, 3066
   prevention of, 3066–3067
   prognosis of, 3068
   treatment of, 3067–3068

Myelopathy
   delayed, 3783
   human T-cell lymphotropic virus-1-associated, 1806

Myeloperoxidase deficiency, 1138

Myeloproliferative disorder, Down syndrome and acute leukemia and, 2655

Myelosuppression, 2640, 2645

MYH9-related thrombocytopenia, 2616

MYH-associated polyposis, 2062t

Myoadenylate deaminase deficiency, 823–824

Myocarditis, 2471–2473
   bacterial infections and, 2472
   clinical manifestations of, 2472
   as complication of measles, 1673
   diagnosis of, 2472
   differential diagnosis of, 2472
   enteroviral, 1693–1694
   epidemiology of, 2471–2472
   etiology of, 2463t, 2471–2472, 2472b
   MRI findings in, 2473f
   in mumps, 1682
   parvovirus B19 associated with, 1700
   pathophysiology of, 2472
   prognosis of, 2473
   sudden death and, 2449
   treatment of, 2473
viral infections and, 2471–2472

Myocardium, diseases of, 2460–2473
  arrhythmogenic right ventricular cardiomyopathy, 2471
  classification of, 2461t–2462t
  dilated cardiomyopathy, 2468
  endocardial fibroelastosis, 2471
  hypertrophic cardiomyopathy, 2469–2470
  left ventricular noncompaction, 2471, 2471f
  myocarditis, 2471–2473
  pediatric, etiology of, 2463t
  restrictive cardiomyopathy, 2470–2471
  Takotsubo cardiomyopathy, 2471

Myoclonic absences, 3097

Myoclonic astatic epilepsy, 3098

Myoclonic encephalopathy, in nonprogressive disorders, 3099

Myoclonic epilepsy of infancy, 3098

Myoclonic epilepsy with ragged red fibers (MERRF), 3098–3099, 3174t, 3175

Myoclonic seizures, 3112

Myoclonus, 207t, 3092, 3161–3162
  benign, of infancy, 3125–3126
  causes of, 3162t
  characteristics of, 3150t

Myoclonus dystonia, 3163–3164

Myofascial pain disorders, 488

Myofibrillar myopathies, 3269–3271
  laboratory findings of, 3270–3271
  subtypes of, 3270t
    clinical manifestations of, according to genetic background, 3269–3270, 3271f
  treatment of, 3271

Myogenic regulatory genes, of inherited diseases of muscle, 3254–3257

Myoglobinuria, 2718–2719
stain-induced rhabdomyolysis with, 3296

Myomaker, 3254

Myonecrosis, 1559

Myopathies
- endocrine and toxic, 3295–3296
- in etiology of arthrogryposis, 3658b
- in Guillain-Barré syndrome, 3335
- reversible infantile cytochrome C oxidase deficiency, 3176
- and sports participation, 3680–3683

Myophosphorylase deficiency, neonatal form of, 3300

Myopia, 3344–3346, 3345f

Myositis, in enterovirus infection, 1695

Myotonia congenita, 3288, 3297t

Myotonia fluctuans, 3288t

Myotonic chondrodystrophy, 3287–3288

Myotonic dystrophy
- cardiac involvement in, 3260t–3261t
- pedigree, illustrating anticipation, 651f

Myotonic muscular dystrophy, 3285–3288
- clinical manifestations of, 3285–3287, 3286f
- diagnosis of, 3287
- genetics of, 3287
- laboratory findings in, 3287
- treatment of, 3287

Myotubular myopathy, 3257–3263, 3263f
- clinical manifestations of, 3257–3261
- diagnosis of, 3261
- genetics of, 3262–3263
- laboratory findings of, 3261
- pathogenesis of, 3257
- prognosis of, 3263
treatment of, 3263
MyPlate, 327–328, 327f
Myringotomy, 3426
Myxedematous syndrome, 2927
Myxomas, 2476
Myxopapillary ependymoma, 2673

N
NAATs, Nucleic acid amplification tests
N-Acetylcysteine, for acetaminophen poisoning, 499
N-Acetylgalactosamine-6-sulfatase deficiency, 814
NADH cytochrome b5 reductase deficiency, hereditary methemoglobinemia with, 2553
NADPH (nicotinamide-adenine dinucleotide phosphate) oxidase, 1128f
Nafcillin sodium, 1417t–1425t
Nail disorders
   abnormalities of shape or size, 3543–3544, 3543f
   changes in nail color, 3544–3545, 3544f–3545f, 3545t
   clubbing, 1101t
   dystrophy, in lichen striatus, 3507f
   hyperkeratotic nail in onychomycosis, 3564f
   hypoplastic, 664f
   ingrown toenail, 3606
   paronychial inflammation, 3546–3547, 3547f
   paronychial tumors, 3547
   periungual wart with disruption of nail growth, 3566f
   pitting, in psoriatic arthritis, 1270f
   skin disease associated nail changes, 3545–3546
   trachyonychia, 3546, 3546f
Nail infection, fungal, 3546, 3547b
Nail-patella syndrome, 3543, 3730–3731, 3731f

Nails, 3440–3441
  ingrown, 3547

Nalidixic acid, 1417t–1425t

Naloxone
  for burn injuries, 621
  for resuscitation and arrhythmias, 545t

NAP1/BI/027, 1553

Naproxen, in pain management, 474t

Naratriptan, for migraine, 3135t–3136t

Narcolepsy, 181–183
  clinical manifestations and diagnosis of, 182
  diagnostic criteria for, 182b
  epidemiology, 181
  etiology of, 181
  treatment, 182–183

Narcolepsy-cataplexy syndrome, 3128

Narcotic analgesics, indications and adverse reactions, 1247

NARP syndrome, in mitochondrial disorders, 3301t

Narrow complex rhythms, 539

Narrow-band imaging, 2160

Nasal cannula, for respiratory distress and failure, 589
  high-flow, 590

Nasal crease, 1174–1175

Nasal decolonization, 1008

Nasal films, diagnostic approach to respiratory disease, 2155

Nasal flaring, 583–584

Nasal nitric oxide (nNO), 2159

Nasal obstruction, in common cold, 2187
Nasal polyps, 2184–2185
   clinical manifestations, 2184
cystic fibrosis and, 2296–2297
diagnosis and differential diagnosis, 2185
etiology, 2184
treatment, 2185

Nasal septum, congenital defects of, 2181
Nasal spray, for migraine, 3135t–3136t
NASH, Nonalcoholic steatohepatitis
Nasolacrimal duct obstruction, congenital, 3363
Nasopharyngeal airway, 590
Nasopharyngeal carcinoma, 2704

Natural history
   of coccidioidomycosis, 1655f
   of gastroesophageal reflux disease, 1935
   of idiopathic scoliosis, 3635–3636
   of tyrosinemia type I, 699
   of vesicoureteral reflux, 2798, 2799f

Natural killer (NK) cells
   deficiency, 1119
   development, 1105–1106
   donor vs. recipient alloreactivity, 1161–1162
   enumeration of, 1102
   inheritance of developmental abnormalities in, 1107
   postnatal lymphopoiesis, 1107

Natural waterways, drowning in, 608

Nausea
   functional, 2043, 2043t
   and vomiting, in palliative care, 61
      nonpharmacologic approach to, 60t
      pharmacologic approach to, 57t–59t

Navajo neurohepatopathy, 2125

Navicular stress fracture, 3700

NBTE, Nonbacterial thrombotic embolus
N -Carbamyl-β-amino aciduria, 825–826

NDI, Nephrogenic diabetes insipidus

Nebulized racemic epinephrine, 2205

Nebulizers, for asthma, 1204

NEC, Necrotizing enterocolitis

Necator americanus, 1878–1881

Neck
   anomalies of, in Diamond-Blackfan anemia, 2510t
   assessment in newborn, 870
X-ray of, showing subcutaneous emphysema, 2225f

Neck blocks, in pain management, 485

Neck disorders, 3646–3650
- cervical anomalies and instabilities, 3649–3650
  - 22q11.2 deletion syndrome, 3650, 3650f
  - Down syndrome, 3649–3650, 3650f
  - os odontoideum, 3649–3650
- Klippel-Feil syndrome, 3647–3649, 3648f
torticollis, 3646–3647

Neck muscle tone, in deformational plagiocephaly, 3083

Necrobiosis lipoidica, 3518–3519, 3518f

Necrolytic migratory erythema, 3447–3448

Necrosis
- avascular
  - in developmental dysplasia of hip, 3628
  - in sickle cell anemia, 2544–2545
- fat, cold-induced, 626
- fibrinoid, of muscular artery, in polyarteritis, 1322f
- subcutaneous fat, 3533, 3533f
testicular, 2831f

Necrotizing enterocolitis (NEC), 867, 915, 1556
- changes in microbiome with, 1344
- clinical manifestations, 951
diagnosis, 951–952, 952f
- microbiome and, 1344
- pathology and pathogenesis, 951
- prevention, 953
- prognosis, 953
treatment, 952–953

Necrotizing fasciitis, 1558, 3551–3553
- GAS infection, 1442–1443

Necrotizing lymphadenitis, histiocytic, 2626

Necrotizing pancreatitis, 2081
Necrotizing periodontal disease, 1921–1922
Necrotizing spider bites, 3825
Necrotizing ulcerative gingivitis, acute, 1921–1922, 3549
Necrotizing vasculitis, 1324t
Negative selection, 1104
Neglect, 99
Neglectful parenting, 123–124

*Neisseria gonorrhoeae*, 1478–1484
  - Infection
    - Asymptomatic gonorrhea, 1480
    - Clinical manifestations of, 1480–1481
    - Complications of, 1483
    - Diagnosis of, 1481
    - Epidemiology of, 1479
    - Etiology of, 1478–1479
    - Pathogenesis and pathogenesis of, 1479–1480
    - Prevention of, 1483–1484
    - Treatment of, 1481–1483, 1482t
    - Uncomplicated, localized gonorrhea, 1480
  - Laboratory screening, 1083b
  - Management guidelines, 1089t–1090t
  - Vulvovaginal infection, 2847t

*Neisseria meningitidis*, 1469–1478
  - Acute bacterial meningitis, beyond the neonatal period, 3224, 3231
  - Infection
    - Antibiotics, 1474–1475
    - Clinical manifestations of, 1471–1472, 1473t
    - Complications of, 1476
    - Diagnosis of, 1472–1474
    - Differential diagnosis of, 1474
    - Epidemiology of, 1469–1470, 1470f
    - Etiology of, 1469
    - Host factors, 1471
    - Immunity, 1471
    - Pathogenesis and pathogenesis of, 1470–1471
    - Prevention of, 1476–1478
    - Prognosis of, 1476
supportive care, 1475–1476
  treatment of, 1474–1476
  vaccination of, 1476–1478, 1478t

Nelson syndrome, 2985

Nemaline rod myopathy, 3264–3266, 3264f
  clinical manifestations of, 3264–3265, 3265f
  genetics of, 3265
  laboratory findings in, 3265
  treatment and prognosis of, 3265–3266

Neocytolysis, 2505

Neomycin sulfate, 1417t–1425t

Neonatal abstinence syndrome, 977f, 978t

Neonatal atrial flutter, 2442f

Neonatal breast abnormalities, 2853

Neonatal cholestasis, 2092–2100, 2092f
  bile acid-coenzyme A ligase deficiency and, 2096
  biliary atresia and, 2097–2099, 2097f
  disorders of embryogenesis and, 2096–2097
  evaluation for, 2093
    value of specific tests in, 2093t
  intrahepatic, 2093–2096
    disorders of transport, secretion, conjugation and biosynthesis of, 2094–2096
    neonatal hepatitis and, 2093–2094
    mechanisms of, 2092–2093
    prognosis for, 2100

Neonatal circulation, 2345

Neonatal deaths, 21

Neonatal diabetes, key features of, 3022t

Neonatal disorders
  acne, 3581, 3581f
  alloimmune neutropenia, 1144
  alloimmune thrombocytopenic purpura, 2616
conjunctivitis, 3365t
corneal opacities, 3369, 3370t
hyperglycemia, 720
lupus erythematosus, 1279–1280, 3445, 3445f
thrombocytopenia, 2610t, 2616

Neonatal encephalopathy, as delivery room emergency, 928
Neonatal gynecomastia, 3000
Neonatal hemochromatosis, 2105

Neonatal hepatitis
    disorders of transport, secretion, conjugation and biosynthesis of, 2094–2096
    idiopathic, 2094
        differentiation of, from biliary atresia, 2098–2099
    intrahepatic cholestasis and, 2093–2094

Neonatal infections
    Candida, 1641–1642, 1642t
    clinical manifestations, 1000–1002
    conjunctivitis and pneumonia, 1617–1618
    Enterococcus in, 1457
    enterovirus, 1695
    epidemiology of early- and late-onset infections, 997–998
    general approach to management, 1002–1003
    genital mycoplasmas, 1612–1613
    healthcare-acquired, 1005–1008, 1005r
    herpes simplex virus (HSV) in, 1705
    incidence and epidemiology, 996–1005
    laboratory findings, 1002
    mode of transmission
        ascending bacterial infection, 998f
        intrauterine, 1010
    prevention, 1003–1005
    tuberculosis, 1575
    varicella, 1710

Neonatal iron storage disease, 2094, 2105
Neonatal jitteriness, 3124

Neonatal liver failure, 2125

Neonatal mastitis, 2854–2855

Neonatal mortality rates
  - global statistics, 1
  - low birthweight and, 867, 897
  - prediction models, 904–905

Neonatal myotonia, 3296

Neonatal myotonic dystrophy, 3257

Neonatal-onset multisystem inflammatory disease (NOMID), 1297t, 1299, 1301f, 1305

Neonatal screening tests, e 2–e 4

Neonatal seizure syndromes, 3113

Neonatal seizures, 910, 3111–3116
  - diagnosis of, 3114–3115
  - duration of therapy in, 3116
  - etiology of, 3112–3113, 3113t
  - pathophysiology of, 3111
  - prognosis of, 3115
  - treatment of, 3115–3116
  - types of, 3111–3112, 3112t

Neonatal sleep myoclonus, 3127

Neonatal teeth, 1912

Neonatal tetanus, 1550

Neonatal-onset multisystem inflammatory disease (NOMID), 1297t, 1299, 1301f, 1305

Neonates
  - antibiotics use in, 1415
  - critically ill, with cyanosis and respiratory distress, 2395–2396
  - defecatory disorders in, Rome IV diagnostic criteria for, 1959t
diarrheal disease in, 1989
hemoglobin in, 2504
overgrowth in, 2893
red blood cell transfusions, 2581–2582
sepsis in, 527
vitamin A status in, 361

Neonicotinoids, 3789

Neoplasms
 acute hepatic failure and, 2134
 acute myeloid, 2654
 of bone, 2689–2697
 gonadal and germ cell, 2698–2700
 of kidney, 2681–2685
 laryngeal, 2216
 of liver, 2700–2702
 malignant
 incidence and survival rates, 2628
 in patients undergoing enterocystoplasty, 2815
 ovarian, 2862–2865
 tonsillar, 2199
 tracheal, 2216, 2216
 of vulva and vagina, 2852

Neoplastic diseases, arthritis or extremity pain caused by, 1265

Nephritis
 Henoch-Schönlein purpura, 2731
 lupus, 2730

Nephroblastoma, 2681–2682

Nephroblastoma overexpressed (NOV) protein, 2980

Nephrocalcinosis, 2744, 2836, 2953
 common causes of, 2838
 medullary, 2766

Nephrogenic diabetes insipidus (NDI), 393, 2889
 treatment of, 2889
Nephrogenic rests, 2682
Nephrogenic syndrome of inappropriate antidiuresis, 396
  as cause of hyponatremia, 2890
Nephroma, mesoblastic, 2685
Nephronophthisis, 2745
Nephrons, blood supply of, 2714, 2714f
Nephropathic cystinosis, 2921
Nephropathy
  contrast-induced, 2735
  HIV-associated, 2729
  immunoglobulin A, 2720–2721
    renal pathology of, 2724t
  membranous, 2725–2726, 2753t–2754t
  polyomavirus, 2784
  sickle cell, 2743
  toxic, 2735–2736
Nephrotic syndrome, 1786, 2752–2760
  causative genes and histologic patterns of, 2754t–2755t
  causes of, 2753t
  clinical consequences of, 2755–2757
  congenital, 2760
  etiology of, 2752, 2752f
  idiopathic, 2753t–2754t, 2757–2759
  pathogenesis of, 2752–2755
    immune system role in, 2755
    podocyte role in, 2752–2755
  secondary, 2759–2760
  steroid-resistant, implications of, 2758
Nephrotoxins, renal syndromes produced by, 2735t
Nerve ablation, in pain management, 486
Nerve agents
  decontamination and management, 3813t
sudden-onset neuromuscular syndrome, 3808

Nerve biopsy, in neuromuscular disorders, 3253

Nerve conduction velocity, in neuromuscular disorders, 3246

Nerve injuries, stingers (burners), 3703

Nerve involvement, in leprosy, 1584, 1584f

Nerve palsies
  3rd, 3356
  4th, 3356
  6th, 3356–3357

Nervous system
  arsenic effects in, 3793t
  disorders, arthrogryposis caused by, 3658b

Nesiritide, for heart failure, 2480t

Netherton syndrome, 3515, 3515f

Nettleship-Falls ocular albinism, 702

Neural crest tumors, 2332
  ROHHAD and, 358–359

Neural damage, in acute porphyrias, 836

Neural tube defects, 652, 911t, 987t, 3064, 3774–3775
  bladder function in, 2813–2815

Neurally mediated syncope, 3122–3123

Neurapraxia, 3762–3763
  transient, 555

Neuraxial analgesia, 467–468

Neuritis, optic, 3387

Neuroacanthocytosis syndromes, 2540t

Neuroblastomas, 2636, 2678–2681
  clinical manifestations of, 2679–2680
  diagnosis of, 2680, 2681f
Neurocardiogenic syncope, 566
Neurocognitive late effects, of cancer and treatment, 2645t –2647t
Neurocognitive performance, optimizing, in CCHS, 2334–2335
Neurocristopathy, 360, 3331
Neurocristopathy syndrome, 2679t
Neurocutaneous disorder, 3092
Neurocutaneous syndromes, 3140–3150
  genetic and clinical features associated with, 3140t
  incontinentia pigmenti, 3149–3150
  linear nevus sebaceous syndrome, 3148
  neurofibromatosis, 2631, 3140–3144
  PHACE syndrome, 3148–3149
  Sturge-Weber syndrome, 3146–3148
  tuberous sclerosis, 3144–3146
    retinal phakoma, 3382f
  von Hippel-Lindau disease, 3148
Neurocysticercosis, 1896f
  parenchymal, 1896
Neurodegeneration
  with brain iron accumulation, 3194–3196, 3194f, 3195t
  pantothenate kinase-associated, 3165–3166, 3166f
Neurodegenerative disorders, 3187–3196
  adrenoleukodystrophy in, 3191
  Alexander disease in, 3191, 3192f
  blindness caused by, 3347b
canavan spongy degeneration in, 3191
intellectual disability caused by, 284t
language development and, 278
leukodystrophies in, 3192, 3192f–3193f, 3194t
Menkes disease in, 3192
metabolic conditions associated with developmental regression in, 3187t
miscellaneous, 3191–3196
neurodegeneration with brain iron accumulation in, 3194–3196, 3194f, 3195t
neuronal ceroid lipofuscinoses in, 3190–3191, 3190t
Pelizaues-Merzbacher disease in, 3191
Rett syndrome in, 3192–3194
sialidosis in, 3191
sphingolipidoses in, 3187–3190, 3188f

Neurodegenerative syndrome., 2711

Neurodermatitis, of external ear, 3417

Neurodevelopmental dysfunction, 253–261
assessment and diagnosis, 258–260
clinical manifestations, 256–258
core neurodevelopmental functions, 253–256
terminology and epidemiology, 253
treatment, 260–261
visual-spatial/visual-perceptual function, 254

Neurodevelopmental functions
etiology and pathogenesis, 253
frontal lobe functioning
attention, 255
executive functioning, 255–256, 259f
intellectual function, 254–255
language, 254
memory, 255
sensory and motor development, 254
social cognition, 255

Neuroendocrine cell hyperplasia of infancy, 2263–2264, 2263f

Neuroendocrine deficits, 2668
Neuroendocrine disorders, traumatic brain injury and, 3755
Neuroendocrine dysfunction, 2668–2669
Neuroendocrine tumors, diarrhea from, 2040–2041, 2040t
Neuroenteric cysts, 1932
Neurofibromatosis (NF), 2216, 2631, 2896, 3140–3144
clinical manifestations and diagnosis of, 3141–3143
 genetic counseling for, 3143–3144, 3143f
 management of, 3143
 multiple café-au-lait spots in, 3141t
 optic glioma in, 3142f
 type 1, 2656, 2980t, 3141f–3142f, 3475
 pheochromocytomas and, 2986
 type 2, 3144t
 von Recklinghausen, 3141f
Neurofibrosarcoma, 2689t
Neurogastrointestinal encephalomyopathy, mitochondrial, 826, 1958
Neurogenic pulmonary edema, 2234
Neurogenic tumors, 2288

Neuroimaging
 in acute disseminated encephalomyelitis, 3196–3198, 3198f
 in child, with headaches, 3133t
 for febrile seizures, 3094

Neuroirritability, in palliative care, 56–60, 57t–59t

Neuroleptic malignant syndrome, 194–195, 505

Neurologic complications
 of IBD, 1975t–1976t
 of sickle cell anemia, 2545–2546

Neurologic criteria, death by, 47

Neurologic deficit, primary survey for, 551

Neurologic development
adolescent, 1017–1018
fetal, 126–127

**Neurologic disease, 196**
central, in congenital muscular dystrophy, 3293
diagnostic evaluation of impaired child, 685b
in differential diagnosis of torticollis, 3647b
in etiology of arthrogryposis, 3659
manifesting as respiratory distress, 585
obesity-associated comorbidities, 352t
respiratory patterns in, 586t
and sports participation, 3680t–3683t
Wilson disease and, 2104

**Neurologic emergencies and stabilization, 557–563**
neurocritical care principles in, 557–559
traumatic brain injury in, 559–563

**Neurologic evaluation, 3053–3063**
coordination in, 3060
cranial nerves in, 3055–3057
diagnostic procedures, 3060–3063
electroencephalography, 3063
evoked potentials, 3063
lumbar puncture and cerebrospinal fluid examination, 3060–3061
neuroradiologic procedures, 3061–3062, 3062t
specific and general genetic and metabolic testing, 3063
general examination in, 3060
head in, 3054–3055, 3054f
history in, 3053, 3054t
mental state in, 3054
motor examination in, 3057–3058
bulk, 3057
involuntary movements, 3058
strength, 3058, 3059f
tone, 3057–3058, 3058f
in musculoskeletal examination, 3594–3595
neurologic examination and, 3053–3060
reflexes in, 3059–3060
sensory examination in, 3058–3059
special diagnostic procedures in, 3060–3063
electroencephalography, 3063
evoked potentials, 3063
lumbar puncture and cerebrospinal fluid examination, 3060–3061
neuroradiologic procedures, 3061–3062, 3062t
specific and general genetic and metabolic testing, 3063
station and gait in, 3060

Neurologic examination, 3053–3060

- coordination in, 3060
- cranial nerves in, 3055–3057
- head in, 3054–3055, 3054f
- mental state in, 3054
- motor examination in, 3057–3058
- in newborn, 872
- reflexes in, 3059–3060
- sensory examination in, 3058–3059
- station and gait in, 3060

Neurologic lesions, associated with neurofibromatosis type 2, 3144t

Neurologic management

- of drowning patients, 611
- of mucopolysaccharidoses, 816t–817t

Neurologic manifestations

- of cancer, 2635t
- of electrical burns, 622t–623t
- of enterovirus infections, 1694–1695
- of Henoch-Schönlein purpura, 1319

Neurologic signs, of high-altitude cerebral edema, 605

Neurologic syndrome, 2927

Neurologic system

- dysfunction of, criteria for, 574t
- in SIRS differential diagnosis, 576b

Neuromotor dysfunction, dental or oral findings associated with, 1914t
Neuromotor late effects, of cancer and treatment, 2645t –2647t
Neuromuscular blockade, 464
for intubation, 591t
for mechanical ventilation, 599
other causes of, 3310
Neuromuscular disorders
Bell palsy, 3339–3340
as cause of oropharyngeal dysphagia, 1903t
evaluation and investigation of, 3245–3253
   cardiac assessment in, 3253, 3253t –3254t
   clinical manifestations in, 3245–3246, 3246f–3248f, 3247t, 3249t
   genetic testing in, 3245, 3246t
   laboratory findings in, 3246–3247
   muscle biopsy in, 3253
   muscles and central nervous system imaging, 3247–3253
   nerve biopsy in, 3253
gene mutations of, 2467t
   respiratory signs and symptoms, 2166t
Neuromuscular junction disorders, in Guillain-Barré syndrome, 3335
Neuromuscular maturity, 903f
Neuromuscular scoliosis, 3639–3640, 3639f
Neuromuscular syndrome
delayed-onset, botulism, 3808
sudden-onset, nerve agents, 3808
Neuromuscular transmission, disorders of, 3304–3320
   myasthenia gravis as, 3304–3310
   spinal muscular atrophies as, 3310–3316
Neuromyelitis optica (NMO or Devic disease), 3387
Neuromyelitis optica spectrum disorder (NMOSD), 3185, 3207–3209
   clinical manifestations of, 3207
diagnosis and differential diagnosis of, 3207
epidemiology of, 3207
imaging and laboratory findings in, 3207, 3208f
pathogenesis of, 3207
prognosis of, 3209
red flags: findings atypical for, 3208

treatment of, 3207–3209

Neuronal ceroid lipofuscinoses, 3098–3099, 3190–3191, 3190

Neuronal dysplasia, intestinal, 1964

Neuronal heterotopias, 3069

Neuronal migration, disorders of, 3068–3070, 3069

Neuropathic bladder, 2797, 2813–2816, 2813

associated disorders, 2815–2816

augmentation cystoplasty, complications of, 2815

clinical manifestations and diagnosis of, 2813, 2814

neural tube defects, 2813–2815

renal damage, 2813–2814, 2814

urinary incontinence, 2814–2815

Neuropathic disorders, arthritis or extremity pain caused by, 1265

Neuropathic pain, 478, 480b, 480t

Neuropathic pain syndrome, 480b, 480t, 488

Neuropathic POTS, 570

Neuropathies

autonomic, 3331–3335

congenital hypomyelinating, 3327

giant axonal, 3328, 3329

hereditary, with liability to pressure palsies, 3328–3329

hereditary motor-sensory, 3320–3329

hypermyelinating, 3328–3329

metabolic, 3331

porphyric, 837

toxic, 3330–3331, 3331

Neuropathology, 2333

Neuropathy
Neuropathy, ataxia, and retinitis pigmentosa (NARP) syndrome, 3174t, 3175
Neuropsychiatric symptoms, in SLE, 1276f
Neuropsychologic problems, in myelomeningocele, 3767
Neuroradiologic procedures, in neurologic evaluation, 3061–3062, 3062t
Neurosensorial late effects, of cancer and treatment, 2645t–2647t
Neurotmesis, 3762–3763
Neurotoxic shellfish poisoning, 3805–3806

Ocular larva migrans, 1888–1889

Ocular manifestations
  of electrical burns, 622t–623t
of enterovirus infection, 1693
of herpes simplex virus, 1704–1705, 1707
of IBD, 1975–1976
of poisoning, 492t
of progeria, 827
of sarcoidosis, 1307–1308
of SLE, 1275t

Ocular motility testing, 3343

Ocular motor apraxia, congenital, 3358

Ocular motor dysmetria, 3360

Ocular toxoplasmosis
    clinical manifestations of, 1866, 1869f
    serologic testing for, 1874
    treatment of, 1875

Oculocephalic reflex, 565t

Oculocerebral renal syndrome of Lowe, 3373

Oculocerebrocutaneous (Delleman) syndrome, polymicrogyria and, 3070t–3071t

Oculocerebrorenal syndrome of Lowe, 2763

Oculocutaneous albinism (OCA), 701t
    with melanosomal abnormalities, 3478
    OCA₁ (tyrosinase-deficient), 701, 3477
    OCA₁ A (tyrosinase-negative), 701
    OCA₁ B, 701
    OCA₂ (tyrosinase-positive), 701–702, 3477
    OCA₃ (rufous albinism), 702, 3477
    OCA₄, 701

Oculocutaneous tyrosinemia, 699–700

Oculoglandular tularemia, 1535

Oculomotor abnormalities, that mimic seizures, 3122t
Oculomotor apraxia, 3127
Oculomotor nerve, in neurologic examination, 3056
Oculovestibular reflex, 565t
Odor, as sign of poisoning, 492t
Office
  intervention for behavioral and mental health issues, 77
  preparedness, in emergency medical services, 515–516
  system change for quality improvement, 77
Ofloxacin, 1417t –1425t
Ogawa strains, Vibrio cholerae, 1516
O -glycans, 798
1,25(OH)₂ D (calcitriol), produced by sarcoid macrophage, 1307
Ohtahara syndrome, 3098
Ointments, 3451
Olanzapine, for psychosis and agitation, 194t
Older children
  antibiotics use in, 1416
  Enterococcus in, 1457
  fever in, 1393–1396
    diagnosis of, 1393–1395, 1393t
    evaluation of, 1395–1396
    general approach, 1395
    management of, 1396
  measures of pain specific to, 471, 472f
Olfactory nerve (CN I), in neurologic examination, 3055
Oligoarthritis, 1259t –1260t
Oligodendrogliomas, 2673
Oligofructose, 309
Oligohydramnios, 877–878, 880t, 2786
  complex, 2744–2745
Oligomeganephronia, 2788
Oligomenorrhea, in female athletes, 3706
Oligosaccharides, 308
Oligospermia, formation, after localized radiation exposure,
Ollier disease, 2693–2694
Omalizumab, for atopic dermatitis, 1215
Omega-3 fatty acids, dietary supplements, 511
Omnenn syndrome, 1115 , 1116f
Omphalitis, in newborn with SIRS, 1001–1002
Omphalocele, 871 , 911t
congenital, 975–976
Omphalomesenteric duct remnants, 1954–1955
Omsk hemorrhagic fever, 1766 , 1769
OnabotulinumtoxinA, for migraine, 3135t –3136t
Onchocerca volvulus , 1885–1886
Onchocerciasis (Onchocerca volvulus) , 1885–1886
Oncogenes, 2630
Oncogenesis
of Epstein-Barr virus (EBV), 1718
genes involved in, 2630–2631
genomic imprinting and, 2633–2634
telomerase and, 2634
viruses associated with, 2631–2633
Oncologic emergencies, 2644t
NHL as, 2663
Oncotic forces, plasma, in shock, 575b
Oncotic pressure, decreased, 2234t
Ondansetron, for acute gastroenteritis, 2030
Onychomycosis, 3546
  hyperkeratotic nail in, 3564f
Oophoritis, as complication of mumps, 1682
Opacification, of thorax, 2277f, 2324f
Opacities, neonatal corneal, 3369, 3370t
Open globe injury, 3395
Ophelia syndrome, encephalitis with, 3180t–3181t, 3185
Ophthalmia neonatorum, 1480, 3364
Ophthalmitis, gonococcal, 1480
Ophthalmologic anomalies, in Diamond-Blackfan anemia, 2510t
Ophthalmologic lesions, associated with neurofibromatosis type 2, 3144t
Ophthalmologic manifestations
  of cancer, 2635t
  of Marfan syndrome, 3741–3742

Ophthalmologic system, management of mucopolysaccharidoses, 816t–817t
Ophthalmopathy, thyroid-related, 3390
Ophthalmoplegia, chronic progressive external, 3301t, 3302
Ophthalmoscopy, 3344
Opiates, abused by adolescents, 1056–1057
Opioids, 463
  abuse of, 1045t
  in pain management, 475–478, 475b, 476t–478t, 479b
  poisoning, 496t–497t
Opisthorchiasis, 1893
Opisthorchis spp., 1893
Opisthotonos, 1550, 3058
Opportunistic infections
  Burkholderia cepacia, 1532
in HIV, \textit{1784}
prophylaxis to prevent first episode, \textit{1802}–\textit{1803t}

Opportunistic microorganisms, chronic diarrhea and, \textit{2034–2035}

Oppositional defiant disorder (ODD), \textit{236} , \textit{1037t}
clinical course, \textit{238}
comorbidity of, \textit{238}
differential diagnosis of, \textit{238}
DSM-5, \textit{237b}
epidemiology of, \textit{238}
etiology of, \textit{238}
prevention of, \textit{238–239}
sequelae of, \textit{238}
treatment for, \textit{239–240}

Opsoclonus, \textit{3056} , \textit{3360}

Opsoclonus-myoclonus, \textit{3127}
and other types of brainstem-cerebellar encephalitis, \textit{3180t}–\textit{3181t} , \textit{3185}

Opsoclonus-myoclonus-ataxia syndrome, \textit{2679t} , \textit{2680} , \textit{3161}

Optic glioma, in neurofibromatosis, \textit{3142f}

Optic nerve (CN II)
head edema, \textit{3236f}
mulberry lesion of, \textit{3145f}
in neurologic examination, \textit{3055–3056} , \textit{3055f}
trauma to, \textit{3395–3396}

Optic nerve abnormalities, \textit{3385–3388}
 aplasia, \textit{3385}
coloboma, \textit{3385} , \textit{3385f}
drusen, \textit{3386}
glioma, \textit{3388}
hypoplasia, \textit{3385} , \textit{3385f}
Leber optic neuropathy, \textit{3387}
morning glory disc anomaly, \textit{3385–3386} , \textit{3386f}
optic neuritis, \textit{3387}
papilledema, \textit{3386}
tilted disc, 3386
traumatic optic neuropathies, 3388

Optic nerve hypoplasia syndrome, 2888

Optic neuritis, 3199–3200
diagnostic evaluation for, 3199, 3200f
epidemiology and clinical presentation of, 3199
prognosis of, 3200
treatment of, 3199–3200

Optic pathway tumors, 2668

Optical coherence tomography (OCT), 617

OPTN, Organ Procurement and Transplantation Network

Optokinetic nystagmus, 3343

Oral allergy syndrome, 1238

Oral anticoagulants, direct, 2606, 2606t

Oral candidiasis, in immunocompetent patient, 1642

Oral cavity
cleft lip and palate, 1915–1917
dental trauma, 1922–1923
disorders associated with other conditions, 1914
malocclusion, 1915
periodontal diseases, 1921–1922
soft tissue lesions of, 1924–1925
syndromes with oral manifestations, 1917–1918

Oral cephalosporins, 1427t

Oral contraceptives
combined, 1065t–1066t
estrogen-containing, 2873
in polycystic ovary syndrome, 2858f
progestins, 2874

Oral food challenge, 1178–1179
Oral hairy leukoplakia, 3549
Oral health, disparities in, 14
Oral hygiene, 1921
Oral language, 271–272

Oral manifestations
  of electrical burns, 622t–623t
  of poisoning, 492t
  syndromes with, 1917–1918

Oral mucosal neuromas, 2703–2704
Oral opioids, poisoning, 501

Oral pathology, in leukocyte adhesion deficiency type 1, 1137f
Oral rehydration, 1382

Oral ulcers
  in Behçet disease, 1290, 1290f
  in SLE, 1274f
  suggestive of rheumatic disease, 1249t

Orbital abnormalities, 3390
  exophthalmos and enophthalmos, 3390
  hypertelorism and hypotelorism, 3390
  inflammation, 3390
  tumors of, 3390

Orbital cellulitis, 2687
  Haemophilus influenza in, 1488

Orbital complications of acute sinusitis, 2192f
Orbital fractures, 3396

Orbital infections, 3391–3393
  dacyroadenitis, 3391, 3391f
  dacyructisis, 3391, 3391f
  orbital cellulitis, 3365t, 3391t, 3392–3393
  periorbital cellulitis, 3365t
preseptal cellulitis, 3391–3392, 3392f

Orchitis, as complication of mumps, 1682

Orellanine poisoning, 3803

Organ donations, declaring death and, 47–48

Organ dysfunction, in shock, 574t, 579t

Organ involvement, in primary mitochondrial hepatopathies, 2124t

Organ Procurement and Transplantation Network (OPTN), 2780

Organ transplant recipient, and sports participation, 3680t–3683t

Organic acid metabolism, disorders of, 689b

Organic acidemias

combined methylmalonic aciduria and homocystinuria, 719
cytosolic acetoacetyl coenzyme A thiolase deficiency, 713–714
isovaleric, 710
β-ketothiolase deficiency, 713
maple syrup urine disease, 708–710
3-methylglutaconic aciduria, 712–713
methylmalonic, 717–719
mevalonic aciduria, 715
mitochondrial 3-hydroxy-3-methylglutaryl coenzyme A synthase deficiency, 714
multiple carboxylase deficiencies, 710–711
propionic, 715–717
succinyl coenzyme A:3-ketoacid coenzyme A transferase deficiency, 715

Organic anion-transporting polypeptides, 443

Organic cation transporters, 445

Organic mercury, 3794–3795

Organophosphate chemicals, in neuromuscular blockade, 3310

Organophosphate poisoning, 496t–497t, 506

Organotins, 682–683

Oriental sore, 1842
Orientation, 188

*Orientia tsutsugamushi*, 1627–1628

Orificial tuberculosis, 3558

Ornithine, 735

Ornithine carbamoyltransferase deficiency, 733

Ornithosis, 1618

Orofacial clefts, nonsyndromic, 1916f

Oropharyngeal airway, 590

Oropharyngeal dysphagia, 1903, 1903t

Oropharyngeal infections
  candidiasis, 1924
  herpes simplex virus (HSV), 1703, 1703f

Oropharyngeal tularemia, 1535

Orotic aciduria, 2521

Orthopedic evaluation of child, 3592–3596
  back pain, 3594
  history of, 3592
  laboratory studies of, 3596
  limping, 3594, 3596b
  neurologic evaluation of, 3594–3595
  physical examination of, 3592–3594
    gait assessment, 3594, 3595b
    inspection, 3592, 3594b
    palpation, 3592–3594
    range of motion, 3594
  radiographic assessment of, 3595–3596

Orthopedic problems
  arthrogryposis, 3658–3662
  complications
    of JIA, 1268
    of myelomeningocele, 3767
  leg-length discrepancy, 3613–3617
obesity-associated comorbidities, 352
septic arthritis, 3676–3678
torsional and angular deformities, 3606–3613

Orthopedic problems of foot and toes, 3597–3606
in arthrogryposis, 3661
calcaneovalgus feet, 3598 , 3598f
cavus feet, 3603 , 3603f
congenital vertical talus, 3600 , 3600f
hypermobile pes planus, 3600–3601
metatarsus adductus, 3597–3598 , 3597f
osteochondroses/apophysitis, 3603
painful foot, 3606 , 3606f
puncture wounds of foot, 3604
shoes, 3606
talipes equinovarus, 3598–3599
tarsal coalition, 3601–3602 , 3602b , 3602f
toe deformities, 3604–3606

Orthopedic problems of hand, 3654–3657
  camptodactyly, 3655 , 3655f
  clinodactyly, 3655 , 3655f
  fingertip injuries, 3656–3657
  polydactyly, 3655 , 3655b , 3655f , 3656f
  syndactyly, 3656 , 3656b , 3657f
  thumb hypoplasia, 3655–3656
  trigger thumb and fingers, 3657

Orthopedic problems of hip
in arthrogryposis, 3661–3662
developmental dysplasia of, 3623–3628
growth and development, 3623
Legg-Calvé-Perthes disease, 3628–3631
slipped capital femoral epiphysis, 3631–3633
transient monoarticular synovitis, 3628
vascular supply, 3623

Orthopedic problems of knee
anatomy and range of motion of, 3617
anterior cruciate ligament rupture, 3622–3623, 3623f
in arthrogryposis, 3661
discoid lateral meniscus, 3617–3618, 3618f
normal knee development, 3617
Osgood-Schlatter disease and Sinding-Larsen-Johansson syndrome, 3620–3621, 3620f
patellofemoral instability, 3621–3622
patellofemoral pain syndrome, 3621

Orthopedic problems of neck

cervical anomalies and instabilities, 3649–3650

22q11.2 deletion syndrome, 3650, 3650f
Down syndrome, 3649–3650, 3650f
os odontoideum, 3649–3650

Klippel-Feil syndrome, 3647–3649, 3648f
torticollis, 3646–3647

Orthopedic problems of spine

back pain in children, 3642–3643, 3642b
classification of, 3633b
infection, 3645
intervertebral disc herniation/slipped vertebral apophysis, 3645–3646
kyphosis, 3640–3642
normal spinal curvatures, 3633
scoliosis

compensatory, 3639–3640
congenital, 3637–3639
idiopathic, 3633–3637
neuromuscular, 3639–3640, 3639f
spondylolysis and spondylolisthesis, 3643–3645, 3644f, 3693
syndromes and genetic disorders, 3640
tumors, 3646

Orthopedic problems of upper limb, 3651–3657

in arthrogryposis, 3662
elbow, 3651–3653

nursemaid elbow, 3653, 3653f
Panner's disease, 3651–3652, 3651f
radial longitudinal deficiency, 3652–3653, 3652r–3653r
shoulder, 3651
  congenital pseudoarthrosis of the clavicle, 3651, 3651f
  Sprengel's deformity, 3651
wrist, 3653–3654
  ganglion, 3654
  Madelung's deformity, 3653–3654, 3653f

Orthopedic prostheses, associated infection, 1413
Orthophoria, 3353
Orthoses, lower extremity, 3767
Orthostatic hypotension, initial, 569–571, 569f
Orthostatic intolerance, 571
  syndromes, 1095
Orthostatic proteinuria, 2750–2751
Orthotopic liver transplantation, 2136
  for portal hypertension, 2143
Orthotopic ureteroceles, 2807
Ortolani maneuver, 3624–3625, 3625f
Os odontoideum, 3649–3650
Oseltamivir, for influenza, 1730, 1731t
Osgood-Schlatter disease, 3620–3621, 3620f, 3697
Osler-Weber-Rendu disease, 3468

Osmolality
  in acute kidney injury, 2772t
  ICF and ECF in equilibrium, 389–391
  regulation of, 391

Osmoles, idiogenic, in hypernatremia, 394

Osmotic diarrhea, 1905, 2034
  pathways of, 2033f

Osseous development, delay of, hypothyroid infants, 2918, 2918f

Ossification centers
anatomic locations of, 3591, 3591f
musculoskeletal growth considerations, 3592b
radiologic appearance of, 134t

Ossifying fibroma, 1926
Osteitis pubis, 3694–3695
Osteoarthroophthalmopathy, hereditary, 3723
Osteoarthropathy, hypertrophic, 1334
Osteoblast differentiation, defects in, 3738–3739
Osteoblastoma, 2694
Osteochondritis, in newborn with congenital syphilis, 1593, 1593f
Osteochondritis dissecans (OCD), 3687
Osteochondroma (exostosis), 2693, 2694f
Osteochondroses, 3603
  juvenile, 3735, 3735t
Osteodysplasias, 3716–3717
Osteodystrophy
  Albright hereditary, 2948
  renal, 2773t, 2776–2777
Osteofibrous dysplasia, 2696
Osteogenesis imperfecta (OI), 1913, 3736–3740
  clinical manifestations of, 3737–3739
  complications of, 3739, 3739f
  epidemiology of, 3736–3737
  etiology of, 3736
  genetic counseling in, 3740
  of inner ear, 3435
  laboratory findings of, 3739
  mild form of, 3737
  pathogenesis of, 3737
  pathology of, 3737
prognosis of, 3739–3740
treatment of, 3739
types, gene defects and phenotypes, 3737

Osteoid, 375
collagen-containing, 3746

Osteoid osteoma, 2694, 2695f

Osteolytic bone lesions, 3582

Osteomalacia, tumor-induced, 379b, 383

Osteomas, involving external ear, 3417, 3437

Osteomyelitis, 2692

anaerobic, 1558
Aspergillus, 1647, 1649
chronic recurrent multifocal, 1296f
clinical manifestations of, 3671–3672, 3672f, 3672t
diagnosis of, 3672
differential diagnosis of, 3673–3674, 3674f
DIRA, 1302f
epidemiology of, 3671
etiology of, 3670–3671
Kingella kingae, 1485
pathogenesis of, 3671
prognosis of, 3676
radiographic evaluation of, 3672–3673
treatment of, 3674–3675
antibiotic, 3675
physical therapy, 3675
surgical, 3675

Osteonecrosis, 3632–3633

Osteopenia

after spinal cord injury, 3759
risks, in female athletes, 3706–3708

Osteopetrosis, 3731, 3732f

of inner ear, 3435
Osteoporosis, 3750–3752
in myelomeningocele, 3766
risk factors for, 3751b
secondary, treatment of, 3751–3752, 3752f

Osteoporosis-pseudoglioma syndrome, 3751

Osteosarcoma, 2636, 2689–2691
clinical manifestations of, 2690
diagnosis of, 2690
epidemiology of, 2689
pathogenesis of, 2689
prognosis of, 2691
treatment of, 2690–2691

Ostium secundum defect, 2374–2376
clinical manifestations of, 2375
complications of, 2375
diagnosis of, 2375
pathophysiology of, 2374, 2374f
prognosis of, 2375–2376
treatment of, 2375

Otalgia, 3398, 3399b, 3420, 3423t

Otitic hydrocephalus, 3430

Otitis externa, 3414–3417
clinical manifestations of, 3414–3415, 3415f
diagnosis of, 3415–3416, 3415t
etiology of, 3414
treatment of, 3416–3417, 3416f

Otitis media, 3418–3431
adhesive, 3431
allergy, 3420
asymptomatic purulent, 3422
clinical manifestations of, 3420
complications of, manifestations of sequelae and, 3429t
conjunctivitis-associated, 3422
diagnosis of, 3421
epidemiology of, 3418–3419
etiology of, 3419
examination of tympanic membrane, 3420–3422
*Haemophilus influenza* in, 1489
host factors, 3420
immunoprophylaxis for, 3422–3423
intracranial complications of, 3429–3431
main types of, 3418
*Moraxella catarrhalis* in, 1491
pathogenesis of, 3420
physical sequelae, 3431
possible developmental sequelae, 3431
prevention of, 3422
treatment of, 3423–3426
tympanometry, 3422
viral pathogens, 3420

**Otitis media with effusion**
distinguished from acute otitis media, 3418f
etiology of, 3419
*Moraxella catarrhalis* in, 1491
tympanometry in, 3409, 3422

**Otitis media with effusion: management**, 3427–3429, 3427b
adenoidectomy, 3428
decisions regarding, 3427
medical treatment, 3428
myringotomy and insertion of tympanostomy tubes, 3426
tympanic membrane perforation, 3428

**Otoacoustic emissions**, 3409

**Otomastoiditis**, 1589

**Otomycosis, *Aspergillus***, 1648

**Otorrhea**
acute otitis media with and without, 3423t
purulent, 3398
 tympanostomy tube, 3426–3427

Otosclerosis, of inner ear, 3435

Otoscopy, 3420–3421

Ottawa ankle rules, 3698–3699 , 3699f

Outcome, of germinal matrix intraventricular hemorrhage, 917t

Outcome elements, for outcome measures, 521

Outcome measures, in emergency medical services, 521 , 522b

Outcome-based approach, of outcome measures, 521

Outflow tract obstruction, 2868

Out-of-hospital care, in developing world, 523–525
  access to, 523
  methods of transport for, 525
  prehospital care in, 523–525

Outpatient management, of minor burns, 617–618

Oval window, fistula, 3436f

Ovalocytosis, Southeast Asian, 2535–2536

Ovarian neoplasm, 2862–2865

Ovarian torsion, 2862

Ovaries
  adnexal torsion, 2864
  cystadenomas, 2864
  cysts
    functional, 2863
    neonatal and pediatric, 2862
  development of, 2988
    46, XX in, 2988
  endometrioma, 2864
  function of, 2992–2993
  hypofunction of, 3001–3007

national organizations, involved in quality improvement, 38t
overview of, 1–9

Pediatric-specific emergency centers, in developing world, 525

Pediculosis, 3574–3575
capitis, 3574–3575
infestation, 1373t –1374t
corporis, 3574
pubis, 3575

Pedigree notation

assisted reproductive technology symbols, 643f
autosomal dominant pedigree, 644f
autosomal recessive pedigree, 645f
common symbols, 641f
demonstrating X-linked dominant inheritance, 646f
demonstrating X-linked recessive inheritance, 645f
digenic pedigree, 647f
family history and, 640
of mitochondrial disorder, 647f
of myotonic dystrophy, illustrating anticipation, 651f
pedigree line definitions, 642f
pseudodominant inheritance, 645f
suggestive of imprinting, 675f
symbols of genetic evaluation and testing information, 644f
of X-linked dominant disorder with male lethality, 646f

Peer groups, 1018
Peer-guided exercise, for children with disabilities, 3771t

Pegasparagase, indications and adverse reactions of, 2641t – 2642t

Peginterferon
  for hepatitis B, 2112t
  for hepatitis C, 2116

Peginterferon-α₂, for hepatitis B, 2113

Peglispro, for T2DM, 3045t

Pegvisomant, 2897

Pelizaeus-Merzbacher disease (PMD), 3191

Pelkan spur, 374

Pellagra, 368, 3589

Pelvic actinomycosis, 1466–1467

Pelvic examination, 2843–2844, 2843t – 2844t
  in girls with special needs, 2873

Pelvic inflammatory disease (PID), 1085, 1087–1088, 1910t
  tuboovarian abscess and, 2864

Pelvic trauma, secondary survey for, 553

Pelvis
  musculoskeletal pain syndrome, 1329t
  sports-related injuries, 3694–3695
  tumors, differential diagnosis of, 2683t

Pembrolizumab, 2659–2660

Pemphigus
  bullous pemphigoid, 3489–3490
  foliaceus, 3489, 3489f
  vulgaris, 3489

Pena-Shokeir syndrome, polymicrogyria and, 3070t – 3071t

Penciclovir, 1667

Pendred syndrome, 2915, 2925, 3404f, 3404t
Penetrance, 678
Penetrating injury, of orbit, 3395
Penicillamine, for Wilson disease, 003843p0455
D-Penicillamine, for arsenic and mercury poisoning, 3796
Penicillin, 1244–1245, 1416–1425
  adverse reactions to, 1426
  enterococci resistance, 1456–1457
  prophylactic, for sickle cell anemia, 2549
  for rat bite fever, 3820
Penicillin G, 1417–1425
  benzathine, 1417–1425
  procaine, 1417–1425
Penicillin V, 1417–1425
Penile injury, 2835
Penis
  circumcision, 2823
  sexual maturity ratings, 1015
Penis disorders
  chordee without hypospadias, 2822
  inconspicuous, 2824–2825
  meatal stenosis, 2825–2826
  micropenis, 2825
  other, 2825
  phimosis and paraphimosis, 2822–2823
  priapism, 2825
  in sickle cell anemia, 2545
  torsion, 2823–2824
  trapped, 2824–2825, 2824
Pennyroyal, potential toxicity, 512
Penoscrotal hypospadias with chordee, 2822
Penoscrotal transposition, 2821
Pentobarbital, 463
  coma, for status epilepticus, 3119t
  infusion, for increased ICP, 562–563

Pentose metabolism, 797
  essential pentosuria, 797
  ribose-5-phosphate isomerase deficiency, 797
  transaldolase deficiency, 797

Pepper syndrome, 2679t

  bleeding in, management algorithm for, 1972f
  clinical manifestations of, 1969–1970
  diagnosis of, 1970
  etiologic classifications of, 1969t
  pathogenesis of, 1969
    acid secretion, 1969
    mucosal defense, 1969
  primary ulcers of, 1970–1972
    *Helicobacter pylori* gastritis, 1970–1971
    idiopathic, 1971–1972
  secondary ulcers of, 1972
  stress ulceration, 1972
  treatment of, 1972–1973
  Zollinger-Ellison syndrome and, 1973

Peptide absorption, disorders of, 2006–2007

*Peptostreptococcus*, 1560

Peramivir, 1668–1669
  for influenza, 1731t

Perampanel
  adverse effects of, 3106t
  dosages of, 3104t–3105t

Percentile, regarding individuals in group, 121f, 123

Perceptual processes, and elementary school success, 149t
Perchlorate, as goitrogen, 2927t
Percutaneous umbilical blood sampling, 968
Perennial allergic conjunctivitis, 1220
Perennial allergy, 1217
Perforation
  esophageal, 1941
  intestinal, 952f
  spontaneous, of augmented bladder, 2815
  of tympanic membrane, 3428, 3435–3436
    chronic, 3431
Performance-enhancing aids, 3708–3709, 3709t
Perfusion, decreased, signs of, 574t
Perfusion pressure, cerebral, 557–558, 558f
Perianal abscess, 1986, 2059–2060
Perianal dermatitis, 1442
Perianal fistula, 2059–2060
Perianal infectious dermatitis, 3555–3556, 3555f
Pericardial disease, in tuberculosis, 1571
Pericardiocentesis, 547
Pericarditis, 1650–1651
  acute, 2473–2475
    clinical manifestations of, 2474
    diagnosis of, 2474
    differential diagnosis of, 2474–2475
    infectious, 2474
    pathogenesis of, 2473–2474
  constrictive, 2475
  enteroviral, 1693–1694
  Haemophilus influenza in, 1488
  infectious, 2474
  noninfectious, 2475
  purulent, 2474
Pericardium, diseases of, 2473–2475
   acute pericarditis, 2473–2475
   etiology of, 2473b

Pericentric inversions, 665

Perichondritis, of external ear, 3417

Pericoronitis, acute, 1921

Perilymphatic fistula
   congenital, 3414
   of oval window, 3436

Perinatal arterial ischemic stroke, 3212, 3213f

Perinatal causes, intellectual disability caused by, 284t

Perinatal infections, 1008–1013
   Campylobacter, 1521
   clinical manifestations of, 1012
   cytomegalovirus (CMV), 1721
   diagnosis of, 1012t, 1013
   general approach, 1011
   herpes simplex virus (HSV), 1705–1706, 1705f
      treatment of, 1707–1708
   infectious agents, 1012–1013
   pathogenesis of, 1011–1012
   tuberculosis, 1575, 1582

Perinatal lethal type of osteogenesis imperfecta (type II), 3737

Perineal hypospadias, 2822f

Perinephric abscess, 2793

Periodic alternating nystagmus, 3358t

Periodic fetal heart rate deceleration, 884f

Periodic fever, 1387

Periodic fever with aphthous stomatitis, pharyngitis, and adenitis (PFAPA), 1303–1304
Periodic limb movement disorder, 180–181
Periodic paralysis, 3296–3298
    secondary causes of, 3298t
    sodium channel myopathies with, 3289t
Periodic reevaluation, of child with intellectual disability, 292
Periodicity schedule, 75
Periodontal diseases, 1921–1922
    acute pericoronitis, 1921
    aggressive periodontitis
        in adolescents, 1921
        in children, 1921
    cyclosporine- or phenytoin-induced gingival overgrowth, 1921
    gingivitis, 1921
    necrotizing, 1921–1922
Periodontal ligament, 1919f
Periodontal structures, injuries to, 1922–1923
Perioperative agents, indications and adverse reactions, 1246
Perioperative care, 456–468
Perioperative fluids, 432
Perioral dermatitis, in food allergy, 1238
Periorbital cellulitis, 2190–2192, 3365t
Periorbital necrotizing fasciitis, 3392
Periosteal osteosarcoma, 2689
Periostitis, in newborn with congenital syphilis, 1593, 1593f
Peripheral adenopathy, 2634
Peripheral arterial thrombosis, 2604
Peripheral nerves
    anatomy of, 3763f
    injury to, during birth, 924–925
    morbidities of perinatal and neonatal illness, 867t
sarcomas, 2689

Peripheral nervous system manifestations, of Leigh syndrome, 3177

Peripheral neuropathies
   in Guillain-Barré syndrome, 3335
   hereditary, 3320–3324
   in tyrosinemia type I, 699

Peripheral pulmonary stenosis, 2387

Peritoneal abscess, 2148

Peritoneal bands, congenital, 2145

Peritoneal dialysis
   in acute kidney injury, 2773, 2774
catheters, 1413
   in ESRD, 2778–2779

Peritoneal malformations, 2145

Peritoneum
   epigastric hernia in, 2148–2149
   peritonitis, 2147–2148

Peritonitis, 2147–2148
   acute primary, 2147
   acute secondary, 2147–2148
   meconium, 950

Peritonsillar cellulitis, and abscess, 2198

Peritonsillar infection, 2200

Periungual fibroma, 3146

Periungual infections, in immunocompetent patient, 1642

Periungual wart, 3566–3567, 3566

Periventricular leukomalacia, 915–918, 917, 918t, 3385

Periventricular nodular heterotopias, 3069

Perkins line, 3626
Perlman syndrome, 2893, 2896
  associated with Wilms tumor, 2682
Permanent neonatal diabetes (PND), 3022, 3047–3048, 3048f
Permissive hypercapnia, 935
Permissive parenting, 123–124
Pernicious anemia, 2520
Pernio, 626, 3534
Peroneal muscular atrophy
  axonal type, 3327
  Charcot-Marie-Tooth disease, HMSN type IIa, 3320–3327
Peroral absorption, 446–448, 448f
Peroxisomal disorders, 745–749
  associated with neuropathy, 3329t–3330t
  epidemiology of, 746
  etiology of, 745–746, 745f
  pathogenesis of, 746–748, 746b
  pathology of, 746
Peroxisomal fatty acid oxidation, isolated defects of, 747
Peroxisomes, 2083
Perrault syndrome, in XX gonadal dysgenesis, 3005
Persistent asthma
  daily medication, 1199t
  and initiating therapy, 1194t
  risk factors for, 1187b
Persistent cloaca, 2057
Persistent depressive disorder, 217–218, 219b
Persistent diarrhea, 2033
  antimicrobial treatment for, 2039t
Persistent fetal vasculature, 3379
  clinical manifestations of, 3379
pathogenesis of, 3379
treatment of, 3379–3380

Persistent hyperinsulinemic hypoglycemia of infancy (PHHI), 853, 854t
Persistent hypoglycemias, 851b, 852–859
hyperinsulinemic, 855b–856b

Persistent Müllerian duct syndrome, 3016

Persistent pulmonary hypertension of newborn, 942–944, 943f

Persistent pupillary membrane, 3352

Personal flotation device (PFD), 608, 614

Personal readiness planning, in disaster preparedness, 519

Personalized medicine, concept of, 433

Pertussis, 1373t–1374t, 1492–1496
clinical manifestations of, 1493
complications of, 1495
diagnosis of, 1493
epidemiology of, 1492
etiology of, 1492
pathogenesis of, 1492
prevention of, 1495–1496
DTaP vaccines, 1495
Tdap vaccines, 1496
treatment of, 1493–1495, 1494t
adjunct therapies, 1495
antibiotics, 1494–1495, 1494t
care of close contacts, 1495
isolation, 1495

Pes planus, 3700

Pesticides
exposure, 3788–3789
food-borne noninfectious illnesses and, 2018t
poisoning, 3776t–3777t

Pet therapy, in pain management, 484–485
Petechiae
  in HIDS, 1298f
  perifollicular, 374f
  in streptococcal pharyngitis, 2194

Petechial rash
  in parvovirus B19, 1700f
  treatment algorithm for, 1475f

Peters anomaly, 3369, 3369f

Peutz-Jeghers syndrome, 2062–2063, 2062t, 3474

Peyer patches, reexposed to Salmonella typhi, 1503f

PFAPA, Periodic fever with aphthous stomatitis, pharyngitis, and adenitis

Pfeiffer syndrome, in craniosynostosis, 3082

P-glycoprotein, 436t

pH, extended monitoring of distal esophagus and, 1929

PHACE syndrome, 3148–3149
  associated with congenital heart disease, 2347t–2348t

Phagocytic cells
  defects, screening tests for, 1101b
  deficiency, laboratory tests for, 1103t

Phagocytic disorders
  Chédiak-Higashi syndrome, 1138
  chronic granulomatous disease, 1139–1140
  leukocyte adhesion deficiency, 1136–1138, 1136t
  myeloperoxidase deficiency, 1138

Phagocytic system
  disorders of phagocyte function, 1133–1140
  eosinophils, 1131–1133
  leukocytosis, 1147–1149
  leukopenia, 1141–1147
  monocytes, macrophages, and dendritic cells, 1128–1130
  neutrophils, 1125–1128
Phakomas, retinal, 3382
Phakomatoses, 3347b
Phakomatosis pigmentovascularis, 3463
Phalangeal fractures
  of finger, 3666
  of toe, 3669
Phallotoxins, 3802
Pharmacodynamics
  definition of, 433, 445
  ontogeny on, impact of, 450–451
  principles of, 445–446, 446f
Pharmacogenetic polymorphisms, 434
Pharmacogenetic testing, 629
Pharmacogenetics, 433–445, 434f
  definition of, 433
  developmental/pediatric, 434–437, 434f, 437f
  of drug transporters, 442–445, 443f
Pharmacogenomics, 433–445
  current and future applications, 444f, 445
  definition of, 433, 435t, 445
  developmental/pediatric, 434–437, 434f, 437f
Pharmacokinetic properties, 433, 436t
Pharmacokinetics
  age-related differences in, 2084
  definition of, 433, 445
  principles of, 445–446, 446f
Pharmacologic therapy, for nocturnal enuresis, 2821
Pharmacometabonomics, 436–437
Pharmacoproteomics, 433–445
  and metabolomic tools, 435–437
Pharmacotherapy

for asthma, 1198–1200
  quick-reliever medications, 1204
for HAPE, 606–607
for JIA, 1267t
for neonatal abstinence syndrome, 978t
for RDS, 935–936
for schizophrenia, 249–250

Pharyngitis, acute, 2192–2196
  chronic group A streptococcus carriers, 2196
  complications and prognosis, 2196
  diagnosis of, 2194–2195
  infectious etiologies, 2192–2194, 2193t
  prevention, 2196
  recurrent, 2196
  treatment of, 2195–2196, 2195t

Pharyngitis, in PFAPA, 1303–1304

Pharyngoconjunctival fever, 2193

Pharyngotonsillitis, 2199, 2199f

Phases of schizophrenia, 249

Phasic sinus arrhythmia, 2438f

Phencyclidine (PCP), 1054–1055

Phenobarbital
  adverse effects of, 3106t
  adverse reactions in premature infant, 905t
  dosages of, 3104t–3105t
  for neonatal abstinence syndrome, 978t
  for neonatal seizures, 3116
  for status epilepticus, 3119t

Phenocopy, 678

Phenol perineural injections, for spasticity, 3762
Phenotype, 677
characteristics of subgroups of juvenile myositis, 1283t
of mitochondrial cytopathies, 2124t
PiZZ, 2225
for polycystic ovary syndrome, 2859t
of primary antibody deficiencies, 1110t

Phenotyping, 683

Phentermine, 355–356

Phenylalanine hydroxylase (PAH), 695

Phenylalanine metabolism defects
classic phenylketonuria, 695–697
hyperphenylalaninemia, 695
caused by cofactor BH4 deficiency, 697–698

Phenylephrine, for shock, 582t

Phenylketonuria (PKU), 695
clinical manifestations of, 695
diagnosis of, 695–696
maternal, 697
treatment of, 696–697

Phenytoin
adverse effects of, 3106t
dosages of, 3104t – 3105t
for neonatal seizures, 3116

Phenytoin-induced gingival overgrowth, 1921

Pheochromocytoma, 2704–2705, 2986–2987
clinical manifestations of, 2986
differential diagnosis of, 2987
etiology of, 2986
laboratory findings in, 2986–2987, 2987f
MEN2 and, 2942
treatment of, 2987

Philadelphia chromosome, 2630, 2656
Phimosis, 2822–2823
Phlebotomy, in treatment of porphyria cutanea tarda, 843
Phlegmon, around appendix, 2052
Phlyctenules, 3371
Phobias, 211b, 215
Phonemic awareness, 268–269
Phonologic disorder, 278
Phonophobia, migraine with, 3131–3132
Phosgene
decontamination and management, 3813t
sudden-onset respiratory syndrome, 3809
Phosphatase, reference intervals, e 6t – e 13t
Phosphatase and tensin homolog hamartoma tumor syndromes, 2063
Phosphate
homeostasis, 3746
tubular reabsorption of, 2763
urinary, 413
Phosphate binders, 2777
Phosphodiesterase inhibitors
for atopic dermatitis, 1214
for heart failure, 2481
Phosphoenolpyruvate carboxykinase deficiency, 861
Phosphofructokinase deficiency, 2560
Phosphoglucomutase-1 deficiency, 805–806
3-Phosphoglycerate dehydrogenase deficiency, 723
Phosphoglycerate kinase deficiency, 2560
Phosphomannomutase-2 deficiency, 800–802
clinical manifestations of, 800–801, 801f
diagnosis of, 801–802
pathophysiology, 801
treatment of, 802

Phosphoribosylpyrophosphate (PRPP) synthetase, superactivity and deficiency, 822

Phosphorus
conversion factor, 404t
deficiency, rickets caused by, 376b , 382–383
excretion, 407
hyperphosphatemia, 409–410
hypophosphatemia, 407–409
metabolism, 407
reference intervals, e 6t –e 13t
serum, 407t

Phosphorylase kinase deficiency, 783–784
limited to heart, 784

Phosphoserine aminotransferase deficiency, 723

Photon emission CT, in neuroradiologic procedures, 3062

Photoparoxysmal epilepsy, 3098

Photophobia, migraine with, 3131–3132

Photopsia, 3132

Photosensitive rash, of SLE, 3445f

Photosensitive reactions, 3497–3498

Photosensitive seizures, 3120

Photosensitivity, 3496–3501
actinic prurigo, 3499–3500 , 3499f
acute sunburn reaction, 3496–3497 , 3496f , 3496t
Bloom syndrome, 3501
Cockayne syndrome, 3500
colloid milium, 3499
Hartnup disease, 3501
hydroa vacciniforme, 3499
porphyrias, 3498
reactions, 3497–3498
Rothmund-Thomson syndrome, 3500–3501
solar urticaria, 3499, 3499f
xeroderma pigmentosum, 3500, 3500f

Phototherapy
for atopic dermatitis, 1215
for glucuronyl transferase deficiency, 2102
for kernicterus, 959–960, 959f
for psoriasis, 3503

Phototoxic reactions, 3497–3498

PHOX2B gene, 2332
Phrenic nerve paralysis, 925

Phthirius pubis, management guidelines, 1090t

PHV, Peak height velocity
Phyllodes tumor, 2856
Phyloquinone, 386
Physeal injuries, 3687
Physical abuse, 99

Physical activity, for children with disabilities, 3770

Physical development
adolescent, 1014–1020
age 0-2 months, 132
age 2-6 months, 134–135
age 6-12 months, 135
age 12-18 months, 137
age 18-24 months, 142
middle childhood, 146–149

Physical examination
of acutely ill child, 528–529
of adolescent, 1034–1035
for appendicitis, 2050
cardiac, 2346–2354
in diagnosis of
  ADHD, 265
  cancer, 2634–2636
dysmorphic syndrome, 993
diagnostic approach to respiratory disease, 2150
of ears, 3398–3400, 3399f
genereal, 2346–2350
gynecologic, 2841–2844
  adolescents, 2843–2844
  in infants and prepubertal girls, 2841–2843
  in neonates, 2841
of idiopathic scoliosis, 3634–3635, 3635f
of newborn, 130, 868–872
orthopedic, 3592–3594
  gait assessment, 3594, 3595b
  inspection, 3592, 3594b
  palpation, 3592–3594
  range of motion, 3594
preparticipation sports examination, 3679–3683, 3679b, 3679t
of rape victim, 1079–1080
of skin, 3439

Physical maturity, 903f

Physical therapy, in pain management, 484

Physical urticaria, 1222–1223, 1223t
  angioedema, 1223
  aquagenic urticaria, 1223
  cholinergic urticaria, 1223
  cold-dependent disorders, 1222–1223
dermatographism, 1223
  pressure-induced urticaria, 1223
  solar urticaria, 1223

Physician orders for life treatment (POLST) system., 55

Physiologic anemia, of infancy, 2516–2517
Physiologic buffers, 411
Physiologic jaundice, 955–956
Physiologic leukorrhea, 2846
Physiologic myoclonus, 3161
Physiologic studies, SIDS and, 2174
Physiologic therapies, 631
Phytobezoars, 1968–1969
Phytophotodermatitis, 3497–3498
Phytosterolemia, 2538
PI3K-related syndromes, 2896t
Piaget's cognitive theory, 120t
Piaget's preoperational stage, 144
Pica, 204–205
   differential diagnosis of, 205
   epidemiology of, 205
   etiology of, 205
   treatment of, 205
Picobirnaviruses, 1745
PID, Pelvic inflammatory disease
Piebaldism, 702, 3478
Pierre Robin syndrome, 911t, 989
   with oral manifestations, 1917, 1917f
Pierson syndrome, 2760
PIGA deficiency, 804
Pigment gallstones, 2139
Pigmented hamartomas, of iris, 3142f
Pigmented villonodular synovitis, 1334
Pigtail, chest tube, 2275f
Pilar cyst, 3583, 3583f
Pili annulati, 3542
Pili torti, 3541–3542
Pill esophagitis, 1939–1940
Pills, progestin-only, 1065t–1066t, 1068–1069
Pilocytic astrocytomas (PAs), 2666, 2669–2671
Pilomatrixoma, 3583, 3583f
Pilomyxoid astrocytoma, 2672
Pilonidal sinus and abscess, 2061
Pineoblastoma, 2676, 2676f
Pineocytoma, 2676
Pinguecula, 3368, 3368f
Pink disease, 3795
Pinna malformations, 3411–3412, 3412f
in diastrophic dysplasia, 3729f
Pinta (Treponema carateum), 1601
Pinworm infection
    drugs for, 1813t–1828t
Pinworm infection, vulvovaginal, 2847t, 2850
Piperacillin, 1417t–1425t
Piperacillin-tazobactam, 1417t–1425t
Piriform sinus fistula, 2923
Pit vipers, 3823f
Pits
    preauricular, 3456
    in red blood cells, 2620–2621
Pitted keratolysis, 3557, 3557f
Pituitary adenoma, 2982–2983
Pituitary dwarfism, 982
Pituitary dysfunction, LCH and, 2710

Pituitary gland
anatomy of, 2876
anterior pituitary cell types, 2876–2880
embryology of, 2876
hormones
hypersecretion of, 2897–2898
primary hypersecretion of, 2893
hormones of, 2878f
hypothalamic-pituitary growth hormone axis, 2878f
hypothalamic-pituitary-gonadal axis, 2879f
hypothalamic-pituitary-thyroid axis, 2877f
posterior pituitary cell types, 2880
vascular supply of, 2876

Pituitary gland disorders
corticotropinoma, 2898
excess GH secretion and pituitary gigantism, 2896–2897
hyperpituitarism, 2892–2898
hyponatremia, 2889–2892
hypopituitarism, 2880–2887
overgrowth syndromes, 2892–2898, 2893f, 2894f, 2896f
prolactinoma, 2897–2898
tall stature, 2892–2898

Pituitary hormone deficiencies, hypogonadotropic hypogonadism associated with, 2999

Pityriasis alba, 3494, 3494f

Pityriasis lichenoides, 3503–3504, 3504f
clinical manifestations of, 3504
differential diagnosis of, 3504
etiology/pathogenesis of, 3503–3504
pathology of, 3504
treatment of, 3504

Pityriasis lichenoides et varioliformis acuta (PLEVA), 1333–1334, 1333f, 3503, 3504f

Pityriasis rosea, 3505
  clinical manifestations of, 3505
  differential diagnosis of, 3505
  etiology/pathogenesis of, 3505
  treatment of, 3505

Pityriasis rubra pilaris, 3505–3506, 3506f

PiZZ phenotype, 2225

PKU, Phenylketonuria

Placenta
  examination in twinning, 897–898
  surgery, indications and rationales, 893t

Placental abruption, as delivery room emergency, 928

Plague (Yersinia pestis), 1524–1526
  clinical manifestations of, 1525
  delayed-onset respiratory syndrome, 3809–3810
  diagnosis of, 1525, 3810
  differential diagnosis of, 1525
  epidemiology of, 1525
  etiology of, 1524
  pathogenesis of, 1525
  prevention of, 1526
  treatment of, 1525–1526, 3811t–3812t

Plan-do-study-act (PDSA) cycle, 31, 32f

Plant thorn synovitis, 1334

Plantar fasciitis, 3700, 3715

Plantar response, in neurologic evaluation, 3059

Plantar wart, hyperkeratotic, 3566f
Plants, toxicity, 508, 509t

Plaque morphea, 1285b

Plaque psoriasis, 3497

Plaques
confluent, in candidal infection, 3564f
erythematous scaly, 3445f
hyperpigmented, of early morphea, 3519f
papulosquamous, in infants with syphilis, 1593f
of porokeratosis of Mibelli, 3508f
warty, 3559f

Plasma
cations and anions, 390f
vitamin D metabolic values in, 3747t

Plasma complement component deficiencies, 1153t

Plasma complement control protein deficiencies, 1154–1155

Plasma concentration
acetaminophen, 499f
vs. time curve, 445–446

Plasma lipoprotein metabolism, and transport, 752–754

Plasma membrane carnitine transport defect, 744

Plasma oncotic forces, in shock, 575b

Plasma proteins, increased production of, 2749

Plasma transfusions, 2585–2586
in children, 2586
in neonates, 2586
products and patient testing, 2585–2586

Plasma volume, decreased effective, 2891

Plasmalogen synthesis, isolated defects of, 747

Plasminogen activator inhibitor deficiency, 2599

Plasmodium, 1851–1863, Malaria
life cycle of, 1853f

*P. falciparum* malaria
clinical manifestations of, 1854, 1855f
complications of, 1857–1862
treatment of, 1857

*P. vivax, P. ovale, P. malariae,* or *P. knowlesi* malaria, treatment of, 1857

Plastic bronchitis, 2221–2222, 2221f, 2221t
clinical manifestations of, 2222
complications and prognosis of, 2222
diagnosis of, 2222
epidemiology of, 2221
pathogenesis of, 2221–2222
treatment of, 2222

Plastic deformation, 3664, 3664f

Plateau pressure (*P*$_{plat}$), 599–600, 600f

Platelet adhesion, 2609

Platelet aggregation, 2593

Platelet count, 2503f
laboratory tests of hemostasis, 2591

Platelet disorders, 2609–2618

Platelet dysfunction, treatment of patient with, 2618

Platelet function disorders, 2617
acquired, 2617
congenital, 2617–2618

Platelet production, impaired, 2610t

Platelet products, 2584

Platelet transfusions, 2583–2584

Play, in preschool years, 145

Play audiometry, 3407

Pleomorphic type, rhabdomyosarcomas, 2686
**Plesiomonas shigelloides**, 1528–1529
- clinical manifestations of, 1528
- diagnosis of, 1528
- epidemiology of, 1528
- etiology of, 1528
- pathogenesis of, 1528
- treatment of, 1528–1529

**Pleural effusion**, 2274–2278
- dry pleurisy, 2274–2275, 2275f
- in eosinophilic pneumonia, 2253f
- serofibrinous or serosanguineous pleurisy with pleural effusion, 2275–2276
- in tuberculosis, 1571, 1571f

**Pleural fluid**, differentiation of, 2274t

**Pleurisy**
- dry, 2274–2275, 2275f
- serofibrinous or serosanguineous, 2275–2276

**PMDD**, Premenstrual dysphoric disorder

**PMS**, Premenstrual syndrome

**Pneumatocele**, 1432f, 2280

**Pneumococcal conjugate vaccine (13 valent) (PCV13)**, 1350t, 1353–1357, 1359, 1439t–1440t

**Pneumococcal empyema**, 2273f

**Pneumococcal polysaccharide vaccine (23 valent) (PPSV23)**, 1350t, 1359, 1440t

**Pneumococcal vaccination, schedule, for persons with cochlear implants**, 3411t

**Pneumococcus**, 1436–1440

**Pneumocystis jiroveci**, 1662–1664
- clinical manifestations of, 1662
- complications of, 1663
- diagnosis of, 1663
- epidemiology of, 1662
etiology of, 1662  
laboratory findings of, 1663, 1663f  
pathogenesis of, 1662  
pathology of, 1662  
prevention of, 1663–1664  
prognosis for, 1663  
supportive care for, 1663  
treatment of, 1663

**Pneumocystis pneumonia, in HIV, 1784**

**Pneumomediastinum, 947–948, 948f, 2321**
   
clinical manifestations of, 2321  
complications of, 2321  
etiology of, 2321  
laboratory findings for, 2321, 2321f  
pathogenesis of, 2321  
treatment for, 2321

**Pneumonia**
   
aspiration, 941  
bronchiolitis obliterans organizing, 2226–2227  
*Chlamydia trachomatis*, 1617  
community-acquired, 2266–2274
   
clinical manifestations of, 2269–2270  
complications of, 2273–2274, 2273f, 2274t  
diagnosis of, 2270–2271, 2270f, 2271t  
edemiology of, 2266  
etiology of, 2266–2267, 2268t  
pathogenesis of, 2267–2269, 2269t  
prevention of, 2274  
prognosis of, 2273  
treatment of, 2271–2273, 2272t–2273t

Protein 4.2 mutations, in hereditary spherocytosis, 2531t

Protein B deficiency, surfactant and, 2301–2302

Protein C deficiency, 2602, 2602t
  surfactant and, 2302–2303

Protein hydrolysate formulas, 325–326

Protein kinases
  MAPK signaling pathway, 990f
  in normal liver development, 2082t
Protein N-glycosylation, congenital disorders of, 800–804
   Dol-P-GlcNAc-P transferase deficiency, 804
   glucosyltransferase-1 deficiency, 803–804
   mannos phosphoisomerase deficiency, 802–803
   phosphomannomutase-2 deficiency, 800–802

Protein O-glycosylation, congenital disorders of, 804

Protein S deficiency, 2602, 2602t

Protein tyrosine kinase inhibitors, in treating malignancies, 2640t

Protein-calorie malnutrition, in cystic fibrosis, 3589

Protein-losing enteropathy, 1990, 1999–2000
   causes of, 1999t
   chronic diarrhea and, 2035

Proteinuria, 2775
   causes of, 2751t
   clinical considerations of, 2750
   clinical evaluation of, 2749–2750
   fixed, 2751–2752
      glomerular, 2751–2752
      tubular, 2752
   measurement of urine protein, 2749–2750
      dipstick, 2749
      protein-to-creatinine ratio, 2749–2750
   normal physiology of, 2749
   orthostatic (postural), 2750–2751
   pathophysiology of, 2749
   test for, 2750t
   transient, 2750

Proteomic studies, 435–436

Proteomics, 1342

Proteus syndrome, 3585

Proteus syndrome myopathy, 3273

Prothrombin 20210 gene mutation, 2602
Prothrombin deficiency, 2598
Prothrombin time, 2591–2593
Protocols, for emergency medical services, 515
Proton MR spectroscopy, in neuroradiologic procedures, 3061–3062
Proton pump inhibitors
  antisecretory, 1971t
  for GERD, 1937
Proton-beam radiotherapy, 2643
Protooncogenes, RET, 2703–2704, 2942
Protoporphyrinogen oxidase (PPOX) deficiency, 845
Protozoan diseases
  amebiasis, 1831–1833
  antiparasitic drugs for, 1812
  babesiosis (Babesia), 1863–1865
  balantidiasis, 1835–1836
  causing systemic neonatal infections, 996t
  Cryptosporidium, 1836
  Cyclospora, 1837
  Cystoisospora, 1837
  giardiasis, 1833–1836
  leishmaniasis (Leishmania), 1839–1844
  malaria (Plasmodium), 1851–1863
  microsporidia, 1837–1838
  primary amebic meningoencephalitis, 1829–1831
  trichomoniasis (Trichomonas vaginalis), 1838–1839
  trypanosomiasis
    African (sleeping sickness), 1844–1846
    American (Chagas disease), 1847–1851
Provocative testing, 1178
  of ankle injury, 3698
Provoked seizures, 3086–3087
Proximal femur, vascular anatomy, 3624f

Proximal humeral stress fracture (epiphysiolysis), 3689

Proximal humerus fractures, 3667–3668

Proximal renal tubular acidosis, 2762–2763, 2762t
- clinical manifestations of, 2763
- pathogenesis of, 2762–2763

Proximal tibia fractures, 3668

Prozone effect, 1595

Prune-belly syndrome, 2808, 2808f

Pruritus
- chronic cholestasis and, 2100
- liver disease and, 2086
- in palliative care
  - nonpharmacologic approach to, 60t
  - pharmacologic approach to, 57t–59t

Pseudoachondroplasia, 3723–3724, 3725f

Pseudoagouti phenotype, 680f

Pseudoallergic reactions, 1242

Pseudoappendicitis, acute gastroenteritis and, 2026

Pseudoautosomal region, 2988

Pseudocyst, pancreatic, 2080

Pseudodominant inheritance, 645, 645f

Pseudogenetic inheritance, and familial clustering, 647

Pseudo-Hurler polydystrophy, 777

Pseudohyperkalemia, 399

Pseudohypertrophy, 3057

Pseudohypoaldosteronism, 2769, 2978–2979
- type 1, 400, 2891t, 2969
- type 2, 400, 2891t
Pseudohyponatremia, 390–391, 395, 395b, 2892

Pseudohypoparathyroidism, 2948–2950, 2949t
- acrodysostosis with hormone resistance, 2949–2950
  - type la, 2906, 2949
  - type lb, 673f, 2949

Pseudo-Lennox-Gastaut syndrome, 3097

Pseudomembranous colitis, 1553

Pseudomembranous conjunctivitis, 3367

Pseudomigraine syndrome with CSF pleocytosis, 3186

Pseudomonal folliculitis, 3556

*Pseudomonas aeruginosa*, 1529–1532
- in burns and wound infection, 1530
- clinical manifestations of, 1529–1531
- in cystic fibrosis, 1530
- diagnosis of, 1531
- epidemiology of, 1529
- etiology of, 1529
- in immunocompromised persons, 1530, 1530f

Pubic hair, 2899
changes, 1016f

Pubic lice, management guidelines, 1090t

Puddle sign, 2145–2146

Pufferfish (tetrodotoxin)
food-borne illness, 3776t–3777t
noninfectious, 2018t
poisoning, 3806

Pulmonary abscess, 2280–2282
clinical manifestations of, 2280
diagnosis of, 2280–2281, 2281f
pathology and pathogenesis of, 2280
prognosis of, 2282
treatment of, 2281

Pulmonary agenesis, 2229

Pulmonary airway malformation, congenital, 2230–2231

Pulmonary alveolar microlithiasis, 2228–2229, 2228f

Pulmonary alveolar proteinosis, 2304–2305
clinical manifestations of, 2305
comparison of, 2305t
diagnosis of, 2305
etiology and epidemiology of, 2304–2305
severe, 2305f
treatment of, 2305

Pulmonary aplasia, 2229

Pulmonary arteriography, 2155
Pulmonary arteriovenous fistula, 2424

Pulmonary artery
  absence of branch, 2399
  anomalous origin of left coronary artery from, 2422–2423
  anomalous origin of right coronary artery from, 2423

Pulmonary artery sling, 2224

Pulmonary aspergilloma, 1647

Pulmonary aspergillosis
  chronic, 1647
  invasive, 1648–1649, 1648f

Pulmonary aspiration
  in drowning, 609
  postnatal, 941

Pulmonary atresia
  with intact ventricular septum, 2401–2402, 2402f
  tetralogy of Fallot with, 2401
  transposition of the great arteries with, 2405–2406

Pulmonary blood flow
  decreased, cyanotic congenital heart disease and, 2396–2407
  increased, cyanotic congenital heart disease and, 2407–2420
  obstructed in newborn, 911t

Pulmonary capillaritis, 2306

Pulmonary complications
  of cystic fibrosis, 2282t
  of sickle cell anemia, 2546–2547

Pulmonary diseases
  associated with primary and secondary immune deficiency, 2259t
  causing SIDS, 2168t
  obesity-associated comorbidities, 352t

Pulmonary edema, 2233–2235
  clinical manifestations of, 2234–2235, 2235t
etiology of, 2234, 2234t
high-altitude, 605–607, 606f
pathophysiology of, 2233–2234
treatment of, 2235

Pulmonary embolism, 2309–2315, 2683
  chest CT of, 2604f
  clinical decision rules for, 2310t
  clinical manifestations of, 2311
  epidemiology of, 2310
  etiology of, 2309–2310
  laboratory findings and diagnosis of, 2311
  pathophysiology of, 2310
  prognosis of, 2312–2313
  risk factors for, 2309t
  symptoms of, 2604
  treatment of, 2311–2312, 2312t

Pulmonary fibrosis, 2647

Pulmonary function, skeletal diseases influencing, 2326–2329

Pulmonary function testing, 2155–2159
  in anti-glomerular basement membrane disease, 2262–2263
  in asthma, 1189–1192
  in cystic fibrosis, 2289–2290
  in interstitial lung disease, 2261
  long-term mechanical ventilation and, 2338–2339
  in primary immune deficiency, 2251
  in systemic scleroderma, 1287

Pulmonary hemorrhage, 948–949, 2309–2315
  clinical manifestations of, 2314
  epidemiology of, 2313–2314
  etiology of, 2313, 2313t
  infant, 3775
  laboratory findings and diagnosis of, 2314, 2314f
  pathophysiology of, 2314
Pulmonary hemosiderosis, 2306–2308
- clinical manifestations of, 2307
- epidemiology of, 2306
- etiology of, 2306, 2306t
- laboratory findings for, 2308
- pathology of, 2306–2307
- pathophysiology of, 2307
- prognosis of, 2308
- treatment of, 2308

Pulmonary hypertension, 2424–2428
- cystic fibrosis and, 2295
- developmental lung disease associated with, 2425b
- drugs used for, 2427t
- persistent, of newborn, 942–944, 943f
- in pertussis, 1495
- primary pulmonary hypertension, 2424–2427
- pulmonary vascular disease, 2427–2428
- in sickle cell anemia, 2547
- updated classification of, 2425b

Pulmonary hypoplasia, 2229–2230

Pulmonary infarction, 2309–2315

Pulmonary infections
- coccidioidomycosis, 1655
- complicated, coccidioidomycosis, 1655
- nontuberculous mycobacterial, 1589–1590

Pulmonary infiltrates, 2710

Pulmonary interstitial emphysema, 947–948, 948f

Pulmonary lymphangiectasia, congenital, 2232–2233, 2233f

Pulmonary manifestations
- of electrical burns, 622t–623t
- extrapulmonary diseases with, 2166
of SLE, 1275
systemic disorders with, 2259
of tuberous sclerosis, 3145

Pulmonary mucormycosis, 1661
Pulmonary pathology, localizing signs for, 584
Pulmonary pressure-volume relation, in acute lung injury, 592
Pulmonary renal syndromes, 2307, 2732
Pulmonary sequestration, 2231–2232, 2231
Pulmonary sling, 2421, 2421

Pulmonary stenosis
in combination with intracardiac shunt, 2387
infundibular, double-chamber right ventricle, 2386–2387
peripheral, 2387

Pulmonary tumors, 2316–2317
clinical manifestations and evaluation for, 2316–2317, 2317
etiology of, 2316

Pulmonary valve disease, in rheumatic heart disease, 2460

Pulmonary valve stenosis, 2434–2435
with intact ventricular septum, 2384–2386
clinical manifestations for, 2384–2385
laboratory findings for, 2384–2385
pathophysiology of, 2384
prognosis and complications of, 2386
treatment of, 2386
relative frequency of, 2367

Pulmonary valvular insufficiency, 2393–2394

Pulmonary vascular disease (Eisenmenger syndrome), 2427–2428
clinical manifestations of, 2428
diagnosis of, 2428
pathology of, 2427–2428
pathophysiology of, 2427
treatment of, 2428
Pulmonary vascular resistance, neonatal, 942
Pulmonary venolobar syndrome, 2224
Pulmonary venous hypertension, 2393
Pulmonary venous return, partial anomalous, 2376
Pulp, 1919f, 1922f
Pulse oximetry, 526
    in respiratory distress and failure, 588
Pulse rates, at rest, 2350t
Pulseless disease (Takayasu arteritis), 1320–1322
Pulseless electrical activity, 609
Pulses, evaluation of the character of, 2348

   screening: Pediatric Symptom Checklist, 2817

Quetiapine
   in pain management, 474t
   for psychosis and agitation, 194t

Quick-reliever medications for asthma, 1204
Quinidine gluconate, 1858t –1860t
Quinidine sulfate, 1858t –1860t
Quinine, 1858t –1860t
Quinolones, 1428–1429
   enterococci resistance, 1457t
   for Legionella , 1540
Quinupristin-dalfopristin, 1417t –1425t, 1458
enterococci resistance, 1457t

R

Rabies, 1774–1777
clinical manifestations of, 1775
diagnosis of, 1775–1776
differential diagnosis of, 1775
epidemiology of, 1774–1775
immunoglobulin, 1349t
pathogenesis of, 1775
prevention of, 1776–1777
immunization and fertility control of animal reservoirs, 1776
postexposure prophylaxis, 1776–1777, 1776f, 1777f
preexposure prophylaxis, 1777
prognosis for, 1776
treatment of, 1776
vaccines, 1350t, 3819

Rabson-Mendenhall syndrome, 3050

Rac2 deficiency, 1134t –1135t

Racoon eyes, 104

Race
adolescent health outcomes by, 1029t
and prevalence of otitis media, 3418
risk factor of childhood injuries, 82

Racemic epinephrine, nebulized, 2205

Rachitic rosary, 375–376, 377f

Racial identity development, in adoptive children, 64

Racism, 16–21, 16t
defined, 17, 18b
opportunities to address, 20–21
Radial dysplasia, 3652f
Radial longitudinal deficiency, 3652–3653, 3652t –3653t
Radiation damage, 2994
Radiation encephalopathy, 3178
Radiation exposure
  acute and late effects of therapeutic radiation, 3782–3783, 3782t
  basic principles of, 3778, 3779f
  biologic effects of, 3778–3781
  cancer risk over lifetime, 3781, 3781f
  deterministic dose levels, 3779t
  in diagnostic imaging, 3781–3782
  external contamination, 3785
  internal contamination, 3784–3785, 3785t
  measurements, 3779t
  mutagenesis induced by, 3780f
  radiation dose by imaging test, 3779t
  second malignancies, 3782f
  tissue radiosensitive weighting factors, 3778t
  unnecessary diagnostic radiation, 3781–3782
  whole-body irradiation, 3783–3784
    localized, 3784, 3784t
    uncontrolled large- or small-scale exposure to, 3783–3784, 3784t
  X-ray sensitivity, inherited human syndromes associated with, 3781b
Radiation exposure, effects on fetus, 889
Radiation myelitis, 3783
Radiation sickness, 3785f
Radiation therapy, 2701
  in children with cancer, 2643
Radiation thyroiditis, 2923
Radiation-induced hypogonadism, chemotherapy and, 2994
Radical nephrectomy, 2684
Radioactive iodine, 2921

Radioactive iodine, for hyperthyroidism, 2932t

Radiocontrast media, indications and adverse reactions, 1246–1247

Radiographic evaluation
  - of clubfoot, 3599
  - of hypermobile pes planus, 3601, 3601f
  - of idiopathic scoliosis, 3635
  - of leg-length discrepancy, 3614, 3614f
  - of osteomyelitis, 3672–3673
  - of septic arthritis, 3677, 3677f

Radiographic features
  - of pulmonary alveolar microlithiasis, 2228f
  - of pulmonary edema, 2235f

Radiographic sacroiliitis, in ankylosing spondylitis, 1270–1271, 1271f

Radiographic techniques, in diagnostic approach to respiratory disease, 2154–2155

Radiographs
  - abdominal
    - in neonate with bilious vomiting, 1952f
    - showing congenital duodenal atresia, 1951f
  - of ankle injuries, 3698–3699
  - from asplenic male neonate, 2418f
  - cephalometric, 1926
  - cervical spine, of patient with JIA, 1263f
  - of cystic fibrosis, 2289f
  - diagnostic, in developmental dysplasia of hip, 3626–3627, 3627f
  - of hand, showing changes in JIA, 1266f
  - intraoral dental, 1926
  - panoramic, 1926, 1926f
  - of patient with bacterial tracheitis, 2206f
  - plain
    - appendicitis, 2051
    - in musculoskeletal evaluation, 3595
    - osteomyelitis, 3672
septic arthritis, 3677
of primary pulmonary hypertension, 2426f
of valvular pulmonary stenosis, 2385f
of ventricular septal defect, 2380f

Radiography
for interstitial lung disease, 2261
long-term mechanical ventilation and, 2338–2339

Radioiodine administration, hypothyroidism resulting from, 2916

Radioisotope studies, in urinary tract obstruction, 2803

Radiologic cardiac assessment, 2354–2366

Radiologic evaluation, for secondary survey, 554

Radiologic findings, of hypopituitarism, 2885, 2885f

Radiology
for allergic bronchopulmonary aspergillosis, 2256, 2256f
in asthma, 1192
for cystic fibrosis, 2288–2289
diagnostic, in dental assessment, 1926
for hypersensitivity pneumonia, 2241–2242, 2242f
for sarcoidosis, 2249–2250, 2257f

Radionuclide angiography, 2363

Radionuclide cerebral blood flow study, 566

Radionuclide cystogram, of vesicoureteral reflux, 2798f

Radionuclide scanning, for liver, 2091

Radionuclide scintigraphy, in evaluation of esophagus, 1928–1929

Radionuclide studies
in osteomyelitis, 3673
of thyroid, 2913

RAG1 deficiency, 1116t

RAG2 deficiency, 1116t

Ragged red fibers, myoclonic epilepsy with, 3174t, 3175
Rainbow Center for Global Child Health, 526
Rales, 2150
Raloxifene, for gynecomastia, 3001
Ramsay Hunt syndrome, 3339, 3417
Rancho Los Amigo Scale (RLAS), 3754, 3754
Range of motion
   in deformational plagiocephaly, 3083
   knee, 3617
   in orthopedic evaluation, 3594
Ranula, 1925
Rape
   clinical manifestations of, 1079
   epidemiology of, 1077–1078
   interview and physical examination, 1079–1080
   laboratory data, 1080
   prevention, 1081
   treatment of, 1080–1081
   types of, 1078–1079
Rapid antigen-detection tests, for GAS pharyngitis, 2194
Rapid eye movement (REM) sleep, 173
   disorders, 3127
Rapid healing, of fracture, 3664
Rapid HIV tests, e 2, e 3t
Rapid multiplex molecular panels, for acute gastroenteritis, 2028
Rapid plasma reagin (RPR), 1088
   test, 1595
Rapid psychosocial history, screening interview for taking, 186, 186b
Rapid response systems, 41
Rapid sequence intubation, 537, 538t, 590–591
Rapidly involuting congenital hemangiomas (RICH), 3466

Rapidly progressive glomerulonephritis
crescentic, 2727–2728
classification of, 2727–2728, 2728t
clinical manifestations of, 2728
diagnosis and differential diagnosis of, 2728
pathology and pathogenesis of, 2728
prognosis and treatment of, 2728
idiopathic, 2724t

Rapidly progressive thrombosis, 2604

Rapid-onset obesity with hypothalamic dysfunction, hypoventilation, and autonomic dysregulation (ROHHAD), 358–360, 2679t, 2941–2942, 3180t–3181t, 3186
autoimmune hypothesis of, 360
center of excellence for, 359
clinical manifestations of, 358–359
diagnosis of, 359
etiology of, 359–360
genetic studies, 359–360
management of, 359

Rare tumors, 2703–2705
adenocarcinoma of colon and rectum, 2704
adrenal, 2704–2705
desmoplastic small round cell, 2705
nasopharyngeal carcinoma, 2704
thyroid, 2703–2704

Rash
in Henoch-Schönlein purpura, 1319
of HIDS, 1297f
of JDM, 1281f–1282f
malar
of SLE, 3445f
suggestive of rheumatic disease, 1249t
in newborn with SIRS, 1001
of NOMID, 1300f
petechial
  in parvovirus B19, 1700f
treatment algorithm for, 1475f

purpuric
  in meningococcemia, 1472f
  suggestive of rheumatic disease, 1249t
  in Rocky Mountain spotted fever, 1624, 1624f
scalp, biotin treatment for, 370f
suggestive of SLE, 1248–1249
of systemic JIA, 1264f
  varicelliform, in vaccinated persons, 1710
  vasculitic, of SLE, 1274f

Rashkind balloon atrial septostomy, 2409f
Rasmussen encephalitis, 3097, 3117, 3180t–3181t, 3186
Rastelli operation, 2405–2406, 2405f

Rat bite fever, 3820
  clinical course, 3820
diagnosis of, 3820
etiology of, 3820
treatment of, 3820

Rat lungworm, 1887
Rat poison, 2607
Rat snakes, 3823f

Rat-bite fever (Streptobacillus moniliformis), 1401t

Rate, electrocardiography, 2356
Rattlesnakes, 3823f
  envenomation, antidote, 497t
  Southern Pacific, bite from, 3822, 3823f

Raxibacumab, 3815
Raynaud phenomenon, 1285–1289, 1288f, 3534

RB1 gene, 2697
Reaching Every Child through Quality Improvement (REC-QI), 25–26

Reactivation tuberculosis, 1571

Reactive airways disease syndrome, 2244, 2247

Reactive arthritis

*Campylobacter* in, 1521
CDI-associated, 1553
characteristics, 1269t
clinical manifestations of, 1272–1273
complications and prognosis, 1273
diagnosis of, 1273
differential diagnosis of, 1272–1273
etiologic microorganisms, 1269b
pathogenesis of, 1272
poststreptococcal, 1444–1445
treatment of, 1273

Reactive attachment disorder, 298–299

Reactive perforating collagenosis, 3522, 3522f

Reading

disorders of, 257, 257t
and IQ, uncoupling over time, 267f
lack of fluency in, 269
typical and dyslexic, 268f

Rearrangements, balanced and unbalanced, 653t

Rebound, 3060

Receptive language, 149t, 274–275, 279t

Receptors, in normal liver development, 2082t

Reciprocal translocations, 665

Recognition molecules in lectin pathway, 1150, 1150f

Recombinant activated factor VII, 2586

Recombinant human growth hormone (rHuGH), in CKD, 2777
Recombination, 639
Recommended caloric intake, 353
Recommended dietary allowance (RDA), 303
Recovery, 220
Recreational activities, for child with intellectual disability, 292
Recreational needs of child with intellectual disability, 292
Recrudescence, malaria, 1854
Recruitment, 593
Rectal atresia, 2057
Rectal mucosal prolapse, 2060–2061
Rectal prolapse, for cystic fibrosis, 2296
Rectum
  adenocarcinoma of, 2704
  surgical conditions of, 2055–2061
Recumbent length, measurement of, 151
Recurrence risk estimates, for dysmorphic syndromes, 996
Recurrent conditions
  appendicitis, 2055
  cholangitis, liver disease and, 2089
  coagulopathy, indications for antivenom in, 3824b
  otitis media
    Moraxella catarrhalis in, 1491
    in Turner syndrome, 3003
  pancreatitis
    acute, 2078–2080
    etiology of, 2075r
  pharyngitis, 2196
  pneumonia, 2268–2269, 2269r
  respiratory papillomatosis, 2215, 2215f
  Reye-like syndrome, 3178
  UTI, 2795
Red blood cells (RBCs)

acquired pure red blood cell anemia, 2512–2513

debris in, 2620
destruction of, 2528f
inclusions, 2621
membrane cross-section, 2531f
metabolism of, 2559f
morphology
  abnormal, 2509f, 2534f
  associated with hemoglobin disorders, 2551f
pitted, 2622f
product and dose, 2582
red urine with and without, 2718
storage age, 2582
structure, hemolytic anemia, 2530b
transfusion, 2580–2582
  for homozygous β-thalassemia, 2555–2556
  for sickle cell anemia, 2548, 2550

Red eye, 3365t

Red flags, associated with hemangiomas, 3465t

Red man syndrome, indications and adverse reactions, 1246

Red reflex, 3353f

Red urine, 2718t

Reductive adaptation, 338

Reed-Sternberg cell, in Hodgkin lymphoma, 2657

Reentry HAPE, 607

Refeeding hypophosphatemia, 408

Refeeding syndrome, 342–343, 342t

Reference intervals, e 6t – e 13t

Referred pain, 1910

Reflectance confocal microscopy (RCM), 617
Reflex epilepsy, 3098
Reflex seizures, 3087, 3120
Reflex syncope, 569
Reflexes
  brainstem, 565, 565t
  deep tendon, in motor system, disorders of, 3246t
  in neurologic evaluation, 3059–3060
  Santmyer swallow, 1927–1928
Reflex
  intrarenal, 2794f
  nephropathy, 2796
  -related renal injury, 2796
  vesicoureteral, 2796–2800
Reflex laryngitis, GERD and, 1938
Refraction
  abnormalities of, 3344–3346
  in eye examination, 3344
Refractory status epilepticus, 3117
  treatment of, 3118
Refsum disease, 3327
Refsum syndrome, 3515–3516
Refusal waiver, for immunization, 1365
Regional anesthesia, 467–468, 485
  definition of, 460b
Regionalization, in emergency medical services, 517, 517f
Regression, 158
Regurgitant lesions, in acyanotic congenital heart disease, 2393–2395
  congenital absence of the pulmonary valve, 2393–2394
  congenital mitral insufficiency, 2394, 2394t
  mitral valve prolapse, 2394–2395
pulmonary valvular insufficiency, 2393–2394
tricuspid regurgitation, 2395

Regurgitation, 1903–1904
   effortless, 1901, 1903–1904
   infant, 2041, 2041t
   mitral, 2394t
   tricuspid, 2395

Rehabilitation
   for ankle injuries, 3699
   for burn injuries, 621
   for heart transplantation, 2486
   for musculoskeletal injury, 3686

Rehabilitation medicine
   for birth brachial plexus palsy, 3762–3765
   for children with disabilities, health and wellness in, 3769–3773
   evaluation of child for, 3753
      child characteristics, 3753–3754
      family characteristics, 3754
      physical environment, 3754–3755
      for previously healthy child, 3754
   for meningomyelocele, 3765–3767
   for severe traumatic brain injury, 3753–3755
   for spasticity, 3760–3762

Rehydration, in cholera, 1518

Reifenstein syndrome, 3017

Rejection
   after liver transplantation, 2145
   of graft, 1165
   in intestinal transplantation, 2011
   in renal transplantation, 2783–2784

Relapse
   ALL, 2653
      CNS, 2653
      testicular, 2653
Hodgkin lymphoma, 2659–2660
nephrotic syndrome, 2758
non-Hodgkin lymphoma, 2665

Relapsing fever (*Borrelia recurrentis*), 1387, 1401t, 1603–1604
clinical manifestations of, 1603–1604
diagnosis of, 1604, 1604f
epidemiology of, 1603, 1603f
etiology of, 1603
pathogenesis of, 1603
pathology of, 1603
prevention of, 1604
prognosis for, 1604
treatment of, 1604

Relapsing polychondritis, 1333
Relational bullying, 242–243

Relaxation, 199
  training, in pain management, 484

Reliability, 160–161

Reliability science, 40

Religious objections to treatment, 48

Remediation of skills, 260

Remission, 220
  induction, 2652
  in nephrotic syndrome, 2758

Remittent fever, 1387

Remodeling
  of ductal plate, 2082–2083
  fracture, 3663, 3663f

Remote symptomatic seizure, 3086–3087

Renal abscess, 2793
Renal agenesis, \textit{911t}, 2786
consequences of, \textit{991f}

Renal angiogram, for hypertension, \textit{2496f}

Renal anomaly, and sensorineural deafness and hypoparathyroidism, 2945–2946

Renal calculi
- calcium oxalate and calcium phosphate, 2837–2838
- cystine, 2838
- indinavir, 2838
- nephrocalcinosis, 2838
- struvite, 2838
- uric acid, 2838

Renal cell carcinoma (RCC), 2685

Renal complications, of IBD, 1975t–1976t

Renal cysts and diabetes syndrome, 406

Renal damage, due to neuropathic bladder, 2813–2814, 2814f

Renal disease, 196
- anemia of, 2515
- in secondary intracranial hypertension, 3237t

Renal drug elimination, 447f, 450, 450t

Renal dysfunction, 2647
- criteria for, 574t
- liver disease and, 2088
- in shock, 579t

Renal dysgenesis, 2786–2788

Renal failure, 2640, 2769–2779
- acute kidney injury, 2769–2774
- chronic kidney disease, 2774–2778
- end-stage renal disease, 2778–2779
- metabolic acidosis caused by, 416–417

Renal hypoplasia, 2788
Renal hypouricemia, 2769

Renal injuries
  grading of, 2833t
  treatment of, 2834

Renal late effects, of cancer and treatment, 2645t–2647t

Renal losses
  hypokalemia caused by, 401b
  hypomagnesemia caused by, 405b
  hyponatremia caused by, 395b
  hypophosphatemia caused by, 408b

Renal malformations, in Turner syndrome, 3003

Renal manifestations
  of electrical burns, 622t–623t
  of Henoch-Schönlein purpura, 1319
  of SLE, 1275t, 1276b

Renal osteodystrophy, 2773t, 2776–2777

Renal pelvis, obstruction, 2801t

Renal transplantation, 2779–2785
  characteristics of donors and recipients for, 2780–2782
  common causes of ESRD in recipients, 2780t
  evaluation and preparing for, 2780–2782
  fluid management in infants and small children, 2783
  graft survival, 2784
  immunosuppression for, 2782–2783
    complications of, 2784–2785
    induction therapy, 2782
    maintenance, 2782–2783
  incidence and etiology of, 2779, 2779t
  indications for, 2779–2780
  kidney biopsy, 2784
  long-term outcome, 2785
  rejection of, 2783–2784

Renal tubular acidosis (RTA), 2761–2766
contrasting features and diagnostic studies in, 2765t
distal, 378f, 384, 415, 2763, 2764t
hyperkalemic, 416, 2764–2766
normal urinary acidification, 2762
predisposition to renal calculi and, 2838
proximal, 415–416, 2762–2763, 2762t
rickets associated, 2766
type IV, genetic mutations associated with, 2891t

Renal vein thrombosis, 429, 2604, 2742–2743
clinical manifestations of, 2743
diagnosis of, 2743
differential diagnosis of, 2743
epidemiology of, 2742
pathogenesis of, 2743
prognosis of, 2743
treatment of, 2743

Renin-angiotensin system, 392

Renovascular hypertension
on children, 2495b
diagnostic pathway for, 2499f

Repaglinide, for T2DM, 3045t

Repeat pregnancy among teen mothers, 1076

Replacement fluids, 427–428, 428b
for diarrhea, 428b
for emesis or nasogastric losses, 428b

Replacement therapies, 425–428, 1347
enzyme, 631
gene, 634
transplantation, 631–632

Reporting quality, 36–37

Repositioning and physiotherapy (RPPT), for deformational plagiocephaly, 3085

Reproductive issues
associated with high-risk pregnancy, 877t
in polycystic ovary syndrome, 2860t

Reproductive system, late effects of cancer and treatment, 2645t–2647t

Reptilase time, 2593

Reptiles, *Salmonella* transmission to humans, 1502t

Research, pediatric, ethical challenge of, 49–50

Residential segregation, 13–14, 19–20

Residual volume, 2155–2156

Resilience, 119–120
  of GLB youth, 1025

Resistance
  antibiotic, of *Haemophilus influenza*, 1487
  antimicrobial
    in *Enterococcus*, 1456–1457, 1456t–1457t
    in *Neisseria gonorrhoeae*, 1481–1482
    patterns of, 1414, 1414t
  to antiretroviral therapy, 1800
  bacterial, and otitis media, 3425
  in equation of motion, 592–593
  generalized, to glucocorticoids, 2968
  IVIG, 1315, 1316t
  pulmonary vascular, 942
  steroid, in nephrotic syndrome, 2758
  to thyroid hormone, 2928, 2934

Resorption, filtered bicarbonate, in proximal tubules, 412f

Resource-based outcome measure, 521

Resources
  for information on childcare, 167t
  of pediatric emergency care, 524b

Respiration
  failure to initiate or sustain, 926
  paradoxical, 555
Respiratory acidosis, 414t, 422–423
causes of, 423b

Respiratory alkalosis, 414t, 423–425
causes of, 424b

Respiratory depression, 927

Respiratory disease, 196
acute, in adenoviruses infection, 1740
diagnostic approach to, 2150–2161
airway visualization and lung specimen-based diagnostic tests, 2159–2161
blood gas analysis, 2150–2154
examination of lung secretions, 2159
exercise testing, 2159
history of, 2150
laryngoscopy, 2159–2161
microbiome, 2159
physical examination of, 2150
pulmonary function testing, 2155–2159
radiographic techniques for, 2154–2155
transillumination of the chest, 2154

in newborn, 911t
and sports participation, 3680t–3683t

Respiratory distress, 583–586, Respiratory failure
in acutely ill child, 528
cardiovascular disease manifesting as, 584, 585b
clinical examination in, 588
critically ill neonate with cyanosis, 2395–2396
definition of, 583
as delivery room emergency, 928
localizing signs for pulmonary pathology in, 584t
management of, 589–591
monitoring a child in, 588–589
neurologic disease manifesting as, 585
nonpulmonary causes of, 585t
other nonpulmonary entities manifesting as, 585–586
respiratory disease manifesting as, 584
in severe malaria, 1861
toxic metabolic states manifesting as, 585
treatment of, 533–537
without respiratory disease, 584–586

Respiratory distress syndrome (RDS)
clinical manifestations of, 932–933, 933f
complications of, 936
diagnosis of, 933–934
etiology and pathophysiology, 932
incidence of, 932
pharmacotherapies for, 935–936
prevention of, 934
treatment of, 934–936

Respiratory failure, 586–588
anatomic sites of lesions causing, 584t
definition of, 583
as delivery room emergency, 926
diffusion in, 587–588
hypercarbic, 586–587
hypoxic, 586–587
management of, 589–591
monitoring a child in, 588–589
acid-base abnormalities in, 588–589
assessment of oxygenation and ventilation deficits in, 589
blood gas abnormalities in, 588
clinical examination as, 588
pathophysiology of, 586–588
treatment of, 533–537
ventilation-perfusion mismatch in, 587

Respiratory impairment, in muscular dystrophy, 3258t–3259t

Respiratory manifestations
of cancer, 2635t
of enterovirus infections, 1693
in food allergy, 1238–1240

Respiratory mechanics, monitoring, 599–600
Respiratory patterns, in neurologic disease, 586t

Respiratory (“atypical”) presentations, as complications of GERD, 1938

Respiratory support, modalities for, 2329–2330
   invasive positive pressure ventilation in, 2329–2330
   optimal ventilator support in, 2330

Respiratory syncytial virus (RSV), 1734–1737
   antiviral therapies, 1666t
   bronchiolitis and, 2217
   clinical manifestations of, 1736
   in common cold, 2185
   diagnosis of, 1736
   epidemiology of, 1735
   etiology of, 1734–1735
   passive immunoprophylaxis for, 1737
   pathogenesis of, 1735–1736
   pneumonia, 2270f
   prevention of, 1737
   prognosis of, 1737
   treatment of, 1736–1737
   vaccine for, 1737

Respiratory syndrome
   delayed-onset, anthrax, plague, tularemia and ricin, 3809–3810
   sudden-onset, chlorine, phosgene and cyanide, 3809

Respiratory system
   chronic/recurrent symptoms in, 2161–2166
   complications of cystic fibrosis and, 2282t
   cultures, 1337
   dynamic and static compliance of, 599–600
   dysfunction of
      criteria for, 574t
      fetal therapy for, 891t
      in shock, 579t
   morbidities of perinatal and neonatal illness, 867t
   secretions, pharmacologic approach to, 57t–59t
signs of poisoning, 492t

**Respiratory tract disorders, 929–949**

- apnea, 930–932
- aspiration of foreign material, 941
- cystic fibrosis, 2286
- diaphragmatic hernia, 944–946, 946f
- and differential diagnosis of asthma, 1190b
- eventration of diaphragm, 947
- extrapulmonary air leaks, 947–948
- foramen of Morgani hernia, 946–947
- meconium aspiration, 941–942, 942f
- *Mycoplasma pneumoniae*, 1609–1610
- paraesophageal hernia, 947
- patent ductus arteriosus, 940–941
- persistent pulmonary hypertension of newborn, 942–944, 943f
- pulmonary hemorrhage, 948–949
- RDS, 932–936
- signs and symptoms, 929, 930f
- transient tachypnea of newborn, 941
- transition to pulmonary respiration, 929–930

**Respiratory tract infections**

- antivirals for, 1668–1669
  - amantadine and rimantadine, 1668
  - oseltamivir, zanamivir, and peramivir, 1668–1669
  - ribavirin, 1668
- coronaviruses, 1743–1744
- diphtheria, 1459–1460, 1459f–1460f
- in HIV, 1786
  - *Staphylococcus aureus*, 1431
- viruses, multiplex assays for, 1341t

**Response, in nephrotic syndrome, 2758**

**Responsive neurostimulation (RNS), in epilepsy surgery, 3110**

**Restless legs syndrome, 180, 180b, 3127**

**Restraint methods, 82t**
Restrictive cardiomyopathy, 2470–2471
  clinical manifestations of, 2470
  diagnosis of, 2470
  echocardiogram of, 2466f
  etiology and epidemiology of, 2470
  etiology of, 2463t
  pathogenesis of, 2470
  prognosis and management of, 2470–2471

Restrictive dermopathy, 830t–831t

Resuscitation
  equipment, 515, 516t
  fluid, for burns, 618–619
  initial, in drowning, 610
  neonatal, 925–929, 926f–927f
  in palliative care, 55

Retentive encopresis, 1959–1960

Reticular dysgenesis, 1116t, 2577

Reticulocyte index, 2527–2528

Reticuloendothelial sequestration, neutropenia secondary to, 1144

Retina, zones of, 3378f

Retinal disorders
  Best vitelliform degeneration, 3381
  blood disorders, 3384
  cherry-red spot, 3381, 3381f
  Coats disease, 3382, 3382f
  coloboma of fundus, 3384–3385
  diabetic retinopathy, 3383, 3383f
  familial exudative vitreoretinopathy, 3382–3383
  hypertensive retinopathy, 3383, 3383f
  myelinated nerve fibers, 3384
  persistent fetal vasculature, 3379
  phakomas, 3382
retinal detachment, 3382
retinitis pigmentosa, 3380–3381, 3381f
retinoblastoma, 3379–3380, 3380f
retinopathy
  of prematurity, 3377–3379
  in sickle cell anemia, 2550
  trauma-related, 3384
retinoschisis, 3382
Stargardt disease, 3381
subacute bacterial endocarditis, 3384

Retinal hamartoma, 3145f

Retinal hemorrhage, 104, 104f, 3396f
  birth-related, 3342
  due to child abuse, 3396

Retinitis pigmentosa, 3380–3381, 3381f

Retinoblastoma, 2697–2698, 3379–3380, 3380f
  clinical manifestations of, 2697, 3379
  diagnosis of, 2698, 2698f, 3379–3380
  differential diagnosis of, 2698
  epidemiology of, 2697
  familial, 2631
  pathogenesis of, 2697
  prognosis of, 2698
  screening of, 2697
  treatment of, 2698, 3380

Retinoic acid, 362
  all-trans, 2655

Retinoic acid embryopathy, 987t

Retinoids, for acne, 3577–3578

Retinol
  low plasma levels, inflammation-caused, 361–362
  structure of, 361f–362f

Retinopathy
diabetic, 3383, 3383f
exudative (Coats disease), 3382, 3382f
hypertensive, 3383, 3383f
malaria, 1860–1861
in sickle cell anemia, 2550
stellate macular, in cat-scratch disease, 1543

Retinopathy of prematurity, 3377–3379, 3378f, 3379b
classification of, 3377
clinical manifestations and prognosis of, 3377–3378
diagnosis of, 3378
pathogenesis of, 3377

Retinoschisis, 3382
Retractile testes, 2827
Retractions
eardrum, 3399
eyelid, 3361

Retrocaval ureter, 2805
Retrocochlear hearing loss, 3401
Retrograde urethrogram, 2810
Retropharyngeal abscess, 2197–2198
Retropharyngeal space infection, 2200
Rett syndrome, 3192–3194

Return to play
contraindications, after cervical spine injury, 3704t
graduated, after TBI, 3702t
transition from immediate management to, 3686

Reverse cholesterol transport, high-density lipoprotein and, 754
Reverse sequence screening for syphilis, 1088, 1089f
Reverse transcriptase inhibitors
nonnucleoside, 1788–1798, 1789t–1798t
Reverse transport, critically ill newborn, 910
Reversible cerebral vasoconstriction syndrome, characteristics of, 3221t
Reversible infantile cytochrome C oxidase deficiency myopathy, 3176
Revised pediatric emergency assessment tool, 522–523, 522b
Revised World Health Organization Classification of Lymphoid Neoplasms, 2657
Reye syndrome, 2126, 3178
    clinical staging of, 2126t
    diseases that present a clinical or pathologic picture resembling, 2126t
Rh deficiency syndrome, 2538
Rh incompatibility, hemolytic disease of newborn caused by, 967–970
Rh sensitization, prevention of, 970
Rhabdoid tumor, of kidney, 2685
Rhabdomyolysis, 2749, 3246
    causes of, 3250t
    conditions associated with, 3250f
    episodes of, inherited neuromuscular disorders associated with, 3251t
    statin-induced, with myoglobinuria, 3296
    in toxicologic diagnosis, 494b
    triggers of, 3252f
Rhabdomyomas, 2475–2476, 2475f
Rhabdomyosarcomas, 2216, 2636, 2685–2688, 2687f, 2852
    clinical manifestations of, 2686–2687
    comparative features of, 2686t
    diagnosis of, 2687–2688
    in ear, 3437
    epidemiology of, 2685–2686
    genetic disorders associated with, 2686t
    pathogenesis of, 2686
    prognosis of, 2688
Rheumatic disease, in differential diagnosis of Kawasaki disease, \textit{1315b}

**Rheumatic disease: suspected**

- autoantibody specificity and disease associations, \textit{1250t}
- diagnosis, evaluation based on, \textit{1250t –1251t}
- erythrocyte sedimentation rate and C-reactive protein, \textit{1251t}
- evaluation, \textit{1248–1252}
- imaging studies, \textit{1252}
- laboratory testing, \textit{1249–1252}
- signs suggestive of, \textit{1248–1249}
- symptoms suggestive of, \textit{1248}

**Rheumatic disease: treatment, \textit{1252–1258}**

**Biologic drugs**
- B cell depletion, \textit{1257}
- IL-1 antagonists, \textit{1257}
- IL-6 receptor antagonist, \textit{1257}
- IVIG, \textit{1257}
- modulator of T cell activation, \textit{1257}
- TNF-α antagonists, \textit{1256–1257}

**Cytotoxics**
- azathioprine, \textit{1258}
- cyclophosphamide, \textit{1257–1258}

**Nonbiologic drugs**
- glucocorticoids, \textit{1256}
- hydroxychloroquine, \textit{1256}
- leflunomide, \textit{1256}
- methotrexate, \textit{1253–1256}
- mycophenolate mofetil, \textit{1256}
- sulfasalazine, \textit{1256}

**NSAIDs, \textit{1253}**

- rheumatology teams and primary care physicians, \textit{1252 , 1253t}

**Rheumatic fever, \textit{1445–1450}**

- chemoprophylaxis for, \textit{1449t}
- clinical manifestations and diagnosis of, \textit{1446–1448 , 1446t}
- complications of, \textit{1449}
- epidemiology of, \textit{1445–1446}
etiology of, 1441
major criteria, 1447
carditis, 1447
chorea, 1447
erythema marginatum, 1447
migratory polyarthritis, 1447
subcutaneous nodules, 1447
minor criteria, 1448
differential diagnosis of, 1448, 1448
recent GAS infection, 1448
pathogenesis of, 1446
prevention of, 1449–1450
prognosis of, 1449
treatment of, 1448–1449
antibiotic, 1448
antiinflammatory, 1448–1449
Sydenham chorea, 1449

Rheumatic heart disease
aortic insufficiency, 2460
mitral insufficiency, 2458–2459
mitral stenosis, 2459–2460
pulmonary valve disease, 2460
tricuspid valve disease, 2460

Rheumatic valvulitis, echocardiographic findings in, 2458t

Rheumatologic arthritis, and sports participation, 3680t–3683t

Rhinitis
allergic, 1179–1185
in asthma, 1198

Rhinitis medicamentosa, 1180

Rhinocerebral infection, mucormycosis, 1660–1661

Rhinorrhea
in common cold, 2187–2188
respiratory syncytial virus (RSV) and, 1736

Rhinosinusitis
bacterial, 2190f
cystic fibrosis and, 2297

Rhinoviruses, 1741–1742
  clinical manifestations of, 1742
  complications of, 1742
  diagnosis of, 1742
  epidemiology of, 1741–1742
  etiology of, 1741
  pathogenesis of, 1742
  prevention of, 1742
  treatment of, 1742
Rhizomelic chondrodysplasia punctata, 747, 747f
Rhizotomy, selective dorsal, 3173f, 3762
Rhododendron toxicity, 509t
RhoH deficiency, 1114t
Rhombencephalosynapsis, in brainstem and cerebellar disorders, 3073
Rhus dermatitis, 3493
Rhythm, electrocardiography, 2356
Rhythmic movements, sleep-related, 181
Rib fractures, 552
  hemothorax and, 2322f
Ribavirin, 1668
  for bronchiolitis, 1736
  for hepatitis C, 2116
  for parainfluenza viruses, 1734
Riboflavin (vitamin B₂)
  deficiency, 366–368
  dietary reference intake, 310t–316t
  dietary sources, 367t–368t
  for migraine, 3135t–3136t
  supplements, 511t
Riboflavin transporter deficiency, 3099
Ribonucleic acid (RNA)
  flow of information from DNA to, 636f
  messenger, 635–636
  site of action of anticancer drugs, 2642f
Ribose-5-phosphate isomerase deficiency, 797
Ribosomopathy, 2510
Ribs, wavy, hypophosphatasia, 3748f
Richner-Hanhart syndrome, 699–700, 3517
Ricin, delayed-onset respiratory syndrome, 3809–3810

Rickets, 375–379, 377f
associated with renal tubular acidosis, 2766
autosomal dominant hypophosphatemic, 382
autosomal recessive hypophosphatemic, 382
calcium-deficient or phosphate-deficient, 3747
clinical features of, 377b
clinical variants and related conditions, 3747t–3748t
hereditary hypophosphatemic, with hypercalciuria, 382–383
hypophosphatemic, with hypercalciuria, 409
of prematurity, 383–384
risk factors for nutritional, 379b
vitamin D-dependent
dental or oral findings associated with, 1914t
type 1, 381
type 2, 381
X-linked hypophosphatemic, 382

*Rickettsia*

*R. akari*, 1627
*R. conorii*, 1626–1627, 1626f
*R. prowazekii*, 1630
*R. rickettsii*, 1622–1626
*R. typhi*, 1629–1630

Rickettsial infection
associated with hemophagocytic syndrome, 2708t
as causes of infectious pneumonia, 2268t
ehrlichiosis and anaplasmosis, 1630–1633
Q fever (*Coxiella burnetii*), 1633–1635
scrub typhus (*Orientia tsutsugamushi*), 1627–1628
spotted fever group rickettsioses, 1619–1627, 1620t
flea-borne spotted fever, 1627
Mediterranean spotted fever or boutonneuse fever, 1626–1627
rickettsialpox (*Rickettsia akari*), 1627
Rocky Mountain spotted fever, 1622–1626
typhus group rickettsioses, 1628–1630
epidemic (louse-borne) typhus, 1630
murine (endemic or flea-borne) typhus, 1629–1630

Rickettsialpox, 1620

Rickettsioses
  spotted fever group, 1619–1627, 1620
  typhus group, 1628–1630

Ridley-Jopling scale, 1583

Rifabutin, 1429
  against *M. tuberculosis*, 1560–1561

Rifampin, 1429
  for Hansen disease, 1585
  against *M. tuberculosis*, 1560–1561

Rifamycins, against *M. tuberculosis*, 1560–1562

Rifapentine, against *M. tuberculosis*, 1560–1561

Rifaximin, 1429

Rift Valley fever, 1766–1767, 1769

Riga-Fede disease, 1912

Right aortic arch, 2420–2421

Right middle lobe syndrome, 2278

Right to consent, by minors, 1033

Right ventricle
  double-chamber, 2386–2387
  double-outlet, 2404–2405
    with malposition of the great arteries, 2411
    without pulmonary stenosis, 2410–2411

Right ventricular hypertrophy, 2357, 2357f

Right-to-left shunt, in newborn, 911t

Rigid cavus feet, 3700

Rigid pes planus, 3700

Rigidity, 3058
Riley-Day syndrome, 3331, 3371f

Rimantadine, 1668

Ring chromosomes, 668

Ring sideroblast, 2526f

Ringworm, black-dot, 3561f

Risk adjustment
  in emergency medical services, 521–523
  tools, for ED, 522–523

Risk area, adolescent, 1019t–1020t

Risk factors
  for acute gastroenteritis, 2022t
  for acute mountain sickness, 602
  for adolescent health behaviors, 1029t
  for anaerobic bacterial infections, 1557t–1558t
  for arterial ischemic stroke, 3211t
  for *Bartonella*, 1541t
  for cerebral sinovenous thrombosis, 3214t
  for childhood cancers, 2629t
  for childhood injuries, 81–82
  for deformational plagiocephaly, 3082, 3082t
  for disruptive disorders, 238
  for hemorrhagic stroke, 3216t
  for high-altitude pulmonary edema, 605
  for hyperbilirubinemia development, 954t
  for Legionnaires disease, 1539–1540
  for osteoporosis, 3751b
  for persistent asthma, 1187b
  for poor outcome in active coccidioidomycosis, 1655t
  prenatal, for attachment, 129b
  for pulmonary embolism, 2309t
  for thrombosis, 2604t
  for UTIs, 2791t
Risk group

for neuroblastoma, 2679t
for pneumococcal infection, 1437t
for rhabdomyosarcoma, 2688t

Risk reduction, for SIDS, 2174–2175
Risk-adapted therapy, 2684
Risk-directed therapy, 2651

Risks

of adolescent pregnancy, for mother and child, 1076
of blood transfusions, 2586–2589
of tonsillectomy and adenoidectomy, 2202t

Risperidone

for aggressive behaviors, 240
for burn injuries, 621
for pain management, 474t
for psychosis and agitation, 194t

Risus sardonicus, 1550

Ritter disease, 3553–3554

Rituximab, 1257 , 1267t , 2640t , 2659 , 2665
for ITP, 2613

Rizatriptan, for migraine, 3135t–3136t

RNA, Ribonucleic acid

Road rash, 557

Robertsonian translocations, 665

Robinow syndrome, 2825

Rocky Mountain spotted fever, 1401t , 1620t , 1622–1626
clinical manifestations of, 1624 , 1624f
complications of, 1625
diagnosis of, 1624–1625
differential diagnosis of, 1625
epidemiology of, 1622–1623, 1622f
etiology of, 1622
laboratory findings of, 1624
pathology and pathogenesis of, 1623–1624, 1623f
prevention of, 1626
prognosis for, 1625–1626
supportive care in, 1625
transmission of, 1623, 1623f
treatment of, 1625

Rocuronium, 464

Rodent bites
  complications, 3817
  microorganisms associated with, 3818b

Roentgenogram, of swollen epiglottis, 2204f

Rogers syndrome, 2521

ROHHAD, Rapid-onset obesity with hypothalamic dysfunction, hypoventilation, and autonomic dysregulation

Romiplostim, to stimulate thrombopoiesis, 2613–2614

Rosai-Dorfman disease, 2626, 2706t, 2708–2710

Rosenthal fibers, 2669–2671

Roseola (human herpesviruses 6 and 7), 1723–1726
  clinical manifestations of, 1724, 1724f
  complications of, 1725
  diagnosis of, 1724–1725
  differential diagnosis of, 1725
  epidemiology of, 1723

Rumination disorder, 204–205
   differential diagnosis of, 205
epidemiology of, 205
etiology of, 205
treatment of, 205

Runaway children, 242
   among GLB youth, 1026
Running
  hyponatremia, 2892
  injuries associated with, 3714–3715

Ruptures
  anterior cruciate ligament, 3622–3623, 3623f
  sinus of Valsalva aneurysm, 2384
  splenic, 553f
  tunica albuginea, 2835f

Rural location, risk factor of childhood injuries, 82
Russell-Silver syndrome, 3475t–3476t
Ryanodine 1 (RYR1) mutation-related central core disease, 3267t

S
Sac, at base of umbilical cord, 976f
Saccadic intrusions, 3127
Saccular (cystic) bronchiectasis, 2279
Saccular cysts, 2209, 2210f
Sacral agenesis, 2816
SACRAL syndrome, 3149
Sacroccygeal teratoma, 2700f
Sacroccygeal tumors, 2698–2699
Sacroiliitis
  imaging of, 1271, 1271f
  sports-related, 3693
Safe zone of Ramsey, 3628f
Safety, 38–45
  culture, 40
  frameworks, 39
  in interfacility transport, 520–521
issues, with dietary supplements, 511
opportunities and gaps, 41–43
research and improvement, emerging areas of, 43–45

Salicylate
intoxication, 417, 860
poisoning, 496t–497t, 500

Salivary gland, diseases of, 1925–1926

Salmon patch (nevus simplex), 3454

Salmonella, 1496–1507
antibiotic therapy for, 2031t–2032t
bacterial gastroenteritis and, 2014t
enteric fever (typhoid fever), 1502–1507
nontyphoidal salmonellosis, 1496–1502
serotypes typhi or paratyphi infection, 1373t–1374t
transmission from reptiles and amphibians to humans, 1502t

Salmonellosis, nontyphoidal, 1496–1502
acute enteritis, 1500
bacteremia, 1500–1501, 1500f
chronic Salmonella carriage, 1501
complications of, 1501
diagnosis of, 1501
epidemiology of, 1496–1497
etiology of, 1496
extraintestinal focal infections, 1501
formation of Salmonella-containing vacuole, 1499f
pathogenesis of, 1497–1500, 1498f, 1500t
prevention of, 1502, 1502t
prognosis for, 1501–1502
treatment of, 1501, 1501t
virulence system of, 1498f

Salpingitis, 1617

Salt

cerebral salt wasting, 2892
depletion, cystic fibrosis and, 2297
loss, primary, 2890–2891
supplementation, for POTS, 571

Salter-Harris classification, of physeal fractures, 3665f , 3665t
Salt-wasting form, in 21-hydroxylase deficiency, 2971

Sampling
chorionic villus, 890
fetal blood, 885
mycobacterial, 1577–1578
percutaneous umbilical blood, 968

Sandhoff disease, 3189
Sandifer syndrome, 3125
Sanfilippo syndrome, 812f , 814
Sanitary facilities, improved, for acute gastroenteritis, 2032
Saprophytic (noninvasive) syndromes, 1647–1648
chronic pulmonary aspergillosis, 1647
otomycosis, 1648
pulmonary aspergilloma, 1647
sinusitis, 1647

α-Sarcoglycan, 3291
Sarcoglycanopathies, cardiac involvement in, 3260t –3261t
Sarcoidosis, 1306–1310 , 2248–2250
clinical manifestations of, 1307–1309 , 1307f –1309f , 1308t , 2249
diagnosis of, 1309
diagnostic laboratory testing for, 2249
differential diagnosis of, 1309
epidemiology of, 1307 , 2248–2249
etiology of, 1306–1307
histopathology for, 2249 , 2249f
laboratory findings of, 1309
pathogenesis of, 1307 , 2248–2249
pathology of, 1307
prognosis of, 1309–1310
radiology for, 2249–2250
treatment of, 1309, 2250

Sarcoidosis, CSF findings in, 3222–3223

Sarcolemma, 2343

Sarcoma botryoides, 2687, 2866

Sarcomas
  clear cell, of kidney, 2685
  nonrhabdomyosarcoma, 2688
  pancreatic, 2081
  rhabdomyosarcomas, 2685–2688

Sarcomere, 2343

Sarcoplasmic reticulum, 2343

Sarcoptes scabiei
  management guidelines, 1090
  mites, 3569

Sarcosinemia, 720

Saxagliptin, for T2DM, 3045

Scabies, 1373–1374, 3570–3574
  canine, 3573–3574
  clinical manifestations of, 3571–3572, 3571f–3572f, 3571t
  differential diagnosis of, 3572, 3572f
  drugs for, 1813t–1828t
  etiology and pathogenesis of, 3570
  management guidelines, 1090
  Norwegian, 3573
  treatment of, 3572–3573, 3573t

Scald burn, 614, 618

Scalp
  boggy granulomatous mass of, 3561f
fetal, blood sampling, 884
nevus sebaceus of, 3473f
rim moles, 3469f
vertex lesion of aplasia cutis congenita, 3457f

Scaphocephaly, in craniosynostosis, 3080–3081
Scapuloperoneal SMA, 3317
Scarf sign, 3057–3058
Scarlet fever, 1441–1442, 1442f
Scarring, in recessive dystrophic epidermolysis bullosa, 3488f

Scars
   acne, treatment for, 3581f
   of chorioretinitis, 3376f

Schatzki ring, 1932

Schedules
   feeding, during age 0-2 months, 133–134
   for hepatitis B vaccine, 2114t–2115t
       pneumococcal vaccination, for persons with cochlear implants, 3411t

Scheie disease, 812–813
Scheuermann kyphosis, 3641–3642
Schimke immunoosseous dysplasia, 2577
Schindler disease, 775
Schirmer test, for Sjögren syndrome, 1291

Schistosoma, 1890–1892
   life cycle of, 1891f

Schistosomiasis, 1890–1892
   clinical manifestations of, 1891
   diagnosis of, 1891
   drugs for, 1813t–1828t
   epidemiology of, 1890
   etiology of, 1890
pathogenesis of, 1890–1891
prevention of, 1892
treatment of, 1891–1892

Schizencephaly, 3069, 3069f

Schizophrenia spectrum disorder
  assessment, 249
  clinical course, 245–246
  comorbidity, 246
  description, 244–245
  differential diagnosis of, 246
  epidemiology of, 245
  etiology and risk factors, 246–247
  neuroanatomic abnormalities, 247–248
  pharmacotherapy, 249–250
  prevention, 248–249
  screening/case finding, 249
  sequelae, 246
  treatment of, 249–250

Schizophréniform disorder, 245b

Schmid metaphyseal dysplasia, 3723, 3725f

School reentry program, after burn injuries, 621

School refusal, 211–212

School stressors, as risk factor for somatization, 203

School violence, 87–88, 1036
  epidemiology of, 87–88
  risk factors for, 88
  treatment and prevention of, 88

School-age children
  BEARS sleep screening algorithm, 183t
  drowning in, 608
  neurodevelopmental function and dysfunction, 253–261
  responses to death, 170
School-based intervention, for problem behaviors, 238–239

Schools

  adolescent, 1019t–1020t
  elementary, success in, 149t
  issues, anxiety, 217
  in palliative care, 53
  suicide screening for, 228

Schwartz-Jampel disease, 3287–3288, 3296–3298

SCID, Severe combined immunodeficiency

Scimitar syndrome, 2224

Scintigraphy

  radionuclide, in evaluation of esophagus, 1928–1929
  renal, 2803

Scleredema, 3520

Scleredema adulterum, 3520

Scleredema of Buschke, 3520

Sclerema neonatorum, 3533–3534

Sclerocornea, 3369

Sclerodactyly, 1287f

Scleroderma, 1285–1289

  diagnosis of, 1288
  differential diagnosis of, 1288–1289
  epidemiology of, 1285
  etiology and pathogenesis, 1285
  evaluation based on suspected diagnosis, 1250t–1251t
  laboratory findings, 1289
  localized (morphea), 1285
    clinical manifestations of, 1285–1288
  Raynaud phenomenon, 1287–1288, 1288f
  systemic, 1285
    clinical manifestations of, 1286–1287
    provisional criteria, 1286b
severity scale, 1287t

Sclerosing cholangitis, 2120

Sclerosis, 2717

Scoliosis
  in adolescents, 1035
  compensatory, 3639–3640
  congenital, 3637–3639
  idiopathic, 3633–3637
  neuromuscular, 3639–3640, 3639f
  problems due to arthrogryposis, 3662

Scombroid (histamine), food-borne noninfectious illnesses and, 2018t

Scombroid fish
  foodborne illness, 3776t –3777t
  poisoning, 3805, 3805f

Scorbutic rosary, 374f

Scorpion stings, 3826

Screen for Child Anxiety Related Emotional Disorders (SCARED), 186

Screening
  adolescent
    Bright Futures guidelines, 1031t
    interviewing, 1034
  for blood lead level, 3799, 3799t –3800t
  for bullying, 88
  for cervical cancer, 2866–2867
  hearing, 3404–3405, 3406f
  for hepatitis C, 2116
  for HPV, 2866
  laboratory clues in toxicologic diagnosis, 494b
  neonatal, e 2–e 4
  newborn, 873
  pGALS, 3593f
  prenatal, 634
of meningomyelocele, 3765
pulmonary and asthma, in sickle cell anemia, 2550
questionnaires, Pediatric Symptom Checklist, 2817
for STIs, 1083
for substance abuse disorders, 1041
in well-child care, 75–78

Screening cultures, 1338
Screening profiles, e 4 , e 5t
Screening tests
    anger/aggression-specific instruments, 239t
    for B cell defects, 1097–1103
    immunologic, for recurrent infections, 1101b
    for infectious diseases, 68b
    international adoptees, 63b
    vision, 3342t
Scrofula, 1572–1573 , 1572f–1573f
Scrofuloderma, 3557–3558
Scrotal contents, disorders and anomalies, 2827–2833
    epididymitis, 2831
    hydrocele, 2832–2833
    spermatocele, 2832
    swelling, 2828–2830
    testicular torsion, 2830–2831
    torsion of appendix testis, 2831
    undescended testis, 2827–2828
    varicocele, 2831–2832
Scrotal orchiopexy, 2830
Scrotal swelling, 2828–2830 , 2829t
    clinical manifestations of, 2828–2830
    differential diagnosis of, 2830t
    laboratory findings and diagnosis of, 2830 , 2830f
Scrotal tongue, 1925
Scrotum

- acute inguinal-scrotal swelling in, 2066–2069
- examination, in adolescents, 1035
- hypospadias, 2822
- ultrasonographic assessment, 889

Scrub typhus (Orientia tsutsugamushi), 1620t, 1627–1628

- clinical manifestations and laboratory findings of, 1628
- complications of, 1628
- diagnosis and differential diagnosis of, 1628
- epidemiology of, 1627–1628
- etiology of, 1627
- pathology and pathogenesis of, 1628
- prevention of, 1628
- transmission of, 1628
- treatment and supportive care in, 1628

Scurvy, 373, 374f, 3589

Seabather's eruption, 3575–3576

Seafood poisoning, 3804–3806

- amnesic shellfish, 3806
- azaspiracid, 3806
- ciguatera fish, 3804–3805
- diarrhetic shellfish, 3806
- neurotoxic shellfish, 3805–3806
- paralytic shellfish, 3805
- pufferfish, 3806
- scombroid fish, 3805, 3805f

Sealant, dental, 1921

- treatment of, 3632, 3633f

Slipped vertebral apophysis, 3645–3646

Slit-lamp eye examination, 1268f, 3344
- in sarcoidosis, 1309

Slow-wave sleep (SWS), 173

SLURP-1, gene, 3516

Sly syndrome, 814–815

SMA with progressive myoclonic epilepsy (SMAPME), 3317

Small bowel
- immunoproliferative disease, 2002
- obstruction, 1910f
- primary carcinoma of, 2063
- structure and function of, 1946
- transplantation surgery, 2010f

Small fiber polyneuropathy, 1330

Small gonads, in male-appearing genitalia, 3011t

Small intestinal bacterial overgrowth, chronic diarrhea and, 2035

Small intestine
- movement of $Na^+$ and $Cl^-$, 2024f
- obstruction in, 1905t

Small round blue cell tumors, 2678

Small-for-gestational-age infants, 906–907
- hypoglycemia in, 850–852
Smallpox
delayed-onset dermatologic syndrome, 3810
diagnosis of, 3810
treatment of, 3811t–3812t
vaccine, 1350t

Smith-Lemli-Opitz syndrome (SLOS), 760–761, 761b, 3018

Smokeless tobacco, 1050

Smoking
by adolescents, 1029t, 1049–1051
and anti-glomerular basement membrane disease, 2262
bronchitis and, 2221
cessation, 1051t
as goitrogen, 2927t
marijuana, 1051–1052, 1052f
SIDS risk factors and, 2170
as susceptibility factor for porphyria cutanea tarda, 842

Smooth muscle, hamartoma, 3473–3474, 3474f

SMR, Sexual Maturity Rating

Snake bites, 3822–3825
disposition, 3824–3825
management, 3822–3824
severity score, 3824t
venoms and effects, 3822

Snapping hip syndrome, 3695

Snellen acuity chart, 3343

Snow sports, skiing and snowboarding-related injuries, 3713–3714

Snowboarding, injuries associated with, 3713–3714

SNPs, Single-nucleotide polymorphisms

Soaps, bath, 3451

Soccer, injuries associated with, 3713
Social behaviors, and language, 279
Social cognition, 255
Social communication disorder, 276b
Social contagion, 3816
Social development
  in adolescent, 1014–1020
  in adoptive children, 64
  in middle childhood, 150–151
Social effectiveness therapy for children (SET-C), 211
Social factors, suicide and, 226
Social marketing, adolescent, 1019t–1020t
Social phobia, 211
Social skills program, 300
Social stratification, 9–10
Social support, in multiple trauma, 554
Socioeconomic factors, contributing to susceptibility to STIs, 1082b
Socioeconomic status
  and prevalence of otitis media, 3418
  risk factor of childhood injuries, 82
Sodium
  excretion, 392–393
  extracellular, 389
  hypernatremia, 393–394
  hyponatremia, 394–398
  metabolism, 392–393
  movement of in small intestine, 2024f
  reference intervals, e6t–e13t
  retention, during volume depletion, 392
  tubular transport, 2762
  urine, in differential diagnosis of hyponatremia, 2890t
Sodium bicarbonate
   for resuscitation and arrhythmias, 545t
   tablets, 2777
Sodium channel blockers
   mini-toxidromes, 494t
   poisoning, 497t
Sodium channel myotonias, 3297t
Sodium channel periodic paralysis, 3289t
Sodium dietary reference intake, 319t–320t
Sodium fluoride
   foodborne illness, 3776t–3777t
   food-borne noninfectious illnesses and, 2018t
Sodium methohexital, 463
Sodium nitroprusside
   for postresuscitation stabilization, 545t
   for severe hypertension in children, 2498t
Sodium retention, in refeeding syndrome, 342t
Sodium supplementation, for burns, 619
Sodium valproate, for migraine, 3136–3137
Sodium wasting, in CKD, 2775t
Sodoku, 3820
Soft tissue disease, nontuberculous mycobacteria infection and, 1588t, 1589
Soft tissue infections, 1007
   Aeromonas in, 1527
   anaerobic, 1558
   catheter-associated, 1411
Soft tissue injury, after cervical spine injury, 3703
Soft tissue mucormycosis, 1661
Soft tissue sarcomas, 2685–2689
nonrhabdomyosarcoma, 2688
rhabdomyosarcomas, 2685–2688

Softball, injuries associated with, 3711

Soil-transmitted helminths, 1879f

Solanine poisoning, 3804

Solar urticaria, 1223, 3499, 3499f

Solid tumors, 2640–2643

Solid-organ transplantation, 1408–1410, 1408t–1409t

Solitary left testis, 2829f

Solitary mastocytomas, 3523

Somatic cough disorder, 2163

Somatic development, 126

Somatic growth, 1014–1017
    in postnatal androgen excess, 2974

Somatic pain, 1909–1910

Somatic symptom and related disorders (SSRDs), 201

Somatic symptom disorder, 201–204, 201b
    assessment of, 203
    differential diagnoses, 203
    medical, 203
    psychosocial, 203
    epidemiology of, 201–202
    management of, 203–204
    risk factors, 202–203
    treatment of, 204
    treatment setting, 204

Somatomedin, 2876–2877

Somatosensory evoked potentials (SSEPs), 3063

Somnolence, 2643

Somogyi phenomenon, in T1DM, 3038
Sonic hedgehog pathway, 990–991
  adrenal cortex, 2954
  in medulloblastomas, 2675

Sorafenib, 2702

Sore throat, in common cold, 2188

Sotos syndrome, 2894–2895, 2896
  in corpus callosum, 3071
  in megalencephaly, 3079

Sounds
  bowel, in toxidromes, 493t
  heart, 2352
  respiratory, 2151t

Southeast Asian ovalocytosis (SAO), 2535–2536

Southeast Asian population
  cultural norms, 73t–74t
  disease beliefs, 74t

SOX9, 2988

Soy formulas, 325

Space-occupying lesions, as oncologic emergency, 2644t

Spacer devices, for asthma, 1204

Spasmodic croup, 2204

Spasms, 3111–3112

Spasmus nutans, 3358t, 3360
  that mimic seizures, 3127

Spastic diplegia, 3169, 3169t, 3170f

Spastic hemiplegia, 3168–3169

Spastic quadriplegia, 3169, 3169t

Spastic-ataxic syndrome, genetic and metabolic disorders that can cause, 3155t

Spasticity, 3058, 3760–3762
after spinal cord injury, 3759
Ashworth scale of, 3596
oral medications for, 3760–3762, 3761
α₂-adrenergic agents, 3760
GABAergic, 3760
peripherally acting calcium blockers, 3760–3762
surgical management of, 3762
botulinum toxin intramuscular injections, 3762
intrathecal baclofen, 3762
phenol perineural injections, 3762
selective dorsal rhizotomy, 3762
traumatic brain injury and, 3755

Spatula test, in tetanus, 1551
Spear tackler's spine, 3703
Special healthcare needs (SHCN), 1035
Special needs children
childcare and, 164–166
girls, gynecologic care for, 2872–2874

Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), 331

Specialized growth charts, 154
Specific granule deficiency, 1134–1135
Specific language impairment, 275–276
Specific learning disorder, 253
Specificity, e 1–e 2, 160–161
Specified/unspecified somatic symptom disorders, 202b
Specimens
collection, for diagnostic microbiology, 1335
viral infections, 1339–1340

Speckled lentiginous nevus, 3471
Spectrin mutations, in hereditary spherocytosis, 2531
Speculum, in pelvic examination, 2844
Speech
with cleft palate, 1916
evaluation, 279
motor speech disorders, 278
screening, 279
therapy, 279–280
Speech sound disorder, 276
Speech-recognition threshold, 3407
Spelling impairment, 257
Spells
breath-holding, 240–241
management of, 241
cyanotic, 241
pallid, 241
Spermatic cord torsion
diagnosis of, 2830
etiology of, 2830
treatment of, 2830–2831
Spermatocele, 2832
Spermicides, 1065t –1066t, 1073
Spherocytosis, hereditary, 2530–2534
Sphingolipid degradation pathway, 3188
Sphingolipidoses, 3187–3190, 3188
associated with neuropathy, 3329t –3330t
gangliosidoses, 3188–3189
Krabbe disease, 3189
metachromatic leukodystrophy, 3190
Spider angiomas, 2086–2087, 3467, 3468
Spider bites, 3825–3826
necrotizing spider, 3825
neurotoxic spiders, 3825
Spiders, 3569t

Spielmeyer-Vogt disease, 3191

Spina bifida, Meningomyelocele

Spina bifida occulta, 2816, 3064–3065, 3065f–3066f, 3065t

Spinal arteriovenous malformations, 3243–3244, 3244f

Spinal cord compression, 2680–2681
  as oncologic emergency, 2644t

Spinal cord disorders, 3238–3244
  diastematomyelia in, 3240–3241, 3240f
  spinal arteriovenous malformations in, 3243–3244
  syringomyelia in, 3241–3242
  tethered cord in, 3238–3240, 3239f
    secondary to lipomeningocele, 2816f
  tumors in, 3242–3243, 3242f

Spinal cord embolism, 3215

Spinal cord injuries, 554–556, 2335–2336
  ASIA flow sheet, 3756f
  during birth, 923–924
  causing autonomic dysreflexia, 3755–3759, 3757b
  clearing the cervical spine in, 555, 555f
  clinical manifestations of, 555, 3755–3759
  complication of cervical trauma, 3704
  epidemiology of, 2335
  functional outcomes at one year after, 3759t–3760t
  management of, 2336
  pathophysiology of, 2336
  prevention of, 556
  prognosis of, 3759
  treatment of, 555–556, 556f

Spinal cord injury without radiographic abnormalities (SCIWORA), 555

Spinal cord lesions
  associated with vascular processes, 3214–3215
in Guillain-Barré syndrome, 3335

**Spinal disorders, 3633–3646**
- back pain in children, 3642–3643, 3642b
- classification of, 3633b
- infection, 3645
- intervertebral disc herniation/slipped vertebral apophysis, 3645–3646
- kyphosis, 3640–3642
- scoliosis
  - compensatory, 3639–3640
  - congenital, 3637–3639
  - idiopathic, 3633–3637
  - neuromuscular, 3639–3640, 3639f
- spondylolysis and spondylolisthesis, 3643–3645, 3644f, 3693
- syndromes and genetic disorders, 3640
- tumors, 3646

**Spinal dysraphism, occult, 2815–2816**

**Spinal epidural abscess, CSF findings in, 3222t–3223t**

**Spinal muscular atrophies (SMA), 3310–3316**
- clinical classification of, 3311t
- clinical manifestations and course of, 3310–3313, 3311f
- diagnosis of, 3313–3314, 3314f
- etiology of, 3310
- 5q, differential diagnosis of, 3312t
- genetics of, 3314–3315, 3314f–3315f
- laboratory findings in, 3313, 3313f
- main forms of, not linked to SMN1, 3319t
- management of, 3315–3316, 3316t
  - therapeutic advances for, 3315–3316
- molecular genetic tests in, 3313t

**Spinal muscular atrophy, 3246f**

**Spinal paralytic poliomyelitis, 1684**

**Spinal shock, 555**

**Spindle and epithelioid cell nevus, 3471, 3471f**
Spine
changes in, causing hyperhidrosis, 3536b
component of pGALS screen, 3593f
congenital stenosis, 3703
injury to, during birth, 923–924
musculoskeletal pain syndrome, 1329t
normal spinal curvatures, 3633

Spinning-top deformity, 2818 , 2818f

Spinocerebellar ataxia (SCA), 3155 , 3156f
multiple sclerosis and, 3203t

Spiral CT, of large arteriovenous fistula, 2313f

Spiritual issues, and dealing with tragedies, 177

Spirochetal infection
Borrelia (relapsing fever), 1603–1604 , 1603f–1604f
Leptospira , 1601–1603
Lyme disease (Borrelia burgdorferi) , 1604–1609
Nonvenereal treponemal infections, 1599–1601
bejel (Treponema pallidum endemicum) , 1601
pinta (Treponema carateum) , 1601
yaws (Treponema pertenue) , 1600–1601

Spirometer, 2158

Spirometry, in asthma, 1189–1191 , 1191f

Spironolactone, for heart failure, 2479 , 2480t

Spitz nevus, 3471 , 3471f

Spleen
anatomy and function of, 2619
dysfunction, diagnostic techniques for, 2621t
enlarged, and sports participation, 3680t–3683t
palpation, in sickle cell anemia, 2549

Splenectomy, 2622
for β-thalassemia, 2557
for hereditary spherocytosis, 2534
Splenic cysts, 2619
Splenic sequestration, in sickle cell anemia, 2543
Splenic trauma, 2621–2622
Splenomegaly, 2619–2620
  clinical manifestations of, 2619
  differential diagnosis of, 2619–2620, 2620t
    congestive splenomegaly, 2619–2620

Stereo-EEG, in epilepsy surgery, 3110

Stereotype threat, 17–18

Stereotypic movement disorder, 209–210
  clinical course, 209
  comorbidity, 209
  definition of, 209
  differential diagnosis of, 209
  epidemiology of, 209
  etiology of, 209
  treatment of, 209

Stereotypies, 207t, 3126
  characteristics of, 3150t

Sterile pyuria, 2792

Sternal clefts, 2327

Sternal malformations, in Turner syndrome, 3003
Steroid
  adrenal, biosynthesis of, 2954–2956
  adrenal androgen actions, 2958
  glucocorticoid actions, 2957
  mineralocorticoid actions, 2958

Steroid 5α-reductase deficiency (SRD), 804–805, 3016

Steroid resistance, in nephrotic syndrome, 2758

Steroid-hormone induced myopathy, 3295–3296

Steroidogenesis, inborn defects of, 2959

Steroidogenic factor-1, overexpression of, 2980, 2980t

Steroids
  affecting growth after renal transplantation, 2784
  anabolic-androgenic, 3708–3709, 3709t

Stevens-Johnson syndrome (SJS), 1245–1246, 3482–3483
  associated with Mycoplasma pneumoniae infection, 1610
  clinical manifestations of, 3483, 3483f
  differential diagnosis of, 3483
  etiology of, 3482–3483
  pathogenesis of, 3483
  toxic epidermal necrolysis, 3449t
  treatment of, 3483

Stickler syndrome, 911t, 1917
  dysplasia, 3723, 3723b, 3724f

Stiff baby syndrome, 3124–3125

Stiff-Person syndrome, 3051

Stigma
  management of, 1022
  regarding GLB youth, 1025

Stillborn, 22

Stimson maneuver, 3689
Stimulant
  abuse of, 1045
  for ADHD, 190 – 191
  for aggressive behaviors, 240
  cardiac evaluation of children receiving, 266
  side effects, 189

Stimulus-precipitated seizures, 3120
STING-associated vasculopathy with onset in infancy, 1303
Stingers, peripheral nerve injuries, 3703
Stitch, for laceration, 557

Stomach
  bezoars, 1967–1969
  congenital anomalies of, 1946–1950, 1948
    congenital gastric outlet obstruction, 1948–1949
    gastric duplication, 1949
    gastric volvulus, 1949
    hypertrophic gastropathy, 1949–1950
    hypertrophic pyloric stenosis, 1946–1948
  eosinophilic gastroenteritis as, 1987
  fetal, ultrasonographic assessment, 890
    full, 459–460
    normal development of, 1945–1946
    obstruction in, 1905
  Stomatitis, aphthous, 3548, 3548
    in PFAPA, 1303–1304

Stomatocytosis
  acquired, 2538
  hereditary, 2536–2538, 2537

Stones
  calcium, 2836
  cholesterol gallstones, 2140
  formation, 2835–2836
prevention, 2839–2840
size and location vs. surgical treatment, 2839

Stool osmolar gap, 2038

Stools
Bristol Stool Chart, 2818f
in cholera, 1517f
color card for, 2098f
in constipation, 1906–1907
microscopy of, in evaluation for intestinal protozoa, 2028
number, color, and consistency of, 1901
in pediatric ulcerative colitis activity index, 1980

Stoplight zone system, for asthma, 1194–1196

Storage diseases
in differential diagnosis of splenomegaly, 2620t
glycogen, 860, 1146
lipid, 1130
neonatal iron, 2094, 2105

Storms, drowning during, 609

Strabismus, 3056, 3353–3357
3rd nerve palsy, 3356
4th nerve palsy, 3356
6th nerve palsy, 3356–3357
clinical manifestations and treatment of, 3354–3357
comitant, 3354–3356
diagnosis of, 3353–3354
noncomitant, 3356

Strabismus syndromes, 3357
Brown syndrome, 3357, 3357f
Duane syndrome, 3357
Möbius syndrome, 3357
monocular elevation deficiency, 3357, 3357f
Parinaud syndrome, 3357
Straddle injuries, 2852, 2852f

Strains, 3685
  lumbar, acute, 3693

Stranger rape, 1078b, 1079

Strawberry tongue
  in Kawasaki disease, 1311f
  in scarlet fever, 1442f

Strength
  in motor examination, 3058
  training, for children with disabilities, 3771t

Strengthening of strengths, 260–261

*Streptobacillus moniliformis*, 3820

Streptococcal infection
  group A, 1440–1450
    pharyngitis, 2194
    rheumatic fever, 1445–1450
  group A β-hemolytic
    in acute poststreptococcal glomerulonephritis, 2722–2723
    in impetigo, 3549
  group B, 999t, 1450–1455
    intrapartum prophylaxis, 1004t
  groups C and G streptococci, 1455
  Lancefield grouping, 1455t
  non-group A or B streptococci, 1455–1456
  pharyngitis, 1373t–1374t
  viridans group, native valve endocarditis caused by, 2455t–2456t
  vulvovaginal, 2847t

*Streptococcus dysgalactiae* subspecies *equisimilis*, 1455

*Streptococcus pneumoniae*, 1436–1440

*Streptococcus pneumoniae* infection
  acute bacterial meningitis, beyond the neonatal period, 3224, 3232
  clinical manifestations of, 1438, 1438f
  diagnosis of, 1438
epidemiology of, 1437
etiology of, 1436–1437
pathogenesis of, 1437–1438
prevention of, 1439
prognosis of, 1439–1440
treatment of, 1438–1439
vulvovaginal infection, 2847

*Streptococcus pyogenes*
  in cellulitis, 3550
  vulvovaginal infection, 2847

Streptogramins, 1429
Streptomycin, 3815

Stress fractures
  calcaneal, 3700
  in gymnastics, 3715
  lower leg, 3697–3698
  metatarsal, 3699–3700
  in running, 3714–3715

Stress reactions, in children exposed to war, 94b
Stress ulceration, 1972
Stress-produced hyperglycemia, 3029
Stretch marks, 3517, 3518
Stretch syncope, 3122–3123
Striae cutis distensae, 3517, 3518
Striate palmar xanthomata, 755f
Stricture
  esophagus, 1938
  urethral, 2810

Stridor, 2150
  in acutely ill child, 528
  GERD and, 1938–1939
Stroke, 3209–3218
- arterial ischemic, 3209–3212, 3210f, 3211t
- cerebral sinovenous thrombosis in, 3213–3214, 3214f, 3214t
- heat, 3705, 3706f
- hemorrhagic, 3215–3217, 3216f–3217f, 3216t
- metabolic, 716
- in progeria, 828
- spinal cord lesions associated with vascular processes in, 3214–3215
- stroke-like events, differential diagnosis of, 3217–3218, 3218t
- thrombosis related, 2604

Stroke-like events, differential diagnosis of, 3217–3218, 3218t

Strongyloides stercoralis, 1883–1884, 1883f–1884f

Strongyloidiasis, 1883–1884, 1883f–1884f
- drugs for, 1813t–1828t

Structural competency, 20

Structural defects of hair, 3541

Structural elements, for outcome measures, 521

Structural epilepsy, 3091

Structural kyphosis, Scheuermann disease, 3641–3642, 3641f

Structural lesions, as cause of oropharyngeal dysphagia, 1903t

Structural problems, adolescent, 1019t–1020t

Structural racism, 19–20

Struvite calculi, 2836t, 2838

Sturge-Weber syndrome, 3146–3148
- clinical manifestations of, 3146–3147, 3147f, 3147t
- diagnosis of, 3147–3148, 3147f
- etiology of, 3146
- management of, 3148
- polymicrogyria and, 3070t–3071t
Stuttering, 144
   comorbidities, 282
   developmental progression, 282
   epidemiology of, 282
   etiology of, 282
   genetics, 282
   treatment of, 282–283

Stuttering priapism, 2825

Stx1, 1514

Stx2, 1514

Stye, 3362

Subacute bacterial endocarditis, retinopathy in, 3384

Subacute sclerosing panencephalitis, 1673–1674

Subacute thyroiditis, 2923, 2924t

Subacute toxicity, 3793

Subarachnoid hemorrhage, 915

Subclinical form of measles, 1672

Subclinical neurotoxicity, 3788f

Subclinical porphyria, 834

Subconjunctival hemorrhage, 3367, 3393f

Subcoronal hypospadias, 2822f

Subcortical heterotopia, 3069

Subcutaneous emphysema, 2224–2225, 2225f

Subcutaneous fat necrosis, 3533, 3533f

Subcutaneous insulin therapy, in T1DM, 3032–3038

Subcutaneous morphea, 1285b

Subcutaneous nodules, 2654
   in rheumatic fever, 1447
Subcutaneous tissue, 3439
  infections
    cellulitis, 3550–3551
    necrotizing fasciitis, 3551–3553
Subcutaneous tissue disease, 3531–3535, 3531f
  corticosteroid-induced atrophy, 3531
  erythema nodosum, 3531–3532, 3531b
  lipodystrophy, 3534–3535
  panniculitis, 3531–3534
Subdural empyema, CSF findings in, 3222t–3223t
Subdural hematoma, 560f–561f
Subdural hemorrhage, 915
Subendothelial matrix proteins, 2589–2590
Subependymal calcification, 3145f
Subependymal giant cell astrocytomas, 3144–3145
Subependymal nodules, 3144–3145
Subgaleal hemorrhage, 914
Subglottic hemangioma, congenital, 2209, 2209f
Subglottic stenosis, congenital, 2208
Subluxation
  lens, upward, 3374f
  periodontal, 1922
Submersion injury, 607–614
  epidemiology of, 607–609
  etiology of, 607
  management of, 610–612
  pathophysiology of, 609–610
  prevention of, 613–614
  prognosis of, 612–613
Subperiosteal abscess, 3391t, 3392–3393, 3393f
Subperiosteal hematoma (SH), 375f

Substance abuse
  among GLB youth, 1025
  among teen mothers, 1076
  and neonatal abstinence, 977

Substance abuse in adolescents, 1039–1057
  alcohol, 1048–1049
  amphetamines, 1055–1056
  annual prevalence use, 1042t–1044t
  bath salts, 1057
  clinical manifestations of, 1041
  club drugs used recreationally, 1046t
  cocaine, 1055
  commonly abused prescription drugs, 1045t
  complications, 1041–1048
  CRAFFT mnemonic tool, 1047b
  diagnosis of, 1041
  epidemiology of, 1041
  etiology of, 1039
  hallucinogens, 1054–1055
  inhalants, 1052–1054
  marijuana, 1051–1052, 1052f
  opiates, 1056–1057
  prevention, 1048
  prognosis of, 1048
  protection and risk model, 1040f
  risk and protective factors, 1048t
  screening for, 1041
  seriousness of drug abuse, 1040t
  stages of, 1040t
  stimulant abuse and diversion, 1056
  tobacco, 1049–1051
  toxic syndromes, 1047t
  treatment of, 1048
urine screening, 1047t
Substitution, 637, 637t
Substrate specificity, 437
Subsyndromal bipolar disorder, 222–223
Subtelomeric regions, 665–667
Subtle seizures, 3111
Subungual exostosis, 2693, 2694f, 3606
Subungual onychomycosis, distal, 3546
Subvalvular (subaortic) stenosis, 2387
Succimer, for arsenic and mercury poisoning, 3796
Succinic semialdehyde dehydrogenase deficiency, 728–729
Succinimides, adverse effects of, 3106t
Succinyl-CoA:3-ketoacid-CoA transferase (SCOT) deficiency, 745
Succinyl-coenzyme A:3-ketoacid coenzyme A transferase deficiency, 715
Succinylpurinuria, 823
Sucking
  blisters, 3454
digit, 1915
Sucrase-isomaltase deficiency, 2004–2005
Sucrose solution, in pain management, 474t
Sudden cardiac death, myopathies developing, 3261t
Sudden death, 2448–2451
  cardiac arrhythmia, 2449
cardiomyopathy, 2448–2449
  causes of, 2448f, 2449b
  congenital heart disease and, 2448
  mechanism of, 2448
  medication for attention-deficit/hyperactivity disorder, 2450
  mimics, 2449b
miscellaneous causes of, 2450
prevention of, 2450–2451
resuscitated patients, 2450
during sports, 3679–3683

Sudden infant death syndrome (SIDS), 164, 607, 2167–2176
apnea and, 932
clinical strategies for, 2174–2175
conditions causing, 2168t
differential diagnosis of, 2168t–2169t
environmental risk factors for, 2170–2171, 2170t
epidemiology of, 2167
gene-environment interactions, 2172–2173, 2173f
genetic risk factors for, 2171–2172, 2172f
infant groups at increased risk for, 2173–2174
pathology of, 2167–2170

Sudden unexpected death in epilepsy (SUDEP), 3100–3101, 3110–3111, 3111t

Sudden unexpected postnatal collapse (SUPC), 2175–2176
diagnosis and differential diagnosis of, 2176
epidemiology of, 2175
outcome of, 2176
pathogenesis of, 2175
prevention of, 2176
risk factors for, 2175–2176
treatment of, 2176

Suffocation, 225
death rates, 79, 79t

Suicidal ideation, 227
and attempts, 225

Suicide, 225–228, 226f, 243
among GLB youth, 1025
assessment of, 226–228
completions, 225, 227f
death rates, 79, 79t
drowning and, 608
epidemiology of, 225
intervention of, 227
prevention of, 228, 228b
risk factors of, 225–226, 226f

Sulfadiazine, 1417t –1425t
Sulfamethoxazole, 1417t –1425t
Sulfasalazine, for rheumatic diseases, 1256
Sulfisoxazole, 1417t –1425t
Sulfite oxidase deficiency, 706–707, 736
Sulfonamides, 1428
Sulfonylureas, poisoning, 496t –497t, 503
Sulfur-containing amino acids, 703f
Sulthiame, dosages of, 3104t –3105t
Sumatriptan, for migraine, 3135t –3136t
Sunburn, acute reaction to, 3496–3497, 3496f, 3496t
Sunlight
cutaneous reactions to, 3497b
polymorphous light eruption, 3499
and vitamin D, 378–379

Sunscreens, 3453
Superfecundation, 899
Superior mediastinal syndrome, 2663
Superior mesenteric artery syndrome, 1964–1965
Superior vena cava syndrome, 2644t
Supernumerary nipples, 3457
Supernumerary teeth, 1913
Superrefractory status epilepticus, 3117
treatment of, 3119

Supplemental Nutrition Assistance Program (SNAP), 331

Supplemental oxygen, for HAPE, 606

Supplementation
  folic acid, 892
  with neurotransmitter precursors, 698
  for vitamin A deficiency, 364
  zinc, for acute gastroenteritis, 2029

Support group, on genetic conditions, 630

Support modes
  in invasive mechanical ventilation, 596–597
  in patient-ventilator asynchrony, 599

Supportive care
  for acute bacterial meningitis, 3231
  for acute porphyria, 838
  for ALL, 2653
  for botulism, 1548–1549
  for children with acute toxic effects of cancer treatment, 2643
  for common cold, 2187–2188
  for hemophilia, 2597
  for human metapneumovirus, 1739
  for intellectual disability, 291–292
  for meningococcal disease, 1475–1476
  for poisoning, 495
    antidotes, 496–497
    decontamination, 495–498
    directed therapy, 498
    enhanced elimination, 498
  for tetanus, 1551
  for tuberculosis, 1580

Supportive psychotherapy, 198–199, 221

Suppression, ophthalmologic, 3347

Suppurative arthritis
Haemophilus influenza in, 1488
syndrome, 1480

Supracondylar humeral fractures, 3667f, 3690
Supracristal ventricular septal defect with aortic insufficiency, 2381
Supraglottitis, 2203–2204

Haemophilus influenza in, 1488

Supramalleolar orthosis, 3768t
Supratentorial primitive neuroectodermal tumors (SPNETs), 2676
Supratentorial tumors, 2668
Supratherapeutic ingestion, of acetaminophen, 499–500
Supravalvular aortic stenosis, 2387–2388
Supraventricular tachycardia, 540–541, 2439–2443
clinical manifestations of, 2440
treatment of, 2440–2443

Suramin, 1846

Surface area
body weight, adult dosage and, e 14f
nomogram for estimation of, e 13f

Surface molecules, lymphocyte, CD classification, 1105t

Surfactant
deficiency, in RDS, 935
recovered by alveolar wash, 932f

Surfactant dysfunction disorders, comparison of, 2302t
Surfactant metabolism disorders, 2259–2260, 2260f, 2260t
inherited, 2301–2304

Surfactant protein B deficiency, 2301–2302
clinical manifestations of, 2301–2302
diagnosis of, 2302
genetics of, 2302
Surfactant protein C gene abnormalities, 2302–2303
  clinical manifestations of, 2302
diagnosis of, 2303
genetics of, 2302–2303

Surgery
  in children with cancer, 2640–2643
cosmetic, of breast, 2857
for cystic fibrosis, 2297
fetus, indications and rationales, 893t
for fractures, 3670
for hyperthyroidism, 2932t
laparoscopic inguinal hernia repair as, 2068–2069
repair of diaphragmatic hernia, 946
for septic arthritis, 3678

Surgical management
  of burn wound, 619
  vesicoureteral reflux, 2799–2800, 2800f

Surgical safety, 41–42

Surrogate endpoints, 451

Surveillance cultures, 1338

Survival probabilities, for ALL, 2653f

Survival rates
  of ALL, Kaplan-Meier analyses, 2652f
  of cancer and leukemia, event-free, 2653f
  of malignant neoplasms, 2628t
  of Wilms tumor, 2682t

Susceptibility factors
  for development of porphyria cutanea tarda, 841–842
  familial or genetic, to malignancy, 2632t–2633t

Susceptibility testing, antimicrobial, 1338

Sustainability Development Goals (SDGs), 24, 25f, 333
Sustained fever, 1387
Sustained viral response, 2116
Sutures, for laceration, 557
Swab test
  cervical, 1084f
  vaginal, 1086
Swallowing, 1927–1928
Sweat gland disorders, 3535–3537
  anhidrosis, 3535–3536
  bromhidrosis, 3537
  Fox-Fordyce disease, 3537
  hidradenitis suppurativa, 3537
  hyperhidrosis, 3536
  miliaria, 3536–3537
Sweat glands
  cystic fibrosis and, 2288
  eccrine, 3440
Sweat testing, 2288, 2288f
Sweet syndrome, 1334, 1334b, 3447, 3447f
Swelling
  acute inguinal-scrotal, 2066–2069
  allergic laryngeal, 2205
  calabar, of the hand, 1886f
  of eyelids, ecchymosis and, 3393–3394
  scrotal, 2828–2830, 2829t
    clinical manifestations of, 2828–2830
    differential diagnosis of, 2830t
    laboratory findings and diagnosis of, 2830, 2830f
Swimmer's ear, 3712
Swimming, injuries associated with, 3712
Swimming pools
  drowning in, 608
Swine bites, microorganisms associated with, 3818b
Swyer syndrome, 3014
Swyer-James syndrome, 2223
Sycosis barbae, 3556
Sydenham chorea, 3156–3159
    in rheumatic fever, 1447, 1449
Symblepharon, 3368
Symmetric IUGR, 906–907
Symmetric progressive erythrokeratoderma, 3514–3515
Sympathetic blocks, in pain management, 486
Sympathetic ophthalmia, 3376
Sympathomimetic syndromes, 1047t
Symptom management, in palliative care, 55–61, 55b
    intensive, 61
Symptom modeling, in somatization disorders, 203
Symptom review, 188
Symptomatic seizures, 3086–3087
Synaptic defects, in congenital myasthenic syndrome, 3306t
Synbiotics, 1347
Synchronized intermittent mandatory ventilation (SIMV), 595–596, 596f
Syncope, 566–571
    cardiac causes of, 568b
    clinical presentation of, 570–571
    comparison with seizures, 567t
    diagnosis of, 571
    and dizziness, 567t
    evaluation for, 566–569, 568b
    management of, 571
mechanisms of, 566
neurally mediated, 570f
noncardiac causes of, 566, 567b
that mimic seizures, 3121–3124, 3122t
treatment for, 569, 569t

Syndactyly, 3656, 3656b, 3657f
of toes, 3604–3605, 3605f

Syndrome of inappropriate antidiuretic hormone secretion (SIADH), 391, 396, 396b, 398
as cause of hyponatremia, 2889–2890
disorders associated with, 2890t
treatment of, 2892

Syndrome of pyogenic arthritis with pyoderma gangrenosum and acne (PAPA syndrome), 1300–1301, 1301f

Syndromes of hereditary persistence of fetal hemoglobin, 2553

Syndromic craniosynostosis, 3080t

Syndromic diarrhea, 1997

Syndromic ichthyoses
  chondrodysplasia punctata, 3516
  Netherton syndrome, 3515, 3515f

Tibia vara, 3610–3611, 3611f
  in Schmid metaphyseal dysplasia, 3725f

Tibial bowing
  anterolateral, 3613
  anteromedial, 3612
  posteromedial, 3612

Tibial longitudinal deficiency, 3613

Tibial rotation, 3608

Tibial torsion
  lateral, 3610
  medial, 3609
Tibial tubercle, in Osgood-Schlatter disease, 3620f

Tic cough, 2163

Tic disorders, 206–208, 206b
  assessment, 208
  clinical course, 206
  comorbidities, 206–207, 207f
  differential diagnosis of, 206, 207t
  epidemiology of, 206
  etiology of, 207
  screening, 208
  sequelae, 207–208
  treatment of, 208, 208b

Tick paralysis, in neuromuscular blockade, 3310

Tick-borne diseases
  Colorado tick fever, 1756
  encephalitis, 1757–1758
  Lyme disease, 1604–1609
  lymphadenopathy, 1620t
  relapsing fever, 1603
  rickettsialpox (Rickettsia akari), 1622–1626

Ticks, 3569t

Tics
  characteristics of, 3150t
  definition of, 206

Tidal recruitment, 594

Tidal volume, 2155–2156
  exhaled, 599
  and rate, settings of, 598

Tigecycline, 1417t–1425t, 1458

Tillaux fractures, 3669, 3669f

Tilted optic disc, 3386
Time constant, 593, 594f

Timed (24 hr) urine collections, for proteinuria, 2749

Timing
  of changes in puberty, 1018
  of first eye exam, 3378t

Tin
  foodborne illness, 3776t–3777t
  food-borne noninfectious illnesses and, 2018t

Tinea capitis, 3560–3562, 3561f

Tinea corporis, 3562, 3562f

Tinea cruris, 3562–3563

Tinea nigra palmaris, 3564

Tinea pedis, 3563, 3563f

Tinea unguium, 3563–3564

Tinea versicolor, 1646–1647, 1648f, 3559–3560

Tinidazole, 1812

Tinnitus, 3398

Tissue analysis, fetal, 883t

Tissue engineered neobladder, 2815f

Tissue injury, DIC caused by, 2609t

Tissue plasminogen activator (TPA), 2607
  dosing of, 2607

Tissue-nonspecific alkaline phosphatase isoenzyme (TNSALP), 3748

Titration, in antiepileptic drugs, 3107–3108

Tizanidine, for spasticity, 3760, 3761t

T-lymphocyte-dependent vaccines, 1351

T-lymphocyte-independent vaccines, 1351

T lymphocytes
in allergic disease, 1170, 1171f
autoimmune hepatitis and, 2127–2128
cytotoxic (CTLs), 2660f
development and differentiation, 1103–1104, 1106f
evaluation for suspected immunodeficiencies, 1098–1102
immunodeficiency syndromes, 1120t
inheritance of developmental abnormalities in, 1107
laboratory tests for deficiency, 1103t
postnatal lymphopoiesis, 1106–1107
predominant defect in primary immunodeficiency, 1099t
screening tests for defects, 1101b

TNSALP, Tissue-nonspecific alkaline phosphatase isoenzyme

Tobacco, 3790–3792
smoke
risk factor for otitis media, 3419
second-hand, 3790–3791
toxicity, 509t

Tobacco use in adolescents, 1042t–1044t
cigarettes, 1049–1050
clinical manifestations of, 1050
e-cigarettes, 1050
hookah, 1050
pharmacology, 1050
smokeless tobacco, 1050
treatment of, 1050–1051

Tobramycin, 1417t–1425t

Tocilizumab, 1257

α-Tocopherol, 385

Toddlers
antibiotics use in, 1416
behavioral disturbances in, 241
chronic constipation, 1958–1959
defecatory disorders in, Rome IV diagnostic criteria for, 1959t
fracture, 3669, 3669f, 3699
heart failure in, 2478b
limping in, 3595t
psychosocial assessment, 185
self-conscious aware, 144
sleep
   BEARS sleep screening algorithm, 183t
normal patterns, 174t

Toddler's diarrhea, 2036

Toe deformities
   annular bands, 3605, 3605f
   claw toe, 3605
   curly toes, 3604

   juvenile hallux valgus (bunion), 3604
   macrodactyly, 3605–3606, 3605f
   mallet toe, 3605
   overlapping fifth toe, 3604
   polydactyly, 3604
   subungual exostosis, 3606
   syndactyly, 3604–3605, 3605f

Toenail, ingrown, 3606

Toes, hemorrhagic vesicles, 3820f

Togaviruses, Dengue-like diseases, 1761

Toilet training, 143
   normal, 2816

Toluene, inhaled, 1053b

Tomaculous neuropathy, 3328–3329

Tone
   in motor examination, 3057–3058, 3058f
   in neuromuscular system, 3245

Tongue
aphthous ulceration in HIDS, 1298f
black hairy, 3549
dysautonomic, 3331f
fissured, 1925, 3548
geographic, 1901, 1925, 3548–3549
oral mucosal neuromas of, 2703f
strawberry
in Kawasaki disease, 1311f
in scarlet fever, 1442f

Tongue-tie (ankyloglossia), 322
Tonic neck reflex, 3059–3060
Tonic pupil, 3351
Tonic seizures, 3092, 3111
Tonometry, 3344

Tonsillectomy
comparison of guidelines for, 2201t
Paradise criteria for, 2200t
risks and benefits, 2202t

Tonsillitis, in infectious mononucleosis, 1716f

Tonsils, 2198–2202
anatomy, 2198–2199
chronic airway obstruction, 2200–2202
clinical manifestations of, 2199
diphtheria of, 1459f
normal function, 2199
pathology, 2199
pharyngotonsillitis, treatment, 2200

Topical agents
for acne, 3579t
antibiotics, 3452
for bacterial conjunctivitis, 3366t
for burns, 619t
corticosteroids, 3452–3453
nonsteroidal antiinflammatory agents, 3453

Topical calcineurin inhibitors, for atopic dermatitis, 1214

Topical ophthalmic medications, for allergic conjunctivitis, 1221t

Topiramate
   adverse effects of, 3106t
   dosages of, 3104t–3105t
   for migraine, 3135t–3136t
   in pain management, 482
   for status epilepticus, 3119t

Torsades de pointes, 2450f

Torsion
   adnexal, 2864
   of appendix testis, 2831
   penile, 2823–2824
   testicular, 2830–2831

Torsional and angular deformities, 3606–3613
   congenital angular deformities of tibia and fibula, 3612–3613
   coronal plane deformities, 3610–3612
   evaluation of, 3607–3608
   normal limb development of, 3606–3607
   torsional deformities, 3609–3610

Torsional deformities, 3609–3610
   external femoral torsion, 3609–3610
   medial tibial torsion, 3609
   metatarsus adductus, 3610

Torticollis, 2666–2668
   benign paroxysmal, of infancy, 3125 , 3166–3167
   congenital muscular, 3646–3647
   differential diagnosis of, 3647b
   other causes of, 3647

Torus fracture, 3664

Total anomalous pulmonary venous return, 2411–2413 , 2411f , 2412t
Total body irradiation, growth impairment due to, 1168
Total body water (TBW), 389
Total burden (DALYs), of drug dependence, 1039f
Total energy expenditure (TEE), 303
Total fiber, 309
Total hemolytic complement activity (CH₅₀), 1152
Total lung capacity (TLC), 2155–2156
Total parenteral nutrition, cholestasis associated with, 2121–2122
Tourette syndrome, 735, 3125
Toxic alcohols, 507–508
Toxic alopecia, 3541
Toxic effects, acute, of chemotherapy, 2643–2645
Toxic epidermal necrolysis, 1245–1246, 3484
  clinical manifestations of, 3484
  epidemiology and etiology of, 3484
  treatment of, 3484
Toxic goiter, 2928
Toxic metabolic states, manifesting as respiratory distress, 585
Toxic myopathies, 3295–3296, 3295t
Toxic nephropathies, 2735–2736
Toxic neuropathies, 3330–3331, 3331t
Toxic shock syndrome (TSS), 1434–1435
  diagnostic criteria of, 1434t
  GAS, 1442–1443, 1442t
  Staphylococcus aureus, 1431
Toxic shock syndrome toxin-1 (TSST-1), 1430
Toxic stress, 6
  in adoptive children, 64
Toxic syndromes, 1047t

Toxic synovitis, 1273, 3628

Toxicity
- of agents in small dose, 490t
- hydrocarbons, 507
- plants, 508, 509t

Toxidromes, 493t, 526
- mini-toxidromes, 494t

Toxin A, 1553

Toxin B, 1553

Toxins
- acute pancreatitis and, 2075t
- blindness caused by, 3347b
- DIC caused by, 2609t
- hemolysis and, 2565–2566
- liver injury induced by, 2130–2133
  - prevention of, 2133
  - prognosis of, 2133
  - treatment of, 2133
- maternal exposure, effects on fetus, 886–889
  - mushroom, 3776t–3777t
- systemic signs related to poisoning, 492t
- toxicants vs., 3774

Toxocara canis, 1888

Toxocara cati, 1888

Toxocariasis (visceral and ocular larva migrans), 1888–1889
- clinical manifestations of, 1888, 1888t
- diagnosis of, 1888–1889
- epidemiology of, 1888
- etiology of, 1888
- pathogenesis of, 1888
- prevention of, 1889
- treatment for, 1889
Toxoid, 1349

*Toxoplasma gondii*, 1865–1877

detected in breast milk, 876

Toxoplasmosis, 1865–1877

acquired, 1866
clinical manifestations of, 1866–1870
congenital, 1865
diagnosis of, 1872–1874, 1873
drugs for, 1813–1828
epidemiology of, 1865
etiology of, 1865, 1866–1869
in immunocompromised persons, 1866–1870
isolation for, 1872
ocular, 1866, 1869
pathogenesis of, 1865–1866
pregnant women with, 1875–1876
prevention of, 1876–1877
prognosis of, 1876
serologic testing in, 1872–1874
systemic signs of, 1870–1872
treatment of, 1874–1876

*TP53*, germline mutations in, 2979

Trace element, 387, 387–388

Trachea

normal appearance of, on chest radiography, 2154
stenoses, webs, and atresia, 2210

Tracheal compression, 2644

Tracheal foreign bodies, 2212

Tracheal neoplasms, 2216, 2216

Tracheal tubes, dimensions for, 591

Tracheitis, bacterial, 2206
Tracheoesophageal fistula, 911t, 1929–1931, 1929f
  diagnosis of, 1929–1930
  H-type, 1930f
  management of, 1930
  outcome for, 1930–1931
  presentation of, 1929
Tracheomalacia, 2214–2215, 2214f, 2214t
Tracheotomy, in infectious upper airway obstruction, 2205
Trachoma, 1616
Trachyonychia, 3546, 3546f
Traction alopecia, 3538–3539
Traction response, 3057–3058
“Traffic light” diet, 354–355, 355t
Traffic-related injuries, prevention of, in developing world, 523
Training, staff, for emergency medical services, 515
Transactional model, 119–120
Transaldolase deficiency, 797
Transcatheter closure, of patent ductus arteriosus, 2383f
Transcatheter occlusion, of atrial septal defect, 2376f
Transcellular shifts
  hyperkalemia caused by, 399b
  hyperphosphatemia caused by, 410b
  hypokalemia caused by, 401b
  hypophosphatemia caused by, 408b
Transcobalamin, absence of, 2520–2521
Transcobalamin-cobalamin complex, 718
Transcranial diagonal difference, in deformational plagiocephaly, 3084
Transcranial Doppler ultrasound, 2546, 2549
Transcription, 636
writing disabilities, 272

Transcription factor disorders, 3729–3731
- campomelic dysplasia, 3729–3730, 3730f
- cleidocranial dysplasia, 3730, 3730f
- nail-patella syndrome, 3730–3731, 3731f

Transcription factors
- chamber-specific, 2340
- in development of, adrenal glands, 2954
  - GATA1, 2510
  - in normal liver development, 2082t
  - in tumors, 2630, 2631t

Transcutaneous electrical nerve stimulation (TENS), in pain management, 484

Transdermal drug absorption, 447f, 448

Transdermal patch, contraceptive, 1070

Transdiagonal difference, in deformational plagiocephaly, 3084

Transesophageal echocardiography (TEE), 2359, 2362

Transferrin saturation, 2524t

Transfusion-related acute lung injury, 2588f, 2589

Transfusions
- blood
  - with HIV-infected blood, 1781
  - for homozygous β-thalassemia, 2555–2556
  - for sickle cell anemia, 2548, 2550
- exchange
  - for fetal hemolysis, 969
  - for kernicterus, 959–960, 960f
- intravascular fetal, 969
- for neonatal anemia, 966
- neutrophil, 2584–2585
- plasma, 2585–2586
- platelet, 2583–2584
- red blood cells, 2580–2582
- risks of, 2586–2589
thresholds, 966r

Transgender
clinical presentation of, 1022–1023
definition, 1021
diagnosis of gender dysphoria, 1023–1024
etiology of, 1022
identity development, 1024
interventions and treatment, 1024
prevalence, 1022

Ullrich syndrome, 3255t–3257t
clinical signs of, 3258t–3259t

Ulna, hyperostosis, 364f

Ulnar collateral ligament (UCL), 3691

Ulnar nerve subluxation, 3691f

Ultradian cycle, within-sleep, 173

Ultrarapid-metabolizer (UM) phenotype, 438

Ultrasound
of abdominal aorta, 2488f
for appendicitis, 2051, 2052f
of breast masses, 2857
classification of cystic echinococcosis, 1899f
in evaluation of
septic arthritis, 3677
hypertrophic pyloric stenosis, 1947, 1947f
for liver, 2091
renal, for urinary tract obstruction, 2803, 2803f
thyroid, 2913–2914
transcranial Doppler, 2546, 2549

Ultrasound: diagnostic
- developmental dysplasia of hip, 3626, 3626f
- fetal disease, 890t

Umbilical artery
- catheterization, 936
- flow velocity waveforms, 882f
- single, 975

Umbilical cord, 975
- delayed clamping, 971
- initial care of, 873
- surgery, indications and rationales, 893t

Umbilical cord blood
- samples, 885
- transplantation, for HSCT, 1160–1161

Umbilical hernia, 975

Umbilical-urachal sinus, 2812–2813

Umbilicus, 975

Uncombable hair syndrome, 3542, 3542f

Uncompensated shock, 572, 578

Uncomplicated gonorrhea, 1480

Uncomplicated grief, 169

Unconjugated hyperbilirubinemia, 2086, 2087t

Underactive bladder, 2819

Underfill hypothesis, of nephrotic edema, 2755

Under-five mortality rate (U5MR), 1, 5f, 21, 21f–22f
- global causes, 2f

Undernourishment, 332

Undernutrition, 331, 332f, 333–336, 343
child mortality, 22
classification of, 334t
clinical manifestations of, 336
consequences of, 335–336, 335t
key interventions, 336, 336t
measurement of, 333–334
prevalence of, 334–335
treatment of, 336

Undescended testis, 2827–2828
classification of, 2827
clinical manifestations of, 2827–2828
epidemiology of, 2827
management algorithm for, 2828f
pathogenesis of, 2827
treatment of, 2828, 2829t

Unfractionated heparin, 2311–2312, 2605–2606
complications of, 2605–2606
dosing of, 2605

Ungual infections, in immunocompetent patient, 1642

Unicameral bone cysts, 2695, 2696f

Unicornuate uterus, rudimentary horns and, 2870

Unidentified bright objects, 3142

Unified theory of behavior change, 111–113, 112f, 112t

Unilateral cryptorchidism, of testes, 3000

Unilateral hyperlucent lung, 2223, 2223f

Unilateral pulmonary agenesis, 2224

Unintentional injury, 1

Uniparental disomy, 649, 672–673

Universal screening, 873

Universal vaccination, for hepatitis B, 2113
Unknown epilepsy, 3091

Unpredictable drug reactions, 1242

Unproven therapies, for atopic dermatitis, 1215–1216

Unprovoked seizures, 3086–3087, 3094–3095
  differential diagnosis of, 3094–3095
  history and examination for, 3094
  long-term approach for, 3095

Unstable hemoglobin disorders, 2551–2552

Unverricht-Lundborg disease, 3098–3099

Upbeat nystagmus, 3358t

Upper airway, normal anatomy of, 2154f

Upper airway disease, acute inflammatory obstruction, 2202–2206

Upper airway film, 2154–2155, 2154f

Upper esophageal sphincter, 1927
  dysmotility of, 1932

Upper extremities
  fractures, 3666–3668
  motor control, clinical scale of, 3596t

Upper GI series, showing hiatal hernia, 1936f

Upper limb disorders, 3651–3657
  in arthrogryposis, 3662
  elbow, 3651–3653
    Panner's disease, 3651–3652, 3651f
    radial longitudinal deficiency, 3652–3653, 3652t–3653t
  hand, 3654–3657
    camptodactyly, 3655, 3655t
    clinodactyly, 3655, 3655f
    fingertip injuries, 3656–3657
    polydactyly, 3655, 3655b, 3655t, 3656f
    syndactyly, 3656, 3656b, 3657f
    thumb hypoplasia, 3655–3656, 3656f
    trigger thumb and fingers, 3657
  shoulder, 3651
congenital pseudoarthrosis of the clavicle, 3651, 3651f
Sprengel's deformity, 3651
wrist, 3653–3654
ganglion, 3654
gymnast's, 3654, 3654f
Madelung's deformity, 3653–3654, 3653f

Upper limit of intake (UL), 304f

Upper respiratory tract
anaerobic infections, 1556
tuberculosis of, 1572

Upper urinary tract disease, hematuria caused by, 2719t

Upper-extremity blocks, in pain management, 485

Upper-to-lower body segment ratio, 151

Urachal anomalies, 2812–2813

Uracil DNA glycosylase, gene mutation, 1111

Urbach-Wiethe disease, 3520

Urban location, risk factor of childhood injuries, 82

Urea nitrogen, reference intervals, e 6t – e 13t

Ureaplasma urealyticum, 1612–1614

β-Ureidopropionase deficiency, 825–826

Uremia, toxic, with toxic neuropathy, 3330

Ureter, ectopic, 2805–2806, 2806f, 2819f–2820f

Ureteral ectopia, 2819

Ureteral injuries, 2835

Ureterocele, 2806–2807
prolapsed ectopic, 2826f

Ureteropelvic junction obstruction (UPJ), 2805

Ureterosigmoidostomy, 2811

Ureters, configurations of ureteral orifices, 2796f
Urethral anomalies, 2821–2826
  hypospadias, 2821–2822
  prolapse (female), 2826, 2826f, 2851

Urethral disorders
  atresia, 2810, 2826
  diverticula, 2810
  duplication, 2826
  fistula, 2826
  hypoplasia, 2810, 2826
  obstruction, 2801t
  strictures, 2810

Urethral fistulas, 2057

Urethral prolapse, 2851

Urethral valves
  anterior, 2810
  posterior, 2808–2810

Urethritis, 1083–1084, 1086, 1480
  infectious causes of, 2748

Urethrorrhagia, 2719

Urge incontinence, 2816

Uric acid, reference intervals, e 6t – e 13t

Uric acid calculi, 2836t, 2838

Uridine diphosphate galactose-4-epimerase deficiency, 790

Uridine diphosphoglucuronate glucuronosyltransferase (UDPGT), 2101–2102

Uridine diphospho-glucuronosyl transferases (UGTs), 440

Uridine monophosphate synthase type 1 deficiency, 824–825

Urinalysis
  in acute kidney injury, 2772t
  in anorectal malformations, 2057
  monitoring, in nephrotic syndrome, 2759t
Urinary 17-ketosteroids, 2983
Urinary acidification, normal, 2762
Urinary alkalization, 498, 500
Urinary ascites, 2803
Urinary catheters, 1413
Urinary concentrating defect, in CKD, 2775
Urinary incontinence
  cause of, 2817
  complications of augmentation cystoplasty, 2814–2815
  future management of, 2815, 2815f
Urinary potassium wasting, 402
Urinary tract dilation (UTD), 2802f
Urinary tract infection, 1910t
  S. saprophyticus in, 1436
Urinary tract infections (UTIs), 2789–2795
  asymptomatic bacteriuria, 2792
  clinical manifestations and classifications of, 2789–2790
  complication of augmentation cystoplasty, 2815
  cystitis, 2790
  diagnosis of, 2792–2793
  febrile, imaging studies in, 2793–2795, 2795t
  fever without a focus, 1390
  imaging findings of, 2793
  pathogenesis and pathology of, 2790–2792, 2791f
  prevalence and etiology of, 2789
  pyelonephritis, 2789–2790
  risk factors for, 2791t
  sensitivity of urinalysis, 2792t
  treatment of, 2793
Urinary tract obstruction, 2800–2810
  ancillary studies for, 2804–2805
anterior urethral valves, 2810
of bladder neck, 2808
clinical manifestations of, 2801
diagnosis of, 2801–2803
ectopic ureter, 2805–2806
etiology of, 2801
hydrocalycosis, 2805
imaging studies for, 2803–2805
male urethral meatal stenosis, 2810
megaureter, 2807–2808
midureteral, 2805
physical findings of, 2803
posterior urethral valves, 2808–2810
prune-belly syndrome, 2808
ureterocele, 2806–2807
of ureteropelvic junction, 2805
urethral atresia, 2810
urethral diverticula in males, 2810
urethral hypoplasia, 2810
urethral strictures, 2810
urine chemistries in, 2772

Urine

in congenital erythropoietic porphyria, 840f
cultures, 1337
maple syrup urine disease, 708–710
maximum osmolality, 391
minimum osmolality, 391
red, 2718t
screening, for drugs of abuse, 492–494, 1047t
sodium, in differential diagnosis of hyponatremia, 2890t
in water loss, 427

Urine anion gap, 2764–2765

Urine chemistry, normal values, 2837t

Urine output, 428
Urine protein, 2749–2750
   dipstick, 2749
   protein-to-creatinine ratio, 2749–2750

Urogenital sinus, 2868

Urolithiasis, 1910t
   caused by metabolic abnormalities, 2839t
   classification of, 2836t
   clinical manifestations of, 2836
   diagnosis of, 2836
   metabolic evaluation of, 2836–2837
   pathogenesis of specific renal calculi, 2837–2838
   stone formation, 2835–2836
   treatment of, 2839

Urologic disorders
   anomalies of
      bladder, 2810–2813
      penis and urethra, 2821–2826
      scrotal contents, 2827–2833
   congenital anomalies and dysgenesis of kidneys, 2786–2789
   enuresis and voiding dysfunction, 2816–2821
   neuropathic bladder, 2813–2816
   trauma to genitourinary tract, 2833–2835
   urinary lithiasis, 2835–2840
   urinary tract obstruction, 2800–2810
   UTIs, 2789–2795
   vesicoureteral reflux, 2796–2800

Uroporphyrinogen decarboxylase, specific inhibitor of, 841f

Urticaria, 1222–1228
   chronic idiopathic, 1223–1226
   diagnosis of, 1224–1225, 1225f, 1225t
   diagnostic testing, 1226t
   as drug eruption, 3449t
   etiology and pathogenesis, 1222, 1222t
   physical, 1222–1223, 1223t
solar, 3499, 3499f

treatment of, 1226–1227, 1227t

Urticaria pigmentosa, 1226, 3523–3524

Urticarial vasculitis, 1226

U.S. food assistance programs, 331

Usher syndrome, 3381, 3404t

Uterine bleeding, abnormal, 1060–1062, 1060b, 1061t

Uterine compression, deformation abnormalities resulting from, 990f

Uterine didelphys, 2870

Uterine malignancies, 2865–2866

leiomyomas, 2866

leiomyosarcomas, 2866

rhabdomyosarcomas, 2865–2866

Uterine septum, 2869–2870

Uterus

limited intrauterine spacing, 3659

septate, 2869–2870

Uveal tract disorders, 3375–3377

Uveitis, 3375–3377

anterior, 3365t, 3375b

in Behçet disease, 1290

chronic anterior, in JIA, 1268f

posterior, 3365t, 3375b

treatment of, 3376–3377

V

Vaccine Adverse Event Reporting System (VAERS), 1352

Vaccine Alliance, 1365

Vaccine Information Statement (VIS), 1352
Vaccine Safety Datalink, 1352

Vaccine-preventable diseases, 24–26, 27t

Vaccines, 1349

BCG, 3558
against tuberculosis, 1581–1582
cholera, 1518, 1519t
diphtheria and tetanus toxoids and acellular pertussis (DTaP), 1495
diphtheria toxoid, 1461–1462
Haemophilus influenza type b, 1489
hepatitis A, 2109
inactivated polio, 1689
indications and adverse reactions, 1246
influenza, 1732, 1732f
measles, 1675, 1675t–1676t
meningococcal, 1476–1478, 1478t
parainfluenza viruses, 1734
pneumococcal, 1439t–1440t
of persons with cochlear implants, 3411t
pneumococcal conjugate, 2274
polio, 1689
rabies, 3819
respiratory syncytial virus (RSV), 1737
rubella, 1680
smallpox, 3811
Td, 1496
universal, for hepatitis B, 2113
varicella, 1714–1715

Vaccines for Children (VFC) program, 1351–1352, 1365

Vaccinia immunoglobulin (IV), 1349t

Vaginal adenosis, 2866

Vaginal agenesis, 2868

Vaginal anomalies, 2870–2872
abnormalities of hymen, 2870–2871
congenital absence of, 2871
longitudinal vaginal septa, 2871
transverse vaginal septa, 2871
treatment of, 2871–2872

Vaginal candidiasis, 3564
Vaginal fluid, microscopic findings, 1087f
Vaginal foreign bodies, 2851
Vaginal malignancies, 2866
Vaginal ring, 1065t –1066t , 1070 , 1072f
Vaginal voiding, 2819
Vaginitis, 1084 , 2844
   GAS infection, 1442
Vagus nerve, in neurologic examination, 3057
Vagus nerve stimulation, in epilepsy surgery, 3110
Valacyclovir, 1667
Valerian, interactions with drugs, 513t
Valganciclovir, 1667
Validity, genetic testing interpreted in light of, 628
Valine metabolism defects, 708–719
Valproate
dosages of, 3104t –3105t
   for status epilepticus, 3119t
Valproate sodium injection, for migraine, 3135t –3136t
Valproic acid
   adverse effects of, 3106t
   for migraine, 3135t –3136t
Valsalva-like maneuver, compulsive, 3122
Values, cultural, 73t –74t
Valvar aortic stenosis, sudden death and, 2448
Valvular pulmonary stenosis, physiology of, 2385f
Van den Bergh reaction, 955t
Vancomycin, 1417t –1425t
   for Clostridium difficile infection, 1554, 1554t
Vancomycin-resistant enterococci, 1457–1458
Vanishing testes, 2827–2828, 2993–2994, 3014–3015
Vanishing white matter disease, 3192
Vapor, mercury, 3795
Variability of fetal heart rate, 884
Variants, of hypereosinophilic syndrome, 2257t
Variants of unknown sequences (VUS), 627
Varicella, 1373t –1374t
   progressive, 1712
   treatment of, 1713–1714
   in unvaccinated persons, 1709–1710, 1710f
   vaccine, 1350t
Varicella-zoster immunoglobulin (VariZIG, IM), 1349t
Varicella-zoster virus, 1708–1715
   antiviral therapies, 1666t
   clinical manifestations of, 1709–1711
   congenital varicella syndrome, 1710–1711, 1711f
   diagnosis of, 1713
   epidemiology of, 1708–1709
   etiology of, 1708
   involvement in acute facial palsy, 3340f
   neonatal varicella, 1710
   pathogenesis of, 1709
   prevention of, 1714–1715, 1714t
   postexposure prophylaxis, 1715
   vaccine, 1714–1715
vaccine-associated adverse events, 1715
prognosis for, 1714
treatment of, 1713–1714
herpes zoster, 1714
varicella, 1713–1714
varicella in unvaccinated persons, 1709–1710 , 1710f
varicelliform rashes in vaccinated persons, 1710

Varicella-zoster virus: complications, 1711–1713
bacterial infections, 1711–1712
encephalitis and cerebellar ataxia, 1712
herpes zoster, 1712–1713 , 1712f
pneumonia, 1712
progressive varicella, 1712

Varicelliform rashes, in vaccinated persons, 1710

Varices
esophageal, 1941
portal hypertension and, 2141–2143

Varicocele, 2831–2832 , 2832f

Variegate porphyria, 845–846

Vas deferens, injury to, inguinal hernia and, 2070

Vascular abnormalities
associated with pulmonary arterial hypertension, 2425f
hematuria caused by, 2742
pulmonary, 2224

Vascular access, 543–546

Vascular anomalies, 2210 , 2216

Vascular events, in neonatal seizures, 3112

Vascular malformations
angio-keratoma circumspect, 3463
arteriovenous, 3462
capillary (port-wine stain), 3461–3462
cutis marmorata telangiectatica congenita, 3463 , 3463f
Klippel-Trenaunay syndrome, 3462–3463, 3462f
nevus anemicus, 3463
Parkes-Weber syndrome, 3462–3463
phakomatosis pigmentovascularis, 3463
venous, 3462

Vascular permeability, increased, in shock, 575b

Vascular processes, spinal cord lesions associated with, 3214–3215

Vascular rings, 2210, 2421–2422, 2421t
  clinical manifestations of, 2422
  diagnosis of, 2422
  treatment of, 2422

Vascular supply, to pituitary gland, 2876

Vascular tumors, 2064, 3463–3469
  angiokeratoma corporis diffusum, 3468–3469
  angiokeratoma of Mibelli, 3467
  ataxia-telangiectasia, 3468
  classification of, 3461t
  hereditary hemorrhagic telangiectasia, 3468
  infantile hemangioma, 3463–3465, 3464f–3465f, 3466t
  kaposiform hemangioendothelioma, 3466
  Kasabach-Merritt phenomenon, 3467–3469
  Maffucci syndrome, 3467–3468
  multifocal infantile hemangioma, 3465–3466, 3467f
  pyogenic granuloma, 3467
  spider angioma, 3467, 3468f

Vascular tumors, benign, 2702–2703

Vasculitis
  Behçet disease, 1290, 3447
  central nervous system, 3219–3221
    characteristics of, 3221t
    classification algorithm for, 3219f
    clinical manifestations for, 3219–3220
    diagnosis of, 3220–3221, 3221f
    diagnostic evaluation of, 3220t
epidemiology of, 3219
prognosis of, 3221
secondary, causes of, 3219t
treatment of, 3221
cerebral, classification of, 3212t
childhood, classification of, 1317b
distribution of vessel, 1317f

Ventilator-associated pneumonia, 600, 1007

Ventilator-induced lung injury, 600–601

Ventilatory insufficiency, paralytic poliomyelitis with, 1685

Ventricles
cerebral, dilated in fetus, 890t
septation of, 2342

Ventricular arrhythmias, 2443f
myopathies developing, 3261t
Ventricular assist device (VAD) for heart failure, 2482, 2482f

Ventricular hypertrophy, 2355–2356
   left, 2357, 2358f
   right, 2357, 2357f

Ventricular output, fetal, 2344f

Ventricular septal defects, 2379–2381, 2433
   coarctation with, 2392
   diagnosis of, 2380
   different types of, 2379f
   pathophysiology of, 2379
   physiology of, 2379f
   prognosis of, 2381
   and pulmonary stenosis, transposition of the great arteries with, 2405–2406
   relative frequency of, 2367t
   transposition of the great arteries with, 2409–2410
   treatment of, 2380–2381

Ventricular septum, intact
   d-transposition of the great arteries, 2407–2409
   pulmonary atresia with, 2401–2402
   pulmonary valve stenosis with, 2384–2386

Ventricular tachyarrhythmias, 2443

Ventriculogram, of tetralogy of Fallot, 2398f

Venturi mask, 589–590

VEPTR, Vertical expandable prosthetic titanium rib

Verbal auditory agnosia, 278

Verbal speech and language, 158

Vernal conjunctivitis, 3367, 3367f

Vernal keratoconjunctivitis, 1220, 1220f

Verruca peruana, 1543, 1543f
Verruca plana, Flat warts
Verruca plantaris, 3566–3567
Vertebra plana, 2696
Vertebrae, butterfly, 2097f
Vertical expandable prosthetic titanium rib (VEPTR), 3637
Vertical fusion defects, 2871
Vertical suspension, test of, 3057–3058
Vertical talus, congenital, 3600, 3600f
Vertical transmission, HIV, 1781
Vertigo, 566, 3435
  vestibular migraine with, 3131t
Very low birthweight infants, 902
Very-long chain fatty acids, disorders of, 745–751
Vesicoamniotic shunting, 894, 894f
Vesicobullous tinea pedis, 3563f
Vesicourachal diverticulum, 2812–2813
Vesicoureteral reflux (VUR), 2781, 2796–2800
  classification of, 2796–2797, 2796t
  clinical manifestations of, 2797
  diagnosis of, 2798
  natural history of, 2798, 2799f
  treatment of, 2798–2800
    antimicrobial prophylaxis, 2799
    current guidelines, 2800
    observation, 2799
    surgery, 2799–2800, 2800f
Vesicular monoamine transporter deficiency, 729
Vesicular trafficking disorders, 1146
Vesiculobullous disorders, 3480–3491
  dermatitis herpetiformis, 3490
erythema multiforme, 3480–3482
linear IgA dermatosis, 3490–3491
mechanobullous disorders, 3484–3488
pemphigus, 3489–3490
sites of blister formation, 3481t
Stevens-Johnson syndrome, 3482–3483
toxic epidermal necrolysis, 3484

Vespids, 1217
Vest therapy, 2330
Vestibular migraine, with vertigo, 3131t
Vestibular nystagmus, 3358t
Vestibulocochlear nerve, in neurologic examination, 3056–3057
Vestibulopathy, stroke and, 3218
Viable yellow mouse model, 679–680, 680f
Vibration, in transport physiology, 520

_Vibrio cholerae_ , 1516
bacterial gastroenteritis and, 2014t

_Vibrio parahaemolyticus_ , bacterial gastroenteritis and, 2014t

_Vibrio vulnificus_ , bacterial gastroenteritis and, 2014t

Victimization, rape, 1078b
Victims, of bullying, 243

Vidarabine, 1668
Video capsule endoscopy, 2000f

Vigabatrin
adverse effects of, 3106t
dosages of, 3104t–3105t

Villi, swollen, 2000f

Villous atrophy syndrome, 2126

Vinblastine, indications and adverse reactions of, 2641t–2642t
Vincent angina, 1556
Vincent stomatitis, 3549
Vincristine, indications and adverse reactions of, 2641–2642
Violence, 1
    impacts of, 86–87
    school, 87–88
    teen pregnancy and, 1075
    urban, stress reactions and, 94b
    witnessing, 86
    youth engaged, 1036
Violent behavior, 1036–1038
    clinical manifestations of, 1037
    diagnosis of, 1037
    epidemiology of, 1036–1037
    etiology of, 1037
    injuries due to, 85
    prevention, 1038
    treatment of, 1038
Viper bites, 3822
Viral gastroenteritis, etiologies of, 2013
Viral hemorrhagic fevers, 1766–1771, 3811–3812
    clinical manifestations of, 1768–1770
    Dengue fever, 1764–1766
    diagnosis of, 1770
    differential diagnosis of, 1770
    epidemiology of, 1766–1768
    etiology of, 1766, 1766t
    prevention of, 1770–1771
    treatment of, 1770
    yellow fever, 1764–1766
Viral hepatitis, 2106–2119
    clinical approach to, 2118f
issues common to all forms of, 2106–2108
common biochemical profiles in the acute infectious phase, 2107–2108
differential diagnosis of, 2106, 2107
pathogenesis of, 2107

Viral infection
associated with hemophagocytic syndrome, 2708
astroviruses, 1745–1747
caliciviruses, 1745–1747
as causes of infectious pneumonia, 2268
causes of systemic neonatal infections, 996, 998, 998
common cold, 2185–2188
conjunctivitis, 3365, 3366–3367
coronaviruses, 1742–1745
cutaneous, 3566–3568
molluscum contagiosum, 3567–3568
wart (verruca), 3566–3567
dengue fever and dengue hemorrhagic fever, 1764–1766
detected in breast milk, 876
in differential diagnosis of Kawasaki disease, 1315
fever in older children, 1393–1394
hantavirus pulmonary syndrome, 1773–1774, 1773
healthcare-associated infection and, 1007
in HIV-infected children, 1785
human herpesvirus 8, 1726
human metapneumovirus, 1738–1739
human T-lymphotropic viruses (1 and 2), 1805–1806
influenza viruses, 1727–1732
laboratory diagnosis, 1339–1341
antigen detection tests, 1340
molecular diagnostics, 1340–1341
specimens, 1339–1340
viral culture, 1340
lymphocytic choriomeningitis virus, 1771–1773
maternal, affecting fetus or newborn, 879
measles, 1670–1676, 1671
mumps, 1680–1683
myocarditis and, 2471–2472
nonpolio enteroviruses, 1690–1697
parainfluenza viruses, 1732–1734
parvoviruses, 1697–1701
polioviruses, 1683–1689
polyomaviruses, 1777–1778
predisposition to, 1098t
principles of antiviral therapy, 1664–1670
rabies, 1774–1777
vaccination, 3819
respiratory syncytial virus (RSV), 1734–1737
rhinoviruses, 1741–1742
roseola (human herpesviruses 6 and 7), 1723–1726
rotaviruses, 1745–1747
rubella, 1676–1680
in T1DM, 3024
transmissible spongiform encephalopathies, 1806–1811
of upper airway, 2202–2203
varicella-zoster virus, 1708–1715
yellow fever, 1764–1766

Viral meningitis, CSF findings in, 3222t–3223t

Viral meningoencephalitis, 3232–3234
  clinical manifestations of, 3233
  CSF findings in, 3222t–3223t
  diagnosis of, 3233
  differential diagnosis of, 3233
  epidemiology of, 3232
  etiology of, 3232
  laboratory findings in, 3233
  pathogenesis and pathology of, 3232–3233
  prevention of, 3234
  prognosis of, 3234
  treatment of, 3233–3234

Viral pneumonia, 2267

Viral respiratory illness, fever without a focus, 1390
Viral vectors for gene transfer, 631
Virginal hypertrophy, 2854
Viridans group streptococci, native valve endocarditis caused by, 2455t –2456t
Virilizing adrenal tumors, 2982
Virilizing maternal tumors, in 46, XX DSD, 3013 , 3013t
Virulence system, nontyphoidal Salmonella, 1498f

Viruses
  associated with, arthritis, 1273b
  associated with aseptic meningitis, 3227t
  of low pathogenicity, 2645
  pathogenesis of malignancy, 2631–2633
  respiratory
  multiplex assays for, 1341f
  transfusion-transmitted, risks of, 2587f

Virus-host interaction, in cytomegalovirus (CMV), 1719
Visceral larva migrans, 1888–1889
  drugs for, 1813t –1828t
Visceral leishmaniasis, 1843 , 1843f , Kala-azar
Visceral pain, 1909
Vision, in neurologic examination, 3056
Vision disorders, 3346–3349
  amaurosis, 3347–3348
  amblyopia, 3346–3347
  diplopia, 3347 , 3348f
  dyslexia, 3349
  nystagmus, 3348
  psychogenic disturbances, 3348–3349
  suppression, 3347

Vision problems
  disparities in, 14
Vision testing
  in adolescents, 1034–1035
  screening guidelines, 3342t

Visual abnormalities, that mimic seizures, 3122t

Visual acuity assessment, 3342–3343

Visual evoked potentials (VEPs), 3063

Visual field assessment, 3343

Visual hallucinations, that mimic seizures, 3127

Visual impairment, severe, 3347b

Visual reinforcement audiometry, 3407

Visual snow, 3127

Visual-spatial/visual-perceptual function, 254

Vital capacity, 2155–2156

Vital signs
  assessment, of acutely ill child, 526
  normal, 530, 530t
  in toxidromes, 493t

Vitamin A
  for acute gastroenteritis, 2032
  characteristics of, 362t
  in children, dietary reference intakes in, 364t
  dietary reference intake, 310t–316t, 364
  functions and mechanisms of action, 362
  hypervitaminosis A, 364–365
  low plasma retinol, inflammation-caused, 361–362
  for measles, 1674
  metabolism, 361–362
  overview of, 360–361
  status in neonates, 361

Vitamin A deficiency, 334
  clinical manifestations of, 363
cutaneous changes due to, 3589
diagnosis of, 363
epidemiology and public health issues, 363–364
as goitrogen, 2927t
malabsorption and, 2006
malnutrition in, 363
supplementation of vitamin A for, 364

Vitamin B₂ (riboflavin)
deficiency, 366–368
dietary reference intake, 310t–316t
dietary sources, 367t–368t
for migraine, 3135t–3136t
supplements, 511t

Vitamin B₃ (niacin), 368–369
biochemical action, 367t–368t
deficiency, 368–369

Vitamin B₅ (pantothenic acid)
deficiency, 367t–368t
dietary reference intake, 310t–316t

Vitamin B₆ (pyridoxine)
deficiency, 367t–368t, 370
dependence syndromes, 370
supplements, 511t
toxicity, 370

Vitamin B₁₂ (cobalamin)
absence of transport protein, 2520–2521
absorption of, disorders of, 2007
biochemical action, 367t–368t
impaired absorption, 2520
inadequate intake, 2520
metabolic pathway, 705f
metabolism, 2520
    inborn errors of, 2521
in vegetarian diet, 330

**Vitamin B**$_{12}$ **deficiency**, 372–373, 373f, 2520–2521
- clinical manifestations of, 2521
- diagnosis of, 2521
- etiology of, 2520–2521
- laboratory findings of, 2521
- treatment of, 2521

**Vitamin C** (ascorbic acid)
- biochemical action, 367t–368t
- deficiency, 373–375, 375f, 3589
- dietary needs and sources, 373
- dietary reference intake, 310t–316t
- for methemoglobinemia, 2553
- toxicity, 375

**Vitamin D**
- for atopic dermatitis, 1215–1216
- dietary reference intake, 317, 319t–320t
- excessive, hypercalcemia caused by, 2952t
- food sources of, 376t
- metabolism, 3746, 3746f
- physiology of, 379
- in vegetarian diet, 330

**Vitamin D deficiency**
- associated with hypophosphatemia, 409
- congenital, 380
- malabsorption and, 2006
- nutritional, 379–380
- rickets due to, 375–379, 376b
- secondary, 380–381

**Vitamin D-dependent rickets (type 1)**, 381

**Vitamin D-dependent rickets (type 2)**, 381

**Vitamin E**
- dietary reference intake, 310t–316t
Vitamin E deficiency

- ataxia with, 385
- clinical manifestations of, 385
- diagnosis and differential diagnosis of, 385
- laboratory findings of, 385
- malabsorption and, 2006
- pathogenesis of, 385
- prevention of, 386
- prognosis of, 385–386
- treatment of, 385

Vitamin K

- administered to newborns, 873
- dietary reference intake, 310t–316t, 317
- food sources of, 376t

Vitamin K deficiency, 386–387

- bleeding, 386
- malabsorption and, 2006
- pathogenesis of, 386
- postneonatal, 2607–2608

Vitamin K deficiency bleeding (VKDB), 386, 972–973, 972t

- clinical manifestations of, 386
- diagnosis and differential diagnosis of, 386–387
- laboratory findings in, 386
- late, 386

Vitamins

- for cystic fibrosis, 2296
- malabsorption of, 1988t
- supplements, 511t
- water-soluble, 367t–368t

Vitiligo, 3479–3480

- clinical manifestations of, 3479–3480, 3479f–3480f
etiology and epidemiology of, 3479
   treatment of, 3480
   vulvar, 2845–2846, 2849–2850, 2850f

Vitreous disorders, 3377–3385

Vitreous seeding, 2697

Vocal cord, dysfunction, vs. asthma, 1189, 1190b

Vocal nodule, 2215

Vogt-Koyanagi-Harada syndrome, 3480

Vohwinkel palmoplantar keratoderma, 3516

Voiding
   disorders, without incontinence, 2820
   Dysfunctional Voiding Symptom Score questionnaire, 2817, 2817f
   infrequent, 2819
   normal, 2816
   vaginal, 2819

Voiding cystourethrogram (VCUG)
   in ectopic ureterocele, 2806f
   in posterior urethral valves, 2809f
   in urinary tract obstruction, 2803
   in UTI, 2794–2795f, 2794t
   in vesicoureteral reflux, 2796f–2798f, 2819f

Volatile substance abuse, 1053t

Volitional behaviors, 207t

Volleyball, injuries associated with, 3711–3712

Volume depletion, 392

Volume load, increased, congenital heart lesions resulting in, 2372

Volume overload, 392

Volume regulation, 391–392

Volume-controlled ventilation (VCV), 596, 596t, 597f
Volume-support ventilation (VSV), 596–597

Volumetric capnography, 588

Volutrauma, 593

Volvulus
  associated with malrotation, 1953
  gastric, 1949

Vomiting, 1904
  in acutely ill child, 528
  as cause of GI symptoms, 1902
  complications of, 1906
  cyclic, 1904, 1905
  cyclic, syndrome of, 2046–2048
  differential diagnosis of, 1904
  functional, 2043, 2043
  Jamaican vomiting sickness, 860
  measles and, 1673
  migraine with, 3131
  in newborn, 911–912
  pharmacologic therapies for, 1906
  supportive and nonpharmacologic therapies for, 1907
  while using combined oral contraceptives, 1071

Vomiting syndrome, cyclic, 3123

Vomitoxin, foodborne illness, 3776–3777
  noninfectious, 2018

von Gierke disease, 778–781, 3298

von Hippel-Lindau disease, 2081, 2705, 2980, 3148
  pheochromocytomas and, 2986

von Recklinghausen disease, 3141, 3475

von Willebrand disease (VWD), 2599–2602
  classification of, 2599–2600, 2601
  platelet-type pseudo-, 2600
  type 1, 2599
type 1C, 2599
type 2A, 2600
type 2B, 2600
type 2M, 2600
type 2N, 2600
type 3, 2600

laboratory diagnosis of, 2600, 2600r, 2601f
pathophysiology of, 2599
treatment of, 2600–2602, 2601t

Von Willebrand factor (VWF), 2599
- containing concentrates, 2600, 2601t
in hemostasis, 2589
reference values for, 2592t
specialized laboratory testing, 2601f

Voriconazole, 1638–1639

Vulvar disorders, 2845t–2846t
complete vulvar duplication, 2872

Vulvar malignancies, 2866

Vulvitis, 2844

Vulvovaginal anomalies, 2867–2872
abnormalities of hymen, 2870–2871
clinical manifestations of, 2868–2869
clitoral abnormalities, 2872
cloacal anomalies, 2872
complete vulvar duplication, 2872
congenital absence of vagina, 2871
ductal remnants, 2872
embryology of, 2867–2868
epidemiology of, 2868
laboratory findings of, 2869
longitudinal vaginal septa, 2871
transverse vaginal septa, 2871
treatment of, 2871–2872

Vulvovaginitis, 1480, 2844–2851
clinical manifestations of, 2846–2850
dermatoses, 2848–2850
diaper dermatitis, 2846
genital ulcers, 2847–2848
labial agglutination, 2846–2847
physiologic leukorrhea, 2846
diagnosis and differential diagnosis of, 2850
epidemiology of, 2844–2846
etiology of, 2844
in immunocompetent patient, 1642
treatment and prevention of, 2850–2851

VURD syndrome, 2809

W
Waardenburg syndrome, 702–703, 987t, 3404t, 3478
Wada test, in epilepsy surgery, 3110
WAGR syndromes, 3014

associated with Wilms tumor, 2682, 2682t
Waldeyer ring, 2198–2199
Walkers, 3768
Walker-Warburg syndrome, 3255t–3257t

in congenital muscular dystrophy, 3293
Walker-Warburg variant, in lissencephaly, 3069
Walk-jogging program, for children with disabilities, 3771t
Wang syndrome, 673f
War

effects on children, 92–95, 93b
protecting children from, 94
psychologic impact of, 93–94
role of pediatricians and allied health professionals, 94–95
stress reactions in children exposed to, 94b
susceptibility of children in times of, 93
Warfarin, 2606
- complications of, 2606
- dosing of, 2606
- embryopathy, 2606
- teratogenic effect, 888

Warm antibodies, autoimmune hemolytic anemias associated with, 2563–2564

Warthin-Finkeldey giant cells, 1670

Warts, 3566–3567
- clinical manifestations of, 3566–3567, 3566f–3567f
- differential diagnosis of, 3567
- etiology of, 3566
- genital, 1091t, 1750, 1750f
- histology of, 3567
- treatment of, 3567

Warty tuberculosis, 3558

Wasting
- chronic wasting disease, 1806
- renal magnesium, 405
- renal phosphate, 408
- renal salt, 396
- urinary potassium wasting, 402

Water
- balance, physiology of, 2887–2888
- chemical exposure in, 3790
- deficit, hypernatremia caused by, 393, 393b
- dietary reference intake, 317–321, 319t–320t
- ingestion, increased (primary polydipsia), 2891
- intake, regulation of, 391
- maintenance, 426, 426b, 426t

Water facilities, improved, for acute gastroenteritis, 2032

Water-soluble vitamins, 367t–368t

Watery diarrhea-hypokalemia-acidosis syndrome, 2080–2081

Wet dressings, 3451
Wheelchair, 3768–3769
Wheezing, 584
    bronchiolitis and, 2217–2220
    inhalational injury and, 620
    recurrent/persistent, 2164
    respiratory signs and symptoms, 2166t
    transient nonatopic, 1188b
Whipple disease (*Tropheryma whippelli*), 1401t, 2001
Whipworm (*Trichuris trichiura*), 1881–1882
White blood cells (WBC), leukemoid reaction, 1147
White line of Fränkel, 374
White matter disease, vanishing, 3192
White nail, 3543t

White spot lesions, 1918, 1918f

WHO youth violence prevention strategies, 1038t

Whole exome sequencing (WES), 627, 632

Whole genome sequencing (WGS), 685–686, 2631

Whole-body irradiation, 3783–3784
  localized, 3784, 3784t
  uncontrolled large- or small-scale exposure to, 3783–3784, 3784t

Whole-bowel irrigation, for poisoning, 498

Widal test, 1506

Wide complex rhythms, 539

Width, in deformational plagiocephaly, 3084

Wiedemann-Rautenstrauch syndrome, 830–831t

Wilkie syndrome, 1964–1965

Williams syndrome, 667t, 668f, 2387–2388, 2388f, 2920–2921, 2953

Wilms tumor, 2681–2685, 2781
  clinical manifestations of, 2683
  diagnosis of, 2683–2684, 2684f
  differential diagnosis of, 2683–2684
  epidemiology of, 2682
  genetics and molecular biology of, 2682–2683
  late effects of, 2685
  prognosis of, 2685
  recurrent disease, 2685
  treatment of, 2684–2685

Wilms tumor suppressor gene (WT1) mutations, 2682, 2988, 3014

Wilson disease, 2103–2105, 2566, 2762, 3165
  clinical manifestations of, 2103–2104
  diagnosis of, 2104
  pathology of, 2104
prognosis for, 2105
treatment of, 2104–2105

Wimberger lines, 1593–1594
Wimberger sign, 374f
Windswept deformity, 375–376
Wiskott-Aldrich syndrome, 1117 , 1405 , 2615–2616 , 2631
Withdrawal
  benzodiazepines, 1055t
  as contraceptive method, 1073
  neonatal, and substance abuse during pregnancy, 976–978
Wnt signaling pathway, 2682
Wolff-Parkinson-White syndrome, supraventricular tachycardia in, 2440f
Wolfram syndrome, 2888 , 3023 , 3049
Wolman disease, 761 , 776 , 1998
Wood lamp, 3441
Woolly hair disease, 3542
Work of breathing, 594 , 595f
Working memory, 255 , 270
World Health Organization
  classification of, lupus nephritis, 2729
  diagnostic criteria of polycythemia vera, 2566t
World Symposium, on Pulmonary hypertension 2013, 2426f
Wormwood toxicity, 512t
Wound botulism, 1546 , 1548t
Wound care, in envenomations, 3822
Wound infection
  inguinal hernia repair, 2070
  *Pseudomonas aeruginosa*, 1530
  of puncture of foot, 3604
Wound management, tetanus prevention measures, 1552, 1552t

Wound membranes, for burns, 618t

Wrestling, injuries associated with, 3714

Wright and Giemsa stains, 1336t

Wrist, 3653–3654
  fractures of, 3666
  ganglion, 3654
  gymnast's, 3654, 3654f
  injuries, 3654, 3654f
  JIA of, MRI, 1266f
  Madelung's deformity, 3653–3654, 3653f
  problems due to arthrogryposis, 3662
  Walker-Murdoch wrist sign, 3741f

Writing disabilities, 269–273
  DSM-5, 271, 272b
  epidemiology of, 271
  executive functions, 272
  oral language, 272
  skill deficits associated, 272–273
  transcription, 272
  treatment of, 273
  working memory, 272–273

Writing impairment, 257, 257t

Written asthma action plan, 1197f, 1206–1208

Written language, 271

Wuchereria bancrofti, 1884–1885

X

X chromosome inactivation, 646f, 680–681
45,X males, 2997
45,X/46, XY gonadal dysgenesis, in hypergonadotropic hypogonadism, female, 3005, 3005f

Xanthine oxidoreductase deficiency, 824

Xanthochromia, 3061

Xanthogranuloma, 2713
  juvenile, 3584–3585, 3585f
  in eye, 3353

Xanthogranulomatous pyelonephritis, 2790

Xanthomas, liver disease and, 2087

Xerocytosis, hereditary, 2536, 2537t

Xeroderma pigmentosum, 2631, 3500, 3500f

Xerophthalmia, 363, 363f

Xerostomia, 1926

X-LAG syndrome, 2896–2897

X-linked conditions
  adrenal hypoplasia congenital, 2998
  agammaglobulinemia, 1107–1109
  cardiomyopathy, 712
  hyper-IgM, 1111
  hypophosphatemic rickets, 382
  ichthyosis, 3510–3513, 3512f
  IPEX syndrome, 1121–1122
  isolated GH deficiency in hypopituitarism, 2882–2883
  liver phosphorylase kinase deficiency, 784
  lymphoproliferative disease, 1111–1112, 1112t, 1718
  macrothrombocytopenia and dyserythropoiesis, 2615–2616
  recessive hypoparathyroidism, 2945
  SCID, 1116

X-linked inheritance, 645, 646f

X-ray
  chest, 2154, 2154f
46,XX DSD, 3012–3013
- androgenic drugs, exposure to, by women during pregnancy, 3013
- aromatase deficiency in, 3012–3013
- congenital adrenal hyperplasia in, 3012
- genes mutated in, 2989t – 2990t
- glucocorticoid receptor gene mutation in, 3013
- virilizing maternal tumors in, 3013, 3013t

46,XX gonadal dysgenesis, 3013
XX gonadal dysgenesis, in hypergonadotropic hypogonadism, female, 3004–3005
XX males, 2997, 3013
46,XX ovotesticular DSD, 3013
46,XX testicular DSD, 3013
XXX females, in hypergonadotropic hypogonadism, female, 3005–3006
47,XXX males, 2997
XXXX females, in hypergonadotropic hypogonadism, female, 3006
XXXXX females, in hypergonadotropic hypogonadism, female, 3006
XXY syndrome, 2894
46,XY DSD, 3014–3018
- androgen action, defects in, 3016–3018
- testicular differentiation, defects in, 3014–3015
- testicular hormone production, deficiency of, 3015–3016
- undetermined causes of, 3018

46,XY DSD, genes mutated in, 2989t – 2990t
XY gonadal agenesis syndrome, 3014–3015
XY pure gonadal dysgenesis, 3014
XYY syndrome, 2894
Y

Yaws (Treponema pertenue), 1600–1601, 1600f

Yellow fever, 1764–1766
  clinical manifestations of, 1765
  complications of, 1765
  diagnosis of, 1765
  epidemiology of, 1765
  etiology of, 1764–1765
  pathogenesis of, 1765
  prevention of, 1766
  treatment of, 1765
  vaccine-associated viscerotropic disease, 1766

Yellow fever vaccine, 1350f

Yellow nail syndrome, 2278, 3544–3545

Yersinia enterocolitica, 1522–1524
  bacterial gastroenteritis and, 2014f
  clinical manifestations of, 1523
  complications of, 1523
  diagnosis of, 1523
  differential diagnosis of, 1523
  epidemiology of, 1522–1523
  etiology of, 1522
  pathogenesis of, 1523
  prevention of, 1523–1524
  treatment of, 1523
  vulvovaginal infection, 2847f

Yersinia pestis, 1524–1526
  clinical manifestations of, 1525
  diagnosis of, 1525
  differential diagnosis of, 1525
  epidemiology of, 1525
  etiology of, 1524
  pathogenesis of, 1525
prevention of, 1526
treatment of, 1525–1526

*Yersinia pseudotuberculosis*, 1524
bacterial gastroenteritis and, 2014t

*Yersinia* spp., antibiotic therapy for, 2031–2032t

Yew toxicity, 509t

YF-VAX, for yellow fever, 1766

Y-linked inheritance, 645, 646f

Yohimbe, potential toxicity, 512t

Yolk sac tumors, 2864

Young adults, ALL in, 2652

Z

Zafirlukast, for asthma, 1203

Zanamivir, 1668–1669
for influenza, 1730, 1731t

ZAP-70 gene mutations, 1114t

Zeitgebers, 172–173

Zellweger spectrum disorder, 746–747, 746f, 747t

Zellweger (cerebrohepatorenal) syndrome, 2094
polymicrogyria and, 3070t–3071t

Ziehl-Neelsen stain, 1336t

Zika virus, 1758–1760
clinical features of, 1759
differential diagnosis of, 1760
epidemiology of, 1758–1759, 1758f, 1759t
laboratory diagnosis of, 1759–1760
management of, 1759
prevention of, 1760, 1760t
prognosis for, 1760

Zinc, 387t–388t
  in common cold, 2187
  dietary reference intake, 319t–320t
  foodborne illness, 3776t–3777t
    noninfectious, 2018t
  supplementation, for acute gastroenteritis, 2029
  in vegetarian diet, 330
  for Wilson disease, 2104–2105

Zinc compounds, in toxic neuropathies, 3330
Zinc deficiency, 317, 334, 388, 3587f–3588f
Zinner syndrome, 2786, 2787f
Zollinger-Ellison syndrome, 1973
Zolmitriptan, for migraine, 3135t–3136t
Zona fasciculata, 2955
Zona glomerulosa, 2955
Zona reticularis, 2955
Zones of adrenal cortex, 2954
Zones of destruction, in scurvy, 374f
Zonisamide
  adverse effects of, 3106t
  dosages of, 3104t–3105t
Zosteriform lentiginous nevus, 3471
